*ABBREVIATIONS*

**Books of the Bible:**

- Old Testament
  - Gn = Genesis
  - Ex = Exodus
  - Lv = Leviticus
  - Nu = Numbers
  - Dt = Deuteronomy
  - Jos = Joshua
  - Jg = Judges
  - Ru = Ruth
  - 1 S 2 S = 1 and 2 Samuel
  - 1 K 2 K = 1 and 2 Kings
  - 1 Ch 2 Ch = 1 and 2 Chronicles
  - Ezr = Ezra
  - Neh = Nehemiah
  - Est = Esther
  - Job
  - Ps = Psalms
  - Pr = Proverbs
  - Ec = Ecclesiastes
  - Apocrypha.
    - 1 Es 2 Es = 1 and 2 Esdras
    - Tob = Tobit
    - Jth = Judith

**New Testament:**

- Mt = Matthew
- Mk = Mark
- Lk = Luke
- Jn = John
- Ac = Acts
- Ro = Romans
- 1 Co 2 Co = 1 and 2 Corinthians
- Gal = Galatians
- Eph = Ephesians
- Ph = Philemon
- Col = Colossians
- Heb = Hebrews
- Jas = James
- 1 Th 2 Th = 1 and 2 Thessalonians
- 1 Ti 2 Ti = 1 and 2 Timothy
- Tit = Titus
- Phi = Philemon
- Jude
- Rev = Revelation

*Authorship Details:

CONFIRMATION. — r. Names. — The word 'confirmation,' as used in this article, indicates an act, closely connected with baptism, in which prayer for the Holy Spirit is joined with some ceremony, such as the laying on of hands or anointing, through which the gift of the Spirit is believed to be conferred. So long as confirmation continued to be administered at the same time as baptism, the two forming a single rite, the need of a special name for the former was not much felt. The rite as a whole was known as baptism, and the part of it which was associated with the gift of the Spirit was designated by terms derived from its most prominent ceremony, such as 'laying on of hands' (ἐκθένσις χερσίν, Ιού 62); ETHERICE, Clem. Alex. Exc. Th. 22; Const. Ap. ii. 32, iii. 16. vii. 44; cf. Virgilian, ap. Cyp. Ep. 75; imposito manu) and 'chrism.' The word 'seal' (σφραγίς) originally, it seems, applied to baptism (Hermas, Sim. ix. xvi. 2-4; Iren. Deo. 3), was early used of confirmation, with reference to the signing of the baptized with the cross (Clem. Alex. Strom. ii. 3; Cornelius, ap. Eus. HE VI. xiii. 14 f.; cf. Const. Ap. iii. 17). 'Confirmation,' now universally accepted as the name of the rite in the West, does not appear to have been so used before the 5th century. It occurs in Faustus, Bishop of Riez, formerly Abbot of Lérins, de Sp. S. ii. 4 (ed. Engelbrecht, Vienna, 1889, p. 143), hom. in die Pent. (Ligne, Max. Ed. Pat., Paris, 1877, vi. 630), and the cognate verb is similarly applied by St. Patrick (Ep. 2), who spent some years at Lérins. It appears, therefore, to have originated in Gaul, and probably at Lérins, though it was perhaps not fully established as a name of the rite at Lérins when St. Patrick left that monastery c. A.D. 415 (Bury, Life of St. Patr., 1905, pp. 284, 336 ff.), since in his Confession (38, 51) he uses the word confirmaunt instead of confirmare. St. Ambrose had at an earlier date used the latter verb with a similar but not identical meaning (de Myst. 42); and in the middle of the 5th cent. Pope Leo I. (Ep. 159) applies it to the laying on of hands on those who had been baptized in heresy. In Egypt at the present day the rite is called tathbit—a word exactly equivalent to 'confirmation.' In the 9th cent., when confirmation was deferred, the newly baptized were said to be 'confirmed' by the reception of the Holy Communion.

(Alcin, Ep. 90; Jesse Ambian. Ep. de bapt.; Amathuris, de Car. Bapt. 4; Raban. Maur. de Cler. Inst. i. 29.)

2. Confirmation in the Apostolic Age. — A study of Ac 19:4-6—the account of the twelve disciples who had been baptized into John's baptism—seems to yield the following results. St. Paul's first question implies that a reception of the Holy Spirit usually, though not always, synchronized with admission to the Christian Society, and that in the case of disciples whose conversion was not due to the preaching of him or his immediate companions (v.9 ἐλαχισταὶ παρευρέσθενες). It is also implied in what follows that the outpouring of the Spirit was not a result of the act of baptism (v.5), but that it was mediated, at least in St. Paul's practice, by a laying on of hands which normally followed immediately upon baptism (v.6). Since apparently St. Paul, in accordance with his rule (1 Co 13-17), which was also that of other Apostles (Ac 10:4, cf. 20), did not himself baptize the Ephesian disciples, though he laid his hands upon them (v.16, κατατίθησα σὺν δόξῃ τῶν εὐαγγελίων), he may be inferred that, while baptism was commonly administered by persons of lower ministerial rank, confirmation was reserved for those who had a higher place in the ministry, if not for Apostles.

These conclusions are confirmed by the narrative of the planting of the Church in Samaria (Ac 8:19-27). From it we learn that the practice of the older Apostles coincided with that of St. Paul. Baptism by itself did not convey the gift of the Spirit. That was mediated by a laying on of hands by Apostles, with prayer for the Holy Spirit (v.14, 17), the baptisms having been previously performed by Philip, and perhaps by others of inferior ministerial office who accompanied him. It is hinted that, at least when St. Luke wrote, according to established usage the bestowal of the Holy Spirit was not separated in time from the administration of baptism (v.16).

In each of these cases the reception of the Spirit was manifested by the exercise of miraculous powers (9:19). But it would be contrary to the teaching of the NT as a whole to suppose that such manifestations were of the essence of the gift. If we may suppose (Chase, Confirmation in the Apostolic Age, p. 35) that 2 Ti 1:6 refers to...
CONFIRMATION

Timothy's confirmation, rather than to his ordination, it proves that the graces looked for as a result of the laying on of hands were such as 'power and love and solemnity' (cf. Ac 20:32, where 'wonders and signs' are confined to the Apostles).

The influences which have here been drawn from Ac 8:16-17, 19-20, are corroborated by many references in the Epistles to a reception of the Holy Spirit on admission to the Church (Ro 5:5, 2 Co 5:21, Eph 1:18, 4, 1 Jn 2:2, 3), in some of which St. Paul uses the very phrase ascribed to him by St. Luke, as pointing to a laying on of hands, παρασκευάζειν (Ro 8:26, 1 Thess 5:23), which indicates that the bestowal of the gift was an act distinct from and following the washing (1 Co 6:11, 12, 2 Co 12:12, Tit 3:5). To these may be added He 6:1, where βεβαιοῦται ἔκτις τε Χριστῷ must at least include a laying on of hands, likely so posed clearly with a Christian act of unction.

3. A review of the evidence afforded by the NT, therefore, leads to the belief that in the Apostolic age, and to a large extent, the gift of the Holy Spirit to a new believer was associated with an unction in the earliest sub-Apostolic records (Iren. Haer. i. xxi. 3; Tent.; Con. Hipp. 134-136; to the authorities cited by Chase may be added Theophilus of Antioch; see below, § 6 a); (c) The NT adds force to such passages as 2 Co 1:13, 1 Jn 2:20, 27. It must be noticed, however, (a) that no Scripture evidence has been produced that unction was used along with the laying on of hands; while, on the other hand, it was, among both Jews and Gentiles, an accomplishment of the bath (Swete, The Holy Spirit in the NT, 1909, p. 356, citing Lu 3:16, to which see Aa 11); (b) that neither Irenaeus (loc. cit.) nor Theophilus makes any reference to the laying on of hands and anointing; and (c) that neither in the Eucharist. It has occurred to some that the union with the gift of the Spirit in 1 Jn 2:27 does not by itself establish the contention. It may, however, in part account for the close relation which subsisted in later times between the union and the imposition of hands, leading in some cases to the overshadowing, or even the superseding of the latter by the former.

On the whole, the reasonable inference from the facts appears to be that unction was a primitive accompaniment of baptism rather than of confirmation.

4. The passages of the NT examined in § 2 point to confirmation by laying on of hands after baptism. Nevertheless, it must be remarked that there is no indication that any feeling of incongruity was occasioned by the outpouring of the Holy Spirit upon Cornelius and his friends before they were baptized (Ac 10:45-48), and it is recorded that Ananias laid hands on Saul that he might be 'filled with the Holy Ghost,' and afterwards baptized him (Ac 9:16-18). These facts suggest the possibility that confirmation may regularly have preceded baptism in some regions, concerning whose customs in this matter the NT supplies no information. It will be found that this suggestion has some bearing upon peculiarities of the early Syrian rite of initiation (§ 5).

5. References to confirmation in the sub-Apostolic period. — It was not to be expected that the scanty remains of the earliest extra-canonical Christian literature would supply many references to confirmation comparable with Martyr's 1st Apology, both of which contain accounts of the baptismal rite, explicit mention of it might, indeed, have been looked for. The absence of such mention in the former may, however, be accounted for by the fact that administration belonged to the Apostles and prophets, for whose guidance the Didache was not intended. In Justin, on the other hand, but few details of the baptismal rite are given (I Apol. 61), and we are told (ch. 63) that, after the washing, the neophyte was brought into the assembly, where prayer was made for him and others, followed by the kiss of peace and the Eucharist. That this is a vague allusion to a liturgical act common to all, it is not, of course, to generalize from the Didache to all the primitive Christians: the resemblance in general outline to Con. Hipp. 155 ff. (see below, §§ 26, 28). Irenaeus seems to imply that a laying on of hands followed the immersion, both being included in the rite of baptism. This view he distinguishes from the ceremony of baptism by referring to the present life of the Church, by describing believers as the habitation of the Spirit given in baptism (cf. Haer. iv. xxviii. i, 2).

6. The ancient Syrian rite. — About the ceremonies of baptism widely used in Syria in earlier centuries there is a considerable amount of evidence, which must be set out as briefly as possible. (a) From Theophilus, Bishop of Antioch (c. 180), we learn (pro Ant. 1, 12, 27) that associating with the 'oil of God' was, when he wrote, an important feature of the initiatory rite; and his statement that the name 'Christian' was derived from it implies (see Ac 11:27) that he believed it to date from the Apostolic age. According to him, the immersion conveyed regeneration and remission of sins. (b) Clemens Recognitions, iii. 67 (Gersdorff, p. 110; Jaguer, p. 110, cf. 260 [3]). A description of baptism is put into the mouth of St. Peter. However, he states that, while the administration of baptism was handed down by the former, the rite of anointing was transmitted by the latter, and so he distinguishes the grace of baptism from the gift of the Spirit; and in Dem. 3 he describes the former as forgiveness of sins and regeneration, while in Dem. 411 he speaks of the Apostles as baptizing their converts and anointing them with the Holy Spirit, and connects this with the present life of the Church, by describing believers as the habitation of the Spirit given in baptism (cf. Haer. iv. xxviii. i, 2).

(c) Clementine Recognitions, iii. 67 (Funk, p. 241). In the 3rd century, the writer mentions anointing with the oil of unction on the midst of the body by deacons or presbyters, "and this anointing has been referred to a post-baptismal anointing by supposing that the deacons had no share in it; but it must not be assumed that there was any unction after the baptism.

(d) Syr. Acts of Judas Thomas, in Wright, Apost. Acts of Ap. (vol. ii. Eng. tr. 1873 [1st cent.]). This work contains five detailed accounts of baptisms (pp. 165, 158, 257, 260, 299), which, combined, give the following results: After the blessing of the oil, the candidates are anointed with the seal on the head, the men first. Their bodies are then anointed, in the case of the women by a woman. They are subsequently baptized and communicated. There is no consecration of a consecration of the water, and apparently no recognition of a distinction between the grace conveyed by the anointing and by the immersion.

(e) Aphraates (c. 260). In one of his few allusions to the baptismal rite this writer mentions the unction before the baptism (Dem. xii. 13), though he does not actually state that the former preceded the latter in this case. He apparently mentions the gift of the Spirit, but he connects both regeneration and the giving of spiritual armour with 'the water' (Dem. vi. 1, xiv. 10).

(f) Ephraim, Ephraim Hymnus (Eng. tr. by Gwynn in Nicene and Post-Nicene Fathers, vol. iii, 1884, p. 292). In some of his allusions we gather that the baptismal rite included the following elements in the order in which they are given: (i) anointing with 'the seal' (iii. 1, 2, v, 8); (ii) the baptism (x, 8, xiv. 41; for the orders of these two, see iii. 17, iv. 1, v, 5, 18, 19, 20, vol. iv. 4, 12, 15, 19, xlv, 8, 9), vestsing of the neophyte (xvi. 19, xlv, 10, iii. 1, cf. iii. 4); (iv) crowning (xvii. 4); and (v) communion (vi. 19, xlvii, 12, cf. iii. 17). From Sermo Ezech. ex Ps. cx. iii (Opp. Syr. Rome, 1763-47, ii. 225) it appears that the anointing...
CONFIRMATION

7. From this evidence some important inferences may be drawn. It would seem to have been common in Syria up to the 5th cent., and among the Nestorians to the end of the 6th cent., the initiatory rite included three principal acts—unction, baptism, and communion of the baptized. The union consisted of the three parts—the anointing (3rd and 4th cents.), forehead (5th and 5th cents., and later in the case of women), or breast (6th cent.), and the anointing of the body. The gift of the Holy Spirit is usually associated with the union (see above, § 6 f; g, h, i, k, l, and e, c, where the union is ‘at the laying on of hands’); and in this connection it should be noticed that the evidence for the consecration of the oil is earlier than for the consecration of the font (see b, o).

There is no trace, apart from the Apostolic Constitutions, of any important act following the immersion except the confirmation of the baptized. Thus, according to the earliest known custom of the Syrian Christians, confirmation preceded baptism. It is not difficult to believe that this usage was simply a development of local primitive practice. In places where in the laying on of hands for the imparting of the gift of the Spirit took place before baptism (above, § 4), if the baptismal union also corresponded with that custom, the laying on of hands and the union would in time come to be closely associated. Thus the confirmation would become the union ‘at the laying on of hands’ (§ 6 f). Finally, in accordance with this tendency of the ancient Syrian practice, the laying on of hands and the union would supersede the laying on of hands, except so far as the signing of the person with oil could be so described (cf. § 6 e).

In the early part of the 3rd cent. (§ 6, o) confirmation was administered by one person—bishop or priest—assisted by a deacon or deaconess. It will be observed that there is early evidence for the existence of the same ceremonies between the immersion and the baptismal, the anointing, or the Encharch—baptismal union. The signs of the former step are indicated, and a sign of the latter, probably on the lips, below, § 6 f, g, h, i, k, l, and c, o; the laying on of hands could be so described (cf. § 6 f, o).

Modern Nestorian rite—The Syrian rite was re-established shortly after the middle of the 7th cent. by the catholics Isaiyāh III (652-661), and the office of baptism drawn up by him is the basis of the rite as now practised by the East Syrians. He replaced the prebaptismal anointing by a central (see b, o) anointing of the head, followed by an anointing of the body. The result of this change has been much confusion, through the persistence of 6th cent. customs, in the existing MSS. But in one point all agree. In the formula pronounced at this union there is no reference to the gift of the Spirit. No special grace seem to be connected with it, and in a rubric it is described as a symbolic act indicating that ‘the acknowledgment of the Trinity is imprinted on the heart’ of the person about to be baptized. It no longer corresponds to confirmation.

The distinctive rite of Isaiyāh’s ritual is, in fact, confirmation after baptism. It consists of two main acts—the imposition of the hand upon the head of the baptized with an appropriate prayer, and the signing of the forehead (without anointing), accompanied by a formula. Some of the MSS omit the mention of the use of oil in this signing, but there is good evidence that it was ordered by Isaiyāh, and is apparently still customary (A. J. Maclean, Recent Discoveries illustrating early Christian Life and Worship, 1904, p. 68). In the present Nestorian rite, as everywhere in the East, the priest is the minister:
of confirmation. But it is characterized by several unusual features. The priest (not the bishop) consecrates the oil at each performance of the rite, the laying on of the hand is separated from the anointing, and there is no use of ointment, as distinct from olive oil, at any part of the rite.

That post-baptismal confirmation was actually introduced by Isāyāb III, follows almost certainly from the evidence given in § 6, for there seems to have been no earlier between Isāyāb I. and Isāyāb III. who was a liturgical reformer. The supposition is confirmed by the fact that Isāyāb III. was a traveller, who must have had some knowledge of non-Syrian rites (Connolly, op. cit. p. 101). And by the latitude of the variations of existing rituals from each other, and from the Ordo drawn up by him—a natural consequence of so startling an innovation.

One or two of these may be mentioned. Isāyāb seems to have given no direction about the ceremony of crowning. Bishop’s crown is used, and existing ritual is described at certain in some places. In another it appears in its original position after the vesting, and therefore before confirmation (Luterer, op. cit. p. 37). Its present place is after the anointing (Macarius, The Catholicon of the East, 1892, p. 273). Again, Isāyāb I. ordered that the water should not be poured over the face till after the anointing, i.e. apparently the Eucharist—had been administered (Dietrich, op. cit. p. 91). Isāyāb II. ordered, that, as a matter of order, the water should be let over at least before the confirmation (ib. p. 93). Nevertheless the older usage persisted, and is still followed (ib. pp. 304, 82, 101).

The Eucharist is consecrated by the bishop or one of those present by the name of Severus and one of that of James, while the fourth is anonymous (ib. p. 267), resemble one another closely, and are apparently all derived from the Syr. Ordo of James of Edessa, and are only directly from Severus, a monophysite, anonymous ritual probably represents a recension subsequent to that of Barhebrus. There is also a short office for the baptism of the dying (ib. p. 318), attributed to Severus’ contemporary Philoxenus, Bishop of Mabug or Hierapolis (c. 435-519). All these Orders contain a post-baptismal anointing orunction. In two respects they stand apart both from ancient Syrian and from modern Nestorian usage: they have no form for the blessing of the oil, which is consecrated, not by the priest at the baptism, but by the bishop (ib. p. 361); and at the final anointing unguent, likewise consecrated by the bishop, is used instead of oil.

10. On the other hand, among the liturgical reforms attributed to Peter, Bishop of Antioch (471-488), by Theodorus Lector (Vaësianus, Hist., ed. Reading, 1729, iii. 582), was the consecration of the miopos in the church before the whole people. This might seem to give colour to the supposition that post-baptismal confirmation was introduced among the Monophysites by him. But Peter, Bishop of Edessa (488), appears from the Chronicon of Joshua the Stylist (32, ed. W. W. T. Ryan, 1876), written during his episcopate to have adopted the principal reforms of the Fuller about A.D. 500: among other things, 'he [prayed] over the oil of anointing on the Thursday (before Easter) before the whole people.' From this passage it would seem that Theodorus quoted the actual words of the Fuller, and that the latter used miopos as equivalent to oil (cf. § 6 b). It may be inferred that what the Fuller did was to reserve the consecration of the oil at the baptism, and that post-baptismal christening had not come into use at Antioch in 488, or at Edessa by the end of the century.

11. The post-baptismal confirmation consisted of a prayer following by a threelfold signing of the baptized with chrism on the forehead and other parts of the body, with the formula, 'N. is signed with the holy chrism, the sweetness of the oil of Christ, the seal of the true faith, the complement of their body and mind, life and salvation, etc., followed by an anointing of the rest of the body, the vesting in white, and prayers, one of which contained a petition for the sending forth of the Holy Spirit upon the neophyte.

That this form of confirmation is a later addition is perhaps already sufficiently clear. But this becomes still more evident when we consider the portion of the office which immediately precedes the immersion. Here the Monophysite rituals seem to follow another than the Nestorian. Before baptism the candidates are signed on the forehead with oil, and their bodies are anointed. The connexion between these two acts is obscured in all the MSS by the interpolation of other orders of the office, etc., the oil is added to the water. They are accompanied by prayers which distinctly associate with them the gift of the Spirit.

The first prayer has the petition: 'Vouchsafe to send upon them thy Holy Spirit.' The second begins: 'Holy Father, who by the hands of thy holy Apostles didst give the Holy Spirit to those who had been baptized in the name of the Lord, in the shadow of my hands, thy Holy Spirit on those who are about to be baptized, that they may be filled with the holy anointing. This is evident that a laying on of hands once preceded this anunction, though no mention is made of it in the extant rituals (cf. § 6 e, f). The third reads: 'Then who didst send upon thy only-begotten Son ... thy Holy Spirit ... and didst sanctify the waters of Jordan, may it please thee that the same thy holy Spirit may dwell upon these thy servants ... and do thou perfect them ... purifying them by thy holy water;' etc. This extract seems to indicate (1) that the consecration of the font originally followed the anointing, and (2) that the indwelling of the Spirit preceded the purification of the water.

Thus the Monophysite rite is strangely anomalous. It has two distinct anointings, one before and the other after baptism, by both of which it is implied that the subject of the rite is Severian, a monophysite anonymous ritual probably represents a recension subsequent to that of Barhebrus. There is also a short office for the baptism of the dying (ib. p. 318), attributed to Severus’ contemporary Philoxenus, Bishop of Mabug or Hierapolis (c. 435–519). All these Orders contain a post-baptismal anointing or unction. In two respects they stand apart both from ancient Syrian and from modern Nestorian usage: they have no form for the blessing of the oil, which is consecrated, not by the priest at the baptism, but by the bishop (ib. p. 361); and at the final anointing unguent, likewise consecrated by the bishop, is used instead of oil.

12. Of the attendant ceremonies, the vesting, the crowning, and communion follow the christening. All are omitted in the anonymous ritual. It has not been thought necessary to take account here of two rituals used by the Monophysites, bearing the name of St. Basil, since they are not of Syriac origin. One is a more literal translation of the Gr. Ordo, the other incorporates some Syrian elements (Denzinger, op. cit. p. 207).

13. Maronite rite—It is probable that the two closely similar early Maronite baptismal rituals (Denzinger, op. cit. pp. 334, 351) are derived from an Order drawn up by James of Serug (†521), whose name appears at the head of one of them. But that they have been subject to considerable revision is evident; e.g. the baptismal formula is not in the third person, as in all other Eastern Orders, but in the first, as in the Latin rite. This assimilation to Western standards was carried into the liturgy, and was the more closely followed now in use was composed (ib. pp. 334, 350). Till that revision, however, some ancient Syrian characteristics were preserved. The oil was consecrated at each baptism, and at the consecration
the deacon bid the prayers of the people that they might be marked with the sign of the cross, and then bade them kneel and pray: ‘Let the Lord have mercy on us, and bless these, his holy people, that they may be made pure for the habitation of the Holy Spirit.’ Again, the pre-baptismal anointing was divided into two parts, as in the Monophysite rite, by the consecration of the water. Before the act of anointing, the candidate was signed with oil on the forehead, the prayer following, ‘Let thy Holy Spirit come and dwell and rest upon the head of this thy servant;’ after this the priest again signed him with oil, at the head, and the deacon anointed his body. After the baptism the candidate was signed with chrisms, and then his body was anointed (ib. p. 349), or the principal members were signed (ib. p. 357), a formula being used rather similar to that of the Monophysite rite. In an accompanying prayer (not in all MSS) the words occur, ‘Grant us by this seal the union of thy Holy Spirit.’ Thus in this rite there is the same anomaly as in the Monophysite, proving that the post-baptismal confirmation had no place in the ancient Syrian Order from which it was derived.

14. The attendant ceremonies are the vesting— which in one Order retains its original place immediately after baptism (ib. p. 357), and in the other is performed preceding the chrismation—the crowning, and the communion.

15. Armenian rites.—The Armenian baptismal rite is said to have been drawn up by the catholics John Mandakuni (c. 400). It was revised by the patriarch of Jerusalem, John (Conybeare, Rituale, p. xxvii ff.). The extant office obviously differs much from the original from which it was derived. After the consecration of the ‘holy oil,’ the filling and consecration of the font takes place, and the anointing. The latter contains there is a prayer for the baptized, and an anointing with the ‘holy oil,’ with which the forehead and several members of the body are signed, in each case with an appropriate formula. In these formularies no mention is made of the Holy Spirit. The consecration of the oil at the beginning of the baptismal office proper seems to imply an anointing before immersion, which has fallen into desuetude (cf. Denzinger, op. cit. pp. 55, 57). At present immersion is the usual rite, and the prayer of consecration is said over the chrisms which has been already consecrated by the catholics at Echmiadzin (ib. p. 34; Neale, Hist. East. Ch. ii. 185). In the single petition for the grace of the Holy Spirit, the candidate, before the anointing is so wanting in definiteness that this act can scarcely be regarded as a confirmation. It is less emphatic than in the clause in the prayer of consecration, ‘Send the grace of thy Holy Spirit into this oil, to the end that it shall be to him that is anointed therewith unto holiness of spiritual wisdom, etc. On the whole, it appears that this rite is of Syrian origin, and that it has, on account of the mixture in the material, and the pretense ot the oil on the forehead, the prayer used at the bowing to the altar has no special appropriateness to this ceremony; but it contains words which imply a laying on of the hand (‘Stretch forth thy unseen right hand and bless him’), and is perhaps misplaced.

17. The baptismal rite of the Patriarch of Jerusalem is somewhat obscure, but may be treated as one. There are two anointings, but the first is performed outside the baptistery and is separated from the baptism by a long interval. Immediately after the baptism comes the confirmation. The priest, standing before the altar, prays for the bestowal of the Holy Spirit on the baptized, and signs his forehead or head with chrisms in the threefold Name. Other parts of the body are then signed with an appropriate formula. This is succeeded by the laying on of the hand and with a formula in which the words occur, ‘Receive the Holy Ghost,’ and another prayer for the neophyte, including a petition for the sending forth of the Spirit upon him. Both oil and chrisms are consecrated by the Patriarch of Alexandria.
CONFIRMATION

By means of the newly recovered Sacramentary of Serapion and the evidence of contemporary writers, it has been shown that an Order of confirmation identical with this in its main features was in use in Egypt in the 4th cent. (Brightman, in JThSt 2. 252 f., 263 ff., 268 ff.). Indeed, some of its elements can be traced much further back. Originally the laying on of hands was connected with the laying on of the hand (lxxi. 1, lxxiii. 6, lxxvi. 5). Thus baptism and confirmation are distinct, yet closely related as parts of the same rite (lxx, 3, lxxiii. 9).

The immersion was immediately followed byunction (lxx, 2), and it is implied that the unction was connected rationally in several parts with confirmation. The gift of the Spirit is not associated with it in the one passage in which it is mentioned; and in that passage, arguing against the validity of heretical baptism, as distinct from confirmation, Ezek. 36, 25-27 was put out of the invalidity of the unction which accompanied it. It is to be added that he speaks of sanctification (sanctification) as one of the benefits conferred by baptism, in lxxxiv. 1 (cf. Gen. 41, 55, 1, 6). At some time in the course of the rite, probably after unction, the kiss of peace was given (lxxxiv. 3, 4).

It is to be noted that the bishop, according to the earlier usage, usually baptizes (lxxiii. 9). The oil used in the unction was consecrated on the altar at the Eucharist, and therefore not at the administration of baptism (lxx, 2).

The number of administration of the rite remained much as it was in the 2nd cent. till at least the beginning of the 5th; but the giving of milk and honey was transferred to the baptismal Eucharist (C. Cartag. 111. i. 24, longer form).

The Gallican rite.—The rite which prevailed most widely in the West in early centuries was that known as the Gallican, which was used in North Italy, Gaul, Spain, probably Britain, and Ireland. The earliest descriptions of it are found in Ambrose, de Mysteriis, and another tract founded upon it, viz. ps. Ambrose, de Sacramentis. These witnesses to the rite in N. Italy c. A.D. 400. In this rite baptism was immediately followed by an anointing with chrism on the head or forehead (Trident. Psych. 350; Patr. Ep. 3; Missal, Bobbi.; cf. Stowe Missal), with the formula De quo est universus . . . noster. After the chrismation the feet of the candidates were washed (Maximus Taurin. Tract. ili.; Cesarius, Serm. clxviiii. 3, clxviiii. 2 (Pl. xxxix. 227, 2280), Serm. de unct. cap. [PL xl. 1211]; C. Elixir, e. 185.), and they were vested in white. They then received the signaevae spirituale—apparently a signing with the chrism (cf. Greg.
Tur. Hist. Franc. ii. 31)—which was accompanied by a prayer for the septiform Spirit, no doubt similar to that which occurs in all later Western rites, including the Anglo-Celtic (Isidor. de Eccl. Off. 1, cit. Ill; Hesych. de Bapt. iv. 6, Bapt. 127). Finally, they communicated (Soc. Gall. Soc. Goth. ; Stich. Missal; Zeno Veron. Tract. ii. 38, 53). Since there is early evidence that confirmation consisted of two acts—chrismation and the imposition of the hand—or 'benediction' (Gaul: C. Aratus. c. 1. 11; Gennadius. Massil. de Eccl. Doëg. 52, xiv. 24; Spain: Isidor. op. cit. ii. xxv. 9, xxvii. 1; Hdecons. op. cit. 121-125, 128 f.)—it may be inferred that both the anointing and the signaculum, though not in immediate sequence, belonged to it. In some Ordines this signaculum, or laying on of hands, disappeared as a separate act (Gaul: German. Paris. Ep. 2; Soc. Gall.; Soc. Goth.; North Italy: Maximus Taurin. ut supra; Missal. Bobbien.; Ireland: Patr. Ep. c. 21; Stone Missal), and with it the invocation of the septiform Spirit. Thus the 'confirmation' was reduced to an anointing with chrism, perhaps including a signing, without any direct prayer for the Holy Spirit. If this was the use of the Irish Ordines of the 20th century, that of the present day (Vita S. Mal. 3), that confirmation was not practised in Ireland, is not only intelligible but justified.

25. It is clear that about the end of the 4th cent. both the confirmation and the anointing were commonly administered by the same person (Ambro. op. cit.; ps.—Ambr. op. cit.; Pacificus. Serm. de bapt. 6, Ep. i. 6; Zeno Veron. Tract. ii. 53). This, according to Ambrose and Pacificus, was the bishop; but ps.—Ambro. op. cit., is given as the presbyter; the latter is found in both (Wordsworth, Ministry of Grace, 1901, p. 89). A century earlier the Synod of Elvira (cc. 35, 77) implies that if a presbyter baptized he also confirmed, and that presbyterial confirmation prevailed widely in later times, in spite of continual efforts to suppress it, there is abundant evidence (Gaul: C. Aratus. c. 1. 11; C. Arcl. ii. c. 20 f.; Gallican Statutes(C. Carth. iv.), c. 36; Leo, Ep. de prise, Chorp.; C. Epaon. c. 16; C. Antiochus, c. 6; C. Hipal. ii. c. 7; Soc. Gall.; Soc. Goth.; cf. Vasen. c. 3; North Italy: Missal. Bobbien.; Ireland: Stone Missal; Spain: C. Tolet. c. 20); Mart. Bracae. Orputus, 82; Isidor. op. cit. ii. xxvii.; Hdecons. op. cit. 128, 131; cf. Montanus, Ep. 1 (Mart. Bracae. Orputus, c. 18). This summary of the evidence will suffice to show that between the Gallican and the Eastern confirmations there are many points of resemblance. Gallican usages gave place to Roman in France at the end of the 8th century. They had a more prolonged existence in Spain, Milan, and Ireland (Duchesne, Orig. p. 97 f.).

26. The Roman rite.—If the Gallican rite resembled that of the Eastern Church, the baptismal rite of Rome was akin rather to that of Africa. According to the Canons of Hippolytus (134 f.), in the Rom. use of r. A.D. 200, the priest, immediately after administering baptism, signed the baptized on the forehead, mouth, and breast with the signum signaturae, or anointing, which had been consecrated by the bishop at an earlier stage of the office, and then proceeded to anoint his body. The baptized was then vested and brought into the church, where he was confirmed by the bishop. The confirmation consisted of imposition of the hand and a prayer, in which there was a thanksgiving for the outpoured of the Holy Spirit, and a petition that the neophyte might receive the earnest of the Kingdom, followed by a blessing on that head without oil.

That this represents early Rom. practice is confirmed by Hippolytus, in O. A. 16, where the oil used in the bath is said to signify 'the power (δύναμις) [read δυνάμεια] of the Holy Spirit wherewith (αὐτοῦ) the believers are anointed after the laver, as though (ὡς) with ointment,' the implication being that oil was not actually used in conferring the Holy Spirit.

Thus the union was connected with baptism, not with the sealing on of hands.

The imposition of the hand continued to be the principal act in confirmation till at least the end of the 4th cent., when it was accompanied by the prayer for the septiform Spirit (Jerome, cont. Luc. 9; Suriens. Ep. ad Honor.). But by that time the union on the forehead seems to have come to be regarded as closely associated with it, and as belonging, like it, rather to the bishop than to the priest. In 416, Pope Innocent I. permitted an additional union, which did not lie on the forehead, but on the breast of the neophyte; this is the first notice of the double chrismation, which soon afterwards became the regular practice of the Roman Church (Innoc. Ep. ad Dec. 6, cf. 9; Joan. Diacon. Ep. ad Senor. 8, 14). A signing of the head with chrism after baptism, with a formula almost identical with that of the Gallican rite (§ 24), is enjoined in the Gelasian Sacramentary and in later Rom. books.

27. The development of the Rom. order of confirmation in the Sacramentary (which agrees with the description of the Rom. rite in the Epistle of Jesse of Amiens, A.D. 812), and the 9th cent. Ordo St. Amand (Duchesne, op. cit. p. 453)—as in the much later Liber S. Caroli, S. Audri, and S. Andreae, 1855, App. 5)—the imposition of the hand, with the prayer for the septiform Spirit, is preserved, and at the subsequent chrismation a special formula is used. In the Gregorian Sacramentary the laying on of the hand is given as the raising of the hand. In later orders the raising or extending of the hand is sometimes accompanied by the formula 'Spiritus sanctus superveniet,' etc., the prayer for the septiform Spirit following, and a formula more or less resembling the Gelasian being used with the signing. Of the latter the latest form is that which Pope Eugenius IV. (Docr. pro Armen.) declared to be the 'form' of the sacrament.

28. In the Canons of Hippolytus, and in most later Orders in which confirmation immediately follows baptism, the communion of the neophytes is enjoined. The communion commonly followed baptism when confirmation was deferred, though it is sometimes ordered with the reservation that it is to be given when the chrism has disappeared from all the chrismate tubes of the neophyte are of snitable age. Two ceremonies anciently followed confirmation (Can. Hipp.)—the kissing of the neophyte, with the words, 'The Lord be with you,' and the giving of milk and honey. The former has disappeared from all later Orders, but the memory of it is preserved in the words 'Pax vobiscum' after the chrismation. The latter continued till the 6th cent. (Joan. Diacon. op. cit. 12). The bishop has always been the minister of confirmation in the Rom. Church, though apparently Innocent I. (ut superius) permitted priests to confirm in cases of necessity if authorized to do so by the bishop. The bishop has also always consecrated the chrism (but see Joan. Diacon. op. cit. 8).

29. The mingling of Roman and Gallican rites. —In early centuries the Rom. rite was used only in the immediate neighbourhood of the city. That it had not been adopted in the Gr. district of Lacedaemon at the end of the 5th cent. is easily understood (Gelas. Ep. ix. 6, 10); but it is more surprising that at the beginning of the same cent. Pope Innocent I. should find it necessary to urge a bishop of Umbria to bring the custons of his diocese into conformity with those of Rome. From his letter to Decentius (Book II. 5) it appears that the Bishop of Engubium (Gubbio) the consecration of the chrism was not reserved to the bishops, and that presbyters anointed the baptized with chrism (apparently on
the forehead) and laid hands upon them, with an invocation of the Spirit. Thus in Eugubium (c. 400) the baptismal rite was of the type cited by Leo, Ep. 168). Innocent compromised matters with Decentius by suffering the chrismation by the priest to remain, provided it was not on the forehead, and provided the baptized was subsequently confirmed. Cf. the following artichip. One result of his letter, which was widely quoted as an authoritative document, was, no doubt, the modification of Gallican usage in a Romeward direction in many places; another was the introduction into the Roman baptismal order of the post-baptismal chrismation. The Western rite, in fact, combines the Gallican and the earlier Roman confirmation Orders, which suffices to explain the anxiety of Gallican writers like Rabanus Maurus (de Cler. Ins. i. 28-30; cf. De confirmatione, b. 35, et al.); it was, at least, his influence which brought itself in the rites of Western Syria (above, §§ 11, 13, 15). The consequence of the interaction of the Roman and Gallican rites, exemplified in this striking case, is that the present Latin confirmation rite has been termed, as has the Roman, though it is not now possible to distinguish in all cases those features which were developed within the Rom. Church from which others may have been imported from without.

30. The separation of confirmation from baptism.—For many centuries in the West, confirmation has been divided from baptism by a considerable interval. The beginning of this separation of the rites may be traced to the 3rd cent., when the validity of heretical confirmation was denied even by those who admitted the validity of heretical baptism (but see E. W. Benson, Cyprian, 1897, p. 429). By them persons baptized in heresy, when they joined the Catholic Church, were baptized a second time by a ceremony analogous to, if not identical with, confirmation. Later on we find cases contemplated in which confirmation at the time of baptism was impossible, either because the minister was a deacon or a layman, or because the baptism was already a chrismation (C. Eib. cc. 38, 77; C. Avanat i. c. 2). But the practice of administering confirmation apart from baptism in ordinary cases had a different origin. The Rom. tradition of restricting the administration of confirmation to the middle and post-baptismal period of life, which had its postponement in the case of all persons baptized by a priest in the absence of the bishop. This, of course, became more frequent as the Church spread beyond the cities, as bishops became fewer in proportion to the number of Christians, and in many places baptism became the rule. It was already common at the end of the 4th cent. (Jerome, loc. cit.; cf. Anon. de Re-baptismate, 41). But the separation of the rites did not become universal in the West for many centuries, and, when confirmation was postponed, it was usually only deferred till the offices of a bishop could be had. If it was not administered in infancy, the delay was due to the negligence of parents or of the bishops themselves. On the eve of the Reformations, infantiac confirmation was still the normal practice (see, e.g., Tindal, Answer to More, 1531, ed. Parker Soc., 1590, p. 72). At a much earlier period, however, there was a movement towards admitting to confirmation only those of more mature age (Griining, Decr. iii. v. 6; Syn. Colonien. 1280, c. 5), and in the latter part of the 16th cent. it became the rule, both in the Rom. and in the Anglican Church, that candidates for confirmation should have come to years of discretion (Eng. Pr. Bk.; Cat. of paroch. ii. 3, §§ 8; cf. CQR xxii. 72 d.).

For information about modern offices of confirmation and substitutes therefor, in the Reformed Churches, in the Anglican type of Office, see Confirmation, an Act named at the close of the following list of authorities, and to art. Baptism (Later Crit., vol. ii. p. 404.

H. J. LAWLOR.

CONFIRMATION (Roman Catholic).—As a supplement to the data furnished in the preceding article, the following points illustrating the position of Confirmation in the present teaching and practice of the Roman Catholic Church seem worthy of note:

1. Dogmatic tenets.—The doctrine according to which Confirmation is named as the second of the seven Sacraments is clearly enunciated at least as early as the middle of the 12th cent. In a sermon which he delivered into the church of the Bishop of Bamberg († 1139), by his biographer Heribord (c. 1159), the preacher, addressing the newly baptized Pomeranians, discourses at some length on the seven Sacraments. Enumerating them in their order, he says:—"The second Sacrament is Confirmation, that is, the anointing with chrism on the forehead. This Sacrament is necessary for those that are to fight against, to wit, the devil and the world armed by the strengthening of the Holy Spirit, as they will have to fight against all the temptations and corruptions of this present life. Nor can the grace given be deferred until old age, as some suppose, but it is to be received in the vigour of youth itself, because that age is more exposed to temptation" (Frvs., Mh. xi. 733).

Most of this doctrine, including the sevenfold number of the Sacraments, can be shown to have been taught by Radulphus Ardens sixty years earlier, in his as yet unprinted Speculum juvenatum (above, p. 151). It is also stated by Grabmann, Gesch. dcr schelast. Methode, i. 59), but much vagueness still prevailed regarding the nature and definition of a Sacrament. A decree of the Council of Innocent III., which speaks of the Sacraments as "the words of Jesus," of Juris Canonici (Friedberg, 1876-80, ii. 135), outlines further the main points upon which stress was laid by scholastic theologians both before and after the Council of Trent.

By the auction, he says, 'of the forehead with chrism (per frontem chrisimationem) is denoted the imposition of hands, which is otherwise called Confirmation, because by this means the Holy Spirit is bestowed on increase and strength. Hence, while a simple priest (sacerdos vel presbyter) may perform other aunctions, this ought not to be administered by any one but a high priest, that is to say a bishop, seeing it is reserved to the Apostles alone, whose vices the bishops are, that they conferred the Holy Spirit by the imposition of hands" (cf. Ac. 10:47).

During the Council of Florence (1438-1443), a bull was issued by Eugenius IV., known as the Decretum pro uniformitate in ecclesiasticis actionibus, which states that the ordination of bishops was not so much a dogmatic decree, defining points of faith, as an instruction to secure uniformity of practice. A portion of it, which consists of a compendious treatise on the Sacraments, is taken almost word for word by Thomas Aquinas, De fidei artificis et septem sacramentis. The 'matter' of the Sacrament is declared to be chrism, i.e., oil mixed with balsam, and the 'form' I sign the thief with the sign of the cross, and I confit his chrism of salvation in the name of the Father and
of the Son and of the Holy Ghost,' spoken both then and now by the bishop in administering the
unction. In view, however, of the imperfectly
dogmatic nature of the Decretum pro Armenis,
this decision is not held to be a peremptory pro-
ouncement. On the contrary, the more commonly
accepted view regards the act of unction as itself
constituting an imposition of hands, so that the
'matter' comprises both the unction with chrism
and the laying on of hands.

The most prevalent theory, then, concerning Con-
firmation regards the 'outward sign' of the Sacra-
ment as consisting in the act of the bishop, who
makes the sign of the cross with chrism upon the
ear of the candidate, the words already quoted. The Council of Trent, in
its systematic review of Sacramental doctrine, is
very guarded in its affirmations concerning Con-
firmation. It contents itself with declaring that
it 'lays and properly a sacrament,' and 'one of
the seven, all of which were instituted by Jesus
Christ our Lord.' It denies that 'it was in olden
days nothing else but a sort of catechism in which
they who were entering upon youth gave an
account of their faith in the presence of the Church.'
It condemns those (Reformers) who had declared
that to attribute any virtue to the chrism used in
Confirmation was an outrage to the Holy Ghost.
In other words, the simple priest himself could administer the Sacrament: but, by pronounc-
ing that a bishop was the 'ordinary minister,' it
tolerated the practice by which simple priests in
special cases receive from the Holy See faculties
to confer Confirmation. Finally, the Council declares (Sess. vii.
can. 9) that 'in Confirmation a character is
imprinted in the soul, that is, a certain spiritual
and indelible sign, on account of which the
Sacrament cannot be repeated.' It will be observed
that this leaves many questions open. In particu-
lar, nothing is said as to the time and manner of
the institution by Christ, whether direct or in-
direct; and no definition is given regarding the
matter and form—for example, as to whether the
use of chrism is essential to the validity of the
Sacrament.

Of late years another pronouncement, which,
however, is not usually regarded as possessing
infallible authority, has been made in the decree
of the Holy Year, Lecetatatis Nostri, of 3rd July
1907. This, in its 44th heading, condemns the
following proposition as an error, viz., 'there is no
proof that the rite of the Sacrament of Confirma-
tion was employed by the Apostles; while the
foregoing beatitudes of Matthew 5:1-12 were
Baptism and Confirmation, has no place in the
history of primitive Christianity.' (Denzing-Bannwart, Lekhzerdiom, Freiburg, 1898, p. 204).

Lastly, it should be noticed that, according to the
teaching outlined in the above-mentioned
Decretum pro Armenis, and universally held by
Catholic theologians, the Sacrament of Baptism is
vite spiritualis una, and consequently no other
Sacrament can take effect except in the case of
those who have first been admitted to the life of
supernatural grace through these portals. Hence
it follows that, if Confirmation should precede
Baptism, it would be invalid.

2. Adjustment of theory to historical fact.—It
must be sufficiently obvious that, accepting the
foregoing as a summary of approved Roman teach-
ing upon the Sacrament of Confirmation, some
explanations are needed to bring these tenets into
accord with the facts of early Church history set
forth in the preceding article. Attention may be
directed, in particular, to the following points:

(1) Although infallible pronouncements
like all the other Sacraments, was instituted
by Christ, nothing is positively laid down concerning
the manner of that institution, i.e. whether in-
mediate or mediate, whether in genere or in specie.
Modern theological opinion seems to favour the
view that Christ did Himself immediately institute
all the Sacraments (i.e. that we do not owe our
institution to the Church, acting upon His general
commission), but that He did not Himself give
them all to the Church for Constitution. As a
recent authority puts the matter:

'Oon some Sacraments particularly essential to Christianity, Baptism and Holy Eucharist for example, Christ explained
himself completely, so that the Church has had from the
very beginning full and entire consciousness of these sacra-
mental realities. But many Sacraments were left to the
Saviour's disposal according as the necessities of the
Church and development of doctrine should require.' (Pourrat, Theol. of the
Sacraments, Eng. tr. p. 201 f.)

(2) It would be readily conceded that, in the
case of such a Sacrament as Confirmation, the
historical evidence is in some respects imperfect
and obscure. It is the practice of theologians
to light up all the dark passages, but the claims to supple-
ment by supernatural guidance and theological
reasoning the data which we owe to natural
research.

(3) With regard to the early recognition of the
gift of the Holy Spirit as a distinct rite following Bap-
tism, great stress is usually laid by Roman Catholic
theologians, and deservedly, upon the opening of
the heavens and the descent of the Holy Ghost in
the form of a dove. In particular, nothing is said as to
the time and manner of the institution by Christ, whether direct or in-
direct; and no definition is given regarding the
matter and form—for example, as to whether the
use of chrism is essential to the validity of the
Sacrament.

(4) The extensive treatment which, following
Commelli's Homilis of Narsisi, pp. xlii-xliiix, has been
given to the peculiarities of the ancient
Syrian rite (Dubbeg, Jerusalem, 1907),
tends to obscure the very local character of the
observances by which the gift of the Spirit seems
to be connected with unctions preceding baptism.
At Jerusalem itself, where the testimony of St.
Narsisi, Bishop of Alexandria, Northern Africa, Rome, and through-
outr of the West, we find full and dear historical evidence which not only establishes the practice of conferring the Holy Spirit after baptism, either
by unction or by imposition of hands, but points to a very marked consciousness of the distinc-
tion between the two rites; in other words, to
the recognition of Confirmation as a sanctifica-
tion of a separate order, often conferred by a
separate minister. For a discussion of this subject
the reader may be referred to Dolger, Das Subra-
ment der Ernennung, while the same writer, in an
article in the Rom. Querimischer (1905, pp. 1-41),
has dealt with the archaeological evidence of early
date, which establishes the existence in many
places, e.g. at Naples, Rome, and Salona in
Dalmatia, of a separate Confirmation chapel (con-
signatorius, christnaraun) distinct from the baptis-
tory. In the Syrian Church, however, the accounts
given of the institution, e.g. the Homilies of
Narsisi himself, do not seem to remove it from the
category of a mere ceremony subsidiary to bap-
tism, while the effort made in the Apostolic Con-
stitutions to alter the Syrian practice, introdus-
CONFORMITY.

The ethical question regarding conformity is, How far may a man, from regard to the feelings or authority of others, consent in outward action to what, apart from such regard, he is not inwardly convinced is right or true—more shortly, How far may a man conceal or act against his own inward conviction, in deference to the feelings of other persons or to external authority? Such questions concern conformity except for as a dereliction, unless we are prepared to assert for certain abstract forms of duty (e.g. that we ought to speak the truth) a kind of absoluteness which ignores the social ends to which all duties are relative, and ignores also the way in which a general rule, valid under ordinary and tacitly assumed conditions, may be modified or abrogated by the presence of extraordinary conditions not contemplated in the general rule. No one would seriously contend, e.g., that the duty of promise-keeping requires the promiser not to stop even to save a drowning man's life, if by so doing he would have to break an appointment.

But on the other hand, it is evident that our question is, as it has been called (Morley, On Compromise), 'a question of boundaries,' a question involving a conflict of duties. And, so far as the decision of such questions turns upon the infinite variety and subtle details of personal relations between individuals, ethical science can have nothing to say beyond the vague generalities, such as that, on the one hand, we ought not unnecessarily to wound other people's feelings, or that, on the other, we ought not to suppress our own.

It is difficult, e.g., to see how the writer just quoted is entitled to say, so emphatically as he does, that 'one relationship in life, and one only, justifies us in being silent where otherwise it would be right to speak; this relationship is that between child and parents' (op. cit. p. 165). If we take a duty such as that of a son to support and care for his parents in old age, it is obvious that the duty is one which falls upon a son as such: the relationship is the very basis of the duty.

But we can hardly say the same of the duty of suppressing one's convictions: here the relationship seems to require only that added degree of deference which a son will naturally pay to his parents' opinions in all things of life. And, if so, it is surely paradoxical to contend that a like deference is not equally obligatory in the more intangible relation of husband and wife.

It would seem, then, that the only cases in which we can look for a definite development of ethical doctrine in regard to conformity—as distinguished from mere casuistical discussion—are those in which some external authority has a peculiar claim upon one, either formally or informally, to that in which parents have a peculiar claim to their boy's obedience or to their adult son's support. The two authorities which most evidently possess such a claim, and whose claims most nearly develop, are the Church and the State. How far is a citizen morally permitted or obliged to obey legal injunctions of whose nature or objects he disapproves? How far, e.g., is military service to be obligatory upon a Quaker? Payment of Church rates upon a Dissenter? And the question of obligation is, of course, both accentuated and modified when the citizen is himself an official of the State acting as such; e.g., how,...
CONFORMITY

far is a soldier or a subordinate officer, when ordered to fire upon a mob, relieved from all moral responsibility by the fact of his superior's command? Very similar questions are raised by the Church's claim to authority. How far may a layman, and still more a clergyman, subscribe a creed without any duty? We cannot answer these questions.

All that can be attempted here is to point out some of the more general considerations which must be kept steadily in view if these questions are to be adequately discussed. In the first place, we must put aside as an empty truism—irrelevant or even question-begging—the assertion that a man must at all costs obey his conscience. For our problem is precisely to determine what, in the above cases, conscience really commands. We cannot, then, from the ethical point of view, start with a deliverance of conscience as a fixed datum. (From the political point of view, the ruler must needs take the conscience of any section of his subjects as a datum to be reckoned with. Not that he is obliged to give way to their conscience if he thinks them wrong,—for the sanctity of conscience can extend, in any ultimate sense, no farther than the amount of moral truth which it appears to us he must take as the basis of one of the data of his problem. A Christian ruler might be very unwise in trying to enforce monogamy on a Muhammadan population, and yet the United States be entirely justified in putting down Mob that the second American Revolution. In other words, we must apt to think of the relation as merely a modifying circumstance, in the sense of being essentially subordinate to the abstract rule of duty. That is to say, we are apt to assume beforehand that the relation to the external authority, and then bring in this relation to modify our conclusions. We may, therefore, apt to think of the relation as merely a modifying circumstance, in the sense of being essentially subordinate to the abstract rule of duty. That is to say, we are apt to assume beforehand that the relation to the external authority, and then bring in this relation to modify our conclusions.

We have illustrated the duty of conformity, as regards the ordinary citizen, from the supposed case of a citizen required, e.g., to fire on a mob. For it is interesting to observe that our English system of law commits in practice, and in an even aggravated form, the same mistake as that to which we have objected in theory. It treats the soldier's special duty of obedience to military law as a mere qualifying circumstance in relation to his general civic duty to obey the ordinary law of the land; or, rather, it says he must obey both laws, and choose, if they conflict. Hence he may . . . be liable to be shot by a court-martial if he disobeys an order, and to be hanged by a judge and jury if he obeys it. (Dicey, Law of the Constitution, 1902, p. 288.) The law and of, cases, we must be able to guard our guard against a fallacy into which we are likely to fall, if we begin by considering what the individual's duty would be, apart from his relation to the external authority, and then bring in this relation to modify our conclusions. We may, therefore, apt to think of the relation as merely a modifying circumstance, in the sense of being essentially subordinate to the abstract rule of duty. That is to say, we are apt to assume beforehand that the relation to the external authority, and then bring in this relation to modify our conclusions.

The question of religious conformity differs from that of civic in this respect, that membership of a Church is voluntary in a sense in which citizenship is not. We ought not, indeed, to exaggerate this difference, for in the case of a person of strong religious convictions, and of (what may be roughly called) 'high' Church views, it may amount to very little in practice. We can hardly wonder, e.g., at the submission with which Roman Catholic disbelievers in Papal infallibility received the decree, when the choice lay between submission and excommunication. Provided these disbelievers have already committed ourselves, tacitly or by implication, to that denial of the value and authority of the State as an institution to which he proceeds to give open expression (Kingdom of God is within you, 1894, ch. vii.). But, on any less extravagant view than his, it is impossible for the citizen of a State, that is to say, the institution on which the whole system of law and order in life practically depends, to treat his relation to the State in any matter of public duty as a mere qualifying circumstance to be taken into account after his duty has been otherwise determined. In any matter of public duty the real question at issue as regards conformity is always this: Do I think the human interest that is endangered by conformity so vital, that I, with others of like mind, am prepared to endanger, by our refusal of service or our passive resistance or our active rebellion, the institution which the whole fabric of human interests depends? This, at any rate, is the question of principle. To say, with regard to a par.

It might be objected that what is endangered by war is not a particular human interest, but the sanctity of human life in general. But the objection simply repeats the original fallacy. There is no World-Empire which could assert the sanctity of human life against warring States, and therefore we have to distinguish between a citizenship and a civic patriotism, but between a civic patriotism and anarchy.
The Chinese Empire was created in the 3rd cent. B.C., when the mighty Shi Hwang, the Ts'ing dynasty, which had ruled in the north-west since the 9th cent. B.C., destroyed in streams of blood the complex of States which, up to that time, had existed in the birthplace of higher East Asian culture, the home of Buddhism. But the House of Ts'ing did not exist long enough to organize the great creation of this first Emperor of China. It collapsed after a few years, giving place to the glorious House of Han, which maintained itself and its traditions till the 3rd cent. A.D. This dynasty, in organizing the enormous young Empire, built up a political constitution, naturally and systematically taking for its guide the principles, rules, and precedents of the old time, that is to say, the ancient literature. It so far as possible resurrected and irrecoverably lost in the flames which Shi Hwang, in a frenzy of pride, had kindled to devour it. With a view to the completion of this gigantic task of organization, this classical literature was sought for, restored, emended, commented upon, and thus there arose a classical, ultra-conservative State-constitution, which, handed down as an heirloom to all succeeding dynasties, exists to this day. The religious elements contained in the classics were not given a religious interpretation, but that constitution, together with the political, seeing that everything contained in the classics was to be preserved and developed as a holy institution of the ancients; in other words, those religious elements become the Shih Shu, the religious constitution, in consequence, now fully two thousand years old. Its basic principle, Universalism, is, of course, older, much older than the classical books by which it has been preserved. As is the case with many other religious creeds, Universalism is lost in the darkness of antiquity.

With the classical books the name of Confucius is inseparably associated. Five are called King; the others are called Shu. Confucius did not write them all; they belong partly to a much older, partly to a later period. He is held to have written only one King, the Ch'ün-ch'iu. Three other Kings, called the Shu, or Book of History, the Shih, or Songs, and the Yeh, or Natural Law, contain statements which, in consequence, now fully two thousand years old. Its basic principle, Universalism, is, of course, older, much older than the classical books by which it has been preserved. As is the case with many other religious creeds, Universalism is lost in the darkness of antiquity.

With the classical books the name of Confucius is inseparably associated. Five are called King; the others are called Shu. Confucius did not write them all; they belong partly to a much older, partly to a later period. He is held to have written only one King, the Ch'ün-ch'iu. Three other Kings, called the Shu, or Book of History, the Shih, or Songs, and the Yeh, or Natural Law, contain statements which, in consequence, now fully two thousand years old. Its basic principle, Universalism, is, of course, older, much older than the classical books by which it has been preserved. As is the case with many other religious creeds, Universalism is lost in the darkness of antiquity.
assimilated respectively with the fruitifying Heavens, and with the Earth which they fructify, as also with heat and cold, light and darkness. The vicissitudes of these souls, indeed, every year produce the seasons and their phenomena.

*Confucian Religion.* Every state, minister, and mandarin may form his assigned place on the altar and its terraces, or on the marble pavement which surrounds it. On the upper terrace, a large tablet, inscribed 'Imperial Heaven, Supreme Emperor,' stands in a shrine on the east side, and faces due south. In two rows, facing east and west, are shrines which contain tablets of the ancestors of the Emperor. Before each tablet a variety of sacrificial food is placed—soaps, meat, fish, dates, chestnuts, rice, vegetables, spirits, etc.—to conform them to ancient classical precedent and tradition. On the second terrace are tablets for the spirits of the sun, the moon, the Great Bear, the five planets, the twenty-eight principal constellations, and the host of stars; furthermore, there are tables of the winds, clouds, rain, and thunder. Before these tablets are dishes and baskets with sacrificial articles. Cows, goats, and swine have been slaughtered, and all these offerings are set out before the ceremonies are proceeding. A bullock or heifer is burning on a pyre as a special offering to high heaven. The Emperor, who has purified himself for the solemnity by fasting, is led up the altar by his proxies, and stands, not preceded by any official, but crowded with dignitaries. Directors of the ceremonies guide him, and loudly proclaim every action or rite which he has to perform. The spirit of Heaven is invited, by means of a hymn accompanied by sacred music, and is let in on the altar-park and then to settle in the tablet. Before this tablet, and subsequently before those of his ancestors, the Emperor offers incense, jade, silk, broth, and rice-spirits. He humbly kneels, and knocks his forehead against the pavement. A grandee reads a statutory prayer in a loud voice, and several officials offer incense, silk, and spirits to the tablets of the sun, moon, stars, clouds, rain, wind, and thunder. Finally, the sacrificial gifts are carried away, to the songs, and are burned.

The Imperial sacrifice is probably the most pompous worship which ever has been paid on this earth to a divinity of Nature. It is attended by a large body of musicians and religious dancers, performing all the ancient ceremonies, and reciting the words of the prayers. In the same vast altar-park there is, to the north of the Round Eminenence, another altar of the same form, but of smaller dimensions, bearing a large circular building with dome or cupola, called the high priest, or temple where prayers are sent up for a good year, that is to say, for an abundant harvest throughout the Empire. Here a sacrifice is offered by the Emperor to the Sun and to his ancestors, in the first decade of the first month of the year; while, to obtain reasonable rains for the crops, a sacrifice is presented in the same building, in the first month of the summer, to the same tablets, as also to those of rain, thunder, clouds, and winds. This ceremony is repeated if rains do not fall in due time or sufficiently copiously. These sacrifices are mostly performed by princes or ministers, as proxies of the Son of Heaven.

The ritual for all the State sacrifices is similar to that for Heaven, but the pomp and offerings vary with the rank of the god.

Next to Heaven in the series of State divinities is Earth, called officially Hsü-Ü, or 'Empress Earth,' whose square altar of marble, open to the sky, is situated in a park, with gigantic trees, and surrounded by high walls, near around this altar, which is the largest in the world. On the longest night of the year, the Emperor proceeds to the altar, escorted by princes, grandees, officers, and troops, to the number of many hundreds. Everybody is in the richest ceremonial dress. The spectacle, illuminated by the bountiful light of large torches, is most imposing. Every member, minister, and mandarin may form his assigned place on the altar and its terraces, or on the marble pavement which surrounds it. In two rows, facing east and west, are shrines which contain tablets of the ancestors of the Emperor. Before each tablet a variety of sacrificial food is placed—soaps, meat, fish, dates, chestnuts, rice, vegetables, spirits, etc.—to conform them to ancient classical precedent and tradition. On the second terrace are tablets for the spirits of the sun, the moon, the Great Bear, the five planets, the twenty-eight principal constellations, and the host of stars; furthermore, there are tables of the winds, clouds, rain, and thunder. Before these tablets are dishes and baskets with sacrificial articles. Cows, goats, and swine have been slaughtered, and all these offerings are set out before the ceremonies are proceeding. A bullock or heifer is burning on a pyre as a special offering to high heaven. The Emperor, who has purified himself for the solemnity by fasting, is led up the altar by his proxies, and stands, not preceded by any official, but crowded with dignitaries. Directors of the ceremonies guide him, and loudly proclaim every action or rite which he has to perform. The spirit of Heaven is invited, by means of a hymn accompanied by sacred music, and is let in on the altar-park and then to settle in the tablet. Before this tablet, and subsequently before those of his ancestors, the Emperor offers incense, jade, silk, broth, and rice-spirits. He humbly kneels, and knocks his forehead against the pavement. A grandee reads a statutory prayer in a loud voice, and several officials offer incense, silk, and spirits to the tablets of the sun, moon, stars, clouds, rain, wind, and thunder. Finally, the sacrificial gifts are carried away, to the songs, and are burned.
CONFUCIAN RELIGION

of Earth and to those of the Imperial ancestors, and, on the second terrace, to the tablets of the chief mountains, rivers, and seas.

From the fact that the Emperor, in performing the sacrifices to Heaven and Earth and to the tablets of his ancestors, it follows that they stand, in the system of the State religion, next to Heaven and Earth in rank. Solemn sacrifices are offered to them by the Emperor in the T'ai-miao, or Grand Temple, on the south-east of the Palace grounds, and at the mausolea, in temples erected there, one in front of each grave-mound.

Next in rank to the Imperial ancestors in the pantheon of the State are the Shih-Tai, or gods of the ground, and of millet or corn. They have their large open altar in a park to the west of the Grand Temple. The Emperor sacrifices there in spring and autumn, or sends a proxy to perform the rite (26th cent. B.C.)

2. The above are the so-called Ta-tze, or 'Great Sacrifices.' Next in rank are those of the second category, the Chung-tze, or 'Middle Sacrifices.' The Emperor, in various altars erected in or about Peking. The Sun-god has his large walled park, with round open altar-terrace, outside the main east gate, to the region of sunrise; the Moon-goddess has her square altar also outside the same gate to the west in the region in which the new moon is born. Sacrifices are offered there to the sun by the Emperor or his proxy, at the astronomical mid-spring, when the sun conquers darkness; the Moon receives her sacrifice on the day of mid-autumn, when, in China's natural philosophy, is associated with the west, where the new moonlight is born.

The other State-gods of this Middle Class are the famous men of fabulous antiquity who introduced the Tao, or Order of the Universe, among men, thus conferring on them the blessings of civilization, learning, and ethics. They may be enumerated as follows:

(1) Shen Nung, the 'divine husbandman,' the Emperor of the oldest mythical period, received special sacrificial worship in a temple in the Palace, viz., Yuh Hi, Shen Nung, Hwang-ti, Yao, and Shun, together with the founders of the house of Chou, and Confucius.

(2) Sun-t'wan, or 'the first breeder of silkworms,' supposed to have been the wife of the Emperor Hwang (27th cent. B.C.). In the first month of spring, the Empress, followed by a great train of court-ladies, presents a sacrifice to her on an altar in the park of the Palace.

(3) 188 Imperial and princely rulers of the past. The five Emperors of the oldest mythical period receive special sacrificial worship in a temple in the Palace, viz., Huh Hi, Shen Nung, Hwang-ti, Yao, and Shun, together with the founders of the house of Chou, and Confucius.

(4) The State deities are the men and women who, in the course of the centuries, have been distinguished for Confucian virtue and learning. Four temples are built for them near every Confucian temple.

(5) The Ti-k'i, or 'deities of the sky,' that is, to say, of the clouds, the rain, the wind, and thunder.

(6) The Ti-hsien, or 'earth-gods,' are the ten principal mountains of the Empire, besides five hills and ranges of hills which dominate the site of the mausolea of the present dynasty; further, the four seas or oceans at the four sides of the Empire or of the earth, and the four main rivers of China, viz., the Hwang-ho, the Yang-tze, the Hai, and the Tsai; and, lastly, the mountains and streams in the neighbourhood of Peking, and various others within the Empire.

(8) Next comes Tsii-sui, or 'the Great Year,' the planet Jupiter, whose path in the heavens governs the arrangement of the almanac which is annually published by Imperial authority, and gives the various days considered suitable for the transaction of various business of life. This god thus rules the Tao of the Empire, and consequently the Tao of human life, which, in order to bestow happiness and prosperity, must fit in with the Universal Tao, or course of Time.

3. The third section of the Confucian State religion embraces the Kiu-szu, or 'Collective Sacrifices.' These are all offered by mandarins to the gods in the following lists: (1) the Sien-i, or 'physicians of the past,' patriarchs of the art of promoting and preserving health; (2) the Tsiang, or 'mandarins' and Hwang-ti; (3) Kwan-yu, the war-god of the present dynasty, a great hero of the 2nd and 3rd centuries. A.D.; (3) Wen-ch'ang, a star in the Great Bear, the patron of the classical studies on which the Confucianism is based; (4) the Ta-tze, or 'the Divine Sons,' who, in their rule maintain the Tao among men; (5) Pe-khi, the 'ruler of the north pole'; (6) Hwo shen, 'the god of fire'; (7) P'nao-shen, 'the cannon-gods'; (8) Ch'ing-huang shen, 'gods of the walls and gates'; (9) Shi-ken, 'deity of the altars of walled cities and forts throughout the Empire'; (10) Sung-yoh shen, 'the god of the Eastern Mountain,' i.e., the Thaishan in Shan-tung; (11) Hu-tsun, 'or' god of the ground'; (12) Sze-kung shen, the patron of architecture, to each of whom, before any building work is undertaken, sacrifices are offered on altars erected on the site of the building; (12) Yao shen, 'the gods of the porcelain kilns'; (13) Men shen, 'the gods of the various city gates and doors of Peking'; (14) T'ian-shen, 'the gods of the store-houses' of Peking and Tung-chow.

Many of these State sacrifices are also offered by the authorities throughout the provinces, on altars or in temples which have been built for this purpose in the chief city of each province, department, or district—namely, those of the gods of the ground and of millet; those of Shen Nung, Confucius, and the gods of clouds, rain, wind, and thunder; those of the mountains and rivers in the country; those of the walls and gates of the city; and those of Kwan-yu. In Peking, as in the provinces, there are, moreover, temples, built with the same official design, for a great number of historical persons, who have rendered services to the dynasties and the people. They have, on that account, received titles of honour from the Emperors, and have their special temples in the places where they lived and worked. By the way, there are also certain rulers, who by former wise and faithful princes, nobles, and statesmen; for men who have sacrificed their lives in the service of the dynasty, etc.

4. Lastly, three sacrifices are prescribed to be offered annually by the authorities all through the Empire for the repose and refreshment of the souls of the departed in general. All the State sacrifices take place either on certain fixed days of the calendar, or on days which are indicated as favourable and felicitous.
This synopsis of the State pantheon shows that the Confucian religion is a mixture of Nature-worship and worship of the dead. It is the rule to represent the gods who are believed to have lived and died by images in some form, and the others by tablets inscribed with their principal divine titles. Images as well as tablets are inhabited by the spirits, especially when, at sacrifices, these have been formally prayed to or summoned, with or without music, to descend into those objects. Confucian worship and sacrifices, then, being actually addressed to animate images, is idolatry. Certainly it is quite inconsistent with the Chinese spirit to think of such tablets and images as mere wood and paint.

The religion of the State, performed by the Son of Heaven as high priest, and by ministers and mandarins all through the Empire as his proxies, is thoroughly ritualistic. Since, during the Han dynasty, under the auspices of Emperors and by the care of illustrious scholars, the classics were rescued from oblivion, an elaborate ritual, based on those classics, was at the same time called into existence in the form of rescripts, regulating in minute detail every act in the State religion. Subsequent dynasties framed their institutions in general, and their ritual of the State religion in particular, on those of the House of Han, though with modifications and additions of more or less importance. Instances of eminent statesmen presenting memorials to the throne, in which they criticized rituals and proposed corrections, abound in the historical works; and these instances prove that formal codifications of rites have always been in existence since the reign of the House of Han.

These codifications have for the most part been preserved in the dynastic Histories, but it is not possible now to decide whether they are given in their entirety or in an abridged form. None of them equals in elaboration that of the Khai-yuen period (713-741). This vast compendium of statutory rites of the Tang dynasty is a systematic compilation of nearly all the ceremonial usages mastered by the classical literature of the most ancient statesmen of China have held their place as standard rites of the State religion to this day. The Ta Те’ng hенn теn, or Collective Statutes of the Great House of Ts‘ing, are modeled on it. It is also the prototype of the Ta Те’ng hеn t‘еn, or General Rituals of the Great Ts‘ing dynasty, which is an official codification of the rites proper for the use of the nation and its rulers. Therefore, whoever is able to read and interpret Chinese texts has it in his power to study and describe, in its details, the State religion from official printed documents.

The conclusion is, of course, ready to hand, that the State religion is instituted for no other purpose than to influence the Universe by the worship of deities who constitute the Yang, in order that happiness may come to the Emperor and his household. In other words, a religion of the State is the supreme rule of the Tao, who, as universal originator, has made the Universe the medium of his universal power. Out of this natural, if not universal, the work of the W坚定 in Yan 內 centre, is the exercise of that religion, the highest duty of the subject, to use the language of the Tao, "So the greatest of his subjects is he who ensures the peace and prosperity of the people by not allowing them to take part in it, except by exerting the State temples and altars, and keeping them in good repair at their own cost and by their own labour. The only religion allowed to them by the State is the worship of their own ancestors, which is classical and therefore Confucian." Yet, as everywhere in the world, religious instincts in China go their own way, in spite of official ritual form. Not content with the worship of their ancestors, the people freely indulge in the worship of Confucian deities. In villages and in other localities they have temples for the worship of mountains, streams, rocks, and the like. The god of the earth in particular enjoys much veneration; in all quarters the people have erected temples or chapels and shrines to him; they regard and worship him as the god of wealth, and the patron divinity of agriculture. And everywhere the people resort to certain State temples in the chief towns of provinces, departments, and districts, and worship the idols there after their own fashion.

This popular worship of Confucian divinities being practised all through the Empire, the images of gods exist by tens of thousands, the temples by thousands. Almost every temple has its idol gods which are co-ordinate or subordinate in rank to the chief god, so that China fully deserves to be called the most idolatrous country in the world. The religion of the State in private houses, many of which have altars for gods and goddesses, to whom, on fixed days, sacrifices are annually presented.

The worship of ancestors is mentioned in the ancient classics so often, and in such detail, that we cannot doubt it was also the core of the ancient religion. It has assumed the form of a most elaborate system of disposal of the dead. Washing and dressing of corpses, colling and burial, and grave-building are matters of the greatest solicitude. The erection of large tumuli for princes and nobles was always the rule in China, and the mausolea built for emperors and princes were magnificent structures. Those of the present ruling dynasty certainly belong to the greatest and grandest which the hand of man ever produced.

The ancestral cult is regulated in the State ritual by special rescripts for all classes of the Chinese people. On certain fixed days the sacrifices in the ancestral temple, where the soul tablets of its older generations are preserved, and where sacrifices are offered to them. In the dwelling-house a part of the altar is set apart for the worship of the latest generations. Sacrifices are offered to the altar for the offerings, which are presented by the family on various fixed days in the calendar, with the father or grandfather at their head. Besides, there is an altar on each grave, which has been built with some outlay, and the mausoleas of the great of this earth have even a temple, containing an altar with the tablet of the soul which rests with the body in the grave. In the first months and years after the burial, certain sacrifices are offered on the grave; later on, another is offered once in every year, in spring, in the Teyn жоаеi season, reserved for visits to the family repairing them. In China, the same is always offered by many other families, too.

No doubt ancestrality is an important and powerful ethical element. The possession of the property of fathers is always a great matter of glory, and the duty of the fathers is always to protect the property of their sons. The protection of property strengthens the ties of family life, as it supplies the descendants with a rallying point in the common ancestral altar. It thus fosters a spirit of mutual help in the emergencies of life, and it has exercised a powerful influence upon Chinese family life and social institutions.

LITERATURE.—See end of next article.

J. J. M. DE GROOT.
CONFUCIUS.-The system which is known in the West as Confucianism is described in China as K'ung Fu-tsu, the philosopher Kung, whose name is familiar to Westerns under the Latinized form of Confucius, Ju-kiao represents orthodoxy in China, all other systems being nominally heterodox, though Taoism and Buddhism have, as a result of long association, been popularly admitted to a place among the 'three Schools.' Taoism is, of course, exotic in its origin; but Taoism is based upon the same ancient materials as Confucius requisitioned. Laotse, or Lao-tze, to whom is attributed the system known as Tao-Kiao, or 'School of the Way,' was a strenuous moralist who boldly applied the teachings which he discovered in the ancient Chinese records to the amelioration of existing conditions, making non-interference and the suppression of personal ambition the keystones of his system. Confucius made no profession of original thought, and confessed himself to be but a transmitter of the manners and maxims of the 'good old times.' What he attempted to do was to apply to the degenerate days in which he lived the best elements of the accumulated wisdom and experience of the past, which he found locked up in the ancient records, and reflected in the time-honoured ceremonials. These he endeavoured to elucidate and explain, in order to guide the great people who flocked to him from all quarters, and to the feudal lords whom he interviewed in the course of his wanderings from State to State, but also by carefully prepared and annotated editions of the early writings for the benefit of posterity. His highest hope was to lead the rulers of the feudal kingdoms, by easy stages, to the gentler manners of the past, and thus to initiate a reign of peace. In order to appreciate the standpoint of Confucius, it is necessary that the political circumstances of their times should be carefully considered.

1. The times in which Confucius lived. The Chow dynasty, established by King Wu (1122 B.C.), was in a declining condition at the time when Confucius was born, and the central authority, which gave its name to the Central State, or 'Middle Kingdom,' as the Chinese call their Empire even to-day, was powerless to enforce its dictates upon the turbulent States which were its nominal vassals. Constant war, with its dreadful concomitants, was the 'Sign of the times.' The soldier was in the ascendant, the schoolmaster unemployed. Agriculture languished for lack of manpower. War, and plague, pestilence, and famine wrought untold horrors upon the feudal kingdoms. In the midst of scenes such as those a son was born (551 B.C.) to an ancient officer of the K'ung family, who had distinguished himself by commanding physical and martial powers in the wars of his line. He was of a retired life in the State of Lu, situated in the modern province of Honan, on the northern edge of the empire. He was the 63rd generation of the family. His mother was descended from Yen, one of the old feudal families of China. The life of K'ung Fu-tsu, or, as we know him, Confucius, may be divided into 3 periods: (1) 500-501, covering his early boyhood, his marriage at the age of 19, and his appointment to the office of keeper of the State granaries, and, a year later, to that of guardian of the common lands; (2) 500-501, when he devoted himself to the work of teaching, and gradually collected around him an enthusiastic band of disciples, at the same time completing his own education and labouring at a new edition of the ancient Odes and Historical Records; (3) 500-486, when, for a short period, he acted as magistrate in his native State, and, as a result of the signal success of his methods, was promoted to the office of Minister of Works, and, subsequently, to that of Minister of Justice, but resigning his office only when he found his counsels unavailing to turn the reigning Duke from the evil ways he had adopted; (4) 486-453, when he wandered over a large number of the feudal States, vainly endeavouring to induce their rulers to reform their manners and return to the ancient ways; and (5) 453-478, the last period of his life, spent in his native State, during which he devoted himself to the completion of his literary labours in connexion with the ancient records, and to the production of his one original work, the 'Ch'un-t'ieh,' or 'Spring and Autumn' annals.

2. The Confucian library. The materials upon which the system known as Confucianism is based are to be found in the various King, or Canons, and the Shu, or Writings, which are attributed to Confucius and his disciples. These have been variously tabulated at different periods of history, but are nowadays divided into the 'Four King,' or 'Five King' (see preceding art., p. 12).

3. The doctrines of Confucius. When the condition of the feudal kingdoms in Confucius' time is borne in mind, it will be seen to follow naturally that Confucius' disciples, who directed his efforts was the tranquilizing of the Empire. The possibility of effecting this aim he demonstrated in three ways: (1) by his redactions of the ancient historical records and poetry, showing, to the princes and to all other rulers by which the great rulers of antiquity, Yao, Shun, and others, had succeeded in controlling and directing the 'black-haired people'; (2) by his personal instructions and counsels to the various nobles whom he interviewed in the course of his journeys through the feudal kingdoms, and to the ardent students who delighted to sit at his feet; and (3) by his own example in the small spheres which were entrusted to him, and where his methods are represented as being entirely successful. This, indeed, was the cardinal principle which he so frequently emphasized, viz., that, if Sage and Sovereign could be combined, in one person, the difficulties of empire would disappear. The force of Confucius' doctrine was that he sought to apply to every exigency; if the lord paramount would but imitate the ancient worthies, the various princes would be excited to emulation, and thus, through every grade of society, the process would be continued until the whole nation was reformed. The stages by which this process was to be completed are thus described in the 'Great Learning' ('Great Study'):

The ancients who wished to illustrate illustrious virtue throughout the Empire ordered well their own States. Wishing to order well their own States, they first regulated their families. Wishing to regulate their families, they first cultivated the thoughts of their persons. Weaving to cultivate the thoughts of their persons, they first rectified their hearts. Wishing to rectify their hearts, they first sought to be sincere in their thoughts. Wishing to be sincere in their thoughts, they first extended to the utmost their knowledge. Such extension of knowledge lay in the investigation of things. Things being investigated, knowledge became complete. Their knowledge was the same as theirs. Such as were born thus in their hearts, their hearts were cultivated. Such as were not thus regulated, were valiantly brought to right thinking, the whole Empire.
sion men to perform certain tasks, and protect them whilst in the execution of them, but, for the carrying out of those commissions, man must depend upon his own unaided abilities, upon that nature, predisposed towards goodness, which Heaven had conferred on him, and to which he himself must allow its full development, in harmony with the observed course of Nature and the examples of the great sages of the past. The gifts of nature vary in different individuals. There are four great classes of mankind: (1) those who possess intuitive knowledge; (2) those whose natural abilities enable them to bear with ease the fatigue of labor; (3) those who, though naturally dull, are able by earnest application to become learned; and (4) those who decline the attempt to acquire knowledge because of natural incapacity and indolence. Yet it is possible for every man, by means of self-cultivation, to reach the highest development of which his nature is capable; and nothing less than this should satisfy the aspirant. Rest in the highest, or 'cease only when thou art manched,' is the key-note of the 'Great Learning.' Confucius himself aimed high; he did not expend his strength in the interests of common men, but concentrated his efforts on the education of those already in office or those who were likely to attain to power, believing that, if he should succeed in implanting his opinions amongst the highest classes, the regeneration of the masses would follow as a matter of course.

There is practically nothing of a religious nature in Confucianism pure and simple. Religion, in the strict sense, existed in China long before his day, and survives even to the present in the sacrifice to Shang-ti, described on p. 17, which the Emperor offers as the representative of the myriad people. Confucius seems to have directed all his energies to the promotion of self-cultivation, adopting an attitude of strict reserve on the question of religion. He certainly countenanced the religious observances of his time so far as they were consonant with the ancient rites, and did not openly rebuke the extravagances which existed, as, for instance, the burial alive of human victims, which was not unknown among his contemporaries, and which was guided by a principle which he enunciated, viz., 'When good government prevails in a State, language may be lofty and bold, and actions the same. When bad government prevails, the actions and the language may be timid and with some reserve.' It may be that he had but little sympathy with the religious decadence of his own times and the abuses which were then prevalent, but he evidently considered it no part of his mission to attack them in any iconoclastic spirit, and he preferred to adopt an attitude of strict reticence towards the question of religion, recommending the observance of the acustomed ritual, but deprecating a too close inquiry into the spiritual nature of things. He evidently regarded the offering of sacrifice as of great subjective value, but professed ignorance of the meaning of the great sacrifice to Shang-ti. He certainly added nothing to the contemporary knowledge of God or of spirits; he had nothing to say with regard to death or the hereafter; the present distress was a sufficient occasion for the exercise of his disciplinary methods; the present life was the only theatre in which he sought to inspire men to act their part. The existence of a moral law was implied through the unceasing struggles of the feudal States, and his great endeavour was to induce their several rulers to suppress their overweening ambitions, and to cultivate that moderation, that harmonious balance, which is emphasized in the 'Doctrine of the Mean'; so that the various parts of the social organism might work together smoothly and with mutual profit, like a perfectly fitted and well-oiled machine, each State furnishing its quota of Imperial service, each ruler and officer occupying his appointed place, and all friction being avoided, so that the Middle Kingdom might become once more a model to the barbarians on its frontiers, and the whole world which no alien combination might venture to impugn.

Confucius was, above all things, a political reformer, but one who founded his political principles upon moral bases. He wished the harmony of Nature to be re-established in the world of men, and hence the very first essential in his system was the cultivation of knowledge, especially natural science. But, by a strange irony of fate, the chapter of the 'Great Learning,' which was supposed to deal with this fundamental question of culture, on which so much remains occupied with the lesser details which appear as branches detached from the tree. The abortive attempts of later philosophers to deal with the phenomena of nature are described in art. 17.

The steps in the process of self-cultivation have already been enumerated: the completion of knowledge leads to sincerity in thought, for the reason that the scholar, once aware that the outward appearance can no longer be deceived by outward appearances or inward imaginings, being thus freed from the deceptive influences of passion, emotion, fear, etc., is able to rectify his heart, i.e., to restrain wayward thoughts, feelings, and tendencies; as a consequence, his outward actions are conformed to the highest ideals of propriety, i.e., the cultivation of the person; and, from this point, he becomes a centre of influence which extends to his officers and associates, and the whole Empire is made tranquil and happy.

This may be said to be the Confucian gospel in a word, and it will be evident that it is based upon the conviction that man's nature is originally good, and may by observance of the laws of his time be restored to its highest perfection. Confucius admitted that 'by nature men are nearly alike; by practice they get to be wide apart.' It follows, therefore, that what is prescribed for rulers should also be followed by the commoners. But this point, he becomes a centre of influence which extends to his officers and associates, and the whole Empire is made tranquil and happy. But, by a strange irony of fate, the chapter of the 'Great Learning,' which was supposed to deal with this fundamental question of culture, on which so much remains occupied with the lesser details which appear as branches detached from the tree. The abortive attempts of later philosophers to deal with the phenomena of nature are described in art. 17.

The steps in the process of self-cultivation have already been enumerated: the completion of knowledge leads to sincerity in thought, for the reason that the scholar, once aware that the outward appearance can no longer be deceived by outward appearances or inward imaginings, being thus freed from the deceptive influences of passion, emotion, fear, etc., is able to rectify his heart, i.e., to restrain wayward thoughts, feelings, and tendencies; as a consequence, his outward actions are conformed to the highest ideals of propriety, i.e., the cultivation of the person; and, from this point, he becomes a centre of influence which extends to his officers and associates, and the whole Empire is made tranquil and happy. This may be said to be the Confucian gospel in a word, and it will be evident that it is based upon the conviction that man's nature is originally good, and may by observance of the laws of his time be restored to its highest perfection. Confucius admitted that 'by nature men are nearly alike; by practice they get to be wide apart.' It follows, therefore, that what is prescribed for rulers should also be followed by the commoners. But this point,
not only self-culture, but also the regulation of the family and the government of the State. It may have been for this reason that Confucius was willing to overlook the extravagant attention paid to ancestor-worship, because it served to emphasize his own doctrines of Divine right and the paramount importance of acquaintance in the prevailing ordo benevolentiae.

Equilibrium was the side and correctness the opposite to the influence of Confucius, which had been subordinate to the religious law of society. The doctrine of the Mean, which forms the subject of his discourses with the ruler of the several States he visited and the disciples he gathered. The most popular exponent of Confucianism was Chu Hsi, or Chuenus (A.D. 1180-1290), whose commentaries on the classical books are now generally accepted as the highest standard of orthodoxy. Like Confucius, he proceeded upon the assumption that human nature is originally good, but applies his speculations to the hitherto unsolved problem of the origin of evil. So far as it has been the influence of Confucius upon modern thought in China, that ‘Chuenusianism’ might be substituted for ‘Confucianism’ as descriptive of the later development of the tenets of Confucius and his followers.

4. Secret of the success of Confucianism.—In view of what has been stated above as to the absence of religious motive in Confucianism, it may be asked how the system which is thus denominated could have found so much general acceptance. As a matter of fact, Confucius utterly failed to convince his generation of the value of the methods he so ardently advocated. Outside of the circle of those who formed his school of disciples he appears to have had few admirers. No ruler of his day was prepared to put his opinions to the test; only in the small sphere which he himself occupied, for a short period, in his own State of Lu, was he able to demonstrate their practical character; and even there, after his immediate followers must have been immense, though his family life was unfortunate; but, when his despairing complaint of the non-appreciation of his doctrines and non-recognition of his character which had been sick of social and political dispositions, seemed as if the very memory of the sage was about to perish. Many years elapsed before any national attempt to commemorate him was initiated, but succeeding ages and dynasties have utilized the moral influence of his history, which were admired by his immediate followers, and the sages of his time. There must be 'no contrariety' in the home or in the State; no trespass beyond the narrow and rigorous range of what he considered the duties of his position, and every member of the family, in like manner, must fulfill his part with loyal submission. Amongst the factors which conduct towards the correctness of conduct are included Poetry, which inspires to the aspiring of noble deeds; Cereemoniel, by which the habit of correct action is established; Music, which, if it be a thing, produces an atmosphere congenial to the cultivation of virtue, and gives a finish to character; and Archery, which is recommended as exercising a moral discipline.

From the above it may be seen how little of a transcendental character there is in the teachings of Confucius. The process of self-culture must proceed independently of any spiritual aid, except in so far as the conventional rites of sacrifice may be considered as of such a nature—a supposition which appears to be negatived by the fact that to Confucius they were evidently of little objective value.

The doctrines thus enumerated find illustration in the Analects, or Consuls, of Confucius—a collection of acts and sayings attributed to him by his immediate disciples; and they are represented in concrete form in the person of the 'princely magnificence, who is the subject of his discussions with the rulers of the several States he visited and the disciples he gathered. But the most popular exponent of Confucianism was Chu Hsi, or Chuenus (A.D. 1180-1290), whose commentaries on the classical books are now generally accepted as the highest standard of orthodoxy. Like Confucius, he proceeded upon the assumption that human nature is originally good, and applies his speculations to the hitherto unsolved problem of the origin of evil. So far as it has been the influence of Confucius upon modern thought in China, that 'Chuenusianism' might be substituted for 'Confucianism' as descriptive of the later development of the tenets of Confucius and his followers.

5. Defects of Confucianism.—The failure of
Congregationalism to satisfy the cravings of man's spiritual nature, its attitude of reserve on questions affecting the unseen world, its silence with regard to sin and its remedy, and its equivocal references to the possibility and value of prayer—all of these are the evidences of a way for the introduction of Buddhism, with its doctrines of an All-merciful One, its spiritual aids and consolations, its plans of salvation and theory of a 'Western Paradise,' and its recognition of women's place in its plans for art, Cults (Buddhism in). Here also is offered a field where Christianity, when once relieved of the prejudice and suspicion which now encompass it, will find a place and a welcome, and the true Sage whom Confucius dimly outlined, the true 'Coming One' of whom the Buddha prophesied, will be recognized in Jesus Christ, in whom alone the highest definition of brotherhood is exhibited, and in whom alone fatherhood, in the ultimate sense, is propounded—The Fatherhood of God. Revolution is not limited to the confines of the four seas, but embraces 'all nations of men' who ' dwell on all the face of the earth' (Ac 17:26); in whom also is found that motive power which can compensate for man's weaknesses and counteract the corruption of human nature, and can enable men to attain to the highest perfection—a standard far transcending that which Confucius had in mind when he eulogized his great axiom, 'Honest in the highest excellence.'

CONGREGATIONALISM.—I. The Name.—The term 'Congregationalism' came into general use about the beginning of the great Civil War in England, and contemporaneously in New England, as the distinctive form of Church policy in which the local congregation is the unit of organization and the source of ecclesiastical government (e.g. Richard Mather, An Apology, London, 1643 [written 1639], p. 6, and generally in the literature of the succeeding years). From the last decade of the 16th cent. its adherents had been nick-named 'Brownists,' from Robert Browne (see Brownism). Against this name they protested (e.g. A True Confession, Amsterdam, 2-290, title: An Apologetica, and Defence, London, 1613, p. 24). They were also called 'Separatists,' because of their withdrawal from the English Establishment. The title 'Independency' was attached to the system at about the same time as that of 'Congregationalism,' and was an object of early protest (e.g. An Apologetical Narration, p. 23), long remained its usual designation in Great Britain, though it is now generally supplanted by Congregationalism. In America it was not in use in the Congregationalism, as a list of the adherents of the polity, is encountered in 1692 (C. Mather, Blessed Unions, Boston); and Congregationalism,' in 1716 (I. Mather, Disputation on Ecclesiastical Councils, Boston, p. vi).

As a polity, Congregationalism is much more wide-spread than the Congregational name. The Baptists, the Plymouth Brethren, the Disciples of Christ, the Unitarians of the United States, as well as certain tracts of the Lutherans, are congregationally governed. In this article, however, only that group of Churches to which the name 'Congregationalism' is attached by historic, popular, and official usage, will be considered.

2. Fundamental principles.—Early Congregationalism was a product of the devotion of the Reformation epoch to the Bible. That period exalted the Bible as the only rule of faith and practice. If the Scriptures teach fully all that it is requisite for men to know or believe, and all duties of the Christian life, it was but logical to raise the question whether they did not also contain a complete and authoritative guide as to the nature, organization, officiating and administration of the Christian Church. It was the conviction that the Bible contains such a pattern that gave rise to Congregationalism.

The parties of Church-Government are all of them exactly described in the word of God, and not a thing is added, nor a thing is altered or taken away, as in all other systems of Church-Government (Cambridge Platform, 1648, ch. i.; see also A True Confession, 1596, of the London Amsterdam Church, ch. xx.).

Examining the Scriptures, therefore, in the light of the knowledge of their actual import and in the light of the great inspiration which made every portion a word of God, the Congregationalists of the 16th and 17th cent. denied the existence of national or territorial Churches; and, while holding that the Church can in no wise be 'Christ's Church' in it all the Elect of God that have bin, are, or shall be' (A True Description, Dort, 1559, p. i), affirmed that none but local associations of experiential Christians are visible Churches. Each of these Churches has Christ as its immediate and only Head. Each hath power and commandment to elect and ordain its own minister, as well as to receive in or to cut off any member (A True Confession, chs. xxiii. and xxiv.). Each local Church is therefore a completely self-governing body.

There can be no doubt that early Congregationalism felt a mystical conviction, not now characteristic of it, that Christ is in so real and true sense the Head of each church of His disciples, and they are so one with Him by covenant, that the acts of such a church, though those of human agents, are in vital reality His acts, whether in the appointment of officers, the choice of officers, or the administration of discipline. That which distinguishes between a church assembly of Christian people and a church is that the members of the local congregation are united into church-estate by a 'willing covenant made with their God' and with one another (R. Browne, A Book worm, Mildredburg, 1652, p. 3), 'A company becomes a Church by entering into the Covenant' (R. Mather, An Apology, p. 5). Yet this covenant is not necessarily formal, though it is more desirable that it be so, for 'wee conceive the substance of it is kept where there is a real agreement, and consent of faithful persons to meet constantly together in one congregation for the publick worship of God and their mutual edification' (Cambridge Platform, ch. iv.). The only fit persons to enter into such a covenant, and hence church-members, are those of personal religious experience; but, by a comparison with the Abrahamic covenant of Gn 17, early Congregationalists argued that the children of such covenanting members were included in the parents' covenant and were themselves therefore church-members. The status of such children, when grown to maturity and not consciences of a personal religions

1 C. J. Iverach, In God Knowable, 1854, p. 112 f.
CONGREGATIONALISM

faith, was a sore puzzle to New England Congregationalism from the middle of the 17th to the end of the 18th century, and it is one of the numerous controversies known as the Half-Way Covenant discussions; but the belief of Congregationalism has always been that the true material of church-membership is to be found only in conscious and purposeful Christian discipleship.

Such a local church as has been described should have no officers but those of NT example—'pastors, teachers, elders, deacons, helpers.'\(^1\) (A True Confession, ch. xix.) The 'pastor' 'hath the gift of teaching,' and 'exercising,' especially in the 'teacher' that of teaching especially.' (R. Browne, A Book which sheweth, p. 32.) Both preached, though the teacher gave special attention to doctrinal exposition. Both administered the sacraments. The 'ruling elder' was a disciplinary officer, reckoned to the ministry, whose 'work is to join with the pastor and teacher in those acts of spiritual rule which are distinct from the ministry of the word and sacraments' (Cambridge Platform, ch. vii.). The business of destruction and 'aptly applying,' especially as the 'teacher' that of teaching especially, was that of the ministers of the Gospel. But the 'ruling elder' who could the ruling elder preach, and in no case could administer the sacraments. All three offices, known as 'teaching,' 'ruling,' and 'pastoral,' were chosen by the congregational elders and, in England, Congregationalism, were ordained by representatives of the congregation. Ordination, being considered but the recognition of a charge in a particular church, was to be repeated at each fresh entrance into office. But by the time that the Cambridge Platform was adopted, in 1648, custom was changing, and ordination was passing from the membership of the particular church to the hands of those already in the ministry. In such churches where there are no nominees, or 'standing committees,' the ordination is not often performed by the elders of other churches.' (ib. ch. ix.) Ordinations by the membership of the local church ceased soon after the middle of the 17th century. Two other classes of officers were recognized as to be chosen by the church. Of these the more important were 'deacons,' whose work was to 'receive the offerings of the church, gifts given to the church, and to keep the treasury of the church.' This was performed with a table where the church is to provide for, as the Lord's table, the table of the ministers, and of such as are in need (Cambridge Platform, ch. vii.). Therefore, we decline, "to minister to the church in giving attendance to the sick' (ib.); but, though an instance or two of their appointment may be found in early English Congregational practice, none held office in New England.

Each local church was from the first free to express its faith in its own language, and to make such tests for admission to its membership as it chose. Congregationalists from the beginning felt, however, that churches had only oracles of fellowship, and one with another, which were generally pictured as those of sisterhood in a common family of God.

'There be synodes or meetings of sundrie churches, which are when the shall churchs secke helpe of the stronger, for they have permiss'd, and seeke out the stronger brethren for them for redesse' (R. Browne, A Book which sheweth, p. 30.).

'Althoogh churches be distinct, and therefore may not be confounded one with another, and equal, and therefore have not dominion one over another; yet all the churches ought to preserve re-recognition one with another' (Cambridge Platform, ch. xv.).

The two principles of local autonomy and fellowship have always been the soul of Congregationalism, and the latter has preserved it from independence. The principle of fellowship gave rise almost at the settlement of New England to the occasional council—a meeting of pastors and lay delegates from such churches as the church seeking advice chooses to summon, called to give advice in such matters as ministar's installation, and dismissal of ministers, cases of discipline beyond the power of the local church to control, and similar ecclesiastical exigenes. Such councils have always been a feature of American Congregational practice, though not employed in Great Britain.

3. Present Congregational principles and organization.—Early Congregationalism, as thus described, has undergone much modification in detail, though it is a close-knit and rather unaltered. Modern Congregationalism, like its prototype, still conceives of the Church as a local company of experiential Christians, autonomous, yet owing fellowship to sister churches. But it does not preserve the fast and fast pattern of the Church in the Scriptures. It would emphasize the congregational as a desirable, rather than as the only rightful, polity. Congregationalism sees the merits of that polity in its denials of the absence of both the elders and pastor and teacher. The 'ruling elder continued late into the 18th cent., and a single example of the 'ruling elder' may be found in the 19th, most Congregational churches, on either side of the Atlantic, had before the middle of the 17th cent. reduced their officers to a pastor and several deacons. These are the chief officers of a Congregational church at the present time. The larger fellowship of the churches is expressed not only in the occasional councils, characteristic of the United States, of which mention has been made, but in a Union for Scotland in 1812, and for England and Wales in 1832. The latter now meets twice a year. In the United States, the first voluntary ministerial 'Association' was formed in Cambridge, Mass., in 1699. In Connecticut, a 'union' of ministers and lay delegates were organized in 1799. The system of meetings representative of churches by pastors and lay delegates was not generally introduced, however, till the early years of the 19th century. It is now universal in American Congregationalism. A variety of nomenclature exists, but uniformity is now being sought, so that the local groups into which churches are con federated shall be known as 'Associations,' and the larger State-wide organizations as 'Conferences.' After preliminary gatherings representative of the Congre...
21 and, Establishment, but were nationalism proposed instead of nationalism, the opposition to war, their denial to Christian disciples of the right to hold civil office, and their criticisms of the Augustinian theology. Congregationalism followed them in none of these things. But they also held that the Church is made up of local congregations of experiential Christians, and that each congregation is self-governing, and is empowered in democratic fashion by the suffrages of its members to ordain and ordain its own officers and administer its own discipline. They held that the Bible is the all-sufficient rule of faith and practice, in these principles Congregationalism was drawn mostly from the ignorant lower orders of the population, though not without a few educated leaders, the Anabaptists were neither denounced by Calvinistic nor Puritanical; and, in the opinion of their opponents, the movement was its apparent frontage in the world. Anabaptists were called, "to establish and maintain by their laws every part of God's word, his pure religion and true ministry." (A True Confession, ch. xxxix.) It was a constitution discharged by the local associations in Great Britain and America is that of certification of ministerial good-standing; and efforts are being made in America to constitute the local Association the regular ordaining body instead of the occasions composed of delegates from the churches, possesses judicial or legislative authority. Their action is purely advisory; but such action, in actual practice, carries great weight. An important function discharged by the local associations in Great Britain and America is that of certification of ministerial good-standing; and efforts are being made in America to constitute the local Association the regular ordaining body instead of the occasions composed of delegates from the churches, possesses judicial or legislative authority. Their action is purely advisory; but such action, in actual practice, carries great weight. An important function discharged by the local associations...
Puritan thought, despairing of securing the reforms desired in England, inclined to seek the New World to which the Scrooby-Leiden Pilgrims had already shown the way. In 1628 the advance-guard of Puritan emigration, under John Endecott, landed in Salem, Massachusetts. On 4th March 1629 the royal charter to the 'Company of Massachusetts Bay' was sealed. The same year the Salem colony was largely reinforced. In 1630 no fewer than 1,000 persons left old England for the new, and the emigration ran full scale till the advent of the Long Parliament in 1640 changed the political situation in the homeland.

To the Massachusetts colony of 1629, Connecticut was added in 1635-1636, and New Haven in 1638. These settlers were Puritans, not Separatists. They were, many of them, less in crest of wealth and position, and they had among them a large proportion of well-educated, influential ministers. Yet the remarkable fact is that, on their arrival in the new land, they organized their ecclesiastical institutions, beginning with the church in Salem in 1629, essentially on the model of Separatist Plymouth. The explanation is that the Scripture model of Church government seemed to them that which Separatism had already chosen, and, under the favorable conditions of new settlements, they created churches of practically the same type as the earlier Separatist congregations. But, as has been indicated in the section on the relations of Congregationalism to the New World, these New England churches became a real Establishment, and enjoyed State support in a manner for which the earlier Separatist never had opportunity, and which it repudiated in principle. The history of Congregationalism in England was largely that of growth in numbers by reason of the slow increase of the population, of a declining religious enthusiasm, and of discussions arising from the development of politics. Education was fostered, and schools were established, both by the founding of Harvard College in 1636, and of Yale College in 1701. There was little doctrinal division, all the churches representing the current Puritan Calvinism, and there was remarkable uniformity in organization, worship, and method. Congregationalism made slow progress in England from its permanent establishment in Southwark in 1616 to the meeting of the Long Parliament in 1640. Its chief representatives found refuge in New England. The history of the outbreak of the struggle between King and Parliament, and the return of a number of the exiles, it grew very rapidly. Though the Westminster Assembly, which began its sessions in 1643, was overwhelmingly Presbyterian, it included five determined Congregationalists and several at least partial adherents. The desire of Cromwell and the army for a large toleration was favourable to the spread of Congregationalism. Congregationalists were appointed to many important ecclesiastical and educational posts under the Protectorate, and enjoyed the cordial favour of Cromwell. The Savoy Synod, held in London in 1658, gathered the representatives of 120 churches of the plain, fanatical, and nonconformist Dissenters. The enthusiasm of the epoch of the struggle between King and Parliament and of the Commonwealth was spent, and Congregationalism shared in the spiritual decline of the first half of the 17th century. It was, too, a little chagrin at the slight Arian and Socinian defection that made such inroads on contemporary English Pres-
lyteranism. During the latter half of the 18th cent., it felt with increasing power the stimulus of the Great Awakening in the West, which the Wesleyans and Whitefield had initiated, and experienced a profound spiritual reawakening which led to rapid growth. County Associations were generally estab-
lished between 1783 and 1810. The London Missionary Society, nominally an undenominational organization for carrying the gospel to the heathen, but increasingly Congregational in constituency, came into being in 1795. The Home Missionary Society was organized in 1819, and the Colonial Missionary Society in 1821. The year 1822 saw the formation of the Congregational Union of England and Wales. The period from that time to the present has been one of healthful growth and spiritual fruitfulness.

In Scotland, Congregationalism did not gain a permanent foothold till the last decade of the 18th cent., when it won its way as the supporter of a warm, evangelical type of piety and preaching.

It holds on the Scottish people has been relatively small, but it has proved a vigorous force in the religious life of the nation.

The earlier part of the 18th cent. witnessed a decline in the spiritual vigour of Congregationalism in America as in England. From this condition in America was powerfully relieved by the 'Great Awakening' in 1700-1742, through the preaching of George Whitefield, Jonathan Edwards, and other promoters of the revivals. The 'Awakening' led to division of sentiment, though not to actual separation of the New England churches—the 'Old Lights' opposing its methods, which the 'New Lights' favored. With Jonathan Edwards (1703-1758) a great theological development began, essentially Calvinistic in fundamentals, but with little modification of historic Calvinism. This was continued by Joseph Bellamy (1719-1779), Samuel Hopkins (1723-1803), Jonathan Edwards the younger (1745-1801), Nathanael Emmons (1745-
1810), Timothy Dwight (1752-1817), Nathaniel W. Taylor (1785-1855), and others, and produced the most distinctive school of theology that America has originated. In the Revolutionary War the Congregational churches sympathized warily with the colonial cause. The year 1792 saw the be-
ginning, especially in Massachusetts, of a movement that continued to recur at intervals till 1838. By 1800, Congregationalism, which had been practically confined to New England, began to spread westward with the settlement of the country, and the establishment of nearly three-quarters of the present Congregational churches of the United States beyond New England borders.

By 1815 a Unitarian movement, the roots of which ran back into the 18th cent., was felt especially in Massachusetts, and resulted in a separation, which still continues, from the main Congregational body. The American Board of Commissioners for Foreign Missions was organized in 1810 to do the work indicated in its title, and was begun by State bodies, commencing with Connecticut in 1774, and resulted, in 1836, in the formation of a Home Missionary Society of national scope. The American Missionary Association, which has laboured chiefly among the Negroes and the Indians, came into being in 1840; and the Congregational Church Building Society dates from 1833.

World-wide Congregationalism has expressed its faith in the International Councils, of which previous mention has been made.

7. Beliefs.—Congregationalism has been a system of Church polity rather than a peculiar form of faith. In its early history it stood, in common with Puritanism in general, on the basis of Calvinism. The Cambridge Synod in New Eng-

land, in 1648, approved the doctrinal portions of the Westminster Confession, which the Westminster had initiated; and in London, ten years later, expressed a like concurrence, except for slight modifications. The 'New England Theology' of the 18th and 19th cents., whatever its departures from earlier Calvinism, belonged to the Calvinistic school. It regarded itself as an improved or 'consistent' Calvinism. The Declaration adopted by the Union of the Congregational Churches of England and Wales in 1833 is distinctly, though mildly, Calvinistic. The year 1822 saw the formation of the Congregational Churches of the United States, held in Boston in 1865, with was with difficulty prevented from adopting a declaration that the faith of the Churches was 'that which is commonly known among us as Calvinism.' The Declaration was frustrated by the determined efforts of those who deprecated any party shibboleth. But the later years of the 19th cent. witnessed a rapid decline of interest in the older doctrinal discussions. The 'Declaration' adopted by the National Council at Oberlin, in 1871, was designed by its omissions to make the way easy for those of Arminian sympathies. The 'Creed,' prepared in 1883 by a commission appointed by the National Council, main-

tains the same high emphasis on the divine in the Calvinism. It will be remembered that these various expressions of belief have the value only of testimonies, each local church being free to declare its faith in its own way. Since the last of them was brought before the Convention, in 1907, the great question in the Congregational churches, in common with Protestantism generally, have been passing through a period of theological re-statement—the result of Biblical criticism, of the wide prevalence of an evolutionary view of history, of the new emphasis on the divine in man's experience, and of a quickened conception of social service as a main aim of the Christian life, whether of individuals or of Churches. No body of Chris-
tians has on the whole been more willing to welcome these newer views than the Congrega-
tionalists, but the degree in which they have been accepted varies widely in different churches. It is not sufficient, however, to disturb their sense of fellowship and of continuity with their historic past, or their sense of identity. The convictions of their conception of the meaning of the Gospel.

8. Worship.—The Congregational churches, at their origin, shared to the full the Puritan objection to ceremonies and vestments which seemed to alienate the services from the Bible. The Puritans in general, rejected fixed forms of prayer. They long confined the hymns of their services to rhymed portions of Scripture. It was not till the first half of the 18th cent., through the influence of the English Congregational hymn-writer, Rev. Isaac Watts (1674-1748), that this prejudice against hymns 'of human composition' gradually broke down. The typical Congrega-
tional service of the 17th cent. began with a prayer in words of the minister's own choosing, followed by the reading of Scripture, generally with comments verse by verse, then the singing of a psalm, the sermon, a second free prayer, a second psalm, and the benediction. This order was slightly modified, very possibly through the influence of the Westminster Directory, so that the sequence became commonly a brief prayer of invocation, reading of the Scriptures, usually without comment, singing, a 'long prayer,' the sermon, prayer, singing, and the benediction. This is the almost universal order till within half a century, and still constitutes an approximate outline of Congregational worship. The last few decades have witnessed a large use of responsive readings, anthems, and other elements at the 'enrichment' of
CONGREGATIONALISM

services, and the individual freedom of each congregation makes possible the consideration of the variety of usage. Opposition to some use of fixed forms of prayer is waning, but Congregational worship is still non-liturgical in its fundamental character. The Lord's Supper has been observed since the early days of this movement in intervals of six months or two months. Till near the close of the 18th century. Congregational worship involved two services, such as have been described, each Sunday, and in large towns a mid-week 'lecture,' which was really another sermon. About the end of the 18th century, the 'prayer-meeting' was generally introduced for the cultivation of the Christian life —by prayer, Scripture exposition, singing, and informal addresses, under the presidency of the pastor, with open participation by the laity.

It has been ever since a feature of congregational worship, but its successful maintenance, save in times of unusual religious interest, is generally regarded as one of the most difficult of pastoral problems.

9. Characteristics.—Congregationalism has always favoured education, both in the pulpit and in the pew. In England many 'academies' were founded after the Act of Uniformity and throughout the 18th century. A number of these have become flourishing 'colleges,' their aim being to train a learned ministry and to provide the higher education for laitymen who would be ecclesiastical tests, now abrogated, the more or less attainable in the Universities. In the United States the Congregationalists have been foremost among religious bodies in planting colleges and fostering schools. The Congregational spirit has not been sectarian, however, and these institutions have been freely opened, and have not been used as a means of denominational propaganda.

Congregationalists have been greatly interested in home and foreign missions. The efforts of the Rev. John Eliot (1604—1690), begun in 1646, for the conversion of the Massachusetts Indians, led to the incorporation by the Long Parliament, in 1649, of the first English Foreign Missionary Society, the 'President and Society for the Propagation of the Gospel in New England,' the establishment of the London Missionary Society in 1795 and of the American Board of Commissioners for Foreign Missions in 1810 has already been noted.

The flexibility of Congregationalism has made it easy to try experiments in methods of Christian work, and these churches, as a whole, have always been ready to welcome novel activities which seemed to promise greater usefulness in Christian service.

10. Problems.—The problems of Congregationalism are those of democracy generally. That which is most pressing is how to secure efficiency without sacrificing democratic liberty. Congregationalism has proved itself admirably adapted to rural conditions among a homogeneous population of intelligence. It has been less successful in cities where contrasts in wealth and education are extreme. Each church being a self-governing, democratic community, there is always danger that those congregations in the more needy parts of a city will be unduly weak in resources both of money and of men of ability. Congregationalism endeavours, with partial success, to counteract this tendency by Home Missions and by the extension of Superintendency. There is also the peril, in city communities, where congregations are gathered largely by elective affinity, that a church may become essentially a religious club. As in all democratic bodies, union for strategic advance is often accomplished at the cost of undue effort, or is not achieved at all. In order to make itself more efficient in these re-

LITERATURE.—The Literature of Congregationalism is enormous, but a substantially complete bibliography to 1879, embracing 2700 titles, may be found in H. M. Dexter, The Congregationalism of the last Three Hundred Years as seen in its Literature, New York, 1880. The following works will be found of special value—

CONNEXIONALISM.—There are many systems of Church organization in which itinerant evangelists link together scattered congregations, and maintain a strong corporate feeling by regular meetings among themselves, when they as a body arrange the sphere of work for each, and oftentimes exercise other functions of government. Such systems are usually styled 'Connexional,' and although that name is also employed more loosely, it is such systems that are here compared with one another. They flourish where a democracy, or an oligarchy, is already in possession of the field, and especially where a revival is promptly and supported by Bible study.

Connexional elements may be traced even in the Apostolic era, when the Apollos allotted among themselves their field of labour, and when St. Paul and his companions travelled widely, and kept in touch with the churches they founded, both by visits and by letters, and by delegates to supervise, such as Timothy, and Tychicus, and Tertullian, who, with the Greek love of independence, and the Third Epistle of John shows at the close of the Apostolic age a local minister revolting against the mere presence of any visiting missionary. This tendency was reinforced by the office of the officers of commerce, appointed primarily to serve tables, and the gifted brethren, including those who were set apart to give themselves to the ministry of the word. The local administrators steadily gained in esteem at the expense of the travelling evangelists, and, when the Montanist movement failed, the reaction within the Catholic Church practically ended the career of the evangelists. They survived only on the frontiers of Christendom, and we shall see that connexionalism flourishes best in the mission stage of a church, and in communities which emphasize evangelism.

While a bureaucracy of church officials developed, on lines suggested by the Roman civil service, there was also a tendency, inspired within a connexional system. But among the laity there arose a new plan of organization, whereby those who were in thorough earnest about their Christian life put themselves under severe discipline as monks, Basili for the East, and the Augustinian for the West, producing bodies of rules to order the community life, and these were widely adopted. But neither the one nor the other contemplated evangelicalism as a leading feature; salvation of self rather than salvation of others. The English monks had a better conception, yet they copiously lacked the faculty of organization, and their foundations were not. But the Roman and the English,—and certain developments of the Benedictine scheme due to these nations show signs of connexionalism. Thus Steiner in 1695 wrote of the Cistercian method, whereby the religious belonged to an Order rather than to a single House. Year by year the Abbeys of the Houses met in consultation, and by theory not only the humblest members, but all the Abbeys themselves, could be transferred from convent to convent. Since, however, no systematic plan of rotation was adopted, or even any rule that rotation should take place, there was no such practice much in sight. And as the aims of the Order did not exalt evangelism, there was no special motive for circulation.

A century later the English Benedictines moved to the same direction, but the Italians evolved farther, producing the Silvestrine, the Celestine, and the Olivetan organizations. Instead of officers being appointed for life, they had fixed terms of duty; a General Chapter chose a nominating committee which selected them. This line of evolution culminated in 1432, with the approval of the Cappellani Universales and the scheme is given by Abbot Gasquet in his Introduction to Montalembert's Monks of the West (Eng. tr. 1861-79).

It might have been expected that the friars would show more facility, that their ideal of brotherhood would express itself in a democratic rule, and that their ideal of service would impel them to steady organized work for others. But the movement was soon captured by the Roman Curia, and the former connexional schemes were given up. The latter were modified, with the slight changes needed for definitely local groups of professed Christians instead of areas within which a professed clergy ministered to a population nominally Christian. Thus friaries and parishes were set up, and all were ruled by a minister-general. The Roman monarchical ideal prevailed in the plan of government.

But a similar movement, originated by Peter Waldo of Lyon, who was not only recruited by the authorities, was free to elaborate its own machinery (Newman, Manual of Church History, i. 571-8). In 1218 a conference was held at Bergamo, when, amongst other matters, the policy came up for discussion by the officials of the order. In Lombardy, when probationers were admitted to membership after long training and testing. They made promises of celibacy, poverty, and readiness to evangelize, quite on the Franciscan model. But, since the initiation was admitted, he found himself a member of a governing corporation, which not only recruited itself and saw to the purity of the whole body, but also required reports from every part of the field, and administered the funds of the community. And during the year, the Lombards, indeed, with the Italian instinct, decidedly preferred a single head, chosen for life; and they favoured a general life tenure of all offices. The Germans, again, upheld the plan of Waldo, that all offices should be terminable, and that there should be no single head, but several rectors. In this matter the two parties apparently agreed to differ, maintaining their own customs and recognizing the legitimacy of each others' officers. But since the Cistercian pattern was adopted, offices of a minor order and the inordinate powers of the major officer were abolished, and they in the appointment of all officers, in allotting to each member his work, and in determining its nature and sphere. To some extent this scheme influenced the Bohemian Brethren and the Moravian Anabaptists, though these bodies
adopted the Italian plan of a single head holding office for life.

In 1527 an important conference was held at Augsburg, from which the Anabaptists were organized on new lines (Lindsay, Hist. of Reformation, Edinb. 1907, ii. 435). All the officers of all the congregations within a convenient district chose a committee of themselves to act for the group, and the committee chose a president. The districts associated on the same principle, and thus a pyramid of committees was erected. To these people, popularly known as ‘Anabaptists,’ is therefore due not only the machinery of a single congregation, which was presently turned over to John Calvin in his Institutio, and put in practice at Geneva, but also the machinery for an alliance of congregations, adopted in France during 1559, and in Scotland next year, and so well known as the Presbyterian scheme. But the ‘Brethren’ had one feature which was dropped by the French, the Scots, and the Dutch—an order of evangelists whose business it was to travel and propagate the faith. It is not quite clear how these were appointed, or how their routes were determined— if, indeed, appointment and travelling were not spontaneous rather than systematic. And, although several conferences were held, the persecutions of the next few years were enough to disorderize any machine.

A year after the fall of Münster, an important meeting was held a few miles away at Bockholt, when the Anabaptists of Lower Germany and England re-organized and adopted the connexional plan of union (Lindsay, Inner Life of the Commonwealth, 88). Each congregation sent delegates to an annual meeting, which stationed the ministers and arranged for the support of those who itinerated, besides aiding poor congregations and providing for the education of the young in the Netherlands and up the Rhine, and, though many divisions occurred,—into Mennonites, Waterlanders, Doopsgezinde, Flemings, Old Flemings, Frisians, etc.—yet each body held to the connexional type. As most of these Connexions held the doctrine of passive resistance, and objected to bearing arms or taking oaths, they found their position extremely awkward during the Napoleonic era; and the renewal conscriptions of the 1814 and 1870s, true to the connexional type in that the annual meeting governs; but, as the numbers have greatly diminished, the vote is exercised not by officers alone, but by all male members.

Recruiting to the Reformation period, we find forty churches in Lombardy and Switzerland acting together; and a special convention was held at Venice in 1550 (Newman, Hist. of Anti-Pedobaptism, Phila. 1886, pp. 327–9). The Waldensian plan was so well known in the vicinity that it had been adopted in general outline, and the government lay in the hands of the itinerant preachers, who associated with themselves candidates under training, and not appointed to all the congregations, but also ordained the local ministers. These churches mostly adopted anti-Trinitarian views, and were persecuted till they left the district; but many members went to Moravia and Poland, where they spread the tenets, that the ‘Socinians’ were indebted to them for hints on ecclesiastical polity as well as on doctrine.

The Reformed Churches took over from the Anabaptists the general scheme of organization, and especially the principle that, whether in a single congregation or in a court supervising several congregations, the power was vested entirely in the officers. Ordinary members might have a voice in adopting an elder, but his ordination rested with the existing elders, who thus tended to become a self-perpetuating caste. Ruling elders were usually local, but preaching elders or ministers were liable to move; in Germany and Scotland the authority of the State was interposed in various matters, extending occasionally to the location of a minister, and thus the autonomy of the Churches was crippled. Owing partly to the high educational qualifications of the Reformed ministry, and partly to the long tenure of a pastorate became customary, and thus one frequent feature of a Connexion was observed. But in theory the whole spiritual government of a Presbyterian church resides with the ordained members, and they have at least an influence in the increase of their number, or on the translation of any minister; nor is his personal preference a decisive factor any more than the wish of a single congregation. While these theories are still upheld, the connexion does not hold, and however little certain powers may be actually exercised. Yet there has been much specialization, so that ruling elders hardly rank themselves with ministers on the ground of their common ordination; and their interests are so closely linked to those of their fellow-members, with a corporate life of their own; still less do the officers as such pursue systematically a policy of extension—a policy which seems closely linked to the vigorous connexionism.

In England, voluntary sects were unable to organize till the general relaxation of government in 1640. Then the General Baptists, who for thirty years had been in close contact with the Waterlanders of Amsterdam, entered on a vigorous campaign of evangelization. As churches were gathered in different parts of the country, they were kept in touch, and the earliest minutes that survive testify to some plan of organization, and the necessity of closely linked stations with the rigid connexionism. By

In 1578, Thomas Grantham published a folio on primitive Christianity, and, when expatiating on the offices of the Christian Church, he put in the forefront the Messengers or Apostles, whose permanent functions were to succeed the original Apostles ‘as travelling Ministers, to plant churches, and to settle those in order who are as Sheep without a Shepherd.’ These, like the Bishops (or Elders) and Deacons, were to be elected by the free choice of the brotherhood and then ordained; and the latter were expressly laid down that the power of ordination is not limited to those who were already ordained, but is shared by all who have received the gifts of God’s Holy Spirit. Then, in discussing General Assemblies, which were proved to be Scriptural, and were therefore

27

held regularly by the General Baptists, not only the Messenger and Elders who signed were admitted to the meetings, but also any gifted brethren who came to them. And the office of Messenger was evidently regarded asakin by some. So, from the analogy of Timothy and Titus, it was claimed by Grantham that, while they had a larger circuit, had business in many places, and their duties as those of ministers, yet they had no jurisdiction over other bishops (Grantham, Ancient Christian Religion, 186). Then, in a special treatise, Grantham showed that the actual practice of the Brethren was to ordain regularly. They both in preaching to the World, and setting things in order to remote Congregations, to exercise Discipline by Excommunication of Offenders and ordaining the Penitent; by ordaining them Elders, and dispensing to them the Holy Mysteries or Ordinances’ (op. cit. 169).

Grantham wrote on his own authority only, but probably expressed the feeling of the Fen districts—Lincoln, Hunts, and Cambridges. In the same year appeared the Baptists, near Bucks and Oxon, adopted a Confession, drawn up by Monk, another Messenger, in which Article xxxix.

is very explicit:

‘Assemblies, Conferences, or assemblages, consisting of bishops, elders, and brethren, of the several churches of Christ, and being legally convened, and met together out of all the churches, and all the churches appearing by their representatives, make one Church, and have lawful right and suffrage in this general meeting or assembly, to act in the name of Christ, by being of divine authority, and is the best means under heaven to preserve unity, to prevent heresies, and stop the growth of unbelief or in any congregation whatsoever within its own limits or jurisdiction, etc.’

In a long article, xxxxi., ‘Of Officers in the Church of Christ, we see a slight difference of opinion as to the power of ordination: The bishop or messenger is to be chosen thereto by the common suffrage of the Church, and notoriously set apart by fasting or prayer, with imposition of hands, by the bishops of the same function, ordainably; and those bishops, so ordained, have the government of those churches that had suffrage in their election, and no other ordainably; as also to preach the word or gospel to the world, or unbelievers. And the particular pastor, or elder, in like manner is to be chosen by the common suffrage of the particular congregation, and ordained by the bishop or messenger God hath placed in the church he hath charge of, etc. (Hanserd Knollys Society, Confession of Faith, pp. 159, 160).

While in 1859 the organization comes into full light, and its records become continuous, we find not only this order of Messengers fully rooted in the esteem of the Connexion, but numerous Associations established, each of which was a corporation at least, while all sent representatives to the General Assembly. As everything depended on voluntary consent, the choice of a new Messenger was a matter of careful negotiation between the Assembly and the Association concerned, usually extending over more than a year, and generally the consent was sought of the church where he was a member. Ordination was by authority of the Assembly, or of the Association concerned, and was usually performed by a mixture of elders and bishops. The office was maintained by voluntary subscription, which, however, was not large enough to free the officer from the necessity of supporting himself, often by manual labour. The Messenger not only represented the Church, but also visited all the churches there freely. The order was considered superior to the Eldership, both priority and presidency being conceded. But there are no signs that the Messengers ever met together, as the Elders did. The office no longer seems to be that of a corporate body. The Elders were so far from any system of itinerancy, that in 1696 it was resolved that no Elder might leave his own people and be established as Elder over another people in another place (T. Goodall,

By-paths of Baptist History, London, 1871, p. 244). The funds of the Connexion were vested in lay trustees, on trusts so loosely expressed that the Messengers never tried to assert any legal rights to them. (The Minutes of Assembly are published by the Baptist Historical Society.)

As the Connexion lost vitality during the 18th cent., whole Associations ceased to meet, and the elders of their Messengers died out, while the local churches, in many cases, asserted their independence. Then the foundation of the New Connexion of General Baptists effectually stopped the revival of the Old Connexion, and attracted some of its component parts. In this case, there are about a score of churches, unobtrusively pursuing their way, with their Messengers, keeping up their General Assembly, and showing still this primitive connexional system, though completely developed, which inspires it, the spirit of propaganda.

In the 17th cent. this organization had been copied and developed by the Society of Friends, who were among the more direct competitors of the Dutch Mennonite Congregations. In the year 1642, a group of local Friends formed a church for local purposes, the provision of evangelists was clearly beyond the power of such a group. At first George Fox organized, with the help of the local churches recognized, ministers and certified them as fit to travel; these then shared his responsibility, both gathering converts and organizing them into churches, even appointing the first Elders (ib. 388). By 1681 a regular Yearly Meeting was established in London for the whole Society (ib. 392). As custom became settled, it was agreed that the Travelling Ministers were not official members of this Yearly Meeting, and Fox even applied when the terms of the General Baptists had borrowed from Scripture. The other members were to be chosen by the quarterly meetings out of the local Elders, but these did not always sit with the ‘Public Labourers’ (ib. 404). These Travelling Ministers retained for themselves the right to organize and control their own work of evangelization, which fell entirely into their hands when Fox passed away. They met regularly on Monday and Sunday to travel where they might, and on Tuesday to discuss openings for new work, and the character of those who wished to be recognized as ministers, and they kept a roll of their own membership (ib. 381).

The fervor of the age died down, and propaganda became less important, so that the Travelling Ministers lost their pre-eminence. In 1733 the Yearly Meeting forbade their meeting to control its own membership, and within twenty years they were brought under the direction of Mixed Meetings, in which the dominant element was a new kind of Elder, whose main business was to administer, not to preach. Thus, with the cessation of evangelizing came the transformation from the term ‘Traveller,’ which was used, to the term ‘Apocalypse’, which was used. The pyramidal series of courts remains, but the Travelling Ministers now form a very small element in them, and in the Society.

The general decay of the 18th cent. was met by the vigorous evangelism of Whitfield and Wesley; and, as crystallization took place, it was on the connexional system. In 1744 six clergymen and five lay preachers met, and traced the foundations of the Methodist polity; forty years later, their local churches provided the institutions which settled the government of the Connexion, while in the same year a Conference at Baltimore organized the Methodist Episcopal Church in America. The United Empire Loyalists laid the foundation of Methodism in Canada, while from
England other Methodists spread throughout the British dominions. Questions of Church polity, however, have been fiercely debated, and have led to many secessions in both England and America, which have only partially been effectually dealt with by Conferences and unions; the very principle of these secessions calls in question the connexional scheme. As Wesley organized it, the body with supreme authority in spiritual matters was a Conference of a hundred ministers. These, however, were desired to act in harmony with the whole number of mutually recognized ministers, and his wishes have invariably been respected. Thus all questions of doctrine, of discipline, and of ministerial standing and employment were to be settled by a Conference, consisting of the same ministers as had been chosen for the Church or Parochial Conferences. It was against the exclusion of other members that revolts chiefly occurred, and the resulting bodies, such as the Primitive Methodists and the United Methodists, temper their Conferences with laymen, especially in America. The Wesleyan Methodists now have a Representative Conference, with equal numbers of ministers and laymen meeting first and dealing with all matters of policy and finance. But less is it to be noted that the trust deeds on which chapel property is held ensure that the enjoyment is secured to the ministers stationed by the Pastoral Conference. The Methodist Episcopal Churches have maintained their lines; but both the bishops and laymen retain their exclusive powers, and when met as a body they define the duties of each member. While an increasing deference is paid to local wishes, the supreme authority technically resides in the Conference, and in England at least the Conferences regularly exercise their powers. The itinerant system is being encroached upon by the claims of central offices or by the new system of Central Missions, in which continuity of service is sought. The conference system is also being relaxed, both in the parent body by ingenious constructions of the Deed Poll, and in the offshoots by open legislation.

The title of 'Connexion' was adopted by other bodies, such as the Calvinistic Methodists of Wales, the Countess of Huntingdon's chapels, and the New Connexion of General Baptists. Historically these originated almost independently of one another and of other bodies, and in their gradual growth they have ignored the experience of Methodists and Presbyterians, besides steadily rejecting the central feature of the present Episcopal system; thus they have given new extensions to the term 'Connexion.'

The whole history of the whole movement, especially the nucleus of the New Connexion of General Baptists, had retained all power to themselves at first, and so had the Yorkshire preachers who joined with them; but soon the local officers were associated, and, when negotiations were undertaken with the Lincolnshire churches of the Old Connexion, they explicitly repudiated the office of Messenger as not of Divine institution, although they were ready to discuss its expediency. The first rules were drafted by ministers and laymen advised that the Association should be open only to ministers and elders; but the separate churches made steady efforts to secure local control by the whole body of local members. Thus in 1817 their historian summed up to the effect that they were in their discipline strictly congregational, that each society allowed no foreign control even from its own Conferences or Association, and that the rights of church members were sacred against the encroachments by ministers. The London General Synod, in 1828, of each Synod, was able to capture and transform the machinery of the Church. For many centuries within Christian circles, a steady claim to supremacy has been put forth from Rome by an oligarchy of Pope and cardinals, who have succeeded in rendering nearly every revival subservient to their concentrated rule. Nor is it needful to look outside connexional circles; the corps of ministers most readily arranges to perpetuate itself, excluding the mass of members from the 'list of Evangelicals.' When the influence it reaches beyond the stationing and supervising of its own members, to the control of all activity, on which it can at least interpose a veto. Such encroachments have more than once excited revolt,
and led to the formation of other bodies in which such domination is expressly guarded against. Within the body of active self-governing workers there has often arisen some commanding figure, whose actual influence extends far beyond the nominal position he holds; but such a phenomenon is exceptionally rare. Moreover, the decision of management, and no such leader has proved able, or even desirable, to found a dynasty which may subvert the general principles.

In estimating the permanence of the type, we have frequently found that details of organization are not prescribed in the New Testament, but a few principles are insisted upon as fundamental. None is more urgently reiterated than this: 'All ye are brethren; one is your Master, even Christ.' Again, the primary object of the Church is evangelization: Go everywhere, tell all peoples, enlist the converts, instruct them in the ways of Christ; such are the purposes for which the Church was called into being. Propagandism and brotherhood are thus to be inextricably linked.

Now, as a matter of history, every great revival of religion has been marked by an appreciation of these elements, and has fashioned its system so as to suit them. True, the Franciscans were brought under the control of the Curia, but the very struggle against this, and the rapid degeneracy from the spirit of Francis, show the natural relation of Consangunity to these principles, so that the disappearance of the one imperils the existence of the other. Similarly the transformation of the connexional type among the old General Baptists and the Friends reflects the decay of the spirit of these denominations. But the great Methodist Churches, with their firm grasp on the evangelistic purpose of their existence, and their wariness, hold fast to the connexional system as the best embodiment of their principles.

And whenever a revival takes place, even on a microscopic scale, it seems natural that those who are actively concerned shall meet simply as brethren to consult and arrange mutually as to the division of labour.

W. T. WHITELY.

CONSANGUINITY.—By 'consanguinity' is meant blood-relationship, and more particularly, close blood-relationship. When we speak of a consanguineous union, we mean that the two organisms are near relatives; when we speak of a high degree of consanguinity in a herd or in a community, we mean that there has been much inbreeding or endogamy. It is desirable to know what the biological facts are in regard to the results of the union of closely consanguineous organisms, but it must be admitted that clear-cut facts are few. It should also be noted that, as the range of living creatures expresses a very long range, we must be very careful in arguing from one level to another; and it is of course normal and apparently wholesome at one grade of organization may not be desirable at another.

It seems to have been securely established that some hermaphrodite animals habitually fertilize their own eggs. This autogamy has been proved in some tapeworms and flukes—not auspicious illustrations; it seems sometimes to occur in the freshwater hydra and a few other free-living animals. There are numerous self-fertilizing flowers, though there is no case known where cross-fertilization is impossible. It may also be that some hermaphrodite liver-fluke sometimes inseminates another, so that the habitual autogamy may be interrupted. In the great majority of hermaphrodite animals invertebrates in general, and snails, cross-fertilization is the invariable rule. It is also relevant to recall the fact that in many of the small Crustaceans, in many Rotifers, and in some insects, such as Aphides, there may be long continued parthenogenesis—generations successive without loss of vitality, although the eggs develop without any fertilization. In some of the Rotifers the males are still undisclosed; Reamur kept Aphides breeding parthenogenetically for over three years (though in generations), and Weismann kept females of a common water flea (Cypris reducta) breeding in the same way for eight years. This shows that at certain levels of organization a vigorous life may be kept up for many generations, not only without any introduction of 'fresh blood,' but without the presence of any males.

A number of careful experiments have been made on in-breeding mice for twenty-nine generations, and his assistant Von Guita continued the experiment for seven more generations, but the only notable general result was a reduction of the fertility to thirty per cent. Some other experimenters, such as Cramp, have found that the in-breeding of rats resulted in disease and abnormality, but this was not observable in the equally careful experiments of Richter and Bos. He found in-breeding of rats productivity; for the first four years (twenty generations) there was almost no reduction in fertility; after that there was a very marked decrease of fertility, an increase in the rate of mortality, and a diminution of size. These and other experiments (namely, insufficient to be satisfactory as a basis for generalization, suggest that very close in-breeding may be continued for many generations without any observable evil effects, and, on the other hand, that there are limits beyond which in-breeding becomes disadvantageous. It is certain that, if there be well-defined hereditary predisposition to disease in the stock, then in-breeding soon spells ruin.

'Extensive experiments by Castle and others [see Proc. Acad. Nat. XLII.] In-breeding of the pomace fly (Drosophila anguliflora) led to the general result that 'inbreeding probably reduces very slightly the productiveness of Drosophila, but the productiveness may be fully maintained under constant inbreeding (brother and sister) if selection is made from the more productive families' [J. A. Thomson, Heredity, 1908, p. 393].

Some of the histories of domesticated breeds are so well recorded that they may be ranked as carefully-conducted experiments, and it seems that some successful breeds of cattle—such as Pollard Angus—have in their early stages of establishment involved extremely close in-breeding. When we examine the pedigree of famous bulls and stallions, we find in some cases an extraordinarily close consanguinity. Valuable results have often been attained by using the same stallion repeatedly on successive generations.

From breeding experiments four general results seem to be certain: (1) that progressive results have usually followed mating within a narrow range of relationship; (2) that close in-breeding has a great utility in fixing characters or developing 'propriety'; (3) that close in-breeding may go far without injurious effect on physique; and (4) that, if there be any morbid idiosyncrasy, close in-breeding tends to perpetuate and augment it.
CONSCIENCE

Darwin paid much attention to the question of in-breeding (see Variation of Animals and Plants under Domestication [London, 1868], etc.), and his general conclusions were:

1. The frequency of close inbreeding is often more frequent and more successful than was at first believed, and adheres to the whole body.

2. The term ‘conscience’ is derived from the Lat. conscientia, which meant originally ‘joint knowledge,’ or the knowledge which we share with others. It is the term we mean by concomitant knowledge, that is, consciousness or self-consciousness, and only in later literature had it the meaning which we attach to conscience. Even then it was not exactly what we mean by it now, as it is rather power in right and wrong.

3. This was in use by Plato and the Stoics, and denoted joint knowledge, and with the Stoics it also denoted the knowledge of right and wrong. In Greek, conscientia can be translated indifferently ‘conscience’ or ‘consciousness.’ It is the same with the French term conscience.

4. It is more distinctively in modern times that a radical difference is marked between the idea of consciousness and that of conscience. Consciousness with us is a purely intellectual function, a generic term for the phenomena of mind, or for that concomitant act of mind which Hamilton has well called the ‘common idea’ of the cognitive energies. Conscience is a term with a moral import, though complicated with the intellectual, and implies an emotional content at the same time.

5. Conscience is thus a term for Psychology, and conscience the term of Ethics. Nevertheless, however, that consciousness is implied in the problems of Ethics, while conscience is not necessarily so implied in those of Psychology. Conscience is thus a name for the function of distinguishing between right and wrong, and of enforcing the one or preventing the other. The difference between the ancient and the modern conception of it is determined by the difference between their ideas of morality, and may be said to reflect the whole Greek and Roman (W. H. S. Jones), p. 37. Jewish (M. Gaster), p. 41. Muslim (D. S. Margoliouth), p. 46. difference between their ethical and religious civilizations. The morality of antiquity, in so far as it was a subject of reflection, hardly got beyond the conception of prudence—except, perhaps, with the Stoics. That of modern times involves the idea of duty or devotion to a law which may require sacrifice. There is no doubt a perfect reconciliation between these two points of view when we come to a knowledge of the actual life as the people lived, as they are supposed to apply; but in their abstract formulae they seem opposed to each other. In its conception of rational conduct antiquity sacrificed a proximate to a remote interest; modern ideas assume that there is no such thing as interest, and demand unswerving obedience to law. But when this is carefully scrutinized it often turns out to be a sacrifice of the interests of the present life to a remote interest in a life to come. The Christian system was the originator of the phrases which came to express inflexible obedience to duty; but this system was based on the immortality of the soul, and on the rewards and punishments appurtenant to the nature of one’s conduct in this life. Hence, when they are subjected to analysis, they do not differ absolutely in kind from those of antiquity, but they take two worlds into account where the ancient took only one, namely, the present world. Plato is thereby inferred that as it is a difference, was between a materialistic and a spiritualistic view of the present life, and also between merely intelligent action and such action as involved duty with personal sacrifice.

The difficulty of acquiescing in the conception of conscience with that of the ancients is apparent in the philosophy of Plato. Though he used the etymological equivalent of the modern term ‘conscience,’ this was not the term for one of the main functions of conscience with us.
"Reason" was the function which did service for conscience, and even this was not the motive agency in the direction of the will, but the guide for other influences. The myth of the chariot with the two steeds represents Plato's conception of the moral nature. Plato's distinction was between 'rational' and 'irrational', which meant the distinction between intelligent and ignorant conduct. Irrational action was under the influence of desire and passion, two unruled steeds which in their behaviour never looked before and after, but rushed into action without deliberation or reflection. Reason was the charioteer whose function it was to direct these two steeds or impulses towards an end which represented knowledge of what the subject does, instead of blind passion. In the supposition of this, the idea of light and not power. The motive agency was in the desires and passions, and reason only gave counsel or directed them, without providing any other end than these impulses offered. It took a form of a 'neo-sense-world', which was distinctly different from that of sense and passion, and so to modify the conception which gave rise to the modern idea of conscience. The distinction between right and wrong with Plato and Aristotle, with all Greece, was that between the prudent and the imprudent, between what was best for the individual and what was injurious to him, and the judge of this was intelligence, not conscience in our conception thereof. Ours was the Stoic obedience to law, a law too which sacrificed the impulses and started the reflective mind towards the later Christian doctrine. But it was still an appeal to reason, and to reconcile its opposition to passion by insisting upon traditional ethics in details. But other Greek thinkers conceived reason as the director, not the commander, of the impulses, and so the Greek point of view was not that of the supremacy of reason, but the making prudence instead of law its standard of morality. The emotional element of conscience the ancients did not recognize. The influence which introduced this factor into the conception was partly that of Greek工地 sophistry, and partly the idea of respect for an inner life of law and conduct, suggested by the Stoic ethics, and made effective in the Christian system by the necessity of eschewing politics. This conception was explained later through the ideas of Immanuel Kant, as represented in his 'categorical imperative,' an unending sense of duty, regardless, in some thinkers, of all consequences, and in others of pleasure and pain. Here it denotes not only the consciousness of moral distinctions, but also an impelling motive or influence towards the execution of the right and the evasion of the wrong.

The Furies, or Erinyes (g.v.), are often regarded as mythological representations of the inner voice of conscience. But the interpretation of them is due to certain analogies with the more modern conception of remorse as a punishment for sin inflicted by conscience on the transgressor. The Furies were not inner monitors, but external agencies punishing the individual for the violations of the moral law. Remorse is an inner and punitive. The rationalistic stage of Greek reflection there was a tendency on the part of some thinkers to give a subjective interpretation to the idea of the Furies, but this never seems to suggest to them the modern idea of conscience as a distinct function of the mind. There was no tendency in Greek thought to combine the ideas of reason, and conscience, and conscience for sin as to form the complex idea which has done much service in modern ethics. The consciousness of sin was not a characteristic of the Greek mind.

It was the general character of Christianity that gave rise to the new conception of conscience, and this was because it created a new morality. The Greek mind got away from the secular view of things. When we talk about the Divine, he associated it with the aesthetic and political view of the world; his ethical interests were confined to the present life and its joys. But Christianity extended the horizon of human hope beyond the present, and created the brotherhood of man, a new social feeling and interest. At the same time it brought a doctrine of personal salvation, based upon the idea that the world which he had made was better, and that man's only hope of happiness in the next life was his conformity to duty here. With this new social ideal, the extension of man's horizon of hope, and the strenuousness of his conception of duty and limited probation, the idea of morality was formed with a direct reference to a spiritual as opposed to a material or carnal world. Morality was conceived as possibly demanding a sacrifice of all that the Greek mind valued in life, namely, the world of sense and the intellectual world of speculation—which was only the grosser sense-world a little refined. The transfer of happiness to a spiritual world forced morality to neglect that end hero, and gave a very abstract meaning to duty. It also laid stress on the idea, so little on more intellectual culture, that morality became the important characteristic of the man who was to be saved; that is to say, his morality would not be judged by his actions, but by the consequence of the democratic as opposed to the aristocratic view of social relations involved. In all, however, it substituted moral for intellectual virtues, and started civilization on a new track, which was the most important part of man's constitution, and it was appealed to not only to secure individual salvation, but also as the characteristic in man which reflected his lineage with the Divine.

The early Fathers defined conscience as the director of man's spirit, and from the Cartesian speculation—which was the after-emotion of the soul in regard to conduct. It was not, with Kant, a faculty of judgment determining means to end, or deciding when any particular course was right or wrong, but the faculty which impelled the right attitude of mind towards any course which the judgment made right or wrong. The consequence was that conscience was convertible with the inner sense of duty or the compulsory nature of the moral law.

Bishop Butler's view proceeded that of Kant historically, but was much the same as that of the great German. It did not have the same development, but it reflected the logical consequence of the age toward this view. Butler expands his conception of conscience in his new interpretation of human nature. There is a tendency to emphasize the emotional element, but the intellectual is admitted as essential to it. He says:

"There is a principle of reflection in men, by which they distinguish between their own and divine actions. We are plainly constituted such sorts of creatures as to reflect upon our own nature. The mind can take a view of what passes within itself, its propensities, aversions, passions, affections, as
CONSCIENCE

respecting such objects, and in such degrees; and of the several actions consequent thereupon. In this survey it approves of one, disapproves of another, and towards a third is affected in neither of the two ways, but is quite indifferent. This principle in man, by which he approves or disapproves his heart, temper, and actions, is conscience (Serres. I. § 17).

He is subsequently called on to insist that the function involves 'reflection,' and distinguishes it from the appetities or natural affections, as the agencies which can give their prompting stability and rationality. The conception at this point takes on some resemblance to that of Plato, with additions from the course of Christian development. But in completing his conception of it he assigns a supremacy to conscience which is based not on its power but on its right to prior judgment in questions of right and wrong. 'Thus,' he says, 'that principle, by which we survey, and either approve or disapprove our own heart, temper, and actions, is not only to be considered as what it is in its turn to have influence; which may be said of every passion, of the lowest appetites; but likewise as being superior; as from its very nature manifestly claiming superiority over all others—inso- much that you cannot form a notion of this faculty, conscience, without the right attitude of the will and reverence for the law. This is a constituent part of the idea, that is, of the faculty itself; and, to preserve and govern, from the very economy and condition of beings in all things to it. Has it strength as it has right; had it power, as it has manifest authority; it would also be so to the world (Serres. ii.).

In respect of the idea of authority, this view is strikingly like that of Kant, but it contains an element of judgment and emotional attitude after the act which does not appear to make a part of Kant's notion, and is started with a law of rational action which is to hold good for all its constituent beings, and makes this an imperative duty which is to regulate conduct without regard to consequences or external relations and conditions. External deeds are with him neither good nor bad. The only good or bad thing in the world is a good or bad will, and any will governed by the 'categorical imperative,' or sense of duty, is moral, regardless of what the external act is. One does not need to know the means to an end or to reflect on consequences in order to be virtuous in this conception. Neither the amount of intelligence or wisdom nor the after-emotional effects of approval or disapproval have anything to do with virtue, but only the right attitude of the will and reverence for the law. The motive or mere sense of duty was sufficient to determine the whole character of conduct, and this motive constituted the nature of conscience.

Both these schools or tendencies resulted in the conception that conscience is a simple and unique faculty of the mind. This was especially indicated in the simplicity of its function in the Kantian system, and in the view that it was not a product of experience, and with the English thinkers it was further favoured by the emphasis placed upon its presence in man as an evidence of the Divine. The Kantian argument for immortality and the existence of God pointed in a similar direction, as it rested on the moral nature of man. Both schools treated conscience as an implanted power and not the result of experience, and accordingly their conception came into conflict with the implications of the doctrine of evolution. This theory attributes a subjective conscience various conditions in man's social nature, and refused to regard it as an implanted and unique faculty of the mind.

The controversy between the two schools was made clear by the relation of the idea of conscience to the doctrine of predestination, and the question of the origin of conscience. Evolution had assumed that it had proved its claims in all other matters, and was ready to extend them to the origin of conscience. It was only natural that it should so treat the question, and it was unfortunate for the theistic view of things that it seemed to stake its claims on the integrity of its argument regarding the origin of conscience.

This controversy, however, is not the best setting for the consideration of conscience. We should first see what we think it is as a fact, and we can then discuss its origin. The function of the controversy has been to consider conscience not as a unique or simple faculty, but as a complex of mental phenomena organized with reference to moral ends. Instead of being made a separate faculty into the 'faculty' Psychology having been abandoned—it is considered as the mind occupied with moral phenomena. This enables us to conceive it as the organization of all that intelligence and feeling which are connected with the actions called moral or immoral of men. It was in their relation to this view in the conception of Butler, but it was concealed by the prevailing interest in other questions. But, taking conscience as a complex instead of a simple function, the present writer would propose to make the following three definitions: (1) The intellectual or cognitive element, which is concerned with the perception of the means to ends, and the fact of some end which we agree to call the good as distinct from the merely true. Other mental functions are called to determine what shall be the good as distinct from the true, but the intellectual judgment and perceptions are involved in determining both the fact of this idea and the necessary means to its realization, and on these means rests a part of the value of the ends or ends and wrong. In fact, right and wrong hardly have any meaning without this conception of means to ends. (2) The emotional element, which is primarily the valuation of facts and things in relation to our welfare, whether they represent retrospective or prospective feelings. Hence they divide into what we shall call the judicial and the legislative feelings. The judicial feeling represents the approval or disapproval of any action in relation to the moral law. The legislative feeling is the sense of duty, or the categorical imperative, and commands of duty as the retrospective feelings pass judgment on acts already done. (3) The deprecative element, or that mental state which may be called reverence, good-will, or conscientiousness, and is representative of respect for law, where the sense of duty represents a sense of compulsion often against the desires. The highest condition of conscience is that in which respect for law is the imperative which feels a struggle against natural desire.

These various elements will include all the social instincts which figure so prominently in the theories of Darwin and Spencer and the evolutionists generally. The important point, however, is that they show the moral nature or conscience to be complex and not simple. The view solves many perplexities in the evolutionist controversy. The difficulty proposed by the older view, in its effort to utilize the distinction between man and the animal in respect of morality, was that evolution could not account for this new increment in the process of creating man, and that, since it was not derived from anything like it in previous organic life from which man was supposed to be developed physically, a special creative act was necessary to account for it in man. But with the analysis of conscience into elements which may be found in all consciousness, animal or otherwise, we may suppose that the process of evolution has only organized or consolidated elements otherwise separate into a systematic tendency to act in the direction we call conscience. In this manner we may admit the uniqueness of the function, and so its distinction from animal life, while we at the same time accept the evolution, if not of the ele-
CONSCIENCE (Babylonian).—As is indicated in the art. CONFESSION (vol. iii. p. 825), the Assyroyan-Babylonians felt strongly the consciousness of the commission of sin and wrongdoing, and herein the idea of conscience appears plainly, and must have presented itself with all its force to their minds. Confession of sin, in fact, can exist in all sincerity only when conscience speaks to a man, and tells him that he is in fault;—when,

Sitting in lamentation,
In bitter musings and pain of heart,
His heart in conscience evil assumes,
He mourns as a dove; tearfully night and day,
To his merciful god like an ox he lows, and
Weeps crooked tears, he constantly.

The Assy.-Bab. conception of sin, however, differed from that prevailing in a Christian community, as the failings of a religious man belonging to the theocratic type, having no king or god to cause which over which he had no control—the effects of the actions of evil spirits, or the ritual uncleanness brought about by acts of forgetfulness or by the effects of illness. The disadvantage arising from this consisted in the disfavour of the gods, or of the king as the gods' representative, and there was a desire to avoid such disfavour in future by refraining from the commission of the misdeeds which brought it about. This, though not the Christian idea of conscience (including, as it does, the feeling of remorse), may have tended to bring about the frame of mind which we understand thereby, or something akin to it.

An excellent example of the heart-searchings of the Babylonians and their remorse of conscience is given by the 2nd tablet of the Surpu-series. Here the afflicted man has not only to ask himself whether he has committed the sins of blasphemy, uncleanliness, bribery (?), or theft, but he must also put to himself searching questions as to whether he has separated father and son (or other near relatives), restrained from freeing the captive, failed to enable the imprisoned to see the light of day, whether, being 'upright of mouth,' his heart was nevertheless faithless, and whether, while saying 'Yes' with his mouth, 'No' was in his heart. As these queries run to about 80 lines, it will easily be recognized that the Babylonian, in his conscientiousness, was exceedingly thorough.

In fact, we may, perhaps, see in the last of the following lines this excellent expressing the idea which the word 'conscience' connotes;—

1. On account of his eye, which is filled with tears, [accept thou his] lamentation;
2. On account of his eyes, [accept thou his] lamentation;
3. On account of his mind (?), from which tears depart not, [accept thou his] lamentation;
4. On account of his hands, which rest spread abroad, [accept thou his] lamentation;
5. On account of his breast, which complains like a receding lake, [accept thou his] lamentation.

In this extract the breast, the seat of the feelings, may be regarded as the inner conscience of a man, and as practically synonymous with the heart, when used in the same sense. In the Laws of Hammurabi, the person who had a complaint to make was recommended to go before Merodach and Zerpamundi in prayer, with perfection of heart. 'Perfection of heart would, therefore, seem to have been an expression equivalent to freedom from the consciousness of sin—a clear conscience. If the fullest sense of the word, therefore, the great gods of Babylon, exacted for their favour, not only that restitude in the sight of the world which every right-minded person desires, but also a good conscience, such as would urge on him, by instance, constraint, reconciliation, and restitution when the interests of his fellow-men were involved.

Numerous inscriptions, mostly of the nature of penitential psalms and litanies, might be quoted in illustration of the above, but very little fresh information is to be obtained from them. Their cumulative evidence, however, shows the Babylonians in a most favourable light, notwithstanding that the objects of their worship were the gods and goddesses of their national theocracy. Religious in the extreme, the constant aim of the believer among them was a clear conscience, without which there was no hope of happiness, but, on the contrary, pain and grief in this world, and, to all appearance, an incarceration in another world to come from the deity whom they worshipped.

LITERATURE.—This is given in the notes.

4 See Jastrow, op. cit. ii. 1-137 ("Klaegelder und Bussgebeten").
CONSCIENCE (Egyptian).—The actual word 'conscience' does not occur in the indexes of Egyptian works—which is a significant fact. For not only must we suppose the ego that the word has no exact equivalent in the Egyptian vocabulary (any more than have the terms 'sanction,' 'morality,' 'remorse,' etc.), but we must also conclude that the literature of ancient Egypt has nothing to say on the subject. Of course, we find numerous writings on propriety, on duty, on everything connected with the vast domain of ethics in general; but there is nothing that bears directly upon the concept of conscience in themselves. Since, on the other hand, we still find most delicate manifestations of what we might call an organized conscience in Egypt, in its literature and religious works, we must presume that the Egyptians had quite a different conception of conscience from ours for both of the senses in which the word is used to-day. Psychologically, they connected it with very different phenomena, and with methods of perception of the ego which are no longer ours. Morally, conscience was regarded as playing a part in concepts grouped in a different way from that followed by our method. Or, rather, Egyptian thought arranged the operations of the moral conscience in a set of independent categories, wherein we make them a unity. It would take too long to investigate whether this fact is due to the general inability of the Egyptians to make abstractive definitions, or, on the other hand, to the method where the Egyptian intellectual formation originally formed the foundations of its knowledge. The latter is probably the more correct view.

These radical differences of terminology explain, at any rate, why the question has never yet entered into modern works of Egyptology. These speak very often of the moral culture of Egypt, but never of its conscience or of the possible formation of the same (the work of Filders Petrie, Religion and Conscience, is the only exception at present; but note also the restriction made in the Literature at the end of this article). In fact, the complete absence in ancient Egypt of definition or treatment of the subject foretold the absence of a conception of the Egyptian conscience by means of the direct study of whatever implicit manifestations of conscience can be seen in the whole collection of Egyptian writings. The inscriptions such as a prayer, a hymn, a biography, or a copy of a legal text or a legal decision or a ritual or a treatise or a papyrus; or even magical incantations may supply a detail here or there; and the sum of such contributions may gradually make it possible to reach a knowledge of Egyptian conscience. This study is necessarily a very intricate one; but it is indispensable for our ultimate understanding of the duties and divisions of Egyptian morality, of which so much has been said. It is any more than any first attempt, of provisional character.

It is a common thing to read that the Egyptians had a conscience superior to that of the other peoples of classic antiquity. Such an expression in the actual meaning of the word has never been ascribed to this nation. The literary expressions employed in the question as to 'whether conscience is the herald of the Lawgiver or the Lawgiver Himself' have no precise meaning here. If we can prove that social morality is the product of the body of individual
Consciences, and show the initial separateness of morality and any given religious system, we see that this separation naturally affects the origin of conscience. Now this separation of morality from religious beliefs has been attempted time after time, since Tylor, in all the religions of uncivilized mankind. Nowhere is this phenomenon more scientifically clear than in Egypt, where, from the time of the prehistoric texts of the Funerary Books to the Roman Empire, the accession of the gods to the domain of morality, the succession of the Right, near the latter period, Osiris was almost the only god connected with a moral idea (Ptah of Memphis is perhaps an exception, if we judge by the latest discoveries, in his temples, of stelae to the name of 'Ptah who hears the plaint of the wretched' [cf. Petrie, _Memphis_, i., Lond. 1908, p. 17ff.]). The other gods neither prescribed nor taught anything of morality. They only punished those who did them wrong, and blessed their benefactors. It may even be remarked, as one of the strongest characteristics of Egyptian religions, that this neutrality of the gods persists throughout the whole domain of ethics.

Thus we base conscience on 'sympathy' seem incapable of explaining its manifestations in Egypt. Not one of the texts of the monuments, e.g., or of the moral or popular literature, makes any mention of, or even allusion to, and nothing is the doctrine of the kānī. In Egypt, to 'follow the dictates of the heart' would lead to very different results from those of a fundamental concept that 'the heart is good. On the contrary, the total impression given by Egyptian texts is that a humblest man be shown up in two remarks which do not favour this system.

(1) We find a great lack of those ideas which are often regarded as indications of the 'sympathetic' origin of conscience. These are the feelings which are usually qualified with 'temporary sanctions,' and are called the pleasure and joy of doing good, and the remorse, regret, and repentance for evil-doing. Indeed, certain chapters of the Pyramid and the Book of the Dead, and certain references of the popular tales, offer lamentable analogies, in point of 'sympathy,' with the present mental status of the very lowest races among those studied in the Congo (cf. _Notes sur la vie familiale et juridique de quelques populations au Congo Belge_, t. ii, fasc. 1 [Brussels, 1909]). (2) The study of 'sanctions' properly so-called (of very different kinds, of course) reveals an organization (i.e., a formation) which shows its connexion with fundamental elements that are quite different, and perhaps even totally opposite.

The history of this will be examined elsewhere (see Ebrus). Here, however, we should note this angle—at first sight inextricable—of the most various fundamental sanctions. The lowest of these are based on violation of 'tabus,' and have no possible connexion with any moral action whatever; the others show themselves as consequences, conceived from a utilitarian point of view (and recognized as such by experience), of incoherent series of actions which are not arranged in any kind of logical group. This is seen to this day in the absolutely persistent incapacity of the Egyptians to compose any kind of reasonable list of sanctions. All that we find in the _Pyramid Texts_, Book of the Dead, Maximus, Proverbs, Instructions, etc.) are lists formed in reference, not to classes of duties, but to the individuals or forces whence these sanctions proceed: the gods, the chief, the dead, the family. Sometimes, indeed, there is a suggestion of a conscious prohibition. But then we find a vast confusion; the career of the individual, long and prolix, the multitude of demands, long list, the gratitude of men, business gains and losses, ethnological considerations, etc. Few documents of this sort cannot, in some degree, give the idea of a moral conscience with any other basis better than that of 'innate goodness' or 'sympathy.'

The innate appreciation of right and wrong, which makes it necessary to constitute the human being as the subject of the moral conscience, seems at first sight a good theory for Egypt. There is probably no other ancient literature so egregiously with ideas of right and justice. Disseveres like the one supposed to be addressed by the king to his vizier on the duties of the guardians of the dead (cf. Newberry, _Rekhmera_, Lond. 1900, p. 33), the statements of ch. cxxxv, of the Book of the Dead, and especially the constant references of the biographical inscriptions tell us how wrong in all its moral and social forms, would seem to picture the very inmost mental state of the race. A critical examination of the texts, however, makes this tempting hypothesis untenable. In exams like the concept of 'retribution' or 'like fortune' or the average of years of good fortune' (cf. Griffith, _Stories of the High Priests_, Oxford, 1900, pp. 41-66) is of late appearance, and the most perfect injustice preceded it, for has been noticed—that is, the 'Negative Confession' confines itself to a magical affirmation without proofs. Finally, the moral concept which it supposes in relation to the actions of this life is not ancient in respect of its insertion in the Book of the Dead: there is no getting over the plain fact that, while we have for several years been in possession of about two hundred specimens of the Book of the Dead of earlier date than the XVIII dynasty, we have not one containing a single line of the moral chapter of this literature. It is the same with the ordinary inscriptions, where the development can be followed from the _nastabas_ of the IVth dynasty.

We turn to the other side of the case, that of the universal system of social and moral ideas, which, in the form of affirmations of the lawful ownership of various goods, or the absence of work done to those things of which the deceased has need—which is quite a different thing. Even reducing it to its most humblest form, we find, in the _ancient_ period, the right of ownership, without the distantounding of a moral idea of right, for any one of the ancient Egyptian cases. On the other hand, it is a new idée fixe that this taken up lately by Leroy (op. cit. 255), which posits at the outset an irreducible innate idea of right, while admitting the infinite and contradictory variety of practical applications. It is an evident paradox to make, from the establishment of a connexion by mental operation, an entity existing by itself. The philological examination of the texts that would apply to this special exposition might arrive some time at the conclusion that the primitive phase of the moral consciousness and utility, and never at an abstract conception of right; such a process would lead rather to conclusions remarkably like that suggested by the examination of the moral ideas of the races recently examined in Equatorial Africa, in the basin of the Congo, or in British East Africa.

Petrie's conclusion is the theory of utility brought to perfection by heredity (op. cit. 58).

The views may be summed up as follows: The conscious idea of right and wrong conforms at its basis with what is useful or the reverse for the community. Passing centuries have gradually done away with this idea, as have imposed on the individual, and thereafter on his descendants, respect for it (if not intelligence); so that the manner of appreciating it has, like hereditary movements, become impossible. In the primitive reasoning of the ancestor has been transmitted to his posterity in the form of a connexion to conscience.

This theory of Petrie's is a remedial form, to suit Egypt, of the conception that we find elsewhere in all sorts of analogous forms; e.g., the 'principles and conscience par herédité' (Béville, op. cit. 276); or the elementary principles are 'Principles and conscience par herédité' (C., Le Bon, _Premières civilisations_, ed. 1905, p. 56). The whole idea seems well adapted to the Egyptian world, so well organized in all its workings for social co-operation and utility.

But this is a narrow basis, and must be broadened. So a system does not explain why Egypt, having the same constitutive element of conscience as the other African peoples, should have developed its moral conscience further than...
they. A more precise and intricate mechanism must be found, and can be found—in the present written opinions—an elaborate examination of Egyptian literature. A total of 500 or 600 proverbs, maxims, precepts, ideas, or thoughts of a moral type, extending from the 18th dynasty to the Christian era, will suffice for this inquiry, the fruit of which will be the idea of duty or its working out (see ETHICS), but to find the elements of formation of what we call conscience in Egypt. The development of the utilitarian and self-interest ideas appear as the result of the combination of two chief elements.

The first consists essentially in the feeling that there is no indifferent action, and that every action has consequences for its author. This idea is by no means the same nature as that of right and wrong. It is not even the idea of responsibility, but it contains the latter in embryo. It also includes the future idea of reciprocity, applied to the door of the action. It thus reduces itself to the form: ‘If I do this, the same will be done to me (or will happen to me)’; then to the form: ‘I shall not do that, so that the same may not be done to me (or happen to me).’ A comparison of the mentality of the black African of to-day with the mentality of certain parts of certain modern people, shows that this idea of the necessary consequences of every good or bad action is a true innate idea, or, if not innate, at least the most primitive instinctive idea that can be found. It does not presuppose, so to say, a delayed perception or experience of its consequences.

And this pessimism, rightly remarked as a characteristic of the African mind, is still visible in Egyptian literature. The action, with its consequences, agreeable or harmful or displeasing to one or other of those immaterial spirits and forces, begets the immediate perception of a good or evil consequence for the doer. This is clearly seen in the case of numerous interdictions of a ritual nature, or in the mysterious vengeance of spirits and gods, as of the Karamoko or Ubangi native conscience. And the idea is spread, men, women and boys, are linked by their death or by their guardian-spirits, to this sum of mysterious forces brought into motion by every action, seems to have supplied the natural means for the extension of this primitive feeling.

Whether the original mental operation in innate or not will not be discussed here. The positive fact is that, in every case, as described as the first manifestation of the feeling of conscience among the ‘non-civilised’ Africans is at the foundation of Egyptian mentality. Experience naturally gave this feeling definiteness and precision, and, low as we may judge it from the moral point of view, shows itself to be composed from the very elements as those of a Karamoko or Ubangi native conscience. And the idea is spread, men, women and follow- men, are linked by their death or by their guardian-spirits, to this sum of mysterious forces brought into motion by every action, seems to have supplied the natural means for the extension of this primitive feeling.

The whole question, then, in the special case of Egypt, turns upon the theory that the idea of conscience must arise out of the efforts made by the Egyptians to cultivate moral sentiment. This question is raised by the EgyptianCalendar, and we have here documentary evidences of this evolution; e.g., in the very frequent references in the ancient texts to the necessity of keeping in view the moral standpoint, filled by the questions relating to water, irrigation, and the struggle against the desert (cf. ch. xxxv. of the Book of the Dead; certain passages in the papyri of the lords of Syut in the 4th dynasty; or of Beni Hassan in the 11th, etc.). The idea of a higher authority and an eternal hierarchy essential in this world, as they are in the celestial world, for the common good, is also a result of a conscience based on the idea of the gods; this vision has likewise impregnated all the literature of the ‘moral’ type.

In conclusion, from the vague fear common to all primitive societies, the nature and climate of Egypt developed the more fertile and definite idea of an arrangement of the forces and beings of the sensible world into regular armies, some of which are allies and preserve over the progress of the world, while others try to harm the world and so lie in order to the future; the consequences was followed by the comprehension of the necessity of social order, the comprehension of social interest, etc. Owing simply to the complex origin, Egyptian conscience never succeeded, in its monadistic conception, the other conception of dialectical philosophy, ‘the all’ turning tabu from the obligation of the moral domain.

These were for the Egyptian two different forms of the necessary co-operation of men for the maintaining of the order requisite to society. A satisfying counter-proof of this view is supplied by a comparison with a certain number of living races in the uncivilized parts of Africa. It might be the degree of organization of the moral conscience in Africa
CONSCIENCE (Greek and Roman).—I. GREEK.—1. Definition.—Conscience operates when the individual passes an intellectual judgment on definite acts, accomplished or purposed, of himself or of others, whether he judges them right or wrong. Such judgments, being self-regarding, are always accompanied by self-satisfaction, or self-dissatisfaction, according as the individual feels he has fulfilled, or fallen short of, the moral law; conscience punishes or approves, deters or suggests. It has an intellectual side and an emotional side; it may be enlightened or the reverse, sensitive or the reverse. Its enlightenment is to be estimated by the moral ideal of the individual; he may obey the moral law through fear of punishment here or hereafter; through hope of reward here or hereafter; or simply in order to realize the ideal self. The most educated conscience is that of the man who has the highest ideal, and who with the greatest confidence in the possibility of which humanity is capable. The sensitiveness of conscience depends partly upon heredity, and partly upon habit and training. Some people naturally feel their shortcomings more acutely than others, which, in the long run, tends to lessen the shame felt at such indulgence.

2. Homer and early times.—Although there is embedded in the Greek language the notion, in later times developed by philosophers, that virtue and sin have an intellectual side (Homer's phrase for 'versed in wickedness' is ἀθέμετα εἰδὼν, 'knowing lawless deeds' [see, for example, Od. ix. 189, 428, xx. 287]), yet the most common moral terms used in early times refer to the moral calm, or the moral side of conscience. In Homer we have: (1) ἀθέμης (ἀθεμώς), used of those who feel reverence towards the gods (H. lxxv. 593; Od. ix. 269, xxi. 28), towards suppliants or guests (H. i. 25, 577, xxi. 24, xxi. 419; Od. iv. 26, iv. 322, xii. 297), as being unable to inhibit their passions in order to realize some higher end (H. v. 352, vii. 93, xiii. 122, xiv. 561, 657, 661, xivv. 44; Od. iii. 24, vi. 221, vii. 172, 224, 450, xiv. 166, xx. 171). The substantive may be rendered 'shame' or 'stigma' of the body or men, 'respect for the moral rebuke of others,' 'modesty,' 'sense of honour,' 'self-respect.' (2) If ἀθέμης sometimes approaches to the 'law-giving conscience' which precedes an act, αἰσχόρασα (Od. xiv. 928, xlviii. 176) was generally represented by the shame (or the fear of it) inflicted by the 'judging conscience,' although it is not always possible to distinguish between the terms. (3) The indignation felt by others at transgression is represented by the word ἄθημα. The moral sanctions of the Homeric Greek were thus (I.) fear of the gods, (II.) respect for public opinion (φόρος ἀθρόων, Od. xlii. 325), and (III.) self-respect (Helen calls herself 'a dog,' H. iii. 356), and a sense of honour which sometimes led to deeds of heroism. Achilles would rather die than fail to avenge his friend Patroclus (H. xviii. 98),—an instance of devotion to duty which Socrates, in the Platonic Apology (28 C D), quotes with strong approval. Conscience, in fact, was acting, although as yet no special word existed to represent it, while the intellectual side was less developed than the emotional.

3. Individual merged in the citizen.—The characteristic Greek respect for public opinion found freer scope as city life developed, and as State discipline became the chief feature of Greek life. The Greek people. The citizen looked upon morality as submission to the will of a corporate body. 'We lie here in obedience to our country's commands,' was the epitaph of the noblest heroes that Greece ever produced; acts and virtues were invested with a peculiar sanctity of its own, and the individual found moral satisfaction in yielding implicit obedience to the powers that be; in modern language, he surrendered his conscience to the general conscience, and was content with his sentence by the latter. Plato (Crito, 51 E) makes Socrates personify the Laws, who point out that every citizen has virtually agreed to abide by them, and not to prefer his own sense of right and wrong. That such was the belief of the historical Socrates is shown by Xenoph. Mem. iv. 4, 15, where τὸ ὑμένιον is equated with τὸ ἐθικόν. It was generally felt that the vast majority of men needed some strong external constraint. Hesiod (Works, 192 ff.) dreads the departure of moral fear from the earth, and the Platonic Protegoras (Prot. 332 B C) calls ἀθέμης and ἄθημα the bonds of political and social life. The language of Aschylus is stronger still. 'Who,' asks Athene (Eum. 699), 'is righteous if he fear nothing?' While in the case of Sophocles (1073 ff.) it is stated that ἐθικὸς and ἄθημος are necessary defence to both States and armies; that only ἐθικὸς and αἰσχόρασα can bring a man safety. Plato, in a yet more telling passage ( Laws, 600 D E), makes ἐθικός and ἄθημος responsible for the Athenian victories over Persia. The
Athenians, he says, had a despotīc mistress in aēsīs, through whom they were the willing slaves of the laws (688 B), and those who would be good must be similarly disciplined.

4. Unwritten laws.—But, in spite of the tendency to merge morality in legality, the Greek was aware that the individual ought to form moral judgments for himself when the laws were silent. The jurymen at Athens were to decide suits according to the laws, but, when these were no guide, to judge the case consciencelessly (γρηγορώς τῷ ἐθνῷ, Aristotle, Rhet. i. 15. 5; cf. Ἀριστ. Epid. 674). Again, the Greek acknowledged certain great laws (ἀκολούθουσα καταφύσης ὁμογενεῖς), in which he had to abide, that the individual must decide for himself; the individual must decide between them. The tragedians are constantly depicting situations in which a character has to choose between the traditional code and some higher moral end. Philoctetes, for example, was a victim of his period, and the individual must face death rather than obey the edict of Creon, and, by leaving her brother unburied, violate the unwritten laws.

5. Decay of State discipline.—It is remarkable that, at the time of Xenophon, was more severely approached just at the time when the morality of the masses began to decline, that is, during the period subsequent to the outbreak of the Peloponnesian War. The reason is partly that, as the State discipline weakened, the vicious and weaker characters, no longer having so firm a check upon them, grew more immoral, while the stronger and nobler natures (not necessarily the philosophers) learned to obey an inner law of righteousness, but the latter being considerably few, and Plato, in the second book of the Republic, repeats the story of Gyges' ring in such a way as to show his own belief that the many are incapable of being virtuous for the sake of virtue.

6. Decay of State religion.—Not only the State discipline, but the belief in the State religion, had by this time lost much of the power it once possessed. Few thinking men continued to believe in the existence, let alone the providence, of Zeus, Apollo, or any other of the Olympian deities, as Herodotus (vi. 86) of Glauceus and the Delphic oracle illustrates how the State religion had once been, in some respects at least, a good moral influence. When, however, the Divine sanction failed to exert its effect, the individual conscience more clearly manifested itself. In yet another way did the decay of belief in the Olympic pantheon further the development of the idea of conscience: the early Greek had thought, with a strange inconsistency, that the gods both tempted men to sin and punished sin; at first he blamed the gods for leading him astray; then, deprived of this excuse, he began to blame himself.

7. Other components in Grecian religion.—But there were other and more abiding components than Olympian worship in the religion of the Greeks. One should note the ὑστατικός, or scapegoat, mentioned by Hippomax (frag. 4, ed. Bergk) and Aristophanes (Fug. 723), probably Pelagian in origin, as it is not to be found in Homer, especially dreadful of a murdered man's ghost, gave rise to the idea of an avenging deity (ادة), and of blood-guilt (σαμαρέως, περιπάτουσα, ἐσπάγη). The latter might infect a whole family, or even a State (Thuc. vii. 18). Doubtless at first the infection (μῶμα, μωσάω) was regarded as something material, to be cleansed by expiatory ceremonies, or it might even be personal (Pepym. arch, Chor. 1501); but in the time the doctrine was spiritualized.

Xenophon (Cyrop. viii. vii. 18) speaks of the fears that the souls of wronged persons bring upon murderers, and of the avenging spirits (αἰματόμον) which they cause to visit the guilty. While Euripides interprets the Furies of Æschylus as the stings of conscience (Orestes, 396).

Orphism introduced the doctrine that the soul was exiled from heaven because of sin and that in Homer the gods lead men to transgress, but Orphism taught that guilt arose from man himself. Abstinance and rites were the Orphic means of cleansing; but, however decisive, might be the impious hands (Plato, Rep. ii. 364 E), it was possible to give it a spiritual interpretation (ὑπερτερον κακομέτας [Empedocles, 406, ed. Karsten]), and it most certainly helped to foster a sense of the doctrine of ἐφιλοσοφία (becoming like unto God) is Orphic in origin, and gave to the world an idea which increased in moral value as the idea of the Divine nature was purified and ennoble. According to Orphism, man was given moral nature, and the realization of man's dual nature must have tended to develop the individual conscience. In the Pythagorean sect, which owed much to Orphism, examination of the conscience was enjoined (μετέπεισθαι τον ἰδιότητον, a priest, 1883) from early times, and in the Hippokrates of Euripides we have an Orphic who is horrified at the suggestion to commit a sexual offence. In the history of morals the idea of physical impurity generally prevails, and leads up to, the conception of a guilty soul.

8. Morality and the human heart.—Whatever the origin may have been, the 5th cent. witnessed the development of the idea that the human soul (ψυχή, ψυχη, ψυχος) was a more cleanly and more susceptible of cleansing, to the extent of mortification and of vice. Chastity is said to reside in the human ψυχή (Bacch. 314, 315, Hipp. 79, Tro. 987, 988; Thers. 1602, 1603) has a 'mighty shrine of righteousness' in her ψυχή; this may possibly come from the asyndeastic ἐστι. 'My heart is my own soul' (Hipp. 317). Conscience the lawgiver and conscience the accuser are both manifest in these dramas. The countryman in the Elektra is too honourable to contaminate the marriage which has been forced upon Electra; Macaria goes voluntarily and readily to an awful death in order to save her kindred; Orestes is tormented by the consciousness of matricide. Like many other men, he had been forced by a sense of human nature to admit that the individual conscience is more clearly manifested itself. In yet another way did the decay of belief in the Olympic pantheon further the development of the idea of conscience: the early Greek had thought, with a strange inconsistency, that the gods both tempted men to sin and punished sin; at first he blamed the gods for leading him astray; then, deprived of this excuse, he began to blame himself.

The Greek of the 5th cent. was thus fully aware of the working of conscience, and he began to use the special words to describe its work. He laid stress, not upon the emotion which follows a judgment of conscience, but upon the intellectual character of that judgment. One word is ἀνίκητος, 'deep thought' (Eurip. And. 805), which does not appear to have become popular in the moral sense. Another is πιστεύω, 'understanding' by which Euripides described Orestes (Fr. 10, ed. Orestes (Or. 290), by Xenander (fr. incert. 86, Meineke), who says that 'conscience doth make men wiser,' and by Polybius (VIII. xxvi. 8) the idea behind the passage is this: 'There is no more terrible witness, or more formidable accuse, than the conscience that dwells in each man's soul.' But the most
common term is the verb ἐυδοκεῖ, with its participial substanti- 
avos  ἐυδοκίας, etc.) generally refer, not to the law-making conscience, but to an adverse decision of the judging conscience, and to the self-dissatisfaction which accompanies it. Now, it was with the enlightenment of morality that Greek ethical philosophy chiefly concerned itself. As a rule it passed over the shame that accompanies wrong-doing, and never tried to make it the highest moral motive. Convinced that vice is ignorance, both Socrates and Plato devoted their lives to educating the moral sense; and Plato constantly insists that mere conscientiousness, like that, for example, of Euthyphro, is not suf- 
1. Philosophy and conscience.—It has been maintained, and as energetically denied, that this clear adverse judgment of the shamefulness of sin is to be attributed to the work of the philosophers. Both seem to have been due to the same cause, namely, the decay of old beliefs, but it is perhaps unreasonable to deny a real, though indefinite, influence to philosophic ethics. It should be noticed, however, that ἐλπις and ἄμερος are popular, not philosophic, expressions. There are plenty of examples throughout the course of Greek literature and Greek history of the individual deliberately following the dictates of his better self, but such instances are so closely associated with the words employed to designate con- 
science. The latter (ῥ ἀμερος, etc.) generally refer, not to the law-making conscience, but to an adverse decision of the judging conscience, and to the self-dissatisfaction which accompanies it. CONSCIENCE (Greek and Roman)

(1128 b), sometimes as a shrinking from the ugliness of sin (1116 a, 1179 b). Emphasizing as much as Plato the necessity of an enlightened intelligence for truly virtuous conduct, Aristotle did good service by laying the idea of a public virtue, and its elaboration of the idea of duty (φρονήσεως, καθήμενα), and their exhortations to live a life according to the Divine reason implanted in the heart of man, did much to develop the notion of conscience, the name being coined to designate the word ἐνέργεια, but this is more than unlikely. By ἐνεργεία conscience is described in the (of course apocryphal) sayings of Bias and Periander recorded by Stobaeus (Flor. xiv. 11, 12), in Wis 17, in the N. T. (S. Matt. 26, 24), and in the scholia to Aristotle, with its attentuated or lengthened form. Even the later Stoic writers, Epictetus and Marcus Aurelius, though they constantly mention the action of conscience, seem purposely to avoid the word ἐνέργεια. The fact is that all the Greek works for the most part lay great stress upon an exception, to conscience the judge, and are associated with shame. Pindarch, in his famous description of conscience (Moralia, 476 F), says, in wonderfully modern language, that it wounds and pricks the souls which suffer pains, or rude, increases this; the guilty mind punishes itself. The Greeks, familiar as they were with the working of conscience the legislator, had no special word to describe it, although its emotional aspect is hinted at in aisēs. Now, the Stoics attributed "abundance of emotion" (ἀπειθεῖα) to their wise men; yet, though he would not entertain fear of disgrace (Diog. Laert. vii. 112, 116), he would feel aisēs. It was the legislating conscience, ἐνεργεία, that the Stoics emphasized; but, while Roman Stoicism came to express this by conscientia, among the Greeks it had no generally recognized name.

(4) Epicureans.—Perhaps it was the Epicureans who first coined this idea of a general conscience, and this would account for the Stoics avoiding the term ἐνεργεία. At any rate, Epicurus held that sin is an evil only because of the fear of discovery (Diog. Laert. x. 151), and a graphic description of conscience is given in the 30th phrase of the Epicurean Lucretius (de Rer. Nat. iii. 1014-1023, cf. iv. 1135). Probably, however, whether Stoic or Epicurean, had less influence than the facts of moral experience, which were more and more conscientiously realized by the popular mind. 11. Summary.—From the earliest times the Greeks had terms referring to the emotional side of conscience in most of its aspects. From the end of the 5th cent. συνέσεως and συνείδησις were used to denote the intellectual part of the judge. Orphism had emphasized the dual nature of human personality, while the gradual decay of the State religion and of State discipline, along with the intellectual movements of the 5th cent., forced men to realize that they had a judge in their own hearts. The idea, present from the first, that a man should feel shame before himself grew clearer; the hapativeness of sin was more acknowledged, and is urged with unsurpassed moral force in the writings of Plato. From the first it was felt that man owes allegiance to his better self; that he must obey, not only the traditional code, but the dictates of an inner law. Haced at occasionally in aisēs, this feeling was not crystallized into a special term; but the philosophers laid stress upon educating this better self, and thereby enlightening morality. Of the individualistic schools, the Stoics insisted on obedience to an inner law of reason, the Epicureans on the law of Nature (Laws, 653D), upon the importance of training youth by habituation to love good and to hate evil (Ethics, 1104 b). (3) Stoics.—It has been held that the Stoics, with their individualism, their doctrine of the self-sufficiency of man, their sense of public opinion, and the crystallization of the idea of duty (φρονήσεως, καθήμενα), and their exhortations to live a life according to the Divine reason implanted in the heart of man, did much to develop the notion of conscience, the name being coined to designate the word ἐνέργεια, but this is more than unlikely. By ἐνεργεία conscience is described in the (of course apocryphal) sayings of Bias and Periander recorded by Stobaeus (Flor. xiv. 11, 12), in Wis 17, in the N. T. (S. Matt. 26, 24), and in the scholia to Aristotle, with its attentuated or lengthened form. Even the later Stoic writers, Epictetus and Marcus Aurelius, though they constantly mention the action of conscience, seem purposely to avoid the word ἐνεργεία. The fact is that all the Greek works for the most part lay great stress upon an exception, to conscience the judge, and are associated with shame. Pindarch, in his famous description of conscience (Moralia, 476 F), says, in wonderfully modern language, that it wounds and pricks the souls which suffer pains, or rude, increases this; the guilty mind punishes itself. The Greeks, familiar as they were with the working of conscience the legislator, had no special word to describe it, although its emotional aspect is hinted at in aisēs. Now, the Stoics attributed "abundance of emotion" (ἀπειθεῖα) to their wise men; yet, though he would not entertain fear of disgrace (Diog. Laert. vii. 112, 116), he would feel aisēs. It was the legislating conscience, ἐνεργεία, that the Stoics emphasized; but, while Roman Stoicism came to express this by conscientia, among the Greeks it had no generally recognized name. 12. Obligation to external, and to internal, law. In early times obligations felt to an external moral law; it was only when the Republic was tottering to its fall, and the State religion ceased to hold the hearts and minds of men, that the inner voice of conscience was heard more clearly. We cannot trace the development of the idea so well as in the case of Greece, because, with the exception of Plutarch and Terence (who adapted or translated Greek originals), there is very little Latin literature of earlier date than the 1st cent. B.C. But it cannot be doubted that much of the change was due to the teaching of the Stoics, especially of Posidonius and Panætius, who exhorted men to follow the deity within them, i.e. the Divine reason, of which a portion has been given to each
CONSCIENCE (Jewish)

individual. The conception of this deity (Deus), this fragment of the Divine mind, this guide and protector, must have helped to develop the notion of conscience; indeed, Epictetus (fr. 97) speaks of God handing men over to be guarded by ‘their innate conscience.’ Cicero, in speaking of the same deity (Deus) (De Fin. ii. 44) says that he who takes an oath summons as witness God, ‘that is, his own mind’; and the same writer is the first to employ the noun conscientia (pro Rosco Am. 67).

The verb conscire occurs only once (Hor. Ep. i. i. 61), and is there used (with a negative) of a clear conscience. Conscius is often used without any moral meaning, but once in Plautus (Most. 544) animus conscius has the sense of a guilty conscience; this phrase and sentence was probably found with the same meaning in later writers (Lucret. iii. 1018, iv. 1105; Ovid, Fasti, i. 485; Sallust, Cat. 14). Ovid (Fasti, iv. 311) uses conscire morte recti of a clear conscience that laughs at slander; but in Virgil (Aen. i. 604), miser sibi conscia recti probably refers to conscience the guide, which leads men to differentiate between right and wrong.

In the sense of ‘consciousness,’ conscientia is rare, but it is exceedingly common in most writers after Cicero with the meaning ‘conscience.’ The first time it occurs it is joined to animi (Cic. pro Rosco Am. 67), ‘conscientiae animi terrent’—the words are associated with the interpretation of the Pythagoreans, and, as Mulder remarks (De conscientia notione, p. 97 f.), the expressions animi conscientia, mentis conscientia (the latter in Cic. pro Cluent. 159) are intermediate between the vague pectus, animus, me, and the improved conscience, with its full moral meaning on the other.

From Cicero onwards the idea of conscience grows more distinct and more full of meaning. It is regarded as Divine (Cic. Paradox. iv. 29); it accuses and judges (Livy vi. 32; Tac. Hist. iv. 72; Sen. de B. vi. 42); it is a witness (Sen. Ep. 43; Quint. Inst. Or. v. vi. 41; Juvi. xiii. 198).

Bona conscientia, malis conscientia, ‘clear conscience,’ ‘guilty conscience,’ are terms which do not appear to be used by Cicero, but are common enough in Seneca and other later writers. But conscientia (with a genitive case added) not infrequently occurs in Cicero with the meaning of ‘a clear conscience,’ which he calls ‘fruit’ (Phil. ii. 10); on the one hand, and plans a conscientia (with its full moral meaning) on the other.

3. Conscience the lawgiver valued as a guide.—

The Stoic teaching, consisting as it did upon obedience to the Divine reason in the heart, led men not merely to fear conscience, but to value it highly as a director of life. Cicero recognizes conscience as a lawgiver (ad Att. xiii. 20), and so does the younger Pliny (Ep. i. 22), while the idea is especially common in Seneca. Conscience, from Cicero onwards, is considered a better guide than public opinion (Cic. de Fin. ii. 71, ad Att. xii. 28; Livy, xxxiii. 29; Pliny, Ep. i. 8, iii. 29; Sen. de B. vi. 42), though it is difficult to decide whether these are the cases of the judging conscience or of the legislating conscience; indeed, it is impossible to keep these quite distinct, as a judgment on a past act is, of course, a guide to future conduct.

4. Conscience, then, was always accorded a high place, but it took the form of a strong feeling of obligation to a transcendent law that was sanctioned by tradition, religion, and the State. As the influence of these grew weaker, men transferred their allegiance to their own hearts, and realized that they had within them an accuser, a judge, and a guide. The Stoic doctrine of a Divine reason immanent in each individual was a most powerful aid to a clearer conception of conscience; the writings of Cicero and Seneca, who were both imbued with Stoicism, afford the best evidence of the way in which the notion of conscience developed.

The ethical terms used by the early Greeks emphasized chiefly the emotional side of conscience; these used by Plato, Aristotle, and the Stoics were to develop into a moral obligation. Among both peoples the development of the idea of conscience was due to the decay of the State religion and of the State discipline, and the consequent turning of men’s thoughts inward. But, whereas the Stoics made little use of the popular term τὸ ἐνεργόν, and devoted their energies to improving the moral ideal according to which conscience judges, the Roman Stoics appear to have adopted the term conscientia, as a moral concept, far more than its Greek equivalent. The Greek word nearly always stands for a guilty conscience; the Latin word, although very often associated with guilt, not infrequently denotes moral self-satisfaction or the inner promptings of conscience the lawgiver. Neither word is associated with the State religion; but, while philosophic religion neglected τὸ ἐνεργόν, conscientia was naturally used as an equivalent of the Stoic ‘guardian,’ the fragment of Divine reason immanent in the heart of each individual. Hence Christianity found in conscientia a term whose fuller meaning it could develop by its doctrine of the Holy Spirit accusing, exhorting, and reminding. The Stoic idea, it should be noticed that the ancients made no attempt to analyze psychologically the conception of conscience, which remained to the last popular rather than philosophic, in spite of its adoption by Roman Stoicism.

W. H. S. JONES.

CONSCIENCE (Jewish).—Conscience is an essential element in the system of Jewish ethics. It is the motive power and the guide of the moral rectitude of man; it is the judge, and at the same time the highest standard by which his actions in his relation to God and to his neighbours are measured. Conscientiousness in the fulfilment of duties is a moral heightening of the principle of duty, and is the necessary preparation for the virtues of mercy and love. The principle of righteousness which underlies conscience may be of a purely legal and ceremonial character, whereas conscience goes beyond simple legal forms, and springs from higher motives than those of obedience to the law and the performance of ceremonies. The motive force is a truer conception of the relation between man and God, and the acknowledgment of the principle that human perfection can be attained only by imitating, as far as human power allows, the ways of God. The ‘hallowing of life’ is the real object of all the laws, and still more so of the moral injunctions and acts of conscience which supplement them. The motive of life in achieving the purpose of making the Jewish nation ‘a kingdom of priests and an holy nation’ (Ex 19). More than once is the sanctification of life enunciated in the Pentateuch, and the reason given is ‘because the Lord thy God is the holy one’ (Lev 19). The life is the ultimate explanation and the laws of cause which man, who had been formed
in the image of God,' to reach a higher standard, and place him almost on a par with the angels (Ps 8). As explained by the Rabbis, the various instances recorded in the Bible of God's direct communion with the Patriarchs were intended to teach their descendants how to act. 'Just as God clothes the naked (Adam and Eve), so should man clothe the naked; just as God visits the sick (Abraham), so should man visit the sick; just as God buries the dead (Moses), so must man bury the dead; just as God comforts the mourners, so must man comfort the mourner' (Gen 21:33). In fact, all acts of charity and benevolence, all those duties which a man is bound to perform, not in virtue of a direct command or a legal prescription, but prompted by his 'heart,' are to conform to the Divine standard and promote the sanctification of God's name. And all the blessings that follow from it—peace, happiness, charity, goodwill, love—make man approach the Divine. The seat of this higher conception of the body of Sirach and the Wisdom of Solomon is summed up in the 'heart,' which stands in Hebrew for mind, sentiment, feeling, conscience.1 Hence 'a pure heart,' 'a clean heart,' as mentioned by the Psalmist, means a clean conscience, a noble conception of duty realised without any other motive than the desire of self-sanctification.

In Jewish teaching, however, the legal and the purely ethical have never been really separated, but have existed side by side. For, as remarked above, the justification and explanation of the former were sought in the latter, and both were to lead to the sanctification of life. Thus we read: 'And the heart of David the king of Israel established the Torah and the law. All these ethical principles are summed up in a masterly manner, and show us the workings of that spirit of holiness in the practical walks of life. The other books of the Prophets teem with denunciations against 'harshness of heart,' harsh treatment of widows, orphans, and slaves, and dishonest dealings with one's neighbour. Moral perfection is thus defined by the prophet Micah (6): 'He hath showed thee, O man, what is good; and what doth the Lord require of thee but to do justice, and to love mercy, and to walk humbly with thy God?' 'To do justly' was the particular realm of the mind, the work of conscience for God's sake, the work associated with 'the heart.' (cf. Concordance, s.v. 'Heart'); and the expression 'with all thy heart' (with the whole heart, etc.).

These ethical principles and guides of life, in addition to the legal prescriptions, found terse expression in proverbs and maxims, saws of wise men, and teachings left by venerated persons—a kind of moral compendia like the Books of Proverbs and Ecclesiastes. The authors of some of the apocryphal books followed these examples, and the Books of Sirach and the Wisdom of Solomon, as well as Fourth Maccabees, are nothing other than such moral compendia. Direct reference to conscience we find in Sir 43 and Wis 17(18), which are in the spirit of Jewish ethical teaching. A special place in Jewish literature of this period is also occupied by the works of one Hillel, the great teacher, who lived in the time of the Second Temple, and whose teachings had a vast influence on the rabbinical schools. He taught that 'the way of a man with all his heart, with all his soul, and with all his might.'

Rabban Gamaliel, the son of R. Judah the Prince, said: 'An excellent thing is the study of the Torah combined with moral discipline (derakh eretz), for the practice of both cannot be out of remembrance' (Bi. 25). 'Billed said: "Judge not thy neighbour until he come into thy place"' (Bi. 5). According to R. Eleazar, the good way to which a man should cleave is 'the possession of a good heart,' and the evil to be shunned, 'a wicked heart' (G. 12, 13), where 'heart' no doubt is to be taken in the Biblical sense. R. Eleazar says: 'Let the honour of thy friend be dear unto thee as thine own' (G. 14). R. Jose said: 'Let the property of thy friend be dear unto thee as thine own.' Among those who have no share in the world to come, R. Eleazar the Middateh places the man who puts his fellow-man to shame in the world to come. If he is a moral and not the self-righteous, then he is shunned, and if committed it is to be expelled by 'repentance and good deeds,' as is often repeated here (v. 15). In the Yerushalmi, 'Just of the Jewish Fathers,' (Cambridge, 1807, ad loc.)

Round this collection of maxims grew up a whole cycle of similar teachings, acclamations, and additions from other sources, and examples drawn from the lives of the rabbis. The moral guides, independent of the codes of laws which regulated the strictly formal mode of life. It would be out of place here to discuss the whole range of ethical teaching; hence we must limit ourselves to those passages that refer to 'conscience,' uprightness, moral responsibility, in the daily relations between man and man—references found scattered throughout the literature, however, is imperative for the historical sequence of such teachings, and in view of the fact that ethics had not been reduced to a system, or split up into different parts, the same value of one principle as opposed to another. All stand on the same footing, and demand the same attention. There is no room for eclecticism in these collections. The oldest example is perhaps the author of the Testament of Tobit, which was written in the 2nd century B.C., and which had done in his lifetime, the moral duty of burying the dead—one of those pious duties and works of charity which the law does not prescribe, and neglect of which is not punishable by its letter, but whose fulfillment was held to be incumbent on every pious Jew. More important is the reference (To 14°) to the History of Achiacharh (Ahi'kär), since recovered and restored to its place at the end of the Book of Tobit. This is a collection of wise maxims, which are treated in a higher moral sense, and moral actions, though in the versions preserved it is more in the nature of worldly practical wisdom of not too elevated a type. It interest lies also in another direction; the form of address is 'O my son,' and, as distinguished from the earlier collections, it mentions and venerated the famous collection of the 'Fathers of the Synagogue,' called 'The Chapters' (Pirke Aboth) after they had been grouped together in chapters. They can only be properly understood as such testamentary injunctions, the last wills of the leading men of the Great Synagogue and their successors in the high position of spiritual guides and leaders of the people during the period of the Second Temple. The rabbis grouped them logically, and these chains of ethical maxims served the purpose of being a chain of tradition. In reality they are the principal ethical teachings representing the ethical wills of those sages, and as such values them naturally into their place, whilst the hitherto they had been a riddle. A few examples may suffice:

1. Rabban Gamaliel, the son of R. Judah the Prince, said: 'An excellent thing is the study of the Torah combined with moral discipline (derakh eretz), for the practice of both cannot be out of remembrance' (Bi. 25).

2. "Billed said: "Judge not thy neighbour until he come into thy place." (Bi. 5). According to R. Eleazar, the good way to which a man should cleave is 'the possession of a good heart,' and the evil to be shunned, 'a wicked heart' (G. 12, 13), where 'heart' no doubt is to be taken in the Biblical sense.

3. R. Eleazar says: 'Let the honour of thy friend be dear unto thee as thine own' (G. 14).

4. R. Jose said: 'Let the property of thy friend be dear unto thee as thine own.' Among those who have no share in the world to come, R. Eleazar the Middateh places the man who puts his fellow-man to shame in the world to come. If he is a moral and not the self-righteous, then he is shunned, and if committed it is to be expelled by 'repentance and good deeds,' as is often repeated here (v. 15). In the Yerushalmi, 'Just of the Jewish Fathers,' (Cambridge, 1807, ad loc.)

Round this collection of maxims grew up a whole cycle of similar teachings, acclamations, and additions from other sources, and examples drawn from the lives of the rabbis. The moral guides, independent of the codes of laws which regulated the strictly formal mode of life. It would be out of place here to discuss the whole range of ethical teaching; hence we must limit ourselves to those
CONSCIENCE (Jewish)

Judah the Prince (*Me'asseh R. Yehudah ha-Nasi*), and later on developed into the chapters of R. Judah the Prince (*Pirke de Rebbeinu ha-Raذا*). Another is 'The Will of Eliezer the Great,' or 'The Ways of the Pious' (*Semachat R. Eliezer ha-

This page contains text discussing the Talmudic concept of conscience and its role in moral decision-making, emphasizing the importance of religious principles and the idea of 'discretion of the heart.' It refers to the 'principle of ethics' and the 'discipline of the heart' as fundamental in ethical teaching. It mentions the sanctification of life, the role of conscience in ethical decisions, and the importance of religious principles over legal obligations. The page also discusses the multiplication of examples and maxims, highlighting the power of a pure heart and conscience in guiding and informing moral actions. It concludes with the idea that, while the law is strict and necessary, the heart and conscience are more lenient and forgiving. The text underscores the interrelation between law, conscience, and the heart in shaping ethical behavior.

The page also touches upon the concept of 'conscience' and its role in determining the correct course of action, emphasizing that 'conscience is the ultimate guide,' and that it must be 'elevating' and 'enlarged' to be effective. It discusses the importance of conscience in the face of temptation, highlighting that a pure heart can withstand any test with integrity. The page concludes with a reflection on the role of conscience in shaping the moral character of a person, and the importance of maintaining a strong and steadfast conscience in guiding one's actions.
of Greek, and directly of Arabic, philosophic speculations, the Jews began to develop systems of religious philosophy in which special attention was often paid to the ethical side of the Jewish faith. Whilst, in the older period of Hellenism, Jewish thought was in the category both of natural, and of the Stoics, as Philo and the author of the pseudo-Josephus 'On the Rule of the Intellect,' and were more or less guided by allegorical interpretations of the Bible, the philosophers of later times were mostly under the influence of Aristotle and his Arabic commentators, such as al-Farabi (†1058), Ibn Siná (Avicenna, †1038), Ghazálí (†1111), and Ibn Rushd (Averroës, †1198), while the purely theological deductions from the adherences of the Kalám (the Mutakallimun) also found followers among the Jews.

Before referring to the Jewish philosophers, it is of interest to mention a fact hitherto entirely ignored in connexion with the dissemination of their moral teachings. Such collections of maxims as are mentioned above were also put into verse, and formed terse epigrams or long didactic poems—a form better adapted to render them popular, for it was not caring for their concrete or theoretical investigations, and still less for philosophical justifications of moral conduct. Fragments of the ancient saws of Ben Sira were then collected, and other collections of a similar nature were made. It is in the Compendium of Wisdom about that period (9th-10th cent.) the Book of Sirach was re-translated into Hebrew, as the language of the newly discovered version testifies. It is the period of 'Achicharun' in its modern recession (Lukcarun), containing less a personal than the last of the great Genónim of Babyl., Hai (940-1039), wrote his rhymed didactic poem Músaar Hasqué—also a kind of moral vade-mécum adapted to the understanding of the people, and probably taught in the schools and otherwise learnt by heart. It agrees also with the 'will' of Elccazar, Achicharun, etc. A few examples must suffice.

My son, my first word is: Fear the Lord; and with each of thy deeds give praise unto Him' (Pr. 1: 7). 'Forbid the sin and transgression of thy neighbour, and be ready to accept repentance and regret.' 'Be not treacherous or seek strife, and foster not rebellion' (v. 79 ff.). 'When thou hearest the defamation of thy neighbour, cover it up and pretend not to have heard it' (vv. 58-60). ‘Wisdom is to walk in the path of justice and the fear of the Lord; knowledge of understanding (character) is to avoid evil.' 'Be an honest judge among thy people, and fear not their riches or their poverty; have pity on the poor and miserable, and appoint an adviser and admonisher to thy soul' (vv. 53 ff.). 'Let thy heart be not rebellious against the Lord; do not despise thy neighbour, Come to morrow, when thou canst give to-day; give and do not tarry.' 'Judge thyself as thou wouldst judge others' (v. 79).

His contemporary Samuel Ha-Nagid imitated Hai in Spain, in his Ben Kokeleth ('Son of Ecclesiastes'). On other didactic poems we need not dwell.

To return to the Jewish philosophers, we note that, though they were all bent on finding in Judaism the highest expression of Divine truth, and aimed at leading to the highest good, yet they differed in their definition of the summum bonum and in the means of attaining it. To cultivate all the virtues was the road which led to the knowledge of God, and in this knowledge was to be found the ultimate goal of human perfection, i.e. nearness to God. Hence sometimes the intellect and wisdom are used as synonymous, or from one another. This is not the place to discuss the various systems of ethics evolved by these Jewish philosophers. It may suffice to point out that every system of thought among Arabs and medievally the Spaniards is found among the Jews. Of those thinkers some—like Saadya, Gabirol, Ibn Zaddik, and Maimonides—are more rationalistic, assigning to the knowledge of God and to Wisdom the highest potentiality for good, and considering that the highest aim is to be attained by moderation, by the rule of the intellect over the actions and thoughts of man, while others incline more to the mystical side. To the latter class belonged the man who wrote a special work on the 'Duties of the Heart' (such is the title of the book, Hóboth hó-Lebabóth). He recognizes human conscience as the last arbiter, and the true inward prompter and guide in all moral actions which lie outside the specifically legal injunctions. He lays special stress on the elevating and purifying influence of moral consciousness, and therefore leads up to a kind of religious asceticism. Quietism, by recommending retirement from life, celibacy, meekness, self-denial, means for attaining perfection. Without being morbid, he exhibits a high moral sensiveness, and has had a lasting influence upon succeeding generations. One can trace his influence especially in a whole series of subsequent writings.

These philosophical writings, being almost all composed in Arabic, had to be first translated into Hebrew, and only then could they gain a wider circulation. So were they brought to France and Central Europe, through the medium of the Hebrew anonymous translation which was used by Berechjah ha-Nakdan (second half of 12th cent.) in his two ethical compilations—the Guide of the Pious (Teherut, 1130) and the Maparé, ed. H. Gollanze, London, 1902. He eliminated the entire speculative part, and retained only the ethical, which he augmented with excerpts from the writings of Ibn Gabírol, Bejáy, and Nissim.

Of sin and repentance he says: 'From the passage Hos 14: 10.' 'Return, for thou hast stumbled,' we learn that she should have an inwardly lesson at our guilt, and,' 'therefore, that the sins have proved unto us a wretched stumbling-block' (p. 71, ed. Gollanze). He speaks most emphatically of the 'duties of the heart.' All acts rest upon the heart's intention and upon the secret thoughts; their study must necessarily precede the study of the physical, practical performance of the commandments. And he goes on to relate the following: 'A pious man once said to his disciples, 'If you had no sins whatever, I should be afraid lest you had something worse than sin.' And they asked, 'What can be worse than sin?' He answered: 'Insolent pride, for it is written, Every one that is proud in heart is an abomination unto the Lord.' (Pr. 16: 19). Very beautiful is the chapter 'The Man Devoted to the 'Duties of the Heart' (Ch. iii. in the Guide of the Pious). The author has skillfully collected verses of the Bible, teachings of the Sages, and philosophical speculations, to show that Reason, Law, and Tradition are the three kinds of righteousness. He introduces his actions by which human perfection can be attained, and that man must be guided by an enlightened understanding and a pure heart, i.e. by pure conscience.

Of the same way of thinking as Bejáy was Abraha b. Hiyyah (middle of 12th cent.), although he was more emphatic about fasting and repentance to assure the pangs of stricken conscience, and to serve as the means of avoiding sin. Like Bejáy, he shows points of contact with the teaching of Gažálí and of the Sifít (the pure brethren). Of the Intellectuals, or, better, of those who derive all the moral virtues—charity, piety, energy, loving-kindness, love of God, moral rectitude, etc. —from the knowledge of God, and seek the road to that knowledge in the 'middle way,' the most prominent is Maimonides. He formulates his views in his commentary on the 'Chapters of the Fathers,' in the chapters on the 'Knowledge of God.' in his great Compendium of the Law, in his 'Guide of the Perplexed,' and in other writings. The problem of distinguishing between those that time, and, one may add, the philosophers of religion at all times, was that of human free will, with the concomitant problem of reward and punishment, of virtue and vice, of human perfection and degeneration among the Jews. Man's soul is the seat of know-
CONSCIENCE (Jewish)

45

ledge, and from it alone emanates the impulse to action or inaction (Introd. to Aboth, ch. viii.). It is his moral conscience which causes reward or punishment for deeds which are neither commanded by the Divine will, nor forbidden by it (Guide, i, 17, fifth section; Maimonides). 

It is derived from the root 'itik," which means 'to teach.' Thus the Divine sainthood inculcates teaching and denoting the meaning of the Heb. words 'itik ("loving-kindness"), mishpat ("judgment"), and 'itikah ("righteousness"), and says of the last:

"The term 'itikah is derived from 'itik, the root of righteousness. It denotes the act of giving every one his due, and of showing kindness to those who are deserving of it as it deserves. In Scripture, however, the expression is used in the first sense, and does not apply to the payment of what one owes to others. When we are not paid for the hired labour we have rendered, or pay a debt, we do not perform an act of 'itikah. But we do perform an act of 'itikah when we fulfill those duties towards others which we have undertaken, and below to read them in the original language. These books show the manner par excellence of Jewish women; they were translated into the Jewish-German and Jewish-Spanish languages, and parts also into Arabic and Persian, thus becoming real household treasures."

Shabbethai Bass gives his list of over 120 such books in his bibliography (SifteYehoshbm, printed in the year 1680, fol. 150), exclusive of the numerous commentaries on the "Chapters of the Fathers." A few of the more prominent may be mentioned, for example, regarding the conscience, and direct quotations from the older literature, the authors have added some more instructions—personal expressions of their own conceptions of the duty and moral obligation incumbent on every Jew. Here, of course, the notions of the fear of God and the love of God prevail, for everything must be done out of that love and for the sake of hailing His name by moral actions, and thereby sanctifying human life.

Maimonides, in 1267, writes to his son Aaron a moral epistle, in which he exhorts, among other things, that he be modest and humble, and when thou speakest, let not thy tongue be lifted on high (nurum corda), and speak quietly, and consider every man whom thou addressest as being greater than thou art. If he be poor and downcast, be the more scholar than he is, then think that thou art more full of guilt; if he be simple and ignorant, be more patient, unselfishly, and not deliberately. In all thy deeds and thoughts remember Him of whom it is said that His glory filleth the world.

Johann of Gerona (1203), known as the Habad and Kaddish, i.e., Martyr, wrote, in the strain of 'itikah, his famous Shabareh Teshubah, "Gates of Repentance," and Sider ha-Yirah, "Book of the Fear of God," where the feeling of consciousness of the gravity of sin and the duty of repentance are expanded in a masterly manner. He says: "There are people who believe that, if you do not transgress any of the written laws, you cannot commit sin, for it is connected with active work. And yet there is no greater loss for the soul than to imagine that sin consists only in having gone against the laws of active sin; and not also in the neglect of the performance of deeds of charity and of good works. For the highest perfections can be achieved only by effecting an inward change. Thus when one is round the legal commandments, but ethical demands, such as the exercise of free will, love of God, and contemplation of His loving-kindness, the recognition of God's ways in His visitation and, above all, in the sanctification of His name by worship, fear, and cleaving unto Him (Deut. ii. 14, 17). "Do not pretend that thou art able to help God or dead, for, if thou refuseth, thy strength will wane" (ch. 76). "Thou shalt not take a bribe", and "Thou shalt not allow thy judgment to be influenced by flattery," for the purity of conscience will thereby be corrupted."

Almost contemporaneous with these were Yehudah the Flota in Germany (125th cent.), and his pupil Eleazar of Worms (1258), and Yehiel b. Yehuda of Troja (1263) in Germany, and Yehiel of Coucy in France (1253-45), who wrote ethical treatises and guides for a moral life. Some "Book of the Flota," "Sifer Hassidim" (Yehudah); the "Perfection of Human Conscience," Mo'dah

3. Conscience as a guide to the individual.—So far as the conscience is identical with the moral sense, or instinctive notions of right and wrong, the Prophet's system took little account of it; indeed, its tendency was to make the Prophet's revelations and practice the sole source whence knowledge of right and wrong could be obtained. His followers constantly handed their consciences over to his keeping, being unwilling to set their own opinion against his. The fact that he claimed obedience only in *licita et honesta* shows that he did not really claim the infallibility which logic conveyed to his followers to decode to him. That logic was, however, irresistible; for, if the right of private judgment were once allowed, clearly people could not be compelled to accept Islam at all. Although, then, there are occasional attempts at a reference of ethics to reason or the natural sense of right, these are not really in accordance with the spirit of the religion. The reference is regularly to the Qur'an, the practice of the Prophet, and the sayings of his followers: 'Thou art better to yourself, but me, O Moses right,' is a common saying. The scope allowed to the conscience in private affairs by Muslim writers is similar to that indicated by the maxim *nolite esse oblivige*. So the formula, 'I appeal from you to yourself, O better self,' i.e. occasionally heard.\(^1\) Hence the word *obviis*, 'refusing,' is often applied by poets to a soul which declines of itself to enter humiliating courses.

4. The public conscience.—In Oriental despotism the sovereign does not act as a rule, any much regard to public opinion, and it might be hard to find any case in Muslim history in which the conduct of the sovereign had been of itself actively resented; neither parricide nor fratricide, degradation, nor burning of a robber's body stirred up such indignation among the subjects as to cost a sovereign his throne. The assassination of the monster al-Hakim, the Fatimid Khalif (A.D. 1021), seems to have caused more indignation than the usual cases of murder. Cases are therefore of interest in which concessions are made by the sovereign to the public conscience, to the extent of saving it; for such concessions imply that the sovereign thought it worth saving.

A faction with which we must acquaint Egyptian history more than once is the discovery of buried treasure, enabling the sovereign to build a mosque—there being a doubt whether the Muslims would attend worship in a place which had built of ill-gotten gains. The murder of a brother was occasionally explained in an official document as an accidental death,\(^2\) etc.; but, on the other hand, clever usurpers not infrequently gathered followers by the stirring up of indignation against the monarch whom they wished to overthrow. The Unayyad and Abbasid dynasties both won their first triumphs in this way. It was at times thought worth while to murder a saintly man and make it appear that a sovereign had perpetrated the crime, with the view of getting him dethroned.\(^3\) Similarly, in our time there have been suspicions of atrocities being engineered in the Ottoman empire for the purpose of rousing the conscience of Europe. The best-informed political writers in the East insist on the maxim, 'the people follow the religion of their kings,' and the maxim, 'even in your conscience curse not the king' (Ec 10:8), represents the prevailing practice.

5. Noteworthy manifestations of the conscience.—Although the lives of the Muslim sovereigns, as told by their chroniclers, frequently, if not ordinarily, display absolute ruthlessness, yet in their relations with those persons who played the part of the Hebrew prophets, conscientiousness seems to have been the rule rather than the exception. Cases in which the sovereign, however tyrannical, permitted himself to be rebuked by a saint, and even followed the saint's advice, are quite common.\(^4\) A saint might even denounce the doings of a Khalif from the pulpit.\(^5\) The following anecdote of the Imam Musa al-Sadr, the maxim Nasir ed-Din Stolnicov's judgment on conscientiousness of an Oriental despot. A traditionalist was summoned to repeat edifying matter before the Sultan. The man commenced his discourse before he had pensively asked, and a slave was told to box his ears. The Sultan overwhelmed the preacher permanently deaf. The Sultan was deeply distressed at this result, and offered abundant gifts in compensation; the traditionalist declined them all, saying that nothing but what had been taken from him, the power of hearing. Requests from the Sultan for pardon were met merely with a reference to the final judgment. To this stubborn reply the Sultan answered with an embrace.\(^6\)

There is a considerable literature on the desirability of cleansing the 'inner man,' of which Ghazâlî's 'Scrutiny of the Hearts' may be mentioned as an example.

**Literature.**—This is given in the article.  

**CONSCIENTIOUSNESS.**—Conscientiousness (from 'conscience' [q.v.]) may be described as an attitude within the moral life, a source of virtue, rather than one of the virtues, with its intellectual reference, and integrity, with its emotional reference, are involved, imparting direction to conduct, and tending strongly to the adaptation of habit on the basis of new values.

Developed mainly by the subjective, or in some groups of elements which interact with each other. These are the objective and the subjective, often termed the universal (or social) and the individual (or personal). The former consists of customs and usages, of conventions and laws, of natural, historic, and legal codes, of social and political institutions. All, in turn, are integral to a cultural organization such as a race, a people, or even an epoch. The latter, though inseparable from the former, consists of the peculiar contribution resultant upon the reaction of individuals to the norms of the social unity. So long as this response remains unconscious or unreflective, personal character misses complete distinctiveness, and tends to keep the level of the unconscious. But when, thanks to a subtle admixture of intellect and emotion, men place themselves in a reflective attitude towards the norms of the communal spirit, conscientiousness supervenes, and obligation acquires an enhanced, because positively recognized, influence upon character.  

\(^1\) Conscientiousness, then, is reflective intelligence grown into character. It involves greater and wider recognition of obligation in general, and a larger and more stable emotional response to everything that presents itself as duty; as well as the habit of deliberate consideration of the moral situation and of the acts demanded by it (J. Dewey, *Outlines of a Critical Theory of Ethics*, 1881, p. 290).

In a word, conscientiousness is marked by the following characteristics:

1 E.g. Tabari, iii. 608.  
2 J.R.A.S., 1907, p. 299.  
3 Yaqût, *Dict. of Learned Men*, v.  
presence of a reaiford requirement of conscious, and by the effort to met it. Yet, even so, the condition of moral anxiety, accompanied by habitual introspection, can hardly be accepted as an equable acception of the matter. This view savours too much of temperament, i.e., of moods, associated, say, with such supersitious entities as the 'Con-
nonformist conscience,' the 'New England conscience,' or the like. Possibly the Puritan strain led Emerson to formulate his famous reflective analysis:

'There remain the cases (1) of reflection on past actions of our own, (2) of consideration whether an act should be presently done, and (3) of reflection on ourselves to see whether we do it. In both these cases, the question of the character or state of will which an action represents may be raised with a possibility of being answered. (a) The idea of a rational and moral man may ask himself: Was I, in doing so and so, acting as a good man should, with a pure heart, with a will set on the objects on which it should be set?—or again, Shall I, in doing so and so, be acting as a good man should, goodness being understood in the same sense? . . . The habit of raising such questions about himself as those just indicated, is what we have mainly in view when we speak of 'conscience.' (Fred. to Elt Holocaust, 1836, p. 328.)

But conscientiousness is not to be identified with conscience 'in its extreme form of self-reflextive
ness,' which 'investigates with the searching power of an expert, in order to discover the slightest de
dected fault of its conduct, and to make it good.' It is because of its personal or individual character that it is able to put forward a claim to independence of the State or of any social order' (S. Alexander, Moral Order and Progress, 1889, p. 157 E.). Accordingly, one state transcendental aspect of con-
sciousness readily, and thus minimize the objective reference. If it be reduced to a mere analysis
of internal moods, it may very well indicate weakness rather than strength of character.

The simply ethical temper is related to monastic productiveness as more good taste is to creativeness in poetry and art. With so circumstantial a step it makes no way; and, though it may stand out with their more distinguished, it acquires the habit of fear instead of love—say, above all things, its refusal to be the victim of ignorance, whose shape themselves into negatives, and guard every avenue with the flaming sword of prohibition, "Thou shalt not." In apprehension of possible evil, it dares not surrender itself to any admiration and bring itself to unauthorized action for any haunting end; the admiration must first be scrutinized, till it has cooled and its force is gone; the end in view is traced through a thicket of comparisons, till it is lost in the wood. Nothing, accordingly, is more rare than be character with balanced and powerful, judicial and enthusiastic; and, faultless perception is apt to involve false inspiration "(James Martineau, "Types of Ethics," 1893, ii. 50).

Thus the division of opinion regarding conscien-
tiousness has its roots in the two groups of elements inseparable from morality. If the objective factor have, as is the case with all moral demands, or insight into their nature, is viewed as the dominant feature. If, on the other hand, emphasis be laid on the subjective factor, self-examination, with anxiety about personal moods and feelings, assumes primary importance.

In the Greek world, where our sense of conscien-
tiousness had not developed, but where 'wisdom' (σοφία, σοφεία, not yet σοφιστής) played a parallel role, the community-aggregate of predispositions and tendencies in the realms of values (cf. Plato and the Other Companions of Sophocles, 1865, i. 249) furnished plentiful material which was regarded as neither good nor bad. The 'wise man' was likened to an artist, who shaped this raw stuff in the semblance of a model of a noble and desirable type. For example, Aristotle presents us with the general type of the subtle and shifting problem, the solution of which must be worked out a fresh individual in each particular case. Conduct is good for him is a free and living creature, and not a machine controlled by the cold faculty of reason. In a life is a work of art shaped by the man who lives it (O. L. Dickinson, The Greek View of Life, 1907, p. 157).

Accordingly, paradox though it may seem, virtue was knowledge, in the sense that the superior, and therefore thoughtful, citizen superimposed a con-

scious (reflective) attitude upon the traditional custom of the συνείδησις. In this way the 'higher law' of wisdom was made manifest. But, leaving the imperfect Socrates out of account (cf. Cynics, Casuistry, it bore rather upon group-norms than upon the independent 'conscientious' judgment of the individual. The internal thrust of the prin-

ciple had to wait Stoicism and the Christian con-
sciences.

Nevertheless, the classical moralists of Greece did originate the idea of inward principle, of indi-

vidual resition upon the cultural situation, with the result that, consequent upon profound civil vicissitudes, the Stoic conception of 'conscience,' based on the independence of the 'wise man,' grew up and acquired fixity. In this way, dynamic pro-

gress in morality, as contrasted with static custom, was cultivated and foreseen, without pathological accompaniments, because the restraints of the old society weakened. Despite this, two heritages had been prepared for the Christian consciousness: the conception of inner principle, mediated indi-

dually; and the doctrine that, in the sphere of morality at least, whatever might be said of reli-

gion, this inward principle must be adjudged by the mind. Thus the contrast between the two ele-
ments—the objective or social and the subjective or individual—contrasted, the faculty of con-

sciousness witnessed, if not a struggle, then a lack of balance, between them. At one time, as in the medieval view of 'prudence,' the objective tended to assert itself; at another, as in the Renaissance, the subjective excised prenun. In a word, men con-

structed their description of the source of virtue on the basis of current relative evaluation of the virtues.

The very fact, then, that the Christian conscious-

ness has substituted 'conscientiousness' for the 'wisdom' of the Greeks—and this finally—suffices to show that the internal and individual had won full recognition. The conscientious man must use discernment, according to the inward principle, with reference to the norms of social custom. Moral progress and initiative pivot upon this. On the other hand, this initiative is concerned about these same customs—to discover how they may be pre-

served lively. And yet, of necessity, this process means that, because they are subjects of concern and of consequent new estimate, they must alter.

Conscientiousness, then, may be described as genuine concern, mediated intelligently, for all such values as this cannot be accepted and disapproved; and these attitudes are traceable in part to emotional convictions about an inward ideal. So far as the conscientious man has made this ideal his own, being able to say, 'This one thing I do,' it has become 'the way and the truth' for him. Accordingly, in the issue, conscientious-

ness turns out to be an energetic pursuit of an individual-social ideal—an ideal that appeals to emo-

tion; mainly through objective associations, and to intellect mainly through intelligent per-

sonal reactions to these associations. The con-

scientious man is at once responsive to social achievements and ends, and considerate of the one principle with whose ends are associated or do place in a harmonious whole. He feels that his own goodness is bound up with that of others, hence personal assertion of the norm as he envisions it; he knows that his own progress must depend ultimately upon that of the inward principle. Thus reflective insight, on the basis of affective conviction, grasping and transforming group-norms, constitutes the moral attitude known as conscientiousness. For this reason, while the latter is held to be the source and guardian of virtue. It serves itself the central factor to be reckoned with in an active moral con-

sciences.

But, further, this implies that conscientiousness
CONSCIOUSNESS

is characterized by disinterestedness. Otherwise, it would not include a concrete estimate of the entire import of an action. Self-assertion here becomes a species of self-foreignness. For by this quality the self-reference of consciousness is more or less whole. So, if this quality be emphasized, consciousness may find a place in the list of virtues. It would then stand as the chief of the cardinal virtues, thus becoming more or less identical with 
what modern philosophers have termed and at the 'good will.' This implies that it is the guarantee, not of mental acumen or of aesthetic taste, but of goodness realizing itself throughout the entire circle of a life which, in turn, draws sustenance of the norms of the community. In these norms the conscientious man discovers new stimuli to the inner principle. But the necessity for reflexion rules out suppositions automatic deliverances of an equally suppositions 'internal tribunal'—'conscience.' Briefly, vital interest in the good, as the principle reveals it, at once sets problems, and points the conditions of their solution. Fusion of sober judgment with earnest aspiration, and fusion of restraint, mediated socially, with fervent desire, by passing over in all, constitute the modern counterpart of the Greek 'wisdom.' And this species of ethical apprehension which imports our experience into a moral order, and also perceives that it is originated from a moral order, is true consciousness. It is the re-constituting and accomplishment of any end which moral beings can adopt for the completion of their well-being. Hence its inevitable relation to questions which pass over into the field of religion.

CONSCIOUSNESS.—What is consciousness? From the dawn of modern philosophy the question has been discussed, and psychology and philosophy have endeavoured to find a reply. The answers given have been very various, but we may not summarize them in this article. To summarize those given from the time of Descartes onwards would be to write a history of modern philosophy, and at the same time present the question is more widely and more inclusively discussed than ever before. Some philosophers and psychologists almost insist on discarding the name altogether, while others make the role of the name a central part of their philosophy. For example, A. E. Taylor writes:

"This is perhaps the place to add the further remark that, if we entertain a naturalistic and logical terminological position, we ought to banish the very expression "consciousness" or "states of consciousness" from our language. What are really given in experience, and that form the basis of our consideration, are the character of the act of consciousness and the character of the act of consciousness and the character of the act of consciousness and the quality of the consciousness and the quality of the consciousness and the quality of the consciousness. We abstract this character and give it the name of 'consciousness,' and then fall into the blunder of calling the concrete processes "states" or "modifications" of this abstraction, just as in dealing with physical things we make abstraction of their numerous properties under the name of "matter," and then talk as if the things themselves were forms of matter. In properly speaking of conditions and things and there are minds, but there are such things in the actual world as "matter" and "consciousness," and we do well to avoid using words when we mean "metaphysics," (p. 79 l.). In the text, with all the emphasis of it, Taylor says: 'But we cannot too strongly insist on the fact that by 'self-consciousness' is meant a conscious state which is its own object, there is no such thing, and it is a psychological possibility that there should be such thing as self-consciousness. No cognitive state ever has itself for its own object. Every cognitive state has for its object something other than itself' (p. 79).

Taylor makes short work of consciousness; and if we took his view, the writing of an article on consciousness might be dispensed with. But, as we are hardly able to conceive what is meant by a cognitive state which has an object which is something other than itself, we may be permitted to go on. It is scarcely consistent with the ordinary use of language, and certainly quite inconsistent with the use of psychological language, to speak of a cognitive state in active relation with an object. For whom is the state, and who is aware of it? But this question may be better discussed at a later stage. Meanwhile it may be safely said that the word 'consciousness' denotes something of our mental life, and that it is not identical with any of the other aspects which we apply to particular mental processes or states. It is not feeling, nor is it willing, nor is it thinking; but these states or processes have this at least in common that they are conscious states. The contrast does not lie between feeling and consciousness, or between willing and consciousness, or between thinking and consciousness. The contrast lies between consciousness and unconsciousness. The characteristic of every mental state, or of every mental process, seems just to consist in the fact that they are states of a conscious subject, and that they are for that subject.

While this is a number of questions of interest and importance arise as to the relations of the subject to its states, as to the distinction, if there is a distinction, between the phrases 'states of consciousness' and 'conscious states.' Consciousness is to be identified with the sum of its states? Can we neglect the reference to a subject, and proceed to a study of ethical principles? The need for this is perhaps best illustrated by the following: A. J. Thomson, The Making Character, 1900, pp. iii.; W. Wundt, Ethics (Eng. tr.), 1901, vol. iii. p. 64; S. S. Logis., Ethica (Eng. tr.) 1901, pp. 60 l., 60l.; G. H. Palmer, The Field of Ethics, 1901, Lect. vi.; Alice Gardner, The Conflict of Duties, 1903, ch. iii. xi.; E. M. MacMacken in The American Life in the Christian Church and State, 1904, ch. viii., pp. 599 l.; A. H. Lloyd in J.U. viii. (1898) 310 l.; J. D. Robertson, The Elements of Ethics, 1898, (with Bk. iv.), 429 l.; J. Royse, The Philosophy of Loyalty, 1908, ch. iv.; T. von Haering, The Ethics of the Christian Life (Eng. tr.), 1909, pl. ii. ch. vi.

R. M. WENLEY.

For my part, when I enter most intensively into what I call myself, I always stumble on some particular perception or other, of heat or cold, light or shade, love or hatred, pain or pleasure. I never can catch myself at any time without a perception, and never can observe anything but the perception. This is very true of me. I can never observe or enter into a state of sleep, so long as I am insensible of myself, and may truly be said not to exist. And were all my perceptions always provoked by desire, and could I neither think, nor feel, nor see, nor love, nor hate, after the dissolution of my body, I should be entirely annihilated, nor do I conceive what is further requisite to make me a perfect non-entity. If any one, upon serious and unprejudiced reflection, thinks he has a different notion of myself, I must confess I can read out certain common characteristics of it, that I may be in the right as well as I, and that we are essentially different in this particular. He may, perhaps, per-
It is a curious passage, and the more we study it the more curious it appears. There is the suggestion of a theatre, so often made since by other psychologists, and no sooner is it made than it is withdrawn. Yet it has fulfilled its aim. It has directed attention to the theatre figure, and has so far served its purpose. But a theatre suggests a stage, and players, and spectators. These suggestions, however, are somewhat inconvenient, and raise awkward questions. So we are told that "the conception of the theatre is no mislead nor unsuccess. For it is the "successive perceptions that only constitute the mind." One is compelled to ask, What is a perception, and what is a succession? Above we were told that several perceptions succeed each other, and that their appearance, pass, re-pass, slide away, and mingle in an infinite variety of postures and situations. The perceptions make their appearance—to whom? Hume had formerly spoken of "what I call myself." So it is to what he calls himself that these perceptions appear, and all the passing, re-passing, and other movements are perceived by himself. And yet the mind that perceives, that looks on at the gliding show, is nothing but the bundle or collection of different perceptions. Is the mind aware that it is a bundle? Or that it is a collection? Whence came the bundle or collection? And how does it recognize itself to be a unity? In the passage before us, Hume seems to state his point without the implication, in every sentence, of what he formally denies. He is in the presence of a unique fact—the fact of a succession of perceptions which recognizes itself as a bundle or collection. How is it so? We are careful to state it in his own language, for that language implies the unity of the conscious subject to which all the gliding appearances are referred. It would appear that we are face to face with a unique kind of thing—a thing which seems at the same time to be known and known, actor and spectator, a show and the spectator for whom the show is. For all these passing, re-passing, and gliding appearances, so felicitously described by Hume, had an existence only for himself; and, while we are content with the result of these particular experiences were for him alone. And he was something more than the bundle of perceptions, he was the self for whom the perceptions were. We do not require here to discuss the relations between body and mind, or between brain and mind, or of physiology and psychology. Nor can we dwell on the attempts to deduce the unity of consciousness from the unity of the brain (see II. 17). The relations are parallel. Between the growth of mind and the growth of an organized nervous system. Physiology has often given useful hints to psychology. There are parallels between the evolution of the organism and the evolution of consciousness. But, while that is so, the fact of consciousness remains without parallel, and its nature must only be described and not explained. It is interesting, for example, to follow Herbert Spencer through his works setting forth the Synthesis of Philosophy, fundamental Principles, through Biology and Psychology to Sociology and Ethics. It is of special interest to mark the description of the origin and growth of these, and then to notice how psychology enters in. After he has described the development of the organism, he seeks to correlate the stages of evolution with a corresponding mental growth. How about consciousness? Whence did it come? In its highest development, nor does the mind at first notice of any place where these scenes are represented, or of the materials of which it is composed" (Hume's Works, ed. Green and Grose, Lond. 1896, i. 531 f.). Or again, a little further on: "What we call mind is nothing but a heap or bundle of different perceptions united together by certain relations, and supposed, though falsely, to be endowed with a certain simplicity and identity. It is a curious passage, and the more we study it the more curious it appears. There is the suggestion of a theatre, so often made since by other psychologists, and no sooner is it made than it is withdrawn. Yet it has fulfilled its aim. It has directed attention to the theatre figure, and has so far served its purpose. But a theatre suggests a stage, and players, and spectators. These suggestions, however, are somewhat inconvenient, and raise awkward questions. So we are told that "the conception of the theatre is no mislead nor unsuccess. For it is the "successive perceptions that only constitute the mind." One is compelled to ask, What is a perception, and what is a succession? Above we were told that several perceptions succeed each other, and that their appearance, pass, re-pass, slide away, and mingle in an infinite variety of postures and situations. The perceptions make their appearance—to whom? Hume had formerly spoken of "what I call myself." So it is to what he calls himself that these perceptions appear, and all the passing, re-passing, and other movements are perceived by himself. And yet the mind that perceives, that looks on at the gliding show, is nothing but the bundle or collection of different perceptions. Is the mind aware that it is a bundle? Or that it is a collection? Whence came the bundle or collection? And how does it recognize itself to be a unity? In the passage before us, Hume seems to state his point without the implication, in every sentence, of what he formally denies. He is in the presence of a unique fact—the fact of a succession of perceptions which recognizes itself as a bundle or collection. How is it so? We are careful to state it in his own language, for that language implies the unity of the conscious subject to which all the gliding appearances are referred. It would appear that we are face to face with a unique kind of thing—a thing which seems at the same time to be known and known, actor and spectator, a show and the spectator for whom the show is. For all these passing, re-passing, and gliding appearances, so felicitously described by Hume, had an existence only for himself; and, while we are content with the result of these particular experiences were for him alone. And he was something more than the bundle of perceptions, he was the self for whom the perceptions were. We do not require here to discuss the relations between body and mind, or between brain and mind, or of physiology and psychology. Nor can we dwell on the attempts to deduce the unity of consciousness from the unity of the brain (see II. 17). The relations are parallel. Between the growth of mind and the growth of an organized nervous system. Physiology has often given useful hints to psychology. There are parallels between the evolution of the organism and the
CONSCIOUSNESS

automatically proceeded until the stimuli have learned how to pass through a centre, and to pass in orderly procession all down the whole, consciousness is greatly needed in the system of Spencer. For 'all mental action whatever,' we are told a little further on, 'is definable as the continuous differentiation and integration of states of consciousness' (op. cit. ii. 201). The states of consciousness determined by the states of the organism? Are they part of the integration and differentiation of matter and motion? Or is there only a parallelism between the two? Is psychophysical paralleled the interaction of the whole and the parts of the organism? The consciousness simply an epiphenomenon, a mere accompaniment, or, in the metaphor of Huxley, is it simply the ticking of the clock which is mistaken for consciousness?

Leaving on one side the questions of the origin of consciousness as unanswerable, and the further questions of the relations of mind and body as too large for our proper theme, let us ask, What is really presupposed by consciousness, that subject where consciousness is manifested by consciousness? As we reflect on what happens when we attend to the processes of our inner life, we note three main characteristics: (1) There is the fact of change; without change, or without the entrance of the new fact into consciousness, there is no consciousness. Continued sameness would mean unconsciousness. (2) There is the preservation or reproduction of previously given elements, with some connexion between elements of the earlier and those of the present. (3) There is the inward unity of recognition. In the stream of the inner life there are always present those three factors. Thus synthesis is the fundamental fact of all consciousness. But the synthetic activity of consciousness has always a certain end in view. This will become abundantly clear as we look at the mental attitude towards an object. This attitude is three-fold, corresponding to the three aspects of mental activity. Consciousness is always a relation with some object. It is not needful to define the object for our present purpose. But, be it what it may, (1) it is an object of knowledge; we seem to know it, or to know something about it. (2) It brings to us some pleasure or pain; it affects us in some way. (3) We tend to alter it, transform it, take possession of it, and master it. We desire to have a clearer view of its character, or to make it serve our purpose. An object is thus related to us in the threefold way, but he who explores and describes these aspects of conscious activity—knowing, feeling, and striving, which are three aspects of the same mental state, not to be separated from each other, not to be thought of as successive in time, but elements of one concrete experience. From any of these points of view we arrive at the conclusion of the unity of the subject, which recognizes all these attitudes as its own. Cognition, recognition, or any other name descriptive of the cognitive attitude, presupposes the unity of consciousness. The feeling of pleasure in activity, or of pain in the interruption of the activity, presupposes a central point in relation with which the changing elements of consciousness are brought. Similarly, it may be shown that all evocative consciousness presupposes the unity of the subject, for it is the attempt to bring the object into harmonious relations with the other objects formerly or presently held together in our experience.

Thus from many points of view, as we look at the living, moving, thinking, willing, concrete being, we are presented with the fact of a unitary consciousness, of a real self, capable of a real experience. Yet, it has been impossible for systems to be constructed, theories of knowledge to be promul- gated, psychological theories to be set forth, and views to be argued, from which personalism has been excluded, and all reference to self and the unit of the self avoided. It is worth while to see how this has been possible. The possibility of it has not been without advantage in the interests of science. What does science desire to accomplish? A man of science does not know anything; does not desire to know anything. He desires, in the cause of science, its causal relation to one another. He seeks to look at things as parts of Nature, strives to construct and to model them until he has arranged them in their sequence as causes and effects. He strives to find the linkages, and to link all things together in a scheme which seems to include the whole, he is satisfied with his work. But, in order to fulfil this purpose, he has to make himself a martyr to science. He is no longer a man with his will and his purpose, a living, breathing man with a life of his own; he has become what we may call an abstract spectator, a consciousness which simply becomes aware of the goings and comings and the linkages of the energies of the universe. Such a personality is the subject where consciousness is manifested by consciousness. The standpoint of the spectator involves certain abstractions. He has put aside all interests, all living attitudes, and all the varied manifoldness of his concrete life, and he has converted himself into a means of attaining the whole aim is to understand the ways in which things are linked together. It is so far an artificial attitude, but in this abstraction from all that relates to personal will and purpose lies the enormous strength of the scientific attitude. It enables the unlooker to regard the processes of the world as the outcome of laws, to bring them into relations, to master them, and harness them to the fulfilment of his purposes. In fact, the scientific spectator who desires simply to know and describe the system of the world, abstracts altogether from his own life-interests, even from his own individuality, becomes merely a spectator of processes which are not for this individual or for that, but the same for every one. Further to this he does abstract from all personal interests and from all individual proclivities, he finally comes to abstract from the activity of the knowing subject itself, and to look at the world as a system complete in itself, and that it is the subject who is the knowing knower, who has detached himself from every personal characteristic, attitude, and interest, who merely watches the processes of Nature and registers them, is a useful creature for many purposes, but he cannot be taken as an adequate and adequate representative of what consciousness, or self-consciousness in the fullness of its concrete being, means.

Science has proceeded after the fashion described, if it is to do its work. But we ought to remind ourselves of the limitations prescribed by this attitude. In particular, we are not to put this abstract spectator, who has reduced himself to the stature of a mere spectator, in the place of the living man. The synthetic unity of consciousness, the feeling, may be all that is required for the purposes of describing the world, but this abstract attitude of the subject is not sufficient when we seek to speak of consciousness, or self-consciousness as it is in living experience. In the science of psychology we have also to assume this abstract attitude. Before the psychologist are the perceptions and thoughts, the feelings and emotions, the judgments and volitions, which he is to study and describe. He is well aware that the only key to the understanding of them lies within himself. No one save himself is aware of these conscious states, so far as they are his own. They are for him part of his own individual experience, and no one else has these particular experiences. But he has to take them as typical, and the subject
which has the experience becomes an abstract detached subject, a spectator who stands outside of the skull of everybody, and is supposed to have the manifold life of every conscious subject open to his gaze. It is necessary to make the abstracts; to make them indispensable for the solution of particular problems, and helps us to attain to that mastery of the world which is essential for the fulfillment of the tasks of life. It is not needful to quarrel with the abstract attitude of every science, or to accuse it of wilful neglect of many elements in conscious life; our quarrel arises only when these special scientific aspects are set forth as complete and exhaustive accounts of the world. To neglect the subject and all its individual experiences, hopes, fears, and wishes, is quite right on the part of the physicist, the chemist, and the naturalist; and so to exclude the individual, and that begotten by psychology, is quite legitimate when the psychologist is seeking to understand the process of consciousness in general. But if the aim is to understand the fullness, the manifoldness, the congeries of all that begotten by psychology, it is inadequate. The psychologist looks at the inner life as mere contents of consciousness. This consciousness only becomes aware of what is going on, and from this point of view it is nothing more than a data, a fact, or, rather, they are of value simply because they have a place in the stream of consciousness. But this view of consciousness is of value only to the psychologist, whose business it is to describe and explain the contents of consciousness, and to organize them into a system. When we look away from the peculiar business of psychology, and speak of men in their habit as they live, we are aware of a great deal of what psychology makes no notice of. There is the life which the poet sees, expresses, and interprets; there is the life of which the historian writes, which he seeks to interpret and to understand; there is the world of political, social, moral, and religious intention, the fullness of all of us are in the world—each a separate personality, characterized for solves and others as personalities, with the power of looking before and after, of foreseeing ends, and adopting means to realize them, of forming ideals, and of living a historical life. Again, in every act of ours, in every feeling, every volition, and every thought, we are conscious of a self which expresses itself in aims and meanings. We see ourselves girt about with duties, laden with responsibilities, and we feel that we have a meaning in ourselves, and a place in the world.

We are not called on to explain here the different meanings which the self has for the psychologist, and for all others, such as the poet, the historian, the jurist, the artist. In the world of all these we are in a field of personal will and personal interest; in the company of the psychologist we are merely in the presence of a consciousness which is reduced to the aspect of being only aware of its contents, and has no special interest in, or preference for, any of these contents. Such a potentiality we may leave on one side as we proceed to deal with consciousness. What is it? Well, it is not to be identified with the sum of all its states, or with the sum of all its real or contingent presentations. It is not the stream of changes which goes on within it, or merely the awareness of the contents of that stream. It is not knowing, or willing, or feeling, for outside of it there is no feeling, no willing, no knowing. Consciousness is the condition of all mental life; without consciousness there is no mental life. A psychical fact is simply a fact in consciousness, and it is nothing else. Unconscious knowing is impossible to which there is no meaning. Just as little can we interpret a willing of which we have no consciousness.

Consciousness, therefore, is indefinable. Like all ultimates, we must simply accept it as the condition of the explanation of all else, itself remaining unexplained. It may not be identified with the sum of its states, any more than we can identify a real whole with the sum of its parts. For, after we have summed up the parts, there remains an unaccounted for whole. Consciousness is no more the machine is not the sum of its parts, and an organism is something more than the sum of its structures and functions. This statement, true of every whole, is uniquely true of the whole of consciousness. It is not a faculty in addition to other faculties, as memory is different, say, from imagination; it is implied in all the faculties of the mind. It is an essential property of every process that goes on within the mind. The simplest view is that which regards consciousness as the real mind, the imme- diate experience goes on. We are baffled by the very simplicity of the immediate operation of consciousness. We are baffled also by the fact that out of this simplicity are evolved all the results of the activity of consciousness, the real world and to selves. Sciences, poems, histories, all the outcome of human endeavor, are due to the activity of consciousness. But what we are conscious of at any given moment is simply the mental state of the time, or, rather, the presentations with which they work. What we insist on here is that consciousness cannot be deduced from anything else.

Certainly we cannot be deduced from the play of unconscious forces, or from the elaboration of correspondences between the growth of consciousness and the evolution of a nervous system. It may be well to dwell for a little on the attempts made to deduce consciousness from the play of unconscious forces. 'Latent mental modifications,' 'unconscious cerebrations,' are among the phases used in this connexion. W. James, in discussing the 'mind-stuff' theory, thus deals with the distinction between the conscious and the conscious being of the mental state:

'1 is the sovereign means for believing what one likes in psychology, and of turning what might become a science into a fumbling game for whims. It has no content, and elaborate reasons to give for itself. We must therefore accord it due consideration' (Principles of Psychology, i. 163).

In answer to the question, Do unconscious mental states exist?, James enumerates no fewer than ten proofs,—an almost exhaustive list,—submits them to a drastic criticism, and returns the verdict, 'Not proven. Of one proof he says:

'None of the facts, then, appealed to so confidently in proof of the existence of ideas in an unconscious state, prove anything of the sort. They prove either that conscious ideas were present which the next instant were forgotten; or they prove that certain results, similar to results of reasoning, may be brought out through the intuition of all these which no mental seems attached' (90. 170). The tenth proof may be quoted more fully: 'There is a great class of experiences in our mental life which may be described as discoveries that a subjective condition which we have been having is really something different from what we had supposed. We suddenly find ourselves bored by a thing which we thought we were enjoying well enough; or in love with a person whom we imagined we only liked. Or else we deliberately analyze our motives and find that they contain jealousies andcupidity which we little suspected to be there. Our feelings towards people are perfect wells of motivation, undulations of itself, which introspection brings to light. And our sensations likewise: we constantly discover new elements in our sensations, new presentations containing our sensations. The elements must exist, for we are to them discriminable by; but they must exist in an unconscious state, since we 93

CONSCIOUSNESS

self, and the pure ego. In the course of the discourse he says that the substantivalist view of the soul is at all events needless for expressing the actual subjective phenomena of consciousness. We have forgotten them all without its aid, by the supposition of a stream of thoughts, each substantially different from the rest, but cognitively the same. And indeed, his thought is really self-evident. At least, if I have not already succeeded in making this plausible to you, then all the more must you understand by this that everything that our soul can know about the unconscious, and with no appeal to reference to any more simple or substantial agent than the present Thought or 'section' of the stream (p. 131).

It is true that this passage relates only to the active subjective phenomena of consciousness as they come to be through the wheel and pencil of our consciousness, and not to the unconscious, and the primitive unconscious, and the power of explanation, as, from the very nature of the case, it is impossible to bring these into clear consciousness, or into consciousness at all. Instead of saying, with Saussure, that the function of the unconscious is to throw light on the conscious, it would be more consistent with the facts to say that the unconscious and the sub-conscious are storehouses of products manufactured by consciousness, and kept in reserve until they are needed. Habits have been described as being literally mental, as the outcome of repeated conscious processes, so often repeated that they have become automatic. Similarly it may be possible to deal with all the evidence of sub-conscious and unconscious activity of the self so as to show that all or most of these activities had conscious beginnings, and, in any case, that they are not unrelated to conscious activity either in the past or in the present.

At all events, it is not from these unconscious or sub-conscious processes that the whole of our subconscious, or unconscious, or unconscious activity is derived, out of which are built up those conclusions which make up the science, the poetry, the history, and the philosophy of the world. For the principles which underlie these achievements of the human intellect are not mind and reason, but the self, and the self-consciousness, and the certainty which they attain to are derived from the conscious and not from the unconscious activity of the mind. The basis of certainty lies in consciousness itself, its affirmations, its intuitions, are the foundations of our experience.

The necessity of thought which is manifested in the certainty of particular acts of judgment owes its distinctive character to the last instance to the unity of self-consciousness. Every particular judgment may be repeated, with the consciousness of the identity of subject and predicate as well as of the act of judgment; starting from the same data, it is always the same synthesis which takes place, and our self-consciousness cannot exist apart from this invariability. Thus our judging, ego, with its own activity, is opposed to particular acts of judgment as a universal, as the same and the permanent which binds together the whole of experience.

With the confidence of the movement in each particular case is connected the self-consciousness of unvarying repetition, of return to the same point. In this confidence there is presented a general law in contrast with the particular act, we are conscious of our judgment as if it were withdrawn from us, the other person, or the world, and we have a subjective choice and are free to bring about alterations; we are conscious of it in the same way as when it maintains itself in some particular act against contradiction. Because this identity and constancy of our action is the condition of our consciousness as one and indivisible, it is also the final and fundamental basis upon which we can fall back (Sigwart, Logia, Eng., tr. 1.87).

It is one of the merits of Sigwart's great treatise on Logic that it brings all the logical judgments into close relation to the unity and identity of self-consciousness. We know no work in which this has been done so thoroughly and so convincingly. Take another passage, dealing with certainty:

'The certainty that a judgment is permanent, that the synthesis is self-evident, that I shall always know this certainty can be forthcoming only when it is seen to depend, not upon memory, psychological explanations, nor upon any hypothesis, but upon the identity of mind as it laughs time goes on, but upon something which is immutable the same every time I think, and is unaffected by any change. This something is, of course, the one hand, the self, and of the other, the sub-conscious, that which is conscious of itself. The unconscious must remain a negative conception. It is simply metaphor, and had metaphor at that, to speak of 'inversions,' of 'rushes' and 'uprushes,' from the lower world, and it vain to seek for explanations of the on-
same way, the certainty of my consciousness that I think this or that is immediate and self-evident; it is inextricably interwoven with my self-consciousness; the one involves the other" (p. 210).

The form under which consciousness exists is that of the distinction of subject and object. As factors in the same act, subject and object may be distinguished. Thus it is possible to be conscious of an object, and the subject which is conscious of the object. The object is for the subject, and is either a state of the subject, or an activity of it, or a quality of external things. If we make the mind completely self-conscious, it is clearly made, there is a clear consciousness; when vaguely made, there is a vague consciousness; when not made at all, there is no consciousness. Each of these forms of consciousness is a kind of consciousness, and we are conscious of that something only as we distinguish it from self, and place it over against self as its object. We are not to enter into the age-long controversy as to whether there exists a purely sensitive consciousness which is neither subject nor object, but consists only of particular feelings. It has been widely contended that a purely sensitive consciousness is possible, and that the reference to subject and object, which all experience exhibits as the characteristic of consciousness, arises out of associated experiences. These are classified as vivid and faint, the vivid coming from the object, and the faint from the subject. Out of these particular feelings association builds up all the rest, a unitary consciousness. But if Hume does not allow any validity to this conception; it is only a fiction of the mind. Herbert Spencer, while he strives to account for the distinction of subject and object by the associationist theory, yet admits, or rather lays stress on, the distinction between subject and object, as a cardinal principle of his synthetic philosophy. But the mere addition of units of conscious feeling could never reach a unitary consciousness. For these units of feeling are each different from all the rest, and, as they begin in time, they perish as soon as they appear, unless they are held together by reference to the self who is the object. States of consciousness can never be without a consciousness of states. If there is to be a consciousness of states, there must be a subject which discriminates itself from the states, can hold them together for discrimination or analysis, and can distinguish all of them as states of itself.

Consciousness may range from the simplest awareness to the closest discrimination. It may be vague and narrow, or it may be clear and comprehensive. At lowest range it may be dim and indefinite, as when we are dropping off to sleep, or when our attention is directed to something else. In fact, many impressions may be made on our senses which rise only to the threshold of consciousness, and perhaps may not rise even to the threshold.

In these cases, consciousness approaches a vanishing point, and often reaches and passes it. The object exists for us only as a vague objectivity without definite significance. They emerge from this state only by a voluntary or involuntary direction of our attention towards them. If, now, we choose to call this state unconscious, and reserve the name of consciousness only for clear or distinct consciousness, we should say that very many mental states exist below consciousness. This has often been done, and the theory maintained that we may have manifold sensations and feelings without being conscious of them. But this is the same as holding vague and imperfect consciousness with none, the truth being that we may have vague and unsubstantial sensations without directing our attention to them; the lower limit of consciousness does not admit of being definitely fixed" (Bowring, "Introduction to Psychological Theory," p. 298).

The truth is, that we are unable to express consciousness save in the form "I am thinking this or that, I am feeling pain, I am doing this act, or I am intending to take such a course of action." It is quite true, as Hume says, that we always find ourselves in some particular state, but in every state, whatsoever it may be, we find ourselves. It is not possible to interview a blank self, or to abstract the ego, so as to have an idea of it as we have of external objects, or of events of a particular kind in consciousness. There cannot be an object completely an object, for, even if that were possible, there is always that subjective activity of the subject which goes on while we seek to make the ego completely subjective. Like this is so, yet the further step which is so often taken, namely, to abstract altogether from the subject, and to make conscious activity only a stream of thought, or a more aggregate, seems altogether illegitimate. Can we have a true form of the single permanent subject of our psychic activities? Even a stream has its identity, and anything which we can call a unity is something more, as already observed, than the sum of its parts. But can we really think of a feeling in abstraction from something that feels, or of a willing without a subject that wills, or of a thought without a thinker? Can we really think of our psychic life in an impersonal way? It is possible to describe, as in fact we do, the psychic life in an impersonal way and in an impersonal way to say "it rains," "it thunders," "it hails," "it storms," "it is dark," or "it is a stormy night." Try this in describing the psychic life, and immediately we feel how incongruous it is. "It thinks," "it feels," "it speaks," "it is full of joy"—we can write so, as we can write nonsense, but the incongruity is too obvious, when plainly put, to allow us for one moment to regard it as an adequate account of the facts.

Even when a stream is subdivided, the phenomena of consciousness to a stream of thought, he is constrained in unguarded moments to speak of our will, our psychic states, thus adding to the stream that factor without which it could not have been even a stream. In the mere statement of the case, this statement which seems at first to eliminate the necessity of a subject—one is forced to imply the subject in every statement. One is compelled to imply a subject. For ideas, feeling, or will are not there in a vacuum; they are, after all, only modes of consciousness. We may neglect a pain which nobody feels, a pleasure which is pleasant to nobody, or a will and a purpose which is the activity of no will. Is it possible to imagine or conceive a perception of these mental experiences where there is no perceiver, a perception which is only the bare object perceived, a mere subjectless feeling? How are we to account for the connexion of all the events of consciousness? Is it possible to make the recognition of the events of consciousness present to all its states, and as able somehow to hold them together, and to group them according to their real likenesses? Can any one think of himself as the sum of the events of his experience, or think of the events of his experience using the events which he thinks them so? Hume boldly calls this a fiction, and Stuart Mill calls it a "final inexplicability," and neglects it as a source of explanation. Is it not the easiest solution simply to acknowledge
CONSCIOUSNESS

that the ideas of persistence and duration find their simplest explanation from the supposition that we are, and know ourselves to be, identical in time.

While we have thus to postulate continuity of the conscious subject—for on any other supposition we are not able to account for the ideas of change, continuity, or persistence—we are met by many questions which remain for discussion and for settlement. It is almost a matter of course to say that psychical events as such exist only in so far as there is a subject of consciousness; the only distinctive character lies in the fact that they are conscious. A seeing, of which we know nothing, a pain of which we are not aware, an act of volition which takes place without our being able to notice it, is not possible, for the seeing, etc., is only by means of consciousness. While this is true, it is also true that there are different degrees and modes of becoming conscious. When a consciousness has attained to some fullness of self-possession, and is in experience of the results of experience, there is for such a consciousness a fund of experience organized into masses, and any new experience can take up a new feeling or idea into such an ideal mass already formed. The process is so fully described in many psychological books that we need not dwell on it here. Thus, we refer any new experience of colour to the class of colours we already know, and, being in possession of these names, we make the new experience of colour accordingly. But there was no such discrimination of the particular elements which co-exist at every moment, and some note taken of fire not possible, for the seeing, etc., is only by means of consciousness at all.

At this earliest stage of conscious life, the subject is in possession of the wealth of organized experience, the subject is, as it were, lost in the object.

Our immediate consciousness of objects seems at first to be a direct perception of them to the passive subject, to a self that is not in any way occupied with itself, but only with or even conscious of itself at all. The outwardly directed gaze seems simply to adjoin the object of consciousness and to be aware of itself as reacting upon it. But, in the first place, we have learned to recognize that, whether we are conscious of it or not, there is always a perceptual and aesthetic activity of thought, even in our simplest perceptive consciousness; for, without this reaction, no idea of any object as distinct from, and related to, other objects could ever arise to trouble the self-involved sleep of sense. Apart from such reaction, we might say that the sensitive subject would remain for ever confined to itself, were it not that in that case there would properly be no self to be confined to; for where there is no outward, there is, of course, no inward life. It is thus the mental activity of the subject that creates for him a world of objects, or, to put it more simply, that enables him to become conscious of the world of objects in which he exists. . . . In the second place, not only is the subject active in perception, but he necessarily and inevitably has an inchoate consciousness of himself as a subject, in distinction from the subjects which act upon him as objects. To apprehend an effect, as such, is to distinguish it from, and related to, the self that is conscious of it. It is to refer an idea or feeling to that which is other than the self, to reject it from the self and to objectify it; and such a rejection or repulsion necessarily involves, on the other side, a withdrawal of the self from the object. The simplest outward-looking reaction which seems to lose itself in the object to which it is directed, yet recognizes that it is distinct from and independent of the object; and, indeed, all its absorption in the object may be said to be its effort to heal the breach, of which, in the very act of perception, it has become conscious. Again, whenever we come to look that, even in its utmost apparent possibility of perception, the mind is active; and, indeed, the absorption in the existing world, it is conscious of itself in distinction from it. It is true that the subjective aspect of the consciousness of objects are at first latent, or they are not directly presented in an inchoate form. Attention is not specially directed to them, and in any description which the individual would give of his own consciousness, they would generally be always left out. But we see a little, and instinctively for a little, the inchoate thought of it cannot be wanting to one who is conscious of objects as such.” (Edward Caird, The Evolution of Philosophy. Pp. 54–55)

As we know consciousness in ourselves, it has a beginning, a growth, and a history. Thrust into the midst of conditions not realized, slowly learning to find itself, to take the world, and gradually coming to the knowledge that there is an external order to which it is related, the self-conscious being, in intercourse with things, comes, so far, to the knowledge of the world and of itself. The story need not be told here, but there is a story, for the finite personality does come to the knowledge of itself. It learns to distinguish between itself and the world. But consciousness becomes clear and definite when it recognizes that there are distinctions of self and not-self, and as knowledge progresses, consciousness finds itself in an ordered world, and, just in proportion to its recognition of the objects of sense, it is the recognition of itself as the counterpart of the order of the universe. Its own rational principles are realized there, and it becomes more rational as it recognizes the objective value of its own rational principles in the growth of the world. But we may not regard the distinction of self and not-self as if it were identical with the distinction of subject and object. The first may be called an ontological distinction, for it relates to the distinction between the universe that endures and the universe that is, the whole sphere of being, whereas the distinction between subject and object describes a mental function. The contents of the two are constantly changing. At one moment the object may be this table, with its shape, colour, material; and the next moment it may be the mental process which passed through the mind when the table was the object. The object may be things in the outward world, or it may be the state of consciousness, in means of which we deal with the outer world. It may be the thing I see, or it may be the vision through which I see it. The distinction between subject and object is the form under which consciousness relates to the world. The subject and object are a relation within one experience, and they are essential to the reality of that experience.

It may be observed that the conception of self, like all other conceptions, is one of gradual growth, and the time of its full realization is, for us, not yet. We are not to look for the self as if it were laid on a shelf, a thing among other things. It is the subject of all experience, and usually it is the last conception which is reached by the conscious subject itself. This late recognition of the conception of itself may be paralleled by the late emergence, in the history of thought, of the problem of thought itself. Nothing is nearer to us than thought, and yet the problem of thought is one of the very last to be grappled with. Psychology deals with objects rather than with itself, and reflection is hard. Thought hides behind itself; it is so occupied with its processes and problems that it does not reflect on them, and, having reached conclusions unreflecting, often takes these as original data given from without. Knowledge is taken for granted, and the knowing process was for a long time utterly neglected. Nor had knowledge any suspicion of the complexity of the knowing process, nor did knowledge find it necessary to submit itself to an analysis of the process of knowing or to inquire into its own validity. It was
inevitable that in the long run the question of the possibility of knowledge should arise, but it could not arise until knowledge had been at work for a long time, and had attained to some mastery over itself and its work. So is it with the problem of the self. As shown by the preceding pages, the consciousness of the self in the consciousness of objects is at first latent; it may be delayed, but it is always implicitly there. As a matter of fact, it may always be latent and never come into clear consciousness of itself. Self-experience may be the only form in which self-consciousness may assume. The self may be so lost in the process of experience, so absorbed in its feelings, desires, and thoughts, that it may never reflect on itself, and never ask consciously what it is. It may remain on this level all through life. Absorbed in its object, living out its experience of pleasure, engaged in its own pursuits, and interested in the success of its plans, it may never seek to reflect on its own nature or on the order implied in it as simple experience. One may be active, energetic, far-sighted, wise, and yet may have never given a single hour to the thought of that self which has all these characteristics, for in the history of human thought and life in the simplest times most fundamental of all problems are the latest to emerge into the light.

The two factors—subject and object—which always represent the form which experience has, are not, at first, distinguished. Thought and experience may go on all through life without any clear consciousness of the distinction. Yet the two inseparable factors are always there. It is always possible, however, to focus our attention on the one factor or the other, and direct attention on the object or on the subject. The consciousness of self may remain at the level of mere self-experience; it may be so absorbed in the object as never to ask itself about itself. It may, indeed, neglect itself altogether, and may so seek to formulate its experience as to make the subjective factor disappear. Thus it may seek to become a philosophy, and find a sufficient explanation of experience in a something which does not require a subject of knowledge at all. But such a philosophy, though it constantly reappears, is after all inadequate to answer the questions which constantly recur and which we need not here relate. For immediately the question arises, as it did in the very first experience, what is this subject from whom all experience is possible, and, when we ask this question, the answer must be that a self which is conscious at all has implicitly within itself the possibility of a complete self-consciousness. Focusing our attention, then, on this factor of experience, we can regard it as the subject of experience which takes up all particular experiences, rules them, binds them into a system, and makes them elements in one consistent experience. In this event self-consciousness would have attained its ideal, for it would have reached the goal of self-knowledge and self-control. The conception of a perfect self-consciousness consists in the fact that is in possession of itself, and can set the bounds of its knowledge, self-reverence, self—control—in these, and not in finitude or infinitude, lies the conception of a perfect selfhood. But for finite beings, for us men, this ideal is a goal, and cannot be an actual experience. For we do not pass the limits of our own experience; we are subject to irritants from without, we have experiences which are inherently irrational, and we have feelings which are sometimes uncontrollable, and generally there is so much of our experience which is simply given that we cannot be said to be masters of ourselves. Yet the growth of a rational personality is measured by the progress of the mastery which it has over the elements of its own experience, and the power of placing every impulsive and merely emotional element under the guidance of reasonable self-consciousness.

Thus, then, we may regard the self as conscious of itself in all its lawful experiences. Knowledge is possible, because all the objects of knowledge can be brought into relation to the self. Objects out of all relation to the conscious self are for that self non-existent. Whether we look at the self-consciousness of the self, the self-knowledge, or the ethical, the aesthetic, or the religious point of view, the result is to raise our estimate of the self-conscious being to the highest. For each of these affirms that the self-conscious being is the postulate without which truth, beauty, goodness are without meaning or worth. The conscious subject is the subject for whom all objects are; it is also the subject in which goodness is realized, and ethics affirms that the self is that in which goodness is to be realized through a continual process of self-realization and self-determination. The world of beauty has no meaning without the seeing eye and the ideals which the self in intercourse with the world builds up for itself.

We do not require to follow out the results of the analysis of self-consciousness into its further issues, or to enter into the discussion regarding an absolute, all-inclusive self-consciousness, for we have sought to bring into all its consequences may find it fully unfolded in the works of Hegel and his followers, as well as in the works of Green, of the two Cairs, of Royce, and of many others. It may be shown in the most absolute, to describe the totality of things according to the analogy of one self. The Hegelian philosophy is a perfect description of the way in which an inchoate self arises, or may arise, at self-consciousness. It is the highest value from that point of view. But to make it absolute seems too great a demand. For this is a universe of many selves, and the unity of the universe cannot be construed after the fashion of the growth and evolution of one self. While, therefore, the world is indebted to the Hegelian idealists for the analysis of self-consciousness, and for the far-reaching results of that analysis, the attempt to construe the life of the universe after that analogy cannot succeed.

Ere we close, it may be well to notice the argument of Bradley, because it would make all the contendings of this article invalid. We quote his summary:

"We had found that our ideas as to the nature of things—as to substance and adjective, relation and quality, space and time, motion and activity—were in their essence indefinable. But we had heard somewhere a rumour that the self was to bring order into chaos. And we were curious first to know what this term might stand for. The present chapter has supplied us with an answer too plentiful. Self has turned out to mean so many things, to mean them so ambiguously, and to mean so wavering in its applications, that we do not feel encouraged. We found, first, that a man's self might be his total present content; his discoverable character at any cross section. Or it might be the average content we should presume ourselves likely to find, together with something else which we call individuality. From this we drifted into a search for the self as the essential point or area within the self; and we discovered that we really did not know what this was. Then we went on to perceive that, under personal identity, we entertained a confused handle of conflicting ideas. Again the self, as merely that which is for the time and place, not satisfactory; and from this we passed to the distinction and the division of self as against the non-self. Here, in both the theoretical and the practical realm, the essentials of the self had no contents that were fixed; or it had, at least, no more sufficient to make it a self" (Appearance and Reality, p. 101.)

In his own ironical way Bradley had said elsewhere:

"There remains still left a third moral, which, as I am informed, has been drawn by others, that if we are not able to rear with the vulgar, nor to shout in the battle of our great schools,
it might be worth our while to remember that we live on an ideal firmament, and that in this ideal mind, it would not enrich it, nor grow insensible; that nor far from us there lies (they say so) a world of thought, which, with all variety, is neither one nor the other, and which is the best of all. It is the last and unp一系列 philosophy itself against two undying and opposite one shades. And it would not be clear what the vulgar belief is of a philosophy, lastly, which we have all refuted, and, having so cleared our consciences, which some of us at least might take steps towards dissipating it, of the biological St. Thomas.

Perhaps Appearance and Reality is the endeavour to think what the vulgar believe. But there is left in it no shred of belief of what the vulgar believe. Of the whole work set forth with such anxiety, and with which the last notion treatises that very much may be said, that it amounts to a demonstration of the unessentialness of the attempt to interpret experience from a mere abstract point of view. Bradley finds that all the categories and relations of thought abounded in contradiction, herculean, predication, quality, identity, causality, unity, space, and time are full of contradictions. When we arrive at the question of the self and its reality, contradictions swarm more and more. We have already said that no method of using the category of contradiction is there somewhere removed in the Absolute. These contradictions are Appearance, and Reality has somehow absorbed them into itself. But it would be quite possible to show that the same method is used by Bradley to dissociate Appearance and Reality would have also with the Absolute. That is on the supposition that his logical procedure could be carried out in the Absolute. The greatest contradiction we know is the contradiction between the self and its being, logic and naturalism, and the slackness of it as applied to the Absolute. Apart from this, it is not the method of Bradley simply an illustration of a wrong conception of the categories, and of their application.

The self-consciousness of the human interest makes it most unwilling to admit anything that cannot be conceptually grasped. Accordingly it seeks to make ideas all-embracing. At the same time it is clear that this view is a tissue of abstractions. The impression of idea is a pure fiction. All actual ideas are owned by, or belong to, some one, and mean nothing in themselves. We have already seen that the various categories of thought, apart from their formal character as modes of intellectual procedure, get any real significance only in the concrete self-consciousness of the living mind. Apart from this, when considered as real, they become self-destructive or contradictory. The ideality of the type we are now considering assumes that these categories admit of being conceived in themselves, and that they are in a sense the negations of self-consciousness, and, in some way, that we might almost suppose that a personal being is compounded of being, plus unity, plus identity, plus causality, etc. Thus personal existence appears as the outcome, and the product of something more ultimate and fundamental. The logic of self-consciousness comes into its own, and abstractions which already have a meaning turn out, as we have seen, that mean the significance we find them to have in our self-consciousness. In the concrete the terms have no meaning except as it is abstracted from our own personal experience. The only unity we know anything about, apart from the formal unity of logic, is the unity of the unitary self; and the only identity we know anything about is the abstraction continuity of existence through an abstract time; it is simply the self-equality of identity throughout its experience. And the change we find is not an abstract change running off in an abstract time, but is simply the successive form under which the self-equal intelligence realizes its purpose and projects that resolving activity against the background of its self-consciousness. Similarly for being itself, in the concrete it means the passing object of perception, or else it means existence like our own existence, Personalism, pp. 253 ff. Again, "The notion of the self can easily be taken in from self-consciousness.

We are not afraid of what the use we see, is, after all, in explaining the mental life. How does the unity explain the plurality and variety of consciousness?, and the unity, how does it explain, and yet the unity is no less necessary. For the consciousness of plurality is demonstrably impossible without the fact of conscious unity; the consciousness of the manifold, enables us to understand plurality, and hence the plurality must be viewed as an aspect of the unity; but if only we had a vision to be contradicted, but, taken solely, it is the fact of consciousness, and none the less so because the unity for us subjective thought finds it impossible to of itself to construe it" (ib. p. 511).

The unity of consciousness, the identity of the self-consciousness life, the progressive realization of the self in intercourse and in interaction with the world and with its fellows, are thus among the most sure of our belief, and among the most indispensable of our postulates. Many further questions arise which cannot be discussed here, for the adequate solution of any one problem involves the solution of the other. The problem can be solved on a merely impersonal plane, and no category is of value except as a function of the concrete personal life.

Literature. The following is a list of books from the vast literature dealing with the questions: Adamson, The Development of Modern Philosophy, 1908; Bowne, Intro. to Psychological Theory, 1896; and Personality, 1898; Bradley, Appearance and Reality, 1893 (2nd ed., 1897), also Ethical Studies, 1876; Edward C.ard, The Evolution of Religion, 2 vols. 1895; Höfling, Outlines of Psychology, Eng. tr. 1902; James, The Principles of Psychology, 2 vols. 1890, also Varieties of Religious Experience, ed. 1898; vols. 1 (1888); Kulpe, Outlines of Psychology, Eng. tr. 1895, also introd. to Philosophy, Eng. tr. 1891; Lotze, Metaphysics, Eng. tr. 1884; Ladd, Philosophy of Knowledge, 1897; Münsterberg, Psychology and Life, 1895; Shadworth Hodgeson, The Metaphysics of Experience, 4 vols. 1896; Stout, Manual of Psychology, 2 vols. 1898-9; Sigwart, Logic, 2 vols., tr. 1892; Ward, The Psychology in Ebr., also Naturalism and Agnosticism, 2 vols. 1899; Taylor, Ancestral Memory, 1890; Wandt, Human and Animal Psychology, Eng. tr. 1894; W. illa, Contemporary Psychology, 1899; Royce, The Spirit of Modern Philosophy, 1899, also The Mysteries of the Individuation, 2 vols. 1900-1; see also the Histories of Philosophy, such as Ueberweg, Höfling, Erdmann. JAMES IVERACH.

CONSECRATION.—"Consecration," or 'dedication,' may be defined as the solemn setting apart of persons or things for some particular religious work or use. It is the act of separating for God. The ceremony is to be found in the performance, whenever possible, of some act which is typical, or symbolic, of that for which the setting apart or consecration is to take place. Thus the first or in process of time, is naturally accompanied by some announcement to the congregation of what is being done or intended, and by forms of prayer asking for the Divine approval and blessing; but not always free. We have already seen that the various categories of thought, apart from their formal character as modes of intellectual procedure, get any real significance only in the concrete self-consciousness of the living mind. Apart from this, when considered as real, they become self-destructive or contradictory. The ideality of the type we are now considering assumes that these categories admit of being conceived in themselves, and that they are in a sense the negations of self-consciousness, and, in some way, that we might almost suppose that a personal being is compounded of being, plus unity, plus identity, plus causality, etc. Thus personal existence appears as the outcome, and the product of something more ultimate and fundamental. The self-consciousness comes into its own, and abstractions which already have a meaning turn out, as we have seen, that mean the significance we find them to have in our self-consciousness. In the concrete the terms have no meaning except as it is abstracted from our own personal experience. The only unity we know anything about, apart from the formal unity of logic, is the unity of the unitary self; and the only identity we know anything about is the abstraction continuity of existence through an abstract time; it is simply the self-equality of identity throughout its experience. And the change we find is not an abstract change running off in an abstract time, but is simply the successive form under which the self-equal intelligence realizes its purpose and projects that resolving activity against the background of its self-consciousness. Similarly for being itself, in the concrete it means the passing object of perception, or else it means existence like our own existence, Personalism, pp. 253 ff. Again, "The notion of the self can easily be taken in from self-consciousness. We are not afraid of what the use we see, is, after all, in explaining the mental life. How does the unity explain the plurality and variety of consciousness?, and the unity, how does it explain, and yet the unity is no less necessary. For the consciousness of plurality is demonstrably impossible without the fact of conscious unity; the consciousness of the manifold, enables us to understand plurality, and hence the plurality must be viewed as an aspect of the unity; but if only we had a vision to be contradicted, but, taken solely, it is the fact of consciousness, and none the less so because the unity for us subjective thought finds it impossible to of itself to construe it" (ib. p. 511).

The unity of consciousness, the identity of the
the doorkeeper of the church receives the keys of the church doors, the sub-deacon receives the chalice and paten (the vessel of holy), the virgin is veiled to signify her marriage with Christ (or His Church), the lector himself actually receives a copy of those Gospels which he is henceforth privileged to read, and so on. The Greek writer of the first centuries of building (τεμενών; cf. καθολικόν and καθάριον) himself suggests that the idea here emphasized lies at the root of the ceremonies employed.

It is hardly necessary to say that the Christians followed in this practice of thus consecrating, or dedicating, persons or things to religious purposes. Apart from the well-known custom of the Jews (e.g. in dedicating houses, Dt 20, Ps 30 [title] or city-walls, Neh 127; or the Temple, 2 Ch. 5, 6; Jos. Ant. xli. 7, xlv. 16), both the Greeks and the Romans (and other nations as well) observed such ceremonies for their priests and sacred buildings. But for Christians, during a considerable period after the foundation of their faith, anything but the simplest and least imposing ceremonies in connexion with consecration would have been both out of place and practically impossible. This article does not deal (except incidentally) with the consecration of the clergy (see Ordination). We proceed, therefore, to consider the cases (chiefly those of buildings) to which the word 'consecration' is more usually applied in the present day.

As Duchesne (loc. cit.) has pointed out, the church of St. Paulinus at Tyre is a representative of one out of two types of church in the first ages, viz. what we should now call the parochial church of a town or district. Of this type there would sometimes be more carefully restricted to religious purposes, as consecration decreased and the affairs of the Church became more settled. But we can easily imagine that, almost from the first, forms and ceremonies grew up in connexion with the dedication of these buildings. As J. Wordsworth has reminded us, the two primary conditions were probably 'a transference of previous ownership on the part of the Founder, and an acceptance of the trust by the Bishop of the place.'

We have to dismiss as evidence the quotation from Philo Judæus, de Vita Contemplat., given by Eusebius (HE ii. 17. 9) and adopted by Bony (de Rob. Liturg., Rome, 1671, t. xii.) as ἐκ πρεσβυτερίων ἡ ἁγιασματίζων [of the Theopetæae in Egypt] ἐστιν οἰκία λεγον 'δ καλεῖται σημαίνα καὶ μονοστρόφων κτ. τ.λ. because Eusebius's statement is not only unattested, but was not even written in Christian times. The only certain parts of the Christian Society in its new home could hardly be otherwise than magnified than in the Old Testament in which the builders, gathered under the presidency of their chief priest, came together to meet their Lord in his new house, to plead his sacrifices, and to feast upon him.

We have to dismiss as evidence the quotation from Philo Judæus, de Vita Contemplat., given by Eusebius (HE ii. 17. 9) and adopted by Bony (de Rob. Liturg., Rome, 1671, t. xii.) as ἐκ πρεσβυτερίων ἡ ἁγιασματίζων [of the Theopetæae in Egypt] ἐστιν οἰκία λεγον 'δ καλεῖται σημαίνα καὶ μονοστρόφων κτ. τ.λ. because Eusebius's statement is not only unattested, but was not even written in Christian times. The only certain parts of the Christian Society in its new home could hardly be otherwise than magnified than in the Old Testament in which the builders, gathered under the presidency of their chief priest, came together to meet their Lord in his new house, to plead his sacrifices, and to feast upon him.

1 ἁγιασματίζω is another noun, and ἁγιασμὰ another verb.
3 Cf. the two corresponding regulations from the letter of Pope Vigilius, quoted above: 'ōmes basileus missa dedit senum... and milites presbyter missae celebret præcinctum... in sacris ab episcopo locis.' These, though not so early as they claim to be, probably embody ancient tradition (Wordsworth, loc. cit., p. 484), and even the very Roman usage, speaks of dedications without missa publica or publica præcinctum, but these are (according to Duchesne, op. cit. p. 484) 'casus monumentorum, or the dedication of the public church, so that the inaugural missa would be of a quasi-private nature.

4 Wordsworth, loc. cit.

57, no. 100, 'Kal. Aug. Romae dedicatio primae ecclesiae a beato Petro constructa et consecrata,' is unhistorical; 1, and so, no doubt, is the attribution to Enochius (NICHEP. ii. 3), who was the first bishop of Antioch, that James was consecrated first bishop of Jerusalem, and that the seven deacons were ordained in that house in which Christ instituted the Lord's Supper and where the Holy Ghost descended on the Apostles.

It is not till the cessation of the persecution of Diocletian that we are on safe ground with regard to any accurately recorded sacred ceremonies. Eusebius (HE 2) speaks of the restoration of peace at that time being marked by the founding of new churches, and, among other signs, mentions ἑγκαινίων ὑπομνημάτων κατὰ πόλεις καὶ τοις ἅγιοι ναοῖς προσκυνήσαντες ἐφημερίες, a notable instance being the dedication of the Church at Tyre (in the name of Paulinus), which took place A.D. 314, and at which the historian himself preached the inaugural sermon. There was a large concourse of bishops, clergy, and people on this occasion, and the Holy Mysteries were apparently celebrated, but no other distinctly initiatory ceremony is mentioned. This occasion is historically important, because it seems to be the first recorded instance, both (1) of a kind of special consecration of a church with what is now commonly called a 'dedication,' i.e. consecrated under the title of a patron saint, and (2) instances of both sorts become more and more frequent.

As Duchesne (loc. cit.) has pointed out, the church of St. Paulinus at Tyre is a representative of one out of two types of church in the first ages, viz. what we should now call the parochial church of a town or district. Of this type there would sometimes be more carefully restricted to religious purposes, as consecration decreased and the affairs of the Church became more settled. But we can easily imagine that, almost from the first, forms and ceremonies grew up in connexion with the dedication of these buildings. As J. Wordsworth has reminded us, the two primary conditions were probably 'a transference of previous ownership on the part of the Founder, and an acceptance of the trust by the Bishop of the place.'

1 Cf. Mart. Hier.; D'Acary, Spicileg. (Paris, 1652-67) tom. iv. The Church of St. Peter ad Vincula on the Esquiline was dedicated in the name of both St. Peter and St. Paul on Aug. 1, in the episcopate of Felix iv. (432-440). There may, however, have been some church built there before that date.
2 Quoted by him at length (loc. cit. 4). The Gal. Sacramentorum, Oxford, 1884, p. 110 f.) contains 'ornations et preces in dedicationibus basilicae; quum conditor non dededit regulas, et also [missa in ejusdem conditoris aedificiis, etc.]
3 The medieval cathedral at Aux in Provence is said to be dedicated to the Twelve Apostles, and have dedications like the Ascension, Corpus Christi, etc., or even Holy Cross, House of Prayer, etc.
4 Hence what are called the 'stations,' and the 'station days' of early Roman service-books and calendars.
CONSECRATION

more numerous than martyrs' tombs, it also became sufficient to have some portion of a saint or some small personal relic of him (pignora, sanctuaría), perhaps only a piece of linen dipped in the blood, or a leaf from the Gospel book of consecrated bread, to represent or symbolize the 'patron' in each case; and eventually this second type of church was adopted, though very gradually, and not so universally as is sometimes imagined, in the second half of the 3rd century. The Roman Church was originally inclined to a severe simplicity in matters of ritual, and that the fuller ceremonies and forms of prayer which afterwards obtained and are still in use in the Roman Communion are largely due to the Gallican influence.1 It seems not unlikely also that these ceremonies in the Western rite which are distinctive of consecration proper are ultimately derived from the East (e.g. from the Byzantine ritual), and that only in so far as they are related to the deposition of relics in the new building is originally Roman. The student cannot fail to be struck, as Duchesne and others have pointed out, with the fact that this deposition of the relic is first given in its fullest form in the two most ancient Ordines Romani,2 parishes distinctly of a funerary character, while the 'Gallican' ceremonies all point to the idea of adapting the Christian baptism of persons to the ancient rite of the lustratio. Hence, as Duchesne has shown, this service is a combination of the two types of ceremony, but in it the deposition of the relics is to some extent outbalanced and overshadowed by the consecration rites proper.

A concise account in detail of the regulations and order of service as now provided in the Roman Pontifical is subjoined, and will be found useful, both because it exhibits most of the rites that have gradually gathered round the occasion in Western Christendom, and also because, since the Reformation, the Bishops of the Anglican Communion have, with varying degrees of exactness, drawn up their Consecration Offices.

With regard to the first point, it will be seen carefully in mind what J. Wordsworth has remarked in the valuable treatise (On the Rite of Consecration, p. 19) to which reference has already been made: 'I conjecture that (here), as usual, in process of time, diverse ceremonies were heaped together without much regard to their congruity.' Wordsworth makes this remark with special reference to the ceremony of the absen
darium (see below), but one feels its applicability to a good deal of the present overserved service. As in post-Reformation forms of consecration, the student will find a list of those 'in use in the 17th century' on p. 27 of the same treatise, and the present Sarum Form on p. 50 ff. (with the masses). This is much the most satisfactory adaptation of ancient forms and uses, Eastern as well as Western, that the present writer has been able to come across with. The S.P.C.K. also publishes the forms authorized for the dioceses of London, Truro, Worcester, Wakefield, and Winchester; and their first three series are on the lines, whilst the last two are based on Bp. Andrews' Form (1639). It may be added that no form would seem to be really adequate which does not provide that the consecration shall conclude the consecration with a solemn Eucharist, either at the time indicated or at a later service. We have, in the Sarum service, a reasonably early hour the next morning.3 This provision is made in the Form of the modern Irish Church, and in that of the Church of the United States of America.

The similar description of the modern Eastern rite, with which this article concludes, will be likewise interesting both in itself and as illustrating much that has been said during the course of our discussion.

i. MODERN ROMAN USE.—1. Preparatory regulations.—(1) Consecration may take place any day, but by preference on Sunday or a Saint's day. (2) The archconsecrator is to give notice of the day fixed beforehand. (3) The consecrator, the clergy, and the people should fast before the service. (4) On the evening before, the consecrating bishop prepares the relics which are to be deposited in the church, placing them under a glass casket, with three grains of frankincense and a written record of the consecration, and laying the

1 See on this point a valuable paper by W. Legg, in no. 330, of Ch. Hist. Soc.'s Tracts, p. 53 ff., and another by J. Wordsworth in no. 22 of the same series, p. 19 ff. (already quoted).
2 Cf. also P. Legay's article on the Ambrosian Rite in Dalz. pp. 1437–9. 'I would venture to suggest that the reason of the absence of the rite from this [English] form of consecration was that the early English and Irish Churches only dedicated their churches to living saints. In this case no relics could be had, and therefore the rite was of necessity omitted' (T. Gaden on the Church, 1905, vol. iv. pt. ii., R. P. and E. B.'s Ecc. Soc. P. 99).
3 According to R. Balden, Brown, From Schola to Cathedral, App. 1 p. 217 ff.
5 Opiniones, and in consecrationes de S. Ilii usus prior maius euripus.
6 No. This is simply a more important part of the Roman rites, seems originally to have been practised by Christians to possess houses rather than their churches (see Duchesne, op. cit. p. 407 [quoting Lib. Pontif. i. 1327]).
7 P. 15, ed. Fliche, Camb. 1896; the collect here speaks of consecrationes in consecratum et in sacrum Petri eum esse sancta sacra deceferimus, and each of the other formularies also mentions S. Peter.

2 On this point see Duchesne, op. cit. p. 239.
4 See Wordsworth's remarks (op. cit. p. 9 ff.).
The second part of the Litany is next said to the end, but with special petitions by the bishop, standing, for the church and its altar now in act of being consecrated. After this the bishop says two collects, the church having fully vested itself, and being attended by another deacon, a subdeacon, acolytes, and other ministers, goes to the place where the relics are reposing, and the seven Penitential Psalms are recited. He then proceeds to the choir stool before the church, and knells there, after an antiphon and collect ('Actiones nostras, quaesumus, Domine,' etc.), says a vespers with the choir the first portion of the Litany.

(2) The next ceremony is the exorcizing and blessing of water, which, being afterwards mixed and again blessed, are made use of in the following manner: First the bishop sprinkles himself and his assistants, whilst the choir sings the usual antiphon, 'Asperges me, Domine;' he then takes a second time to be preceded by two candlebearers, round the outside of the church, sprinkling the walls as he goes, the choir singing an appropriate responsory; each time he reaches the principal door and kneels on a casket and then performs this very ancient and dramatic ceremony:  he stands on the threshold and strikes the door with the butt end of his staff, saying, 'Attollite portas, principes, vestras,' etc. (Ps. 2 18); the deacon, from within (see above) inquires, in the words of vers. 3, 'Quis est iste rex gloriosus?' and the bishop answers, 'Domini fortis et potens,' etc.; at the third time those who stand by call out 'Aperi,' the bishop makes the sign of the cross on the threshold, the door is opened, and the procession passes in, the bishop proclaiming, 'Pax huic domni,' and the deacon from within replying, 'In introitus vestro.'

(3) Whilst the bishop goes to the centre of the building, the acolytes and deacons are employed in the use of second of which is very ancient. 'Zachaeus, festinans descende' (see above). Then, during the singing of the 'Venice Creator Spiritus,' one of the ministers sprinkles ashes in the form of a cross.

1 This is most conveniently the west door, if the structure has one.
2 All this is in accordance with very ancient use, probably Gallican (see Sacramentum of Donicon, Bishop of Metz [820-855], quoted by Duchesne, op. cit. p. 667 ff., and described by Delisle, Men. sur d'anciens sacramentaires, Paris, 1886, p. 186 ff.);
3 Gallican. These crosses are still often to be found in our English churches. 'It is said that the English use differed from the foreign in having crosses both within and without. The Irish use shows its primitive character in ordering the crosses to be cut with a knife, without wooden posts,' etc. (J. Wordsworth, op. cit. p. 16); W. Gell., op. cit. p. 84).
4 Pontifical of Egerb, 1653 (Surtees Soc.); Benedictale of Archb. Robert (H. Bradshaw Soc.); cf. G. S. Soc., 1827; Wilson, 1894). The antiphon now is: 'Adaste, Deus munis omnipotens,' etc. in the 'Benedicamus Domino'; Zaccariae, festinans descende, etc. which now comes later in the service.
5 This is the first of two sprinklings that occur; see note 1 on next col., for comments on the origin of the practice.
6 Gallican, Egh Port., Greg. (722 Mur.), etc. The Irish use shows its primitive character in cutting the crosses to be cut with a knife, without wooden posts,' etc. (J. Wordsworth, op. cit. p. 16); W. Gell., op. cit. p. 84).
7 The earliest word for 'staff' here is canamus (or canabita), 'shepherd's crook, perhaps derived from catus.'
8 The Irish use shows its primitive character in cutting the crosses to be cut with a knife, without wooden posts,' etc. (J. Wordsworth, op. cit. p. 16); W. Gell., op. cit. p. 84).
9 The order of Verona (see note 9 on p. 689) mentions the use at the end of the service, this may be a later innovation.
CONSECRATION

benefits typified by it may accrue to the newly consecrated building. The bishop then signs the inside of the church door with two crosses, using his manto, and utters another prayer suitable to the action. Returning to his former position, he invites the congregation to pray for a blessing upon the building, 'per aspersionem huic aquae cum vino, sole et cinere mixtae.'

(6) The consecration of the altar.—The choir begins by singing Psalm 92 (Judicia me, etc.), with the antiphon (Introibo, etc.), while the bishop, standing before the altar, dips his thumb into the water in a Gergorian way and makes a cross first in the middle of the same, then on each of its four corners, saying, 'Sanctificetur hoc altare,' at each time. At the conclusion of the introit, the bishop, having said the prayer 'Singulari thud,' etc., goes seven times round the altar, sprinkling the water, with a branch of bay, whilst the antiphon ('Asperges,' etc.) and Psalm 59 ('Miserere mei,' etc.) are said. 3

(6) All the walls and pavements of the church inside are sprinkled in the manner of three times round the singing of Psalms 121, 67, and 90, with various antiphons. Two prayers (both ancient) and a preface follow, the bishop standing with his face towards the door.

(7) The bishop now goes once more to the altar, mixes some cement with holy water, which he duly blesses, and throws what remains of the water away at the base of the altar.

(8) His next duty is to go and bring the relics solemnly to their new resting-place in, or under, the altar that has been prepared for them. 4 This he does with much ceremony while the choir sings Psalm 94 (Venite, exultemus, etc.), with several antiphons. But, before entering the church with the relics, he calleth down on each of its four corners, outside and within, and delivers a set oration at the principal door, on the duty of treating churches with reverence and on the importance of endowments, after which the archdeacon reads two decrees of the Council of Trent. Then the bishop next addresses the founder of the church as to his intentions in maintaining it and the clergy attached to it, and, on being satisfied with regard to them, asks for the people's prayers on his behalf and that of the religious, the response (Exsultemus et Dominus in Deum, etc.), Gn 28:21-22 is sung. The bishop also signs the outside of the door with chrism, which he has brought down with him from the sanctuary. At last the procession enters the church, and, during the singing of the Psalms 9, 14, and 150 are sung, with various antiphons. After a collect (Deus qui in omni loco, etc.), the bishop first signs with chrism the receptacle in which the relics are to be laid, and then places the vessel containing them therein. 2 While the antiphon (Sub alteare, etc.) is sung, he crosses the relics, and fixes with the cement he has previously prepared (see above) the slab upon the confessio. Further antiphons are sung, and other collects ('Deus qui ex omni habitatione oris contemptus'), are said while this work is carefully completed.

(9) The mensa altaris (i.e. the upper slab) is then censed, anointed, and blessed with a number of antiphons, collect, and Psalms 144, 45, and 89. In this part of the ceremony oculus catachumenorum as well as sanctum chrismum is used for anointing, to typify the right of confirmation as the completion of the initiatory rite.

(10) After this the 12 consecration crosses on the inner walls of the building (see above) are each separately visited to be anointed, censed, and blessed, after the singing of Ps 147, an antiphon, and two responsories.

(11) Incense is specially blessed, and has then by the bishop's own hands to be formed into 5 crosses, placed with holy water, oil, chrism, and wax on the 5 crosses of the mensa, and lighted with antiphons and prayer (Domine sancte, etc.). The ashes are carefully removed and another prayer and preface, and Ps 67 is sung, with an antiphon. The altar is yet again anointed in silence, and, after two more prayers ('Majes-tatem tuam, etc.', and 'Supplices te deprecamur, etc.'), the bishop grasps the slab near the altar and cleanses his hands with bread, while the deacons wipe the mensa with coarse towels.

(12) The other vessels and ornaments of the church and altar are then similarly dedicated with antiphons, prayers, and collects, and, at last, when the altar has been properly vested and prepared, the Missa dedicationis is solemnly celebrated.

At the end of the service the ashes on which the alphabet was traced are removed, and the whole church is cleansed.

ii. MODERN EASTERN RITE.—For this we must take the Orthodox Greek Church as the norm. Here there is a general resemblance to the Western rite; but, since in many places a certain amount of elaboration introduced into the service during the last 200 years, partly, perhaps, in the direction of assimilation to Western usage;—yet it is, on the whole, a simpler ceremony, and there are important differences.

To begin with, there is a short and simple form

1 This is now called 'confessio, i.e. est, sepulchrum altaris.' The term confessio is found also in many early books; it is equivalent to martyrium, and means the hollow place beneath the altar which is still to be seen in some of the oldest Roman churches, and which is the origin of the later and larger crypts, marking the place of burial of the martyrs over whom the church was first raised.

2 The only direction now is that this should be done ' venerabiliter'; but in the Amb. Pontifl. and Pont. Egh., as also in the Greg. (485 Mur.), the rubric requires that a veil should be stretched in front of the altar at this point ("extenso velo inter ecc. etc."). Both the Bened. of Archib. Robl., and the Pont. Egh., characterize a prayer at this part of the service as "votivo post sanctificationem," but it is quite clear whether the word does not here mean 'vested' rather than 'veiled.'

3 What this veil was which Duchesne considers 'Gallican' is uncertain; perhaps it was only the ordinary altar curtain, which there is reason to believe used to be drawn before the altar at the consecration in the Mass (see Wickham Legg, op. cit. p. 9).

5 All these (excommunication, degrees, and address) or any of them may be omitted now.

6 Benedict, of Archib. Robl., Greg. (485 Mur.), etc.
CONSECRATION

63

provided for laying a foundation-stone. This consists of first cleansing the site, the choirs going in procession with the bishop round the foundations, singing the ἀρνητικαὶ τῶν αἰμάτων of the saint in whose name the church is to be dedicated. Then, after a prayer on the site of the future altar, the bishop takes a stone, makes the sign of the cross with it, and lays it somewhat near the foundation, saying, 'God is in the midst of thee.'

In due time, when the church is built and ready for use, the dedication (ἐξώδομα) itself takes place. The following articles have to be prepared beforehand: 4 drams of pure wax, about the size of a small chestnut; 2 vessels, some paper and twine, a litre of finely powdered marble, relics of martyrs with a little silver recepiacle, holy chisels, 10 cutlets of linen cloth, wax, oil, consecrated water, and 4 vessels of coral embossed with the figures or names of the Evangelists, the καταστάσεως and as many ἀρτοίων as the bishop intends to consecrate (see below, p. 52).

Then, on the evening before the day fixed for the consecration, the bishop and clergy meet in the new church. The relics are placed upon the βαθέα (paten) in three parts on the altar itself, and the א. A short service is conducted, consisting of the Blessing, the Trisagion, the Lord’s Prayer, certain τραπέζων, and the Dismissal (ἀπελευθέρωσις).

Next, if the church is to be fully dedicated (i.e. not as a mere oratory or for temporary use), the relics are taken out into some neighbourly consecrated church, and laid upon the altar there; otherwise, this adjournment does not take place, and the vesting of the altar is performed in the new building. Vigil is kept that night in possession of the relics.

(1) There is a special ἀρτοίων (Vespers), with proper δίσημα and three proper lessons (viz. 1 K 85-84, Ezk 435-44, and Ps 98-98).

(2) Later on, again, there is a special ἀρνητικαί (Lauds), in which the Gospel is that of the saint of the dedication; the proper canon, with its nine odes, is attributed to John of Damascus. This service is concluded with the great Duxology.

Next day, on the first Sunday, the bishop and clergy assemble once more in the new church. In one vessel the wax, marble, etc., are all melted together in a fire. In the other water is heated. The μεσον is taken off its supporting pillars, and placed on the altar, in a niche sixty inches high, and as much broad, so as to hold the powdered marble when it is poured in. Thereupon the priest begins the office of the Prothesis, while the bishop proceeds to the old church, where he dons his episcopal robes, and orders the Liturgy to take place. The vesting of the altar is then performed, the bishop takes the outer covering (called εκκοράσια) and unfolds it over the μεσον while they sing Ps 93. Lastly, he takes all the new ἀρτοίων which are to be consecrated, and spreads them out, one on top of the other, on the altar; and on the top of all he puts an ἀρνητικαί which has already been consecrated; meanwhile Ps 26 is sung.

After this, the first altar, then the whole church, is censed. Next the ἀρνητικαί are anointed, where they lie, with chisels and the ἀρτοίτος, and the ceremony is completed. The altar is then opened, and the bishop washes his hands. The bishop recites a second prayer. Finally, the Liturgy proceeds to the end as usual, the Epistle now being He 314, and the Gospel John 10.

The Liturgy must be repeated for 7 successive days, on the new altar, and the new ἀρνητικαί remain there as before. After that they are all regarded as fully consecrated, and may be distributed as occasion requires.

It will thus be seen that at a consecration chief stress is laid on (a) the erection of the altar in the church, and (b) the anointing of the ἀρνητικαί, which can never be a separate service, and is

1. A linen cloth, the length of the Holy Table, forming the middle one of its three coverings.

2. The bottom cloth upon the Holy Table is so called. The natural derivation of the word would be as if it were a substitute (ἀντά) for the μεσον, and this seems to accord with the use of the article; but it is always spoken with, not alone, and seems to be a canting word (Neale, op. cit. p. 180).

3. The following words are used in this sense, which is said to imply the setting up of the bishop’s throne in it, for every church in his diocese is potentially his cathedral, and becomes so for the time when he is present (see Neale, op. cit. p. 1043, note, and Fortescue, Orth. Esth. Ch., London, 1907, p. 84, note 2).

4. This four-legged table usually stands near the ιεραποστάς for the use of the clergy (see Neale, op. cit. p. 1041).

5. For a third time they march round the walls, while the 6th ode of the canon is sung. Then the relics are laid upon the τερματισμὸς as before, the bishop prays, and the τραπέζων is sung. Then, after the closed church doors, the clergy sing Ps 2475, some from within demanding ‘Who is the King of Glory?’ and those without answering. Then the doors are thrown open, and the relics enter. The procession enters each of the 4 doors; the bishop, passing up the nave, solemnly places the relics in their receptacle, pours chisels on them, and prays. The powdered marble and the hot mixture of wax and other ingredients are then poured round the base and at the top of the altar, and the μεσον is securely replaced and fixed thereof. While the cement cools and dries, Ps 145 and 23 are sung.

Then the bishop places in the 10 cutlets of linen which have been provided, and fastens the 2 napkins over his arms, so that his vestments are entirely protected from being soiled in the ceremonies which ensue. After this he kneels down and prays, (this being an unbroken liturgy of prayer in the East) and recites a long prayer of dedication, and the deacon says the litany (εκκοράσια). Then the bishop washes the μεσον, first with the soap and warm water during the singing of Ps 84, next with the wine, while Ps 140 is sung. Then the ἀρνητικαί to wipe it off; lastly, he makes three crosses with the chisels (or oil) on the μεσον, spreading the oil from them all over the top, and also on the pillars, while Ps 153 is sung. The ceremony is complete.

The vesting of the altar next takes place. At the corners of the μεσον the 4 cloths with the Evangelists’ names or figures on them are fixed with the cement; over them the καταστάσεως, with its four tassels at the corners, is spread, during the singing of Ps 152; then, after washing his hands, the bishop takes the outer covering (called εκκοράσια) and unfolds it over the μεσον while they sing Ps 93.

Lastly, he takes all the new ἀρνητικαί which are to be consecrated, and spreads them out, one on top of the other, on the altar; and on the top of all he puts an ἀρνητικαί which has already been consecrated; meanwhile Ps 26 is sung.

After this, this altar, then the whole church, is censed. Next the ἀρνητικαί are anointed, where they lie, with chisels and the ἀρτοίτος, and the ceremony is completed. The altar is then opened, and the ceremony is repeated as usual. Finally, the Liturgy proceeds to the end as usual, the Epistle now being He 314, and the Gospel John 10.

The Liturgy must be repeated for 7 successive days, on the new altar, and the new ἀρνητικαί remain there as before. After that they are all regarded as fully consecrated, and may be distributed as occasion requires.

It will thus be seen that at a consecration chief stress is laid on (a) the erection of the altar in the church, and (b) the anointing of the ἀρνητικαί, which can never be a separate service, and is

1. A linen cloth, the length of the Holy Table, forming the middle one of its three coverings.

2. The bottom cloth upon the Holy Table is so called. The natural derivation of the word would be as if it were a substitute (ἀντά) for the μεσον, and this seems to accord with the use of the article; but it is always spoken with, not alone, and seems to be a canting word (Neale, op. cit. p. 180).

3. The following words are used in this sense, which is said to imply the setting up of the bishop’s throne in it, for every church in his diocese is potentially his cathedral, and becomes so for the time when he is present (see Neale, op. cit. p. 1043, note, and Fortescue, Orth. Esth. Ch., London, 1907, p. 84, note 2).

4. This four-legged table usually stands near the ιεραποστάς for the use of the clergy (see Neale, op. cit. p. 1041).
CONSENT

peculiar to the East. The Syrians, however, are said to use slabs of wood instead of cloths for this purpose, and in cases of necessity permit the Eucharist to be offered on a leaf of the Gospels, or even on the hands of a deacon.¹

See also ANointing, Eucharist, King, Ordination, Priest, Sacrament, Sanctuary.

C. L. Feltoe.

CONSENT.—The usual meaning of the noun 'consent' is voluntary agreement to, or acquiescence in, another's proposal. The verb is used similarly: 'to consent' is voluntarily to accede to, or acquiesce in, what another proposes or desires; to agree, comply, yield. The original meaning of the word (Lat. consentire 'to feel; think, judge, etc., together') is almost obsolete. It is rarely used to denote agreement in sentiment, opinion, or judgment, though this meaning is preserved in the phrases 'common consent,' 'universal consent,' etc. In these senses we find it in Sidgwick's Methods of Ethics² (1901), bk. i. ch. viii. § 3. We are led, he says, to endeavour to set at rest doubts as to the validity of the particular moral judgments of men by appealing to general rules, mainly established on a basis of common consent.

And in Matthew Arnold's Mixed Essays, 1879 ('Equality'), we find the sentence: 'As to the duty of pursuing equality, there is no such consent among us' (p. 49). Most of the primary, and some secondary, meanings of the word have, however, been taken by other words, so that we now speak, e.g., of assenting to statements, doctrines, and creeds, and of consenting to proposals. Examples of this use of the word are to be found as early as the 12th cent. (see OED, s. v.).

A stage logically intermediate between the primitive and modern usages is the employment of 'consent' to denote agreement in a course of action. 'When the wills of many concur,' says Hobbes, 'to one and the same action and effect the concurrence of wills is called consent' (Works, iv. xii.), and in Lk 14:² we read that 'all with one consent began to make excise.' There is no reference to the sentiment, expectation, or judgment of the persons concurring to act.

But in its modern prevalent use 'consent' denotes a type of volition which implies acquiescence in what is proposed by another, an acquiescence, not in the proposer's sentiment or judgment, but merely in his proposal. The state of mind preceding consent seems to include some reluctance to the action proposed. The reluctance may be of any degree, from mere indifference, through definite disinclination (which may be simply lack of light), to decided aversion. In the typical case of consenting, the reluctance is overcome without ceasing to exist. When reluctance ceases, the end takes on a more or less desirable character. An end desired, whatever else be the psychological origin of the idea of the end. It may have been suggested by another because he approved of it or desired its realization; but, while the end is his

only, and not attractive to us, there may be an indifference, at least, if not a more positive reluctance, to adopt it. When it touches us and creates desire or wins approval, it becomes to that extent our own end, and ceases to be what we acquiesce in.

We consent to, that is, voluntarily acquiesce in, an end which is not our own in the sense explained. Consent so defined raises difficult moral problems.

The fact that a deed is done does not do away with the fact that it is will, nor, according to John Stuart Mill (Utilitarianism, 1901, ch. ii.), does it affect the morality of the action. It may affect our judgment of the character of the person who does it, but the will of the volition depends upon the nature of the whole result which was foreseen to depend upon the volition. The apocrypha in selling poison to Romeo said, 'My poverty, not my will consents, but he pressed and ordered the execution of the poisoning proposed by Romeo. He did not wish the poisoning, yet 'the consent, though said not to be of the will, might have been enough to hang one' (T. H. Green, Prolegomena to Ethics, 1880, bk. ii. ch. ii.).

This is the case in certain cases may signify much or very little. It may mean, e.g., anything between non-interference and full co-operation.

Would we give as much credit to one who permits a good deed to be done as to another who actively helps to perform it? Would the volume equally persons who allow an evil to be done, as the consent to, or do it entirely themselves? Salome consented to the proposal of Herodias that John the Baptist should be beheaded, and demanded his head of the king. Herod, however, determined to satisfy the demand of the people to crucify Jesus Christ. Jesus consented to die. The consent of the one showed him to be a weak and unjust ruler; the consent of the other revealed Him as a Saviour of men. It is clear, therefore, that to determine the moral significance of an act of consent, the whole complex result willed must be analyzed into its elements and considered in their relation to one another, and also in relation to the concrete conditions in which the person willing finds himself. The situation is often very complicated. The acquiescence of Jesus in His own death, e.g., was an act of obedience to His Father's will, yet consenting to that will involved the committing of a crime by the Jews and Pilate. Matheson (Studies of the Portrait of Christ, 1890-1900, bk. ii. ch. iii.) thinks that the agony of Gethsemane was largely due to His aversion to allow such a crime, and to doubt what it would be in accordance with the will of God. 'Taking up the cross' for a Christian frequently means consenting to a course of action which he does not desire, and cannot see the reason for, or the reasonableness of; nevertheless he acquiesces, in the belief that he is obeying the will of God, and that the will of God is good.

Submission of the will to authority of any kind amounts, directly or indirectly, to acquiescence in what is proposed by others. Obedience is consent, so is compromise; co-operation involves it. We cannot live in social relations with others without

¹ See art. 'Antinomism,' in D.C.T. 911.

² There is a distinct difference in consequence between the consent of belief and the consent of will. The consent of belief is, in a measure, a forced consent,—it attaches to what stands in the order of ideas whether I consent or not. The consent of will is a forced consent—a consent to what shall be through me (G. Baldwin, Handbook of Psychology, 1891, 'Will and Feeling,' p. 171).
having, now and again, to do things for them which we do not ourselves desire, and in which we have no share (the master judgment.

For it is not easy to know whether the ends which our fellow-men set themselves to realize with our help are, on the whole, good. The goodness of particular ends is, within limits, relative to the individual or society for whose good they are aimed at. An end which is good for one may be bad for another. This is true irrespective of our conception of the ultimate ideal of life. Even if the ultimate good be one and the same for all, it is individualized in a different fashion, i.e., each man may claim the right to realize it in his own way. This seems a legitimate claim, and consequently the good man may feel called upon to regard consent to special ends which he does not desire, and is not in a position to approve or disapprove, as a normal duty. By recognizing the claims of his neighbours to his love and help, he admits also their right to expect him sometimes to acquiesce in their purposes and to trust their judgments. He must act, not on his own insight, but in dependence on that of others. His will must consent to theirs. The appeal of many proposals may depend not so much on their intrinsic reasonableness, as on the persons making them. Therefore the wise man is only partly a legislator, and may be called upon to rescind his consent. Reason can scarcely hope that the ends which his fellow-men seek are always good. Moreover, good men often come into apparent conflict with one another, and co-operation is limited by competition.

A more difficult problem is raised by a consideration of the fact that man’s life is lived in a world over whose course he has very little control. If the world is the result of blind forces utterly indifferent to human ends, the wise man has no ground for hoping that life will ever be satisfactory. He cannot acquiesce in such a world. His mind and heart must protest against it, however useless the protest may be. If these forces form a mechanical system, whose operations can be calculated, the wise man’s intelligence may bow to the inevitable order, and seek to understand it, but his conscience does not consent to such a scheme. The moral will would be inevitably opposed to a merely mechanical causal process. It cannot acquiesce in a world which is not based on moral principles, and which is not ultimately amenable to human ends.

And even on this assumption a completely rational life is an ideal which is scarcely realizable by human beings. This unhappy state of affairs, and that of the impossible world in which we have no share, make it necessary to raise the question whether happiness consists in the intellectual love of God (amor intellectualis Dei). For consent in marriage, see MARRIAGE.

LITERATURE.—This is sufficiently indicated in the article.

D. PHILLIPS.

CONSEQUENCE.—If a proposition $p$ implies a proposition $q$, but $q$ does not in turn imply $p$, then $p$ is called the antecedent and $q$ the consequent; whereas, if each implies the other, they are preferably called inferents. Logical consequence is thus the relation obtaining between a conclusion and its premises, such that if the premises are true the conclusion is true. The reverse of this relation—the relation holding between the consequent and the antecedent—is logical presupposition. That is, the consequent is logically presupposed by the antecedent; for only if it be true can the latter be true, whereas the antecedent might be false and the consequent still true.

By causal consequence, is meant the relation between an antecedent event and its effect; and the philosophically important question at once arises, Are the two types of consequence the same? For a century it has been believed that Hume and Kant proved successfully that the relation between cause and effect is not that of logical consequence, by showing that we discover causal relations not by deduction, but by observation and experiment, or inductively. But this does not follow from the mere discovery of causal relations is usually made inductively, the relations discovered are logical. Moreover, many causal relations have been deduced, to wit, those inferred in mechanics and mathematical physics. All relations must be explicitly formulated as propositions of the type $p$ implies $q$. Perhaps what confuses us is that the temporal relation between an antecedent cause and its effect is foreign to logical consequence, and that the antecedent event seems to us, for practical reasons, necessary for the effect, and not the effect for it. But the effect is quite as necessary for the cause as the cause for the effect; and, though in a temporal system, such as the world is, events must be related in time, still their relation is formally accidental to the generic relation whereby from the nature of one part of the world-system we are enabled to infer the nature of another part. This generic relation is that of logical implication, and is either the causal relation or a class of which the causal relation is a member. See CAUSE, CAUSALITY.

WALTER T. MARVIN.

CONSISTENCY (Ethical).—In so far as ethics is a theory, we must ask whether such a theory is open to the test of consistency; and in so far as ethics bears upon conduct, we must inquire whether consistency also applies to the practical sphere. In
regard to its theoretical aspect, the question arises whether ethics is simply knowledge of moral facts, or whether it must fashion an ideal to serve as a rule for conduct; whether, that is to say, it merely describes, or also enjoins and judges, if by any mere descriptive, its sole aim will be to discover the characteristic and essential features of morality. The latter view has very largely come into favour in modern times.

Consistency in naturalistic ethics.—Utilitarianism, Eudemonism, or the Ethics of Feeling, proposes to explain the origin of morality. It starts from phenomena; it examines the native capacities of mankind, and even tries to trace the devil necessarily involved a change itself with the psychological analysis of impulses, feelings, and emotions, with man’s relations to his environment, and his dependence upon, or relative independence of, this environment; with his relations to Nature, to other men, to his conscience, and in so far as ethics bears this empirical character, its business is to subject the conduct of men to historical and psychological investigation, to analyze it, to discover, if possible, the laws which actually regulate and determine such conduct, and furnish a standard of value for conduct, and to determine the class of actions most conformable to this standard. For this school, in fact, the only important matter is to draw from the boundless mass of material such general truths as will be valid within this particular sphere. It is impossible on these lines ever to get beyond probability or merely relative points of view. An ethical theory of this sort is inevitably tied down to the relative. Philosophers can find no footing here. All that is required is to bring the manifold data under general categories by induction. Empirical thinkers, and more especially sceptics, who place their mark of interrogation upon everything, will even tell us that the endeavours to introduce consistency into ethics is a mere futility, and really prevents us from doing justice to the facts. A moralist like Bentham, for instance, will have nothing to do with consistency. For, though he admits the general proposition that morality is concerned with the good of the whole, he yet holds that experience alone shows what makes for this good. Laws derived from the facts are only of relative value. A change in the facts will alter the value of any proposition in the laws. Those who favour the historical method give special prominence to the fact that ethical ideas undergo extensive modifications, and that every age has its own particular assortment of such ideas, and thereby quite incapable of being reduced to unity. Efete conceptions—vestiges of earlier modes of thought—still continue to operate in certain circles, or in the general consciousness, at times when other views and ideas, by no means reconcilable with the old, have come to the front. Hence, it is said, the collision of duties and the existence of contradictory views of moral life are just what we might anticipate, and accordingly the demand for consistency is sheer folly. Moral judgments are thus the result of a psychical and historical process—the mere temporary compromise between the competing interests of the day. To look for consistency under such conditions is to look for the facts. A judgment must be passed upon the theory which finds morality in the spontaneity of our nature, which builds upon instinct and unconscious tendency, and which, as wholly averse to rational principles, would trace moral action to the impulse of an inherent goodness in mankind, or of partly conscious, partly unconscionable, propensities; or, again, would even bring in the operation of a natural impulse or emotion, for the theory of emotion is the proper arena for the irrational, for a power quite irresponsible to reason. Here, it is said, we encounter the fact of personality; here the concrete, the merely particular, is to be brought into play—that which in the last resort eludes the grasp of thought. All general principles are therefore left bare abstracions drawn from a limited field of experience, and as divergent as the data they refer to.

2. Consistency in religious ethics.—Frequently, too, even religious ethics gives no more consideration to the idea of consistency than does empirical ethics. The ethics of religion has usually been content to give sacred sanction to a traditional morality, which has grown up amongst a people under the most heterogeneous influences; or it has, at least, industrious direction been given, monomaniacal observances, ecclesiastical duties, and especially works of piety. We need not expect to find a harmonious consistency under such conditions.

We have an instance of this in Jewish ethics, which, of course, presents the same contradictions regarding individual conscience and conduct, and regarding social, communal, and political affairs. The ethics of the Persian religion embraces a vast array of ceremonial and moral ordinances, together with injunctions regarding social duties, such as planting trees, killing noxious animals, and the like; Jewish and Mohammedan ethics, however, are to a degree in receipt of the same name, and all the various regulations into a formal unity, namely, the will of God, as the source of all; and it is this will—what faces the penalty of transgression and the reward of obedience.

A second type of religious ethics is that which admits a dualistic morality. In Buddhism, for instance, there is one morality for the monks and another for the laity. The universality of this religion was not carried to its final issues; thus, woman was placed on the lower rank than man, and the system of caste was left undisturbed; and, while the leading principle of Buddhist ethics was the complete surrender of desire in a life of patience and contemplative wisdom, this was subsequently enjoined in different degrees for layman and monk respectively. The monks might be required not only to renounce the world and abstain entirely from sexual intercourse, to avoid luxury, and to give themselves to meditation, but also to undergo bodily austerities, while the rules of proper were added to moral obligations. A consistently developed ethical theory is thus clearly the exception of the rule.

The same is true of the ethics of Brahmanism. The Law Book of Manu contains an exposition of duties, as well as injunctions regarding the renunciation of the caste system and submission to the Brahmans. On the other hand, there is, as early as the Veda, the Aryan law (Hindu, Early, and Cosmoc) art tham, which bids each find himself in his fellow man; and, while asceticism, solitary meditation, and withdrawal to the forest must for more than family or business life, yet a compromise is made between the two by the regulation that the forest life shall be adopted only after a man has lived in a family and brought up a son.

Consistency is likewise allen to the ethics of Roman Catholicism. For one thing, morality is here made to rest upon the isolated fact of an external authority; for another, a distinction is drawn between obligations and counsels. Moreover, the external moral obligation of external conscience prescribes a sentence of condemnation, while, finally, the moral ethics of the religious is severed from the ethics of the laity.

Nevertheless, it would be wrong to imagine that religious ethics must necessarily assume this double form, or that it can be no more than a mere aggregation of contingent and isolated commands, and must in consequence lack consistency.

As a matter of fact, the ethics of Confucius, who put a check upon belief in spirits, sorcery, exorcism, and who read a divine revelation in the natural and social order, exhibits a more homogeneous and self-consistent morality than any of the above. 'The wise man obeys the law and awaits his destiny; that is the sum-total of duty,' says Confucius. 'The hierarchy of moral duties is subject in the subjection of the wife to the husband, of children to parents; in family affection, which is to be nurtured by ancestor-worship; in the relations of the sexes, as providing a 'barrier for the people'; in the subordination of the younger to the older, and of the subject to the ruler.'
The law also declares that this social order shall be represented in the ritual. Kindness to the poor, the friendless, the widow, and the orphan, is counseled, and great stress is laid upon fidelity to the wife. The government is often aimed at nurturing a peaceful, industrious, and contented people. It prescribes that Confucius great store by ancient tradition and history, as exhibiting the disasters of heaven in punishment and reward. Obscenity of this moral order is at the root of human conduct. He maintained that, notwith-standing the anathematized form which this moral teaching tends to assume, nearly everything is dominated by a single thought.

Finally, the ethical principle of Christianity exhibits certain features which not only imply that the entire moral life is brought under one point of view, but also set forth a consistent moral ideal.

3. Consistency in rational ethics.—(a) As the application of an abstract law.—We have attributed the religious, ethical, and social virtues, therefore, either as giving formal sanction to incongruous usages, or as mixing together arbitrary laws, or as separating the moral interests of religion from those of the secular life, tends in the main to dispense with consistency. It is quite different with rational ethics. The fundamental tenet of the latter school is that the moral is grounded in the rational; and, even if a distinction be made, as by Kant, between practical and theoretical reason, the test of consistency holds good in either. When Kant wishes to prove that a breach of the universal moral law is indefensible, he points to the contradictions which such a breach is bound to involve. If we question the validity of a maxim, we have but to ask how it would work as a universal law. Thus, for instance, the refusal to implement a promise, were it made a universal rule, would result in a state of things where no promise was accepted, i.e., the maxim would defeat its own purpose. The criterion applied here is therefore that of logical consistency. Similarly, in his Critique of Practical Reason, Kant resorts to the logical categories as furnishing a more precise test of action. In one form or another, rational ethics makes an attempt to pass from an unconditional to a conditional principle in morality, and it must vindicate the claim of this unconditional and universal principle to be supreme, i.e., to determine everything that comes within its province; in a word, it demands consistency.

Consistency in rational ethics is, primarily, the requirement that the practical side of life in its entirety shall be brought to the test of the universal moral law. This the Stoics maintained that all morality lay in the one supreme virtue, namely, harmony with the law of nature or of reason. From the same standpoint Kant treated morality in a purely formal way, taking reverence for the law as the motive. This law, however, being as yet wholly abstract, is incapable of positively determining the concrete materials of concrete actions. Concrete conditions are brought within the scope of the law; they are not, however, derived from the law, but only tested by it. For example, the institution of marriage is not deduced from the law, nor is its place in the ethical economy assigned by the law; the sole question is whether, marriage being assumed, the universally valid law can take effect in its relationship. Strictly speaking, in such a case we can say only that the law must not be infringed; we cannot determine the actual duties of marriage. It is, in fact, precisely on this account that Kant distinguishes between duties of perfect and those of imperfect obligation. Thus, for instance, the obligation of developing one's natural powers is an imperfect one, because, while the maxim of such effort is undoubtedly a law, the mode and degree of such effort in no way depend on the individual. Even on Kant's view, therefore, there is a conflict of the spheres in morals, to which the consistency of the moral law cannot be extended—a sphere of practical universality, in which particular cases cannot be decided by the law.

Kant's mode of applying the test of consistency in the field of rational ethics is in contrast with that of Herbart. On the one hand, the unifying principle from which Herbart starts is an aesthetic a priori judgment regarding relations of will; and from this judgment proceed the ethical ideas. On the other hand, rational ethics begins with the particular actions of will, group them together, and, on this basis, forms a principle. Closer examination, however, reveals that these ideas are not held together by the thought of a harmony in all the principal relations of will, while a similar universal will may be attributed to the conception of living society, which combines all possible practical laws, and thus holds together individual and social relations of will. Looked at in this way, the ethics of Herbart presents us with a much more concrete ideal than Kant's universal abstract law, and so exhibits a higher degree of consistency.

(b) Consistency in the structure of the concrete moral ideal.—The criterion of consistency is applied even more cogently by those who seek to derive morality by speculative reasoning. Adherents of this school have endeavored to reconcile the moral law with the concrete form. It was on these lines that Plato fashioned his ideal Republic, which he regarded as the highest image of the Good upon earth, though his dualism stood in the way of a perfectly consistent moral theory. Given the theory, he sought to delineate a harmonious act, type of the Idea of the Good; and it was his conviction of the universal supremacy of this Idea that moved him to incorporate in his scheme the concrete conditions of human life and the specific faculties of the soul. In the Laws, it is his belief, he somewhat lowers the Ideal in favor of the existent civic situation, yet this does not so much imply a surrender of consistency as a desire to actualize his ideal State amid given conditions. The idea of the Good which manifests itself in the individual (as virtue) and in the State—the macrocosm of man—is set forth by Plato with the strictest consistency as the unifying principle of morals. This was even more true with Aristotle. With him, the one τὸ σῶμα is supreme in man, laying down just proportions for all emotions and all goods; and, although he gives an empirical tabulation of the particular virtues rather than a classification determined by an universal principle, yet his guiding thought is that the diatonic virtues are concerned with the development of the practical intelligence, while the ethical virtues have to do with reason's mastery of the passions by exercise. In other words, according to Aristotle, virtue is one, viz. the supremacy of reason, which, however, can be adequately realized only in the State—the State itself, again, being founded upon the home. Aristotle also agrees with Plato in laying his doctrine of virtue to the Idea of the Supreme Good, but he concedes a much wider scope to the operation of reason in practical life, and thus carries out his ethical doctrine in a more consistent way.

In modern philosophy, G. F. Hegel and Schleiermacher have urged the importance of unity in ethical theory, and have given complete consistency to the moral ideal. True, Schleiermacher discarded inductive ethics and advocated the descriptive method. In his system, however, he maintained that the moral is empirical or inductive, but rather a speculative, scientific. The moral ideal is not an ideal of obligation, but it is described as the ideal by which men act—duty; or in terms of the faculty which manifests itself as law—virtue; or in terms of the result of action—the highest good. In all this Schleiermacher applies the ideal with such rigorous consistency as to demand that every man, with due allowance for his individual nature, shall construct and realize his ideal completely and in full detail. He gives no place to the distinction between perfect and imperfect obligations, or to the collision of duties, since at every moment only one mode of action is ethically possible—that, namely, which in the circumstances best furthers the entire moral process. Morality being an integral whole, every action is in its degree a reflection of this whole. The distinction he draws is that of a symbolizing and organizing action he admits to be right only when it is the other in smaller compass; the same is true of the universal and the individual factor. Each ethical province therefore in a measure embraces the other, and, when combined, they constitute the highest good—a unity absolutely complete in itself. The ideal has no gaps, and, consequently, nothing
is purely permissive. The ideal embraces the entire range of human conduct; in fact, even the mode of action in any given situation is determined by fixed rules.

According to Schleiermacher, reason is a power which moulds nature to new issues; and among modern thinkers it is he who has most consistently developed the thought that the whole spiritual life of man is ethically determined, no phase whatever being left to mere chance. His "Theorie der göttlichen Zwecke" bears this same character. It simply describes how the religious impulse—the Divine spirit operating as the intensified power of reason—works as the constraining motive in the determination of moral action. He founds the first rational action (as it is called in his Philosophical Ethics) without running counter to it or altering its content. The man who is in harmony with the Spirit of God is, in thought and feeling, an integral concentrated force, which manifests itself in the moral ideal, and effects the highest good. This concrete form of the ideal exhibits a far more strict consistency and uniformity than does the abstractly hypothetical knowledge of the ethical idea.

c. Consistency in the historical development.—We can scarcely look for a more exigent standard of consistency in ethics than that of Schleiermacher, but we may give more consideration to the idea of a consistent Hegelian ideal, which is really timeless. No doubt he holds that the speculative view of ethics may be brought into relation with historical science and practical life by means of critical and technical studies, and he follows Locke in the full extent of the individual's place in the Kingdom of God; he even grants upon the ideal the laws by which the whole course of conduct must be directed; but, nevertheless, he practically overrules the factual moment in the speculative consciousness. In his "Kritik der bisherigen Sittenlehre" he submits the history of ethics to a searching investigation, but from a purely critical point of view. This defect was made good by J. G. Fichte, and notably by Hegel and afterwardly also by Chodkiewicz, Harnack, and von Hartmann. These thinkers took account of the successive stages through which morality had passed, and contended for consistency in the ethical idea. As an example we may take Hegel's Weltrechtsphilosophie, which also comprises his ethics.

In the history of moral experience Hegel sees a logically necessary process of development. He argues that the component factors in the moral idea are exhibited in the several stages of the developing moral consciousness; that they are all contained in the highest unity of the embracing unity of the moral organism. From the moral condition of the natural life, with its impulses, out of which, in process of time, grows a system of values, Hegel differentiates the stage of abstract law, in which man is subject to an external arbitrary norm, expressed primarily in the regulation of property and contract. Next, consciousness passes, by an inner necessity, from this purely outward phase of freedom to the stage of morality, which lays stress upon inner being, to an abstract and one-sided way. Advance is then made to the stage of Stiftsrecht, or established observance, in which moral thought aligns itself with an objective content embodied in the moral community. This content manifests itself first of all in the family, which forms an expression of natural feeling, and in which individual property becomes family property; it then appears as civil society, with its system of wants, police regulations, and corporate institutions; finally comes the State, which assimilates the results of the whole development. The State is the common family and civic society, in which the individual finds his satisfaction; it conserves the inner disposition, which now acquires a concrete ethical content; it concerns the abstract law, and the life of natural impulse together with its system of wants.

Now we may possibly take exception to some of the details of this sequence, but we cannot well ignore the Hegelian view that the man advances from a state of nature to a state of average morality characterized by statutory law; that, passing from the stage of positive enactment, he formulates the law abstractly as good disposition; and that, finally, he transforms this abstract morality into a concrete established observance, thus arriving at a Supreme Good which recapitulates in itself all the preceding stages. The idea of consistency in ethical knowledge is thus extended to the process of development, and at the final stage we are brought to a provisional harmony in which the consistency of the ethical idea is revealed as the economy of the moral organism.

(d) Consistency in the relation of Ethics to the ultimate end of Philosophy.—Of course, the moralists, however, carry consistency to still further lengths. Not only do they assign to ethics, as a special science, its proper place in the system as a whole—as even Kant does, in his distinction of theoretical and practical reason—but they either trace it to, or deduce it from, an ultimate unity, a supreme integral principle, thus fitting it organically into a complete philosophical rationale of the universe. Such is the procedure of Plato, who holds that the world of moral ideas is the highest that is known, the Good, and Beautiful. These Ideas Plato deems to be realities, so that the True and the Good and the Beautiful are one. The subject-matter of metaphysics or dialectics, which embraces the knowledge of being, is identical with the Good and Beautiful; and, as this highest Idea is Deity, metaphysics, religion, and morality are in the last resort one—just as truth, goodness, and beauty cannot be discovered. Plato's solution of the differentiation of consciousness is due to the fact that the good and beautiful of the actual world is only a copy of the real—a mere representation in material form, since the world is the sphere of becoming.

Although Aristotle and the Stoics likewise aspired to place ethics in its right connexion with philosophy as a whole, yet their endeavours after unity, their ideas of consistency, were not carried out so fully as Plato's, the reason being that their interpretation of experience and of the human was greater than his, and so far deranged their philosophical views. On the other hand, we have a striking instance of consistency in the work of Spinoza. Even his mathematical method, which in reality is logical rather than metaphysical, supplies an illustration of this. He regards metaphysics, ethics, and religion as constituting an integral whole; and, further, his theory of the parallelism of thought and extension enables him to incorporate physics into this unity. Here, therefore, we have an attempt on a grand scale to connect ethics organically with the entire system, and to enforce the principle of consistency to its extreme limit. A similar course is followed by the Absolute Philosophy of Germany, as exemplified by Fichte, Schelling, and Hegel, and, as they take the historical process into account, their system is even more comprehensive than that of Spinoza. Hegel looks upon man's whole moral experience in its several gradations as a phase of development in the self-manifestation of the Absolute, or the Idea, which actualizes itself in moral life in order to attain, in aesthetic intuition, in religious conception, and, finally, in philosophical thought. In this sense, moral life is thus an aspect of the Idea, a stadium in its development. Here consistency reaches the acme of rigour. Schleiermacher, too, endeavoured to bring ethics into organic connexion.
with his whole philosophy. For him, as for Schelling, the highest principle was difference, i.e., the absolute unity of opposites. This principle is confronted by the world, where, in virtue of the underlying unity, the several opposites of thought and being, real and ideal, manifest them- selves as the double of this very unity. The interfusion of real and ideal, if the former preponderates, is nature; if the latter prepon- derates, it is reason. Reason and nature, how- ever, tend towards a state of mutual adjustment, reason becoming nature general good and nature reason, likewise labouring to become reason. Thus ethics becomes physics, and physics ethics. Still another opposition confronts true scientific knowledge. Our thought is at once speculative and conditioned by experience. Hence the science of reason and the science of nature have each a speculative and an empirical side. The speculative science of reason is ethics; the empirical is history. The speculative science of nature is Natur-philosophie, while the empirical embraces the special natural sciences. Ethics and history are linked by technical and critical studies. Such is Schleier- macher's way of making ethics an organic part of universal science.

4. General Investigation.—It appears from the foregoing synopsis that moralists differ very greatly in regard to consistency as applied to ethical theory, the main cleavage corresponding to that between the empirical and the rational interpretation of morality. Generally speaking, morality is regarded as merely a means to the greatest possible good, then reason itself must be similarly interpreted, and, on this view, consistency comes into consideration only in so far as it is conducive to the single end. This general view, it is alleged, is best served by obedience to rules which have been inferred from experience. But absolute laws, laws permitting of no exception, are scarcely within the scope of such a hypothesis. General rules are deduced from limited empirical bases, subordinating his personal interests to those of others, this law will be recognized by him only so long as he finds it to his own advantage. Thus ethics, if it be but a means to a relative end, cannot itself get beyond the relativity of consistency.

The same result follows when a purely empirical theory of development is applied to morality. Altered conditions or the progress of civilization will necessitate a change in moral laws. Since, on this theory, ethics merely summarizes the best directions for human well-being under given circumstances, and since the variability of such directions and maxims is held to prove the relative character of the science, strict consistency is put out of court. As correlative of this view, it is alleged, in particular, that ethics must needs keep within the limits of the attainable, and that it is impossible to apply the idea of consistency at all hazards. If we bear in mind the way in which such maxims are formed, the way in which impulses, feel- ings, and passions are adjusted by the psychical mechanism, and in which we become conscious of this adjusting process, we can formulate rules which, so far from remaining mere ideals, take account of our actual capacities and circum- stances, and are therefore capable of being put into practice.

But even the most extreme empiricism must allow that morality emerges only when certain demands are made in obedience to the data of experience—demands which this school finds so little self-explanatory that it has recourse to all manner of 'sanctions' to establish their authority. Without the sanification of an ideal confronting the data of experience as a regulative law, morality is impossible. It may, indeed, be said that this ideal is simply the resultant of our empirical value- judgments, a purely consistent ideal. This, thus, for instance, the law of altruism, as against egoism, may be traced to the experience that other-regarding conduct brings an increase of satisfaction. But the question then arises whether this generalization is universally valid; and, again, whence the faculty by which such generalizations are made. The truth is, this faculty of abstraction is that by which we coligate the manifold in a unity, on the assumption that it is amenable to law. The ideal set up by the moral reason is something more than an aggrega- tion of rules, derived by abstraction from value- judgments; it is in reality reason's own craving for unity, which it seeks to realize in the ethical judgment it applies to the fact-ideal. The unity which is not overtly given in our various impulses, feelings, and passions is demanded by reason, and the demand cannot be met by anything relative. It is a fact that a number of moralists take their stand on the uniqueness of the faculty of morality; and this fact can neither be explained nor explained away by the empirical school. Reason cannot rest till it has moulded the man- fold into a unity, and in the ethical field this means not only the ideal end, but also, that its ideals are consistent. It is, of course, true that different epochs have different ideals, but this by no means implies that the ideals of any period were defective in the matter of consistency. Reason has built itself into the intellectual form; it has in ever-increasing measure incor- porated therein the various spheres of conduct; and, by defining the mutual relations of these spheres, it has attained perfect symmetry in its ideal. Indeed, there has at length reached a point where it can survey the whole historical sequence of ideals in a single view, and where it seeks to grasp the process of development by which the approved element of each依次 to the present time.

In short, if by an inherent necessity the moral reason is to carry out its task of ideal-making, and if its demand for unity is put forward unconditionally, then the entire task of voluntarism must be subjected to its authority, and its ideal must seek to effect the complete organization of moral life. In ethics, therefore, consistency is an unconditional requirement. Since the whole spiritual life of man is touched by the will, it must of necessity fall under the moral ideal. It has been said, indeed, that the concept can never reach the concrete, the particular. But, while this is the case, we can nevertheless form the concept of the particular, and assign the particular to its proper place in the ethical system, subordinating it to the whole in such a way as to make it an organic part thereof— a component which, so far from causing any dis- location, really works in with all the others complementarily, and is thus brought into the harmony of the whole. If it be deemed pedantic thus to bestrew the whole way of life with man- traps of duty, it must be frankly conceded that there are sections of life where movement must be free, as, for example, the sphere of recreation, of sociality, of imagination, or the aesthetic sphere. But the moral ideal encompasses these tracts in such a manner as to permit a certain freedom therein, provided the limits laid down by the moral system as a whole. Here, therefore, we have no exception to
the moral law, but simply an application of the ethical principle that each sphere shall be dealt with in its own way, while ever remaining a consistent entity of itself, and lost.growning within its own bounds. Here too, therefore, the unifying normative reason may manifest itself in constructing ideals.

Further, consistency, to be effective, must be complete. No doubt, it is present a prevalent view that a narrow and one-sided policy achieves the best results. An oppressed class, for instance, demands its rights; these are not to be won, it is said, by deliberations as to how that particular section of society is to be fitted into the social organism; nothing but the ruthless enforcement of its claims can secure for it improved conditions of life, though eventually, of course, such emancipation may benefit the whole. Again, it is asserted that a State attains prosperity not by enthusiasm for the ideal of humanity, but by a self-centred struggle for a recognized place in the council of the nations. Or, again, the individual who has formed a new religious views must, he held, not walk solely make compromises, but must carry his views into effect ruthlessly, i.e., consistently. Mankind, in short, makes progress only by the one-sided pursuit of narrow aims. Society is so constituted that, while one man is carrying out his inescapable task, the very inducements of his actions are being circumscribed by the interests of others. The whole process culminates in the mutual adjustment of interests. Thus the striving of reason for unity at length attains its end uncomplect, although the ethical ideal seems to be inharmoniously distributed. Progress is secured by mutual conflict. It is wrong, therefore, to lay the burden of this final adjustment upon the individual; all that we can expect from him is consistent, in his particular sphere, and in the advocacy of his special interests.

Plausible as such a theory may seem, and numerous as are its champions, it is nevertheless unconsistent. Were it consciously put into practice, it would forthwith plunge nations, classes, municipalities, and individuals—in fact, human society at large—into embittered strife, without a single reconciling element. Passions would become rampant, and animosities more virulent. We must proceed to the other and more vital side: viz., that the individual shall recognize the rights of others; that each class, each group, shall feel itself to be an organic part of the larger whole, the State; and each nation a section of the human race; and that in the conflict of opinion particular spheres shall take pains to apprehend what is good in the view of others. As a matter of fact, it is not laid upon men to prosecute their individual aims with relentless consistency, but rather to realize those aims in a manner compatible with the ideal, so that personal interests may be advanced without detriment to the larger whole. Such a mode of apprehending the moral task demands, without doubt, a high degree of intelligence. But a consistency which is merely sectional is no consistency at all, and is incapable of securing true progress, for it carries within itself the seed of reaction, which will sooner or later germinate. Moral development proceeds from mere simple conditions to the more complex; but, for that very reason, the prime necessity is to gain control of these complicated conditions by taking into account the various relevant elements which they contain, and by subordinating them to the unifying and moulding power of reason. Our object is to systematize the whole ethical data in harmony with the ideal, for only such an issue can adequately meet the unconditional demand for unity which reason makes.

5. Consistency between the moral ideal and practice.—The more perfectly consistency is attained in the formation of ideals, the less possible it is to escape from the ignoble and despotic questions. That there is an ideal and the actual moral situation. When the reality is compared with the ideal, it appears incongruous, contradictory, one-sided, narrow, circumscribed, rent by antitheses—in a word, bad; while the ideal itself seems but a futile and impracticable demand. In particular, it is rational ethics, with its special insistence upon a logically constructed ideal, which is mainly affected by the discrepancy, so that its boasted consistency would here seem to be lost in the confusion. Plato traces the defects of the empirical world—as compared with the Idea—to matter, and thus edition in dualism. Spinoza deduces not only the inadequate ideas and allusions, but also the adequate ideas—not only human servitude, but also human freedom—from the same mathematical necessity, and can therefore make his ideal avail at most only for the favoured few. Nor could Hegel dislodge this discrepancy: for, though he held the antithesis to be the very mainspring of progress, and as such to be subject to logical sequence, the contradiction was not thereby removed. Above all, Kant felt the opposition between the practical reason and the natural propensities so intensely that he went further than his predecessors. As his task was to recognize a difference between the speculative moral ideal and actual moral practice, and accordingly he introduced—in his Christian Ethics—a "purifying activity," which was in reality a confession of the fact that the moral ideal could not be attained within the sphere of moral action being in the end simply an anomaly to the will, which finds no satisfaction in any moral result. Here the antagonism is carried to such a point that moral action is made a means to its own ultimate abrogation. From this it would appear that the consistent formation of ideals, as thought by the utopians and anarcho-moralists, comes to grief upon the incongruity between the ideal and the actual.

Now this would undoubtedly be true, were the construction of ideas the final task of ethics. Such, however, is not the case. Nature, especially human nature, is so constituted that it must have recourse to reason as a means to its own harmony and perfection. The first stage, therefore, is the idealizing activity of reason, the outcome of which is the rationally harmonized image of nature. But this is only the first stage; and, when once consistency has been realized here, a further advance is made, for now practice is to be moulded into conformity with the ideal. Thus the contradiction above noted is simply a necessary point of transition—necessary, that is, if we are to have ethical life or action at all. In other words, if moral results are to be achieved by the rational activity of the soul, then the end, the task set before us, must first of all be known; and only when it is known can we proceed to the task of realizing it. The antithesis between the rational ideal and human nature, as it is, is not an absolute one. The truth is rather, that life, as we know it, awaits us for the soul in the medium by which it is to be harmonized and transfigured. The initial, or idealizing, stage of the moral process of reason is therefore responsible for no more than the harmonious, consistent for-
CONSOLATION, COMFORT (Christian)

Consolation, comfort is a complex emotion induced by means of consolation, or the act or process of comforting; but, although it is to be classed among the emotional states, it has certain well-defined presentational aspects. In its fullest, and especially in its religious, sense, there is the consciousness of a person whose presence, words, or acts are the source of the feeling of comfort, and constitute the consoling element. Although there are several weakened uses of the term 'comfort,' and it is often employed in an abstract and derived sense, the personal (or quasi-personal) source is always implied. The immediate effect of comfort will be a sense of peace or soothing, restraint from agonizing or neurotic effort, and the inhibition of excited acts. The subconscious effect is that of a tonic, and the will is braced thereby for healthful exercise. Whilst the consciousness of a personal presence and influence is the dominant feature in religious consolation, there is always, in the background at least, the presentation of something that produces pain.

1 See W. James, Varieties of Religious Experience, p. 566.
distress, or anxiety. Probably in most cases the cause of the painful feeling is at first the focus of attention, but the process of consolation forces it into the background as the comfort is experienced. The conscious but unnoticed support is the positive element in the case, whilst the negative is the sense of relief and mitigation.

As consolation and comfort play an exceedingly important part in the Christian consciousness and in the offices of religion, the connotation of these terms in devotional literature is in general identical with Scripture usage, from which it is derived. The Heb. word קפור (Ps 119:29, Job 6:26) has its roots in the act of breathing paitingly or sighing, whence it appears that a pathetically feeling on the part of the consoled. It especially refers to God as the Comforter of His people in their affliction, calamity, or persecution, or even in their repentance. In most cases, as in Ps 119:29, comfort is given to the righteous, as such, in their tribulation, but in some other instances, as in Is 49, the comfort follows upon repentance, and Jahweh is represented as having caught up from His state of wrath to that of pity and compassion for His people. The richest form of comfort in the OT is probably what is often designated 'the motherhood of God' (Is 66:13.),1

The NT conception of consolation and comfort is essentially the same. Scripture refers rather to the persecution, distress, and tribulation to which the faithful are exposed. The word most frequently employed is παρακάτις, whose primary significance is that of the ministrations of one called to comfort, and which (1 Cor 14:16 only) refers to comfort given by word or speech, whilst παρακάτις (Col 4:18 only) brings out the aspect of soothing. The presence of God is the dominant feature in Christian consolation, together with His love, a word that is often repeated in various contexts, and the grace of sympathy, tenderness, and gentleness with other sufferers, together with patience and fortitude. 'Tunc non est medicinal quam patientia, et abnegatio mei in voluntate Dei' (a Kep. [1 Cor 9:22]). The classic example of this form of consolation is that of St. Paul's 'thorn in the flesh,' and his comment thereupon, 'Most gladly therefore will I rather glory in my weaknesses, that the strength of Christ may rest upon me when I am weak, then am I strong' (2 Cor 12:9).

(2) Anxiety, perplexity, and care.—Here the Christian needs the assurance that he is in the hands of an All-wise and All-loving Heavenly Father, and that, so long as he makes God's cause and kingdom his chief interest and aim, all that is necessary for the effective discharge of his duty and the accomplishment of his work will be secured to him (Mt 6:33). As God is in the whole environment of one's life, so shall those who are under His direction, as they are beneath His protecting hand.

(3) Depression and spiritual desolation.—The best consolation under these conditions is the exhortation to the assurance in the prayerful and consistent discharge of duty and Christian work, and to wait patiently for the revealing of God's face and favour, and especially not to rely too exclusively upon one's feelings. Von Hugel points out the need for the 'sober and stable, consistent and persistent, laborious upbuilding of moral and religious character, work, and evidence,' instead of yielding to 'fierce and fitful, 'wayward and fleeting feelings,' in the hours of darkness and isolation of soul (The Mystical Element of Religion, i. 54.). The exercise of faith strengthens the Christian in the consciousness that prayer for light and joy will sooner or later be heard, and that the inner witness will be given.2

(4) Difficulty in Christian work, opposition and persecution.—Here the conflict of wills comes into play, and the determination of the heart against God and in defiance of the gracious influences that are brought into operation. This is particularly distressing to the Christian, as in the sense of persecution, the opposition assumes an aggressive form. Christians are exhorted in the NT not to grow faint-hearted or weary in bearing their testimony even though they may have to seal it with their blood.

1 The Arabic signifies the act of 'being kind to,' or 'patient with' (a person), and consequently 'comfort.'
They are encouraged to take comfort in the prospect and promise of the ultimate triumph of the truth and the all-conquering power of love which refuses not to suffer and to die. Moreover, they are to regard their sufferings borne in love on behalf of others as the means whereby the hearts of the persecuted are prepared, and they are taught to pray and hope that the opposition will be ultimately broken down. The line of consolation adopted by the Fathers in encouraging the Churches to endure persecution was in general to remind them of the predictions of our Lord and the Apostles (Irenæus, adv. Heer. lib. iv. c. xxiii.); to point to the notable examples of martyrdom, from the death of Abel to the passion of our Lord (Cyprian, Ep. lv.); and to seek to win the hearts of the faithful by closely related is the dying saint to his Lord, that St. Paul speaks of him as among those who are asleep in (or through) Jesus (διὰ τοῦ Ἰησοῦν, 1 Th 4th), and as dying unto the Lord (I Cor 15). This thought is also carried out by St. John in the Apocalypse: 'Blessed are the dead which die in the Lord' (v. 14). This relationship ensures to Christian believers the hope of heaven, eternal life, and a glorious resurrection.

A number of sermons here summarized call for consolation, and that consolation is found in the promises of Scripture and in waiting upon God, there is always an implicit reference to the Divine Being Himself as the primary source of comfort. Thomas à Kempis clearly expresses this when he says: 'Unde potes, amica mea, plene consolare nec perfecte recerari, nisi in Deo, consolatore puirorum ac susceptorum humilium' (de Imit. Christi, lib. iii. c. xlvii.). In a secondary or derived sense, the words of God, His attributes, His gifts and His promises are often referred to as being in themselves comforts, just as, in ordinary affairs, material things are designated 'comforts' if they minister to our well-being, not being luxuries on the one hand, or necessities on the other. Also it is one of the duties and privileges of Christian believers to be the means of communicating the comfort they have received of God to others, by sympathy and tenderness, and by the support of collective faith and intercessory prayer. In the exercise of this function of consolation, the reflex action is experienced, which, in no slight degree, brings a sense of satisfaction, and even of joy, in being of service to suffering humanity.

Further, comfort is realized by Christians in the consciousness of community with their Lord in His sufferings, in being partakers with Him in the work of redemption, in drinking of the cup from which He drank, and in being baptized with His baptism. In tribulation incurred in the service of humanity, and incidentally to the accomplishment of His work, there is, as St. Paul expressed it, the filling up what is lacking of the afflictions of Christ (Col 1:24). They have been accustomed to direct the attention of the persecuted to the cross of Christ as the chief source of consolation, especially where sufferings have resulted from devotion to His cause. In contemplating the cross of Christ, and the sense of desolation that He endured upon the cross, they have realized that they were one with Him in bearing reproach and ignominy, even though they could not suffer as He did in expiation of human guilt. Moreover, the thought of the transcendence of Christ's sufferings inspired a feeling of gratitude and an inspiration to the believing soul to endure 'the contradiction of sinners' without complaint or impatience. John Newton, in his well-known hymn, 'Blest are the Meek', shows this thought—'Did Jesus thus suffer, and shall I repine?'. These considerations inspired the hymn of John Keble, in The Christian Year, for Good Friday, that the meek soul's eye should turn 'with softer power for comfort' in earth's darkest hour than on any bright day.

The full meaning of Christian consolation is not exhausted apart from the conception of the mystic union of Christ with the believer. There is a sense in which the Church has ever been conscious that, as Christ is the head of the body of believers, He suffers not only for their sins, but in all the sorrows and tribulation that God's people have to endure. What God's consolation is in these difficulties is the realization of Christ's presence with us in all life's painful experiences, in His humanity and His eternal priesthood. The realization of God's presence in Christ bears the promise of ultimate triumph, and, although Christ's mind that of the tribulation in the world, their final conquest is secured and guaranteed in His victory over all.

J. G. JAMES.

CONSOARATION (Greek and Roman).—In Greece the germs of a literature of consolation can be traced to ancient times. The dead were commemorated in threnodies, which were designed also to console the bereaved, and a great vogue was enjoyed by a threnos of Pindar, in which the ideas of the Orphic eschatology were drawn upon for consolation. The classic form of this pseudo-Platonic dialogue Ateichos. In Athens it was customary, probably after the Persian wars, to engage a rhetor to deliver a funeral oration—like that, e.g., which Thucydides puts into the mouth of Pericles, regarding the Athenians who had fallen in battle; and it was usual at the close to address the relatives in consoling terms. Several of these
orations are still extant; one, the epitaphios of Hyperides, is known to have been delivered in 322 B.C. The grounds of consolation are set forth in the epitaphios of Antisthenes and the Creec may have suggested what Xenophon makes Socrates say in the Apology. Aristotle's dialogue 'Eudemus on the Soul,' and the 'Callithenes on Mourning' of Theophrastus, were also well stored with consoling sentiments. But the standard work of the kind was that of Crantor the Academic (c. 270 B.C.) 'On Mourning,' which was sent by the author to a friend whose children had died, and which Cicero calls 'auraeos et ad verbum elisnisenus libellus' (Loud. ii. 133). As it treated of sorrow not as a reproducible emotion—in the manner of the Stoic—but rather as a natural impulse, requiring only to be kept within bounds, the book found many readers; and, when Cicero, in 45 B.C., essayed the composition of a work of his own concern, he showed that Crantor's work the basis of his own, while he reproduced its ideas a little later in the Disput. Two, (esp. i. 19-72). Plutarch does the same thing in his life, or in what he calls 'The Pleruchis.' He there shows how he had elaborated many comforting sentiments, as he was specially concerned to deliver men from the fear of death; so sought to convince them of the painlessness of dying; and of the absolute cessation of all the affections when the body is taken away. He also shows how he had been the center of all the popular superstitions about the terrors of the under world (Lucret. de Rer. Nat. i., with Heine's com.).

No less had the rhetoricians neglected the consolatory oration, and in the Hellénistic period—perhaps even from the time of Isocrates—they had framed for this species of composition certain rules, which in their later form are found in the μηθοδείαν του ρητόφου of pseudo-Dionysius and the προ κατάμνησις of Menander (4th cent. A.D.). These rules are followed not merely by heathen, but even by Christian, funeral discourses (cf. F. Bauer, Die Trostreden des Gregor v. Nysson, Marburg, 1892). It is specially worthy of note that the plan of the consolatio oration, as given by the rhetoricians, was taken over by poetry, the most outstanding instance of this being the Consolatio ad Liviam which bears the name of Ovid, and which is neither a fabrication of the poet himself, for it is said that he had fired from the plan of consolation given by the rhetoricians, under Seneca's influence, from the later school of rhetoric, but a poem actually presented to Livia upon the death of Drusus in 9 B.C. The rhetorical scheme had also an influence upon the work of Statoius (esp. Silier. ii. 6; 'Consolatio ad Flantium Ursum').

Among the elements of a consolatory oration a special place is given to the praise of the deceased. A constant feature of the detailed rules for the 'epitaphios' was this permitted of great amplification. The discourse likewise described the way in which the departed would be received by his ancestors and the heroes of antiquity. The bereaved were also shown the good fortune which might befall the widow, that not only individuals but whole kingdoms had perished, that life is simply a trust from the Deity, and that excessive grief can profit neither the mourner nor the dead. Instances were also given of miracles, which, had they happened, would have happened if they had happened earlier.

A distinct species of this literature appears in the 'consolations' addressed to those who had been banished, as, e.g., Seneca's letter to his mother Helvia, and Plutarch's 'προ φροσκή.' In these, as in works of consolation generally, special use is made of the ideas expressed in the popular distrope of the Cynics, emphasis being laid upon the thought that life is not a particular city but the whole world. Here, too, the writers drew extensively upon the examples of celebrated exiles, such as Antenor, Evander, and Diomedes.

Larnerav.--K. Buresch, Leipziger Studien, ix. (1886) 1; A. Gercke, in Tireorica Philologica (Bohun, 1883); Skutsch, 'Consolatio ad Liviam,' in Fawen's 'Disp. 45; E. Giesecke, De philosophorum veterum ad eum obitum epistulae (Leipz., 1891)."
to love men and to labour for their good, to make one's life valuable to humanity. Such purposes admit minor changes, such as pride, and lie behind some forms of constancy. In order to maintain a vitally important consistency, superficial inconsistency is often imperative. There cannot be a righteous adhesion to opinions the falsity of which has been demonstrated. The 'constancy in mistake is constant folly.' Would not a resolution never to vote differently, never to espouse another faith, imply that in youth infallibility had been acquired? A man may hold to truth necessarily tates changes in beliefs, habits, and allies. But serious men cannot alter easily or without pain. The lower consistency is abandoned for a higher, and the abandonment is often accompanied by loss of what is dear, without any apparent compensating gain.

(4) The conditions of constancy.—Failing the predominance of one idea or affection, the ideas and affections must be of a kind to work together with a good measure of harmony. 'A double-minded man is unstable in all his ways' (Ja 1:8). Serious and deep contradictions are ruinous. A commanding purpose (or purposes that harmonize with one another) will consolidate and organize the impulses, so that when they are converted into a army. Noble aims will gather about themselves the strength and warmth of the lower impulses; and after a time the habit of beating down sensual and unsocial impulses will cause the soul to move more and more easily on the higher than on the lower paths. Courage will be required, and sacrifices also. Devotion to the interests of persons can survive the discovery of unworthiness in those whom one loves; and the cause espoused can still stand, or be maintained, and gain popular approval; 'many waters cannot quench love' (Ca 8:26). Generally there is the sympathy of some companions whose support helps to keep the fires of zeal burning. Especially is constancy promoted if the general plan of life or some particular design or way is believed to have the favour of heaven; for then there is the assurance of supernatural assistance, and all the rills and streams of one's purposes seem to be directed by God. 'All the ways of God will is never so firm as when it thinks itself to be merged in God's, and great confidence possesses the aspirant to sanctity who reads, 'This is the will of God, even your sanctification' (1 Th 4:9).'

*CONSTANTINE.*—I. Life.—Flavius Valerius Aurelius Constantius was born on 27th Feb. of a year uncertain, generally given as 274, but probably a little later.1 The place was Naisus (Nisch) in Dardania (Servin) (Anon. Valesii, 2; Constant. Porphyrogenetus, de Thematibus, ii. 9 [in Migne, PG cxii..]). The fiction of his birth at York, current in all medieval English historians (the silence of Bede, HE i. 8, should be noted), arose from a misunderstanding of the phrase 'illic oriendo' (Panegyr. vi. 4), which refers to his accession, not his birth. Constantine's father, M. Flavius Valerius Constantius (the surname Chlorus is not found until late Greek writers), was a noble Dardanian soldier, whose mother was the niece of the emperor Claudius. His mother, Flavia Helena (b. about 250; Enseb. Vita Constantini; iii. 46), was the daughter or servant (Ambros. de Offic. Theodolst. 42) of an innkeeper of Drepunam in Bithynia, a city rebuilt by Constantine in 327 in her honour and re-named Helenopolis. Her marriage to Constantius was probably irregular (Anon. Vales. 1; Zosimus, Des Gerardum.); messages should not be pressed as more than morganatic (see Digest. xxv. 7) until after the birth of her son (cf. Constantine's legislation, infra, V. i. d (2)). When Constantine was about 14, his father was promoted by the son of Caesar (1st March 293), with the government of Gaul and Britain, on condition that he divorced Helena and married Theodora, daughter of the emperor Maximian. Constantine did not accompany his father, but was left in Italy, in Nicomedia, possibly as a hostage, until the growing jealousy of Galerius, after the abdication of Diocletian and Maximian (1st May 305), compelled him to a memorable ride across Europe to his father's camp at Boulogne (Lactant. de Mortibus Persecutor. 24; Anon. Vales. 3, 8), where he arrived in time to share his father's victories over the Picts (Eumenius, Panegyr. viii. 7).

The death of Constantius at York (25th July 306) was followed by the humbling proclamation by the army of Constantine as 'Cesar' (Zos. ii. 9; 'Augustus' in Enseb. HE viii. 13, VC i. 22, though this higher honour was not ratified by Galerius until the following year [Panegyr. vi. 5; Zosimus, Des Gerardum; Ecodes, Panegyr. MP 25]). His seat of government was Trèves, which he embellished with many buildings. In 307 he strengthened his position by his marriage at Arles to Fausta, the daughter of Maximian. The Empire was thus divided between six rulers: in the East, Galerius, Licinius (Valerius Liciniunius Liciniius), and Maximin Daza; in the West, Constantine (Gaul and Britain), Maximian, who had re-assumed the purple, and his son Maxentius. But after Maximian, after a crafty intrigue against Constantine, was captured and forced to strangle himself in Feb. 310 (Lact. MP 29, 30; Eumen. Panegyr. vii. 29), while the death of Galerius at Sardica (Anon. Vales. 5, 8) in May 311 led to the division of the Empire between Constantine, Licinius, and Maximin Daza. The three refused to recognize Maxentius, whose tyranny in his province of Italy, Africa, and Spain, gave Constantine an excuse for the invasion of Italy (Enseb. HE ii. 9; VC i. 26; Nicetas, Hist. copt. ii. 14 says Maxentius was the aggressor). He

1 Seeck, Gesch. d. Unterpräf. d. antik. Welt, i. 435 n., gives 279 as the date, but his reference, CIL 1.3 p. 305, seems inaccurate.
2 Hereafter cited as VC.
3 Hereafter cited as MP.
crossed the Alps (Sept. 312) either by Mt. Canis or by Mt. Genèvre (see the contemporary [A.D. 333] Rim. Anon. Burdigalense, ed. Geyer in CSEL xxxix. 5), and at Vara, and within 58 days of declaring war defeated the sluggish Maxentius at Saxa Rubra, about 9 miles N.W. of Rome. The drowning of Maxentius in attempting to escape over the Milvian Bridge (Ponte Mole) completed his triumph, 8th Oct. 312 (Anon. Vales. 4, 12; Lact. MP 41; Enseb. HE ix. 9; there is a full account in Seeck, op. cit. i. 109-157).

Constantine's victory was followed, early in 313, by a conference at Milan with Licinius, and by the marriage of Licinius to his sister Constantia. The defeat of Daza by Licinius near Adrianople (30th Apr. 313) and his death in August at Tarus left Constantine and Licinius in sole possession—the ex-emperor Diocletian dying probably that same summer (Seeck, op. cit. i. 435 f., following as his source Idatius, Consulares Fasti, dates 3rd Doc. 316) at Salona. But the concord of the two was hollow. The first civil war between them was culled by the triumphs of Constantine at Cibalis (Vinovia in Hungary), 8th Oct. 314, and Marcellus in Thrace (Anon. Vales. 5; Zos. ii. 18-20), after which a truce was patched up, Constantine leaving Licinius in possession of Thrace, Asia Minor, Syria, and Egypt. Constantine now devoted himself to the final settlement. He was called away by the war with the Goths and Sarmatians in Illyricum and Dacia (322) and the final struggle with Licinius. The victories, in spite of Licinius's superior forces, of Adrianople (3rd July 323) and Chrysopolis (Constantinople, 324), still furthered by the humiliation and enforced death of Licinius in 324 (Soc. HE i. 4; Enseb. FC ii. 18; Zos. ii. 28; Evrop. Brev. x. 6) and the re-union of the Empire under one head.

The capital of Constantine was a new capital (4th Nov. 326 [Anon. de Antig. Constant. i. 3, in A. Banduri, Imperium Orientale, Paris, 1711]; see Burckhardt, Die Zeit, etc. 415; but de Broglie, L'eglise, etc. i. 440-1, dates in 328) at Byzantium is one of the great events of history. In reality it continued Constantine's policy of ruling from Nicomedia. It was dedicated on 11th May 330 (Gibbon, ed. Bury, ii. 157 n.), under the title of New Rome. The removal of the seat of government was completed by the execution of the last emperor, the new absolute monarch of Diocletian which had taken the place of the old principate being consolidated and systematized (see Seeck, op. cit. ii.). Constantine's last years, though years of peace were unfortunate. In 337, his character deteriorated (Evrop. Brev. x. 7), his expensive building operations drained the Empire of its resources (Zos. ii. 32, 33, 38; Schiller, Röm. Kaiserzeit, ii. 229), his habits became effeminate, and his jealousy of a rival made his family miserable. His eldest son Crispus, the off-spring of an early irregular marriage with Minerva, had shown great ability in forcing the strait of Holles-pont against the superior fleet of Licinius (325), yet he was executed (July 326) at his father's command (Anm. Marcell. xiv. 11), though the reason for this act is obscure. This was followed, possibly a year or two later, by the execution of his wife Fausta on the charge of adultery. In 335 Constantine was forced to attack the Sarmatians, who had encamped near the Danube. His victory—for his supposed defeat is a curious error of Gibbon (ii. 217)—was the last of his successes. He died near Nicomedia on Whitsunday, 22nd May 337, though only apparently for four months (until 9th Sept.) after his death.

1 For detailed investigation of this domestic tragedy see Giersch and Seeck, 'Die Vorwurfsmaterie Constantia des Grossen,' in ZFT xxx. 1857; 343 ff., xxxiii. 1859.] 623.

In spite of the claims of Rome, he was buried at Constantinople in the great church of the Trinity (later called ' Holy Apostles'), which he had completed for the purpose the previous Easter. At Rome the hearse was carried among the gods (V. Schultze, Untergang d. gr.- röm. Heidentums, 1887-92, i. 66), though the marble struck to commemorate this was made of a Christian type (King, Christian Numismatica, 1873, p. 390). In 1269 his tomb was desecrated by the Latin crusaders on their capture of Constantinople.

Constantine's life, like that of Charles the Great, has become legendary, and was one of the chief sources of the medieval Church. On these see the critical studies of E. Heydewert, esp. 'Constantin der Große in den Sagen des Mittelalters' in Zschr. f. Geschichtswiss. i. [1890] 9, 12.

II. Extent of the Church at the time of Constantine's 'conversion.'—At the outset of an inquiry into the great change brought about by Constantine, it is of importance to understand the extent and influence of the Church and its attraction for any statesman.

(a) Numbers.—Materials for forming an estimate of the strength of Christianity under Dio- cletian will be found in Harnack's elaborate survey (Expansion of Christianity, Eng. tr. ii. [1904] 240-456). From a careful study it would appear that in the East the Christians, except in a few towns, were for the most part in the majority, or at the most—one-ninth or so of the whole (H. Richter, Westström, Reich [1885], p. 85)—and in the West they would be considerably less. Unfortunately we do not know the population of the Em- pire. The figures of Gibbon, derived by the Latin author of the world is, is absurdly large; J. Beuchinger (Bevölkerung d. gr.- röm. Welt, 1886) gives it under Augustus at 54 millions, but this seems too small. If we take it at 80 millions under Nero, the great famines, etc., in the middle of the 2nd cent. would greatly reduce, to slightly less under Constantine. At the out- side, therefore, the Christians would scarcely number five millions (Gibbon's proportion, 13, but [i. 65], thus comes to the same result), or less than the Jews, who numbered over six millions, of whom one million were in Egypt. In Rome in 250 we calculate from Ensebich, HE vi. 43, 11, that the Christians numbered between 40,000 and 50,000 in a city of nearly a million, i.e. 5, though this is exaggerated, as the Empire was at the time of Constantine. In the country districts the Christians were far less numerous than in the towns.

(b) Influence. —But what the Christians lacked in numbers they made up by their organization, unity, wealth, and driving power. In these matters only the Jews could equal them, but Judaism was hindered by its Law from ever becoming an international religion. The Chris- tians, shut off from the pleasures of the world, had grown immensely rich, while their morality, sobriety, and enthusiasm would attract any states- man who looked deeper than popular rumour. For any statesman anxious to infuse new life into a dying world Christianity had no rival except, possibly, Mithraism, for Neo-Platonism, etc., had no value for the vulgar; nor must we overlook the value to the statesman of the Christian doctrine of immortality (Burckhardt, op. cit. p. 140).

III. Personal relation to Christianity.—The personal relation of Constantine to Christianity is a subject of much importance, as upon its decision many questions, both theological and ecclesiastical, depend. As to the date of his conversion, the latest of the scholars is E. Lactant. Instit. Div. vii. 27, a work finished before 311, would be conclusive, but the passage has been shown by its editor, Brandt (CSEL xix. 698), to be an interpolation. Equally
conclusion would be sentences in the letter of Constantine to the bishops at Arles in 314 or 316 (Optatus Milev. Mon. Vet. [CSEL xxvi. 268]), but these probably reflect merely the opinions of Hosius (see infr. IV. b).}.

2 To the tu Julian, [1881]ing paganism. His whole conviction is ascribed to the deliverance of Rome from his tyranny and vices (Euseb. HE ix. 9. 2; VC i. 35; Panegyr. ix. 4; Julian, Cas., ed. Hertlein, pp. 406, 422), and the Christians as such were tolerated (Optat. Milev. ii. 6). As regards Constantine's religious policy, the Milvian Bridge opinion will always be divided. In our earliest authority (Lact. MP 44, written in 314, probably by the tutor of Crispus), Constantine was warned in a dream on the night before the battle to draw the monogram of Christ ( sprz) upon the shields of his soldiers.

3 Spain, where persecutions abounded, was not, as is often stated, in his government, but was under the charge of Diatius, an officer of Maximian.

4 For the martyrs in Britain—St. Alban (very doubtful), Aaron, and Julius (more doubtful still)—see Bede, HE, ed. Plummer, i. 17-29; Haddan-Stukeley, Councils, Oxford, 1863-73, I. 6; Harnack, Expansion, ii. 410, n. 4.
We are told (Euseb. HE ix. 9. 10. 11. VC i. 40) that Constantine erected at Rome a statue of himself, with the spear he usually carried in his right hand shaped like a cross. As evidence the VC is almost valueless, and Brügger thought that the passage in HE vii. 18 was an interpolation. But Eusebius mentioned this statue in a speech at Tyre in 314 (HE x. 4. 16), and this seems to decide its existence and the general belief in the East in 314 as to Constantine’s position, though the popular Christian rumour might be a correct interpretation of the artist’s work. The spear-cross was probably designedly ambiguous. A more important evidence of Constantine’s favour for the Christians is his handing over to the Roman bishop (before Oct. 313; see infra, p. 79) of the ‘domus Faustina,’ a palace possibly of his wife, formerly belonging to the Lateran family (Gregorovius, Rome in Middle Ages. Eng. tr. 1894 ff., i. 88), which became the residence of the Bishops of Rome (Lib. Pontif., ed. Duchesne, p. 178), of which the church of St. Peter is commonly attributed to him (Lataner, St. Peter’s). It is probably a little later, if we may judge from the fact that they were built with pagan spoils (Greg. op. cit. i. 92), though the small St. Paul’s (suaerit sancta) is probably the true seat of the See. Faustina’s church, usually attributed to Constantine, would come under the head of the oratories restored after the edict of Milan (Duchesne, op. cit. i. 178, 196; Lancelian, op. cit. p. 150 ff.; Greg. op. cit. i. 109). On the whole, the evidence of Constantine in Rome (the list of which in the Lib. Pontif. is very exaggerated) is inconclusive as to the date of his conversion.

(c) Between 312 and 323.—After the victory of the Milvian Bridge, Constantine and Licinius promulgated at Milan in the spring of 313, a second edict of toleration—free liberty to choose that form of worship which they consider most suitable—and restoration of forfeited churches and property.

For this edict see Euseb. HE x. 5, and for its original Latin form, Lact. MF 48. Note the non-committal religious references—Quidquid est divinum in se est.—This edict was seconded by that of Galerius, to which the ‘hard conditions’ (apercita) of i. 4 refers. Mason (Persecution of Diocletian) of this period explodes the older idea (see held Dov i. 635) that Constantine issued a second edict of toleration at Milan, before the Milvian Bridge, and that this was the third.

But, until 323, Constantine kept a balance between Christianity and heathenism, though inclining more and more to the former (see infra, IV. (c)). About 317, he selected the Christian Lactantius to be the tutor of his son Crispus (b. 306?); Jerome, de Vir. Ill. 80). From 315 onwards, pagan emblems (Mars, ‘Genius Pop. Rom.,’ Sol) disappeared from his coins, and indifferent legends (‘Beata tranquillitas,’ etc.) took their place. This period of neutrality was ended by his conflict with Licinius in 319, Licinius had begun to oppress the Christians, especially in his army (Workman, Persecution in Early Church, 1906, p. 187 n.), though without much bloodshed (Euseb. HE x. 8; VC i. 40; Greg. op. cit. i. 157; for a clear exposition see E. Goser, Die Linic. Christen- verfolgung, Leipzig, 1875, esp. p. 29 ff.); this persecution seduced the Forty Martyrs of Sebaste (see O. v. Gebhardt, Acta Mart. Selecta, 1902, pp. 166–181). This foolish move gave Constantine the opportunity of appearing as the advocate of the Christians (323), who were really far more numerous in the Christian’s domain than his emperor’s. The struggle thus became a crusade, and the legio was stamped on most coins (Euseb. HE x. 9, VC ii. 6–12; Schiller, op. cit. ii. 211; Madden, Num. Chron., 1877, p. 53 ff.).

(d) From 323 to his death.—After his conflict with Licinius, Constantine, according to Eusebius, put his hand seriously to the work, forbidding pagan sacrifices in general (see infra, p. 81), and building churches (VC ii. 44–46). But, on the whole, his attitude to paganism was cautious, though his aversion to the old faith would be increased by his unfortunate reception in beaaten Rome in 326, which led to his abandoning it for Constantinople. After this he seems to have increased the privileges of the clergy (Soz. HE i. 8, 9), and he rewarded towns that turned temples into churches (Soz. HE i. 18; Soz. HE ii. 5), in several cases because of immoral rites (cf. Euseb. Laud. Constant. s). Many temples were also despoiled for the foundations of churches, but only by his expressed wish new the city was free from organized heathenism (Euseb. VC ii. 48). At the same time the existing temples of Byzantium—Cybele, Castor and Pollux, etc.—were not destitute of pagan emblems; of Christian connoted to Tyche (Fortuna), though without temple services (Soz. ii. 21; Schultz, op. cit. ii. 281; for this Tyche, Bury refers to a study of J. Strzygowski, ‘Die Tyche v. Constantin,’ in Anarca Graecosien, Graz, 1895). By this time his official series of churches in Rome (the list of which in the Lib. Pontif. is very exaggerated) is conclusive as to the date of his conversion.

Though not even a catechumen, Constantine delighted in preaching sermons, in Latin, to the applauding crowds; one of these has been preserved to us by Eusebius (VC iv. 296), which at the same time his abdication from Catholicism towards Arianism was increasing (see infra, p. 80), helped probably by the death of his mother Helena (c. 330) (Euseb. VC ii. 47); buried at Constantinople (Soz. i. 47). The fact that he did not take any steps either to become a catechumen or be baptized until he felt near to death, may be explained as due either to political balancing, or to lack of decision, or, more probably, to the belief that baptism, like the heathen initiations, ensured the remission of sins, and to the growing dread of post-baptismal sin. He was finally baptized by the Arian bishop Eusebius of Nicomedia (Euseb. VC iv. 62–63; Jerome, Chron., ann. 2350 [in PL xxvii. 690]). In the Greek Church he has possibly been canonized by the title Isertnder, ‘Equal to the Apostles.’

Into the large question of the advantage or otherwise to the Church of Constantine’s adoption of Christianity in the East and of the character of his conversion must be left. The first is at least possible in Cyril of Jerusalem (b. 315), Ep. ad Const. 3, the genuineness of which is, however, doubtful.
Christianity as the State religion, we cannot enter. The familiar lines of Dante (Inferno, xi. 113),
which have often been quoted in the fadism, and the judgment of Mill (Essay on Liberty, ch. 2) deserves to be pondered: 'It is a bitter thought how different the Christianity of the world might have been, had it been adopted as the religion of the Empire under the auspices of Marcus Aurelius, instead of those of Constantine!' For a contrary judgment cf. Newman, Arias, 1871, p. 218.

IV. Constantine and the Church. (a) Relations of Church and State. — Nothing was further from the intention of Constantine than to abandon to the Church any portion of his Imperial prerogative, and this determination would be increased by the sympathies of the Court clergy. Into his adoption of the new religion he carried all the old Roman ideas, for his 'conversion' was not a revolution in the political genius of the Empire. Whatever crudity there may have been about his religious opinions, his views as an official were clear. To the edicts which Constantine issued as an official of the civil service, the consequences of this are apparent in the after history of the Church. The Emperor, it is true, could not be the Pontifex Maximus of the new religion—this title, retained by the Caesars, was dropped by Constantian (Zos. i. 36), and in time lapsed to the Bishop of Rome—but the new anarchy founded by DIOCLETIAN and himself (on this see Gibbon, ch. xvii., with Bury's appendix) made this of less moment than the fact of Constantine's assertion of his spiritual sway. The official title of the new monarchy was the higher 'deus' (Schiller, op. cit. ii. 33, 34). In consequence, in the Eastern Church the Emperor was always the supreme head, as his modern representative, the Czar, is to-day; but in the West the abandonment by Constantine of his new capital gave the bishops of Rome their great opportunity. Thus Constantine and his successors, while giving the Church Councils full liberty of discussion, insisted that their own consent was necessary to confer validity on the canons; and they regulated the business by Imperial commissioners, often laymen. So, at the Council of Arles, Constantine deputed Bishop Marinos to preside (Ep. 24, 4). Again, at the Council of Nice, Bishop Hosius of Cordova (on this complicated question see DBB i. 168, and, for the Rom. Cath. view, Hefele, Concilia, Eng. tr. 1857, I. 37 ff.); while at the Council of Tyre (335) he appointed Donatus as commissioner (Euseb. FC iv. 42; PL xii. 362). The doctrine asserted by Constantine was never wholly lost even in the Roman Catholic Church, and was of great influence as late as the Council of Constance (cf. also Articles of the Anglican Church, no. 21).

(b) Constantine renews the heresy. — To the Roman magistrate religious recusancy was tantamount to political disaffection. Constantine and his successors were therefore hasty, attempting to get the ink on the decree of toleration dry, to deal with heresies and schisms within the Church itself. To allow the Church to be rent into diverse parties would be to destroy the very solidarity and unity of Christendom ('extensorum spiritus'), which Constantine regarded as the politics of all other religions as destined to become supreme. Hence the anxiety of Constantine to secure the peace of the 'legitimate Catholic Church' (Euseb. HE x. 5, 29).

Constantine's first intervention was in regard to the Donatists (q.v.). For Constantin and the Donatists we have Optatus Milv. De Schismate Donatist. (written about 375). 21 ff.; but Optatus is neither complete nor altogether trustworthy. We also possess a valuable collection of anonymous documents, Decom Monum. Vet. et Epist. Donatist. hist., p. 92. First pagination: [31]. These are collected up with Optatus (best ed. of both by C. Ziesa in CSEL xxv. 1892; also by Duchesne, Proc. Soc. of Euch. and Migne, Patrologia Latina, Vol. xliii., p. 565—568, and L. Duchesne, Le Dossier du donatisme, Paris, 1889.

In answer to the appeal of the Donatists (15th Apr. 313) forwarded by Anulius, proconsul of Africa, Constantine summoned CINCIUS, bishop of Carthage, and the ten accusing bishops to appear at Rome before a synod over which he instructed Pope Miltiades to preside (Euseb. HE x. 5, 18; August. Ep. 83, c. Crescon. iii. 81). At the same time, prompted by Anulius, bishop of Cordova, he gave Cæcilius certain marks of his esteem (Euseb. HE x. 6). The synod met (2—4 Oct. 313) in 'the casa of Fanusta on the Lateran,' and the decision was given against the Donatists (Opatt. op. cit. i. 22—24; Aug. contra Ep. Parm. i. 10; Ep. 43, 5 (14)). On the further appeal of the Donatists, Cæcilius was detained at Brescia (ib. i. 26), and two bishops were dispatched by Constantine to Africa to make inquiries 'ubi esset Catholica.' As they reported in favour of Cæcilius, the Donatists pressed the appeal, and Constantine ordered the case to be re-tried at Arles (Euseb. HE x. 5, 21; Opatt. op. cit. i. 20; Decom Mon. Vet. iii. iv. v.), 1 about the same time (Feb. 15, 315) a commission was appointed by Constantine for the guilt of bp. Felix of Autumni. 2 Of the decisions of Arles we have only fragmentary evidence (F. Massaen, Quellen des canon. Rechts, Graz, 1870, p. 188 ff.), and its date, 1st Aug. 314 or 315, is uncertain, though it probably marks the final acceptance of the Donatists were still satisfied, Constantine heard their appeal at Milan (10th Nov. 316; August. c. Crescon. iii. 16, 67, 82, iv. 9, ad Don. 19, 33, 50), and confirmed the decisions of the Councils (August. c. Crescon. iii. 101, 160, 188, contra Ep. Parm. i. 11; cf. PL viii. 750). Constantine thereupon issued edicts persecuting the churches of the Donatists (August. Ep. 105, 2; 9; 88, 3), though within a few years (5th May 321) he adopted a policy of toleration or indifference (Optatus, Dec. Mon. Vet. viii. 13; Brev. iii. 40, 42; cf. Aug. ad Don. 56, Ep. 141, 9).

(i.) As regards other heretics, Eusebius (PC iii. 65—65) tells us of his zeal against 'Novatians, Valentinians, Marcionites, and Caelestians.' The Pontificate of Paul of Samosata, those 'who are called Cataphrygians' (i.e. Montanists) and the confiscation of their meeting places to the Catholic Church. Thus, as Eusebius puts it, 'the savage beasts were driven by the consular mark to the heretics' of the privileges granted to the Church became part of the law of the Empire (Cod. Th. xxvi. 5, 1; Cod. Just. i. 5, 1; in 526).

(iii.) To the greater Arian difficulty which distracted the Eastern Church [see art. ARIANISM, vol. i. p. 777] the attention of Constantine seems to have been drawn about the year 319. As a majority of the bishops of Asia appeared to support Arius' cause, Constantine, in the hope of ending the dispute, first sent his confidential adviser, his bishop of Cordova, to Bishop Alexander of Alexandria and the presbyter Aris, with a characteristic letter begging them to lay aside 'this insignificant subject of controversy' and cooperate. 3 If no. v. is genuine, it was either dictated by Hosius or shows interpolations. It does not seem to the present writer that it can be safely used with reference to Constantine's character and Christianity at this period. 4

2 This is the correct form, not Aptasugi. For the text of this trial see Dec. Mon. Vet. i. ii., in CSEL xxvi. 197, and for its date L. Duchesne, op. cit. p. 614.

3 So Seeck, op. cit.; but Duchesne, op. cit. p. 640, argues for 314; and for these see also to the synod of Trier in the later date. For the decisions see Dec. Mon. Vet. iv. (CSEL xxvi. 206), also in PL viii. 615; August. Ep. 43. For the council see PL viii. 415; Hefele, Concilia, Eng. tr. i. 193 ff.

For Constantin and the Donatists we have Optatus Milv. De Schismate Donatist. (written about 375). 21 ff.; but Optatus is neither complete nor altogether trustworthy. We also
with him in restoring unity (Eusc. VC ii. 61-72). As this failed, Constantine, on the advice of Hosius (Sulp. Severus, Chron. ii. 40, ed. Halin in ChroN. Hebd. and Coment. episc. i. 13) met at Nicaea (18th June-25th Aug. 325). The 'ecumenical' (οἰκουμένικος, i.e. 'of the Empire,' cf. Lk 2' and CIL, passion) character of the Council—about 10 bishops from the West, and 308 from the East (Athanasius, ad Aegres, 2; cf. Soc. HE i. 9)—and its importance alike mark the beginning of a new era for Christianity. Its controversies do not concern us; but for our present purpose it should be noted that the influence of Constantine for peace was considerable (Theod. HE i. 11), that the Council was summoned in his name (Eusc. VC iii. 6), that Constantine presided at the opening (ib. iii. 10 ff.) and addressed it at its close (ib. iii. 21), and that he communicated its decision to the Church of Alexandria (Soc. HE ii. 9). But in 328, there was a change of policy. Whether owing to the influence of his sister Constantinian, the widow of Licinius, who had herself been influenced by Eusebius of Nicomedia, or because Constantine was now more in touch with the speculative East than in his earlier years, he sought a less stringent enforcement of Nicene doctrine. The Ariazing Euschius of Nicomedia, who had been banished at the close of the Council, now reappeared and gained the influence of the empress. The result was seen in the deposition of Athanasius (cf. vol. ii. p. 169, or W. Bright in DCB i. 186) by the Council of Tyre (335), his banishment by Constantine (336) to Trèves, the rehabilitation of Arinas by Constantine (338), and the death (336) of Eusebius, who should have been restored to a more harmonious position, but was never received back into fellowship at Constantinople (336). The death of Constantine left the Arian trouble to his successors, under whom Arianism became more identified with Court circles.

2. Donations. The Eusebian or Constantine's whole policy, as regards heresy and unity fastened upon the Church for sixteen hundred years a policy of intolerance. The result was soon seen in the case of Priscillian (see PRISCILLIANISM).

(c) Endowments.—The supposed 'Donation of Constantine,' all-important historically as this falsehood proved, need not detain us. It carried with it the story of Constantine's leprosy, and baptism by Sylvester at Rome.

Eusebius, HE iii. 25-578. Its date was probably the 5th century. In 1259 two men who ventured to doubt its genuineness were burnt at Strasbourg, and as late as 1583 it was still held. Its disproof and the development of the doctrine of the Melanchthon, Aeschar, Aeg. 1888, iii. 508 n.). Its overthrow by L. Valla (in Donat. Const. Decrees, in Brown, Plut. Rem. Exspond. [1606] i. 129) was one of the first results of the Renaissance.

The benefactions of Constantine were, however, considerable. For instance, he created, Cessalian, bishop of Carthage, 3000 foldes (500ÆAe), or parishes, i.e. nearly £18,000 (Eusc. HE x. 6; cf. VC iv. 28). Great sums were also spent on the building of churches (Eusc. HE x. 2, 3, 4), especially at Jerusalem (Holy Sepulchre [Eusc. VC iii. 34-40]), Bethlehem (ib. 43), Nicomedia (ib. 50), and Rome. Of his benefactions to the great basilicas at Rome we possess a list that seems authentic (PL viii. 803 ἐκ, though many of the gifts mentioned are later accumulations (Duchesne, Lib. Pont. 1 Introduct. p. 152). Of great importance from another standpoint is his order of fifty copies of the Scriptures 'legibly described and of a portable size' (Eusc. VC iv. 36).

V. Influence of Constantine's establishment of Christianity upon legislation.—The following are the most important evidences of the growth, during the Constantinian era, of specifically Christian laws or of the influence of Christian sentiment.

(i) Morals.—(a) Slaves.—There was no abolition of slavery; this was not a burning question in the Early Church. But slaves condemned to games or to the mines must not be branded in the face, 'which is fashioned in the likeness of the Divine beauty' (Cod. Th. ix. 40, 2, March 315; PL viii. 315, 2). In the case of female slaves must not be separated (Cod. Th. ii. 25, in 331; PL viii. 376). Masters must not kill or wantonly torture their slaves (Cod. Th. ix. 12, chs. 1, 2 in 319 and 320; Cod. Just. ix. 14; PL viii. 316). But the wording of this last law left many loopholes of escape, while fugitive slaves must not only be given up (Cod. Just. vi. 1, 4, in 317; PL viii. 150), but could be examined by torture (Cod. Just. vi. 1, 4, 6, in 317 and 333) or slavery; but deprived of a foot (ib. vi. 1, 3, undated). The abolition of crucifixion (SOE HE i. 8) and the breaking of legs (Aur. Vict. Cxs. 41) would chiefly apply to slaves. But the illegality of Christians being held as slaves by Jews (Eusc. VC iv. 27; Cod. Th. vi. 9, 1, 2, 4, xvii. 8, 6; PL viii. 10) was witnessed rather to the growing hatred of the Jews (cf. Cod. Th. xvi. 8, 1; Cod. Just. i. 9, 3; PL viii. 130, in Oct. 315).

(b) Gladiators.—Gladiatorial shows were prohibited in 325 (Cod. Th. xx. 121; PL viii. 253; Cod. Just. xi. 41; cf. Eusc. VC iv. 25; Soc. HE i. 18), though the law was certainly not enforced in Italy. That at Constantinople there were never any gladiatorial shows may be ascribed to the influence of Christianity, or the bloody slaughters at Trèves in his early life (Eunen, Paneg., 12).

(c) Adultery, etc.—(c) Concubinage was disallowed for married men (Cod. Just. v. 26 in 326; cf. Digest. 22). He should be severely punished, the woman, even if not a consenting party, by disinheriting; abettors, by slaves, by burning, or by banishment (Cod. Th. ix. 23, 1; PL viii. 153-158, in April 320).

(d) Children. Children of the Church were forbidden to kill their infant children, the care of whom was henceforth to be an Imperial charge (Cod. Th. xi. 27, 1, 2; for Italy first in 315 [PL viii. 121]), then for Africa and other provinces in 322 (PL viii. 236). The Christian sentiment of this law (cf. Laetant. Inst. vi. 20) is more obvious than its correct political economy. Exposure of children was not forbidden until 374 (Cod. Just. viii. 51, 2, ix. 16, 7). The growing poverty of the Empire again was responsible for Constantine's allowing the sale of infant children by poor people (Cod. Th. v. 8, 1; v. 7, 1, in 329 and 331; cf. Cod. Just. iv. 13)—a practice forbidden in 296 by Diocletian (Cod. Just. i.c.). (2) Illegitimate children were legitimized by a new and more liberal view of marriage. (3) Prisoners were not to be confined without air and light, or with 'chains that cleave to their bones,' or to be imprisoned before trial (Cod. Th. ix. 3, 1, 2; Cod. Just. ix. 4, 1, 2, in 320 and 326; PL viii. 199, 299).

II. CLERGY AND CHRISTIAN WORSHIP.—(o) The 'Catholic' clergy were freed from the discharge of civil duties (Cod. Th. xvi. 1, 2, in Nov. 313, Oct. 319; PL viii. 102, 180), but in July 320 the abuse of this led to its rescission (PL viii. 200), as was also the case in June 326 (Cod. Th. xvi. 2, 6; PL viii. 314). (b) Exception was made to the Lex Papian Poppea against celibacy in favour of the clergy, thus allowing them to inherit (Cod. Th. xvi. 2, 4). (c) Public works and the sitting of the courts were forbidden on Sundays, 'dies solis' (Cod. Th. ii. 8, 1; Cod. Just. iii. 12, 2, in July 321; PL viii. 224; note the balanced 'dies solis,' which would suit Mithrasism also). (d) Manus curious were permitted to be solemnly made in
churches as well as temples (Cod. Thx. vii. 2. 4, iv. 7. 1; Cod. Just. i. 13. 1, 2, in 316 and Ap. 321; PL viii. 2141). As these munificentions were made on Sundays, and especially at Easter, Christianity became accepted in the public mind with the release of slaves.

iii. PAGAN WORSHIP AND RITES.—(a) Prohibition of pagan sacrifices in general (Euseb. VC ii. 45, 118, 19, 25).

There was a law which might be inferred from Cod. Thx. vii. 10, "law of our divine Father," but it was certainly not carried out. The progress of Christianity was slow (S. Dill, Roman Society in the Last Century of the W. Empire, 1898, vol. i. ch. 1; cf. A. Beugin, Histoire de la destruction de l'Empire Romain, 1855, vol. ii.). However, Christianity was more than once proclaimed libel to the pagans to reject certain passages in Eusebius, VC ii. 34; Græc. Ev. Oct. 10. Anonius, Episc. xiv. 4). The question is well discussed in de Broglie (ed. J. C. F. B. Beugnot, op. cit. 1. 100) the takes the prohibition to refer to nocturnal and private sacrifice only.

(b) The re-enactment, Feb. and May 319, of the law of Tiberius against divination (Cod. Thx. vii. 16, 1, 2; PL viii. 155, 162). In Dec. 319 the conscription of haruspices was allowed when public barca was struck by lightning (Cod. Thx. vii. 202).

Literature.—(a) SOURCES.—The estimate we form of Constantine depends chiefly upon the value we attach to the contemporary sources. As far as these sources may be considered frequently be read in Migne, PL viii. "Opera Constantia;" but, as this is both incomplete and unsatisfactory, additional data must be used with care, especially as regards Constantine's correspondence. For the Life of Constantine we gain our main information; The Passages relating to the orations delivered on state occasions, but with a valuable residuum of fact. Two, delivered in 307 and 315, are of unconnected authorship, three are probably by Eusebius (cfr. 310, 311), and one by Nazarius (221); in Migne, PL viii. 450 f., or, better, Ehr. Fünfte Pars (1842), to which edition references have been made by number and chapter. Another work of special pleading, though from a different standpoint, is the Vita Constantini of Macarius, PL viii. 249 f. (by J. Brandt, in CSEL xxvii. [1877]). This work, ascribed in the MS to an unknown L. Cecilianus, was attributed to the close of the 5th cent. (e.g. by Jerome in 392 [d. Vitr. Illust. 50], to L. Cecilianus Firmianus Lanecastus). The genuineness of this ascription has been assailed by his editor, S. Brandt, MGH Inst. ii. 1829), and justified by Bury (pp. 631-532). The date is probably 315. Of the works of Eusebius of Caesarea, the HE, published early in 236, is of great value, but the Vita Constantini (VC) in four books, written between 337 and 340, is a porous edifice (see Socrates, HE i. i) rather than serious history (best ed. of Eusebius by Heinrichs [1868-70]; good Eng. tr. by McNeill and Richardson [New York, 1890]). Of contentions of much importance relating to Constantine's secretary Entropius, Brevierien ab urbe condita (ed. F. Ruelle, 1897), and H. Droysen in Gesch. ii. [1873]). A most valuable source is the series of letters first printed by M. Milz and later, as Aeneas, called Anonymus Valerii (best ed. by Mommsen in Chronica Monacensia, i. 311-7). As the clerical languages in this have been shown by Mommsen (op. cit. pref. p. 6) to be interpo
dulations from Origen, it is probable written before the establishment of the Church's discipline. The valuable contemporary pagan history of Fraxagoras is known to us only in a brief summary of Photius (in C. Müller, P.F.H. xii. 2 [Paris, 1823]).

Of later writers we may single out Euphranes of Samos (347-414). His History (ed. C. Müller, th. iv. 7-66) was one of the main sources of the anti-Christian zeolites, whose History (ed. L. Medelhohson, 1857) was written towards the close of the 5th cent., and is of great value in spite of his bias. The Orations on Constantine of Julian the Apostate (ed. F. C. Hervey, 1876-82) is always of value for what it concedes. Anamnuis Marcellinus (Th. 320) in his great work Rex Gentis (ed. V. Carthausius, 1874, Eng. tr. F. Holland, 1889), though a pagan, treats Christianity without bitterness. Another important source is the Chronicon Paschale in its various forms in MGH ii. 500 f. (1891). Of the Christian historians, Socrates (HE) and Soazon (HE), who both write from the standpoint of the Church, add little to Eusebius, while the later Greek chroniclers may be neglected. For Constantine and the Domitae see supra iv. b. 1, p. 79.

The data be obtained from the earlier sources, must be studied in the Codes of Theodosias and Justinian, especially the former. As the Code of Theodosia is very bulky (ed. Cod. Thx. viii. 4, 7-17, 19, 26; D. Schinz and E. Kuhn u. a. also ed. Hinkel, Bonn, 1842), the student may content himself with a list of excerpts in Migne, P. 1171 f. (600). For the Code of Justinian references should be made to the ed. of P. Krüger (Berlin, 1877). Almost as important as the written sources are the documents and inscriptions of Constantine's time and media. The value of these has been well brought out by Scholier (op. cit. infra). For further study reference may be made to the well-known works in commentary, 6 vols. 1874-85, and also ed. Hinkel, Bonn, 1842, the student may content himself with a list of excerpts in Migne, P. 1171 f. (600).

The value of these has been well brought out by Scholier (op. cit. infra). For further study reference may be made to the well-known works in commentary, 6 vols. 1874-85, and also ed. Hinkel, Bonn, 1842, the student may content himself with a list of excerpts in Migne, P. 1171 f. (600).
utility is limited by the simple desire of consuming them. As this desire becomes satisfied, the pleasure in consuming diminishes, and with it the utility of the commodity, till it vanishes altogether, because the desire is satisfied.

(b) Similar considerations are apparent when we ask what we are willing to pay for different commodities. It depends, of course, on our desires. But the interest of the question is that these are in competition, since we cannot satisfy them all even if we had the means; and the special economic interest of the question is that our means are limited. It is the question how a given income is spent. And in terms of the general law we have these two answers: (1) every one seeks to secure the greatest Total Utility from his income, and (2) he does this by looking to the Marginal Utility of his various purchases in order to make it equal in them all. The first statement is obvious, but the second needs explaining. By marginal utility is meant the utility of any commodity, or quantity of it, that a buyer is just willing to take at a certain price. His debate with himself is always whether he could do better with his shilling now or in the future; and, if he buys and regrets, it is always because he might have had a greater utility for his shilling if he had bought something else with it, or if he had kept it. To spend well is not to buy the same degree of utility with every shilling, for infinite or necessary utilities are usually cheap. The difference between the price for which one gets them, and the price that one would be willing to pay for them, is called the Consumer's Surplus. These notions of surplus utility, total utility, and marginal utility are most clearly presented in diagram. For every commodity there can be drawn a curve representing all three. The shape of the curve is different for different commodities and for different consumers; but in accordance with the general law of diminishing utility it shows in all cases a more or less regular fall in utility with every addition to the quantity bought. Annexed is the general diagram of any commodity. On \( OX \) are marked the units of quantity bought, and so of the price paid; and the diminishing areas drawn on them represent the diminishing utilities, the first being infinite, representing the infinite and marginal utility. The most having equal losses, their difference may be represented by their height, and a curve drawn as in the figure. If a consumer buys 7 units, the marginal utility is that of the last portion, and he makes this his marginal purchase, because for the same unit of money he expects a greater utility of spending it on something else than on an eighth unit of this commodity. The total utility is represented by the total area \( AB \), and the surplus by the area \( AE \).

Taking all his purchases into account, it is clear that he will have nothing to regret (except, of course, the nature of his desires) if his marginal purchases have all an equal degree of utility. For he will thus have the greatest total utility from his income.

(c) A commodity has a different marginal utility for different consumers, the difference being due to the difference in their incomes and their desires. Hence with every price at which a commodity is offered there corresponds a certain demand; and, in general, the greater the price the less the demand, and the less the price the greater the demand. It is in expectation of a sufficient demand at a profitable price that commodities are produced, and it is on the correctness of his expectations, and not on the cost of production, that a producer relies for his price and profit. This is the essential consideration in the familiar law of supply and demand. It is fixed for all values that are fixed by competition (q.v.).

2. As the ultimate aim of economic effort is to consume what is produced, the practical questions regarding consumption may run into great detail; and their answers exist in one or other of the above three, the questions are not systematic. This is seen in the conflict of popular opinions about the spending of the rich. It would be hard to say whether people approve more of the rich man who spends much and so spends his wealth, or of the rich man who spends little, and appears, therefore, not to give work to others. And whatever may be thought of the spendthrift, the miser, and the philanthropist as individuals, and the diversity of opinion about the first two, and some about the philanthropist, as members of the body economic. And not all professional economists appear to have reconciled the truth in the two opposite statements that 'demands for commodities is not due to richer labour,' and that 'work of want of work is due to under-consumption.' The aim of economic organization and effort is, under conditions, to produce the greatest total utility; and, if we ask how economic progress is to be estimated, we ask the conditions on which this total utility depends. First it depends on the quantity and quality of wealth produced, and so on the full and the most efficient use of the labour and the natural and acquired resources of a country. And in looking at the economic progress of a country we are apt to look no further than at the amount and quality of wealth that is thus produced, and at its distribution with a view to further production. But the amount of utility wealth depends on the intensity and variety of the desires for whose satisfaction the wealth is consumed. This is the head under which all practical questions of consumption find their place. It is convenient to divide this question into two by considering, first, the satisfaction of desires that all seek to satisfy, and then the satisfaction of other desires. Regarding the former, it is apparent that the total utility from a country's produce is greater when the margin at which the very per centage of utility is extended, and the margin of others is contracted so as to exclude waste and glutontry. A country of great houses and vile hovels is so far not making so much of its wealth as one where the houses are less great and the hovels less vile. But it is when we turn from more or less necessary desires that we see the complexity of the question that may be organized from the point of view.
of consumption. It is here that there is the nearest connexion between Economics and Ethics. The ideal is that of complete living, and requires a character having variety and depth of interests or desires, quite as much as one having these in unity or system, and so in harmony. In economic progress there must be this variety and depth if the wealth is to be distributed with the increase; and an obvious point is that many desires—most of the higher desires, intellectual, aesthetic, and social—are very little destructive of utility. The cost of creating them, e.g. by education, is greater than the cost of gratifying them, and therefore must the more enter into the more important consideration. The most destructive desires need no learning.

It is also obvious from the nature of consumption that no comment on an economic system can be safer for the most part serious, or even letts, the poor grow poorer while the rich grow richer. The comment is often made, but it is made mainly on the erroneous ground that the gain of one must always be the loss of another. It has not been true in the last 100 years. If it will be a very wealth of life. But, the contrary, the saving in mere hardness of toil has been one of the best fruits of invention (see PRODUCTION).

While there is ground for charging defects in consumption not to thriftlessness merely, but to the bad distribution of wealth and to the struggle to have rather than to enjoy, there is a source that is at least as serious. So long as individual wealth is devoted to the service of a few desires, its increase must be consumed with diminishing utility. Luxuries, vices, ostentation, and luxury are not spared any of the severity and exhaustion of muscular work that he had before the revolution in industry. For nothing tells more against a wealth of life. But, the contrary, the saving in mere hardness of toil has been one of the best fruits of invention (see PRODUCTION).

The statistics of consumption that have most practical interest are concerned with the expenditure of small incomes. There are two methods of obtaining data for the so-called 'intensive' method, makes a minute study of individual families and their mode of life. It is most completely represented in the work of Le Play (1806–1882) and his school. Examples of him—though not so minute—are to be found in Booth, *Life and Labour of the People in London* (1889–97); Rowntree, *Poverty* (1901); and in *Family Budgets* (1896), collected by members of the Economic Club. The other, the 'extensive' method, looks rather to the quantity of his facts, and was Ernst Engel (1821–1896), who formulated a law, usually called Engel's Law, of which the main part is that as income rises the proportion of it spent on food diminishes. And later statistics from various countries give a general support to his view that this proportion may be used as a comparative measure of well-being, viz. the higher the proportion of earnings spent on food, the poorer a community, and requires a character having variety and depth of interests or desires, quite as much as one having these in unity or system, and so in harmony. In economic progress there must be this variety and depth if the wealth is to be distributed with the increase; and an obvious point is that many desires—most of the higher desires, intellectual, aesthetic, and social—are very little destructive of utility. common to all languages (cf. carcer, cruz, patibulum, fæcâ [Mt 5:29], mœch [ib.], dog, 'eum', 'cullion' [Shakespeare, Taming of Shrew, IV. ii. 20], 'geek and gall' [Twelfth Night, v. i. 531], 'John-a-dreams' [Hamlet, ii. ii. 959], 'zed' [Lear, ii. i. 89], of the Eastern street dog is a type of all that is cowardly, lazy, filthy, treacherous, and contemptible (HDB, s. v. 'Dog').

Both in the Heb. of the OT and in the Greek of the NT the verbal forms expressing various degrees of scorn, derision, or disesteem are remarkably rich. In the OT we find ns and ɔs [original meaning dukt]; ɔw with the root idea of rejection; γν where the idea of scorn is connected with the ministration of a foreigner's speech; and πεν, 'smile.' In the NT we have ἐπικινδύνω, πληροῦσθαι, ἐξευθενίσκεσθαι, καταφέρεσθαι, περιφέρεσθαι, διαγγέλειν, and the expression ἐκπεινηθῆναι (Lk 16:25; 'turn up the nose at'). The mimetic or descriptive verb is as conspicuous in exhibiting the feeling of disgust as in other cases (cf. 'dor,' 'nuisance'); and the word ἐκπεινηθῆναι recalls Shakespeare's 'I will bite my thumb at them' (Romeo and Juliet, i. i. 44. f.), a contemptuous action for bringing a quarrel; 'to give her the avance,' i.e. to send her away contemptuously (Henry VII, i. i. 10); or the verbal expression (2 Hen. IV. v. iii. 124), 'Figg me, like the bragging Spaniard' (thumb thrust between first and second fingers as a mark of contempt and insult). The word ομηρεύεται (2 P 3, Jude 1) is also a more obviously external act or gesture than καταφέρειν (Ac 13:18). It may be noted in passing that contempt takes in literature the form of satires and that of caricature in art. 'Satire in EIB and Caricature in EIB 39.'

From Lucilius to the present day scorn is an ingredient of satire. 'Facit indignatio versum,' said Juvenal (Sat. i. 79); and it was a wholesome balancing of duty and motives that inspired such a satire as the Sixth, his 'Legend of Bad Women' (Mackail). The content of satire is fierce and bitter; but it can also be genial, as in Don Quixote, where the follies of medieval chivalry are held up to censure in a similar distinction in the art of the caricaturist.

2. Psychology.—The psychological analysis of contempt has not often been attempted. It obviously belongs to the category of what Wundt calls the objective emotions (Outlines of Psychology, ed. 1908, p. 197), and is generally to be classified as a species of anger, finding a place in what the same writer distinguishes as the 'excitation-depression' series of emotions, or in what Royce prefers to call 'the restless and quiescence' series (Outlines of Psychology, 1903, p. 175). Macdougall, in his Introduction to Social Psychology, draws a distinction between scorn as a binary compound of anger and disgust, or a tertiary compound, if positive self-feeling is added to these, and contempt, which he regards as a 'binary compound of disgust and positive self-feeling, differing from scorn in the absence of the element of anger.' In ordinary usage, however, scorn and contempt are used interchangeably; and, while some kinds of contempt are notably free from anger and suggest serene self-esteem, e.g. the attitude of the educated towards the illiterate, there are other forms in which one may detect the element of indignation, e.g. the loathing which a noble mind feels towards a crucified or ignoble deed. In Shakespeare's Twelfth Night, iii. i. 157 f., Olivia remarks:

'O, what a deal of scorn looks beautiful
In the contempt and anger of his lip?'

where obviously contempt is regarded as of close kinship with anger.

Disgust, aversion, and shrinking from an object are undoubtably one of the elements of contempt; sometimes this is accompanied by facial and other physical reaction, sometimes it is merely intellectual, as when Horace remarks: 'Odi profanum vulgus et arceo' (Od. iii. i. 1). While, then, we can distinguish the aversions which make up the emotion of contempt, its quality is capable of multitudinous subtle gradations and internal shadings, corresponding with the objects and situations which call it forth.

E. B. Tylor.—Contempt, as an emotion which, like anger, finds expression in word and deed, or as part of a mental condition, naturally passes into the sphere of ethical judgment. It is an element in the character of the Psalmist, as when he says, 'The Lord shall have them in derision' (Ps 2, referring to the rebellion of His disaffected subjects; so of the heathen, Ps 59). In both passages the conception of contempt is associated with laughter. Such a theory of contempt is not obsolete: e.g. K. Browning's lines,

'... Happy that I lean
Be crossed and thwarted as a man,
Not left in God's contemptuous part.'

(Exeter-Day, xxiii.),

where a failure of ideal is associated with the sense of Divine rejection and wrath. The monothestic contempt for idol-making and idolatry (cf. Is 44:16) in prophetic literature is an expression of the belief in the unapproachability of God and the moral weight of our own acts and lives (Is 59). In the OT, especially in the Wisdom literature, the 'scorn,' or contemptuous man, (16) is frequently in the teaching of Proverbs: the God, as when he says, 'The Lord shall have them in derision' (Ps 2, referring to the rebellion of His disaffected subjects; so of the heathen, Ps 59). In both passages the conception of contempt is associated with laughter. Such a theory of contempt is not obsolete: e.g. K. Browning's lines,

'... Happy that I lean
Be crossed and thwarted as a man,
Not left in God's contemptuous part.'

(Exeter-Day, xxiii.),

where a failure of ideal is associated with the sense of Divine rejection and wrath. The monothestic contempt for idol-making and idolatry (cf. Is 44:16) in prophetic literature is an expression of the belief in the unapproachability of God and the moral weight of our own acts and lives (Is 59). In the OT, especially in the Wisdom literature, the 'scorn,' or contemptuous man, (16) is frequently in the teaching of Proverbs: the God, as when he says, 'The Lord shall have them in derision' (Ps 2, referring to the rebellion of His disaffected subjects; so of the heathen, Ps 59). In both passages the conception of contempt is associated with laughter. Such a theory of contempt is not obsolete: e.g. K. Browning's lines,
He did not hesitate to use the language of contentment respecting the unreality of Christian morals on the ground 'that their whole life was an acted play,' and that their zeal for righteousness was unwarranted 'thieves from a parentless, for men as such;' nor did he scruple to use the term 'that fox' (12) of Herod Antipas as summing up his moral cowardice and cunning. But contentment for man for man, of class for class, the disparagement of lowly condition, yea of sinners (as opposed to their sins), is ruled out by the example and teaching of Christ. Christ's view of man was 'a transvaluation of all values.' The first promise of the changed view of humanity is given in the Magnificat: 'He himself, that enthroneth the poor in honor and setteth the humble in his sight. (in repudio)' (Psa. 89). Nietzsche, that super-man of a new world, is not the embodiment of the spiritual, physical and intellectual, but the embodiment of perfect love. Aristotle's 'lofty-minded man' looks down upon others 'justly (for he judges truly); but most people do so at random' (Ethics, xi. 6). Even the best hearted of our contemporaries, however, fails to convince us; for in the same context we are told that 'he is not lavish of praise: for this reason he speaks no evil, not even of his enemies, unless he beContrast this with Christ's teaching, which enjoins the love of one's enemies and exalts meekness. The noblest character of ancient teaching 'walks, like contentment, alone' (Timon of Athens, iv. 15), and views his fellows (to quote Shakespeare again) through the 'scornful perspective' which contentment lends him (All's Well, v. iii. 48). He is quite oblivious of the claims of human brotherhood, in fact, his snobbery is hardly distinguishable from that satirized by Thackeray, and is equally out of harmony with the Christian spirit. Pride of birth, intellect, and dominion is by Dante (Purg. x. xi. xii.) consigned to the first terrace of purgatory, from which the poet is escorted by the angel of Humility to the song of celestial voices, singing, 'Blessed are the poor in spirit.' (xii. 3.)

The haughtiness which despises its inferiors, whether it take the form of reserve (épœrapia) or of active scorn (épæpès), is incompatible with the humanitarian ideal of Christianity. Such is the institution of slavery. The treatment of any human being as a chattel or instrument is no longer tolerable. 'Base things of the world and things that are despised did God choose' (1 Co. i. 27). The scorn of the man of the world for pity is an index of an oblique moral vision (cf. the Master of Ballantrae's contentment for his steward's strict and paritcular notions ['my evangelist,' he calls him ironically] in Stevenson's Master of Ballantrae). St. Paul was the Thessalonians (1 Th. ii. 14) against 'contempt of prohesyings,' implying that manifestations of the Spirit have to be judged with careful discrimination, and that they are not to be distrusted because fanaticism or unreason accompanies them in particular instances. Contempt is often a form of bigotry, and the symptom of defective charity or tolerance; and not seldom it is implicit in a cold rationalism or in the materialism which rejects immortality and religion. On the other hand, to be devoid of general conscience is no mean punishment. 'Let no man despise thy youth' (1 Ti. 4?3), or 'Let no man despise thee' (Tit. 2:12), is a summons to the cultivation of moral dignity, which at all stages of our

life, and not in youth alone, is the fine flower of a Christian personality. If, on the one hand, contentment is opposed to humility, reverence, compassion, and love, it is, on the other the chief element of the moral indictment of which the Founder of Christianity is the noblest exemplar.

R. MARTIN POPE.

CONTENTMENT.—Contentment—the condition of being satisfied—is a state of mind which may be regarded as a purely ethical product, or as a phase of religious experience. In the philosophy of life we are able to differentiate three types of contentment: Oriental, Greek-Roman, and Christian; and we propose to treat the subject under these heads. Royce, in his Outlines of Psychology (1903), has classified emotions under two dimensions, namely, restlessness and quiescence. If this classification is accepted, it is clear that the virtue of contentment gathers up into one experience the emotions of the quiescent order.

I. Oriental.—The essential element in the Oriental scheme of life is the suppression of desire. This is common to Brahmanism and Buddhism. Both (Religions of India, Eng. tr. 1882, p. 84) has remarked that the Hindu mind recognizes 'no medium between mental excitement and torpid indifference. Pantheism, fatality, the denial of personality and any real immortality, are the result of the act—these impress upon all that the Oriental produces 'a certain monotonous character compounded of sated and unsatisfied zeal.' So far as we can arrive at any conception of nirvāna, we may think of it as the serenity of the monk, except from all desire, contemplating in passion all that the average man holds dear—love and hate, power and oppression, riches and poverty, fame and contempt—and awaiting with complete detachment the annihilation of the self. The nirvāna-on-earth reached by the arhat is a pledge of the nirvāna-after-death, his 'refreshment from the fire of passion' being the earnest of his 'refreshment from the fire of existence' (cf. Peussin, Bouddhisme, p. 172). Some exponents of Buddhism point out that, while nirvāna is negatively the destruction of selfish desire and ignorance, it is positively universal sympathy and love for all beings. Cf. 'A View of the Bodhisattva' (Suzuki, Outlines of Mahayana Buddhism, p. 398):

1For the sake of all sentient beings on earth,
I aspire for the abode of enlightenment which is most high;
In all-embracing love awakened, and with a heart steadily firm,
Even my life I will sacrifice, dear as it is.
In enlightenment no sorrows are found, no burning desires;
The enjoyed by all men who are wise.
All sentient creatures from the turbulent waters of the triple world
I'll release, and to eternal peace them I'll lead.'

When it is objected that contentment can find no place in a scheme of life in which karma, or the law of moral reaction, prevails, the reply is made that the selfishness of the rich will bear inevitable retribution in a future existence, while the sufferings of the poor, if the poor do not despair of them and yield to temptation, will bring them future fortune. On the other hand, it is argued that human inequalities are not to be ascribed to the diversity of the individual karma (Suzuki, op. cit. p. 189 f.). Poverty is not the result of evil deeds.

The economic sphere is not that in which the law
of 

and misery, he is not concerned to find the explanation of these things in the past, nor is he anxious about the future. Social injustices and economic inequalities are inevitable in the present order.

\[\text{A virtuous man is contented with his cleanliness of conscience and heart. He is satisfied, what proceeds from meritorious deeds is spiritual bliss only, contentment, tranquility of soul, meekness of heart, and immortality of faith.} \] (B. p. 1967)

Again, the true conception of 

is not merely individualistic; that is, it is not true that our deeds affect only our own fate. These deeds leave permanent effects on the general system of sentient beings, of which the actor is merely a component part; and it is not the actor himself only, but every constituting member of the grand psychic community called 'Dharmadhatu' (spiritual universe), that suffers or enjoys the outcome of a moral deed.

In this way the inherent contradictions of the Buddhist view of life are modernized by an enthusiastic exponent; nevertheless, the denial of a Supreme Being and of personal immortality leaves us with some perplexities and cold that contentment becomes merely a fatalistic joyless acceptance of things as they are. Granting the admirable and even noble idealism of the Oriental, we ask the Christian saint who rests in the belief that a Universal Love dwells at the heart of creation and 'sweetly orders all that is.' Moreover, the ideal of contentment proclaimed by Buddhism is remote from life; it is too abstract, too detached; it is the offspring of the cloister, and consequently eclectic and esoteric. Even when it glorifies compassion and charity, it loses itself in vagueness, and, except in some rare passages of the teaching of Sakyamuni, proclaims a universal benevolence rather than specific acts of sympathy. If love be the 'fulfilling of the law' and the condition of true contentment, it has no real place in a philosophy which denies the reality of the ego, or in a religion in which saintliness is synonymous with impenitence.

At the same time, it is but just to remember that, whatever its stress on extreme renunciation of all the joys of life may have been, Brahmanism was far more human in its concept of contentment than was Buddhism. That the 'Vedic' (92, xlii. 2502) can say that 'no end is there of greed' [lit. 'of thirst'], (but) contentment is the highest good' (Avatattva patraman sukhvan), or we may read in the collection of quatrains attributed to 'The head that he is the one who is greatest if the mind be content, who is rich (or) who is poor.'

2. \[\text{Greek-Roman.} \]

While in Eastern thought the extinction of desire is the \textit{summa bonum} of the ethical or religious life, a quite different idea of personal worth was held by the thinkers of Greece. They were frankly humanistic in their outlook. The glory and power, the gifts and virtues, of the individual life, the supremacy of reason and wisdom, and the possibility of immortality of the soul were cardinal points in their system. We begin with the Socratic identification of virtue and knowledge. For a man to know what he is doing and why—in a word, wisdom—this is his supreme possession. Without claiming to have discovered an abstract theory of the Good or the Wise, and while on the whole sceptical as to the possibility of such a discovery, Socrates provisionally conceived of the Good or the Wise as the faithful possessor of a complete, and full of life, and he proclaimed that therein lay the secret of happiness. But what impressed his contemporaries was his independence of judgment and fearless criticism of conventional notions, rather than his love of knowledge. The result was the appearance of two opposing schools of thought—the Cynics, of whom Diogenes and Digenes were the notable figures, and the Cyreneans, of whom Aristippus was the leader. The watchword of the first was self-mastery—the practice of endurance and asceticism; that of the second, pleasure—the serene and untroubled pursuit of the pleasure of the moment, regardless of consequences. No one of Plato's students to Aristotle belonged as the ideal conduct of a life of such moment as the pursuit of truth and the ideal interpretation of the universe. With the advent of the Hellenistic period, about 300 B.C., the interest of the state or community as a whole, is transferred to that of the individual. The realism of Cynic and Cyrenaic was succeeded by the systems of Zeno and Epicurus, in which one more 'ethics is the end and goal; and an ethic, moreover, which looks only to the interest of the individual.' To Stoics and Epicureans the supreme interest is the possession of individual independence, the saving of one's own soul, and the ordering of life nobly and happily. The Epicurean doctrine (see \textit{EPICUREANS}) was far from being a mere glorification of voluptuousness and immoral living. The picture given by Seneca of the Epicurean garden leaves us the impression of a life of frugality and leisure—plain living and high thinking.' The doctrine of Epicureus was regarded as the end of existence was not mere sensuality; it rather consisted, in its finer forms, of freedom from pain or disturbing elements (\textit{aréas}). The pleasures of mind were nobler than those of body, the true realization of happiness are the givers of pleasure; 'it is sober reasoning,' says Epicurus in his letter to Menocles, 'searching out the reasons for every choice, and avoiding, and banishing those beliefs through which the contended life is regarded as the end of existence was not mere sensuality; it rather consisted, in its finer forms, of freedom from pain or disturbing elements (\textit{aréas}). Another word that sums up the contented life is \textit{eudhēkēa} (self-sufficiency), which was afterwards to be used in Christian ethics. 'We consider self-sufficiency a great good in order that, if we do not possess much, we may be satisfied with little' (Dioq. Laert. x. 130 on Epic.). Nowhere do we find the spirit of Epicurean contentment so charmingly expressed as in the odes of Horace, the poet who, enamoured of his Sabine farm ('satis beatus Ganymedes Sabini', \textit{Odes}, ii. viii. 14) far from the haunts and din of city life, urges his friends to 'sweet content' ('desiderantem quod satis est'), \textit{Odes}, iii. i. 25), to calmness of outlook ('quid sit futurum cras fugio quaerere,' \textit{Odes}, i. ix. 12) or to patient endurance is great if the mind be content, who is rich (or) who is poor.'

\[\text{"Aequam momenta rebus in adulescence servare mentem."} \] (\textit{Odes}, iii. ii. 11.)

In such phrases we discover the fascination of the Epicurean ideal of withdrawing from political and dialectical conflict to simple living and serene leisure, in imitation of the eternal leisure of the gods apart from the fortuitous concomitance of atoms that we call a world' (II. Sigwick, 'Ethics,' \textit{Elle}).

The Stoic conception of contentment may be summed up in the word \textit{eudhēkēa} (impassivity). The Stoic sage did not, like an Oriental \textit{yogi}, regard all phenomena as illusions; nor did his essentially Pantheistic view of the universe deny his sense of personal freedom and volition. Man can enter, by virtue of his gift of reason, into relationship with the Eternal reason. His one aim, indeed, is to live a life of reason, or, as the Stoic phrased it, a life 'in conformity with Nature.' To such a life the one of life, and it is its own reward, quite apart from external goods or advantages. The average man conceives of pain, sickness, and death as evils; to the sage living the life of reason they are merely 'indifferent.' Human passions are the enemies of the possession of the soul. The sage will strive to keep the mastery over such faulty fancies, and be true to the consummate virtue,
which is passionless and calm.' Such is the Stoic apathy.

Cf. Lightfoot, paper, p. 39, 'not only the absolute supremacy of reason, but its rightful claim to be the only motive force within the soul, for it would make a solitude of self and every external thing and quiet of heart, and peace; but it is opposed to terror and ecstatic reveries and mystic contemplation, such as those which Eastern ascetics have enjoyed, and their attempts to close every pore and inlet of emotion, and to end at last in pure nothingness of individual being.'

This type of contentment is illustrated poetically in the writings of the Roman Stoic—Seneca, Epictetus (see esp. the latter's chapter on 'Contentment,' Diss. I. 12 [Long's tr.], and also in the Thoughts of Marcus Aurelius (ct. esp. bk. viii.).

3. Christian.—Before considering the Christian ideas of contentment, with which the Stoic found itself confronted in the early ages of Christianity, we may glance for a moment at the OT. The pure monotheism of the Hebrew saint and his unswaying belief in a Divine Providence shaped for him an experience and the calm of the monothelitians which we have considered above. The possession of God is his true wealth. 'The Lord is my shepherd; I shall not want' (Ps. 23). Sadness, pain, exile, loss of wealth and property, drought and disease, were enough in the latter sense of God's presence and reality. Cf. the magnificent psalm of cheerful submission in Hab 3rd-12, which Cooper has reproduced in the well-known hymn, *Sometimes a light surprise,* or the unassailable cry of the 122nd (Job 1)-'We are and the Lord hath taken away; blessed be the name of the Lord.' In the Wisdom books we find happiness associated closely with a common-sense view of life's limitations; e.g. Pr 157-17 etc., or, more not in the sense of wisdom (Pr 31). So far as the Prophetic writings are concerned, a clear apprehension of evils, social and political, a remorseless unveiling of injustice and oppression, and fierce invectives against idolatry, meaningless ritual, and false materialism, are combined with unswaying faith in the Divine guidance and in the ultimate victory of the Divine righteousness. The panic-stricken despair of the materialist is nobly contrasted with the calm of the monotheliots in Is 3rd-13. (cf. art. 'Contentment' in _HDB_). Generally speaking, in the writers of the OT contentment is the fruit of faith.

In the NT the same association of contentment with belief is evidenced in the teaching of our Lord. The new feature is the sublime conception of God's Fatherhood. It is the Fatherhood of God which points Christ's warning against anxiety and adds an immortal beauty to the words in Mt. 6th-13, for it does not proclaim insensibility to the ills of life. He recognizes them, but calls upon us to live as children, to believe that God cares for us, and perfectly to trust the love, the wisdom, and the power of our Heavenly Father. This conception makes resignation to life's limitations and ills a more passive attitude of the soul; submission to God's will in life and death is an energy or act of a sanctified will. Such it was in our Lord's acceptance of the cross as the will of His Father. Dante's words (Par. iii. 83), *e la sua volonte è nostra pace* (see also the earlier words in Molesky's _Life of Gladstone_, i. 215), give the secret of Christian calm.

It is also to be noted that contentment in the NT is closely associated with the truth of immortality. St. Paul cheerfully lays down the spring from contemplation of the great truth that life must soon end, but from the great positive that true life has no end' (Medley, _Interpretations of Horace_, 1910, p. 58, and cf. Lucretius, v. 1171., *Quod si quis verum vitae rationes habet, dicius grandes hominum sunt, vivere parco sequo animo*).

Moreover, if, as Lightfoot suggested, there was a reference in St. Paul's epistles to the Stoic ideal of the sage and citizen of the world as one possessing absolute wealth and freedom, that idea is transfigured in the Christian experience. 'Already are ye filled, already ye are become rich, and ye have reigned without us' (1 Cor. 4th-7), are works for Christ's sake, but ye are wise in Christ; we are weak, but ye are strong; ye have glory, but we have dis- honour' (1 Cor. 4th-13). Cf. also the passage in 2 Co 6th-1, as sorrowful, yet always rejoicing, as always making much of the one thing, the scriptures, and as always enriching' (2 Co 4th-16); and finally, 'I have learnt in whatsoever circumstances I am to be self-sufficient . . . I have all things to the full and to overflowing' (Ph. 4th-13, 18). The Stoic attains his universal kingship by self-isolation: the other by incorporation (Lightfoot, _Philippians_, p. 305). 'Godliness with contentment (αὐτοκεραυνὸς) is great gain' (1 Tm 6th)-thus does the evidence of the wealth of the Christian saint. Heroism, patience, courage, endurance, whether we look for them in the annals of persecution and martyrdom, or in the daily round of common life with its constant cares and trials, may be regarded as the fruits of the contentment which inhabits what Wordsworth calls the

't central calm subsisting at the heart

of endless agitation.'

CONTINGENCY.—The term contingent, as applied to that which is actual and accidental in contrast to that which is logically necessary and in accordance with law, originated in philosophy. The idea involved goes back, however, to the problems of Greek philosophy. The thinkers
of Greece, once they had discovered the significance of general conceptions, and of the order of things typified thereby, came to distinguish between the worlds of ideas in scholasticism with these conceptions and that which is not wholly determined by them. The former, at this stage of thought, was identified with the sphere of the heavenly bodies, the latter with the sublunary world, where the rigid sway of law—the authority of form and conception—was circumscribed by accident and anomaly. It was only upon a basis of materialism that Democritus was able to trace a rational order throughout the entire universe, while Heraclitus, the Eleatics and with its inflected contingency acquired a new meaning from its connexion with Judaeo-Christian Theism. It was now used to express the volitional nature of the Creator, who is not limited by universal laws, but actually reveals the innermost structure of Being in the contingency of what eludes these laws. Thus, as Conceptual Realism (universalia ante res) evoked counter-movements of an empirical character, and interest in maintaining the freedom of the Divine will, so the latter gave rise to Scholasticism, various attempts to reconcile the validity of the pure Idea with a recognition of the actual—compromises which ranged from the specifically Aristotelian systems to Mysticism and Pantheism.

Not until the dawn of modern philosophy was there a revival of the pantheism of Heraclitus and the Stoics, as represented in the philosophies of Nature that sprang up with the Renaissance; and, as it came to be recognized, in consequence of the newer investigation of Nature, that the laws of the sidereal world are identical with those of the lower sphere, there arose a fresh wave of pure Rationalism, which excluded contingency. Then the metaphysics of the physical world, with the system of Spinoza in the forefront, made this revived Rationalism supreme. All the more vigorous, however, was the reaction of that Empiricism, with its insistence upon the fact of contingency, took shape in the hands of Locke and Hume, of Leibniz and Kant; for, in spite of the fundamental Rationalism of the latter two thinkers, the one distinguished between the verité de raison and the verité d’fait, the other between the rationality of the categories and the contingency of the matter of experience. The problem having thus been placed upon the new basis of a universal cosmic order, the Aristotelian view of Nature, with its cosmic world, was, of course, discarded, as was also the Neo-Platonic identification of contingency with the irrationality of matter and sense. But contingency emerged once more in connexion with a general profound elements of Nature in their metaphysics, as the term was now used to signify the irrational factor beside and within the rational, and as the idea came into immediate touch with the questions regarding the conception of Deity; the thought of a creative cause without motive was pitted against that of a logical necessity by which the world proceeds from the Idea. It was in these controversies that the full significance of the conception of contingency was at length realized.

The various aspects of the problem must be considered in detail, as follows:

1. The difference between the universal and necessary and contingent. The facts embraced, universal, and contingent, by these categories. The facts, as such, are irrational and contingent. We cannot comprehend why this or that should exist; and, even if any particular thing be rationalized in virtue of or derivative from another, yet that other itself remains contingent. Should it be affirmed, however, that the whole manifold of phenomena can logically be deduced from the fact of the world as a whole,—a consummation which is not even remotely possible, and to be thought of as just a logical postulate,—nevertheless, the existence of the world itself would still remain irrational and contingent. The truly incomprehensible thing, as D’Alembert puts it, is that anything should exist at all. Here, in fact, we have the reason why metaphysics must, in the ultimate resort, refer the existence of the actual to the arbitrary fiat of Deity, precisely as was done by Augustine and the Nominalists, and, in another form, by the modern theologies of the 19th and 20th centuries. Yet it is so decided a rationalist as Descartes fell back upon the same explanation of the world as a whole.

2. The contingent elements in rational and logical necessity itself. The so-called cosmic law, ‘cosmic order, as not limited by universal laws, but actually reveals the innermost structure of Being in the contingency of what eludes these laws. Thus, as Conceptual Realism (universalia ante res) evoked counter-movements of an empirical character, and interest in maintaining the freedom of the Divine will, so the latter gave rise to Scholasticism, various attempts to reconcile the validity of the pure Idea with a recognition of the actual—compromises which ranged from the specifically Aristotelian systems to Mysticism and Pantheism.

3. The idea of individuality. Even if we assume the existence of a universal rational order, yet we must admit that every single concrete phenomenon found in this network of rationality has a certain individual character which is not derivable by universal laws, but always exhibits some special and distinct element not derivable therefrom. This holds good alike of the simplest natural event and of the most delicate complex of psychical life. As a matter of fact, the acts without motive were pitted against that of a logical necessity by which the world proceeds from the Idea. It was in these controversies that the full significance of the conception of contingency was at length realized.
CONTINUITY

89

system of thoroughgoing rationalism, which accordingly usually endeavours to deny or ignore the existence of the particular or to interpret it as something else. This is what Leibniz means when he says that Spinoza would be right if there were no monads.

4. The problem of the new.—On the principle of a thoroughgoing rationalism, nothing new could ever emerge in the world of the real. Everything would be involved in the existence of the whole, and therefore everlast present therein; or the apparently new would be only a phase and form of something primary, the 'positing' of which is clear, however, that on either alternative the new is got rid of by a mere evasion. In the first case, still persists as something that has emerged in the process of development, as that which distinguishes the actual from the potential; in the second, as appearance and manifestation. A thoroughgoing rationalism must, like the Eleatic school, repudiate movement and becoming altogether, for, if it does not, then the admission that something has come into existence which was not contained in the antecedent situation implies an element of contingency. Hegel, in importing into the rationality of the Idea the principles of negation and transition to the new, makes movement altogether the principle of becoming, really, though surreptitiously, provides a place in his system for the contingent and irrational. Metaphysically expressed, this contingent element is the idea of creation and 'posing,' which is here applied to the particular in the same way as to the universe in § 1 above. Epistemologically expressed, it is the idea of a causality of non-equivalence, as opposed to the causal equivalence with which alone a consistent rationalism is possible. Further, the idea of equivalence the nexus signifies identity of essence, with a mere change of form. In causal non-equivalence the nexus provides a place for the new. The endeavour to reduce all our knowledge of causes to the former causalities, manifestly and accordingly an element of contingency clings to the conception of causality itself.

5. The connexion between contingency and freedom.—Freedom, in the sense of self-determining, universal law by law, according therewith, as contrasted with the haphazard of a purely psychical motivation, involves per se no contingency whatever. On the contrary, as determination by universal moral and social law, it forms a part of the universal law in general, which is first of all realized in the personal sphere, and then transferred to the uniformities of the world-process. In reality, however, the causal 'must' of the process of things, when judged by the absolute standard of ideal values, manifests itself as something contingent. For, if these values represent the true significance of the existent, it is impossible to see why they should demand for their realization this particular sphere of causality. Moreover, freedom, in the sense indicated, implies the exclusion of absolute rational necessity from that sphere of objectivity which is at once the base and the theatre of its activity, since it demands, in the order of things, a certain elasticity, in virtue of which it may intervene in the manifold and mould it to its own ends. From this side also, therefore, an element of contingency insinuates itself into the conception of universal laws—a conception which is thus once more shown to include an element of the merely relative and to be no longer a conviction of the absolutely valid. In relation to the ideal of universal necessity, interrupted or variable laws are contingent. Here, in fact, we touch the ground, as well as the limits, of determinism, which is never more than a deduction from the axiom of the absolute rationality of things, and never reaches the level of a truth scientifically proven.

6. Contingency in the ideas of freedom themselves.—While the ultimate cognizable source of the idea of law, and, therefore, of unconditional necessity also, lies in the ideas of freedom, absolute validity and validity, yet the particular elements of that ideal order cannot arise from within, but must be in themselves necessary. Our observation does not carry us beyond an actual control of the soul by ideas bearing this or that interpretation, but we can never divorce ourselves from the conception of absolute necessity. As regards the elements of ideas may be unconditionally necessary, but their content is dependent upon the actual conditions of human life. Here, we come upon the root of the old Scholastic controversy whether the moral laws are good because God wills them, or whether God wills them because they are good. We thus see that the idea of contingency pierces even to the deepest sources of all ideas of necessity.

The problem of contingency, then, in its various aspects, contains in nuce all the problems of philosophy, just as from the opposite side they are all contained in the problem of Rationalism. The question of contingency is in reality the question of the relation to the rational of the actual to the logical, of creation to the eternity and necessity of the world. The reconciliation of these opposites is impossible. The actual thinking activity of man consists in a continuous combination of the rational, of the Absolute, of Spinoza with the Pantheism as its logical conclusion, and absolute Irrationalism, with its logical consequence of the irreligion and incoherence of things, or Polytheism, are alike impossible. The final synthesis of human thought and of human thought, and all attempts to reach it lead to contradiction.

In its religious aspect, the idea of contingency implies the vitality, multiplicity, and freedom of the world in God, and, indeed, the creative freedom of God Himself; and accordingly an element of contingency clings to the conception of causality itself.

E. TROELTSCH.

CONTINUITY (Gr. συνεχος, το συνεχης; Lat. continuatio, continuum).—We may perhaps distinguish three stages in the history of the notion of continuity: (1) a pre-scientific stage, in which the notion is no more than a simple description of certain obvious facts of sense-experience; (2) a second stage, in which scientific philosophy first arrives at an apparently clear and distinct conception of the continuous as a peculiar kind of magnitude which is to be distinguished from discrete. This stage of reflection makes its appearance for the first time in the Eleatic criticism of the assumptions of Pythagorean Geometry, and culminates in the Philosophy of Aristotle, in which the conception of a 'uniform continuous motion' is central for the whole doctrine of Nature.
CONTINUITY

Mathematically, it leads to the sharp contrast between Arithmetic as the science of non-continuous, and Geometry as the study of continuous, magnitude, which we find carried out in the elements. (3) Pythagoreanism, represented by the labours of the 19th cent. mathematicians, and embodied in such theories of the continuous as those of Dedekind and Georg Cantor, consists essentially in the attempt to develop, by means of an extension of the notion of number, a purely arithmetical conception of the continuum, and so to restore the correspondence, broken down by Eleatic criticism, between Geometry and Arithmetic. That the new mathematical conceptions until, as it were, 'presenting no sensible gap,' 'hanging together,' Thus, with reference to space, we find Thucydides speaking of the siege-works at Plataea as ἑκάστηρ ἔκδομα, 'buildings without a gap,' which, as he goes on to say, looked like an unbroken wall (iii. 21). So, with reference to time, in the medical writers of the 5 cent. ἄνεμοι ὑνωτοί τοῦ σαρκοτότον, 'non-remitting fevers,' are distinguished from διάκερτοι πυρετοί, 'periodical fevers,' and in Thucydides (v. 88 Εἴρηκε φιλάνθρωπος ὕπαξ χειρί, 'he who ended the address,' is contrasted with a free conference, in which each point made by one party is immediately answered by the spokesman of the other. In all these cases we are dealing with a simple experience, yet coloured by scientific reflexion. Every one knows the difference between an unbroken line and a series of dots with sensible intervals between them, between a steadily persisting pain and one which comes and goes, between the flight of a missile and that of a bird. The former seems to 'hang together,' the latter do not; and it is this sensible 'hanging together' which the plain man has in mind when he speaks of the former as 'continuous.' So too a reflexion has been 'continuous' and a 'discrete' kind of magnitude, one which cannot, and which one can, be broken up into ultimate units, themselves indivisible. The plain man, for instance, would not object to talking of 'numbers' (e.g. those from 1 to 10), though he commonly looks on an integer as a 'collection of ones' (exactly as Aristotle did). He would call the series 'broken' only if one of the members were left out. 2. The Pythagorean Mathematics and the Eleatic criticism; views of Plato and Aristotle.

—Serious reflexion on the presuppositions involved in the notion of the 'unbroken' first meets us in the criticism of the Eleatic philosophers of the 5 cent. on the theories of magnitude and space in the views of their Pythagorean neighbours. Amid all the uncertainty which surrounds the reconstruction of early Pythagoreanism, one thing seems certain. The Pythagoreans were primarily interested in Arithmetic, the discovery of incommensurables, comes first (bks. i.-iv.), Arithmetic next (bks. vii.-ix.), and then the theory of surds (bk. x.),—is due to the effects of the criticism of the nature of number. The Pythagorean doctrine itself led very directly to consequences which were fatal to its own assumptions. If lines are simply made up of an integral number of 'units,' it ought to be possible in theory to take an infinite number of points, in any given terminated line. In other words, all lines ought to be commensurable, since the 'unit' measurement by any other of these facts show how severely the Pythagoreans felt the contradiction between their assumption and their conclusion. Hence, it is not wonderful that their critics should have pressed it to the utmost. Parmenieids (β. c. 475 B.C., according to Plato) had already attacked their fundamental position by asserting in his poem that, since πη β' ὅν ('what is not,' 'empty space') is a pure unreality, το ουδέν ('what is,' 'body') cannot be divided at all, because it is Ψευδέα τινα ('all is hanging together'); hence the distinction 'between 'whole' and 'broken,' 'empty' and 'full' ('τό αὐτοῦ τοῦ μακροτέρον, ἀνάτομον τινα, εὐκρίνεια). This conclusion would be immeasurably strengthened by the discovery of surd or 'irrational' lengths (i.e. lengths which have not, to the unit of measurement we assume, the medos, or ratio, of one whole number to another). We may put the difficulty thus. The Pythagorean conception of the point as a 'unit' of length involves the view that, if on a terminated straight line AB we mark off points corresponding to the successive integers, we have only to make our unit of length sufficiently small (i.e. to take our successive points near enough together) to exhaust all the points of the line. The discovery of a single 'surd' length is enough to show that this is false. However close together we take our points, we shall never have included one which lies from the origin at a distance equal to the diagonal of a square on the 'unit' length; or again, there will not be among them any point at which a straight line is divided in 'extreme and mean ratio.' Such a conclusion would, of course, be destructive of Geometry, because it would invalidate some of its most fundamental constructions. How far the study of surds was advanced
in the 5th cent. we do not know, but probably not far, since in the Theaetetus (p. 147 D ff.) Plato assumes the discovery of the successive quadratic surds from $\sqrt{2}$ to $\sqrt{17}$ to have been a recent achievement of his friends, Theodorus, Theaetetus, and the younger Socrates. Plato and his school are known to have given much attention to the subject, which was especially advanced by Theaetetus, and an incidental reference in the early Peripatetic treat on "Indivisible Line" shows that they had already examined and named at least two of the types of such expressions studied in Euclid x. — the $\sqrt[n]{2}$ and the $\sqrt[n]{3}$ of $\sqrt[n]{2}$.

By word of the explicit study of such magnitudes, results equally fatal to the Pythagorean identity of Geometry with applied Arithmetic can be derived from the argument from infinite divisibility, and it was this argument which was specially pressed home by Parmenides' pupil, Zeno of Elea (b. c. 450, according to Plato). To appreciate Zeno's employment of the argument, we need to bear in mind that what the Greeks called $\alpha\nu\iota\sigma\tau\iota\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigma\varsigm
'common measure,' and are therefore incommensurable. The point is put very clearly in the introductory scholium to Euclid x. (Heiberg, v. 415):

'The Pythagoreans first began to investigate commensurability, being the first to discover it from a study of numbers. For, when the number 1 is a common measure of all numbers, they failed to find a common measure of magnitudes (μέτρον). The reason is that any number, however you divide it, leaves you with a least part which admits no further division. But no magnitude, though you divide it ad infinitum, leaves you with a part, which is a magnitude, but with a part which cannot itself be divided ad infinitum.'

Thus, owing to the criticism of Zeno, infinite divisibility came to be regarded as the only criterion of commensurability. In language the effect of the polemic was that the old definition of the point as a 'unit with position,' which we know to be Pythagorean, was replaced by that which now stands at the opening of Elements: 'The point is that which has no parts.' (εὐθεία τεσσαρων μη ὁτι οὐκέτι). In thus dividing the point is not divided, does not, differ from the 'unit,' or 'number 1' (τετράγωνο) (cf. Plato, Republ., 325 E), but it is maintained that the point is not divided because it is not clearly seen that, unlike the 'unit,' the point cannot be a 'measure' of anything. Hence in Plato and Aristotle μέτρον always means the number 1; for 'point,' Aristotle always says μέτρον or στρογγυλόν, which is an expression of the Periclean circle, argued, in 'refutation' of the geometers, that a circle and tangent have a stretch, not a single point, in common (Aristotle, Metaph., B 997), 35). This looks like an attempt to divide the infinite, and the infinite of the line, to identify the minimum visible with the unit of extension, and thus to get rid of the notion of incommensurability. Hence it may be, as Burnet has suggested (op. cit. 188), that the formula Protagoras chose for his relativism, 'Man is the measure of all things,' was influenced by opposition to the new doctrine of magnitudes which have 'no common measure.' The anti-mathematical argument of Protagoras led to a rejoinder from his greater townsman Democritus, in the catalogues of whose works division up to the hundred cent. A.D. by Thrasylus we find one on 'the contact of the circle and the sphere,' and another on 'irrational lines.' According to Plato and Aristotle, (following above, 144 A, B, Republic, 540 B) a problem involving surd magnitudes is, in each case, under consideration.

Plato's attitude towards the problem raised by the discovery of surds, and the recognition that the infinitely divisible cannot be matched by 'units,' is, at first sight, perplexing. He is deeply interested in the study of surd expressions, and fully aware of the infinite divisibility of μέτρον, but refuses to take the step of severing Geometry from Arithmetic. He himself confirms the theory of numbers, is the foundation on which all other branches of Mathematics should be based, and the clue to their meaning. We can exempt him from the charge of incoherence only by supposing that his retention of Arithmetic as the core of Mathematics was due to a conviction that 'number' is not exhausted by the series of the natural numbers, the μονάδον. We can exempt him from the charge of incoherence only by supposing that his retention of Arithmetic as the core of Mathematics was due to a conviction that 'number' is not exhausted by the series of the natural numbers, the μονάδον. But if the series of natural numbers is not complete, if it is interrupted by the incommensurability of certain proportions, what is the basis of arithmetic, of Geometry, of numbers and magnitudes? Is Plato right in viewing the series of natural numbers as complete? Do we really possess a complete series of numbers, or have we to do with a succession of numbers, which, by reason of the fact that they are indivisible, is complete in a new sense? (cf. Aristotle, Metaphysics, Book X, 990. 11). We may, however, look for a complete series of numbers, but we cannot reach it by the continued division of the number 1. Hence we are led to consider the number-series, without incurring any of the difficulties which were fatal to the old Pythagorean geometry. (Just so, our ordinary Analytical Geometry rests on assuming such a correspondence between the points of the line and the numbers, without the complete series of the real numbers.) That Plato had formed some such conception of a possible extension of the concept of number seems clear from more than one consideration. The suggestion, as Milhend has shown (op. cit. bk. ii. ch. 5), explains why Aristotle regards it as a capital point against Plato to insist that there is no way of generating numbers except by the addition of units, and why so much is made in Metaphysics M of the complaint that the 'numbers' of which the Platonic 'ideas' are composed are not all εὐθεία τεσσαρων, incommensurable with one another. Aristotle is, in effect, complaining that Plato's theory presents us with expressions like \( \sqrt{2}, \sqrt{3}, a + b \), and the like; whereas he himself holds that there is no point in the number-series. For it is obvious to Plato that Aristotle (Meno, 82-85 B Theor. 148 A B, Republic, 540 B) a problem involving surd magnitudes is, in each case, under consideration. Aristotle's statement that Plato refused to speak of 'points,' but called them instead 'the beginning of the line,' seems to indicate another attempt to face a difficulty inherent in the current conception of the number-series, instead of severing Geometry from Arithmetic. If we turn to the Pythagoreanism downwards, we find it regularly assumed that the number-series must begin with 1,
the 'unit.' But the criticism of Zeno had shown that we cannot think of the 'point' as a 'unit length.' If the correspondence between Geometry and Arithmetic is to be kept up, as Plato wished it to be, we must begin our number-series with something which answers to a 'unit magnitude in Geometry'; the first number must be 0, not 1. It was, no doubt, this character of the point as a zero which led Plato to avoid recognizing it as a distinct entity, and to call it 'the beginning of the line.' It seems most probable, however, that he did not clearly draw the right conclusion that, in the same way, 0 is the beginning of the number-series. More probably he thought of the point, as Xenocrates is known to have done, as an 'infinite interval,' and must be added to the list of thinkers like Leibniz, who have been led astray in their theory of the continuous by this phantasm of a thing which is somehow at once something and nothing.

Further interesting contributions are made to the theory of continuity in the puzzling dialogue Parmenides. Without raising the question of the purport of the dialogue as a whole, we may note the references made in its antinomies to the difficulties of thinking things out of real elements. We may take first the treatment of 'contact' (p. 148 D E). When a number of things are in contact, each 'lies next to' (ἔφηβη κείτα) that which is in contact with it; e.g. if a straight line is made up of distinct 'end-points' in contact with one another, the units must leave no gaps between them, and each must have a definite 'next adjacent' unit. In modern phraseology, the line must be a 'well-ordered' assemblage of points. Hence, in a sense of the word, there must be (n-1) contacts. It is therefore inferred that, 'if there is not number in τὰ ἄλλα' (the things 'other than the One,' 'the Many'), 'the One' cannot 'be in contact with them.' For Geometry this plainly means that, if the points on the line are not 'units' (and the criticism of Zeno had shown that they are not), no point on a line has an immediately adjacent or next point. Since every integer has a next integer in the actual number-series, this means that the points on a terminated straight line, taken in the order of their distances from one of the end-points, cannot be symbolized by the series of integers. Continuity, as exhibited in the line, must be something other than the mere succession of the whole number-series 1, 2, 3, ... etc. Later on (155 E-157 B), we have an argument to show that the very concept of change leads to the thought of time as a series of 'moments' which have no duration, just as the points of a line have no extension. When a body which was moving comes to rest, or vicissitudes, there is a transition from the one state to the other. This cannot take place 'in time,' i.e. there is no interval, however small, in which the body is neither moving nor at rest, but passing out of motion into rest; in any given interval it is either moving or stationary. Hence the transition occupies no duration, but happens instantaneously, and we are compelled to formulate the 'regallogical' (ὁ κατατριχήθη) or 'instaneous' (τὸ ξαίρηθη). The paradox seems to lie in the fact that it is hard to decide whether the moment at which the velocity 0 is reached should be counted as the last moment of motion or as the first of rest. In the former case, think of the time during which the body moves as having no last moment, in the other of the time during which it is stationary as having no first moment—an immediate consequence of the consideration that no moment has a 'next moment.'

In Aristotle we meet with none of the anticipations of a riper thought which fascinate us in Plato, but we have, by way of compensation, a very explicit account of continuity, in so far as infinite divisibility may be taken as a sufficient criterion of it. The notion is fundamental in the Aristotelian system, because the steady and uninterrupted process of the development of latent potentialities into actualities, which makes possible 'Nature,' depends in the last resort upon the uniform and continuous movement of the heavens, and continuous movement demands the continuity of time and space. Hence any denial of the continuity of time, duration, and movement, as Zeno's was, is fatal to Aristotle's whole Naturphilosophie. The tract on the Categories gives us the general view current in Academic circles and presupposed by the more special discussions in Aristotle's discourses on 'Physics.' 1 τὸ πᾶσον (quantum) has two species—ὁ διωρισμένος (elsewhere also ὁ διάσωμεν), 'the discrete,' and ὁ συνεχῆς, 'the continuous.' The vital difference between them is that the 'parts' (ἄρμα) of the 'discrete' (quantum) have no 'ends' (ἀκίνητον), at which they join; e.g. 10 (for Aristotle always confuses the number of a collection with the collection itself, and many of his attacks on Plato arise from inability to see that, though there are many parts of things in the world, there is but one number 2, and this number itself is not a 'pair') consists of 7 + 3, but no one of the 'units' of the 7 is identical with any unit of the 3. But the 'parts' of a 'continuous' quantum always have such a 'next point,' which, in the case of the line, is a point; i.e. when the terminated straight line AB is divided at C, the writer reckons C as belonging both to AC, of which it is the last point, and to CB, of which it is the first, thus logically continuous; but AC and CB twice over. Similarly with time: the present moment 'joins on' (συνάρρευτε) both to the past and to the future. It may be taken either as the first or as the last moment of an unbroken time-series. This is the real and important point of continuity drawn for us between the two kinds of quantum, since it implies, of course, that the συνεχῆς πᾶσον or continuum is infinitely divisible, and therefore does not consist of units or minima. It is added that not all continua are composed of parts which 'have position'; e.g. since the past, present, and future are not all co-existent, no part of time is 'anywhere' relatively to the rest. The parts have no position, but only 'order' (τάχησις), and so far resemble the members of the series of the whole number-series, if we do not, of course, press this analogy too far, since it would lead to the view that the 'parts' of time form a 'well-ordered' aggregate, in which each term has an immediately next term. Time would then be made up of minima of duration, and would not be continuous in the writer's sense (Categories, 3-5). More characteristic is the account given in Meteorology A 1029, 7 ff.—πᾶσον (quantum) means 'that which can be divided into constituents inherent in it, whereas each is one and 'this' (τὸ διαιρέτων εἰς ἐνέργητα ἐν ὕδατον καὶ ἔνεργον ἐν τοῖς τεῖχοις εἰναι [1029, 8]). Such a quantum is a πλήθος, or assemblage, if it can be numbered; a μέγεθος if it can only be measured. Thus a κλήρου can be divided into countable non-continuous elements, but a μέγεθος only into continua. (We cannot, e.g., divide a line into points, but only into lesser lines, so that infinite divisibility is taken as the criterion of μέγεθος, 'continuous quantity.') A delimited (περικεφαλάζω) πλῆθος is a whole number; a delimited μέγεθος is a line, surface, or body, according to the number of its dimensions. Thus there is only one kind of magnitude which is continuous in its own right (καὶ τὸν τεῖχος ἐν τῷ—extension. The parts are not in their own right, but derivatively (εἰσάγων ἀκρατῶς), in virtue of their connexion with the μέγεθος τοῦ τεῖχος, extension. Since the trajectory of
CONTINUITY

A moving body is a continuum, the motion is a continuum also, and therefore also the time occupied in the transit. A fuller, but logically unsatisfactory and immaterial, definition is (Physics, 227b, 4) that 'a second' (the fundamental category of a science of 'Nature') is generally held (διά) to be one of the continua, and it is in the continuous that the 'infinite' first makes itself noticeable. Hence, those who give definitions of continua consider the concept of the infinite, on the ground that what is divisible is continuous (200b, 18). The point that the one primary continuum is spatial recurs in bk. 3, ch. xi. Time is relative to change (μετανομή), since it is only when we perceive change that we are conscious of duration. If the 'seven sleepers' woke up, they would not be aware that time had elapsed during their sleep. They would connect the former next with the subsequent now, and make one of them. To know what time is, we have to ask in what way it is related to motion (τί την κινητικήν ἐστιν). But what moves, moves from somewhere to somewhere. The one in the middle on any path of the plane traverses. Motion is thus continuous because its path is so, and time is continuous because motion is. Time is 'the number of motion in respect of before and after' (220a, 24). The use of the word 'number' is unhappy, since Aristotle is never tired of insisting that there are no numbers but the μετανομή ἄρμον, the whole numbers made by addition of units; and the definition, taken strictly, is thus inconsistent with the view that there is no minimum of duration. The definition is accounted by Timaeus, 37 D, and the Academic collection of ὕσσων, that time is the measure (μέτρον) of motion, which Aristotle sometimes repeats, is thus much more accurate.

Finally reach Aristotle's own formal definition of τὸ σωκράτησι in Physics 227b, where it is given as the last resultant of a whole series of previous definitions. Things are 'together' (ὁμαλά) when they are in 'one and the same primary place' (ὁ εὐ τερον δύο ἑστιν ἡ ἰσότητα) and 'in the same connexion', away from each other and from any other. Two things of which the extremities are 'together' are 'in contact', or 'touch' each other. A thing is 'between' (μεταξὺ) two others, when something which is continuously contiguous to it, lies at the end of the 'process of change' (γιὰ τὸν τάσιμον τοῦ ἐπικρατείον τοῦ ἀντίκρατον). We now define 'next after', and 'immediately adherent.' A term in an ordered series is 'next after' (πρός τοῦ ἐπικρατοῦν) another when there is no term of the same kind between them. The phrase 'adherent to' (ἐπικρατείον) means both 'immediately adherent' and 'in contact with it' (ἐπί τοῦ ἐπίκρατον τῷ ἀντίκρατῳ).

Finally, continuity is a special case of immediate adherence, which arises when the two 'ends' (πρός τοῦ) of things which immediately adhere become one and identical (ὥστε καὶ τὸ πρῶτον καὶ τὸ ἐπικρατής εἶναι ἀντικρατηστὶ). Alexander of Aphrodisias, as we learn from Simplicius, found this passage hard to interpret, and with good reason. Apart from the logical ἀνατρέψων προτέρον already noted above, there are three important points in the definitions of 'together' and 'contact'. What is meant by 'the same primary place'? Simplicius escapes from Alexander's uncertainty as to whether the notion of continuity is not tacitly presupposed by such a phrase only by giving it a purely relative sense; it may mean at will 'in the same town,' 'the same house,' 'the same room,' etc. In fact, it has no definite meaning at all. The same defects attach to the subsequent definitions, which depend on that of 'together.' Two things are 'in contact' when their extremities are 'together.' And such contact may exist without continuity. The extremities, as in the case of things which are merely 'adherent,' can be 'together' and yet remain distinct. Such a definition does not satisfy our geometrical notion of 'contact.' However small we take the 'primary place' of the two extremities to be, so long as the extremities remain outside the extent of the infinite, we can have a set of concentric spheres enclosed within one another so that no space is left between the convexity of one and the concavity of the next outermost, and yet that the convexity and the concavity remain distinct surfaces. But this is geometrically impossible.

The one point of real interest which emerges from the discussion is the hint of a connexion between the notion of continuity and that of series. As Aristotle states the connexion, it is open to unanswerable criticism. The idea of dividing the continuous into 'units' shows that a continuum, as given, cannot consist of members each having a 'next following term,' but the main idea has borne remarkable fruit in our own days in Cantor's definition of the continuum, and a striking attempt has been made by Zermelo (in Mathematische Annalen, LIX, iv. 514 ff.) to show that any continuous series (e.g. that of the points on a terminated straight line) permits of an arrangement of its members such that every one has a 'next following' member. That no member of such a series as given in experience has a 'next' member is, with laudable inconsistency, insisted on by Aristotle himself.

Nothing continuous can be made out of points, or even of finite arcs, or finite circles, or finite lines, or finite areas, or finite volumes, or finite tilings, or finite spaces, or finite rooms, etc. Hence, if we attempt to make out of points a straight line by infinitely repeated division we can only break it up into lesser lines, which are, again, divisible. σωκράτης can be divided only into σωκράτης, or, as Bradley has put it, space (and time) are 'lengths of lengths of nothing that we can find' (Appearance and Reality, London, 1897, p. 57). On the straight line, e.g., we can find nothing but points, yet it is not a series or class of points, but something more, though what that something is we cannot say. This failure of Aristotle to break with the Platonic view that Arithmetic, Geometry, and Kinematics form a single science with a single body of postulates, 'Physics,' so he unhappily concludes, is distinct from Mathematics, and Mathematics itself falls into two distinct doctrines, each with its own peculiar postulates—the theory of the διομετέρων πάρον, or number, Arithmetic; and Geometry, the theory of the σωκράτησι πάρον— and it is a logical fallacy to attempt to prove a conclusion which is only involved in the definitions of the postulates of the other (ὅτι δ' αὐτόν μὲν ἢ διομετέρων γένος μεταβλητάς διάδικα, οἷον τὸ γεγονότος λεγόμενον, Aristotel. Post. A 75b, 38). Zeno has at last come by his rights, in spite of Aristotle's personal failure to appreciate his historical significance.
Continuity

To consider the way in which Aristotle goes on to develop the view that the regular continuous development from potentiality to actuality which makes up the life of Nature, as we see it in the adult organism from the germ, and of the germ, in turn, from the adult organism, or even in any steady qualitative change from one 'opposite' (e.g., white, hot, dry, hard, cold, moist, and so on) upon another, is a dominant idea in the Metaphysics. In the Eudemian Ethics, it is the only curve of constant curvature. (For all this see Physics, de Caelo, and de Generat., Part 1.)

The fact that the course which it suggests for the development of potentiality into actuality is closely paralleled by the actual process of observation is one, no doubt, interesting as showing the study of at least some of the irrationals examined by Eudoxus, goes back to Plato and his immediate followers, as do also the ideas of the 'infinimals.' Some interesting notices are preserved to us by Sextus Empiricus, in bk. x of his work on DOGANAKOS, Philo, which is the essence of the Megarian logician's argument against Aristotle's whole conception of the gradual development of potentiality into actuality, of which we read, in Metaphysics, 1049a, 23-25, was connected with a revival of Zeno's arguments against motion. Diodorus Cronus (Diodorus Cronus) in his work, the Mathematicae, x, 80, strongly attacked the notion of a 'state of motion,' i.e., a time at which one cannot say of a moving material point (an unbroken etava, i.e., a unbroken point) as an atom (Heraklitos in the sense of Democritus and Epicurus, since the atom was not apopoe to) that it is at any position, but only that it is moving from one position to another, though one can, Diodorus admits, say that such a body must have moved, when it is seen first at A and afterwards at B. The view of the Eudorean that a state of motion is attacked is, in fact, one of the chief difficulties inherent in Aristotle's whole treatise of continuity.

Nothing would be gained by following the history of the notion of continuity in Greek philosophy, the Stoics, to be sure, influenced later thought considerably by their vigorous insistence on the idea of the absolute continuity of matter, but neither they nor the Neo-Platonists, whose doctrines may be called the final product of Greek speculation, added anything to what Aristotle had laid down as to the logical analysis of the concept of the continuous itself. The sharp division between the two main kinds is the 'infinite divisibility of the 'units' (the 'discrete' quanta) and those which are not (the σωρης or continuous πόρος), the adoption of infinite divisibility as the criterion of continuity, and the consequent view that incommensurables (numbers) and have no place in Arithmetic were the permanent legacy from the ancient to the modern philosophy of the continuous.

3. Modern attitude.—The general acquiescence in Aristotle's distinctions makes it unnecessary to treat at any great length of the views of most modern philosophers on the nature of a continuum. For the most part these views have been determined by the conception of infinite divisibility as the criterion of continuity, and have no place in Aristotle's work. This means that the theory of continuity as presented by Descartes seems to have been blinded to the real difficulties of the subject by his familiarity with the practice of employing the symbols of Algebra indifferently to denote rational and irrational numbers, which, if we had asked himself what conception was to be formed of number, if we are to recognize such expressions as \(\sqrt{2}\), the like as numbers, and thus his Geometrica, with all its historical importance, can scarcely be called a contribution to the philosophy of Mathematics. It does not appear that the continuity which he claims for matter amounts to more than infinite divisibility, the absence of real 'atoms' or 'units' of extension. Hobbes explicitly accepts the Aristotelian definition, 'Continua inter se tum spatia tum tempora duo dicuntur, quorum est aliqua per comminus,' (de Corpore, vii. 10); 'Corpora etiam duo spatio et tempore continuisse' (ib. viii. 9). Spinoza even returns to the Eleatic position, according to which extension, because continuous, is not really divisible at all, and is supposed to have parts or elements only by an illusion. 'Substantia absoluta infinita est indivisibilibus' (Ethica, i. 13); 'ex sequitur . . . nullem substantiam corperaem, quatenus substantia est esse divisibillum' (ib. corollarim). Hence he infers that quantitas is divisible only so long as we merely imaginare (i.e., think inaccurately about it); when we form the concept of it, we see it to be 'infinita, unica, et indivisibilibus' (Ethica, i. 15, schol.). It should follow that we can form no concept of a plane, a straight line, or a point—a conclusion which would be the reduction ad absurdum of Spinozism. Similarly Kant's critical philosophy throws no real light on the nature of a continuum. Indeed, if we take seriously the Aesthetik, with its account of the way in which the mathematician's 'mathematical intuition' is generated, we shall clearly be led to think of both as composed of minima, and therefore not continuous, though, to be sure, this account conflicts with the repeated assertion that both are 'infinite wholes.' 'The 'synthetic a priori' conception cannot help us here, since it is just as much manifested in the counting of the units of a group of 'discrete' quanta as in that 'drawing' of a line in which Kant has so much to say.' So, when we are told that Kant's 'categories are one more a space or a time.' Nothing can conceal the fact that Kant is trying to combine Aristotle's denial that a σωρης can consist of minima with a theory which requires the construction of space and time out of such minima. The synthesis exists just as much when we consider 2 as the sum of the series \(1 + \frac{1}{2} + \frac{1}{2} + \ldots + \frac{1}{2} + \ldots\) as when we ask whether the 'world had a beginning in time,' as Hegel correctly saw. In principle, Kant,
like Aristotle, identifies the infinitely divisible with the continuous.

Hegel's own account is so largely coloured by metaphor, and so distended by the method of the dialectic, that every concept is precisely what it is not (that, e.g., perfect continuity and absolute discreteness are the same thing), that it is far easier to say what his real meaning is. Since, however, he supposed Kant's transcendental antinomies (everything must be, and yet cannot be, composed of simple elements) to be concerned with continuity (Werke, iii. 216), he, too, presumably means by continuity no more than divisibility ad infinitum. His ontological praise of the continuous (everything is, and yet cannot be, an aggregate of points) thus arises from Aristotle's treatment of the problems of space, time, and motion, points to the same conclusion (ib. p. 237). The vagueness of Hegel's notions may be seen from the fact that he actually regards the Anzahl, or cardinal number, of a group as itself a group of 'units,' and asserts that it is at once 'continuous' (because it is one group among others) and 'discrete' (because it is a group of units (ib. p. 233 f.).)

There may fairly demand separate consideration, in virtue of the peculiar stress which he lays on the Principle of Continuity as fundamental, not only for Mathematics, but for Metaphysics. This principle, as stated by him, is much more limiting than the principle of the extension of space, time, and motion. Since his philosophy requires a denial of the validity of a vacuum, he is led further to maintain the continuity of matter against all forms of the atomic theory. Further, the conception of 'substance' is as much the characteristic of the continuous, as of the substances or 'monads,' whose interrelations and internal self-development are the reality of which the extended and temporal world is symbolical. Real substances form a continuous system, in which each part differs from some other by a purely infinitesimal difference. Or, as Leibniz himself states the principle in a letter to Malebranche, dated 5th Dec. 1692, 'datis ordinatis etiam quasita sunt ordinatae et consequentes.' Hence the absolute continuity of the series of monads has the continuity of the various μετάθεσις as an immediate consequence (Couturat, Logique de Leibniz, p. 233 f.). A special case of this principle is the correspondence between soul and body. For Leibniz it was in virtue of the continuity of the soul that . . . omnia quae in uno hint per se percipe respondeat omnibus quae in altero fluat.' As to the nature of the continuity thus asserted, we learn much from the dialectic on motion composed by Leibniz on his journey of 1676 to visit Spinoza (op. cit. pp. 594-627). The question there raised is whether the moment in which a man dies may be regarded as at once the last moment at which he is alive and the first at which he is dead (as it must be, according to the Aristotelian account of τὸ ἐνεφέχον). To say that Aristotle's view is correct seems to violate the law of continuity; to reject it seems to imply that two moments—the last of life and the first of death—are immediately adjacent, and, if moments can be immediately adjacent, why not points? (ib. p. 604). As a solution of this difficulty Leibniz conceived of the extension and time as made up of series of indivisible points and moments (ib. p. 608), and find ourselves involved in the 'labyrinth of the continuum.' For we are forced to say that the number of points in the side of a square is infinite, and since we can draw one and only one parallel from any point in the diagonal to a given side, and since this parallel cuts two of the sides of the square in determinate points, the diagonal will contain the same number of points as the side, and will therefore be equal to it. This Leibniz regards as a proof that the line cannot be an aggregate of points (ib. p. 611). The number of points in one, or even a segment of the continuum, is asserted to be equal to the number of all the numbers, since in both cases it is infinite. Leibniz's way out of the difficulty is to deny that there is a 'number of all numbers,' since, as he holds, such a number, if there were one, would be the greatest possible integer, but there is no greatest possible integer. Hence there is no such thing as a ratio of one infinite to another (ib. p. 621 f.), and no assignable number of points on a line. There are as many as we choose to take, but we never take all there are to take. It is, indeed, true that every portion of extended matter is actually infinitely divided, but it is divided into portions which are themselves continua, not into points, and no portion is actually divided into all the minor parts possible. Thus, in the end, Leibniz adheres to the position that the continuous cannot be composed of simple elements, and it is for this very reason that space and time and motion are regarded by him as merely phenomenal, since they are, at the beginning of the Monadology, must be composed of simple elements. How these views are to be reconciled with the further positions that there is at least one continuum, that of the monads themselves, as opposed to simple elements, and that order in space is phenomenal of the order of real monads, it is not easy to see.

4. The number-continuum in modern Mathematics.—Under this head it is impossible to say more than is done in the present article. The reader who wishes for more information may be referred to the works mentioned in the annexed bibliography, especially to the brief and luminous chapter on the continuum in Couturat's work, Les Principes des mathématiques. As we have seen, the first discovery of the continuum was due to the discovery of incommensurable magnitudes in Geometry, which led to the age-long severance of the originally united studies of Arithmetic and Geometry. It has been the great achievement of the modern Theory of Assemblages to show that the number-system is so far from being inadequate to cope with the continuity of the points of the straight line (the so-called 'linear continuum') that the opposite is the case. As the continuity of a body is the limit of divisibility which can obtain is one which can be stated in terms involving nothing but the properties of ordered numerical series, and that the only certainly known line is the 'continuum.' In other words, it is no immediate datum of intuition that the straight line is absolutely continuous. Its continuity is postulated, not intuited, and means no more than the assumption that there are on every terminated straight line as many distinct points as there are distinct real numbers in a given segment of the number-series, such as that composed of all the 'real numbers' > 0 < 1. To begin with, we have to see that none of the old familiar criteria of continuity is really adequate to express the property which we have in mind when we speak of the continuousness of this number-series. It is clear that infinite divisibility is no such criterion, since it gives us only whereby to conceive of linear segments of rational fractions. By no process of infinite division of a unit length could we ever arrive at such quotients as 1/3, 2/3, and 3/3. This corresponds to the arithmetical consideration that the complete assemblage of rational fractions between 0 and 1 does not form a continuous series, since it omits all the fractions which have surds for their numerator or denominator or both. Even the inclusion in the series of all fractions having algebraical
surds in their numerator or denominator would not make it completely continuous, since we should still have no place left for the infinitely numerous fractions involving 'transcendental' numbers in their numerator or denominator. In fact, it is possible to make such an arrangement of the series of rational fractions, and even of algebraical fractions, that each term of the series has an immediately next term. In other words, both series can be so arranged that each member corresponds in order to one and only one member of the series of natural integers, 1, 2, 3, ... Their ordinal number, or 'type of order,' is thus the same as that of the integers. The same, however, is the number-continuum adequately defined by the property that no term of the series as taken in ascending order has an immediately adjacent term. For this would obviously be true of the assemblage of rational numbers, and of all the algebraic numbers, though neither of these exhausts the whole of the number-series. The task of the modern theorist is thus a twofold one. He has first to formulate a satisfactory definition of the concept 'real' number, showing not only how the assemblage of 'real' numbers is logically related to that of integers or 'natural' numbers, but also how the existence of the 'real' numbers follows from that of the integers. Secondly, he has to identify the peculiar characteristics which distinguish the whole assemblage of 'real numbers' from those of 'natural' or 'rational' or 'algebraic' numbers; that is, he has to point out the criterion of the continuity of a series.

It is the achievement of Cantor to have first stated this criterion exactly, and afterwards to have re-cast it in terms involving nothing but the notion of serial order, and entirely independent of any appeal to our intuition of integers. We can here go no more than give Cantor's two definitions of the linear continuum with such brief explanation as is necessary for their comprehension. To understand his original definition we have first to make clear the meaning of the terms, and of the manifold 'limiting point,' and 'derivative.' By a 'point manifold' is meant any aggregate of numerical values whatsoever. Any 'point' $X$ is said to be a 'limiting point' of such a manifold $M$, if, given a distance $e$ from $X$, there is always at least one 'point' of the manifold $M$ which is at a finite 'distance' less than $e$ from $X$. (Such a limiting point may, or again may not, be itself a 'point' of $M$.) The 'derivative' of $M$ is the assemblage of all the 'points' of $M$. When every 'point' of $M$ is one of the limiting points of $M$, and every limiting point of $M$ also a 'point' of $M$, that is, when the manifold $M$ is identical with its own 'derivative,' $M$ is said to be perfect. Further, $M$ is said to be quasimoment $hanging$, or 'cohesive,' when, if any two points of $M$, $p, p'$, be given, it is always possible to find in $M$ any finite number of points $p_1, p_2, \ldots, p_n$ intermediate between $p$ and $p'$ such that the distances of the $p_i$ from the one to the other be less than a given finite number $e$, however small $e$ may be. The definition of the linear, or one-dimensional, continuum is, then, that it is a 'point manifold' which is both perfect and cohesive. It is manifest that the series of 'real' numbers; between 0 and 1 satisfies these conditions, and that the removal of even a single term from it would prevent its realization. The series of 'rational fractions,' on the other hand, would satisfy the demand for cohesiveness, but would not be 'perfect' and cohesive; the surd fractions are obviously limiting points of the series of rational fractions. With the postulate that to every real number from 0 to 1 we can assign one and only one corresponding distance on the straight line, the straight line is also obvi-

ous only a linear continuum satisfying the definition (Conturant, Principes, p. 91 f.). It still, however, remains the fact that Cantor's first definition retains the appearance of an appeal to geometrical intuition. The notion of 'distance,' in however metaphorical a sense, is employed in explaining both cohesion and perfection. And this means, as Conturat says, that the definition is essentially declarative. It defines a continuous manifold only by reference to another manifold (metaphorically called space), which is already continuous, in which it may have limiting points not contained in itself (op. cit. p. 92). Hence it is only in Cantor's second definition (Nouv. Ann. Math. IV., p. 137) that the series of rational order are presupposed, that we get an absolute definition of a continuum by means of its intrinsic properties. To obtain the definition, we start again with certain auxiliary con-

cepts. We confine our attention to a case of an ascending fundamental series. By this is meant a series in which the terms have the type of order $\eta$ just defined. Such a series $S$ is said to have a limit in $\eta$, if there is a term in $\eta$ which is the first after all the terms of $S$. We then call any manifold 'perfect' if all the 'fundamental series' contained in it have a limit in it, and if all its terms are limits of 'fundamental series' contained in it. With these pre-

suppositions, the type of order $\theta$, belonging to a one-dimensional continuum, is defined as follows:

The manifold $\theta$ (1) is perfect, and (2) contains within itself a denumerable manifold $E$, such that there is always at least one term of $E$ between any two terms of $\theta$. The definition is manifestly different from that of the 'rational numbers' between any two 'real' numbers (Conturat, Principes, p. 102). It can readily be shown that the series is 'perfect' in the sense defined, and that, moreover, there is always at least one term of the series of the 'rational' numbers between any two 'real' numbers of $M$ (op. cit. p. 137). Hence, the definition of the series is manifestly different from the definition of the series of the 'rational' numbers, and the 'fundamental series' contained in it have a limit in $\eta$.
between Geometry and the theory of number. Every geometrical proposition can once more be stated in terms which involve only the notions with which the study of number has already made us familiar. 'This fact,' as Couturat says (op. cit. p. 97), 'finally refutes all the doctrines which regard the notion of number as of a nature transcending our sensuous immediate and refractory to the understanding.'

LITERATURE.—I. FOR ANCIENT PHILOSOPHY AND MATHEMATICS: Pseudolida Opera, edited and Latin interpretation of J. L. Heiberg, Leipzig, 1883; and the 2 vols. by R. Diels, and other works on the same, vols. I-IV. of this, the only critical edition, 1883-1885; Procli Diadochus' commentary on the first twelve books of the Elements, 4 vols., 1888-1892, and 2 vols, 1900. Also the works of Leibniz, Paris, 1873; and the text-critical editions of the works of Leibniz, Paris, 1903; and also Les Leibniz de l'apres des documents inédits, Paris, 1903. Critical Exposition of the Philosophy of Leibniz, Cambridge, 1906, also 'Recent Work on the Philosophy of Leibniz' (in Mind, new series, no. 46, April 1903).

II. FOR MODERN PHILOSOPHY: Besides the collected editions of the works of philosophers, special mention may be made of L. Couturat, Les Principes de la Logique, Paris, 1904, 1903, also La Logique de Leibniz d'apres des documents inédits, Paris, 1904, Critical Exposition of the Philosophy of Leibniz, Cambridge, 1906, also 'Recent Work on the Philosophy of Leibniz' (in Mind, new series, no. 46, April 1903).

CONTRACT.—I. DEFINITION.—If one makes an engagement to go to dinner at a friend's house, no contract arises, because the purpose of the engagement is not such that the law will deal with it; or again, if one buys an article in a shop for ready money, that is not usually termed a contract, because the transaction is terminated, as it were, on the instant; but when one undertakes to pay for the article afterwards, a continuing contract emerges, because, in this case, the agreement gives rise to an undertaking which can be enforced. From these examples we see that contract is really the combination of two legal ideas—that of agreement and that of obligation. In the case of the invitation to dinner there is agreement, but no legal obligation; in the case of the sale of goods for ready money, the obligation follows away as soon as it arises. But, according to the Indian Contract Act, for example, 'an agreement enforceable by law is a contract' (Sec. 2 (ii)); and, while, when there is no undertaking, we find a legal obligation, sometimes, where the law says, that there is an obligation, something for the law to take hold of, directly adjusting the contracting parties. In other words, the agreement, as it has been put, 'contemplates something to be done or forbidden by one or more of the parties for use of the others or other,' to which the law can attach itself; and it is generally said that it must be the intention, or implied intention, of the parties that the relation should have a legally binding effect. Sir Frederick Pollock, writing with reference to the English law, adds to the word 'agreement' the word 'promise' (1892, pp. 2, 3, 5). But that is a minor subtlety. Theoretically, at least, we can fix our attention on an agreement as being the starting-point in which there must be, as it is frequently stated, the meeting of two minds in one bond. And thus the more technical treatment of contract fits into these statements of the doctrine in which it is regarded as a phase of the legal will, constantly to be found in the works of philosophical jurists—especially German jurists,—and which is said to be the meeting of individual wills in one intention, as opposed to the individual's endeavours to realize his will by means of the materials found in the world around him, which gives rise, logically, to the concept of a contract, in which the individual meets his fellows; in the latter, the external, material world.

It has, however, been suggested that it is not necessary, in order that a contract should be entered into, that two minds should be really at one (Holland, Jurisprudence, 1896, ch. xii.). Should we not say, it is argued, that here emphatically the law regards not the will in itself, but the will as manifested voluntarily? There are well-founded explanations which put the individual's endeavours to protect by its enforcement of the contract, and these do not always arise from expressions which truly represent the intention. What of the contract in which one person enters into a contract, resolved all the time not to perform his part, yet induced another party to enter into it on the contrary supposition? Surely the contract will hold good. Is it not the will, as expressed, and nothing more, that the law regards, leaving the question of a true consensus on one side? If so, can it be altogether? The language of positive systems of law, it is said, moreover, is ambiguous on the point; for the question is practically a new one, and it has not yet been seriously considered how far a true consensus, in the significance explained above, is needed. In answer to this doctrine, it may be maintained that, although the inner agreement is a fact to be proved, and in some cases is not allowed to be disproved, the agreement itself is vital to the theory of contract. The inference drawn is that there was an agreement; and such inference depend for their reasonableness and usefulness on the fact that in the vast majority of cases they are sound. Out of reference to the will—to the inner intention, if one chooses—the expression of agreement would be meaningless. It must in the last resort be connected with the man, with the personality; and not merely attach its force to the use of force for case expression. Unless this is done, we obtain a view of contract which is too scholastic to be satisfactory.

The two main aspects of the agreement by which the tie is created find their typical form in the ideas of offer and acceptance, which give rise to the large body of law in a developed system. On the other hand, such facts as error, fraud, misrepresentation, undue influence, and force operate on the consent embodied in the agreement, and may vitiate its legal position, or create the law which renders it reducible from one side. These are most usefully studied in relation to some definite legal
system. Again, the State itself places certain legal restraints upon contract generally, with regard to its subject-matter; these are more immediately the concern of the general reader. In Pollock's work on Contract, agreements are said in English law to be unlawful and void (1) if the matter or purpose with which they deal is contrary to positive law; (2) if it is contrary to positive morality recognized as such by law; (3) if it is contrary to the common welfare, as tending to prejudice the State in its external relations, or in its internal relations, or as tending to improper or excessive interference with the lawful actions of individual citizens (op. cit. 273). And we may say generally that the State will refuse to recognize a contract not only when it is simply illegal (without further explanation being offered), but also when the object is contra bonos mores, or when it is against "public policy" and cannot be allowed free scope in the State's own organization. In the case of public policy, the disputable points which arise are numerous, and the dividing lines between what the State should, and generally impose upon contracts, are extremely difficult to find. Then we may couple with such restraints the complicated subject of form. The modern tendency is towards simplicity of form. Complexity is undoubtedly repugnant to the spirit of our age. The modern enterprise demands essentials and nothing but essentials. A complicated form, however, prevents a bargain from being rashly made, and it renders it easier to prove afterwards what has taken place. The modern tendency in contractual ethics, to use a bird's-eye view of the field of modern contract. It follows mainly the arrangement given by Holland in his Jurisprudence.

4. Principal contracts.—Principal contracts are those where the service is spoken, for their own sake, as opposed to accessory contracts.

(1) Contracts of alienation.—These may be gratuitous, when they are contracts to give, but are not generally so. In fact, a contract to give is generally enforceable by law only in certain limited cases. But gifts made in view of marriage are not considered as mere gifts, for marriage is an onerous consideration. Then under this head fall barter and exchange, when regarded as contracts; and, more important, sale. A distinct line should be drawn between barter and sale; the essence of sale seems to be, in the simplest words, the giving of something for money. Specific formalities are generally imposed by law only in certain important classes of property, such as the rei muecici of the Roman Law, "real property," immovable. Apart from these, perhaps the most important variation in the views taken of the common law, when it comes to consider what is connected with the transfer of the property sold. Sometimes a contract of sale, in the usual case, per se, transfers the property—it has the power of transference by itself. Sometimes it has no such legal consequence; it remains an agreement to sell, which must be concluded before sale is possible. Parties to the contract, again, may have various duties, but two of them are generally recognized. The duty of the seller is to deliver the goods, and the duty of the purchaser is to accept and pay for them. These duties, regarded from the point of view of rights, yield the main rights of purchaser and seller.

(2) Contracts dealing with hiring, loan, etc.—Hiring has largely superseded gratuitous lending; and the law of hiring has been extended in many directions. Two important branches of it in the commercial world are contracts for carriage and agency. Both in commercial and in domestic life we find contracts for the hire of servants engaging much attention. As regards immovable, hiring is generally guarded by specific restrictions. In a loan for consumption, we find money or certain kinds of things given to the opposite party on the undertaking that he shall return it on a future day return, not necessarily the things themselves, but their equivalent in kind. It is in connexion with this branch of the law that the interesting problems of how to treat usury from the legal point of view arise. In a loan for use, again, which is in essence gratuitous, the identical thing lent is returned. In deposit, one gives a thing to another in order that the latter may keep it for him gratuitously and restore it upon demand.

It will be observed that this group of contracts is very miscellaneous. Holland has attempted to minimize the confusion by making the two principal divisions of (a) contracts for personal use, and (b) contracts for service. In the first class (a) he places (1) loan; (2) sale; (3) letting for hire of real property; and (3) 'letting for hire. In the second (b) he places contracts (1) for care-taking; (2) for doing work on materials; (3) for hire; (4) for professional or domestic services; (5) for agency; (6) for partnership. Here (a) is divided into contracts for personal use, and (b) into contracts for partnership under contracts for service—a doubtful arrangement. The reader, however, may certainly begin by taking the whole of the large class of contracts with which we are dealing as capable of being split up into three divisions—permissive use, service, negative service—although he may afterwards come to consider the principles of grouping somewhat strained. Partnership, which is thus disposed of under (b), is a result which is clear. A relation which subsists between persons carrying on a business in common, with a view of profit (Partnership Act, 1890); and the law of partnership widens out into the whole law of Joint Stock Companies.

Agency deserves special notice. It is itself a contract, as has been pointed out; but it is also an important instrument in extending the power of contract. It enables us, as it were, to move objects at a distance. Through it, the contractor can work at the other side of the world. In the ordinary use of the term, agency is constituted where one person is employed to act for another—to represent him in dealings with third persons. A distinction between a general and a special agent is often made; but it is of doubtful value logically; it seems to be most consistently drawn between an agent whose business has a defined scope and character, apart from his legal system, being connected with his agreement with his principal, and one who is merely empowered to do certain specific acts. The main logical point to be noticed in the law of agency is that, when the agent contracts as an agent with third persons, the agent and the principal, and then, so to speak, drops out of the transaction. If he binds himself, he is something more than a mere agent; and any exceptions are modifications of the general principle. On the other hand, it must be noticed that the agent does not really act.
CONTRACT

as the blind instrument of his principal, as the pen or the hand acts. His real usefulness arises from his being an intelligent instrument, and without the help of such intelligent instruments many of the tasks of modern commerce would be quite impossible.

3. Contracts of marriage.—But marriage is only technically and in a somewhat strained sense a contract. No doubt it cannot be entered into without the consent of at least two parties. But the relationship stands by itself; and even in a system of law, like that of Scotland, which favours the contractual construction, there are grave difficulties in regarding it as a contract in anything more than a very technical sense. In contract, the tendency is to allow the contracting parties to attach what conditions they please to their bargain, provided these are not against 'good morals' or 'public policy'; it may be conditional in its origin, and its duration is dependent on the will of the parties. In marriage these features are not, as is generally supposed. It is not governed by private contract in its most important particulars, but by the fixed rules of the law of husband and wife. It cannot be entered into on condition that a certain event shall happen, or that it shall be dissolved at all; and it shall not be dissolved for a certain period of time. The relation between the two persons, also, extends an influence to their relatives and maintains that influence even after death ends the marriage. The husband and wife do not have their own status, but the status of their children; and that status can never be taken away or infringed by the acts of the parties (Fraser, Husband and Wife, 1876, ch. II.).

Such considerations, primarily applicable to Scots Law, as have been noted are not altogether inapplicable to the marriage vow, but should be differentiated from an ordinary contract. Of course, it may be said that all these restrictions are made merely with the object of maintaining 'good morals' and furthering 'public policy.' But the whole tendency of contract is to leave the parties as far as possible to shape their own bargain; and, where we have a relation so governed in its essentials by the law—so restricted to meet the needs, as the law conceives them, of family life—marriage is, it is only in this aspect and, as has been said, technical sense that it can be called contractual. It derives its type not from the contracting parties, but from moral and social considerations, which are such as are peculiar to the marriage tie, and these considerations not only restrict it, but shape it.

A distinction must, of course, be drawn between an engagement to marry in the future—an 'engagement' in popular language—and an engagement which actually amounts to a marriage. The former more nearly approaches a contract of the ordinary type than the latter, provided it is recognized by the system of law which governs it as a legal subject for legal interference. When that is the case we find untried engagements frequently giving rise to actions for breach of promise of marriage. On the whole, such actions seem to be discouraged by the systems of law in vogue on the Continent; and many jurists are of opinion that they ought not to be allowed in our own country. But this opinion, it must be noted, does not imply that actions for seduction should be discontinued.

(4) Wayrign contracts.—This is an unfortunate name for an important group. In these contracts, one of the effects of the contract, as regards profit and loss, either for all the parties, or for some of them, depends upon an uncertain event. But it is almost impossible to define them satisfactorily; and that statement must be taken as merely explanatory. Broadly, bets and stakes are not enforceable in modern law. And the most important group under the general head is formed by contracts of insurance—marine, fire, and life insurance, and less important types. Of course, these are not logically gambling transactions, but are rather attempts to eliminate the risks of the unforeseen.

2. Accessory contracts.—There is a large number of contracts which may be entered into as accessory to the main transaction; and these forms, as previously stated, a second main branch of the subject. It may suffice to name a few of them—indentures, mortgage, warranty, ratification. A promissory note forms such a contract. Suretyship is in many systems a formal contract; and the guarantee may sometimes support an obligation which is merely natural, i.e., which itself cannot be expressed to their own satisfaction.

3. There are certain legal relations placed on the borders, as it were, of contract proper, which must not be forgotten. Thus the Indian Contract Act speaks of certain relations resembling those created by ordinary contracts and speaking to contracts and then to their remedies, the law of obligations, arising out of them, and the nature of the remedies. These relations may be called quasi-contracts; and it is perhaps better to reserve this name for those cases where the implication is most clearly seen. They are, at any rate, analogous to contract; for it is necessary, in following out the ramifications of a legal system, to hold that a certain contract is sometimes created from force of circumstances, though not by express agreement. Often the person bound may reasonably be held to have agreed to the formation of the tie; but that is not perhaps essential in all circumstances. Thus the doctrine of scopoletum gestio consists, in principle, in the management of the affairs of an absent person or a person merely unable to attend to his own affairs himself, by one who undertakes that task without the knowledge of the other; and, it is not infrequently stated, on the presumption that the other, had he known the circumstances, would have approved. There does not seem to be any peculiar difficulty in treating such relations, except that they are not habitually subjected to the mode of classification.

ii. Extinction of contracts.—Contracts may be extinguished in various ways—by performance, by execution of a contract, by release of performance. Or there may be a substitute for performance; or it may simply happen that the non-performance of the contract alters the whole aspect of affairs and gives rise to a new set of rights. Performance is the natural, and undoubtedly also the usual, mode of closing the transaction.

iv. Social bearing of contracts.—Contract, standing as it does at the centre of the great department of Private Law, has many important bearings on the general problems of society. It forms an endeavour made by the State to set up a sanction for expectations of good faith which have grown up through the dealings of the averagely honest man. True, it has been suggested that contract is merely the taking of a risk, since the only universal consequence of a contract is to make the default pay damages; but, as already pointed out, it is the observance of contract that is primarily expected. These contracts, payment of damages, that makes the social wheels go round. And the State, having brought its sanction to bear on this enormous mass of relations, finds itself compelled to interpose certain restrictions—that is, to place upon such actions as we have spoken before. What precisely these ought to be, and how they ought to operate, depends on
many different social considerations. Is the exploitation of the individual by his fellows—the driving of a hard bargain wrung from a man's necessity, when his poverty, but not his will, compels the over-reaching of one not worldly-wise—a fit matter for State interference? Are combinations of 'labour' to be recognized wholly or partially, or altogether condemned? Are contracts for service to be regulated, when the claims which arise under them bid fair to reduce one party to the position of existing merely as an instrument for the realization of another's personality instead of being an end in himself? Slavery, it is certain, cannot now be tolerated; but how far with the exercise of the intellect to abolish various forms of so-called practical slavery, accomplish good, or how far will it merely afford encouragement to laziness and fraud? These questions and many others are among the implications of contract, the subject of contract itself. Probably most of them must be answered, not abstractly, but in relation to the particular community with which we have for the time being to deal. What is one man's freedom is another's path. The character and state of social advancement of the community must always be taken into consideration. But, however that may be, the importance of the great branch of law deals with the rights of another man's contract cannot be safely ignored.

LITERATURE.—In addition to the works mentioned in the text, the following may be consulted: W. R. Anson, Principles of the English Law of Contract, 1890; G. J. Bell, Principles of the Law of Scotland, 1890, for the Scots Law; F. Pollock, First Book of Jurisprudence, 1896, pt. i. ch. 8; Kant, Philosophy of the Future, 1876; W. A. Watt, Theory of Contract in its Social Light, 1897.

CONTROVERSY.—1. The term 'controversy' is not exclusively applied to the weapon by which battles have been fought in the field of theology and philosophy, and skill in disputation has not been valued by professed dialecticians alone. Professor Edward Caird tells us that the philosopher Kant was keenly alive to the uses of controversial methods as a mental training, and that in the year 1758 he announced to his class on metaphysics that on two days in the week he would treat polemically the doctrines expounded on his being. This method has often been devoted in schools of learning, with a view to cultivating a high standard of controversial ability. To Kant it did not so much bring dialectic skill as rivet into the attitude of criticism a mind already alive, even skeptical. The essential thing for him, as for Socrates, was the problem of knowledge, the limitations of our knowing, the question how far we can know anything at all. So throughout life he practised elaborate exercises in the art of disputing, which he recommended to his students, using it as a touchstone to test what is knavish and expose the illusions of the understanding. To this attitude of mind, this deep-seated love of inquiry and discussion, we owe what is considered the greatest system of philosophy of modern times—a philosophy critically alive in spirit and in name.

2. The Kantian 'dialytic,' however, is not a new phenomenon in the history of philosophy. It is a thought upon the compation which it bears for him, that of an arguing for and against, Kant inherited the term from the Stoics and Aristotle. But the practice of dialectic is to be connected with the name of Socrates. As friendly discussion in the market-place about the ethical problems which alone were of interest or moment to him, Socrates held it to be the ideal method of philosophizing. He thought that there were answers, more or less definite, to these questions, and this was the way in which the answers were to be got. This earnest conviction, this seeking after truth in the belief that it is to be found, is one of the essential requisites in which Socrates is to be distinguished from the class of professional Sophists to which, in the eye of the ordinary Athenian, he undoubtedly belonged. These men were in the first place teachers of argument and rhetoric, and regarded disputation as a kind of sport, and its profit. They argued in order to show their pupils how arguing should be done; they talked for victory. But they did not stop here. They were from some points of view extremists in philosophy, and they took up a concept or idea with the deliberate purpose of showing it to be full of contradictions, and hence unthinkable. The Sophist did not hesitate to tackle any question, or, as Aristotle would say, to 'talk persuasively' on any subject. As the exponents and popularizers of an esoteric philosophy—they were not for the most part originators of new doctrine—they raised problems in the spheres of ethics, politics, and religion, debating freely, in a spirit of tolerant scepticism, the questions which through the ages and through the eyes of the old-fashioned was not only new, but impious and depraving. Like Abelard, who has been called the medieval counterpart of such a teacher as Protagoras, the Sophist at his best, they thought that controversies must be settled, and attacked, and against, or in Abelard's phrase, sic et non. To them none was sacred. At the first glance, criticism of this kind seemed wholly destructive; many of its immediate effects were undeniably pernicious. But the term controversy and overturning, was of supreme value, not only in the interests of education, but also in the narrower field of dialectic. It was owing to the Sophists mainly that Aristotle was able to draw attention to a clearly marked difference in the matter of our thought. He saw that relatively few problems belong, like those of mathematics, to the sphere of what is strictly demonstrable, and that beyond this, on the vast mass of questions which puzzle the mind of the natural man, we can have discussion, but can never have certainty.

3. It was, however, in the Middle Ages that dialectic or discussion in the Platonic and Aristotelian sense became professedly the vehicle of philosophical inquiry. Bound as they were not only by point and overturning, was of supreme value, not only in the interests of education, but also in the narrower field of dialectic. It was owing to the Sophists mainly that Aristotle was able to draw attention to a clearly marked difference in the matter of our thought. He saw that relatively few problems belong, like those of mathematics, to the sphere of what is strictly demonstrable, and that beyond this, on the vast mass of questions which puzzle the mind of the natural man, we can have discussion, but can never have certainty.
speculative thought to that of everyday life, we find that here the uses of controversy are less obvious, but not less real. In the ordinary sense of the word it may be nothing more than negative criticism, the mere raising of objections to a doctrine or theory brought forward. But, even so, it is of practical value in sharpening the faculties and clearing up confusion in the mind. For contradiction, whether it proceeds from conviction or not, is always stimulating, and even a superficial discussion of most questions is enlightening. When objections for which no answer is fairly carried on, that is, with candour and moderation, in a spirit of honest inquiry, it is of great ethical and educative value. The prejudices of the fair-minded rarely withstand the presentation of fact or the plainest of sincere question. So, at least, most of us, knowing but one side of controverted questions; an argument with an intelligent opponent will show us the other side, and expose the weaknesses of both positions. If our conclusions are correct, their value; if they are faulty, light will be thrown on the premises on which they are based. John Stuart Mill, in his eloquent defence of liberty of thought and discussion, says that every one ought to make a habit of seeking this evidence, and that outside the sphere of mathematics no man's opinions deserve the name of knowledge except in so far as he has gone through the mental process which would have been required of him in carrying on an active controversy. (In Liberty, p. 2.)

5. The benefit to the individual of such a knowledge of most subjects no open-minded person is likely to deny. But there is a deeper aspect of the question. It has often, and rightly, been said that controversy is the battle-field upon which truth comes into collision with error, and that by means of it alone we can acquire new truth. The progress of the race is thus best served by unlimited freedom of discussion, by such a right 'to argue freely according to conscience' as Milton held to be among the first of human liberties. Mill lays stress upon another point. It is a matter of history that the ethical and religious doctrines of the world owe their preservation and development to the fact that they were vigorously defended against attack in the earlier stages of their existence. What is true of sects and nations applies equally to the spiritual life of individuals. It is for the sake of the religious life that we are in least danger of losing it. It is in beliefs, which are most universally accepted, most rarely questioned, that we are apt to become least full of meaning to us, even to be accepted by us mechanically. It would be easy to multiply instances of this. Can the precepts of Christianity, for example, be said to bear the same literal meaning for us as they did for the Founder and the persecuted of the early Church? Or, to take the case of religion in Scotland, is there in Scotsmen of to-day the fire, the blind devotion, the love of the Church, which animated their forefathers? Most people, even allowing for change of circumstances and conditions, are inclined to answer these questions in the negative, and say that creeds and opinions do seem to draw the breath of life from the heat of battle, to grow faint and languid when the struggle is over. This is one sense in which peace and harmony do not make for progress.

6. Every theory, however sound, has its limitations. All doctrines may be, in the main, erroneous; at the best they can contain only a part of the truth, for the truth lies always somewhere at the extreme position upon which man takes his stand. While the progress of knowledge, in spite of apparent disheartening retrogressions, bears always onward and upward, its course is, broadly speaking, a constant tendency now in the direction of one of these opposite poles of thought, now in the direction of another. Dogmatism (to use Kant's expression for these extremes), criticism, and scepticism, follow one another in the way of science—a new dogmatism—again. But in this struggle of theory with theory, of half truth with half truth, the way is gradually becoming clearer, the fresh starting-point is always a little higher, and, human intelligence being limited and fallible, all this can come about only in this way.

LITERATURE.—The reader will find the source of most of the ideas suggested above in such works as: E. Caird, Critical Philosophy of Kant, 1889; Hegel, History of Philosophy, Eng. tr. 1892-96; and J. S. Mill, On Liberty, 1859, pt. ii. See also well-known History of Greek Philosophy, such as that of Zeller, of Ueberweg, of Erdmann, and of Schwengel. On the significance of the work of the Sophists, the student may be referred to G. Groce, Histories of Greece, new ed., 1870, pt. ii.

M. CAMPBELL SMITH.

CONVENTICLE.—The word is derived from Lat. conventicum, dim. of conventus. According to Bingham (Orig. Ecles.), it originally signified no more than a small assembly, and was also used by ancient writers for a church. It came to be applied specifically to meetings of religious associations, particularly private and secret gatherings for worship. Later it became a term of depreciation of a certain approach, implying that those of whom it was used were in opposition to the ruling ecclesiastical authorities; for example, it was applied to a cabal of actious monks in a convent monastery. Ultimately it came to mean religious meetings of dissenters from an Established Church, held in places that were not recognized as specially intended for public worship or for the exercise of religious functions. It implied that a condition of affairs obtained in which the State made a distinction between public and private worship, and that religion whose practice and propagation were authorized by statute, and such as were expressly prohibited by enactment. This usage has received legal sanction in Britain.

In this sense the term 'conventicle' may be, and has been, widely applied. Harnack (Mission and Expansion of Christianity, 1906, Bk. II) uses it of the missionary activity of Methodism in the Eastern parts of the Roman Empire throughout the domain of Hellenism (Greece, Asia, Syria, Egypt, etc.), in which religion as a whole was prohibited, but that which professes Christianity, which was regarded as belonging to a heretical and illicit sect (P. Camont, Mystères de Mahdist, Brusnich, 1896). To attend the conventicle was, therefore, a sin, a crime, according to Celsus, who represented the contemporary opinion which considered Methodism as an imitation of the religions of the East, and exposed itself to the hatred and intolerance of all. It may be observed that, so far as we can learn, a similar sentiment prevailed against the early Church, which was branded itself as that of the Jews and the Apostles, and the enemies of the Mystical Church, to which the sectars of the Roman Empire, often contemptuously called the 'conventicles,' belonged (Ac 19). Within a short time they drew upon themselves the suspicions of the Jewish ecclesiastical authorities, who branded the new faith as a combination of Judaism and heathenism, and who sought to suppress it by means of legal and ecclesiastical measures. The case of the early Christians is parallel to that of the conventicles, and the latter may find an analog in the history of modern movements, which have been opposed and persecuted in a variety of ways, and which have succeeded in converting themselves to religious competing with the imperial cults.

In accordance with the accepted usage of the word, Church historians properly assert that Christianity took its rise essentially from a conventicle. Such was the meeting in the Upper Room of the first disciples of Christ after the Ascension (Ac 1). This gathering was the type of those which soon began to meet for prayer, mutual edification, and memorial observances, in private houses such as that of Mary, the mother of John (Ac 12). Within a short time they drew upon themselves the suspicions of the Jewish ecclesiastical authorities, who branded the new faith as an imposture, and who sought to suppress it by means of a variety of measures, such as the confiscation of property, the arrest and imprisonment of the leaders, the banishment of the converts, and the use of force, which were employed with great success in the case of the early Christians (Ac 19). Within a short time they drew upon themselves the suspicions of the Jewish ecclesiastical authorities, who branded the new faith as an imposture, and who sought to suppress it by means of a variety of measures, such as the confiscation of property, the arrest and imprisonment of the leaders, the banishment of the converts, and the use of force, which were employed with great success in the case of the early Christians (Ac 19).
An act of uniformity (p. 102) had been propagated in England by refugees from the Continent, were ordered to leave the Kingdom. Even during the subsequent reign of Puritanism, the meetings of this particular body were regarded and treated as suspect, which was incensed by their aggressive fanaticism.

For other persecuted sects, with only one or two exceptions, there was a breathing-space of toleration and freedom.

After the Restoration of the Stuart dynasty, established Episcopacy once more became intolerant under the aegis of Charles II. An Act of Uniformity was promulgated in 1662, which ordained the expulsion from his charge of any clergyman who refused to subscribe to everything contained in the Book of Common Prayer and to the doctrine of the King's supremacy in matters ecclesiastical, and held by the Solemn League and Covenant of 1643, prohibiting such from exercising his religious profession in private houses. 2000 clergymen were ejected from their livings in one day for declining to comply with these tests. This enactment was reinforced in 1664 by a statute called "the Conventicle Act," which declared any gathering in a private house for religious worship attended by a number exceeding by five the regular members of the household, under penalty of fine, imprisonment, or transportation. A second version of the act deprived these outlying ministers of the right of trial by jury, and empowered any justice of the peace to convict them on the oath of a single informer, who was to be rewarded with a third of all fines levied (D. Neal, History of the Puritans, new ed., London, 1889, pp. 163).

Identical measures were taken during the same reign to secure the suppression of Presbyterianism in Scotland, where it had been the popular and dominant form of religion since the Reformation. From 1662 to 1678 various Acts were passed by the Privy Council and the Court of High Commission, prohibiting conventicles and imposing penalties of increasing severity upon those who attended them, masters being made responsible for their servants, landlords for their tenants, magistrates for the citizens of the burghs over which they presided. It was forbidden to supply denounced persons with meat or drink, or to harbour or have intercourse of any kind with them. These measures, proving unavailing to effect the ultimate end, namely the establishment of a legal trial—an authority which was used without scruple or mercy in numerous instances by such as
Conversion. This policy proved, however, quite abortive. The bulk of the religious population in the south and south-west districts continued to adhere to the old faith, while those who were persuaded, were arranged to be conducted by the objecting ministers. Where the congregation was too large for any suitable private house, resort was had to barns, granaries, or such like commodious buildings. Frequently, however, the number of those who locked to these illeget gatherings amounted to thousands, and the result was the institution of field-conventicles—meetings held, sometimes under cover of night, in the open air, on moors or hills, or in glens and ravines, where safety and seclusion were combined. These frequently lasted for hours, the preaching taking up a large portion of the time. At such conventicles, the ordinances of the Church according to Presbyterianism were faithfully observed. Baptism was administered, and Communion was dispensed, often to hundreds together, and even thousands, the rite taking days to celebrate, several ministers officiating in turn. When repressive measures became more severe and attendances at these gatherings was enacted to be a capital offence, the men came armed with such rude weapons as were obtainable—scythes, flails, etc. Sentinels were posted at look-out points; for the royalist soldiery, aided by spies and informers, often succeeded in crushing the meetings. It was the attack upon such a conventicle that precipitated the battle of Drunclog, 11th June 1679, which issued in the only victory gained by the Covenanters (as the upholders of Presbyterianism were called), at the cost of the lives of many who were afterwards outlawed. After this, the attempt to suppress these conventicles, and the ever-enthusiastic manner in which some of them were conducted lent colour to the charges. In Württemberg a wise middle course was adopted. Those conventicles in which the great principles of Lutheranism were professed, received legal sanction, while the more radical assemblages were banned (cf. PREP iv. 799, xviii. 612). In Sweden, Pietism aroused similar opposition, and a law of 1726 forbade all conventicles conducted by laymen; one way or another, the meetings under the direction of the clergy were permitted, this law not being repealed until 1858 (PREP xvii. 33, 36).

At the present time, it is perhaps only in Russia, with the Greek Church in a position of ecclesiastical supremacy recognized by the State, that conventicles in the strict sense can still be said to exist. Measures of repression are now from time to time directed by the Government against dissenting sects which have been suppressed; such religious societies as the Stundists (q.v.) and the Doublobrics (q.v.), who were denied the liberty of private meetings for worship. The spirit of tolerance seems, however, to be rapidly gaining ground, and nonconformists of any kind, on giving satisfactory assurances to the police, are generally permitted liberty of worship according to their accepted mode. The signs of the times point to the spirit of religious toleration soon becoming universal, with the consequent cessation of that hateful and repressive attitude of State or Established Church to any form of religion which resulted in conventicles. 

Conversion.—1. Ethnic Conversion. —Conversion, the greatest of moral events, is not the monopoly of one religion. It is a human as well as a Christian fact. As there is one blood in the veins of all nations, and one breath in all nostrils, so there is one Divine Spirit brooding over and striving within all souls. God has made all men with a capacity for conversion, with possibilities of response to the highest call (Acts 17:30). And in every age and race there have been minds that have turned to the light, hearts that have felt the "expulsive power of a new affection," wills that have striven, and not all in vain, to attain the ideal. We need not grudge the name or the idea
of conversion to many experiences recorded in non-Christian literature. "Facies quod omi omnibus Polonem?" (Hor. Sot. II. iii. 253 sq.).

The movement which was initiated by the religious reformers of the 16th century, where RV uses the term "conversion," from polytheism to monotheism, and it had its saints and martyrs. Dill has shown that, towards the beginning of the Christian era, Greek-Roman philosophy became evangelical; it sent out an army of converts, partly by preachers, and in Is 6, where RV has "converting" becomes in the RV "turned." In the NT στρέφομαι appears very frequently, and in AV it is nine times rendered "convert"; but this word appears only twice in RV (Ja 5:19-20), being everywhere else changed into a "turn" or "turning of the mind," according to the context.

The Bible is the drama of the conversion of the world, of the turning, or rather the return, of man to God. The sacred writings must, in the last resort, always determine and control our conception of the origin, growth, and nature of the Christian religion. It is not the only vision that a Christian conversion, for there could be no adequate knowledge of God as revealed by Christ Jesus, if we are able to trace the lineaments of the soul of a Christian, it is because we have in the Bible the perfectly formed norm of the new life.

1. The OT.—The OT is a mine of gold for the inductive study of the facts of conversion, but the prospector has to encounter certain initial difficulties. The subject of conversion is often the nation as a whole, and the part played by the individual is usually left to be inferred instead of being directly expressed. Again, the Oriental mind is not analytic; it reasons a priori; it is national, rather than phenomenal. Where the West says, "Felicex qui potuit rerum cognoscere causas," the East is content with "causa."] To search for secondary causes, to pry too curiously into the subjective conditions of spiritual experience, seems to it not only superficial, but even a little profane. "This is Jahweh's doing" (Pr 11:28), "The king's heart is in the hand of the Lord as the watercourses: he turneth it whithersoever he will" (Pr 21:1). "None can stay his hand" (On 4), the Hebrew inclination to move in pictures—due in great measure to the absence of abstract terms from the language—causes many spiritual experiences to be clothed in a figurative or symbolic garb. The psychologist must be a very skillful as well as reverent exegete who would re-tell in modern scientific phraseology the story of the conversion of Jacob at Bethel, of Moses in Arabia, of Solomon at Gibeon, of Isaiah in Jerusalem. The last of these experiences, enshrined in the incomparably vivid and illuminating page of autobiography (Is 6-9), presents a type of conversion in Israel which is no doubt, in some respects, unique and incomunicable, but in its broad outlines may be described as normative. Four distinct momenta are enumerated in the thrilling and transforming experience. There is a vision, flashed upon the young Hebrew's inner eye, of the King, Jahweh of hosts, whose glory fills the earth. There is a conversion of sin, penitent self-concentration itself like a subtle poison in nuclear lips. There is the unutterable comfort of absolution, which comes in the hand of a Divine messenger, by the way of the alter, to a heart wrung with anguish. And there is a mission, Divinely offered and humbly accepted, to live in the service of God for the welfare of men.

Just because Israel's moral and spiritual ideal—
their conception both of God and of man—was so much the more strikingly useful to any other nation of antiquity, conversion was to them a more real and radical experience than elsewhere. Theologically construed, conversion was, in their eyes, always a reversion, not to a low but to a high type, not to an animal but to a Divine pattern. This was not a movement contrary to nature; it was man finding himself, realizing his own true nature. But the general point of view was intensely ethical rather than speculative. Historically, the one aim of the spiritual leaders of Israel was to constrain the backsliding nation to ‘return, to be converted,’ unto Jahweh. ‘Let the wicked return unto Jahweh,’ ‘Return ye, and turn yourselves from all your transgressions,’ ‘Turn your selves, and live.’ ‘Take with you words, and return unto Jahweh’ (Is 55, Ezk 18:32, Hos 14). The Prophetic literature rings with the clear call to a definite change of spiritual attitude. Conversion is always equivalent to repentance and faith. But the same Hebrew word (שׂוּחַ) expresses both the turning to and the turning again from Jahweh, conversion and perversion, and the two movements form the perpetual systole and diastole of the heart of Israel. The possibility of conversion is based upon the conception in the past and the hope of Divine co-operation in the present. ‘Return unto me; for I have redeemed thee,’ ‘Turn thou me, and I shall be [or, that I may be] turned’ (Is 44, Jer 31). God also speaks of the diastole, of repentance by a natural disposition, can change the stony heart into one of flesh. The command, ‘Make you a new heart and a new spirit’ (Ezk 36:26), would be a mockery if it were not accompanied by the promise, ‘A new heart also will I give you, and a new spirit will I put within you’ (36:26), and unless there was a Divine response to the prayer, ‘Create in me a clean heart, O God, and renew a right spirit within me’ (Ps 51). The Book of Psalms gives lyrical expression to the joy of conversion, to the triumph of the soul’s return unto its rest in God. The Psalms have many authors, and it matters little whether any singer describes his first or a subsequent spiritual experience. Here in the Psalms we have not intended to mirror the heart of the nation as well as the individual. Be that as it may, no human document has greater value for the psychologist of conversion. Here especially in the Penitential Psalms, 6, 10, 38, 18, 51, and many others, we have the picture of sighing, groaning, despairing, sure that God has hidden His face, spending nights in sleepless agony, tossings wearily to and fro, watering the couch with tears. Here is the tortured conscience, whose sins are exposed in the light of God’s countenance, gnawed with remorse, seized with the pains of Sheol. Here is the sense of inward uncleanness, of hereditary sin, the horrible feeling of being sunk in the mire of a deep pit from which there is no deliverance. Here is the piercing cry of fear from abysmal depths, the prayer for Divine mercy and forgiveness. And here is the glimmering light in the darkness, the blaze of spiritual illumination, the clear vision of God, the sense of His redeeming love; and, lastly, the rapture of deliverance, the gratitude that words can never utter, the desire to tell to others what Jahweh hath done for the soul, that sinners may be converted unto him.

At an early period the Hebrew nation began to direct its attention to the younger. There was an enthusiasm for education (see EDUCATION [Jewish]), and the discipline was never merely intellectual, but always primarily ethical and spiritual. The fear of Jahweh is the beginning [or, it may be, ‘the chief part’] of wisdom (Pr 1). Here ‘wisdom’ is almost equivalent to ‘religion.' It was often personified by its lovers, and praised as ‘a friend and a sister’ (Pr 7). It was even as the eternal companion of Jahweh (Pr 8). The great aim of Hebrew parents—no mention is made of schools—was so to ‘train up a child’ in the service of God and in the atmosphere of healthy piety, that in his manual he should need no sudden, violent, convulsive return unto Jahweh from a life of sin and shame. How entirely such pedagogy corresponds with our latest ideals of education, we shall see later. That the end was often realized, we cannot doubt. Some of the noblest servants of God knew that they were sanctified from their mother’s womb (Is 5, Lk 2). There was no time when they did not reverence and love Jahweh, no time when they played the fool, no time when they needed to hear the arresting trumpet-voice, ‘Turn ye, turn ye...why will ye die?’ (Ezk 33). But there are incausal elements in human nature as well as defects in the best education, and the sons of many servants of Jahweh—such as Eli, David, Josiah—showed that it is always in man’s power to abuse the mystery of his freedom and defeat the grace of God.

Conversion in the OT was often a profound and radical change. The desire for God—the hunger, the thirst, the famine of the soul—that was as passionate, and the response to the human cry was the outstretching of a strong arm that not only wrought deliverance from evil, but drew men into close and satisfying fellowship with God. Yet the joy of conversion by a natural disposition was for a long period troubled by the idea that spiritual restoration must necessarily be followed and attested by material prosperity. To the end it awaited a fuller revelation of the Fatherhood of God, the breaking of the bonds of sin and the prospect of immortality. There was to be a final answer to the oft-repeated prayer, ‘Turn us again, O God, and cause thy face to shine, and we shall be saved’ (Ps 80:7–8).

ii. The NT.—In the NT, conversion is the chief end of all teaching and preaching. It has rightly been called (Ecce Homo 21, London, 1873, p. 245) ‘the true artius est et cadet est ecclesia.' Jesus began His ministry by preaching repentance and faith (Mar 1:14–15), that is, the conversion of sinners, a statement of the faith of the Church from its beginning to the present day. The language in which conversion is described varies considerably, according to the needs of the individual: but the root or core of the change is always the same. It is figured as a transition out of darkness into marvellous light (1 Pt 2:9), as a being born again, or ‘from above’ (Jn 3:3), as a redemption from all iniquity (Tit 2:8), as a passing out of death into life (Jn 5:24), as a turning from the power of Satan unto God (Ac 26:20), as a new creation (2 Co 5:17), as putting off an old and putting on a new man (Col 3:10), as becoming children of God (Ro 8:16), as having Christ dwelling together equivalent to a temple in the body (Eph 3:17), as a dying and rising again (Ro 6:4). Practically, it is a new life which turns all the forces of one’s being into a new channel. All the energies that formerly made a man a sinner are now employed to make him a saint. His carefulness, indignation, zeal, and revenge are directed against his sin (2 Co 7:9). The converting power is never the mere force of truth, or the beauty of holiness, but always the fascination of a person—of a person. The whole life of the convert organizes itself anew around Christ living, dying, rising, and reigning; He is the power of God unto salvation (Ro 1:4). The NT tells of multitudes who have been re-claimed from vice, and never gone back. Science regards all facts with reverence, and the NT abounds in such transfigured realism as the fol-
CONVERSION

loving: 'Neither fornicators, nor idolaters, nor adulterers, nor effeminate, nor abusers of themselves with mankind, nor thieves, nor covetous, nor drunkards, nor revilers, nor extortioners, shall inherit the kingdom of God. And such were some of you: but ye were washed, but ye were sanctified, but ye were justified in the name of the Lord Jesus Christ, and in the Spirit of our God.' (1 Co. 6:9.)

Conversion has a double aspect: a moral, spiritual, intellectual, and practical (John Watson, *Inspiration of Our Faith*, p. 79 ff.); and such groupings are useful, if not logically perfect.

There are conversions from sin to holiness, from doubt to faith, from legality to grace, from selfishness to self-sacrifice; but we must beware of analyzing the indivisible self into so many faculties, and ascribing conversion to the exercise of one of them, to the exclusion of the others. Conversion is the response of the whole personality—whether they regarded as mind, or heart, or will—to the personal Christ. It is man's meeting with Christ, believing in Christ, gaining new life in Christ. Intelligence, emotion, volition are all mastered by the Author and Finisher of Christian faith. The harmonious functioning of every energy of the mind is the perfect spiritual life.

Jowett, in a fine essay on 'Conversion and Changes of Character,' calls attention to the fact that the last generation—the very opposite of their forefathers; their spiritual nature came again like the flesh of a little child (Jowett, *Theological Essays*, p. 40). Sometimes the change was violent and dramatic, as in the case of St. Paul, whose conversion is the most momentous in history; sometimes it was quiet and unexsational, as in the instances of Zaccheus, Matthew, Lydia, Timothy. But, whether the type was explosive or gentle, the change was radical and complete. And it is impossible to say when it was always the opposite of a gradual and laborsious reformation.

'Easier to change many things than one is the common saying. Easier, we may add, in religion or morality, to change the whole than the parts. Easier, because natural, unaccustomed, not agreeable to the voice of conscience and the promises of Scripture... Take care of the little things of life, and the great ones will take care of themselves, is the maxim of the trader. But more true is it in religion that we should take care of the great things, and the trifles of life will take care of themselves. Christianity is not an art acquired by long practice; it does not care and polish human nature with a graving tool; it makes the whole man; first pouring out his soul before God, and then casting him in a mould' (Jowett, op. cit. 56).

For certain purposes, theology distinguishes conversion from regeneration. They are the human and the Divine side of the same experience. Regeneration is the gift of God. Conversion, the power or principle of the new life implanted by His Spirit; conversion is the act of human freedom, the voluntary turning of the heart to God. The one is a necessity—'ye must be born again' (Jn. 3); the other, a duty—'repent and be converted' (Ac. 5:32). Regeneration occurs but once, conversion may have to be repeated. 'Convert your conversion' is the keen counsel of Adolphe Monod (Saint Paul, Paris, 1839, p. 114). St. Peter's faith never failed, for his Master never gave it; but Divine good pleasure grew cold; but in a moment of temptation he denied his Lord, and he needed to be reconverted was painfully evident (Lk. 22:54). And if there is any truth in the *Domine, quo vadis* legend, he had yet another conversion at the very end of his life, and it was again a look on the face of Christ that wrought the change. 'And Peter turned, and rushed on Rome, and died.' Conversion plays too important a part to be exhausted in a single decision.

'The whole life of a man,' says Fraser of Brea, 'is a continued conversion to God, in which he is perpetually humbled under sense of sin, and driven by fear and love and faith to endeavor and persevere to make nothing less than a perfect faith and love, and daily walks closer with the Lord, endeavoring at certain times to be more and more holy, and over again his work in the heart, forming His people more exactly than before; and therefore no wonder they meet with something like a second sight, and a third spiritual sight, especially where there are backslidings' (Memoirs, Edinburgh, 1736, ch. v. 2).

St. Paul describes his own conversion objectively in the Acts, and subjectively in his Epistle to the Romans. Ro. 7 is the most searching analysis ever given of the divided self, the *homo duplex*. Whether it mirrors a first or second or still later spiritual conflict is immaterial, for each crisis in man respects the same. How forcibly the Apostle's self-dissection illustrates the teaching of the modern psychologist!

'The welds of the twice-born character seems to be a certain discordancy or heterogeneity in the nature temperament of the subject, an incompletely unified moral and intellectual constitution. 'Homogeneity, homo duplex, . . . Heterogeneity may make havoc of the subject's life. There are persons whose existence is little more than a series of zigzags, as one tends upward and then downward and then again upward and the upper hand. Their spiritual lives with their flesh, they wish for incompatible, which causes them to have liberal plans, and their lives are one long drama of repentance and of effort to repair misdeemeeus and mistakes. . . . The higher and the lower feelings, the useful and the erring impulses, begin by being a comparative chaos within us—yet must end by forming a stable or function of function, as the gentleman and the peasant' (James, *Varieties of Religious Experience*, London, 1902, ch. viii, p. 167 ff.).

While the battle rages in the Apostle's soul, while his heart is a kingdom divided against itself, and in all the chambers of his being his moral ideal is torn between friends and foes, his anguish is pitiful. 'O wretched man that I am,' he cries, 'who shall deliver me!' (Ro. 7:24). But in the end, by the power of Christ, his higher self triumphs over his lower; his divided spirit is healed; peace and harmony take the place of civil war and turmoil; and the most tragic lament in the Bible is followed by the finest psalm.

3. Conversion in Church History.—The supreme task of the Church is the conversion of the world—the making disciples of all nations (Mt. 28). The apostolic and evangelical continuity of spiritual life is to be maintained, the Christian faith is to be propagated, the Kingdom of God is to be advanced, through an unbroken succession of conversions. All the preachers who have profoundly moved the heart of mankind—master-spirits like Chrysostom, Savonarola, Luther, Wesley—have made conversion their theme. And, from a scientific point of view, the evidential value of conversions is the highest.

'Of Augustine,' says Romances, 'after thirty years of age, and other Fathers, bear testimony to a sudden, enduring, and extraordinary change in themselves, called conversion. Now this experience has been repeated and testified to by countless millions of civilized men and women in all nations and all degrees of culture. It signifies not whether the conversion be sudden or gradual, though, as a psychological phenomenon, it is more remarkable when sudden and there is no symptom of mental aberration otherwise. But, even as a gradual growth in maturity, its evidential value is not less' (*Thoughts on Religion*, p. 102).

The theology of the Church was early caught in the meshes of the problem of the relation of Divine grace to human freedom in the experience of conversion. Thought has moved between two extremes. On the one hand, the sovereignty of God is emphasized, grace is irresistible, the number of the elect is certain and must be made up, the elect certain—*in utramque quietum*. Under such conditions, man, impotent in the grip of original sin, is converted almost against his will. He is scarcely more than an automaton; his salvation appears to be due to his mere good
fortune; he chances to be a vessel unto honour. On the other hand, human liberty is accentuated; conversion is viewed as the outcome of forced resident in man himself; he has a native power to repent and believe, and the new life is from first to last a hard-earned, self-obtained, personal possession. The age-long controversy between Augustinian and Roman Catholic and Arminian, regarding the fact of conversion has now spent much of its force. With the help of a better psychology we can do justice to both the Divine and the human initiative. God is all-operative love, and man's whole life is his gift. All the conditions of human life are Divinely ordered, and man has an intense consciousness of dependence. He has nothing that he has not received. But part of his equipment is his freedom. He is at once a real and not an illusive sovereignty. He is conscious of acting of his own accord, and of using the causal order for ends which he himself chooses. He is a free, self-determining personality, and his conversion is one that we are the impulse of love he voluntarily and joyfully surrenders himself to God. A German theologian illustrates the interaction of Divine sovereignty and human freedom in conversion by the familiar process of personal soul-saving being perceived as die Bekehrung und Ueberzeugung (Seeberg, art. Bekehrung, in PRE). Every man is constrained by the love of Christ; but every man is fully persuaded in his own mind. If the convert calls the grace or fascinates of Christ 'inexpressible,' he partly speaks with the enthusiasm of a lover; but it is had theology to change the warm logic of the heart into a cold dogma of the intellect. Man may after all use the Divine gift as he pleased—it may be to thwart—the will of God. The way of its individuality is to make Divine ends personal ends, and to pour forth all the energy of one's being in the service which is perfect liberty.

Conversion meant in the Middle Ages, as it still does in Roman Catholicism, the adoption of a creed and submission to the authority of the Church. In Protestant theology it always means the re-birth of the soul, but in the Anglican Church there is no way to regard regeneration and conversion as independent and separable in time, and different in important aspects. Certainly, if regeneration is mediated by baptism, the subject of which is usually unconscious of the rite, then when and turning to the will to God, the personal acceptance of Christ by faith, then the second process is often separated from the first by a long interval; and it is possible to contend, as Anglican theology sometimes does, that 'a regenerated man it not necessarily a converted man.' If the effect of baptism is that 'it remits all sin, original and actual; that it bequeaths sanctifying grace, and endues the soul with the heavenly virtues of faith, hope, and charity; that it invests the recipient a member of Christ, the child of God, and an inheritor of the kingdom of heaven' (V. Staley, The Catholic Religion, London, 1853, p. 248), there can be little need for another religious phase called conversion. But this view appears to lose all touch with the central truth and vital experience of the NT, to empty the Christian religion of its moral and spiritual contents, and to reduce it to the level of a magical formula.

4. Conversion in the light of science.—Professor Henry Drummond was an eye-witness of the facts of conversion, as the youthful comrade of Mr. Moody in a great revival of religion. From that time he never ceased to advocate a scientific treatment of the phenomena of the spiritual life, which he happily called 'the contemporary activities of the Holy Ghost.' There can be nothing presumptuous in the endeavour to classify the facts and discover the laws governing the phenomena of forced resident in man himself; he has a native power to repent and believe, and the new life is from first to last a hard-earned, self-obtained, personal possession. The age-long controversy between Augustinian and Roman Catholic and Arminian, regarding the fact of conversion has now spent much of its force. With the help of a better psychology we can do justice to both the Divine and the human initiative. God is all-operative love, and man's whole life is his gift. All the conditions of human life are Divinely ordered, and man has an intense consciousness of dependence. He has nothing that he has not received. But part of his equipment is his freedom. He is at once a real and not an illusive sovereignty. He is conscious of acting of his own accord, and of using the causal order for ends which he himself chooses. He is a free, self-determining personality, and his conversion is one that we are the impulse of love he voluntarily and joyfully surrenders himself to God. A German theologian illustrates the interaction of Divine sovereignty and human freedom in conversion by the familiar process of personal soul-saving being perceived as die Bekehrung und Ueberzeugung (Seeberg, art. psychological development, and a wide induction proves that.

Among males there are two tidal waves of religious awakening, at about 13 and 16, followed by a less significant period at 18; while among males the great wave is at about 16, preceded by a wave at 14 and followed by a spike up to 18 (Stark, op. cit. p. 34). 'Feeling plays a larger part in the religious life of females, where it is more confused with intellect and volition' (Fosdick, op. cit. p. 65). 'Conversion for males is a more violent incident than for females, and more sudden' (ib. 95). And one may say that boys with deficient mental equipment fully justifies it by bringing it into relation with other well-known mental processes. There are moments, as Browning says in his Cristina,

1 When the spirit's true emendaments
Stand out plainly from its fake ones.

Our best thoughts are often startling intimations, 'flashes struck from midnight.' The seeker after truth utters his sudden 'Eureka,' and so does the seeker after a Saviour (Jn 10-24). Love, both natural and spiritual, is often love at first sight; when two souls, like two dovets, rush into one, the time element counts for nothing; the psychological moment has in it the quality of eternity. Our minds and souls and psychology completely justifies it, and we are quite justified in bringing it into relation with other well-known mental processes. There are moments, as Browning says in his Cristina,

1 When the spirit's true emendaments
Stand out plainly from its fake ones.

The world and its laws,' to quote Jowett again (op. cit. p. 63), 'bear witness to our true determinations. At any moment we can begin a new life.' R. L. Stevenson prays the Celestial Surgeon to stab his spirit broad awake (Underwoods, p. 10). A work of art is the result of an original Christian conversion.

Even those who have never avoided God, never dishonoured Christ, often become suddenly and profoundly conscious of their need of conversion; and there are creative periods of the mind when the inductive faculty, and the instinct to good are tremendously strong. While, however, the actual change is frequently swift, there is almost invariably a season of preparation for it.

Conversion is the climax of a gradation, the crisis of a process more or less drawn out. The evidence on this point is all but unanimous. We may even accept Vinet's strong statement: 'Rome might more easily be built, than a man converted, in a day. Such a prodigy is possible with God; but not in a day. In a day, we say, we may safely predict that He will not perform it' (Outlines of Theology, 1870, p. 84). Vinet is here perhaps missing language, confusing the means with the end, the way with the goal. He does not feel that the change is often instantaneous. In such cases conversion is the firing of a slowly-laid train, the bursting of a silently-maturing bud, the transformation seen in the lifelong drama of the soul. It is evident that much is lost by the deliberate postponement of decision.

'Convert me, but not yet,' was Augustine's prayer. 'Men are quiet to feel, and keen to know; but they are not only slow, they are averse to decide. Yet it is for decision that Christianity calls, it is for decision that the energetic universe calls, for more than for a mere impression in response. A crisis has to be formed and the soul to be resolved at the will' (P. T. Forsyth, Preaching and the Modern Mind, 1907, p. 131).

(3) Conversion may be unconscious.—There is a happy class of Christians who cannot tell when or how they began to believe; who have 'no bitter regrets, no broken lives, no ugly memories.' There is the anima naturaliter Christiana, the sanguine Sceol that has always been on the side of the angels. It was the teaching of Bushnell that, under the pervasive influence of the Christian family, the child should grow up a Christian without his ever knowing himself to be otherwise. The Christian life, being natural to man, should begin with the beginnings of conscious experience; and a great wrong is done to a child when he is led to imagine that he must wait till he comes to years of discretion and then have an experience which will make him a Christian. If the soul will for itself realize, there will be no rude shock, but a beautiful continuity, in his spiritual life. 'Of such is the kingdom of God' (Lk 18:9), said Jesus of the children of Galilee, and the prevention of a fall from the grace so delicately connected to childhood should be the aim of all education.

'That is the ideal type of conversion in a Christian land; and it is the scandalous neglect of duty by Christian parents and by the Church which has made it less frequent than it should be' (D. W. Forrest, The Christ of History and of Experience, 359).

'The soul is father of the understanding. And I could wish my days to be

Bound each to each by natural pity.'

Some, indeed, deny that in this Christian science there is any conversion at all. Francis Newman distinguished the 'once-born' from the 'twice-born' Christian, and this idea—legitimate enough as a protest against an exclusively revivifying type of conversion—has been wonderful in an age of psychologists and greatly overworked. It is not a Christian idea. Jesus assumes in many indirect ways the natural sinfulness of the human heart and its need of regeneration. Even the child who is 'sanctified' by his mother's prayers is once-born. The most the 'sky-blue' and 'healthy-minded' Christian is regenerated. Science is here rendering a valuable service to theology. It has proved that every man has a sub-conscious self, that changes both small and great occur in the subliminal region of the mind.

'Consciousness is a very poor witness to what takes place in the abodes of soul life. The remembered experiences of individuals are pitifully fragmentary and puerile, and often absurdly mistaken as to cause, process, issue, and object' (Hall, Adolescence, p. 317).

We are largely the creatures of instinct and unconscious imitation, and, if many things are wrought into the fabric of our being without our knowledge, why not the grace of God?

'Think you,' said all this mighty sun Of things for ever speaking, That nothing of itself will come, But we must still be seeking?

'God giveth his beloved in sleep' (Ps 127), and His beneficence is no wonder in an ungrateful as in a conscious regeneration. But see, on this whole subject, art. CONSCIOUSNESS, p. 53.

(4) Conversion must not be stereotyped.—The phenomena of the spiritual life are marvelously complex, and psychological inability to attempt to standardize, normalize, conventionalize it. Every individual has his own ancestry, his own history, his own idiosyncrasy, and therefore his own spiritual experience. The variety of grace is like the variety of our experience. A man is not a fly; and the Spirit is not a machine. He loves originals more than duplicates. The conversion on the way to Damascus cannot be a pattern for all men. There need not always be the same tragic intensity, the same high lights, the same deep shadows. The diversities of operations of the same Spirit must all be orthodox.

But every man is tempted to make his own experience a kind of law for other people. Schleiermacher thinks that the religious life is, in its inception and growth, the product of feeling; Herrmann believes that 'greater and higher than all the motions within the Christian, there rises and lowers religious thought.' The type of religious experience that seems native to a cultured community is, in general, respected and retained; but the fervours of the Salvation Army and the Methodist meeting are to the psychologist no less natural.

Théodore Monod tells of a French friend who thus described his conversion: 'I cannot say that I had a very strong sense of sin, I just felt happy in the love of God. God did to me as a mother sometimes do to her child who has only to be fed; I was no more a self: he wove me up in a kiss' (Monod, Foreign Grace, Lond. 1899, p. 116). The Christian of the unconscious type, who has never felt a single emotion or experience, has by the convert who knows himself to be a brand plucked from the burning, to whom conversion is a thing volcanic or cataclysmic, in whom 'habits of years' standing are overthrown in as many
CONVICTION.

moments; and whose 'very organic impulses and desires are so utterly transformed that he can scarcely recognize himself' (Pratt, Psychology of Religious Belief, p. 253).

(5) Consequences of the mystery.—When being studied scientifically, spiritual phenomena lose none of their Divine significance. Psychology has done much and will yet do more; it even asserts that, 'if we know the person psychologically, we can prophecy quite correctly the type of his conversion, whether sudden or gradual, quiet or excited' (Cutten, Psych. Phen. of Christianity, p. 253). But, after all, psychology can see only the under side of conversion.

'Spiritual life, like natural life, is in its foundations a mystery,' says Mr. T. J. Lipman, 'Nothing can be more crude than the notion that to discover the reign of law is to eliminate God and mystery. Law is only God's uniform method of working, and He is in the field when He is most invisible. We have not to deal with a God remote from the world and manifested only through occasional interferences with the order of Nature, but with a God whose dwelling and working are in the lives of men. Just as the correlation of brain states with diseases does not prove the case of the materialist, so the correlation of conversion with certain mental and physical forces is far from proving that the inception and growth of the spiritual life is not a Divine act. Nothing may all be due to so-called natural causes,' says Romans, 'no evidence against its so-called supernatural source, unless we beg the whole question of Divinity in Nature' (op. cit. p. 106). Even Riesch, with all his dislike for mysticism, never denies that God Himself is present and operative in regeneration, using the religious community as His medium, not His substitute. 'This wonderful change,' says Pfeiderer, 'is not arbitrarily brought about by man, it creates itself in the person of the happening. It happens upon him; it appears to him as the operation of a higher power, as the gift of undeserved divine favour or grace. And is not this a thought, in fact, can do nothing but confirm what the believer holds as a truth requiring no proof' (Coo, Eng. tr. iv. 1889, p. 36).

Frode complains that conversion, like other Christian doctrines, has been 'pawed and fingered by incautious hands for now nearly two hundred years. The bloom is gone from the flower. The plumeage, once shining with hues direct from heaven, is soiled and bedraggled. The most solemn of all realities have been degraded into the passwords of technical theology' (Life of Baynton, London, 1880, p. 34). But all that is needed to bring back the bloom of the flower and the plumeage to the wing is a new springtime. Human errors and caricatures do not alter Divine facts, any more than the mists extinguish the stars. A wide survey of the data of the spiritual life leads to the conclusion that the majority of these evolutionaries have little of the picturesque or dramatic in them; that some take place beneath the threshold of consciousness; that others are but dumb yearnings of penitence and faith towards God; that the memorabilia of soul-life are usually brief, the convert sometimes limiting himself to the wondering exclamation, 'Whereas I was blind, now I see' (Ju 9 11). Yet every conversion enfolds in itself a Divine secret—the mystery of life—whose power and beauty will gradually be unfolded to the eye, but whose inner significance no mind can penetrate. The psychological study of the New Life will probably do more than anything else to convince the twentieth century of the immanence and transcendence of God.

personal influence of those who confidently and plausibly proffer doctrines and statements for the acceptance of ill-equipped minds.

Respecting conviction as the result of a mental process, and determined by evidence, there is usually a change of belief and of mind-content. Here we have evidence pointing out old belief and substituting new; conviction then leaves old opinion and clings to new. In this case the feeling of reality comes as a response to the force of evidence applied by comparison and judgment.

That is, belief seems to be the real (and so it is known) to be a matter of conviction; but it is also a matter of both feeling and will. In respect of all the higher intellectual, aesthetic, ethical, and religious realities, feeling and choice largely determine knowledge through the dependence of this belief of the world. Yet we have spoken of feeling not because it is a special form of affective phenomenon—because as conviction—having that warmth of colouring which the word implies—it may be regarded as a sort of universal affective accompaniment of the intellectual and voluntary aspects of all knowledge' (G. T. Ladd, *Psychology*, 1891, p. 54).

Convictions are beliefs accepted and vitalized by the emotions of those convinced that realities are indicated by them. The acceptance of beliefs is partly determined by the absence of contradictory beliefs in the mind when the new propositions are tendered. This fact Buckle long ago pointed out.

The absence of antagonistic ideas in the mind permits indiscrimination the acceptance of true and of false forms of belief. Children may be brought up to believe almost anything religious. In the same way the presence of beliefs antagonistic to proffered ideas may as often keep out the true as the false. Bias towards false forms, and erroneous prejudice, make impossible the adve of truth and prevent it from being admitted. Hence it is that new general truths are seldom acquired after mental maturity. Minds usually become hopelessly biased long before middle age. While credit may sometimes permit the truth to enter, constant incredulity resists the truth and hugs old errors.

The test of actuality we find in our own consciousness and life. 'Whatsoever things have intimate and constant connexion with my life are things of whose reality I am thoroughly assured' (op. cit. p. 298). Doctrines strongly stirring the higher emotions, and not conflicting with prejudice, will with a force which carries conviction with it, though the doctrines may vary with all the religions of the world. Truth hides under many forms. We may be sure that, in all these varying doctrines as applied to the human heart, there is a living element of eternal truth. God does not forsake the beings that have emanated from Himself. Each soul has the conditions and the knowledge it can bear and make use of under the religion it is born to or adopts.

2. Conviction of sin is usually present in the state of consciousness known as conversion (p. 129), or change of heart. It is a 'sense of sin,' a feeling of unworthiness and general wretchedness, accompanied by a strong desire to lead a better life. It is shown by a more or less sudden distaste for accustomed thought, language, and conduct, and by a new-found yearning within for an improved state of being. Conviction may last for days, months, or years before the crisis, or conversion, supervenes, and this is followed by restfulness of thought, language, and conduct.

Conversion is described by Starbuck as a step for breaking the lower for the higher self:

'A process of struggling away from sin, rather than of striving towards righteousness, seems to be a step in growth which calls into activity the deeper self. . . . The feelings, which are the primal elements in consciousness, function so strongly. In the tendency to resist the new life, one also, an indication that the new life is forcing its way even against the person's will' (*The Psychology of Religion*, 1896, p. 64).

Though the proximate cause of conviction of sin is often fear of torments to come, yet we may be sure that behind this fear there are certain emotional and mental conditions ripe for a change to a higher state.

Viewing the phenomena observable at great religious reviews, such as the movement among the Welsh people in the years 1904-1905, we recognize, despite certain objectionable features and mistaken views and conduct, the action of the Holy Spirit in meeting the aspirations of those who are struggling against the difficulties of the lower planes of emotion. It is through the power of the Spirit, which is the life-force of the universe, that the transmutation of the emotions is effected, and this must be at the bidding of the lower nature. The raising of the emotions to higher levels is part of the process of evolution, and, when accomplished, is a sign of the soul's development, or growth in grace.

LITERATURE.—The literature is given in the notes.

CONVOCATION.—This is the name given to the general assembly of the clergy of the Church of England. The older name was 'synod,' of which 'convocation' became equivalent when English began to take the place of Latin in the official documents of the Church. We read of the 'Synode of London' in 1533, but of the 'convocation held in London' in 1522. The synodal activity of the Christian Church is coeval with her life. It gradually took form in diocesan, provincial, and national synods, and these different forms of synods were held wherever Christianity was established. The British Church, in common with the rest of the world was familiar with conciliar action.—witness the Council of Verulam in A.D. 446. In Anglo-Saxon times, Church Councils were assembled 'acconse with our Parliaments' as national synods, while the bishops and clergy in addition were constituent members of the 'great council' of the nation.

In Norman times the conciliar activity of the Church became still greater. Bishops, abbots, priors, archdeacons, and deans were summoned; but the first known representative element occurs in 1225 under Langton. Later in this century, however, we have proof of direct representation in a provincial synod, for in 1273 we find Archbishop Kilwarby issuing his mandate to the Bishop of Lincoln 'to the effect that the two archdeacons in that province should attend. Side by side with provincial synods were diocesan synods, which were held under their several bishops to enforce the decrees of the provincial synods. National synods fell into disuse through the jealousy felt by the two Archbishops of their respective claims.

It is to be noted that this synodal action of the Church preceded the attempt made by Edward I. in 1295 to incorporate the clergy into his newly
CO-OPERATION

devised parliamentary system. The king hoped that the clergy would not only meet, as heretofore, as the spiritual counsellors of the Archbishops, but that they would also add to their spiritual duties the further duty of sitting in Parliament as the king's council, especially to make it easier for him to raise money by taxation. The king's attempt, however, failed through the refusal of the clergy to objects of summons addressed to them, through the Archbishops in the famous pr\n\nmunientes clause. The Crown acquiesced, after 1340, in the rule that the clergy should tax them\nselves in their Convocation, and in consequence the great function of the Convocation did not outlive the following century. The writ with the pr\n\nmunientes clause is still issued at the summon\ning of every Parliament, but is never obeyed. Convocation, however, is still summoned in both Provinces whenever Parliament is summoned, though it would seem that there is nothing to hinder its meeting at other times 'if the existence of affairs shall so require.'

Convocation, in common with the Church of England as a whole, lost much of its independence, and at the same time much of its power and influence, at the Reformation. The Act of Submission (25 Henry VIII. c. 19) embodies in its pre\n\namble an Act of Convocation abjuring all power to do anything without the king's consent; and it affirms that Convocation always had been, and ought always to be, assembled only by the king's writ. Accordingly, Convocation was reduced to an instrument of the 'Supreme Head.' The Supreme Governor, in his purposes, and was given the duties of considering forms of public worship, articles of religion, and canons, though not as possessing any independent effective authority. Indeed, it is now an estab\n\lished fact that whatever is made by the clergy in Convocation are of no binding power over the laity.

After the Restoration, Convocation prepared in 1661 the Act of Uniformity, revised the Prayer-Book, and re-modelled the canons. The same Convocation is remarkable as being the last to grant a clerical subsidy—acting, it is said, in dropping the custom, upon a verbal agreement made between the Lord Chancellor Clarendon and Archbishop Neill. This bishop declared that 'the greatest alteration in the constitution ever made without an express law.' Since this change Convocation has ceased to enjoy any political importance.

After the Revolution, the history of Convocation is a story of bitter conflicts between the two Houses, in which Atterbury, Wake, and Burnet played leading parts. This conflict culminated in 1717, when the Lower House was about to censure the writings of Bishop Hoadley, whereupon Conv\n\nocation was prorogued by royal writ, and met no more (except formally till 1741) until it was again summoned for business in 1852, through the efforts of Bishop Wilberforce and others.

Convocation now assembles concurrently with Parliament, being summoned by a royal writ addressed to the Archbishops. In Canterbury the Upper House consists of 23 members, the Lower of 154. In the Province of York the corresponding numbers are 9 and 60. The custom of separating into Upper and Lower houses dates from the end of the 14th cent., when the inferior clergy began to withdraw into a lower room, viz. one under the chapter-house of St. Paul's Cathedral, or a small room in the crypt in the crypt.

Though Convocation is described in Canon 139 of 1604 as 'the true Church of England by repre\n\n\nsentation,' it remains an unformed body. The official element is preponderant, and the large body of stipendiary curates is without any voice in the election of clergy-proctors. It is not surprising, therefore, that Convocation exercises but little influence over the minds of the majority of the members of the Church of England, though it affords an excellent opportunity for the more highly-placed clergy to discuss affairs as they affect the Church, and though its debates and reports are of uniformly high order, and are frequently of permanent value. See also art. CHURCH OF ENGLAND.

W. F. COBB

CO-OPERATION.—Co-operation (i.e. literally 'working together') might express any combined action of two or more persons for any purpose. It is used in general, and will be employed here, to denote the combinations of working men for production or distribution of commodities, including incidentally some other forms of mutual help. In 1794, Dr. Shute Barrington, bishop of Durham, established a co-operative store at Mongewell, in the county of Oxford, at the instigation of that and three small adjoining parishes. A quantity of bacon, cheese, and other articles was procured from wholesale dealers to be subdivided and sold at prime cost for ready money. The salesman was an infirm old man who could not read or write, but his honesty was unimpeached, and he was allowed a shilling a week as well as the benefit of the shop. The transactions of 1796 amounted to £253. The net saving to the poor in the cost of the articles was £140, and the Rev. Dr. Glass invited several village shop at Greenford in Middlesex. The receipts for six months exceeded £150, and the margin of saving was from 15 to 25 per cent according to the nature of the article sold. A third was established about the same time at Hanwell, by the Rev. G. Glass, vicar of that parish, with like success. In all three cases, great good was done by avoiding the burden of debt.

In 1795, a co-operative saw-mill was established at Hull, and it continued in operation for a hundred years. In 1796 a parish windmill was erected by subscription on Barham Downs in the county of Kent, and in 1797 one at Chislehurst. A co-operative society at Nottingham has existed for more than 100 years.

In 1844, a few workmen of Rochdale joined in establishing a society called the 'Equitable Pioneers,' and that Society was so successful that the works of many others followed in many parts of the country. It now has more than 16,000 members holding £300,000 in shares, and its sales amount to £340,000 a year. A portion of its profits is yearly applied to educational purposes. The paid up capital consists largely of accumulation of past profits. No credit is given. By its means the workmen of Rochdale have been enabled to supply themselves with accessories of life, genuine in quality and at a cheap price, and to accumulate out of their savings and the profits of their trade a capital sum averaging nearly £20 for each share\n
holder. This Society was registered as a Friendly Society under the Act of 1846.

In 1850, the Rev. F. D. Maurice, the Rev. Chas. Kingsley, Mr. H. M. Ludlow, Mr. T. Hughes, Mr. E. Vansittart Ncule, and others, joined in the formation of a Society for promoting Workmen's Associations, and commenced a Working Tailors' Association. The excellent motives and aspirations
COPTIC CHURCH.

Introduction. — When Christianity was first introduced into Egypt, it found itself confronted not only by the religions environment common to all Hellenistic provinces of the Roman Empire, but also by the influence of the old native religion. The latter, although beginning to show signs of decay which was soon to overtake it, was still immensely powerful, especially in the towns and villages situated at some distance up the Nile, away from Alexandria. In certain ways it had scarcely been touched by Hellenic influence, and had, indeed, rather self-influenced Hellenic thought. It had certainly impressed itself strongly on the imagination of the Platonist idealists of Alexandria, as is evidenced by Plutarch’s treatise de Iside et Osiride and by bk. xi. of the Metaphysics of the same author. It was at the beginning of the Roman period the native priests still kept alight the sacred lamp of religious knowledge, the general mass of the people had become ignorant of a great number of the lesser-known deities, and many of the old forms of ceremony. Nevertheless, the main doctrines of the old religion were as firmly rooted as ever. The worship of the gods of the dead was still paramount, and especially there remained unshaken the belief in the Osirian idea of resurrection and the confining of the dead man to the underworld. But, by the power of Evil, who lived again as king of the dead. The people still believed in the so-called ‘resurrection,’ that is to say, they thought it was possible that the dead might live for ever if they were not involved in the ceremonies which enabled Osiris to escape corruption. Also, if we may rely on such papyri as that containing the tale of Setne Khaemwaset and St. Osiris, not only was the weighing of the heart maintained, but evil deeds still thought necessary to be followed; the soul could pass the judgment-hall of Osiris, but very elevated notions of morality and justice played an important part in the hopes pertaining to eternal felicity. On the other hand, the Greek sympathists of Alexandria had adopted the cult of Osiris and Isis, and had transcendentized it out of all knowledge, to suit the current Platonist doctrines of the day; according to them, the mysteries of the Egyptian religion were the keys to a knowledge of esoteric, after long study and strict asceticism. Platonism had also involved the large Jewish community in Alexandria, and demanded from its devotees, as we know from Therapeutic ideals, the practice of asceticism and contemplation. There can be little doubt that these two things—(1) the belief in a future life to be obtained through a god who had himself overcome death, and (2) the transcendentized form of Osiris and Isis-worship adopted by the Greeks, which demanded asceticism and abstention from the desires of the flesh—largely influenced the early Christian communities in Egypt.

1. Introduction of Christianity into Egypt. — The tradition that St. Mark was the last to preach the gospel of Christ in Alexandria is first related by Eusebius, but prefaced by the word φασ. In spite of the tradition being firmly rooted to this day, it has little historical value. When and by whom the gospel was first introduced into Egypt is unknown, and, indeed, the whole history of the Alexandrian Church is enveloped in obscurity until the episcopate of Demetrius (A.D. 189–231), when it appears as a flourishing institution, with a school of philosophical learning attached to it which must already have made its influence felt far beyond the city itself. Eusebius (HE vi. 11–13) states that ‘thousands’ were martyred from Egypt and all the
The Coptic Church, as distinct from the Alexandrians, or more by the Bythons under the Jewish. The latter inference is the more probable, as there seems to have been little attempt at first to reach the masses of the native Egyptians, the appeal of the new faith being made almost entirely to those of Hellenic birth. Here again we find that, in spite of the close parallelism between the known fragments and the canonical sources, there is not only a tendency to Modalism, but also a strong tinge of Encratism.

The latter was also one of the evidence of a very early sect within the Church, which set up extreme asceticism and abstention from sexual intercourse as the Christian ideal. There can be little doubt that the asceticism affected by the devotees of Isis and the Jewish Therapeutae has become thus introduced in very early times into the Christian communities of Alexandria. Clement, however, defends the Gospel according to the Egyptians from the charge of extreme Encratism.

It was hoped that the finding of the now famous ‘Sayings of Jesus’ at Oxyrhynchus by Grenfell and Hunt would have thrown some light on these early uncanonical versions; not only have they not done so, but their own origin is extremely uncertain.

The first series of these ‘Sayings’ (eight in number) was found in 1897 with a host of other valuable literary fragments, and their date is not geographically determined. The longest series of these, three are new, with a tendency to mysticism and a harsh and severe judgment of mankind. Barnack saw in these extracts from the lost Gospel according to the Egyptians (Expositor, Nov., Dec. 1897), but other theologians and the editors them- selves were not by any means unanimously in agreement with him.

The second series, found in 1903 on the same site, was written on the same vessels, and had been probably written by Thomas and another disciple whose name is missing. This, however, may only be a bold claim on the part of the writer. They agree in form and in date with the first series, but differ in being less akin to canonical sources. One of the sayings is almost exactly paralleled with a quotation of Clement’s from the Gospel according to the Hebrews, and can therefore be assigned to that work without hesitation. Whether such a series is a selection of sayings from any one Gospel or from different Gospels is a matter of considerable doubt; Grenfell and Hunt themselves came to the conclusion that the find was a collection of ‘sayings’ as such, and not the words of Christ as unauthentic.

There was also found at Oxyrhynchus a fragment of an uncanonical Gospel which unfortunately breaks off just where it appears to be closely parallel with the known passage from the Gospel according to the Egyptians, inasmuch as the latter is advocating extreme asceticism as the Christian ideal. Altogether it must be admitted that the Oxyrhynchus finds have served to prove rather than to establish us as regards to the early Christian documents of Egypt.

But we are at least able to surmise that there was considerable unmixed competition with the canonical sources, and that the uncanonical Gospels were strongly tinged with the ascetic ideals prevalent at the time in Alexandria; also, incidentally, that a Christian community flourished as far south as Oxyrhynchus in A.D. 298, if not earlier.

Archaeology also helps to throw light on this early period of Christianity in Egypt, although here again the evidence is scattered and obscure. It was the custom at this time to bury the mummies of the dead down the shafts of the tombs, or tesseres, tied round the neck, bearing the name of the deceased and of the cemetery to which the body was to be consigned. A large number of these tesseres exist in museums to-day. One at least (in the Berlin museum) was that of a Christian; and, although the symbol Χ Π on it has caused it to be considered post-Constantinian in date, there are good reasons for assigning it to an earlier period. There are also other tickets found in phosphorite known to be Christian, but which cannot be absolutely identified as such. They all have a peculiar symbol of the Christ, and all the Christ was unmanuscribed and buried in the same
COPTIC CHURCH

115
cemeteries as their pagan brethren— from which we may presume that these early Egyptian Christians still believed in the necessity of preserving the body in order that the existence of the soul might be assured (see DEATH, etc. [Coptic]). From the same site there came the fine collection of tapestry, some of which dates from the earliest times of the Roman empire. The symbols of the fish and the cross occur as patterns, and these have been thought to have come from very early Christian burials. If this be so, it points to a Christian community existing in Akhmim early in the 2nd century. We also have as evidence the libelli, several of which have been preserved to us. The first libelli issued in the beginning of the 2nd century, those to which we have referred, were Euchimian, a devotee of some Gnostic sect. The evidence for the latter supposition is, however, slender. The cords which bound the shroud were scaled with a curious mixture of pagan and Christian usages, including the Mysteries, but, if the contention that this symbol is evidence of a post-Constantinian age be correct, the early date assigned must be abandoned. Another remarkable characteristic of the shroud is the figure of a Premiere woman painted on the exterior, in the manner of the beginning of the 2nd century. The hand is represented as changing the pecus for the patera of gift, 'crux ansata', or symbol of life. Whether this is Christian must be considered doubtful.

2. Gnosticism and Arianism. — Although our knowledge of the early Christian communities in the upper country is so remarkably slight, when the Church became well established in Alexandria Christians began to form an important part of the community of that city, while the works of Clement and Origen prove that the intellectual stimulus of the pagan Hellenic schools was not lost upon them. The famous catechetical学校, founded, according to Eusebius (HE v. 10), in the earliest days of the community, and preserved in turn by Pantanxis, Clement, and Origen, was designed not only to teach catechumens, but also to appeal, by a system of philosophy, to a Christian community. Its influence was very considerable, but confined entirely to those of Hellenic education. Such a propaganda was useless to the natives of the upper country, whether pagan or Christian, as sovereign bishop of all Egypt, was very great; and he must have occupied a position similar to that of the pagan 'Chief Priest of Alexandria and all Egypt,' and the Jewish Exarch. This powerful position was retained by his successors until it reached its highest point under Athanasius, and lastcd, indeed, until the Council of Chalcedon. On the whole, too, at first the Alexandrian Church had good opportunity of developing itself free from internal opposition, according to the persecutions of Severus in 202 and of Decius in 250, there was little or no external pressure brought to bear on the Christians. The real enemy at this time lay within the Church itself in the shape of the Gnostic sects. The earliest record of the attack of those who professed a higher gnostis and the preachers of the simple gospel is the dispute between St. Peter and Simon Magnus, the latter of whom appears to have been the first to associate Christianity with Gnostic mysteries. Christendom. We have seen how, even in the early days of the Church, when Christianity was confused mainly by the Hellenic world or education, there was a tendency to asceticism or mysticism. In their extreme forms these two movements led to fantastic Gnostic systems, but the more sober and quiet side manifested itself among those Christians who carried out their ascetic ideals, not by withdrawing from the world, but by living in the midst of their own households, observing fasts, abstaining from marriage, and devoting themselves to prayer and the care of the sick and the poor. But, although these ascetic ideals, which affected the Egyptian Church to such a remarkable degree, and, through it, in later times the Church throughout the world, seem to have had their origin in Egypt, it is curious to note that the native Egyptian character in the past had exhibited little or no tendency either to asceticism or to mysticism. Magic in pagan Egypt was, and had always been, of an eminently practical kind, and, so far as we can judge, never included philosophic mysticism of any sort; indeed, the native mind was incapable of any of the higher subtleties of thought. It seems, therefore, that these two potent forces were introduced into Egypt by the Greeks, through the medium of Platonic and Pythagorean philosophers, and associated themselves with the native Egyptian superstitions by the Platonizing of the Osiris and Isis cult. We know that the Jewish community in Egypt was subject to an identical process. The fragments of lost Gospels, as well as the works of Clement and Origen, prove that the Alexandrian Jews, as well as the pagan and Jewish communities of Alexandria, exercised their influence on the early Christian Church. During the 3rd cent., however, Christianity began to make many converts among the native worshipers of Osiris and Isis, whose minds were little influenced by Hellenic ideas, had little or no Greek blood in their veins, and were quite incapable of understanding Clement's or Origen's conception of Christianity as Plutarch's theories about Osiris and Isis. Nevertheless, the ascetic side of the new faith seems to have appealed strongly to them, although the mystic and philosophic ideas interwoven with asceticism were not in the least comprehended, unless the literal practice of the extraordinary feats of endurance which appealed so strongly to the Egyptians, and produced countless hosts of imitators. Our chief authorities for the history of this movement are The Life of Anthony (a work attributed to Athanasius), Cassian, and especially the Louisaie History. The arguments of the school of Weingarten, that these are monastic works of the 6th cent., may be said to have been finally disposed of by Louis Curtius (c.d. 1871) in his edition of the Louisaie History. From these sources we draw a wealth of material concerning the ascetic movement, which is supplemented by the later Coptic documents. The first man who actually led the ascetic life, cut off from his fellow-men, was one Paul, who was driven into the desert during the Decian persecutions in 250, and there may well have been others who were forced to lead solitary lives owing to the same circumstances; but the fact that the world looks to the founder of ascetic solitude.

Born probably about the year 250, of Jewish parents, Anthony was converted to Christianity as a boy by hearing the Gospels read in a church. He is said to have been the first to presuppose the existence of a Coptic version at this early date.) For fifteen years he lived with ascetics, who at that time practised the ascetic life in huts built outside the town;
but, deeming this insufficient, he withdrew to the desert, and
endured a life of strict solitude in a cave for upwards of twenty
years. He was joined by large numbers of monks, fired with his
enthusiasm, and the burning deserts of Lower Egypt, especially
those of Scete and Nitria, swarmed with solitary ascetics. The
Bishop of Alexandria, in an attempt to quell the rising clamour
against Athanasius, sent him a bishop, named Hilarus, to
organize the communities of desert monks. While this
monk was visiting the different communities, an edict of the
Emperor Constantine was issued, commanding Athanasius to
return to the city. He died at an advanced age, and left special directions that his body should not be preserved by
any religious ceremony. He had expressed his desire that the
Christians continuing this pagan custom. The ideals of
monasticism that he left as a heritage are remarkable for
their strictness and purity. The monks observed a
strict rule of life in the Antonian communities, although the
number and size of their monasteries varied. The
rules were looked upon as a type, and sought to
avoid all absolute intellectual stagnation by repeating
long passages from the Psalms and other Scriptures learnt
by heart. Although the monks assembled on Saturdays and Sundays in the great church, the other days of the week were spent mostly in solitude.

The whole system was individualistic, each monk living for
his personal advance in virtue, contending against his fellows in
severities and mortification of the flesh, and striving, as Dom
Butler says, 'to make a record in austerities, and to outdo
the others in the length of his fasts, and his general observance of the
strict monastic rule.'

About the same time that Anthony left his desert cavern to
organize his followers, Pachomius, another Egyptian, founded
a more comprehensive system of monasticism in the south, at Tabennisi. Pachomius was born of pagan parents, and, according to
his own account, was brought up in the household of one of the
communities of Scete at Shenesi (Chenobocium). These communities, although hardly ascetic in the stricter sense of
the word, organized small brotherhoods for definite
missions, and it is quite possible that Pachomius may have utilized some
points in their form when, after he had been converted
by Christianity, he founded his Cenobitic monastery of monks.

Briefly, the Pachomian organization was as follows. In
place of the hermitages, a nave was added to the
scriptures by heart, and assembled in the great church only
on the more solemn festivals. So rapid was the extension of Pachomius' system, that at his death it included eighteen monasteries and
more than a thousand monks, while his brother has founded a similar institution only a few years later.

It is difficult to give a just estimate of this movement, which is the most outstanding, not only in Egypt, but in the entire Church of
the time. That the monks offered in many cases examples
of great patience, self-denial, and singleness
of heart and spirit is not to be denied. On
the other hand, few of his followers seem to have been possessed with the kindliness and shrewdness that are generally attributed to Anthony. Many of them outdid one another in the severity of their
ascetic self-discipline, but it would appear in many
cases that the general result was a stunting of the
intellect and a narrowing of the outlook on life.

Amelineau, whose acquaintance with the
demonstrated by the
Council of Nicaea, has said
that it has been customary to
hold up the monks of the pre-Chalcedonian days as a pattern of virtue,
and the Jacobite as a picture of vice, whereas, as a
matter of fact, there is little to distinguish between
the two orders of monks. Although, though
given to asceticism, was at times a very
ordinary mortal, 'mangeant net, buvant see,' and
prone to irregularities of life. Certainly even the
most admirable chronicles relate with perfect frankness
more about the vices than about the
ascetics. This, however, does not imply that all
were bad, and there is no doubt that at first the
ascetics were, on the whole, animated by a high
ideal. They threw themselves passionately on the
closest of Arians during the-Arian controversy, and
sheltered him in their desert communities while he was in exile. It is highly improbable
that they understood the complicated doctrinal
point involved. It was sufficient for them that
Arians seemed to desire to destroy the Son from
His equality with the Father. But, as time went on,
they became fierce, more bigoted, and a prey
to the inherent superstitions of their race. Childish
miracles and belief in univer-sal devils took the
place of the old magic and demonology which had
fascinated the Egyptians in pagan times, while in
the following century the fact that herds of fierce
monks could be summoned to Alexandria by the
patriarch led to an increase of religious turbulence and
sectarian strife.

There is no doubt that the adoption of
Christianity as the State religion and the rise of monasticism were the immediate forerunners of a period of lasting
and severe strife, which culminated in the Egyptian
Church. The death-knell of paganism was already run,
and with it that of the culture and freedom of
philosophic thought that had made Alexandria the
intellectual centre of the Hellenistic world. In 379 the Emperor Theodosius attempted to force the
Christian faith on the entire population of the
Roman Empire, and this was followed in 385 by
the sack of the temple of Serapis and the conversion
of other pagan cults. Meanwhile, while the
character of the illiterate monks began to assert itself, and their child-like faith in angels and
demons led to the communities of Scete being
accused by the patriarch Theophilus of Origenism,
the unerring vision of the latter proved
improbable, as revealed in the incident of the Tall Brothers, led to recriminations and unifying quarrels.

In fact, the power of the patriarch had risen to such
a pitch that he did not hesitate to consider that
those who were his theological enemies had
rebels against the Emperor, and, acting in ac-
cordance with this idea, he took some troops and
destroyed several of the Nitrian monasteries. During the reign of his successor, Cyril, turbu-
lence and disorder increased rather than diminished.

The Christians organized a wholesale plundering of the Jews in
Alexandria, whose quarters were sacked by hordes of monks and
fanatics, and the richest element of the community
was driven from their homes. This was
implied in the murder of Hypatia, a young and beautiful woman, who strove
to keep alight the lamp of pagan cul-
ture by lectures on Neo-Platonic philosophy. The
bigotry and turpitude of the Christian mob at
this period is only too well known. But as the
Patriarch grew more powerful, and the
Christians more fanatical, the relations between
the Egyptian Church and Constantinople became more
and more strained, until open rupture took place
on a question of doctrine, which was decided at a
Council held at Chalcidon in 451.

Monophysitism.—The controversy which had been
the cause of the Council of Nicaea was con-
cerned with the relationship of the Son to the
Father. The doctrine of Nestorius, which was taken
place in the Church were now due to disputes on
the nature of the Son—whether that nature was
human or Divine, or both. Cyril, who had already
been at odds with the See of Constantinople
against which it was occupied by John Chrysostom, had
later taken a violent part in opposing the doctrines
of Nestorius, which implied that the Divine
nature was not incarnate in Christ, but subservient to
the human nature. The chief opponent of the
doctrine of Nestorius was Eutyches, who, in his zeal to assert the Divine
nature of Christ, went further than the Alex-
drian school and Cyril were prepared to go, by
asserting that, after the Incarnation, Christ had
only one nature—the Divine. Meanwhile, Cyril had died in 444, and Dioscorus, his successor, warmly supported the cause of Ephraim, and built a palace for him near the city of the Egyptian monks. Eutyches was finally declared excommunicated and banished, at the Council of Chalcedon, but he counted among his adherents the majority of the Egyptian Christians, added to the ever-increasing friction between Constantinople and the Alexandrian See, due to the turbulence and fierce independence of the Christians of Egypt, was the peculiar bent of the Egyptian mind, unable to appreciate the subtleties of argument indulged in by the Greeks and Latins. The attempts of the Arians to dethrone Christ from His equality with the Father they could understand, but two natures which were yet one nature—this was beyond their comprehension. Henceforward the cry was 'One Nature,' and it has remained so to this day. Egypt at this time might be described almost as one vast monastery, and the fierce ascetics of the desert stoutly maintained the doctrine of the single nature of Christ. The power of the monastic institutions was now almost paramount, and the authority exercised by such monks as Shenoute and Boul was enormous. The tendency was to unite the systems of Pachomius and Anthony by confining the contemplative or monastic life to the cell on the one hand, and by making the asceticism of the Antonian Eremita, and the network of monasteries was fast extending all over the country.

5. During the 6th century.—The century following the separation of the Egyptian Church from the orthodox at the Council of Chalcedon is remarkable in Alexandria only for the modifying disputes between the Monophysite patriarchs and the orthodox, or Melkite, as they were called because of their separation from the Monophysite influence of Constantinople, and, in the upper country, to the growing power of the monastic system. The land was held largely by the monasteries, whose ruins now are not the least remarkable feature all over Egypt. The cultivation was chiefly in the hands of the monks. It is stated in the Life of Shenoute that his monastery fed the prisoners captured from a raid of the Blemmyes for three months at a cost of 285,000 drachmae, and that the monks could eat their bread daily on the proceeds of the wines and olives. The numerous inscribed ostraca, and the commencement of a vast Coptic literature, consisting chiefly of Lives and Sayings of holy men and monks, show the commercial and literary activity of the monks. They were also in a position to prevent Imperial pressure for the over-exaction of taxes, and in this way maintained to a certain extent the dwindling prosperity of the country, although the minority who were not connected with the monastic institutions were crushed by cruel burdens. But religious life was gradually sinking to a low ebb, and was distinguished by little spirituality. While the Alexandrians were occupied with the opposing factions of Melkites and Monophysites, the monasteries in Upper Egypt were engrossed in petty squabbles between monastery and monastery, or the enumeration of abased miracles wrought by the foremost ascetics. Religious life, like political, was fast losing all dignity and depth.

6. The Persian and the Arab domination.—In the year 616 the break-up of the Imperial power in Egypt began with the occupation of the country by the Persians on behalf of the Suebian king Chosroes of Persia, who was crowned in Egypt. Whether the Copts welcomed their new masters is a matter of some doubt. That they hated the Byzantine domination is certain. Ever since Justinian had given the Melkite Patriarch the military authority of a prefect, in the futile hope of coercing the Monophysites into orthodoxy, the Copts had been harried and oppressed by the Imperial power. The whole nation now looked to their own Patriarch, not so much as the champion of the Monophysite doctrine, but as the leader of the nationalists against the minions of Imperial bigotry and corruption. The wonderful victories of Heraclius, who drove out the Persians and re-conquered Jerusalem and the Holy Sepulchre, were a cause of rejoicing to orthodox and Monophysite alike throughout the Eastern Empire, and it is possible that a wiser statesman than the Emperor might, amid the universal rejoicings of Christendom, have secured some kind of reconciliation. But Heraclius would extend no tolerance to heretics, with the result that a few years later, when a sterner and more formidable enemy was at the gate, the Copts of Egypt were ready to welcome him. In 642, Egypt, now ruled by 'Amr ibn al-Asi, who had conquered it in the name of Islam.

The Arab tradition is that the conquest was aided by the treachery of one called Makkaqis (probably the Byzantine honorific title megasqyris), who is generally supposed to have been the Coptic Patriarch. It must be mentioned, however, that it has been ably argued by the late A. A. Butler in A. A. Butler, Persia and Egypt (1909), that the Copts were intensely hostile to the Arabs, and that the treachery of 'Makkaqis' (Makkanis) at Cyrene, the Melkite Patriarch. It is probable that the Copts, after years of oppression on the part of the orthodox and Imperial party, welcomed a new religious organization, which, as they thought, could not in any case be worse.

From the doctrinal and ethical point of view, the Coptic Church has little history of interest during its long subjection to the rule of Islam. The Arab invasion imposed on it a new submission, and it is probable that from the first many were converted to the faith of Muhammad in order to avoid payment. For the first three centuries or more, it is true, considerable activity is evidenced by Coptic MSS, which were copied during this period by countless MSS, chiefly of a homiletic character, or containing Lives of holy men, although such important historical works as the Chronicles of John of Nikion must not be overlooked. Such an attempt to break away from the Christian workman was either suppressed or forced into the service of his masters. The Copts, as they gradually became a smaller and smaller section of the population, were estranged by the Mohammedan conquest, which was with them, in all probability, not a stimulus but a check to literary progress, as the Copts seem to have been little influenced by the victories of the Crusaders, and, indeed, as Crusaders and Copts looked on each other as heretics, little collaboration was possible. It is interesting to note that the surrender of Constantinople to the Turks seems to have reacted badly on them, and that they were eventually wretched with a state of ignorance; for in the correspondence, so long after that event as 1017, addressed by Cyril, then Coptic Patriarch, to George Alber, archbishop of Canterbury, we...
CORNERS

119

read: 'On account of our sins we are become the most contemptible of all nations; and with the overthrow of the Empire have lost the liberal arts' (Nich. Pseudo-Mark, Hist. of Phil., vii. 15). From the 16th century onwards the Roman Church has made intermittent efforts to convert the Copts to Roman Catholicism, but with little success. They have clung to their own Monophysite doctrine, and to their ritual of St. Mark, with the same tenacity with which they have resisted Islam.

7. The Coptic Church of to-day.—After centuries of oppression and ostracism, the Copts to-day are naturally a people apart. The males having intermarried little with the Arabs, they are supposed to represent more faithfully the old Egyptian type; but this is doubtful. Several of their fine churches, some of them dating from Byzantine times, are still in use, although stripped of the most part of their woodwork and pictures. The liturgy and ritual of St. Mark are in use. The Eucharist is in one kind, only the priests taking the wine; the bread is given to the communicants in wooden spoons, and confession is obligatory before receiving the Eucharist. Women are not allowed into the body of the church, but confined to the narthex. There are five great fasts: (1) the Fast of Nineveh, for three days and three nights before Lent; (2) the Great Fast (Lent), occupying 55 days; (3) the Fast of the Nativity of the Virgin, during the 28 days before Christmas; (4) the Fast of the Apostles, following the Festival of the Ascension; (5) the Fast of the Virgin, for 15 days prior to the Feast of the Assumption. The festivals are those of the Nativity of Our Lord, of the Annunciation, Palm Sunday, Easter (the Great Festival), Ascension, and Whitsunday. Baptism is universal, and, though attempts have been made by the Patriarchs in the past to exclude early converts, they have been baptized till they are 40, and girls till they are 80 days old. Circumcision is general. The hierarchy to-day consists of the Patriarch, 12 bishops, and priests and deacons. The Patriarch is always elected from among the monks of the Monastery of St. Anthony. In recent years the Copts have acquired considerable wealth, and in some districts have become important members of the community. Their willingness to be educated is shown by the fact that they are only 6 per cent. of the population of Egypt, 17 per cent. of the children at school are Copts. This education is enhanced by the schools of the foreign missionaries, which supply teaching at a very high standard. In the Copts there is much change in the clerks and book-keepers—occupations to which their talents are admirably adapted; but attempts to turn them into Protestants or Roman Catholics are of doubtful wisdom. The monastic system is still in force, and some of the ancient monasteries are inhabited by a few monks; but the monks themselves are narrow and ignorant, while in a few cases they have not a very good reputation for an orderly life. With regard to marriage, and more especially death, the Copts have adopted many of the customs of their Muslim neighbours.

This article cannot be closed without some mention of the Coptic Church in the 20th century. The whole of Nuba was Christianized, and for many years the Arabs were opposed by the Christian kingdom which had its centre at Dongola, Alwa, and Sela. But the missionary efforts of the Copts did not stop here, for Christianity was afterwards introduced into Abyssinia during the 16th century. The Copts are also still of importance in the ancient remains of the north-west part of Africa, such as the ruins of the church of St. Agnes at the base of the cataract, of which a description is given from a translation of an inscription of Naba-namid made by Oppert when the science of Assyriology was young. We now

tribes, or by the Muslims, until they were finally exterminated by the powerful Fraternity of negro slaves in the 14th century. Abyssinia, however, remained Christian and Monophysite, and its Metropolitan is still a Coptic bishop appointed by the Patriarch of Alexandria.

P. B. G. SCOTT-MONCRIF.

CORN, CORN-SPIRIT.—See HARVEST.

CORNERS.—Among the Semitic peoples, as among others also, an especial sacredness or significance was supposed to pertain to the corners of structures, fields, and other objects. The evidence for this conception can be most widely traced among the Semitic peoples in connection with buildings.

1. Bab.-Assyrian.—Among the Babylonians and Assyrians it took the form of making a deposit of inscriptions and images under the corner or corners of a temple, palace, or other building. The inscriptions were, in the Assyrian and Neo-Babylonian periods, usually in the form of hexagonal, octagonal, or decagonal cylinders, or cylinders in the form of barrels. Such deposits, placed under the corners or built into the building itself, were discovered at Nimrud, Botta and Oppert at Khor-Khabur, and Rassam at Koyunjik. The great cylinder of Ashurbanipal was found at the corner of a room, and not at the corner of an entrance, which was the chronicler's way of saying that these kings were prepared and deposited in little receptacles of masonry at the corners of walls. At Tellah, de Sarzec found similar receptacles which contained bronze statuettes of human figures, both male and female, and of animals. The making of these deposits was probably, as in Egypt, accomplished by sacrifice.

Thou Sargon of Assyria (722-705 B.C.) says (Cylinder Inscription, I. 60): 'To the brick-god, the lord of Hebat, the architect, Bel, I offered a sacrificial lamb, I poured a libation, I raised the lifting up of lands.' In emphasizing the importance of this custom, Perrot and Chipiez are led to suppose that in the 20th century the whole of Nuba was Christianized, and for many years the Arabs were opposed by the Christian kingdom which had its centre at Dongola, Alwa, and Sela. But the missionary efforts of the Copts did not stop here, for Christianity was afterwards introduced into Abyssinia during the 16th century. The Copts are also still of importance in the ancient remains of the north-west part of Africa, such as the ruins of the church of St. Agnes at the base of the cataract, of which a description is given from a translation of an inscription of Naba-namid made by Oppert when the science of Assyriology was young. We now

2. Egyptian.—In Egypt, foundation deposits have been found at several places. One made by Thothmes IV. of the XVIIIth dynasty is reported from Memphis; another set was found at each of the corners of a temple at Memphis built by Aahmes II. of the XXVIth dynasty; another, under a XXVIth dynasty building at Denderah founded by Psametik I.; a complete set belonging to a building of Hophrah, at Avaris; and another deposit at a temple of Ptolomeus II. at Thebes. Foundation deposits showed that a temple built by Queen Tausert of the XIXth dynasty once stood on a spot south of the Ramesseum, although the temple itself has not been identified. 1 At Abydos, foundation deposits, or the receptacles for them, were found from Thothmes III. and Amenophis III. of the XVIIIth dynasty, 2 Sesosiris III. of the XXIst dynasty, 3 and Pepi of the Vth dynasty. 4 At Koptos, a box (though robbed of its contents) was found under a threshold; 5 at Kahun, a receptacle (still full) under the middle of a building of Sesosiris II. of the XIth dynasty; 6 and, at Heliopolis, deposits from the temple of the last-mentioned monarch. 7 At Gizeh no such deposits were found under the temples belonging to the IVth dynasty. 8 These deposits in Egypt consisted of plaques of copper or stone on which the name of the builder was inscribed, together with models of the tools and materials which were used in the construction. At Denderah, however, the bones of birds and animals offered in sacrifice were also found, together with the ashes of offerings which had once been consumed. These showed that the sacrifice was the important feature connected with the deposits, and that the other objects were incidental to it. A similar deposit has recently been found under the corner of the temple of a modern chieftain of the time of the XVIIIth dynasty in Egyptianized Nubia. This differed, however, from the Egyptian deposits in that it consisted of ten mud-sealings. These represent a conqueror wearing the Nubian crown seated on a throne, with the long hair captive by a cord. On a level with the chief's shoulder is the figure of an animal like a dog. 9

3. Canaanite.—The evidence for the sacredness of corners and for foundation sacrifices in ancient Palestine is bound up with the Canaanite nature. Gezer the skeleton of a woman was found built into the wall of a house at the corner. 10 More numerous, however, were the skeletons of children found under the corners, children having been used for such sacrifices whenever adults were not available. The sacrifices at Gezer, like the Egyptian deposits, were not always placed at the corners. The skeleton of a man, and sometimes those of children, were found buried under the middle of a house or a room, or the ashes of these were found, showing that the food for the victims was also buried, as sometimes were lamps. Later, the sacrifices themselves were omitted, but the bowl and lamp were still used as foundation deposits. 11 At Megiddo and Taanach, 12 Petrie, Nebeshek (Am) and Denderah (Taphataris), London, 1888, p. 14.

4. Hebrew.—From the sacred nature and importance of corner-stones, which in the earlier time led to certain ceremonies as have been described, certain literary uses have survived in the Old Testament. Thus Jer 51 20 and Job 38 8 use 'corner' and 'corner-stones' as synonyms for 'foundations.' In Jgs 20 19 and 18 19 'corners' is used figuratively for 'corners,' and Job 18 'corner-stone' is apparently a synonym for 'ruin.' In Is 28 25 it occurs in an enigmatic passage, where, whether the 'corner-stone' is a figure for a king or a kingdom, or for trust in Jahweh or the relation of Jahweh to His people, the result is right-ousness. Such figurative uses of 'corner' led in two late passages to the thought that it was the crowning stone of a corner, not the foundation stone, which was important (see Ps 118 22, Zec 4).

In Zec 9 11 the 'corners of the altar' are mentioned as being 'filled.' These were projections which were sometimes called 'horns' (see ALTAR [Somite], § 17). Possibly, like the corners of buildings, the corners of the altar were thought to be specially holy. The sacredness which attached to corners was applied by the Hebrews to the hair. Lv 19 27 reads, 'Ye shall not round the corners of your heads, neither shalt thou mar the corners of thy beard.' 13 As usual these phrases were figuratively used, together with other symbols, in connection with sacrifices. They were regarded by the Semites as sacred to Jahweh (see W. R. Smith, pp. 323-381), possibly the corners were all considered to be sacred to Him. One might infer from the statement of Herodotus (iii 8) about the hair of the Agathocles that he sacrificed the 'corners' of their hair to their god. Whatever the motive of the Levitical regulation,—whether to differentiate their custom from that of the heathen Arabs, or simply to keep locks sacred to Jahweh, the grain which grew in it must be left, that the poor might come and gather it. This regulation was generally observed in OT times, as the Book of Ruth shows. Since the law was indefinite, however, just what this law demanded of a farmer became a matter of debate when the oral law developed. The results of these discussions were afterwards embodied in the Mishnic tract Perah, or 'Corner.' Perhaps because the Rab. Jews were nearly all engaged in commerce, this tract is copied in the Rab. Talmud without additions. But in Palestine, where the Jews were still agriculturists, the law of the 'corner' was still vital and developing, so that the Jerusalem Talmud contains a Gemara upon the Mishnic tract.

The first problem to which the Rabbis addressed themselves was how much the owner of a field must leave for the poor in order to satisfy the law. It was agreed that a just man would leave one-fourth. 14

sixtieth of the field as a 'corner,' though the amount might vary with the size of the field, the number of the poor, and the richness of the yield. If a man left one stand standing, he could not be held to have missed a considerable tree, but did not define the size of a corner. Secundum all possible questions were raised and decided by the Rabii. For example, they decided that a man fulfilled the law if he left the proper amount in the standing line due to the yield; that it applied to leguminous plants as well as to grain; that it applied to the following trees: tanners' sumac, the carob tree, nut trees, almond trees, vineyards, pomegranates, olive trees, and the date palm. They had to decide when the 'corner' should be estimated before the tithes were paid, and when after; when two men shared a field, whether they must both leave a 'corner'; if a man's kinds of grain in his field, whether he must leave a corner for each; if a man, left a 'corner' for the poor and they did not take it, how long he must wait before he could take it himself; whether, if something more than what was necessary were left in the standing line, the owner could return for it, or whether it must be counted as a 'corner'; whether a rich man, who, when on a journey, had been compelled to avail himself of peltch', was obliged to restore it; and many other points such as arose in administer the law.

CORRUPTION AND BRIBRY.—1. Ancient Rome.—For first-hand information on bribery in ancient Rome we naturally turn to the speeches of Cicero, pro Cn. Plancio and pro I. Marcellus. As we study these, we feel inclined to subscribe to the dictum of Montesquieu upon the condition of Rome and her provinces under the Republic: 'La liberté était égale et ce centre, et la monarchie aux extrémités.' The provinces were the farm of the Roman people, and the provincials were the live stock to be fleeced by the governor. Whether a Cecilius or a Cornelius obtained a province, it is as clear that the main aim of the provincial governor during the year of his provincial life, was to acquire enough money to purchase that supreme object of his ambition—the consulship. In order to ingratiate himself with the people, he therefore supplied the citizens of Rome with large quantities of corn below cost price, the deficiency being made up by the province. When the rivalry for the consulship grew acute, it became usual for a candidate, anxious to secure his election, to give the people a munus, or 'treas,' in the way of a gladitorial show. A munus, it may be remarked, sometimes cost the candidate a matter of seven thousand pounds. All this expense came out of the amount accumulated during the year of provincial life, and an analogously large sum had to be provided to bribe the jury who should try the successful candidate for bribing the tribes. This indirect bribery of the people dated from the beginning of the 6th cent. of Rome.

In 159 B.C. the lex Cornelii punished with exile those found guilty of bribing the electors with money; it is, therefore, evident that the direct purchase of the votes of the electors must have existed a considerable time before the passage of that law. Indeed, as early as the year 432 B.C., we meet with the first law against ambitus, forbidding persons to add white to their dress to signify that they were candidates. 'Ne eum a tumur,' and Livy informs us (IV. xxv. 19), 'that the investiture of the scutum ligerum. This measure reminds us of the (English) Corrupt Practices Act of 1854, prohibiting the giving of cockades to voters. The lex Peota (335 B.c.) forbade candidates to carry on their cause anywhere save in the Forum and Campus Martius, 'De ambitu,' writes Livy (vii. xii. 12), 'ab C. Postelo tribuno popis auctoribas patribus tum primum ad populum latum est; etque ragottones novorum maximo et magni aigis abula obire soliti crani, compressam credolant.' The laws against ambitus increased in number, but decreased in value. In 181 B.C. the lex Cornelii de abolitionibus was passed (L. xii. xii. 11). Attempts were made to remedy the corrupt practices of the day by the lex Gabinius, or Ballot Act (159 B.C.), and the lex Maria. In the former it was enacted that in elections voting should be by ballot, i.e. by writing the name of the candidate on a ticket or tablet (tabella). By the latter, C. Marius, in his second consulate (104 B.C.), established the pontes, or narrow passages to the voting-booths, by which he designed the protection of the voters against the evil influence of the adulate electioneering agents. Regular agents (interpreters) employed to arrange the bargain with the elector, and the money promised (promentum) by the parties, who held it until the elections were over. Cicero, in the de Lege Agraria (ii. 4), terms the lex Gabinius a law whereby 'Liberty can assert herself without a word'; but in practice the voice of Liberty was as much stifled then as it was afterwards in the case of the English boroughs. In Rome, as in England, the electors appear to have habitually adhered to their contracts.

By the lex Elia Calpurnia (67 B.C.), a heavy fine was imposed on the candidate who should use bribery, whether successful or not; and this law deprived him for a year of the right of holding an office or sitting in the Senate, in this respect surpassing in stringency even the Corrupt Practices Prevention Act, under which the disability to sit in the House of Commons or to vote at an election to Parliament lasts only seven years. This just law contains a provision which grates somewhat harshly on our ears. If a person convicted of bribery secured the conviction of another on the same charge, in the eyes of the law his guilt was wiped out. In the lex Calpurnia, we have inflicted a fine on dinumores and other agents, thus recognizing a principle which was long ignored in English legislation. The law in question was repeated, with additional rigour as to its penal clauses, in the lex Fulia de ambitu, which was passed in Cicero's consulate (63 B.C.). The purport of this measure is given in the Scholia Babriacca (p. 309) and in Dio Cassius (xxvii. 29), as well as by Cicero himself in several passages of the speeches pro Marcellus (47, 89), pro Roscianus, and others (pro Sest. 133; Interv. in Vat. 57; pro Planc. 53). In his desire for reform, Cicero was supported by all true patriots, amongst others by Servius Sulpicius, who wished for some change of the laws.
relating to elections under certain conditions, viz.,
to establish confusion suffragiorum, or 'mass voting,'
as a means of preventing bribery, whenever a fresh
election was in the offing, of an election magistrate
having been convicted of ambitus. We also begin
to hear of indices editelii to try cases of
bribery. The Senate, on Cicero's motion, declared
by a senatus-consultum the provisions of the lex
Ella Calpurnia applicable to any candidate who
should keep about him hired followers, or who
should entertain the people with gladiatorial shows
—except under the peculiar circumstances of its
being required by a testamentary disposition—or
refurbishments of any kind, or even perhaps the
earliest law against 'treating' of which we find
record. In the provinces the lex
Coloniae Genevitc likewise forbade treating at
municipal elections. By it—and the provisions
sound wonderfully modern—no candidate is to
give, or cause to be given, dinners: he is not to
have more than nine any day at dinner; nor is he
to give, or cause to be given, bribes or gifts; nor
is any one else to give dinners or bribes for him.
The penalty for the violation of this statute is five
thousand sesterces. The lex Tullia of Cicero's
consulate confirmed the provisions of the lex Ella
Calpurnia, punished corrupt candidates with ten
years' exile, and inflicted severe penalties on cor-
rupting voters. The practice of exhibiting
gladiatorial shows or public amusements
within two years of the commencement of his
candidature.
If efficiently enforced, the lex Tullia should have
stopped bribery at Rome; but it never did. Rods
shows how little effect this law exercised in putting
an end to corruption. The price of the consulate
showed no tendency to fall. The quotations for
the year 34 B.C. show the enormous figure of ten
million obols, precluding the slightest chance of
the first voting division alone. A few facts about
some of the chief men speak eloquently as to the
spread of bribery. In the year 62 B.C., Caesar owed
nearly £250,000 sterling. When twenty-four years
of age, Marcus Antonius owed £50,000; fourteen
years later his liability was no less than £200,000.
Cicero (Ep, ad Att, iv. xv. 7) writes to Atticus:
'Bribery is at boiling point. Ecco siguum! On
15th July interest on money rose from 4 to 8 per
cent. The law only exacted so much to demand
for the electors that the rate of interest doubled.
The Senate felt impelled to take action, and
in 61 B.C. two noteworthy decrees were passed.
By one it was rendered unlawful to search the houses
of magistrates suspected of having money deposited
with them to be used for corrupt purposes (ib. i. xvi. 13).
By the other it was enacted that any
magistrate in whose house bribing agents should
be harboured should be held guilty of a State
offence. When Cicero (pro Planc. speaks of a
sum of money hidden in the Flaminian circus, and
seized by the authorities, he clearly implies that
the concealers thereof meant the voters to find it.
This ancient plan has been imitated in modern times.
For instance, in 1863 each freeman in the
city of Dublin received his £5 note from a hole in the wall. At Shaftesbury, in 1774,
an Independent of the town, disguised as Punch, passed through a
dozen house in twenty-four hours to each voter, for which each
was obliged to sign a bill payable to a fictitious Glenmackey,
in order to rescind the libel.
The two decrees of 61 B.C. were as ill obeyed as
their predecessors. In the year 59 B.C. was carried
the lex Licinia de Sodaliis, which forbade the
corruption of the tribes by means of the illegal
organization of clubs. This law brings before us the
widespread practice of 'tripod' elections, and at times the border line between the two was
thin. For example, it was right and proper to
give treats or public shows to the voters in their
tribes (tributina), but it was illegitimate if given to
the people en masse (enjoy). It was right and
proper to employ libertinæ in the conduct of the
election, while it was wrong and improper to use
votatio (pro Planc. 44-47, also 37, 59). Unsuccessful candidates
should look to their sodales, or 'brother-
hoods,' for assistance at the time of election; but,
if they employed the sodales to mark off the tribe
into small companies (decuriae), such to be brought
by the wiles of one of the brotherhood to he bar
a particular candidate, then the Lexician law
pronounced this candidate guilty of using undue
influence (on the modus operandi, cf. pro Planc.
44-47, also 37, 59). Unsuccessful candidates
should be punished, but only such ones could be tried under the provisions of the Act of Sodaliis.
In 82 B.C., Pompeius intro-
duced a measure against bribery, intimidation, and
illegal influence, which applied to offences
committed so far back as 30 years before his
third consulship. That the offenders were many is
evident from the letters of Cicero. In Fam., vii.
4, he writes: 'I am kept incessantly at work
by the number of trials under the new Act.' The
reference retrospectively gives the impression and in the issue hastened the fall of the Republic.
Julius Caesar perceived the hopelessness of attempting
to suppress corruption by statute, and he
efforted to minimize its effects by reserving to
himself the right of examining the exhibits
of the Empire the all-important power of the Prin-
ors; left no room for ambitio, save in the restricted
sphere of election to municipal office. The attention
of Augustus was directed not against electoral
corruption, which was a much greater
problem. Cicero's reference to this is well known. Cicero
had been acquainted on the charge of violating
the rites of the Bona Dea, when Cicero gave evidence
against the aliibii which he set up. 'The jury,
accused Cicero, 'had given you credit for all or
your oath.' 'Yes,' retorted Cicero, 'twenty-five-out
of the fifty-six did; the remaining thirty-one refused
you credit, for they took the bribes in advance.'
When we bear in mind the scanty amount of
legislation in early times, it is obvious that stra-
nour efforts—at least on paper—were made to put
down corruption. In practice, however, little was
done, and we feel inclined to think that many of these
laws savoured of the pious resolutions often
passed at popular meetings. Those who passed
like the resolutions, looked well. An enlightened
electorate like the Roman may have a vague sense
of public duty which we may call Imperialism.
Unless moved by this spirit, or unless highly
organized by the party system, it is almost in-
visible that bribes will be employed with such
voters. The Roman lacked this sense of Impe-
rialism, and he certainly lacked the party spirit.
'Party phrases,' writes Mommsen (iii. 300), 'were in free
circulation; of the parties themselves there was little trace in
matters really and directly practical. Throughout the whole
seventh century the annual public elections to the civil magis-
tracies, especially to the consulship and censorship, formed the
real standing question of the day, and the focus of political
agitation; but the elections were only in isolated senses the
different candidates represented opposite political
principles; ordinarily the question related purely to persons, and
it was the course of affairs a matter of indifference whether
the majority of votes fell to a Cicero or to a Cornelian. The
Romans thus lacked that which outweighs and compensates all
the evils of party, viz., the true and popular spirit. A citizen
voted towards what he discerned as a bolting aim—and yet
endured all that was done solely for the benefit of the policy
game of the rating parties.'
2. Ancient Greece.—Greek history discloses a
purer state of affairs than Roman, and this is due,
inter alia, to the fact that Imperialism and party
spirit prevailed in Greece. The ancient Greeks
knew that he could reckon on the spirit of Impe-
rialism when he reminded his soldiers, in dire
strains in the harbour of Syracus, of τὸ μεγά
νῦμα τὸν 'Αθηναίον. The democracy of Athens possessed
a political education superior to the Roman, and her citizens developed a sense of duty to the City of the Violet Crown, not possessed to the same extent by him who owed allegiance to the City of the Seven Hills. When no longer moved by these better feelings, party spirit (παρθενία) exercised much influence. The democracy, in its loyalty to party when he punished the citizen who, on the outbreak of any sedition or attempt at revolution, should stand aloof and take part with neither side—an enactment that we find in some Constitutions, as in the Athenian (vii. 10) or records the terms of an oligarchical oath taken on assuming office. 'And I will be malignant,' it runs, 'against the people, and I will devise against them whatever evil I can.' In order to meet with a parallel to this oath, we must refer to the notorious remark of President Andrew Jackson when he proclaimed the doctrine, 'To the victors belong the spoils.'

The dependence of office on lot, the mode of electing the officers in Laconia (Pol. ii. 26), rendered electoral corruption impossible in Greece. One fact is highly significant. The word δεξαμενα, the only Greek word for 'to bribe,' is a very rare verb; indeed, and its use is for taverns with jurors rather than with electors. Aristotle does not recognize electoral corruption at all, unless such be his meaning when he says that in Carthage the most important offices, including even the throne of the command of the forces, were ' purchasable' (δεξαμενα, Pol. ii. xi. 10), adding from the outspoken reflection, 'It is natural that a man should make money of his office if he has to pay for it.' Perhaps his meaning is that it may have been possible to procure high office in Carthage, just as it was possible, till our own day, to purchase commissaries in the British army or judicial positions in France. If his meaning is that office was accessible only by bribery,—and this seems to be the view of Pol. ii. 4,—then in this respect Carthage, in the opinion of Aristotle, was unique in the ancient world.

The payment of persons invested with public functions to induce them to use them unjustly, and of jurors to put aside the evidence against criminals, were, however, grave forms of corruption.

The quarrels of Demosthenes and Aeschines show how untrustworthy the public functionaries became, and the history of Sparta illustrates the same matter (Hdt. v. 87, 88). Paulus, for example, when attained of treason, returned to Sparta in the certainty that he could buy off his punishment (Hdt. i. 139). Ladies of the highest station, Astycolus, Chonidas, and Cygippe all took bribes. Thucydides tells us (vii. 45) that the triarchs and generals of the Laconid and allied State—all save Hermocrates—took money from Thermophrates to betray the interests of their country. Thucydides (Herod. viii. 5) took and administered bribes; but it was to save, not to betray, his country. Aristotle evidently thought that the ephemoral in Sparta was corrupt. 'The 'ephemers,' he remarks, 'are chosen from the whole body of the people, so the office often falls into the hands of very unscrupulous men, who accordingly have shown themselves corrupt' (Pol. ii. 19). As he joined with Plutarch in supposing that the correspondence between patron and client, we may infer that Sparta was more corrupt than the majority of the Greek States.

One remark of Aristotle shows clearly how little electoral corruption prevailed in Greece. He condemns canvassing; he condemns even the candidate's application for office. 'The man,' he informs us, 'who is fit for the place should have it, whether he wants it or not' (No one would apply for office if he were not ambitious). In our native soils, the most common motives to crime (Pol. ii. 19). With regard to corruption, Aristotle was plainly afraid of the embrazing of public monies, and the dishonest discharge of public functions. To use the words of a prosopis (v. viii. 19) that transfers of public money should be made in the presence of all the citizens, and that duplicitis of the accounts should be deposited with certain bodies; and, to contrast the latter, that there should be 'certain distinctions ordained by law for those who have a good name for probity.' In England and other countries the latter provision is customarily observed. Aristotle holds that public officials should be absolved from the necessity of supporting themselves while serving the State. They must have leisure to govern. But at the present time, he writes (Pol. iii. vi. 10), 'for the sake of the profit to be made out of the public purse and official position, men want to be always in office. They hunt after places with such eagerness that one might imagine they were invalids to whom health was impossible except when in office.' These official salaries, however, must not be so great as to excite envy.

A mere competence was not the goal of that 'ambition' which Aristotle regarded with such alarm.

3. The East.—In the West we are accustomed to speak of the dangers of democracy; but in this, as in so many other particulars, no such language prevails in the East. In India,—till lately, at least,—the people are not to be feared. 'Blessed are the poor and needy' is the familiar account of Holy Writ. St. James, however, stands in some dread of the influence of the latter and somewhat in the East (2. 5). In the East the masses are never the objects of attempts at corruption, but the classes are; whereas in the West the exact reverse holds good. The corruption in the East assumes the terrible form of being directed to the masses. When aged Samuel, when he invites the closest examination of his conduct, exclaims, 'Whose ox have I taken? or whose ass am I have taken? or whom have I defrauded? whom have I oppressed? or of whose hand have I received any gain under oath thereof?' (I S. 12). Amos, in his denunciation of the rule of Jeroboam II., exclaims, 'They afflict the just, they take a bribe, and they turn aside the poor in the gate from their right' (Am 5:10).

In the OT the acceptance of a bribe is expressly forbidden (Ex 23:6-8, Dt 16:9), and one of the grievous woes of Isaiah is launched at them which justify the wicked for reward, and take away the righteousness of the righteons from him' (Is 5:8; cf. Job 13:20, Am 2:9). While he gives the consent of the passions that shaketh his hands from handling of bribes . . . shall dwell on high (Is 33:26).

Accordingly, Jehoshaphat forbade his judges to accept bribes (2 Ch 19; cf. Ex 18), though it is only too obvious that the Hebrews were not means unfamiliar with corruption (Is 1:29, Exk 22:23, Mic 7:15, Mt 25:23, among the cases being the betrayal of our Lord by Judas. Talmudic Judaism was very severe on bribery, though it seems to have been permissible, before the time when the judge received a regular salary, for him to accept an equal amount from each of two litigant before trying a case (JE ii. 379-381).

Zoroastrianism, with its intense horror of falsehood, was naturally hostile to bribery, though no specific mention of corruption occurs in the extant Avesta texts. According to the late Pahlavi vision of Artio-Virdah (cf. lxxxix., ed. Haug and West, Bombay, 1872, p. 140), the soul of the bribe-taker suffered horrible torture in the world to come. Both in China and in Japan the corrupt judge is severely punished; and it may here be noted that in ancient America, among the Aztecs, such a judge endured the death penalty in grave cases of bribery, while for lighter forms of venality he was degraded from office, with the additional customarily of having his head shorn (Post, Grundrisse der ethnolog. Altertumskunde, Oldenburg, 1854-55, ii. 228). In the East it is always the people who bribe, it is always the officials who are bribed; and in India
the difference between East and West is conspicuous. It is perfectly true that the Hindoo law-books rank bribery in the class of 'open thefts,' and that the crime was punishable by fine, confiscation of property, banishment, loss of the case, etc. (Jolly, Roman Law, p. 125, 142) 1; but in spite of this, the native Indian under British rule is greatly puzzled by the apparent purity of the English officials. That they are really incorruptible he cannot believe. He looks on incorruptibility as Chinese, and questions the existence of that virtue. He knows he could not dare to offer a bribe to the 'Burra Sahib' directly. It must, he thinks, be conveyed through successive grades of native servants who entered the Court, and it will surely—after all, an Englishman is not different from other mortals—be accepted, if offered with sufficient discretion. No experience can teach him that pure administration of justice is an existing fact, or anything else but a means subtly devised for making small bribes ineffective.

A native became an Indian Civil Servant, and, as such, accepted presents. His principle in so doing was that of Francis Bacon: 'It is a matter on the merits of the case. If the plaintiff won, he kept his gift and returned that of the defendant, and the hard thing is that the Indians understood and admired the attitude of this judge, while that of his British colleague was incomprehensible to the native mind.

Thus regarded as a native and a judge, his virtue is clearly shown in a memoir of the Hon. Onocool Chunder Mookerjee, who tells that in the course of a discussion in the High Court, 'Such was the integrity of this remarkable man,' writes his nephew, 'that, having taken a brief from one party in a case and read it, immediately refused to listen to the other side.'

4. Great Britain and Ireland.—We turn from the East to the West, and we find the whole situation changed. With us the tendency is to corrupt the people in many insidious ways. In Stuart days the members of Parliament were not corrupted because they were not easily amenable to public opinion. It was then thought necessary to lubricate the wheels of political machinery with golden oil; but, as the people gained more control, this bribery of their representatives slowly passed away. Tampering with judge and jury was once common in England.

A statute of the reign of Henry vi., in the year 1394, recites that 'in regard to being appointed to certain public and judicial offices, the persons appointed with the consent of the Commons and the Lords, and with the approbation of the King, are more or less corrupted than others. The London judges and the London juries were purchased by having money papers fastened to their heads, setting forth how they had been bribed. A letter from a bishop of London to Cardinal Wolsey, given by Grafion in his Chronicles, says that a London jury would find Abol guilty of perjury. As a form of bribing, in his 'On the Civil Tribals,' it maintains that 'the proceedings against persons accused of State offices in the early parts of our history do not deserve the name of trial; they were a mockery of justice.'

The impecuniousness of Bacon made possible the long line of incorruptible judges and immaculate jurists that justly forms the glory of our police. Yet, in the days of the early. 19th century, 588 cases were treated near all for political jobbery (May, Constitutional History of England, i. 292). Bad matters were prevailing in England, in Ireland they were a great deal worse.

'Twas long,' wrote Lord Cornwellis, Lord-Lieutenant of Ireland, to the Duke of Portland on 12th Dec. 1708, 'to kick those whom my public duty obliged me to court. My occupation is to negotiate, and I have not been much corrupted. I am under heaven's displeasure and hate myself ever for engaging in such dirty work, and am supported only by the reflection that without a moisture in the one hand, there are no opportunities in the other.'

Corruption in England, as in Rome, assumes the shape of bribery of the electorate. This reached its widest development in the days of George iii. Writer on the North, Richard Tilly is said, 'If the Duke of Northumberland requires some gold pills for the election, it would be wrong not to satisfy him.' Aristotle laid down that man was a political animal, but the evidence of election petitions goes to prove that man is an avaricious animal. If Rome gave her citizens bread and circuses, England was no whit less lavish to her electors. Charles ii. held that every man had his price, and this maxim holds of electioneering almost as true as to agree with him. If the struggle for the consulate in the 700th year of the Roman Republic produced an offer of nearly $100,000 for the vote of prerogatives, it is humiliating to reflect that this struggle over a hundred years ago, in 19, when Wilberforce contested Yorkshire against Lord Milton and the Hon. Henry Lascelles, the total expenses of the candidates exceeded a quarter of a million. In the same year, at Wetherby, the price of a single vote rose from twenty guineas to forty-five. From the will of Lord Vernon, L5000 seems to have been the recognized sum paid in 1812 for a seat in Parliament.

At so recent a date as the General Election of 1874, corruption was on such a large scale. The moment the trumpet is sounded for a General Election, deposition a witness before a Norwich Election Commission, 'there seems to spring from the ground, as it were, a host of employment-seekers.' This form of bribing of voters by offering good wages for the discharge of nominal functions during the period of election, is now the sublimest form of bribery, except perhaps the bribery which takes the form of munificence. Yet, within a few days, perhaps, a son of the days are gone when the beautiful Duchess of Devonshire could buy a butcher's vote with a kiss, when the gentle Dick Steele could win over the women with an apple—stuffed with guineas—as a prize for the ballot for the borough of Westminster.

5. America.—In the far Western world, our cousins do not seem to have got rid of corruption. Parts of the United States are no better than the small boroughs of Southern England. The case is strengthened before the Corrupt Practices Act of 1883. Venality occurs, according to J. Bryce (American Commonwealth, ii. 238), chiefly in connexion with private legislation. Foreign missions and consulates, department bureaus, custom-houses, revenue offices, army and navy contracts, postmasters and agencies, and places of all sorts are the spoils of the victors. The essence of the United States system is that paid officials are given and taken away for a price. A letter from a bishop of London to Cardinal Wolsey, given by Grafion in his Chronicles, says that a London jury would find Abol guilty of perjury. As a form of bribing, in his 'On the Civil Tribals,' it maintains that 'the proceedings against persons accused of State offices in the early parts of our history do not deserve the name of trial; they were a mockery of justice.'

The impecuniousness of Bacon made possible the long line of incorruptible judges and immaculate jurists that justly forms the glory of our police. Yet, in the days of the early. 19th century, 588 cases were treated near all for political jobbery (May, Constitutional History of England, i. 292). Bad matters were prevailing in England, in Ireland they were a great deal worse.

'Twas long,' wrote Lord Cornwellis, Lord-Lieutenant of Ireland, to the Duke of Portland on 12th Dec. 1708, 'to kick those whom my public duty obliged me to court. My occupation is to negotiate, and I have not been much corrupted. I am under heaven's displeasure and hate myself ever for engaging in such dirty work, and am supported only by the reflection that without a moisture in the one hand, there are no opportunities in the other.'

Corruption in England, as in Rome, assumes the shape of bribery of the electorate. This reached its widest development in the days of George iii. Writer on the North, Richard Tilly is said, 'If the Duke of Northumberland requires some gold pills for the election, it would be wrong not to satisfy him.' Aristotle laid down that man was a political animal, but the evidence of election petitions goes to prove that man is an avaricious animal. If Rome gave her citizens bread and circuses, England was no whit less lavish to her electors. Charles ii. held that every man had his price, and this maxim holds of electioneering almost as true as to agree with him. If the struggle for the consulate in the 700th year of the Roman Republic produced an offer of nearly $100,000 for the vote of prerogatives, it is humiliating to reflect that this struggle over a hundred years ago, in 19, when Wilberforce contested Yorkshire against Lord Milton and the Hon. Henry Lascelles, the total expenses of the candidates exceeded a quarter of a million. In the same year, at Wetherby, the price of a single vote rose from twenty guineas to forty-five. From the will of Lord Vernon, L5000 seems to have been the recognized sum paid in 1812 for a seat in Parliament. At so recent a date as the General Election of 1874, corruption was on such a large scale. The moment the trumpet is sounded for a General Election, deposition a witness before a Norwich Election Commission, 'there seems to spring from the ground, as it were, a host of employment-seekers.' This form of bribing of voters by offering good wages for the discharge of nominal functions during the period of election, is now the sublimest form of bribery, except perhaps the bribery which takes the form of munificence. Yet, within a few days, perhaps, a son of the days are gone when the beautiful Duchess of Devonshire could buy a butcher's vote with a kiss, when the gentle Dick Steele could win over the women with an apple—stuffed with guineas—as a prize for the ballot for the borough of Westminster.

The effects of Andrew Jackson's famous doctrine of 'To the victors belong the spoils' can perhaps be seen in the operations of the Tammany Ring in New York City. The cost of erecting and furnishing the County Court House at New York in 1828 at $250,000, but before the end of 1837 about $13,000,000 had been expended upon it, and it was still unfinished. The items of $294,347 for 'Lawyering the Court,' $720,000 the way the money had disappeared. The total price which the city paid for the privilege of being ruled by Tammany from the beginning of 1806 to Sept. 1857—that is, thirty-two months—amounted to no less a sum than $87,000,000.
6. France.—France believes as thoroughly as America in the creed of Andrew Jackson. As in France, direct tampering with the electorate hardly exists. The Wilson scandals showed that political corruption was wide-spread in the Republic. The public and private bribery of the supporters of the Second Empire left many evil traces behind it. The embellishment of the capitol fostered a spirit of jollity, infecting all the departments of the State. The most dreadful of all the scandals was the Panama affair. The thefts of Panama and the subscriptions left standing for the piercing of the Isthmus of Panama, undertaken by M. de Lesseps. In 1892 it was known that most of the money had disappeared, and at the trial it was clear that corruption accounted for the disappearance. Floey, avowed that, when Prime Minister, he had laid hands upon £12,000 of the Panama funds, and had utilized it in combating the enemies of the Government on questions unconnected with the Canal (Bolley, France, p. 508). He based his defence on the perilous doctrine that, under normal circumstances, it was the right and the duty of the Ministry to supervise the distribution of such subsidies so as to prevent them from being used to the prejudice of the Government (Chamberlain, England, p. 189). In 1892 (23 December). This principle has been followed by ministers both before and since the days of Floey. The party system is probably the strongest purifying agent in Parliamentary government, so that, even in America, Rome, so in France. In neither country did the party system exist, and consequently, in both, corruption prevailed. No doubt, the general working of the Parliamentary system assists the operation of corrupt practice in France, by showing that the absence of government by parties means the presence of bribery. The great motive power, concludes Bolley (p. 515), "to keep wavering members on the path of parliamentary integrity is the party system, and this is wanting in France." Indirect tampering with the electorate can always be observed. There is a bridge to be built, or a lyric to be instituted, especially in the case of a reform which shows itself faithful to the Government. Here we must meet with the kind of corruption we are certain to encounter in the future. 'Perhaps we are at liberty to forget,' wrote Sir Henry Maine in his Popular Government (p. 146), 'that there are two kinds of bribery. It can be carried on by promising or giving to expectant parties funds paid out of the taxes, or it may consist in the direct process of legislating away the property of one class and transferring it to another. This last is likely to be the corruption of these latter days.'

Corruption used to appeal to individuals; now it appeals to classes. The farmer is bribed with an anticipation of prairie rent, and the artisan is bribed by the prospect of protective legislation; The future alone can disclose whether the old form or the new form of corruption is the more dangerous.

COSMOLOGY AND COSMOLOGY.

Introductory (L. H. Gray), p. 125.
Babylonian (A. H. Sayce), p. 128.
Buddhist (L. De La VALLÈE Poussin), p. 129.
Celtic (G. F. W. Maisey), p. 130.
Egyptian (W. F. Middendorp), p. 144.
Greek (L. F. Burns), p. 145.

COSMOLOGY AND COSMOLOGY (Introductory).—By cosmology is meant the theory of the origin of the universe. The existence of a developed cosmology seems to be characteristic of a somewhat advanced degree of thought. Among the Australians, for example, such careful observers as Spencer, Gillen, and Howitt record no cosmological myths, and the aboriginal Australian and Indian tribes have but scanty legends of this type. On the other hand, the Polynesians and North American Indian stocks have cosmogogies of considerable elaboration. The reason for this deficiency in certain parts of the world evidently lies in the amount of abstract thought required for the development of a cosmology; for, though the existence of living beings, especially those of human kind, presents a creation problem which even primitive man endeavours to solve in many ways long before attempting to account for the beginning of the universe, these solutions do not come, strictly speaking, within the scope of cosmology, but rather within that of creation (q.v.). Yet it must be remembered that at least the rudiments of cosmogonic ideas may exist among tribes which are not now known to entertain them. A further element of difficulty is introduced into the study of primitive cosmogonies by the unconscious absorption of foreign elements derived from Christian missionaries, just as is the case with legends of the Flood. Throughout all cosmology run certain basic principles, and it is also noteworthy that legends of this character, at first discordant and contradic-
the god Marulk. This cosmic ocean rears in other systems as well, notably in some of the Hindu cosmogonies and in the Egyptian legend of the Creation. Yet in various parts of the Nile Valley different cosmogonies were held; at Elephantine it was believed that Khnum had made the vegetative parts of the Nile; while at Memphis, Ptah was said to have carved the earth, like a statue, into its present form. Among the Greeks, with their highly developed philosophic and abstract thought, a large number of cosmogonies were developed, with a distinction of the universe being ocean, according to Homer; earth, according to Hesiod; air, according to Epicnemides; fire, according to the rhapsodic cosmogony; water, and earth, according to Hieronymus and Hellenes. Water and earth according to Athenagoras; and water, according to Thales. The Greek cosmogonies may be divided into three classes: those beginning with a spiritual principle, as Zeus; those beginning with an abstract principle, as Chaos, Time, and Night; and those, beginning with a material principle, such as water, earth, and other. Of these, the third category is doubtless the most primitive, although even the Hesiodic cosmogony is highly so, so that it is a system of philosophy rather than theology. An almost equal degree of speculative thought appears in the earliest record of India's cosmogony. The late 129th hymn of the tenth book of the Rigveda describes the "That," or abstract universe, as fired with inward illumination that resulted in the creative Katyayana, which corresponds strikingly and curiously with the cosmogonic Eros of the Greeks. Other Vedic hymns vaguely ascribe the formation of the world to the gods, while a late hymn of the Rigveda (x. 90) declares that the world was formed from the different members of the body of a giant. In the later development of Hindu thought the universe is the creation of Brahma (or those who present the All, or an All-God), while the universe itself is conceived as a cosmic egg—a legend as early as the Brahmanus, and recalling the cosmic egg of Egypt, the Polynesian creation-myths, and the Greek Orciphe mysteries. It is also noteworthy that creation is ascribed to sexual congress in cosmogonies so diverse as the Hindu, Maori, and Taoist.

The Greek and Hindu cosmogonies may be termed quasi-philosophic, while the Babylonian creation of creation is not. In the Iranian legend of the origin of the universe the same element of opposition appears, and at the same time it may possibly illustrate the bond which links the two. The earliest form of the legend is marked by a conflict between Ormazd and Ahriman, and the entire cosmic process is a series of beneficent creations by the former and of maleficent counter-creations by the latter, thus affording an analogue, in a certain sense, with the conflicts of the children of Papa and Ra from the American and New Zealand creation-myth. At a later period, however, philosophic speculation evolved the doctrine of "boundless time," from which both Ormazd and Ahriman, represented by Light and Darkness in Manicheism, were sprung. It is clear that the unitarian tendency is a later development; and if one may argue from analogy it would seem that the earliest Greek cosmogony, instead of being philosophic like the Hesiodic version, was based on opposition, as Hesiod's account itself of the cosmic egg is but a reflection to imply.

The order of creation naturally varies in different cosmogenic legends. In one of the numerous systems of Egyptian cosmogony the primal spirit and primal matter co-exist from all eternity in indistinguishable form. The gods create, thus recalling the cosmic Desire (Kamit, Epos) of the Hindu and Greek systems. This results in motion of the primal material, whose basal qualities thus become visible. With the aid of one of them the cosmic egg is formed, from which arises Re, the god of light, who forms the world and all that is contained in it. In the Iranian account, as given by the Hāndōshān, the order of earthly creation is sky, stars, moon, sun, land, sea, river, plants, animals, and man. A certain similarity with the Greek cosmogonies, as represented by Hesiod, is shown in the Germanic version given by the Voedsel, in that the creation of the gods, to which the Babylonian and Athapascan tablets also refer, is elaborately described. The basal elements are primordial time, Ginnungagap (which corresponds, in many respects, to the Greek Chaos), and primeval matter. The gods Odin, Hoernir, and Loki raised the sun out of the rearing egg (or the earth). After this Midgard, the home of mankind, is built; the plants are produced by the warmth of the southern sun; the seasons are ordained. The home of the gods is then built, and the three Norns, or Fate, and the world of the cosmo
gloses and the creation of dwarfs and men. In this last system the cosmic egg, which plays so prominent a part in many creation-legends, is replaced by the cosmic tree, which is, at least to a certain extent, paralleled by the golden lotus of the Hindu Purāṇas.

A curiously isolated cosmogony is found in Chinese Taoism, which derives the four seasons from the conjunction of the male and female principles Yang and Yin. The four seasons, in their turn, produce the eight kuei, or phenomena of Nature, which are the source of the universe. Equally isolated is the general type of the North American Indian cosmogonies, which is essentially one of opposition. It presupposes the prior existence of another world before the earth of man. In this world dwelt the gods, who gradually came into conflict with each other, and in the struggle all, with a few exceptions, were metamorphosed into objects, both animate and inanimate, to which they were in disposition most closely akin, thus giving rise to beasts, birds, reptiles, trees, rocks, and everything else. Meanwhile, the divinities who had escaped metamorphosis departed to new regions, the present world being occupied by American Indians.

In entire keeping with the late development of cosmogony and its pre-eminent philosophic character, there is one immemorial postulated and yet being attached to it. Few peoples seem to have thought of a design for which the world was brought into being. The Iranians, however, held that the universe was created for the glory of Ormazd, who should find his triumph completely over the machinations and creations of the evil Ahriman. In conclusion, it must be noted that the concept of creation ex nihilo was practically unknown to the ancient world. It is present neither in Babylonian, Egyptian, nor Greek; its existence in the Iranian postulated and yet at least problematical. On the other hand, the keenest philosophers of antiquity, the Hindus, evolved the idea as early as the Rigveda, even though but vaguely, declaring in a late hymn (xii. 20): "in the primeval age of the gods being was born of non-being (devamâm pârâ yugâ yugâ atâkhyât)

COSMOGONY AND COSMOLOGY (North American).—1. Athapaskan family (widely distributed in northern North America, in Alaska, Siberia, and the Pacific).—The Athapascans of the North-west attribute the phenomena of creation to a raven,
COSMOGONY AND COSMOLOGY (American)

whose eyes were fire, whose glance was lightning; soon the waters, when it rained, were sufficient to cause a deluge. With the descent to the ocean, the earth instantly rose, and remained on the surface of the water. From this being, also, the Athapascons traced their descent. Yet by name, it saved their ancestors from the flood, and they are named by them after the wave from heaven. It probably sprang, with the Mexican god Quetzalcoatl, from some common original form. The more eastern Athapascons believe their ancestors to have sprung from a dog, probably an allusion to that Indian type.

2. Iroquoian family (Hurons, Mohawks, Oneidas, etc., situated from the St. Lawrence to the St. Lawrence, and the Cherokee in Eastern Tennessee).—The Iroquois tribes believe in a similar myth. Their original female ancestress fell from heaven. There was as yet no land to receive her, but presently it suddenly bubbled up under her feet, and waxed bigger, so that ere long a whole country was perceptible. Some Iroquois tribes, however, believed that amphibious animals, such as the otter, beaver, and musk-rat, bearing her descent, hastened to dig up sufficient earth from beneath the waters to provide her with an island upon which she might dwell. Several Iroquois tribes report that the people of Oswego in New York State as the locality in which their forefathers originated, and the name of the Oneida (People of the stone) is held to indicate some such relationship.

3. Algic family (formerly distributed over an area embracing a space from Newfoundland to the Rockies, and from Churchill River on the north to Patuioxide Sound on the south).—The words for "light" and "rabbit" in the Algmic tongue are the same, so that Michaho or Michaho, the sun, their creative agency, has become conflated with them by the rabbit. The myth relates that one day, when Michaho was hunting, the wolves which he used as dogs entered a great lake, and disappeared there. He entered the lake to rescue them, but it rose suddenly, overflowed its banks, covered the land, and destroyed the world. Michaho dispatched the raven to find a piece of earth wherewith to re-build the land; but, after having searched everywhere, it returned and reported that it could find none. Then he ordered the otter to dive for some, but the animal returned to the surface without any. At last he sent down the musk-rat, which returned with a small piece, which sufficed for Michaho to re-erect his sun, which then presented itself by a lake. The trees having lost their branches, they shot arrows at their bare trunks, and the arrows became new limbs. He then avenged himself upon the malevolent beings who had caused the flood, and married the musk-rat, by whose aid he populated the world.

4. Muskogean family (Creeks, Choctaws, Chickasaws, Seminoles, etc., confined chiefly to the Gulf States east of the Mississippi).—The Muskoghees believe that before the Creation a great body of water alone was visible. Over the dreary waste two pigeons flew to and fro, and at last espied a blade of grass rising above the surface. Dry land gradually followed, and the mainland and islands took their present shapes. In the centre of the hill Yenne Chahe was the house of Evageth Emisse, the 'Master of Breath,' who moulded the first man from the clay which surrounded his abode. The waters still covered the earth, so that he was compelled to clad himself in the raiment of the fashionable men upon. When the soft mud had hardened into flesh and bone, he directed the waters to their present places, and gave the dry land to the men whom he knew. Here we cannot doubt that the appearance of the two pigeons signifies the brooding of the creative spirit upon the waste of waters. The similarity of this myth to the Creation story of Genesis is most remarkable.

5. Siouan family (Arapahos, Comanches, Mandans, etc., dwelling on the right bank of the Mississippi and Missouri valley).—The Mandan branch of the Sioux possess a very complete creation-myth, which bears a strong resemblance to those of the Caraya Indians on the Amazon and the Waran Indians of Guiana. They affirm that the entire nation resided in an underground village near a great subterranean lake. The roots of a grape-vine penetrated to their habitation, and some of the more adventurous of them climbed up the vine, and were rewarded with a sight of the earth, which they coveted because of its richness in fruits and the plentifulness of buffalo meat. The pioneers returned laden with grapes, the taste of which so enchanted the people that they resolved to forsake their subterranean dwelling for the upper world. Men, women, and children clambered up the vine; but when about half the nation had ascended, a corpulent woman who was climbing after her mother lost her hold and fell in the lake. Her fall filled up the gap which led to the upper world. At death, the Mandans expect to rejoin their forefathers in their original seat, the good reaching the ancient village by way of the lake, which the burden of the world will not allow them to cross. The cognate Minnetarees had a tradition that their original progenitor emerged from the waters of a lake, bearing in his hand an ear of maize—a typical example of the culture-hero myth. As regards the actual creation of the earth, the Mandans had a vague tradition, resembling that of the Muskoghees, concerning the brooding of pigeons upon the primate waste of waters.

6. Californian sub-families.—California was, and is now, spared to the ancient tribe, a number of Indian tribes belonging to as many as twenty-one distinct linguistic families. The mythologies of these tribes were, however, very similar to one another, and were characterized by unusually well-developed and consistent myths, which, in the case of the Maidu, had best typified by that of the Maidu, formerly dwelling in the Sacramento Valley and the adjacent Sierra Nevada. Their mythic era appears to fall into a number of periods, each of which is dealt with by a group of myths, which, however, differ one from another. One of the most remarkable things that their creation-myth makes its appearance, with the coming of Kodoyame the creator, and Coyote. They discovered the world, and proceeded to place it in fitting order for its first inhabitants. These they made from small wooden images, but, as they engaged in violent conflict, they were metamorphosed into animals. Kodoyame conceived an antipathy to Coyote, whose evil desires clashed with his beneficent wishes, and resolved upon his destruction. In this he was assisted by the 'Conqueror,' who destroyed many monsters and evil beings which later would have endangered the life of men who were yet unborn. In the last scene of the cosmic drama Kodoyame is defeated by Coyote, and takes his flight eastwards—which shows, at least, that he is not a sun-god. The Indians then spring from the places where the small wooden figures of the 'first people' had been buried. Unlike most American creation-myths, this is a veritable conflict of the race destruction of the universe. In the beginning was only the great primeval waste of waters upon which Kodoyame and Coyote dropped in a canoe. Of the origin of these supernatural beings the Maidu were ignorant; but a neighbouring people, the Achomawi, pushed their cosmogonic legend much
further back. According to them, at first there existed only the shoreless sea and the clear sky. A small cloud appeared thereon, which gradually increased in size and then descended until it became the silver-grey fox, the Creator. Then arose a frog, which, condensing, became Coyote. The Ashochni of California told of the drowning of the world so that no man escaped. But, when the waters retired, the Coyote went forth and planted the feathers of various birds, which grew into the various tribes of men.\(^1\)

7. **Chinookan family** (a distinct family, formerly dwelling on Columbia River).—The creation myth of the Chinooks is practically that of the Maidu, and relates how Itlapus, the Coyote, encountering a heavy surf at a place called Gofi', was afraid that he might be drifted away, and threw sand upon the surf, saying, 'This shall be a prairie, and no surf. The ebb and flow generations shall walk on that prairie.' The Chinook mythological rich in myths of the other world, and in cosmogonic sun, moon, and star-myths, which are dealt with at length in art. CHINOOKS.

The **Caddo family** (Pawnee, Kichai, Wichito, etc., dwelling in Nebraska and Arkansas).—The Caddo believed that they came originally from the under world, and related that the first individual to emerge into the light of day was an old man, covered with long hair and fire and smoke, and in another a drum. He was followed by his wife with corn and pumpkin-seed. They spoke of a creator, Atius Tirawa, intangible and omnipotent, whose house was the heavens, and whose messengers were the eagle and the buzzard. He it was who called sun, moon, and stars into being, and ordered them their various circuits.\(^2\)

9. **Shoshonean family** (Hop! or Moqul, Comanches, etc., inhabiting a territory from Mon to Texas, and from Nevada to Colorado).—The Shoshones held originally no conception of a Great Spirit. They speak of the earth as always having existed, and of the human race as having emerged through an opening in the earth. Called the Sho-po-ph, which was identified with the Grand Canyon of the Colorado. The dead they suppose to return to the under world. The Sky-father and Earth-mother they hold as responsible for the upkeep of the universe.

10. **Pueblo Indians** of Arizona, New Mexico, and New Mexico (Hopi, etc.).—The Pueblo believe that the Creator—Aamonawilona, Maker and Container of all—existed before the beginning of time, in the darkness which knew no beginning.\(^3\) He then conceived within himself, and, projecting his breath into the darkness of night, evolved gods pot with growth. He next took upon himself the form of the Sun, the father of men, who thus came into being, and by whose light and brightness the cloud-nests resolved themselves into water, gradually developing into the primeval sea. Then from his flesh, 'drawn from the surface of his person,' he made the seed of two worlds, and fecundated the sea therewith. By the heat of his rays green scums formed, which became the first earth, which filled the world, and the 'All-covering Father-sky.' Terrestrial life sprang from the embraces of these, and they separated. These twin were described as 'transmutable at thought, manifesting themselves in any form that the mind beheld by mask-making' (Cushing, op. cit. 379 f.). Then, from the lowest of the four worlds of the world, the seed of men and living things form and grew, until the lowest cave or womb grew over-full of living and half-finished creatures men among them, and the press became so great that Poshtaynanka, the

3. F. H. Cushing, "Rain Creation Myths," in *J. RBW*, 1896.\(^4\)

 Probably emanated from Nippur in northern Babylonia, and was harmonized with difficulty with the cosmology of Eridu (Sayece, Religions of Ancient Egypt and Babylonia, pp. 375, 377).

The beliefs of Eridu are embodied in a bilingual (Sumerian and Babylonian) poem, discovered by Pinches (Jr. 18, 1891, pp. 333-408), which, however, in its present form has been much modernized by the introduction of lines referring to Babylonia and the other chief cities of later Babylonia, and the substitution of Merodach, the god of Babylon, for Ea, the god of Eridu. The original version began as follows:

No holy house, no house of the gods in a holy place had as yet been built.

No rest had grown, no tree been planted,
No house been walled, no city founded,
No city built, no man (adam) made to stand upright;
The deep was uncreated, Eridu unkind.

The seat of its holy house, the house of the gods, uncreated:
All the earth was sea,
While within the sea was a current ('literally watercourse,' 'pantmoni.')

Then we are told how

[Prim] the reeds (readi) together to form a weir in the water,
He made dust and mixed it with the reeds of the weir;
That the gods might dwell in the seat of their well-being;
The gods (بشر الجهد, Editions), the living creatures in the field, he created;
The Tigris and Euphrates he made and set them in their place,
Giving them good names.

Mesopotamia, the marsh, rush and reed he created,
He created the green herb of the field,
The earth, the jungle, the cow and its young,
The sheep and its young, the land of the field.

Of far later date is the so-called Epic of Creation, which perhaps existed in reality of Merodach and his overthrow of Tiamat and the powers of chaos. As this involved the creation of the existing world, the poem is prefaced by an account of the origin of the universe as it was conceived in the schools. The cosmogony is a frankly materialistic, abstract principles taking the place of the gods who are themselves the offspring of the principles, in flagrant contradiction of the rest of the Epic, in which the god Merodach appears as the creator.

The Semitic idea of generation is invoked in order to explain the creation, which thus becomes a process of evolution, the old animistic objects of Sumerian worship being introduced to form the links in the chain of development. Water remains the prime element, but its role is made to reconcile the antagonism between the two conceptions of this element, according as it is regarded as anarchic or as under the dominion of law, by making Ap[\textdagger] (the Deep) and Tiamat (the watery chaos) complementary principles whose union resulted in starting the evolutionary process.

The first lines of the Epic run thus:

'When above unannounced was the heaven,
(And) earth below by a name was uncalled, Ap[\textdagger] (the deep) in the beginning (riziz) being their beggetter,
(And) the flood (Mummu) of Tiamat the mother of them all,
Their waters were embers joined (in one place),
But no reed had been harvested, no marsh-plant seen;
At that time the gods had not appeared, any one (of them) by no name was called, nor death fixed.
Then were the gods created in the midst of (heaven),
Lakhmu and Lakham appear (at first).
The ages multiplied, they . . .
Anan and K[\textdagger]as (the Upper and Lower Firmaments) were created,
Long were the days, forth came . . .

The cosmogony of the Epic is reproduced by Danuscius, a contemporary of Jus-winnu (de Prin.), Princip. 125 [p. 384, ed. Kopf, 1826].

'The Babylonians,' he says, 'like the rest of the barbarians, pass over in a larger or smaller degree from the universe and constitute two, Tavthu (Tiamat) and Apsun (Ap[\textdagger]), making Apanu the husband of Tavthu, and denominating her "the mother of the sea." The name of the god (the father) derives only from son Ay[\textdagger]ne, which, I conceive, is no other than the intelligible word wVgVgV, proceeding from the two principles. From them another progeny is derived, Lakh and Lakhor (corrupted in the MS into Lakh, Lakhor); and again a third, Reisun and Assulun (from which have arisen Ass, Assunn, and Thulla, corrupted into Illinois) and Assu. And of Apsun and Davdik (Danakkil) is born a son called Ede (Bel Merodach), who, they say, is the endicator of the day.'

Here Mummu, the Flood or chaos, who is identified with Tiamat in the cuneiform text, becomes the son of Tiamat and Ap[\textdagger], and is accordingly explained by Danuscius as the ideal world— that is to say, the world as it exists in the mind before it is realized externally. Such an explanation, however, is excluded by the Epic, where Mummu would rather correspond with the darkness which in (Tn 1) is said to have been "upon the face of the deep."

According to the Babylonian legend, the appearance of the gods of light and order was followed by the revolt of Tiamat (or, as it would seem, according to another version, of Ap[\textdagger]). But the powers of darkness and chaos were overthrown by Bel Merodach, who cut Tiamat in two, and stretched the sky across one of the two halves, thus preventing the waters which were in her veins from breaking forth again, while the other half was similarly confined under the dry earth and the heavens above which it feeds. The conquest of Tiamat was followed by the creation of man, who was brought into existence in order to build temples and altars and offer sacrifices and prayers to the gods.

The world, however, was not yet to be prepared for the reception of man by fixing the movements of the celestial luminaries, and so regulating the sacred calendar, and then by creating plants and animals which could be offered or used in the service of the temple. The earthly paradise existed in reality with Tiamat, so that the deities with whom they were identified had been the offspring of the trinity or tried of Ann, En-Hi, and Ea. Indeed, Bel Merodach himself was originally a Sun-god.

In the Epic, allusion is made to another system of cosmology, which ascribed the universe to the creative word. Merodach is described as destroying and creating by his word alone, and so proving his fitness to destroy the forces of anarchy and create a world that should be governed by law.

Another system of cosmology was that which emanated from Nippur (now Niffer) in northern Babylonia. In this Tiamat, the dragon of the subterranean waters of chaos, was the elementary principle, the creator of which, in the form of a mountain. The brood of chaos, composite creatures who belonged to a first and imperfect creation, continued to exist in the dark underground, which was also the dwelling-place of the ghosts and demons of night. How the world-mountain was believed to have been formed we do not yet know. At the Syrian Hierapolis (Membij) the waters of the deluge of the Babylonian Sylhetes were believed to have drained off into a cavern beneath the temple, which was accordingly kept securely closed, and Simu, the daughter of the supreme god Hadad, was said to have put an end to the attacks of a demon by filling the pit in which the monster dwelt, with the water of the sea (Cureton and Raman, in Pitra, Quiriquina, Solesmesc, ii p. xlvii).

COSMOGONY AND COSMOLOGY (Buddhist).—1. Preliminary notes.—

(i) In the earliest times, speculations on the universe were apparently regarded as wrong. We may recall the attitude of the Buddha toward the rise of speculative dinners the infinity of the world (see Aoosntris [Buddhist], vol. i, p. 212), and his efforts to give a moral or psychological meaning to

Vol. IV. 19
COSMOLOGY AND COSMOLOGY (Buddhist)

The researches of natural science, when a monk wants to know where the material elements (earth, water, fire, air) sit in their external relations, by way of answer, how people are delivered from desire and from existence. Obviously that is what the cosmo- and cosmo-analysts (sattvalokas) do, with their physical laws, or the formulae that the materials are subject to the exercise of virtues are ‘cosmological’ (sattvalokikā).

It is probable that a large number of Buddhists, imbued with the ‘morals’ of their master, avoided cosmological speculations of this kind. In this sense the materials of the sattvalokas are nembhāvatādina, the materialists. The formula, ‘The diversity of the world comes from the act,’ contains a well-informed Buddhist the Alpha and Omega of the necessary cosmological imposition.

But, long before the time when the Mahāyāna books demanded that the learned Buddhist, the preaching Bodhisattva, must have a knowledge of lay sciences, a Buddhist cosmology was formed, constituting a very well-developed collection of various opinions and systematizations; and, in fact, accurate information on cosmological questions seems to have been as ancient as the statements defending or ridiculing the speculations of the kind which is recalled above.

The aim of the present article is to give an outline of Buddhist cosmology, without entering into details (except on a few points which have not been published, or are obscure), and without spending time over variants. It should prove interesting, and profitable for the history of the sects, to study the history of the various theories, to distinguish the most ancient elements and aspects of them, and to note the succession of homemade arrangements. Such a study, however, is possible for only a limited number of the theories; we shall endeavour to pursue it wherever we can with profit.

I. Cosmology. — Cosmology seems to be the most accurate translation of lokoprajñapti, ‘world-teaching,’ a term denoting that part of the Sarvāstivādin Abhidharma (‘summaries and systematization of matters of doctrine’ [see Abhidharma, vol. i, p. 19]) which deals with cosmological problems—the origin, arrangement, and destruction of the universe.

But the lokoprajñapti deals also with questions that it is more correct to call un- or marginal: the Buddhists, in fact (at least the Sarvāstivādin), distinguish two ‘worlds’ (loka)—the bhūjnahaloka, ‘receptacle-world,’ and the universe as the abode of beings (sattva), and the sattvaloka, ‘world of living beings.’ There are, accordingly, two lokoprajñapti, the first a ‘cosmology,’ the second a ‘zoology’ (sattva ca sūtra).

Tiers are, naturally, close connections between these two ‘worlds,’ for the first is made for the second, being created and arranged to form a shelter for it. The whole of demonology, anthropology, and theology (i.e. pantheology) is connected with cosmology. Although it is difficult to separate the two, we shall give special prominence to the facts considered by our source as relating to the ‘receptacle-world’ (bhūjnahaloka); e.g., the abodes of the gods, the length of their lives, the dimensions of their bodies, and their ‘non-embryogeny’ are ‘cosmological,’ while their psyches, their 299) capacities, etc., are subject to the exercise of virtues are ‘zoological’ (sattvalokikā).

COSMOLOGY AND COSMOLOGY (Buddhist)

The Buddhist religion has four "great elements" (mahabhutas), called great because they are the substance of all material things; they are earth, water, fire, and wind. Ananda, a disciple of the Buddha, says in the Dhammapada: "This earth is the source of all things that are produced in the world. The world is composed of earth and water and fire and wind." (Pali; translated as "The wind-circle" by Waddell, 1938.)

The earth, water, fire, and wind are the four elements of the universe in the Buddhist cosmology. The earth is the base element, water is the fluid element, fire is the burning element, and wind is the circulating element. These elements are the building blocks of all phenomena in the universe.

The Buddhist cosmology holds that the universe is a finite, bounded system, with the earth at its center. The universe is divided into three realms: the heavenly realm, the human realm, and the animal realm. The human realm is further divided into four castes: the brahmin, the warrior, the merchant, and the laborer.

The Buddhist cosmology also includes the concept of rebirth, or the Twelve Steps of the Law. These steps are: right understanding, right thought, right speech, right action, right livelihood, right effort, right mindfulness, and right concentration. The goal of these steps is to achieve nirvana, or release from the cycle of rebirth.

The Buddhist cosmology also includes the concept of karma, or the law of cause and effect. This means that every action has a consequence, and that one's present life is shaped by the actions of past lives.

The Buddhist cosmology is a complex and rich system that is still studied and practiced today. It continues to be an important part of Buddhist thought and practice, and its teachings have influenced many other religious and philosophical systems throughout the ages.

COSMOGONY AND COSMOLOGY (Buddhist)

Earth, water, iron, etc., which form (a) in the centre of the system, Mount Meru; (b) eight mountains, or concentric chains of mountains, seven of which (of gold) are contiguous below the Mount Meru and nearly each other, while the eighth (of iron) is almost at the very edge of the system; (c) oceans flowing between the concentric mountain-chains; and (d) islands, notably four great islands or continents situated in the largest of the oceans—the 'exterior' ocean, between the 7th and 8th mountains. 1

The outside mountain is called Chakravāla, and this name is also applied to the entire 'small universe,' lokottara, or chāṭardiṃśokottara, 'the 32th' mountain-universe.'

Chakravāla (Cēlota, Sūtra, the Sūtrakathā of Sp. Hardy) = 'circle,' 'bracelet,' 'horizon' (see E. Senart, Études sur les légendes du Bouddha, p. 17, Paris, 1885. p. 17). In the northern sources there are a chakravāla-mountain and a great-chakravāla-mountain, called 'black mountains' from Behar, or Aparate (Halle, 1869), p. 212; Lotus, in SBE xx, 233; Sūtra, in SBE xxv, 193, 200, etc. The great chakravāla consists of two hemispheres, each equal to a globe—a cosmic abyss, which recalls the unārārātathāhāritu, 'universe suspended in space,' and the Sarvatathāgata, in SBE xxvii, p. 314, 315, q.v. 194, 2, 397; Digha, com. on ii. 12, Sp. Hardy, Legends, p. 129; Burnet, Lotus, p. 832; and Beal, Catena, p. 64. 2

The iron-mountain-range, Chakravāla, like the continents on the golden earth. It is 312 leagues high and 312 broad, and 312 leagues above the level of the exterior ocean which it surrounds. This ocean is 225,000 leagues in extent, 5 and is bounded on the inner side by the Nāma-devā, 'globe-bearing,' 625 leagues in height and breadth, and 312 leagues in projection (above the ocean's level). Then there is an ocean of 1250 leagues; then Viṇaṭaka, 'inclined,' 1250 in height and breadth, 625 in projection; an ocean of 2950 leagues (horse-encircling); 2950 leagues in height, 625 in breadth, and 312 leagues in projection (above the ocean's level). The diameter of the whole is in 1,200,875 leagues (Abhidharmakośa).

As regards the order of the mountains, we have followed A. Schueller, Entwurf einer allgemeinen Prüfung der klassischen Mythologie (Stockholm, 1878), p. 140; Beal, Catena, p. 50; Skolfield, Meru, p. 29; and Saradāpa, Sarasvati, and Nāma-devā (date in vi. 231, 232). See also T. W. Rhys Davids, The Principle of the Mandala, pp. 19, 64, 71, 72. The names of the mountains are sometimes doubtful, e.g. Īddhārā, Īddhārā, Īddhārā, Īddhārā, Īddhārā. The dimensions of the mountains and oceans are also doubtful. The Pali documents have, as the starting-point of their calculations, a Meru of 105,000 leagues high, with base 8 x 105, and so the numbers become less accurate. Source, Agnttara, iv, 100. From this, if we adopt a scheme that appears as classical in all sources, we get 42,000 for the first ocean, and the name for the first circular chain of mountains, then 21,000 . . . . This gives a greater total diameter than that which we get according to the Abhidharmakośa. In fact, the Pali Agnttara has for the diameter of Chakravāla 1,199,440 (Sp. Hardy, Legends, p. 55, seems inaccurate), and the Vāyudhatuagga has 1,232,456, i.e. the number attributed by the Kanakakośa to the same diameter, which, according to A. K. Coomaraswamy, 2, excels Chakravāla by 2575. 3

Most of the sources give the generic name of Kauñāsika, 'principal, noble mountains.' They are composed of gold, being excrescences of the golden earth. They are like wandering trees, having nothing being equal. You may ask

1 See an excellent map of the Chakravāla (100,000 leagues to an inch) in Geyger, Geognosia Buddhica, Stuttgart, 1888.

2 There are numerous legends on this 'great ocean'; see Sp. Hardy, in SBE xxv, 191, 202. On the Mahānātha we must refer to Saṅgītaka, v. 411.

3 The generic name of the seven 'interior' oceans is Ādhañjula, which, native to the Abhidharmakośa, has for its particular names, see Dharmasphutagāra, § 135; Chikharās, n. Sudāgarā; Sp. Hardy, Legends, p. 84; Rémusat, op. cit. p. 89.

4 In the Pāli Agnttara, 'islands' or 'continents,' (abodes of mankind).—In the 'exterior' ocean, facing the eastern, southern, etc., sides of Mount Meru, and lit up in succession at distances of 6 hours after each other by the sun turning round Meru, are four islands (kappa, dipa). These are the four excellent, or the excellent earth, and rest on the golden earth, or circle of gold (kīrtikālakharā), with a depth of 80,000 leagues of water (cf. Dīghaṇakātā, p. 157, 7). These islands are supposed to be on a level with the ocean, and it appears that, in this western definition, the small variations that constitute our earthly mountains are not taken into consideration.

5 In the east is the Pārśvanātha, 'Eastern Man,' 4 in the form of a half or permanent mountain, to which are attributed, nevertheless, four sides: three 2000 leagues (yojana) long, the fourth 350 leagues (perimeter, 6550 leagues). The men in this continent dwell in towns and villages, and live for 250,000 years; they are greyish brown, their height, and their faces, like the continent itself, are half-moon-shaped. 5

6 In the south is the Jambudvīpa, 'Rose-apple-tree's continent,' 6 our continent, the continent where the gods and men are born. This form takes four sides: three 2000 leagues long, the fourth 35 leagues (perimeter, 6000 leagues). The men there live 100 years at most; their height is from 3'5 to 4' cubes; they resemble the continent in shape. If the west is the Jambudvīpa, the east is the Savantāvīpa, or 'Shining island.' These have various inhabitants of the continents, and notably one of them: the Blindfolds (good horses), Jambu, Ketumandya, Uttarānura (see E. W. Hopkins, JĀOS, 1919, p. 360; and Art. Cosmology are Cosmology and Hedin). 7

7 Saradāpa (Tibet. Dict. p. 1173 ff.) gives the names of the mountains of the several continents—five, four, and two respectively—with the names of the wild beasts inhabiting them.

8 Vīdita—the modern Tribhūma; Buddha kañcapaśa, 'noble body' (play on the Shr. word dharma, 'body'), because the human body there is of gold, and it is also said to be 'noble' (Buddhavāsita), because of the influence of the place, as well as the inhabitants of the Himalaya or the Yātidrā mountain, have particular characteristics (A. K. V., 2546; cf. Sp. Hardy, Legends, p. 65). Notice the breadth, height, and circumference of the Himalaya, which, according to A. K. Coomaraswamy, exceeds Chakravāla by 2575. 3

9 On this matter see art. Cosmogony and Cosmology (Indian), Agnttara, i. 104 (1883). According to Saradāpa (Tib. Dict. p. 1184), this continent is also named 'from the jambu tree sound made by falling of the leaves of the wishing tree into the river Ganges.' We are not concerned with the Buddhist geography of this continent (Sp. Hardy, Manual, p. 15, etc.).

10 The Sīkṣāsūtra (PT, 1901, p. 422) knows only one length of human life (84,000 years is the same as that of Jambu); evamāna alpam eva bhīmam iti. Life differs in one and the same continent according to the period of the age of the world (see A. K. V. or the Western Buddhist Handbook, p. 35). 9

11 This is, at least, the meaning of the Tibetan Nāb bar-lha-me, but math is a geographical name.
is round, i.e., it has three sides of 2500 leagues (perim. 7500); 1 length of human life, 500 years; height, 5000; breadth, 7000; and length and breadth, 7000, and 8000.

In the diagrams which the Buddhist cult (Great Vehicle and Thoroughfare) makes of the contents of the various heavens and hells, the continents are represented: (1) half-moon (avakshabhanda) and white, (2) triangular (tripura) and golden, (3) circular and red, and (4) square and dark blue.

According to the 'northern' sources, there are alongside each of these categories of continents (equivalents) of the same shape but half the size, in the following order, starting from N.E. : Dvādaśa, Madhavā, Kesāla, Mahāyakṣa, Saṅghavā, and Ālayavā. The 'western' and 'eastern' sources make the same division but are differently named, and the depths of the hells, in the following order, starting from E.: Vajra, Mahāvajra, Vajrakīla, Vajrapāda, Padmapāda, and Mahāpāda. There are also noted the 'southern' and 'northern' hells.

5. UHOOH LEAVES.—The day after Chhū (cf. Sūtra, vii, 76), a serene and auspicious day, is celebrated by the gathering of leaves of the Uhooh tree. Such a tree is called 'leafy'; it is a species of the Calophyllum family. The leaves are collected in the lime-shell, and the leaves are often called 'the powder of the heaven's lime-shell.'

6. THE HELL OF THE GYLPHS.—According to the 'northern' sources, the Hells of the Gylphs are divided into four parts, the name of each is followed by the name of the half-moon which surrounds it. These names are: (1) Akiu, 'fierce,' (2) Vajrasattva, 'fierce,' (3) Vajrapāda, 'forceful,' and (4) Mahāpāda, 'great.' The 'western' sources divide the Hells of the Gylphs into five parts: (1) Vajra, (2) Mahāvajra, (3) Vajrakīla, (4) Vajrapāda, and (5) Mahāpāda.

7. THE HELL OF THE JEWELS.—This is a very difficult and obscure passage. The 'northern' sources make the Hells of the Jewels into eight parts, each of which is named after a jewel. These are: (1) diamond, (2) emerald, (3) ruby, (4) topaz, (5) chrysolite, (6) sapphire, (7) beryl, and (8) diamond. The 'western' sources make the Hells of the Jewels into five parts: (1) diamond, (2) emerald, (3) ruby, (4) topaz, and (5) beryl.

8. THE HELL OF THE NIGHTMARES.—This is a passage in which one is forced to grovel in the darkness, all the material references of which are obscure. The 'northern' sources divide the Hells of the Nightmares into three parts, each of which is named after a nightmarish animal. These are: (1) elephant, (2) tiger, and (3) lion.

9. THE HELL OF THE WARRIORS.—This is a very obscure passage. The 'northern' sources divide the Hells of the Warriors into three parts, each of which is named after a warrior. These are: (1) sword, (2) mace, and (3) spear.

10. THE HELL OF THE TREES.—This is a very obscure passage. The 'northern' sources divide the Hells of the Trees into three parts, each of which is named after a tree. These are: (1) pine, (2) oak, and (3) walnut.

11. THE HELL OF THE COLD.—This is a very obscure passage. The 'northern' sources divide the Hells of the Cold into three parts, each of which is named after a place of cold. These are: (1) ice, (2) snow, and (3) frost.

12. THE HELL OF THE PARADISES.—This is a very obscure passage. The 'northern' sources divide the Hells of the Paradises into three parts, each of which is named after a paradise. These are: (1) paradise, (2) heaven, and (3) kingdom.

13. THE HELL OF THE JUICE.—This is a very obscure passage. The 'northern' sources divide the Hells of the Juice into three parts, each of which is named after a kind of juice. These are: (1) wine, (2) honey, and (3) milk.

14. THE HELL OF THE FIRE.—This is a very obscure passage. The 'northern' sources divide the Hells of the Fire into three parts, each of which is named after a kind of fire. These are: (1) fire, (2) flame, and (3) spark.

15. THE HELL OF THE WATER.—This is a very obscure passage. The 'northern' sources divide the Hells of the Water into three parts, each of which is named after a kind of water. These are: (1) water, (2) river, and (3) sea.

16. THE HELL OF THE LIGHT.—This is a very obscure passage. The 'northern' sources divide the Hells of the Light into three parts, each of which is named after a kind of light. These are: (1) light, (2) brilliance, and (3) brilliance.

17. THE HELL OF THE SOUNOSS.—This is a very obscure passage. The 'northern' sources divide the Hells of the Sound into three parts, each of which is named after a kind of sound. These are: (1) sound, (2) noise, and (3) scream.
COSMOGONY and COSMOLOGY (Buddhist)

1. Emergence of the world (kammadhātu) (c): On the fourth terrace of Meru is the retinue of the Four Great Kings (chaturmahārajāyukṣas, caḷanmahārajikṣes), 80,000 in all (5), and (higher up we believe Dīgha, i. 216), the Four Great Kings, rulers of the cardinal points. These are the first beings who regularly receive the name of 'gods,' and are classed as such. The length of their life is 500 years, a day being equal to 50 human years. Their dwellings is a kro[8] (½ yojana, 'league'). Perhaps the numerous servants and courtiers of the Great Kings, the gandharvas, 'celestial musicians,' etc., although they are not devas, ought to be regarded as belonging to this category.

2. Half-way up Meru are the chariots of the sun (51 leagues), of the moon (a league further down), and of the stars. These deities do not form a special class.

3. On the summit of Meru are the gods who have the Thirty-three at their head (trayastrīṇās; śivottāntas), to the number of 100,000 (7), and, above them (according to Dīgha), is their king, Suya[ama, the Indra of the gods. Their town, the 'infra-world,' is

4. There then are palaces which might be called aerial (vimāna): 8

5. 160,000 leagues above Jambudvīpa, i.e. 80,000 above the Thirty-three, and 80,000 leagues broad, the palace of the yanma gods, whose king Suya[ma, according to Dīgha, lives 80,000 human years, one day = 500 human years, height, ½ kro[8].

6. The abode of the tāṣṭas, 'satisfied' or 'blissful', is the residence of a future Buddha before his last existence; king, Suntusita; length of life, 4000 years; height, 1 kro[8].

7. The abode of the nirvāṇaratūtis, 'who have their pleasure in creation,' happy creators; king, Sumrīnata, 'well-built.' According to the A.K., the meaning of rūtis, 'all kinds of pleasures,' in contrast with the inferior gods, who enjoy objects which are presented to them on account of their deserts (cf. Śivottānta, p. 94).

8. Length of life, 8000 years; height, 1 kro[8].

9. (f) 1,283,000 leagues above the Thirty-three, 80,000 leagues broad, the abode of the 60,000 paramīvatāvatīra (paramīvatīra, and sometimes wrongly [7 pari], having Vassavatīr, 'the sovereign,' as king (Dīgha, i. 219). The name of these gods means 'rulers over the things created by

1. See Mahāyānaputtika, § 103, 26-35; Burnet, Introduction, p. 590 (quoting George, p. 489); Mahāyāna, L. 25; Dighāniyāsa, p. 518 (which mentions rōgans, 'dragons,' resting on the water (sahambhūta at the foot of Meru; Morris, J.PTS, 1915, pp. 21-26). These gods, dit marshes, are sometimes called devas, especially the kūḷapīṇaśas (Divparādāyana and Mahāyānaputtī); see also the hereditary titles in Lattisana, etc. Devaputra, 'god-son,' is sometimes an epithet of greater gods.

3. See A.K., iii. 66; Beal, Lattisana, p. 71; Spence Hardy, Manual, p. 56.

4. (f) a year or 6 months' (see above, p. 130; and art. Dīgha.

5. The Tibetan translation means 'non-measurable (a vi-maṇa) munias.' These palaces may be spiritual, i.e. they are composed of subtle material (such as, meru, pagodas, unattached palaces, invisible from place to place by an effort of will) (Childers, Dict. p. 574); see Vimaṇakappāthā, and Bollibggde-k, s.n. Vimaṇa.

6. The meaning of yonma is not clear. The Tibetan is lhahab- brtsas, 'free transference,' because they can move through the air, with the air. The same (p. 14, 13) in the Thirty-thre[3] have to do. The yonmas, as we have seen (§ 3), are created before the chariot-race. The kings are named in Lattisana, p. 44.
Brahmā were placed above the heavens of the *karma*-gods (gods owing to their merit) and the birth-gods (*Taitt. Up. ii. 8; Windisch, *Buddha’s Geburt*, Leipzig, 1908, p. 15). Being by his nature invisible to the inferior gods, he was known as the ‘solid’ body for himself when it pleases him to show himself to the Thirty-three (*Dīgha*, ii. 210). In this respect there is some resemblance between the *Kena*-sūkta and *Dīgha*, i. 228. This connection is still more unusual with *Mahāyāna* (*Dīgha*, vi. 250, vii. 290, 309). Brahmat (the god Brahmat then called Bodha, ‘Heron’) tries in vain to disappear from the eyes of Buddha; he was more successful with Varuṇa, the Vedic god.

The text which we have quoted, ‘divine . . . with all major and minor kinds complete’ (cf. *Mahāyāna*, ii. 17, i. 203), is clear enough: the *vipā:-*gods possess all the organs of the body. This opinion, however, came to be regarded as almost ‘heretical’ by *Mahāyāna:* the text is still more unusual with *Mahāyāna* (*Dīgha*, vi. 250, vii. 290, 309).

The Buddhas, making the most of the theory of the four *dvāpara-yānas* (‘trances’), have established very coherent systems on the hierarchy of the so-called ‘material’ celestial spheres. The complete table is as follows:

1. **FIRST-TRANCE HEAVENS.**—(1) Brahmaparāsyāya (or *Buddhakāya*), 1st retinue of Brahmat; length of life, 20 small ages of the world (20 *narakarākalpā-s*: great *kulpas*). Height: 12, length: 12, age: 12. This heaven is situated 2,580,000 leagues above Jambudvīpa, and is 1,290,000 leagues broad. These numbers have to be doubled for the following heavens.

2. **Brahmaparibhāsas, ‘Brahmā-chaupās’;** length of *life*, 24; height, 24; *kulpas*; number of *kulpas*, ‘Great Brahmat’; length of life, 2; *kulpas*; height, 12; age, 3.

The common opinion is that there are as many stages as there are classes of gods. But some say that *Brahmat* has no distinct form of his own; only in the heavens of the *parihāra*-gods is he represented by an enormous tower, and this is the abode of Brahmat. Every trance-heaven has a king, ministers, and people in it. The people are described in *Aśvaghoṣa’s* *Kathavagga* (iii. 120, where Brahmatakaśyapa (life, 1 *kulpas*) is the general name of the gods of the first trance). Contrast with this *Dīgha*, i. 236: the *parihāra*-gods are no *vīra*-gods and have no *kulpas*. It will be noted that this plural, ‘great Brahmat’, is strange, because there cannot be more than one. In former Buddhist theology there was not more than one Brahmat. But the early texts, when mentioning several ‘parihāra’-gods of Brahmat, probably believed in different classes of *kulpas* at different ages of the world, had opened the way for this new idea. On different classes of Brahmat, see below, § 9.

1. Mentioned in *Satapathābṛddhāna*, l. 145, 155. The *Lalitavistara* (p. 130) draws a distinction between *kāpya-kāpya* and *parikāpya* (p. 45) as also in *Parāśaragama-kusumānti*. 2. According to *Kalpadruma* (Feer (AMV. p. 325) says 256, i.e. double the height of life, or the height of the parihāra-gods. 3. We give the heights and lengths of life according to the *A.R.V.* ‘The first gods of the *rajya*-world are 12 in *jātaka* in number and height; another 12 are double the parihāraks; and one more double the parihāras. As regards the length of life, *rajya*-world the sources have nothing definite to say. Length of length of life, 4, 1, and 1 *kulpas* (Vijaghana, p. 424; Warren, p. 259). The text quoted in the commentary to *Kathavagga*, vi. 5, however, assigns a *kulpas* to each of the *rajya*-gods of the second trance, and one more double from the parihāras. As regards the length of life, *rajya*-world the sources have nothing definite to say. *Lalitavistara* (p. 130) draws a distinction between *kāpya-kāpya* and *parikāpya* (p. 45) as also in *Parāśaragama-kusumānti*.

(1) **SECOND-TRANCE HEAVENS.**—(1) Parāśatākshas (‘limited splendour’); length of life, 2 *kulpas*; height, 2 *kulpas*. These figures are doubled for the next five classes.

1. According to *Kalpadruma* Feer (AMV. p. 325) says 256, i.e. double the height of life, or the height of the parihāra-gods. 2. According to *Satapathābṛddhāna*, x. i. 3. 4; *Taittirīya Upaniṣad*, i. 1-5 (Rhys Davids, *Dialogues*, p. 158). 3. According to *Kalpadruma*, ii. 330, vi. 95; ii. 330, *Parāśaragama-kusumānti*. 4. The idea of the progressive refinement of the body of the gods is old (*Satapathābṛddhāna*, x. i. 3. 4; *Taittirīya Upaniṣad*, i. 1-5 (Rhys Davids, *Dialogues*, p. 158). 5. The worlds of Prapajñā (cf. *Mahāyāna*, i. 2) and *Buddhakāya*, it refers to a *kappeka-nāla*, i.e. a portion of a *kappeka-nāla*. The *Ačkārakāla-bhañja* (AMV. p. 320) is very similar. In the commentary, the same author maintains that *kappeka-nāla* must be taken to mean 1 *kulpas*, therefore 1, 1, and 1 *kulpas* (Vijaghana, p. 424; Warren, p. 259). The text quoted in the commentary to *Kathavagga*, vi. 5, however, assigns a *kulpas* to each of the *rajya*-gods of the second trance, and one more double from the parihāras. As regards the length of life, *rajya*-world the sources have nothing definite to say. *Lalitavistara* (p. 130) draws a distinction between *kāpya-kāpya* and *parikāpya* (p. 45) as also in *Parāśaragama-kusumānti*.

1. *Achakārakāla-bhañja* (AMV. p. 320).
measurable splendour." (3) Abhásvara (Abhás-
vara), 'Radiant.'

(ii.) Third-trance heavens.—(1) Purāṇa-
trākṣa, (2) Abhásvara, (3) Abhásakṣa, Im-
measurable beauty.

(3) Subhakṣāya (Subha-
kiṃya, wrongly Subhakṣiya), 'Complete beauty.'

2 length of life, 64 kalpas, i.e. until the return of the
destruction of the cosmos by wind (see Ages of
THE WORLD [Buddhist], vol. 1, p. 188); height, 64
leagues.

(iv.) Fourth-trance heavens.—(1) Aṣṭaka-
kratas ("Cloudless"); 125 kalpas and leages (not 128,
which would be double that of the Subhakṣāya); these
classes are not followed by anyone.

(3) Purāṇa-trākṣas (Vehāpphas), 'Abhānant fruit.'

(4) Aṣṭaka (Arhats), 'Effortless' (3), (5) Atapas
(atapastātāyāya), 'No heat,' 'Cool gods.'

(3) Subhakṣāyas (Subhakṣāya), 'Beautiful.'

(7) Subdāratā (Subdāratā), 'Abhāsakṣāya,' 'Sub-
bhakṣāya,' 'inhabitants of the Pure abodes.

(4) Arhats (Arhats), 'Effortless' (3), (5) Atapas
(atapastātāyāya), 'No heat,' 'Cool gods.'

(3) Sattvadīya (Sattvadīya), 'Spiritual.'

The total number of "places" or "stages" in the rāga-world,
therefore, is seventeen, according to the Abhidarmikas (iii.
2); the Katharnakas suppose one of them (see above, p. 189).
The Pali tradition of Abhidharma counts only sixteen; it has
never the Aṣṭaka-kṛatas nor the Purāṇa-trākṣas, but it adds
the Ākṣiṇāmāsās (Cetasa, 'unconscious beings, gods' as
follows: 1) Ākṣiṇāmāsās (i.); 2) Abhānantapphas; (3) Purāṇa-trākṣas,
fixed in number. (In later documents, e.g. in Abhi-
numadhi, the number of the heavens, etc., is 17; in Abhak-
ninga, p. 289, the Abhakṣās come after the Vehāpphas; and
the sanskritisation occurs in Northern texts, viz. Lātīni-
kottārā, p. 116; Abhakṣāya, i. 125; Beal, p. 36 (according to
the Vījñānabha, which add the Ākṣiṇāmāsās to the list of
the Kosa.)

Lastly, certain sources place the heaven of Mahābhaktāvara,
the Great Lord, Siva, above the Abhakṣās—a non-Buddhist
idea borrowed from

1 Abhāsvara appears in several early texts, not as the name
of the third category of the second trances, but (i.) the general
name of the gods of the first rank (Abhakṣāya, i. 114) above
Mahābhaktāra, (ii.) the general name of the gods of the second
trance in Abhakṣāya, i. 127 (life, 64 kalpas).

2 Aṣṭakās appear in several early texts, not as the name
of the third category of the second trances, but (i.) the general
name of the gods of the first rank (Abhakṣāya, i. 114) above
Mahābhaktāra, (ii.) the general name of the gods of the second
trance in Abhakṣāya, i. 127 (life, 64 kalpas).

3 See RajabhadRD, i. 26; Warren translates it "inquisitive."

4 See RajabhadRD for the general name of the fourth trance
in Abhakṣāya, i. 127 (life, 64 kalpas).

5 See RajabhadRD, i. 26; RajabhadRD, i. 26; Warren translates it "inquisitive."

6 According to the Vījñānabha, which add the Ākṣiṇāmāsās to the list of
the Kosa.)

Hinduism (Mahāyānaprāti, § 161; Tristiglot, 53; Rūmān, Fo-kouch-ki, p. 146).

We shall now go on to make some more or less hypothetical
remarks on the origin and development of this theological
world. It is probable that Brahmrā was at first regarded as
the greatest god. (See Dipa, i. 572; Mahāyānaprāti, § 161; etc.)
When Brahmā was again attached to the rāgas-world, and
in some cases the abodes of beings (vinnasāya-
na) he has (Aṣṭakāy, iv. 48), (1) Brahmarāgakṣāya, (2) Abhānantsaya,
(3) Subhakṣāya, and, according to the trances (Ākṣiṇāmāsās
of Abhakṣās), for which the catalogues of "abodes of beings"
(sattvadīya) have (Aṣṭakāy, iv. 48), (1) Abhānantapphas, Abhān-
antsaya, Subhakṣāya, Vehāpphas, and Abhānant.

To get a scheme very near the classical (scholastic) scheme, the
classes of Ākṣīnās Abha and Sutha had to be formed in imitation of the classes
of Brahmarāgakṣāya, Abhānantapphas; and this is what we find in
Mahāyānaprāti, i. 167; Purāṇa-trākṣa, Appamānibbha, Abhakṣāya,
Parittasāna, etc. The Vehāpphas of Mahāyānaprāti, i. 2, are kept,
and in place, the Abhakṣās and four Abhānantapphas.

Abhānantsaya. But Dipa, ii. 55, adds the fifth category,
Sudāsa (Sudarāna). It is possible, therefore, to follow to a
certain point the scholastic work which has amalgamated
several traditions and speculations; for instance, the Vehāpphas,
for instance, the Abhānantsaya, and the Abhakṣās and four Abhānantapphas.

8. Immaterial sphere (avāpābdha, ariyā).

There are two views on the ariyā. According
to the first, which keeps to the letter of the canoni-
cal text, the ariyā is not properly a part of the
world; it contains only 'spiritual' beings, free
from matter, disembodied intellects (vijnāna),
consisting in thought (sānānayāna). When the
transmigrating 'vijnāna' are re-born (if we may say
so) into this immaterial category, they become
an apparatus (nāman) for themselves, but do not
accumulate matter (rāpa), or organs of knowl-
dge (saddātana).

Instead of planes, the ariyā presents four
'species' (ākosa), according to the state of the
pure intelligences which constitute it. There are
the (1) realm of the infinity of space (abhānātay-
nta), (2) the realm of the infinity of intellect (vijnāna),
(3) the realm of nothingness (abhānātay-
nta), and (4) the realm of nothing-ness (or notion
or not-consciousness (nāmanasānayānta),
according to the kind of meditation in which the mind finds itself absorbed for
20,000, 40,000, 60,000, and 50,000 great
kalpas.

The first three realms are vijnānāsthitis (Dipa,
i. 69; Abhakṣāya, iv. 40), 'meditations on which
intellcit (vijnāna) dwells (abhi); an intellect which has in the
realm of vijnāna, the ground, space is infinite,' 'intellect is
infinite,' (4) there is nothing,' and finds itself, for
countless centuries, in the same meditation—vijnānāsthitis only, for intellect is
disincarnated and without any relation to matter (rāpa). Like the
Avidyājī the Abhakṣās are of four classes, the fourth
realm is not a vijnānāsthiti, but a nāmanasānayānta
"dwelling-place of beings," or an ayānta, 'place,'
for it does not include attachment to (or dwelling
upon) any kind of existence, being
established on an absolute indiffercence (upekṣap).

1 See also Abhakṣāya, p. 4, 12, 6, 12, 12, 315, 32, etc.

2 This is the orthodox theory (Vījñānabha, p. 53, 419; Kath-
adhivṚ, viii. 8, 224, 244, 244, 254; Chandraśākha, Purišhakṣhakṛapa). See Compendium of
Abhidharma (Pitolis, 1909), p. 64. It is also referred to in later
texts, from the Vījñānabha tradition as given by Buddhist tradition as previous to Sakyamuni (e.g.
Mahāyānaprāti, i. 164; Warren, p. 280).
Cosmology and Cosmology (Buddhist)

But we must not regard the double negative 'neither consciousness...nor the absolute negation of consciousness; thought (chitta) and its derivatives (chittavijnana) are the content of the actualized state.' In fact, if thought happened to cease in these immaterial existences, the result would be nirvana; and we know (Aguttara, i. 267) that 'non-converted persons (paryajnaka) may reach nirvana, although not worthy of the heaven of Brahma, without being free from the danger of falling back again into hell or among the preta.'

Several schools maintain the existence of 'matter' in the 'Birth-domain' (antarabhava), etc., in the form of 'unconditioned aggregate' (ungati-khandha), etc., which it also includes the five kinds of perceptible knowledge (tijjana-khandha) and their natural result (jijajjana-dvipada), etc., and a remnant of the same or the 'life-bride' (vajjika-dvipada), etc., explained as a diminutive (vaghartha). An argument in favour of this opinion (tijjana) needs a material support (arupa), and this support must be the special 'matter' called arupakaruna, 'heart-thing' (according to the A. K. F. opinion of the Tantrapaññas, i.e., the Buddhists of Tapanā, the Sinhaleses).

Another argument is that, according to the formula of 'original creation' name (intellectual data) and matter (rupa) proceed from nirvana.

Cosmic systems, chiloicosms.—It is the most ancient Buddhist cosmology did not imagine anything but the 'small universe,' the chakravāla properly speaking; but, in documents which appear to be very archaic (agreeing, in fact, with the Rigveda), there is a hypothesis of a 'thousand, millions of millions of millions, a thousand millions of billions; this is the middle chiloicosm, dviṣaṁśiṣṭa maṇjhika lokadhātu,' (two thousand-million universes); and (3) a system of a thousand million universes, 'great chiloicosm,' or the 'thousand-thousand-thousand-thousand universe,' tisatva mahāsahāsri lokadhātu.'

See Kathavattu, iii. 32; Beal, Ceylon, p. 101; C. A. F. Rhys Davids, Beal, Kathavattu, p. 329; i. 267, and in the 'Birth-domain' (antarabhava), etc., in the form of 'unconditioned aggregate' (ungati-khandha), etc., which it also includes the five kinds of perceptible knowledge (tijjana-khandha) and their natural result (jijajjana-dvipada), etc., and a remnant of the same or the 'life-bride' (vajjika-dvipada), etc., explained as a diminutive (vaghartha). An argument in favour of this opinion (tijjana) needs a material support (arupa), and this support must be the special 'matter' called arupakaruna, 'heart-thing' (according to the A. K. F. opinion of the Tantrapaññas, i.e., the Buddhists of Tapanā, the Sinhaleses).

Another argument is that, according to the formula of 'original creation' name (intellectual data) and matter (rupa) proceed from nirvana.

Cosmic systems, chiloicosms.—It is the most ancient Buddhist cosmology did not imagine anything but the 'small universe,' the chakravāla properly speaking; but, in documents which appear to be very archaic (agreeing, in fact, with the Rigveda), there is a hypothesis of a 'thousand, millions of millions of millions, a thousand millions of billions; this is the middle chiloicosm, dviṣaṁśiṣṭa maṇjhika lokadhātu,' (two thousand-million universes); and (3) a system of a thousand million universes, 'great chiloicosm,' or the 'thousand-thousand-thousand-thousand universe,' tisatva mahāsahāsri lokadhātu.'

See Kathavattu, viii. 8; cf. Warren, Buddha, p. 178, l. 15, and see also Nisessa, xxxii. 13.

The Śrāvakas admit the infinity of the world upwards and sideways (see Pāñcavisākāvāsaka, xvii, 2, 6; in Hopkins, 'Gods and Saints of the Great Brahma,' p. 71, Boston, Connecticut, August 25, July 1900). The theory that the world is infinite, both in space and in upward and downward directions, is condemned in Dīgha, i. 23 (Rhys Davids, Dīghakosā, p. 96; see Averulentm [Buddhist], vol. i, p. 234, note). A tradition which was not then being attrited (Athāthakavāsaka, p. 234, quoted in Dīghakosā, p. 234, 1st part, of, and Introduction, 509; the scope of the ancient in the hindu philosophy is well known (Beal, Kathavattu, p. 178, l. 15, and see also Nisessa, xxxii. 13).

The Śrāvakas admit the infinity of the world upwards and sideways (see Pāñcavisākāvāsaka, xvii, 2, 6; in Hopkins, 'Gods and Saints of the Great Brahma,' p. 71, Boston, Connecticut, August 25, July 1900). The theory that the world is infinite, both in space and in upward and downward directions, is condemned in Dīgha, i. 23 (Rhys Davids, Dīghakosā, p. 96; see Averulentm [Buddhist], vol. i, p. 234, note). A tradition which was not then being attrited (Athāthakavāsaka, p. 234, quoted in Dīghakosā, p. 234, 1st part, of, and Introduction, 509; the scope of the ancient in the hindu philosophy is well known (Beal, Kathavattu, p. 178, l. 15, and see also Nisessa, xxxii. 13).

Mahāyāna-buddhist cosmology considers that the number of chiloicosms, or 'fields of Buddha,' is infinite in every direction (e.g. Lotus, xi. 5; SBE, xxii, 232), and there are not limited by either the 'great universes' (e.g. Karuṇāyapundarakāra) and in the Avatamsakas we get a systematic arrangement of these chiloicosms. On whirlwinds in the Yama Ocean, which carries an infinite number of world-garlands (lokabhis); from it there issue lotuses infinite in number—very far removed, indeed, from each other. Each one of these (great chiloicosms), above which (separated by whirlwinds) there are three, there is a whirling and so on in both directions, where there are 20 great chiloicosms. We are not told whether this development of a 'world-garland' is in the form of a triangle or of a fan, or whether it is to be understood as 'wicker' (catuspadaka)
COSMOGONY AND COSMOLOGY (Chinese)—Chinese theories of cosmogony and cosmology may be said to be of comparatively modern date. They profess, however, to be based on a system which claims an antecedent immemorial antiquity, i.e. the 8 trigrams, which are usually attributed to Fu-hsi (2582 B.C.), though somewhat contradictory accounts are given as to their ultimate origin. These figures were intended to represent the stages of the world (P'ermint-sbirivu), which were employed by diviners in close association with the lines which were produced on the shell of the tortoise, as described in art. COMMUNION WITH THE DEAD (Chinese) vol. iii. p. 721.

The starks were divided into longer and shorter lengths, and the order in which they were drawn and disposed, in varying combinations of long and short or ‘strong’ and ‘weaker’ lines, was interpreted 1 according to the arbitrary methods which prevailed from time to time, but of which the details have not been handed down. It may, however, safely be assumed that the function of the trigrams was limited to questions of tribal or domestic interest, and that nothing of a theological or cosmological character was attached to them.

The trigrams were arranged in 8 groups thus:

A new arrangement was invented by Si-peh (= King Wen), appended to each of the hexagrams an explanatory outline, giving the general sense supposed to be conveyed by the figure, and his son Tan, better known as Chow-kow (Duke of Chow), added an analysis, showing how each line of the hexagram was to be interpreted so as to contribute to the general conclusion which his father had established. The deductions of King Wen and the Duke of Chow form the text of the Yi-king. Throughout the 64 chapters of the original work there is nothing whatever of a cosmological character; the compilers were entirely occupied with political and personal matters, endeavouring to draw from the oracles furnished by the starks and their representative symbols the probable results of certain courses of conduct which were in contemplation. The harmless divining, as it seemed to his father, with which the prisoner, Si-peh, employed his leisure, was in reality a means by which he was able to develop his revolutionary schemes without let or hindrance; none but himself knew the significance attaching to the harmless starks with which he amused himself; and when, in course of time, his liberty was restored, he was enabled to consummate his schemes with complete success.

A new element is, however, introduced in the 10 A PENDIX TO THE Yi-king, written by the imitator of Confucius, though it seems probable that only the first and second are properly attributed to him. To Confucius it seemed inevitable that the thought which had been expended upon the hexagrams should pass so easily on to his son, could not fail to be of permanent value, and that, though the political conditions which had first inspired their studies no longer existed, the lessons which they contributed might be applied with equal value to the troublous circumstances of his own times. Hence Confucius, in later life, devoted a great deal of attention to the study of the Yi-king, frankly acknowledging the difficulty he experienced in the interpretation of its cryptic phraseology and in adapting its lessons to his own enlarged conception of the scope of the work. Later commentators, building upon the theory that the three lines of the early trigrams represent the three powers—Heaven, Earth, and Man—attempt to transfer the lessons of the figures from the smaller stage of human affairs to the larger theatre of universal Nature. In the Appendixes, therefore, we discover, in an ever-ascenting scale, the application of the hexagrams to the constitution and course of Nature, and various later commentaries, in some of the material out of which Chu-hsi (Chuen, A.D. 1130-1290) developed his scheme of cosmogony and cosmology, which now represents modern Chinese philosophic thought on the subject.

A word of explanation may here be necessary in order to show the mechanism of the developed

1 This expression seems to denote a great chilo[...](1856-1885), during his two years' imprisonment at the hands of the ruler of Ch'uan, it may, however, safely be assumed that the function of the trigrams was limited to questions of tribal or domestic interest, and that nothing of a theological or cosmological character was attached to them. The trigrams were arranged in 8 groups thus:

A new arrangement was invented by Si-peh (= King Wen), appended to each of the hexagrams an explanatory outline, giving the general sense supposed to be conveyed by the figure, and his son Tan, better known as Chow-kow (Duke of Chow), added an analysis, showing how each line of the hexagram was to be interpreted so as to contribute to the general conclusion which his father had established. The deductions of King Wen and the Duke of Chow form the text of the Yi-king. Throughout the 64 chapters of the original work there is nothing whatever of a cosmological character; the compilers were entirely occupied with political and personal matters, endeavouring to draw from the oracles furnished by the starks and their representative symbols the probable results of certain courses of conduct which were in contemplation. The harmless divining, as it seemed to his father, with which the prisoner, Si-peh, employed his leisure, was in reality a means by which he was able to develop his revolutionary schemes without let or hindrance; none but himself knew the significance attaching to the harmless starks with which he amused himself; and when, in course of time, his liberty was restored, he was enabled to consummate his schemes with complete success.

A new element is, however, introduced in the 10 A PENDIX TO THE Yi-king, written by the imitator of Confucius, though it seems probable that only the first and second are properly attributed to him. To Confucius it seemed inevitable that the thought which had been expended upon the hexagrams should pass so easily on to his son, could not fail to be of permanent value, and that, though the political conditions which had first inspired their studies no longer existed, the lessons which they contributed might be applied with equal value to the troublous circumstances of his own times. Hence Confucius, in later life, devoted a great deal of attention to the study of the Yi-king, frankly acknowledging the difficulty he experienced in the interpretation of its cryptic phraseology and in adapting its lessons to his own enlarged conception of the scope of the work. Later commentators, building upon the theory that the three lines of the early trigrams represent the three powers—Heaven, Earth, and Man—attempt to transfer the lessons of the figures from the smaller stage of human affairs to the larger theatre of universal Nature. In the Appendixes, therefore, we discover, in an ever-ascenting scale, the application of the hexagrams to the constitution and course of Nature, and various later commentaries, in some of the material out of which Chu-hsi (Chuen, A.D. 1130-1290) developed his scheme of cosmogony and cosmology, which now represents modern Chinese philosophic thought on the subject.

A word of explanation may here be necessary in order to show the mechanism of the developed
system of the Yi-king. Each trigram bears a distinctive name, as well as a local habitation or direction, together with a natural allusion, quality, etc. Thus the 6th group, as arranged by Si-p'eh, or Pi-tao, the head of that group according to the earlier system, consisting of 3 unbroken or 'strong' lines, is designated K'un, which means 'untiring,' 'strength,' etc., and represents Heaven, a sovereign, a father, etc. Its locality or direction is north-west, its principal virtue is its fertility, etc.

The hexagrams are formed by the combination of 2 trigrams, and also have distinctive names. Each line bears a certain relation to the other lines; thus the first or bottom line in the lower trigram is related to the first line of the upper trigram, i.e. to the 4th line of the hexagram. The position of the various lines is a most important consideration—sometimes a 'strong' line is found in an 'empty' place, and vice versa.

An illustration of how this is the case is the Yi-king (SSE, xi. 71) may serve to indicate the method of interpretation. The 7th hexagram, known as K'un, is written thus: —consisting of the 2 trigrams K'un and K'ung K'un representing water, and K'ung K'un representing earth, suggesting, by the combination, waters collected on the earth, or, in the language of the diviner, multitudes of people musterling for purposes of defence or attack. The 'strong' or unbroken line occupies the most important place in the lower trigram, or the middle, second only to the middle place in the outer, or upper, trigram, which is the paramount position in the whole figure. The 'strong' line, therefore, occupying a secondary position, must stand for that of the weaker force: the line that occupies the highest position, i.e. the 5th line from the bottom—the middle line of the upper trigram—he would represent the sovereign. These, of course, are perfectly arbitrary preconceptions.

The Duke of Chow thus interprets the figure: 'The first line (receding from below), divided, shows the host going forth according to the rules (for such a movement). If these (rules) be not the good, there will be evil.' Legge adds: 'The line is divided in a strong place, a perfect stroke, this justifies the caution which follows.'

The second line, divided, shows the leader in the midst of the hosts. There will be good fortune and no error. The King has thrice conveyed to him his charge.'

The third line, divided, shows how the hosts may possibly have many commanders; (in such a case) there will be evil.' Legge explains this: 'If a divided triple place is on the line, it should be occupied by a strong line, instead of which we have a weak line in it. But as it is the top of the lower trigram, and its subject should be in office or active; there is a suggestion that perhaps the subject has vaulted over the second line, and wishes to share in the command. This would be true if the King were commander-in-chief. The lesson of the previous line is made of none effect. We have a divided authority in the expedition. The result can only be evil.'

The fourth line, divided, shows the hosts in retreat; there is no error.' Legge comments thus: 'The line is also weak, and victory cannot be expected; but in the fourth place a weak line is in its correct position, and its subject will do what is right in his circumstances. He will retreat, and a host is for him the part of wisdom.'

The fifth line, divided, shows birds in the fields, which it is advantageous (to capture and destroy). There will be no error. If the oldest son lead the host, and younger men be (also) in command, both will return safely; he may be, there will be evil.' Legge interprets the Duke's finding thus: We have a divided scene, and there will be trouble. The oldest son has vaulted over the second line, and wishes to share in the command. This would be true if the King were commander-in-chief. The lesson of the previous line is made of none effect. We have a divided authority in the expedition. The result can only be evil.

The topmost line, divided, shows birds in the fields, which it is advantageous (to capture and destroy). There will be no error. If the oldest son lead the host, and younger men be (also) in command, both will return safely; he may be, there will be evil.'

Legge interprets the Duke's finding thus: We have a divided scene, and there will be trouble. The oldest son has vaulted over the second line, and wishes to share in the command. This would be true if the King were commander-in-chief. The lesson of the previous line is made of none effect. We have a divided authority in the expedition. The result can only be evil.

If the eldest son lead the host, and younger men be (also) in command, both will return safely; he may be, there will be evil.'

The topmost line, divided, shows the great ruler delivering his charges (to the men who have distinguished themselves), appointing some members of the ruler to the post of commander, etc.; the eldest son is head of the clan. But small men should not be employed in such places, as they would give rise to complaints: 'The advantage of the hexagram has been gone through. The expedition has been conducted to a successful end. The enemy has been subdued.

His territories are at the disposal of the conqueror. The commander-in-chief has done his part well. His sovereign, the 'great ruler,' is pleased upon the success, and rewards the officers who have been conspicuous by their bravery and skill, conferring on them titles and lands. But he is warned to have regard to the moral character of the officers. Small men, of ordinary or less than ordinary character, may be rewarded with riches and certain honours, but there will be no reward for his territory should not be given into the hands of any who are not equal to the responsibility of such a trust.'

To turn now to the main deduction of King Wen, of which the above is the detailed explication. We find the lessons of the hexagram thus expressed: 'See indicates how (in the age which it supposes), with firmness and correctness and (a leader of) age and experience, there will be no error.'

It will be observed, from this example, how the character of the lines (whether divided or un-divided), their place in the hexagram (whether odd or even, e.g. 1, 3, 5; or 2, 4, 6), and their interaction with other lines (corresponding to 5, etc.) are all of great importance in the explication of the lessons they are supposed to convey. The mutual relation of the 2 trigrams in each hexagram is also a matter of importance.

This specimen will serve to show how little there is of any cosmological element in the original Book of Changes, and how far the modern commentators have wandered from the intention of the compiler and his earliest expositors; in fact, it was only by an extraordinary form of the inner or lower trigram, by various modes of divination, and the introduction of entirely new ideas in the Appendixes, that Chucius succeeded in building up the system which is attributed to him, and which has only the slightest affinity with the diagrams of King Wen. A parallel might be established between the diagrams and our modern playing cards, in which the calendar may be said to be represented, though with no cosmological intention, the 4 suits representing the 4 seasons; the 13 cards in each suit = the 13 sidereal months; the 52 cards = the 52 weeks of the year; the 364 pips (including the value of the 'coat' cards) = the days of the year, etc.; and, as the cards are now employed by pretended 'fortunetellers' as a key to the secrets of human existence, so the hexagrams of King Wen came to be applied, in course of time, to issues much larger than were ever contemplated by their inventor.

The chief exponent of the modern system was Chucius, whose name is prominent amongst the philosophers of the Sung school of the 11th and 12th centuries in China. Confucius and Mengius were practical philosophers, but Chucius was not content to accept the traditional Heaven and Earth, which had been sufficient for the great teachers who preceded him; he endeavoured to establish a systematic theory of the origin of all things, finding in the Yi-king, as he supposed, a groundwork for his researches.

He was further aided in his speculations by Taoistic and Buddhist suggestions, as well as by other philosophic concepts which may well have reached China by that time, and which to an ardent and omnivorous student would prove attractive. It is highly probable that he was familiar with Persian and early Christian ideas propagated by the Nestorian teachers in the centuries preceding him.

It is very important to bear in mind that the earliest conception of cosmology (the universe was a theological one, while the later system of Chucius is philosophical); and it is owing to this fact that Chucius found himself involved in frequent difficulties in the endeavour to harmonize the two. The Taoistic or philosophical concept takes its starting-point from Shang-ti, or Heaven; the Taoistic or philosophical concept goes no further back than the 'Great Extreme'; but Chucius, though professedly no theologian, appears unable to elimin-
COSMOGONY AND COSMOLOGY (Chinese)

ate from his system some traces of the ancient conviction that behind all phenomena there is a power, variously described as Heaven, the 'Controller,' the 'Great Framar' (or 'Potter'), etc., while he shrank from any suggestion of anthropomorphism, and disclaimed the view that that power actively interfered in the affairs of men.

As a matter of fact, the theories of Chucius are not intended to account for ultimate beginnings; his conception of the present world is that it is but one of a long series of similar existences which have-flourished in turn, and have been corrupted, exhausted, and destroyed, and have given place to a new world. He makes no attempt to explain how the primal element came into being, but finds its starting-point in the theory of the existence of a Natural Law which he denominates Li, or 'Robot.' He calls Ki (pronounced Chee). He does not inquire wherein this Law resides, or where this vital 'breath' is derived from. The theologian may contend for the recognition of a Divine creator or framor, but Chucius, though he does not take the argument, declines to discuss the subject.

In inquiring, therefore, into the evolution of this present world, he finds its material basis in Ki (vapour, breath, air, etc.), and its active principle in Li, and both are divided in their nature, as existing before the clock of time began to strike, yet admitting of a priority of order in the case of Li. The alternate action and inaction of Li, in the sphere of K', produced the positive and negative forms, Yang and Yin, variously represented as Light and Darkness, Heaven and Earth, Male and Female, etc., whose vices are the Tao, or Course of Nature, as reflected in the 4 seasons, the alternations of day and night, etc. The Yang and Yin contain the 'Five elements' in embryo, viz. metal, wood, water, fire, and earth, of which water and fire are regarded as the simplest forms. Each element possesses a Yang and a Yin quality, and all are pervaded by the Tao. As a result of the interaction of these two forms—ie. the Yang and the Yin, which are in constant motion—a certain amount of 'sediment' is precipitated to the centre of the whirligig mass and becomes Earth, whilst the Yang and Yin have a central axis: the Earth is divided by the spontaneous coagulation of the finer essences of the five elements in the Yang-Yin, forming a hermaphroditic being, which, in course of time separated and gave birth to the male and female species which now constitute the human race.

It will be seen at a glance how far removed these theories are from the system of divination attributed to King Wen, and it seems inevitable that they represent an interpretation of that system entirely alien to the purpose which inspired its first exponents. From Chucius' own words, we are led to conclude that the study of the Yi had made little progress during the centuries which had elapsed from the days of Confucius until his own time. It seems probable that the later Appendices, popularly ascribed to the great 'Master' himself, belong to a period long posterior, and they seem to reflect opinions which began to be current only in Chucius' days. Philosophers such as Shao-yang (A.D. 1017-1073), to whom is attributed the circular diagram of the Great Extreme, apparently made use of the Yi as a vehicle of Taoistic ideas, and applied to the 'strong' and 'weak' lines of King Wen the system of Yang and Yin, which nowhere appears in the text of the Yi, but which is suggested by the words of Lao-Tze in the Tao-Te-King):

'Two produced unity; unity produced duality; duality produced trinity; and trinity produced the innumerable objects; the innumerable objects, carrying the feminine or shadow principle on the one side, and the masculine or sunlight principle on the other, created a just balance by their respective clashes of primitive impulse or ether' (Parke's tr.).

It may be assumed, therefore, that the Chinese cosmogony is of comparatively recent origin, and that the ancient philosophical system is an attempt to accept the fact of the universe without abstruse theorizing as to its origin and method. The Sung philosophers adopted the trinomial figures of the Yi, but devised a new diagram of what they called the 'Great Extreme,' which circle intended to represent the ultimate principle Li, which, in their system, indicates the limit of philosophical discussion. This circle was subdivided thus:

To illustrate the interaction and constant gyrations of the Yang and Yin, i.e. the primal essence, or K' in its 2 forms, the motive power in which is Li. Another circle represents the K' as divided into its constituent elements, i.e., the five active principles—water, fire, wood, metal, and earth. Sometimes the four seasons are represented.

From these we may learn that, according to Chucius, the world came into existence as a result of the operation of Li, or 'Natural Law,' setting in motion the K', or 'vital essence,' which, by the interaction of its two forms, Yang and Yin, containing the 5 elements, threw off, in its perpetual revolutions, the excreta which coagulated respectively into Heaven, on the outward edge, and Earth, in the centre; and that the vices or essences of Yang and Yin account for the regular succession of day and night, the alternate waxing and waning of the same being the cause of the four seasons; and that, when the great cycle, pre-determined as occupying a kalpa, or 129,600 years, is accomplished through the exhaustion of the Yang element in man, as exhibited by moral declension and universal corruption, the whole system is resolved into its constituent elements, and a new heaven and earth are called into being.

Man's place in Nature.—As to the place which man occupies in this system, since man is compounded of the five elements constituting the K', or vital essence, in which the Li operates, he is described as a microcosm—a world in miniature—from which it follows that every man has within him a 'spark of the Divine.' In some men the Yang predominates; in others the Yin. Of the former are the Sages, the great men of past and present times; the latter are represented by the 'mean' men, the dull, the criminal, etc. As in the case of Nature, so man has his seasons of spring, summer, etc., and his days and nights, and, like the world, comes to an end by the exhaustion of the K', or vital breath. His great business, therefore, is to frame and fashion his life so as to live in conformity with the Tao, or observed order of the universe. No contrariety must be his motto. By so doing he may attain in time the proud distinction of being an associate of Heaven and...
Earth. As to his future, neither Lu-tze, Confucius, nor Chucius has anything to say; probably, from the philosophical point of view, death to them, though they would not discuss it, meant a return to the origin, rendering the idea of being at the end of its cycle of existence; or, to express it in the polite but equivocal phrase of ancient and modern days, a 'return to Heaven.'

The philosophic idea was, however, too lofty and remote to receive general comprehension, and, during the Sung dynasty, the tradition of a 'first man' was evolved, ascribing the ancestry of the human race to a certain Pan-ku, of whom it is stated in the Lu-shè (Mayers' tr.):—

'... it is said that the Tu had given birth to the two primary forms, and these had produced the four secondary figures, the latter undergoing transformations and evolutions, whereas the natural objects depending from their respective influences came abundantly into being. The first who came forth to rule the world was named P'an-ku, and he was also called the 'Undeveloped and Unequilibrated' (i.e. the Embray).'

This idea is now almost universally accepted by the mass of the uncultured in China, and by not a few of the scholar class, being, as it were, a sort of commonplace of the<D>ideal</D> thinkers of the Chucian philosophers as to the origin of man.

The place occupied by spiritual beings.—Though Confucius and Chucius (16 centuries later) were unwilling to enter into the question of spiritual existence, they did not declare the difficulties involved in such a theory, the fact that the earliest records refer so frequently to the existence of spirits made it necessary that a place should be found for them in the Chinese philosophy, and, accordingly, the ideas of Heaven and Earth being adopted as representing, so to speak, in personal form, the activities at work in the changing phenomena of Nature; but the ancient doctrine that the spirits are the ministers of God, carrying out his behests, and that the officers of State fulfilling the decrees of the sovereign, survives, in a somewhat debased form, in the popular opinion which invests the earth and air with a numberless host of good and evil spirits or demons.

The place of God.—In the earliest days of which we possess any record, Shang-ti, or God, appears to have occupied a chief place in the mind of China's rulers, but at the beginning of the Chow dynasty (c. 1100 B.C.), 'Heaven' and 'Earth' coming into prominence, representing the operations of God in Nature and Providence, and, as a consequence, Shang-ti is removed to a greater distance than that intimate relation in which he seemed to have stood, for his votaries in the earlier days. Later developments contributed towards the increasing of this distance, and the attitude of Confucius towards metaphorical and transcendental questions tended to whiten the chasm. Chucius appears to have relegated God to a position of infinite remoteness and unknowableness, though he did not deny the possibility of there being an ultimate ruling power, of whose existence individual students must satisfy themselves; and he referred to the 'Great Frame,' the 'Root of the Great Extreme,' the 'Heavenly decree which set in motion the primal elements,' etc. His conviction seems to be that God, or the 'Infinite,' invested the K's, or vital essence, with His own Li, or Law, and then allowed the creation to develop itself spontaneously, He Himself taking no further active share in the affairs of Nature or of human life. Such a contention, indeed, was directly contrary to the earlier beliefs, and led Chucius to adopt the theory of origin, to which he received opinions. He, however, steadily refused to discuss the matter, and insisted that every man should be 'fully persuaded in his own mind' and make his own investigations. Here again the agnosticism of Chucius was unable to overcome the immemorial persuasion of his fellow-countrymen, that the 'Supreme Ruler' interferes actively in the affairs of the nation, and sends forth His agents, including spirits and demons, to fulfill His behests. Hence it happens that Shang-ti is still worshiped officially by the Emperors of China, and Heaven is invoked by the mass of the people, whilst the spirits are solicited to exert their influence on behalf of their petitioners.

The theological conception has thus survived the philosophical, and, by a strange inconsistency, the materialism of Confucius and Chucius, as represented by the modern Chinese literate, is exhibited in a country which, above all others, is remarkable for its active provision of and frenzied addiction to the propitiation of spirits and demons.

W. GILBERT WALSH.

COSMOGONY AND COSMOLOGY (Christian).—Christian Cosmogony was not seriously perplexed by questions of cosmogony. They had come into a heritage, whereby they had grown up into the current Palestinian-Jewish ideas of the origin and constitution of the world. Moreover, they had pronounced the whole realm of Nature from the purely religious standpoint. 'In the beginning God' (Gen 1) was the primary article of their faith. It was Jahweh, the God of Israel, who had measured the waters in the hollow of his hand, and strewed out heaven with the span, and comprehended the dust of the earth in a measure, and weighed the mountains in scales, and the hills in a balance. . . . It is He that sitteth upon the circle of the earth. . . . that stretcheth out the heavens as a curtain, and spreadeth them out as a tent to dwell in. . . . I am Jahweh, and there is none else. . . . I form the light, and create darkness: I make peace, and create evil. . . . Jahweh do all these things' (Is 40:12-18, 21f; Ps 89:10f; 104:3). The Book of Job is likewise pervaded by this belief, and the same is true of Ps 89:29-33. Thus, 'Heaven' and 'Earth' (Mt 1:1) were derived from the sources from which the early Christians drew their conception of the material cosmos and God's relation to it. This simple religious view found free expression in their prayers: 'O Lord, thou dost make the heavens and all that in them is' (Ac 4:24). And Jesus had expressed His faith in the same direct and simple way. To Him God was 'Lord of heaven and earth' (Mt 22:45), who 'maketh his sun to rise on the evil and the good, and sendeth rain on the just and the unjust' (Mt 5:45). His heavenly Father also feeds the birds of the heavens, and clothes the grass of the fields (Mt 6:28f). The disciples, like their Master, were absorbed in the thought of the loving care of God for His creatures, and the_palette_3675 visualization of all His creatures. 'In him,' says St. Paul, 'we live, and move, and have our being' (Ac 17:28).

But the profound and enduring impression which Jesus made upon His followers soon constrained them to associate Him with the Father in the work of creation. It was He who had brought redemption from sin, and given them a glad new sense of sonship with God. But Lordship in the spiritual world must and did ultimately involve personal Lordship in the universe, and the whole realm of the Divine activity. This idea was early expressed by St. Paul, who says: 'To us there is one God, the Father, of whom are all things, and we unto him; and one Lord, Jesus
COSMOGONY AND COSMOLOGY (Christian)

Christ, through whom are all things, and we through him (1 Co 8:6; 1 Cor 12:13) for in him (the Son) were all things made; and things invisible, . . . and he is before all things, and in him all things consist (Col 1:16; cf. Heb 1:3). By faith we understand, says the author of the Ep. to the Hebrews, that the worlds have been framed by the word (Heb) of God (He 11:3). In the beginning was the Logos, says St. John, and the Logos was with God, and the Logos was God . . . all things were made by him (Jn 1:3; cf. Rev 4:11). The specific use of the word Logos by the Fourth Evangelist completed and confirmed a development which had been in progress for several decades, by which Jesus as the Son was definitely classed with God the Father, and associated with Him in the creation and government of both the visible and the invisible world. It also tended to reconcile and adjust the Christian faith to the late Jewish development of the concept 'wisdom' (Pr 8, Sir 24, Wis 8, and the like) and the current Hellenistic idea of the Logos (Book of Wisdom, Philo Judaicus, and the like). Christian cosmology henceforth was definitely related to the Person of Christ.

But the tragic fate which overtook Jesus, and his own utterances concerning the machinations of the 'prince of this world,' together with his telescopic sense of His 'dualistic' judgment, and the 'last things,' made a deep and solemn impression upon His disciples. Everything seemed to constrain them to believe in the presence of an opposing Satanic power in the universe (Ac 8, 27, 53; Jud 1:4). How was Satan to be accounted for? The early Christians assumed him in the form of the lawless one . . . whose coming is according to the working of Satan (2 Th 2:8); he declares that the 'whole creation groaneth and travaileth in pain together until now' (Ro 8:22), and that 'our whole being is now in a state of lessening, against the world-rulers of this darkness, against the spiritual hosts of wickedness in the heavenly places' (Eph 6:12). The Book of Revelation attempts to describe this great world-drama, this duel between good and evil, and the final triumph of the 'Lamb that hath been slain.' In this more or less incoherent and dualistic view of things, we have the outcropping of Babylonian and Persian ideas, which for the Jews had found a place in Jewish thought (see Test. Trev. Patriarch, Bk. of Jubilees, Bk. of Enoch, Assumpt. of Moses; cf. Mt 4:8-10; 15:23; 24:15. Bk. of St. Paul's teaching against the Jews infected by the half-assumption of the physical basis of sin, and he exhibits a distinct tendency toward asceticism (Gal 5:22; 1 Co 3:17; 7:25, Ro 7:14-16). The whole trend of thought within the Christian Church gradually became reactionary and ascetic. Some began to withdraw from material and social relations and to flee from the world. Asceticism entered as a constituent element into Christian ethics, and soon coloured the whole view of things, giving rise to certain cosmologies. If evil is inherent in matter, or, rather, if matter is inherently evil, the question of the creation and government of the world by an all-wise and beneficent God becomes seriously complicated. The Christians were, as a rule, inclined to emphasize the Genesis story of the 'Creation' and the 'Fall,' and thereby to shield God from complicity in the introduction of evil. But there were other and diverse accounts of the origin of the cosmos and the entrance of evil into it.

The Gnostics were not only the 'first Christian theologians,' but the first cosmologists and cosmologists. Indeed, their primary concern was to discover and develop a theory of the cosmos which should shield the Supreme Being from all complicity in, or responsibility for, its creation, which seemed to them to involve also the production of evil. They, accordingly assumed that the material cosmos arose through the more or less blind and perverse activity of the Demiurge, who was far removed from the Supreme God and the heavenly Piera. Although man was created by the Demiurge, he yet received, through 'Sophia,' form from the Divine nature, and is struggling to get free from his material bondage. Ascetic discipline is, accordingly, one of the means by which the Gnostic is to overcome 'sin in the flesh,' and secure salvation. Another means is the rational revelation which the Logos made to the world when he became manifest in the Christ. The 'prince of this world' must be overthrown by the Supreme God, who has sent his Son to rescue men from their bondage to evil. In these views we have but the exaggeration or perversion of ideas that were then present in current Christian thought, and which had come as a heritage from Judaism and environing paganism. In other words, Gnosticism betrays the seeds of the Christian faith, and its crude and fantastic cosmologies were, after all, only abortive efforts to solve the riddle of the universe in a supposedly Christian fashion. The cosmic views of the Gnostics persisted in material form in Neo-Platonism (q.v.) and in Manicheism (q.v.).

The Apologists, contemporaries of the Gnostics, fell back, as a rule, upon the simple 'Creation' and 'Fall' stories of Genesis, and thereby escaped the worst excesses. They also made ample use of the Platonic-Stoic-Philonian Logos idea, and emphasized the mediatorship of the Logos in the work of creation. They were likewise surcharged with a belief in demons and opposing Satanic powers, but these were a later development of the material cosmos and the overthrow of all hostile forces. Justin Martyr and Athenagoras speak of God as having fashioned the world out of formless material (639), but Theophilus declares that God created all things ex nihilo (Eccles. 33). Each based his assumption upon Gn 1:1-26 (Justin, Apol. i. 10, 29, 59, 67; Athenag. Apol. for Christ. i. 5; Theophilus, Autol. i. 6, 7, 10, ii. 4, 6, 10; cf. Tatian, Adtr. to Greeks, 5 and 12; Aristides, Apol. 1 and 4). The Apologists, as a rule, thought of evil as inherent in matter, and accordingly were inclined towards asceticism; but they preserved, to a degree, the simpler religious view of Apostolic times, which they derived mainly from the OT.

Irenaeus and Hippolytus rejected the Gnostic theory of the creation of the world by the Demiurge, and emphasize the function of the Logos-Son in the whole realm of the Divine activity. The NT writings are now quoted as authoritative Scripture, but the OT is also heavily drawn upon to explain God's relation to the cosmos. But, as was to be expected, these men were 'children of their own times,' although seeking to pass on a heritage. Some of the errors of the Apologists, especially the belief in evil as somehow inherent in material things. With some slight aberrations, the Church Fathers of the 3rd cent. were true to the unformulated cosmology of the OT and NT, coloured by the speculations of the Apologists.

COSMOGONY AND COSMOLOGY (Christian) 113

There was little thought upon these subjects. The leaders of the Church were content to follow the teachings of the Fathers, and Augustine's interpretation of the formation of the world was accepted without question. But there was no such accepted belief, or to try to explain it in a philosophical way, was John Scotus Eriugena. In his history of the writings of Dionysius he became acquainted with Neo-Platonic ideas, and he tried to apply these to the Biblical account of Creation. He departed from the views of the Fathers by bringing in the theory that all things emanate from God. His views are expressed in his book entitled Concerning the Division of Nature, including under the term 'Nature' the whole of cosmology, admitting that this sense is divided into four species: that which creates and is not created; that which is created and creates; that which is created and does not create; that which neither creates nor is created.

The first of these—that which creates and is not created—is God as the essence, source, and substance of all things, the one Being who truly exists. Eriugena's view is pantheistic, in that he teaches that God created the world out of His own essence. He believes that God is the universe, which He is and which is all. It was easy for Him to reconcile his apparent pantheism with the teaching of the Church, by saying that the Divine essence was the nothing out of which the world was created.

Through the Middle Ages the Schoolmen gave little attention to the subject of Creation. They were content to accept the views which had been handed down to them, and those who failed to agree with the views of the Church authorities were excommunicated. It was agreed that the universe came into being and was sustained and governed by the Divine will. Whether the six days of Creation were days of twenty-four hours each was open to some discussion; but two points must be agreed to by the orthodox, viz. that the universe was created out of nothing, and that it was not from eternity, but had a beginning in time. The most profound thinker on this subject in the medieval period was Anselm of Canterbury, who modified the traditional views by the introduction of Platonic ideas. He explains (Monolog. ix.) the meaning of the expression EX nihilo by saying that there is no way by which anything can be made by anyone unless is is in the mind of the one making it. Before creation things existed eternally, from God and in God, as ideas. They did not exist as individuals, but in the sense that God foresaw and predestined that they would be made. They were in the Divine mind as an example, similitude, or rule of what was to be made. Before the making of the universe it was in the thought of the Supreme Being, but no material existed of which it was to be made. Yet there is nothing in its relation to the mind of the One making it. By reasoning in this way Anselm is able to reconcile his philosophical views with the accepted interpretation of the account given in Genesis. There is one passage (Carm. Deus, Hymn. 1. 58) in which he implies that perhaps the six days of Creation were different from the days with which we are acquainted. Thomas Aquinas discusses the subject at considerable length, but adds little to the current views. He accepts the Biblical cosmology, and there is room for a difference of opinion about the six days. Like Albertus Magnus, he teaches that Creation was a miracle which cannot be comprehended by the natural reason. He believed that it was unable to think in its relation to the matter was not eternal, depressing the efforts of other men to make the temporal character of the material universe a matter that could be proven.
COSMOGONY AND COSMOLOGY (Egyptian)

He taught that it was an article of faith to believe that the world was created in time.

Contemporary with the schoolmen were the various heretical sects, differing in one respect from the orthodox in their views of the creation and government of the world. The most divergent from the commonly accepted views were the dualistic sects, which at the same time claimed to be Christian. They went by various names, such as Cathari, Albigenses, and so on. They seem to have gained their heretical views from contact with the religions of the East, where dualism was very common at the time. In general they held that there were two distinct creators, which had to do with the making of the universe visible and invisible. These two were the good and the evil, and both were from eternity, though some held that the evil spirit was originally good and became evil from his first estate. The evil spirit was the author of the OT, and the maker of all visible nature. He had created man as a physical being, and was the cause of all natural phenomena and all disorders in nature. The good spirit was the author of the NT. He was also the creator of the human soul, which had been captured and imprisoned by the evil spirit.

In the later Middle Ages there arose various schools of thought, some of these were heretical and frankly pantheistic. Others, like Eckhart, considered themselves orthodox Christians, but were unable to escape the suspicion of pantheism. Eckhart was in agreement with Aquinas in his belief that there existed from eternity a world of ideal, distinct entities from the world of creatures. He explained what seemed to his contemporaries to be pantheism, by saying that creatures are made in time and out of nothing, and that they exist from eternity in God in the same sense that a work of art exists in the mind of the artist before it takes material form. The existence of the creation from all time was in the Divine reason. God exists in created visible objects. The external world is but the reflection of the innermost essence of God.

The modern Roman Catholic Church holds to the teaching of Aquinas, but allows a difference of opinion on unimportant points. What a Roman Catholic must believe to-day in regard to cosmology and cosmogony is defined by the Vatican Councils. The Council declared against the statement that matter alone exists, and in opposition to the view that the substance and essence of God and of all things created are the same as in opposition to the view that finite things, both corporeal and spiritual, or at least spiritual, have emanated from the Divine substance, or that the Divine essence by the manifestation and evolution of itself became all things, or that God is universal or indefinite Being, which, by determining itself, constitutes the universality of things. The positive statement by the Council was that God from the very beginning of time produced out of nothing the world and all things both spiritual and corporeal.

The Protestant position, as given in the earlier creeds, is merely a paraphrase of the cosmology found in Genesis. The Westminster Confession states: "It pleased God in the beginning to make or create out of nothing the world and all things therein in the space of six days." (xv. 1.) The Belgic Confession is more explicit: "We believe that the Father by the Word created of nothing the heavens, the earth, and all creatures," and all things therein in the space of six days." (Art. xii.)

There is, of course, no authoritative statement for Protestantism relating to Christian cosmology and cosmogony. With the freedom of investigation which is now so general, there are many divergent views. Some still hold to the statements of the older creeds, and believe that the conclusions of science have nothing to do with religion. The extreme holders of this position are the Unitarians, by whom the world was made in six days of twenty-four hours each, but this view has a decreasing number of adherents. Others believe that the account of creation given in Genesis is strictly scientific, and that the statements there found correspond to or spirits, or to both. Others consider that the account in Genesis agrees with the facts only in a general way. Others regard the account as a myth or legend corresponding to the creation stories in Assyrian and Babylonian literature. The only points upon which modern Protestants agree are that God is the source of the universe; that it came into being as a result of the free exercise of His will; and that it is continually under His care and control.

See also art. Creation.

COSMOGONY AND COSMOLOGY (Egyptian).—We shall here divide this subject into three stages: (1) earth-myths, (2) sun-myths, (3) theology.

1. Earth-myths.—The attention of primitive man was naturally first directed to explaining tangible Nature—the earth, the sea, and the mists which lay on the land. The most elementary division between racial views is the sex of the earth and of the abyss or sea, which from its blue-slime was naturally thought to be the same nature as the blue sky—the heavenly ocean. In Egypt the sky (Nut) was feminine, the land (To) was masculine. Exceptionally in the 19th cent. B.C., when Scimitic influence was strongest, the sexes were reversed, so that Nut, the sky, was masculine, and Uaum, or 'earth' is feminine. Similarly in Babylonia, Ea (the deep) and Anu (the sky) are masculine, while Enkiu (the land) is feminine. The same attribution is adopted by Greek, Latin, and German, and in the New Zealand mythology. Egypt was, therefore, exceptional in the sex of land and sky.

These elements of land and water were thought to have been evolved in the primal chaos of the universal ocean (Nu or Nun), when 'not yet was the heaven, not yet the earth, men were not, not yet born were the gods, not yet was death' (Pyramid of Pepi I., I. 683).

This idea passed to Hebrew, along with the same sexes as in Egypt: 1 From chaos were generated Erebos (mascul) and black Night (fem.).

And from Night again were generated Ether and Day, Whom she brought forth, having conceived from thebraces of Flame. (Theog., 138 ff.)

He probably derived it through the Sidonians, who, Damascene asserts, 'believed that the first things place Grenos, and Osiria.' And by a connexion between Petos and Osiria, as the two principles, are generated Air and Aura.' This view then seems to be also shared by the Egyptians. (Petos, 1.)

The lifting of the watery mists, which are seen rising each morning from the Nile, the parting of them from the earth and the raising of them to the sky, was a work variously attributed.
(to Ra (the sun) or Shu (the atmosphere). The heaven (Nut) was forced apart from the earth (Keb or Seb); and usually Shu is represented as thrusting it upward. Similarly in New Zealand, the earth and heaven clave together in the darkness, and had produced gods and men. The gods try to part them, but cannot until the god and father of forests, birds, and insects drives in; his head is now thrust up on his mother the earth, his feet raise up and rest on the sky and firmament, and he exerts mighty effort. Now are rent apart Raangi and Papi, and with cries and groans of woe they shriek aloud. . . . It was the force thrusting of Tane which tore the heavens from the earth, so that they were rent apart, and darkness was made manifest, and so was the life.' (G. Grey, Polynes. Mythol., Lond. 1855, reprint, p. 33.)

In Egypt it was similarly assumed that Seb and Nut had produced Ra or Shu before they were separated.

2. Sun-myths.—The genesis of the sun (Ra) is variously attributed to Seb and to Nut. According to the view, Ra was 'the eg of the great cackler,' Seb being, by a play on words, equated with the goose. In another view, Ra was born as a calf of the celestial cow, or child of the sky-goddess, and this may be the motive for regarding the sky as feminine. Another, and a more general, view, when the theologie frame of creation came forward, was to posit the formation of Ra direct from the chaos Nun, and so make him an ancestor of mankind. There is no reason to suppose that the Heliopolitan Ra-worshippers, as distinct from the older Seb- and Nut-worshippers in the Nile valley. Ra came into being 'while as yet there was no heaven, . . . and there was nothing that was with him in the gloom where he was. . . . the last of all in the waters of Nun, and he found no place where he could stand' (Erman, Religion, p. 26). Ra then united with his own shadow, and from his seed created Shu and Tefnut, in the midst of the chaos. Shu certainly represents gods symbolized by an ostrich feather; Tefnut represents moisture. From Shu and Tefnut were born Seb and Nut; and from them, in turn, the Ostride family, and mankind.

The heaven was regarded as an ocean parallel with that on earth. It was on the heavenly ocean that the sun, the moon, and the stars sailed in ships each day and night. To explain the sun's re-appearing in the morning, they supposed a man, with his boat, with whom the sun sailed as by day. The dead were, on this view, considered as joining the boat of Ra, and sailing, under his protection, through the hours of the night as well as of the day.

258. Other deities associated with creation are many. Khnum, 'the Shaper,' who shapes living things on his potter's wheel, 'created all that is, he formed all that exists, he is the father of fathers, the mother of mothers . . . he fashioned men, he made the gods, he was father of the beginning . . . he is the creator of the heaven, the earth, the underworld, the water, the mountains . . . he formed a male and a female of all birds, fishes, wild beasts, cattle, and of all worms (Greek). Homer, vol. I, verses 150, 190, etc.; He, vol. I, is figured always with the ram's head, to signify his creative power, and was worshipped at the source of the Nile—the cataract. Pith, 'the Great Artificer,' the Demiurge, shapes the sun- and moon-eggs on his potter's wheel; he is the god of law and order who created all things by Mmrt, truth or exactness. Osiris 'formed with his hand the earth, its water, its air, its plants, all its cattle, all its birds, all its winged fowl, all its reptiles, all its quadrupeds; he was the embodiment of the primitive idea of Osiris as a god of vegetation. Amom-ka, also, on the growth of his worship when Thebes was the capital, became 'the father of the gods, the fashioner of men,' and all other things (see Wiedemann, loc. cit.), Thoth, according to Hermopolite legend, when in the chaos of Nun, created Seb and Nut by his word; and they were parted asunder at Hermopolis. This tradition is an essentially highly spiritualized idea of later times, and is seen in the Kore Kosmou (500 B.C.), where Thoth-Hermes is first of the gods.

Other sky-gods are Anther, 'He who goes above,' god of Themis or Orithyia and Horus as the sky-supported by four pillars who are the four sons of Horus. The mixtures of ideas in later times are so complex, and so combined with the theology, that we cannot touch on them here. Our object has been to show the primitive idea in the various nuclei of thought which were combined.

Since the word 'cosmogony' describes the origin of the universe by the figure of birth, it suggests to us in the first instance accounts more truly poetic and mythological kind. Yet science also has its fairy tales, and one who sought for information about Greek cosmogonies might not unreasonably look at Homer, for example, which is contained in the Timaeus. If this be introduced, so should those of one or two other philosophical systems. We propose, therefore, to deal first with what may be called the poetic cosmogonies, and afterwards with the philosophic. We shall devote rather more space to the former, as being probably less familiar to most readers. In the case of the latter, we shall take three typical examples, describe them briefly, and try to show the primitive idea in the history of Greek thought as to the relation between God and the world.

1. Poetical Cosmogonies.—I. Homer.—We find in Homer not only a cosmic cosmogony, but ideas of a cosmogonical kind, or, rather, of a geogonical, as all he is concerned about is the world in which we live. In H. xiv. 246, Oceanus is the father of all the gods, and in xiv. 201 he is the father, and Tethys the mother. The latter name is derived from the Greek term, on which the word in its full form, cosmogonion, p. 154 n. from θεόθεν, 'to suck' (θεόθεν = 'nurse'). Tethys will then symbolize the sucking mother, Earth. But behind these Nature-powers stands a third still more august, the goddess Night. In H. xiv. 244, she is referred to by a term, which, however, is not a word for a goddess, but, indeed, but more potent, than Oceanus; Night, on the other hand, even Zeus fears to offend (ib. 259 ff.). Lukas, therefore, follows Damascius (6th cent. A.D.), our chief authority on the first principles of the Greek cosmogonies, in supposing that, for Homer, Night was the supreme geogonical conception (Damasc. περὶ παρέχοντος τῆς ζωῆς, c. 124, ed. Kopf, 1826, p. 382).

2. Oldest Orphic cosmogony.—To this head Lukas refers those fundamental conceptions which in various fragmentary notices are directly ascribed to Orpheus. Not the least evidence of their antiquity is their practical identity with what we have found in Homer. Eudemos the Peripatetic declared, according to Damascius (loc. cit.), that Orpheus made his beginning with Night. John Lydus (6th cent. A.D.) stated that Orpheus' three first principles were: Night, Earth, Heaven (Lobeck, Aglaoph. 1829, i. 494). Plato, again, quotes a complete set of the gods as from Orpheus, and states that he was the discoverer of the first theological pair (Cret. 402 B), while he informs us in the Timaeus (41 A) that Oceanus and Tethys were the offspring of Earth and Heaven. As the former statement is expressly referred to Orpheus, we may be sure that he had the same

Vol. IV. — 10
real or fancied authority for the latter. In this Orphic cosmogony, it will be seen, Oceanus and Tethys are a degree less venerable than in Homer; Earth and Heaven are the older pair. Yet the difference is insignificant, and here, as in Homer, they are not quite genuine beyond. According to the Gruppe (Griech. Culte, etc., 1857, i. 613 f.), the cosmogony of II. xiv. was borrowed from the Orphics. But the question of their relation is an extremely difficult one, and cannot be disposed of here.

3. Hesiod.—In the introduction to his Theogony, Hesiod actually names Earth, Heaven, and Night—the reputed Orphic trinity—as the sources of the gods (verses 106–107); and one feels that, whatever its origin, he is using a familiar and probably ancient formula. But, at the outset of the poem proper, he proceeds to give us what in fact, though not in name, is a cosmogony of his own (verses 116–136). Its outline is as follows: In the beginning was Chaos, after whom, on the one hand, came Gaia and Eros, and, on the other, Erebus and Night. Erebos and Night were the parents of Ethe or Light) and Day. Gaia of herself produced, first Uranus (Heaven), that he might live in seclusion, and that she might be a secure dwelling-place for the gods; and after him the mountains and seas. Lastly, mating with Uranus, she became mother of all the gods, except the few who sprang from Erebos and Night. At the beginning of Hesiod’s cosmogony stands Chaos. Its meaning has been variously interpreted by ancient no less than by modern commentators. It has been taken for Water, Air, Fire, and Space (cf. for ref. Lukas, op. cit. p. 157 f.). Etymology has been appealed to in connection. But no derivation seems more probable than that from χαος (the root of χαορε, ‘to gape,’ χαορε, χαορα, Lit. hiceo, hieus, etc.). Thus we get the meaning of Space, and this further accords with the manner in which Hesiod seems to have arrived at his first principle, viz. by abstraction. In pondering the origin of the universe, he thinks away one by one its various contents, until he reaches Space as the final presupposition of all things. As Time comes to the Orphics, as the Phicomimata of the Greeks, and, as we shall see, in some Greek cosmogonies, so does Space in this of Hesiod. Zeller (Pre-Soc. Phil. i. 83 f.) agrees with Lukas that Space was Hesiod’s first principle, and that he reached it by abstraction, but that Hesiod took it as an innumerable, waste, and formless mass, while Lukas understands it by the mere unlimited void.

On the next cosmogonic stage we have two pairs, of which the first is Gaia and Eros. Gaia is Earth, not however as an element, but as a vaguely conceived mass. There is, at first sight, something detached about the appearance of Eros. He enters the stage with the others, but seems to perform no role. But the reason is that he is a potency rather than a person. He is the soul of all the unions here recorded. He is the Eros, not of art, but of early local cult like that at Thephae (‘Paus. ix. 27. 1), who was life and love in one, and was taken over by the Orphics (cf. Gomperz, Gr. Thnikos, i. 89, and, for the connexion of Eros with the Orphics, J. Harrison, Proleg. to Gr. Relig. ch. xii.). We are not told how Gaia and Eros came into being. They may symbolize matter and spirit, but not derived from Chaos as a higher principle. The ruling principle of the cosmogony is not that of cause and effect, but that of sequence in time. We only hear that Gaia and Eros came afterwards (ετερα). And the same is doubtless true of the ‘pair, Erebos and Night. They are said to have come εκ Xaορο, but the εκ may be merely local (Space being referred to), or temporal, or both. Accordingly Gaia, Eros, Erebos, and Night occupy together the second cosmogonic stage.

A step further removed from Chaos are Αθας and Day, who are children of Erebos and Night. So the unrelied darkness gives place to the brilliance of the sun. At this stage Hesiod gives birth to Heaven, that he may shield her with his vault, to the mountains also and the seas; and then, when all is ready for their reception, Earth and Heaven coming the parents of the gods. In Hesiod’s cosmogony there is no real attempt to explain the causes of things. But it has, according to Lukas, two elements of speculative worth—the conception of purpose in creation (the provision of a safe home for the gods), and the far-reaching abstraction by which the poet goes back to Space, and then step by step reconstructs the world.

Passing by Aemilius, a prose chronicle of the 6th cent., and, like Hesiod, a native of Boeotia, whose cosmogony, contained in Damascius, resembles Hesiod’s, and has also a marked Orphic colouring (Lukas, op. cit. pp. 162–163), we come next to—

4. Pherecydes.—He was a native of Syros, but lived at an uncertain period. His works have been come down to us from ancient times, and which relate to various parts of his cosmogony, enable us to form, though with reserve on some disputed points, a tolerably full as well as reliable estimate of his system (cf. Lukas, op. cit. p. 124, ed. Kopp, p. 384) and Diog. Laert. (i. 119). Pherecydes derived the universe from three first principles—Zas (=Zeus), Chronos, and Chthonia (or Chthon). At the summit of the cosmos, then, stands Zeus. He is probably best regarded as a purely spiritual principle (so, e.g., Arist. Met. xiv. 4, 1091 a, and many others, but cf. e.g. Zeller, op. cit. i. 91), so far as mind was consciously distinguished from matter at that early date. The Cosmological problem is therefore confirmed by the statement of Proclus (5th cent. A.D.)—which at the same time presents a new and interesting phase of the cosmogony—that the Zeus of Pherecydes changed himself into Eros when he meant to create the world (Το ζεύς τον χρόνιον τον κόσμον τον ζεύς τον κόσμον τον ζεύς). Besides the three first principles of Pherecydes were alike eternal (ευζων ζεύς).

The cosmogony begins when Chronos produces from his seed Fire, Air, and Water, who then in turn beget the five families of the gods. Thus gods and elements alike are the offspring of Time. And Zeus—Eros plans to create the world. But at this stage, according to Max. Tyrins (Dissert. xxix. p. 301, ed. Davis; cf. also Celsus op. Origem c. Cels. vi. 42, et al.), a fearful conflict intervenes between Chronos (not to be confused with Chronos) and
dragon Ophionenus for the lordship of Nature. Only when Cronos wins and the dragon is cast into the sea can Zeus set about his creative task. The epiphany is not quite of a god with the cosmogony, since Zeus is from eternity,—there is no Cronos before him. But there is no reason to doubt that Pherecydes employed the myth. Perhaps, as Philo of Byblus states (op. Esp., Prep. Ev. i. 10, 33), he borrowed it from Phenician sources. In any case the meaning is clear: before the ordered world, the chaos can be established, a victory must be won over the forces of disorder.

The final stage is related by Clem. Alex. (Strom. vi. 621 A). Pherecydes, the Syrian says: Zos makes a mantle, large and fair, and broders it on earth and ocean and ocean's dwellings.' Again he speaks (ib. 642 A) of 'the winged oak and the embroidered mantle that rests upon it.' The winged, or borrowed of Pherecydes before than Gomperz, the embroidered if the Pherecydes found of the World-Egg. In the other hand, there is a certain suggestion of science in the cosmogony. The four elements are named before the formation of the world. So far, indeed, as our accounts go, Pherecydes does not work the suggestion out. On the other hand, he clearly treated Eros (Love) as a cosmical principle, and one cannot but suspect that, if his whole work had reached us, we should have found that Zeus—Eros used the elements as materials for his creative task.

Damascius (c. 124, ed. Kopp, p. 385) gives a fragment of a cosmogony by the Cretan Epimenides (c. 600 B.C.). In this cosmogony we meet for the first time among the Greeks the doctrine of the World-Egg. It is little more than a suggestion, and so we shall pass at once to give some account of the later Orphic cosmogonies, in which it plays a prominent part.

5. Later Orphic cosmogonies. — In a former section we dealt with the stories of the origin of the world which were ascribed to Orpheus, but here we are dealing with entire systems. They are highly mystical and pantheistic, and, though fanciful and grotesque, are most natural and inevitable. They form the third, and probably the last, great philosophical synthesis. Hence some critics like Zeller (op. cit. i. 100 ff.) refuse to regard any of them as earlier than the 1st or 2nd cent. B.C. Others, however, assign a much earlier date to the one which Damascius tells us was contained in the current 'Rhapsodies,' and which he describes as the usual Orphic theology. Thus O. Gruppe (in Roscher, s.v. 'Orphes') argues strongly, but cautiously, in favour of the view that it was formed in the 5th cent. B.C. on the basis of a still earlier Orphic myth. To this system we now turn our attention.

(1) Rhapssidiot cosmogony.—This includes what the Orphies taught both about the Divine nature and about its relation to the world. The fullest account of the former is contained in Damascius (c. 123, ed. Kopp, p. 380). He must, indeed, be used with caution, owing to his Neo-Platonic bias. Lukas points this out, but thinks he may be trusted for the main principles. In any case the evidence is still earlier Orphic principles. In this he seems to go too far, but, if we combine all that is essential in Damascius with what we learn from other sources, especially Orphic fragments (for which cf. Gruppe, loc. cit. p. 1130), we reach the following result, which will be found in essential agreement with what, for example, is contained in Zeller (op. cit. i. 104) or in Gruppe (in Roscher, s.v. 'Phanes'). At the summit of the system stands Chronus (Time). Next comes Aether (bright, fiery substance, cf. 'Stoic cosmogony' below) and Chaos (Space). Lukas observes that, though Time is named before Space, it is not viewed as producing it, but merely as the active principle, while Space receives that which arises in Time (but cf. Zeller, l.c.). After Aether and Chaos comes the Egg, which is viewed sometimes as the offspring of Chronus and Aether (fr. 53), sometimes as that of Aether and Chaos (Proclus, Tim. i. 138). In either case it springs from the Sea, as Lukas calls it, an Egg of Light. Damascius elsewhere describes it as ?arkfepwv, 'silver-white.' And it deserves the name, not only because it was formed from the light of heaven, but because from it, as we shall see, Phanes, the light of the world, proceeded. Finally, there issues from the Egg the first Orphic god. Damascius, who favours trinities, calls him Phanes-Ericapens-Metis, which is generally interpreted 'Light, Life-giver, Counsel.' But, above all, he is Phanes 'Light.' Phanes will give the light of reason, the light of life, and—for he is also Eros—the light of love. As first-born of the gods he is Protogonos. There is something sublime in these concepts, but the Orphic also 'polymorphic, a best-mystery god, a creature monstrous and grotesque, as in the fragment quoted by Proclus (Tim. ii. 130):

'Heads had he many,
Head of a ram, a bull, a snake, a bright-eyed lion.' (J. Harrison, op. cit. p. 563.)

Such was the Orphic doctrine of the Divine nature. It had one feature which, according to Lukas, gave speculative value to the Rhapssidiot cosmogony. This is the effort to explain the evolution of the world. While many cosmogonies begin with a Divine being, the Orphic sees in his God the last stage in the evolution of life out of the life-less.

We have next to consider Phanes' relation to the world. He had in him all the forces, or e'tpwrpa, out of which it sprang. Hence, though he was sometimes called its creator, he was generally thought of as having given it birth. The idea took the form that the succession of dynasties of gods represent the successive stages in the evolution of the world. In this process, part of the god became the world's life; with the other he withdrew as sun into the heavens, where only Night could be with him: yet this, while his splendour amazes the other gods. But when Zeus attained to sovereignty he devoured Phanes. Thus the old order was dissolved, but thus also Zeus became the sum of all things. He became Phanes (see next section), and from him a new race of gods, a new world, sprang. In his son, Dionysos, the god of the mysteries, Phanes was born again. Like Phanes, Zeus became the world—Ze?a sov? ?arh, ?e? 7r' a tara r?r?vra (fr. 125),—but, with Dionysos, he is not apart, for his mind was the other (Gruppe, in Roscher, s.v. 'Orphes' and 'Phanes'; Pauly-Wissowa, s.v. 'Orphes'; Zeller, op. cit. p. 104 f.; J. Adam, Relig. Teachers of Greece, p. 95 f.; Lobbeck, Aigypt. 515 ff.; fr. 129 f.).

The story of the swallowing of Phanes has usually been explained as a device to recover for Zeus his ancient dignity as source of life—for had he not long ago devoured Metis and borne Athena? This could be done by assuming that Rhapssidiot Phanes who was also Metis. But Gruppe sees in the story a different motive. It was to depict the periodic renewal of the universe, which he regards as the ground thought of the Rhapssidiot cosmogony. This was a feature of Stoic cosm-
COSMOLOGY AND COSMOLOGY (Greek)

COSMOGONY

The cosmogony (see below) to which the Orphic doctrine has other points of resemblance—especially its pantheistic materialism, and its view of Αθήνας as the principle of Divine life. On the whole, it is difficult not to believe that they were in all of the two cosmogonies, on which ever side the borrowing lies.

(2) The cosmogony of Hieronymus and Hellanicus is often theistic ever be published (see also) and, as far as its original form, in accordance to the same law which governs every living thing.

(3) Before leaving the Orphic cosmogonies proper, we may note three others of minor importance.

(a) The first and the best known is that of Apollonius Rhodius (3rd cent. B.C.), who in the Argonautica (I. 494 ff.) puts into the mouth of Orpheus some version of the world cosmogony. In this the separation of the four elements is ascribed to the action of Discord—an idea evidently borrowed from Empedocles. The legend of Orphic cosmology and chronology, which was by Pherecydes in Proto-Orphic cosmogony, is not what different and, judging by internal evidence, less authentic form (cf. Gomperz, op. cit. i. 91).

(b) Alexander of Aphrodisias (3rd cent. A.D.) gives us the following series: Chaos, Oceanus, Night, Uranus, Zeus. This, it will be seen, resembles the older rather than the latter form of Orphic cosmogonies.

(c) Lastly, the author of the Clementine Recognitions (x. xvii.) gives a brief summary of Orphic doctrine. Some of the first principles, notably the Egg and Pan, are found in the Rhapsodist cosmogony, but the account as a whole is less coherent, and strikes one as probably less accurate, than that of Damascius.

6. Aristophanes.—In one famous passage (Ae. 692 ff.) he says, Here Time is viewed as force—force which presupposes matter to work on. The Orphic imagination runs riot in depicting this force. Chronos is a winged dragon with the heads of a bull and a lion, and betwixt them a serpent.—In the Choruses of Hecuba, Chronos-Herakles—Ananke—Adrasteia. Herakles betokens his might, Ananke his necessity, Adrasteia his inevitability. Next, Chronos produces Αθήνας, Chaos, and Erebus. We met Αθήνας in the Sphere of Chaos in the Rhapsodist cosmogony, but here they follow after the primary matter, and so Αθήνας is more grossly conceived as άνακτόρ (ένακτορ). In the same way Erebus is μιστή (μιστήνεα). Lastly, in the midst of the vaporous space, with its mingled light and gloom, Chronos produced an Egg (φελλός, φέλλος). This naturally implies that it partook of the substance with which space was filled. It was, therefore, formed out of grosser elements than the Egg of the Rhapsodist cosmogony. Thus also we are told out of the void or space within it the female, and likewise of all manner of things without life. For this reason it better deserves to be called a World-Egg. But it is not an Egg of Light. And, lastly, we have the same contrast in the Divine Being, the Maker and Ruler of the world, who issues from the Egg. In his monstrous and grotesque form he resembles the first-born God of the other cosmogony. But he has lost his title of Φάνας, the god of light, and appears as Progynos-Zeus-Fan.

As compared with the current Orphic doctrine, that just examined is marked by a certain coarse realism. Both in form and spirit it is less distinctively Greek. In some points, indeed, it closely resembles the Phoenician cosmogony, and Zeller maintains that its author borrowed directly from that source (op. cit. i. 102-3 n.; but, on the other side, cf. Gruppe in Roscher, s.v. Orpheus, p. 141).

In describing the Orphic doctrine, Athenagoras, who was a Christian, might have selected the cosmogony of Hellanicus and Hieronymus because he saw most in it to condemn. But what specially concerns us is the form in which he presented it. The series begins with Water and Slime, and out of these Chronos-Herakles is evolved. But here the resemblance to Damascius is made. Both the firstborn ones are made of Chaos, Chaos, and Erebus. Chronos-Herakles produces a gigantic egg, which breaks into halves, of which the upper forms the heaven, and the lower the earth, as in Orphism. In none of the two cosmogonies does there exist any notion of speculative value. The egg has no special significance beyond its shape. On the other hand, in the cosmogonies described by Damascius, the World-Egg is an expression of the profound thought that the universe is an organism, gradually formed from its original form, in accordance to the same law which governs every living thing.

7. Aristotle calls those whose doctrines we have been considering, represent a perfectly distinct phase of Greek thought. 'Their mind was less scientific than that of the philosophers. It was only the need of male and female, and likewise of all manner of things without life. For this reason it better deserves to be called a World-Egg. But it is not an Egg of Light. And, lastly, we have the same contrast in the Divine Being, the Maker and Ruler of the world, who issues from the Egg. In his monstrous and grotesque form he resembles the first-born God of the other cosmogony. But he has lost his title of Φάνας, the god of light, and appears as Progynos-Zeus-Fan.'

As compared with the current Orphic doctrine, that just examined is marked by a certain coarse realism. Both in form and spirit it is less distinctively Greek. In some points, indeed, it closely resembles the Phoenician cosmogony, and Zeller maintains that its author borrowed directly from that source (op. cit. i. 102-3 n.; but, on the other side, cf. Gruppe in Roscher, s.v. Orpheus, p. 141).

In describing the Orphic doctrine, Athenagoras, who was a Christian, might have selected the cosmogony of Hellanicus and Hieronymus because he saw most in it to condemn. But what specially concerns us is the form in which he presented it. The series begins with Water and Slime, and out of these Chronos-Herakles is evolved. But here the resemblance to Damascius is made. Both the firstborn ones are made of Chaos, Chaos, and Erebus. Chronos-Herakles produces a gigantic egg, which breaks into halves, of which the upper forms the heaven, and the lower the earth, as in Orphism. In none of the two cosmogonies does there exist any notion of speculative value. The egg has no special significance beyond its shape. On the other hand, in the cosmogonies
the universe from a single, and that a material first principle. They discussed more or less fully the nature of the changes which the primary matter underwent, but the ultimate cause of the movement, by which the world in all its parts was formed and developed was stated in which the Pythagoreans subscribed to which Thales and his immediate successors had little or nothing to say. The reason was that they regarded the cause as inherent in the nature of matter itself (Gomperz, op. cit, i. 56). This was also true of Heraclitus of Ephesus (600 B.C.): to him also matter was ‘organically alive’ (ib. p. 60). But a great step in the history of Greek speculation is marked by his doctrine of the Logos, by which he gave expression to the thought that the world-first created ‘by Logos’ was a continuous development, a process, by which the world was being formed. He taught, indeed, that all reality is reason, and that the primary element is Fire; but, as he assigned to the latter the attribute of reason, he called it also the Logos. In other words, the Logos is the Fire viewed on its spiritual side, was the Logos (J. Adam, op. cit. p. 224). Here, then, a first principle was postulated, which was at once rational and material, and it is on this basis that the whole of his cosmology (see below) was afterwards reared. But before that time the great thinkers of Greece had sought to show that the world was framed by God as at once a rational and non-material being, and Heraclitus at least passed the threshold of this conception when he endowed his First Cause with the attribute of reason.

2. The first Greek philosopher who traced the world to a non-material agency was Empedocles (c. 480 B.C.). He did this in his doctrine of the four elements, whose movements were determined by the twofold agency of Love and Discord (J. Adam, op. cit. p. 245). But a far more important step in the direction of idealism was taken by Anaxagoras, who, though not quite as early as Empedocles, probably had the work of the latter before him when he wrote (ib. p. 234). According to Aristotle, it was Anaxagoras who first pointed to the real cause of the movement by which the world was formed, this cause he named Nous, or Reason, to which also he seems to have contributed, if not exclusively, transcendent existence (ib. p. 371).

3. Plato.—Though Anaxagoras did not make much use of his great conception, it led to far-reaching results. Its influence is seen in the view the opposition between matter and spirit. The opposition may not be absolute, but it was naturally the distinction between the two which first occupied the attention of philosophers. It was the chief problem of Plato's Dialectic. But it is with its cosmological aspect that we are here concerned. If the First Cause was purely immaterial, how could he act on matter at all so as to create the world! In this question and the answer to it lies the chief significance of the cosmogony which Plato has set before us in the Timaeus:

Even apart from much that does not strictly belong to it, the cosmogony of the Timaeus is fascinating, but here it will be enough to consider its main ideas. For a fuller exposition and discussion the reader may be referred to Jowett's Plato, vol. iii., or to Adam, op. cit. p. 260f.

God formed the world out of matter so tractable that it could not be completely moulded to his will. But he introduced into the primary substance 'as many proportions as it was possible for him to make,' in order to give it all the powers, which thus resists the Creator, Plato calls 'Necessity.' It is the root of evil in the world, and as it will not wholly yield to God, 'the Creator in Plato is still subject to a remnant of Necessity which cannot wholly overcome' (Jowett, 'Plato,' iii. 391).

In forming the world, God gave it a Body and also a Soul. (1) The Body. On certain portions of primary matter, which was formless and chaotic, God imprinted various mathematical 'forms' and numbers' (Tim. 53 B). Thus arose the four elements of which the body of the universe was composed. The idea of a Divine mathematician, who, under the guidance of the Logos, created the World-Soul, is one which runs through the whole account of creation. According to Plutarch, Plato said that God is always playing the mathematician (θέα δὲ γεωμετρεί). (2) The soul. Plato describes the elements of which the World-Soul was composed, but his account is highly metaphysical, and need not detain us here. It is enough to examine its attributes. Of these the first is Motion. It is manifested in every movement (Tim. 30 D), but in other aspects, not directly referred to in the Timaeus, which are important in estimating the nature of the World-Soul. According to the Laws (x. 866 A), the essential quality of soul is self-movement. Further, the Soul is the cause of movement in other things, and by movement (κίνησις) Plato understood every kind of change (ib., Phaedrus, 245 C). The World-Soul, therefore, is the cause, not only of the motion, but also of imotion, growth, decay, and dissolution (J. Adam, op. cit. p. 368). The second attribute is Intelligence. It is here to be taken in the widest sense, for we are given to understand that the World-Soul apprehends not by ideas, but by intelligences, and such as lie between the two (ib. p. 369 f.). On the other hand, 'the World-Soul, as described in the Timaeus, has nothing analogous to the principles of anger and desire . . . which, according to Plato, constitute the necessary causes of the actions of the human soul' (ib. p. 370). Plato speaks of the World-Soul as created. In what sense he used the term he nowhere precisely explains, but there can be little doubt that he thought of an uncreated principle. Such is the view of the author just quoted, who thus sums up the cosmogonical process: 'At the beginning of Time, God created the Universe. A spirit or soul went forth from him, and inhabited the body which he redeemed from chaos by imitating mathematical forms on primordial matter' (ib. p. 373).

The universe, thus formed of body and soul, is described as ἄνθρωπος καί μοίχη, μαντεία, 'image of its Creator, only-begotten.' Thus it is related to the One, as the Son to the Father. Hence the Ἰδέα αὐτοῦ, or 'perceivable god' (Tim. 92 C). On the other hand, the Creator is a Being mysteriously remote, 'hard to discover' (ib. 28 C), who, when He had made the world, 'abode in his own nature' (ib. 42 E).

We may now see how the Platonic cosmogony was an attempt to explain the world on dualistic principles. Since God as pure thought could have no contact with matter, Plato was obliged to assume for the work of creation some formative principle separate from God Himself. Hence the separate existence of the mathematical forms imprinted on matter, and especially of the World-Soul incorporated within it. It is from this point of view that Cædr describes the World-Soul as 'a kind of bridge to connect two terms which it is impossible really to unite' (Evolution of Theology in the Gr. Phil. ii. 206).

4. Although Aristotle (q.v.) effectively criticized the theory of 'Ideas,' which Plato held to exist apart from matter, yet his own doctrine was fundamentally dualistic, as appears from his view of the Divine life as an energy of self-contemplation. But after his Greek thought swung round to the opposite pole, an attempt was made to see in which mind and matter, subject and object, were opposed to each other as mutually exclusive realities, it sought to explain the world by means of
a single principle. This men sought where they
felt surest of finding it, in their own subjective
experience. Thus they hoped for a certainty which
they could never have about an object with whose
appearances only they were acquainted. It may
be better in the history of the theory in philosophy
be part of a general movement affecting the last
epoch of Greek national life, from Alexander the
Great onwards (Schwegler, Hist. of Phil.; pp. 121-
122). Now, the subjective life itself has two sides,
the one universal and spiritual, the other individual
and material. It was on the latter view of man's
nature that the Epicureans based both their ethical
and their physical theories. The Stoics, on the other
hand, appealed in their Ethics to man's rational
nature, while in their Physics they derived the
world from a material principle (for the reason of
this apparent inconsistency, see Schwegler, op. cit.
p. 125). It will be seen that in their use of a single
principle the Stoics and Epicureans returned to
the point from which philosophy had stood back after
the time of Heraclitus, but, as R. D. Hicks
remarks (art. Stoics, in EB 11), 'until dualism had
been thought out, as in the Peripatetic school, it
was impossible that monoism or any rate material-
listical philosophy could be distinctly and consciously
maintained.' Both the Epicureans and the Stoics
had what may be called a materialistic cosmogony,
but that of the Stoics is in several ways the more
important, and to it therefore we now turn.

5. Stoic cosmogony.—The Stoic first principle
was akin to the Fire of Heraclitus, but of a subtler
nature—a fiery breath (πνεῦμα) or ether (αἰθήρ).
But in a more important respect it differed from
Heraclitus' principle. For the Stoic primary
substance was matter regarded in its distinctively
active aspect as force. Viewed in relation to the
actual world, it is thus described by R. D. Hicks
(loc. cit.):—

'Before there was heaven or earth, there was primitive
substance or Pneuma, the everlasting presupposition of particular
things. This is the totality of all existence; out of it the whole
visible universe proceeds, hitherafter to be again resolved into it.
Not the less is it the creative force, or deity, which develops and
shapes this universal order or cosmos.'

So the theory runs much of the
which we have already met with in other systems. But
the mode of the creative activity, as conceived by the
Stoics, was altogether new. The Stoic primary
substance, be it remembered, is matter and force in one;
the thirty years, 'the force in which force . . . is in itself something material,' etc.). Its force is that of tension, the expansive and
dispersile pressure due to heat, and the extremity of the
tension is seen in the fact that all distinction of particular things, due to relative density, is lost
within it. It cannot long withstand the intensity of this inward
pressure. It sways to and fro, and this movement cools a little the glowing ether.
Condensation begins, and with it the first dis-
tinction within the primal substance—the separation
of force from matter. Matter is now the
relatively passive; but, as first formed, it differs
but little from the pure activity of the substance
from which it sprang. It is the element of fire.
But again, as condensation proceeds, fire produces
air, and this in turn the grosser elements of water
and earth. Throughout the process, however, the
more active substance never quite surrenders its
own nature. Thus only a portion of air becomes
water, and so a certain portion of earth remains in
the ether which stretches above and around the world. As already seen, the dis-
tinction of active and passive in the case of the four
elements is only relative; and this appears still
further in the blending with the other.
In the universe thus formed the finer substances are
those in which the tension of the primary substance
is greatest, and the solid are those in which it is most
relaxed, and in which matter appears most inert
and passive. And, finally, all the shapes and other
attributes of things are referred to the ethereal
phosphorus. It is the underlying force of which we
most felt. And in fact the force moving in the
world was to the Stoic the Soul of the World.
Although material, it was, like the Fire of Heraclitus, also intelligent, even as the Λόγος
spoken of by the Eleatics before the dawn of creation slumbered within it.

The Stoic cosmogony was the chief attempt
made by the Greeks not merely to derive but to
explain the origin of the world from a purely
material first principle. It was ingenious, and its account of the manner in which force works
in the material world contained elements of permanent
value. But it went too far in treating force as a
genetic first principle. For material energy is always relative to matter as passive and inert.
Nor does it, indeed, appear that the Stoics
conceived of force as anything else than the formative
aspect of matter (cf. Zeller, L.c.). Nevertheless, by
regarding it as a primary substance out of which
the world was evolved, they inspired it with
within himself, and thus made it an independent reality. Hence the Stoic
first principle was an abstraction which could explain
nothing.

6. Neo-Platonic cosmogony.—Before leaving the
Greek cosmogonies, we may notice briefly a
second and very different attempt to explain the
origin of the world from a monistic standpoint.
We refer to the system of the Neo-Platonists, who
belonged to the last period of Greek thought,
which, when Stoicism and Epicureanism had run
its course. The Neo-Platonists taught that the ultimate
source of being was neither matter nor spirit, but a real unity transcending both. In this
they might seem to quit the subjective standpoint
of the later philosophical systems. Yet in reality
theirs was the most subjective of all. They found
the key to the Divine nature solely in the subjective
side of human experience, in the unity given to outward impressions by the thinking subject.
They sought to establish the real and perfect than the ideal world, that intellectual cognition is the pathway to truth and
goodness, and that actual contact with these
realities is attained only by means of an 'ecstasy,' in
which the distinction between subject and object disappears.

The Neo-Platonists claimed that their doctrine
was the direct outcome of Plato's teaching, but
in this they did less than justice to the objective
element in the latter. No doubt there were
features in Plato, especially the terms in which he
described the transcendence of God, which gave
some support to this claim. But Neo-Platonism
owed far more to Oriental influence, the causes of which we need not inquire (cf. Ueberweg,
Hist. of Philos., i. 222 f.). It is, in fact, a blend of
Greek and Oriental elements. It may be added that
such as the religious philosophy of the Alexandrian Jews
and the Gnostics of early Christianity are products
of the same elements, but under an Oriental form
(ib., p. 223).

Plotinus (A.D. 204-270) is the most representative
teacher of this school. Of his doctrine, contained
in the six Enneads, which were published by his pupil
Porphyry only after his death, nothing was
made public until the works of St. Augustine and
some of the school of Alexander. It is the first system,
from which Plotinus derives the universe, is called by him the One, or the
Good. This supreme essence is absolutely
transcendent, and incognizable. It cannot be
described as either good or intelligible, for the epithet
which would imply a limitation of its absolute
unity. It is τὸ δευτέρου, and also τὸ ἄνωθεν.
Cosmogony and Cosmology (Hebrew).

—There are generally recognized in the Hebrew Scriptures two formal cosmogonies, the earlier of which is contained in Gn 2, beginning with v. 4, or rather v. 2.

I. Cosmogony of J.—This story, as we have it, belongs to the pre-critical, historical Prophetic narrative of the Judæan kingdom (J), which was in course of composition from about the time of Solomon until the middle of the 8th cent. B.C. The cosmogony, as much as we have of it in Gn 2, presupposes the world in a state, and explains its condition, only with its preparation for the use of man.

With it is connected the story of the Garden of Eden, the Temptation, and the Fall and its consequences. The object is not so much to answer the question, How was it made, as the question: Where did man come from? Why does man differ from the beasts? especially, Why does man have a sex consciousness and a sex shame, which the beasts do not have? and, Why man, who is the crown of creation, toil and labour to get his bread, and to reproduce his kind, by the sweat of his brow and the agony of his body? So far as the nature of man is concerned, this cosmogony, while naively primitive, is full of a childlike wisdom and sweet spirituality, which has commended it to all succeeding ages, and which was doubtless the cause of this part of the J narrative being preserved at a time when the Pentateuch was cast into the present form and confirmed by the great cosmogony of the Priestly Code (Ge 1-2).

In the cosmogony of Ge 2, the earth is assumed as already in existence, a bare place on which there were no streams and no herbs, because Jacob's Elohim had no need of a name on it, and because—a charming bucolic touch, characteristic of the anthropomorphism of the whole narrative—there were no men to till the ground. But references to the heavens and the earth which came all the same, into the river of the world. In this narrative the waters
COSMOGONY AND COSMOLOGY (Hebrew)

earth and watered all the face of the ground (v. 9). Then, out of the dust of the ground, molded by this water, Jahweh Elohim, like a potter, made man, and, having made him, breathed into his nostrils the breath of life; and man became a living creature. And, because he was made out of the dust of the ground, therefore, they called him 'man' (Elohim). Then Jahweh Elohim planted a garden in Eden, far away to the east, and caused all sorts of beautiful trees and goodly fruits to grow and the tree of life; and the tree of the knowledge of good and evil. Through the garden, coming from the fountain which connected with the waters beneath the earth, flowed a great stream, watering the whole place, and dividing, as it left it, into the four great rivers of the world—Pishon, Gihon, Tigris, and Eabani.

Jahweh Elohim put man in His garden to till it and guard it, and permitted him to eat of all the trees in the garden, except only for the knowledge of good and evil. Then, seeing that the man was alone, He planned to give him a helper or companion, a mate. So He took one of his ribs, into which flesh and made it out of woman; and the man, thus recognized as his mate, bore to him flesh and named him Eve. Woman (ishshah) was the called, because derived from man (ish). There was no mate for man. Then Jahweh Elohim caused man to fall into a profound sleep, and, taking one of his ribs, clothed it with flesh and made it out of woman; and the man, thus recognized as his mate, bore to him flesh and named him Eve. Woman (ishshah) was the called, because derived from man (ish).

The story here told is in many of its particulars identical to the cosmogonies and cosmologies which we meet elsewhere. The thought is world, a thought, the out-thinking of primitive man almost anywhere. When he asks himself the question, Of what is man created? the natural answer is: Dust, out of dust; tree of life out of dust; and so, as the potter makes vessels out of clay (dust mixed with water), God made man. So breath, which is wind (a part of God's breath), is the element of life; and, if the wind or breath goes out of the man, he is dead. So, too, the relation of name to thing, which plays so important a part in this cosmogony, is not characteristic of any one people, but is a very widespread conception of primitive man. Name and thing are one. To know the name is to know the essence of the thing; and to know is to have power over—

...Utterance by Adam of the names of the beasts puts these beasts in subjection to him who had given them their names. The serious plays upon words—'God made man, and Adam called the name of every living creature'—are based upon the same theory of the identity of name and thing. Of course, this assumes that the primitive language was Hebrew, in accordance with the universal belief of primitive peoples that their own language was inspired by God Himself. The story of the origin of mankind, told in the person of a being bearing the name 'Man,' is common also to various national cosmological myths. The same is true, too, of the relation of man and woman here described, and, to a considerable extent, of the garden of God in which man was placed. But, while much in the story may be classed as universal primitive thought, there are also certain earmarks which unmistakably indicate a Bab. connection for at least some of the fundamental thoughts of our tale.

The park or garden which God plants, and in which He sets the man whom He creates, is far off, in a remote land far away to the east. This is the case also with the Egyptian paradise; but, when we note the name Eden, apparently the Bab. eden, 'place of delight,' and, in referring to the names of the rivers which have their source in it, we are obliged to recognize the influence of Bab. thought. The garden, it is true, is not in Babylonia, yet beneath the earth are assumed; it is only with the rain, which comes down from Babylonia, that we are concerned. Cf. Skinner, ed. loc.

1 This story is a man's story, homo sexualis. In general it is an interesting example of the methods of primitive thought. Man measures the universe by himself. He explains the relations of all about him by what he knows of himself. Woman depends upon man, and woman was made for man, who, as a subordinate but very intimate part of himself. The rib is chosen for a material support and construction because ribs are relatively numerous, and therefore superficial, in man's composition; while at the same time a rib belongs so much to the inward part of the body, it is easily in use in the construction of woman the most intimate relation with himself.

2 Of, for the latter, the P version of the Flood story (Gen 8).
material indirectly derived, it shows, in the last stages of its development, the high, spiritual thought of the Prophetic narrators of the 9th and 8th cent. B.C., who paved the way for the great writing prophets of the succeeding centuries.

The story was evidently popular among the Hebrews, not on the ground of its cosmogony, but for its account of the Garden of God in Eden and the Fall of man, which we find particularly used in later literature in the Book of Ezekiel (cf., for instance, ch. 28, and the other chapters of which fall of Tyre). It is this element also which has profoundly influenced Christian thought. The cosmogony proper is negligible in its influence on later thought, and is manifestly itself very incomplete. 2. Cosmogonic myths in Hebrew cosmology.—A more complete and more systematic cosmogony is contained in Gn 1. The composition of this chapter dates probably from the early post-exilic period, but it is founded on old myths, which appear in much older passages, and which display a striking similarity to the cosmogonic myths of Babylonia. Some of these passages it is worth while to consider before we analyze the more systematic and elaborate cosmogony of Gn 1. The Jewish cosmogonic origin (as is shown clearly by the use, in v. 12, of Tabor and Hermon as landmarks of north and south), now forming part of a later Psalm, this is one of those Psalms whose words imply a polytheistic conception of the world. With this strength, He was equal to Jahweh among the sons of the gods? Jahweh is described as ruling the waves of the sea, stilling the tumult of its billows. He has smitten and contemptuously treated Rahab. With His strength and His fear, He has bounded the earth. This is referred to as a part of the Creation work by which He founded the heavens and the earth, the world and its fulness, Creation being depicted as connected with a battle of Jahweh against some monster, here called Rahab, and its allies, who are foes of God or of the gods.

Ps 74:12-17 is similarly an ancient passage, apparently of north Israelitic origin, 1 in a Psalm which, in its later form, is Maccabean. Here God is described as having, in olden time, done wonderful works in the midst of the earth. He divided the sea by His strength, He smote the heads of dragons or sea-monsters on the waters, He crushed the heads of Leviathan and gave him food for food to the fowls of heaven. He made darkness a devouring deep, and imprisoned it with bars and gates. 2 According to the cosmogonic ideas of this book, 'God spread out the sky, strong, as a molten mirror' (57:2); this rests upon pillars (28:8), and above it are the waters and fountains of the earth. He becometh the sea, and imprisonment to which reference is made in Ps 89. That this is a part of a Creation-myth is shown by the following description, where, as the result of this battle with the sea-dragons and Leviathan, God digs out the fountains and the valleys in which their waters run, dries up the primitive rivers, forms night and day, moon and sun, establishes the boundaries of the earth, etc.

The Book of Job, while itself of relatively late origin, is notably full of old traits. In it we find a number of references to mythical monsters, with whom God contended in connexion with the creation of the world. Of these the most noteworthy passage is that of Job 40-41.

1 With his strength he troubled the sea, And with his skill he pierced Rahab. His wind spread out heaven, His hand slew flying serpent.

We have here two monsters—Rahab (connected with the sea), and the flying serpent (connected with the heavens). The battle with the sea, indicated in the first line, is connected with the piercing of Rahab; and bound up with this is the spreading 1 of the wind. Among other things, the most exclusive reference in the Amahh Psalms is that of Ps 150, which speaks of the Psalms of Solomon, of Pompey; but in both cases the ancient myth is clearly in mind.

2 In Ps 40:14 the plural of this rhabim, appears to mean 'false gods'; and rhab is used in the same sense in 1 S 12:20 and Is 43:19.

3 Folklore frequently exhibits this phenomenon. So, for instance, in the Wendish Spreewald one finds old fairy tales, identical with those collected by Grimm, told about Frederick the Great, Zieten, and others of the same period.
by the same means (cf. the late Isianic Apocalypse, Is 24–27). Here, however, we have (27) three monsters which are 'the third serpent,' and which correspond to Job 4, inhabiting the waters above the firmament and causing the eclipse; Leviathan the crooked serpent, which is the sea encircling the earth; and the dragon in the depths of the sea, which is the second Am 9.

In a somewhat similar picture of the reduction of the earth to chaos through the wrath of God, in Jer 4, birds, men, and beasts are destroyed; mountains and hills lose their solidity and sink to and fro; the light of the heavens is turned into darkness; and the earth becomes waste and void—tōhā and bōhā—the technical words for 'chaos' used in Gn 1.

Out of these various references we may reconstruct the general cosmogonic conception of the Hebrews: first, a condition of chaos and darkness, a waste of waters, inhabited by monstrous and noxious forms; then a battle of Jahweh, with the approval and rejocing of the gods (divine or semi-divine beings, stars, etc.), against the deep and the monsters of chaos, in which in some way He uses the wind. By means of this He spreads out a firmament above, resting upon pillars, provided with windows through which the waters above may be let down upon the earth. Beneath, upon the great void, He spreads the earth, a dwelling-place for living things, under which is the sea or abyss (Thkhlm). In this abyss, as also in the heights above, there are all great monsters, whom the Lord has preserved there, whom no other than He can control, and who are dangerous and noxious to men and to the works of men.

This was not only the cosmogonic thought of the Hebrews, but it also formed an element of their religion, and was represented in their ritual and religious paraphernalia. So, in the temple of Solomon was a great laver, the so-called 'sea,' representing the Thkhlm; and on the candlesticks of Herod's temple, as represented on Titus' Arch at Rome, are apparently pictured the monsters of that Thkhlm which Jahweh had overcome. This cosmogony clearly is closely related to that of Babylonia, where we have the same contest of gods for the earth, whom, however, largely supplanted with a great female monster, Tīnmāt, which is by root the same as the Heb. Thkhlm. This monster he splits in two, after infesting her with a great wind. He renews her strength by submission, and, after treating her corpse with contumely, he divides it into two parts, out of one of which he makes the heaven, and out of the other the earth, the waters being thus separated into two great seas, the one above the firmament of heaven and the other beneath the earth.

3. Systematized cosmogony of the Priestly Code.—The Bab. cosmogony, as we know it in the cuneiform texts, is contained in seven tablets. Such a systematization, however, is not to be found in the Priestly Code (Gn 1–2), which formulates and develops in a scientific and exact manner the popular belief, is divided into seven days.

The consonances with the description of a condition where the earth was tōhā and bōhā (i.e. chaos)—two words evidently handed down from antiquity. This chaotic condition is described as 'darkness upon the face of the Thkhlm.' Thkhlm, as already stated, is radically identical with the Bab. Tīnimāt (here used without the article), and is evidently, like tōhā and bōhā, a technical term of the cosmogonist. Following this description of the condition of darkness, chaos, and confusion, the narrative of the creation of the world begins. The earth was, it seems, for the seven days, a field or a plain. Out of the face of the Thkhlm God was rushing upon the face of the waters. Here perhaps we have a reminiscence of the myth which represents Marduk using the wind as his weapon against Tiāng (cf. Job 4).

Having thus condensed the mythical material, which bulked so largely in Talmud, etc., and story, and which is to an equal extent a result of the teachings of the Priestly narrator, it proceeds on a higher plane and presents the result of seven utterances of God. The order of these creative utterances may be taken as a clue to the historical development of the story. seven tablets, although this cannot be stated certainly, owing to the fragmentary condition of these tablets.

First came light, second, the firmament. Third, the waters, to divide the waters beneath from the waters above; third, the separation of dry land and the springing of verdure, trees, and the plants upon the earth; fourth, the days and the years, the sun, moon, and stars, which are set in the heavens, both to give light and to rule the day and the night—the latter, perhaps, containing a trace of the polytheistic conception of the celestial worship, which it is intended to correct by stating that these rulers of day and night are creations of God; fifth, the creatures of the sea and the birds of the air, both of them created out of water, among which it is noteworthy that the writer recognizes the continued existence of the great sea-monsters, dragons, serpents, etc., of the popular belief (v. 23), included in Job, Ps, and Esdras, under the titles Behemoth and Leviathan. The sixth day covers the creation of the creatures of the earth and of man. In the note of the creation of man (v. 26) we have the remnant of the mythological and morphic conception of God, of which the writer could not entirely disavow, as is the statement concerning the names of the image of God; and perhaps also an echo of the earlier polytheism in the words put in the mouth of Elohim: 'Let us make man in our image, after our likeness.' Such a myth of more than one God of Israel, but he cannot yet altogether divest himself of the thought of a plurality of gods in human shape. The role of Elohim on the scene is thus emphasized, and its fulfillment in connexion with that of an eternal Sabbath, which is peculiarly Hebrew; for, although a rudimentary Sabbath existed among the Babylonians, it played no important part in Bab. religion or mythology. The seventh tablet of the Bab. Creation-series, with which to Hebrews corresponds the establishment of the Sabbath as a part of Creation itself, contains a hymn of praise to Marduk as the creator.

The question arises, To what extent was this cosmogonic myth of Bab. origin? We have already seen that, in general, it is a statement, in precise, scientific, monotheistic, and unmythological form, of cosmogonic views prevailing among the people of Israel from an early period. Certain resemblances have also been pointed out between those cosmogonic myths and the cosmogonic myths of the Babylonians. It would seem that at some early period Bab. cosmogony became known to the people of Palestine. The general view at present is that the Bab. cosmogony, after its adoption into the Pentateuch, was modified by the Hebrews. From the narrative in the Bab. cosmogony became the common property of Palestine and surrounding regions during the centuries of predominating Bab. influence, in the West (c. 2000 B.C.), and that the Hebrews adopted it as cosmogonic, after its adoption into the Hebrew Scriptures, and modified it to fit into their religion, eliminating the polytheistic and grosser traits, and spiritualizing and rationalizing the residue. The cosmogonic myth, accordingly, pursued the same course

1. Commonly rendered 'the spirit of God was brooding,' etc. This rendering of the Heb. רַעָשׁ is supported by a supposed connexion with an Aram. root. In Hebrew it occurs elsewhere only in Dt 33, in a description of the vagina teaching its young to fly, where it has been translated 'hovering.' This is manifestly incorrect (but see Skinner on Gn 1). The parent birds do not feed their young for a year, but go out over the sea to the next to fly for themselves, but make rushes at them, and away from them. The LXX has preserved the correct tr. of the word properly 'dove.' This agrees with other references in Heb. Literature to the use by God of wind in creation (see above), and also agrees with the Bab. myth.

2. Unfortunately we lack, up to the present time, a sufficient knowledge of Phoenician cosmogony and the cosmogony of other neighboring people of the period, to be able to say. True, certain fragments of Phoen. cosmogony have come down to us, claimed to be the relics of the myths of a certain Sanchuniathon; but, in the first place, it is very doubtful whether such a man ever existed, and, in the second place, what has been handed down in such a form is too remote to be identifiable to its original form. Hence, we find, in Phoen. cosmogonic, one passage, which is the Third tablet of the Thkhlm and the Bab. Tīnimāt, and a Bab. tablet, which appears to be the Hebrew bāhā, to that extent Phoen. remains may be said to support this hypothesis.
COSMOGONY and COSMOLOGY (Indian)

5. The highest and final Hebrew thought concerning Creation.—The cosmogony of Gn 1–21, lofty as it is in its monotheistic conception of the power of God, did not reach the highest limits of Hebrew thought. Hampered by the old myths, it stood perilously near dualism in reckoning chaos, darkness, and the deep as existing, independently of God, from eternity. There were men of the same period, but a different school of thought, with prophetic vision, and a higher, less hampered spirituality, who had perceived and were teaching a still higher thought, namely, that God was the Creator of darkness as well as of light, of chaos as well as of the ordered world. The Deutero-Isaiah, familiar to us, was the highest expression of this new thought, and the deep to God he utterly rejects. 'I am Jahweh, and there is none else, forming light and creating darkness, making prosperity and creating evil' (Is 40:25). This is the highest expression of the creative thought in the Old Testament. In Pr 8:22–31 Creation is an expression of the wisdom of God, which is almost hypostatized. In some of the late Psalms we have very beautiful and spiritual conceptions of Creation, especially in Ps 19:1–6. It is formed an integral part of the religion. The Bab. seven tablets of Creation were ancient. Their 'sevenness' is an element which would naturally have impressed itself on a people so thoroughly monotheistic, and that one and only one regarding the number seven as holy; and, while there is no other evidence in the Biblical passages, indicating acquaintance with the cosmogonic myths, knowledge of this 'sevenness', it is not impossible that it formed a part of the popular scheme of cosmogony, even though the events of the days of Creation may not coincide altogether with the order of events in the Bab. tablets, than that it was borrowed by the ancient writers directly from the creation scheme of the Priestly Code. The author of the Priestly Code cosmogony was concerned rather with those things which differentiate the Heb. from the Bab. versions of the cosmogony. And, indeed, the difference between the two is far more strikingly marked than is generally thought. There is a wonderful how out of the fantastical, puerile, and gross fancies of the Bab. original there has been developed so sane, so lofty, and so spiritual a system of cosmogony as that contained in Gn 1–21. In fact, it is quite possible that there are the same parallels to be traced between the popular cosmogony and cosmogony of P.—How does it happen that two cosmogonies so radically different in conception continued to exist side by side? As already pointed out, ch. 2 deals, not with the water of the world, but with the problems of man. It finds him on the barren hills of Judea. It does not concern itself with their creation, but with the manner in which they are made habitable, and the problems of the man who inhabited them, who had been driven out, for their sins, from the beautiful Garden of God in the fertile far east, to live on, and till, this land of thorns and thistles. Had the narrator been asked how the dry land, the heaven above, and the water of the sea, into existence, and rendered in-}

1 Cf., for instance, the form of the Fourth Commandment in Ex 20, which, however far removed from the form of the original 'Word,' is at least much earlier than the Priestly Code.

2 Cf. also Ps 33:9.
achieved, even in the Pur\'anas; for all statements, however contradictory, contained in the revealed literature were regarded as truth, and might be reproduced by later writers. Cosmogony, on the other hand, had another fate. Different writers of the same period are much more nearly at one regarding the structure of the Universe, at least in its main outlines, than regarding its origin and development; but it goes without saying that both sets of ideas—cosmogonic as well as cosmographic—are equally fanciful, and lack the basis of factation

1. Vedic period. — The world, according to Vedic notions, consists of three parts—earth, air, and sky, or heaven. But, when the idea of 'Universe' is to be expressed, the phrase most usually employed is 'heaven and earth.' Both Heaven and Earth are regarded as gods and as the parents of gods (deva-patra), even although they are said to have been generated by gods. Sometimes one god, Indra, or Agni, or Brahma, or Soma;—sometimes all the gods;—are said to have generated or created heaven and earth, the whole world; and the act of creating is metaphorically expressed as building, sacrificing, or weaving. That heaven and earth should be gods of the gods, that the same time have been generated by them, is a downright self-contradiction; but it seems to have only enhanced the mystery of this conception without lessening its value, since it recurs even in advanced speculation, and is advocated in the incarnation that another Aditi is everything, and brings forth everything by and from herself, in another place it is said that Aditi brought forth Daksha, and Daksha generated Aditi. Here Aditi is apparently the mythological expression for the female principle in creation, and Daksha for the male principle or creative force. The latter is more directly called Pur\'us\'a, man or male spirit, and is conceived as the primate male who is transformed, or who transforms himself, into the world. To him is dedicated the famous Pur\'us\'as\'kta, Rigveda, x. 90, which recurs, with variations, in the Atharvaveda (ix. 6), the Vajasaneyi S\'asth\'a\'ha (xxxii.), and the Taittir\'iya \'Arany\'a (lii. 12), and greatly influenced later theosophical speculation as a statement of Vedic cosmogony we subjoin Mi\'\'s translation of it (from Orig. Skr. Texts, v. 368 ff., though it, or rather the original, contains many obscure points:

Pur\'us\'a has a thousand heads, a thousand eyes, and a thousand feet. On every side enveloping the earth, he transcended (it) by a spear which (he) burst. (1) Pur\'us\'a is this whose universe, whatever has been, and whatever shall be. He is also the lord of immortality, since through food he expands (it). Such is his greatness; and Pur\'us\'a is superior to this. And existing things are a quarter of him, and that which is immortal in the sky is three-quarters of him. (2) With three-quarters Pur\'us\'a mounted upwards. A quarter of him again was produced here below. He then became diffused everywhere among things animate and inanimate (4). From him Vir\'a\'j was born, and from Vir\'a\'j, Pur\'us\'a. As soon as he was born, he extended beyond the earth, both behind and before (5). When the god and-sacrifice, up burned Pur\'us\'a, as a sacrifice, the spring was clarified, butter, summer its fuel, and autumn the (accompani- ment) libation (6). This victim, Pur\'us\'a born in the beginning, then is explained on the nature of the sacrifice. What he offering, the gods, S\'ad\'hy\'a, and R\'i\'si sacrificed (7). From that universal sacrifice, in consequence the god Pur\'us\'a was divided (8). He then distributed Pur\'us\'a into how many parts did they distribute him? What was his mouth? What were his arms? What were called his thighs and legs? (9). When the Brahmanas was his mouth; and the R\'aj\'ug\'a his arms; the Va\'s\'i\'s his head, the Vish\'nu from his feet (12). The moon was produced from his soul; the sun from his sleep; and Indra from his breath; and Agni from his mouth; and V\'ayu from his breath (13). From his navel came the atmosphere; from his head rose the sky; from his thighs the earth; from his head came the four quarters; so they formed the worlds (14). When the gods, in performing their sacrifice, bound Pur\'us\'a as a victim, there were seven pieces of wood told for him round the fire, and three seven pieces of fuel employed (15). With sacrifice the gods worshipped the sacrifice. These were the first institutions. These great beings are then addressed to the heaven where the gods, the ancient Vidy\'a, reside (16).

The unity of the Godhead as the cause of the world, which is recognized in the above hymn, is directly expressed in others where he is called the One, the Unborn, and placed above all gods. In two hymns (Rigveda, x. 81, 104), he is identified by the name Vis\'v\'ak\'ar\'ma, 'All-creator,' who in later mythology became the architect of the gods; in another remarkable hymn (x. 121) the poet inquires who is the first-born god that created the world and upholded it, and to this he answers, as Pur\'ja\'pati, 'Lord of the creatures.' Pur\'ja\'pati later became the current designation of the creator, and synonymous with Brahma. In connexion with Vis\'v\'ak\'ar\'ma and Pur\'ja\'pati occurs what seems to be an ancient mythological conception; the highest god is said to have originated in the primeval waters as the Golden Germ (Hiranyagarbha) which contained all the gods and the world, or became the creator. This idea was afterwards developed to that of the world-egg, and of Hiranyagarbha = Brahma.

An entirely different treatment of the cosmological problem is contained in the philosophical hymn, Rigveda, x. 129 (cf. Taittir\'iya Br\'ahas\'pa, x. 8, 9, 3-6). Such, for example, as a practical translation of Mu\'\'r (op. cit. v. 336, note 530):

'Then there was neither Ang\'\'i nor Nought, no air nor sky, beyond. What covered all? Where rested all? In watery gulf profound? Nor death was then, nor deathlessness, nor change of night and day. That One breathed calmly, self-sustained; nought else beyond. It lay

Gloom hid in gloom existed first—one sea, shining view. That One, a void in chaos wrap, by inward fervour grew. Within it first arose desire, the primal germ of mind,

Which Nothing with Existence links, as sages searching find. The kindling ray that shot across the dark and drear abyss,— Was it beneath? or high aloft? What hard can answer this? These fermenting powers were found, and mighty forces grew,—

A self-supporting mass beneath, and energy above. Who knows, who ever told, from whence this vast creation rose? No gods had then been born,—who then can ever tell the truth delineated? Whence sprang this world, and whether framed by hand divine or nature's serried hands? Is its lord in heaven alone can tell, if even he can show.'

In the Atharvaveda we meet with some cosmological hymns, chiefly of the Pur\'ja\'pati type, in which the highest god and creator is conceived under other forms, and invoked under various names, such as Rohi\'ta (the red one), An\'\'day (the ox), Va\'s\'i\'s (the cow), K\'\'ala (time), K\'\'ama (desire), etc.

1. Lippert, in 'The Blanket of the Brahmans and the Upanisads.'
or the like; and therefore, after a few general remarks on the creation of the world, they plunge again into the same discussions (see the specimens given by Deussen, op. cit. p. 183E). But the little information they give is sufficient to show what were in their time the popular opinions about the origin of the world.

lso, it is to be noted that the beginning of things, there are others, according to which the waters seem to have been believed to be coeval with him or to have preceded him. Thus it is said (Taittirya Brăhmana, v. 6, 4, 2, and similarly elsewhere) that Prajapati, the creator, became nothing but the waters, and Prajapati, as wind, went over them or floated on a lotus leaf. Connected with this order of ideas is the now more commonly developed conception of the world-egg in Sātvatī (Brahmana, i. 1, 1, 1 ff), which runs as in Muir’s translation (iv. 25):

“In the beginning this universe was water, nothing but water. The waters desired, “How can we be reproducered?” So saying, they talked, they performed austerity. While they were performing austerity, a golden egg came into existence. Being produced, it then became a year. Wherefore this golden egg floated about for the period of a year. From the end of a year a period (pūraṇa) came into existence, who was Prajapati. . . . He divided this year. . . . In a year Prajapati desired to speak the world. “Bhrū,” which became this earth; “bhūmā,” which became this firmament; and “svār,” which became that sky. . . . For two periods Prajapati perceived the further end of his life as one may perceive the opposite bank of a river. Desiring offspring, he used to go on water and the goddess. . . . With his mouth he created the gods, etc.”

We take of comparison, another ancient account of the world-egg from the Chāndogya Upaniṣad, iii. 19 (SBE i. 1. 411): “In the beginning this was non-existent, in the midst of non-existent became this egg. The egg lay for the time of a year. The egg broke open. The two halves were one of silver, the other of gold. The silver one became this earth, the golden one the sky, the thick membrane of (the white) the mountains, the thin membrane of (the yolk) the mist with which the wind went over the earth. And what was born from it was Aditya, the sun, etc.”

While the authors of the Brähmanas treated cosmogonic myths from their liturgical point of view, the authors of the Upaniṣads used them in order to illustrate their great philosophical tenet of the transcendent oneness of Brahmā and its presence in all created things. Accordingly, they frequently substitute for Prajapati philosophical abstractions, e.g. Brahman, Atman, Not-Being, or Brahman and refer to this first principle the words, or the Vedas, or those escholitical and psycho-physical agencies which explicitly express their speculations. They develop and combine these notions in ever-varying ways, but it is not well understood, or properly stated, that the first principle, after having created things, entered them, so that it is present in them, and in a way, identical with, and yet different from, them. It is impossible to reduce the variety of opinion on the origin of the world, contained in the Upaniṣads, to one general idea underlying them: we shall, therefore, illustrate them by some selected specimens.

In Brhad Aranyaka, i. 4, the creation is ascribed to Atman in the shape of a man, as such there was nothing but himself, he felt no delight, and therefore “made this his Self to fall in two, and thence arose husband and wife.” He embraced her, and men were born. In the same way he created all things that exist in the worlds. Then he created other things, developed them by name and form, and ‘entered thither, to the very tips of the finger-nails, as a razor might be fitted in a razor-case, or as fire in a fire-place’ (SBE xxv. 87). The account for the egg of the Chāndogya Upaniṣad has already been quoted above. Of a less mythological and more speculative character is a passage in Taittirīya Upaniṣad, i. 1, according to which from this Self (Brahman) sprang space, from space wind, from wind fire, from fire water, from water earth, from earth food, from food seed, men, and all creatures. An older account in Chāndogya

Upaniṣad, vi. 2. 2 ff, mentions only three elements: it runs thus (SBE i. 93 E):

(“Uddalaka speaks to Śvetāculo.”) “In the beginning, my dear, there was only that which is (śūnya), one only, without a second.” Others say, in the beginning there was only that which is (śūnyaḥ), one only, without a second; and from that which is not, that which is born.”

“The father of the creation said, ‘How could that be, which is born of that which is not? No, my dear, only that which is, was in the beginning, only with this, only, only. . . . May I be many, may I grow forth.’ It sent forth fire. That fire thought, ‘May I be many, may I grow forth.’ And therefore whenever anybody anywhere is hot and perspiring, water is produced on him from fire alone. Water thought, ‘May I be many, may I grow forth,’ without fire (food). Therefore whatever it rains anywhere, most food is then produced. From water alone is eatable food produced.”

That Being (i.e. that which had produced fire, water, and earth) thought, “Let me now enter these three beings (fire, water, earth) with this living Self (jīva stūpa), and let me then reveal (develop) names and forms.” Thus being, having said, “Let me make each of these three tritāpita (so that fire, water, and earth should become of this original ingredient, besides the admixture of the other two) entered into these three beings with this living self only, and revealed names and forms.”

Here we have the first forerunner of Sākhya ideas, which are more fully developed in the Svetāvatara and some later Upaniṣads which form the connecting link between this period and that of the Epics and Purāṇas. The genesis of the evolutionary theory of Sākhya can be traced to these Upaniṣads (see 4, 9, 1 p. 216); but we pass this subject over here, as it will be treated in § 3.

The notions as to the structure of the Universe entertained by the Vedic poets continued to hold in the period of the Brāhmanas, and Upaniṣads, where frequently the Universe is spoken of as a tritāpita: earth, air, and sky, symbolized in the three ‘great utterances’ (vyāhrtis), ‘bhūr’, ‘bhūmā’, ‘svār’. In Aitareya Aranyaka, ii. 4, 2, however, it is said that Self sent forth the worlds of Ambha, Marichi, Mara, and Ap. ‘That Ambha (water) is above the heaven, and it is heaven, the support. The Marichi (the lights) are the sky. The Mara (mortal) is the earth, and the water below the earth is the Ap world.”

Nine or ten worlds are enumerated in Brhad Aranyaka Upaniṣad, iii. 6, viz. the worlds of wind, air, Gandharvas, sun, moon, stars, gods, Indra, Prajapati, and Brahman; each again into the next, so that other one, ‘like wap and wool’.

More importance is attached to a sevenfold division of the world. This was introduced by the augmentation of the vyāhrtis from three, the usual number, to seven, which is indicated in Taittirīya Aranyaka, x. 27 ff. There we find the following vyāhrtis: ‘bhūr’, ‘bhūmā’, ‘svār’, ‘mahār’, ‘jānuś’, ‘tapas’, and ‘satyam’. Now, as the second, the original vyāhrtis (‘bhūr’, ‘bhūmā’, ‘svār’), symbolically denoted the three worlds (earth, air, sky), so the four added vyāhrtis (‘mahār’, ‘jānuś’, ‘trivas’, ‘satyam’) became names of still higher worlds. Thus, in some later Upaniṣads seven worlds are mentioned, and in the Aranyaka Upaniṣad of a non-seven worlds (bhūr), and distinguished from seven other worlds: Atala, Pātala, Vitala, Sutala, Rasātala, Mahātala, and Talatala. This last conception of a twice sevenfold world was, in the next period, developed in doctrine that exists today.

3. Period of the Epics and the Purāṇas.—While in the preceding period cosmogonic myths are of an episodic character, the same subject is now treated more at length, and for its own sake. Its importance is fully realized by the cosmogony as a secondary creation—i.e. the successive destructions and renovations of the world—belong to the five characteristic topics (pañcakanyakā) of the Purāṇas.

1 In the cosmography of the Yajurveda, which will be dealt with in § 3, the views of the highest celestial spheres are Mihendras, Prajapatyas, and Brahmas.
COSMOLOGY AND COSMOLOGY (Indian)

The variety of views as to the origin of the world which obtained in the preceding periods still continues; but there is a decided tendency towards introducing some order. The mythological elements of cosmogony are mostly adopted from Vedic literature, and, in one form or another, harmonized with some modern views. Both elements are variously combined. These mythological elements are as follows: (1) the highest godhead, Brahma or Atman, identified with Narayana, Viṣṇu, Sambhu, etc., according to the sectarian tendency of the author; (2) the primeval waters or darkness; (3) the Purusa or Hiranyakarṣa, who sprang up therein; (4) the world-egg, which brought forth Brahma (or Prapata, Pātanaḥ); (5) the lotus, from which sprang Brahma; the lotus itself came forth either from the waters or from the navel of Viṣṇu; (6) the intermediate creators, or mental sons of Brahma, numbering seven or eight, Marici, etc.; (7) the successive creations and destructions of the world. Though the last-mentioned conception can be traced to a greater antiquity, it was only then developed into a gigantic chronology of the world which reckon by kalpas, manvantaras, and yugas (see art. AGES OF THE WORLD [Indian]).

The Vedic view is shared by all, though conflicting views on the origin of the world by assigning some cosmogonic processes to primary, some to secondary, and creation, and by distinguishing the several secondary creations. But all these are vouched for in the medieval writings in greater or lesser conflation, for primary and secondary creations were inextricably mixed up with one another. The framers of cosmogonic systems in the Mahābhārata and the Purāṇas freely laid under contribution the mythologies of the several nations. We thus see the evolutionary theory as taught by Kapila, or they tried to improve on it. As it formed the theoretical foundation of cosmogony, a brief sketch of it must be given here.

According to Sānkhyā philosophy, there are two principles, entirely independent of each other: (1) the souls, Purusas; and (2) Prakṛti, original nature, or Prakṛti (principle, viz. matter), which is made up of the three guṇas (secondary elements)—darkness (taddāla), goodness (sattva)—in the state of equipoise. When this equilibrium is disturbed through the presence (or co-inexistence) of the Purusa, then from Prakṛti is developed Mahābhūta or Brahma, the thinking substance, the ideal world, from which all the guṇas arise. He, who can be conceived by the internal organ (alone), who is subtle, indiscernible, and eternal, who contains all created beings and is inconceivable, shows forth of his own will (7). He, desiring to produce beings of many kinds from his own body, first with a thought created the waters, and showed his seed in them (9). That seed became a golden egg, in brilliancy equal to the sun; in that egg he himself was born as Iraṅga, the principal ākāśa (space) of the goodness (sattva)—in the state of equipoise. When this equilibrium is disturbed through the presence (or co-inexistence) of the Purusa, then from Prakṛti is developed Mahābhūta or Brahma, the thinking substance, the ideal world, from which all the guṇas arise. He, who can be conceived by the internal organ (alone), who is subtle, indiscernible, and eternal, who contains all created beings and is inconceivable, shows forth of his own will (7). He, desiring to produce beings of many kinds from his own body, first with a thought created the waters, and showed his seed in them (9). That seed became a golden egg, in brilliancy equal to the sun; in that egg he himself was born as Iraṅga, the principal ākāśa (space) of the goodness (sattva)—in the state of equipoise. When this equilibrium is disturbed through the presence (or co-inexistence) of the Purusa, then from Prakṛti is developed Mahābhūta or Brahma, the thinking substance, the ideal world, from which all the guṇas arise. He, who can be conceived by the internal organ (alone), who is subtle, indiscernible, and eternal, who contains all created beings and is inconceivable, shows forth of his own will (7). He, desiring to produce beings of many kinds from his own body, first with a thought created the waters, and showed his seed in them (9). That seed became a golden egg, in brilliancy equal to the sun; in that egg he himself was born as Iraṅga, the principal ākāśa (space) of the goodness (sattva)—in the state of equipoise. When this equilibrium is disturbed through the presence (or co-inexistence) of the Purusa, then from Prakṛti is developed Mahābhūta or Brahma, the thinking substance, the ideal world, from which all the guṇas arise. He, who can be conceived by the internal organ (alone), who is subtle, indiscernible, and eternal, who contains all created beings and is inconceivable, shows forth of his own will (7). He, desiring to produce beings of many kinds from his own body, first with a thought created the waters, and showed his seed in them (9). That seed became a golden egg, in brilliancy equal to the sun; in that egg he himself was born as Iraṅga, the principal ākāśa (space) of the goodness (sattva)—in the state of equipoise. When this equilibrium is disturbed through the presence (or co-inexistence) of the Purusa, then from Prakṛti is developed Mahābhūta or Brahma, the thinking substance, the ideal world, from which all the guṇas arise. He, who can be conceived by the internal organ (alone), who is subtle, indiscernible, and eternal, who contains all created beings and is inconceivable, shows forth of his own will (7). He, desiring to produce beings of many kinds from his own body, first with a thought created the waters, and showed his seed in them (9). That seed became a golden egg, in brilliancy equal to the sun; in that egg he himself was born as Iraṅga, the principal ākāśa (space) of the goodness (sattva)—in the state of equipoise.

The last, combining with one another, form the five gross elements (māhābhūta): space (or air), fire, wind, water, and earth. These are the twenty-five principles (tattva) of Sānkhyā. They and the corresponding productions have been adopted, and adapted to the order of ideas taught in the Upaniṣads, by the authors of those parts of the Mahābhārata which deal with this system when employed in that work. In order to reconcile Vedic cosmogony with the principles of Sānkhyā philosophy, those didactic poets invented various changes of the latter or of their arrangement, though none of these attempts was generally adopted. We shall mention only two points in which the epic writers departed from the Sānkhyā system and, at the same time, disagreed among themselves. (1) The established belief in a first cause, Brahma or Atman, was radically opposed to the Sānkhyā doctrine of two entirely unrelated elements, Purusa and Prakṛti; yet both views had to be harmonized somehow. No wonder that opinion differed widely on this head. For instance, Purusa is identified with Prajñāna, or Hiranyakarṣa with Buddha, or Brahma with Ahaṅkara, etc. (2) The Sāṅkhya doctrine, which derived the elements (of modern origin; some of the Vedic) and the interposition of the transcendental tanmatrās seems to have been thought unduly abstruse by those poets who preached to a mixed audience. They therefore usually omit the tanmatrās, and make those who meditated upon the tanmatrās, just as in the Upaniṣads the elements are said to have sprung directly from Brahma. It is needless for our purpose to multiply instances; for details the reader is referred to E. Washburn Hopkins' work, The Greek and Indian Systems of Philosophy, in which epic philosophy is exhaustively treated (p. 85 ff.). It must, however, be stated that some scholars, e.g., Dahlmann, and Densen, are of the opinion that epic Sāṅkhya represents a preliminary stage of speculation, from which systematic Sāṅkhya was developed.

The cosmological passages of the Great Epic belong to an age of transition, and none of them seems ever to have been generally accepted as an authoritative statement of the events of the world. Though, different from another document which may roughly be assigned to the same period—the cosmogonic account in the Laws of Manu, i. 5 ff.; for (or parts of it) is quoted in a great number of works, it may serve to illustrate the state of the views on cosmogony which prevailed before the time when the Purāṇa took their present form. We quote here Bühler's translation in SBE xxv. 2 ff.

'This (universe) is composed of the elements of Darkness, unperceived, indistinguishable, of knowable, wholly immersed, as it were, in deep sleep (5). Then the divine Self-existent [svāyabhūta, himself] indiscernible, (first) making (all) this, the great elements and the rest, discernible, appeared with irresistible (creative) power, dispelling the darkness (6). He who can be perceived by the internal organ (alone), who is subtle, indiscernible, and eternal, who contains all created beings and is inconceivable, shows forth of his own will (7). He, desiring to produce beings of many kinds from his own body, first with a thought created the waters, and showed his seed in them (9). That seed became a golden egg, in brilliancy equal to the sun; in that egg he himself was born as Ishvara, the principal ākāśa (space) of the goodness (sattva)—in the state of equipoise.
COSMOLOGY AND COSMOLOGY (Indian)

The puruṣa, and creation

The puruṣa, the天空, the oceans, the mountains, the planets, the sun, and the moon. In this way, pleasure, desire, and anger, this whole creation he likewise produced, as these being called his seven elements of creation. Moreover, in order to distinguish actions, he separated merit from demerit, and he caused the creatures to be affected by the principle of Prakṛti, or the gunas, which are the three primary qualities of goodness, badness, and neutrality.

Puripañcarat, and creation

The puripañcarat, the brauhma, the yuga, and the siva, is the passage from heaven to earth. The puripañcarat, which is the seven elements of creation, was the seventh, and was that of man. There is an eighth creation, the Aranyakas, which possesses both the qualities of goodness and badness. Of these creations, we are secondary, and three are primary. But there is a ninth, the Vaisñava creation, which is the third creation of Prakṛti. These are the nine creations of the great projector of all, and, both as primary and secondary, are the radical causes of the world, proceeding from the seven primary causes.

The seventh chapter relates how Brahma after the creation of the world created 'other mind-born sons like himself'; about the number and names, however, of these Prajañapis, or mental sons of Brahma, the different Puripañcas do not agree. Then Brahma created Manu Śvayambhuva, for the protection of created beings. Manu's daughter Prusūti was married to one of the Prajañapis, Dukṣa, who thereby became the ancestor of a great number of divine beings, of the sacerdotal character, as personified virtues and vices.

The preceding abstracts from the Vīṣṇu Purāṇa give some idea of the heterogeneous character of the cosmicogonic theory which henceforth was generally adopted. Mythological and allegorical notions inherited from the Vedic period have been combined with notions of later origin—genealogic legends, the evolutionary system of Sāṅkhyā, and the scheme of the ages of the world—in order to give a rational theory of the origin and evolution of the universe in the world, in harmony with the teachings of the Vedas. But the materials proved too refractory, or rather the authors were not bold enough in re-creating the old traditions; hence their work leaves the impression of disparate parts, ill-combined or only formally united.

The authors of the Puripañcas succeeded better in delineating a plan of the Universe; for the cosmogonic notions which are actually connected with the Vedas, and which have been sketched above under § 1, lent themselves readily to such an undertaking. The Great Epic added little to the old stock of cosmogonic ideas, except a detailed description of the earth and some particulars about the hells. There was, indeed, the ancient belief in worlds of Indra, Varuṇa, Vāyu, Agni, Aditi, Yama, etc., but the notions as to the situation of these worlds (except those of Indra and Yama) seem always to have been rather vague, so that the Puripañcas were not over much prejudiced by tradition in their endeavours to devise a systematic cosmography. The system is practically the same in all Puripañcas; the following description of it is based on the Vīṣṇu Purāṇa; the details, in details the reader may be referred to Wilson's notes in his translation of the Vīṣṇu Purāṇa.

The whole system of the worlds contained in the world-egg may be divided into three parts in agreement with the current expressions tribhava, tṛílokya, etc., the 'three worlds.' The middle part, which is, however, many times nearer the base than the top, is formed by the earth, an enormous disk of five hundred millions of yejunus in extent; it is circumscribed by the Lokāhala (the atmosphere) and contains the continents and oceans. A description of the earth need not detain us here, as it will be given in the art, GEOGRAPHY (Mythical). Above the earth are the heavens, and below it the nether worlds, or Patala. But actually the Universe is divided into two parts; for it consists of seven upper regions, the lowest of which is the earth, and of the seven nether regions. Hence frequently two divisions have been added to the six, one of which is the lowest part of the Universe. The number of

hells seems originally not to have been fixed (Viṣṇu Purāṇa, ii. 6), though Manu (iv. 87) gives their number as twenty-one.  

Omitting the hells, there are seven nether worlds (Atala, Vitala, Nitala, Gahastinat, Mahātala, Rasatala, and Cenatala) and the seven upper worlds (Būhr [the earth], Dyaus, Svar, Mahār, Janas, Tapas, and Satya). Patāla—for this is also the collective name of the seven nether worlds—extends downwards 70,000 yojanas below the surface of the earth, each of its seven regions having a depth of 10,000 yojanas. Patāla is the abode of Nāgas, Daityas, and Dānāvas, and it equals the heavens in beauty and magnificence. Below Patāla, the dragon Aprasen, who 'bears the entire world like a diadem upon his head, and who is the foundation on which the seven Patālas rest.' As said above, the hells, or narākas, are beneath Patāla; but their exact situation cannot be made out, because some place them below, some above, the waters which encircle the Universe. The cause of this uncertainty with regard to the hells seems to have been that originally they were not distinguished from the nether worlds. For, as will be seen below (§ 4), the seven hells are seven Patālas instead of seven Patālas, and find room for the Asuras in caves below the earth and above the first hell, instead of seven Patālas. The upper regions begin with the terrestrial sphere, Bhūrloka; the next, Tapaloja, looks below to the seven hells, which reach even to the sun; while from the sun to the pole star extends the Sarasvata, or the heaven of the gods. These three worlds are destroyed at the end of each kalpa. The next higher world, Mahāloka, is not destroyed, but at the end of the kalpa its tenants repair to the next region, Janaloka, the inhabitants of which are Sanandana and other sons of Brahma. The sixth region is Tapaloja, peopled by the Vaiṛāja gods; and above it is the highest region, Satyaloja or Brahmaloa, the inhabitants of which never know death. It must, however, be stated that the different Purānas do not agree regarding the inhabitants of the higher heavens. The distance of these regions from one another increases from below upwards: Mahāloka is ten million yojanas above the pole star, Janaloka twenty, Tapaloja eighty, and Satyaloja a hundred and twenty, millions of yojanas above the next lower region.

A somewhat different description of the Universe is given by Viṣṇu in the Yogābhāṣya, iii. 23. This account, which may be ascribed to the 7th cent. A.D., is much more detailed than that of the Purānas, with which, however, it agrees on the whole. But it has also some curious affinities with the Buddhist description of the world, in proper names as well as in the part played by contemplation. The entire Universe is contained in the world-egg, which is but an infinitesimally small particle of the Pradhāna. The bottom of Bhūmaloka are the seven hells, one above the other. The lowest is Bhūrloka, which extends from the lowest hell to the top of mount Meru. The second region, Antarikṣa-loka, reaches to the pole star. The third is termed Svar- or Mahār-loka; the fourth Mahār- or Prājañatapaloka. The fifth, sixth, and seventh regions, called Jana-, Tap-, and Satya-lokas, form together the tripartite Brahmaloka. Bhūrloka is subdivided into hells, Patālas, and cast. The top of Bhūrloka is the bottom of Bhūmaloka, and the bottom of Bhūrloka is the top of Bhūmaloka. They have therefore no cosmogony, but they have a cosmogony of their own which differs widely from that of the Brahmanas, especially with regard to the upper spheres or heavens.

The Universe seems to be divided into two parts, that part of which lies beneath Viṣṇu's heaven, Vaikuṇṭha, is wanting in these lists of heavens. Apparently the authors of cosmogony did not come under that influence, so popular in Vaishnavism or Saivism.

1 For particulars, see Wilson, op. cit. ii. 215, and Hall's note to that passage.

2 For variations in other Purānas, see Wilson, op. cit. i. 208.
circumstance, is called Lokākāsa; the remaining part, Alokākāsa, is an absolute void and perfectly impenetrable to anything, either matter or souls. The Lokākāsa is coterminous with the two substances Dhārma and Adhārma, the substrata of moral and mental events are, therefore, the only sensible conditions of the presence of all existing things. ‘The world is figured by the Jaina as a spindle resting on half of another; or, as they describe it, three cones, of which the lowest is inverted; and the uppermost meets at its circumference the middle one. They also represent the world by comparison to a woman with her arms akimbo.\(^{1}\) Older, however, is the comparison with a man (purusa). The disk of the earth is in the lower part of the spindle, and forms the waist of the purusa; below the earth are the hells, and above it the upper regions. The entire world rests on a big layer of ‘thick water,’ this on one of ‘thick wind,’ and this again on one of ‘thin wind.’ The lowest, the middle, and the upper regions of yojanas. The seven lower regions (bdhāmis), one below the other, are Ratnaprabhā, Sarkaraprabhā, Vahukaprabhā, Paukaprabhā, Dhunaprabhā, Tamahaprabhā, and Mahatamahaprabhā. Another set of lower regions are Vimala, Umsvālī, Dharma, Vamśa, Saiva, Añjīra, Ārṣita, Madhavā, and Mādhavi (cf. the double set of names for the hells in the Yogabhāṣya, above, §3). These regions contain the hells; the lowest one has but five, while the uppermost has three millions of hells. Their inhabitants are the damned, nirakās, whose stay in hell is not without end, but for fixed periods of time, varying from 10,000 years to 33 oceans of years, when they are re-born in the lowest of the hells, and separated from each other by layers of 10,000 yojanas containing no hells; but in the layer separating Ratnaprabhā from the earth are the dwellings of the Bhavamāsin gods; these dwellings are apparently the Jain counterpart of the Brahmanic Pātālas. Above the seven regions of the hells is the disk of the earth, with its numerous continents in concentric circles separated by rings of oceans; these are described [Mythical]. In the middle of the earth the Mount Meru begins the threefold series of heavenly Vimalas, and is inhabited by the Vāmānīya gods. These three tales are as follows: (1) the twelve kulpas, Saudharma, Asāīna, Samatikumāra, Māhendraya, Brahmaloka,\(^{2}\) Lāntaka, Mahāmakara, Sahasrāra, Anata, Pranata, Arana, and Antarata (the Dwighantottam). Before Lāntaka; Kāpāṭha and Sukra after it, and Satāra after Mahāsukra); (2) the nine Gravīrīgakya (these heavens form the neck [ghruṣa] of the man figuring the world; hence their name); (3) the five Ānutāras, Vijaya, Vajayanta, Jaya, Arajayanta, and Sarvārtheśa. The gods in the Ānutara Vimānas will be re-born no more than twice. It is to be understood that all these twenty-six heavens are one above the other. Above Sarvārtheśa-the topmost of the universe, is situated Isatprābhā, the place where the souls resort on their liberation (nirvīpa). The following description of it is given in the Uttarādhyāyaṇa Sūtra, xxxvi. 57 ff. (SBE xlv. 211 ff.):

yojana above the (Vimāna) Sarvārtha is the place called Isatprābhāhara, which has the form of an umbrella (58). It is forty-five hundred thousand yojanas long, and as many broad, and it is somewhat more than three times as many in circumference (59). Its thickness is eight yojanas; it is greater in the middle, and decreases toward the borders, until it becomes thinner than the wing of a fly (60). This place, by nature pure, containing white gold, resembles in form an open umbrella, as has been said by the learned scholar (61). This place (called Sīla), which is white like a conch-shell, the akṣara-stones, and kumāra-flowers; a yojana thence is the end of the earth (62). The pure souls penetrate the sixth part of the uppermost krūsa of the (above-mentioned) yojana (63). Thereon at the top of the world reside the blessed perfected souls of all re-transmigrations, and arrived at the excellent state of perfection (64).\(^{3}\)

In concluding our exposition of Jain cosmogony it may be remarked that the knowledge of it seems always to have been popular among the Jains, for the plan of the Universe as described above is always before the mind of Jain authors, and they presuppose an acquaintance with it on the part of their readers.

**Literature.**—The above account of Jain cosmogony is based chiefly on Umāvati’s Utpattihārṣikā Sūtra (ib. by the present writer in ZDMG ix. Leipzig, 1890).\(^{4}\)

**COSMOGONY AND COSMOLOGY (Iranian).—**The chief Iranian texts on the creation of the world are Firdawsi’s Shahname; the Zend-Avesta; the fae. of the Hāft-patshāh and the more elaborate is the latter, and according to it both Ormazd and Ahriman have existed from all eternity—a view which is as old as the Gathās (cf. Yasna xxx. 3, which distinctly terms the two spirits ‘twins’ and—xlv. 2). The pair are parted by the ether (ratya), and Ormazd dwells in ‘endless light,’ while his opponent lurks in an abyss of infinite darkness. Ormazd, moreover, was aware, through his omniscience, of the existence of Ahriman, the evil spirit was ignorant of the higher being until aroused to conflict with him by beholding light. Thereupon, as Ormazd created excellent lands, Ahriman sought to mar his work by bringing into being plagues, moral and physical. Herein the essential dualism of Zoroastrianism finds one of its most important illustrations.

Zoroastrian cosmogony covers a period of 12,000 years, which are divided into four ages of 3,000 years each. The first of these epochs is the age of the spiritual creation, in which the creations remained ‘in a spiritual state, so that they were unthinking and unmoving, with intangible bodies’ (Dāndakhā 1. 8; Selections of Zend-gāriman 1. 29). These spiritual ‘twins’ were of analogy to the Platonic ‘Ideas,’ and Darmesteter has sought (Le Zend-Avesta iii., Paris, 1853, pp. li-liii), although without success, to trace an actual connexion between the two. Meanwhile, Ahriman created demons for the overthrow of the creatures of Ormazd, and refused the peace which the celestial being offered him. Thereupon, they agreed to combat for nine thousand years, Ormazd forswearing that for three thousand years all things would go on according to his own will, while in the second three thousand years the two spirits should struggle in bitter conflict, and in the third Ahriman should be utterly put to rout. The second epoch of three thousand years was that of the material creation that the order being, after the Amesha Spentas (g.v.), heaven (including the heavenly bodies), water, earth, plants, animals, and man. The third period of three thousand years begins with the creation of Ahriman into the good creation of Ormazd. The evil spirit spreads disease, devastations, and noxious creatures, throughout the world, harming and defiling water, earth, plants, and fire, in addition to slaying the primeval ox and the primeval man. Finally, however, the demonic hosts are driven back to hell. The remainder of this period is concerned with the legendary history of the Iranian kings, so that

COSMOGONY AND COSMOLOGY (Japanese)

neither it nor the final eschatological period comes under consideration in an outline of the Persian cosmogony.

Problem about the Avesta the creation of all things is ascribed to Ahura Mazda (Ormazd), as in Yasna xvi. 1, although a certain amount of creative activity is also attributed to the Amashaspands (Yasna xiv. 12; Visperad xi. 12; Yast xix. 18). In Yasna xxviii. 1, however, the chief motive, and quite the striking passage, is:

Here, then, we worship Ahura Mazda, who created both kine and holiness, and created water, created both good trees and light, both the earth and all good things (cf. xlv. 3-5). That this held for Iranians in general is certain from similar phraseology in the Old Persian inscriptions, as in Nl. a, 1-8: 'A great god is Aharma Mazda, who created this earth, who created you heaven, who created man, who created peace for man, who was the top ruler of many,' although similar phrases are not known in Assyrian inscriptions (Gray, ASJL xvii. 152).

The creation itself, according to the Parsi Āfrīn Gahānbārd (tr. by Darmesteter, op. cit. pp. 180-187, and edited by him in Études iran., Paris, 1883, ii. 318-333) and the Bāndahān xxv. 1 (cf. also the section of the Great Bāndahān, tr. by Bluchet, RHR xxxii. 226), occupied about 180-187 years, and the tradition of a cosmic calendar of 12,000 years, although not mentioned in the extant Avesta, must be of considerable antiquity, for the historian Theopompus, an author of the 4th cent. B.C., says, in a fragment preserved by Plutarch (de Iside et Osiride, xlvii.): 'According to the Magi, one of the gods conquers and the other is conquered for three thousand years each; and for another thousand years they fight and war, and one destroys the other, and finally Hades loses, and mankind shall be blessed, neither needing nourishment nor casting shadows.' The Iranian cosmogony seems to have been geocentric, and, according to Dāstūnān-Denik xxxv. 24, 'the sky is in three thirds, of which the one at the top is joined to the endless light, in which is the constantly-beneficial space; the one at the bottom reached to the gloomy abyss, in which is the fiend full of evil; and one is between those two thirds which from the middle and space was made. This has led some scholars, notably Spiegel, to seek to find the idea of the cosmic egg in Iran, but of this, as Casartelli has well pointed out, there seems to be little evidence. The question whether the Iranian cosmogony, which was a creation of nihilo has been much discussed, although it would seem from the phrase in the Bāndahān (xxxv. 5), 'when they were formed, it was not forming the future out of the past,' that at least in the later development of the religion this doctrine was not unknown. The earlier texts, however, shed little light on this problem, nor do the verbs used of the creative activity of Ormazd (da, 'establish,' thavares, 'cut'; tāz, 'form,' cf. Gr. τέκτων) and Ahura Mazda (cut) of the aid, although thavares, tāz, and karat seem to imply the elaboration of already existing material, while it may be urged that da connotes, at least in some passages, actual creation ex nihilo. Equally dubious is the problem of the origin of the Iranian cosmogony. An elaborate comparison has been drawn by Spiegel (Ernāsche Alterthumskunde, i. 449-457) between the Iranian and the Semitic, particularly Hebrew, accounts of the creation of the world; but this leaves the least, unsolved. It is true that both in Genesis and in the Bāndahān, creation occupies six periods, but in the former the epochs is a week of six days, and in the latter a year of six gahānbarā, and the correspondence in the main between the order of the two accounts is a natural sequence of development, and not due to the borrowing of either from the other. It should also be noted that the Iranian account makes no allowance for the seventh day of the Biblical record, thus further increasing the improbability of borrowing from either side. On the other hand, the division of the earth into seven kārvars, or 'zones,' which is mentioned repeatedly in the Avesta (as in Yasna xvi. 5; Yast xix. 82), and is as old as the Gāthās (Yasna xxxii. 3), is undoubtedly the Iranian idea, and the Semitic cosmogony likewise divided the earth into seven zones (tubugāt). This origin of the Iranian kārvars seems more probable than the view which associates them with the deities ('islands') of Ilinda cosmogony, which usually number seven, although they are occasionally regarded as four or thirteen. They are not mentioned, however, before the Mahābhārata and the Brahmanas, and may have been influenced the Avesta (cf. Muir, Original Sanskrit Texts, i. London, 1872, pp. 489-501; and, for the proof of Bah. influence, P. Jensen, Kosmon. der Babylonier, Strassburg, 1890, pp. 175-184).

The cosmogony as outlined in the Avesta and the Pahlavi texts, underwent some slight changes in the course of time as a result of philosophic thought. The reduction of the dualism of the Gāthās—i.e., no doubt, a reduction of an earlier polytheism—further, may have been due to the elaboration of the concept of 'Boundless Time' (ezavvakarana), which is hailed as a godling even in the so-called Younger Avesta (Yasna lxxi. 10; Nyāyā i. 8; Vendidad xix. 13). The Zarvanes sect, which in the Avesta, as early as the 4th cent. A.D., derived both Ormazd and Ahuramazda from 'Boundless Time,' making the evil spirit born first in consequence of the doubt of 'Boundless Time,' while Ormazd did not come into being until later, and was long inferior in power to Ahuramazda. In somewhat similar fashion, the Khuiyomartians, another Zoroastrian sect, held that Ahuramazda, the principle of evil, was sprung from Yazdani ('God,' i.e. Ormazd) because of his sinful thought (Yasna xlvii. 3). It is, perhaps, likely that he would be fashioned? (cf. the account of these sects by al-Shahristani, tr. Haarbrucker, i. Halle, 1850, pp. 276-280; and see Spiegel, Ernā, Alterthumskunde, ii. 175-189; Darmesteter, Ormazd et Ahuramazd, Paris, 1884.)

LOUIS H. GRAY.

COSMOLOGY AND COSMOGRAPHY (Japanese).—The most ancient and most authentic account of Japanese cosmology is found in the Kojiki ('Records of Ancient Matters,' A.D. 712). The following is the description of the description of the universe contained in this valuable text:

1 For the Gr. text, see vol. i. p. 299, where a different interpretation from the one here given (which agrees independently with that of Lagrange, RB, 1904, p. 25) may be found.

1 The names of the Deities that became (i.e. that were born) in the Plain of Heaven, when Heaven and Earth began, were Ame-no-mi-naka-mushihohako (the Deity Master of the August-Centre of Heaven), next Taka-mi-mi-nasu-mi-kami (the High-August-Producing Wondrous-Defy-the-Dead-kami (the Divine-Producing Wondrous-Defy)), and finally, the Deities that were all Deities born alone (i.e. spontaneously, without being produced, and had their personal names in essence, death or otherwise). The names of the Deities that were born next from a thing that sprouted up like unto a root-duck when

Digitized by Microsoft®
From these very first lines of the sacred account we have before us a genesis that is not lacking in grandeur. The world appears as a nebulous, moving chaos; Divine beings develop in it by spontaneous generation;1 and in the heart of space, others coming from a reed-plant that has arisen from the mud; while others spring up, at first solitary, then in pairs, following a progress and bearing names that recall in a striking manner a Chinese cosmogonic explanation of the ancient national myth did not escape the Japanese commentators who elucidated these texts in the 18th and 19th centuries.

And it cannot be denied that the above-quoted myth reveals under the transparent symbolism of its Divine figures an intellectual effort to find a logical explanation of the genesis of the universe.

To this slender outline of the Kojiki we may now add the complementary picture supplied by the Nihongi (‘Chronicles of Japan,’ A.D. 720). This account is less simple, and is permeated by Chinese ideas, which must be eliminated; but, on the other hand, it is also richer in various developments borrowed from other indigenous sources.

Of old, Heaven and Earth were not yet separated, and the In and Yō not yet divided. They formed a chaotic mass like an egg, which was of obscurely defined limits, and contained germs. The purer and clearer part was thinly diffused and formed Heaven, while the heavier and grosser element settled down and became Earth. The finer element easily became a united body, but the consolidation of the heavy and gross element was accomplished with difficulty. Heaven was therefore formed first, and Earth was established subsequently. Therefore Divine Beings were produced here. Hence, it is said that, when the world began to be created, the soul of which lands was composed floated about in a manner which might be compared with floating on the surface of the water. At this time a certain thing was produced between Heaven and Earth. It was in form like a reed-plant. Now this became transformed into a god, and was called Uto-tokotachi-no-kami (the August Standing-Eternally-in-Heaven), the cosmic figure or principle of Earth.

And it is said that this being was the first to be created. He was the ancestor of all flesh, and was called Kami. Kami is the personal deity. The five Deities in the above list are separate Heavenly Deities (i.e., were separate from those who came into existence afterwards.

The names of the Deities that were born next were Kuni-no-tokotachi-no-kami (the Deity Standing-forever-in-the-Earth), next, Man-tokotachi-no-kami (the August Standing-Integrating-Master, or Deity). These two Deities were Likewise Deities born alone, and the names of the Deity that was born next were U-hiji-ni-no-kami (the Deity Mud-Earth-Lord), next his younger sister (i.e., wife) Su-hiji-ni-no-kami (the Deity Mud-Earth-Lady), next, Iku-guhi-no-kami (the August Standing-Perfect-Plant, or Deity), next, Tsun-guhi-no-kami (the August Standing-Integrating-Deity), next, his younger sister Higashi-guhi-no-kami (the August Standing-Integrating-Deity), next his younger sister Toyo-hiji-no-kami (the Deity Earth-Mother), next, Iku-guhi-no-kami (the Deity Earth-Mother), next his sister Tsun-guhi-no-kami (the August Standing-Perfect-Plant). From the Deity Standing-Eternally-in-Heaven down to the Deity of the Female Who-Inherits in the foregoing list are what are termed the Seven Divine Generations. The two solitary Deities above-mentioned are each called one generation.

After the cosmic figures had attained the form and names of the Earth, the pure element was afterwards divided among the Deities each pair of Deities each pair of names is called ‘generation’ (Kojiki, at the beginning of vol. 1; tr. B. H. Chamberlin, ed. 1906, p. 15.)

Sometime after the first generation of Deities was formed, the reed-shoots came forth from the mud; and this thing was immediately metamorphosed into human form.

All these texts are valuable from their very incoherence, which, like the incoherence of the Hindu myths on the same subject, proves their authenticity and affords all the most interest from the point of view of comparative mythology. In the first place, indeed, this abundance of versions enables us to trace in Japan the cosmogonic myths of many other races; e.g. the idea that gods and men were part of the same entity, which we meet with from the time of the ancient Greeks, who believed that they had sprang from the earth like cabbages, were born from certain trees, or had risen out of a marsh, right down to the Amazulu who make their Universe originate from a bed of reeds or even from a reed-plant (which corresponds exactly with the Japanese idea).

In the second place, by examining these most ancient texts in relation to each other, we can distinguish, as far as is possible, the true myth from the myths influenced by the Chinese notions added thereto. The idea of the separation of the Heavens and the Earth, with which the Nihongi begins, and which also exists in China (myth of P’an-ku), is found again in India, Greece (Kronos), Africa, New Zealand (Rangi and Papa), and consequently it would be rash to affirm a simple Chinese imitation here. But the whole passage on the In and the Yō (the Yin and the Yang, the passive or female principle, and the active or male principle, which are the main springs of Nature in Chinese philosophy) is clearly only a little dissertation of foreign metaphysics, preparing for the way the native tradition of Izanagi and Izanami, the creators of Japan. As regards the cosmic egg—which seems to be a postulate of the male and female principles, and that it does not harmonize very well with the image of the fish employed immediately after. It is only at this point (Hence it is said . . .) that the real national account, agreeing with that of the Kojiki, begins. Thus we see the
leading line of the purely Japanese myth disentangling itself, viz., the essential notion of a floating earth, from which springs a red-dead, which in turn engenders the human form. And in this way we have, along with the origin of the world, the origin of man himself: the cosmogony terminates in a mysterious theogony, in which the Divine and human elements are confused in an insensible transition.

At this stage the last couple born in the Plain of the High Heavens are commissioned by the other gods to 'make, consolidate, and give birth to this divinity on it; and so, the cosmogony terminates in a mysterious theogony, in which the Divine and human elements are confused in an insensible transition.

Hereupon all the Heavenly Deities commanded the two Deities, His Augustness the Male-Who-Invites and Her Augustness the Female-Who-Invites, ordering them to 'make, consolidate, and give birth to this drifting land.' Granting to them so heavenly jewelled spear, they thus died, and so to change them. So the two Deities, standing upon the Floating Bridge of Heaven (most probably, the Rainbow), pushed down the jewelled spear and stirred it with it, whereas, when they had stirred the brine till it went curdle, and drew the spear up, the brine that dripped down from the end of the spear was the land (i.e. Self-Condensed) (Kojiki, 10).

Izanagi and Izanami descend from Heaven to this island and celebrate their union. They give birth first to a weakly child, which they abandon in a reed-boat, and then to the islet of Awa (Foam), which also they refuse to acknowledge. But, on being told by the celestial gods that, if these children should perish, 'it is to cause the woman species first,' in the purpose of the ceremony, they resume their work of creation under more favourable conditions, and give birth first to the island of Awaji (Foam-way), and then to the other islands of the archipelago, and this they put into the world, in the same manner a whole tribe of Nature-gods. Here, again, we observe the idea of evolution so familiar to Japanese thought.

The god of Fire, Kagu-tench, Izanami's last-born, desires to be her mother so badly that she dies in a terrible fever. Izanagi in despair drags himself round about the body groaning, and from his tears is born another god. He buries his wife on Mount Hiba, on the borders of the land of Izumo. Then, in the fury of grief, he tears the matri-rice to pieces, the blood and scattered members also changing into new deities. He finally descends to Hades to recover his wife, and finds himself face to face with a mass of putrid matter. Horror-struck, he returns to the light of day, and in order to elaborate the nations in a race of Kyushu, in order to get rid of the uncleanness contracted in his sojourn with darkness and death, Twelve deities are at this time born from his staff, various parts of his clothing, and his bracelets, as he throws them on the ground, and then fourteen others spring from the various processes of his ablations, among these being three illustrious deities who are the last to appear, when he washes his left eye, his right eye, and his nose, viz., Amaterasu-oho-mikami (the Heaven-Shining Great-August-Deity), Tsukuyomi-no-mikami (the Moon-Night-Deity), and Take-haya-susa-no-wo-no-mikoto (His Brave-Swift-Invincible-Male-Augustness).

To these three deities—the goddess of the Sun, the god of the Moon, and the god of the Ocean, soon transformed into the god of the Storm—Izanagi proceeds to give the investiture of the government of the universe: 'To Amaterasu this Male-Who-Invites greatly rejoiced, saying: 'I, begetting child after child, have at my final begetting taken three illustrious children.' At once he enclosed them in three jewel-forms of precious stones. To his august necklace, he bestowed it on the Heaven-Shining Great-August-Deity saying: 'To this Augustness rule the Plain of High Heaven.' With this charge he bestowed it on her. . . .

Next he said to the Moon-Night-Deity: 'Do Thine Augustness rule the Nation of the Night.' And he charged her.

Next he said to His Brave-Swift-Invincible-Male-Augustness: 'To Thine Augustness rule the Sea-Can.' (Kojiki, 10).

So, then, is the universe organized in its essen-
tial elements. It still remains, however, to complete the construction of the earth. This is the task, after the clear-cut division of the universe, of a god of the land, a god of the sea, and a god of another element, the god of the earth, the god of names. (A.D. 753).

The august god declared: 'The country of Izumo, . . . is indeed a youthful country of narrow stuff. The original country is still very little. Therefore, I am going to set a new piece of land to it.' He spoke; and, as he looked towards the cape of Shirai (a Korean Kingdom) to whether there was not excess of land there, he said to himself: 'There is an excess of land'; and with a mattock he hollowed out a cleft like that between a year old's breasts; this cleft he filled with the excess of land, and put a stone to hold it. Then he said: 'There is an excess of land': like those dealt on the gills of a large fish (to kill it); and cut it away . . .; and, fastening round it a thick three-strand rope, he drove it long, balanced, and the rope thus sewn on is to be found between the extreme boundary of Kozu and the promontory of Kinko, which has been formed eight times. The post arranged in this way is Mount Sakurahara, the boundary between the country of Iki and that of Izumo. Moreover, the rope with which he dragged the land along is the long beach of Someo. When looked towards the country of Kaki, at the gates of the North (i.e. in the North), to see whether there was not an excess of land, he said: 'There is an excess of land' (as above, down to "Come, Land!"). The land thus brought and sewed on is the country of Sakai, which is divided from the very borders of Tatsu to here. When he looked towards the country of Sunami, at the gates of the South, to see whether there was not an excess of land, he said: 'There is an excess of land' (once more the same words, ending with "Come, Land!"). The land thus brought and sewed on is the country of Karazato, extending from the borders of Tatsu to here. When he looked towards Cape Tsutsu, at Someo, to see whether there was not an excess of land, he said: 'There is an excess of land' (always the same phrase). The country thus brought and sewed on is Cape Mito. The rope which was thus brought is the island of Yomi (one of the place-names that are connected with the entrance to Hades, situated in Izumo). The post arranged in this way is Mount Obi-ke-no-kuni. In the above, it is said: 'This country has been finished bringing land,' he said. And, as he drove his august stuff into the ground, in the wood on which he treaded: 'Yomi' whence the name Omi (Izumo Fudos, ed. Ohara, 1896, pp. 4-6).

This 'bringing of land' (Ishiki-bishi), the naive account of which ends with an equally childish explanation of the name of the place, is a striking illustration of the material character of the task devolving upon Oho-kuni-nushi—the finishing of the work by the creator-figure, the continued by Izanagi on his being widowed, and finally interrupted by Izanagi's death. Only the method is different. A short passage in the Nihongi (ii. 366) shows the extent to which this putting together of the country seemed a natural work: one night, in an A.D. 657 a noise was heard coming from the east like the rolling of drums, in the morning it was seen that an island had suddenly risen out of the waves; the conclusion was that the ominous noise was the din the gods made when roiling this island. Without leaving Japan, we can trace the same idea of building in an Ainu myth. It is intended to explain why the west coast of Yezo ends in treacherous rocks, while the east slopes down gently to the sea. The western coast, the land was built by a Divine couple, and the woman, who had charge of the west shore, neglected her task by speaking all the time.

In short, apart from spontaneous generation, which is freely admitted for the primordial gods, the creation of the world can be explained prin-
Finally, "cosmos" and "cosmology" are terms commonly used to denote the belief that the Sun, Moon, stars, and planets all move in a harmonious order; that the Earth is the center of this universe and is surrounded by the skies, which, like the waters, are divided into two parts, the heavens above and the earth below. This concept is universal, as it can be found in many cultures around the world. For example, the ancient Egyptians believed in a world consisting of a central land surrounded by water, with the gods above and the dead below. The ancient Greeks also had a similar concept, with the gods dwelling in the heavens and the humans living on Earth. The ancient Chinese believed in a world where the gods lived in the heavens and the dead lived in the underworld. This universal belief in a harmonious order of the universe can be seen in the diverse cultures that have developed throughout history.
"Ame-no-uxume-to-mikoto (Her Augustness the Heavenly-
Alarming-Female) drove together all the things brood of
and the sky-blazed very bright, saying: "Will you, respec-
tively, serve the august son of the Heavenly Deity?" to
which all the fishes declared that they would respectfully
serve, and the sky-blazed very bright. Then said Ame-
no-uxume-to-mikoto: "Ah! I am a month that gives no
reply. I am a month with waste merchandize. And now,
the present day the bōke-de-miyer has a slit month." (Kojiki, 139).

In the same way the Breton legend explains how the
fishes claimed for making a grimmace at the Holy
Virgin, even all kinds of crooked mouth; and an
Oceanic legend tells how the sole refused to sing,
and was trampled upon by the angered fishes, and
was thereafter. In Japan itself a popular tale, which
is said sacred, but which nevertheless undoubtedly very ancient, tells us
that the reason why the medusa has no bones to
shapeless substance is that, for being
in the performance of a task entrusted
to her by the god of the Seas, she was so maltreated by
blows that she was reduced to pulp. In all these
stories, as in that of the Biblical serpent
deemed to creep for ever (Gen 3''), the punishment
continues in the descendants of the afflicted animal —
her filiation, since the established
form of the animal precisely constitutes the raison
d'être of the myth.

We find myths of this kind to an even greater
extent in relation to man himself, his physical
nature, displaying all his defects which shored
his instinct of preservation. Like all primitive
peoples, the ancient Japanese see in death
an abnormal phenomenon. Natural death does not
exist; death must be the work of some
supernatural agencies. On the fatal frenzy of
Izanagi might be a manifestation of the fire of god, and the last
illness of the hero Yamato-dake, who was seized
with a sudden chill in an icy shower, must be the effect
of the vengeance of the god of the mountain
when he lost his way. Speaking in a more general
way, just as the majority of civilized races claim a
spiritual immortality which they deny to animals,
so primitive man liked to believe that physical
immortality would have distinguished him from
all other beings, if death had not been introduced
into the world by some mistake or as a tyrannous
punishment. This conception is found equally
among Hebrews and Greeks, Kaftirs and Hotentots,
Fijians, New Zealanders, etc.

The punishment by death of the islander of the Shimto myth:

"Asu-te-bi-daka-bi-ko-ho-no-ai-nig-ko-no-mikoto (Hii Augustness
Heaven's-Son-of-Bright-Prince-Rice Ear-Ruddy-Plenty) met a
hag on the west-front of Cape of Izu, and asked her
whom her daughter was. She replied, saying: "I am a daughter
of Yo-ya-tea-mi-ni-ko-kami (the Deity Great-Moun-
tain-Possessor), and my name is the Divine-Princess-of-the-
Trees," Then she charged her, saying: "I wish to make thy
wife. How will this be?"

She replied, saying: "I am not able to say. My
father, the Deity Great-Mountain-Possessor, who,
greatly delighted, respectfully sent her off, joining to
her other islander princess Long-as-the-Beans, and caused
merchandise to be carried on tables holding an hundred. So
then, owing to the elder sister being anxious, His Augustness
Princess Rice Ear-Ruddy-Plenty was alarmed at the sight of
her, and sent back, only keeping the younger sister Princess
Blossoming-Blissfully-Like-the-Flowers-of-the-
Trees, whom he waited for one night. Then the Deity Great-Mountain-Possessor
said to the younger sister Princess Long-as-the-Beans being
sent back, and sent a message, saying: "My reason for respect-
fully presenting both my daughters together was that, by
sending back the younger sister Princess Blossoming-
Blissfully-Like-the-Flowers-of-the-Trees, they might live
nourishingly unlike the elder, and the blossoming
beauty of the heavenly Deity shall be as fair as the flowers
of the trees." So it is for this reason that, down to the present
day, the august lives of Their Augustnesses the Heavenly
Sovereigns are not long." (Kojiki, 180).

This curious case at first sight to apply only to the
Imperial line, but there is no doubt whatever
that, in primitive thought, it was meant to explain
why all men are mortal. This is proved by the
following variant from the Nihongi, the Japanese
Bible:

"I-naga-hime, in her shame and resentment, spat
and wept. She said: "The race of visible mankind shall change
its outwardness like the flowers of the trees, and shall decay
and pass away." This is the reason why the life of man is so short.

There is a rather striking resemblance to be seen
between this myth and a legend of the Non
American Indians: the Pebble-and the Bushes
were with child at the same time, but the children of
the Bushes were born first; that is why man is
subject to death. I-naga-hime also recalls in
a wonderful manner O-te-papa, the rock-wife
of Tangaloa, in Polynesian myth.

Besides death, life also has its place, especially
among a light-hearted people like the ancient
Japanese, whom even Buddhism itself could not
seduce. They sought to probe to the origin of
death, but they understood none the less that
this was not the only problem of their
destiny. They admired life with its fertility; and
another important myth proceeds to tell how, in
spite of the truths of the real world, the
humanity develops and triumphs in the immor-
tality of its perpetual rejuvenation. Izanagi,
the father of men and islands, fled from the sub-
terrestrial kingdom, pursued by the Fujiree,
The Thunderbolt, and all the horrible army of Hades.

"Last of all his younger sister Her Augustness the Princess
Who-Invites came out herself in pursuit. So he drew a
thousand-drang out rock, and blocked up the Even Path of Hades
(Yomo-tsua-hira-saka, forming the frontier-line between Hades
and the World of the Living), and placed the rock in the
middle; and the rock was oped opposite to one another
leave-taking; and Her Augustness the Females-Who-Invites
said: "My loving older brother, Thine Augustness is
like this, I will in one day strangely to death a thousand
of the folk of thy land." Then His Augustness the Male-Who-
Invites replied: "I will not a lovely younger sister, Thine Augustness!
If thou do this, I will in one day set up a thousand and five
hundred partition-houses (the separate hut for a woman
about to be delivered). In this manner each day a thousand
people would surely die, and each day a thousand and five
hundred people would surely be born."“

I-nan is thus conquered; Izanagi prevails;
and in commemoration of his victory the Japanese
thereafter called themselves Ame-no-masu-hito-ra,
'the heavenly surplus-population.'

All these are the components of which was
ruined by the serious questioning of primitive
curiosity regarding the affairs of Nature and
man, of physical phenomena and living beings,
the origin of the world and its present appearance,
and, short regarding everything that afterwards con-
stituted the complicated object of the sciences
—provide us with a mythology in which cosmogony
holds the place of honour, and cosmology is only
beginning to appear. The ancient Japanese felt
themselves enveloped in mysteries which they
would have been glad to solve; but, as the limited
extent of their knowledge set strict bounds to
their attempts, they soon tired of looking for
these causes; they accordingly stopped short with in-
visible and intangible explanations, which
excited them, but which could scarcely approach a deep
investigation of the laws that underlie the sensible
world. It was only under Chinese influence that
this type of investigation developed, and that the
ancient mythology became a more or less
abstract science, as we have seen in the typical
example of the story of the creation in the Nihongi.
This desire to harmonize national tradition with the
philosophical ideas of China, or even of Europe,
led the Japanese to turn to the hands of the modern Shintoist theologians.
Thus, e.g., they attempted to explain the origin of the
stars, sometimes by investigating whether they
would be
might have sprung from the excess of material stirred up and scattered into space by Izanagi’s spear, sometimes by supposing that the shell of the primitive egg got lost. But these apologetic speculations are clearly foreign to the simple cosmogony and embryonic cosmology of the ancient Japanese.

MICHEL REYON.

COSMOGENY AND COSMOLOGY (Jewish).

—Speaking generally, it may be said that speculation as to the origin of the world was not encouraged during the early Rabbinic period. Between Biblical times and the era of the Jewish philosophers, cosmology in the modern sense can scarcely be said to have flourished, by which is meant that it is so closely connected with philosophy itself that separate treatment is scarcely possible. The well-known verses of Ben Sira (Sir 32:4),

1Search not the things that are too wonderful for thee; and seek not that which is hid from thee.

... thou hast no business with the secret things'.

(G. G. Taylor,

are quoted in Talmud and Midrash, and were applied to this form of investigation (see JQR iii. [1890-1] 690; Bab. Hagiga, 113a, etc.; Midr. Bereishith Rabba, ch. viii.; cf. also parallel passages quoted in JQR iii. 690). It may also be said that, in most cases where cosmological elements are found in Rabbinic sources, the scientific character is subordinated to the religious. Leaving the Biblical records, the following are the main groups of writings, during this intermediate period, which deal with the question of creation: (1) references in Talmud and Midrash (cited above); (2) special references to the 'Logos' as distinct from other means of creation; (3) Kabbalistic writings and references, such as the Sepher Yezira and the Zohar, etc.

With regard to the first class, the verses of Ben Sira which have been cited are typical of the disapproval displayed by the Rabbis towards cosmological studies. With this statement one must carefully compare the Gemara in the first Mishna of the second perek of Hagiga (11b). This passage is the locus classicus, though scarcely less noteworthy are the beginnings of Genesis Rabba and Tanhuma. It is evident that the dislike of the Rabbis to the study of cosmology was due to two causes—the fact that the material and method appeared to be Greek in origin, and the fact that such study sometimes led to atheism and sacrilege. In support of this the famous story of Elisha b. Abuya (Aher) (cf. Hagiga, 15b foot, etc.) may be recalled. The study of Greek mythology and philosophy leads to Hellenization, and must be discouraged. It would seem, however, that the ardor for these studies grew, in spite of the Rabbis, and the latter seem to have abandoned a policy of resistance and adopted a new attitude—that the creation of the world must be shown to have depended entirely on the Divine power. Hence the early chapters of Bereishith Rabba are devoted to proving that God, and God alone, is the Creator.

There are clear traces of replies, on the

part of the Rabbis who are there quoted, to opponents, who seem to have been Gnostics and dualists, by whom the Biblical scheme of creation is rejected; in some cases it would seem as though we were face to face with Panteistic ideas, but that would be difficult to establish. The creatio ex nihilo is frequently affirmed, but this question, as well as that of the 'eternity of matter,' belongs to Jewish philosophy rather than to cosmology; they cannot be considered without reference to later writers, e.g. Maimonides and Judah Halevî.

Each of the three great Semitic religious has had to face the problem of harmonizing a doctrine of pre-existence of the Deity with the teaching of concurrent belief in the creatio ex nihilo. In the case of Christianity it is the Arian controversy. Among the Muslims, the question of the Qurán—whether it was created or eternal—was one of the points on which the Muḥammad—was clear from the beginning. In the early Jewish writings, the controversy was expressed in different terms, and it would have been alleged that the Torah had some share in the actual work of creation (contrast B. I. Raba, ed. Theodor, p. 6). But, while the Bereishith Rabba compares the Torah to the parchments plans of an architect, the function of the Divine Creator are not only never usurped, but, on the contrary, the supremacy of the Godhead in the work of creation is emphatically stated. From this it may be inferred that the belief was never reduced to a pre-existence. The same may be said of the passages in the Midrash. Their purpose is homily, not science; 'their concern is to praise the works of the Deity rather than to investigate the ways of Nature or to explain the wonders of the universe. The methods employed. A verse of Scripture is regularly interpreted by natural phenomena, and the functions of heaven and earth are derived philosophically from the Bible. Had the objective of the Rabbs been primarily scientific, a different method would have been adopted. As it is, arguments post factum are quite legitimate and in keeping with the purpose.

To imagine that the Rabbis would have been content with such methods of argument, or would have considered them adequate, is impossible for two reasons. (1) This would overlook the true character of Haggada (i.e. allegoric homily); and (2) it would imply ignorance of the scientific capabilities of this period. The Rabbis had a special regard for astronomy, in order to see what they could achieve. Hence it is desirable, for cosmological purposes, to pass over Bereishith Rabba and most Talmudic passages. It is also fair to exclude the famous controversy of the Talmud and Shammai as the relative precedence of Heaven and Earth 1 in this category (Hag. 12a), because their objective also was religion, not science. On the whole, the dogma of the creatio ex nihilo was accepted, though not without reservations and even opposition. In 2 Mac 7:2 the author speaks actually of a creation Et ex loco, but Wis 11:8 prefers the theory of re-arrangement of existing matter rather than creation. Plato allegorizes: God gave the form to the matter, and man may change, of course, ultimately He is the Creator. According to the

1 This was one of the questions asked by Alexander of Macedon (see Tumiel, 32b, and B. I. Raba, ed. Theodor, p. 13).

2 The postmoderate suh koi nitsa nyon labas 32b nity lokm 32b.}

.....
beginning of de Opifíc. Mundí, the world was created for the 1717, and with the 1717 all natural phenomena must be in harmony. This is perhaps an extension of the Midrashic thought that the world was created 1717 1722 (B. Rabbá, ed. Theodor, p. 9, line 9). Tholos's Logos does not perform quite the same functions as the Mishnic or Targumic Logos or Memra—if such a term may be used. In Abott (v. 1) we read that the world was created by ten 1705, or sayings; that is to say, "And God said" occurs ten times with reference to the Creation. Now this theory has developed from what may briefly and conveniently be described as the Targumic attitude—the objection to anthropomorphism. The Memra, or Memra, to some extent intervenes and becomes the mouthpiece or instrument of creation. This gives rise to theories of Mediators, whether in form of Demiurge or of Mētraón, which are, however, often expressly repudiated: e.g. Bereishith Rabbá (ed. Theodor, p. 5, l. 10), and p. 27, l. 2), where the date of the creation of angels is discussed. The question is in itself unimportant. Stress is laid on the fact that they could not have been created on the first day, lest any share in the way, in which the Mētraón (μέτα όρων or μετατόπων) is mentioned by name frequently (cf. Sanhedrin, 336, which is a warning against ascribing Divine powers to Mētraón). It may be doubted whether it was ever believed that a mediator, by means of special agencies functions; it is more probable that the idea was invented to account for the text, and repudiated when felt to be dangerous. At all events it cannot be included in true cosmology.

The Kabbalah, which, of course, belongs really to a later period, the same air of unreality is experienced. In the Sepher Yeshirá and similar works, permutations and arrangements of numbers and letters are the basis of argument, and this is typical of the whole mystical outlook of the Kabbalah. A close relation is postulated between the real and the unseen, between the written word and the abstract idea of which it is the symbol; hence it was possible to derive the spirituality of the physical world from the form, i.e. from the word in which it was confined. The deductions are, of course, ingenious, but they are reached by literary or quasi-philosophical arguments. It is obvious that in attempting to establish or even to suggest the selected tradition must form the foundation of cosmology, and it cannot definitely be stated to what practical extent the authors of Kabbalistic reasoning desired their results to be taken. The truth is that between the period of the Bible and that of the mediaval Jewish philosophers there is no real cosmology. The Scriptures supplied the needs of all seekers, until Judaism was brought face to face with Aristotleanism and Neo-Platonism. Hence cosmology was not taken seriously in the scientific sense, it was more homily; but henceforward it became an integral portion of the system of each thinker. It is impossible to discuss the theories of 1727, creatio ex nihilo, in mediaval times, apart from the rest of the philosophy which was established upon it.

LITERATURE.—There is a critical edition of the Midrash Bereishith Rabbá by O. J. Theodor (Berlin, 1900). For those unacquainted with Hebrew the Talmudic references may be studied in M. L. Rothkis's tr. (Haggag. vols. v. and vi.), New York, 1900; and in L. Loew's tr. (Bereishith, London, 1897, etc.). The treatise Haggag was translated (with notes, etc.) by A. W. Stranea, Cambridge, 1893. Some idea of the Midrash may be obtained from J. S. Rapaport and Maurice Frank, of the Midrash (London, 1907); see also J. S., artt. "Cosmology," "Creation."

HERBERT LOEWE.

COSMOGONY AND COSMOLOGY (Mexican and South American).—I. Mexico.—On the origin and constitution of the universe the ancient Mexicans developed a number of complex and, in part, discordant myths. In the earliest times, according to Sahagún's version, the gods assembled in Teotihuacan for the purpose of debates on who was to govern the world and who was to be the sun for that at time there was no daylight. A deity named Tecuciztecatl offered to illuminate the world. His compiers asked who would act as his mate, but none of them could summon sufficient courage, each offering excuses. At last they delegated the task to Nanahuztin, who was afflicted with the pox (rubus), and he cheerfully acquiesced. The luminaries-elect then began a four days' penance. A fire was built, and both made their offerings. After the four days had elapsed, Tecuciztecatl and Nanahuztin received their ceremonial vestments. The gods ranged themselves in two rows, one on either side of the fire, and first called upon Tecuciztecatl to leap into the flames. The deity approached the blaze, but recoiled from its excessive heat. Four times he made the attempt, and four times he abandoned it. Then the gods ordered Nanahuztin to try. He mustered all his courage, closed his eyes, and leapt into the flames. At the last instant a hoarse sound was heard. Then Tecuciztecatl followed suit. When the two deities had been completely consumed by the fire, the other gods seated themselves, expecting to see them rise. After a long period of suspense the assembled company, a poor aspect, and there appeared the light of dawn. The gods fell on their knees and turned hither and thither, not knowing from what quarter the sun would come, for the light of dawn was shining everywhere. Last it rose from the science to and fro, and dazzling the onlookers with its brilliancy. Presently the moon rose from the same cardinal direction. They appeared in the same order in which the two gods had entered to fire. At first sun and moon were equally brilliant. The other gods debated whether this was proper, and decided in the negative. Then one of them began to run, and struck Tecuciztecatl's face with a bare. Straightway it turned darker, lost its splendor, and its sights for the moment, and the sun in the moon. Though the sun and the moon had thus been created, they were still stationary. The gods asked another: 'How could we live under these conditions? The sun does not move. Are we to suffer the fate of kind? How could we live eternally? Let us all die, so that our death may annul these luminaries.' The wind then offered to kill the gods, and did so. Still the sun did not begin to move. At last the wind blew so violently that he forced the sun to commence its journey, but the moon remained stationary for a while. Finally, it also began to move. Thus, sun and moon became separated and assumed the habit of rising at different hours of the sky. Tecuciztecatl, recorded before Nanahuztin, he would have been the sun.1

A somewhat similar version has been recorded by Mendieta. Cithalatonie and Cithalic appear as the primeval deities. They were bore a limb, which her enraged cons hurled to the earth. From the shattered stone there developed 1600 gods, the friends of mier for permission to create man. Cithalic refused them to Mictlanecuhtli, who was to furnish them with the bones and ashes. The messenger of the gods received the required objects from the lord of the underworld, but, lest Mictlanecuhtli might recall his gift, he fled in haste, stumbled, and broke the bones. Hence gathered them together and presented them to the gods, who enclosed them in

1 Sahagún, Hist. gén. des choses d la Nouvelle-Espagne (Paris, 1809), 478-492.
a bag and bespattered them with their own blood. On the fourth day there issued forth a boy, and on the eighth a girl. These became the ancestors of mankind. The sun was not yet in existence. The gods assembled in Teotihuacan and there decided to make the sun. They formed a bag and jumped into the fire should be transformed into the sun. One man ventured to leap in, and the spectators anxiously watched for the rising of the sun. In the meantime they laid a wager that the animals present would not be able to guess the place whence the sun would rise, and, as the animals actually failed to do so, they were all sacrificed. At last the sun appeared, but did not move. Angered by his immovability, Citlil (the hare) let fly three arrows at him, wounding him twice. The chagrined god deified one arrow back at the enemy, piercing his forehead. The gods then recognized their relative inferiority, and consented to be sacrificed. Xolotl tore out their hearts, and himself committed suicide. Approached by this sacrifice, the sun began his daily course.1

A rather different tale is narrated in the Zumaraga Codex. There dwelt originally in the third month a young girl named Tlalocatl, and Tonacacuiltli, who begat four sons, viz. Camaxtli, Yayaquitzatlipoca, Quetzalcoatl, and Huiztilopochtli. After 600 years of inactivity these four created the world. Quetzalcoatl and Huiztilopochtli, the sun and the moon, were the first pair of human beings, the days, the denizens of infernal regions, the heavens beyond the thirteenth, and finally water and the monster Cipactli. In the further creation the entire quartet participated. They formed the deities Tlatloacuatzitli and Chalchihuitzitli, and then created out of Cipactli the earth and her deity Tlaltcuitli. The first human pair, Oxomoco and Cipactonal, begat a son who married a woman shaped out of clay, and from this pair were the first beings. As the sun was first of all created, but little light, it was decided to perfect it, and accordingly Tezcatlipoca transformed himself into a real sun. Then the giants were created. After Tezcatlipoca had slain for 670 years (13 cycles), Quetzalcoatl hurled him into the water, himself assuming solar functions, while his enemy transformed himself into a tiger which devoured the giant race. In commemoration of this event, there developed the constellation of Charles's Wain, which represents the Tezcatlipoca descending into the ocean. After Quetzalcoatl had served for an equal space of time, his rival hurled him headlong with a blow of his paws, causing a tempest that destroyed the majority of human beings. Then Tlatloacuatzitli reigned as the sun for 364 years (7 cycles), but Quetzalcoatl drove him away by means of a torrent of fire and installed Chalchihuitzitli in his place. She served in this position for 312 years (6 cycles), then a deluge occurred, Chalchihuitzitli was changed into a fish, and the heavens fell down. The divine quartet next opened a passage under ground, and created four men. By the joint efforts of all of these the sky was raised to its present altitude. As a token of his gratitude, Tonacacuitl transferred to his sons the sovereignty of the stars, they settled in the heavens, and by their migrations they are smoothing the path known as the Milky Way. Two years later Tezcatlipoca first produced fire by fire and smoke, and several years later still a new race of man was created. After the lapse of five years, the gods decreed the formation of a new sun. War was waged in order to secure a sufficient number of human sacrifices for the sun, then the gods hurled the fire, driven from their earthen vessels, and leaped up firewood. Into the blaze Quetzalcoatl cast his own son, who thus became the sun. Tlatloacuatzitli, however, threw his son into the ashes, thus making him rise as the moon, which continually follows the sun without ever over-taking it. Both then announced to the air without ever reaching the heavens. The Codex Vaticanus mentions the bis-sexual deity Ometecuhtli as the creator of the universe. He creates the first human pair, Oxomoco and Cipactonal. These beget Tonacacuitl, to whom the later stages of creation are due.2

The modern Tarahumare believe that the present world was preceded by many others, all of which were destroyed. In these earlier periods all the watercourses flowed eastward, but now there are also some rivers that empty into the Pacific. Originally, the world was but a waste of sand, which the bears put into shape. The rocks were at first soft and small, but they grew to be large and hard. The people grew up from the soil, and the earth was quite level. At that time men lived to be only one year old, dying like the flowers. According to another tradition, they came from heaven with corn and potatoes in their ears, and were led by Tonacacuitl. The earth was made by a Christian name—into the mountains, the middle of the world. In the beginning, the Morning Star was the only heavenly body to illuminate the earth, and the 600 Indians then in existence were devoured by it. The sun, then, is the first pair of human beings, the days, the denizens of infernal regions, the heavens beyond the thirteenth, and finally water and the monster Cipactli. The first human pair, Oxomoco and Cipactonal, begat a son who married a woman shaped out of clay, and from this pair were the first beings. As the sun was first of all created, but little light, it was decided to perfect it, and accordingly Tezcatlipoca transformed himself into a real sun. Then the giants were created. After Tezcatlipoca had slain for 670 years (13 cycles), Quetzalcoatl hurled him into the water, himself assuming solar functions, while his enemy transformed himself into a tiger which devoured the giant race. In commemoration of this event, there developed the constellation of Charles’s Wain, which represents the Tezcatlipoca descending into the ocean. After Quetzalcoatl had served for an equal space of time, his rival hurled him headlong with a blow of his paws, causing a tempest that destroyed the majority of human beings. Then Tlatloacuatzitli reigned as the sun for 364 years (7 cycles), but Quetzalcoatl drove him away by means of a torrent of fire and installed Chalchihuitzitli in his place. She served in this position for 312 years (6 cycles), then a deluge occurred, Chalchihuitzli was changed into a fish, and the heavens fell down. The divine quartet next opened a passage under ground, and created four men. By the joint efforts of all of these the sky was raised to its present altitude. As a token of his gratitude, Tonacacuitl transferred to his sons the sovereignty of the stars, they settled in the heavens, and by their migrations they are smoothing the path known as the Milky Way. Two years later Tezcatlipoca first produced fire by fire and smoke, and several years later still a new race of man was created. After the lapse of five years, the gods decreed the formation of a new sun. War was waged in order to secure a sufficient number of human sacrifices for the sun, then the gods hurled the fire, driven from their earthen vessels, and leaped up firewood. Into the blaze Quetzalcoatl cast his own son, who thus became the sun. Tlatloacuatzitli, however, threw his son into the ashes, thus making him rise as the moon, which continually follows the sun without ever over-taking it. Both then announced to the air without ever reaching the heavens. The Codex Vaticanus mentions the bis-sexual deity Ometecuhtli as the creator of the universe. He creates the first human pair, Oxomoco and Cipactonal. These beget Tonacacuitl, to whom the later stages of creation are due.

Tobil, one of these tutelary gods, gave fire to the people, but it was extinguished by rain and hail, and he threatened it then by stamping his feet. Owing to the suffering undergone by the people in Tulan, they abandoned the place under Tobil's guidance, and, after long-continued migrations, reached Mt. Hacavitz. There sun, moon, and stars were called into being, though they did not then shine as brightly as they do now. The origin of these heavenly bodies, however, is differently accounted for in the myth of Hunahpu and Xbalanque, the miraculously born twin heroes of Quiché. In order to avenge their father's death, the brothers descend to the infernal realm of Xibalba, and slay their parent's murderers. They cause their father and his brother to rise as the sun and moon respectively, while 400 youths who had been killed by the Xibalba monarch's son are transferred to the sky as stars.\footnote{Brasseur de Bourbourg, \textit{Popol Vuh} (Paris, 1893), 1-51, 157-159; Brühl, \textit{op. cit.}, 441.}

The Maya proper of the present day believe that the world is in the fourth period of its existence. In the first era there lived the Saiyauwinkoo ("Adjusters"), the mythical dwarfish aborigines of Yuacatan, who are credited with the construction of the ruins before the appearance of the sun. As soon as the sun appeared, these people turned to stone. Figures found in the temples of Chichen Itza and Tulum, and some others supposed to represent the Saiyauwinkoo. After a deluge, another race, the "Offenders," came into being, but again a flood destroyed the greater part of the world, and the Masecalli, or modern Maya, rose to power after the deluge. According to the present period, during which a mixture of all the previous inhabitants of Yuacatan took place. The present natives of Yuacatan distinguish seven heavens, each of which has a hole in the center. The Philosophers' Stone (\textit{Bombax ebul}) sends its branches through these seven openings, and by means of it the spirits of the dead clamber up to their final place of repose. One version substitutes a ladder of vines for the tree. The \textit{Gran Dios} of the white man is believed to reside in the uppermost heaven, while the lower heavens are peopled by the older deities of the natives, now degraded to the rank of subordinate spirits. Below the earth there is an under-world. The spirits of the dead first descend to this region for a short time, but then begin their ascent to the upper worlds. Men who have died in war and women who have died in childbirth are absolved from the obligation to visit the under-world, and commence their ascent to the upper worlds immediately.\footnote{\textit{A. M. Tozer, A Comparative Study of the Mayas and Lacandones} (New York and London, 1907), 153-156.}

3. Chibcha.—The Chibcha philosophers postulated that the original substance \textit{chiminigagua}—light enclosed in some undefined envelope. When the light freed itself from this covering, it created black birds which flew through the world, emitting radiant fire from their beaks. Later it created all living things save men. Mankind traced their descent from a woman named Bucue (or Fuachogue) and a boy, both of whom issued from a lacquer in the mining of Tunja. At puberty, the boy married his companion, and their numerous progeny soon peopled the entire country. According to another myth, mankind was created by the \textit{ecigues} of Soganozo and Ramiriqui—men out of yellow earth who peopled the hill-stones with bones, and bones, which he left near the shore. Then he created men and women, and appointed chiefs to rule over them. When Vichama learned of his mother's death, he restored her to life from her concealed hair and bones; then he set out to avenge her destruction. Pachacamac threw himself into the sea where afterwards stood the temple and city named after him. Vichama devastated the fields, and implored the sun to turn the people away from the use of Vegueta into stone, because, he alleged, they had participated in his mother's murder. Thus, all Pachacamac's creatures were transformed into stones. Repeating their deed, the sun and Vichama transferred the former chiefs and nobles to the coast, setting them up there as \textit{huacas} to be worshipped in the future. Then Vichama implored his father to create a new race. The sun gave him eggs of gold, silver, and copper, from which there developed the chiefs, their wives, and the common herd, respectively. A legendary figure descended mankind from two male and two female stars sent down to earth by Pachacamac.\footnote{\textit{Brühl, op. cit.}, 461 f., 458.}
On the shores of Lake Titicaca there developed variants of another myth. Before the reign of the Incas, the natives believed, there was no sun, and the ancestors stayed to eat the bitter root of the coca plant. Suddenly the sun rose radiant from the island of Titicaca. At the same time there appeared from the south a white man of slimg figure, who levelled the mountains and caused springs to gush forth from the rocks. Hence he was regarded as the author of all things, the creator of the sun, man-kind, and the brute creation. He travelled northward, and never retraced his steps. In the course of his travels he saw soldiers of his own race in the land of the descent his di- nes. The author of this book intended to extirrate the anaco, and it was surrounded by many quadrupeds. He hung a long piece of busher rope towards the earth, and climbed down. After a successful campaign, he returned home with some version of the story. The Warrau and the Warron are called by the author, because he has been much that they decided to emigrate to the earth. After many of them had climbed down, a woman of large proportions got stuck in the opening, and, though her fellow-tribesmen attempted to extricate her, it was found impossible. Accordingly, those Warron who were already on the earth were obliged to remain in their new place of residence, while those who were still in the sky-land could not return in the under regions. The same story, with minor variations, is told by the Carib Indians. The Bakairi, a Carib tribe living on the alluvium of the upper Xingu river, regard the sun as a large ball made of the feathers of the red macaw and the toucan, and the moon as a ball of the tail feathers of the Cacicus. The sun is covered at night with a large pot, which is removed at daybreak. During the rainy season it is carried by a snail, during the dry season by the peacock. The moon is divided into thirty parts, the number of moons is due to the successive appearance of a lizard, an ordinary armadillo, and a giant armadillo, the last of which completely covers the feather-ball. Corresponding explanations are offered for the solar and lunar eclipse. A fire is a symbol of the sun, a manioc, the larger stars form doorpost kno- les, and Sirius constitutes a large cross-beam supporting the frame on the side. The Pleiades are simply a pile of flour-grains. The firmament shows merely a duplication of the features of the earth, and there are manioc, cultivated soil, forests, etc. The Milky Way is a huge tomont, near which the two culture-heroes, Keri and Kame, performed their deeds. Other heavenly phenomena are regarded as a jaguar, ant-eater, vulture, etc. The place of a genuine cosmogony is taken by a number of myths, accounting not so much for the ultimate origin as for the more or less miraculous arrangement and regulation of observed phenomena through the power of the twin culture-heroes, Keri and Kame. Practically everything existing in the universe is believed to have existed from the very beginning. There are even some Bakairi tribesmen and members of other tribes. Con- ditions, however, required a sort of tampering to be consol- ted with the present cosmos. In the beginning the earth was the sky. Earth and sky were in close proximity, so that it was possible to walk to and from the sky without using the ladder. Hence for his people were dying; but the sky refused to do so. Then Keri decided to depart. He accordingly, became the sun, and was transformed into the sun, and the sky rose to its present height. The sun was in the possession of the Umbu vulture; when the bird was away, darkness reigned supreme. Owing to this darkness, the tapir fell into a pit belonging to the Umbu. Keri saw him and entered one of his front feet; while Kame, who had entered a little yellow singing-bird, was to inform his brothers of everything that was going on. When the vulture swooped down on his prey, Keri seized him and, on pain of death, ordered him to surrender the sun. The Umbu dispatched his brother to bring the sun, but his messenger only came back with the dawn. Sent back again, the vulture’s brother offered Keri the moon, but the hero persisted in his demand until the sun was presented to him. Then he released the Umbu. The sun was shining continually, and Keri did not know what to do with it, though finally he covered it with a large pot, which was simply removed to make daylight. The parrot was the first bird to learn the art of flying. The first day of the week was a solar day. The moon was first introduced. The moon was given to Kame. Another quasi-cosmogonic tale accounts for the origin of the Parandings and Romoro-Kulistya rivers. Keri and Kame were sent for water. They found three pots with water, but broke two of them, so that the water flowed down, forming the water-courses in question. The remaining origin-tales of the Bakairi, though for the greater part belonging to the same cycle, are of less importance, and some are, in fact, but merely narrate the heroes’ exploits in acquiring fire, manioc, tobacco, the hammock, and other necessary of life for the benefit of mankind.

The Parássí, though members of the Nu-Arawak family, possess a number of cosmic notions akin to those of the Bakairí. They also believe the sun to be composed of red macaw feathers, which are hidden in a gourd at night and uncovered by their own dead. They also believe in yellow "mutung" feathers. The full moon begins to wane when a thin spider appears on its edge, and it is successively covered by four armadillos, the last being the giant armadillo, Dasypus giganteus. The galaxy is dotted with countless stars, and of these many are recognized as an ostrich, jaguar, or some other animal. In the beginning there was a woman named Maisá. Neither earth nor water was in existence, and there was no light. She took a piece of wood and introduced it into her body, from which there then issued forth the Rio Cayuña. Its muddy stream was soon followed by the limpid waters of the Rio Parássí. Maisá then placed land in the stream, and thus made the earth. She rayed out many quantity of human beings of stone, first of all being Daruakaváti, who married Ursahiiu. This couple procreated the sun, the moon, and all the celestial beings, and assigned to each its place in the sky. Daruakaváti, the sun, was a large and long-stemmed, and snakes, until Maisá made his wife conceive Uazale, the ancestor of the Parássí and the first really human being.1

1 Of the Weltanschauung of the Bororo we have, under the most meagre sketches. Like the Bakairí and Parássí, they regard the sun and moon as bunches of macaw feathers. Mankind are believed to dwell on a large island in a river. The sun and moon, or their owners, are on one side and pass over the river, while all pass by and becomes the new moon. The Pleiades are the blossoms of a tree, Orion is looked upon as a tortoise, and single stars are generally regarded as sand-flies, Venus, for example, being characterized as the large sand-fly. The rainbow is supposed to be a large shamanistic water-snake. A meteor that appeared during the second German Xingu expedition was regarded as the soul of a shaman bent on afflictling some Bororo with dysentery.2

The cosmogonic notions of the Jibaro of Ecuador are insufficiently known. According to one tale, the world was fashioned by a great spirit, who amused himself with manufacturing clay objects. He made a large blue vessel, and placed it where the sky is nowadays seen. A more detailed account is given of the deluge. A member of the Morotó sub-tribe was fishing in a lagoon. A little crocodile swallowed his hook, and was killed by the Indian. The mother of the crocodile was so incensed at this deed that she struck the water with her tail, and flooded all the country bordering on the lagoon. All the Indians perished, save a single individual who climbed a palm-stalk, where he stayed many days in utter darkness. From time to time he dropped a great fruit, but he invariably heard it strike water. One day, however, the fruit appeared to strike the earth. The Morotó climbed down, built a lodge, began to till the soil, and planted a piece of flesh from his own body. From this there grew up a woman, whom he married. A deluge deluge deluge derived the Morotó, but another attributed by Suarez to the Jibaro, records the escape of two brothers, who fled from the flood to the top of a mountain, which continued rising in the elevation of the waters. After the flood the two Indians went in quest of food, and on their return were astonished to find some dishes already prepared in the but that they had constructed. One of the brothers hid himself in order to talismans, and discovered two parrot-women, who set them on fire and burned them. After running from his hiding-place, he seized one of the bird-women and married her. The couple had two sons and three daughters, who became the ancestors of the Jibaro.3

The Caraya of the Araguaýa River believe that their ancestor, Kaboi, and his people, when they first arrived in the land, were living in huts where the sky was dark, and vice versa. Hearing the call of a bird, Kaboi decided to follow it. He got to an opening leading to the earth, while his companions succeeded in passing through it, he himself proved too large and was able to get only his head above ground. The other Indians gathered many kinds of fruit, also honey and bees, as well as other things that they ate. The chief, Kaboi, told them that, while the country seemed to be beautiful and fertile, its inhabitants, as indicated by the dry wood, could not live to the old age that fell to the lot of their own people, for they lived to a great age, and died only when they were too old to move any part of their body. In spite of this warning, the people preferred to stay above ground. Accordingly, while their fellow-beings in the lower regions are still in the prime of life, the descendants of Kaboi's companions are destined to die. At an apparently later period, two powerful beings, Teníra and Sokron, hurled all the Indians into a blazing fire and then destroyed each other in a trial of strength. Only two dwarf parrots and two belated youths, returning from the hunt after the destruction of their fellow-tribesmen, escaped. When the young men set out on the next day to hunt, they heard the pounding of mortars, and on their return they observed parrots that had been prepared by unknown hands. This was repeated on the next day. On the third day they discovered that the food had been cooked by the two parrot-women, married them, and thus became the ancestors of the modern Indians.4

Another tale recounts the destruction of the Indians by a flood. The Caraya were out hunting and drove their game into a pit. After taking out the captured animals, they dug up the magician named Anasital, and brought him to their village. Frightened by his strange antics and unintelligible gibberish, they fled from his house. The magician followed them, and summoned to his aid several species of fish. Finally, one fish possessing a large mouth ascended the peaks from the rear, passed the people down, and thus drowned them. Only a few of them escaped. These descended to the valley when the waters had fallen again.5

The Caiungá of the State of Paraná (Brazil) tell of a great flood which submerged the entire world inhabited by their ancestors, with the exception of a single mountain-peak. The Caiungá, the Kadjuruiks, and the Kame all swam towards this summit, carrying the fish in their mouths, but only the Caiungá and a small number of Kuriton Indians reached the goal, where they stayed without food for many days, some lying on the ground, while others, for lack of shoes, were obliged to cling to the branches of the trees. They were beginning to give up hope when they heard the singing of saracura (water-fowl), which were carrying lampers full of earth. By dropping this into the water, they caused the flood to recede. The Indians shouted to them to make haste, which they did, asking the ducks to aid them. In a short time they got to the summit of the mountain and formed a platform on which the Caiungá departed, those that had clung to the branches of the trees being transformed into Kuritos and the Kuriton into Carayá, Indians. Because the saracura had begun their work in the east, all the watercourses of the land flowed towards the west into the Paraná. After the flood the Caiungá and Kame established themselves in the mountains. The Kadjuruiks and Kame, whose souls had gone to dwell inside the sierra, began to cut roads, and finally succeeded in getting out in two opposite directions. The Kadjuruiks entered the level country by way of valleys and without rocks, so that their feet remained small. The road of the Kame, however, led to a rocky region, 6

5 Hubert, op. cit., 119.
where their feet were bruised and swelled up to their present size. As there was no spring there, they had to beg water of the Kadjurukre. On leaving the sierra, the Caingang ordered the Karuton to look for the baskets and endashes which they had abandoned below before the deluge. But the Kadjurukre were too lazy to rise and ascend the mountain, so they remained where they were and never joined the Caingang. During the night following their departure from the sierra, they built a fire, and a Kadjurukre married one of the ashes and hid them, devouring the people and the game. As he had not enough coal left for painting the creatures he meant to fashion next, he made the tapsis, painting them with ashes and bidding them eat game. But, as they were heretics, offended by his ceremonies, they told him again what to do. Being already engaged in creating another species, the Kadjurukre answered gruffly, 'Eat leaves and the branches of trees!'. Since then they have eaten only foliage and the branches of trees. The Kadjurukre was making another animal, which still lacked a tongue, teeth, and several claws, when the day began to break. As he was unable to complete the animal in the daylight, he quickly put a tongue, teeth, and claws to it. As you have no teeth, feed on ants!' Hence the imperfections of the ant-eater. The next night the Kadjurukre resumed his labours and created other animals and insects, among them the bees. In the meantime the Kame had a number of huge poisonous snakes, which he sent to combat his rival's, such as the pumas, venomous snakes, and wasps. All the Indians marched on together. The young men of the Kadjurukre's band married the girls in the Kame's, and vice versa; and, as there were still left a great many young men, these married the Caingang women. For this reason the Kadjurukre, Caingang, and Kame consider themselves allies and relatives of one another.1

The Tupi derive their origin from Manon, the creator.2 Offended by bad ceremonies, this deity caused a universal conflagration, which destroyed all human beings save Irinmage. Upon the solicitation of Irinmage, Manon extinguished the fire, and afterwards gave him a wife. From the descendants of this pair there issued Manon Maire, who acted as culture-hero, transforming men into animals and establishing the cultivation of plants. However, the Indians feared him for his magic, and forced him to commit suicide. One of his descendants, his brother, was made man, but finally ascended to heaven radiant with beauty. His son vainly attempted to follow, being transformed into stone. Another son of the same line, Maire Ates, begat the twins Tamenduare and Arikutte. The brothers went in search of their father, who resided in the east, and were subjected to a number of tests. They proved their miraculous powers by shooting an arrow into the sky and sending an arrow into its notch, containing in this way the first motives for the deluge-myth. They further passed through clashing rocks ('symplegades') and descended to the underworld. In the course of their wanderings Arikutte attacked his brother, who caused a deluge, from which both were obliged to flee, seeking the shelter of trees. After the flood they re-peopled the earth, becoming the ancestors of two tribal divisions.2

The Aruweniens worship as their supreme deity the conceptions of thunder, lightning, and fire, the latter being regarded as the origin of all life. This deity, Pillan, is believed to reside on the highest summits of the Andes, and definite localities  

1 O. Bürger, Acht Lehr- und Wanderjahre in Chile (Leipzig, 1909), 85.
3 Ehrenreich, op. cit. 60, 82.
and substance to the folk-tales current among their less civilized congeners in both Americas. The Quiché myth is probably fuller of abstract concepts than its Jornada del Sur and South American creation-story, yet these metaphysical portions of the Popol Vuh are relatively insignificant compared with the elaborate tale of the twin heroes, which has numerous parallels on both continents. Contrary to the traditional notion that folk-tales are degenerate myths, it might, therefore, be plausibly contended that myths are merely Märchen with a speculative gloss, or secondarily invested with religious significance. This view, however, which has been urged by the present writer, still awaits intensive discussion.

Literature.—This is sufficiently indicated in the article.

ROBERT H. LOWIE.

COSMOGONY AND COSMOLOGY (Muhammadan).—The account in the Qurán of the creation of the universe is founded upon an imperfect version of the story in Genesis. In xii. 8 ff. it is written (Rodwell's tr.):

"Be ye indeed disbelievers in Him who in two created the earth? and He hath placed on the earth the firm mountains which tower above it, and He hath blessed it, and distributed its resources throughout the earth; the earth is all alike, in four days; then He applied Himself to the heaven, which was then darkness, and said to it and to the earth: 'Come ye, in obedience or against your will'; and they both said: 'We come obedient.' And He completed them as seven beings and in each of them He made known his office; and He furnished the lower heaven with lights and guardian angels. Other references are xv. 15 ff., xxxv. 12, xxv. 12, etc.

The commentators Zamahshé and Baidáwí, whose remarks are abstracted in the notes to Sale's Korán (Lond. 1734, p. 389), explain that the "darkness" of the heavens preceded from the waters under the throne of God (which was created before the heavens and the earth), and rose above the water; and, the water being dried up, the earth was formed out of it; and the heavens out of the smoke which had mounted aloft. It is added that the heavens were created on Thursday; the sun, moon, and stars on Friday, in the evening of which Adam was made. The guardian angels were appointed to ward off the devils (Baidáwí, A. 211). The Traditions add little to this vague material:

- God was; but nothing was before Him, and His imperial throne of light. After that God created the regions and the earth; and wrote everything on the tablet of His own memory. 'The angels were created from a bright gum, and the devils without smoke, from Adam's fallen flesh. When God created Adam in paradise . . . the devil came and took a look at him, and, when he saw him with a body, he knew that God had created a creation which could not guard itself from hunger' (Misbah al-Musabih, tr. Matthews, Calcutta, 1910, xxv. 1).

Orthodox Muslim imagination has elaborated a fantastic idea of the creation of these scanty materials, aided by suggestions from foreign sources (such as the seven spheres and seven climates), but without allowing notions of science or philosophy to trench upon revelation. Thus the Qurán (ii. 20, lxviii. 6) states that the earth was "spread out as a bed, or as a carpet; so it manifestly must be a flat surface. The Muhammadans interpret these words literally, and believe that there are seven heavens, one above the other, and seven earths, one beneath the other; and they lay down the distances between them, and the diameter of each, and the substance of what is between, with much precision. (These valueless speculations and opinions may be read in some detail in Lane, 1001 Nights, London, 1895, Introd., note 2.) One account pretends that the seven superimposed worlds being unstable, God created a series of supports beneath each (as below). He ordered an immense angel to go beneath and hold the earth (or rather the seven earths) on his shoulders; and beneath his feet, to support him, God created a rock of ruby, with 7000 perforations, from each of which poured a sea. But the devils said nothing, so God created a huge bull called Kuytud, with 1000 eyes and number of other features, to bear it up on his back and horns. And under the bull God made Behemoth (Bahaantri), the great fish, to lie; beneath which was Hashem, and under the water darkness, 'and the knowledge of mankind falls as to what is under the darkness' (al-Damitri, Iblal-al-Wardi, etc., ap. Lane, op. cit.); but the general belief is that there lies Hell with its seven stages, as was first supposed to be in the seventh heaven or above it. Muslim philosophies of the sort did not always subscribe to such opinions, but, as their philosophy was wholly borrowed, their ideas of cosmogony possess no original value.

Literature.—This is given in the article.

STANLEY LANE-POOLE.

COSMOGONY (Polynesian).—Throughout Polynesia the creation of the world is assigned to Tangaloa, the god of heaven, who is thus named in Longa and Samoa, while in Tahiti, Raite (as in the Hervey Islands, and elsewhere he is called Tangaloa in New Zealand Tangaroa, and in Hawaii Kanaloa. He dwells in the highest heaven, and is often believed to have the form of a bird, this being his popular aspect as the great unknown controller of the world. His left eye, and he is likewise often the god of the sea, the mirror and the earthly representative of the blue sky. His wife is an enormous rock named O-te-papa, by whom he became the parent of the gods, the planets, the sea, and the winds. The gods, in their turn, were the parents of mankind, although, according to other accounts, Tangaloa himself formed man of red earth. Besides O-te-papa, Tangaloa had other wives, by one of whom, Hina, at one of his daughter and in many other cosmogonic myths, some legends made him the parent of heaven, earth, sea, and numerous gods. After man he created beasts, fowls, and fishes. Still other creation-myths ascribe the creation of the sky, clouds, stars, winds, beasts, fishes, sea, and the like to Raitubu, 'the maker of heaven, a sort of demiurge and the son of Tangaloa. The earth is also explained, especially in the western Society Islands, as the exterior of Tangaloa's body, while in Raitubu he was a great tower of mussel, throwing away the shells from time to time, and thus enlarging the world. The myth of the cosmic egg was not unknown in Polynesia. A legend current in Hawaii, the Society Islands, and Tahiti, made Tangaloa in his aspect as a bird, a prisoner for long ages in a gigantic egg. He finally broke this place of confinement, and, however, and the two halves of the shell formed the heaven and the earth, while the smaller fragments became the islands. Another tradition makes the islands bits broken from the cosmic rock O-te-papa, as she was dragged by her husband through the sea, or else pieces broken off from the mainland by angry gods. The myth of the cosmic egg recurs in New Zealand, where mankind was believed to be produced from an egg laid on the waters by a gigantic bird.

Tangaloa's exertions at the creation of the world were so great that, according to some cosmogonic legends of Polynesia, the salt west which streamed from him to the land amounted to three oceans. Tangaloa attempted to fish the earth; but, just as land was appearing above the surface of the water, his line broke, and the potential continent was dashed into a mass of small islands. A similar legend of Tangaloa fishing up the earth was found in Samon, though the incoherent condition of Polynesian cosmogony is again exemplified by the existence in this island of divergent myths on this subject. Two islands, Savaii and Upolu, were
hurled from heaven by Tangaloa. He then sent his daughter, Turi or Tuli, to people this first land, and she, assuming the form of a snipe, settled down near the place which grew in the earth that formed beneath her feet. From the decaying leaves and tendrils of the creeper came worms, which Tulli pecked in two with her beak, thus forming human beings.

Both earth and sky were regarded as impersonal in Samoa, Tahiti, and Karotonga, and as being so close together that men could not stand upright, but were forced to crawl on the ground. The two were separated, according to the Samoan and Tahitian myths, only by the first stroke by a man who pressed them apart. In Tahiti, on the other hand, Ru, the sea-god, raised the sky to its present elevation. In Kaïatea, a monstrous cuttle-fish held the earth and the heaven together, but he was killed by the sun-god Maui, whereupon the sky rose up to heaven. On the shoulders or the back of this god the earth rests; and, when he moves, the earth quakes. He is also confused with Tangaloa as the deity who fished the earth from the sea, which at that legends takes the place of Tangaloa’s daughter, Tulli, assumes the shape of a bird, and forms man by dividing a worm in two. In Tonga the earthquake is caused by the subterranean god Mataike, who carries Samoa in his left arm, while an old serpent, regarded as described to other gods, such as Maui himself in Tahiti.

Throughout this cycle of Polynesian cosmogonic myth one fact, not without parallel in other religions, is clear. O-te-papa, the primal barren earth, becomes the mother of the people, which is fructified and made to give birth to all things living, by the fertilizing rain which falls from the superincumbent male Tangaloa, the sky. In New Zealand the way of the separation of earth and sky undergoes a curious modification, recalled to other gods, such as Maui himself in Tahiti.

Originally Rangi, the sky, who takes the place of the general Polynesian Tangaloa, who becomes a mere sea-god in this island, was closely united in matrilineal marriage with Papa, the earth. From this union sprang countless children, but they were forced to dwell in utter darkness. In discomfort at this gloomy existence, the offspring of the pair sought to separate their parents. Tu-matauenga, the most cruel of all, urged that Rangi and Papa be killed; but Tane-mahuta, the god of trees, urged that the pair be parted. All assented, excepting Tawhirinui, the god of winds. The gods in turn now endeavoured to break the umbilical cord of the parents—Rongo-tokomoko, the god of cultivated plants, Haumia-tikitiki, the god of wild plants, Tangaloa, the god of fishes and reptiles, and Tu-matauenga, the god of heroes. Finally, Mahuhu pressed her arm against her mother’s and his father’s against his father, thus parting Rangi from Papa. assorted. However, the latter was angry with his brother and followed his father, so that the wind and his children, the storm winds, still make war on the forests and the sea, and only man, and his offspring, are able to resist them. Strife also arose among the gods who had remained on earth, especially between the god of the sea and the god of the forest, since the latter gave Tu-matauenga wood for fishing-implements, wherefore the sea is angry with men and seeks to devour them. On the other hand, Tane-mahuta and his offspring, mankind, were able to conquer all the gods, with the exception of the wind which blows from heaven.

This version, although more detailed than any other Polynesian creation-myth, is obviously of much later origin than the legends current elsewhere in the present Oceania.

LOUIS H. GRAY.

COSMOGONY AND COSMOLOGY (Roman).—The only Roman cosmogonies which go beyond mere single statements about the origin of the world are found in the works of later writers. They belong, therefore, to a period when Roman culture was foreign and struck with variously Greek elements. On the other hand, we meet with various cosmogonic ideas which may be referred without hesitation to the earliest Roman times. We shall, therefore, give some account of these, and afterwards inquire how far they enter into, and give a genuinely Roman character to, the cosmogonies of a later age.

1. Early cosmogonic ideas.—Nearly all the cosmogonies in front of the author with the god Janus, who is admitted only one of the very old Roman divinities (cf. e.g. Herodian, i. 16: θεὸς φανέρωτος τῆς Ἱραλίας ἑνδιάμεσον). As F. Lukas (see Literature) puts it, he is related to Jupiter as the highest. Accordingly, in the public worship of the Romans the first sacrifice was paid to Janus (Mart. Epig. x. 28. 2). As first in time he was naturally also regarded as the cause of all that followed after. So Festus, explaining 'propter Jana, ' means a creation of the entire universe. As the author of organic life, he is described in a fragment of the Salicary Hyrum (Varro, Ling. Lat., 7, 25) as 'duous cerus,—where 'duonus = bonus, 'good,' and 'cerus' (or 'kerus,' connected with chereos, Skt. kur, 'to make') means a creative, productive power, as described to other gods, such as Maui himself in Tahiti. There is nothing, in fact, that Janus was a cosmogonic personage. But it is difficult to say what cosmic principle, if any, was originally represented by him. Here everything depends on the meaning of the name, about which opinions have varied greatly both in ancient and in modern literature (s.v. 'Janus'). Of the ancient explanations, which regarded Janus as a personification of the Sun (Nigid. In. Marc. sat. i. 9, 11, etc.) has been most generally adopted by recent writers, amongst whom we include those who think of the sun’s light rather than the sun itself (cf. Roscher, l.c. Lukas, p. 202, etc.). According to another and very similar ancient view, Janus represented the Heaven (Marc. sat. i. 9, 11), and, further, we are informed by Varro that he is the character of the highest honor among the Etruscan—άθροισις οὐκ ηλικεν καί ἐκεῖνος πάντως πρέσβεις (op. J. Lydus, De mens. iv. 2). Now, there is a remarkable fragment of an Etruscan cosmogony in the oracle of V incidere, as Novone (see Grunt. Lat. 350; cf. Müller-Deecke, Die Etrusk. ii. 30 ff., 165, 295, 312; Preller, Rom. Mythol. i. 172, 256), which begins: 'Scias mecum ex aetherem remun. Cum autem Jupiter terram Etruriae sibi vindicavit, etc. Here we have a Latin translation, probably of the 2nd or 3rd cent. B.C., of an ancient Etruscan oracle, which, according to Preller, represents ancient Italian popular belief. The oracle, which relates to the protection of land property in Etruria, is thus preceded by a priestly doctrine about the origin of the world: the Sea arose by separation out of primal Ather—and the same must also have been asserted in the original oracle about the Earth (Preller, i. 256 n.). But Ather is practically the same as Heaven (see art. Athér in vol. i. Roscher, s. v. 'Aitier'), with which we are told that Janus was identified in Etruria, and it includes the notion of Light (see 'Greek' art. above; and Lukas, p. 298). Athér=Licht des Himmels), which is associated with the attribute of Janus. Hence it is reasonable to suppose that the early Italians not only regarded Janus as creator of the world, but pictured his creative activity after the manner described
in the Etruscan oracle (Lukas, loc. cit. ; Proll, p. 172).

2. Literary cosmogonies.—We are now in a position to inquire how far the cosmogonies of the later poets can be regarded as an independent product of Roman thought. We may fairly ascribe this to the idea only in so far as any cosmogony which is based on the ideas already described. Franz Lukas has tried to show that this is the case with regard to the theory sketched by Ovid in the Metam. i. 5 ff., and Fasti, i. 103 ff. Ovid's is also, so far as we know, the only complete narrative cosmogony whose dependance on primitive Roman ideas can be at all confidently asserted. To it, therefore, we shall now turn.

In the Metamorphoses we read that the world was preceded by Chaos. This was not, however, the empty void of the Hesiodic cosmogony, but the primary substance with which space was filled. It was a formless and confused mass—'rudis indigestaque moles'—the parts of which all struggled with one another, by reason of opposite qualities of moist and dry, hot and cold, etc. The process by which the world arose out of Chaos is attributed to what Ovid calls 'Deus et melior natura.' The 'melior natura' is evidently the material force by means of which order is brought out of chaos. Did it reside already in the firmament? The passage is not clear on this point (cf. Lukas, p. 208). But at least it implies that at some point of time the Deity either infused a higher nature into the primal substance, or gave effect to a higher power latent within it. This, with the divine elements separated from each other, and united with their like, and the wholes thus formed took up a relative position in accordance with their several natures. Fire, the lightest element, flashed forth from the topmost arch of heaven; beneath it was the Air, and lower still the Earth, while Water, encircling the latter ('circumlux luminor'), still further compressed its solid mass. Next, the Deity moulded the Earth, which must here be taken as including the liquid element, into a form and formed it into all its parts—seas, rivers, plains, valleys, hills, and zones. He likewise completed the serviance of the Ether from the Air, the region of cloud and storm. Then the cosmos was filled while hidden in the Chaos, glowing in the firmament. Life in all its grades appeared. The stars, as Divine Beings, dwelt in heaven; fish, bird, and beast tenanted their respective homes, and lastly Man was born.

The cosmogony of the Fasti is similar, but with some notable differences. There is nothing here about the 'Deus' or the 'melior natura.' The former is absent because the poet is concerned with the evolution of the four elements rather than with the formation of the world; and the latter, because here, whatever may be the case in the Metam., the evolution of the primary matter is regarded as due to its own indwelling force. Another difference lies in the fact that the primary matter, which is again called Chaos, is here expressly identified with the god Janus. This brings us directly to the question whether the Ovidian cosmogony is to be regarded as essentially Roman. Now, the mere fact that Ovid equates Chaos with Janus counts for little, as the connexion of the names depends on a fantastic etymology (cf. Roscher, s.v. 'Janus,' pp. 35, 43). What is important is that the cosmogonical ideas contained in the Metam. is essentially the same with those of the Roman god. The ground-thought of the passage is the separation of the elements from primal matter in obedience to the law of its own nature. The same thought is present in the Fasti., though there the evolutionary process is described in part to a 'melior natura' working along with a separate Divine agency. We have seen, further, that the separation of the elements from the primal Ether (and that apparently without reference to an external agency) was an ancient Etruscan doctrine, and that in all probability Ether and Janus were equivalent terms. Still the connexion of the Etruscan doctrine with Janus rested on conjectural etymology, and there is no evidence that Ovid expressly associates the same ideas with Janus is strong evidence both that the former inference was correct, and that we have here a genuine Roman cosmogony. At the same time it is probable that in the working out of the fundamental idea Ovid was more or less indebted to Greek thought (cf. Lukas, p. 209).

The idea of a force inherent in primary matter, which forms the basis of Ovid's cosmogony, appears also in the representations of other poets of Nature in general. As examples of these, Lukas refers to Virg. Georg. ii. 336 ff., and .Ein. vi. 724 ff. In the former passage the poet ascribes the origin of the world to the same force which at each new spring-time clothes it with fresh life: 'Non alios prima creaturus origine mundi / Fulcrus dies; alumnum habens tenens / Creaturam. Ver illud orat; ver maxamus agebat / Orbis, et hibernis parcentibus flatus Enri / Quam frigore, deinde lucerna pecudes haud. / Cumque Ferrea progenies dum caput extulit arvus, / Immissaque fera silvis et sidera coeae.'

In the second passage the poet sings of the Soul which animates the body of the world, which streams through every member, and from which every living creature springs. In both these passages the poet, no doubt, borrowed freely from other writers, and especially from Lucretius (see Conington's Virg.). But he gives expression to the thought which we have seen reason to believe was familiar to the Romans from the earliest time—that, namely, of the evolutionary capacity of matter.

COSMOGONY AND COSMOLOGY (Teutonic).—The word 'Teuton,' as we take it, is in its way descriptive of all peoples of Germanic origin, such as the Scandinavian, German, Dutch, and Anglo-Saxon. The word 'Teuton' first appears in the 13th cent. B.C., and was applied to the Germanic tribe living around the mouth of the river Elbe. Modern ethnologists join in the common division of the Teutonic race, as yet existing, into three branches: (1) the Scandinavian, (2) the Low German; and (3) the High German. The Scandinavian branch includes the Icelander, the Norwegians, the Swedes, and the Danes; the Low German branch includes the Frisians, the Dutch, the Low or Northern Germans, the Flemings, and the Angles; and the High Germans: the High Germans are the Germans of Middle and Upper Germany, of Switzerland, and of Austria. For convenience' sake it is just as well, however, to speak only of the Scandinavian and the German branches, since this is both common and satisfactory.

As Teutons, these two great branches had a common origin and a common faith in the supernatural. Thus their myths are also essentially identical, though the Scandinavian is much richer than the Teutonic. The case is especially the case with reference to their cosmogony, for which we have to depend almost entirely upon Scandinavian sources. But whether the common stock of Teutonic belief...
is faithfully preserved in the Northern myths is a matter of much dispute. In reference to this problem, two different schools have developed—the conservative, and the critical—to which must be added a number of more or less independent investigations by historians, being less valued toward the one side or the other, though, of course, having much in common with both (cf. Literature at end of art.).

It is, however, safe to say that most modern scholars hold the Christian Christianity in its earlier forms has, in a marked degree, influenced the old Norse poets, their songs, and their sagas, and consequently has made it very difficult to ascertain which elements in this mythology are genuinely Teutonic. Thalian cosmogonic material is especially viewed with much suspicion, as may be well noted, for instance, in E. H. Meyer's edition of it (Voluspä, eine Untersuchung, Berlin, 1889), in which he arrives at the conclusion that this great cosmogonic poem is of a heathen disguise, composed in the 12th cent. by Saxemund the Learned. Several later authors do not agree with this view, but rather consider it erroneous, though they allow that the great song has suffered from various influences, probably mostly Christian. Furthermore, it is generally held that the author of this poem, as well as of all the songs of the poetic Edda, is unknown, though the various lays were all collected in the 13th century.

From the German sources little can be learnt concerning the cosmogony of the old Teutons. Indeed, they tell us next to nothing of any of the beginnings, and they have no good prophecies with reference to the future, while there is much of both kinds in the Scandinavian myths. Traces, indeed, have been found in Germany of a mythological belief similar to the Scandinavian, and even identical with it. Thus in Wace's 'Merliner' (probably from the 10th cent.) there are indications of a Balder as an originally Teutonic character; Odin is mentioned and Frigga his wife, as is also a class of beings named Ælids, who perform the same services as the Valkyries of the Northern myths. These names occur in certain magic formulas of undoubted heathen character, which are contained in the manuscript just mentioned. A similar source is the so-called 'Wessobrunn Prayer' from the 8th cent., in which, according to Müller and others, there are traces also of an original Teutonic cosmogony with the concept of a large void and yawning abyss, etc. But this may have been derived from Christian influences, as Wackernagel contends. Another source is found in Helmod's work, in which he incidentally or otherwise touches upon the belief of the Teutons (cf. esp. An. xiii. 57; Germ. li.). From these notices it seems that the old Teutons considered fire and water, and also salt, as original elements. Similar notions are to be found in Snorri Sturluson's Gylfaginning, chs. 5 and 6 (cf. below, p. 178, on the cow Audhumla licking salty stones in Ginnungagap). Finally, there exists at Mainz a letter of Daniel of Winchester (Ep. 15, Men. Monmutes Coll.) to Boniface, the missionary to the Germans, written c. 720, which to some extent describes the cultus and beliefs of the ancient heathen. In it there are some references to the origin of the world and of the gods themselves.

These are really the only remains which we possess from the German branch of the Teutons as to the beginning of the world, except that in the idioms of the language itself and in certain remaining forms of many of these there are some residua of ideas once entertained by the original Teutons. But from all these remains brought together there cannot be constructed anything like a Tentonic cosmogony. For such we have, as already indicated, to turn to the North.

The two main cosmogonic sources of the Scandinavian branch of the Teutons are Snorri Sturluson's Gylfaginning and the Voluspä. The former is, however, hardly fair to be fair to make this the only source of the cosmogony of the Teutons, as long as there is another, which proceeds to a much more detailed description. This is found in the prose Edda of Snorri Sturluson, and under the heads of Gylfaginning, as before mentioned, it is rather too extensive to quote. In the remaining literatures of the Eddas there are also a few other references to the creation of the world and the...
of origin, of these, and these, together with the two main sources just mentioned, offer the following account of the Teutonic cosmogony.

Ginnungagap was limited to the north by the cold and frosty region called Niflheim, and to the south by Muspellsheim, with its fire and burning heat. In Ginnungagap itself the cold from Niflheim, carried along by the twelve poisonous rivers, the Elvágar from the fountain Hvergelmir in the lowest depths of the abyss, met the heat from Muspellheim, resulting in the first development of life, which took form in a being similar to a man and called Ymir, who was of immense size and became the progenitor of the giants.

Along with Ymir there arose from the same union of cold and heat a monstrous cow called Audhumula—an original conception, it seems, and such the frustrating power. With her milk she sustained Ymir, while she herself fed from the saltry stones in Ginnungagap, which she licked. From her contact with the saltry stones there grew forth another being called Buri, who united with Ymir. Ymir then killed Buri and drank of his blood his entire progeny, the giants, with the exception of Bergelmir, who escaped, and, in his turn, now became the father of a new race of giants. With Ymir's loss the gods filled the awestruck world with new men, but he remained a being of a more rude and simple character. This view seems probable to the present writer. But, as the examination of this hypothesis would lead us into the altogether uncertain, we shall have to rest satisfied with what we know, and congratulate ourselves that we have so much. Perhaps its philosophy may be summed up as follows. The early Teutons believed in a pre-existing substance in a pre-existent chaotic state. In the incompatible forms of cold and heat, there arose the primitive forms of life, endowed with reproductive power. In this early state only the most monstrous beings were produced—but with the intervention of nature, and the struggle between the gods and the giants, between good and evil, shall be fought, when evil will be for ever vanquished. After this the Yggdrasil will flourish as never before, and there shall be a new age, with a new race of gods, and the righteons shall dwell for ever in perfect bliss.

This is as nearly as possible an objective statement of the views of the early Teutons as regards the beginning of the world. But no one can tell whether there was or was not a race of gods before this, or whether the Teutonic race was the result of the meeting of a more rude and simple character. This view seems probable to the present writer. But, as the examination of this hypothesis would lead us into the altogether uncertain, we shall have to rest satisfied with what we know, and congratulate ourselves that we have so much. Perhaps its philosophy may be summed up as follows. The early Teutons believed in a pre-existing substance in a pre-existent chaotic state. COUNCILS AND SYNODS (Buddhist)

Buddhist (L. de la Valée Poussin), p. 179.

COUNCILS (Buddhist)—
Before giving a short survey of the traditions relative to the Buddhist Councils, it seems advisable to state what these Councils were. While it is impossible to accept the Buddhist opinion that they were held as economical gatherings after the Nicene type, it is at the same time necessary to explain how Buddhist monastic life, without the help of such solemn assemblies, was kept in order. As a first step, the character of the early sects cannot be evaded, for sectarianism is as old as catholicism in the Buddhist world; and Councils are said to have been held by the 'orthodox' to impugn sectarianism, and by the 'heterodox' to define their own peculiar tenets. At the history of the Councils and of the Sects will be dealt with elsewhere, we shall say here only what is necessary to avoid misleading ideas about the Councils, and to justify our half-conservative, half-critical, half-epistemological procedure.

1. COUNCILS, CANONS, AND SECTS.—The professed dogma of the Buddhists of the post-canonic age is, that Councils were solemn synods of Saints, where quæsumisscient and sinless old men (archets, skatvas) gathered in order to re-secure, to 'chant together' (sangiti), the Word of Buddha (First Council), or to re-state it against the heretical views of innovators (Second and Third Councils), or to approve the addition of new treatises to the sacred lore, or to give authoritative summaries to some theory of exegesis (Third Council and Kaniska's Council).

It is hardly necessary to point out that, as regards the First Council, the ecclesiastical dogma is in itself illogical. If there were five, or ten, or thirty, or one hundred 'authenticity' of the whole Pali scriptures; and—without troubling to refer to a number of specious arguments—in presence of such facts as are adduced by Rhys Davids (Buddhist Antiq., London, 1893, p. 170) or R. O. Franke ('Buddhist Councils' in JPTS, 1908, p. 5), the relative lateness of a great or the greater part of the Nikayas themselves is evident (see below, on the later Councils). But it is safe to believe with Kern, whose critical methods are by no means服务于 the sectarians, that there have been 'synods' ('Qu'il y ait eu des synodes, personne le ne lave' [Geschiedeniss, ii. 265]). Upansas as well as Suttantas furnish many evidences of the habit of discussing doctrinal matters. We shall venture to add (1) that such meetings were sometimes legal sessions, of the type approved of in the Pali Vinaya, held by the parochial or diocesan (or even polydiocesan) clergy, i.e. a saṅgha in ordination or discipline, and (2) that heretical views, no less than extra-legal practices, may have been a matter of scandal, of inquiry, of doctrinal appreciation by the soi-disant supporters of tradition (Council on the Five Points of Mahādeva)—there was on some occasions at least more or less formal 'consensus' of the contending parties; (3) that, possibly—were we not to say probably, for no human being knows anything about it, and 'probably' would be misleading where no appreciation of probability is possible—immediately after some human act of such of his disciples, headed by Upali or Ananda or Kāśyapa, tried to ascertain at least a list of his authentic sermons and teachings: they agreed, let us say, on the technical 'parases' which are the oldest form of the Pātīlīpanās (cf. Mahāyānapitaka, § 236 ff.), on the wording of the Benares sermon, etc.; (4) that kings of old concerned themselves with ecclesiastical affairs, as did kings of later times—synods and doctrinal dispositions, usual in the Middle Ages, are told in many sources, may have acquired special importance, owing to royal intervention (Āsoka, Kanisaka?); (5) that some monasteries (and in early times there were huge monasteries) were like permanent councils. Their 'living libraries' became Canons: for the canonical shape which the Word of Buddha (budhayavaca) received at last, when Word became Scripture, had been for a very long time foreshadowed by the oral and uncanonized distribution of the Pali by the wandering Baskets (Pīlādhas) and Collections (Nikayas).

But, while acknowledging the possibility (even the probability) of synods, we are at no loss to point out more certain and farther reaching causes of the facts to be explained, viz. the formation of the body of the Scriptures, the general (if not strict) 'consensus' of the sects of the Hinayana as concerns Buddha's teaching, and, conversely, the splitting of the Order into sects.

If one excepts the division of the clergy named upanikṣās, forest-men, or pratijñāparamitha, those who leave the world to live as the saints of old (cīryaśravasi; see Poussin, Boudhisme, 1900, p. 80), the Buddhist monks have never been hermits, 'ghorence-like' solitary. A novitiate so-called, and often prolonged apprenticeship, study, and service at the feet of the preceptor, tertagibility confusion, erudite life, and prolonged living together during the rainy season

1. We may cite Aëkleh's Bhaiṣaj Edict and Pillar Inscription at Sārnāth (V. A. Smith, Early History of India, Oxford, 1908, p. 190) also (possibly) his Edict on the Quinquennial Assembly (Fourth Book XX, 105; A. Smith, The Edicts of the Buddha, 110; Kern, Manual, 101); on the assemblies convened by Hsüan, see V. A. Smith, Early History, p. 227; Kern, loc. cit., and Geschiedeniss, ii. 220.

COUNCILS AND SYNODS (Buddhist)

were designed to prevent the admission of heterogeneous elements was examined closely in every monastery, and the itinerant habit3 which led the Bhedas from their aboriginal country to the farthest reaches of the " fraternity " established, a strong tie between the fraternities. Thus, the sons of Sākyas constitute only one family held together (not merely through the blood of their mates) and through common spiritual aims; but by frequent intercourse and a common teaching from Buddha, the councils, whether Jain or Brahman, were a danger to orthodoxy, although they were also a cause of it.

There are no bishops in the Buddhist Order, nor ever were there any in the Sinhalese (suhaddars); there was no monk entitled by the Buddha himself, or by the Church, or by ' Elders in number' (sahajapitro), to be the protection (patiariyage) of his brothers.4 Nevertheless, the present writer is now inclined to believe that Buddha, in the council of the Elders (theratara = paribuddhi, theracchārappabājī), and the oldest Elder on earth (pathaṁ saṅghathera); and these old monks are styled Fathers of the Church.5 Leaders of the Church (sahāghapitro, sāhaḥparyinghathā) are, in the eyes of the world, the spiritual heads of the Church. Thus was evolved the idea of Patriarchs, rinengpimokkha, 'chiefs of discipline,' or sacharāya, 'Masters,' who are supposed to have been inspired by the Sinhalese,6 and the Northern Buddhist Church,7 therefore, in the course of history, very accurately controlled the universal Church. Oldenberg rightly observes that the discipline of Patriarchs is a branch of canonical literature, but we are told in Diṭṭa, i. 124, that such and such a saṅgha possesses theras and pimokkha.8

The feeling for the unity of the Church, and the actual strive to promote or to restore this unity, assert themselves in the sermons of Buddha on 'schism' (saṅghahēdha),9 the most hateful crime, in punishment of which an eternity (koppa, 'age of the world') of suffering is hardly sufficient.10 In some cases Buddha goes far as to forbid the re-ordination of monks who have turned away to schism (or who have followed schismatic).11

But we ought to be aware that these sermons contain a legal idea, and a vendetta against the non-Buddhist, and the conservative party, as well as to followers of disruption.

The following is reported to Buddha: 'A certain monk, Lord, had committed an offence which he considered as an offence, while the others considered it a non-offence. Afterwards he began to consider that offence as no offence, and the other monks began to consider it as an offence. . . . Then those monks . . . pronounced expulsion against that monk for his refusal to see that offence. . . . Then that monk got his companions and friends among the monks on his side, and sent a messenger to his companions and friends among the monks of the whole country, and the parities of the expelled monk . . . persevered on the side of that expelled monk and followed him. . . . Buddha peaceably exclaimed: 'This saṅgha is divided! But he has words of rebuke for the 'expellers': Do not think, O monks, that you are to pronounce expulsion against a monk for this or that offence.'12

One has to distinguish between what is really important and what is not worth disputing, Pitakkonkha, the essential rule of the Order, and Dhamma, the essential doctrine leading to salvation.

1 In Mahāyana, saṅgha = bodhisattvavagya, 'the cohort of the celestial Bodhisattvas' (Sāntikya's Bodhisattvavagya, G. H. Gunaratna, in Si. vii. 19, translated as 'saints'). But these are saṅgha, the four owners of, and the four candidates for, the fruits of etajjapana . . . arah (Kathiraththu, p. 32. 'buddhist fold, the four possessors of the saṅgha only are real members of the saṅgha is evident in Sutta, i. 335. In the vihāra, and in the vihāra, saṅgha is not a single Brethren dwelling in some particular place, knowing the Pitakkonkha (Mahayana). The following, ii. 17 (SBE vii. xx. xxxiv), this would hold far too much. It sometimes happens that the similar monks are small, and the pious monks feebly; these last are dejected, forced to silence in the saṅgha, and go away to another country (Abhujata, i. 69).

2 All these testimonies, and many others, e.g. the dishonest method of securing concord and orthodoxy by manipulation of the votes (Oldenberg, Buddh. p. 292; = Boudhika [tr. Fonckh], p. 236; Chullavagga, iv. 14. 26, in SBE xx. [Vinnaya Text, pt. ii. 56]), establish at the same time: (1) that there are germs of division, and no small danger of the Order's losing its originality; (2) that, conversely, there is a catholic and traditional spirit, asserting itself in the rules of eccomunism, etc. That this spirit gained the upper hand is sufficiently proved by the Rule of the Ordination of the Northern Brethren (the constitution of Canons, etc., But the same history (growth of Mahāyāna, Layāgattas, Tattaraphāya, etc.) has made the view clear that there has always been a Buddhism du dhāra, a heretical, popular Buddhism, which later gained the predominance. See also, on the 'Northern Patriarch', Kern, Geschiedenis, i. 215.

3 There are a number of synonyms, or quasi-synonyms, which are translated as follows: 'altercations, contentions, discord, quarrels, divisions' among the saṅgha (bhedas), division among the saṅgha (sahajapitro), saṅgha among the saṅgha (sahajapitro; SBE xvi. 238). There is 'discress,' when the number of disputing monks does not exceed eight; 'schism,' when they are nine or more (Chullavagga). It must be observed that the Vinaya has in view disputes in a particular group, and hold it a point of duty to hear to their words,' etc. (We have objections to the translation of the 'order', and prefer of the fraternities, of the parasites.) Here, again, the text shows that discord towards Elders was not impossible. Cf. the Vaiśali legend.

5 Son Buddhā, 396 (= Boudhika, 336), reference to Dippurikaka, vi. 3, Peter, ii. 291, Sanampannāṣakara, 252 (Vinayapitaka, vol. ii. 178). See also, on the 'Northern Patriarch' Kern, Geschiedenis, i. 215.

6 Chullavagga, vi. 77 (= SBE xi. 6): 'So long as the brethren honour and esteem and reverence and support the elders of experience and long standing, the fathers and leaders of the Order, and hold it a point of duty to hearken to their words,' etc. (We have objections to the translation of the 'order', and prefer of the fraternities, of the parasites.) Here, again, the text shows that discord towards Elders was not impossible. Cf. the Vaiśali legend.

7 Dippurikaka, vi. 336 (SBE xi. 6): 'So long as the brethren honour and esteem and reverence and support the elders of experience and long standing, the fathers and leaders of the Order, and hold it a point of duty to hearken to their words,' etc. (We have objections to the translation of the 'order', and prefer of the fraternities, of the parasites.) Here, again, the text shows that discord towards Elders was not impossible. Cf. the Vaiśali legend.

8 Son Buddhā, 396 (= Boudhika, 336), reference to Dippurikaka, vi. 3, Peter, ii. 291, Sanampannāṣakara, 252 (Vinayapitaka, vol. ii. 178). See also, on the 'Northern Patriarch' Kern, Geschiedenis, i. 215.

9 Dippurikaka, vi. 77 (= SBE xi. 6): 'So long as the brethren honour and esteem and reverence and support the elders of experience and long standing, the fathers and leaders of the Order, and hold it a point of duty to hearken to their words,' etc. (We have objections to the translation of the 'order', and prefer of the fraternities, of the parasites.) 12 Dippurikaka, vi. 77 (= SBE xi. 6): 'So long as the brethren honour and esteem and reverence and support the elders of experience and long standing, the fathers and leaders of the Order, and hold it a point of duty to hearken to their words,' etc. (We have objections to the translation of the 'order', and prefer of the fraternities, of the parasites.) Here, again, the text shows that discord towards Elders was not impossible. Cf. the Vaiśali legend.
—those are important; and happily there are not," Ananda says to Buddha, "two monks who differ concerning the Eightfold Path, the Four Efforts, etc." There are also Adhipatimokkha, Ajñāyaya, and Abhidhamma, subtleties or refinements or niceties concerning monastic life and discipline (Tattvaratana).

When two monks differ (or believe that they differ) on Abhidhamma, one has to content oneself with the mere statement of facts; he differing believing the meaning and the letter (of a Sutta); well, do acknowledge that you differ, and do dispute them with all your heart.

Again, 'orthodoxy' has two aspects: not to rest content with 'unreliable' evidences (see below), and not to impugn systematically received opinions: "Whatsoever monk shall speak thus: 'I cannot submit myself to that precept, brother, until I shall have inquired touching it of another monk, an experienced master of the Discipline,' that is a Pachittaya, a fault requiring repentance' (Jata 71).

The principle of the abhidhamma at once occurs to us, according to which 'it is allowable to do a thing on the ground that 'my preceptor, my teacher, has practised this or that.' This principle, acknowledged in Brahman circles, was maintained by some Buddhist, the heretics of Vaishali (Chulavasa, xi. 2, 8); and it is said to some extent to be adopted by orthodox, for we are told that, when the First Council was just concluded, there came a celebrated monk, Porun, with his 500 disciples, who recited a rule relating to the holding of the council. The doctrine and the disciplinary rule have been well sung by the Elders. But the forests and the monasteries are in such manner that they have been heard by me, and received by me from the very mouth of the Blessed One; in that manner will I bear it in my memory." Neither the Elders nor the people have a word of reprobate for this individualism (Chulavasa, xi. 11).

There are, we say, evidences of a very tolerating tendency. In order to assure concord, the most reasonable are to yield, for discord is the greatest evil. The care to live 'well, without dispute,' and the care not to lose any word of Buddha, whosoever it might come, were both commented.

We must then learn that laymen were the only supporters of some important texts: 'If he sends a messenger to the monks, saying, 'Might their reverences come and learn this suttanta; otherwise this suttanta will fall into oblivion', then you ought to go even during the rainy season (Mahasangha, iii. 5, 9 [SBE xiii. xxiv]).

But the care to be 'orthodox,' and not to alter Buddha's practice (Buddha-achinaya), does not prove less effective. Not only irregular practices, but sin of doctrine (dhamma dilka), must be abandoned. The legend of the Vaishali Council relates the endeavours of the 'good ones' to enforce the old rules. The Mahaparinibbana, without mentioning Councils, points out that one ought not to refuse or alter the orthodoxy of a theory or of a practice, merely with the testimony of a hearer of Buddha, of an Elder, of a (parish) saṅhāra, or of many Elders, but that one must look at what it Concern in order to accord, the most reasonable are to yield, for discord is the greatest evil. The care to live 'well, without dispute,' and the care not to lose any word of Buddha, whichever it might come, were both commented.

be 'cannontents' without discord, 'diversities' without excommunication. It is, for instance, a fact that Buddhists used their own 'sacred' books and their own sacred language (Sanskrit), and such a book as the Buddha himself is said to have allowed his disciples to do so, and diversity of language is more than sufficient to cause discord and we may call it 'Buddhistic' or 'religious' discord. But, in these cases, and for these purposes, the robes, and traditions are also decisive in this regard: discrepancies could not but arise in the Suttas when states and the suttas compromises ought to be tolerated in some provinces (Aranya); four monks make a sima in 'Bordering countries,' nine are necessary in 'middle countries' (Madhyantika, etc.).

As we know from later documents, such discrepancies did not end with the death of the monk himself, for he was obliged to follow the rules to which he has subscribed as a novice; but he is not obliged to protest when he is the guest of monks who use another, nor do we know what consequences, if any, were attached to it. As a rule, doctrinal contradictions do not disrupt the sima. If there are no apparent contradictions, that is the sum of a syna. Otherwise, draw a synthesis of the Law, the objection is ready at hand: 'You alter the Law' (सुरेण्य महानमतः).

Nor, we have nothing like the cardinal dogmatic, theological, moral, is the answer. And this answer, be it right or wrong, is what the scriptures are talking about. Theory, for instance, the prajnapada (a doctrine of a personable, young) would lead some sects so far as to deny the authenticity of certain suttas; or, conversely, it may be a question amongst the orthodox whether such sects have any right to style themselves Buddhists, and yet they are recognised as 'sacred' of the tradition of the Elders. Thus, if we consider the mutual relations of sects and their legal position as branches of the universal Sangha—leaving out of account doctrinal differences which are not of paramount importance—sects are not to be contrasted as hostile bodies, with closed traditions. The dream of Bimbisara may be quoted to give a true symbol of the Buddhist Church:

King Bimbisara once saw in a dream a place of cloth was torn, and a gold stick broken, both into eighteen fragments. Being frightened, he asked the Buddha the reason. In reply, Buddha said: 'More than a hundred years after my attainment of nirvana, there will arise a king, named Asoka...

2 Kathākatha, xxi., i; cf. Mādhyāmikī, ii, 245.

3 Kathākatha, xxi. 12; cf. Mādhyāmikī, ii, 246.

4 This figure, 12, which does not agree with our lists of sects, possibly depends upon the &shakaśāstra, 'causes of discord in the Buddha's time.'

5 It is in Brentano's Record of the Buddhist Religion (tr. B. Taluttah), Oxford, 1903, pp. 13-14; cf. and T. R. Srinivas, in Soc. for the Promotion of the Buddhist Religion, 2nd Sess. (1901), p. 162, if: 'The texts of the Suttas keep the same isolated, and do not always agree, although special discord makes many ways to the same end: . . .'

6 Manual, i (1906), p. 1014, (with some omissions).

utterances, Kāsāyana the Great made the proposal that the Brethren should assemble to reshape the Lord's precepts. The proposal was adopted, and Kāsāyana was now entrusted to select 500 Arhats. This being done, it was decided that Bājārīya should be the place of assembly. During a seven months' session the Vinaya ("Discipline") was revised, with the assistance of Utpali; the Dharmac ("Law", doctrine), with the assistance of Ananda.

There are numerous divergences and errors (saffalas) in the traditions of Ananda, which had to make amends for them. Lastly, a celebrated monk, Purāna, arrives when the 'chanting together' of the Law is completed, and, although he admits that the Law has been revised thus far by the Elders or Arhats, he prefers to 'hear' the Law as he has himself received it from the Master.

According to Oldenberg, 'what we have here before us is not history, but mere invention'; and every one will agree with him, as far as the 'chanting together' of the whole Vinaya and Dharmac (Sutras) is concerned, although, in the words of Kern, 'it is by no means incredible that the disciples, after the death of the founder of their sect, could, and ought to, issue new versions concerning the principal points of the creed and of the discipline.' As concerns the minor details, whose unhistorical character is by no means evident (miracles of Ananda, excommunications of Chāṇakya, etc.), Missnyana thinks that they were to some extent historical, and the present writer does not see how this opinion can be 'proved' to be either right or wrong. He ventured to believe that it is right.

The author of the Chaṭṭha-sutta, a very ancient work, falsify his history of the First Council [a legend or a quasi-legend, an 'aetiological' or 'apologetic' construction which may cover some kernel of truth], and has used traditional data, which are neither so near, nor less reliable than the traditions of the Buddhist Tradition contained in Vinayas or Sutras. Moreover, it is not necessary to decide whether these data are true or false; in any case, they present us with useful evidence as to the early Church.

The narratives of several sects—Dharmaśāstra, Sarvāstivāda, Mahāsāṃghikas—are parallel with the Chaṭṭha-sutta. Although there are manifold discrepancies, it is far from certain that they furnish us with independent traditions. The Chaṭṭha-sutta looks older, for it does not contain any allusion to the rehearison of the writings of the secular books and the last days and the funeral of Buddha, tr. Rāys, Davids, SBE xi, and Dialogues, ii.

3 See Dialogues, ii, 70.

7 See L. 1906, p. 8, note; also Nanjio, Catalogue of the Chinese Transactions of the Buddhist Tripitaka at Myohara, SBE, xvi.

8 For the last line of the last sentence, see the last sentence of the last paragraph of 552, etc., and SBE xi, p. xxvii. [We are indebted for this reference and this argument to M. Louis Finot.] A typical instance of the complexity of the Buddhist system in the narrative and literary problems is furnished by the manuscripts of the narrative of the expedition of Purāna. There is much truth in this information. According to the Sinhalese, Purāna demanded the insertion of seven permissi (keeping) of the Elders or Arhats, the last of the eight. At the Chaṭṭha-sutta, of eight. Now the Purāṇa (Mahāsūtra, v. 17-19, 20, 52) states that the problem of the eight
2. Council of Vaiśāli (Vesālī).—According to a tradition fully developed in Chulavatthu, tīrtha (SE 380), and common to at least several sects, there was held, in the year 100 or 110 after the Nirvāṇa, a Council to examine and condemn ten extra-legal practices of the monks of Vaiśāli. In the third year of the Asoka's reign, in the country of Vaiśāli, the monks were ordered to put an end to the ten extra-legal practices (Vaiśāli, the modern Braj) as known as Vaiśāli (Pāli Vaiśāliputra), and the heretic monks as Vaiśāliputra (Pāli Vaiśāliputta). The heretical practices were described, or technically pointed out, in short phrases, as, e.g., *description of the wrong sin,* etc.—some of which were no longer intelligible when Chulavatthu, tīrtha, and the other Vaiśālīs alluded to were compiled, as is shown by the discrepancies in the interpretation of the phrases.

We may safely acknowledge the character of a Vaiśālian controversy on ten points of monastic discipline, but it is as yet impossible to draw from it any conclusion regarding the importance or the date of the event, the development of the monastic institution at that time, or the date of the Pāli Vaiśāsa as a whole. The present writer considers it a misleading contrast to fancy that the Vaiśāli controversy was brought to the Vaiśāli Council because it does not contain any allusion to the ten phrases. Further, as is generally admitted, the figures 100 and 110 are round numbers.

(i) The Pāli Vaiśāliputra, Mahākāla, and the heretic monks as Vaiśāliputra (Pāli Vaiśāliputra), and the heretic monks as Vaiśāliputra (Pāli Vaiśāliputta). The heretical practices were described, or technically pointed out, in short phrases, as, e.g., 'description of the wrong sin,' etc.—some of which were no longer intelligible when Chulavatthu, tīrtha, and the other Vaiśālīs alluded to were compiled, as is shown by the discrepancies in the interpretation of the phrases.

We may safely acknowledge the character of a Vaiśālian controversy on ten points of monastic discipline, but it is as yet impossible to draw from it any conclusion regarding the importance or the date of the event, the development of the monastic institution at that time, or the date of the Pāli Vaiśāsa as a whole. The present writer considers it a misleading contrast to fancy that the Vaiśāli controversy was brought to the Vaiśāli Council because it does not contain any allusion to the ten phrases. Further, as is generally admitted, the figures 100 and 110 are round numbers.
COUNCILS AND SYNODS (Buddhist)

The obvious conclusions are as follows, (a) Nothing precise was known concerning the origin of the Mahabodhi; they claimed to be ancient and orthodox. Others styled them heretics and schismatics. The Sinhalese identified them with the Vesalan Vajjiputtakas, but there is no evidence that the latter is the identification; some seem to believe that they originated out of the dispute on the five points, and it seems certain that they admitted the five points. (b) There was a tradition of an Vesalian Council on ten points, date uncertain, no mention of king; and (c) a tradition of a Council on some controverted question, more precisely on five points; date uncertain, and probably no mention of king. (d) The monks of Ceylon supposed that their Kathavatthu, a catalogue of heresies, had been first preached mystically by Buddha; they were well aware that the book was modern, nay, that it had been revealed by Tissa Mogaliputta, some centuries after the Nirvana; and they had reasons to admit that the inclusive Council, the Kathavatthu, had been rehearsed in a Council, which could not be the Vaishali Council, since the Chulavangga ignores Tissa and the Kathavatthu.

It was reasonable to place all the important events in the history of the Church under Aoka, who had evidently been a second-mover of the Wheel of the Law; and this being the case, the exceptional case of Nanda and Mahapadma, above, p. 183. Again, Patialapura was the evident seat of a chronologically second Council.

Our Northern documents are scanty and misleading, but they give some reason to imagine that there was, in certain tradition of the date of Aoka: 100, 110, 137, or 169 are figures out of which no chronology can be extracted (no oil out of that stone, no date from Patialapura tailam).

The Sinhalese tradition places the Vaishali Council in 100 under Kalsika, and the Patialapura Council in 110 under Dharmapala. Besides the Northern figures for Aoka (100 [110], 137, 169), there was a fourth figure, a.b. 250 (17 or 18 years after his corona-

nion in a.b. 261, 270). We are not concerned with the question whether these were fateful or traditional computations. In fact, the authors of the ecclesiastical history 'concocted' in Ceylon admitted this figure, without troubling themselves very much to adjust it to some other chronological details of their own; and they did not even mention the canonical date of Vaishali, and were at a loss to name the sovereign reigning in a.b. 169, they imagined a 'black Aoka', Kalsika—a mere guess and legend.

It is obvious that the Sinhalese tradition was open to serious objections as concerns the rehearsal of the Pali Canon and of the Kathavatthu as it stands now, and as regards the solemn declaration by the whole clergy that Buddha, as 'the Half-brother', had decreed the rules of the Vaishali Council, and that the tenets of the school of this name. But some details are historical, and the story itself rests on historical ground. Aoka's inscriptions are explicit enough as to the king's intervention in clerical questions: we know that he decreed expulsion ('putting in white [i.e. layman's] garments') against [monks or nuns]. The Sinhalese tradition may be relied upon when it affirms that such rules were enforced against bad monks, 'pseudo-Buddhists' as they were. What the king said by the way, the king seems rather incredible. On the other hand, it is unfortunate that the inscriptions contain no allusion to a 'Council,' and some historians feel obliged to place

the Council in the short time between the Pillar-inscriptions and the death of the king (see ii. 126). But the question is whether the Council was what it is said to have been, a 'Nicene' Assembly, and not rather a series of synods or dogmatic disputations.

Until the Kathavatthu has been thoroughly studied and compared with 'Northern' documents, it will be impossible to describe the ancient

doctrinal discussions; but we already possess a few hints which may prove useful.

(a) The name of Tissa Mogaliputta, the hero of the Third Council and the principal author of the Vaishajyavadin faith, is quoted in the books of a rival sect, the Sarvastivadins. The Vajja-

nikaya, a treatise of this sect, is a tedious argumentative controversy comparing the views of a Mahasanghika monk with those of a 'Vesalian'. It denied the reality of the Past and the Future . . . (Watters, On from Ceylon, p. 346.)

(b) Further, the heresy condemned in the Kathavatthu—

'Is there in the truest and highest sense a soul (pudgala)?'—is known from the Northern sources as the capital tenet of the Vaipallapitas (cf. above, p. 184); and it seems that the problem of the 'soul' aroused division in the earliest times. The second heresy—'Can an Arhat fall from Arhatship'—is also very ancient, of the 4th century B.C.

To sum up: it seems almost certain that a number of heresies discussed in the Kathavatthu may have occasioned discussions, synods, and divisions in the days of Asoka, at least a generation before his time; that there was a Kathavatthupakaranam, a 'book on controversies,' which could be easily completed and, in fact, has been enlarged through many and manifold additions. There is no reason to doubt that the Sinhalese versions were in some way connected with Tissa Mogaliputta.

4. Council of Kaniska. The documents concerning this Council are late, more or less at variance, and, moreover, very vague.

It seems that this Assembly is for, the Sarvastivadins School, and is based on an apocryphal manuscript known as the Kathavatthupakaranam, a treatise on Abhidharma, and maintains that there are authoritative (words of the Buddha); their authenticity and the authority of the Abhidharma, was, at present, held at the Council held under Kaniska, and, moreover, a Commentary on the Abhidharma-treatises (Vibhad) was compiled or written on this occasion. The text of these works has been preserved, but the later scholastic development of the Kharsnaitas, who consider the Abhidharma-treatises as human works, does not mention, we think, Kaniska's Council; further, that the Kanisaka (monks of Kaniska, the stronghold of the Sarvastivadins and Valahikas) are not Sarvastivadins.

The narratives of this Council are to some extent dogmatic legends, and seem only to best witness to the literary activity of the Sarvastivadins. As is well said by Takakusa, until the treatises of this school shall have been made accessible to scholars, it will be vain to argue about the Council or its proceedings (see att. VAIHJANAS, SARVASTIVA-

DINS)

1 See JAR, 1910, p. 415.

2 Kern, Manual, p. 121 (see also Geschichtslehrer, ii. 289). Kern gives a summary of the narratives of Vaibhasikas, Kalsika, and the Sarvastivadins' books are earlier or later than Kaniska (c.f. 4).

3 It seems certain that the two Abhidharma collections have nothing in common.

The present writer cannot agree with Kern's opinion (Manual, p. 121) that, as a result of the Council, a synod, or an agreement, a maha-sammaita, was held upon the basis of the principal treatises (compared and approved, in a debate) as represented by the Sarvastivadin character of the Council seems to be proved.
COUNCILS AND SYNODS (Christian)

1. The various kinds of Councils.—The Councils of the early Church may be classified as follows: (1) Diocesan, being the assembly of a single diocese; (2) Provincial, being of all the dioceses composing the province of the province; (3) Councils of united provinces, being assemblies of several neighbouring provinces, sometimes called Plenary Councils (concilia plenaria); (4) Patriarchal, being of the provinces united in one patriarchate, sometimes called Patriarchal Councils (concilia patriarcalia, or concilia univer sitaria); (5) National, being of the provinces existing in a country, sometimes called Plenary or Universal Councils, frequently identical with Primatial and Patriarchal Councils, or of the West, being of all the provinces in the West; (6) General Councils representing in their constitutions the whole Church; (7) Ecumenical Councils, being Councils whose decisions were accepted by the whole Church; (8) Synods, being called in a local diocese, either by a bishop, or by the diocese, or by the Pope; (9) Provincial Councils, being constituted only of the presbyters of a province, sometimes called Provincial Councils (concilia provinciale); (10) Mixed Councils, being of a mixed class, consisting of presbyters and laity, sometimes called Mixed Councils (concilia mixtae) of the 9th, 10th, and 11th centuries. To these may be added (9) the Councils held at Constantinople in the 4th and following centuries, known as the Home Councils (εσθονότα θεραπευον) and (10) the Mixed Councils (concilia mixtae) of the 9th, 10th, and 11th centuries.

2. The constitution of Councils.—(1) A diocesan Council consisted normally of the presbyters of the diocese, meeting under the presidency of the bishop. The rule of the bishop was not regarded as being exercised altogether independently of the presbyters, although he had the power and the responsibility of decisions. In the 4th century the authority of the bishop is constantly viewed as being exercised in connexion with the presbyters; see, e.g., ad Eph. 39; ad Magna 6, 7; ad Tollek. Sl. 5, 14 (zur Eph. xiv. 4), writing of his presbyters and deacons, says: 'From the beginning of my episcopate I determine everything by my own judgment, without your advice and without the assent of the laity.' The advice of clergy and laity was sought by the bishop in regard to those whom he ordained. St. Cyril, Ep. 115 (see above), speaks of the 'ordinatio in consilium' of bishops and deacons; says: 'In the ordination of clergy it is our custom to consult you beforehand, and to consult with you after we have given the order of ordination to the persons and to the districts of individual'; and a canon of the 6th cent. Gallican document, known as the 'Fourth Council of Carthage' (canon 22; see Hardouin, Concilia, i. 890), which passed into the general Western canon law (Decret. i. xxiv. 6), enacted: 'that a bishop should not ordain clergy, so that he may look for the ascent and witness of the people.'

3. This canon of Nicaea is of great importance as illustrating (a) the intention of revising the acts of individual bishops by the holding of provincial Councils; and (b) the connexion between the exercise of the bishop's authority and his power of excommunication. Similarly, it was enacted by the Council of Arles (A.D. 256), that 'if any one be excommunicated by his own bishop, he may not be admitted by other bishops unless he has been restored by his own bishop, or by the bishop of some other see.' The Council appeared before it and made his defence, and convinced the Council and obtained a new decision. This decree applies to laity and presbyters and deacons and all ecclesiastics (canon 6; see Hardouin, i. 322-330).

4. Apart from exceptions at Rome at the end of the 5th cent., and in Spain in the 6th, the Councils of the provincial and larger Councils were bishops only, though presbyters and deacons and lay people were sometimes present. The earliest instances of Councils of a character to which the admission of bishops was essential, and the provision in their constitution, and 'Ecumenical' for those whose decisions are accepted by the whole Church.

From this dependence of the bishop on the advice of those in his diocese the diocesan Councils had their origin. The normal constitution of such Councils was that they consisted of the bishop and presbyters of the diocese, though matters other bishops were sometimes associated with the Council.

For instance, a Carthaginian Council, probably earlier than A.D. 340, is described by St. Cyril in the following passages: 'I and my fellow-bishops who were present, and our fellow-presbyters who sat with us.' At a Roman Council held a little later there were present the bishops of Carthage, Alexandria, and the Roman presbyters, five bishops who happened to be at Rome at the time. The same is seen in the Councils of 496, 553, Alexander, Bishop of Alexandria, summoned a Council of the presbyters, together with certain bishops who were then at Alexandria, to consider the case of Arians, and the next day, on the 5th of August, Alexander, Bishop of Alexandria, summoned a Council of the bishops, together with certain bishops who were then at Alexandria, to consider the case of Arians. The same is seen in Epiph. adv. Aria, 1913). A 6th cent. Gallæcan canon in the so-called 'Fourth Council of Carthage' (canon 23; see Hardouin, i. 890), which, passed at least to an extent, the other in the autumn' (canon 6; see Hardouin, i. 322-330).

This canon of Nicaea is of great importance as illustrating (a) the intention of revising the acts of individual bishops by the holding of provincial Councils; and (b) the connexion between the exercise of the bishop's authority and his power of excommunication. Similarly, it was enacted by the Council of Arles (A.D. 256), that 'if any one be excommunicated by his own bishop, he may not be admitted by other bishops unless he has been restored by his own bishop, or by the bishop of some other see.' The Council appeared before it and made his defence, and convinced the Council and obtained a new decision. This decree applies to laity and presbyters and deacons and all ecclesiastics (canon 6; see Hardouin, i. 695).

Apart from exceptions at Rome at the end of the 5th cent., and in Spain in the 6th, the Councils of the provincial and larger Councils were bishops only, though presbyters and deacons and lay people were sometimes present. The earliest instances of Councils of a character to which the admission of bishops was essential, and the provision in their constitution, and 'Ecumenical' for those whose decisions are accepted by the whole Church.
the 2nd cent., in Asia Minor concerning Montanism, and in many places concerning the date of Easter. Such proceedings as this Council indicates that the members of them were bishops only (see Euseb. HE v. 16, 23, 24; Libellus Synodicius, in Hardon. v. 1453-1456; Salmon, in Smith-Wace, DOB iii. 933; Hefele-Lecercq, Concil. l. 128-150). At the African Councils held in the middle of the 3rd cent., presbyters and deacons and lay people were present (see Cypriani Ep. xvi. 4, xvii. 1, 3, xix. 2, xx. 5, xxxi. 6, xxxiv. 4, lv. 5, lx. 15, lxiv. 1), and expressed their opinions, sometimes in opposition to that of their bishop (ib. xvii. 3, lx. 15); but the actual decisions were the work of the assembled bishops, who alone were the constituent members of the Councils. For instance, a Council summoned to discuss the question of the validity of baptism administered by schismatics was held at Carthage on 1st Sept. 256. Besides the eighty-seven bishops from proconsular Africa, Numidia, and Mauretania, who were the members of the Council, there were present presbyters and deacons, and a large number of lay people. That only the bishops were the constituent members of the Council is shown by the judicial pronouncements being their work alone (see "Sententiae Episcoporum", in S. Cypriani Ep. lx. 15). At others (see Cypriani Ep. xiv. 2, 4, lx. 13, lxiv. 1, lxx. 1, lxxi. 1, lxxii. 1, lxxiii. 1). The Councils held at Antioch in 264 or 265, and 269, to consider the charges against Paul of Samosata, are described by Eusebius as consilium presbyterium et diaconorum. Presbyters and deacons were present at Antioch in connexion with the Councils, and at one of them a presbyter took a prominent part in the discussions; but there is no reason to suppose that these Councils differed from those at Carthage, so as to include others besides the constituent members possessing votes, though the letter written to announce the decision of the last Council of the series was in the name of "bishops, presbyters, and deacons, and the Churches of God" (see Euseb. vii. 27-30). Similarly, the African Councils about 241 consisted of bishops, though Origen, who was a presbyter, took part in a conference held in connexion with one of the Councils, and appears to have spoken in the actual proceedings. The Council of Constance, as we have seen, was summoned by the bishops, not as a member of the Council (see Euseb. vi. 33, 37). The constituent members of the Councils held in the 4th cent. were bishops, and any presbyters or deacons or ecclesiastics in number at all, might be elected as representatives of absent bishops and empowered to vote on behalf of those whom they represented. Thus, at Elvira in 305, twenty-six or thirty-six presbyters were present, had seats, and signed the decrees in a group after the bishops; deacons were present standing; and lay people were present. But the decrees were described as the decisions of the bishops (see 'Acts of Elvira,' in Hardon. i. 249, 250). In like manner, at Arles in 314 some presbyters and deacons and ecclesiastics in number at all, might be elected as representatives of absent bishops and representatives of absent bishops (see 'Acts of Arles,' in Hardon. i. 266-268; cf. Euseb. x. 5). So again, at Nicaea in 325, many presbyters, deacons, and acolytes were present as attendants of the bishops, and archdeacons (ib. 276); but no mention is made of attendance on the Bishop of Alexandria, was prominent in discussions connected with the Council; laymen took part in conferences before its formal opening; and the Emperor Constantine, though still unbaptized, was present at some of the proceedings, as the head of the State. But the accounts of all the authorities show that bishops alone were the only constituent members of the Council (see Euseb. Vit. Const. iii. 6-14; Socrates, i. 8-14; Sozomen. i. 15-25; cf. Bright, The Age of the Fathers, 1903, i. 78).

Till nearly the end of the 5th cent., the evidence suggests the same conclusions as those which have been mentioned in regard to the Councils of the 2nd and 3rd and early 4th cents., namely, that at provincial and larger Councils bishops alone were entitled to be present and vote, or, if unable to attend the Council, to nominate representatives with power to vote in their absence; that they frequently brought with them to Councils presbyters or deacons in attendance on them and for purposes of consultation, but without votes; and that they often were careful to ascertain the mind of the lay people about the matters which it was the work of the Council to discuss and decide upon. In the series of Roman Councils held in the latter part of the 5th cent. and during the early years of the 6th cent., the constitution of some Councils was the same as already described; in other Councils of the series the presbyters and deacons, who were the precursors of the cardinals, were considered as present in the Councils. For instance, presbyters apparently shared in the authority of the bishops at the Council held in 495 (see the 'Acts,' in Hardon., ii. 941-948); and both presbyters and deacons at that held in 547 in Spain. At other Councils, and of others than bishops being members of provincial or larger Councils is in the Spanish Councils of the 7th cent., which included abbots, as, for example, the Eighth Council of Toledo in 633 (ib. iii. 967). The 'Acts,' in Hardon., ii. 949-959; and both presbyters and deacons at that held in 547 in Spain. At other Councils, and of others than bishops being members of provincial or larger Councils is in the Spanish Councils of the 7th cent., which included abbots, as, for example, the Eighth Council of Toledo in 633 (ib. iii. 967).

2. The rival claims of bishops and other Christian laity—people, and the number of bishops in the 5th cent. increasing—may have led to more and more disagreements and divisions, and to the formation of smaller and smaller communities. It is important to distinguish two separate matters: the position of the Christian laity as such, that is, as members of the Christian society, the Church; and the position of the representatives of the Church. (1) As already mentioned, Christian laypeople—earlier times probably a multitude who were allowed to come in, and probably including women as well as men, and in later times selected representatives—were present at Councils. Neither in diocesan nor provincial nor general Councils were there any members of the laity as such. (2) As the friendship of the State towards the Church increased, and the relations between them became closer, the Emperors, or their representatives, and great men of the State were present at Councils. At Nicaea on the Sixth Ecumenical Councils in minor orders were present in attendance on bishops or as representatives of absent bishops; but the natural inference from all the evidence is that the only constituent members of the Council, that is, those with a right to be present and vote, were bishops and representatives of absent bishops (see 'Acts of Arles,' in Hardon. i. 266-268; cf. Euseb. x. 5). So again, at Nicaea in 325, many presbyters, deacons, and acolytes were present as attendants of the bishops, and archdeacons (ib. 276); but no mention is made of attendance on the Bishop of Alexandria, was prominent in discussions connected with the Council; laymen took part in conferences before its formal opening; and the Emperor Constantine, though still unbaptized, was present at some of the proceedings, as the head of the State. But the accounts of all the authorities show that bishops alone were the only constituent members of the Council (see Euseb. Vit. Const. iii. 6-14; Socrates, i. 8-14; Sozomen. i. 15-25; cf. Bright, The Age of the Fathers, 1903, i. 78). Till nearly the end of the 5th cent., the evidence suggests the same conclusions as those which have been mentioned in regard to the Councils of the 2nd and 3rd and early 4th cents., namely, that at provincial and larger Councils bishops alone were entitled to be present and vote, or, if unable to attend the Council, to nominate representatives with power to vote in their absence; that they frequently brought with them to Councils presbyters or deacons in attendance on them and for purposes of consultation, but without votes; and that they often were careful to ascertain the mind of the lay people about the matters which it was the work of the Council to discuss and decide upon. In the series of Roman Councils held in the latter part of the 5th cent. and during the early years of the 6th cent., the constitution of some Councils was the same as already described; in other Councils of the series the presbyters and deacons, who were the precursors of the cardinals, were considered as present in the Councils. For instance, presbyters apparently shared in the authority of the bishops at the Council held in 495 (see the 'Acts,' in Hardon., ii. 941-948); and both presbyters and deacons at that held in 547 in Spain. At other Councils, and of others than bishops being members of provincial or larger Councils is in the Spanish Councils of the 7th cent., which included abbots, as, for example, the Eighth Council of Toledo in 633 (ib. iii. 967).

2. Cf. Ao 114-20 for a parallel in Apostolic times.
Council (Constantinople, 690) to Constantine IV. It is said that Constantine, the Syriac Bishop of Rome, summoned the Council of Niceae (Hardoniu, iii. 1417), and in the Liber Pontificiæ (xxiv.) it is said that this Council was held with his assent. If it is the case, as Kallinikus (III. i. 1) says, that Constantine and Theodosius II., in the light of the views of the bishops, there is strong probability that the Bishop of Rome would not have been one of those consulted. (b) The Second Ecumenical Council, held at Constantinople in 381, was summoned from the East only, and was attended by representatives from the West. There is no evidence and no probability that the Pope had anything to do with the convocation of it. (c) Pope Celestine I. took no part in the summoning of the Third Ecumenical Council, held at Ephesus in 431. (d) The circumstances connected with the summoning of the Fourth Ecumenical Council, held at Chalcedon in 451, are complicated. They justify the words of Pope Leo I. himself, that the Council was held 'by the command of the Christian princes and by the consent of the Apostolic See' (St. Leo, Ep. cxiv. 1), and the courteous phrase of the Emperor Marcian, that the Council was to take place at the suggestion of the Pope (Opera S. Leonis, Ep. lxxiii.), if some latitude of construction is allowed in this phrase. They are not inconsistent with the statement of the bishops of Mosia in their letter to the Emperor Leo that the Council had been assembled 'by the order of Leo, the Roman pontiff, who is truly the head of the bishops, and of the illustrious and venerable bishop Anastasius' ('Acts of Chalcedon,' cod. encyc. 12, 'Ep. Episc. Mes. sec. ad Leonem Imper.', in Hardoniu, ii. 710). The facts are as follows. After the 'Robber-Synd' of Ephesus in 449, Pope Leo I. asked the Emperor Theodosius II. to summon another Council of bishops from all parts of the world to meet in Italy (Ep. xliv.). He twice repeated the same request (Ep. lv., lxxxii.), though on the second occasion he said that the Council would be unnecessary if without it the bishops were not to subscribe an orthodox statement of the faith (Ep. lxxiii.). He also asked Valentinian III., the Western Emperor, and his mother and his wife, Gallia Placidia and Lucina Eudoxia, to support this request to Theodosius (Ep. lvi.-lxxii.). The Emperor Theodosius II. appointed a Council, and the Council of bishops was assembled from all parts of the world to meet in Italy (Ep. lxxxiii.-lxvii.). After the writing of the first of these letters, and before the second and third, the Emperor Marcian convoked the Fourth Ecumenical Council. When the Council had been summoned, St. Leo wrote two letters to Marcian. In the first of them, dated 24th June 451, he said that he had hoped for the postponement of the Council, but that, since the Emperor had determined on its being held, he would not offer any hindrance, and appointed representatives to be present at it (Ep. lxxiii. 1). In the second letter, dated 26th June 451, he wrote that, though he had requested the postponement of the Council, he would not oppose the Emperor's arrangements.

The reference to the letters of Pope Damasus to Theodosius in the synodal letter preserved by Theodorus (III. v. 9) concerns the Council of 431 at Ephesus. For Constantinopolitanae, see Ep. cxxxi. 111, 112, 113.

In making this request, St. Leo may possibly have been influenced by the appeals made to him by Flavian of Constantinople and Eusebius of Dorylaion: see G. Amelius, S. Leonis Magnæ f. Pétiniæ, Rome, 1852, pp. 41-49; Spicilegium Casaliumæ, Monte Cassino, 1868, i. 132-137.
(Ep. xc. 1). (c) The attitude of Pope Vigilias towards the Fifth Ecumenical Council, held at Constantinople in 553, was in some respects the opposite of that of St. Leo towards the Council of Chalcedon. In his 237th letter to Theodosius of Cesarea, Pope Vigilias mentions that such a Council had been contemplated at a meeting at which were present, besides the Emperor and the civil officials, many bishops, including the Bishop of Constantinople, the Bishop of Alexandria, and the Bishop of Milan (Festal Letter). 

Sylvester, bishop of Cordova, in his 287th letter to St. Vitalis, stated that the Council was convoked by the Empress and the Emperor on the suggestion of Tarasius, the Bishop of Constantinople (Acts of Nicea), 489, 'to the Emperor and the Empress announcing their intention of convoking the Council' (Acts of Nicea), 'Divitis sacra ad Hadrianum,' ib. iv. 21-24).

5. The president of a provincial Council was the bishop of the diocese, of a provincial Council the metropolitan of the province, and of a larger Council the chief bishop present, or a bishop locally eminent, or some bishop of special note. The presidents of the seven Ecumenical Councils were as follows. (a) At Nicea (325), Hosius, the Bishop of Cordova, was present (see Euseb. Vit. Const. iii. 7; Socrates, i. 13). Possibly the reason why he held this position, notwithstanding the presence of Vito and Vincentius, the legates of Pope Sylvester I. (see Euseb. Vit. Const. iii. 7; Socrates, i. 13; Sozomen, i. 17; Theodore, i. 7; signatures in Hardouin, i. 311, 312), and the fact that the Western bishops who held in the East, was that he was appointed by the Emperor Constantine, whose chief ecclesiastical adviser he was. Both St. Athanasius and Theodoret, however, speak as though his prominence at Councils was due to his personal eminence.

St. Athanasius writes: 'It is unnecessary that I should speak of the great Hosius, happy in his old age, a true confessor. ... This aged man is not unknown, but of the greatest distinction. What Council there been of which he was not the leader, and in which by his right words he did not convince all?' (Apollon. de Fug. 6). Theodore, also quoting Chis passaghe, continues: 'Hosius was Bishop of Cordova, and was prominent at the Council of Nicaea, and took the first place among those who assembled at Sardica.' (U. H. ii. 15).

It is unlikely that credit ought to be given to a statement of Gelasius of Cyzicus, a writer in the second half of the 5th cent. as usualy untrustworthy, that Hosius presided as the representative of the Pope (see his Act. Conc. Nic. ii. 5). (b) At Constantinople (381) the presidents were successively Melctius, Bishop of Antioch; Gregory of Nazianzus, Bishop of Constantinople. Neither the Pope nor any Papal representative was present. (c) At Ephesus (431), St. Cyril of Alexandria was president. The Acts of the Council state that he was the 'most holy and most sacred archbishop of the Romans' (see 'Acts of Ephesians,' in Hardouin, i. 1353, 1465, 1468, 1485, 1509, 1512, 1527, etc.).

Pope Celestine I. sent as legates the bishop's Arcadius and Projectus and the presbyter Philipus. (d) At Chalcedon (451) the imperial commissioners (see 'Acts of Chalcedon,' in Hardouin, i. 588, 589, 591, 367, 65); the Council of 553 (Acts of Nicea); (e) At Constantinople, (f) At Constantinople, (g) At Constantinople, (h) At Constantinople, (i) At Constantinople, (j) At Constantinople, (k) At Constantinople, (l) At Constantinople, (m) At Constantinople, (n) At Constantinople, (o) At Constantinople, (p) At Constantinople, (q) At Constantinople, (r) At Constantinople, (s) At Constantinople, (t) At Constantinople, (u) At Constantinople, (v) At Constantinople, (w) At Constantinople, (x) At Constantinople, (y) At Constantinople, (z) At Constantinople.
COUNCILS AND SYNODS (Christian) 189

Constant, Epp. Rom. Pontif. col. 1393-1420; (those of Chalcedon (451) were subscribed by the Papal legates and accepted by Pope Leo II. (see 'Acts of Constantinople,' in Hardouin, iii. 465-468; St. Leo, Ep. cxiv.);

those of Constantine (660-681) were subscribed by the Papal legates and accepted by Pope Leo II. (see 'Acts of Constantinople,' in Hardouin, iii. 1124, 1125, 1169-1178, 1729-1750);

and those of Nicea (787) were subscribed by the Papal legates and accepted by Pope Adrian I. (see 'Acts of Nicea,' ib. iv. 456, 819). In the case of the Fifth Council, held at Constantinople in 553, Pope Vigilius at first declined from the action of the Council (Vigiliius, Constitution of 553, ib. iii. 10-48, and the Council struck his name from the diplchyts ('Acts of Constantinople,' Coll. vii., ib. iii. 156, 187); but he afterwards changed his mind and a decretal council was held (Vigiliius, Ep. Decret.; Constitution of 554, in Hardouin, iii. 213-214).

7. The relation of the Emperor to Councils.—After the time of Constantine the Great, the close relations between which Papists insisted, was no longer the summoning of Councils and the ratification of their decrees by the Emperors, but also to an influence—sometimes greater, sometimes less—in many other ways. But, whatever the aggressive manner of certain of the empresses and the prominence of prominent members of the Church at some times, the State acknowledged, and the Church maintained, that the work of ecclesiastical decisions and legislation belonged to the Church, not to the State. A few instances of Church action without State suffice to illustrate this fact. Both the Second and the Third Ecumenical Councils, in asking the Emperor Theodosius I. and the Emperors Theodosius and Valentinian III. respectively, to ratify the decrees of the Council, expressed the independence of the Church as wholly their own work, independently of the State (see 'Acts of Constantinople,' 381, and 'Acts of Ephesus,' Act v., in Hardouin, i. 808, 1501-1510). The Emperor Constantine the Great, in his letter giving circumscription to the decrees of the First Ecumenical Council, said: 'Whatever is determined in the holy assemblies of the bishops is to be regarded as the will of God' (Euseb. Vit. Const., ii. 200). The Emperor Theodosius II. and Valentinian III. wrote to the Third Ecumenical Council that they had sent Candidian to be their representative, 'to have no share in the discussions which may take place about doctrine; for it is with us that the bishops have important business in the affairs of the Church' ('Acts of Ephesus,' p. i. cap. xx., in Hardouin, i. 1345). The Emperor Marcian addressed the Fourth Ecumenical Council: 'Our will is that all the bishops at present, in those things which are done, not that we may exercise any power' ('Acts of Chalcedon,' Act vi., ib. ii. 465). The historian Theodoret records a dialogue between the Emperor Constantius II. and Pope Liberius (ib. p. 29). The Emperor Theodosius I. and Theodosius II. and Valentinian III. wrote to the Councils, 'not to shelve unimportant questions, nor confess that your thoughts should mingle in the affairs of the Church' ('Acts of Ephesus,' p. i. cap. II, in Theodoret, Hist. Ec. ii. 16).

The same principle of the independence of the Church is emphatically declared in the letter written by Hosius, Bishop of Cordova, to the Emperor Constantius II., in which he said:

'Push not yourself into the affairs of the Church, neither give commands to the bishops, nor rather learn them from us. God has committed to your hands a kingdom. He has entrusted us with the affairs of the Church. And as he who should seal your rule would be resisting God who speaks to us. You must answer before your God, and not before us. Command all that will appear to the bishops, and let them do it.'

'Judge unto Caesar the things that are Caesar's, and unto God the things that are God's.' Therefore it is not lawful for you to bear rule upon the Church. You, Sire, have not authority to burn incense. . . . This is my determination. I unite not with the Arians, but I anathematize their heresy. I subscribe not against Athanasius, whom we and the Church of the Romans and the whole council acquitted' (St. Athan. Hist. Ariau. iv. 2).

Such instances show that, while the Church acquired in the course of the most extravagant language to describe the Emperor, as when the Imperial commissioners and others called him 'the divine head,' 'the divine and immortal head,' 'our most divine lord,' or when a letter from him was styled a 'divine letter, i.e., 'Acts of Ephesus,' p. i. cap. 19, 20; 'Epp. Cath.' cap. 17, and 'Acts of Chalcedon,' p. i.; 'Epp.' 29, 36, Acts iv., xi., xiv. p. iii. cap. 5, 7, in Hardouin, i. 1344, 1345, 1616, ii. 36, 52, 143, 545, 572, 604, 668), it was not allowed that the Emperor should arrogate any right to dictate what the Councils should do.

8. The relation of the Pope to Councils.—The subject of the relation of the Popes to the convoking and confirming of Councils has been dealt with above. It would not otherwise be the view of the authority taken by the Councils. As of the Emperor, so of the Pope, language of a strong kind was used at and by the Councils. It must suffice to mention some of the more memorable instances. At Ephesus (431) the Papal legate Philipp described St. Peter as 'the prince and head of the Apostles, the pillar of the faith, and the foundation of the Catholic Church;' declared that 'as such he is to be held up to this time and always lives in his successors and gives judgment;' and in this context referred to Pope Celestine as the 'successor and representative' of St. Peter ('Acts of Ephesus,' in Hardouin, i. 1477, 1478); and the Fathers of the Council, in giving force to the words used, the words, necessarily impelled by (άξιος) the canons and by (έξω) the letter of our most holy Father and fellow-minister, Celestine, Bishop of the Roman Church ('Acts of Ephesus,' Act i., ib. i. 1421, 1422, 'Let us receive Peter the head of the Church,' Acts of Chalcedon (451) the Papal legate Paschasius called the Pope the 'head of all the Churches' ('Acts of Chalcedon,' Act i., ib. ii. 67, 68); and the Fathers of the Council in their letter to the Emperor Marcin spoke of the Pope as the 'inviolable champion' ('Acts of Chalcedon (451) the Pope is inviolate,' and in their letter to Pope Leo described him as the 'head' of which they were the 'members,' and as an 'agent to whom was entrusted the Saviour the guarding of the vine,' the Church ('Acts of Chalcedon (451) the Pope is inviolate,' Acts of Chalcedon (451) the Pope is inviolate, 644, 655, 656). At Constantinople (680-681) the Fathers of the Council wrote to Pope Agatho: 'We commit to thee, as the chief ruler of the universal Church standing on the firm rock of the faith, what is to be done, to give effect to the decisions of the Council; and described the Pope's letter to the Emperor as 'uttered about divine truth by the chief head of the Apostles' ('Acts of Constantinople,' Act xvii., ib. iii. 1437-1440). Yet, notwithstanding all this statement, the Councils did not regard the Papal utterances as settling anything; they examined and tested the judgment of the Popes; they assented to these as conforming to orthodox standards; they did not shrink from declaring a Pope to be a heretic. At Ephesus (431) the condemnation of Nestorius was not passed until after the most elaborate consideration of his case, though the letter of Pope Celestine condemning him was before the Council ('Acts of Ephesus,' Act. i., ib. i. 1393). At Chalcedon (451) there was a like examination of the Tome of Pope Leo, and it was eventually approved, as being 'consonant with the confession of great Peter' ('Acts of Chalcedon,' Act. i., ib. ii. 455, 1393). The Fifth Ecumenical Council, held at Constantinople in 553, insisted on condemning Theoe-
COUNCILS AND SYNODS (Christian)

dore of Mopseustia and Theodoret, in spite of the resistance of Pope Vigilins ('Acts of Constantinople,' Coll. viii., id. iii. 187-208). The Sixth Ecumenical Council, held in Constantinople in 680-681, anathematized Pope Honorius I. as a heretic; and with reference to the letters of Sergius and Honorius declared:

"We find that these documents are altogether alien from the doctrine of the apostles and the decisions of the Holy Councils, and all the accepted fathers, and that they follow the false doctrine and heresy and deny and reject them, and we execrate them as destructive to the soul. Moreover, we have determined that the name of the very men whose doctrine we execrate as impious and heretical is to be cut out from the heart of the Church of God, namely Sergius.... And besides these, we have decided that Honorius, who was Pope of the elder Rome, is to be anathematized together with his heretical and anathema.

To Theodore of Pharan, the heretic, anathema. To Sergius, the heretic, anathema. To Cyrus, the heretic, anathema. To Honorius, the heretic, anathema. 'Acts of Constantinople,' Acte xiii., xi. v. xi., 1333, 1355, 1375.

A comparison of the different parts of the evidence shows that, while the Pope was regarded as the chief bishop of Christendom, and while his authority and influence were great, the Councils held that it was for them and not for him to decide in matters of doctrine and discipline; and that, while the ordinary and normal desirable process was that Pope and Council should be in agreement, and that what the Council decided the Pope should accept as effect, a necessity arose of Council taking its own line in opposition to a Pope, and even of condemning him as heretical.

As regards the disciplinary power of the Pope, regulations of the Councils of Nicaea (325) and Sardica (343) are of special importance. Canon 6 of Nicaea assures the possession by the Pope of a certain patriarchal authority in Italy, parallel with that of other patriarchs elsewhere, referred to as an illustration in a way which may imply a primate on the part of Rome.

'The old customs in Egypt and Libya and Pentapolis are to be preserved so that the Bishop of Alexandria shall have authority over all these, since this is customary also in the case of the Bishop of Rome. In like manner, in Antioch and in the other provinces the rights are to be preserved to the Churches of.

Canons 2, 4, and 5 of Sardica provide for appeals to Rome in certain cases. They exact that, if a bishop has been deposed by the bishops of his province, there may be an appeal to the Bishop of Rome, who is to decide whether the appeal is to be granted; if it is allowed, the Pope is to name bishops from the neighbourhood of the province in question to act as the court for the second hearing of the case; if the appellant can persuade the Pope to do so, the Pope may send provincials of his own to act as its legates (obea by TIM potro 6POXwTAppolos...). The Acts of the synod were published.

The authority of Councils.—The degree of authority which a Council possessed varied greatly with its character. A local Council in itself could make no claim to acceptance wider than in the locality to which it belonged, and its decisions were always open to revision by a larger and more representative church body. Thus, the First Ecumenical Council possessed authority for its diocese, and a provincial Council for its province, but in each case this authority was subject to appeal from the diocese to the province, from the province to a union of provinces, and from any smaller Council to a Council of the whole Church; and as the Council was more fully representative, so its authority was greater. But a Council, however fully representative in constitution, was not finally authoritative simply because of the constitution of its decrees by the Emperor gave civil sanction, and the assent to them by the Pope supplied a further ecclesiastical step (cf. the famous saying of St. Augustine, 'Iam enim de hac causa divinorum

cilia missa sunt ad sedem apostolicam: inde etiam rescripta venerunt. Causa finita est: utinam aliquid finitur error' [Scrn. cxxxi. 10]). But the Council did not become Ecumenical, in the sense of being in universal acceptance, simply because the Pope recognized it, so completely binding on the whole body of the Church, without the general acceptance by the Church of its doctrinal decisions, since a Council, however representative in constitution, might fail to represent the real mind of the Church, just as a civil body of the most completely representative character, so far as constitution is concerned, might fail to represent the real wishes of the nation which elected it. This acceptance by the whole body of the Church, as of the decisions of the seven Councils which have here been called 'Ecumenical.' In the case of these Councils the acceptance was not always easily or immediately received. For instance, the First Ecumenical Council, that of Nicaea (325), proved to be the occasion of controversy rather than the settlement of it, and did not receive universal acceptance for more than fifty years, until after the Second Ecumenical Council, that of Constantinople (381); and the decisions of the Seventh Ecumenical Council of Nicaea (787), were for a long time without acceptance in the West, were actually rejected by the Council of Frankfort (794) under a misunderstanding of their meaning, and only gradually came to be recognized in the West, especially as related to the Eastern acceptance, constituted universal approbation. An instance of the way in which a Council not representative of the whole Church by its constitution may become Ecumenical through universal acceptance of its decisions was the Third Ecumenical Council, that of Constantinople (381), which was summoned from the East only, and which no Western bishop attended. The authority of the Ecumenical Councils is thus that of the whole Church. The idea of authority, whether as resident in the Church or as expressed by Councils, was based on the belief that the Church, under the guidance of the Holy Spirit, was giving effect to the teaching of Holy Scripture and the deposit of faith committed by our Lord to His apostles. St. Athanasius described the work of the orthodox bishops at Nicaea (325) as having been to 'collect the sense (Savvas) of the Scriptures.' (ib Decr., Nic. Syn. 29). The work done at Constantinople (384) was carried out by the bishops who met at Constantinople in the following year, who were almost the same as those of the Council of 381, in the words:

'We, whether we have endured persecutions or tribulations or the threats of monarchs or the cruelties of rulers or some other trial at the hands of the heretics, have borne these for the sake of the faith of the gospel which was ratified at Nicaea in Bithynia, by the three hundred and eighteen holy fathers under the guidance of God. For this which we have been at pains to preserve ought to be sufficient for you and for us and for all who do not wrest the word of the true faith. It is the most ancient faith. It is in accordance with our baptism. It teaches us to believe in the name of the Father and of the Son and of the Holy Ghost, and consequently in one Godhead and Power and Divinity of the Father and of the Son and of the Holy Ghost, the dignity being equal and the majesty coeternal; in three wholly perfect Subsistences or three perfect Persons. Also we also preserve unshaken the faith of our fathers.'

† The Council of Nicaea (767) affirmed the lawfulness of reverence of honour (πατρίτα υπερηκτικία) addressed to the images of our Lord and the saints, but condemned any offering of a 'real worship' (σάλαντας) to the Virgin Mary of Nicaea,' Act viii., in Hardouin, iv. 465). What the Council of Frankfort (794) rejected was the right of the Pope to define doctrine.

‡ Allata is in medium quasquato de nova Graecorum synodo quam de adorandis imaginibus Constantinopolis (obviously a blunder) et de Nicaenis hierarchis, in qua scriptum habuerat, quia superbus appetuntum suum ut de ipsius Trinitatis servitium et adorationem nominis sempiternae anathema indiciarentur. Qui super fuere patris nostri omnium adorationem et servitium remunentes contemporaneam atque concentiam condemnaverunt' (canon 32, Hardouin, iv. 304). The Council of Constantinople (757) exactly what that Council had rejected—the offering of images of the adoration due to the Holy Trinity.
the Incarnation of the Lord, receiving the tradition that the divinity of the Word is not without substance or without reason or imperfect, and being fully convinced that the Word of God was a person of substance, of substance and became man in the last days for our salvation" (see Theodoret, H.E. v. 9).

At Ephesus (431) the bishops gave as their reason for the approval of the letters of St. Cyril that they "were in no respect discordant with the Scriptures and that with the faith which has been handed down, which was set forth in the great Council by the holy Fathers who assembled at Nicea, and, as their reason for the condemnation of Nestorius, that his teaching was "wholly alien to the teaching of the gospel" (Acts of Ephesus, Act v., in Hardouin, t. 1505). At Chalcedon (451) the letter of St. Cyril of Alexandria to John of Antioc was read, containing the following passage:

"This is the faith of the Fathers. This is the faith of the Apostles. Thus do we all believe. Thus do the orthodox holy Church of Antioch also teach. The testimony of Peter has been given through the grace of our Lord Jesus Christ. The testimony of the Apostles. The value of the Holy Spirit. Cyril. The memory of Cyril. Cyril and Cyril alike taught. This is the faith of the Fathers." (Acts of Chalcedon, Act v., in Hardouin, t. 1505).

At Constantinople (533) the bishops declared:

"Being gathered together, before all things we have briefly confessed that we hold that faith which our Lord Jesus Christ, true God, begotten of the Father, the only God, and the Holy Apostles, and through them to the holy Churches, and which the holy Fathers and doctors who succeeded them delivered to the peoples committed to their care; and described in themselves, their condemnation of heresy, as lighting 'the light of knowledge from the divine Scriptures and the Holy Fathers,' the teaching of the Apostles of the Acts of Constantinople, 553, Coll. viii., in Hardouin, t. 159, p. 194)."

The bishops at Constantinople (680-681) stated:

"We have examined the synodal letter of Sophronius of holy memory, one patriarch of the holy city of Christ our God, Jerusalem; and, as we have found it to be in harmony with the true faith, and in accordance with the teaching of the Apostles and the holy approved Fathers, we have judged it to be orthodox and have received it as profitable to the Holy Church. The Patriarch of Antioch, and the other bishops of the five holy Ecumenical Councils and the holy and approved fathers, which has been received and defined as the faith, according as the holy fathers from the beginning have taught, and Jesus Christ Himself has instructed us, and the symbol of the holy fathers has been handed down to us in the Act of the Apostles and of their work: 'On us shone the grace of the all-holy Spirit, being present in all things, to lead us through your ministry, so that we might root out every tare and every tree that bringeth forth no good fruit, and commanding that they should be consumed with fire, and, agreeing in heart and tongue and hand, we have put forth, by the assistance of the life-giving Spirit, a definition most free from error and most certain, not removing the ancient landmarks, as it is said, which God forbad, but abiding by the testimonies of the holy and approved Fathers.' (Acts of Constantinople, 660-661, Acts s.l., xi., in Hardouin, t. 3533, 1400, 1440).

At Nicea (757) the bishops defined their work:

"Thus the teaching of our holy Fathers is strengthened, that is, the tradition of the Catholic Church, which has received the Gospel from one end to the other. Thus we follow Paul, who said, 'All the elders of the church of the divine Apostles and the holy Fathers, holding fast the traditions which we have received;' and wrote to the Empress Irene and to the Emperor Constantine, to pass on to the Apostles and to the Fathers, we are held to speak, being one mind in the council of the holy Spirit, and being all brought together in one, having the tradition of the Catholic Church in harmony with us, we are in accord with the agreeing voices set forth in the Sacred Councils." (Acts of Nicea, Act vi., in Hardouin, t. 425, 475).

For their great doctrinal decisions the Ecumenical Councils thus possess the authority of the universal Church, and their teaching is based on the tradition of the faith which goes back to and rests on the authority of our Lord Himself. A more difficult question arises as to the degree of their authority in certain other matters. Some disciplinary enactments must be dealt with local and temporary circumstances, and therefore have local and temporary force, as, e.g., regulations about letters of commendation made at Chalcedon (451) in canon 11, but in other matters of discipline it is less easy to decide how far a principle is involved which may tend towards some degree of permanent authority.

An instance may show the complexity of the problem thus raised. The First Ecumenical Council, in agreement with the condemnation of 'sacrilege' in canon 20 of the Council of Eutyches (325), forbid the communication with the church of Cappadocia for money or interest in canon 12 of the Council of Arles (514), and the regulation in the forty-fourth Apostolical Canon, that a bishop, priest, or deacon, who seeks interest from those who owe him money must either cease from the practice or be deposed, enacted that: 'Since many who are in the list of the heresy, moved by covetousness and the spirit of gain, have forgotten the divine word which says, 'He hath not given his money upon interest,' and lend and require one per cent per month, the holy and great Council declareth that, if any one after this decree he found to be receiving interest...he shall be deposed from the clerical office and his name shall be struck off the list' (canon 17); and this canon passed into the ordinary law of both East and West, and became the discipline of the Church of Nicene (Decretum, t. viii., c. 14, v. 4 (9)). This canon differs markedly on the one hand, from doctrinal decisions concerning central dogma; and, on the other hand, it rests on a personal and temporary regulation of merely local and temporary import.

10. The work of the Seven Ecumenical Councils—It has already been indicated that the seven Ecumenical Councils, though of varying character and importance, some doctrinal, others disciplinary,

(1) Their great work was in regard to the theology of the Incarnation.—(a) by the acceptance of the Nicene Creed, and its definition, though in a phrase in it of 'of the same essence as the Father' (ουκολοκρος τοις Πατερι), the FIRST COUNCIL OF NICEA (325) affirmed the real Deity of Christ (see CONFESSIONS, in vol. iii. p. 856, and CREEDS [Ecumenical]).

(b) the Second Council of NICEA (381) ratified the work of the Council of NICEA (325) in regard to the Deity of Christ; and in particular, by its condemnation of APOLLINARISM—the heresy which maintained that our Lord did not possess a higher human soul or spirit—protected the completeness of Christ's manhood; see canon 1:

'The confession of faith of the three hundred and eighteen Fathers who were assembled at Nicaea, and who, without being abdosed, but shall remain; and every heresy shall be anathema, and condemned by the holy Synod, the Ss. Andreas, Arias or Eudosians, the semi-Arians or Pneumatomachians, the Sabellians, Marcoblines, Photinians, and Apollinarists.'

It has been thought by some that this Council confirmed the older creed, 325, known sometimes called the Constantinopolitan Creed (see CONFESSIONS, and CREEDS, at supr.).

(c) THE FIRST COUNCIL OF EPHESUS (431), by its approval of the letters of St. Cyril of Alexandria and its condemnation of Nestorius, affirmed the one Person of Christ, so that it is accurate to call the Blessed Virgin Mary 'the Mother of God' (θεοτόκος), and to say that 'God was born and died.'

(d) THE COUNCIL OF CHALCEDON (451) ratified the work of the third earlier Councils, by its definition of the Deity, complete manhood, and one Person of Christ, and by its acceptance of the original Nicene Creed and the Constantinopolitan Creed (see CONFESSIONS, and CREEDS); and declared that 'Christ's two natures of Deity and manhood by accepting the Tome of St. Leo and by acknowledging two persons, without confusion, without change, without sending, without separation, while the distinction of the natures is in no way destroyed by the union, but rather the peculiarity of each nature is preserved, one Person and one Hypostasis' (Act v., in Hardouin, t. 433, 456).

(e) The SECOND COUNCIL OF CONSTANTINOPLE (553), by its condemnation of the 'Three Chapters'—that is (1) the person and writings of Theodore
of Moesoeius, (2) the writings of Theodoret in defence of Nestorius and against St. Cyril of Alexandria, the Council of Ephesus (431), and (3) the letter of Ibas to Maris—rejected anew the Nestorian heresy and affirmed the doctrine of the one Person of Christ. The words of the sentence of the Council are:

"We declare that the four holy Councils, that is, of Nicaea, of Constantinople, the First of Ephesus, and of Chalcedon; and we have affirmed, and do affirm those truths which they defined in that sense, and we declare that all who do not receive these Councils to be apart from the Catholic Church, and that the council and the Synod, together with all other heretics who have been condemned and anathematized by the aforesaid four holy Councils and by the Holy Catholic and Apostolic Church, hold their teachings, those who write and his wicked writings, and the wicked writings of Theodoret against the right faith and against the twelve chapters of the holy Cyril and against the First Council of Ephesus, and his writings in defence of Theodore and Nestorius. Moreover, we anathematized also the wicked letter which Ibas is said to have written to Maris the Persian, which denies that God the Word was incarnate of the holy Mother of God and every Virgin Mary, and so was made man of the Holy Trinity..."

(1) The Third Council of Constantinople (680-681) condemned the Monothelite heresy, according to which the human will in Christ, and affirmed the reality of His human will as well as of His Divine will. After declaring their adherence to the Councils of Nicaea (325), Constantinople (381), Ephesus (431), Chalcedon (451), and Constantinople (553), and after writing the original Nicene Creed and the enlarged Nicene or Constantinopolitan Creed (see Confessions, and Creeds, at supra), the bishops said:

"The orthodox creed of the Divine grace was in itself enough for the complete knowledge and confirmation of the orthodox faith; but since the author of evil has never ceased to find means to help his opponents, whereby to diffuse his deadly poison among the human race, and so to find instruments to accomplish his will—we mean Theodoret, who wrote the Nestorian Epistles, Paul, Peter, who were bishops of this royal city; also Honorius, who was Pope of Rome (402), and who held the episcopal throne of Old Alexandria, also Macarius, who was recently in charge of Antioch, and his disciple, Stephen—he did not fail to bring through them scandalous errors on the whole Christian dispensation in the fashion among the orthodox people the heresy of the one will and one operation in the two natures of the one Christ our true God, one Person of the Holy Trinity... The heresy which serves to take away the fullness of the Incarnation of the one Lord Jesus Christ our God by means of a crafty notion, and which impiously brings in the idea of His rationally quickened flesh as being without will and operation... In like manner, the teaching of the Holy Fathers, who proclaim two natural wills (δύο φύσεις ἐν δύον) in Him, and two natures, that is, a human nature, will be without existence, without meaning, without difference, without operation, without confusion, without opposition to another—God forbid—as the wicked heretics declare..."

(2) Of the Second Council of Nicaea (787) dealt with the contents of the Iconodasts that Christ might not be represented in a material form because of the infinity of the Godhead, or, as the more moderate members of the party taught, that the representations of Him might not be venerated. In view of these contentions, the Council affirmed the teaching of the six earlier Ecumenical Councils, and in order to declare these representations of our Lord the visible signs of the reality of the Incarnation, and that the veneration of these in the manner of the images of the saints—which was to be distinguished from the adoration of God alone—lifted the thoughts of the worshipers to the realities which these visible things represented:

"We, holding fast in everything the decree and acts of our divine holy and general Council, proclaim with one mouth and one heart, adding nothing to, taking nothing away from, the things which they delivered to us, but in these we are strong, in these we held fast what we have published; we confess, we so teach, as the six holy Ecumenical Councils have defined and determined. And God the Father, the Son, the Holy Ghost, the Father Almighty, Maker of all things visible and invisible; and in one God, Jesus Christ, the only-begotten Son and Word, through whom all things were made; and in the Holy Ghost, the Lord and Life-Giver, con-
(2) Between the Council of Nicaea (325) and the Council of Constantinople (381), the Councils concerning the Arian controversy were held. The most important of these were those at Antioch in 341, with supplementary assemblies later in the same year and in 344, which drew up five Creeds which in themselves were a series of creeds played into the hands of the semi-Arians by the use of ambiguous expressions about the Deity of Christ; at Sardica in 343, which defended St. Athanasius; and the simultaneous Council at Philippopolis, which condemned him and accepted the fourth of the Antiochene Creeds; at Sirmium in 351, 357, and 358, which were favourable to the semi-Arians, and the third of which drew up a Creed of the same character as the Antiochene Creeds. The Council of 355, which accepted that of 351 as a semi-Arian Creed; at Seleucia in 359, which accepted the same Creed as that adopted at Ariminum; and at Alexandria in 362, which, on the temporary return of St. Athanasius to his See, declared the first three of the Arian Creeds to be unworthy of the approval of the Church.

(3) Particular Councils of special importance.—

(a) The Councils of Laodicea, Hilla, Seleucia, and others in 341 and 344, and the Quincenti, or Trullan, Council of Constantinople (669) made regulations in regard to the books which might be read in church. — (b) A series of Councils held in the 5th cent. in Asia Minor, in Sardinia and Italy were concerned with the Pelagian heresy. With these must be placed the highly important Second Council of Orange (529), which condemned Semi-Pelagianism, and definitely asserted the need of Divine grace for man’s salvation. It was to choose a good work and to enable him to give effect to his choice; but took pains to avoid exaggerations in the opposite direction, by adding to the canons the following statement:

"When grace of baptism is received through baptism, all the baptized, by the help and co-operation of Christ, are able and ought to fulfill those things which pertain to the salvation of the soul, through laboring to fulfill the commandments of God. That any are not predestined to evil by the power of God, we not only do not believe, but also, if any are who wish to believe so great an evil, we say anathema to them with all anathema. This also we healthfully confess and believe, that in every good work it is not we who begin and afterwards are aided by the mercy of God, but God Himself in the first instance inspires us, without any good deserts of our own preceding, believing in Him and loving Him, so that we both faithfully seek for the salvation of baptism, and after Baptism are able with His help to fulfill those things which are predestined to Him." (Acts of Orange, 529, in Herzog, art. Constantine, II. 156.)

These decisions at Orange were accepted as expressing the general mind of the Church (see Pelagianism, Semi-Pelagianism).—(c) A Council was held at Carthage in 313, to which the Fifteen Anathemata in Origen, which are sometimes ascribed to the Fifth Ecumenical Council, probably belong. They include the anathema, if any one maintains the legendary pre-existence of souls and the monstrous idea of retribution which follows from it, let him be anathema" (see Hardouin, iii. 284.).—(d) The Third Council of Toledo (589) was the occasion of the Spanish Church and nation repudiating their traditional Arianism, and accepting the anathema ascribed by the orthodox Councils.

It is of importance, in regard to the history of the Creeds and to controversies between the East and the West, that the clause in the enlarged formula of the profession of faith at this Council as 'ex Patre et Filio procedentem' (see Hardouin, iii. 174).—(e) The Quincenti, or Trullan, Council of Constantinople (692) reaffirmed the doctrinal declarations of the six Ecumenical Councils which had by that time been held, and added to them a series of disciplinary canons which became a recognized part of the Eastern canon law.—(f) The Council of Frankfort (794), expressing the general mind of the Church, condemned Arianism, declaring that it 'ought to be utterly rooted out of the Church' (canon 1; see Hardouin, iv. 904, and art. Adoptionism). Under a misapprehension, it rejected the decisions of the Second Council of Nicaea about 318, but which had arisen through the dominance of the Arians during the reign of Constantine II.

COUNCILS AND SYNODS (Christian)

DAEWELL STONE

The Councils of this protracted period were not important from a doctrinal standpoint, as compared with the Ecumenical Councils from 325 to 693, as compared with the later Councils of Trent and the Vatican.

The term 'Synods', in Caesarea, Antioch, Ephesus, Lyons, and other Churches, was applied to all gatherings of Bishops, on the view that the only dogma which was defined (at the Fourth Lateran, 1215) that had not been defined by one of the first eight Ecumenical Councils.

These Synods are, however, of unusual value for the light they throw on the ecclesiastical movements of the Middle Ages. They legislated upon the relation of the Church to the Empire, upon the prerogatives and election of the Popes, upon Church forms, especially against simony and priestly concubinage, upon heresy and its punishment, upon the details of the conduct of worship, priestly dress and manners, upon the crusades, and upon the evils of 'papism' (through the terms of the 'Treaty of God'), and upon the relation of the Church to the world. As regards locality, Rome was all through the period the chief centre of Church assemblies.

Heretical Synods of Transalpine Churches, and the only Synod of the English Church in modern times was the council of York, 1296, which denied the efficacy of baptism, and which was held in the place of York.

The Synod of Soboles (1092) in Hungarian territory was one of the exceptions. After 1150 the Spanish Synods came into prominence on account of the regulations touching the Church's external discipline, and its ecclesiastical calendar. Notable feature is that not only the Synods in Rome, but many outside of it, were presided over by Popes in person or through their legates. Such were the Synods in France, Germany, and Italy, attended by Leo, Urban II, and Alexander III, the latter held at Cluny III, 1153. The presence of the supreme head of Christendom gave to the acts of such councils their due weight and authority.
Synods a semi-ecumenical importance. The period witnessed seven Ecumenical Councils, the first in the all called over and the Popes. The decrees of some of them are of less importance than the legislation of some of the local Synods, such as the Reform Synods held in Rome in 1049, 1059, etc.; the Synod of Clermont (1035), which set the first crusade in motion, the Synod of Verona (1184), which took up heresy, and the Synod of Tours (1229), which, in addition to other important regulations aimed against heretics, forbade laity to possess copies of the Scriptures. We shall treat the subject under five heads.

I. 870–900.—The Synods of this dark age, so far as they are known to us, were only of temporary and local importance. The subjects discussed were crimes against the clergy and their punishment, the payment of tithes, the rights of patrons over church livings, marriage and divorce. No new measures of Church reform or ecclesiastical polity were taken up. No new statements of doctrine were made. No Synod of importance was held at Rome. The Synod of Tribur, near Mainz (895), was one of the best of them (see Hefele, iv. 552 ff.). It was attended by the three great German archbishops, Hermann of Cologne, Hajo of Mainz, and Bartholomew of Treves, by four bishops, and many abbots. Twelve of its 58 canons concern marriage, which is declared valid only when the parties are equals. A man having a concubine was expressly permitted, in addition, to take a wife. A man committing adultery with another man's wife was forbidden to marry her, even if the husband died. The old Roman law evidently still had its influence, but the movement of the Church was in the right direction, and at the Synod of Mainz (1059), a healer was forbidden, under pain of excommunication, to have a wife and a concubine at the same time.

II. 900–1059.—The 10th cent. witnessed even fewer Synods than the 9th (Hefele, iv. 571), and this, according to the canonist Hergarten, was a sign of the decay of Catholic discipline (Kathol. Kirchenrecht, 342). The Ottos and Henry III had a taste for calling Synods, regarding themselves as the successors of Constantine, Theodosius, Maximian, and other Roman emperors. After the year 1000 there is a very noticeable increase in the number of Synods. Here, again, no theological dogma is stated which had not already been defined. The prerogative of the Papal Chair, which was to pronounce what is true and falsehood, was recognized. Conciliar discussion after 1050, was not touched upon, except incidentally at the Synod of St. Bale, near Reims (991), where Gerbert, afterwards Sylvester II., took a prominent part, and Archbishops Arnulf was deposed. Sylvester, on becoming Pope, restored him (Hefele, iv. 637 ff., 654; Loofs, Dogmengesch., iv. 669, p. 240). A Synod of Rome under Sylvester (998), in the spirit of the time, imposed a penance of eight years upon Robert, king of France, for his blood-relations to Bertha; and the Archbishops of Tours and other prelates, who had assented to the incestuous relation, were suspended. Of the Synods which took up the cases of individual Popes, the Synod of Rome (963) deposed John XII. and elected Leo V.; the Roman Synod of 964 reinstated John XII.; and another Roman Synod (964) restored Leo VII. Otto the Great called the last of these Synods. The most famous of them, the Synod of Satri, has a permanent interest, as bearing upon the relation between a Council and the Papacy. It was controlled by Henry III., and disposed of three Popes and elected a fourth. Benedict IX. resigned, Sylvester III. was imprisoned, and Gregory VI. deposed himself, his resignation being accepted by the assembled Fathers. Descending from the throne, he implor...
ceremony of investiture, clerical concubinage, ecclesiastical simony, the mode of electing the Pope, and the crusades. The so-called Reform Synods, assembling in Rome, which took up the first three questions, form an epoch in the history of the Western Church, and bear the same relation to it as the earlier refomatory Councils of Pisa, Constance, and Basel bear to their last period. The Lord's Supper was the only question of a doctrinal nature to be discussed, being taken up in connexion with the dynamic theory advocated by Lanfranc of Tournay (d. 1088). The doctrine of the transmutation of the elements was assumed, the word 'trans substantiation' not being used. Through the influence of Lanfranc, Berengar's views were condemned in Rome (1088), and subsequently the Roman Synod of Vercelli (1050), over which Leo IX. presided. His case was subsequently taken up at several Synods, notably at the Roman Synods (1059 and 1079). At both of these Synods he retracted his view, but passed by the Roman Synod of 1059 and 1061, under Nicolas II., the law was elaborated by Alexander III. at the Ecumenical Council of 1120, and again at the second Ecumenical Council at Lyons (1124).

The Reform Synods began at the opening of the period in 1049. At the Roman Synod of 1047, Clement II. had already declared against simony, and punished some bishops who practised it. The Roman Synod of 1049, under Leo IX., declared war in earnest against the two evils of simony and clerical marriage, renewed the old laws on the subject, and forbade to clerics, from the sub-denance up to the higher orders, the exercise of religious functions so long as they were married or kept concubines. This legislation was repeated the same year by Synods at Rheims and Mainz, both presided over by Leo. Vigorous laws were also passed by the Roman Synod of 1059 and 1061, under Nicolas II., and by the Synod of Melfi, near Monte Cassino (1059), presided over by the same Pontiff. The energy with which the canon of celibacy was pushed is shown by Nicolas' despatch of an inquest against a Papal reformers by the boldness with which he advocated moral reforms, and the suffering he was ready to undergo in their interest. Simony, clerical concubinage, and lay investiture were the three evils against which he waged vigorous war. At the Lenten Synod in Rome (1074), the first of his pontificate, he ordered all holding ecclesiastical dignities to relinquish them, and all guilty of the crimen fornicationis, that is, having a wife or a concubine, to desist from saying mass. To the resistance offered by localities and bishops to the latter decree was added the unfavourable action of the local Synods of Paris and Erfurt (1074). But such Synodal action was as a passing cloud. Other Synods came to Gregory's aid, and those held at Rome year by year renewed the war; and the legislation for annulling the marriage of the clergy was repeated again and again, even in far-off England, as at the Synods of Winchester under Lanfranc (1076), at London under Anselm (1102, 1108), and at Westminster (1138), etc. These Synods extended the way to the sons of priests who were excluded from succeeding to the benefices held by their fathers. The Roman Synod of 1083, the last under Gregory, placed in one and the same category the sons of priests, the sons of adulterers, and all other bastards, and pronounced them ineligible for ordination. The difficulty met with in putting a stop to the marriage of clerics is shown by the action of the Hungarian Synod of Székesfehérvár (1092), which solemnly granted priests already married the indulgence to keep their wives (see Hefele, v. 204 ff.).

A positive prohibition of lay investiture was laid down by Gregory, at the Lateran Synod at Rome (1075). Henceforward the custom was illegal where, by the Emperor and princes had inducted bishops and abbots into their office by the gift of ring and staff. This right Gregory now reserved for the spiritual authorities, to whom it properly belonged. The principle was asserted at one Council after another, and thus the moral weight of Conciliar action was added to the heroic boldness of Gregory in his personal struggle with Henry IV., until the matter was finally settled by the Concordat of Worms (1122).

Synods undertook an easy task when they began to urge Western Christendom to endeavour to rescue Jerusalem and the other sacred sites from the Turks. The call to chivalry, as well as the impulse of piety, was touched when the appeal was made to assert by arms the right of the Church to the localities where the Redeemer was born, had died, and laid down the Divine laws. This appeal was at first brought to the attention of a Council at the Synod of Piacenza (1093), when an embassy appeared from the Emperor Alexius calling for aid against the encroachments of the Turk upon the Eastern Empire. At the Council of Clermont (1095), presided over by Urban II., the first crusade was determined upon. Urban's address, picturing the distress of Jerusalem, fired the heart of the large assembly with such enthusiasm, that the cry arose, 'God wills it, God wills it,' and multitudes took the cross. More effective sermon was never preached, and at once throughout Central Europe was heard the noise of preparation for the main army which was to start under Godfrey, and the preliminary swarms under Peter the Hermit, Walter the Penniless, etc. See CRUSADES.

IV. 1122-1400 (the Ecumenical Councils).—This period of 250 years is marked by seven Ecumenical Councils, a great increase in the number of local councils, and the action of the Synods of Vienne and Tours (1060) along the same line. Gregory VII. won for himself a foremost place among Papal reformers by the boldness with which he advocated moral reforms, and the sufferings he was ready to undergo in their interest. Simony, clerical concubinage, and lay investiture were the three evils against which he waged vigorous war. At the Lenten Synod in Rome (1074), the first of his pontificate, he ordered all holding ecclesiastical dignities to relinquish them, and all guilty of the crimen fornicationis, that is, having a wife or a concubine, to desist from saying mass. To the resistance offered by localities and bishops to the latter decree was added the unfavourable action of the local Synods of Paris and Erfurt (1074). But such Synodal action was as a passing cloud. Other Synods came to Gregory's aid, and those held at Rome year by year renewed the war; and the legislation for annulling the marriage of the clergy was repeated again and again, even in far-off England, as at the Synods of Winchester under Lanfranc (1076), at London under Anselm (1102, 1108), and at Westminster (1138), etc. These Synods extended the way to the sons of priests who were excluded from succeeding to the benefices held by their fathers. The Roman Synod of 1083, the last...
COUNCILS AND SYNODS (Christian)

Following the counting of the Latins—the 9th Ecumenical Council, or the next in the list after the Council of Constantinople (869). It was called by Calixtus II., and had for its principal object the ratification of the Concordat of Worms, known also as the Pactum Gallicanum. By that pact the Church reserved to itself the exclusive right of investing bishops with the ring and the crozier, and of inducing them into the spiritual functions of their sees, while the temporal prince retained the right of inducing them into the temporalities and of being present at the elections. Our reports of the First Lateran vary in giving the number of attending bishops and abbots and monks. It was the first Ecumenical Council to enthrone clerical celibacy. Following the example of Urban II. at Clermont, it granted indulgence of sins to all participating in the crusades, and, in addition, it took their relatives and their goods under the special protection of the Church.

(2) The Second Lateran, or 10th Ecumenical (1139), was opened with an address by Innocent II. announcing both the close of the disastrous Papal schism which had distracted the Church for nearly two years, and pronounced against the heresy of Arnold of Brescia (see Otto of Freising, de gestis Frederici, ii. 26). It also condemned simony, priestly concubinage, and the dispensation of the sins of the sons of priests, and introduced a new element in forbidding, for a term of years, tournaments. Like the First Lateran and the Third Lateran, it enjoined the truce of God.

(3) The Third Lateran, or 11th Ecumenical (1179), was summoned and presided over by Alexander III. 287 or, according to other reports, 300 or 386 bishops were present, besides many abbots and other clergy. It celebrated the establishment of the Rule of the Bishops and of Frederick Barbarossa. It made some additions to the rules for electing a Pope. Falling back on the 12th canon of the Second Lateran, it legislated against heresies, especially the Cathari and Patarini, and ordered separate burial-places and churches for lepers.

(4) The Fourth Lateran, or 12th Ecumenical (1215), was, with the Council of Constance, the most important ecclesiastical assembly of the Middle Ages, and one of the most eventful in the history of the Church. Its two chief acts were the declaration of Transubstantiation as a dogma of the Church, and the establishment of the Inquisition. The Council was called by Innocent III., and attended by 429 bishops, 112 representatives of many absent prelates, also the representatives of the Emperor Frederick II., the Latin Emperor of Constantinople, the kings of England, France, Aragon, Hungary, and Jerusalem, and other crowned heads. The Latin patriarchs of the East were also there. The sessions were opened with a sermon by the Pope on Lk 22:25: 'With desire I have desired to eat this passover with you.' In his letter of convocation, Innocent had announced as the object of the Council the measures for the re-conquest of Jerusalem and the betterment of the Church. The business was issued by the Pope, and free discussion in his imperial presence was not to be thought of. The doctrine of the Eucharist was discussed for the first time at a General Council, and the assembly made the formal declaration that Christ's body and blood are truly contained in the sacrament of the altar under the forms of bread and wine, the bread being transsubstantiated into the body and the wine into the blood (Mansi, xxii. 1582; Mirbt, Quellen, 133). The formal adoption of the Inquisition by the Council introduced its harsh and un-Christian measures into the body of the discipline of the Latin Church. The Synods of Verona (1184), Avignon (1299), and Montpellier (1215) had already taken definite action, but these were local assemblies, although the first was under the presidency of Albert the Great, who had established the highest authority of the Church,—for both Pope and Ecumenical Council ratified it,—was intended to crush freedom of thought wherever the Catholic Church went, and deliberately pronounced those measures of the civil power which resulted in tens of thousands being brought to the stake for errors of opinion. The third canon calls heresy heredita foeditis, and not only summoned all bishops to search out and punish heretics, but enforced it with excommunication, upon pain of excommunication, to clear their realms of heresy by the use of the sword. More especially was the decree launched against the Albigenses, and the Catholics who girded themselves with the sword for the reduction of that people to the faith were promised the same indulgence that was offered to those who took part in the crusades against the Saracens (Mansi, xxii. 1988 ff.; Mirbt, Quellen, 133 ff.). The Council also approved Innocent’s prayer, which was fixed to start in June 1217. The Pope promised as his own contribution a vessel for the crusaders from Rome and its vicinity, and £30,000 in money. The indulgence for sins was extended to those who contributed to the church, as well as to those who went to the East. The speedy death of Innocent deprived it of his powerful support, and, in spite of the efforts of his two successors, Honorius III. and Gregory IX., it was never realized, unless the last act of Frederick II. in 1229 be regarded in that light. To these decisions of greater moment were added a series of acts of a moral and ecclesiastical nature, which were included in the Decretals or Decree of the Fourth Lateran one of the notable Councils in the history of the Church. The further establishment of monastic orders was forbidden—a canon repeated with an important modification at the second General Council of Lyons (1274). The Jews and Saracens were ordered to wear a different dress from the Christians, lest unaware there might be carnal intercourse between them, and the Jews were forbidden to appear out of doors during the Paschal week, and excluded from public office. Tournaments were forbidden on the ground that they would interfere with the crusade. This rule was repeated at the Ecumenical Council of Lyons (1245).

(5) The Fifth Lateran, of Lyons, or the 13th Ecumenical (1245), was called by Innocent IV., who had fled from Rome to escape Frederick II. It took the place of the Council called by Gregory IX., whose assembly had been prevented by the violent action of Frederick and his son Enzzo. Innocent, in his opening address, called attention to five wounds of the Church, namely, the low estate of the clergy, the distressed condition of Jerusalem, the Greek schism, the menace of the Turks in Eastern Europe, and the persecution of the Church by Frederick II. The last was the greatest and most painful wound of all, and itself justified the assembly. With the assent of the Council, Innocent formally deposed Frederick from his throne for 100 years and the excommunication he has taken such ominous action against an exalted monarch. Frederick was unequal to the contest, and died, defeated (1250).

(6) The Second Council of Lyons, or the 14th Ecumenical (1274), was summoned by Gregory X., and attended by 500 bishops, 70 abbots, and 1000 other ecclesiastics. Gregory opened the proceedings with an address on Lk 22:25, the text which Innocent III. had used in 1215. The main topic was the re-union of Christendom. The Greek
COUNCILS AND SYNODS (Christian)

Church was represented by Imperial delegates—Germannus, patriarch of Constantinople, the archbishop of Nicaea, and other bishops. The Emperor through his representatives announced his acceptance of the double procession, the Holy Spirit, and the primacy of the Apostolic see. The Apostles' Creed was sung in Latin, and then in Greek. A termination of the Schism seemed to be at hand, but the articles of agreement, when they became known in the East, were rejected, and the Council proved a failure at its historic point.

(7) The Council of Vienne, or the 15th Ecumenical (October 16, 1311 – May 6, 1312), was called by Clement V, the first of the Avignon Popes, at the demand of the cardinals. The chief objects of the Council are unsatisfactory, and among the chief objects of business were the abolition of the order of the Knights Templar, the establishment of peace between the two contending wings in the Franciscan order, and the important legislation of the Templars as a heretic. The condemnation of Boniface, which Philip had strenuously demanded, was, after much discussion, set aside, in view, it is supposed, of Clement's concession to the French sovereign that the Templars should be destroyed. The V. 1122 – 1400 (important local Synods).—Speaking in a general way, the local Synods of this period derive their chief importance from their regulating the public life and pastoral care of their people, and from the condemnation of heresies. They throw much light upon the religious conditions and clerical manners of the period. After the Council of Vienne, and until the close of the 14th century, Synods no longer had the importance they had had before. This was due to the distracted condition of Western Christendom, resulting from the exile of the Papacy to Avignon, to the growing tendency to freedom of thought and expression, as manifested by the publicists in the age of Boniface VIII, and the increasing tendency, since Boniface VIII, to autocratic Papal government through bulls. Among the more important of the local Synods were the following:—(1) Toulouse (1110), which passed a synod against heretics. (2) Tours (1168), attended by 17 cardinals, 124 bishops, and 414 abbots. Alexander III, presided in person. Thomas à Becket, whose difficulties had began, was present. The Synod's regulations were not ratified by the Holy See. (3) The Council of Clarendon (1164), a mixed council of laymen and bishops, passed the famous Clarendon Constitutions, which struck at the root of ecclesiastical arrogance as represented by Peter des Roches, bishop of Winchester, and led to his flight to France. (4) Verona (1164), presided over by Lucius III, passed a lengthy and notable decree concerning the trial and punishment of heretics. It makes the first Concular mention of the peneperes de indulsiones, or Walsingham's Walter Map, the English litterator, was present, and has left us an interesting account of the examination and appearance of the humble Waldensian representatives. Impenitent heretics were turned over to the worldly authorities, and magistrates and landlords were ordered to aid bishops in spit out heretics and bringing them to trial, on pain of excommunication. (5) The Synod of Treves (1227) has a place of importance on account of its canons which bear upon the administration of the sacraments. (6) The Papal legate, celebrated the close of the bloody crusades against the Albigenses, prescribed the final punishment of the heretics, and ordained the execution of the canons of the punishment of heretics, its 14th canon forbidding laymen to have in their possession the Old and New Testaments in the original or in translation. The laity—men and women—were ordered to attend the Communion three times a year, and to visit the confessional the same number of times, upon pain of being suspected of heresy. Toulouse was in the centre of the territory most infected with heresy of the Holy Spirit, and the most active in the 13th century, and many Synods in that region and in Spain—at Beziers, Tarragona, Narbonne, Albi, etc.—repeat the rules for the detection and punishment of the unfortunate victims of the Inquisition. In the 14th century, persecutions for witchcraft were carried on, it was a Papal bull—the bull of Innocent VIII,—and a book—the Malleus maleficarum—which encouraged such wickedness, rather than the acts of Synods.

COUNCILS (Christian: Modern, 1400–1910).—It will be convenient to deal with the Councils of this period under four separate heads. Supremely important as was the Council of Florence to both of Trent and of the Vatican, they were themselves the utterances of two dissimilar assemblies, deliberating under the stress of quite different combinations of circumstances, and animated by a notably different spirit. On the one hand, the ecclesiastical-political influences at work in the early part of the 15th century, owing to the Great Schism, were absolutely unique in the history of Christianity, while, from the outset of this period, the high relief and historical importance of the Councils (owing to the gravity of the crisis and the desperate nature of the evils, which only an Ecumenical assembly could remedy) tended to throw altogether into the background the decrees of diocesan and provincial Synods, and to give them all dogmatic character and influence. We have, then, for our four divisions:—(1) The Councils of Pisa, of Constance, and of Basel-Ferrara-Florence, all of which were held under the shadow of the religious unrest caused by the Great Schism of the West, and in all of which the position and power of a concilium generale in itself was a question of primary importance. (2) Trent, the great Reformation Council, in respect of which the Fifth Lateran may be regarded as an ineffective preliminary, overshadowed by the really important work which the Papal legates and the Fathers of Trent, in spite of disheartening political obstacles, carried steadily to a conclusion. (3) The Council of the Vatican, giving expression to that recognition of the Papal magisterium and that acquiescence in the policy of centralization which three centuries of peace, organization, and discipline had bred in the hearts of the more pious, if not always to the canons of the Roman obedience. (4) We also require to give some brief consideration to the local Synods which, in these last four centuries, have done little more than popularize the great principles of dogma and
discipline laid down at Trent. To the influence of these Synods as a whole, is also largely due the extension of those anti-Gallican tendencies which eventually took formal and articulate shape in the definitions of the Vatican.

1. Councils of Pisa, Constance, Basel-Ferrara-Florence—The one outstanding fact in the religious situation at the beginning of the 15th cent. was the division of Christendom owing to the Schism. All attempts to bring about an accommodation between the rival Popes of Rome and Gregory XIII. had hitherto proved abortive. The situation was intolerable, and patience was becoming exhausted. Finally, in July 1408, cardinals belonging to both Papal courts met at Livorno and proposed as a solution the via concilii generalis utricique obedientior, appointing 25 March 1409 for the meeting of such an assembly. The appeal evoked considerable response. At its maximum the attendance numbered from 22 to 24 cardinals, 80 bishops, 80 abbots, etc., while even fewer in person sent procurators. In its eighth session (18 May) the Council proclaimed itself ecumenical and canonically convoked. On 5 June it deposed both the reigning Popes as notoriously guilty of sedition, heresy, and embezzlement. The cardinals then at Pisa to elect a new Pope in their place. The choice fell upon Peter Philargi, Archbishop of Milan (Alexander v.). But, as neither Benedict XII. nor Gregory XIV. was willing to submit, the only immediate result was that there were now the three claimants to the Papacy instead of two. As for the second avowed purpose of convening the assembly at Pisa (the causa reformationis), it was agreed that a more careful preparation of means of reform was necessary than was allowed or even attempted. Any such projects must, therefore, be left for the consideration of another Council to meet in three years' time. Accordingly, on 7 Aug. 1409, the new Pope dissolved the assembly. It has been the custom to speak of the Council of Pisa with some respect as a foolish expedient, foredoomed to failure, which only added to the divisions of Christendom. Moreover, on the ground that it was not summoned by a legitimate Pope, or by the whole Church, or generally acknowledged, it has not usually been allowed, except by favorers of Gallicans, to rank among the Ecumenical Councils (cf. e.g. Hefele-Lecoyer, Conciles, ed. 7, V, 661); but a much more favourable view of its aims and its results has recently been put forward by Dominikus, Der Generali- satis, 500-530). In any case, the assembly at Pisa certainly did much to pave the way for the solution ultimately reached.

(2) Council of Constance.—Alexander v., the Pope elected at Pisa, died within a year of his election. His successor was successively John XXIII. (Baldassare Cossa), who, though not the monster of depravity his enemies have depicted, was certainly unworthy of his high position, and was himself the cause of scandal rather than a promoter of reform. Nothing in John's behaviour seemed to promise an end of the Schism, and so, after an abortive Council at Rome (1412), which mainly occupied itself with Wyclif's writings, Sigismund, king of Hungary, put Pressure on John and forced him to summon a Council to meet at Constance on 1 Nov. 1414. Under Sigismund's patronage, a vast and rather motley assembly gathered there, with the triple object (1) of defining the teaching of the Church with regard to the teaching of Wyclif and Hus (causa fidei); (2) of putting an end to the Schism (causa unionis); and (3) of reforming the Church alike in its head and in its members (causa reformatorum). In respect of the first a long series of propositions was extracted from the writings of Wyclif and his Bohemian followers, and these were unanimously condemned. On the question of Communion in one kind the Council drafted a detailed decree, in which the custom of the Church was approved, that the Sacrament of the Eucharist 'should be received by those who consecrated it under both kinds, and, by implication, that 'it must be most firmly held that the Body and Blood of Christ are contained entire both under the species of bread and under the species of wine.'

In the 15th session of the Council (6 July 1415), Hus, who, in spite of his safe-conduct from King Sigismund, had been kept in close confinement for several months previously, was, after his refusal to retract his errors, solemnly degraded from the priesthood and burnt at the stake. No special pleading can palliate this breach of faith, whether the main responsibility falls upon Sigismund personally or upon the ecclesiastics of the Council (see Wylie, The Council of Constance to the Death of John Hus). Meanwhile, as regards the healing of the Schism, the path of the Council had not been so easy. In spite of John's favoured position as the convoker of the assembly under the protection of Sigismund, men were not slow to declare that a settlement could be reached only by the resignation of all three Popes. To destroy the numerical preponderance of the Italian bishops a plan was adopted of voting by nations (Italian, German, French, English, at a later date also Swiss), and finally, by exclusion, in the general sessions, of the system previously adhered to, which based the decision upon the simple majority of voices. The outcry against Pope John made itself more insistently heard, and on 29 March 1415 he retired from the See. Despite the desertion of its official president, the Council, at the instigation primarily of Zabarella, d'Ailly, and Gerson, passed the famous 'Decrees of Constance,' declaring itself to be ecumenical and lawfully constituted, and, in the absence of the General Council, in so far as it holds its jurisdiction immediately from God, to the obedience of all men, even though of Papal dignity; and finally proclaiming that continual resistance to its authority would be a crime legally deserving of punishment, and involving, it might be, the guilt of schism or heresy. The formal deposition of John, on the grounds of simony, immorality, and the fostering of schism, followed shortly afterwards, on 22 April 1417, resignation of Gregory XIII., after he had been forsaken by the King of Arragon, was also deposed (26 July 1417). Finally, Odo Colonna (Martin v.) was elected Pope (11 Nov. 1417) by 23 cardinals and 30 deputes—six from each of the five nations—thus at last ending the Schism.

A few spasmodic attempts at reform were also made before the Council dispersed. Serious differences of opinion among the nations—the Italian bishops, for example, favouring the Papal claim to Provisors—led to the decision that, while certain general decrees should be passed upon matters as to which all were agreed, the Pope should be left free on the contested points to arrange Concordats with the different nations separately. The periodical convening of General Councils was also determined upon, the first to be held at Pavia in 1423; and on 22 April 1418, Martin v. dissolved the assembly.

The cumulicity of the Council of Constance is a subject of much debate. No one, practically speaking, denies that character to the Council after the election of Martin v. Again, the declaratory document condemning Wyclif was not covered by the declaration of Martin v. in the last session, that he desired to maintain and to ratify the decrees, 'in matters of faith', which he had already passed. The apostolic constitutions of conciliarity. But the decrees maintaining the superiority of a General Council over the Pope were very different, in any case, since it is held that Martin v. had the power to reduce the office of conciliator to that of conciliaritator. In any case, Martin v.'s language obviously suggests that he did not approve the decrees of Constance in toto, while, if he had rejected anything at all his sanction, it must have been the bold, and up to that time almost unheard of, pretension to exalt conciliar authority at the expense of the Papacy, which in 1402 became the founda-
of the famous Gallican Articles (see, e.g., Hetele-Leclercq, Conciles, i. 69-72). By no Roman theologian of the present day is the ecumenicity of the Council of Constance admitted without reservation.

(3) Council of Basel-Ferrara-Florence.—In accordance with the provisions of Constance, Martin v. was bound to convoke a Council at Pavia in 1423; this was done, but the small attendance, the transference to Sienna on account of plague, and other causes, furnished a reasonable pretext for dissolving the assembly altogether in May 1424. Deference, however, was still paid to the agreement arrived at in Constance regarding the periodical recurrence of Councils, and Basel was selected for the next meeting in 1432. Martin v. died before the day appointed, and Eugenius iv., who succeeded him, looking with apprehension at the spirit which had already manifested itself in the handful of delegates present at Basel—a spirit which still persisted in treating the Pope as only the caput ministeriale ecclesice—decided to dissolve the Council even before the end of 1431. A period of great distraction followed. Eugenius, who had to some extent been misinformed regarding the character of the Council, that it would be a long time was also, and without doubt, honestly influenced by the desire to facilitate the re-union of the Greeks by summoning a Council in some, to them more accessible, town in Italy, was eventually constrained, by the deterrence that the claim of the political support accorded them, to set aside his bull of dissolution and to suffer the Council to proceed. Meanwhile the assembly had explicitly renewed the decrees of Constance asserting the supremacy of the Pope over the Eastern Councils and ordering to the Pope the right of dissolution without the consent of the Council itself. Notwithstanding this, Eugenius found himself compelled to pronounce (decernimus et declaramus) the continuity of the Council of Basel as a legitimately constituted assembly from the beginning, to declare pure et simpliciter that it was in the enjoyment of his favour, and to annul (cassamus, revocamus, etc.) whatever he himself had attempted to its prejudice or against its authority.

During the period which followed, beginning with the 16th session (5 Feb. 1434), the assembly passed many useful decrees of reformation, but, by an almost entire abetment of annates and reservations, it was very hardly on the financial resources of the Holy See.

With regard to some dogmatic points in the proposed re-union with the Greeks there was further friction between Pope and Council, and the general question at length entirely occupied the question of the locality to which the Orientalists should be invited for the discussion of their differences. On this point Eugenius stood firm, and when, on 18 Sept. 1437, he convened a Reunion Council to meet at Ferrara, Christendom at large gave him its support in the long run. The remnant of the Basel assembly, after defining, on 17 Sept. 1439, the doctrine of the Immaculate Conception of the Blessed Virgin Mary, and proceeding under the leadership of Card. Lewis Almen, first to suspend and then to depose Eugenius; and on 5 Nov. 1439 they elected a new anti-Pope, Felix v. But the common sense of Europe revolted against the threaten at Basel of the Schism. The handful of prelates at Basel were gradually deserted by their supports. In 1448 they were banished from the city, migrated to Lausanne, and eventually, in 1449, made their submission to Nicholas v.

Meanwhile, at Ferrara, whence in Jan. 1439 the assembly, for sanitary reasons, was transferred to Florence, a conspicuously representative deputation of the Greeks, headed by Joseph ii., Patriarch of Constantinople, and the Emperor John Paleologus, had gathered for the Re-union Council, influenced mainly, no doubt, by the hope of inducing a united Christendom to make common cause in resisting the Turks. The illusion was a very thorny one, but eventually the Filioque difficulty was broached, and in the end the Western doctrine was accepted by all the Greek representatives save Marcus Eugenius of Ephesus, who, along with another objecting concerning the use of unleavened bread, the 'epiclesis' question in the liturgy, the doctrine of purgation, and, with more difficulty, the Roman primacy. Most, but not quite all, of the matters discussed were taken up by the Bull 

cook (6 July 1439), which informed the world that the decree of union had received the signature of the Greek representatives.

Though the main object of the Re-union Council was thus, for the time being, been attained, it continued to sit on, probably as a counterpart to the schismatical assembly at Basel. Several other Eastern Churches—the Armenians (autumn of 1439), the Jacobites (1442), and, after the sessions of the Council of Florence, the Syrian church of Mesopotamia (1444), and certain Maronites and Nestorians Chaldseans (1445)—sent in their submission. The respectus of doctrine, however, in the respective decrees of union, notably, the Lateran Council at the time, which are well influenced in the Church assembly in General Council. At present the more received view asserts that, while the sessions at Ferrara-Florence may be regarded as eccenclusial, those at Basel can claim eccenclusial only for the decrees passed before 1437 and concerned with the suppression of heresy, the peace of Christendom, and the reform of the Church. The Papal approval necessary for their validity cannot be considered to have extended to any other matter (see Hetele-Leclercq, Conciles, i. 80-86, and Baudrillard in Dist. Theol. Catech. ii. [1838-1845]).

2. The Council of Reform (Council of Trent).—The extravagant pretensions of the Councils of Constance and Basel had had disastrous results. The hope of reform in the Church was almost crushed, for the very mention of the word 'reform' awakened resentment and mistrust. Still the energetic protests of such men as Savonarola and Geiler of Kaisersberg kept the idea alive, and, when the friction between Julius ii. and Louis xii. induced the latter to threaten the Pope with a General Council and to organize the schismatical assembly at Pisa (1511), the need of reform was put forward as a rallying cry. Julius responded by anathematizing the conciliarium and its authors, but at the same time by convening a Council himself, the Fifth Lateran (1512), generally reckoned the 18th General Council. It was not numerously attended, and, though it was prolonged by Leo x. until 1517, the work of reform in the Church, with which it professed to identify itself, was handed very half-heartedly. Some useful decrees were passed concerning Papal provisions to benefices, etc., but the chief work accomplished was the condemnation of the Pragmatic Sanction of Charles v., which was cordially approved by Francis i. (18 Aug. 1516). This received the formal approval of the Council, 19 Dec. 1516; and in the bull Pastor aeternus, issued with the approval of the assembled Fathers in the
same connection, the Pope was declared to possess authority over General Councils, which he had also the right to convokes, transfer, and dissolve (Manzi, xxxii. 967). Indirectly the 'Gravamina' drafted by Wimpeling in 1510, which in many respects were based on the Pragmatic Sanction of Charles V., received their answer in the same bull.

There was little, then, in the proceedings of the Fifth Lateran to still the clamour for the suppression of abuses, which made itself heard more and more insistently after the return of Luther in 1517. Soon the appeal came, in a form not to be ignored, from the great ruler and statesman who found himself called upon at the same time to maintain the peace of the German Empire and to uphold the authority of the Papacy. Charles V., who had the difficulties of the German Empire and to uphold the authority of the Papacy. Charles V., who had

The city of Trent had been selected, as situated upon Imperial territory, though south of the Alps, and easily accessible both from Germany and Italy, at the 8th session (11 March 1547), on account of the appearance of the plague, the transference of the Council to Bologna was decided upon, in spite of the opposition of the Emperor. Still, as Charles's command of the number of Cardinals in Bologna was very small, no decisions were passed during the two sessions held there. To put an end to the impossible situation, Paul III. prorogued the Council on 17 Sept. 1549.

An exhortation of the Fathers in 1551, and business was transacted in the 13th to 16th sessions (11 Oct. 1551-28 Apr. 1552); but, on the fresh outbreak of hostilities against the Emperor, when the troops of the Elector of Saxony seemed to threaten the safety of the Council, another prorogation took place.

Finally, Pius IV. (29 Nov. 1560) summoned the bishops to Trent for the third time. They should have met at Easter, but the work of the Council did not begin until Jan. 1563. The proceedings, which were pushed on with great energy, was manifested alike in the sending of five Cardinal legates to represent him, and in the voluminous correspondence maintained by the Pontiff's nephew and secreta, Carlo Borromeo, afterwards canonized (see Susti, Die röm. Curia und d. Concil v. Tr. unter Pius IV.). The 17th and 22nd sessions were held between 15 Jan. and 17 Sept. 1562, after which followed a long period of strides and discussions which nearly brought about the abandonment of the Council; but, thanks to the tact of the Papal legates, two other public sessions were held in July and November. The 25th and concluding session took place under the presid of Cardinal of St. Yves. But Polesley was not present, and latterly the option has been given of employing a shorter form. For contra, when in the year 1714
a Form for admitting converts from the Church of Rome was drawn up and approved by both Houses of the Convocation of Canterbury, the proselyte, if in holy orders, was to be asked: 'Dost thou in particular renounce the twelve last articles added in the confession commonly called "the Creed of 1552," or doth thou renounce them?' to which the proselyte was required to answer: 'I do upon mature deliberation reject them all, as founded upon no warrant of Scripture, but rather repugnant to the word of God' (see The Month, Jan., 1858, p. 198). This Anglican form for the reception of a convert has of recent years been considerably modified.

Prof. Phil. Trid. is quoted in full in art. Conferences, vol. iii. p. 811.

The first hint of Pope Pius IX.'s intention to convocate an Ecumenical Council seems to date from 6 Dec. 1864, and a little later all the Cardinals resident in Rome were invited to send in their written opinion upon the ecclesiastical questions (considerable number of them being feared political complications. Only two of the twenty-one, when speaking of the purposes to be served by such an assembly, made any reference to a definition of Papal infallibility (Grundy, (pap. 44, 45) said, a matter being brought to the notice of a select number of bishops in all parts of Europe, together with certain Catholic Orientals, an almost unanimous reply was received in favor of the scheme. The motive principally insisted on was the dangerous and subsersive nature of much modern religious teaching, which rendered it desirable to emphasize the powers inherent in the Holy See as against those of the Gallican and Erastian tendencies of the times. In 1868, accordingly, a bull was issued convoking the Council for 8 Dec. 1869. A special Congregation of Cardinals had already been appointed to prepare the topics to be discussed and pronounced upon, and, in substitution to this, five separate sub-committees, or 'commissions,' were created to deal with (i.) Doctrine, (ii.) Discipline, (iii.) the Regulars (i.e. Monks and Nuns), (iv.) the Oriental Churches and Foreign Missions, and (v.) Politico-eclesiastical questions. Considerable uneasiness was aroused in circles of Gallican sympathy by the strong Ultramontane bias of many of the preliminary arrangements. The selection of consultants invited to sit on the commissions—a selection on which Dr. Dillingen and von Schulte—evoked protest from many moderate men, e.g. from Cardinal von Schwartzenburg, Archbishop of Prague. The endorsement by the Civitâ Cattolica, 6 Feb. 1869, of a wish attributed to many influential French Catholics, that the definition of Papal infallibility might be carried by acclamation, was taken to indicate the mind, not only of the Jesuits, but of Pius IX. himself. The occasion was used by Dillingen to publish five more pseudo-pseudonyms, of 'Jannes,' and were widely read outside Germany. Other publications, deprecating a pronouncement in favor of infallibility, were issued by Mgr. Maret, titular Archbishop of Sura, and Mgr. Delcourt of Orleans. The Papal constitution Multiplices inter of 27 Nov. 1869, determining the procedure of the Council and affirming the Pope's exclusive right to decide what matters should be submitted for discussion, as well as the objection and difficult was, in the case of the greater number, one of expediency, not of principle, lacked cohesion, and were far from presenting a united front. Even those who most pressed the historical difficulty of the fact that it was largely founded on the 'sacredness' of highly debatable incidents about which we have no clear information. That the opponents of the definition were sincere when almost all described themselves as 'imposturists' rather than anti-infallibilists may be inferred from their subsequent submission, and may be illustrated from the famous letter of Newman to the Bishop of Birmingham, which, made public through an indirection, showed upon the face of it that it was written by a bishop in absolute reverse. Herein, at the very time that he describes the projected definition as the work of an insignificant faction, he remarks: 'If we are all at rest and have no doubts, and at least desire to say something of the Holy Father to be infallible, suddenly there is thunders in the clear sky,' etc.; while, again, the conclusion of the letter makes it manifest that the writer had no intention of doing otherwise than to lay aside the objection and allow the definition to be pronounced (see Collectio Locanis, vii. 1513). On the other hand, Manning (not then a Cardinal) seems to have been the chief and most energetic of the organizers of the movement within the Council to press forward the definition as a matter of the utmost urgency (see Granderath, Gesch. ii. 69, 70), and he himself made no secret of the policy of the committee organized by him, to exclude from the deputatio de fide everyone known to be adverse to the definition. Thus, however, the work was a section, who were carrying through a plan of campaign on constitutional lines. It was not the work of the Pope or the Curia (cf. Friedrich, Gesch. iii. 175).

The first two public 'sessions' of the Vatican Council transacted only formal business (8 Dec. 1869, and 6 Jan. 1870); but previously to the third session, which took place on Low-Sunday (24 Apr.) 1870, a considerable amount of work was done, and the Constitutio de fide (i.e. the pap. 44) was then passed unanimously. It consists of a prologue and four chapters—(i.) of God the Creator of all things, (ii.) of Revelation, (iii.) of Faith, and (iv.) of Faith and Reason—followed by 18 canons which sum up the principal points defined, and subjoin the contrary propositions to anathema. The errors so condemned included some of the fundamental conceptions of Pantheism, Naturalism, and Rationalism; for example, canon 4 (of) runs thus:

'If any one shall say that finite things, both corporeal and spiritual, or at least spiritual, have emanated from the Divine substance, or that the Divine essence, as the substance, by the evolution of itself, becomes all things; or, lastly, that God is universal or indefinite being, which, by determining itself, constitutes the universal, and eventually holds distinct according to species, genus, species, and individuals: let him be anathema.'

Again, in ch. ii. the Council, developing somewhat what the doctrine defined at Trent (see iv.), declares that:

'The books of the Old and New Testament (as enumerated by the Council of Trent) are to be received as sacred and canonical, in their integrity. But if all their parts have not been carefully composed by mere human industry, they were afterwards approved by her [the Church's] authority, or merely because they contain revelation, with no admixture of error; but because, having been written by the inspiration of the Holy Ghost, they have the authority of God's own inspiration and author, and have been delivered as such to the Church herself.'

It is to be noted also that, contrary to the usage
of earlier General Councils, the Vatican decrees are formally issued, not in the name of the Ecumenical Synod, but in the name of the Supreme Pontiff, with the bishops of the whole world assembled round us and judging with us. An amendment, proposing to add the word definitiones to the scholastica, and judicantibus ecclesiasticae episcopatus of the decree, was rejected after a somewhat heated discussion.

Twenty of the general congregations (10th to 29th) which preceded the third session were given up to questions of disciplinary reform, the most interesting of which was perhaps the proposal to draw up one form of elementary catechism, the use of which should be obligatory throughout the whole Church. But this, like other disciplinary schemes, came to nothing, owing to the premature termination of the Council; however, wasted in debate, and the Papal ordinance of 20 Feb. 1870, for abbreviating the discussions and introducing a form of closure, despite the violent protests it elicited from the minority, was reluctantly agreed to.

By this time, however, the energetic agitation of Manning, Ségouin, and other leading infallibilists, resulting, for example, in a petition for the definition, signed by 480 of the Fathers, had pained the Pope sufficiently to make the subject no longer shelved. Originally the question of Papal infallibility had not formed part of the proposed decree on the Church of Christ (see Coll. Liconia, vii. 567-578), but it was later on added to the agenda, and became the subject of the liveliest controversy. The Cardinal Presidents in the general congregations opposed rather than favoured the efforts to declare this urgent, but they yielded eventually to the agitation headed by Manning, Ségouin, and Ségouin (Granderath, Gesch. ii. 270). Fourteen sessions were devoted to the infallibility question in general, and sixty-four speeches were delivered before the closure was applied. Thirteen other sessions and fifty-seven speeches were devoted to amendments. Finally, when the vote was taken (13 July 1870), of 601 Fathers present 450 voted placet, 85 non placet, and 62 placet jacto modo. Throughout the debate more than three-fourths of the speakers had openly expressed disbelief in the doctrine itself; the minority, as a rule, contested only the opportunity of defining it.

Before the public session, 18 July 1870, many of the Swiss and French. Of 555 Fathers present only two voted non placet.

The whole decree de Ecclesia Christi, like its predecessor, consists of four chapters. Ch. i. concerns the Apostolic primacy of St. Peter, ch. ii. the perpetuity of the primacy in the Roman pontiff; ch. iii. the powers and nature of the primacy, and ch. iv. the infallible teaching of the Holy See. The kernel of the doctrine thus set forth is expressed in the terms quoted above, in art. Conv. 

Owing to the heat of summer and the outbreak of the Franco-Prussian War, fewer than 200 Fathers stayed on in Rome. Some further discussions on matters of discipline took place, but the closing session, far by the Holy See was occurred soon afterwards, and on 29 Oct. 1870, Pope Pius IX. formally prorogued the assembly.

Severe criticisms have been directed by many Old Catholic andiscopal writers (e.g. Littlejohn, art. 'Vatican Council,' Ebrard) against the procedure followed in the Vatican Council, more especially with regard to the infallibility definition. It has been urged that the majority were coerced into a simulated acceptance of the decree, that the assembly was not represented in the name of the College of Bishops, but by the sovereign of Italy, a Jesuit, or titular bishop, who came without mandate from any appreciable body of the faithful, that free discussion was not permitted, etc. There is no doubt foundation for some of these objections, but the facts relating to the facility of locomotion, the assembly was not less, but immensely more, representative of the Catholic episcopate than any of its predecessors; the vast majority was in favour of the definition; that in no Council of the Church has there been anything comparable to the astonishment at which bishops in proportion to the population of the dioceses they represented; that the greater part of the opposition, whether sincere or real, came from the hierarchy, not the opportunists, no anti-infallibilists, and so forth. No special pleading can disguise the fact that the subsequent action of the faithful at large has as completely justified the Fathers of the Vatican as the subsequent action of the faithful justified the Fathers of Sardis or Chalcedon in 451. The 26 bishops made their submission, as they all did without exception, we may assume that either they followed the dictates of their conscience, or they were doing, or else they were supporting their flocks would not support them in any act of schism. Whether we hold that the ultimate source is the collective voice of the bishops or to the sense of the great body of the faithful, the definition in either case, from the point of view of the Roman Church, is fully justified. The sensitiveness to the rights of minorities displayed by the critics of the Council is, after all, a thing of modern growth. Any alleged handicaps or irregularities of procedure &c. the Vatican could probably have been mulled many times over in the history of earlier Councils. No one has ever had so great a hand in the restoration of the Holy Spirit as promised only to the learned few in any episcopal assembly, while the necessity that the minority had not been able to make their objections heard, after all the discussions on the spot, and after the occasion caused some months before, by the writings of Döllinger, Dupanloup, and others, excepted to the Congregation, and others, excepted to the Congregation, to be made known, was of the moral anarchy which almost necessarily follows in the wake of a fundamental change in religion, stood in the way of any lasting improvement. It was to the Council of Trent that men's eyes were turned (not altogether in vain) to inaugurate a new era, and the annual diocesan Synods and triennial provincial Councils, which in many places (e.g. at Milan under St. Charles Borromeo) were convoked in strict obedience to the Tridentine decrees (s. xxiv. de Regio, et De), undoubtedly helped greatly to turn the Council's measures of reform to practical account. But under Pope Sixtus v. the important Papal constitution In nuisces (22 June 1859) profoundly modified the conditions which affected the legislation of the provincial Synods. It was now required that the decrees of provincial (though not diocesan) Synods must be submitted to a Roman Congregation, and could be promulgated only after correction, and subject to the modifications, or even the additions, of the congregations in question. This measure, which was the made the ground of animated protest at the Vatican Council (see Granderath, ib. 179 ff.), has greatly furthered the centralizing tendencies at work in the Church of Rome during the last three centuries, but it has also much diminished the influence of provincial synods, now practically deprived of their independence. The same cause was probably not without its effect in bringing about the archbishop, entire peace in the Church during the 17th and 18th centuries.

In comparatively modern times—possibly as a result of the religious reaction which followed upon the French Revolution—a renewed energy began to make itself felt in convocation of provincial councils. For example, in the year 1849 Provincial Councils were people, while 66 bishops came from the States of the Church, with a population of less than 1,000,000. But statistics of this kind are not always significant. The 2,000,000 of the diocese of Paris include the hordes of the Commune who twelve months later became masters of the city, imprisoned the Archbishop, and condemned him to death. It would be rash to argue that Manning represented the six millions of London and the adjacent counties comprised in his diocese.
held at Paris, Rheims, Tours, and Avignon; and in 1380 at Albè, Lyons, Rouen, Bordeaux, Sens, Aix-la-Chapelle, and Bologna. Central Europe, however, had provincial Councils at Vienna (1685), Graz (1858), Cologne (1860), Prague (1869), Kalocsa (1863), etc. In the United States six bishops assisted at the first Provincial Council of Baltimore in 1858, and the first Provincial Council of what met at Baltimore in 1852, the presence of six archbishops and twenty-six bishops marked the developments of Roman Catholicism in the New World. In England four Provincial Councils have had a notable restoradion of the hierarchy, viz. in 1852, 1853, 1859, and 1873.

Historically speaking, apart from the Vatican Council, interest during the last three hundred years has centred chiefly in conventions of a rather orthodox character. Such, for example, was the Gallican Assembly of the clergy summoned by John XIV. (1681-1682), which drew up the famous four Gallican Articles: (1) denying any jurisdiction of the Pope over the royal authority in France; (2) declaring the Pope to be inferior to a General Council; (3) limiting the exercise of the Papal prerogative by the Conciliary decrees and by the customs of the Gallican Church; and (4) affirming that the Pope's decrees in matters of faith and morals became infallibly correct only when confirmed by the consent of the whole Church. John XIV. imposed the teaching of these Articles upon the clergy throughout his dominions; but, in the face of uncompromising Papal opposition, he eventually withdrew them in 1683.

Very similar was the spirit which, growing out of the 'Fehromanism,' or 'Josephism,' current in Germany in the 16th cent., manifested itself at the ‘counsel of Pistoia’ in 1492. The Synod was convened by Scipio Ricci, Bishop of Pistoia-Prato, at the instigation of Ludolph, Grand Duke of Tuscany; and it passed a long array of decrees on points of doctrine, ceremonial, the rights of the secular authority in religion, etc. — all Gallican and Jansenistic in spirit.

Pius VI., in the bull *Auctorem fidéi* (1794), condemned these propositions of the Synod of Pistoia; and in 1795, and again in 1800, made humble submission to the wishes of the See to remove this abuse that could not be avoided without risking the loss of eternal salvation ('*quia sunt necessaria ad consequendum finem aeternae beatitudinis*'), Thomas Aquinas, *Summai,* ii. i. q. xvii art. 4). ‘Counsels’ or ‘councils of perfection’ are suggestions of very virtuous ways of living, by the following out of which a man may arrive more quickly and better at eternal life (*per quae melius et expeditius potest homo consequi finem praedictum, ib.*), but which he may not even justly or imprudently follow, or imperiling the salvation of his soul (*consilium autem in optimum potenter ejus eni datur, ib.*). The ‘councils’ are the new law of the gospel. ‘Counsels’ are something added to that law.

This formal doctrine is simply a statement of the judgment formed by the Church on Christian living—a reasonable account of certain plain phenomena which came within the view of all observers. It was obvious from the very earliest times that men who renounced more of the world's goods, honours, and pleasures than others did; accomplishing, as it seemed, a more complete dedication of their mental and bodily powers to the Lord. These were naturally thought of as living a fuller and higher kind of spiritual life.

The judgment was in accord with that of St. Paul (1 Co 7:9f.), where the virgin state is reckoned superior to the married, although he that marries has not sinned.

The distinction between a higher and lower Christian life meets us in Hermas ([_I_ II. 1. 9._]), how and how also in the apostles, from Gesama, *suum Futurum,* and _et de ordinibus._

In the fullness of a greater in detail (to the _Teut.,_ 3. 5. 11, _et de more, _8. 5. 29, of _Theoc.,_ 1. 1. 2. x._); the words of his master (i.e., how the Lord in more and no hesitations impose, when means voluntarily _continuorum libertarian,_ when it is considered, _prisci aduersarii_ majoris
COUNSEL AND PRECEPTS

In Counsels and Precepts: A Treatise on Christian Life, the author discusses the importance of distinguishing between 'counsels' and 'precepts.' The term 'counsell' is understood to refer to advice that is not binding, while 'precepts' are commands that are to be followed. The distinction is made clear in various passages of the New Testament, where Jesus gives counsels and precepts. The author argues that the Church has always maintained this distinction, and that it is an essential part of Christian living.

The rise of Monasticism gave a new importance to the distinction between a higher and lower Christian life. Hitherto the contrast between the most obvious ascetic and the most naturally human kinds of life had been plain but less striking in the non-Church. The Church, however, was the whole Church and therefore it was clear that the distinction between St. Augustine and his followers was not the Church's.
mandments of which the 'counsels' seemed to be refinements. Sometimes for these particular individuals the 'counsel' was the only means by which the original commandment was fulfilled. Luther, opposing Eck, says that 'counsels' are not 'super' but 'intra praecipitae'; because they are only means of conveniently fulfilling commandments. Thus virginity is not a counsel to be adopted at will or refused. It is a means, perhaps for some the only means, of fulfilling the law of chastity. To such individuals it is evident that to refrain from marriage is a precept, absolutely obligatory. To the others it is not a counsel of perfection, since, being able to observe the law of chastity, there is nothing to be gained by renouncing marriage (Luther, de Veto Monasticis, vii. 583, 30ff.).

The result of the Protestant theory is a reversal of the Catholic conception about those who follow the evangelical 'counsels.' A life of virginity or of voluntary poverty ought no longer to be considered a very eminent kind of devotion. It is a confession of weakness, an admission that with the Protestant faith it is a lower condition than that of the ordinary citizen of the world. In comparison with the old Catholic judgment that the way of greater renunciation is the way of nobler devotion, the Protestant view appears strained, and is not in accord with the voice of the general conscience. It is not possible to alter the judgment of the common man's conscience so as to bring it into line with the deductions which theological thinkers make from the positions of faith. Unless we follow that theory, Protestants still continue to regard as peculiarly admirable the lives of those who have sacrificed wealth, honour, or bodily desire for the sake of renunciation of the world. This fact see Append. III. of J. O. Hanway's Spirit and Origin of Christian Monasticism, 1905. It is, however, to be observed that the Protestant theologian's denial of special honour to lives of complete renunciation has had a certain effect on the Protestantism which is less rich than Catholicism in examples of heroic Christianity. The general tendency of Protestantism has been to raise to a high level the common Christian life and to develop certain virtues of a kind that the Catholic Church has not prescribed, and, except in comparatively rare instances, has not achieved, the production of unique saints, like, for example, St. Francis of Assisi, whose devotion lays hold upon the popular imagination, and so contains a stimulus to the denial of the doctrine of 'counsels' and 'precepts,' and the consequent unwillingness of Protestant teachers to hold up for admiration lives which must always be rare, and are never imitable except by those who realize the peculiar glory of very great kinds of renunciation.

Further, it has happened that certain evangelical sayings, regarded by the Schoolmen as counsels of perfection, have, in times of high religious vitality, laid hold of the average man and compelled obedience. Thus, during the 17th. cent. in England, our Lord's teaching about the non-resistance of evil fascinated the early Quakers. In a Catholic community their kind of life would have been recognized as a form of the counsel of perfection, and they might very well have become an Order within the Church. The refusal of Protestants to recognize the distinction between 'counsels' and 'precepts' had a double effect. It forced the Quakers, who in this matter thought as Protestants, to defend their literal obligation to the commands of Christ as the only way of following Christ. It obliged those Christians whose consciences did not forbid them to use force in self-protection or in the interests of society, to condemn the position of the Quakers as fantastic, exaggerated, and definitely wrong. The same sort of thing happened in Germany and Flanders at the beginning of the Anabaptist movement at the time of private property; and less strikingly in other similar cases (see J. O. Hanway, op. cit. ch. 1.). The greater and more fully organized Protestant Churches have thus been deprived of the services of many enthusiastic men and women who might have been most valuable in deepening the spirituality of the general life; and the teachers of these Churches have been obliged to read glosses into certain passages of Scripture, and to dress up certain passages clearly of the Old Testament, Mount, in such a way as to obscure their plain meaning and weaken their original force.

It appears, therefore, that in formulating the doctrine of 'counsels' and 'precepts' the Catholic Church did not wish to give scientific expression to the natural and obvious judgment of conscience which recognized in the life of great renunciation a peculiarly high kind of life; that by formulating the doctrine the Church ran the risk of deducting being misused in the end outrage, and actually have outraged, the consciences of sincere believers; and the further risk of the list of 'counsels' being enlarged and that of 'precepts' diminished, until the common man's standard of the voice of the general conscience. It appears also that Protestant theologians, in refusing to endorse the natural judgments of conscience, have not succeeded, in fact, in preventing such judgments being made by their followers, but have deceived and confused them. Thus a formula in a way of life is of a sort which is not, in the public mind, the kind of life; and have risked, and actually suffered, the loss to organized Protestant Churches of souls who have felt the need of heroic self-sacrifice for the sake of Christ.

JAMES O. HANNAY.

COURAGE.—Courage has figured as one of the prominent virtues in every ethical system. Yet it has from early times given trouble to scientific moralists, because of its variety. It has at best an uncertain place in a list of the virtues, and is in many cases the result of a sort of falling into it, or associated with an utterly worthless or vicious character. This is, however, only the case where it is identified with fearlessness (p. 8). Absence of fear in physical danger may be the result of temperament, and so called courage must be distinguished from bravery. In moral evil it is not exclusive of courage as usually understood. Thus the Greek philosophers discerned that, to gain an accurate notion of courage, it was necessary to define things worthy or unworthy of fear.

In some of Plato's Dialogues, notably the Laches and the Protagoras, we are made to see the difficulty of finding a place for courage in any system which recognizes the paramount position of wisdom or knowledge in moral life. In the case of the Protagoras and the beasts show spirit and endurance in combat, but the conduct of men in vigorous military efforts loses the merit of courage if prudence suggests that the forces are adequate to the occasion. In the Republic, however (bk. iv. 429 f.), Plato distinctly lays down the principle that the Guardians of the City (in whom the virtue of courage principally resides) must acquire that quality by a sound training in the nature of things to be feared and of things not to be feared. Aristotle, in bk. iii. of the Nic. Ethics, submits the whole subject to a searching analysis. According to his principle of the Mean, courage lies between rashness on the one hand and cowardice on the other. As fear, the forbearance of evil, is not
altogether to be disparaged, Aristotle, like Plato, has to distinguish legitimate and illegitimate fears. Non-military times call for the exercise of patience more than for that of intrepidity,—though both are essential to the well-being of any people,—and there is occasionally cause for fear lest a comparative contempt for men or for authority, or for opinion; (2) that which comes from knowledge that the danger apprehended is not real; (3) courage arising solely from emotion—anger or vengeance—which man shares with some animals; (4) courage of hope—temporality; (5) the courage of ignorance which cannot recognize danger. It may, perhaps, be said that this distinction between genuine and spurious courage corresponds for the most part to the modern distinction between moral courage and that which is purely physical.

Although Aristotle in his general treatment of courage seems somewhat nearer to the modern ideas than Plato, in one respect Plato would seem to us more satisfactory; he includes in courage the power and will to resist evil generally, or to hear calamity without flinching; whereas Aristotle would restrict the term to its primary military significance, regarding other meanings as derivative or metaphorical. Certainly it seems illogical to attach, for instance, to a coward, who is not alarmed but stands to his duty in a shipwreck or an earthquake, while allowing it to one who behaves in like manner during the attack on a city.

Courage thus held its place with the three other virtues—wisdom, justice, temperance—in the system of Greece and Rome. These ‘cardinal’ virtues were combined with the three Christian graces of faith, hope, and charity, to form the seven virtues of the writers of the Middle Ages. Yet in the new atmosphere, courage—or fortitude, as it is commonly called in this connexion—underwent some transmutation. St. Ambrose—who derived his ethical system from the Greeks via Cicero, and passed it on to St. Augustine, and through him to the Western world—would make fortitude include boldness in withstanding temptations to sin. To a certain extent, he agrees here with Plato. But he also dwells much on the virtue of endurance or physical suffering as shown by the Christian martyrs. It would seem probable that the martyr-cult must have tended in the direction of emphasizing the passive side of courage or fortitude, by which it is assimilated to endurance or resignation.

The Christian idea of fortitude is expressed in many admirable works of mediaeval art. Many readers will recall Ruskin’s remarks on the Fortitude of Botticelli (Mornings in Florence, iii.):

‘Fortitudo’s Fortitude is no match, it may be, for any that are coming. Worn, somewhat; and not a little weary, instead of standing ready for all comers, she is sitting, apparently in reverie, her fingers playing restlessly and idly—nay, I think, even nervously, about the hilt of her sword ... and yet, how steadily and gladly will they close on it, when the far-off trumpet blows, which she will hear through all her reverie.’

It may be noticed that by mediaeval Christian moralists fortitude is regarded as the corrective of acedia (q.v.), the sin of gloom and inaction. It subordinates the emotions or any element of cheerfulness, a resolution to live in an atmosphere of hope.

Perhaps there are few virtues that have varied more than courage in their manifestations among different peoples and at different times. There is always an aesthetic as well as a purely moral element in the conception of courage, and human notions vary even more about the beautiful than about the good. Thus, during the age of chivalry in the West, to be the Crusades as enmity and barbarous, while the

knightly spirit of the Franks despised Eastern subtlety as mean and cowardly. Non-military times call for the exercise of patience more than for that of intrepidity,—though both are essential to the well-being of any people,—and there is occasionally cause for fear lest a comparative contempt for men or for authority, or for opinion; (2) that which comes from knowledge that the danger apprehended is not real; (3) courage arising solely from emotion—anger or vengeance—which man shares with some animals; (4) courage of hope—temporality; (5) the courage of ignorance which cannot recognize danger. It may, perhaps, be said that this distinction between genuine and spurious courage corresponds for the most part to the modern distinction between moral courage and that which is purely physical.

Although Aristotle in his general treatment of courage seems somewhat nearer to the modern ideas than Plato, in one respect Plato would seem to us more satisfactory; he includes in courage the power and will to resist evil generally, or to hear calamity without flinching; whereas Aristotle would restrict the term to its primary military significance, regarding other meanings as derivative or metaphorical. Certainly it seems illogical to attach, for instance, to a coward, who is not alarmed but stands to his duty in a shipwreck or an earthquake, while allowing it to one who behaves in like manner during the attack on a city.

Courage thus held its place with the three other virtues—wisdom, justice, temperance—in the system of Greece and Rome. These ‘cardinal’ virtues were combined with the three Christian graces of faith, hope, and charity, to form the seven virtues of the writers of the Middle Ages. Yet in the new atmosphere, courage—or fortitude, as it is commonly called in this connexion—underwent some transmutation. St. Ambrose—who derived his ethical system from the Greeks via Cicero, and passed it on to St. Augustine, and through him to the Western world—would make fortitude include boldness in withstanding temptations to sin. To a certain extent, he agrees here with Plato. But he also dwells much on the virtue of endurance or physical suffering as shown by the Christian martyrs. It would seem probable that the martyr-cult must have tended in the direction of emphasizing the passive side of courage or fortitude, by which it is assimilated to endurance or resignation.

The Christian idea of fortitude is expressed in many admirable works of mediaeval art. Many readers will recall Ruskin’s remarks on the Fortitude of Botticelli (Mornings in Florence, iii.):

‘Fortitudo’s Fortitude is no match, it may be, for any that are coming. Worn, somewhat; and not a little weary, instead of standing ready for all comers, she is sitting, apparently in reverie, her fingers playing restlessly and idly—nay, I think, even nervously, about the hilt of her sword ... and yet, how steadily and gladly will they close on it, when the far-off trumpet blows, which she will hear through all her reverie.’

It may be noticed that by mediaeval Christian moralists fortitude is regarded as the corrective of acedia (q.v.), the sin of gloom and inaction. It subordinates the emotions or any element of cheerfulness, a resolution to live in an atmosphere of hope.

Perhaps there are few virtues that have varied more than courage in their manifestations among different peoples and at different times. There is always an aesthetic as well as a purely moral element in the conception of courage, and human notions vary even more about the beautiful than about the good. Thus, during the age of chivalry in the West, to be the Crusades as enmity and barbarous, while the
taint ritual actions of which the blood-covenant is a well-known, though probably a late, instance. There is produced identity of aims or interests, as well as mutual agreement and sympathy.

1. Each has a part of the other in his keeping, and this part not only assimilates each to the other by transmission of properties, but is itself the other. Thus identity of interests is secured, and the possibility of mutual treachery or breach of covenant, but an injury done to A by B is equivalent to injury done by A to himself, but also by the fact that, if B is wronged, he may work vengeance by injuring... the part of A which he possesses' (Crawley, Mystics Rose, 237).

Without laying too much stress on the latter part of this, it is certain that the covenant-relationship as one of identity fits the facts better than as one of kinship. Yet it may be observed that, if the covenant produces identity of aims and interests, since the aims and interests of the individual are largely those of his kin, the covenant state will so far produce a kinship relation. But, as a third theory, it is maintained that the ritual act (eating together, transfusion of blood, etc.), while it involves the parties to the covenant in certain duties to each other, serves as a conductor of conditional imprecations, of potential punishments for the transgression of these duties (Westermarck, Moral Ideas, i. 590, ii. 208; art. CURING AND BLESSING, p. 356, below).

A common meal is the central act of the religious service which takes an oath to keep it, or execute vengeance on each other if it is broken. And, as many examples show, the food, drink, blood, etc., is itself the oath or curse, or is the vehicle of either. Thus, in Ma'ahgasser, the oath-passed by a sick man to himself that his liquid may poison him who is faithless to the bond (Duumont d'Urville, Voy. pittoresque autour du monde, Paris, 1854-1855, i. 81). Or, as in Morocco, a compact of friendship is sealed by eating together at the tomb of a saint, each one taking an oath to keep the compact (Westermarck, i. 557; cf. below, p. 356).

Examples show now the working of the principle contained in one of these theories, now that involved in the others, but the kinship theory is seldom observed in the complete form which the theory itself presupposes. It is not impossible that the primitive covenant contained both the idea of mutual assistance and that of a conditional curse, for the two are not mutually exclusive, as various examples suggest. But it should not be forgotten that the covenant frequently implies no more than faithfulness to the object of the covenant, and if there is a new relationship of common interest, of aims or of mutual utility, then the kinship theory is justified.

2. Covenssants between men.—Of all the various outward signs of the covenant, that to which most attention has been drawn is that each party to it drinks or is inculcated with the other's blood, or that they swear each other or some sacred object with it. Where the parties to the covenant form two groups, vested individuals undergo the covenant obligation from a primitive notion of an amicable bond (see BLOOD; BROTHERHOOD [artificial], and works cited there). Probably the idea is that kinship means blood-relationship—a relationship which can be involved in the blood-covenant—is not primitive. More primitive is the idea that contact, eating and drinking together, exchange of names, garments, weapons, and the like, will produce a close bond, whether involving identity or relationship between two unrelated persons. Here the underlying idea is that the whole adheres in the part, that whatever has been in contact with a person, whatever is his, is for all practical purposes himself; that for another to obtain possession of it brings the owner under his control; hence to offer it to another is in effect to offer oneself. Thus mutual eating, especially where the food is exchanged, or the mutual exchange of food, makes the mutual possession of food dependent on each other, makes their aims and interests the same, or produces identity or, according to the first theory, kinship. Here, primitively, the act of eating or exchange is itself the covenant, but it is also seen to be vehicles of conditional oaths or curses verbally pronounced. At the same time, witnesses human or Divine may be called to the compact which has been made. The purposes for which a covenant is entered upon are, e.g., friendship and comradeship between individuals; the adoption of a stranger into a kin-group; mutual aid and protection—assistance in war, in revenge, or in some hostile purpose; peace between tribes after war; commercial purposes; union between the members of a society or association, usually at the time of initiation into it, etc. It is obvious that, since a covenant brings the parties to it into such close affinity, their responsibilities towards each other are great and must be scrupulously fulfilled, while also there are produced many mutual privileges.

Where a common meal is the chief feature of a covenant, there is the idea that what is parted from each other is a bond of mutual identity, and this is still more marked where there is an exchange of food. It is possible that the covenant-meal may have been the earliest form of the covenant, and it should be observed that, quite apart from the theoretic view of the effects of mutual eating common among primitive peoples, there is a natural basis to it. For, wherever men eat and drink together, they tend to be friendly towards each other. But, where the theoretic view is accepted, according to the phrase used, 'the food will repay' him who breaks the compact (Westermarck, i. 557; cf. below, p. 356).

Examples show now the working of the principle contained in one of these theories, now that involved in the others, but the kinship theory is seldom observed in the complete form which the theory itself presupposes. It is not impossible that the primitive covenant contained both the idea of mutual assistance and that of a conditional curse, for the two are not mutually exclusive, as various examples suggest. But it should not be forgotten that the covenant frequently implies no more than faithfulness to the object of the covenant, and if there is a new relationship of mutual utility, then the kinship theory is justified.
Among the Ceramec the covenant of peace between two villages is entered upon by the people of one village making a feast to which those of the other are invited. The chiefs drop some of their blood into a dish of food, and weapons are also dipped into the blood. The ceremony is then repeated on the other side. A similar feast is also held at the other village, and the covenant is complete. Here there is a combination (found elsewhere also) of the blood-covenant with the covenant-meal (Riedel, De chiefs, 318). But cannibal intercourse between the signatories is forbidden. Thus, many of the tribes of the Archipelago—such as the Bambala, in the Uganda Protectorate, London, 1862, ii. 795.—have similar custom.

Drinking together is another common form of covenant-ceremony, the draught being frequently accompanied by an oath, while, as many examples show, the liquid partaken of is regarded as the oath itself, which will harm the breaker of it. But there is also such a simple form of friendship as that of the aborigines of Formosa, who put their arms round each other's necks and drink simultaneously a cup of wine (L'Anthropologie, v. [Paris, 1894] 352). Survivals of such a ceremony as this are well known. Nor is it improbable that drinking from other's blood at the making of a covenant was an extension of such a practice, while it is a common custom to mingle some blood with the liquid which is drunk.

As the basis of a covenant of friendship, the exchange of names is very frequent among savage tribes, the name being regarded as part of the personality, while the sacred nature of the act is seen in the fact that the name is usually not revealed, and one could do its owner no use of it. In such a ease the alliance is indissoluble, and forms one of the most sacred bonds. Other exchanges of personal belongings—garments, weapons, teeth, are the basis of covenants of friendship, and will make lasting friends of men who have been enemies. A temporary exchange of wives is occasionally found as a means of sealing a compact, especially among Australian tribes, with whom also, on the occasion of making peace between tribes or certain other alliances, a general exchange of wives takes place for the time being. By this means the identity or union of the two parties is assured (cf. American Antiquity, iv. 125 (4); J. J. Evans, 169, 175).

Salvage is occasionally the vehicle of the covenant state. Thus, among the Orongo in the Bissagos Archipelago the ceremony for sealing a friendship is to spit in each other's hands. The Masai spat at each other with a man who served as mediator of friendship (Hinde, Last of the Masai, London, 1901, p. 47); and among the Somalis a stranger becomes a member of his host's family by the host spitting in his right hand and rubbing it on the stranger's forehead (Paulitsche, Ethnogr. Nord-Africas, Berlin, 1893-1896, p. 246).

Opposite the meaning of the name of this rite are found. Mutual spitting is regarded as an interchange of life, since by many peoples it is held to contain a semblance of life (Cromble, Trans. Inter. Lit. Cong., 1891, p. 240ff.). Westerners, on the other hand, is of the opinion that saliva is the vehicle of a conditional curse, since the Masai spit copiously when cursing (op. cit. ii. 290). Spitting among the Masai is also reported to be a sign of the greatest goodwill and a compliment (Johnston, op. cit. ii. 333).

Covenants of peace between tribes which have been at war are frequent. They are by a covenant meal (see above). In some cases the material of the covenant-meal is the flesh of a human victim. Thus, the people of Vate kill one or more of their number and send the flesh for consumption to the host with the desire peace (Erskine, Journal of a Cruise among the Islands of the W. Pacific, London, 1853, p. 334). In other alliances the cannibal meal is found. Chiefs among the Bambala (a Bantu tribe), in making a covenant against future bloodshed, partake with their followers of the flesh of a slave fattened for the occasion. Any chief who kills a slave after such a covenant must pay a fine to every village which took part in the bond or, as it is called, the covenant-meal (Johnston, op. cit. ii. 334). Hence, in a covenant the meal is served to prevent any member of the covenant from killing another, and to make amends for injuries done in war. Thus, if a covenant be broken, or if it be dissolved, the covenant-meal is taken again as a sign of friendship.

If, then, we consider the character of the liquor served at a friendly meeting, on the one hand we find a medicine or a beverage, and on the other an intoxicant or an anodyne. Here lies the secret of the great value of this form of peace-making, and it explains why it has been used by so many people, in war and peace, as a means of avoiding bloodshed. Even in times of war, the liquor is still served as a sign of friendship; but it is also used as an intoxicant, and the people often make a sacrifice to the god, who may be revealed by the drinker. The liquor is thus a means of communication with the god, and is used as a pledge of friendship. It is also used as a means of keeping the peace, and is regarded as a symbol of hospitality, and was regarded as so sacred that to break the covenant thus made would have been followed automatically by fatal consequences.

Other ceremonies are used elsewhere, with the purpose of making a covenant of peace binding. In Tahiti a wreath was made of green boughs, to which each party contributed. Two young dogs were exchanged, and a band of cloth was made together. In the ceremony, the cloth was then offered to the gods, and imprecations were uttered on those who should break the covenant (Ellis, Polynes. Researches, London, 1829, i. 318; see other instances in Farrer, Military Manners and Customs, London, 1853, p. 162).

Where the bodies of the parties to a covenant are cut to obtain blood, the marks of the wounds serve as tokens of the covenant. Similarly the garments or weapons exchanged will be constant reminders of it. At other times a charm is set up as a witness of the covenant state (cf. Graef, op. cit. ii. 210; Frazer, in Anthorp. Essays presented to E. B. Tylor, Oxford, 1907, p. 131 ff.).

In later times, and in more advanced civilizations, the covenant becomes simply a bond or oath for mutual support, or for unity between men more or less animated by a common purpose. Here there is little or no idea of kinship or identity, though some of the older ritual acts may survive, and the parties to such bonds recognize a brotherly feeling existing between themselves as a result of their bond and of their common purpose. In fact, the covenant at all times is intended to produce solidarity among those who are parties to it, though a body of these covenant acts is not actually and automatically produced. And, though the breaker of the covenant risks great dangers, these are not supposed to result automatically from the oath which he has taken, as in many instances from savage life.

3. Coveneans between men and gods, etc.—The ceremonies and symbolisms of covenants are even more important than the words of contract used, and, in fact, they constitute the covenant. Hence, in great measure, all religious ceremony and worship is the expression of a covenant relationship between men and gods. For the worship paid, man may expect the god to perform duties towards him, and the god is expected to confirm that relationship. But there are certain ceremonies, especially those of a sacramental or sacrificial nature, in which the covenant relationship appears more emphatically. In all sacrifices in which the victim is, or appears to be, a merchandise the victim is made of the flesh of him, the meal is the expression of a close union or a covenant between the god and the group of worshippers. This is seen in the fact that all the worshippers partake, while there are instances, as in Hawaii, where a refusal to eat would be followed by death (Bastian, Der Mensch, Leipzig, 1869, iii. 152). But, even when the slain animal is not the god,
COVENANT (American)—The substitution of an artificial for a natural basis of subsistence had an effect in America, as elsewhere, of establishing

the sacrifice or the meal which follows it marks a desire for union with the god, and is an expression of a covenant or union of spirit to him. In this case, as in covenants between men, there is a common meal of which the two parties to the covenant partake—and the god and the group of worshippers. In the OT, God is often represented as making a covenant with individuals and their descendants, or with Israel (Gen 9:15ff., Nu 23:19, Ex 6:24ff., Dt 5:1ff., Jer 31:34), and it is said that sacrifice was the basis of all covenant rites between God and the individual or the people of Israel (cf. Ps 50:1ff., Jer 31:34). This is particularly noticeable in the case of the covenant with Abraham (Gen 15:18ff.), and with Israel at Sinai (Ex 24:1ff.). In the first case there is no mention of a sacrificial meal, and in the second the blood of the sacrifice is sprinkled on the altar and the covenants are concluded. Hence the blood, clothing, etc., on the altar, but frequently in the OT the sacrificial meal may be regarded as the basis of the covenant—the god or his worshippers eating together and renewing their union with their creator. According to an old theory, the meal itself unites god and men in an act of communion (W. R. Smith, p. 271); or, according to another view, the food is here given to the children of the covenant, as food to the god and worshippers, and to the worshippers themselves, from whom the god expects that in eating and drinking together the spiritual bond of the covenant will be renewed. These ideas may, however, be carried over from the sacrificial meal. It is certain that the case of the OT writers, breaking of the covenant by the individual or nation was followed by punishment (Dt 17:8ff., Jos 7:1ff., 20:1ff., Jg 2:9ff., 2 K 18:12ff.), while blessing followed its being observed (Ps 132). In any case, what holds true of these OT sacrifices is true of similar sacrifices elsewhere. Indeed, in some aspects the mere eating of sacrificial food, the propitiating him, is the token of an alliance with him; hence the worshipping asks and expects help from the god to whom he, for his part, is faithful. The same is true of the vows made to a god and the worshiper, which he promises to perform, and the things, usually a sacrifice, for some specified help given him by the god.

In the OT other things are found as signs of a Divine and human covenant, e.g., the rainbow in the case of Noah and his posterity (Gen 9:11ff.), though here a covenant sacrifice appears also (899); circumcision is the token of the covenant with Israel (Gen 17:9ff.), though it is to some extent a sacrificial rite; and in Ex 31:10 the Sabbath is to be kept for a perpetual covenant. For the letters cuttings on the body as signs of a covenant, see BADGES.

Totemism, as an intimate relation which is supposed to exist between a group of kindred people on the one side and a species of natural or animal object on the other side, which objects are called the totems of the human group (Frazer, Totemism and Exogamy, London, 1910, iv. 1), is essentially a covenant relationship, since both parties have entered explicitly or implicitly into an alliance for mutual help and protection. This covenant state is generally furthered by various ritual acts, by which men assimilate themselves to their totem, these beings analogous to the covenant rites between human beings. The group of men is, in effect, allied with the animal species which is their totem; the relation is one of identity. Similarly, in the rite used at puberty for obtaining an individual animal guardian or monitum, and in the relative positions in which the individual and his monitum stand to each other, there is the suggestion that this relation is essentially a covenant one. Blood-letting is the most significant of such totemic rites. The Ahuau of the Aztecs and the monitum of the Indians are said to have sealed their compact with the monitum by drawing blood from different parts of their body (VPL, 740). Among the Indians of Honduras each youth formed a contract with his nagual, by offering some of his blood to it (whereupon such friendship was contracted between them, that when one of them died, the other did not survive). (Gerrers, General Hist. of . . . America, 176. 13, 190; the young Indian himself—perhaps the origin of the funeral feast. Other methods of this implicit covenant with the dead may be looked for in such rites as that of the mourners cutting themselves, letting the blood drop on the grave, or eating or drinking the fat or decomposed matter of the corpse. These are analogous to the similar rites in connexion with the cult of gods (see Hartland, op. cit. ii. 277ff.; Jevons, op. cit. 41ff.).

Various customs in human covenants—in which, e.g., the parties hold an animal which is sacrificed, its blood being sometimes sprinkled on a sacred object, or are sprinkled with its blood, or drink of what an animal, not apparently sacrificial—are probably connected with that type of covenant sacrifice in which the parties are a god and a group of men. Here, perhaps, the sacred nature of the sacrifice makes it an important bond in such a covenant, while similar sacrifices are frequently the vehicles of a curse; or, again, the god to whom the sacrifice or the blood is offered is regarded as a third party to the covenant (for examples, see Brotherhood [artificial], vol. ii. pp. 85ff., 870; Wellhausen, Theate arab. Heidö, Berlin, 1887, p. 128; Lewin, Wild Races of S.E. India, London, 1870, p. 228). In many human covenants a god is expressly called upon as witness to the contract, as in the similar appeal in the case of vegetables. The god human

VOL. IV.—14
the gods as the principal members of the agricultural community. On their co-operation the maintenance of such a community depended. To some extent the obligation was mutual; for, while men repaid much benefit from the encouragement, advice, and assistance of the gods, these were beheld to men for the sustenance tendered through sacrifice. A definite and tacit, if unwritten, covenant thus came into being between gods and men, any human breach of which was visited with Divine punishment. The arrangement was purely one of self-interest on both sides. Man felt the necessity of placating the only beings from whom he could obtain foreknowledge of seasonal and other changes, and, deeply sensible of the value of supernatural assistance, he rewarded it as handsomely as he could—by gifts of such food, drink, and clothing as in his sight appeared most desirable.

Commencing this practice by an 'understanding' with the earlier tribal deities, he later extended it to the 'great gods' of the heavens and earth, whom from time to time he admitted into his pantheon. He felt that the wealth accruing from this co-operation with Divine beings should be fairly divided between gods and their victims; which would satisfy the gods, for his own special use—these to be worked and tended by (in all probability) the most skilful labourers. Thus, according to Guanilla (Orinoco Illustrado, Madrid, 1745, vol. ii. p. 278), a tribe of Guaybas, in commemoration at an eclipse of the moon, at one commencement work upon a plantation for the moon-spirit, considering the eclipse to be a sign of his displeasure at their failure to supply him with a separate field of maize. The gods of Peru had, thus, a good profit from wool, and pacos, the fleece of which was largely consumed on their altars, while the wool, woven into cloth, was burned to provide them with 'astral' clothing, or used in the provision of raiment for their dependants.

When men's sacrifice fails, either, as in Mexico, owing to the lack of large animals, or, perhaps, because of a more sanguinary popular temperament, the blood of human victims is supplied as atonement. Thus the Mexican god Huiztilopochtli lived wholly upon human sacrifice, countless thousands of victims, for the most part members of hostile tribes, being slain annually upon his altar. The hunter, too, as well as the cultivator and herdsman, paid his debt to the gods, who assisted him to track his game in dreams. Thus the Nicaraguan tendered to his deer- and rabbit-gods clotted blood wrapped in a cloth, and the Chonti offered blood to the great Chontic Huaca (Mucuento). Dwellings, too, were supplied to the Divine beings.

The natural conclusion of the savage in these circumstances is that a breach of his covenant with his divine gods brings upon him calamities of every description. There is much temptation on the part of the cultivator to withhold a portion of the firstfruits or other sacrifice; and, should this temptation overcome him, he becomes an easy prey to the vengeance of the gods. The Peruvians believed that in such a case the offended god sent an evil spirit to haunt the wrongdoer, and that it lay in wait for him in his habitual resorts. His crops failed, his health gave way under some terrible disease, his stock perished. Such were thought to be the consequences of hucha, or sin, in Peru; and, in the event of a national calamity, every member of the community was rigorously examined, until, the guilty one being discovered, restitution was forced from him. Throughout the two Americas the idea of the covenant with the gods was quite as current as elsewhere; and its inevitable workings have been observed in the economy of nearly every tribe.

COVENANTERS.—The subscribers of the National Covenant and the Solemn League and Covenant rejected the theory of the Divine right of kings, and vigorously opposed the assumption which crushed the liberties of the people. In the days of James VI., before the Covenants, the conflict was begun. George Buchanan in 1579 published his De Jure Regni apud Scotas, in which he taught that kings can only use their regalia for the benefit of the people, and, in particular, that the Scots had always claimed and exercised the right to call wicked rulers to account. Two Scotsmen had already dealt with the old kings. After the fruits of the earth produced under supernatural guidance, and to such live stock as had been raised under the same auspices. A step further, and we perceive that the legal outcome of such a policy was to set aside fields and their produce which would satisfy the god, for his own special use—these to be worked and tended by (in all probability) the most skilful labourers. Thus, according to Guanilla (Orinoco Illustrado, Madrid, 1745, vol. ii. p. 278), a tribe of Guaybas, in commemoration at an eclipse of the moon, at one commencement work upon a plantation for the moon-spirit, considering the eclipse to be a sign of his displeasure at their failure to supply him with a separate field of maize. The gods of Peru had, thus, a good profit from wool, and pacos, the fleece of which was largely consumed on their altars, while the wool, woven into cloth, was burned to provide them with 'astral' clothing, or used in the provision of raiment for their dependants.

When men's sacrifice fails, either, as in Mexico, owing to the lack of large animals, or, perhaps, because of a more sanguinary popular temperament, the blood of human victims is supplied as atonement. Thus the Mexican god Huiztilopochtli lived wholly upon human sacrifice, countless thousands of victims, for the most part members of hostile tribes, being slain annually upon his altar. The hunter, too, as well as the cultivator and herdsman, paid his debt to the gods, who assisted him to track his game in dreams. Thus the Nicaraguan tendered to his deer- and rabbit-gods clotted blood wrapped in a cloth, and the Chonti offered blood to the great Chontic Huaca (Mucuento). Dwellings, too, were supplied to the Divine beings.

The natural conclusion of the savage in these circumstances is that a breach of his covenant with his divine gods brings upon him calamities of every description. There is much temptation on the part of the cultivator to withhold a portion of the firstfruits or other sacrifice; and, should this temptation overcome him, he becomes an easy prey to the vengeance of the gods. The Peruvians believed that in such a case the offended god sent an evil spirit to haunt the wrongdoer, and that it lay in wait for him in his habitual resorts. His crops failed, his health gave way under some terrible disease, his stock perished. Such were thought to be the consequences of hucha, or sin, in Peru; and, in the event of a national calamity, every member of the community was rigorously examined, until, the guilty one being discovered, restitution was forced from him. Throughout the two Americas the idea of the covenant with the gods was quite as current as elsewhere; and its inevitable workings have been observed in the economy of nearly every tribe.

of religion. The royal favour to Presbyterianism was of short duration, and in 1596 Andrew Melville told James that he was ‘but God’s sullie vasall,’ and said:

‘Sir, as divers tymes before, so now again I must tell you, that the estate of the state is unbecoming; there is Christ Jesus and His kingdom the Kirk, whose subject King James the Sixth is, and of whose kingdom not a king, but a head, nor a Lord, but a member.’

The words did not convince, and James, casting aside tradition, called by his own authority Assemblies, which yielded to his pressure. At last in 1610 an Assembly restored Episcopacy, and in 1611 the Estates ratified the new order of ecclesiastical government. In justification of his authority, James published, in 1598, The True Law of Free Monarchies, and set forth the Divine origin of the royal

‘Monarchy,’ he wrote, ‘as resembling the Divinity, approacheth nearest to perfection, as all the learned and wise men from the beginning have agreed upon.’ He declared that ‘kings are called Gods by the prophetical King David, because they sit upon God’s throne upon earth, and have the count of their ministration, while by his acts and writings he sheweth the people should pay obedience to the king ‘as to God’s lieutenant on earth, obeying his commandments in all things, except directly against God’s commands of God’s minister, science, or leading a judge set by God over them, having power to judge them, but to be judged only by God, to whom only he must give account of his judgment.’

In the Basilikon Doron, published shortly after The True Law of Free Monarchies, James instructed his son to know and love God, who had made him ‘a little God to sit on his throne, and rule over other men.’

True to his exalted notion of his office, James used his authority to change the government of the Church, and then turned to the customs, and forms of worship. In 1616, called by him, and the first which met after 1610, a new Confession of Faith, Catechism, Liturgy, and Book of Canons were projected; and in an Assembly at Perth in 1618 royal coercion secured the passing of the famous Five Articles, which were starting innovations in the Scottish ritual. When the government of the Church had been changed and the ritual modified, the king was satisfied with the exercise and recognition of his supremacy; but, while his ministers and writings shewed that the attachment to the theory of the Divine right of kings, he ruled in the Church through Assemblies, and, though these were coerced, he preserved the recognized forms of legislation.

Charles I. succeeded to his father’s belief in his Divine right, and continued, but without tact or discretion, the assertion of royal absolutism. In May 1635 he signed the warrant for a Book of Canons, which in the following year was imposed upon the Scottish Church, without the sanction of either an Assembly or a Parliament. Reference was made in the Book itself to a Liturgy, afterwards known as Laud’s Liturgy, which was ratified in 1636, and in 1637, on the sole authority of the king, was sent to Scotland. The Canons, as they made no outward change in the Church, did not stir the people, though they saw in them a violent exercise of royal power; but the Liturgy, also den, but he judged only as a judge, roused a popular clamour, and set the nation against him. The Liturgy met with instant opposition, and the riot which occurred in the church of St. Giles, Edinburgh, when it was first read, inaugurated a reaction. A new assembly was held, and produced the Covenants and the Confession of Faith, the two famous instruments of Presbyterianism, which gave definition to the form of worship to be adopted, and to the boundaries of the Church. The Scots, ever fond of legal bonds of association, prepared a document which is known as the ‘National Covenant,’ and multitudes signed it.

The document was prepared by Johnston of Warriston, one of the ablest of the lawyers, and the Rev. Alexander Henderson, minister of Leuchars, who was the ecclesiastical leader of the Presbyterians; and with them most probably was associated Hope, the king’s advocate. It included the Negative Confession of 1581, which James vi. had signed; a list of the Acts of Parliament confirming the Confession; and the Covenant proper, by which the nation undertook to defend their religion and their king as guardian of it. The signing of the Covenant was begun on 28th Feb. 1638, in the Greyfriars churchyard, which contained the burial-place of George Buchanan, whose De Jure helped to drive James towards absolutism. If the first Coveners, drawn from all classes and representing the greater part of the country, were rebels against the king’s tyranny, their document infringed no law of the land. Yet it was the bond of a nation against the sovereign, and, with troubles in England, Charles was forced to yield. He appointed the Marquis of Hamilton as his commissioner, who tried to divide the Coveners by means of a new Covenant, the King’s Covenant, which included both to enforce the Confession of 1581; and, when the project failed, Hamilton in his master’s name promised a free Assembly, a Parliament, and the abolition of the Courts of High Commission which, with bishops and archbishops, was tried ecclesiastical cases. The Presbyterians did not admit that the royal assent was necessary for an Assembly, and accordingly they called one, which met on 21st November in Gallowtree Hall. The Marquis appeared as the king’s representative, and the members chose Henderson as moderator and John-
so doing, violated the rules of toleration. The Earl of Traquair, the king's commissioner, ratified the proceedings of the Assembly, though Charles indicated to Archbishop Spottiswoode that what had been done could be undone. Parliament agreed to the demand in overthrowing Episcopacy; and, in spite of his action as commissioner to the Assembly, Traquair refused assent in the king's name, and against precedent dissolved the Parliament. War was once more inevitable, since the nation's demands, in spite of the Treaty of Berwick, had been refused. Charles summoned an English Parliament, known as the Short Parliament, and dismissed it when supplies for a war with Scotland were refused. He succeeded, however, in collecting a force at York on 22nd August 1640; and on the 20th of the same month Leslie entered England with an army of 20,000, and marched to Newcastle. The Second Bishops' War was no more romantic than the First; and commissioners were appointed to meet at Hinton, and to arrange terms of peace on the basis of the abolition of Episcopacy and the recognition of the Covenant. The troubles in England forced Charles again to yield to the Scots, though not without an effort to find an uncontentious arrangement made with the Long Parliament, which had taken the business out of the hands of the king.

Hoping to create a party in his favour, Charles in 1641 visited Scotland, and remedied further arrests, especially in the case of the Incendiaries and the Plotters or Banders. The Earl of Traquair and Sir Robert Spottiswoode, the archbishop's son, were the chief men among the Incendiaries, who had been the advisers of Charles from the time of the Covenant; while the Plotters were led by Montrose, who had passed to the side of the king, perhaps the greatest figure of Argyle's prominence among the Covenanters. The affair known as 'The Incident,' whether it was a fact or merely a story, told against the king, and, when he departed from Scotland in October, he had neither weakened his enemies nor strengthened his own party.

In August 1642, Charles raised his standard at Nottingham, and the Civil War in England was begun. The king and the Parliament each sought the aid of the Scots; but themselves divided, were in great numbers favourable to the Parliamentary cause. The Parliament informed them that an Assembly at Westminster had been appointed to consider a reformation in church discipline and ceremonies; and on 2nd Aug. 1642 the General Assembly, associated with the Convention of the Scottish Estates, put forward the Solemn League and Covenant, drafted by Alexander Henderson, as the condition of an alliance. The subscribers to the Covenant were to be reminded to preserve the Reformed religion in Scotland, to secure in England and Ireland a reform in doctrine, worship, discipline, and government, according to the Word of God and the example of the best Reformed Churches; to seek the extirpation of Popery, prelacy, superstition, heresy, and schism; and to defend the privileges of the Parliament, and also the person and authority of the king. The English Parliament accepted the Covenant 25th September 1642, Leslie, who had been created Earl of Leven, led an army into England, which helped to secure the victory of Marston Moor. In his difficulties, Charles granted a commission to Montrose, and, as the English army with the Marquis of Antrim sent him a wild horde of Irish and Sooto-Celts, Victory after victory in Scotland was gained by Montrose, though at the expense of horrible cruelties perpetrated by the savages of his army; and he did not know defeat till September 1645, when he met David Leslie, Leven's nephew, at Philiphaugh. The triumph of the Covenanters was secured, and, on the other hand, being opposed by the Independents, despaired of the success of the Solemn League and Covenant. Charles understood the situation, and in May 1646 threw himself into the hands of the Scots. Yet he would not accept their Cabinets, and they would not support him. Had he agreed to their terms, they would have defended him; but they handed him over to the English Parliament, on condition that his life should be spared, and the money due to them be paid.

One last effort to save his king was to be made by some of the Scottish nobles. The Earls of London, Lanark, and Lauderdale visited him at Carisbrooke Castle, and made a compact, known as 'The Engagement,' according to which they were to advise the king to find an uncontentious arrangement made with the Parliament, and the king was to preserve Presbyterianism in England for three years. In the Scottish Parliament, the nobles, barons, and commissioners from the large towns showed by a decided majority that they trusted the king, though they regarded and despised him, who did not believe that he was sincere. Hamilton, however, raised an army of 10,000 men, when they reached England were met by Cromwell and defeated. Charles was executed on 30th Jan. 1649, and Covenanters and Royalists alike were horrified. Charles was the victim of his cherished principle of the Divine right of kings, which, bequeathed to him by his father, destroyed the peace of Scotland, turning a member of a popular party of Argyle into rebels whom history has justified. James was a despot who knew the value of discretion; but Charles, with an erroneous doctrine of his personality and an anarchic theory of his power, was destitute of tact, and the Scots were strenuously resolved to possess him and his liberties. Yet, though he was a tyrant in their eyes, they would have remembered that he was their king and would not have taken his life.

Six days after the execution of Whitehall, Charles II. flew through Kinross and Kincardine to the Scottish Estates, though he was to be acknowledged only on condition that he accepted the Covenant. The zeal of the Covenanters was not diminishing, and just before the death of the king they secured the Act of Classes, which excluded from civil and military posts all who were hostile to the Covenanters. Montrose cared nothing for the Estates, and still dreamed that the country might be subdued. He failed, however, to gather the Royalist army of his visions, and yet would not cease from romantic expeditions and attacks. At last he was taken, and was beheaded on 21st May 1650 at the Market Cross of Edinburgh. Charles II. landed in Scotland in June, and, according to an arrangement already made, accepted the Covenant. His presence was a menace to England, and on 22nd July, Cromwell crossed the Border. David Leslie was in command of the Scottish army, which in the rush of events was now gathered for the defence of the king, though many of the Covenanters, led by Johnston of Warriston and James Guthrie, of Stirling, did not put their trust in Charles. In their fanaticism they succeeded in banishing all Covenanters from the army, and so interfered with Leslie that Cromwell secured a decisive victory at Dunbar. Immediately after the battle they prepared a Remonstrance against the government of Argyle
and his friends, and presented it to the Committee of Estates, with the declaration that they rejected Charles till he proved ‘the reality of his profession.’ Argyle was forced to choose an alliance with the Remonstrants or with the Malignants, and he gave his support to the friends of Charles. The Covenanters accordingly passed a resolution in condemnation of the Remonstrance, and the Estates abolished the Act of Classes. On 1st Jan. 1651, Charles was crowned at Scone, and Malignants and Remonstrants alike were satisfied. Cromwell, however, was still in the country, and once more David Leslie was placed in command of an army. In hope of a rising in favour of Charles, the Scots marched into England, but Cromwell followed and utterly defeated them at Worcester. Scotland was subjected to the English rule; and, though toleration was enforced, Resolutioners and Remonstrants continued their quarrel, till in 1653 the General Assembly was closed and its meetings forbidden. Enthusiasm for the Covenanters was no longer national but sectarian. The National Covenant had been the protest of a realm against the absolutism of the king, and the Solemn League and Covenant had been framed for the reformation of religion by those who believed that the soul of Scotland should be Presbyterian. In the events which followed the National Covenant, Charles had been compelled to submit to the Scots, and after his death the Covenanters, true to the Solemn League and Covenant, refused to become the guardians of his son’s Protestantism. Fanaticism divided them, but the factions were none the less devoted to the Church which James and Charles I. had assailed, and to its worship and government which had been saved from the hands of the destroyers. After the Restoration with joy, as the English rule was ended and the king was to reign who had been crowned at Scone. The Remonstrants or Protesters alone, in their anxiety for the Church, did not share in the joy, and soon it was seen that they were not foolish in their alarm. Charles nominated a Privy Council, without waiting for a Parliament to advise in the selection; and, while the members of the Council were with him in London, he dismissed the Government and the Committee the Estates, which had not acted after 1651. Remembering injuries and destitute of gratitude, he committed Argyle to the Tower, and then sent him to Scotland for trial, and at the same time issued an order for the execution of Johnston; however, escaped to France. The Committee of Estates, recognizing the attitude of the king to the Covenanters, broke up a meeting of Protesters, and seized among others James Guthrie, the minister of Stirling. In their eagerness to please they issued a proclamation against ‘all unlawful and unwarrantable meetings and conventicles’; and, in decreeing that there should be no meetings ‘without his Majesty’s special authority,’ showed how the notion in the king’s service no longer opposed the absolutism and supremacy which had been fatal to his father. It seemed at first that Charles, though ruthless towards the Remonstrants, would uphold the Church the true church of the Resolutioners; and James Sharp, minister of Crail and professor in St. Andrews, whom the Resolutioners had sent to London, returned on the last day of August with a communication to the Presbytery of Edinburgh. ‘We do resolve,’ Charles wrote, ‘that the democratic principles which George Buchanan taught in the De Jure; and, when he could not be brought to sentence, his book was publicly burned by order of the Government.

Without consent of the Church, Charles II. changed its order of protest and the men who would not obey his orders were driven from their livings. James VI. had forced or corrupted Assemblies and Parliaments to be his agents, while Charles I. had imposed the Canons and Liturgy with neither the Church nor Assembly nor legally selected. It is true that Charles II. acted through a Parliament and through his Privy Council, but the Parliament was not freely
elected, and the Church itself was not consulted. The 300 ejected ministers could urge the Presbyterian claim of free assembly. Their theory of the Divine origin of the Presbyterian polity might be denied, but they could point to Knox and Melvill as might be given to the ministers who were ordered to the struggles and successes of the first Covenanters. Many of the ministers quietly accepted the Episcopacy ordained by the ‘Drunken Parliament,’ but the men who were ejected, and not the men who conformed, were destined to the Presbyterian tradition, and as heirs of the Covenanters were entitled to their name. Opponents of the royal absolutism and advocates of ecclesiastical freedom, the second race of the Covenanters were destined to bear testimony through their sufferings and to their devotion to the lost liberties of their Church.

Fines were imposed by the Privy Council on those who neglected the ministrations of the curates, and soldiers were quartered on offenders till these were paid. At Archbishop Sharp’s suggestion the Court of High Commission was re-instituted to deal with breakers of the law, and the troubles increased when Covenanters, to whom an Act of Indulgence was ordered by the Court to pay their fines. In the disaffected districts the people were galled by the tyranny of the Council in imposing fines, quartering soldiers, and breaking up conventicles (q. v.) for worship. Passive obedience was required, and a rising of the oppressed was to be expected. Sir James Turner, the most zealous of the soldiers of the Government, was in Dumfries, and on 15th Nov. 1666 was attacked and taken prisoner by a company of Covenanters who had been stirred by a shameful tale of enormity. From Dumfries they marched, 3000 in number but untrained, across the country to Lanark, where they renewed their adherence to the Covenant. Information had not got to Edinburgh, they turned on their way to the city, as Sir Thomas Dalziel, a fanatic Royalist who had served in Muscovy, was on their track, and they reached Rullion Green, on the southern slopes of the Pentlands, Dalziel with his disciplined force routed them. Some were killed, many fled, and at least fifty were taken. Two of the leaders, John Neilson of Corsneck and Hugh M’Kail, who was a preacher, were tortured with the boot in presence of the Council, that they might appear before the Dutch Council and were afterwards sent to the scaffold. Ten men, and then five, were hanged in Edinburgh, and the work of execution was continued in Glasgow and Ayr. Many of those who had been engaged in the rising were fined and their lands and goods confiscated. To Dalziel was given the task of quieting the disturbed places, and with his ruthless severities he terrorized the people. In 1667, however, a respite was offered when Lauderdale, who had overthrown Rithes and Sharp in the Council, intimated an indemnity, under conditions, for the Pentland rising. While many accepted the terms, the sternest of the Presbyterians refused obedience to a Government which required conformity to an Episcopal Church and ignored the Covenant.

After the indemnity no further step towards conciliation was taken till 1669, when an Indulgence was offered. It was ordained that vacant parishes might be given to the ministers who would take collation from the bishops; and those who would not take collation might have the manse and glebe, without the stipend, if they agreed, among other conditions, to administer the sacraments from Galilee. The Presbyterians, professing their adherence to Presbyterianism, were admitted; but the most zealous of the Covenanters inveighed against them, and extreme Episcopalians objected to the Indulgence as an Act of Erastianism. Lauderdale, though responsible for the Indulgence with any clemency involved in it, was an avowed supporter of the royal absolutism; and the Lord High Commissioner, the Asserty Act ‘that his Majesty hath the supreme authority and supremacy over all persons, and in all causes ecclesiastical within this kingdom; and that, by virtue thereof, the ordering, disposing of the external government and policy of the Church doth properly belong to his Majesty and his successors, as an inherent right of the crown.’

Burnet, the Archbishop of Glasgow, was deposed for his opposition to the issue of the Indulgence, and Leighton, who succeeded him, proposed an ‘accommodation’ for peace between Presbyterians and Episcopalians. The scheme was futile, as compromise pleased no one, and Leighton, resigning the archbishopric, departed to England. The Indulgence did not remove the opposition of the Covenanters, and they flocked to the conventicles, carrying arms for safety in attack. The Government, on the other hand, showed no leniency. In 1670 an Act was passed requiring all to take an oath to give information regarding conventicles and the men who attended them; and another Act made death and confiscation of goods the penalty for preaching at conventicles. Not content with these severe measures the Scots, and especially the Highlanders, were to be punished, even to exile, should be inflicted on those who had their children baptized by the non-conforming ministers, and also on those who were to pass successive Sundays absenting themselves from the services of the Church. The pressure of the Government, did not cease, and the Bass Rock was turned into a prison. In 1672 the Parliament declared the ordination of ministers by the Covenanters a crime, and decreed that parents should be punished who left their children unbaptized by the curates for more than thirty days. For some reason a second Indulgence was published. It was offered to eighty of the clergy, and some of them accepted it, but the Covenanters were not satisfied. The Government in their straits decreed that magistrates for the burghs and landowners in respect of their estates were to be made responsible for conventicles, and householders were to answer for their families and servants. Another step was taken in the Dutch Council, where communing were issued against 100 persons, including men and women of social position, who were not to be harboured or fed or clothed by any one. Though landowners in 1674 had been made responsible for their tenants and servants, they were required in 1677 to take a bond for all persons on their lands. Many of these men in the disturbed counties, though friendly to the Government, would not sign such a bond; and in February 1678 a host of 6000 Highlanders with 2000 Lowlanders was sent to Ayrshire and let loose for plunder. The Duke of Hamilton and also the Earls of Atholl and Perth appeared with expostulations before the king, and, though Charles approved Lauderdale’s actions, the Highlanders were withdrawn. The disorder increased, however, in spite of inducements and coercive Acts; and the year 1679 witnessed among other tragedies the murder of Archbishop Sharp. From 20th May 1679 three miles from the city, by a hand of men who had absented of attending conventicles. These men were not taken, though a proclamation was issued for their arrest; and another tragic event was to increase the troubles. On 27th May
—th anniversary of the Restoration—a company of eighty men gathered in Kutherglen, and, after extinguishing the signal fire of the Covenant, and the market-cross paper denouncing the Acts of Parliament against Presbyterianism. The same company, increased in numbers, held a conventicle on the Sunday which followed; and Graham of Claverhouse was at the head of it, of course it aimed to seize the men who had appeared at Kutherglen. At Drumolog, two miles from London Hill, where the conventicle had assembled, an engagement took place, and Claverhouse was defeated. The victors determined to form a camp, and many fled to it. The Government, on the other hand, made ready an army, and the king sent the Duke of Monmouth to command it. The battle of Bothwell Bridge was fought on 22nd June with disastrous results to the Covenanters. They had enthusiasm; but, divided over the indulgences, they quarrelled when they should have been drilling themselves for action, and there was no capable and trusted leader. While the number of the dead was not great, more than 1000 prisoners were taken and conveyed to Edinburgh. For months many of the wretched men were confined in the Greyfriars churchyard. Two of the ministers were hanged, and five men, who had not been involved in the deductions, were tried and executed; and to Magus Muir, that the murder might be avenged. Many were allowed to leave their prison, after taking a bond not again to bear arms; and others, to the number of 250, were packed into a ship, and sent to the Orkneys, or to the Islands, and 200 of the unfortunate men, who were kept under the hatches, were drowned. The command to Monmouth, an Act of Indemnity was passed for those who had been at Bothwell Bridge, and a third Indulgence for ministers was published. Conditions, however, were attached, and there were few who did not reject them. Clemency was accordingly thrown aside; a general search was made for those who had been at Bothwell. The thumbkins and lighted matches to the fingers were used by the savage soldiers of the Government to force unwilling informers to reveal their secrets. Covenanters and Covenanting ministers, and wild men were made wilder. The Presbyterians who still remained staunch to the Covenanters separated from communion with those who had accepted the Indulgences, and deliberately threw over their King. The King himself, however, Richard. Cameron and Donald Cargill, were the leaders, and they and their followers called themselves 'Society People,' and were known as Covenanters, Wanderers, Hillmen, or Whigs. The 22nd June, 1680, Cameron and Cargill with some of their men, twenty-one in all, entered Sanquhar and affixed to the market-cross a declaration that they disowned Charles Stuart as king for 'his perjury and breach of covenant to God and His Kirk.' These men did at Sanquhar, in the times of Charles Stuart, what England and Scotland afterwards did when James Stuart was king. Cameron and Cargill were marked by the Government, and at the Market Cross, in July, Cameron was killed, and when he and Hackston of Rathillete, with some of the Hillmen, were attacked by a company of dragoons. Hackston was executed at Edinburgh with a display of abominable cruelty, and Cargill, who was not at Aird's Moss, became the leader of the Covenanters. He appeared in October at Torwood, and in a great assemblage excommunicated the king, the Duke of York, the Duke of Lauderdale, and others; and, though the sentence was futile and the action altogether fanatical, the devotion to a cause consecrated in the tradition of the country made Cargill a hero in the eyes of the persecuted Whigs. He, too, was to die for the Protestant religion.

In 1681 the Duke of York appeared in Scotland, and, in place of Lauderdale, acted as Royal Commissioner. After the Act for securing the Protestant religion, the Parliament, at his direction, passed the Act which declared that the kings of the realm derived their power from God, succeeding to it by lineal descent, and that the succession could not be changed. This declaration, in favour of the Divine right of the king, was followed by the Test Act, which required every holder of office to swear that he owned the Protestant religion as set forth in the Confession of 1567, acknowledged the supremacy of the king in all causes, would not consult about any State matter without royal licence or command, and would never endeavour to alter anything in the Government of the country. Never before had the Scottish Parliament displayed such abject subservience. Eighty of the ministers refused to take the test, and left their parishes; and in January 1682, fifty of the Covenanters published at Lanark a fresh declaration, and submitted the Succession and Test Acts. The Society People were counted rebels, as they were, and were treated as such. The Presbyterianism of Claverhouse, merciless leaders of the rudest soldiers, earned infamous reputations; and, when the troubles were at an end, men continued to talk of the 'Bloody Clavers,' while they spoke, too, of the 'Bloody Boys,' and the 'Bloody Lord Nithope,' who was pitiless in his persecutions. Their victims were fined or sent to slavery, and some were shot and some were hanged. In November 1684 the 'Society People published their Apologetic Declaration,' drawn up by a young minister, which contained a warning to their persecutors that they counted them, and would punish them, as the enemies of God and His covenanted work; and they did not shrink from killing their persecutors. An act of abjuration of the Apologetic Declaration was at once prepared by the Government, and he who did not take it might be shot without pretence of trial. John Brown of Fresthill, in whose house were found bullets and a treasonable paper, was condemned to be hanged and to be put to slavery. 'Whereupon,' wrote Claverhouse, 'I caused shoot him dead, which he suffered very unconcernedly.' A few days later, though Claverhouse was not the perpetrator of the deed, an old woman and a girl were hanged as his adherents; and they would not abjure the Apologetic Declaration.

James II. ascended the throne in 1685, and the Estates expressed their gratitude for the blessings which they owed 'to the sacred race of their most glorious kings, and to the solid, absolute authority wherewith they were invested by the first and fundamental laws of the monarchy.' Acts were passed against the Covenanters, and in one it was declared that any person who preached at or attended a conventicle was to be punished with death and confiscation of goods. The accession of James marked no change of policy in the treatment of the Covenanters, and the first year was known as 'the black year.' Argyle and Rutherglen were taken in the plot with Monmouth, for the removal of James from the throne, landed in Scotland in 1685; but he received no help from the Covenanters, whose cause, at an earlier time, he had forsaken. The plot ended in failure, and Argyle was taken and carried to Edinburgh, where he was beheaded. Before he arrived in the city, the Government resolved to make sure that their prisoners, who might be in sympathy with him, were securely guarded. About 200 of the Covenanters were accordingly removed to Dunnottar Castle. Men
Covenant Theology

1. Preliminary definition. — By this term is designated a type of theological thought which expresses the relations between God and man in the form of a covenant or legal agreement, formalized and binding upon the contracting parties. It was especially common among the English Puritans, from whom it passed to their descendants in America. On the Continent it is first found among the Reformed theologians in France and again in that of the 17th century. Its best known Continental representative is Cocceius (John Koch, 1603-69), who is often wrongly said to be its author.2 Through him and his successors (Barnmann, Witsius, and others) it received its modern literarly expression, and ever since has constituted one of the recognized types of Calvinistic or Reformed theology. It is the purpose of this article to explain the nature of this type, and to give some account of its origin and history.

2. Nature of the covenant theology. — (1) The covenant idea and the covenant theology distinguished. — At the outset it is necessary to distinguish between the idea of covenant and the covenant theology. The covenant idea is common Christian property. It is an inheritance of Christianity from the OT, which frequently describes the relation between Jahweh and His people in terms of a covenant, entered into with individuals and the nation as a whole. The covenant theology describes a special type of Christian thought which gives this idea a central importance and places it not elsewhere assigned to it, and uses it as the organizing principle of the entire theological system. According to this scheme, God at the Creation entered into an agreement with Adam as the federal head of the race, promising to him and to his descendants eternal life on condition of his obedience to the Divine command that he should not eat of the fruit of the tree of the knowledge of good and evil, and threatening him with eternal death for himself and his descendants in case of his disobedience. To the same test, God entered into a second agreement with Christ as the second Adam, on behalf of the elect, promising them forgiveness and eternal life in consideration of Christ’s perfect obedience and satisfaction rendered to it, and assigning to all the gifts and graces which are necessary to the realization of this supreme blessing in experience. The covenant theology in its developed form is a scheme of doctrine in which the entire system of divinity is expressed in the terms of these two covenants, and man’s assurance of salvation based upon the fact that he is included within the latter. In order to understand its origin and significance, it is necessary to consider the problem which it was designed to solve.

(2) The covenant as a ground of assurance. — This problem was, in a word, the reconciliation of the sovereignty of God with man’s assurance of salvation. The federal theologians, as they are called, were Calvinists. Their major premise was the absolute sovereignty of God. Man, in their view, had no independent right as against his Maker. Unquestioning submission to the Divine command was his duty. Perfect obedience, were such possible, carried with it no reward, and even failure was not exacting. If, then, man was to be admitted to the Divine fellowship or assured of the Divine favour, it could be only by some voluntary condescension on God’s part, establishing by arbitrary enactment

1 So by Strong (Systematic Theology, Philol, 1897, p. 151 f.)
relations which had no necessary foundation in nature. The importance of the covenant for these theologians consisted in its assurance that such condescension had, as a matter of fact, taken place. By the covenant God not only bound Himself to a certain definite line of conduct, so far as man was concerned, but so far restricted the freedom of His own choice, but He made known to His creature the nature and conditions of His gracious purpose, and so removed the uncertainty to which he would otherwise have been exposed.

'God,' says Thomas Shepard, in his preface to Bulkleys Gospel Covenant, might have done good to man before his fall, as well as what he did without biding him hid in the bosom of the Covenant ... but the Lord's heart is so full of love (especially to his own) that, it cannot be contained so long within the bounds of secrecy, ... but must be beforehand order and break out into the many streams of a blessed Covenant.'

Arminian theologians also made use of the covenant idea, but for them it had less importance, because their view of the relation between man and his Maker was founded on natural right. Thus, Arminius, while recognizing that God dealt with our first parents by way of covenant, distinguished between the law of nature which God wrote on the heart of man, and the symbolical law, or law of precept, which deals with matters in themselves indifferent apart from the Divine command. While it is necessary to obey in either case, the latter obedience is 'far more subjection,' and 'is not so much obedience itself as the external profession of willingly yielding obedience' (Works, Eng. tr. ii. 570). To the Calvinistic theologians, on the other hand, the highest virtue consisted in submission to the will of God itself, because it was God's will, and the covenants gained their great importance because they defined the specific form which, from age to age, that will assumed for man.

This distinction explains the prominence of the covenant idea in Puritanism. Puritanism, as is well known, is a type of thought which makes much of uniformity. The Puritans believed that God had not only revealed a way of salvation, but had established words certain in themselves and laid down certain laws, by means of which this salvation was to be mediated to those whom God had chosen to enjoy its blessings. He was a churchman as well as an individualist, and valued the covenant not only as the groundwork of the regenerate assurance to the individual Christian, but as the charter which established the existence and defined the laws of the Christian society.

From this fact two further consequences follow which are necessary in the true definition of the covenant theology: (a) the covenant furnished the framework for the treatment of Christian ethics; and (b) it gave the key to the Christian interpretation of history.

(3) The covenant not the standard of Christian duty.—The use of the covenant as a standard of duty, important as it later became, is derivative, not primary. The earlier theologians knew of but one covenant between God and man, namely, the covenant of works with the Father and Son, and secondly the covenant of grace opened unto death, agreed to accept His satisfaction as an equivalent for the punishment due by guilty man, and to accept the persons of the elect as righteous for His sake. The doctrine of the lost Paradise were not brought under the covenant idea except in so far as the promise to Eve that her seed should bruise the serpent's head (Gen 3:15) was regarded as an anticipation of the later covenant of grace. In this way the covenant was extended to include all God's dealings with man, before as well as after the Fall. Two covenants were distinguished — the covenant of works made in Paradise with Adam as the federal head of the race, and the covenant of grace made with Christ, the second Adam, or with the elect in Him as their representative. In the former, God reveals the substance of the moral law as the condition which He prescribes for the attainment of salvation. In the latter, He acquaints men with the machinery which He devised for the repair of Adam's fault. But the substitution of the second for the first covenant does not render the moral law obsolete; it only alters man's relation to that law. After all, as well as before the Fall perfect holiness is essential to salvation, and not the least of the blessings of the covenant of grace is its clear repetition of the substance of the law originally promulgated in Paradise. The covenant of grace differs from the covenant of works in that it adds to the law the promise, i.e., the disclosure of the means through which Adam's original fault is to be repaired and the blessings of salvation won by Christ to be mediated to the elect. Accordingly, the covenant form of grace was given by the presentation of the substance of the moral law, institutions of worship (i.e., sacraments and ceremonies) which, varying from age to age, typify Christ, and seal to believers the grace which He has merited for them.

The literature and the covenant, therefore, is full of discussion as to the nature of the Church and of the sacraments. Since the sacraments are signs and seals of the covenant of grace, it is essential that they should be rightly administered, and that those only should be admitted to partake of them who are really entitled to the privilege. Here we find differences of opinion among those who were agreed as to the general significance of the covenant and were at one in opposition to Arminianism. Some held that the covenant form of grace was given by the presentation of the substance of the sacraments; others were willing to take a Christian profession (i.e., a dogmatic, as distinct from a justifying, faith) as prima facie evidence of right of admission to the sacraments. The controversy about the sacrament of election, which agitated New England in the latter part of the 17th and in the 18th cent., is an echo of these earlier disputes.

There was also a difference of opinion as to the extent to which the conditional language properly applicable to the covenant of works could be rightly employed of the covenant of grace. In the case of the covenant of works we have to do with a real condition. The whole significance of the agreement into which Adam entered, in consideration of Christ's promise of obedience even unto death, agreed to accept His satisfaction as an
be granted to the elect to make possible a faith of which they are incapable by nature. It would seem, therefore, that the condition of any future condition to be fulfilled on the part of the elect as distinct from Christ, and this was the position taken by some of the more rigorous Puritans. Christ, they held, was the sole party to the covenant of grace.\(^1\) Others,\(^2\) however, distinguished two covenants: the covenant of redemption entered into between the Father and the Son, and the covenant of grace made with the elect through Him. The covenant of grace, no less than that of works, they regarded as having national, the difference being that in the former case the sole condition was faith in Christ, which faith was itself made possible through the gift of the Spirit.

But, whatever difference of opinion there may have been as to the conditional character of the covenant of grace, all agreed that no one could be saved whose life did not conform to the standard which it revealed. Of all heresies Antinomiam (q.v.) was the most abhorrent to the Puritan, and many controversial tracts reveal the eagerness of the advocates of the covenant theology to clear their skirts from any imputation of sympathy with so abominable and dangerous an opinion. The assurance in which the Puritans rejoiced was indeed an assurance of salvation, of such an assurance as included ultimate conformity to the Divine law.\(^3\)

(4) The covenant as a key to the Christian interpretation of history.—Thus far we have considered the covenant theology primarily on its practical side, and we have pointed out its importance as well, since it furnished the formula for the Christian interpretation of history. The Biblical writers speak of a number of different covenants entered into by God with different individuals at different times, and we are aware of the relation of these covenants one to another. Should engage the attention of Christian theologians. Protestants were agreed that God followed a uniform method in His treatment of men, and hence could not admit any essential difference in principle between the covenants; but they could not shut their eyes to the contrast between the covenant with Moses at Sinai and the new covenant foretold by Jeremiah and the prophets, which the Apostle says was a superior, fuller covenant. How could they overlook the contrast drawn by Paul himself between the promise to Abraham and the law given by Moses. Thus, the relation between these different covenants constituted a problem of great importance, and furnished the nearest approach to a philosophy of history which the theology of the time possessed.

In general, it may be said that it was the disposition of the earlier Protestant theologians to minimize the difference between the Christian gospel and its preparation in the religion of Israel. All the Reformers recognize the contrast between the OT and the NT, and devote a section of their theology to a discussion of their differences. But they are agreed in the differences are superficial, that in substance, the two Testaments are the same. What the old dispensation shadows forth in types, the new fulfills in reality, but both alike, the OT and the NT, the law of Moses and the gospel of Christ, are to be regarded as different forms of the one covenant of grace (cf. the Westminster formula, "one covenant under different administrations," Westminster, viii. 5, 6).

With the recognition of the twofold covenant a further distinction is introduced. We have now the contrast between the breaking of any covenant of grace into between God and Adam, the substance of which requirement is repeated in the law given on Sinai, and the covenant of grace under its twofold administration, the OT and the NT. Another distinction needs us in William Ames (Amesius),\(^1\) and was further developed by Cocceius and his successors in the early part of the 17th century. These theologians, while making use of the general formula already described, distinguished within the administration of the OT, the old dispensation, and within the administration of the NT, the new dispensation, of these stages marked by characteristics of their own.\(^2\) Thus, there are the periods (1) from Adam to Noah, (2) from Noah to Abraham, (3) from Abraham to Moses, (4) from Moses to David, (5) from David to the introduction of which has its own institutions and sacraments. In like manner, the NT has its own divisions, e.g. (1) from the Advent to the Resurrection, (2) from the Resurrection to the Second Coming, and (3) the Final Consummation in the end of the world. However, it would be impossible for those theologians to do more justice to the facts of Biblical history than was possible under the more rigorous scheme of their predecessors. Robertson Smith, speaking of the federal theology of Cocceius, said: "The object of the (covenant) defects,\(^3\) i.e. 'is the most important attempt, in the older Protestant theology, to do justice to the historical development of revelation' (Prophets of Israel, Edin, 1882, p. 375).

Thus the covenant theology has a threefold significance. In the first place, it is a theory of salvation; in the second place, it is a programme for conduct; in the third place, it is a philosophy of history. The section that follows will attempt to show how the different covenants cross and re-cross in the course of the history.

3. History of the covenant theology.—(1) The antecedents.—The Biblical basis for the covenant theology is found partly in the account given in the OT of various covenants made by Jehovah with Israel\(^1\) and with representative Israelites,\(^2\) partly in the Pauline interpretation of the Christian gospel with the new or spiritual covenant prophesied by Jeremiah and other prophets.

The Heb. word 'covenant' (7273) in our versions, denotes either a treaty or alliance entered into between equals (e.g. between Abraham and the Amorites, Gen 14:14; Av and RV 'coerced a'etc.); a compact of aid and solemn promise (e.g. 'league'), or a constitution or ordinance establishing the relation between a monarch and his subjects (e.g. David and the Israelites, 2 Sam 23:6, 1 Sam 25:26). The difference of meaning is not without its bearing on the later history.

If we analyze the transactions described in the OT by the term 'covenant' (7273), we find that they fall into two classes—those in which Jehovah reveals to His servants a purpose which He has conceived independently of man, and whose execution is dependent upon no one but Himself, and those in which the conduct of the people with whom the covenant is made is a determining factor. Of the former class are the covenants with Noah and Abraham; to the latter belong the covenant of Sinai and the later covenants, Joshua (ch. 19), Hezekiah (2 Chron 29), and Josiah (2 Kings 23). The promise to Noah that day and night shall no more fail (Gen 9:27), or to

\(^{1}\) (1570-1633) Mediaea S.S. Theologer, Eug. tr. The Marrow of Sacred Divinity (London, 1618, ii. 257), following Schweizer (Reformation, 1884, ii. 447) and Schneckenburger (Vergleichende Darstellung, etc., ii. 116), regards this disposition to apply the covenant form to the different stages in the history of religion as characteristic of the Reformers theory from the first, and finds its beginnings in Bullinger and Leo Jud.

\(^{3}\) The Heb. word 'covenant' (7273) in our versions, denotes either a treaty or alliance entered into between equals (e.g. between Abraham and the Amorites, Gen 14:14; Av and RV 'coerced a'etc.); a compact of aid and solemn promise (e.g. 'league'), or a constitution or ordinance establishing the relation between a monarch and his subjects (e.g. David and the Israelites, 2 Sam 23:6, 1 Sam 25:26). The difference of meaning is not without its bearing on the later history.

If we analyze the transactions described in the OT by the term 'covenant' (7273), we find that they fall into two classes—those in which Jehovah reveals to His servants a purpose which He has conceived independently of man, and whose execution is dependent upon no one but Himself, and those in which the conduct of the people with whom the covenant is made is a determining factor. Of the former class are the covenants with Noah and Abraham; to the latter belong the covenant of Sinai and the later covenants, Joshua (ch. 19), Hezekiah (2 Chron 29), and Josiah (2 Kings 23). The promise to Noah that day and night shall no more fail (Gen 9:27), or to
Abraham that in his seed all nations shall be blessed (Gen 12:3 etc.), is obviously not in the same class with the promises which accompanied the Law to Israel. Abraham was, in the nature of the case, conditional upon the future conduct of the Israelites. Yet both alike are described by the same word. 

It is evident, however, that the reference in the prophets to a new covenant which Jehovah is to establish with Israel in the future (Jer 31:31; 32:38-39; Ez 16:60), 61:13; Jer 32:39-50; Ezek 36:24 37:22, 37:37; Hos 2:23-25, 3:3-9) is the same as that referred to by Jeremiah (Jer 31:31). Unlike the old covenant, this is to be inward and spiritual, a law written not on the tables of stone, but in the hearts of the people (Jer 31:32-34) and will be everlasting (Jer 31:34). 

The new covenant of the NT identifies with the Christian gospel, which is contrasted with the Mosaic law as the former or old covenant (Gal 4:5, He 8:10-13, 39, 5 Co 5). Like the latter, it was written not on the tables of stone, but by Jesus, the Blood of the new Law, who by His voluntary obedience and submission unto death has rendered the old sacrificial system superfluous and become the mediator of a new, an everlasting covenant. So is it in the new covenant (336º). This new covenant is symbolized in the cup which Jesus gave to His disciples at the last supper (Mt 26:28, Mk 14:25, Lk 22:15, 1 Co 11:25). It has its anticipation in the covenant of promise made by Jehovah with Abraham (Gal 3:16, Eph 2:14, Ac 3:25), which, being prior to the Law, cannot be superseded by it.

We find thus in the NT the same double usage which we found in the OT, the word δικαίωσις being used now to denote a free promise of God, as to Abraham and his seed, and later to Christian believers in the gospel, now of a series of precepts and oracles given through Moses and his successors, and conditional in their effects upon the obedience of the people.

(2) The new covenant is interchanged with that of the testament, or will—a substitution which explains the difference in usage in the Vulgate, and its literal translation in AV by the word 'testament.' (e.g. Mt 26:28, Mk 14:25, Lk 22:20, 1 Co 11:25, 2 Co 3:6, He 7:22 g, etc.).

In view of the emphasis laid by the Biblical writers upon the covenant idea, and their use of the conception to describe the different steps in the Divine training of mankind, it is surprising that it should so early and so completely have fallen into disuse in the religious thought of the early Christian writer who makes much use of it. He distinguishes several different covenants (δικαίωσις, testamentum) into which God has entered with man, and regards the study of their nature and value as a special science (Irenaeus, xi. 11; iv. 1, xxxii. 2). According to this division, God's dealing with man in the pre-Mosaic period is not to be conceived under the covenant relation, the reason being that law is not needed by those who are just (iv. xvi. 2). The Law, by which Irenaeus means the Jewish ceremonial law, was added later because of sin, and destined in time to be replaced by the Christian gospel, or new law of liberty (cf Acts 16:31; Phil iv. 1, xxiv. 4). As the ancient Church, which alone produces fruit righteousness and salvation are made possible.

We have thus in Irenaeus three distinct stages in the process of the Divine training of man—the pre-Mosaic period, typified by Abraham, in which man works out his own salvation through obedience and faith; the Law period, which gives the Law; the period from Moses to Christ, in which salvation is conditioned upon fidelity to the Jewish ceremonial law; and the period of the guarantee of the Law by the new covenant, which depends upon man's free fulfilment of the moral law, which Christ has established and reinforced with new sanctions. While, in general, the New Testament period is divided into the two later of these periods only, in principle the three belong together as stages in a single period. The new covenant in the NT is identical with the Mosaic covenant.

Thus Calvin finds the agreement (1) in the common hope of immortality; (2) in the fact that both were established by the unity of God; (3) in that 'they both had and knew Christ, the Mediator, by which they were united to God and made capable of receiving his promise.' (4) The difference consisted (1) in that the old covenant was God's personal institution; (2) the New Testament period is exhibited under the form of temporal blessings, which was not the case with the old; (3) in that the promise of the OT was not a legal promise, which exhibited 'only the image of truth, the shadow, not the substance,' whereas the OT gives us 'both the promise and the entire body'; (3) in that the OT is literal, and the NT spiritual; (4) in that the OT is one of bondage, the NT one of liberty; and, finally, (5) in that the promises of the Old Testament are for the people only, while the NT is for all. Cf. Brown, 'Essence of Christian Theology.'

2 It is instructive to compare Calvin's view with that of Irenaeus. He follows the Roman Catholic tradition in opposing the idea of a covenant in the OT, and of the two covenants, the Old and the New. He argues with him further in that he does not apply the term 'covenant' to God's primitive covenant with Adam. He differs from Irenaeus in that he brings both covenants under the conception of grace rather than of law. Irenaeus is extended backwards to include the pre-Mosaic period. In this, as we shall see, Irenaeus is typical of the development of the later covenant theology.
COVENANT THEOLOGY

In thus emphasizing the essential unity of God's dealings with His people, Calvin is representative of the Reformation. Luther, however, recognizes no difference in principle between God's dealings with His people under the old dispensation and under the new. The first specific treatise on the covenant which the present writer has been able to recover is that of the Swiss reformer, Henry Bullinger, which bears date 1534, and has for its title De Testamento sive fide Dei unice et externo. Bullinger, like his predecessors, recognizes only one covenant, namely, the covenant of grace. The nature of the covenant of grace is technical sense are to be found on German soil, and Precede the more famous school of Cocceius by more than half a century. Its representatives were Reformed theologians who, under the influence of a warm and vital piety, and developed a theology which differed in several respects from the stricter protestantism of Switzerland and France. This theology had three main characteristics. In the first place, it used the conception of the Divine covenant in the Church or the Kingdom, as a comprehensive theological idea to express the purpose at once of creation and of redemption, and to give unity to the rest of the system. In the second place, it associated this comprehensive idea of the covenant with Christ; and, in the third place, it deduced from the combination of these two conceptions, rather than from the dogma of predestination, its doctrine of the perseverance of the saints. The best known representatives of this theology were Caspar Olevianus and Zacharius Ursinus, the authors of the Heidelberg Catechism.

Olevianus's most important dogmatic monograph, published anonymously in 1585, is entitled De substantia fidei gratiae inter Deum et electos, tygique de medici, etc. This work, as the title indicates, discusses the nature of the free covenant between God and the elect, and the means through which its substance is communicated to us. The substance of the covenant consists in God's promise and oath that He will never be angry with His former. We may say, indeed, that the characteristic feature of the Reformed theology is the attempt to use legal phraseology to express its doctrine; and the question is essentially this: Why the covenant idea finds such favour with its representatives in the Protestant Church? The answer is not that such expressions and formulations voluntarily are assumed on either side, and hence not properly to be brought under the sphere of necessity.

The design of Bullinger's treatise is to show that the gospel is older than Judaism, Muhammadanism, and Catholoeism; indeed, that it goes back to 'Noah, Enoch, Seth, Abel, Adam, who without circumcision pleased God through faith.' He holds that there is no Christian virtue commended in the NT which was not equally exemplified in the words and deeds of Abraham. Cf. the citations given by Rockwell, Die Doppelte des Landfriedens Philip von Hetten, Marburg, 1871, ed. note 3.

He holds that there is no Christian virtue commended in the NT which was not equally exemplified in the words and deeds of Abraham. Cf. the citations given by Rockwell, Die Doppelte des Landfriedens Philip von Hetten, Marburg, 1871, ed. note 3.

Besides Olevianus and Ursinus, Hepp mentions, as representatives of the covenant theology, Andrew Hyperennis, Professor of Theology at Marburg from 1641 to 1654 (Methodi theologicae sive praeparationis Christianarum religionis locorum communio, Basel, 1560); Peter Boeclius, Professor of Theology at Heidelberg, died 1562 (Ezekias distinctae et humanae communio, Heidelberg, 1561); Joachim Curzen (Ezekios perpisci et ferenda praeparationis Christianarum religionis locorum communio, Leiden, 1570, 1571; editor of the first edition of the Heidelberg Catechism, 1552; and Schaff (Treatise on the Doctrine of the Church, 1853). See Schaff (Methodus theologicae, Opl. ed. 3, 1. 234 ff.); Raphael Egenolf, Professor of Theology at Marburg (Dissertatione in Deutero Thessalonicarum mysteriwm Rom. 6; De fide et gratia ex loco Rom. 28, Marburg, 1568), the author of the famous statement of the Calvinistic-Covenant theory, and P. H. J. Sturm (Christianitates doctrinae summaria capita, 1693), and Ludwig Crocius (De perperversione sanctorum libros septem dogmatis et apologetici, Brevern, 1616).

The discussion of the covenant is introduced by Ursinus between Questions 18 and 19, which deal with the mediationship of Christ, and the gospel, and includes the following sub-heads:

(1) What is a covenant? (2) Whether it can be made without a mediator? (3) Whether there be but one and the same covenant, or more? (4) In what the old and the new covenant agree, and in what they differ.

Cf. Hepp, op. cit., p. 197. It is an interesting question when the idea of the covenant of God with Adam first makes its appearance in the Old Testament, and in what it may have come to be understood. The answer is found in our canonical Scriptures. See Schaff, op. cit., p. 129.

Cf. Hepp, op. cit., p. 197. It is an interesting question when the idea of the covenant of God with Adam first makes its appearance in the Old Testament, and in what it may have come to be understood. The answer is found in our canonical Scriptures. See Schaff, op. cit., p. 129.
The covenant idea makes its earliest appearance in English history in practical rather than theoretical form, in the National Covenants entered into by the Scottish people and their rulers. These were solemn engagements, in which the nation as a whole pledged itself to be true to the Reformed faith based on the Scriptures, and interpreted with the stern literalism of the Puritan conscience. Such a national covenant is the so-called Second Scottish Confession, a practical appendix to the early Confession of Knox (1560), to which the people publicly subscribed in the year 1581. It was frequently renewed in the course of the later history, and played a momentous part in the struggles of the Stuarts with their rebellious fellow-countrymen. It is not strange that a formula so pregnant with a scheme a way should have received early literary expression. See art. COVENANTERS.

One of the earliest Scottish monographs on the covenant bears date 1596, and is by Robert Rollock (1555-1598), a scholar of the University of Edinburgh (Questiones de Responsione ait quantum de fieri Dei quod sacramentum quod fieri should be). Here already there is evidence of the connexion between the covenant and the sacrament which is characteristic of the later history. 1

English monographs were frequent during the first half of the 17th century. An anonymous treatise, bearing date 1616, is dedicated to the mayor and magistrates of the town of Faversham in Kent. 2 Like Olevianus, its author uses the covenant idea as a framework for the exposition of the Creed. His practical interest is apparent in the emphasis upon the importance of renewing one's covenant made in baptism through 'a continual repeating' of it, which takes place in catechizing the children of the faithful (p. 63). Other treatises by John Preston (The New Covenant, or a Savoy Person, London, 1616; and George Downname, The Covenant of Grace, or an Exposition upon Lk. 17-25, Dublin, 1631), are likewise practical in nature.

The theological significance of the idea is apparent in the place given to it in systematic treatises. William Ames (1576-1633) in his Medulla S. S. Theologiae (Eng. tr. Marrow of Sacred Divinity, 1642) 3 distinguishes two covenants—the law or covenant of works given to Adam in Paradise, leaving as its sequel the fall of man; and the covenant of grace made with the redeemed through Christ. Ames traces the various steps in the administration of the covenant of grace, distinguishing not only the periods before and after Christ (the OT and NF), but also, under the first, the periods from Adam to Abraham, from Abraham to Moses, from Moses to Christ; and, under the second, the period from Christ to the end of the world and the eternal reign of the saints in heaven (t. xxxvii. xxiii.). In this he anticipates the later teaching of his pupil Coccineus.

Even more detailed is the description of the covenant given by Ussher in his Body of Divinity, 4 Here the nature of the compact made by God with Adam is described in great detail, and man in the person of our first parent is declared to have professed in the Godhead between God and man playfully declared in having down the chiefest points of Christian religion, London, 1645.

1 Mitchell (Westminster Assembly, London, 1883, p. 377) cites Robert Rollock, another early Scottish representative of the covenant theology, but the present writer has not been able to verify the reference. 2 A Covenant between God and man playfully declared in having down the chiefest points of Christian religion, London, 1645.

3 Mitchell (Westminster Assembly, London, 1883, p. 377) cites Robert Rollock, another early Scottish representative of the covenant theology, but the present writer has not been able to verify the reference.

4 Mitchell (Westminster Assembly, London, 1883, p. 377) cites Robert Rollock, another early Scottish representative of the covenant theology, but the present writer has not been able to verify the reference.

The covenant idea received its first confessed expression in Puritanism. It appears in the 21st article of the 1648 Articles, 5 of which he was the author, and from thence passed to the Westminster Confession of Faith, in which it forms the subject of a special chapter (vii.). 6

The covenant was frequently discussed in the latter half of the 17th century. It appears not only in the works of the great Puritan theologians—Richard Baxter 7 (1615-1691), and John Owen 8 (1616-1683), but in many monographs by men less known to fame, e.g. John Saltmarsh, 9 Thomas Blake, 10 William Allen, 11 Edward Leigh, 12 and Daniel Williams. 13 It filled an important role in the controversies that divided the different parties in the Church, and a correct understanding of its nature and scope was regarded as one of the prime requisitions of the Church.
222 COVENANT THEOLOGY

the action of the human will. The tract of Williams, already referred to, gives an interesting picture of the questions in controversy, and the extent to which the stricter party were willing to carry their logical conclusions.

That these controversies were not confined to Old England, but speedily found their way across the water, finds interesting confirmation in a treatise of Peter Bulkeley, which appeared in London in 1616, and is entitled The Covenant of Grace, or the Covenant of God, opened. It gives the substance of sermons preached by the author in his parish in Concord, in New England. He speaks of great divisions which had arisen about the covenant, and some of the leaders called the preachers 'legal preachers,' and said that they were 'wholly ignorant of the covenant of grace, and . . . shut up under a covenant of works.' The reference is evidently to the rising Antinomianism which is associated with the name of Anne Hutchinson, 'that wretched Jezebel,' as Bulkeley calls her (p. 293). Bulkeley, who himself seems to have been a man of moderate views, gives a list of the questions in dispute, e.g. (1) whether the covenant of grace is between God and man, or only between God the Father and Christ; (2) what is the meaning of the reference to Abraham's seed in Gal 316; (3) what the covenant of Sinai was, whether of works or of grace; (4) whether justification is a condition of the covenant; (5) whether the commandment commanding faith be a commandment of the law; (6) whether faith be a condition antecedent to justification or only consequent; and (7) whether the conditional promises be as good as the unconditional ones written. It is very pertinent (p. 3).

The theoretical difference had its practical effect in the doctrine of the Church. The question here turned on how far it was possible to preserve the purity of the Church in the administration of the sacraments and ecclesiastical discipline. All but the Baptists agreed that the covenant of grace, like the Abrahamic covenant of the OT, included the children of believers, and therefore defended the practice of infant baptism. But this position raised perplexing questions as to the administration of the other sacraments. Since baptism could rightfully be administered to some who were not regenerate, why should the Lord's Supper be confined any more strictly? Why not recognize that the covenant conferred upon the children of believers certain ecclesiastical rights which extended beyond the circle of the elect, and be willing to accept a dispensational, as distinct from a justifying, faith as the sufficient ground for admission to the Supper. This point was further complicated by reference to his interesting treatise entitled The Covenant Stated—a position which brought him into a controversy with Baxter, in which he must be confessed to have been utterly helpless. It was quite impossible to make his position more straitely to defend his more exclusive position on this point.7

These controversies practical effects are seen in America. The case as to those who could rightfully be admitted to the Lord's Supper was one which agitated the New England churches during the so-called half-way covenant. The laxer practice advocated by Blake was long prevalent.2

A typical example of the Puritan treatment of the covenant is William Strong's posthumous Discourse of the Two Covenants (London, 1678), a voluminous treatise of 447 large quarto pages, the substance of which was originally delivered in the form of sermons. Comparing it with similar treatises he says: Continental writers, we notice its practical interlaced with his constant application of the points made to the different classes of people living in Strong's own day; (2) in the emphasis laid upon the obligations created by the covenant as distinct from its benefits; and (3) in its full discussion of the covenant relation of the children of believers. On the last point he leans to the views of Blake rather than to the stricter views of Baxter. He claims federal holiness for the children of the righteous as distinct from the personal holiness of regeneration, but he does not specifically apply the principle involved to the question of the Lord's Supper.

(4) Cocceius and his school.—The most eminent representative of the covenant theology is undoubtedly Jan Cocceius, or, as he is called in his Latin name, Cocceus. He was born in Bremen in 1605, studied Hebrew under Matthias Martinius, and theology under Ames and Croesus. He was Professor of Theology successively at Bremen, 1630-1638; at Freiburg, 1639-1659, where he succeeded Ames; and at Leyden, 1650-1669, where he died. He became the leading opponent and reformer of the scholasticism of his day, and by his more historical treatment of theology prepared the way for the theory of the covenant. In this attempt he found a fruitful clue in the covenant idea, which he used as the organizing principle of his system.

Cocceius' leading monograph is entitled Summa doctrinae de fide et testamento Dei, and was published at Leyden in 1648.1 After a discussion on the meaning of the word fides, or 'covenant,' he defines the covenant of God as nothing else than the Divine declaration of the method (ratio) by which God will save and of obtaining union and communion with him (Opera, Amsterdam, 1673, i. 10). It differs from human covenants in the absence of the mutual feare. God alone initiates it, yet it becomes complete only when man by God's grace hands himself to accept its provisions.2

Cocceius, like earlier theologians, distinguishes two covenants, that of works and that of grace. The sum of the former is the law, both natural and revealed, and with it the sin and guilt of Adam for all his descendants, except Christ. It was abrogated in a fivefold way: (1) so far as the possibility of its fulfilment is concerned, by sin; (2) so far as its condemnation is concerned, by Christ, as set forth in the promises and apprehended by faith; (3) so far as its terror is concerned, by the promulgation of the new covenant; (4) so far as the struggle with sin is concerned, by the death of the body; and (5) so far as all its effects are concerned, by the resurrection from the dead.

The new covenant is the agreement between the Father and Christ as the second Adam, wherein God declares His purpose, in consideration of Christ's atoning sacrifice, to save certain individuals by working in the inner man, and giving life and the gift of the Spirit, and to confirm the same by the institution of the Church, with its sacraments. This covenant is set forth in various ways, both before and after the coming of Christ. It was made known to Adam in Paradise through the institution of sacrifice, and renewed to Abel, Enoch, Noah, Abraham, and to all the people of Israel through Moses. But its most glorious promulgation was through the coming of Christ Himself in the flesh, and the full revelation of God's loving purpose which He made. In this connexion, Cocceius is led to treat at length of the difference between the economies of the OT and of the NT, and to indicate wherein the superior excellence of the NT consists.

The novelty of Cocceius' treatment consists not so much in the special ideas which he enunciates as in the detail in which they are carried out, and, above all, in the free use which he makes of the Biblical illustrations. The idea of the covenant

1 Later enlarged edd. 1654, 1669. The covenant is also treated at length in Cocceius' Summa Theologica ex Sacris Scripturis repetita (Leyden, 1662, Amsterdam and Geneva, 1669), of which the covenant of works forms the subject of the eighth book, and the covenant of grace of the fourteenth and following books.

2 Cocceius distinguishes even greater force to the more radical position taken by Baxter with reference to the Lord's Supper.
Covenant Theology

as we have seen, goes back to Cocceius' teacher, Matthias Martinius; the distinction of different periods within the OT dispensation is recognized by Ames, but there is a breath of freedom and of originality about Cocceius' treatment which gives it a more distinctively English spirit; it has been, but it was brought into the prevailing tradition of the contemporary scholasticism, and it called forth, as such innovations always do, bitter opposition upon the part of those who sat in the seat of authority. 1 Cocceius, temperate and devout as he was, soon found himself in the centre of a bitter controversy, and, what was probably the last thing in the world which he intended, the founder of a school.

Among the representatives of the school of Cocceius may be mentioned Wilhelm Monnman, 2 Johann Braun, 3 Johann van der Weymen, 4 and Hermann Witsius. 5 The treatise of Witsius on the economy of the covenants was early translated into English, and had many readers both in England and America. It is one of the best sources for the knowledge of the covenant theology in its later and more developed form. 7

After an initial discussion of the covenant in general, Witsius begins by describing the covenant of grace and the covenant of works. With the strictest contradiction of parties, the law or the condition, the promises by which it was accompanied, the penal sanction which was attached to it, and the sacraments by which it was sealed. He speaks of its violation by man and its continuing by God in favour of the new covenant of grace. Like Cocceius, Witsius distinguishes between the covenant of redemption, made by the Father with the Son, and the covenant of grace, made by God with his elect. The substance of this is set forth under the familiar theological heads of 'election,' 'effectual calling,' 'regeneration,' 'faith,' etc.; and then its different economies or dispensations in the OT and NT, with the services and ceremonies, are discussed at length.

With this treatise, the covenant theology reaches its final development. Those who come after add nothing in principle to that which has gone before.

(5) The later history.—It is not necessary to follow the later history in detail. Treatises on the covenant continued to be written both in England and on the Continent. Ezekiel Hopkins, Bishop of Wells, published a series of sermons on the doctrine of the two covenants, posthumously published in 1712, in which he declares that 'of all the mysterious depths in Christian religion, there is none more necessary for our information or more influential upon our practice than a right apprehension and a distinct knowledge of the doctrine of the covenants' (p. 2). Thomas Boston, a Scottish Presbyterian (1767-1792), wrote a treatise on the covenant of grace, which was often republished both in England and in America, and

1 Among the leaders in the attack upon Cocceius were Samuel Marsius, Professor of Theology at Groningen, and Glicerius Vorster, Professor of Theology at Utrecht.

2 De varia conditione et sta ecclesiae Dei sub tripticho economia patriarcharum ac Testamentorum Veterum ac novium (Amsterdam, 1678), 2 vol., 4th ed., 1712.

3 Synopsis Theologiae et speculacionis economiae foederum Dei ob in dioecesae sui non ad conciones comorus, Utrecht, 1675.

4 Doctrina foederum, sive systema theologica distributione et electione, Americana, 1690.

5 Summa theologica christiana, 1660.

6 De economia foederum Dei cum hominibus libri iv., 1677.

8 Others who were influenced by Cocceius were Abraham Helianus (1597-1678); Corpus theologiae christiana in xo, loco digestum, 1669; and van der Wey (Theologica utrumque copernicorum ex naturais examinate, Leyden, 1712), though in the case of both these writers the Cartesian influence is also apparent (cf. op. cit. 690 ff.).

9 A View of the Covenant of Grace, from the Sacred Records, posthumously published by his son, Thomas Boston, Boston also left some among his covenant of works, which was published in 1728, with a preface by Michael Boston.

had the rare compliment paid it of being embraced, with scarcely the change of a word; in a work written nearly a hundred years later (J. Colquhoun, 'Treatise on the Covenant of Grace')—not, indeed, without handsome acknowledgment on the part of the borrower. In the Continent, Turrettin gave the covenant idea a large place in his theology, and with his system it passed to America, to reappear in the federalism of the Princeton theologians, Charles and A. A. Hodge. It has continued down to our day to form one of the prominent tenets of evangelical Calvinism.

On the other hand, Jonathan Edwards makes little use of the covenant idea. While the covenant is occasionally mentioned in his history of redemption, the reference is incidental, and the idea exercises no formative influence upon the structure of the work. This is the more striking because of the extent to which Edwards holds fast to the main tenets of the older Calvinism. The reason is not far to seek, if we interest ourselves in the eternal law of things. Not well, but nature, was fundamental in his thought of God. To such a theology the covenant idea, born as it was of the effort to limit the Divine arbitrariness, was foreign. To orthodoxes, like Crisp and Saltmarsh, the covenant idea had long been simply a form into which the wine of a very different gospel had been poured; 5 Edwards, before all things the original thinker, was preserving a form to which there was no content to correspond. To the federal theologians, on the other hand, the covenant idea answered a real need. Their conception of freedom involved power to the contrary, and, in the case of man and God. In the former case, it was the foundation of human responsibility, and the covenant of works was conceived as a real transaction between different individuals. 6 In the latter case, it gave free scope to the electing grace of God, as we have already seen, had its significance as determining the channel within which God, in the exercise of His Divine sovereignty, had determined to confine the river of His grace. God might have acted otherwise, if He had been in the argument ran, but He was pleased to do thus and so, and this sovereign pleasure He has made known to us through the gracious covenant into which He has entered with men through Christ.

It is, no doubt, the weakening of this conception of freedom in our day which explains the falling into the background of the covenant theology. Arbitrariness, whether on man's part or on God's, is no longer the prevailing danger against which theologians are concerned to guard, and, in a world of law, other terms than those of private agreement seem better fitted to express the profoundest and most abiding relationships between God and man. It would, however, be a mistake to minimize the services rendered by the covenant theology to Christian progress. Artificial in its account of the relation between God and man, it was in reality

1 Edinburgh, 1818. Among others to whom the author expresses his indebtedness are the following, not hitherto mentioned in this article: C. E. M. Moore, Moor, Erickson, Brown, Hervey, Gill, Murhead, and Gill.

3 Locus, 1618, loc. cit., i. 1518.

5 Cf. the use of the covenant idea by Timothy Dwight, in his Theology, Explained and Defended (Middletown, 1812, i. 267, p. 207 f.).

6 Hepp (op. cit. l. 134 f.) calls attention to the difference of interest which separates the early covenant theorists and strict predestinarians, with whose teaching their system had so much else in common.

7 This incident appears with special clearness in the American federalists. Cf. A. A. Hodge, op. cit. p. 519 f., Questions 5, 9.
Covetousness—Covetousness in its most general meaning expresses an eager desire to gain some possession on which the heart is set. At first the desire, though strong, may be innocent and even commendable. Thus Caxton says (Geoffrey de Villehardon, 1489): "Strong desire and covetousness of silver and love of her lord," and Shakespeare represents the King in Henry V (Act iv. Sc. 3) as saying:

"Rope, I am not covetous for gold; Nor would I that my ditty should be lost; It yeares me not if my garments wear; Such outward things dwell not in my desires: But if it be a sin to covet honour, I am the most offending soul alive."

In the AV of the Bible the word 'covet' is commonly of evil significance, but it is also used to translate words of good import. Thus in 1 Co. 12-23 we have St. Paul's exhortation, "Covet [RV 'Desire'] earnestly the best gifts." Keen desire, however, was usually associated with unworthy objects, and Hobbes (Levithon, i. vi. 26) went so far as to call such riches (as called Covetousness) a name used always in signification of blame.

In distinction from avarice (q.v.), covetousness emphasizes the desire for things not possessed; avarice, the actual or intended hoarding of mind and spirit and life lays hold of the heart.

The evil in covetousness may be due, however, not merely to the strength of the desire, but to the fact that the object of desire is the possession of some one else. It may be able to seek to possess the spiritual insight or the Christian grace of another, for the imparting of such a gift ennobles and enriches both giver and receiver; but to desire it as a neighbour's or rival's good is to seek its deprivation.

When Ahabs coveted Naboth's vineyard (1 K 21), and David coveted Uriah's wife (2 S 11), they fell into deadly sin, and similar desires bring shame and guilt on those who cherish them. Wrong in itself, they themselves were condemned by the law as crimes. True restraint is exercised only when the rights of others are recognized and honoured.

The very spring of covetousness is found in the common experience of those who are in want; such a desire seems always most desirable. The virtues and defects of actual possessions are known by the owners, but the blessings that are beyond reach are painted by the imagination in glowing colours, and incite the heart to unadulterated desire. This tendency has led to some noble achievements, but it is also the source of amusing comedies, and of many of the deepest tragedies of life. The very opposite state of mind is happily represented in the reply that James Summater in the process of becoming a priest was asked to go to Rome and Venice:

"I suppose I ought to wish to go with you to Rome and Venice. . . . Nothing but a sense of duty will ever drive me to Rome and Venice. My difficulty is that our little back-garden, our copper beech, our weeping ash, our little nailed-up rose tree, and twisting yellow creeper" (Letters of James Sumtaker, London, 1852, p. 861).

COW (Hindi).—The belief in the sanctity of the cow, which is a very prominent feature of Hinduism, seems to have been inherited by the Indians from pre-historic times, before they and for the place of the cow in other religions, see art. ANIMALS in vol. i. p. 506 ff.
of which Mahabharata, a Hindu epic, addressed to Vasa, the personification of cows, and a kind of generating principle of the universe; and another (iv. 11) to Anadav, the primeval ox, to whom a similar function is attributed. In Vedica times the word go, 'cow,' was used to express some other ideas, and had a different import, but, rather in a mystical sense so as to suggest a mysterious connexion between them and the cow. Thus in the Naighatikas (the ancient list of Vedica synonyms, on which Yaska commented in the Nighatika) the word go, which originally and usually denotes 'cow,' is given as a synonym of (1) earth, (2) heaven, (3) rays of light, (4) speech, and (5) singer. The Earth especially was conceived under the figure of a cow, and is so represented in later mythology. This idea goes back to the Vedica Stotthitas. In a hymn, or rather a prose piece, of the Atharvaveda (viii. 10), Viraj, who 'verily was this universe in the beginning,' is extolled, and she is said to have some of the same characteristics of the cow in the following verse: 'She is the mother of all, and who milks from her the beings of their functions—the milker, the calf, and the milking-vessel being stated in each case. Paragraph 24 runs thus:

'she came to men; men called her: "O rich in cheer, cow!" of her Maa stood to brighten hers; of her Udd has gone; of her Yasti milked; from her he milked both cultivation and grain.'

This passage contains the germ of a myth which has been fully developed in the Puranas. A cow, as the sun consecrated universal monarch, desired to recover for her subjects edible plants, which, during the preceding period of anaehy, had all perished. He therefore assumed the Earth, which, assuming the form of a cow, fed from him and traversed all the heavenly regions. At last she yielded to him, and promised to feed all the world with her milk. Thereupon Prithvi flattened the surface of the earth with his bow, uprooting and thrusting away hundreds and thousands of mountains. Having made Svakshambhava Maa, the calf, he milked the Earth, and received the milk into his own hand, for the benefit of mankind. Thence proceeded all kinds of curds and milk, the resultant substance being cow-scent and cow-flavoured. By granting life to the Earth, Prithvi was as her father to his children, and the cow was the milk which had been appalled by Prithvi ('daughter of Prithvi'). Then the gods, the sages, the demons, the Kshatriyas, the Vaisyas, Priests, serpents, manes, and trees took a milk vessel and drank from their hand and milked the Earth of appropriate milk. And the milk and the calf were both peculiar to their own species.

This story is frequently alluded to in classic Sanskrit literature. In legends and popular stories the Earth is occasionally said to assume the figure of a cow, especially in times of distress, and to implore the gods for help, or to give advice to a king or queen, to whom she appears in a dream. Again, the mythical identification of the Earth with a cow furnishes the basis of many poetical conceits, e.g. that a king should milk the Earth tenderly in order to get plentiful revenue, etc. (see Yaska, sv. 29, 30; Hariva, sv. 35; Naighatika, sv. 35; Pitrs, sv. 35; Purus, sv. 35; Cauh, sv. 35.)

In the Mahabharata, a cow is mentioned as the source of numerous allusions and epithets. For example, in the Mahabharata, a cow is said to have given birth to the god Krishna, who is considered to be the embodiment of all the Vedas. The cow is also associated with the god Indra, who is said to have married a cow as his wife. The cow is also considered to be a symbol of fertility and abundance, and is often depicted in paintings and sculptures as a large, healthy, and well-fed animal. This is because the cow was believed to be a holy animal in Hinduism, and was considered to be a source of wealth and prosperity.

In the Mahabharata, a cow is also associated with the god Krishna, who is considered to be the embodiment of all the Vedas. The cow is also associated with the god Indra, who is said to have married a cow as his wife. The cow is also considered to be a symbol of fertility and abundance, and is often depicted in paintings and sculptures as a large, healthy, and well-fed animal. This is because the cow was believed to be a holy animal in Hinduism, and was considered to be a source of wealth and prosperity.
COYOTEROS—CREATION

There is also a cow-heaven, Goloka, the residence of Surabhi. Once the mother of cows practised austerities, and so pleased Brahma by her frugality that he granted her immortality and assigned her as residence a region above the three worlds, the famous Goloka, while her daughters live among men. In another account, however, Surabhi is said to dwell in Rasatela, the lowest region in the nether world, and to have for daughters the Dikpālis, or goddesses presiding over the heavenly quarters. The cow-heaven, Goloka, is frequently mentioned in the epics and the Purānas. It is described as a rich paradise, a most beautiful place of the greatest splendour and happiness, which can be attained only by the most pious and virtuous, especially by givers of cows and by their worshippers. For the cow became the centre of a peculiar connexion (Mahābhārata, xiii. 80.1-3, 78. 241.)

The devotees had to recite the names of the cows, and to bow their heads in reverence to them (ib. 78. 16), and they were enjoined to subsist only on the products of the cow, by the, using cow-dung at the time, etc. For some religious purposes the devotee has to live and to sleep among cows in a cow-pen, or to follow a cow everywhere, as did Dilipa in the story told in the second book of the Bhagavad-Gītā.

Lastly, attention may be called to the story according to which Kṣaṇa, one of the most popular gods of India, passed his youth among cowherds and became the lover of the gopīs, their daughters, especially the lovely Kṛṣṇa. This fact illustrates the high reputation which resulted from the connexion with cows, since even herdsmen were thought the fit guardians and companions of the highest god.

The reverence for the cow has not diminished in modern times. It is well known that the Hindus of the present day are filled with horror at the slaughter of the cow, which is therefore prohibited in native States under treaties with the English.

LITERATURE.—The literature is given in the Introduction.

H. JACOB.

COYOTEROS.—The Coyoteros are a tribal division of the Apaches (q.v.), said by Drake (Indian Tribes of the United States, Philadelphia, 1884, i. 424) to have been the largest and fiercest of all the Apache tribes, although, owing to the indiscriminate method in which tribal names have been applied, it is difficult to make certain that other tribes included in the name are of the same size. The original home of the Coyoteros was on the head-waters of the Gila, between that river and San Carlos; but they were of nomadic habits, and ranged through Arizona and western New Mexico. Geographically, they are divided into two groups—final Coyoteros and White Mountain Coyoteros. The greater number of them are now located on the San Carlos reservation, with other tribes of the Apaches. They took a prominent part in the rebellion caused by the discontent which followed when the Apaches were moved from their tribal grounds to a reservation.

The Spanish name Coyoteros is said to have been given to them on account of the fact that they subsisted largely on the flesh of coyotes, or prairie wolves (Hardy, Travels in the Interior of Mexico, London, 1829, p. 430, quoted by Bancroft, NR i. 474.). Ruxton (Journ. Ethnol. Soc. London, i. 95 [1850]) calls them coyoteros, or 'wolf-eaters.' It is suggested, however, that the name may have been derived from their roving and unsettled habits (Hodge, Handbook, p. 256.) Among the Apaches they are known as Palawi or Parelka (Gatschei, Yuan-Spr. I. [1883] 571, 411; ZE xix. 125.) and also as Jibitche, or the Navahos, ' on the mountain' (ten Kate, Synonymie, Amsterdam, 1884, p. 6).

In culture they did not differ materially from the other Apaches. Among the Apache tribes themselves, we have seen that they have the character of the weapons, the distinguishing mark of the Coyoteros being the method of winging the arrows. These bore three feathers on the shaft, which was of reed, finished with hard wood and dipped with iron or pitch (Creaney, Life among the Apaches, San Francisco, 1877, p. 106). Like other members of the Athapascan linguistic stock, they readily assimilated the culture of neighbouring tribes; and, just as the Lapan followed the Comanche, the Pueblan Coyoteros showed traces of Pueblo customs. Their nomadic habits, as well as the character of the country, were unfavourable to any great advance in civilization, while their habitat in Sierra Blanca was peculiarly adapted to the raids by which they pillaged the occupants of the cow-pens, and acquired food and wealth. Their captives were held as slaves until ransomed or sold. The Pinalenos earned an envious notoriety by their success in this tribal pursuit (see Bartlett, Personal Narrative of a Voyage in N. America, 1854). The Apaches are divided into clans, but these are not totemic. Their names are taken, not from animals, but from natural features of their locality. Affiliation of the clans in different tribes is recognized. A feature of this fact illustrates the high reputation which resulted from the connexion with cows, since even herdsmen were thought the fit guardians and companions of the highest god.

The Apaches displayed little care in the disposal of their dead. The method followed by the Coyoteros is described by H. C. Yarrow (A Further Contribution to the Study of the Mortuary Customs of the North American Indians, I T E B EW, 1881, p. 111 f.), who says they take the least possible trouble. A hole in the ground made by a tree stump is a stone found, and into this they cram the body, partially wrapped up. The stone or stump is then pulled back 3 days, uttering loud lamentations at intervals; but, he adds, unless they are reminded of it, this is frequently forgotten.

LITERATURE.—References to the Coyoteros are scattered throughout the literature dealing with the Apache—see above, at end of art., Apaches, in vol. 1.; cf. also especially footnotes, p. 430, in Bancroft, NR i.; and Hodge, Handbook of American Indians (All. to Bull. 50 EE, Washington, 1907), pt. 1, under 'Apache' and 'Coyote.'

E. N. FALLAZIE.

CREATION.—1. The conception in primitive heathenism.—The principle of causality is a necessary category of thought. The desire for knowledge of the nature and origin of things is inborn. It stimulates the child, wonder and Apheres, the clamorous questions of every child and savage. Primitive man is philosophical in so far as he does not take things as a matter of course, as he makes the phenomena around him objects of reflection, as he is keen to discover the meaning of things which arouse his interest. Curiosity and credulity are the characteristics of the primitive mind, and the roots of all mythology, which has not inaptly been called ' primitive metaphysics.' At the same time it has to be remembered that the childhood of the race included the maturity of the individual, and in not a few creation-
there are features which reflect the vices and passions of grown men as well as the simplicity of child. Man may freely lands him in all kinds of error and confusion; his theories are incredibly childish and whimsical.

'Savages begin ... by mythically regarding various animals, spiders, grasshoppers, toads, eagles, fowls, and others as benefactors or recoverers of the world. As civilization advances, those animals still perform their beneficent functions, but are looked on as gods in disguise,' (ib. p. 241).

Bunjil, the South Australian maker of men and things, is identified with the eagle-hawk: Cagn, the Bushman Creator, with the manis-insect; and even Brahma or Vishnu, with a boar, a fish, or a tortoise. Among the native tribes of America the hawk, the coyote, or the musk-rat is the demiurge; among others the crow, the raven, or the hare plays the chief rôle in the task of creation. If the Creator does not partake of the character of a totem or worshiphul beast, he is identified with a wizard or medicine-man. Every race has had its legendary account of the origin of things, and, while creation-myths can never be far in advance of the ideas and sentiments of a people, they may, and often do, lag far behind. Religious conservatism makes adult nations slow to put away the childish things that faith has once consecrated. If a creation-legend has found its routes over, and been incorporated into the experiences of the world, scarcely anything short of a miracle is strong enough to charm it from the popular mind.

2. The conception in civilized paganism.—All the early ideas of creation are, of course, geocentric. The 'earth is at the centre of the universe' account may be but a circle of hills and valleys known to some wandering tribe. But the great phenomena of Nature—sun, moon, and stars, day and night, storm-wind and thunder-cloud, birds and beasts and things, all having a place where, and they form the warp and woof of all cosmogonies. In spite of immense diversities of detail, there is a family likeness in the creation-myths of the world. Nothing is more striking than the parallelism of the various mythological representations of the one Divine creative energy. Even the priests were helenothists rather than monotheists, worshipping one god as if there were no other, ascribing to him all the highest attributes of deity, but without any idea of logically denying the reality of other beings. The higher god of Memphis, whom the Greeks identified with Hephæstus, was called by his priests the 'master-artisan,' i.e. the Creator. At Elephantine, in the Nile district beside the temple of Khnum, a demiurge, who moulded his creatures like a potter. At Hermopolis it was Thoth who made the world, speaking it into existence. 'That which flies from his mouth, happens, and that which he speaks, comes into being.'

The following hymns date from about 2300 B.C. (1) To Amen-Ra: "Hail to thee, maker of all things, lord of law, the father of the gods. Denunciation of the old conception of a moral, beneficent creator, whose creeds have been involved in sacrifice and anthropomorphist myth."

Unfortunately this invocation of religion in
and men, and of all living animals: intelligence and speech, whatever is in the heart and whatever is on the tongue' (Genesis, 1:26-27).

In a papyrus at Turin, the following words are put into the mouth of 'the Almighty God, the savior of all the earth': 'I am the maker of heaven and earth. I raise up the waters and the creatures which are upon it: I make the waters. ... I am the maker of heaven and earth. I raise up the waters and the creatures which are upon it. I have given to all the gods the soul which is within them. When I open my eyes, there is light; when I close them, there is darkness. I make the hours East and the hours West come into existence. I am Cheperra in the morning, Râ at noon, Tnu in the evening, Ra at night.' (ib. p. 230.)

These are the things that I wish to ask Thee, O Mazda, O beneficent Son of Creation.

The theology of Persia teaches that from the beginning the kingdoms of Ormuzd (Ahura Mazda,) 'the Lord Wisdom' and Ahriman (Angra Mainyn, 'destructive spirit') were independent of each other. Ormuzd created this material world as a kind of rampart between the two invisible realms. Heaven and its lights were first made by his word; then, in succession, the waters, the solid land, the plants, the animals, and, lastly, man. But he rival tried to undo all the work, to spoil the fair creation. He confronted light with darkness, he pitied demons against angels, and to life, love, virtue, and truth he opposed error, vice, hatred, and death. Since then, the history of the old has been the history of the conflict between the two kingdoms of good and evil, wherein this earth is the broad field of battle. See, further, COSMOLOGY AND COSMOLOGY (Iranian).

In Egypt, however, as everywhere, the mythical mingled with the religious, the irrational with the rational. See COSMOLOGY AND COSMOLOGY (Egyptian).

India.—The problem of the origin of things naturally fascinated 'the brooding mind of India,' for ages the East was 'plunged in thought,' and history is a hollow shade thrown by the deeps from the depths. Some of the hymns of the Rigveda are, if not monotheistic, at least henotheistic in their pure and lofty idea of creation. Varuna is praised as the maker of all things, and the Vedas are, on the whole, of the usual polytheistic type, and side by side with the majestic hymns of creation we find a crowd of fanciful, humorous, often obscene, myths of the making of the world, all in flagrant contradiction with every pure religious conception. See COSMOLOGY AND COSMOLOGY (Indian).

The advanced thinkers of the Vedânta accepted a sort of the theory of idealism, and carried it so far as to affirm that the world of phenomena had no real existence; to the calculated it was all illusion; only to the soul which was entangled in the deceptive meshes did it seem real. He who explained the universe by explaining it away, and they did not deem it necessary to answer the question, 'Who created man?'

Persia.—The Avesta, the sacred book of the Persians, begins with the words, 'I proclaim and worship Ahura Mazda, the Creator.' The religious poetry of Persia does not stop short of monothelism, while its mythology and theology teach a dualism of the most pronounced type. 'It is through me,' says Ahura to his prophet, Zoroaster, 'that the firmament, with its distant horizons, ... subsists without pillars to rest upon; it is through me that the earth, through me that the sun, through me that the winds take their radiant course through the atmosphere: it was I who formed the seeds in such a manner that, when sown in the earth, they should grow,' etc. (Darmesteter, op. cit. p. 258.)

Who directed the rapid course of the wind and the clouds? What skilful artist has made the light and the darkness? ... These are the things that I wish to ask Thee, O Mazda, O beneficent Son of Creation.

The theology of Persia teaches that from the beginning the kingdoms of Ormuzd (Ahura Mazda,) 'the Lord Wisdom' and Ahriman (Angra Mainyn, 'destructive spirit') were independent of each other. Ormuzd created this material world as a kind of rampart between the two invisible realms. Heaven and its lights were first made by his word; then, in succession, the waters, the solid land, the plants, the animals, and, lastly, man. But he rival tried to undo all the work, to spoil the fair creation. He confronted light with darkness, he pitied demons against angels, and to life, love, virtue, and truth he opposed error, vice, hatred, and death. Since then, the history of the old has been the history of the conflict between the two kingdoms of good and evil, wherein this earth is the broad field of battle. See, further, COSMOLOGY AND COSMOLOGY (Iranian).

Lagarde and other scholars have strongly maintained that the first cosmogony in Gen. 1 is in some respects dependent on the Persian creation-story, particularly as regards the order of events; but it is generally admitted that the account of creation on Israel did not begin till after the time of the writing of the Priestly Document to which Gen. 1 belongs. Do that as it may, the Persian dualism with its eternal contrast of light and darkness, good and evil, has its obvious parallels in the Israelitish conception. Another view, perhaps, is that the shrewd thinkers like J. S. Mill have thought that the defects of the universe can be best explained by supposing the Creator hmpered through the inefficiency and insubstantialness of the materials with which he had to work (J. S. Mill, Three Essays on Religion, Lond. ed. 1869, pp. 178, 180).

Greece.—See COSMOLOGY AND COSMOLOGY (Greek).

3. The Biblical conception.—The OT has three types of ideas regarding the Creation, embodied in three strata of its literature. (1) The first is found in Gen 1:26-27. The opening words, and the fresh echoes of the ancient writing (J) to which it belongs. It is full of naive anthropomorphisms, representing God as moulding, breathing, planting, walking, and it undoubtedly has a background of popular mythology. But the writer adorns whatever he touches, transfiguring old legends with a new spirit, so that 'in depth of moral and religious insight the passage is unsurpassed in the OT' (Skinner, Genesis, 52). There is no attempt here to represent the creation of heaven and earth; the universe is taken for granted; speculation is not yet advanced enough to grapple with such magnitudes. The whole interest centres in the making first of man, and then of a pleasant and fruitful place for his abode. See, further, COSMOLOGY AND COSMOLOGY (Heb.).

(2) Another type of creation doctrine is found in the Deutero-Isaiah. It was the mission of this prophet to comfort Israel in her exile, and he fulfils it by giving her a lofty conception of God the Creator. He teaches that Jahweh is not merely the God of Israel, but the only God, who brought all things into being by a free act of creation. 'Who hath measured the waters in the hollow of his hand? ... Lift up your eyes on high, and see who hath created these' (Is 40:12). Jahweh is greater than the infinite sea and sky. It was this prophet who made the creation of Jahweh a fundamental Jewish belief, and it is to be noted that in his doctrine there is not the faintest echo of the old creation-legends, not the remotest suggestion of a primordial chaos, or of a conflict between light and darkness, to say nothing of a slaying of 'dragons of the path.' As if to lay the ghosts of all such anticipations, he makes the God of creation say: 'I am Jahweh, and there is none else. I form the light, and create darkness; I make peace, and create evil: I am Jahweh, that doeth all these things' (Is 45:7).
Pure religion has gained an absolute victory over mythology.

(3) The third type of cosmology is found in Gn 1. This majestic prologue to the Bible belongs to those Priestly Writings (I) of the post-exilic period. The whole passage is known as the Hexam- 
touch. Our interpretation of the opening sentences is affected by our solution of a difficult and delicate problem of syntax. Most scholars now rend the passage thus:

‘When God created to make the heaven and the earth—the earth being without form and void, and darkness being upon the face of the deep, and the spirit of God brooding upon the face of the waters.’

Let there be light, and there was light.

If this exegesis is correct, the writer teaches a dualism. He thinks of a dark watery chaos existing before the creation began, and gives it the mythical name Télων (‘the Deep’), which is evidently the Heb. equivalent of the Bab. Tiemát. This is the first of many parallels between the two famous Babylonian tablets, to which no one has the least right to appeal.

See, further, COSMOLOGY AND COSMOLOGY (Heb.)

The doctrine of a creation out of nothing—ex nihilo—is nowhere expressed in Holy Scripture. The first and only approach to it occurs in the words of the mother of the Godhead referred to in the New Testament (Rev 12:1-2). Here, without doubt, the distinction is made from the Greek doctrine of the creation of the world ‘out of nothing’, which is expressed in various ways in the scholastic philosophy of the thirteenth century. Here, in the NT, the Divine creation of the world is presupposed in many sayings of our Lord and His Apostles, as in those which mention the foundation of the world (Mt 25:31, Mk 11:24, Jn 17:24, Eph 1:1, He 4:13, 1 P 1:20), the creation of man and woman (Mt 19-24, Ac 17:26, 1 Ti 2:15), and those which represent Him as the Maker of heaven and earth (Mt 11:25, Lk 10:22, Ac 17:24), the Source of all things (Ro 11:36, 1 Co 8:6, Eph 4), the Father who through the Son made the world (Jn 1:1, Col 1:16-18, He 1:3). Faith grasps the fact that the worlds have been framed by the word (phiān) of God; so that what is seen hath its counterpart of things which do appear: (αὐτοῖς ἐκ φανμένων, He 11:3).

4. The Greek conception.—While the old cosmogonic myths were fading in the light of the pure religion of Israel, the wise men of Greece were thinking into the Greek mind a great decisive step which the Ionian cosmologists took once for all. Aristotle shows, in the substitution of impersonal causes acting according to law in place of personal causes acting arbitrarily. Barrow expresses the matter by simply saying that they ‘left off telling tales.’ This was the beginning of a new era in the evolution of thought, and ‘history teaches that science has never existed except among those peoples which the Greeks have influenced.’ (Early Greek Phil., 1892, pp. 8, 27). For details of Greek speculation, see COSMOLOGY AND COSMOLOGY (Greek).

5. The dogmatic conception.—Till recent times the Church’s doctrine of creation was based on the acceptance of Gn 1 as literal history, and particularly on an ungrammatical exegesis of the first three verses.

Most of the Fathers, the scholastics, and the Protestant theologians believed that the world was miraculously created out of nothing, in six days, some six thousand years ago. This was a truth of revelation, which closed all questions. Luther comments on Gn 1, that ‘Moses is writing history and reporting things that actually happened’ (Dissertatione De Divitis mundi, D. 1674). Calvin, however, says that a history of the creation should exist, and he rejoices a story of Augustine’s about ‘a good man, who, when some one politely asked ... what God did before the world was created, answered: He made a hell for the inquisitive’ (Instit. i. xiv. 1). But the doctrine of creatio ex nihilo cannot be necessarily manifested by the writer, rather, as we have seen, teaches a dualism.

This was, indeed, the explicit doctrine of some of the early Fathers, who remained in closer touch with the Jews, and therefore correctly interpreted the passage in question. Justin Martyr, quoting Gn 1:3, says that Plato (whom he accuses of attacking Moses) and his followers and ‘we ourselves’ have hence learned that ‘through the Word of God the whole world came into existence out of things subjacent and before declared by Moses’ (Apol. 1:59). Clement of Alexandria also maintained that Plato took from Moses his doctrine of a formless matter, expressly referring for the latter to Gn 1:1 (Strom. v. 14).

But Christian thought could not rest in a dualism, whether Mosaic or Platonic or Gnostic. The doctrine of an eternal matter was seen to be a dangerous rival to the doctrine of the eternal Logos, and almost with one accord the theologians tried to demolish the pagan conception of an uncreated ὄλθες. With the LXX or the Vulgate instead of the Hebrew text before them, they honestly counted the Septuagint, distinguishing Moses as a mystic doctrine of the creation of the world from their side, they still naturally based their doctrine upon reason. They were Christian philosophers meeting other philosophers on common ground. Their arguments have been restated in C. M. Walke’s recent book, The Doctrine of Creation (1910). ‘God alone is without beginning’ was the thesis they defended. If matter were uncreated, it would be equal with God—a second God. If there were two first principles, they would be—to repeat an eternalist—‘trinity’, and the third would be the ultimate principle. Plainly the one must come from the other, and, yet more plainly, matter from God rather than the reverse. ‘To be Lord of all, God must have created matter. If it were uncreated, the world could not be constructed out of it, for it could not be receptive of the qualities which God wished to impose upon it, unless God Himself had made it such as He wished it to be. That which is capable of being made in God must itself have had a wise and skilful Maker.

These arguments are certainly sufficient to prove the dependence of all things upon God, and the derivation of all things from God. But the affirmation of a time—of rather an eternity—in which God was not a Creator, in which the universe was non-existent, is another matter. Some of the greatest minds found it impossible to conceive such acimonism. Origen held that before the creation of our world God had created others, as He could create others after ours, without beginning or end; that matter, or the substance underlying all the successive worlds, is eternally created (de Principi. III. v. 3-4). Augustine had the deep and pregnant thought that the preservation of the world is a continuous creation (de Civ. Deli. xii. 25). Scotus Erigena, the profoundest thinker in the Middle Ages, taught that God’s working is equally eternal with His being; that creation is involved in His essence; that He necessarily manifests Himself in the world; that He precedes it not in time but only in the idea, as its cause (de Divisione Naturae, iii. 25). Thomas Aquinas confessed that reason could only be satisfied with the assumption that the world had no beginning. The world, he held, was the Deus creatum mundi, the cause must apparently always have its effect; and that the doctrine of a beginning, or the non-eternity of the world, is to be
CREATION

received sola fide, by an act of pure faith, in deference to authority: 'Mundum non autem demonstrabile vel soliho' (c. Cent. II. 38; Summa, i. 46. 104). The Theologian Germaine has this profound passage: 'It belongeth unto the Will, and is its property, that it should will something.' What else is it for? For it were vain to think there is a work beyond and this cannot have without the creature (or creation).

Therefore there must be creatures, and God will have them, to the end that the Will may be put in exercise. This is expressed in a different manner, and by a different 'io,' in the last place. Jacob Boehme likewise conceived that a hidden will, which did not become present to itself in the object of its creation, would not attain to manifestation for itself, and so would remain unconscious.

6. The philosophical conception. Philosophy entered into the matter of the creation when it ventured to ignore and then to repudiate the orthodox doctrine of creation. For a time it claimed its independence very modestly and tentatively. It seemed still content to bend the knee to authority. Boethius made a distinction between one who philosophizes according to the sense alone, and 'Sacred Writ'—the former representing matter as 'self-existing,' the latter as from 'God.' That 'matter was everything, yea, knows not God, nor faith,' and it is 'one to which those philosophies could not rise' (Works, ed. Spedding, v. 491). Descartes introduces his revolutionary ideas in the humblest tone. 'It may be believed, without discredit to the miracle of creation, that the nature of things purely material is much more easily conceived when they are beheld coming ... gradually into existence, than when they are only considered as produced at once in a finished and perfect state' (On Method, v. 118. Locke did not feel justified in rejecting the doctrine of creatio ex nihilo. He maintained that the impossibility of conceiving the making of something of which no part existed before cannot be regarded as a reasonable criterion to set a limit to the operations of an infinite Mind. To him the existence of an extra-mundane Creator was capable of demonstration. Its evidence, if he was not mistaken, was equal to mathematical certainty (Human Understanding, iv. 10). Such demonstrational processes were during the times of Natural Religion, and Coleridge, not without reason, complained that men had come to regard the relation of the Creator to the universe in the same light as that of a master to his work. Such mechanical determinism, if mechanical, was Spinoza who led philosophy into more fruitful fields. As opposed to those mechanical conceptions, 'the developed idea of God as the omnipresent life of the world, constantly operating in and through natural laws, is common to educated theism with pantheism, and is what modern theism owes to pantheistic exaggeration' (Fraser, Phil. of Theism, p. 53). Spinoza regarded the traditional theory of creation as making the nature of God arbitrary and the existence of the world a matter of chance. He therefore entirely rejected it. For, though its natura naturans, or Nature active, may in a manner be called the Creator of his natura naturata, or Nature passive, these are consubstantial and co- eternal, neither before nor after the other. There is no beginning in the universe; there can be no end. The existing order of things is the only one possible, and in its involuntary evolution it flows from its cause, the one in irregularity with the permanent necessity with which the angles of a triangle are derived from the triangle. Fichte follows Spinoza in emphatically repudiating the doctrine of creation, calling it the 'root error of all false metaphysics and dogmatism,' which perverts the idea of God from the outset, investing it with caprice, and changing thought into a dreaming play of fancy ('ein träumendes Phantasiren,' Werke, 1845, v. 479). Hegel regards the content of the act, not but fills it with a new content. 'God,' he says, 'is the Creator of the world; it belongs to His being, His essence, to be Creator; in so far as He is not this, He is imperfectly conceived. Creation is not an act of being, and this is what belongs to the idea belongs to it as an eternal moment or determination' (Werke, 1832, xii. 157 f.). 'God does not create the world once; He is the eternal Creator. This eternal self-revelation, this actus, is His notion, His designation' (v. 181). 'Ohne Welt ist Gott nicht Gott' (xi. 122). Schleiermacher felt that the idea of a beginning of God's creative activity places Him as a temporal being in the domain of change. He regarded the work of God as Creator as the same as Preserver, and the two together as identical with the totality of causation in Nature (Der christl. Glaube, 1889, i. 294-297).

All the English Idealists agree in identifying the Creation with God's self-manifestation, which they regard as an eternally necessary moral act.

'it is of the very essence of mind or spirit,' says John Caird, 'that it contains in it the necessity of self-manifestation. The term, self-manifestation, and that which we speak of as the "unification of the world" must be conceived as the expression not of arbitrary will, but of the very nature and being of God.' (Final Ideas of Christianity, i. 84 f.). Green expressly expressed the same profound thought more directly by saying that the world is as necessary to God as God is to the world. The words of two leading German thinkers will show how the later philosophy and theology and have welcomed the new conception:

'we do find,' says A. G. Fraser, 'that the presence of order and design within the cosmos means that the cosmos must have had a beginning. That the universe should exist without either a beginning or end, is more than any man or his God could do. The cosmos does not seem less consistent with the ideas of theism and providence, than the hypothesis of its sudden creation in time—whatever that may mean. ... We seem to be born into an unending and unending divine natural evolution' (Phenomena, pp. 125, 133).

We cannot do better than close this section with the calm pronouncement of the Nestor of Scottish philosophy:

'The will to create,' says Lotze, 'is an absolutely eternal predicate of God, and ought not to be used to designate a deed of His, so much as the absolute dependence of the world on His will, in contradistinction to its voluntary emanation from His nature' (Out. of Phil. of Rel. 74). 'It is a nauseous representation,' says Lipsius, 'to trace creation back to a single act now lying in the past, or to speak of a first beginning of creation; rather is the whole world-development, so soon as it is viewed religiously, to be brought under the idea of creation, consequently to be regarded as without beginning or end' (Dogmatische, 259).

7. The scientific conception. Science has widened man's cosmic view and increased his cosmic emotion. His doctrine of creation is transfigured in the light of astronomy and geology, biology and palaeontology. His vision of the making of this world at a certain recent time, and of the rest of the universe with it, is replaced by a grander vision of the slow and progressive formation, by the action of physical forces, of a universe in which countless new worlds are being formed to-day and will be formed to-day for many ages to come, and into which the sun—was formed hundreds of millions of years ago. His idea of a primeval chaos, which found expression in all his antique cosmogonies (as in Gn i.), is discarded for the conviction that, when he goes back as far as the material necessities of this universe, he, this universe, however changed in aspect, is still a cosmos. And his old belief that 'there are just as many species of plants and animals as there were different forms originally created by the Infinite Being' is lost in the great realization, according to the laws of reproduction imposed
upon them, produced others, but always forms like themselves' (Linnaeus), has yielded to 'a view of life, with its several powers, having been originally breathed by the Creator into a few forms or into one; and, that, whilst this planet has gone cycling on according to the law of gravity, it has, from so simple a beginning endless forms most beautiful and most wonderful have been, and are being evolved.' (Darwin, Origin of Species, p. 402).

The progress of science, as Driver frankly admits, 'has brought the hypothesis of Genesis into sharp and undisguised antagonism with the Cosmogony of science, . . . and to expect to find in it supernatural information on points of scientific fact, is to mistake its entire purpose' (Genesis, p. 35).

There is no fact of cosmogony of science that is in conflict with that conception of 'a great and good Maker of the world' which is found at the heart of so many primitive and savage religions; or with Isaiah's idea of a Creator who 'hath measured the waters in the hollow of his hand, and meted out heaven with the span, and comprehended the dust of the earth in a measure, and weighed the mountains in scales, and the hills in a balance (Isa. 40:12, 15).

'The Great Original' can no longer be conceived as a Demiurg or Master-builder, putting forth His power once and then staying His hand; His creative action is spread all along the line of gradual development, revealing itself in ever higher potencies. And in place of a God beyond the stars, who created the world once upon a time and was content with 'seeing it go,' we have a Spirit who is 'closer than breathing, and nearer than hands and feet.'

Further research into the ultimate nature of matter seems destined to upset many hypotheses. 'There is nothing,' said Lord Kelvin, 'between absolute scientific belief in a grand but passive power, and the theory of a fortuitous concourse of atoms. . . . If you think strongly enough, you will be forced by science to the belief in God which is the foundation of all religion' (The Watcher, June 1903).

And now, even the atomic theory of the origin of things, after a vogue of more than 3000 years, is at length being cast aside, for it is suggested that the 'atoms of matter,' instead of being ultimate, 'are liable . . . to break up or explode, and to resolve themselves into called electrons, which again are described as 'knots or twists or vortexes, or some sort of either static or kinetic modification, of the ether of space' (Life and Matter, 22, 23). Either 'is probably the fundamental substratum of the whole material world, underlying every kind of activity, and constituting the very atoms of which our own bodies are composed' (The Substance of Faith, 74).

The scientific idea of creation as involution and evolution has thus brought us nearer than ever to 'the Mind which, like our own, must underlie the material fabric,' the Nous of Anaxagoras. 'The process of evolution can be regarded as the gradual unfolding of the Divine Thought, or Logos, throughout the universe, by the action of the Spirit upon matter' (Bab.-Assyr., 147). And we have seen who 'recognize in this extraordinary development a contact between this material and spiritual power, a contact which has been expressed in the Timaeus: 'Let me tell you, then, why the Creator created and made the universe. He was good, and desired that all things should be as like Himself as possible' (Jowett, iii, 43).

The scientific conception of creation has important bearings upon religion. It has at once made God greater and brought Him nearer. It has not only immeasurably expanded the heavens which declare His glory, but it has substituted the action of an immanent for the action of a transcendent Creator. 'The general effect of the intellectual movement of modern times, says J. Fiske, 'has been to discredit more than ever before the Latin idea of a powerful and all-controlling universe and occasionally interfering with it.' (Through Nature to God, 147).

The 'Great Original' can no longer be conceived as a Demiurg or Master-builder, putting forth His power once and then staying His hand; His creative action is spread all along the line of gradual development, revealing itself in ever higher potencies. And in place of a God beyond the stars, who created the world once upon a time and was content with 'seeing it go,' we have a Spirit who is 'closer than breathing, and nearer than hands and feet.'

**Creeds and Articles**

**Creeds (Bab.-Assyr.)**—Though the religion of Babylonia and Assyria was practically homogeneous, there were probably nearly as many different ideas of the gods and the nature of the universe as there were provinces; and the creed of the people became modified from time to time, either through the progress of thought or on account of political exigencies. These changes in the beliefs of the people, which sometimes bore upon a large scale the lines of the secondary, and in some cases as such to form either important variations in the original creeds, or transformations such as might have made a fresh statement of their position needful.

Notwithstanding that this was the case, it is not certain that in any of the centres of religions teaching the priests ever thought of putting forward anything in the nature of a creed, as we understand the word today; indeed, no document in which they have formulated the articles of their belief has yet come down to us, except the well-known legends of their gods (which, however, are more of the nature of popular tales and traditions than formalizations of the gods). They have formulated a statement of their religious beliefs, however, would not by any means have been either an impossible thing or anything little else than the original proclamations. Of course, and seemingly all at periods, they declared their creeds in the names they bore. Thus, in the time of Lugal-anda and Uru-ka-gina (c. 4000 B.C.), we meet with names similar to the following: *Sumer-Dumuzi, 'servant of Tammuz'; Enina-Surupak 1-siut, 'the word of Surupak is true,' or the

1 Or Sukurna. This was the god of Surippak, or Suruppak, now Fara, which was the city of Ut-napishtim, the Babylonian Noah.

**Hebrew.**—See 'Jewish.'

** Parsi** (N. Soderblom), p. 247.
CREEDS

like; Amaalaras, 'the corn-god's steer,' etc.; and names of the same character continued to be used all through the succeeding periods. During the early Semitic period (2000 B.C.) there occur names which appear as Ashur-tiku, 'he was not the god'; Sammu-ila-Šamaš, 'if my god were not the sun'; Sin-lā-šan, 'Sin (the moon-god) has no equal'; Zēr-pitamumum, 'Zer-pitamum is my mother'; Yaru-šu, 'Jah is God'; Nabu-šu, 'Nabu is God.' In Assyrian literature we likewise find such names as Aššur-taklā, 'I trust in Assār'; Tutultu-Ninip, 'my trust is Ninip,' with its synonym Tutultu-apli-Šarra (Tiglath-pileser), 'my trust is the son of E-Sarra'; Ugur-šan, 'the word (or command) of Ea'; Sin-šanah, 'Sin is our mountain (of defence), etc.' Some names express belief as to the identity of divinities—possibly in opposition to those whose creed was different; for instance, Nabu-gid, 'Nebu is Jah'; Ya-bašarum, 'Jah is Dayton'; and such names as Yašā główni, 'Jah is our father,' form an interesting series. The Babylonians, like all the Semites, were intensely religious, and seldom objected to asserting their creed; indeed, some of these names show that the early Semites in general announced it boldly, and that what men called themselves became, as it were, a challenge to such as they regarded as heterodox.

Naturally, these are very short statements of creed. A faithful recounting in modern English of the many of the thirty or forty other longer ones are likely to be found. Sometimes, however, it seems to have been considered necessary to make some kind of a statement before beginning the utterance of an incantation. This took the form of a recital of principles or maxims or rules of a certain event, which justified the mystic words and the ceremonies which were to follow. Among these are the stories of the various evil spirits, the poetical description of the vine of Ėridu, and the primitive account of the Creation prefixed to, and forming part of, the incantation to toothache. The composition most like a creed, however, is that known as the mystical story of the Creation, which is prefixed to an incantation for purification:

Incarnation.—The holy house, the house of the gods, in a holy place had not been made;
A plant had not been brought forth, a tree had not been planted;
A brick had not been laid, a beam had not been shaped;
A city had not been built, a city had not been constructed;
A city had not been made, the inhabitants had not been installed (1);
Ninebuildings had been built, E-sara1 had not been constructed;
Erech had not been built, E-anon2 had not been constructed;
The Ayes had not been made, Enidu had not been constructed.
The holy house, the house of the gods—its seat had not been made;
The whole of the lands were sea;
When within the sea there was a stream, In that day Ėridu was made, E-sagila was constructed—
E-sagila, which the god Lugalsu-šanga had founded within the Aymes.
Babylon was built, E-sagila was completed;
He made the gods and the Aannakk altogether,
The holy city, the seat of their heart's joy, as supreme he proclaimed,
Marsh bound together a reed-bank before the waters,
He had made and cast east and west the bank, To settle the gods in a seat of joy.
He made mankind.
Amar made the seed of mankind with him.
He made the beasts of the field and the living creatures in the desert;
He made the Tigris and the Euphrates, and set (them) there. With his hands he proclaimed:
Iher, the marsh-plant, the reed, and the thicket, he made;
He made the verdure of the plain;
The above-mentioned rivers were the reed-bank.
The cow, her young, the steer; the sheep, her young, the lamb of the fold;
Plants, trees, and all sorts of forests also.
The goat and the wild goat were dear (2) to him.
Lord Marduk made a bank on the sea shore, (3)
[which at first he made not, he caused to be.
(1) The temple at Niffer.
(2) The temple at Erech.
(3) Or, 'as being good.'

He made [the plant], he made the tree—
Everything he made there—
He laid the brick, he made the beams;
He constructed the house, he built the city;
He built the city, he established the community;
He built the city Niffer, he built E-sara the temple;
He built the city Erech, he built Marduk (ib. 1524), etc.;

Here the obscure breaks off, and, where the text becomes illegible again, on the reverse, it is an incantation for purification, similar to incantations found in Assyrian literature.

It seems probable that the other centres of Divine worship in Babylonia had similar statements of the creed held in the place, and this presupposes theological schools and colleges for the priests. At present we do not know, however, anything about them; but the temple-libraries may ultimately yield information upon the point, together with statements of their beliefs similar to that translated above.

T. G. PINCHES.

CREED (Buddhist).—Nearly six centuries before the birth of Christ, at a time when religious animism and subsequent idolatry were rife, the son of a Sakyu chieftain, went forth from his home to 'seek after what was right.' Reverence and affection for the founder of one of the world's greatest religions have led his disciples, during many centuries, and in different Eastern countries, to embellish, in apocryphal literature, the story of Gautama's life and teaching. But it is beyond doubt that the scheme of life, religious faith, and moral standards attributed to the founder of Buddhism represents his actual teaching. In regard to this the greatest authorities on Buddhism are agreed.

When it is recollected,' says Rhys Davids, 'that Gautama Buddha did not leave behind him a number of deeply simple sayings, from which his followers subsequently built up a system or systems of their own, but had himself thoroughly elaborated his doctrine, partly as to details, after, but in its fundamental points even before, his mission began; that, during his long career, he had another, not his own, as it were, a cloister, a place of retreat, a sanctuary; that he was not a prophet, but a sage, a philosopher and thinker, speaking on principles and details of the system over and over again to his disciples, and to test their knowledge of it; and finally, that his leading disciples were, like himself, devoted to the subtlest metaphysical distinctions, and trained to that wonderful command of speech which Indian philosophers had; that when these facts are recalled to mind, it will be seen that more reliance may reasonably be placed upon the doctrinal parts of the Buddhist Scriptures than upon the more legendary late records of other religions (Buddhism, p. 861).

Odenberg (Buddhism, p. 315, Eng. tr.) speaks to the same general effect: 'On the whole we shall be authorized to refer to Buddha himself the most essential traits of thought which we find recorded in the sacred texts, and in many places it is probably not too much to believe that the very words in which the ecstatic of the Sakyu house preached his gospel of deliverance have come down to us as they fell from his lips. We find that, throughout the vast complex of ancient Buddhist literature which has been collected, certain notions and allusions, the expression of Buddhist convictions upon some of the weightiest problems of religious thought, are expressed over and over again in a style which has been adopted everywhere. Why not may not these be words which have received their currency from the founder of Buddhist Buddhism, which have been spoken by him hundreds and thousands of times throughout his whole life, devoted to teaching?

In the valley of the Ganges, the birthplace of Buddhism, this was, at the time when the new religion came into being, a maze of interacting ideas, which Rhys Davids (Early Buddhism, p. 28) has classified as follows: (1) The very wide and varied group of ideas about souls supposed to dwell within the bodies of all living beings, and to animate moving objects in Nature (trees and plants, rivers, planets, etc.). These may be summed under the convenient modern term of Animism. (2) We have later and more advanced
ideas about the souls supposed to animate the greater phenomena of Nature. These may be summed under the convenient modern term of Polytheism. (3) We have the still later idea of a unity lying behind all these phenomena, both of the first and of the second class—the hypothesis of a one First Cause on which the whole universe in its varied forms depends, in which it lives and moves, and which is the only reality. This may be summed under the convenient modern term of Monism. (4) We have the opposite view. In this the First Cause has either not been reached in thought, or it has been considered and deliberately rejected; but otherwise the whole soul-theory has been developed. The hypothesis of a unity of the ether is that the eternity of matter is held at the same time. This may be summed under the convenient modern term of Dualism.

In modern terms, though useful for classification, never exactly fit the ancient Eastern thought. And we must never forget that the clear-cut distinctions we now use were then perceptible to only a small minority of the ancient thinkers. Most of the people held a strange jumble of many of the notions current around them. The enumeration of these points merely aims at showing that, when Buddhism arose, the country was seeking, very much as the Western world is at the present day, in the multitude of questions—ethical, philosophical, and religious. There was much superstition, no doubt, and no little sophistry. But, owing to the gradual disenchantment of those who were, partly also to the mutual courtesy and intellectual alertness of the time, the whole large proportion of the people who were earnestly occupied in more or less successful attempts to solve the highest problems of thought and conduct (16, p. 24).

Traces of the influence of all these ideas upon his mind can be found in the teaching of Gautama, but the current beliefs satisfied neither his nature nor his aspirations. In two authoritative texts he reveals the reasons why prevailing beliefs were impotent to satisfy him, and why he set himself to understand the fountain-head of truth.

The first is as follows:
"An ordinary unenlightened man, though himself subject to rebirth, old age, disease, and death, to sorrow and vexation, I am not subject to these... What? Why should I set forth? Let me, when subject to these things, see the danger therein, seek the way out of it, and which is not subject to these, even the supreme bliss and security of Nirvana" (Dhpatsara, 1.160).

The other text says:
"Before the days of my enlightenment, when I was still only a Bodhisattva, though myself subject to rebirth, old age, disease, and death, to sorrow and vexation, I was not subject to these. Why should I set forth? Let me, when subject to these things, see the danger therein, seek the way out of it, and which is not subject to these, even the supreme bliss and security of Nirvana" (Maghantar, 1.163).

After having followed, to no purpose, the paths of metaphysical speculation, of mental discipline, and of the ascetics, Gautama resolved one moonless night, the fruit of his prolonged spiritual effort, the truth of things being of a suddenly so clearly revealed to him that he could not for a moment from devotion to his creed and to the mission that it imposed upon him.

The enlightenment which Gautama received, and which was regarded by himself and his followers as a victory over all the powers of darkness, is uniformly described as:
"a mental state of concentration, bliss, insight, altruism. The different Suttas emphasize different phases, different facets, as it were, of this condition. But they regard it as one and the same upheaval of the whole mental and moral nature,—with emotion, and intellect being equally concerned. Thus one Sutta (the Mahabodhi pariniravanai) describes the three forms of Knowledge; another (the Dvedvadha-vakika) in the certainty, the absence of doubt; another (the Dhamma-theravada) on the will, another (the Aryan, parivaraya) on the bliss and security of the Nirvana to which he has attained."

In the face of these Suttas the rectal ends:
"When this knowledge, this insight, has arisen within me, my heart was set free from the intoxication of doubts, set free from the intoxication of ignorance. In me, thus emancipated, there arose the certainty that suffering is real, and I came to regard birth as it is an end. The higher life has been fulfilled. What had to be done has been done, and the future life then is no longer to be expected."

This last insight did I attain to in the last watch of the night. Ignorance was beaten down, insight arose, darkness was destroyed, the light came, inasmuch as I was there serenely, as an angel, master of myself" (Rhys Davids, Early Buddhism, p. 32).

Having received enlightenment, Buddha proceeded to Benares. There he met some of his former disciples, the five ascetics, and explained to them the fundamental teaching of his exposition preserved in the Dhammakakka-pavattana Sutta, the Sutta of the Foundation of Righteousness.

This exposition is described as "Turning the wheel of the Law," which, while retaining the Buddhist figure of speech, fails to represent the idea the figure was meant to convey; the rendering in the Tibetan gives up the figure as having no underlying meaning. The "cakra" (Pali cakka) is no ordinary wheel; it is the sign of dominion; and a "cakravartin" is he who makes the wheel of the universe, and of righteousness, turn. The eternity of matter is held at the same time. This may be summed under the convenient modern term of Dualism.

The full text of the Sutta is as follows:
"There are two extremes which he who has gone forth ought not to follow—together with ascetic and sensual indulgence, or to the passions, to the pleasures of sensual things, a low and pagan asceticism (of seeking knowledge and principle) for the worldly-minded; and habitual devotion, on the other hand, to self-morification, which is painful, ignoble, unprofitable. There is a Middle Path which discovered by the Buddha which opens the eyes, and bestows understanding, which leads to peace, to insight, to the higher wisdom, to Nirvana. Verily! it is this Arjan Eight-fold Path; that is to say, Right Views, Right Aspirations, Right Speech, Right Conduct, Right Modes of Livelihood, Right Effort, Right Middleness, and Right Rapture."

Now this is the Noble Truth as to suffering. Birth is attended with pain, disease, old age, and death; and pain is prolonged Union with the unpleasant is painful, pain is separation from the pleasant; and craving is unsatiated, that, too, is painful. In brief, the five aggregates of clinging (that is, the conditions of individuality) are painful. Now this is the Noble Truth as to the origin of suffering. Verily! it is the craving thirst that causes the renewal of becoming, that is accompanied by sensual delights, and seeks satisfaction, now there, now there, that is to say, the craving for the gratification of the senses, or the craving for a future life, or the craving for prosperity. Now this is the Noble Truth as to the passing away of pain. Verily! it is the passing away so that no passion remains, the giving up the, the getting rid of, the emancipation from, the harassing no longer of, this craving thirst. Now this is the Noble Truth as to the leading to the passing away of pain. Verily! it is this Arjan Eight-fold Path, that is to say, Right Views, Right Aspirations, Right Speech, Conduct, and Mode of Livelihood, Right Effort, Right Middleness, and Right Rapture' (Rhys Davids, Early Buddhism, p. 511).

This concise statement contains all the essential elements of the Buddha's creed. The great deliverance, of which Gautama himself speaks, is not a change, but a transformation of the mind and the means whereby he had attained it, formed the basis of all his subsequent teaching. It was this gospel of deliverance which won his earliest disciples, and which they in turn were commissioned by the Buddha to preach to suffering men. Sixty monks were soon enrolled as converts of the new faith, and they were sent forth as its first apostles. In sending them forth, Gautama thus addressed them:
"I am delivered from all fetters, human and divine. You, too, O monks, are freed from the same fetters. Go forth and wander everywhere, out of compassion for the world, and for the welfare of gods and men, and for the propagation of the dharma of the four noble directions. Preach the doctrine, sanitary in its beginning, middle, and end; and point the spirit, and convey its letter. Preach a life of perfect restraint, chastity, and celibacy... I will go also to preach this doctrine" (Makawagga, 1.11.1).

When the band of believers was increased to a thousand, Gautama preached on a 'burning' sermon, on a hill Gayasaha, near Gayap:
"Everything, O monks, is burning... The eye is burning; visible things are burning. The ear is burning; audible things are burning. The nose is burning; odours are burning; the tongue is burning; tastes are burning; the body is burning,
CREEDS (Buddhist)

objects of sense are burning. The mind is burning, thoughts are burning. All are burning with the fire of passion and desire.

Observing this, O monks, a wise and noble disciple becomes aware of (or disgusted with) the eye, weary of visible things, weary of the ear, weary of sounds, weary of odours, weary of tastes, weary of the body, weary of the mind. Becoming weary of the five senses, he leaves himself from this evil and sets himself free. When he realises that he has left himself, he recites: 'I am free of passion, free of desire, free of depravity, free of self. I am free in the path, I am free in the practice, I am free in the discipline. I am completely ended, perfectly ended, led to the complete end.' (Mahāyāna-sūtra, i. 21, 22.)

Shortly before his death the same teaching was again committed to the faithful Ananda:

'O Ananda, I am now grown old, and full of years, and my journey is drawing to its close; I have reached eighty years—

say sum of days—and, just as a worn-out cart can only move with difficulty, so the body of the wise and noble disciple going with difficulty. It is only when I become plunged in meditative sleep that my body is at ease. In future he ye to your

selves your own light, your own refuge; seek no other refuge. Hold fast to the truth as your refuge; look not to any one but yourselves as a refuge' (Mahāparinibbāna-sūtra, ii. 33, 35).

(2) The duties of the monks who were to be the mission-aries of his faith to the world:

'Which then, O monks, are the truths (the seven jewels) it behoves you to spread abroad, out of pity for the world, for the good of gods and men? They are: (1) the four earnest rejections (śraddhatā, apātijjatā; on the impurities of the body, on the tenaciousness of the mind, on the thought of the conditions of existence); (2) the four right exertions (abhijñatā, ākhiṇatā; viz. to prevent desire from arising, to get rid of it when arisen, to produce merit, increase it); (3) the four paths to supernatural power (abhisam-pāla; viz. will, effort, thought, knowledge); (4) the four forces (paṭika-bala; viz. faith, energy, recollection, self-concentration, reason); (5) the five fire organs of sense (khās, i.e. the sevenREAM limits of knowledge (bodhi-sāna; viz. recollection, investigation, energy, joy, serenity, concentration of mind, equanimity), (6) the noble eight-fold path (Mahā-parinibbāna, iit. 60).'

In order to form an accurate judgment regarding the meaning of the teaching of Buddha as set forth in the Dhammapadā-sūtra, Provinces Sutta, it is necessary not only to explain the terms used in the sutta, but also to understand the doctrine which it involves. In subsequent Suttas each word, each clause, and each idea in the Discourse is fully commented and enlarged upon. It is possible, in the light of these explanations, to arrive at a true conception of an unmeaning word of the Discourses conveyed to early Buddhists. From the same sources a general idea of the underlying beliefs may be gained.

1. The Buddhist scheme of life. In Buddhism the man is regarded as a soul residing in a physical body, or as possessing a soul which may be separated from the body and continue to exist. A belief in self or soul is regarded so distinctly as a heresy that two well-known words in Buddhist literature have been coined on purpose to stigmatize it. The first of these is sakkāya-dīthi, 'the heresy of individuality,' the name given to this belief as one of the three primary delusions (the others being doubt, and belief in the efficacy of rites and ceremonies) which must be abandoned at the very first stage of the Buddhist path of holiness.

The other is attavāda, the doctrine of self or soul, which is a name given to it as a part of the chain of causes which lead to the origin of evil. It is the opposite of the doctrine of non-soul (anatta), and belief in the efficacy of rites and ceremonies—as one of the four upādānas, which are the immediate cause of birth, death, decay, death, sorrow, lamentation, pain, grief, and despair.

What then is man? He is an aggregate of different properties or qualities—called skandhas, or aggregates. These skandhas are as follows:

1. The material properties or attributes (rupa);
2. The internal properties (internal identification), (samma);
3. The tendencies or potentialities (lit. 'confections,' saṅkhārā); and
4. Thought, reason (viññāṇa).

It is distinctly laid down that none of these are separate, nor the skandhas as a whole, the soul.

'Therefore, O monks, whatever in the way of material form, sensations, perceptions, etc., respectively, has ever been made, or is, or either in our case or in the outer world, or strong or weak, or low or high, or far or near, it is not self; this must be in truth percived, who possess real knowledge. Whosoever regards things in this light, O monks, being a wise and noble hearer of the Dhamma, is not turned to despair, from confusion and consciousness. When he discerns therefrom, he is free from desire, he becomes endowed with the right knowledge of desire he obtains deliverance; in the delivered there arises a consciousness of his deliverance; re-birth is extinct, holiness is completed, duty is accomplished; he no longer returns to this world, he knows' (Mahāyāna-sūtra, i. 6. 444f.)

Gautama refused not only to give a definite answer to questions concerning the relation of the body to the soul, but only to keep the matter.
The question 'whether the soul is the same as the body, or different from it,' was one of the Indeterminates, prohibited questions.

It is the union of the skandhas which makes the individual:

Every person, or thing, or god is therefore a putting together, a compound. And in each individual, without any exception, the relation of its component parts is ever changing, is never the same for two consecutive moments. It follows that no sooner has separatedness, individuality, begun, than dissolution, disintegration, also begins. There never is a moment without a putting together: there can be no putting together without a becoming different; there can be no becoming different without a putting together, a disintegration. There never is a moment without a disintegration, a putting away, which sooner or later will inevitably be complete' (Rhys Davids, Early Buddhism, p. 57).

The great fact of life is the 'Wheel of Life,' called Pāli-Samappajjā (i.e. origination through dependence). <br><br>As the wheel is an account of Ignorance, the saṅkhāras; (2) on account of the saṅkhāras, Consciousness; (3) on account of Consciousness, Name and Form; (4) on account of Name and Form, the six Provinces (of the six senses); (5) on account of the six Provinces, Contact; (6) on account of Contact, Sensation; (7) on account of Sensation, Craving; (8) on account of Craving, Attachment; (9) on account of Attachment, Becoming; (10) on account of Becoming, Birth; (11) (12) on account of Birth, old age, and death, grief, lamentation, suffering, dejection, and despair.

Buddhism teaches that everything in life has a cause, and that the Wheel of Life must revolve, one cause leading to another, according to an irresistible law. But there is no attempt to explain the ultimate cause of all things. This Doctrine is embodied in the familiar stanzas, which is engraved upon many an image of the Buddha, and impressed upon the moulded ashes of the dead:

'Of all the phenomena spring from a cause
The Buddha the cause has told,
And he tells, too, how each shall come to its end,
Such alone is the word of the Sage' (Pīthāna, i. 40).

Death does not cause the Wheel of Life to cease to turn; it is only a link in the ceaseless chain of existence. At the moment of death a new life comes into being. The skandhas re-combine, under conditions determined by the amount of merit or demerit which their previous combination has accelerated or diminished. Thereby is the cause in the chain of re-birth. And yet he is not the same; he is on a higher or a lower scale of existence, according as his previous life has been good or bad. This is karma (q.v.), the doctrine on which the whole of Buddhist teaching turns.

Existence is conjointed with pain—pain to which there is no end. The conditions which make a individual are the conditions which give rise to pain. Birth, death, disease, unions, separations, are all conditions which, if not to mak e individuality, are painful; existence, from beginning to end, is painful.

But why this pain of life, this life of pain? The second truth answers the question. Rhys Davids says that the last words in this Noble Truth might be rendered 'the lust of the flesh, the lust of life,
and the love of this present world' (Early Buddhism, p. 55). The author of The Creed of Buddha says (p. 80), with reference to this craving, or thirst, which Gautama affirmed to be the origin of suffering:

"It is the desire for the pleasures, or rather for the joys, that minister to the real self is wholly good. It is desire for the pleasures that minister to the lower self; it is the desire to affirm the lower self, to live in it, to cling to it, so rest in it, so enjoy it. It is the desire to identify oneself with the individual self and the impersonal world which centred in it, instead of with the Universal Self and the eternal world of which it is at once the centre and the circumference—it is this desire, taking a thousand forms in this path, that is to turn itself to evil by ceasing to suffer from mankind. If the self is to be deluded, as the temperament, the environment, is changeable, and unreal must be extinguished; and the gradual extinction of unworthy desire must therefore be the central purpose of one's life.'

The question that Gautama set himself to solve was the cessation of the pain consequent upon and inherent in existence itself, and the answer to his search was the attainment of Nirvāṇa, by way of the Noble Eightfold Path.

2. The Eight-fold Path.—The divisions of the path are, as already stated: Right Views, Right Aspirations, Right Speech, Right Conduct, Right Mode of Livelihood, Right Effort, Right Mindfulness, and Right Contemplation. The fundamental principles of the path are: (1) 'The entering upon the stream, Conversion; which follows on (a) companionship with the good, (b) hearing of the law, (c) enlightened reflection, or (d) the practice of virtue. The unconverted, and to them a sense of sin, enmity, and impurity; but if, by one or more of the means just mentioned, he has arrived at a perception of the 'four Noble Truths,' he has become converted, and has entered the first path. While he is ever in this path he becomes successive from the delusion of self, from doubt as to the Buddha and his doctrines, and from the belief in the efficacy of rites and ceremonies. Better than universal consent in this world, better than going to heaven, better than lordship over all worlds is (this three-fold) fruit of the first path' (Dhammapāda, verse 178). (2) The path of those who will only once return to this world. The converted man, free from doubt and the delusions of self and ritualism, succeeds in this path in reducing to a minimum lust, hatred, and delusion. (3) The path of those who will never return to this world; in which, the last remnants of sensuality and malevolence, hatred, will fade away, and at the end of the path, desire for oneself, or wrong feeling towards others, can arise in the heart. (4) The path of the holy ones, more exactly, worthy ones, arahata; in which the saint becomes free from desire for material, or individual existence; from pride and self-righteousness, and ignorance (Rhys Davids, Buddhism, p. 105 f.).

Several words are used in this description of the Eight-fold Path which require explanation.

i. Right Views.—Right Views refer principally to the four truths, enunciated in the Dhamma-chakka-pavattana Sutta, and the 'three signs,' which include (a) the first of the four truths, (b) impermanence, and (c) non-self, i.e. the absence of a soul. Right Raptures. The Ajahn and non-self are both declared to be the 'signs' of every individual, whether god, man, or animal.

ii. Right Aspirations.—The Buddhist faith does not teach the suppression of all desire, but the satisfaction of wholesome desires, wholesome cravings, idle excitements, by the cultivation of the opposite—right desires and lofty aspirations. In the Majjhima (iii. 25) examples are given of right desire, e.g. the desire for emancipation from sensuality, aspirations after the attainment of love for others, the wish not to injure any living thing, the desire for the eradication of wrong, and for the promotion of right dispositions in the heart.

iii. Right Speech.—To shun the company of the witless; to hold communion with the wise; to give honour where honour is due: this is a great blessing (Maha-parinibbana Sutta, ii. 31).

iv. Right Conduct.—The two most important features of this quality are love and joy. Love, in the Pali, is metta, and the Metta Sutta (Sutta Nipāta, viii. 7-9) says:

'As a mother, even at the risk of her own life, protects her son, her only son, so the private love without measure towards all beings. Let him cultivate towards the whole world—above, below, around—a heart of love unconditioned, unwholesome, free from opposition or opposition. A man maintains this mindfulness all the while he is awake, whether he be standing, sitting, lying down, or lying down. This state of heart is the best in the world.'

Again, the Majjhima (i. 129):

'Our mind shall not waver. No evil speech will we utter. Tender and compassionate will we abide, loving in heart, void of malice within. And we will be ever suffering such an one with the rays of our loving thought. And with that feeling as a basis we will ever be suffering the whole world with the thought of love, far-reaching, grown great, beyond measure, void of anger ever.'

And the Hivuttaka (xxvi.):

'All the means that can be used as bases for doing right are not worth the stigmata as part of the emancipation of the soul through Love. That takes all those up into itself, outshining and putting them in radiance and glory, just as the light of the sun, which is itself, whose rays avoid not the sixteenth part of the radiance of the moon. That takes all those up into itself, outshining them in radiance and glory—just as the sun in the morning, the dawn, the sun, the rays of the sun, the brightness, the splendour, the light. When the dawn is breaking, the morning sun shines out high, and the rays of the sun, the brightness from above, do not avoid the sixteenth part of the radiance—such help as tends towards doing right avail not the sixteenth part of the emancipation of the heart, through Love.'

The joy of the truth is referred to in the Dialogues of the Buddha:

'When these five hindrances have been put away within him, he looks upon this body as a chattel, as a vessel, as an instrument, or means of delivering from sin, as a means of delivering from evil, as a means of deliverance from our ill-doing, as a means of delivering from our ill-will.' (Lasita Sutta, Nettippakā, iii. 2).

vi. Right Effort.—This signifies 'a constant intellectual alertness.' The three cardinal sins of Buddhism are: sensuality (dosā), ill-will (moha), and stupidity or dullness (vaśī). The last mentioned being regarded as the root of all sinfulness.

The 'Four Great Efforts' (sammappadhāna) are the effort or exertion (a) to prevent sinfulness arising, (b) to put away sinful states which have arisen, (c) to produce goodness not previously existing, and (d) to increase goodness where it does exist (Maha-parinibbana-sutta, SBE xi. 63 n.).

The Four Roads to Sainthood (iddhipāda) are four means by which sainthood is obtained, viz. (a) the will to acquire it, (b) the necessary exertion, (c) the necessary preparation of the heart, and (d) investigation (SBE xi. 63).

vii. Right Mindfulness.—This is closely connected with Right Effort. Dialogues in the Digha (ii. 290-315) and Majjhima (i. 55 f.) are devoted to the subject:

'The disciple, whatsoever he does, whether going forth or coming back, standing or walking, speaking or silent, eating or drinking, is to keep clearly in his mind all that it means, the temporary character of the act, its ethical significance, and that, above all, behind the act there is no actor (goer, eater, speaker) that is an eternally permanent entity.'

viii. Right Rapture.—In the Dhammapāda (verses 197-200) this Right Rapture is thus described:

'It is in very bliss we dwell, we who hate not those who hate us;
Among men full of hate, we continue void of hate.
It is in very bliss we dwell, in the world among the living;
Among men very sick and weak, we continue well.
It is in very bliss we dwell, void from care among the care-worn;
Among men full of worries, we continue calm.
It is in this very distress we dwell, who have no hindrances; we will become free of joy, like them, to their lifelong splendor!

In conformity with the Pali text, all the divisions of the Eight-fold Path are described by a single word—right. This is, perhaps, the best translation of the original samādhi. The word signifies 'going with'; used as an adjective, it is rendered 'general,' 'common,' or 'corresponding,' 'mutual,' as an adverb, 'commonly, normally, or fittingly,' 'properly, correctly.' It is used, in a secondary sense, to mean round, fit and perfect, normal and complete. 'Right,' therefore, in the sense of 'correct' has to be understood, i.e., in agreement with their nature. The word is not used with a moral significance. The eightfold description of the perfect life is of such vital importance for the correct understanding of the Buddhist creed that it may be convenient to summarize the meaning of each division of the path:

1. Right views: free from superstition or delusion.
2. Right aspirations; high and worthy of the intelligent man.
3. Right speech: kindly, open, truthful.
4. Right conduct: peaceful, honest, pure.
5. Right livelihood: bringing hurt or danger to no living thing.
6. Right effort; in self-training and self-control.
7. Right mindfulness: the active, watchful mind.
8. Right rapture; earnest thought on the deep mysteries of life.

Gogerly (Journ. Ceylon As. Soc., 1865) gives a slightly different rendering:

2. Correct thoughts. A clear perception of their necessity.
3. Correct words. Inflexible veracity.
4. Correct conduct. Purity of conduct.
5. Correct (mode of obtaining) living.

3. The hindrances in the way.—The hindrances in the way of treading the Eight-fold Path, and thus securing deliverance, are very clearly detailed. They are described under different headings—
(a) The Five Hindrances—'the Ten Fotters,' and 'the Four Intoxications.'
(b) The Ten Fotters (vyāgyāya) are: (1) delusions about the soul (sakkaya-ditthi), (2) doubt (viiviksha), (3) reliance on ceremonies (sabba-bata-pandana), (4) sensuality (kama), (5) ill-will (paṭigha), (6) desire for worldly wealth (riipa-rāga), (7) desire for rebirth in heaven (ura-pa-rāgo), (8) pride (maña), (9) self-righteousness (uuddhacca), (10) ignorance (avijjā).
(c) The Four Intoxications consist in the mental intoxication arising from sensual pleasures, from the pride of life, from ignorance, and from speculation.

4. The ultimate aim—Nirvāna.—When the traveller has resolutely trodden the Eight-fold Path, overcome the Hindrances, broken the Fotters, and resisted the Intoxications, he has reached the goal of all Buddhist ambition and effort—Nirvāna.

To him who has finished the Path, and passed beyond sorrow, who has set himself on all sides, thrown away every fetter, there is no more force of grief.' 'Him whose senses have become tranquil, like a horse well broken-in by the driver; who is free from pride and the lust of the flesh, and the last of existence, and the deligament of ignorance even in the gods' society. Such a one, who has attained to this, remains like a king among the gods, on whose broad earth, unvexed; like the pillar of the city gate, unmov'd; like a gem without blemish, unblemished. For such there are no more births. Tranquil is the mind, tranquil the words and deeds of him who is thus tranquilized, and made free by wisdom.' (Bhavavijñāna Sutta, verses 90, 94-96.)

They who, by steadfast mind, have become exempt from evil desire, and who have meditated in the teaching of Gautama, having obtained the fruit of the Fourth Path, and immersed themselves in that ambrosia, have received without price, and may be in the enjoyment of Nirvāna. Their former carcass, exhausted, no new kamma is being produced; their hearts are free from the longings after future life; once being destroyed, and no new yearnings springing up within them, they, the wise, are extinguished like this lamp.' (Ratana Sutta, 7, 14.)

There is no alms-giving, or holy person, who has quenched (sin) by means of holiness, from whose eyes the veil of error has been removed, who is well-trained in religion, and who, free from yearnings, and skilled in the knowledge, has attained unto Nirvāna.' (Samādhipātthana Sutta, 14.)

The word Nibbāna (Pali for Nirvāna) occurs only infrequently in the Pāli texts. A few illustrations of this word, and other synonyms—given are:

Three wise people (speaking of Arhatas), meditative, persevering, ever full of strength, attend to Nirvāna, the highest bliss (verse 25). "Who are the cordial who has found, who looks with terror on sloth, cannot fall away,—he is in the very presence of Nirvāna." (verse 23.) 'If they keepest thyself as silent as a soundless grove, then last surge away. The angry and the angry and the angry, the angry,—I shall enter the best self-morality to be patient, long-suffering; the best (thing of all) to be Nirvāna; for he is no (true) monk who does not make strikes, no (true) ascetic who insatiably destroys the sensual lust. 'There is no fire like lust, there is no sin like hate, there is no misery like the snake-bite, there is no happiness like peace. 'If danger is the way of peace, the embittered, the unrighteous, the knowing this as it really is, is Nirvāna, the highest bliss' (verse 201). 'Those who, in the past, were ever on the watch, who, in the right night, whose heart is set on Nirvāna, their sinfulness dies away (at the 'It is as if their eyes go to an end')' (verse 226).

In the light of these passages, what is Nirvāna? In the original it means 'going out,' 'extinction.' It cannot mean the extinction of the soul.

It is the extinction of that sinful, grasping condition of mind and heart, which otherwise, according to the great system of Kamma, is the cause of renewed individual existence. That extinction is to be brought about by, and runs parallel with, the growth of the opposite condition of mind and heart; and it is complete when that opposite condition is reached. Nirvāna is therefore the same thing as a sinless, calm state of mind; and, if translated at all, may best, perhaps, be rendered "holiness"—holiness, that is, in the Buddhist sense, perfect peace, goodness, and wisdom.' (Rays Davids, Buddhism, p. 111.)

Fe., further, art. Nirvāna.

Describing Nirvāna, Rhys Davids says (Early Buddhism, p. 721.):

'One might confine ourselves with the praises, many of them among the most beautiful passages in Pali poetry and prose, based on this condition of mind, the state which the Buddha has himself pronounced perfect according to the Buddhist faith. It has its pet names, the poet epitaphs, bestowed upon it, each of them—for they are not names—emphasizing some aspect of the transcendental nature of Nirvāna. The term has this undefined conception—the barrenness of the refuge, the cool cave, the island amid the floods, the place of bliss, emancipation, liberation, safety, the supreme, the transcendent, the uncreated, the tranquil, the home of ease, the calm, the end of suffering, the medicine for all evil, the annihilation, the unborn, the immaterial, the imperishable, the abiding, the further shore, the unbinding, the bliss of effort, the supreme joy, the ineffable, the supreme, the cutting off, the cessation of suffering, the cessation of craving, the cessation of clinging, the completions, the enlightenment, the knowledge of the end of the three cardinal sins—sensuality, ill-will, and stupidity.' (Buddhism, 2nd ed., iv. 251, 263.)

Such, then, according to the authoritative Buddhist scriptures, is the creed of Buddhism. But is it the whole of the creed which Gautama preached to the world? Was this the faith by which Buddha won the 'deepest heart of the East'? The new religion was never classical, nor dogmatic, nor facile, nor facile. It neither evolved the soul, or ego; atheistic, i.e. there was no place for God in his system of thought; pessimistic, i.e. he regarded all existence as intrinsically evil; epoistic, i.e. in his scheme of life he taught men to think of themselves and their personal interests, i.e. he regarded Nothing as the supreme reality. Oldenberg says of the philosophy of Buddha: 'We have a fragment of a circle, to complete which, and to find the centre of which, is forbidden, for
and Paul. Kattenbusch traces the Old Roman Creed back to the year ±100 A.D., and finds in it the archetype of all other forms in both East and West. Other writers have dated the whole of the early Christian, and, indeed, the whole of Buddhism, as early as the 1st century. It is interesting to note that the earliest visible reference to the creed is in the New Testament, in John 20:23, where the resurrected Christ commands his disciples to "Go therefore and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost." This reference is usually taken as evidence of the existence of the creed as early as the 1st century. However, it is possible that the reference is to a later version of the creed, or to a different form of the creed.

At first we can trace only bare allusions, as in a passage of Marcion's revised New Testament where he speaks of a 'covenant with God,' a 'Holy Church,' and implies that the words 'Holy Church' were contained in the Baptismal Creed which had been taught him in Rome before his breach with the Church in A.D. 145. So, again, in two passages of Tertullian: de Virgin., vol. i., "The rule of faith, indeed, is one altogether ... of believing in one God Almighty, Maker of the world, and in Jesus Christ His Son Jesus Christ, and Mary the Virgin, crucified under Pontius Pilate; the third day raised from the dead, received in the heavens, sitting now at the right hand of the Father, about to come to judge quick and dead, through the resurrection also of the flesh." de Praescr. xiii.: "What the (Roman) Church has made a common token with the African Churches; has recognized one God, Creator of the universe, and Christ Jesus, of the Virgin Mary, Son of God, the Savior, and the resurrection of the flesh."

With scanty references in Dionysius and Novatian, we pass on to the 4th cent., when Creeds come out to the light of day, and, greatly to our advantage, Marcellus, Bishop of Ancyra, whom he had been kindly received as an exile by Bishop Julius of Rome (c. A.D. 307), left on record his acceptance of the faith of the Roman Church. The accuracy of his quotation, recorded by Ephraimian, is confirmed by the testimony of Rainerius, priest of Aquileia, who (c. A.D. 400) wrote a commentary on this form, and compared it with the above different form of the creed. Evidently Kattenbusch has minimized the evidence for the existence of similar Eastern forms of the 3rd century. He thinks that the Creeds of Ctesar and Jerusalem, recovered from the pages of Athanasius and Cyril, were derived from the Roman Creed after the date when Paul of Samosata was deposed (c. A.D. 272); and that the Roman Creed was altered to meet the needs of the East, and became the parent of Creeds in Asia Minor and Egypt, as well as in Palestine.

At present the theory of Kattenbusch still holds the field, and is supported by Harnack; but his critics are closing him in on every side. Kunze, working on the same lines as Zahn, reconstructs an Antiochene formula of the 1st cent., which he claims as an independent sister form:

** CREED OF ANTIOCH. **

1. I believe in one and an only true God, Father Almighty, Maker of all things, visible and invisible, 

2. And in One Lord Jesus Christ, His Son, the only-begotten and firstborn of all creation, begotten of Him before all things, through whose agency all things were established, and all things came into existence.

3. Who, for our sakes, came down and was born of Mary the Virgin.

4. And crucified under Pontius Pilate, and buried.

5. And the third day rose according to the Scriptures.

** CREEDS (Ecumenical). **

Within two generations from the Apostles a catechism at Rome produced the famous form which lies at the root probably of all similar forms, certain in the West, and reflects without question the religious tenor of the great body of the Apostles' Creed.

Hence, also, the evolution of the thought of a Divine Saviour in the person of Avakatsitsara (c.e.), which was purely metaphysical invention, and of Malraux, the future Buddha.
6. And ascended into heaven.
7. From thence he shall judge the quick and the dead.
8. Then shall he come to be judged in the presence of God.
9. [The beginning of the third article has not been recorded.]
10. Thus.
11. Remission of sins.
12. Resurrection of the dead, life everlasting.

The Creed which Zdenek have constructed from the Didascalia, a book written in the 3rd cent. not far from Antioch, affords an instructive contrast.

CREED OF THE DIDASCALIA.

1. I believe in God Almighty.
2. And in our Lord Jesus Christ (His Son), who for us came and was born (Mary?) a virgin,
3. and was crucified under Pontius Pilate and died,
4. and the third day rose from the dead,
5. and ascended into the heavens,
6. and sitteth on the right hand of God the Almighty,
7. and is with power and glory to judge dead and living.
8. And in the Holy Ghost .
9. (a Holy Church).
12. resurrection of the dead.

The uncertainties attending such reconstructions stand in marked contrast with the comparative certainty with which we can trace back the Old Roman Creed, the only really doubtful point about which the question whether originally it did not read: "I believe in one God, the Father Almighty, who for us and for our salvation came down from the heavens, was born of the Holy Virgin, was crucified under Pontius Pilate, and died, and rose again from the dead, ascended into heaven, and sits on the right hand of God the Almighty, and is with power and glory to judge dead and living." Once again, the foundation of the later history of the Creed is still at some points obscure. We know that it was used by the Abbot Firminus, who founded monasteries at Reichenau and Hornbach. It is quoted in the Codex Eusebii Nicomachi 199 of the 8th cent., and in the Dicta Abbatum Pannoniarum, which was written about A.D. 720. Probably it was brought into its mature shape at Luxeuil or Bobbio. All the later additions, such as 'descended into hell' and 'communion of saints,' were in use in the Gallican Creeds of the 5th cent., with the exception of 'maker of heaven and earth.' The latest addition may have reached some of the Western countries by way of the travels of Columban, who in Burgundy and Rhetia came across relics of the Old Latin Church of the Danube, and the stream of influence which had flowed from the East in earlier centuries. Nowhere is this the case more than in the Pannonian Creed. Any way, we can make sure that it was from Rome that the Received Text was finally spread, since there are indications that Firminus was quoting from a Roman source, and there would be every reason for the decision in favour of a revision of the Old Roman Creed in the light of experience which had found each of the added phrases useful. The desire of Charles the Great for uniformity, and his careful inquiries about the different uses in Gaul, led him to the triumph of this Revision throughout the Western Church, as the Creed of daily use, although the Gallican Creed of the Church of England still retains certain Gallican peculiarities, only-begotten (unigenitus, non unigenitus) shall come again at the end of the world, and everlasting life after death.

2. The Nicene Creed.—The history of the Nicene Creed begins with the Council of Nicaea, when the Creed presented by Eusebius of Cesarea was deliberately revised to guard against the doctrines of Arianaheim. Whether he had composed it for the occasion, or had simply quoted verbatim

1 Theol. Literaturblatt, xxviii. [1911] 19, 221.
3 Nomina, 102, 1902, 191.
4 Das apod. Symbol, 152.
6 XTW, 1906, p. 262.
the Creed of his Church, is uncertain. So far as it goes, it does not follow the lines of the Creed of Crete, but the wording imply; but he adds a free warning against Sabellianism, and a Baptistical Creed is not likely to have ended abruptly with mention of the Holy Ghost. But the Council was not satisfied. Prompted by Hosius, Bishop of Cordova, the Emperor Constantine himself proposed the insertion of the term homousia, which guarded against all evasions of Scripture teaching. Other changes may be noted by comparing the two forms.

**Creeds of Nicene Council.**

1. in one God, the Father Almighty, maker of heaven and earth, and of all things visible and invisible.

2. And in one Lord Jesus Christ, the Word of God, God of God, Light of Light, Son Only-begotten, first born of every creature, before all the ages, begotten from the Father, by whom also all things were made;

3. Who for our salvation was made flesh, and lived as a citizen among men, and was crucified and was buried,

4. and arose again the third day,

5. and ascended to the Father.

6. And will come again in glory to judge the quick and the dead.

7. And in the Holy Ghost:

8. and was incarnate and was made man.

9. was crucified and was buried,

10. and rose again the third day,

11. and ascended into heaven,

12. and is coming in glory to judge the quick and the dead, whose kingdom shall have no end.

13. And in one Holy Ghost, the Paraclete, who spoke in the prophets,

14. and in one baptism of remission of sins,

15. and in one Holy Catholic and Apostolic Church,

16. and in the resurrection of the flesh, and in the life eternal.

17. We acknowledge one baptism for the remission of sins.

18. We look for the resurrection of the dead, and the life of the world to come.

Three important changes must be noted, which tend to prove that Cyril was the author of this revision, since they agree with the teaching in his lectures: (l.) Art. 7 from son to sitteth; (ii.) Art. 8 from glory to glory to glory; (iii.) Art. 12 from resurrection of the flesh to resurrection of the dead. To these we add the skillful insertion of some of the Conciliar language, including the term homousia, which marked the return to full communion with Athanasius and his allies. What could be more natural than that Cyril, after his return from exile in A.D. 362-364, should so revise his Creed? Epiphanius had connexions with Jerusalem and had lived in Palestine, so his acquaintance with the Creed is easily explained. The theory has been questioned by historians, who claim that Epiphanius wrote down the original Nicene Creed, and that the revised Creed has been interpolated

1. *Cath. ii. cii.*
2. *Lectures.*
3. *Catholic and Apostolic Church.*
by a copyist. He also maintains that the Jerusalem Creed reconstructed from the pages of Cyril is the invention of scholars. 1 Gibson also calls attention to the frequent division of the Creed "new both to the Creed of Nicea and to the Creed of Jerusalem, so that even if the Creed of Jerusalem lies at the basis of the Enlarged Creed, it has been revised by the help of other Creeds, as those of the Apostolic Constitutions and the Church of Antioch." 2 This dependence had not escaped the notice of Hort, and the sources may be regarded as one, since the Seventh Book of the Apostolic Constitutions comes from Antioch, and was put together by the Emperor Constantine's friend, Melcitius, Bishop of Antioch, is quite enough to explain why he should also make use of the Creed of Antioch.

We may regard the ease for the opposition as not proved, but it is clear that Hort's theory must be tested again in the light of all new evidence. He supposed that the subsequent connexion of the revised Creed with the Council of Constantinople in A.D. 381 could be explained by the suggestion that Cyril had it to prove his orthodoxy. But, since Cyril's leader, Melcitius, became first President of that Council, there could be no question about Cyril. A more probable theory has been suggested by Kunze. After the death of Meletius, Bishop of Ambrosianus, Bishop Gregorius of Nazianzus who succeeded him, the new Bishop of Constantinople was Nectarius, Prætor of the city, who at the time of his election was unchristianized. Now it seems to have been suggested to the Emperor by Diotrephes of Jerusalem. At the end of the Council of Chalecedon (A.D. 451) all the Bishops signed the decrees with little notes. One of them, Callinicus, Bishop of Apamea (in Bithynia), referred to the Council of Constantinople as having been held at the ordination of the most pious Nectarius the Bishop, and Kunze suggests that there was some connexion in his mind between the Creed and the consecration of Nectarius. Probably the revised Creed was professed at his baptism, and became from that date the Baptismal Creed of the city. It would naturally be quoted in the Acts of the Council, now lost, from which it was cited at the Council of Chalcedon as the Creed of the 150 Fathers, the original Nicene Creed being accurately distinguished from it as the Creed of the 318 Fathers.

It is not easy to decide on the true form of the text cited at Constantinople, since the form quoted at the second Synod varied from the form quoted at the sixth Session, and both from the form in Epiphanius. Copyists were continually at work assimilating the forms, and to them may be attributed the slight variations found in the pages of Epiphanius which are printed in italics. It is possible that the variations in the texts used at Chalecedon represent the already divergent texts used at Constantinople and Rome. 3

The later history of the Creed is coming out into clearer light. It is probable that the words 'and the Son' in the clause about the Procession of the Spirit were added not by the Council of Toledo in A.D. 589, when King Reccared accepted the Nicene Creed and abjured Arianism, but by later copyists. The Creed thus interpolated spread into Gaul. In A.D. 802, Charles the Great sent a delegation to consult Pope Leo on the text, controversy having already arisen in Palestine between representatives of the Eastern and Western Churches. Leo freely admitted that it was quite orthodox to teach that the Spirit proceeded from the Father and the Son, but deprecating the insertion of the words in the Creed, the Roman Church agreeing with the Eastern theologians as to its form. He even advised the Emperor to give up singing it in his chapel, thus emphasizing its interpolations. It was not interpolated, and in A.D. 1014 the Emperor Henry II. prevailed on Benedict VIII. 'to chant the Symbol at the Holy Mysteries'; and thus came in the use of the Interpolated Creed.

The Western theologians start from the point of view of the immanent Trinity, from meditation on the coinherence of the Divine Persons, while their Eastern brethren are willing to accept the phrase 'from the Father through the Son,' as guarding the truth that there is only one God, Deity. It is one of the saddest facts of history that a merely verbal difference should keep Churches apart, since frank explanation on both sides could clear up the theological as well as the historical question. 4

3. The 'Athanasian' Creed.—The history of the so-called Athanasian Creed—more correctly designated, after the analogy of the Te Deum, by its first words Quenebque est— is still at some points obscure. But we are no longer restricted as to the dates of the important MSS. With the help of photographs, palaeographers are enabled to decide that some MSS belong to the 8th cent.; one, in the famous Ambrosian Library at Milan, may even be of the end of the 7th (Col. Ambros. Bibliotheca 19.)

The famous two-portion theory, put forward by Swainson and Lumbly, has been shown to rest on precarious foundations, and may be dismissed without further notice. We have not yet reached ultimate certainty about small details in the text, the order of certain words, the use of the conjunction et, or the claim of the form surrexit against the reading resurrectit, but any polishing which the Creed has received in the course of its long history is of small account, now that we can say that it reaches us substantially as it was written. It belongs to the class of individual, private confessions of faith, and is, properly speaking, an instruction rather than a Creed, which may be offered as a substitute for the Apostles' Creed, or a canticle parallel to the Te Deum, with which it found its way into an appendix to the Psalter from the end of the 8th century.

There is little difficulty in identifying 'the Faith of the holy prelate Athanasius' commended by a Synod of Antioch, which was presided over by Bishop Lodgar (c. A.D. 670), and then learned by heart by all clergy.

Some forty years after (c. A.D. 633) it had been quoted by the Fourth Council of Toledo together with the so-called Creed of Damascus. The clauses quoted were 4, 20, 21, 22, 28, 29, 31, 33, 35, 36, 37, 39, 40, so that it is evident that the Spanish theologians had the whole text before them.

We can also trace quotations with great probability in the sermons of Cesaris of Arles, the great preacher of the 6th cent. (?543), as has been proved beyond question by Morin. 5 Any doubts which may be felt about the authorship of the pseudo-Augustian sermon 214 do not affect the general argument. Morin joined out that the Creed reproduces both the qualities and the literary defects of Cesaris. In his recent lectures at Oxford he was disposed to put the date later. 6

The proof is not yet forthcoming that the Quenebque belongs to the time of Cesaris, if it is not from his pen. The argument of Waterhand, 7

that it belongs to Apollinarian times, still carries much weight. The fact remains that the illustration from the context of Christ's nature in clause 35, though it had been used freely by St. August-sine, as before him by St. Ambrose, is misused by the Eutychians, who pleaded for one nature in Christ, as soul and body make one nature in man. After the epicurean nature-shrank by evidence covered by Mother Person is Christ, he suffice came Gaul in the beginning of the 5th century. For full justification of the Eutychian position, we must look to the Gaulish bishops of that time, and after the Council of Ephesus. Indeed, the parallels to clauses 32-33 in Vincentius and Fanustus are, as it were, sharpened by subtle turns of phrase, just as we find Alcin and Paulinus of Aquileia sharpening by their quotations from the Quicunque, against the revived Nestorianism of the 8th century.

Moreover, there is a new line of argument which was not the rise to Waterland. In the recently discovered writing of Priscillian we have trustworthy evidence of a heresy which spread from Spain to Gaul in the beginning of the 5th cent., and which called for close vigilance and reasoned arguments from Church teachers to counteract it. The De Fide of Bacchinius is the apology of a monk who came from Spain into Gaul at that time, and was closely examined by the Gallican bishops as to his faith, and it is a significant fact that it has been preserved only in the Ambrosian MS of the Quicunque. The heresy of Priscillian was both Sabellian and Apollinarian. He confused the Persons of the Trinity, and denied that the Lord had a human soul, as the following passages may suffice to prove. In his Blessing over the Faithful he writes:

"For thou art God who... art believed as one God, invisible in the Father, visible in the Son, and art found as Holy Spirit united in the work of both; 1 speaking for God assuming flesh, assigning to Himself the form of God and Man, that is, of Divinity and Humanity."

When language so inaccurate was vehemently put forward as Catholic teaching, there was need of a summary of Catholic belief on the Trinity and the Incarnation, which should lay due stress on the responsibility of the intellect in matters of faith, and at the same time do justice to the moral aspect of these problems, and prove that faith worketh by love, that only they that have done good shall go into life eternal. The Quicunque explicitly refers to this. May it not have been written for the purpose? 2

This suggestion of the present writer has been warmly accepted by Künstle, 3 who has made a special study of Spanish canons and treatises against Priscillianism, though he eludes the argument by assuming that all such writings against Priscillian must have a Spanish origin—for which there is no proof.

From the time of Antelmi the parallels in the Communio and of Vincentius of Lérins have been held to prove his acquaintance with the Quicunque, if not his authorship, which seemed probable to

Ommannye (1897) as to Antelmi (1693). Perhaps it is rash to attempt to discover Ommannye's quotation from the funeral sermon which Hilary of Arles preached after the death of Honoratus, his predecessor both in the See of Arles and in the Abbey of Lérins, if it suggests acquaintance with the Quicunque, suggests also that Honoratus, rather than Hilary, was the author:

'A daily witness wast thou, moreover, in thy most sincere discourses of the Father of Ancient, as of the Holy Ghost, which are not surey has any one treated so emphatically, so clearly, of the Trinity of the Godhead, since thou didst distinguish the Persons from one another by the Father and by the Holy Ghost, and yet dost impose upon them in eternity and majesty of glory' (P. Honoratus, 28).

With this we may compare a quotation from a sermon on the kingdom of Christ by Faustus, whose, like Hilary, had been a loyal disciple of Honoratus:

"Therefore, beloved, that we may gain that which he has obtained, let us first follow that which he taught; and, first of all, let us hold the right faith; let us believe Father and Son and Holy Ghost (to be) one God. For, where there is unity, there cannot be inequality; and, since the Son, because he is in God, is perfect, complete, and full, that fullness certainly cannot be described as "less" (in Depositions S. Honoratus).

Whatsoever may have been here given to Honoratus as a teacher on the very lines of the Quicunque, there can be no question as to the ability and earnestness of the community which had gathered round him during the years of his episcopal rule at Autun, D.D. 430-439. For, we do not focus all that the Gallican Church could show of learning and piety. Their age contrasts favourably with the following century, when Cassarius represents the last hope of the ancient culture, and when the authority of the Sabellianism which was about to sweep away all its landmarks—a century in which the composition of the Quicunque would seem to be incredible.

The arguments of Breuer, that the Quicunque is a work of St. Ambrose, have not received any mention in an article, nor do not seem to be based on any fresh evidence; but they certainly strengthen the arguments for a 5th cent. date. As similar arguments for the so-called Oratorian Commentary, possibly from the pen of Theodulf of Orleans, speaks of its use by clergy as a manual of Christian teaching, which reminds us of the Canon of Antun as well as of the use made of it by Cassarius. Addressing a Synod, the writer says that he has carried out their instructions to provide an exposition of this work on the Faith, which is up and down recited in our churches and continually made the subject of meditation by our priests. A similar use is directed in the 9th cent. by many prominent teachers—Hayto of Basel, Anskar of Bremen, and Hincmar of Rheims.

In the Middle Ages the use at Prive spread everywhere, and subsequent researches have proved that the whole service of Matins, including Lauds, Prime, and Terce, was most popular in England as a preparation for the Mass. William Langland, in 'Piers the Plowman,' at the end of the 14th cent., writes of the duty of all classes to cease from work on Sundays, 'God's service to hear, Both Matins and Mass.' But the fact remains that comparatively few of the people understood Latin, although the devout layman who could afford to possess a breviary would, of course, be able to read and follow it in
the Office. There are several early translations into the vernacular, at one time Norman French, at another English; but there is no evidence of any wide-spread acquaintance with it in such translations. In the First Prayer Book of Edward VI., the English Reformers directed that the Athanasian Creed should be "sung or said" after the Benedic平s, at the greater Feasts. In the Second Prayer Book the number of Feasts was increased at which the use of it was obligatory, and only in 1662 was it substituted for the Apostles' Creed, which had hitherto followed it.

In the course of the present day no amended translation is likely to bring peace, such as the translation put forward by the Archbishop of Canterbury's Committee. The real crux lies in the difficulty which is felt about using the warning clauses in a mixed congregation on days when it is impossible to preach an explanatory sermon. A relaxation of the rule, such as permission to use it at the first lesson of the Festivals of Christmas, Easter, and Whitsunday (when the clergy, and presumably the instructed faithful, could well make it, as the author of the Oratorian Commentary suggests, 'a subject of meditation'), would meet the difficulties of wounded consciences on both sides. The Roman Catholic Church uses it still in Prayers of the Hour. The English Church has only put it in an Appendix to the Hour Office, without any directions for use.

Conclusion.—Looking back over the history of the three great Creeds, one is amazed at the complexity of the problem thus singled out by the common sense of the Church, through the centuries, as of primary importance. We are not concerned with the credibility of miracles as such, only with the evidence that the first witnesses believed that Christ rose from the dead and sent down His Spirit. The earliest forms of Creed present an Historic Faith which summed up their gratitude for the mystery at last revealed through the Spirit to the Church, with the assurance of forgiveness of sins and resurrection to a better life. The theological terms of the Nicene and Athanasian Creeds do not bring in metaphysics of set purpose, or condemn the Church to wander in a barren wilderness of controversy. Athanasius himself declared in his famous and often-quoted phrase "of one substance." He was moulded by it. He found in it a bulwark of the ancient belief that the Son was one with the Father (Jn 10th) and to be worshipped with Him. He had no word for it. It was recognized by the Churchmen of Augustine to make that term current, coin, even though he shrank from the boldness of his thought. Let us note that it was on psychological rather than metaphysical lines that he approached the problem, led on by deep moving on the mystery of his own personality to speculation on the deeper mystery of Divine Personality. And in the first part of the Quinquaginta, whether the author owed little or much to Augustine, it is by the measure of such munificence that it may be valued. The very bravery of the antitheses ranging through the great series of Divine attributes—uncreated, infinite, eternal, almighty—shadows forth the truth of the equal glory and co-eternal majesty, and excludes every rationalistic explanation—Sabel- lian, Arian, or Priscillianist. But this is definitely the Creed of the Church teacher, face to face with errors which are common to the human mind in every age and everywhere. In the hour of death the Examen of the Church Creed suffices as 'an anchor of the soul . . . entering into that which is within the veil' (He 6th).

CREED (Egyptian).—In seeking to arrive at a conception of the Egyptian creed, we are met by the fact that, generally speaking, the Egyptian never attempted to formulate or define a body of doctrine with regard to the earthly gods worshipped in his land. This absence of any systematic theology is due mainly to the prevalence of the idea of the local god. The Egyptian State rose out of a number of small independent tribes, and, even after the unification of the kingdom at the beginning of the Dynastic period, the original subdivisions still existed in the shape of the 'nomes' or provinces, roughly 42 in number, into which the land was divided. Each original tribe possessed its own local god, supreme in his own district; and these gods continued to be worshipped as separate divinities, though they were, in many cases, mere duplicates of those existing in other localities. The Egyptian never attempted to transcend this local belief. The Egyptian Church, thus, has only put it in an Appendix to the Hour Office, without any directions for use.

Conclusion.—Looking back over the history of the three great Creeds, one is amazed at the complexity of the problem thus singled out by the common sense of the Church, through the centuries, as of primary importance. We are not concerned with the credibility of miracles as such, only with the evidence that the first witnesses believed that Christ rose from the dead and sent down His Spirit. The earliest forms of Creed present an Historic Faith which summed up their gratitude for the mystery at last revealed through the Spirit to the Church, with the assurance of forgiveness of sins and resurrection to a better life. The theological terms of the Nicene and Athanasian Creeds do not bring in metaphysics of set purpose, or condemn the Church to wander in a barren wilderness of controversy. Athanasius himself declared in his famous and often-quoted phrase "of one substance." He was moulded by it. He found in it a bulwark of the ancient belief that the Son was one with the Father (Jn 10th) and to be worshipped with Him. He had no word for it. It was recognized by the Churchmen of Augustine to make that term current, coin, even though he shrank from the boldness of his thought. Let us note that it was on psychological rather than metaphysical lines that he approached the problem, led on by deep moving on the mystery of his own personality to speculation on the deeper mystery of Divine Personality. And in the first part of the Quinquaginta, whether the author owed little or much to Augustine, it is by the measure of such munificence that it may be valued. The very bravery of the antitheses ranging through the great series of Divine attributes—uncreated, infinite, eternal, almighty—shadows forth the truth of the equal glory and co-eternal majesty, and excludes every rationalistic explanation—Sabellian, Arian, or Priscillianist. But this is definitely the Creed of the Church teacher, face to face with errors which are common to the human mind in every age and everywhere. In the hour of death the Examen of the Church Creed suffices as 'an anchor of the soul . . . entering into that which is within the veil' (He 6th).

A. E. BURN.
cosmic gods and their relationship to the Creation. The most complete and popular of these was due to the priestly college of An, or Heliopolis (the Biblical On). The priests of the sun-god at this town—from the most ancient times the most noted temple in all of Egypt—had at a very early period a scheme of the relationship of the various members of the cycle of cosmic gods to one another and to the universe, and their doctrine of the great Heliopolitan ennead gives us that view of things that was held with various modifications in different localities. In their scheme there existed in the beginning a primordial liquid element, the Nun or Nu, from which there emerged the sun-god Ra. Then, Ra-thenceforth a local god—produced the male and female divinities Shu and Tefnut, who may be regarded as representing air (or the firmament) and moisture. From Shu and Tefnut, or perhaps by a fresh procession from Ra, came Seb and Nut, the earth and the starry heavens, and from Seb and Nut came the two further pairs of gods, Osiris and Isis (the Nile and the fruitful ground [2]), and Set and Nephthys (the barren desert lands of the life beyond). Creation reaches its present form by the interposition of Shu, the air-god, who came between Seb and Nut, the earth and the heavens, as they were locked in embrace, and lifted up Nut, who since his interposition stands ever between Seb, the heavens, and Nut, the earth at the cardinal points, and her body adorned with the stars.

The Heliopolitan ennead must have been formulated at a very early period of Egyptian history, for in the Pyramid texts the list of the gods is given as above. The popularity of this scheme gave rise to various imitations of it, and other towns and districts formed enneads of their own, sometimes displacing one of the nine gods of Heliopolis to make common cause with a local god, sometimes adding him to the nine, careless of the fact that thus their ennead contained ten divinities. Even as thus modified to suit local preferences, however, the Heliopolitan scheme did not meet with universal acceptance, and side by side with its doctrine of creation there existed other beliefs quite inconsistent with it. At Memphis the fabric of the world was attributed to Ptah, who carved the earth like a statue; at Elephantine to Khnum, the fashioner of the life and body, like a potter working with his wheel; and at Sais to Neith, who wove the universe as a weaver weaves a piece of cloth. In the Creation-story preserved in the famous legend of the destruction of mankind, the heavens are represented, not by the woman-goddess Nut, but by the celestial cow, across whose body the sun-god journeys in his barque. It is probable that this attempt at a scientific grouping of the gods and explanation of the Creation was not so much a popular doctrine as an inspired fiction, not even held by the various priestly colleges, who elaborated it and modified it to suit their local tastes and rivalries. See COSMOGONY AND COSMOLOGY (Egypt.).

2. Beliefs with regard to immortality and the life after death.—In dealing with these, we come into touch with what probably makes the nearest approach to a universally accepted body of doctrine to which the Egyptians ever attained. The idea of immortality has been nowhere more tenaciously held than in ancient Egypt, and the documents relating to it have an overwhelming preponderance in the religious literature of the nation. The most accepted form of belief is that associated with the cycle of Osiris legends. Osiris appears in the Heliopolitan myth as the most important and the most sublime personage, as the heavens and earth, the sun and moon, the air and water, the day and night, the period and the seasons, the fields and the forests, the pyramids and the cliffs, all center in him as the one controlling principle. The chief objects of Osiris at all periods were to forward the accomplishment of the divine order, and to bring order out of chaos or confusion. The doctrine of the Egyptians in regard to Osiris is the first and the purest of all the religious conceptions which have been developed, true subservience to life again is justified before the gods against the accusations of Set, and made god and judge in the under world. Already by the time of the Vth dynasty the idea had been conceived that the story of Osiris was repeated in the case of each Pharaoh, and the conception gradually filtered down, until it was held that every man who was possessed of the necessary knowledge might after death become an Osiris, be restored to his former life and enter into everlasting blessedness. Practically the Egyptian believed, from the earliest historical period, that, because Osiris died and rose again, and after being justified entered into everlasting life, therefore those who believed in him would share the same destiny. Ch. clv. of the Book of the Dead makes the definite assertion of parallelism between the god and his worshipper:

'Homage to thee, O my divine father Osiris; Then hast thy body with thy soul; and thou didst . . . thou didst not become corruption. I shall not decay . . . and I shall not . . . corruption; I shall have my being, I shall live, I shall generate, I shall wake up in peace.'

It is impossible to say whether or not the Egyptian believed that Osiris suffered death on his behalf; the essential connexion between the death and resurrection of Osiris and his own immortality. This belief is held, with no essential variations, throughout the whole historic period.

Definitely the nine gods of Heliopolis, however, when we pass from the fact of immortal life to the manner in which it is to be spent. Nowhere is the jumble of inconsistencies, which seemingly never worried the Egyptian mind, more hopeless than here. The prominent beliefs regarding the state and the abode of the blessed dead are at least four in number, each quite distinct from, and quite inconsistent with, all the others. The oldest and most widespread belief was that after death the deceased leads a second life under much the same conditions as those which ruled the first, dependent upon constant supplies of food and drink, and partaking in his new existence of joys similar to those of his former state. In this state the centre of interest is the idea of the post-mortem fashion of the life and body, like a potter working with his wheel; and at Sais to Neith, who wove the universe as a weaver weaves a piece of cloth. The ancient ideas of the dead were destined to have an abode of blissful labour and pleasure in the Egyptian Elysian Fields. The dead man flies up to heaven like a bird, or ascends a gigantic ladder, and, after passing through many difficulties, arrives at the god Osiris, called Sekhet Aaru, or 'Field of Bulrushes,' where he spends his time in the same agricultural pursuits and field-sports which had occupied him on earth.

Finally, another belief was that the souls of the departed dwell in the upper world through which the sun passes during the hours of the night—a land that in the daytime is one of darkness and desolation. Only at night, as the sun in his barque passes through the twelve domains of the darkness, do the deceased experience something of joy and activity in the hour when he traverses the particular domain in which their lot is cast. Later the belief arose that the illuminated soul, if instructed in the proper formula, might share the voyage of the god through the Under World, merely being gladdened by a passing glimpse of him. These various views co-existed with the Osiran doctrine, though they are essentially quite
independent of it, and, indeed, can be accommodated to it only with difficulty. The popularity of the last of them—of which we shall speak in the fourth, fifth, and seventh volumes—depends, thus far, upon the authority of the sun-god. It was mainly confined to the period of the XIXth and XXth dynasties.

3. Beliefs with regard to the nature and attributes of the gods. In regard to this, we shall not disturb those who believe all that is of mere local significance in regard to the various divinities, it is possible to arrive at a fairly clear idea of what the Egyptian believed concerning the nature of the gods. The material is mainly to be found in the various hymns, the Zendavesta, and the Apocryphal Wisdom of Sirach. In the hymns we are met with a great and almost meaningless accumulation of epithets which are applied individually to various gods in the most bewildering fashion. Setting these aside as mere formalities, we generally find a residuum of evidence as to the nature of the god who is being addressed. Thus, from a fine hymn to Amen at Cusae, we have the following:

'Sole form, producing all things, the one, the sole one, who creates all beings. All beings, human and divine, have come from his eyes, and born from his mouth. He is who makes pastures for the herds and fruit-trees for men; who creates that which is noble and base, that which is light and dark, that which is under the heavens, that which is in the earth. ... Amen is the creator and sustainer of being. Further, he is a god of mercy and justice; listening to the poor and the needy. In his heart is the heart of the timid man from the violent, judging the poor and the oppressed. ... The mercy most longed for, at whose coming the day grows bright. Maker of beings, Creator of existences, Sovereign of life, health, and strength, chief of the gods. We worship thy spirit, O Amen. Do not forget us, we give thee praise and account of thy mercy to us."

Again, from a hymn to Ra in the papyrus of Hu-nefer, we have a remarkably clear statement of the unity, the eternity, and the inscrutable nature of the god:

"Thou art unknown, and no tongue is worthy to declare thy likeness; only thou thyself, thou art One. ... Millions of years have gone over the world; I cannot number the generations which through thou hast passed. Thou dost travel through unknown incognitos, millions and hundreds of thousands of years. ... This thou dost in one little moment of time."

Strangely enough, it is in the hymns and prayers, otherwise "the most human of all the gods," that we find, on the whole, the most endless multiplication of ceremonial epithets, and the greatest dearth of statement as to his nature and attributes. There are, of course, in the hymns and other portions of the religious literature of Egypt, many references to his functions as the bestower of immortality, and prayers that the deceased might share in everlasting life; beyond that there is little that distinguishes him from such gods as Amen and Ra. One of the best known of his hymns has the following:

"The circle of the solar disk is under his orders; winds, rivers, inundation, fruit-trees, as well as all the animal plants. ... Every being invokes him, every man adores his beauties. Delightful for us is his love; his grace enrobes the heart."

There is nothing here which might not be said of Ra, Amen, or any other of the gods of Egypt.

CREED (Jewish).—Articles of creed in the modern sense are unknown in the earlier period of the post-Biblical Judaism. No earlier period had been felt to express man's relation to God in other forms than those found in Dr 6:910 and similar passages of the OT. The belief in God being based on the biblical report of revelation to the patriarchs, and assuming the character of a postulate, obedience to His law was considered a mere logical consequence. The simplicity of this system contrasts strangely with the elaborate array of articles of faith which characterizes the later systems. It is therefore desirable to examine the factors that bridged the gulf.

It was inevitable that Judaism should absorb a certain amount of the metaphysical speculations of the various religious systems which left their mark upon the world. The chief outcome of this was the Philo's theology. In the concluding chapter of his treatise on the 'Creation of the
World' (de Opificio Mundi, ch. ixi.) he gives the result of his investigations in the form of the following five 'lessons' taught by Moses:

1. God's creation; 2. God's providence; 3. God's authority; 4. God's providence embraces the world. The early Jewish Rabbis, however, being concerned with the practice of the Law rather than with speculations, sought to check their propagation among the people.

In reply to the Mishna, 'that should not be studied by a company of two, and the Chariot not even in solitude, unless the student be sagacious and capable of drawing right conclusions,' (Magen, ii.) the terms 'work of creation' and 'Chariot' stand for metaphysics in general. In an additional note the Mishna says explicitly that for him who inquires into 'what is above and below, what was heretofore and will be hereafter, or deals lightly with the glory of his Maker, it would be better for him never to have been born.'

Moreover, Ben Sira (Sir 32):' utters a solemn warning against the study of metaphysics, and several authorities of the Talmud (of the 4th cent. A.D.), commenting on the words both of the Mishna and of Ben Sira, make no other concession than that of allowing the communication of the 'headings of the chapters' to scholars of ripened wisdom (Hagiga, fol. 13). We find, however, in the Mishna an attempt to formulate, in a negative way, something like a creed:

"The following," we read (Sanh. x. 1), 'have no part in the future happiness: he who asserts that the resurrection of the dead did not take place in the Toshur; that the Toshur is not of Divine origin; and the heretic.'

The passage thus enjoins, by way of climax, the king in retirement after death, revelation, and the exaltation of God, and we see, later on, that the same passage was made the basis of real articles of creed. The authorities of the Talmud, however, proceeded in a different way. Instead of forming dogmatical belief, they selected from the moral code three of the most important prohibitions, viz., idolatry, incest, and murder, and laid down that death was to be chosen rather than transgression even under compulsion (Sanh. fol. 74). An enlarged list of laws was imposed upon mankind in general under the name of the 'Seven Noachian Laws,' forming the nucleus of a religious system. They comprised the command of jurisdiction, and the prohibitions of blasphemy, murder, incest, robbery, and the eating of flesh from a living animal (Sanh. fol. 56). A kind of creed in epigrammatic form is Hillel's famous recommendation to the heathen who desired to learn the essence of Judaism in a few words: 'Hillel, then, do not do to thy neighbour' (Shabb. fol. 31).

The first steps in the changing of this attitude were indirectly prompted by Muslim theologians, who created a speculative theology known by the name of Kalâm. The Muhammadan criticism of the anthropomorphisms of the O.T. interfered with the Jewish antipathies to metaphysical research, and the struggle was carried right into the Jewish camp by the sect of the Karaites who, rejecting all Rabbinical tradition and authorizing no value to the authority of Mishnah and Talmud, took up the method of the Mu'tazilite (dissenting) Kalâm for their own needs. The consequence was that Rabbanite Jews were compelled to follow suit and to employ philosophical arguments for the defence of revealed religion. This marks the beginning of the religious philosophy of the Jews, and its oldest exponent was Sa'adya of Fāvāyām, who died in 942 at Sura, in Babylonia. In his work, 'Kol Dammim' and 'Eloq Dammim,' the warning of the Mishnah against metaphysical speculations, on the plea that the Sages did not forbid honest reflection (Amudat, ed. Landauer, p. 21). He was also the first to venture a definition of the idea of creed. 'Faith,' he says, 'is a notion arising in the soul with regard to a subject, the true nature of which has been recognized' (ib. 11). What he really means is conviction gained by the success of the various arguments of the philosophers, such as personal perception, truthful evidence, and logical conclusion. As none of these applies to the tenets of the Jewish religion, he adds, as a fourth source, 'reliable tradition based on revelation'—a phrase which marks the difference between the creed of Rabbanite Judaism on the one side, and Muhammadan as well as Karaita Kalâm on the other. Beyond this first attempt, however, Sa'adya has specified no real articles of faith, employing for the remainder of his work the methods of the Mu'tazilite Kalâm, which held sway among Jewish philosophers for two centuries afterwards.

The hereditary colouring of the Kalâm in the writings of the famous Arab philosopher Avicenna (Ibn Sinâ), in connexion with the criticism of Muslim theologians and the growing pretensions of the Karaites, gradually brought about a reaction in favour of a more decided accentuation of the tenets of Rabbanite Judaism. But in this case also, how little in practice in formulating articles of creed, they again turned to the Arabs, who employed the term 'aqida (phr. 'aqidah) for this purpose. The first Muslim who formulated articles of creed was the famous theologian of Samarkand (1093), who laid down the tenets of his faith in a work entitled 'Aqida (Cod. Brit. Mus. Add. 19143), written in the form of a catechism. Of greater popularity, in fact the standard work on the subject, was that of Ibn Khaldun (1142), which, it is probable, served Jewish writers as a model for the formation of their articles of creed. For it should be noted that the first Jewish work which contained something approaching axioms of faith did not see the light till that period. About 1140 the poet and philosopher Judah Hallevi of Castile composed his famous work al-Khazari in defence of 'the despised faith.' The book (which is written in Arabic) is based on a narrative dealing with the search of the king of the Khazars for the right belief. Being dissatisfied with the doctrines offered to him by a philosopher of the Avicenna type, a Christian and a Jew, he finally asks a Jewish Rabbi for his creed. The last named, in contradiction to his predecessors with their more or less speculative theories, answers:

'I believe in the God of Abraham, Isaac, and Israel, who led the children of Israel out of Egypt with signs and miracles. Our belief is comprised in the Torah' (ib. Khazari, p. 44).

This formal confession is subsequently supplemented by the following sentence:

'To this [prayer] the believer attaches the following articles of creed (Iyad' which completes the Jewish belief, viz. (1) the recognition of God's sovereignty, (2) His eternity, (3) the providential care which He bestowed upon our forefathers, (4) that the Torah was sent from Him, and (5) that the proof of all this is found in the delivery from Egypt' (ib. 154).

From these words we conclude that the notion of articles of creed was familiar to Judah Hallevi, though he saw no necessity to formulate them for the benefit of his Jewish brethren. Sweeping away speculation of all kinds, he substitutes for it a priori belief, from which everything else follows as a necessary consequence (ib. 270). In this way he shows the contrast between his attitude and that of religious speculators, he reproduces in ten axioms the system of the Karaita Kalâm (ib. 275-278). Judah Hallevi's omission to condense the results of his investigation into a similar system is thus far quite consistent with his views. A more definite attempt to formulate axioms of belief on Arab-Aristotelian lines was made by Abraham b. David of Toledo (1161)—the author of a work (like-
Arts for liturgical purposes prefixed each paragraph with the words 'I believe with perfect faith'—words which are absent from Maimonides' original. It was Samuel b. Tibbon who placed the word 'pē' (to believe') at the head of several articles of the first two categories of these articles in poetic form the most popular is the Yigdal hymn by an unknown (but probably Spanish) author. Those who followed Maimonides, writing on the same subject, as Isḥaq Crescas († 1410) and Abraham Abravanel (1357–1508), have added nothing new, and need not, therefore, be further considered.

There now remains a word to be said on the tenets of the creed of the Karaites. By rejecting the Rabbinitic method of interpreting the Bible, they avoided the Muhammadan charge of having altered the Torah, and, being disciples of the Mu'tazilite school, they were under no suspicion regarding their conception of Biblical anthropomorphisms. They had, however, to defend their belief in (1) the prophethood of Moses and the other prophets; (2) the validity of the Torah, and their own interpretation of it; and (3) the arrival of the Messiah. Now the ten axioms reproduced by Judah Halevi (see above) touch only the physical side of the question, and it was left to others to supply the religious element. Judah b. Elijah Hadasasi (1149) was the first to attempt this by grouping the Karaites laws round the Decalogue. Kaleb Alfonsi, who (in 1407) wrote an introduction to Hadasasi's work, extracted from it the following ten articles:

I. God is the creator of all creatures.
II. He is only one Eternal.
III. Every other existing being is created.
IV. God sent Moses and all other prophets mentioned in the Bible.
V. The law of Moses is true.
VI. Believer must have knowledge of the Torah and its interpretation.
VII. The Sanctuary (at Jerusalem) is the palace of the Most High or Divine dwelling.
VIII. The resurrection of the dead [will take place] at the time of the arrival of the Messiah.
IX. There will be a final judgment.
X. Just retribution.

In view of the close relationship between the paragraphs I.–III., IV.–VII., IX.–X., the artificiality of the number ten is conspicuous. Israel Haldarayyân of Alexandria, who (in 1257) composed a digest of the Karaites laws, condensed the Articles into the following six: (1) God; (2) the messengership of Moses; (3) the Torah was revealed through Moses; (4) (Jerusalem); and (5) the judgment.

HARTWIG HIRSCHFELD.

ARTICLES (Muhammadan).—The Muhammadan creed or profession of faith (kalimah as-salāhā) or, shortly, Article, is the word 'I testify that there is no god but God, and I testify that Muhammad is the apostle of God.' It is one of the articles of faith ('aqidah) of faith ('imām), and also one of the 'five pillars' of practical religion (iddah). According to Ibn Khattab (Mehe, Lohmoo, 1861, p. 19) and Zunz (Literaturgesch. des synagoge, Potsie, Berlin, 1860, p. 507), this hymn was completed in 1451 by Daniel ben Judah Duyan of Ronie.
CREEDS AND ARTICLES (Parsi).

1. According to Yasn. xxx, 2, man must make a choice between the two 'creeds' or 'confessions' (verānā). In the beginning the Holy Spirit said of himself and of his spiritual antagonist that their 'confessions' (verānā) did not agree with each other. The word, 'confession' implies a choice, and the corresponding verb is used in the middle voice by fra- as a technical term to express the profession of a religion, especially of the Mazdaian faith: fra-verb, 'profess, confess,' 'I make my profession of faith,' etc. Although from the very beginning Zarathushtrian Mazdaism thus meant a sharp contrast with surrounding worship and practice (cf. Vend. xix. 6; Zarathushtra's mother had invoked the Aryan Māzā; i.e., Mazda-term, neithr proselytizing aims or doctrinal discussions produced a creed in the same sense as in Christianity. The Zarathushtrian reform was of a moral, economic, and ritual kind, rather than intellectual. But the Avesta contains several beliefs based on different occasions, e.g., in putting on the sacred cord, on rising in the morning, in the nayishesh and other prayers, etc. These formula sum up the most peculiar tenets and practices of the Parsi religion. It may be that some of them originated during the Sassanian restoration, owing to the need of briefly distinguishing their own faith from Christianity and other rivals. We shall mention only the most important formulæ. In the post-Avestan time some of the settled in India, who presumably present a summary of their beliefs and sacred customs to Indian rulers.

2. In its shortest form the Fravarene (Yaz. xi. 16, xvii. 12; Yt. xiii. 83, etc.) contains four points: Fravarene, Mazdayasn, Zarathushtrish, Vidēa, Ahrāmatkōh. I profess myself a Mazda-worshipper, a Zarathushtrian, an anti-devil (enemy of the demons), a servant (or proclaimer) of the Lord. That is, the believer declares himself (1) a monotheist; (2) a member of a historically founded religion; (3) a dualist. Or, to put it differently, (1) the revealed God is Ahura Mazda; (2) the revealer is Zarathushtra; (3) the peculiar higher form of life instated by the revealer as the due service of God consists, with the faith against the demons. These points are co-ordinated in a way characteristic of revealed or founded religion (cf. Transactions of the 3rd Int. Congr. for the Hist. of Rel., Oxford, 1908, ii. 405 ff.). (4) The last point seems to hold on to a whole faith, yasnēavād designating more particularly the Divine worship, and 1ākāshō designating the doctrines and tenets of religion in general. Additions are sometimes made to the Fravarene: homage to the genius of the gōkās (hours, watches), of the days, of the months, of the seasons, of the years (Introd. to the Yasn. Y. xi. 16, xxvii. 5; esp. in the five gōkās recited at the five hours of prayer of the five stages of daily and contained in the Khorda Avesta (the book of prayer), etc.); or a more authentic addition—homage to the Amesha-Spenta (Yasn. xii. 1), or other amplifications. A still shorter form (Yasn. xii. 8) runs: 'I profess myself a Zarathushtrian, having made both my avowal and my profession of faith.' Another short formula in Pahlavi runs: 'I declare my adherence to the Mazda-worship and right, and renounce all evil beings and things ornament.' (E. S. Dadaibai Bharucha, Khorda-avestā-arzōh, Bombay, 1906, p. 2).

3. A more explicit creed is formed by the Hāsd. xii. and xiii. of the Yasn. designated, according to Anquetil Duperron, by the Parsis as Fra-verb, 'confession,' 'creed,' and called after the opening words Frastrnē, 'I praise' (Yas. xi. 17—xiii. 7), and Astryē, 'I avow' (Yasn. xii. 8—xiii. 9, as divided by Darmesteter). Astryē, with the shortest Fra-verb, belongs, e.g., to the parer of the investiture with the kōst. Frastrnē is placed at the head of each Yast and of each Patet, and it occurs in a shorter and in a longer—evidently more original—form, which contains elements of really ancient respect. The term fra- (from the Persian fra-, 'I avow good thoughts, good words, good actions.' In the course of the confession, cattle-stalking and destruction of the villages of the Mazdayans are abjured; folk and cattle ought to live in peace. A Frastrnē, 'I make my profession of faith, etc. Although from the very beginning Zarathushtrian Mazdaism thus meant a sharp contrast with surrounding worship and practice (cf. Vend. xix. 6; Zarathushtra's mother had invoked the Aryan Māzā; i.e., Mazda-term, neither proselytizing aims nor doctrinal discussions produced a creed in the same sense as in Christianity. The Zarathushtrian reform was of a moral, economic, and ritual kind, rather than intellectual. But the Avesta contains several beliefs based on different occasions, e.g., in putting on the sacred cord, on rising in the morning, in the nayisheshes and other prayers, etc. These formulæ sum up the most peculiar tenets and practices of the Parsi religion. It may be that some of them originated during the Sassanian restoration, owing to the need of briefly distinguishing their own faith from Christianity and other rivals. We shall mention only the most important formulæ. In the post-Avestan time some of the settled in India, who presumably present a summary of their beliefs and sacred customs to Indian rulers.

4. Anquetil Duperron describes the ceremonies to be undertaken by an unbeliever desiring to join the Parsi faith. The Parsi creed belonging to that ritual and included by Spiegel in the Khorda Avesta is evidently much later than the Avesta. It runs: 'The good, pious, right religion, which the Lord of the created beings has sent, is the one brought by Zartāsh. The religion is the religion of Zartāsh, the religion of Ormazd, given to Zartāsh. The creation of an outsider into the Parsi communion is, in fact, nowadays almost an unheard-of thing; such requests have been rejected lately.

5. The Mazdayans who confesses his sins and seeks also the other course, in quite a different position from a proselyte not belonging to the sacred blood. The explicit formulæ of penance, Patet, give a good idea of what was considered by later Mazdaism to be essential to the Parsi practice of his faith. To the cloistered, having been numbered at length the sins and wickednesses repented of, and having referred to the fact
that the same faith had been professed by the men of the holy tradition, mentioned in the Fruutury, and by Adabdar Mahranpand (4th cent. A.D.), the believer proclaims that neither happiness nor a longer duration of life is possible after the penalty of death, can separate him from the right religion, because he dreads hell and hopes for paradise.

6. On the arrival of the emigrating Parsis at Sanjan in A.D. 716, they presented to the Indian prince of Gujarat a list of sixteen 

dolazy, composed by the most learned of their dasturs, and containing the principal rules and tenets of their religion, selected and stated in a way fitted to consolidate the ruler, without denying or concealing the real content of Mazdeism. The points stated are as follows: (1) the adoration of Ahura Mazda, of the Sun, and of five elements; (2) silence during the bath, in reciting prayers, in presenting offerings to the fire, and in eating; (3) the use of incense, perfumes, and flowers in religious ceremonies; (4) the honour accorded to the cow; (5) the use of the sacred shirt, string, and sp; (6) singing and music at weddings; (7) the adornments and perfumes of ladies; (8) the precepts of generosity in giving alms, and of digging tanks and wells; (9) the precept to extend one's sympathies to all male and female beings; (10) the aubulations with gomutra (emphatically called 'one of the products of the cow'); (11) the wearing of the sacred cord in praying and in eating; (12) the sacred fire fed with incense; (13) the five devotions every day; (14) conjugal fidelity and purity; (15) the annual ceremonies in honour of the forefathers; (16) the precautions to be observed by women after child-birth and during menstruation. There exist different versions in Gujarati and Sanskrit.

CRIMES AND PUNISHMENTS (Primitive and Savage).—I. Introduction.—While revenge is the action of an individual against one who has done him wrong, punishment is the action taken by society against one who has transgressed its laws. Revenge may, however, be followed up by a group of persons in sympathy with the injured person, in this case passing over to the blood-feud (g.v.); and individual or collective revenge may be recognized by the society as the specific form of punishment to which it lends its sanction or its aid. Men seek revenge because they feel that their rights or interests have been wronged upon another without suffering the consequences. The exercise of justice by a community or its representatives against an individual who is obnoxious to it, or to any of its members, is based primarily on the feeling with which underlying the action. Punishment is to some extent vengeance—the vengeance of society for its own preservation. The criminal must suffer, must expiate his crime, whatever other notions may in time enter into the idea of punishment. Private vengeance and public justice are thus so far similar in their point of view and in their action, save that the latter tends to be more discriminating and impartial. Not the individual sufferer himself, but others judge and condemn the guilty person. Public justice at lower stages is extremely limited, and side by side with it exists private or collective vengeance (e.g. the blood-feud). This is to some extent justice, since society recognizes the right to its execution. It has become a specific form of punishment because society has sanctioned it. Or, public justice may, again, recognize private revenge by handing over the evil-doer to the injured person of his relatives, or by making him or them the executors of justice. Public justice, save in the case of a few crimes which more particularly menace the existence of society as a whole, has to content itself with regulating private revenge, or with suggesting a system of compensations. Finally, as it advances, often through the growing supranomy of chiefs, it eliminates private revenge more or less completely, though this can hardly be said to be true of any savage society.

The simplest form of regulated revenge is the duel—the right of the injured party to challenge the offender to single combat, or the case where the aggressor must stand up to the throwing of spears (as in some Australian instances), or must submit to the plundering of his house in revenge. The actual revenge is regulated by being limited to a certain period or to certain offences. The blood-feud is the best example of regulated revenge (see Post, Grundriss der ethnik, Jurisprudenz, ii. p. 467; Eliot, Moral Ideas, i. 496 ff.; see s. 6, ii. (1) below).

In the earliest times, if men, like some of the higher apes, lived in separate families, the family would, when necessary, assist any individual member of it in following up an act of revenge, because they were bound to be in sympathy with him for the wrong done. Thus individual revenge easily passed over into collective revenge. It is out of this feeling of sympathy that justice, strictly so called, arises. Actions by which any individual feels aggrieved are generally those by which all individuals feel aggrieved when they are done to themselves; and the condemnation of such actions tends to formulate itself as a custom or law which cannot be transgressed without risk of incurring the hostility of the society or or individuals composing it. Custom is, in fact, a strong expression of savage man's sense of right and wrong, and it is the test by which actions are judged, although, indeed, some of the actions, from a strictly ethical point of view, may be indifferent. Hence, both collective revenge and public justice are the expression of mutual indignation, though the latter expresses it more strongly. For, the more men realize their solidarity, the more is any ill done to one regarded with indignation by all, as a result of
CRIMES AND PUNISHMENTS (Primitive and Savage) 249

the working of sympathetic emotion. And, as the ill done has transgressed that customary law,—the expression of what is right and what is wrong,—the punishment inflicted is an expression of moral indignation at the wrongdoing. It may be out of all proportion to the offence committed, and in such a case is on a level with mere unthinking revenge, but it is not on just equivalence. At lower levels of savagery, punishment has some proportion to the offence. It is at higher levels, in barbaric and despotic societies, that punishment is most cruel and disproportionate to the offence.

The tendency of punishment is to supplant mere revenge (which is occasionally regarded as wrong) is aided by the fact that the latter often causes great inconvenience to the society, and tends to multiply the revengeful actions. The society, by its collective emotions, decides between the avenger and the wrongdoer, and decides upon the punishment, or restrains the amount of revengeful action. Thus the judgments of a central tribunal are gradually preferred to revengeful acts. Case by case the chief has been given powers over all the community because of the fear of anarchy arising out of private revenge (The Bassutos, 1861, p. 225). The injurious results of the blood-feud are well recognized by savages, and the chief sees the need of the headman for the sake of his people. If the chief will not interfere to stop its excesses; or it sometimes gives place to an appeal to them, or to the payment of a compensation by the offender, as a matter of private arrangement, one suggested by them. This custom generally tends to pool in the tribe to a certain degree, with a graduated scale of payments according to the magnitude of the offence (§ 5). With the growth of the power of the chief, he not only advises or sagaciously, but determines and orders the carrying out of justice over a wider field. Moreover, where the injured person or his representatives are too weak to take revenge against a powerful tribesman, or, on the other hand, where there is proportion to the offence, to the sympathetic emotions of the society, being aroused in the one case for the victim and in the other for the aggressor, gradually contribute to the formation of a tribunal in some shape or form, and to the cessation of private revenge.

Yet private revenge often exists side by side with punishment by a tribunal or a chief. This is natural when we consider what savage character is. But, on the whole, there is a tendency to make some headway in the expression. Thus it may be recognized as the right way of punishing certain wrongdoers, provided that it does not exceed certain limits. This is particularly true where the husband is allowed to avenge himself on the adulterer. Or it may be permitted that the criminal caught hard-handed in certain crimes, e.g. theft, should be slain at once. Or, again, the blood-feud may be the approved method of punishing the murderer. Or the aggrieved person or his relatives may be chosen as executors of the sentence passed by the tribunal. Thus, among many of the Bantu tribes, a murderer proved guilty is given over to the relatives of his victim to deal with him as they choose (Macdonald, J.Afr. xviii. 108). Many other instances might be cited. Private revenge sometimes continues alongside, or in spite of established tribal tribunals in the case of large societies scattered over wide areas, and in which there is little feeling of homogeneity, and hence little preponderance of sympathy in favour of an aggrieved person. Revenge may also be pursued in all societies in matters not usually taken cognizance of by the laws.

2. Crime, morality, and religion.—Even in the earliest stages of human history man may have dimly felt it ethically wrong to murder, commit adultery, or steal, apart from the fact that the instigative act of revenge brought it home to him that in committing it he was transgressing against the rights of another. These crimes are so universally condemned that there can have been no time when they were not regarded as deeds which it was wrong to commit. The sense of guilt attached to these crimes has been largely increased with the growth of society, of the group in which men lived, because such actions tended to destroy the unity of the group. Custom laid down that there were certain things which must not be done, and it was, therefore, highly immoral to do them. Nor is it improbable that, even at the very earliest stages of the growth of the ideas of right and wrong, man may have thought vaguely that in doing wrong to another he was incurring the anger of whatever worshipful being or beings he was aware of. This thought also would become more definite with the growth of society. Where a group of men living together worship a being whom they believe to be interested in the group, any transgressions of custom will be regarded as transgression against him, because the customs would certainly be regarded as having been instituted by him. Whatever constituted a menace to the group or any of the individuals composing it would be said to have offended against the gods, who naturally favoured the community and not him who menaced its existence. The god is apt to punish the group for the breach of custom, and hence the offender is made to suffer speedily for his evil-doing. So are the gods of the Navaho, among whom the victim is punished by the group as a whole. Others are not so punished, but the group approves of the act of revenge by which the offence is required. Revenge or punishment is thus supposed to satisfy the anger of the god. Some sort of expiation is looked for by the victims, and while the evidence here taken is found in the fact that the divinities of very primitive tribes are also to some extent moral governors, who are thought to dislike particular crimes and to punish them. Among savages at a higher level there is a certain amount of evidence proving that their gods take account of crime and are guardians of morality. Whether or not it be true that all morality from the first is connected with religion, it is reasonable to suppose that religion serves to strengthen and assisted morality by its insistence on the fact that the gods or gods of the group desired its welfare, and that all offences against that welfare were thus more than offences against law.

3. The administration of justice.—A regular organization for enforcing justice or maintaining custom hardly exists at the lowest levels of society, though its beginnings may be seen. Justice is a matter of individual action; and yet, as among the Yaghan of Tierra del Fuego, where the feeling of the community gives support to the existing customs, some help in avenging wrongs may always be looked for from relatives or neighbours (Hobhouse, Morale in Evolution, 1. 46, citing Hyades and Deniker, Mise. scient. du Cap Horn, Paris, 1891). This is an approach to collective revenge, and, as a rule, the greater the wrong, the more likelihood is there of the avenger being supported. But, whereas there might be cited a breach of tribal custom, the breaker of a custom is the breaker of a law, and his action arouses strong disapproval. Hence, society approves the action of the avenger, e.g., in cases of murder or adultery; or it takes similar action against the wrongdoer. The latter course is most frequent in the case of crimes which are regarded as bringing the whole community into danger or subjecting it to Divine anger, e.g. sorcery and incest (breaches of exogamous custom). Yet, again, a whole clan or tribe will put to death or banish a man who makes him—
self a nuisance to every one, as among the Eskimos, where a whole village has occasionally risen against and slain an atrocious murderer (Nansen, *Eskimo Life*, 1893, p. 163). Conjoint action by the community is found amongst the Mpongwe, who, according to Tabor (in *Trips to Gorilla Land*, 1876, i. 105), is common among Australian tribes, where the whole camp joins in punishing the ill-doer (Westermarck, *op. cit.* i. 171). But, even when such joint action occurs, individual revenge, especially to litigation to a council of elders; or, again, as among the Kaure, village chiefs judge lesser matters, while chiefs of clans hear appeals against their judgments and try all more serious crimes, aided by the advice of a council (Letourneau, *D'Ecol. juridique*, p. 94). But it is probable that, as among the Central Australian tribes, these offences are breaches of the strict marriage laws (incest, forbidding marriage between the brothers and sisters), or murder by the elder or eldest brother for an avenging party to go out and punish the offenders (Spencer & Gillen, *op. cit.* 15, 477; 163, 556 ff.). In some instances the council has nothing to do with cases of murder, adultery, etc.; and the laws relating to property or to litigation are brought before it (Nagas, *Stewart, JERAS Be* xxiv., 1855, p. 669). Kandhs (Dalton, *Eth. of Bengal*, Calc., 1872, p. 294) and Formosans (Letourneau, *D'Ecol. juridique*, p. 94). Or, as among some N. American tribes (Oglivas, Wyandots, etc.), the avenger appears before a council, and, having obtained judgment in his favour, demands compensation. If this is not given, he falls back on revenge (Kohler, *ZVII* viii. [1897] 407). In many cases, too, the council (as in the case of the chief) delegates the execution of justice to the person who would otherwise be the avenger. Sometimes the leading men of a group will intervene to prevent disputes or to arrange composition. Less usual are the instances of the decision being taken by a council, and as final in all private cases (Todas and other aboriginal Indian tribes [Shortt, *TES*, new ser. vii., 1868, p. 241; Forsyth, *Highlands of Cent. India*, 1871, p. 563]; Tagbana [Worcester, *Philippine Islands*, New York, 1888, p. 107], and a few others). Thus, generally speaking, the savage council seldom constitutes a court in the strict sense of the word.

With the advancing power of the chief, the administration of public justice passes largely into his hands; yet even so, the blood-feud, or the right of the husband to punish in cases of adultery—is still used and permitted, and often the chief's prerogative is exercised only when appeal has been made to him. But there now comes into great prominence in most higher savage tribes, a regular system of compensation or fines for various crimes, payable to the aggrieved person or his representatives, or, in some cases, to the state. We find also in many places regular codes of laws, with different laws for different offences. Sometimes the chief merely intervenes to prevent excessive revenge and to suggest compensation, as among many American Indian and African tribes; sometimes his power of intervention extends to the actual payment, generally those of a public kind; or, again, he merely acts as arbiter or adviser rather than as judge. But, the more his power is established, and the more autocratic he is, so much the more do his functions as judge increase. This is especially true of many of the chiefs and petty monarchs of Africa, and in general of all tribes whose social organization is high. Frequently the court consists of a council of elders; or, again, as among the Kaure, village chiefs judge lesser matters, while chiefs of clans hear appeals against their judgments and try all more serious crimes, aided by the advice of a council (Letourneau, *D'Ecol. juridique*, p. 94). But, with the decay of private revenge, the administration of justice becomes more definite and strict, especially as we advance from savage to barbarous societies. The court or chief maintains order, upholds the rights of every member of society, and punishes all crime. Generally, where a court exists, it is seen to be a guarantee, not found in the exercise of mere revenge, that all offenders shall suffer, and suffer proportionately to their offence.

Where cases are brought before a council or a chief, a palaver usually takes place, at which both parties are fully heard. Sometimes the method of the oath or ordeal is resorted to in order to discover the truth and to point out the guilty person. The oath is frequently in the form of a curse, and accompanies the drinking of a poison or of some liquid, which is supposed to act fatally upon the perjurer or the guilty. The oath is thus a species of ordeal. But the ordeal may occur by itself in various forms: the ordeal by fire, by red hot metal, or by boiling oil or water, in which cases the innocent person is not burned, or his wound heals within a certain time; the ordeal by water—remaining under water for a certain time without drowning, or passing safely through water in which crocodiles lurk; the ordeal by poison (see OATH; ORDEAL; Post, ii. 459 ff.). The person who is proved to be guilty, if he has not already succumbed to the ordeal, is then punished according to the nature of his crime. Among the most civilized societies, such as the Duk-Duk of New Britain, supplement the action of private revenge or public justice where these are imperfect, and punish any one who commits crime.

### 4. Variety of Crimes

The idea of what constitutes crime in savage society is largely akin to that entertained in civilized societies. But there are important exceptions to this, bound up with the nature of savage society and belief, e.g. breach of taboo or relating to the blood-feud; or the right of the husband to punish in cases of adultery—is still used and permitted, and often the chief's prerogative is exercised only when appeal has been made to him. But there now comes into great prominence in most higher savage tribes, a regular system of compensation or fines for various crimes, payable to the aggrieved person or his representatives, or, in some cases, to the state. We find also in many places regular codes of laws, with different laws for different offences. Sometimes the chief merely intervenes to prevent excessive revenge and to suggest compensation, as among many American Indian and African tribes; sometimes his power of intervention extends to the actual payment, generally those of a public kind; or, again, he merely acts as arbiter or adviser rather than as judge. But,
even praiseworthy. They are apt to be considered wrong, however, if they are likely to bring the vengeance of the other tribe upon the tribe of the offender. With the decline of the custom of capital punishment and a wider sense of responsibility this view tends to disappear. Again, we generally meet with the idea that the weight of the crime varies both according to the rank (and often the age and sex) of the offender and according to that of the victim. Chiefs or men of rank may commit crimes with impunity or with slight punishment, but crime committed against them is generally punished more severely than that against lesser men. This is especially the case when the system of compensation for crime prevails, the blood-price or the fine varying strictly according to the rank of the victim, and often also according to the rank of the offender. These views continue to prevail in higher societies. Approximating to the custom of more advanced civilization, there is frequently a distinction made between a first crime and its repetition. A first offence may be punished comparatively lightly; a second or third will receive the utmost penalty—death or punishment.

Thus among the Basobara, for a first theft a hand is amputated; for a second the penalty is death (Letermeau, p. 78). The first time a tribe is charged with a murder, the second with amputation of some fingers, a third with amputation of a hand and feet, a fourth with death (Petroff, "Report on the Criminal Code of the United States," Washington, 1854, p. 150). Among the Wakamba, a first murder is punished by a fine, but on a second conviction the murderer is killed at once (Decé, Three Years in Savage Africa, 1846, p. 457).

In general, those crimes which may be considered public, that is, those crimes that are punished against the community, or to the danger of the whole community, are sorcery (involving, according to current belief, all natural death), breaches of the customary marriage laws (incest), sacrilege (breaking of tabo, and many other "crimes") which are committed against private persons—include murder, adultery, usury, theft, perjury, and the like. Some of the latter may be regarded as public crimes if they are committed against the chief, because of the relation in which he stands to the community. There are, of course, many lesser crimes, while, especially where chiefs have the power of making laws, there is a tendency to multiply offences. With the greater development of savage society and the addition of a central administrative body taking the place of mere public opinion and custom, these private crimes are regarded less and less as offences against an individual, and more and more as breaches of law and order against the community. At the latter stage, in barbaric and semi-civilized societies, that a real approximation to this view is found.

5. Punishments.—Punishment administered by public justice in savage society has generally the intention of making the offender suffer pain, and is thus analogous to punishment inflicted as an act of private revenge. The lex talonis, or principle of equivalence in punishment, is perhaps originally connected with the reflex and instinctive movements of the person who is hurt, and who attempts to make the aggressor suffer a similar hurt by a natural process of imitation. There must be blow for blow. At the same time this movement is one of self-preservation, and this also is an element of all punishment. Such instinctive resentment is, however, indiscriminate in the amount of vengeance which it employs, and this primitive instinct of blow for blow, whilst suggesting the lex talonis, is in no way an explanation of it. We may, therefore, with Westermarck (1, 197), look for a further explanation of it in the feeling of self-regarding pride which desires to bring the aggressor to the same level as the sufferer, and in the social feeling that members of the same society have equal rights, and hence, if one makes another suffer, he must suffer in a similar way and to the same extent.

The simplest form of the lex talonis is found in the idea of life for life, wound for wound, eye for eye, tooth for tooth. But it also assumes some curious forms; for example, especially in the case of the blood-feud, there is often the desire that the vengeance should fall on one of the same rank, or the same sex, or the same age, as the victim—the real aggressor thus escaping. Again, the vengeance is exacted with the same kind of weapon, and in the same way. Such a development forms a series of compensations and lines exists, which are in due proportion to the amount of pain caused. Or it is seen working in still another way: the thief is deprived of sight, of an arm or hand; the perjurer loses his tongue; the adulterer or ravisher is cast out; or, again, the thief must not only restore the goods stolen, but must submit to be pillaged to the same extent (see Post, ii. 238 ff.; Hobhouse, I, 84, 91).

But, while the lex talonis is found as an underlying principle both in savage and in more advanced systems (cf. e.g. the OT and the Bab. Code of Hammurabi), there is often a disposition to exceed it, so that methods of private revenge as well as public punishment are exacted in relation to the crime committed, especially in places where the people are naturally cruel, where a despotic chief rules, or where it is held that a Divine as well as a human law is transgressed. In the last case, as well as in the case of some tribes at the present day, murder is seen as equivalent to the crime committed, especially in places where the people are naturally cruel, where a despotic chief rules, or where it is held that a Divine as well as a human law is transgressed. Hence the punishment is more severe. In the case of the blood-feud, the principle of compensation and collective responsibility—a principle lingering on in more advanced societies.

In a few cases capital punishment seldom or never occurs. But, as a rule, it is meted out in most tribes as a lesser or greater penalty. But it is not, as is commonly supposed, universally applied to murder alone, or to the blood-feud. Murder, murder, incest, treason, sacrilege, adultery, and theft. Some tribes punish capital only for murder and for murder and adultery (especially with the wives of chiefs); but not uncommonly all these offences are liable to the punishment of death. Further, in such despotic kingdoms as Ashanti or other regions of Africa, as well as sporadically elsewhere, even small offences are punishable with death, at the capricious will of the chief (Elita, Tahi-speaking Peoples, 1887, p. 166; Kolmann, Victoria Nyanza, Berlin, 1899, p. 170 ff.).

The methods of death vary; they include decapitation, strangulation, hanging, stabbing or spearing, disembowelment, decapitation, crucifixion, drowning, burning, hanging alive, burying alive, throwing from a height, burning, sending the criminal to sea in a leaky canoes, cutting in two, lopping off the limbs. In some cases, where the crime is believed to be particularly offensive to the gods, the criminal is offered in sacrifice, whilst this is not an unusual way of obtaining victims where human sacrifice prevails (McConihey, Codrington, Melanesia, 1899, p. 123, and under-mentioned elsewhere, von Kotzebue, Voy. of Discovery to the S. Sea, 1821, ii. 246; Tafelii (Eds.), Polynes. Reis., 1829, i. 524); cf. Caumer, vi. 16 [Gauls]; Grimm, Teut. Myth., ii. p. 346; Loomis, 'Travels on the Cape of Good Hope,' 46 (Pretoria). In the event of cannibalism prevailing, criminals are killed and eaten, probably as an extreme form of gratifying revenge and showing contempt.
CRIMES AND PUNISHMENTS (Primitive and Savage)

(For example, Travels in Brazil, 1847, I. 88).

Of all these methods the most cruel are found in Africa, where, a man must die for death, as well as for other torture, is practised (cf. Letourneau, pp. 71, 81, 82, 88; Post, ii. 274; Westermarck, I. 195).

Other punishments consist of various bodily mutilations, cutting off hands or feet (or parts of these), nose, ears, lips; castration; and plucking out the eyes. All these are found commonly in Africa, among Amer. Indian tribes, in the South Sea Islands, and occasionally elsewhere. The mutilations or parts of the body—back, hips, shoulders, legs, stomach—is also used (in S. America, among the Mongols, in Africa). Enslavement is found as an occasional punishment for crime or for debt (commonly in Africa and in the Malay Archipelago, and sporadically elsewhere); or, where the criminal has failed to pay the due compensation, he is often enslaved, or the usual punishment is inflicted upon him. He becomes the slave of his victim or of the latter's family, or of the chief, or he may be sold. Consecration of goods, in whole or in part, is a frequent punishment in cases of theft. Banishment occurs here and there (New Zealand, Mongolia, some African tribes) as a punishment, but it is often the result of general bad or unruly behaviour threatening the peace of the tribe (see Westermarck, i. 172; Steinmetz, Ethnol. Stud. zur ersten Entwick. der Strafe, vol. ii, ch. 5). Lack of a country among the Kung (African Bushmen), the Bannavas of Cambodia, are punished with banishment (Lichtenstein, Travels in S. Africa, 1812-15, i. 265; Mouhot, Trav. in Central Parts of Indo-China, 1864, ii. 27). Other punishments are various forms of discomfit—cutting off the hair, insulting exhibition or parade of the culprit, dressing in women's clothes. Imprisonment as a punishment is rarely found among savages, but instances are noted in various parts of Africa (Krapf, Travels . . . in E. Africa, 1866, p. 38; Letourneau, pp. 80, 84; Post, Afr. Jur. ii. 51).

There is also a widespread system of compensation or fine for certain offences. This method of indemnifying the victim or his relatives is itself a species of theft, though the aggressor, who is wealthy, is easy for him to pay for his crimes. The system probably originated in the custom of paying blood-money to the relatives of a murdered man. The aggressor, to avoid a blood-feud, would be held responsible to the relatives to appease their anger, while at the same time appealing to their love of gain. This, defective as it may be from the point of view of justice, was soon seen to have the good effect of staying the excesses of the blood-feud, and would be encouraged by the community or the chief. Similarly, compensation for theft may also have been suggested by the custom of subjecting the chief to pillage of his goods. The system of compensation was largely adopted, and penalized duties among the Bushmen and other aboriginal races, as a method of assessing criminal actions. But it was far from being universally accepted either in systems of private revenge or in public punishment, and, even where it prevailed, certain crimes cannot be compensated for, e.g. sorcery and deliberate murder. It has a wide-spread vogue, however, as a regular custom, or as an alternative to punishment in cases of murder, adultery, seduction, theft, etc. (cf. Post, ii. 256 ff., for a list of peoples among whom it is found). When it is provided for a regular system of payments is fixed according to the injury done, according to the rank or sex of the victim, and sometimes according to the rank of the aggressor.

In many instances—in such serious crimes as sorcery, murder, or crimes committed against a chief or his household—the wife and children of the aggressor suffer with him, or are sold as slaves. Or, where compensation has not been paid, wife and children may be taken with the defaulting criminal and enslaved; or he himself may sell them in order to obtain the wherewithal to pay the compensation. Thus the first type of the savage doctrine of human solidarity is seen at work—a principle emphasized in the blood-feud, where the murderer's family or clan is often held responsible for his act and the members are liable to be slain for it.

As a further form of indignity and punishment, the body of a criminal is often left unburied, or is thrown into the forest to be devoured by wild beasts (African tribes [Post, Afr. Jur. i. 46]; Eskimos [Kink, Tales and of the Eskim to 1875, p. 54]; Cent. America [Preuss, Die Begräbn. der Amer., Königsh. 1875, p. 311]).

6. As has already been said, a distinction is drawn even by the most backward peoples between public and private crimes. Some example of both will now be discussed, showing the attitude of the savage with regard to them and the punishments meted out to the aggressors.

1. Public Crimes.—As examples of public crimes may be taken sorcery, incest, and sacrifice.

(a) Sorcery.—As distinct from magic, which is authorized for the public good, sorcery, though its methods may often be similar, is almost universally punished by the social sanction. Its commission occurs as the direct object of the central authority acting in its name. The sorcerer is employing unlawful means for anti-social ends, especially to bring about the sickness or death of his neighbor's wife, or to cause sterility in his own; thus, inasmuch as the crime is an anti-social one, it is for that very reason a crime against the divinity of the social group, its guardian or tutelary spirit. As among the Eskimos, it is adverse to the welfare of all, as it prevails in all parts of savage religion. Thus, sorcery is condemned on religious as well as on social or moral grounds, and those who are most active in pursuing it are generally the sorrows among the sorcerers, or priestesses in their employ, the divinities of which are said to abhor witchcraft, thus to punish their actions. The Iroquois to punish it in the future life (Kink, p. 41; Parker, Esnanday Tribe, 1905, p. 79; Codrington, p. 274). As it is a widespread belief that all sickness or death is due to unnatural causes, one of which is sorcery, there is a wide field for the exercise of public justice against the sorcerer, who is generally regarded as a murderer of a particularly offensive type. Hence, not only in the lower culture, but at all higher levels, law and custom condemn him. He is a danger to society; he offends against its gods; and, because of the solidarity of the society, it may be visited by them for his offence. Therefore he is almost invariably punished with death. Sorcery is sometimes the only crime which is so punished, while the method of death is very cruel. In most cases the authorized magician, medicine-man, fetish-man, priest, or witch-doctor, takes steps to discover the sorcerer. When he is found, he is sentenced to an ordeal, e.g. by poison. If this does not kill him but proves him guilty, he is then publicly put to death. The ordeal is thus equivalent to the trial of the suspected person.

Among Australian tribes, with whom all natural death is attributed to sorcery, death is the inevitable punishment. The medicine-man identifies the guilty person, an avenging party
is arranged by the council of old men, and the culprit is fol-
lowed up and slain (Spencer-Gillies, pp. 461, 477-479, 539).
Within the last few years, executions have been ad-
ministered to sorcerers, who were much feared among the
American Indian tribes of all degrees of culture, and the lowest
tribes up to the present day use a method of detecting
such criminals as e.g. burning (Wyndcets, Guatemalans) and
culgelling (Vera Fux).
With the Aztec the victim is thrown into the sea.
(1883, p. 146; Kohler, ZVRW xil. [1887] 319-331; Walsz,
Anthropologie, Leipzig, 1858-1872, ill. 129.) Among the
Mardins the execution of the sorcerer is delayed and thrown
upon the sea (ZEIL VIII. [1888] 190), and the punishment of
death is usual in N. Guinea and among the peoples of the
Melanesian islands. (Wilkins, pp. 202, 205, 303.) In the
Hottentots the sorcerer is executed, and his body is thrown
into the bush (Johannot, UGANDA PROTECTOARTE, 1897, ii. 594 f.)
In E. Central Africa, when the victim of the witch has been
detected and the accursed community by the witch-finder,
it must drink a poisoned coup on the day that he is detected; it is caused
by death, this proves him guilty. In some cases he is burned
alive (Macdonald, AFRICANS, 1887, i. 43, 206 f.; Lettorneau,
1899, p. 35). In New Guinea, witch-doctors declare sorcerers,
who are thought to be very numerous and powerful. When discovered,
they are put to death (Casalis, Le Fantome, p. 229; Deole,
op. cit. p. 27; Macdonald, KAPERS LUXE, and Custom, 1898, p. 32. 41).
Where the punishment of death is not inflicted, the sorcerer
may be executed, or punished by burning (Post, AFR. JOUR. IV.
90-97) ; and occasionally a fine is all that is demanded, but this is,
very rare (Rendall natives (JAL xxv. 227)."
not infrequently the punishment inflicted is limited on the
relatives of the sorcerer and upon his goods. Sometimes all these are
destroyed (Deole, op. cit. p. 27; Macdonald, AFR. JOUR. iv.
90-97; Zouk, and other African tribes). In Bali, the parents,
children, and grandchildren are put to death, and the property
is confiscated (Cuauhtemoc, op. cit. p. 189). In New Guinea,
Asia, and in the Babar Archipelago, the sorcerer and all his adult
blood-relations are slain, and the children given to the relatives
of his victim to slay. (Gutzwiller, Reisen im Indischen Archipel. The
Hague, 1886, p. 349). Among many W. African tribes, where
the sorcerer is executed, his family are sold as slaves
(Post, ii. 161).
(2) Incest.—While the civilized man’s horror of incest
is usually confined to cases of marriage or
sexual relations between parents and children or
brothers and sisters, many savage peoples
marry the bars to marriage, while generally in-
cluding these, usually extend much farther.
Where the classificatory system prevails, the
society is divided into classes, from certain of
which a man must not choose his wife. If, or again,
he may not marry within his totem, his clan, his
village, or even his tribe. Again, marriage may
be prohibited within the kindred absolutely, or
within the kindred of the particular side, where
mother-right prevails (generally totemic prohibi-
tion). In the last case a man might marry his
wife’s daughter, or his brother’s daughter ; or
a brother might marry a sister by a different
mother, since there will be of disingenuous
ancestors. But, as a rule, these unions are also looked upon
with abhorrence. Thus, while in savage life consan-
guous unions are in, with certain exceptions, re-
garded as incestuous, the prohibitions have usually
a much broader basis, and all broth.
whole, because he has sinned against the gods, or has committed a breach of the taboos involving such a breach. He is put to death, for such a dangerous person is safer out of the way. Tabu need be considered here only in so far as it illustrates the savage view of public crime. Many irrational tabus have been imposed at a sacrifice of reason for some definite reason arising out of experience, real or imaginary. If something is conceived to be dangerous for any reason, e.g., on account of its connexion with spirits or gods, then it is wise to regard it as dangerous and to avoid it, and it becomes sacred to break it. Other tabus, those on food-stuffs or animals at certain seasons, have been imposed as a wise precaution, or in the interests of a class or sex. Many others are wilfully imposed by religious or priestly authorities. Generally all tabus have a supernatural sanction, and the automatic punishment is regarded as the working of the Divine anger. Tabus are sometimes of a private sort (tabus on property), but more often they have a public character. It is often a sacrilege (as in the cases of food-supply, interdiction of places, etc.), political, sexual (as in the case of incest), or more purely religious. Tabu has to some extent subserved the growth of the idea that crime is wrong because it goes against the natural law of the tribe, and the breach is regarded as an act of sacrilege and the thief is believed to suffer automatically for his theft (cf. Turner, p. 185 ff.). It is obvious that this belief would foster the idea that theft is wrong. On the other hand, many breaches of taboo, though wrong in the eyes of the savage, have nothing inherently immoral in them.

Where society imposes a punishment for breach of taboo, that punishment is generally death. In Polynesia, where the institution of taboo development, every violation of taboo, or even the merest suspicion of it, was visited with death, the victim being usually sacrificed to appease the gods, since all diseases and calamities were public manifestations of their wrath at breach of taboo (Letourneau, p. 61). But in some other cases it is regarded as sacrilege meriting death.

Thus, with most savage tribes the fruits of the harvest cannot be parceled out until the first fruits have been offered up to the gods. Individuals—chief or priest—or by all the people. In many cases to eat before the time is not only considered wrong but criminal—‘angry—madness (Tjij [JAI xiv. 27]), or death (Tihil [Ellis, op. cit. l. 350]). But, wherever death is thus held to follow a sacrilege, it is not crime in the sense of public punishment, as among the Zulus (death or confiscation of all the man’s cattle [Moerkenhout, Le peuple des Hottentots, p. 359]) and Polynesian (Moerkenhout, p. 359). An analogous crime is that of boiling milk among the pastoral Musk. This is believed to cause cows to go dry and is punished as an insult to the sacred cattle, with death or a very heavy fine (Johnston, Kilimanjaro Expedition, 1886, p. 435).

A more obvious form of sacrilege is the viewing of various sacred by those to whom they are interdicted, e.g., women and children; or the communication of initiation secrets to the unintitiated; or intrusion upon sacred mysteries—those of men by women, or those of women by men. Among the Australians no woman may look upon the sacred mysteries of the men on pain of death, and the women, or bullroarers, must never handle the sacred objects or play upon the sacred totemic drawings, or (among the Arunta) invade the place where the sacred objects are kept. Generally the danger of violating these things is told to boys at initiation (see ‘JAI ii. 271, xiii. 448, xxvii. 311; Howitt and Fison, Reminiscences and Researches in the Interior of Australia, 1894, p. 586, Spencer-Gillen, op. cit. p. 317). The same is true of the natives of the Papuan Gulf (‘JAI xxxvii. 425). Among the Isthmians of the South Sea Islands are warned against certain mysteries by the playing of the drumdrum pipes, the mere chance sight of which is punished with death (Wallace, Mamoa, 1895, p. 349).

Death is not the only punisher of the initiation rites among the Torres Strait tribes (Haddon, ‘JAI xix. 336). The initiation rites of girls and boys are regarded as in most cases, generally, death, inflicted by the women (Rende, Savage Africa, 1883, p. 240; Crawley, Mystic Race, 1905, p. 307)

a. PRIVATE CRIMES. Among private crimes, those of murder, adultery, unchastity, and theft may be examined here in detail. Some of these, e.g. adultery and unchastity, is a breach of tabus, and breaches of such tabus are sometimes believed to produce evil results upon the whole tribe or upon its land—a visitation by the offended spirits.

(1) Murder.—Tylor has pointed out that ‘no known tribe, however savage and barbarous, has ever admitted that a man may kill one another indiscriminately’ (CRE xi. 714). This statement is supported by the express ideas of the horror of murder entertained by many even of the lowest savages. In most institutions murder is to be feared as being a most rare, and are felt to be wrong. But generally the feeling of abhorrence is restricted, and it is considered a harmless or even praiseworthy action to kill outside the limits of the clan or tribe. But the limits of the restriction vary considerably among different peoples. Blood-revenge for murder is a duty or a custom insisted upon by public opinion in most savage societies, and often legally permitted, while it is probably a survival of the time when no supreme authority existed to provide the execution of justice. Though in many cases the relatives of the murderer or any members of his clan or tribe are slain in revenge, because of savage man’s idea of human solidarity and of the collective guilt of the murderer’s tribe, true blood-revenge is more rarely found; in many cases the avenger may mix his blood with that of the murderer, and then a kind of mutual punishment is inflicted upon both sides (Wolff, ‘JAI xxiv. 301; Howitt, op. cit. p. 266), and, though often the custom does rise to tribal wars, yet the evidence shows that the revenge is directed in the first place against frequently only the murderer himself. Often his death satisfies the desire for vengeance, and it is only where it has been found impossible to lay hands on him that the vengeance falls on another. In the insistence upon blood-revenge, therefore, it is disgraceful and irrecoverable to avoid (sometimes because the dead man’s ghost finds no rest till the vengeance falls), and in its falling first upon the murderer, we see exemplified the general savage view of justice. Where a local tribunal exists, it may arrange the blood-feud and set the machinery in motion, or it may go further and, after hearing the respective sides, give judgment in favour of the avenger, and appoint execution to be done, sometimes by him; sometimes by the relatives of the avenger, i.e., by the clan. But nowhere is it strong enough will its decisions be enforced or its suggestions be heeded. This action of the local tribunal may be regarded in the light of a compromise, where the custom of

Other occasional causes of blood-feud are wounds, adultery, seduction, rape, and kidnapping (cf. Post, 129).
blood-feud continues after the rise of such tribunals. It is thus a step towards justice being done in the case of private wrongs. The progress to true justice is further seen where the central authority does not surround a punishment, but occludes the right to inflict, and the court for murder. Frequently the practice of compensation, the wound, takes the place of the blood-feud; or even that voluntary, the relations being satisfied with the payment of a heavy fine, fixed according to sex, age, etc. (cf. Post, i. 249 ff.). Where the acceptance of compensation was seen to lessen the protracted hostilities in the case of the blood-feud, it would be fostered by custom and authority; and in many cases, though not all, it is expected to the municipalisation of the central authority, the elders of the tribe, or the chief (see BLOOD-FEUD).

It should be noted that, though there are marked exceptions to this, the blood-feud has spread, and meets with little or no disapproval, while the killing of the sick and aged, not out of wantonness but for certain definite reasons, is not uncommon in many parts of the world. Similarly, though by no means generally, there is usually a right to the killing of a murderer, though it is not customary, perhaps, when it occurs, to be regarded as proper, and is at once punished (cf. Westermarck, i, 402 ff., 386; Steinmetz, op. cit. ii. 153 ff.).

Warriors do not exist, as well as in many cases where it does, the murderer is punished by the community, or by some special authority, though it is not always easy to distinguish, from the statements made, between true blood-feud and the ordinary retaliation of the community. In most cases the punishment is death.

Among the Fugias, the murderer is placed under a ban, and perishes of hunger, or death is inflicted by his fellows (Quiote-breaker, Mission scient. Amer., xxxii, p. 392). Among some Australian tribes, as has been seen, the council of elders arranges the avenging party in cases of murder by sorcery. But, as among the tribes of S. W. Central Queensland, the camp or a council of the camp punishes the murderer (Rothe, Ethnol. Studies among the S. W. C. Queensland Abor., 1897, pp. 139, 141). With some tribes a council of some tribe is an unsolved matter of common causes against a murderer and put him to death (Nansen, op. cit. p. 165; cf. Petroro, op. cit. p. 152). With many N. American Indians, the murderer is even hunted down by the chief of the tribe that he has killed, or even to the point of being killed. The author of the book, Morgan, League of the Iroquois, Rochester, 1851, p. 330; Schoolcraft, Ind. Tribes, Philadelphia, 1831-60, i. 377; Adair, Hist. of Amer. Ind., 1775, p. 142. Many African tribes also inflict capital punishment on the murderer, the chief frequently deciding his guilt and entering the sentence (Westermarck, i. 189; Lebourne, pp. 83, 83-4; Johnston, op. cit. ii. 336 [murderer executed by warriors among the Mutuell], or, as among the Spongias, the community burn him to death (Burton, Two Trips to Gorilla Land, i. 105). Capital punishment for murder is also found in Polynesia and New Guinea (Turner, Sermom, pp. 375, 384; Thomson, JAI xxxxi, 146; Chalmers, Pioneering in N. C., 1875, p. 178). In other cases, banishment, usually following the murderer, death of the murderer, or the murderer, is inflicted on him (see the punishment of the murderer, who has been found, in South America, in several cases, to have committed the crime, and has been punished accordingly, by the community. It is often so severe that the murderer is put to death (cf. Lebourne, pp. 72, 93, 95: Elphinston, Kingdom of Cuauhtl, 1832, i. 340; Von Martius, Best. zur Ethnol. Amer., Leipzig, 1867, i. 119). The vengeance of the society upon the murderer is in part due to the belief that he is a source of danger to the group. He is infected with the uncleaness of death, or is surrounded by spirits, especially that of his victim, who will afflict not only him but others. Hence he is tabu, and, if he is not put to death, he must undergo ceremonies of purification from the murder performed in the case of the Onalwas (see above, and cf. Kohler, Ziewe, xii. 1857 408; Frazer, G. B. i. 331 ff.). These ceremonies, or the period of isolation, are then a species of punishment.

In some cases it is expressly said that murder is punished because it is hated by a Divine being, or is a breach of his law. This is the case among the Onalwas (Dorsey, loc. cit.), while in other instances murderers are believed to be punished after death (Australians, Dakkar, and Andaman Islanders [Man, JAI xii. 169 ff.]). Melanesians [Codrington, p. 278 ff.], New Hebrides [Turner, Stuato, p. 326]; Aweuba [Sheane, JAI, xxxvi. 1850 ff.], American Ind. [above, vol. ii. p. 685].

(2) Adultery. Among savage societies the wife is regarded as the property of her husband, adultery is generally a serious crime. Before betrothal or marriage the woman may dispose of herself as she chooses, though here the father or guardian has sometimes the right, but often the woman, after marriage her husband has entire right over her. Adultery is therefore regarded as an infringement of the husband's proprietary right, and is frequently a serious form of theft. To add to this the working in of jealousy, it is to understand why the savage mind adultery is so serious an offence and often a capital crime. In many instances, even where there is a regular tribunal, the husband and those whose duty it is to help him have the right of dealing with the culprits, especially if he catches them in flagrando delicto. The local tribunal and, in any case, custom and opinion justify his action, and often, indeed, expect him to avenge himself. He may, however, in such a case be lifted to the capital punishment. Or he may appeal to the tribunal, with confidence that such punishment will be visited upon the offenders, the execution of this punishment being occasionally allotted to him.

The punishment is a fine, or perhaps imprisonment, but, in some cases, for slight indiscretions or even for touching a wife, especially the wife of a chief (Bastian, op. cit. i. 314; Post, ii. 388; MacLennan, Studies on the Iroquois, pp. 178, 228); or they may be visited upon the offending wife or the paramour or both, either separately or jointly. Even in the husband's system, it is seen, there are many cases where the wife or her lover is punished (cf. Adultery [Primitive and Savage]; Westermarck, i. 360; Post, ii. 362, 372); and in some cases adultery is the only crime which is capital punishment (Mishim [JRSAE, 1887]). Occasionally the punishment is meted out to the wife only after repeated offences (Macdonald, Africans, i. 146). In other cases the husband has to suffer adultery, mutilation, mummification, beating, or some other bodily indignity; he must submit to his wife's being outraged; or he must pay compensation, usually equal to the value of the woman, to the injured husband, who is put to death (Post, ii. 269-9, 378; Lebourne, pp. 29, 43, 63, 78, 93, 99). Similarly, where the unhappy wife is not put to death, she is mutilated, disfigured, beaten and ill-treated, enslaved, apostatized, divorced, or driven away, or is put to death (see M'Clen- near, pp. 37, 45, 60). In a few exceptional cases the wife is not punished (Westermarck, Murr. p. 122; Post, ii. 370). These various punishments are usually inflicted by the husband, but occasionally by a tribunal or by the chief. Adultery is occasionally a cause of the blood-feud or of a species of blood-revenge which is called in Canada, Expostulatio delicti (see Goebel). The punishment of adultery is sometimes in proportion to the rank of the offended or of the husband; or, where a system of fines is in use, the fine is similarly proportioned (Post, Afr. Jur. ii. 62-82; Lebourne, pp. 63-68; Johnston, op. cit. ii. 560, 690, 839; 1235; 1250). In many other instances, too, adultery with a chief wife is more severely punished than with a lesser wife or concubine (see Concubines).

As a general rule, in savage societies the wife can obtain no redress for the husband's adultery; but there are occasionally exceptions to this even at low levels (e.g. with some Australian tribes), and the husband is punished more or less severely, or
CRIMES AND PUNISHMENTS (Primitive and Savage)

his adultery (or even bringing a second wife to concubine to the house) is a ground for the wife's divorcing him (see ADULTERY [Primitive and Savage]; Mason, ii. 352; Post, Afr. Jur. i. 465, ii. 72).

There is a certain amount of evidence that among savage tribes adultery is regarded as a grave moral offence, which may bring general censure, or must be expiated, or which is offensive to the gods, or will be punished in the next world (see art. ADULTERY, § 8; Crawley, op. cit. p. 143 ff.; Mason, JRS BE XXXVI. [1886] p. 2, 147 ff. [Karens]; Westernmarck, ii. 675; Perham, JRS NIGERIA (West. Afr.), p. 150 [Dayaks]; Mason, JALI XXI. 157 [Andaman Islanders]; Snouck, JALI XXXVIII. 150 ff. [Ambewla]; Codrington, Melanesians, p. 275 ff.; Bose, Ojehow Inds., 1801, p. 104).

(3) Unchastity.—Unchastity before marriage is variously regarded among savage peoples. In some instances a girl is allowed the utmost licence, but in many quarters unchastity is reprobated more or less severely. The difference in attitude doubtless involves differing moral conceptions, but there can be little doubt that much is due to the question of the girl's position. If she has been betrothed but early years to a prospective husband, she is expected to remain chaste, or she may be repudiated. Or, again, unchastity is held to lower her value in that husband's opinion, because a smaller bride-price will be obtainable for her. But, as the severity of the punishments shows, unchastity is frequently regarded as a moral offence even among some very low tribes (see Westernmarck, Marr. p. 61, and it is supposed to be offensive to the higher powers, or to bring misfortune on the tribe or the crops. Hence it must be expiated in one way or another, as well as punished (St. John, Forests of Far East, 1865, i. 63, 69 [Dayaks]; Mason, JRS B E XXXVI. [1886] p. 144 [Karens]; Frazer, G.P., ii. 212 [Battas]; Bastian, Indognezer, Berlin, 1884-99, i. 144 [Ceram]; Reclus, Prim Folk, London, 1891, p. 92; Post, Afr. Jur. i. 460; Westernmarck, Marr. p. 61 [Loango]; Casalis, Basutos, p. 207).

The punishments are various, and may be inflicted by the home-father, the tribal, or the chief. Sometimes both seducer and seduced are put to death (Post, Afr. Jur. i. 70 [Mariners of the North, 396; Ussher, 1865, p. 270 [Bazila]; Johnston, op. cit. ii. 747 [Kivirondo]; Dawson, Aust. Jur., 1886, p. 875 [Tartars]). In other cases the girl is put to death (Post, ii. 375 [some Igorrote tribes], or she is banished or enslaved (Westernmarck, Marr. p. 61; Johnston, op. cit. ii. 747 [Kivirondo]; Cunninghame, op. cit. ii. 380). In some instances the chief or another person has to pay compensation for the injury to the girl (Post, ii. 375 [some Igorrote tribes]; Mason, JRS B E XXXVI. [1886] p. 102 [Bakoki]; Chanler, Through Jungle and Desert, 1896, p. 317 [Kendle of E. Africa]; Post, ii. 380 [some Malay tribes]; Mason, JRS B E XXXVI. [1886] p. 380), or has to pay compensation to the chief (Post, ii. 380). In some of these cases the seducer is punished, but generally he is to pay compensation or a fine, usually equivalent to the value of the girl (her bride-price or blood-price), and sometimes much heavier (Post, ii. 375-6; Westernmarck, ii. 425-6, 490). In some instances he must also marry the girl, and often, if the fine is not forthcoming, he is enslaved. Seduction may at one time have been a common cause of a blood feud, later compensated for by blood-feud, but occasionally it still leads to a feud (Post, Afr. Jur. i. 81).

(4) Theft.—Proprietary rights are recognized by all savage tribes, most of whom condemn or abhor theft. Theft is punished in one way or another. The thief is frequently punished by the owner of the stolen property (more especially when he is taken red-handed); and in such cases the latter may even have the right to kill him or enslave him. Or he may force him to restore the stolen goods or their value, and sometimes two, three, or more times their value, or may subject his belongings to pillage. Here, generally, custom has arranged a system of regulated composition. In some cases the chief is punished by the tribe, or the chief, with death, enslavement, mutilation, mutilation, or beating; or he is forced to pay a fine, or to restore the goods or their value. In general, the higher the value of the goods stolen, the heavier the punishment. Stealing such things as any tribe sets much store by—cattle, products of the field, weapons, and the like—is usually severely punished. Sometimes the punishment depends on the place from which the thief is made (field, garden, or house), the time at which it occurs (night or day), or whether the thief is taken in the act, and also upon the social position of the person robbed or of the thief. Usually, too, the punishment for theft is increased if the theft is repeated, or if the thief is charged or punished for another theft. Such a thief is frequently considered as a single combatant, and his theft is challenged to single combat by his victim.
7. At those festivals which mark the beginning of a new year or the offering of firstfruits among savages, and which are usually accompanied by ceremonial confession of wrongdoing and by ritual purifications and riddance of the contagion of wrong, very frequently there is considerable licence, and such crimes as may be then committed are not afterwards punished. At such festivals there is great recklessness with regard to crime, and to the ceremonial purifications usual at such periods.

Among most savage tribes the right of asylum or sanctuary for the criminal is clearly recognized, the sanctuary being generally a place sacred to gods or spirits, or the abode of sacred persons (priest or chief), in which it would be dangerous for the avenger or the executioner of justice to shed the blood even of a criminal (see art. ASYLUM; Post, ii. 225ff.)

The language in which they are written (Sumerian) shows that they were drawn up during the Sumorian period, and they may, therefore, date from 2590 B.C., or even earlier. The crimes or public offences referred to therein are not serious, and belong rather to the class of offences against morals than to really criminal acts. Nevertheless, they are exceedingly interesting, and are of considerable importance to us as indicating early ordinances in existence concerning punishment for wrongdoing:

If a son say to his father, "Thou art not my mother," they may shave him, put him in fetters, and send him forth from the house forever.

If a husband say to his wife, "Thou art not my wife," they may throw him into the river.

If a husband say to his wife, "Thou art not my wife," he shall pay her half a mana of silver.

If a man has a slave, and he dies, let the slave, get up, run away, get locked up, falls ill, he shall pay as his hire every day half a measure of grain.

Though the above laws refer only to adopted sons, the respect for foster-parents which the punishment for dereliction of them implies reveals how strongly the feeling of the Sumerians was in this matter. The adopted son might be sold as a slave, and it may be supposed that a real son would have been treated with severity. The denial of a foster-mother brought upon the culprit all the disadvantages of slavery, as is implied by the shaving of his forehead. His being taken round in the city was probably for the purpose of making him his misdeed known, and driving him forth from the house implied his being either left in utter deslegation, or relegated to the position of a slave.

Inequality of the status of the husband and the wife is implied in the punishments for the same or similar offences. Divorcing a husband was punishable with death, but the divorcing of a wife only incurred the fine of half a mana of silver. There is no doubt that women had fewer rights than men, even in Babylonia, but it must be admitted that they are not altogether their equals even now.

The last law of the five shows the respect paid to property. The penalties inflicted are rather hard upon the hirer, who is responsible for whatever sum he has hired, even if a misfortune befailing him is not due in any way to the fault of the hirer. Perhaps it was necessary—the Sumerians may have been (criminally) careless of other people's property, for they did deliver into their hands, "la hirer, la hirer, it is him who, and the origines du droit penal", RHR, vol. XXX, XXX, Paris, 1890-7; A. H. Post, Grundriss der altur. Jurisprudenz, Odem. (Von, Jurisprudence, 1892), 1-Afr. Europ. Jurisprudence, 1897; S. R. Steinmetz, Ethnik. Studien zur ersten Entwicklung der Straf, Leyden and Leipzig, 1894; E. Westermarck, Origin and Development of the Moral Ideas, London, 1896-7; EVW, Stuttgart, 1578ff. See also the other authorities cited in the article.

CRIMES AND PUNISHMENTS (Assyro-Babylonian).—These are revealed to us mainly by the Bab. codes of laws, of which three have been found—the first and the last, fragment only; the second—that of Hammurabi—nearly complete.

1. The first (the earliest known) are the Sumerian laws, of which examples occur in the 7th tablet of the Ululatini-6u ('punctually') series. This work contains specimen-phrases for students of Sumero-Akkadian, the laws being among the legal and other phrases which the student had to learn. Though the tablet dates from the time of Ashurbanipal (c. 650 B.C.), there is no doubnt as to the period to which these laws and their penalties were in force; their reproduction in the contract-tablets of the time of the dynasty to which Hammurabi belonged indicates that the code of which they formed part originated previously to c. 2000 B.C.
In considering such a matter as that of crimes and punishments, it will probably be admitted that the Babylonian mind was not trained in so severe a school as that of the Roman or the modern logist. Moreover, the 다르ners and criminals of the East and the West, to say nothing of the question of period, must be taken into consideration. Thus, many offences against morality and decency were probably not thought worthy of punishment by the Babylonians, notwithstanding that they may have been regarded as most reprehensible. Bigamy was not a punishable offence, and the crime—laws were probably merely rudimentary. Bribery was not punishable, except when it was intended thereby to pervert the ends of justice.

Nothing is said, moreover, concerning bestiality, blasphemy, breach of ritual, drunkenness (except, perhaps, in the case of prostitutes and devotees), or, in the case of priests and devotees, for which the see CONSCIENCE (Bab.), above, p. 33—that this was a thing unpleasing to the deity, malice, prophesying falsely, the desecration of holy days, speaking evil of rulers (šeše moṣeṣet), uncleanness, usury, and many other things which are not only regarded as crimes or misdemeanours among the European nations, but also appear as such with the ancient Hebrews. Idolatry, magic, sorcery, intercourse with a dead person, theft, and adulterous intercourse, if naturally not counted as crimes; though blasphemy, sacrilege, and similar offences against the gods were probably severely punished—certainly the latter (sacrilege). Whether blasphemy was a crime or not probably depended upon the place and the deity, for none would speak slightly of a deity in the place where he was worshipped, except a fanatic. It is to be noted, however, that nothing certain can be stated with regard to many acts which in modern England would consider as crimes in law, for the simple reason that we have only one code in any sense complete, namely, that of Hammurabi (c. 2000 B.C.), and even that has gaps.

The death penalty.—In the Code of Hammurabi, as is fitting, regard is paid to the life of the first place, and the penalty for false accusation of killing is death (§ 1). In the case of a (false) accusation of sorcery, the accused person had to dive into the river, and, if the river refused to drown him, the accusation of sorcery was confirmed, and the man accused took the house of his dead defamer. Death, in fact, was the penalty of any false accusation in which a life was involved. In other cases, a false witness bore the cost of the action (§ 2).

Next to the safety and integrity of the person, that of the property of a man was held to be the most sacred. Theft was not generally punished with death, unless the property stolen belonged to a temple or to the palace (in the king), in which case the receiver suffered the same punishment (§ 6). In later times, the penalty for sacrilegious theft (with the damage inflicted upon the images of deities by stripping them) seems to have been death by fire (Punches, The OT in the Light, etc., p. 551).

Strange, however, is the severity of the law (§ 7) ordaining death for buying the property of a man, either from his own hands or from those of his slave, without witnesses or contracts; or for receiving such property on deposit. Probably possession of a man's property without justifying documents suggested receiving it on false pretences, which the laws of the Babylonians evidently wished to discourage, the more especially as it presupposed the neglect of those legal forms to which the people seem to have paid special attention.

Though theft did not entail the death penalty, the neglect or failure to pay fines and make restitution transformed it into a capital offence (§ 8). There were probably two reasons for this—the respect given to property, and respect for the law. Theft, with the sale of the stolen object, was even more severely punished, as the penalty was not only death, but the restitution of the property, in addition, to both parties (the owner, and the thief, to whom the property had been sold), the purchase-money being returned in full (§ 9). It seems not improbable that a purchaser of property sometimes found himself in serious difficulty, for, if he could not produce the seller or witnesses, he was regarded as a thief and dealt with as such.
CRIMES AND PUNISHMENTS
The real nature of these wine-houses, which were
kept by the wine-women, has yet to he discovered.
That they were places of evil repute seems certain,
and a devotee not dwelling in a cloister who opened
a wine-house, or who entered a wine-house for
drink, was burned to death (§ 110). It seems to
have been the duty of wine-women to accept payment for their drink in kind and any such woman

serf striking a serf paid 10 shekels of
(§ 202).
silver (§ 204), but a slave striking the head of a
freeman lost his ear (§ 205). Thus were intentional
injuries atoned for.
For unintentional injury, even in a quarrel,
things were different. In such a case, a freeman
hurting another had only to swear that he had not
struck him knowingly, and was then responsible
only for the physician's fees (§ 206) and, if death
ensued, he made amends by paying 4 mana of
silver, and for the son of a serf J only (§§ 207, 208).
Striking a freeman's daughter, so that she lost her
expected offspring, entailed a fine of only 10 shekels
of silver (§ 209), and, if the woman died, they
killed the smiter's daughter.
The punishment of
the culprit was in such a case a sore affliction,
calculated to sadden him for the rest of his days,
but here, as in other cases, the innocent suffered
for the guilty simply because the Babylonians
would not admit that a woman was the equal of a
man, and said that, whatever the sex, the penalty
must be ' a life for a life.' Striking a slave- woman
with the same serious result entailed a fine of 2
shekels of silver, and, if she died, J mana (§§213, 214).
In this case it was not slave for slave,' probably
because the expected offspring had to be allowed
for, the fine, it appears, being more than the value
of a slave.
Among the worst examples of the mutilationpenalty, however, are those quoted by Ungnad
{op. cit. iv. 63, no. 1049), where, if certain people
bring action against each other, their noses are
to be pierced and their hands dislocated, and in
this condition they are to go to the market-place
at Sippar. In another case {ib. no. 1051) the hair
of the forehead was to be shaved on account of
bringing an action, the alternative being a fine (no.

penalty was drowning (§ 155) and for incest with
a mother, 2 death by lire for both (§ 157).
Mutilation. This penalty was not uncommon,
and in some cases roughly indicated the crime by
destroying that which was regarded as the oil'ending member. Thus, if the son of a chamberlain
(palace-favourite) or of a public woman denied his
foster-parents, his tongue, the organ with which
the denial was made, was cut out (§ 192). In the
case of an adopted son learning who his real father
was, despising in consequence his foster-parents,
who had brought him up, and returning to his
father's house, the punishment was loss of an eye

(Assyro-Babylonian)

Exceedingly interesting, a»d among the laws
which have attracted the most attention, are those
ordaining retaliation. Injury involving the loss of
an eye entailed the loss of an eye to the person
who had inflicted the injury, and it was the same
for the other members of the body
bone for bone
{i.e. broken limb for broken limb), teeth for teeth

'

I


after an operation, the physician had to pay the owner half his value in silver. A veterinary surgeon who had operated upon an ox or an ass, which had died thereafter, paid to the owner a quarter of its value (§ 225). The 'crime,' in these cases, was that of performing a useless operation; and the penalties were probably as near as the framers of the Code could get to the 'just mean' in each case, for the slave or the animal might have been of greater or less value, taking the injury into consideration, but the penalty was the same. He in the case of a man injuring an ox, and causing its death by negligence or through而导致，the penalty was ox for ox (§ 245), and the same penalty was imposed if he had broken its foot or cut its nose, thus rendering the animal useless. He was accounted guilty of wetting the eyes of a hired ox entailed an indemnity of half its value in silver (§ 247); and breaking off its horn, cutting off its tail, or piercing its nostril was made good only by paying a quarter of the animal's value (§ 248).

4. 'God' left the hirer free from obligation (§ 249).

Though not a crime, an accident which brought an owner within the purview of the law arose from injury to a bull. Upon one occasion, the bull's viciousness could not be known; there was no penalty (§ 250); but the death of a man by a known vicious bull, horned and at large, entailed a penalty of 1/4 man of silver (§ 251), and § 252 states that killing was also a penalty.

In certain cases (see above, p. 238) the punishment for theft or dishonest dealing was death, but the case of an employé differed. Thus, if a man hired to do the work of a farm stole the wheat and the vegetables, and these things were found in his hands, his hands were cut off (§ 253). Here again, we seem to have an instance of vengeance against the offending members; for he who, instead of working for the benefit of his employer, used his hand to steal him, was accounted guilty of this mutilation. In one case not very clear in the Code, the person who took away necessary things and weakened the oxen had to make up the damage he had caused (§ 254); and in another, if he went out the oxen or stole the grain, so that he was unable to cultivate it, he had to pay 60 shekels for every head of ground left uncultivated (§ 255). It seems strange that a thief, in such a case as this, should be let off so easily, but it was the same for other things. Thus a maiming, the cutting off 5 shekels of silver, and the theft of a shadow or a plunder entailed an indemnity of 3 shekels (§§ 259, 260). The question naturally arises whether, in this inscription, the verb šurqu always has the meaning of 'to steal.' A brand was under the same liability as the farmer—if a man, duly in receipt of a salary, reduced the oxen or the sheep, or their natural increase, he had to make up the amount (§ 261); and, if he changed their natural increase, he sold it, the penalty was that he made up the amount to the owner tenfold (§ 265).

Deprivation of office. Apparently only one kind of misuse entailing this is referred to in Hammurabi's Code, and, as is fitting, it bears upon the administration of justice. If a judge changed a sentence, thus making it to be of no effect, he was punished with twelvefold restitution of the sum involved in the lawsuit. In addition to this, he was dismissed from the justice-seat, never to return; nor was he to sit with other judges when trying a case (§ 5).

Imprisonment. It is noteworthy that, in all the engravings of the Code of Hammurabi, there is no mention of imprisonment. The Babylonians, however, certainly had prisons, as the expressions bit šibitti and bit kēli, and the fact that arrests were ordered by the king, show. In all probability, however, they were not houses of detention as a punishment, but simply places where an accused person or a criminal was confined, until tried or punished. An interesting text referring to this is printed in Cuneiform Texts, vi. pl. 8 (Ungnad, op. cit., iii. no. 743), in which a man speaks of being placed in bit šarrūti by his judges, whereas he gives himself to work. He states that he was not to be released until he had fulfilled a certain order—probably the delivery of a document, but the details are not clear.

Possibly imprisonment was more common in later times than at the early period of Hammurabi's dynasty. A letter published in Recueil des Travaux, xix. 107–108 (82–3–28, 845), asks: 'Why take thou my child and placeth him in the prison-house (bit kēli)? None shall take him forth, and thou must bring him forth (again). Send me my son quickly.' Confinement was also effected in a man's own house: 'Shut up Arad-Bau (who sits in the city-gate of Hadad) in his own house with the bolts (Cf. Sayce, Melek, pl. iv. p. 11). The reason of this order is not stated, but something of the nature of a revolt or conspiracy may be suggested.

Resistance to Assyrian dominion entailed all kinds of horrors, and Assyrian kings may have regarded such resistance as among the worst of misdeeds, and worthy of all the pains and tortures which he inflicted, it hardly comes within the scope of the present article. Nevertheless, there is one noteworthy instance of punishment for what might be described as a crime, though those who suffered for it were only obeying their king's orders. Certain Elamite magnates had been sent by Teummān, the king to Ashurbanipal, king of Assyria, asking for the delivery of certain fugitives. The message was an insolent one (dīpir nērīt), and the Assyrian king had the ambassadors detained. It seems not improbable that Teummān made preparations to invade Assyria before the return of his ambassadors on the occasion of their final visit to Assyria; so, after the defeat and decapitation of Teummān, they were shown his cut-off head, the sight of which is said to have driven them mad. The success of the Assyrian armies had been so great that even the present ambassadors to Arbelā to greet Ashurbanipal, who showed them the bodies of the Elamite ambassadors with the 'insolent message' which they had brought.

T. G. Pinches.

CRIMES AND PUNISHMENTS (Buddhist).—Crimes are for the most part committed by irreligious people; and the punishments are determined upon and carried out (even under hierarchies like Rome and Tibet) from political considerations, not from a revival of ancient legislation. If a judge changed a sentence, thus making it to be of no effect, he was punished with twelvefold restitution of the sum involved in the lawsuit. In addition to this, he was dismissed from the justice-seat, never to return; nor was he to sit with other judges when trying a case (§ 5).

Imprisonment. It is noteworthy that, in all the engravings of the Code of Hammurabi, there is no mention of imprisonment. T. G. Pinches.
or legal, rather than from religious, motives. It is, therefore, a complicated problem to decide how far a religion, dominant in a country, is or is not an important factor either in deciding what acts shall be called crimes, or in determining the punishments for them. This is so even when the facts are known and classified; and no attempt has yet been made to write the history either of crime or of its punishment in any Buddhist country. The following remarks must, therefore, be tentative and imperfect. It will be convenient to discuss the subject (1) as regards the Order, and (2) as regards the laity.

1. The Order. — The standard textbook of Canon Law consists of the ancient Rules of the Order, as current in the time of the Buddha (see 'Pâtimokkha,' in art. LITERATURE [Buddh.], edited, about fifty years after his death by his parajika and accompanied by twenty supplementary chapters. These additions by the editors show the development that had taken place, during that interval, in the interpretation of the Rules then as well as in the method of enforcing them. Of the 227 Rules, more than 200 relate to matters of deportment, to the common property of the Order and the proportion allowed to each member, to the time and manner of taking food, etc. The destruction of any infringement of these minor regulations was repentance; that is, the offender had to confess his fault to a brother bhikkhu, and promise not to repeat it. This penalty involved forfeiture of any property held contrary to that point.

The major offenses were divided into two classes —pārājikakas and saṅghadīsās. The former class comprised four crimes —the sexual act, theft, murder, and putting forward a false claim to relics or a repentant murderer. A suspended member of the Order, therefore, could not be expelled from the Order, or, to use the words of the Rules, 'he has fallen into defeat, he is no longer in communion.' The notes and supplements discuss cases raising the point whether some act does or does not amount to an infringement of one or other of these four Rules. The cases put are ingenious, and the decisions harmonize in a remarkable way with the equitable views of modern writers on criminal law.

The second of the above two classes comprises five offenses depending on or inciting to sensual impurity; two connected with building a residence without obtaining the approval of the Order; two connected with slander; two with stirring up dissidence in the Order. The penalty is the inadmissibility, and one with general evil life (being a disorderly person). The penalty for these offenses was suspension for as many days as had elapsed between the offense and its confession. A suspended member of the Order is under disability in regard to 94 privileges of an ordinary member—he is to take the worst seat or sleeping-place, cannot sit on a Chapter, cannot travel without restriction, and so on. When the fixed number of days has passed, he may be rehabilitated. Both suspension and rehabilitation can be carried out only at a formal Chapter, where no fewer than twenty regular bhikkhus must be present. There are some, who, for the sake of regularity in the proceedings, the equity of the decision, and opportunity for the putting forward of the defense, these are too long even to summarize. We must be content to note that, for instance, the rules as to the constiction of the court are given in Vinaya Texts, ii. 263 ff., iii. 46; those as to the accusation being invalid, unless brought forward under the right heading, in ii. 276 ff.; those as to both parties being present, in iii. 47.

2. The above are rules and practices evolved by the early Buddhists, living themselves only; they do not give, or pretend to give, any adequate treatment of the question of crimes, or of that of punishments, but they show that the early Buddhists had a very fair grasp of the general principles underlying the equitable administration of criminal law, and that in the matter of punishment they took, as might be expected, a lenient view. They show also that, at the time when Buddhism arose, such crimes as murder and theft were no longer looked upon as offenses against individuals only, but had already come to be considered as offenses against the community, as moral offenses in themselves—in other words, that this step forward in the treatment of crime was not in any way due to Buddhism, but was the outcome of Indian civilization.

2. Laiety. — The Buddhist scriptures frequently refer to their ideal of a perfect king, a righteous king who rules in righteousness, without punishment, and who is merciful. In the Kālacakratantra, King Wide-realm's country is harassed by dacoits, who pillage the villages and towns and make the roads unsafe. He thinks to suppress the evil by degrading the dacoits, but he is failed. Religious, therefore, the king's revenue will go up; the country will be quiet and at peace; and the people, pleased with one another and happy, dancing their children in their arms, will dwell with open doors. In the legends the king succeeds; and it represents, no doubt, fairly accurately, the Buddhist vague ideal of the right theory of crime and punishment. In the Buddhist historical chronicles we have no instance of its having been realized. Crime and its punishment have been dealt with according to the views current at each time and place, and it would be impossible, with our present evidence, to attempt any statement as to whether, and in what degree, those views have been modified by the Buddhist ideal.

T. W. RHYS DAVIDS.

CRIMES AND PUNISHMENTS (Celtic).—

i. The treatment of crime and of criminals among the ancient Celts is wrapped in great obscurity. Cæsar (de Bell. Gall. vi. 13) informs us that the Druids of Gaul were judges in both public and private disputes, and that they awarded damages and penalties; and we are told (ib. vi. 16) that, when human sacrifices were offered, criminals were sacrificed in the first instance, before recourse was had to innocent victims. It is not improbable, therefore, that among the Celts, as among the Greeks, Romans, and other races, the idea prevailed that certain forms of conduct were displeasing to the gods, and that, in consequence, communion with deity could not be re-established without the expiation of sacrifice. This would appear to have been an empty and false theory, particularly in its consequences, for it is not to be supposed that the persons who were guilty of such conduct (see COMMUNION WITH DEITY [Celtic], vol. iii. p. 749). In this treatment of its un

1 Vinaya Texts, i. 41.
2 The whole of the 94 are given in Vinaya Texts, ii. 388 ff.
CRIMES AND PUNISHMENTS (Celtic)

desirable members by the community it is probable that attention was paid to a general type of character no less than to specific acts of wrongdoing, just as, in the process of compurgation by oath in Welsh law (see below), the witnesses who were called to testify on oath gave evidence quite as much of the character of the accused as to his non-performance of a particular act. The types of character which are always appraised by communities where custom rules, as it did among the Celts, are those which are in danger to the observance of many prohibitions (in Homeric language those of men lacking in óthos), such being conspicuous by their want of scruple and by the quality of óbōs. One of the Celtic roots for 'good' (Ir. déch, Welsh de [now obsolete], cognate with Gr. ἰθός,) meant 'acceptable'; and the other Celtic terms relating to character show the prevalence among the Celts of the same moral conceptions as among other men of Indo-European speech. The idea of a defilement attaching to crime is found in a statement made in the Ancient Laws of Ireland (iii. 97), that body and soul are both defiled by committing crimes.

2. Side by side with the penalty of sacrifice, and parallel with it, was that of exclusion from participation in religious rites. Caesar (vi. 13) tells us that any contumacy with respect to the judgments of the Druids was punished by exclusion from the ritual of sacrifice; and this sentence, he says, was the general practice of the Gauls, since the men so punished were treated as outlaws, and were cut off from all the rights and privileges of human society. In Gaul there appears to have been a measure of centralization in the administration of justice, since the general assembly of the Druids, according to Caesar, in the territory of the Carnutes, held a court for the trial of cases brought from every district around. In the case of the Druids it is clear that the decision was in the hands of the religious learned men. Here, as in Ireland, and this suggests that among the Celts, as in other early communities, the ethical and the religious aspects of crimes and their punishments were not very clearly distinguished. The conception of offenses is given in the Gauls as a sort of caretaker of the Celtic treatment of wrongdoers in the historical period, but this form of punishment was resorted to only in extreme cases. In Irish law, and to a somewhat less extent in Welsh law, recourse appears to have been had with extreme reluctance to the punishments of death and outlawry.

3. In Irish law, also, it is remarkable that imprisonment and all forms of corporal punishment, whether by mutilation, beheading, or torture, are conspicuous by their absence, and mutilation and imprisonment are rarely alluded to in the Welsh laws. It is not impossible that ordinary crime was almost as rare in Ireland and Wales in ancient times as it is to-day, and that the community in question seldom found it necessary to have recourse to very extreme punishments.

4. Another feature of Celtic law, which links it to certain ancient forms of social organization, is the emphasis laid by it upon the responsibility of the family group for the conduct of its members, as is seen especially in the case of the crime of homicide (see, further, art. BLOOD-FEUD [Celtic]). Both in Ireland and in Wales the family group of the slain tended to pay every ransom at the familiar group of the slain for the loss of one of their number. This collective aspect of criminal jurisprudence is one of the chief differences between the older Celtic point of view and that of the more individualistic jurisprudence of the present day; but even in Ireland (Anc. Laws of Ireland, iii. 245) the penalties for all crimes except killing fell on the offender, provided he had the means of paying.

5. Sources of information.—In the case of Ireland there is a body of knowledge relating to crimes and punishments, as well as to other branches of law, contained in the Ancient Laws of Ireland (Rolls Series, 1869-73). This work comprises various legal treatises, such as the Stenchas Meir, the Gorgias Déasc, the Book of Acre, etc. These treatises are the work of the Brehons (the hereditary lawyers of Ireland), who decided the cases that were brought to them. The body of law in question retained its authority among the Irish until the beginning of the 17th cent. The law of England, which was introduced into Ireland by Henry II., was for a long time hardly followed except within the English pale, which consisted of Louth, Meath, Westmeath, Kildare, Dublin, and Wexford. A statute of Henry VIII. (Stat. 13, c. 3), promulgated in 1532, mentions that English law was not observed beyond the counties named. The main body of Irish law is called the Cúlin; local modifications of general laws were called arrandhu, and inter-territorial regulations curride.

6. In the case of Wales there is abundant information concerning criminal procedure in the Ancient Laws of Wales, published under the editorship of the Rev. G. Evans, in the Rolls Series (London, 1841). There is also a very convenient edition of the so-called Guwentian Code, published by A. W. Wade-Evans, under the title Welsh Medieval Law, from Insular MS. (Brit. Mus. 4353) of the 15th cent. (Oxford, Clarendon Press, 1900), to which references will be made in this article. The Welsh laws consist partly of a Code, issued under the royal sanction and authority of Hywel Dda, and partly of a number of legal maxims arranged in groups of three, or triads. The Welsh laws are based on a recension of existing customs by the prince Hywel Dda ('Howel the Good') (c. 960), and vary somewhat for the different regions of the Principality. The oldest of the Code is known as the Dineion, or the Code of Dyfed (S.W. Wales), perhaps better regarded as that of the larger area known as Deheubarth (the Southern region), while another form is usually known as the Gewynedd, from its supposed association with the district of Gwent (S.E. Wales). It is probable, however, that this Code, as Wade-Evans has shown, was that of Powys (Mid-Wales). The Code of Hywel is found in a Latin as well as a Welsh form, but the precise relation of these two forms is uncertain.

7. Attitude of the community to crime.—Among the Celts the community recognized the right of vengeance (Ir. digat, Welsh disw), whereby the individual or his family might themselves obtain satisfaction or compensation for a wrong done to them. This right, however, was one that was greatly restricted in practice, and was not to be put into operation except when other remedies failed. Ancient Irish law, and probably at one time Welsh law, drew a distinction between crimes and torts (though originally some offences may have been viewed as offences against religion), and dealt with them alike as cases for compensation through payment. Where the community's crime is regarded mainly as an offence against the State, though individuals may be
wroth thereby, Irish legal practice, which was in the hands of a hereditary caste of arbitrators called Brehons, developed to an unusual degree the remedial aspect of compensation for wrong to the sufferers—an aspect which in the English law of crime has sunk largely into the background. In Wales there are also signs of the growth of a point of view resembling that of modern States of things resembling that of Ireland, but there are also signs of the growth of a point of view resembling that of modern States.

8. In Ireland, if the guilty party did not pay the amount which the Brehons awarded, the party that was aggrieved was allowed to exercise his right of vengeance by means of reprisals or private war. In Wales, the latter process was called myned ar here ("to go on a plundering expedition"), and the regular term in Welsh for plunder was anrhaith ("absence of law"). The aggressor, if his family cared to support him, might offer resistance, or might become an outlaw, and, in that case, the avengers, if they chose, might put him to death. There are indications, however, that this power was restricted in Irish law by making the right purely personal, to be exercised only by the person who had been specially wronged. The Welsh legal treatise states (Wade-Evans, Welsh Medicine, Book of Life, 234) that there are three legal periods for avenging a dead body:

"between two kindreds who do not originate from the same great house (the parents being one rule), commencing a claim on the first day of the week following that wherein the dead was murdered; if there comes no answer by the end of a fortnight, the law makes vengeance free. The second is, if the two kindreds are in the same great house ("communal"), commencing a claim on the third day after the dead is murdered; if there comes no answer by the end of the sixth day, the law makes vengeance free. The third is, if the two kindreds are in the same great house ("communal"), commencing a claim on the third day after the dead is murdered; if there comes no answer by the end of the sixth day, the law makes vengeance free."

The variations which might arise under this head are then considered, and it is said (op. cit. p. 306) that where a man is killed in his own house (the thief's guise), "there is no exemption for killing a person in the guise of the thief, when he is seen stealing the sidis ("chattels"), or when the track of any particular thing stolen, was found after it. If he was not seen stealing the sidis, or if the track of the particular thing stolen was not found after it, there shall be paid full body-line for killing him, without a manor and without a court, and where there was no power to arrest him at the time of committing the trespass, and there is exemption for every one of them in his guise."

12. Administration of justice.—In Ireland the picture presented by the Brehon legal treatises is that of a community without an official magistracy or police, where the remedy in the case of any wrong done by either a crime or by civil wrong form of damages assessed by an arbitrator possessing hereditary expert knowledge of Irish custom, the main problem for the arbitrator being in each case the accurate assessment of damages, which varied with the status of the person wronged, with the act committed, and with other circum stances. Allusions to the king's power or laws are very rare in these legal treatises. In Anc. Laws of Ireland (iii. 406) we are told that the crimes of the man who violated the king's laws were adjudged on the seven houses in which he got bed, that the penalty for violating the king's laws varied according to the nature of the tenancy and local laws, and that there was a penalty for supplying a vengeful motive to the king's laws, and similarly for the violation of a king's inter-territorial law; but it is clear that the idea of a crime in its relation to the community as a whole was in Ireland more important than in Wales, the Welsh law of the "brawdwy" ("judges"), who had a recognized status in the community, but whose payment appears to have come mainly from the parties to the action.
13. Effect of intention.—The distinction between criminal and non-criminal injuries was recognized in Irish law, although altering the type of compensation required. Whenever a wrong action was shown to be due to malefic aetiological, the fine was determined. Intention had always been considered in the case of theft, wounding, and homicide. In op. cit. iii. 139 there is a minute discussion of the fine due for the intention of theft and, when the theft was not successful. The Welsh process of gaelancus ("recovery of compensation for murder") was always combined with the recovery of the fine for sarhad ("mistain")—a combination which shows that, in historic times at any rate, intention was clearly recognized. It is said, for example (Wade-Evans, op. cit. p. 255), that an unintentional blow is not sarhad.

14. Responsibility.—In Irish law (Anc. Laws of Ireland, ii. 45) it is recognized that certain persons could not be considered responsible for their actions, and the rule is laid down that "a fool, a madman, a male idiot, a female idiot, and a dumb person shall not be eminently the persons who bear their crimes and get their wages shall be distanced." In op. cit. iii. 157, it is said:

"A man who is a fool is he who pays for his crime, in which case the man who commits the crime, i.e., the fool, is exempt; for this is the instance in which fines of design are paid, and no man said had design.

In some cases (see op. cit. iii. 159) there was a difference of opinion, and we read:

"A man who committed a fire under a home, above of his own accord, without cause, without insanity, it is then lawful to give every fool up for his crime; or, according to others, compensation must be paid on his account by his family or the person with whom he is. If it be eminently, each of them pays compensation." In op. cit. iii. 501 it is stated that neglect on the part of the man in not looking after the insane would have to be compensated for; and, according to op. cit. iii. 507, damages would have to be paid for leaving an epileptic lunatic unguarded. The same conception underlies op. cit. i. 157, 161, where it is stated that a person is liable to distress for the crimes of his messenger and of his hired woman, and a man is also liable to a fine for the crime of his jester.

In Welsh law (Wade-Evans, op. cit. p. 255) it is stated that "a free man is to answer for his alldad ("foreign servant") in every case, but a man who is a fire under a home, above of his own accord, without cause, without insanity, it is then lawful to give every fool up for his crime; or, according to others, compensation must be paid on his account by his family or the person with whom he is. If it be eminently, each of them pays compensation." In op. cit. iii. 501 it is stated that neglect on the part of the man in not looking after the insane would have to be compensated for; and, according to op. cit. iii. 507, damages would have to be paid for leaving an epileptic lunatic unguarded. The same conception underlies op. cit. i. 157, 161, where it is stated that a person is liable to distress for the crimes of his messenger and of his hired woman, and a man is also liable to a fine for the crime of his jester.

15. Advocacy. —The Irish treatises make no mention of advocacy, but the Welsh legal triads contain the following statement:

"Three persons are entitled to an advocate for them in court: a woman, and one with a natural impediment in speech, and an alien of foreign speech."

16. Crimes in Irish law.—The forms of what would now be called crimes, or serious wrongs, with which Irish law deals, are homicide, wounding and mutilation, criminal assault, theft, assault, perjury, insult, libel, slander, using charms, false judgings, false aetiology, false witness, false information, false character-giving and bad word, and false oaths, and lying into the Church or the laity—every one of these deprives the man who is guilty of such of half his honour-price up to the third time, but it does not deprive him with regard to every one of them until the third time.

The Irish law-treatise referred to enters minutely into the question of the loss of full and half honour-price in the case of kings, bishops, chieftains, poets, and others; and it is of interest to note the importance attached in Irish law to character and right conduct.

It was not character alone, however, that determined honour-price, and Irish law reflects differences of opinion as to the extent to which it depended upon a man's profession, his separable property, or the rank of the chief under whom he served.

Apart from the cases already mentioned, where it is stated that under certain circumstances a wrongdoer might be put to death (see above), there is no reference to the death-penalty in Irish law, nor is there any reference to imprisonment. The king appears to have had power to assign a wrongdoer to the service of a particular person, but no mention is made of imprisonment as a form of punishment. The only reference to castigation as a form of punishment is in the case of a child under seven, who could be classified only by its parent. In certain cases other fines called ainer ("redemption") and smacht ("discipline") were ex-
19. Penalties in Welsh law.—While, like Irish law, was based upon a consideration of the status of the individual, and upon the determination of the legal worth of every person and object (living or inanimate) it was only for the most serious of crimes that the laws were rigidly defined. The questions of sarcad and galatans, the former being compensation for insult, and the latter compensation for homicide. Thus the same dominant conceptions governed Welsh and Irish law, and they clearly arose from a similar system of ideas. In Welsh law, however, the central power of the king in each territory had attained greater prominence than in Ireland, with the result that the fines called dirrey and camber were payable to persons other than the king, and in the case of a religious community the whole of the camber appears to have been paid over to the abbot and the lay impropriators. The dirrey was a larger fine, paid directly to the king (according to a Latin text, 'a scellum') and the camber was for fighting a duel, theft, and criminal assault. The penalty of emancipation was imposed upon a rasher who could not pay the fine, and a bondman striking a freeman was liable to have his right hand cut off.

Though there is no allusion in any Welsh law to imprisonment as a penalty for any specific offence, yet the fact of imprisonment is implied in more than one passage. For example, in Wade-Evans (op. cit. p. 177) we read that the smith of the house was to receive from every prisoner on whom he should remove irons. Again, of the court-porter it is said that he is to get four pence from every prisoner who shall be lawfully imprisoned in the court. One MS (U455a) gives imprisonment as one of the forms of punishment for neglecting a summons. The Welsh word cearcar ('prison') is derived from the Latin carcer, and is a term used in Welsh for the fetter placed on an animal to prevent it from straying. It is therefore probable that liberty was impeded, whenever necessary, more by the use of chains and fetters than by confinement in a building.

Though Irish law contains no reference to a death penalty, Welsh law alludes to the penalty of hanging. This was in Wales the recognized punishment for theft (as is stated in the Mabinogi of Manawyddan fab Llyr). In Wade-Evans (op. cit. p. 213) we read:

"One person escapes from an admitted theft with flesh and skin on his back (see a necessities attuned ('alien') who shall have been three nights and three days without sile, without relief, and who shall have traversed three towns ('township') daily, with nine houses in every tree; and thus, owing to hunger, shall commit theft, and then shall be caught with flesh and skin on his back. He is to be let free without gallows and without payment.'

Similarly, if a thief was found burning a house stealthily, and was caught, his life would be forfeited. In the case of a thief the Welsh laws recognize the penalty of sale.

Among the fines mentioned in the Welsh laws is that of dylded ("acquittance"), which was enforced as a payment to a woman by her rasher. This was probably meant as a payment to guarantee her status as a virgin in the eyes of the law. The similar payment called gwaddol, payable by a man who failed to rebut a charge of criminal assault upon a woman walking alone.

20. Medium of payment of fines.—In Irish law the items used in estimating fines are the cumhaf and std. By a cumhaf was originally meant 'a female bond-sell', but, in course of time, the word came to mean the equivalent in value of three cows. The method of payment in a fine was as a fixed proportion of certain goods. When half a cumhaf had to be paid, it had to be in one species of goods; when one cumhaf was required, it had to be in two species; and, when three or upwards of three cumhaf were to be paid, it had to be in different species. In that case one-third would have to be in cows, one-third in horses, and one-third in silver. Of the cattle one-third had to be male, one-third of the horses had to be mares, and one-third of the silver by weight might be copper alloy. A std was defined as follows (Anc. Laws of Ireland, iii. 465):

'A common easily divisible std means two live chattle or dead chattel, or one dead chattel the value of which is not lessened by its being divided.'

Of stda the most prized was a milch cow. In Welsh law the fine called camber consisted of three kine, paid as a rule directly to the king, and sometimes doubled. The fine called dirrey consisted of twelve long-imprisoned, for fighting a duel, theft, and criminal assault. The penalty of emancipation was imposed upon a rasher who could not pay the fine, and a bondman striking a freeman was liable to have his right hand cut off.

Thus, in the Welsh law, the aggrieved party compelled the aggressor to submit to three separate writs, by leaving heryth (a'r thogobddail) upon the latter. In its most solemn form the levying of distress required that the person aggrieved should 'fast against' the aggressor (see Asceticism [Oelc], vol. ii. p. 72), that is, call Heaven to witness that his death shall not be averted if his opponent did not submit the case to a Brichon. The consideration of questions connected with distress is one of the most elaborate sections of Irish law. In Wales, in keeping with the greater development of the central power, a man could be called to appear in answer to a gwyd ('summons'). The legal method of accusing for theft is described in Wade-Evans (op. cit. p. 245). As given in the Laws of Ireland, (1) 105, 107 might be arrested for their liabilities, instead of being drained upon, and the circumstances under which this process might take place are fully considered.

In Irish law there is an allusion to be given (op. cit. i. 277) to stop the process of fasting, especially in judgments of theft, robbery, and violation; and the contingencies arising from the giving of the pledge and its possible loss form an important section of the Law of Distress. In Wales, the term mact ('pledge') was used in the Laws only in connexion with civil matters. In criminal procedure the accused person had to obtain a gweregog, i.e. a personal surety, for one who was charged with crime (see Wade-Evans, op. cit. pp. 238, 312). In the Irish legal treatises the question of evidence is not discussed to the same extent as it is in the Welsh laws, and it is noticeable that the latter assign considerable prominence to the oath, both of the accused and of his consorts, as a means of clearing his character. The Welsh term for this process was to put a person upon his rhaith (a word cognate in formation with Lat. rectus), and, in this process, he had to bring forward a certain number of persons to swear on his behalf as to the justice of his claim or defence as a whole.

21. Initiation of legal process.—In Ireland the aggrieved party compelled the aggressor to submit to three separate writs, by leaving heryth (a'r thogobddail) upon the latter. In its most solemn form the levying of distress required that the person aggrieved should 'fast against' the aggressor (see Asceticism [Oelc], vol. ii. p. 72), that is, call Heaven to witness that his death shall not be averted if his opponent did not submit the case to a Brichon. The consideration of questions connected with distress is one of the most elaborate sections of Irish law. In Wales, in keeping with the greater development of the central power, a man could be called to appear in answer to a gwyd ('summons'). The legal method of accusing for theft is described in Wade-Evans (op. cit. p. 245). As given in the Laws of Ireland, (1) 105, 107 might be arrested for their liabilities, instead of being drained upon, and the circumstances under which this process might take place are fully considered.

In Irish law there is an allusion to be given (op. cit. i. 277) to stop the process of fasting, especially in judgments of theft, robbery, and violation; and the contingencies arising from the giving of the pledge and its possible loss form an important section of the Law of Distress. In Wales, the term mact ('pledge') was used in the Laws only in connexion with civil matters. In criminal procedure the accused person had to obtain a gwaregog, i.e. a personal surety, for one who was charged with crime (see Wade-Evans, op. cit. pp. 238, 312). In the Irish legal treatises the question of evidence is not discussed to the same extent as it is in the Welsh laws, and it is noticeable that the latter assign considerable prominence to the oath, both of the accused and of his consorts, as a means of clearing his character. The Welsh term for this process was to put a person upon his rhaith (a word cognate in formation with Lat. rectus), and, in this process, he had to bring forward a certain number of persons to swear on his behalf as to the justice of his claim or defence as a whole.

22. Penalties for particular crimes.—(1) Homicide.—(a) In Ireland homicide was divided into intentional and unintentional. The fine for the former was double that of the latter. The account given in the Senchas Mor suggests that there was some difference of opinion as to whether homicide
should in all cases be treated as a matter for compensation through payment, but the customary law with its eric (‘body-fine’) appears to have prevailed. In the case of secret homicide the concealment was regarded as a separate act, and compensation had to be paid for it accordingly. When a man by a fraint, the slayer had to pay the amount of his own honour-price, together with a fine of seven cumhóls, as compensation for the death. For concealment the slayer paid honour-price, together with seven cumhóls. The body was found, and the fine for concealment was remitted. Looking on at a murder was a wrong which was liable to a fine. Whenever a person found a dead body, he had to give information at once; otherwise, he might be liable to the penalty of a looker-on, or, according to others, of an accomplice. The Anc. Laws of Ireland (iii. 101, etc.) consider with great fullness the various cases that might arise in connexion with homicide.

As illustrating the growth of a different mental attitude from the preceding, it may be stated that the commentator to the Osraí Beanna treats homicide, and all other wrongs done with passion, as being in that case a violation of the ordinary law, and holds that the slayer should be given up, not by his kindred, to the family of the slain man.

(b) In Wales the term for a ‘murder-fine’ was galanos, and, along with the murder-fine, in every case of homicide seirach (‘compensation for insult’) had to be paid. The amount of the murder-fine varied with the status of the person murdered. The murderer was helped to pay by his kinsmen, to the fifth cousin, and the liabilities of these were fixed by law. According to the Welsh law (Wade-Evans, op. cit. p. 193), a third of every galanos was paid to the king, and also whatever of the murderer’s seirach was from time to time obtainable. The reason given is that it is for the king to enforce where it is not possible for a kindred to do so. The murder-fine of a king was three times the amount of his seirach with three augmentations; the amount of his seirach being as follows:

- A hundred kine for every cattle (‘hundred’) in his kingdom, and a silver rod which shall reach from the ground to the king’s pate, when he shall sit in his chair, as thick as his ring finger, with three knobs at the top and three at the bottom as thick as the rod; and a golden cup which shall hold the king’s full draught, as thick as the nail of a ploughman who shall have been 20 years, and is to be covered thereon as thick as the cup, as broad as the king’s face.

There was a similar murder-fine for the heir-apparent. The galanas of a chief of the household was a third of the king’s, ‘without slavery or guilt, and a fee from the court, a falconer, a chief hunt-man, a chief groom, and a page of the chamber all had the same galanas, consisting of nine kine and nine score kine with three augmentations.’ For the galanas of the other officers, except the chief of the household and the priest of the household, six kine and six score kine ‘with three augmentations’ had to be paid. In the case of the priest of the household the murder-fine had to be paid from the estate of the physician. The law fixed the galanas of various other persons, but it is sufficient to mention that the galanas of a free Welshman of pure descent consisted of three kine and three score kine with three augmentations. This was with the amount of the galanas of a king’s seirach, while the galanas of a nobleman’s seirach was half of this amount. For a thief there was no galanas. (For various questions connected with homicide, see Wade-Evans, op. cit. pp. 298, 299.) In those of three or more the kindred were not to pay galanas with the murderer.

(2) Wounding and mutilating.—(a) In the Anc. Laws of Ireland (iii. 349, etc.) there is a very full discussion of the penalties due for wounding and mutilating, and the various wounds and losses that might be inflicted are considered in great detail. For a foot, a hand, an eye, or a tongue, half the eric-fine of every person was to be paid, and in the opinion of some the full eric-fine should be paid for the mouth, the nose, and the tongue. According to op. cit. iii. 472, the sick maintenance of a woman whose person had to be paid for, or a substitute had also to be provided. Among the wrongs requiring compensation was that of shaving bare the beard or the whiskers.

(b) In Welsh law there is an assessment of the worth of each wound or mutilation. (Wade-Evans, op. cit. p. 199 f.) The following quotation will suffice to illustrate the list of values:

- All a person’s members when reckoned together are eight and four score points in value. A person is valued at a score of silver in value. The worth of the thumb is two kine and two score of silver. A person’s nail is thirty peace in value.

With reference to a serf’s limbs there is a passage in MS U27a which reads as follows:

‘The worth of the serf’s limbs by law is as much as the worth of the king’s limbs according to worth. The galanas and the seirach, however, of every one are paid according to his status when a limb shall be broken.’

(3) Arson.—The Welsh laws alone deal with this offence, and refer to the necessity of compurgation to mete it:

‘If an accusation of the crime of burning stealthily he brought against a person, the oaths of fifty men will be necessary for him. If he obtain his schith (‘acquittance’), it will be sufficient for him; if he obtain his chith, he becomes a saileable thief. A saileable thief is worth seven pounds.’

The case of attempted arson by a thief has been mentioned above.

(4) Waylaying.—This crime is also specifically mentioned only in Welsh law, as follows:

‘Whoever shall waylay pays twofold, because it is a violence against a person, the king’s peace, and the commonwealth; and that is the one place in law where violence and theft become connected. And it is to be thus denied, the oaths of fifty men to deny wood and his dwelling and three of them under vow to abstain from flesh and woman and horse-riding.’

This offence was punished by hanging and confiscation.

(5) Criminal assault.—(a) Irish law required the payment of a heavy fine for attempting to violate a person’s wife, and a still heavier fine for actual violation (see Anc. Laws of Ireland, i. 165, 167, 177, 181.) In op. cit. ii. 405, we read as follows:

‘If the girl has been defiled within the age of seven years, full body-fine shall be paid for her, and honour-price in right of God; full body-fine, for him till she comes of age ten, and half the honour-price of her father; two-thirds of body-fine for her from the age of ten forth until she reaches fourteen, and half the honour-price of her husband; and there is no division of the body-fine from that forth.’

(b) Welsh law punished criminal assault, according to one account, as follows:

‘Whoever shall commit a rape on a woman, let him pay her gobr (‘maiden fee’) to her lord; and her ddiry (‘fine’) and her dippled (‘acquittance’) and her agredd (‘down’) and her seirach (‘fine for insult’) he pays to the woman; and, if she be a maid, let him pay her cywys (a gift payable by the husband to the wife on the morning after the marriage).

Some texts add: ‘a silver rod to the king in the manner he is entitled; and, if the man cannot pay, his testicles shall be taken. (For the oath of the woman and the execution of fifty men required for compurgation, see Wade-Evans, op. cit. p. 297.)’

In Wade-Evans, op. cit. p. 294, the case of assault by two men upon two women is considered as follows:

‘If two women shall be journeying through any place and there be no one with them, and two men meet them and violate them, they are not to be compensated. If, however, there be one person with them, although every servant, unless he be a carried child, they lose none of their right.’

In MS U42a the following is added:

‘A woman who shall be violated, if she know not who has violated her, is not to pay amro (‘maiden fee’); since the king preserved her not from violation, he loses her amro; and, if the woman be violated in that respect, they shall give her oath that she knows not who violated her, and that she was violated as aforesaid.

One legal triad speaks of the violation of a woman as ‘one of the three disgraces of a kindred.’

(6) Indecent assault.—In the Welsh laws (Wade-Evans, op. cit.
CRIMES AND PUNISHMENTS (Celtic)

Evans, op. cit. p. 270) the following statement occurs:

"The sarhad of a woman there are, one of which is augmented, and one diminished, and one is a complete sarhad. When a king is given her against her will, that is a complete sarhad. The second is feeling her with the hand, and that is a full sarhad to her. The third is being connected with her against her will, and that is augmented by the third."

(7) Theft.—(a) Irish law deals very fully with the various fines which have to be paid in the cases of death. The amount of compensation varying chiefly with the nature of the object stolen. Among such objects are land, grass, rushes, turf, fruit, fish, boards, firewood, waggles, etc.; and among the special cases considered are that of stealing from a house and from a hunter's cooking-tent, and that of stealing a smith's tools. According to the Anc. Laws of Ireland (ii. 463), it was lawful to kill the unknown or nameless thief, but this right was personal only (op. cit. iii. 409). There was a further rule that no one was to trade with a thief.

(b) Welsh law dealt severely with thieves, and punished it (probably when habitual) with execution by hanging: In Wade-Evans (op. cit. p. 272) it is said: "The Book of Cymlog (a text of the Laws) says it is easier to believe him if there be a chattle which the thief has together with the other chattles which were taken by stealth from him. He is, however, to swear conjointly with all the persons in the house. ..." If the souls are, however, excavated under the house, after he has carried out the law that he is clear, the king owns the soil, and there is to be no guardian assertions for it. The chattle which guardian asserts to have been brought to him to be kept, let him make good, except the chattels conveyed through the soul.

The case of theft by a necessitous alien has been already mentioned. The theft of a king's cat had to be made good as follows:

"Whoever shall kill a cat which guards a barn of a king, or shall take it stealthily, its head is to be held upwards on a clean level floor, and its tail is to be held upwards; and after that wheat is to be heaped about it until the tip of the tail is hidden, and that is its worth. Another cat is four legal pence in value." A dog, on the other hand, might, according to some MSS, be stolen with impunity:

"There is no dreyf for a dog, although it be taken stealthily, nor one man is to consent to deyve a dog, for it is a back-burden of an unclean animal."

The triads in the Diction Code, however, say that a dog-stalker should pay a cambere. Regulation of the amount of charge is left to the discretion of the thief legally and of compurgation in the face of a charge are given in Wade-Evans, op. cit. p. 244 f.

A thief might be punished by being sold, and the value assigned to 'a salable thief' is seven pence. (op. cit. iii. 409) are found the following further provisions as to theft:

"A thief who shall be placed upon sarteties is not to be destroyed. No one is to make satisfaction or answer for an act of his bondman saving for theft."

(8) Assault.—Irish law dealt with assault under the same section as wounding and mutilating, and drew a distinction between a 'red wound' (with bloodshed) and a 'white wound' (without bloodshed). In the Anc. Laws of Ireland (ii. 322 n.) a 'lump blow' is defined as an explanation of lump blow two cows were an adequate compensation, while for the foul lump blow atrer-fine (one of the lesser fines of Irish law) was exacted.

(b) Welsh law (Wade-Evans, op. cit. p. 193) punishes assault as follows:

"Whoever shall strike a person, let him pay his sarhad, first because attack and onset constitutes a sarhad to every person; and a penny for every hair pulled out from his head by hand; and a penny for every finger which shall touch the head; and twenty-four pence for the front hair."

Again, if a person strike a bondman, let him pay him twelve pence; if a bondman strike a free man, it is just to cut off his right hand, or let him be the bondman's lord pay the person's sarhad' (ib. p. 194).

It is clearly stated (ib. p. 239) that a blow received unintentionally is not sarhad, and the following three ‘blows’ are defined as follows: 'one by the lord on his man in ordering him in the day of battle and judging; and one by a father on his son to punish him; and one by a chief of kindred on his relative in order to counsel him.'

(9) Treason.—Irish law, though severe upon lying, treachery, and all forms of deceit, does not deal specially with treason, but in Welsh law the following passage occurs (ib. p. 292):

"Whoever shall commit treason against a lord or waylay, is to forfeit his father’s free; and, if he be caught, he is liable to be executed. If he be not caught and will he be reconciled to his lord and kindred, a twofold payment of dirick and punishment is to be levied on him; and, if he repair to the court of the Pope and return with the Pope’s letter with him, and show that he is absolved by the Pope, he has his father’s free (‘homestead’).

In Ireland, treachery deprived a person of his full honour-price.

(10) Perjury.—(a) Irish law dealt with false swearing, more especially in the case of contracts, and visited it with a fine (Anc. Laws of Ireland, iii. 397). False witness also lowered a man’s honour-price.

(b) Welsh law deals chiefly with perjury (anmod) in relation to suspected testimony (see Wade-Evans, op. cit. p. 269 f.), but denial of suretyship and contract is also discussed (ib. p. 230).

(11) Insult.—(a) In Irish law the maintenance of a man’s honour was a primary consideration, and certain actions were no guards against it (‘honour-price’) appear to have been specially instituted for the defence of personal honour. Among these are the eoch-grise (‘blush-price’), the eoch-ruis (‘defamation’), and the eoch-bawn (‘reparation of honour’). To ask a question with a view to exposing a blemish (Anc. Laws of Ireland, iii. 347), and to give a person a nickname, rendered the offender liable to a fine (op. cit. iii. 93), while one form of insult specifically mentioned (op. cit. iii. 409) was that of opposing a bishop on a ‘hill of meeting.’

(b) Welsh law attached the utmost importance to the maintenance of a person’s dignity, and compensation for sarhad (‘insult’) plays a part therein. The violation of a person’s protection constituted one specific form of insult.

(12) Libel.—(a) In Ireland the fort of a man who tolerated satiric or satires (Anc. Laws of Ireland, v. 169) lost its dirick or honour-price, but in another passage (op. cit. i. 59) it is stated that satirizing, though done intentionally, did not cause loss of the full honour-price until a person evaded the law with respect to it. Satirizing a dead person was also liable to fine (op. cit. i. 185, 189).

(b) There is no specific mention of libel or satire
in Welsh law, and, in view of the practice of the Welsh poets, at any rate after 1300, it would appear that satirizing on their part was tolerated. At an earlier date, libel was probably counted under sarhad.

13. Slander.—(a) In Ireland the Ancient Laws (i. 175, 177) specifically mention a fine for slander. A fine was also obtainable for circulating a calumnyous story (op. cit. i. 195, 199), or for wrongfully questioning a person's legitimacy (i. 183, 193).

(b) The Welsh laws make no specific mention of slander (enillith) other than slander against women (Wade-Evans, op. cit. p. 228), or against an innocent man for murder, and probably included other slander, along with libel, under sarhad.

14. Using charms.—There is no reference to this offence in the Welsh laws, but in Ireland the person committing it was liable to a fine, whether it was committed against a human being or against a dog (see Anc. Laws of Ireland, i. 177, 181).

15. Trespass.—(a) Irish law in several passages defines the compensation required for various forms of trespass, such as 'diptyng a road' (op. cit. iii. 76 n.), bringing a horse into the narrow paths, in a field (ib.), the roof of a churchyard, and the removal of bones from a churchyard. The type of fine called the snachtfine was levied chiefly in the case of trespass by men or animals (see Anc. Laws of Ireland, iv. 53, 87, 89, 93, 95, 107, 109, 111, 115, 117, 119, 121, 123, 131, 144, 155).

(b) The forms of trespass which are specifically mentioned in the Welsh laws are: excavating the land of another to hide anything therein, making a snare, digging a kiln-pit, or building a house on another person's land. The fine inflicted was four legal pence, with certain additions in particular cases.

16. Damage to property.—(a) Irish law had much to say regarding offences arising under this head (Anc. Laws of Ireland, i. 167, 169, 171, 175, 185, 189, 233, 235, 237). The Book of Aecill (op. cit. iii. 357, 385) deals very fully and humanely with the malming, mutilation, and over-working of animals.

(b) In Wales all damage to property, whether living or dead, had to be compensated for in accordance with a scale of legal worth laid down in the laws.

17. Negligence.—(a) In Irish law cases of the kind are, for the most part, dealt with under other heads, such as trespass and damage to property; but the expression 'trespass of viciousness with neglect' is used for the offence of bringing a horse into the narrow part of a street. A fine was also inflicted for neglect of fencing. Attendants, too, were punishable for not guarding the houses of persons of dignity (op. cit. iii. 511), and a similar penalty was inflicted for neglect in not guarding a captive (ib. 499 f.). A judge who was negligent was liable to a fine (iii. 336), and so were sane judges for not guarding the insane. The Irish believed that blotches arose on the cheeks of judges who pronounced false judgment.

(b) The two instances of punishable neglect mentioned in Welsh law are the following (Wade-Evans, op. cit. 268, 268):

(1) If two persons shall be walking through a wood, and the one be in a treath (i.e. the sun shine on) so that he loses an eye, he is to pay the worth of an eye to the other.

(2) If a spear were not so placed as to prevent its point from accosting, its owner, if guilty of such a death, had to pay a third of the slain person's ganatas.

18. Absconding and harboring a fugitive.—(a) It was an offence in Irish law to entertain a fugitive who was also punishable for supporting and advising the women and children of foreigners, as well as for feeding or sheltering a stranger generally (Anc. Laws of Ireland, iii. 385, 387, 389). In the same manner a person feeding a houseless person was liable to a fine, the intention in all these cases doubtless being to make it difficult for persons to escape from justice.

(b) In Wales the law (see above, p. 265) appears to have been a little more sympathetic towards necessitous aliens, and Welsh law also provided that an alien of foreign speech should have an advocate.

19. Abduction.—(a) Irish law (op. cit. iii. 403, 541, 543, 545) deals very fully with the question of abduction in its effects upon family life. The children of the abducted woman belonged to her mother's family, and might be sold by them, but the father was bound to buy them if they were sold, and if he got them gratis he was bound to educate them.

(b) Abduction was a punishable offence in Welsh law, and the various contingencies which arose in connexion therewith are fully dealt with in the Laws (see Anc. Laws of Wales, pp. 86, 88, 92, 204; and Wade-Evans, op. cit. pp. 257, 258, 239).

20. Stripping of the dead.—In Ireland there was a fine for stripping the dead, and burning the remains and the slain in battle in particular (see Anc. Laws of Ireland, i. 175, 177); and a Welsh legal triad speaks of the 'three disgraces of a dead body'—when it is slain, when it is stripped, and when it is left lying.

21. Breach of the peace.—The Welsh laws contain no explicit references to offences under this head; but Irish law (op. cit. i. 231, 235) required a fine for quarrelling in an ale-house, and also for disturbing a fair.

22. Adultery.—It is probable that in Irish law adultery should be counted with the above offences, but the absence of a clear distinction in Irish law between crimes and torts makes it difficult to class adultery with crimes, as was done in some countries. In its effect upon the honour-price of a person, adultery, according to the Anc. Laws of Ireland (i. 57-61), was more disastrous for ecclesiastics than for laymen; but, in the case of all alike, adultery and cohabiting with a kinswoman had the same effect upon the honour-price as unfaithfulness in word (op. cit. i. 59). In the case of adultery by a married man the Welsh laws require (Wade-Evans, op. cit. p. 239) that he should pay some more pence to his lawful wife as a wynnwyorth ('compensation for insult'). When a wife committed adultery, her husband was entitled to thrice the sum of his sarhad (ib. p. 242), and it is further stated (ib. p. 244) that she loses her agweddi ('dowry'), while her chattels are brought by her kindred to her husband. One of the three disgraces of a kindred, according to a Welsh legal triad, is to bring another woman to the house, supplanting the wife and driving her forth.

In the present article Celtic crimes and punishments have been considered chiefly with reference to Ireland and Wales, owing to the fact that it is only for these countries that legal treatises of this type here considered are obtainable. In Celtic Scotland the law was based upon a development of the same ideas as those which are embodied in the law of Ireland. The legal practice of Brittany and Cornwall, too, doubtless was that of Wales, but it would be highly interesting, if it were possible, to know what modifications of the Irish system were developed in Scotland, and, similarly, what local variations of the British system arose in Cornwall and Brittany. In the absence of legal treatises such an inquiry would have to be based mainly on historical and linguistic evidence.
CRIMES AND PUNISHMENTS (Chinese).

The Chinese character for 'crime' is significant of the attitude of the nation towards the infrac-
tion of law, being composed of the radical for 'failure,' under that for 'not,' representing the not-
of the law descending upon the offender; in other
words, 'crime' or 'sin' (for the terms are used interchangeably) is regarded as consisting not so
much in the commission of a punishable act as in
the disregard of the fact that the action has occasioned con-
sequences. For this reason the term is an un-
fortunate one when applied by Christian mission-
aries to a Chinese audience, for the majority of
these thus addressed would strongly object to be
depicted as sinners, although the intention in the
mind of the speaker is merely to bring home to
them a sense of sin.

1. Early enactments.—The Chinese penal code
is based upon enactments for which a remote
ultramundane antiquity is claimed, and the system of
punishments is ascribed to the 'Emperor' Shun
(2255 B.C.), who is said to have established the
'Seven Punishments' which were in vogue at the
end of the Chou dynasty (255 B.C.), viz. (1) brand-
ing, (2) cutting off the nose, (3) maiming, (4) castration, and (5) death.

The founder of the Han dynasty (202 B.C.)
enacted the 'Three Penal Sentences,' viz. (1) life
shall be given for life, (2) compensation for wounds, and (3) imprisonment.

The first regular code of penal laws is repre-
sented as being brought into operation in the 5th
(249 B.C.), comprehended under six heads, the
tenth of which, represented by 11 vols., is occu-
pied with criminal laws concerning treason, robbery,
theft, homicide, criminal intercourse, disturbing
graves, quarrelling and fighting, and incendiari-
ism; and, though each succeeding dynasty has con-
tributed some modification or addition to the original
enactments, the ultimate source of inspiration may
still be traced even in the existing legislation.

The laws of the present Manchu dynasty, which
in China bears the name of the Ta Ts'ing, or
Great Qing, as the Manchus consider themselves
as follows:

(1) The Ta Ts'ing Lu Li, or 'Penal Code of the
Ta Ts'ing dynasty,' which is subject to revision
every 5 years. The sections included under the
first term, Lu, may be described as the original
laws, and the second term, Li, as the supplementary clauses, or common law,
established by precedent or usage. (2) The Ta
Ts'ing Hui Tien, or 'Regulations of the Ta Ts'ing
dynasty.' (3) The edicts and decrees issued by
Emperors and high provincial officials. (4) Cus-
tomary law.

The first of these, the Lu Li, is comprehended in
2906 octavo pages, the criminal laws being
emphasized to the 6th division, arranged under the
following heads: (1) robbery and theft, (2) homicide,
(3) quarrelling and fighting, (4) abusive language,
(5) indictments and informations, (6) bribery and corruption, (7) forgeries and frauds,
(8) incest and adultery, (9) miscellaneous offences,
(10) arrests and escapes, and (11) imprisonment,
judgment, and execution.

2. Punishments.—The modes of punishment
which are recognized by the code are five:

(1) Flogging with a heavier cane of bamboo,
about 3 ft. 6 in. long, 1½ in. thick, and 4½ in.
thick at the end. The punishment admits of 5
degrees of severity, nominally from 10 to 50 blows;
but in actual practice only 4, 5, 10, 15, and 20
blows respectively are administered.

(2) Flogging with a heavier cane of bamboo,
about 3 ft. 6 in. by 1½ in. by ½ in., in cases
of greater gravity, the number of blows ranging
from 60 to 109 nominally, but reduced in unusual
practice to 35, 50, 35, and 10 respectively.

(3) Manchu subjects, or 'Bannermen,' are punished
with a whip instead of the bamboo.

In administering the punishment the factors are
so expert that they can apply 1000 sounding blows
on the bare flesh without raising a blister, or draw
blood if required with three strokes, and actually
make the flesh fly if they set themselves seriously
to work. (This is done by the 'dragging' stroke,
which is different from the usual up-and-down
method; the direction of it is such that the skin is
drawn back along the surface, and in a short time
the skin is literally torn off in strips.) This skill
in applying the bamboo is said to be attained by
long practice on a block of bean-curd, a substance
resembling a stiff custard, the batters kneading
face to face, and striking alternately on the bean-
curd which is placed on the ground between them.

When they have learned to strike the substance a
great many times, producing an appreciable 'note'
standing up, each time, within the time of execution,
corresponding to the time required for each hour
of the 'custard,' they are supposed to be proficient,
and are allowed to exercise their art on the un-
fortunate human beings who may be surrendered
to them. Another power which they must culti-
ivate is that of counting aloud at a great rate whilst administering the strokes; the
man kneeling on one knee at one side of the victim
calls out the odd numbers, whilst the other counts
the even numbers, and this requires long and fre-
quent rehearsal. If it also succeeds in acquiring the
art for 'sharp practice,' for the number called does not
necessarily correspond with the blows struck; and it is very easy for skilful perform-
ers to run up a very large total of figures without applying an equal number of strokes. Thus a man condemned
to receive 1000 strokes may be let off with 700 or
so if he has a proper understanding with the lieters,
though the full number is reported by them even
once at the time of imposition. The rod is steeped
for some months in a saline bath before it is con-
sidered fit for use, as this is said to ensure that
mortification will not set in when the flesh is lacerated; it no doubt also increases the sufferings of the victim.

(3) Banishment, for a limited period, to a dis-
tance not exceeding 500 li (= 170 miles). Here
again 5 degrees are admitted, viz. 1 year and 60
blows, 1½ years and 70 blows, 2 years and 80 blows,
2½ years and 90 blows, and 3 years and 100 blows.

(4) Transportation, for life, to any distance vary-
ing from 2000 to 3000 li (= 1000 miles), with 100
blows; in extraordinary cases the distance is in-
creased to 4000 li, or the criminals are condemned
to reside in muriatic or savage districts. The
exiles are nominally required to render military
service, but are usually permitted to engage in
humble occupations, such as the managing of in-
ferior pawn-shops, etc. The wives of criminals are
expected to appear on the next trial with their husbands in exile, and their children and other relatives may do so if
willing. Bannermen are subjected to the 'cangue'
(see below) in lieu of banishment.

(5) Death by strangulation, decapitation, or the
so-called 'lifting-up process,' which is usually
confirmed by the Emperor; but in cases of murder, piracy or highway robbery, rebellion,
uttering false coin, forging official seals, arson,
robbery with violence, criminal assault on girls
under 12 years, and, frequently, for forgery, murder, or supineness at public examinations, or smuggling salt, the local
authority is empowered to put the sentence into
execution at once, unless extenuating circum-
stances can be urged for delay. In cases of piracy,
highway robbery, etc., the criminals are decapitated, and their heads exposed over the city gates as a warning to all.

(a) Strangulation.—The penalty of strangulation is inflicted on the cases of murder of a stepchild by a stepmother, abuse of parents or paternal grandparents, abuse of husbands' parents or grandparents; also in certain cases of homicide where premeditation is not alleged, or where death is brought about by indirect means; also in cases of opening coffins and rifling the dead, refusing to pay tribute, or inciting to riot. In extreme cases the process is aggravated by the method known as 'three strangulations and three recoveries,' which means that the victim is strangled into unconsciousness three times, and restored to animation before the final garroting takes place. In some instances high officials who have offended are presented by the Emperor with a silken scarf, with which they are expected to strangle themselves in lieu of the heavier and more disgraceful punishment of decollation.

(b) Decapitation.—Decapitation is the penalty inflicted in the case of a large number of offences, especially in a treaty between China and a foreign power, which includes: (1) rebellion, (2) disloyalty (as, e.g., destroying or attacking the Imperial tombs, palaces, etc.), (3) desertion, (4) parricide, (5) massacre (i.e. where three or more persons are killed), (6) sacrilege, (7) insolvency, (8) discord, and (9) insubordination. The treasonable character of these offences consists in their being hurtful to the Sovereign either in his person, his property, or his honour, or the persons and property of his subjects. The principal offenders are sometimes sentenced to the ling chi.

(c) The ling chi.—The third form of capital punishment, i.e. the ling chi, or 'lingerling process,' which is popularly supposed to consist in an indefinite number of cuts inflicted on the victim's body, before the administration of the coup de grâce, does not amount, in ordinary cases, to more than a few slashes on the face and body before the final blow is struck. It is intended to make the death process more lingering and shamefaced, as the word ling chi mean; but the degree of aggravation of the penalty is left very much in the hands of the executioner. The lingering process is ordered in the case of treason against the Imperial person, perpetration of a murder of which no distinction is made between principal and accessory; also in the case of parricide, murder of a husband, etc.

(d) The death cage.—Another form of capital punishment is the standing cage, which consists of a tall frame of wood enclosing the victim in the cage, the floor being a foot or so from the ground. His neck is enclosed by the bars which form the top or lid of the cage. In this position he is unable to touch the floor with his feet or hands, a number of bricks are inserted upon which he is permitted to stand, and these are gradually removed until at last he is practically suspended by the neck, unless death intervenes, as generally happens. The cage being hinged, the administration of an opiate supplied by a relative or friend. Victims of this form of punishment have been known to survive four days of torture, even when exposed to the burning rays of the summer sun.

(6) The cangue. A minor form of punishment which is recognized by the Li, or 'supplementary laws,' is that of the 'great collar,' or 'wooden neck-tie,' as it is nicknamed, generally known amongst Europeans as a substitute for the real cangue (from the Portuguese canga = yoke). It consists of a heavy wooden framework in two parts, through which the head of the victim is introduced by means of a scallop on the inner edges of each; the two parts are then brought together and fastened in position upon the wearer's shoulders, and an inscription is added stating the nature of the crime committed, etc. The weight of the cangue is generally from 20 to 30 lbs., but it is sometimes heavy enough to make it impracticable for the recipient (from the Portuguese -" to "yoke.")

7. The conduct of law.—The almost total absence
of legal machinery is another feature which is worthy of notice. There is no such thing as the empanelling of a jury; no assistance of counsel for the prosecution or the defence; no association of judges on the bench; no oath upon oath. The magistrate sits alone to try the case, unless he decides upon inviting another magistrate to assist him. The cases for and against are prepared by self-constituted lawyers, a somewhat degraded class of literati men, who do not appear in person before the court. The magistrate is furnished by his secretaries with whatever information he may require as to law or precedent, and decision is given, ordinarily, without long debate. But if he is perplexed until he confesses his crime; and, should he hesitate to do so, the means are available by which such confession may be elicited. Some of these methods have the sanction of law, while others are enforced without such authority. The legal instruments of torture consist of wooden presses for squeezing the ankles or fingers, and the bastinado; in addition to these, however, there are many others which have been in use until quite recently, but which have now been nominally abolished—such as forcing the victim to kneel upon hot bricks, iron chains, powdered glass, sand, or salt; twisting the ears; suspending the body by the thumbs or fingers; tying the legs to a pole placed under the knees, so as to bend the body forward in a kneeling posture, etc.

8. Popular courts.—So great is the terror inspired by the law-courts and the ‘pens’ which do duty for prisons (the Chinese word means originally a ‘corral,’ or stable for cattle), that many people prefer to settle their cases out of court, by resorting to the ‘tea-houses,’ which are the equivalents of our public-houses, and submitting the question to the oracle of the moment present—the nearest approach to trial by jury; and the practice has become so well established that these tea-houses are often called ‘Little Halls of Justice.’

Law of guilt.—An interesting feature of the Chinese enactments is that the standard of punishment, in many cases, is not measured by the character of the offence, but by the amount of profit secured by the offender; the penalty, for instance, in cases of robbery, is fixed at ten fold of all proportion to that which is incurred by stealing 1 oz.; it is assessed on a scale indeed which would seem to place the act in an entirely different category of crime, for the latter is punished by 60 blows by stranguilation, whereas robbery is only punishable by 50 blows, the breaking of one tooth by 100 blows, of two teeth by 60 blows and a year’s imprisonment. Causing a person to be incapable of becoming a parent is punished by 100 blows and banishment to a distance of 3000 li, and, in the case of male offenders, with forfeiture of estates.

10. Treason.—The punishment of treason is particularly severe, and the list of crimes which are classified as treasonable is very comprehensive. The penalty of making even an attempt against the persons, palaces, or tombs of the Imperial house is execution by the lingering process, and no distinction is made between principals and accessories (though in ordinary cases of crime a careful discrimination is made, and accessories before the fact are punished one degree less severely than the principals). All male relatives of the condemned, in the first degree, i.e. father, grandfather, sons, grandsons, paternal uncles and their sons of the age of 15 or older, are sentenced to decapitation, together with all other male relatives, within the same limit of age, who may be living with the offender at the time. Male relatives of the first degree under the age of 15, and all females similarly related, are distributed as slaves amongst the relatives of the condemned. The great majority of the condemned is confiscated by the State. All who renounce country and allegiance are liable to decapitation.

11. Homicide.—The definition of homicide is also very comprehensive, no fewer than 10 possible cases being included under the term, viz. (1) killing with deliberate intent, the penalty of which is decapitation; (2) killing in an affray, where perhaps no special individual is attacked; (3) killing in self-defence, where the act is sanctioned by the law; (4) killing with a deadly weapon, the act constituting duels, duels being called by the Chinese sham-fights; (5) killing due to fear; (6) killing due to anger; (7) killing due to rage; (8) driving of a person into danger by false representations, e.g. leading a man to walk into deep water, assuring him that it is shallow and fordable (strangulation is the penalty in these cases also); (9) killing a person by mistake when intending to kill some one else (the penalty for this offence is beheading); (10) killing accidentally when using legitimate instruments or weapons (punishment is deemed sufficient in such cases); (11) killing through carelessness (punished by beheading); (12) killing by the administration of improper medicines (punishable by beheading, but, if inadvertence can be urged in defence, compensation and retirement from medical pursuits are ordered); (13) killing by means of traps and snares (punishable by blows and banishment); (14) killing by the utterance of threats which lead to suicide on the part of the threatened person (punished by strangulation).

12. Privileged classes.—There are no fewer than ten instances where privilege is claimed, as in the case of those enjoying hereditary rank, or high judicial office, or being connected with the imperial line. These classes are excepted from the ordinary processes of law, and the Imperial sanction must be obtained before the law can be put into operation against them. No privilege, however, of whatever kind can avail in the case of the following instances of the accused, in ordinary cases, are taken into account: as, e.g., extreme youth, i.e. under the age of 15 years; or extreme age, i.e. 70 years and upwards; infirmity, too, is recognized as an occasion for the exercise of lenity and the relaxation of the heavier penalties, with exemption from torture. The condition of the parents of the accused is also taken into account, and an erring son is mercifully dealt with if it be shown that his parents depend upon him for support; even the death penalty may be remitted in the case of an only son, lest his parents should be deprived of the worship which is expected from him after their decease.

13. Favourable treatment of women.—Women are seldom imprisoned, except on capital charges, or for adultery, but are placed in the custody of their nearest relatives; and, if they are arrested when in a pregnant condition, the full penalty of the law is not inflicted till 100 days have passed after parturition. Injured husbands are permitted to kill, out of hand, the guilty wife and her paramour, if discovered in flagrante delicto; but, if the parties have already left the apartment where the
act was committed, or surrender themselves to the hurt of little time elapsed since the event, the husband is not justified by law in exacting the extreme penalty. A master who is accused of killing a slave is not regarded as guilty of a capital offence, but a slave who murders his master is, or some of those petty treasons.

14. Patria potestas. — The patria potestas is still in force in China, and the slaughter of one's offspring is dealt with as a minor offence, or indeed as no offence at all, if, for instance, a parent has been struck by a son, to daughter of damage. The law decrees that the penalty for striking or cursing a parent is death, as was the case with the Hebrews.

15. Professional bullies. — The killing of a professional pugilist, or 'strong man,' is not regarded as murder, on the ground that such persons voluntarily subject themselves to danger and death, and must be prepared to take the consequences of their rashness.

16. The law of debt. — In cases of debt a stated period is allowed by law for repayment, viz.: three months after the expiry of the time stipulated in the original arrangement between the parties. In the event of this period of grace being allowed to expire, the debtor is liable to the bastinado. In some cases the creditor will take up his quarters in the house of the debtor, and continue to live at his expense until the debt is discharged. The fear of being unable to meet one's obligations before the Chinese New Year causes many suicides to take place at that season.

17. Bad company. — Amongst miscellaneous enactments it is worthy of notice that the sons of families enjoying hereditary rank, and officers of government, are prohibited from associating with provincials, under penalty of 60 blows.

18. Treatment of domestic animals. — Special laws are enacted with a view to the proper treatment of domestic animals; e.g., when draught animals are improperly harnessed, and sores are thus produced on the back or withers, the penalty of such carelessness is 20 to 50 blows. Similar penalties are imposed in cases of insufficient feeding, etc.

19. Care of the young. — Amongst the laws relating to the care of the young, it may be noted that the 'age of consent' in China is 12 years in the case of both boys and girls, and that a recent edict decreed that smoking on the part of boys under 18 was a punishable offence.

20. Abhorrence of conduct. — The comprehensiveness of the Chinese penal code is remarkable; there is hardly a circumstance connected with law and its infraction for which provision is not made; and a large liberty is extended to judges in the treatment of what is described as 'improper conduct' — an expression which is interpreted to mean offences against the spirit of the laws, though not necessarily involving an actual breach of the letter thereof.

21. Lynch law. — In addition to the ordinary legislation there are many morbothod methods in practice amongst the people in country districts. Lynch law is very common, and the treatment of crimes in such places often induces cruelties which fully deserve the designation of 'savage.' Theft is severely punished, as are also fraudulent practices in connexion with marriage negotiations. A favourite method is the suspension of the culprit by his thumbs and great toes to a horizontal branch, so that the body is raised while a bow; sometimes a large stone is placed in the middle of his back to increase his sufferings. In extreme cases, where death is decreed by the village tribunal, a bloody iniquity is exhibited in the invention of new methods of torture. In the case of village feuds 'a life for a life' is the universal standard of justice; annual outbreaks of a kind of outcast gangsters, in various districts, and continue until the blood-feud is settled by the slaughter of an equal number of persons on both sides.

22. Reform. — The revision of the penal code, so as to bring it into harmony with the principles of justice, is at present under consideration; and a number of Chinese commissioners visited Europe last year (1910) for the purpose of studying Western prison methods, with a view to a reform of the Chinese houses of correction.

CRIMES AND PUNISHMENTS (Egyptian). — There is no reliable record of the principles which guided the Egyptian judge in the punishment of crime. There may have been much that was arbitrary in the administration of justice, even in the best bureaucratic period of the New Empire, but that rules dating from a remote age, and attributed to the god Thoth, were appealed to is certain. A charge given by the king to his newly appointed judge is preserved, but scarcely touches this question.

The Negative Confession in the Book of the Dead (see CONFESSION [Egyptian]) contains a long list of moral and religious obliquities, including adultery, falsification of measures, theft and forgery, and cursing the king. More to our purpose is a list of charges brought against a shipmaster at Elephantine, preserved in a papyrus at Turin; amongst his offences are breaking into stores and stealing the grain, embezzeing corn put in his charge, extorting corn from the people, burning a boat and concealing the fact, also adultery, and apparently the misuse of cattle bred by the sacred Mnevis sires. There is no record whether the charges were proved, or of the punishment. A decree of King Horemheb to repress military exactions and oppression in Egypt imposes a severe penalty on the unauthorized commandeering of boats; the offender loses his nose and ears, and is transported to the frontier city of Zaru (agreeing with Diodoros' account of the city of Rhinocolura); and soldiers who stole hides were to be beaten with 100 lashes so as to open five wounds, and to restore the property to its owners. Other documents indicate how a conviction of embezzelement was punished, where perhaps convicts were forced to toil in the gold mines. The condition of suspected persons after examination 'by beating on their hands and feet' must have been miserable in the extreme, but probably the law contrived to make it still worse for the convicted criminal in the end. Accounts of several criminal trials are preserved — of robbers of the royal tombs (in Breasted, Anc. Records, London, 1906–1907, iv. 499–556); and of a conspiracy in the baram against the life of the king (ib. pp. 416–456). The punishment of the men and women condemned for participation in, or guilty knowledge of, the conspiracy is not specified, but it was evidently death in some form, and many seem to have been permitted to commit suicide. Two of the judges and two custodians who had misconducted themselves with female criminals during the time of the trial were condemned to lose their noses and ears; one of these committed suicide a week after atoning for the crime, and the other was allowed to escape with a severe reprimand.

From the end of the Middle Kingdom there is a decree of a King Antef deposing a monarch (7) and high official of the temple of Coptos for harbouring the king's enemies. He and all his descendants were deprived for ever of the power
to hold the office. The consequences of desertion to another country are hinted at in the story of the fugitive Simihe, who was plainly in peril of death (M.L. Chro., 38, 1906, p. 62). In the treaty between the Hittite king and Ramses II. restoration of deserters and free pardon for them are stipulated for on both sides.

CRIMES AND PUNISHMENTS (Greek).—1. A crime may be considered as an act of disobedience to a Divine command, and, as such, punishable, if at all, by Divine retribution; or else, in its stricter sense, as an offence against the Divine community, for which a definite punishment is prescribed by law. But it is only gradually that the latter notion has been evolved. In the Greek States, none of which succeeded in working out a scientific system of jurisprudence comparable with that of Rome, many crimes continued to be treated, as in primitive communities, as wrongful acts done to an individual, for which he was entitled to claim compensation from the offender (see Minute, Ancient Law, ed. Pollock, London, 1897, p. 379). Although the familiar distinction between a crime and a tort was increasingly recognized with the progress of time, acts definitely criminal in character were recognized by the law. Such, e.g., as homicide and theft under certain conditions, were technically made the subject of a civil action (diex') rather than of an indictment (taphph). Even in the latter the State was only indirectly concerned; for a fine would be levied on the wrongdoer in a private, and a public prosecution, and in private prosecutions, which formed by far the more numerous class, the prosecutor was regarded as acting for his own satisfaction rather than as fulfilling a public duty.

It would be impossible, within the limits of an article like the present, even if the material existed, to describe in detail, or even satisfactorily to summarize, the progressive development in the establishment of legal penalties for crime by the various divisions of the Hellenic race, from the dawn of history down to the time when their independence was finally lost. All that we shall attempt is a short survey of the general ideas relating to the subject of crimes and punishments which prevailed from time to time according to the most important literary records together with some account of the particular remedies provided by the Athenian courts in the period at which our information is most abundant, namely, the 5th and 4th centuries B.C. For States other than Athens the necessary evidence is almost entirely wanting; there is not much authentic record. Such scraps as have come down to us, when it is impossible to present them in their proper setting, or to make a trustworthy estimate of their worth, are not sufficiently authoritative to make us think that the Athenians invented the regular administration of justice (Xen., Var. Hist. iii. 38). Still, it would be a mistake to suppose that the Athenian courts were a unique product of Hellenic civilization. Of the better-known Greek States it seems probable that Sparta was the most backward; and the existence of an elaborate judicial organization in remote and semi-barbarous communities such as Cyrene and Western Locris leads to the conclusion that great commercial cities like Athens, Megara, and Corinth had a legal system as highly developed, if not so famous, as that of Athens herself (L. Whibley, Greek Observations, London, 1860, p. 177).

2. With crime in the wider sense, as a breach of religious obligation, and the Divine punishment which it thereby merits, we do not propose here to deal, since they will be sufficiently discussed elsewhere (Chap. xix., Chre. xvi. 4, 135). Nevertheless, the gradual growth of a system of jurisprudence was so largely conditioned by religious belief that we cannot entirely put out of view the religious as distinct from the legal aspect (Plato, Crat. 416 c, Euthyphraeon, 147 a). This is most strongly marked in the case of the most important of all crimes, that of homicide. In the primitive age, for which our authority is to be found not only in the Homeric poems, but also in the works of the tragedians, so far as they reproduce the old legends, beliefs, and customs prevalent in the Epics now lost, it was universally believed that the shedding of blood was pursued and punished by the avengers (Erinyes) of the slain man (Esch. Cho. 408; Soph. El. 115). These superior natural visitants may be regarded as the embodiment of the curse pronounced by the injured victim against the wrongdoer (Esch. Thrb. 70), or even as the punishment itself (Hesiod). In Homer, however, they never appear as murdering agents, but rather as protectors of parents against wrongs done to them by their children, and as guardians of the sanctity of family life. The mother of Meleager cursed her son by playing her son, and prayed for his death; her prayer was heard by the Erinyes that walk in darkness (II. ix. 571). Similarly, we find GEdipus visited by the curse of Jocasta (Oed. xl. 250); the Erinyes were summoned to thevenge the crime committed by Phoenix to his father Ambyrion (II. iii. 454); and, so far as can be seen, they were ready to visit every crime committed against the ties of family or society (Aeneid-Hort. on Od. ii. 135). There is nothing more to the fact that Homer says the Erinyes were the avengers of homicide in a private case; and, inasmuch as they avenged wrongs done to kindred, they might well have been found harassing Orsteus for the murder of his mother, if Homer had narrated this version of the story (see Soph. El. 135; Arist. Pol. 1463b; Age, New York and London, 1907, p. 89). The subjects handled by the Tragic poets, being more nearly concerned with the ideas of crime and punishment, regularly present the Erinyes as the avengers of homicide, and so the Erinyes are the murderers of kinfolks. Their victim, driven from place to place, in his vain effort to escape (Esch. Eum. 210), was attacked by madness (Eur. Iph. Taur. 1481) or wasting sickness (Or. 358 ff.); and, until he either was released or reconciled to the Erinyes as his wife (Ag. 1160; Soph. Oed. frag. 4, 57 b; Robbe, Psychagogia, 228). Until a comparatively late date this was one of the excuses alleged by the Stoics, who were hard put to it to reconcile the existence of moral evil with the doctrine of Providence (Cic. Nat. Dcur, iii. 90). But these crude notions failed to satisfy the curious inquirer or the ardent champion of Divine justice. Aschylus, a profound religious thinker, attempted to justify the gods by the assertion that the punishment of a crime is to be ascribed to the sinner in his descendants (Ag. 755-760), so that the actual sufferer is punished, not directly for his ancestor's guilt, but because he himself has yielded to temptation. But popular superstition required a less subtle solution. Even if the innocent must suffer for the guilty, it could not be supposed that the guilty themselves escape altogether. Hence came the belief in punishment after death, which may properly be called post-Homeric, though it appears in an isolated passage of the Iliad (Od. xi. 576-600; see Seymour, p. 468). It was a leading tenet in the creed of the devotees of Orphism (Plat. Rep. 364 E; Rohde, Psyche, ii. 125). The same doctrine took firm root in the consciences of the initiated, who had availed themselves of the reward offered to the partici-
In the Eleusinian mysteries, that they, and they alone, could look forward to a blessed existence after death (Soph. frag. 763); though how far it is correct to speak of the 'symbolism' of the mysteries themselves is a difficult and doubtful question (Rohde, i. 294). From such sources the doctrine spread even to philosophic circles, where it provided the material for several of the myths in the writings of Plato (Phaedo, 110 B, Resp. 357 C; Gorg. 526 A), as well as for those of his imitator Plutarch (Socr. Num. Vind. p. 583 ff.; Gen. Socr. p. 590), and was countenanced by the Stoics in their efforts to make common cause with the nephelophors of the popular religion (A. C. Pearson, Res Gestae of Zeno and Cleombrotus, Cambridge, 1891, p. 146).

4. The belief in the power of the spirit of the murdered man to exact vengeance persisted throughout the historical age, but the practical consequences of this permission were of widely different character in those which prevailed at a later time. The homicide in Homer was under no disability, so long as he kept outside the range of the influence exercised by the claim of blood-avenger or in the murder of a kinsman within those limits his life was forfeit to the kinsmen of the murdered man (Od. xv. 271 ff.). So long as the murderer remained at home, the kinship of blood survived, even if the victims himself wished to avoid the wrath of the dead man's ghost; only by permanent exile, by renouncing for ever the ties of home and country, could even one who had accidentally caused the death of another escape from the vengeance of the blood-feud. Such is the inference to be drawn from the fate of Patroclus (I. i. 769 ff., xxiii. 85 ff.). But once he reached a new country, no moral disgrace and no religious taboo attached to the person of the fictive murderer, although his action was deliberate. Even assassination seems to excite no moral disapprobation (Od. xiii. 267). Exile, however, was not always inevitable. If the relatives were willing to accept a fine, the murderer might by a payment acceptable to them compound for his life, and remain at home (I. i. 628-632). There is nothing here of ceremonial uncleanness, or of the propitiation of an offended deity (Rohde, i. 271); a murder is a wrong done to the family which is vengeable by a money payment, and such an act, if exact a suitable expiation. The only reference to judicial proceedings in connexion with homicide is in the description of the shield of Achilles (II. xviii. 497-508). Unfortunately, however, critics are not agreed upon the nature of the trial scene, and the question is still open whether the issue to be tried before the elders was one of fact—had the blood-price been paid or not?—or whether the community had undertaken to decide the question of right, when a blood-price had been offered and refused. (See, on the one hand, Seymour, p. 89, and Lipsius, Das attische Recht, p. 4; and, on the other, Leaf, in loc., and Maine, p. 406.)

5. When we pass to historical times, we find an entirely different state of affairs. The only adequate explanation of the change seems to be that in the interval a new religious influence had grown up, strong enough to modify completely the Greek conception of murder. This was the Delphic cult of Apollo, which at one and the same time emphasized the moral guilt of the shedder of blood, and by its ceremonies of purification opened the means of escape from the need for a blood-requital. But it is not easy to understand whether this new attitude of the community was due to the influence of the Homer poems, and if so, ways given to a stricter estimate of guilt (Rohde, i. 257; Demosthenes, xxiii. 28, 33), which appears to be a reversion to the primitive rule that every murder must be expiated by blood (Eisch. Cho. 311). It has usually been inferred that the practice of Homeric society was a temporary deviation due to special conditions, which suspended the fundamental principle of its later development (T. Gomperz, Greek Thinkers, Eng. tr., 1901, ii. 4).

6. The Athenian criminal code.—However this may be, when we at length reach the system administered by the Athenian courts, we find that the punishment no longer depends upon the choice of the individual avenger, but is prescribed by the State (Demosoth. xxiii. 69), although the kinsman is still required to appear as the instrument which sets the law in motion, unless the murder has been forgiven his death (ib. xxxvii. 59). The circumstances and motive of the homicide are no longer regarded as indifferent, but the various grades of guilt are distinguished with precision. Thus (1) the trials of the Aryan homicide, instituted according to the legend, on the occasion of the trial of Orestes, had jurisdiction in cases of wilful homicide (φόνον εκδοσία). The judges were the Council of the Areopagus, a body constituted from those who had held the office of archon and had passed a subsequent scrutiny, under the presidency of the 'king' archon, who, as exercising the priestly functions of the old kings, testified by his presence on the scene of the murder that there was a trial for blood-guiltiness. The penalties of death and confiscation of goods followed a conviction (Demosoth. xxi. 43). The Areopagus also had jurisdiction over cases of wounding with malicious intent (νυκτίαν τι νυκτίαν), of arson (φωνος), and of poisoning (φονεύσας τιν αιτιολογίαν δοτι). The penalty for wounding and for poisoning, if death did not result, was banishment and confiscation of property; if the poisoning was followed by death, it was punished in the same manner as murder committed by violent methods.

(2) The second of the courts dealing with homicide sat at the Palladion, a sanctuary of Pallas, outside the walls, on the east side of Athens. Here were tried cases of involuntary homicide, compounded by a conspiracy against the life of another (συνάρνατος: Arist. Resp. Ath. 57, 3), as well as those relating to the killing of a slave, a resident alien, or a foreigner. The sentence on a person found guilty of involuntary homicide is for them to stand as avengers of the deceased. Here the word 'king' archon was used, that is, he had assembled the relatives of the deceased, or, if he failed to do so, for a definite (but not ascertained) period. The death of a non-citizen seems also to have been punishable with banishment.

(3) Not far from the Palladion was the Delphinion, or Temple of Apollo Delphinios, where all were tried who alleged that the homicide committed was justifiable or excusable. The examples given are the slaying of an adulterer taken in the act, death on the battlefield in consequence of mistaken identity, and the fatal result of an athletic contest.

(4) Of minor importance was the court in the precinct of the hero Phreates (Lipsius, p. 130), on the Piraeus promontory. Here any person was tried who, while in exile for involuntary homicide, was accused of murder or malicious wounding committed before he went into exile. In such circumstances the accused pleaded his case from a boat moored off the coast. The judges in the three courts last-mentioned were a body known as the ἐγκαίνας, 51 in number, about whose qualifications and mode of appointment there is no information except the vague statement that they were chosen by a majority vote, not always by the well-born citizens. Their number may be explained by the 'king' archon being counted as one of them, or may be due to the same principle as prevailed in the jury-courts—the necessity of an odd number in
order to secure the decision of a majority (Lipsius, p. 18; otherwise Gilbert, Handbuch d. gr. Staats-
alterthümer, p. 136). This system seems to have lasted from the time of Draco until about the year
400 B.C., when, in place of it, a panel of ordinary jurors (σωφροῦσαι) was substituted (Lipsius,
p. 41). The president in these courts was always the 'king' archon.

(5) Lastly, there is the court of the Pythianum, composed of four trial 'kings' (πολεμαρχικοὶ)
together with the 'king' archon, who, when the actual criminal could not be discovered, conducted
a ceremonial trial of the weapon or of any other inanimate object, such as a stone or a piece of
the ground, to decide whether it had been committed.

At the conclusion of the trial the inanimate instru-
ment of death was cast beyond the boundaries of
the State. A similar proceeding took place if the
death was due to an animal (Arist. Resp. 
Gilbert, p. 90). The death penalty was the ear-
vival of a custom which went back to a remote
antiquity.

In regard to trials for homicide, the following
points of interest may be noted: (a) The connexion of
the primitive blood-feud is pre-
served in the requirement that the prosecution
must be undertaken by the nearest relatives of the
deceased. (b) The trial always took place in the
open air, on order avoide pollution to those present from being under the same roof with the
accused. (c) The fact that the place of
trial was always a temple is derived from the time
when the slayer was protected by the right of
asylum, until he had accorded with his adversaries on
the amount of the blood-price. (d) The accused
could withdraw himself from the trial not later
than the conclusion of his opening speech (Demosth.
xvii. 69), and, so long as he remained abroad, his
life was protected; but, if he put himself at
Athenian mercy, he could be put to death with impunity. (e) Cer-
emonial purification was required before even an
involuntary homicide could be restored to his full
rights. (f) The court of the Areopagus was closely
associated with the cult of the Erinyes, who appear
as the accusers of Orestes not only in Eschylus,
but in the account preserved in Demosth. xvii. 56
(Robeo, p. 269).

At Sparta, cases of homicide were tried before the
council of elders (τυποὶ), where other public proceedings also took place (Arist. Pol. iii. 1, 1275b, 
10). From a case in which permanent exile was the
penalty for an act of involuntary homicide committed in committee (Xen. Anab. iv. viii. 25), it
has been inferred that the punishment had been put
away. (g) Our information is so meagre that we can seldom
distinguish the various crimes to which they were
assigned; it appears, however, that cowardice in
battle was punishable with exile (Thuc. i. 72), and
παρὰδοσία with permanent disfranchisement (Plut.
Mor. p. 237 C). In Boeotia murder trials took
place before the council (Xen. Hell. vii. iii. 5).

To return to Athens: it is desirable, before pro-
cceeding further, to mention ed. ity. The administra-
tion of the Athenian criminal law which distinguish it from the system
established in Great Britain. Every criminal pro-
cressing was assigned to the office of a magistrate or
board, who took charge of the necessary docu-
ments, heard all the preliminary applications, and
presided at the actual trial. But these officials
were very far from exercising the functions of a
modern judge. They had no legal training or
experience, but were simply holders of office for a year, a few being chosen by election, but the
majority owing their position to the chance of the
lot. Their duties were for the most part minis-
terial, and at the trial they exercised no control
over the jury, who were expected as representing
the sovereign people. These latter—in criminal
trials a panel, generally 501 in number and often
far larger, chosen by an elaborate system from a
body of 6000 citizens annually liable to be
apt to stop at an irrelevant argument, if it appealed
to their fancy, or to require every statement of an
advocate to be proved by strict evidence (Mahaffy,
Social Life in Greece, London, 1877, p. 387 ff.).

Their freedom from responsibility tempted them to
debate according to the caprice of the moment, and
their ignorance enabled advocates to misrepresent
the law without any check but the speech of the
other side. Moreover, they were often swayed by
political prejudice. From the connexion of
the trial with the political questions of the
day, it is nocredible, informed, were prepared to swell the State
revenues by confiscation of the goods of the accused
in order to improve the security for the jurymen's
pay (Aristoph. Eq. 1391 f.; Lysias, xxvii. 1). They
voted by ballot and their decisions were
final. In many cases the sentence was fixed by law (Δράκο
διὰ τοῦ δικαίου,
but, where it was left to the discretion of the
court (Δράκο διὰ τοῦ δικαίου), the jurors had only a choice between two alternatives, as presented to
them by the criminal in question. It is obvious that
any wider liberty would have been attended with seri-
ous practical difficulties.

If the crime of treason (τροστροστήρεια) was not pre-
cisely defined in their code, it was not because
the Athenians did not cherish, as the constitutions
of their constitutional liberty. On the contrary,
the names of Harmodius and Aristogiton were always
cherished, and special privileges granted to their
descendants, in order that the Athenians might
never forget the dangers from which their ancestors
had been liberated. Charges against the oligarchi-
cal party of conspiring against the democracy
(Aristoph. Eq. 236), or against some popular leader
as aiming at a tyranny, were freely brought to and
probed during the memorable times. Parry says:
War: 'Aye! "conspiracy" and "tyrant," these
with you are all in all, [Whatsoever is brought
before you, be the matter great or small" (Aristoph.
Vesp. 458 f., tr. Rogers). The importance attached
to the safety of democracy is attested by the
provision of a special process (εὐλογία) for the
impeachment of traitors. Historically, indeed, it
may be regarded as a survival of the only form of
criminal procedure known to the primitive State,
in which there is no distinction between a criminal
trial and an act of legislation (Maine, pp. 383, 393).
But in practice this solemn proceeding was reserved
for the trial and punishment of serious public
offences which did not admit of delay (Harper, a.v.
eὐλογία). A law of Solon entrusted the Areo-
pagus with the trial of those who conspired to
overthrow the democracy (Arist. Resp. Ath. 8. 4); but it was at a later date—which has been fixed as
either about the year 629 or the year 529 B.C.
(Thaulhofer, in Hermes, xxxvii. [1902] 342 ff.)—that
a comprehensive enactment enumerating and de-
fining various treasonable acts (ταύμενοι εὐλογίαν) was
was passed, as the offences comprised in
it may be divided roughly into four classes: (1)
Attempts to overthrow the constitution, either
actual or constructive; (2) the treasonous surrender
of a fortified place or of a military or naval force;
(3) desertion to the enemy, or assistance given to,
or bribes received from them; 1 (4) corrupt advice given by a speech in the assembly (Hyperid. iii. 29). Either as included in the scope of this enactment or as authorized by earlier or separate legislation, with judicial proceedings by impeachment against those who made deceitful promises to the people, and against ambassadors who were false to their duty (Demosth. xix. 277, xx. 135). The procedure, as might have been expected, was entirely different from that of an ordinary criminal indictment. An impeachment might be either instituted before the Council of the Five Hundred or brought direct to the Assembly. In the former event, if the Council approved the prosecution, the accused was held to be a traitor (Hyperid. ii. 20). In early times, in order to encourage prosecutors to undertake proceedings, it was provided that any one who failed to obtain a fifth part of the votes should not be liable to the usual fine of 1000 drachmae; but in the year 330, when the facilities thus given were abused, the privilege had been withdrawn (Demosth. xviii. 250).

The remedy of κρασοείδη was also prescribed for certain offences of a less serious character, such as official maladministration, particularly in the office of an arbitrator or in the dockyards; and also to rectify wrongs committed against those who were in a dependent position, or had special claims to protection. The chief characteristic of these cases was the attempt to prevent or abate a wrong by means of a writ (κρασοείδη) or writ of amnis (αμνιστία), when laying his plaint (Wyse on Isæus. iii. 40). But, instead of going to the Council or to the Assembly, the prosecutor made his ‘denunciation’ to the chief archon (εργασιόν), who, exercised a criminal jurisdiction in this matter under his official superintendence in inheritance cases. The chief archon was, in fact, in a position similar to that of an English Lord Chancellor, who, as represented nowadays by the judges of the Chancery Court, has the power to control his cases, and to determine his official superintendence in inheritance cases. The chief archon was, in fact, in a position similar to that of an English Lord Chancellor, who, as represented nowadays by the judges of the Chancery Court, has the power to control his cases, and to determine his

1 A famous instance of a trial of this kind was the prosecution instituted by Lycurgus against Leocrates, who was alleged to have absconded with the money left by the late battle of Chaeronea. This is recorded by Themistocles (Pol. ii. 37).

2 It is interesting to find that the last-named provision was a traitor who he was liable to an offence of immemorial antipathy, since it is implied in the story of the burial of Polycydes by Aristophanes (Acharn. i. 499).

3 The best-known instance is that of Sophocles, against whom proceedings of this kind are said to have been taken by his son. This is recorded by Euripides (Iphigenia Taurica, i. 902). This is recorded by the Sophocles, against whom proceedings of this kind are said to have been taken by his son. This is recorded by Euripides (Iphigenia Taurica, i. 902).
tagoras for opening his treatise on the gods with a profession of inability to say whether they existed or not, or what they were (Diels, ii. 2 [1907] 553); and against Socrates, whose indictment charged him with corrupting the youth, and with introducing the worship of deities other than those recognized by the State (Plut. Apec. 24 B). On the other hand, Alecradbes was impeached (σφηκτὴν) on the delation (μεταταξις) of an informer for holding a mock celebration of the Eleusinian mysteries in his own house (Plut. Alcib. 22); and an information (προσαύξεις) was laid against Andocides for taking part in a sacrificial act, while under a disability previously imposed (Andoc. i. 71). The sacriligious adulterer, he alleged, distrusted from a temple, was treated as a distinct crime, and was punishable with death, deprivation of the right of burial, and confiscation of goods, on an indictment preferred before the themisteuta (γραφὴ ιστρικίας). Thus arises the accuser, as Demosthenes (xxii. 27) takes occasion to remark; but, so far as our information goes, the trial always took place before a helastic court. A single exception, known to us from the 7th book of Polybius, relates to the charge of uttering the stumps (σείδας) of a sacred olive-tree. Here the cause was pleaded before the Council of the Areopagus, under whose supervision these olive-trees stood. In this case the punishment was fixed by law—death for destroying a tree, and banishment for removing a stump. For impiety in general, however, the penalty—death, banishment, confiscation of goods, or money fines—was left to the assessment of the jury, as is known from the celebrated trial of Socrates.

Adultery (μυκηθα) was treated at Athens as a criminal offence, and was punished with severity, as was natural in a society which tolerated concubinage. The adulterer might be executed on an indictment laid before the themisteuta (Arist. Resp. Ath. 59. 3), and the sentence was probably left to the decision of the court (Lipsius, p. 432). But the injured husband could also take the law into his own hands. He might either kill the adulterer, and plead justifiable homicide in answer to any proceedings taken against him; or he might exact or secure retribution from him, until he was satisfied by a money payment. In the latter case, he might have added additional punishment—action for false imprisonment (δίκεσιν εργαθήματι ἄν μυκηθα) against the husband, and, if successful, was released from any undertaking he had given under duress. If the husband continued to live with a deceiving adulteress, the temple of Apollo at Delphi was closed to him, and the adulteress herself was forbidden to enter the temples or to wear the customary ornaments of free women. If she infringed these restrictions, she might be subjected with impunity to any injury short of death (Dem. i. 87). Stinging repetitions were in force against those who procured youths or girls for immoral purposes (πορευέσσας), and a total disability was imposed automatically upon those who had prostituted themselves, so that, if they excused the adulterer of the civil right, they became liable to an indictment (γραφὴ οἰκονομίας), and, if convicted, to be sentenced to death. Cf. also art. ADULTERY (Greek).

In dealing with other crimes of violence against persons or property, we have to take into account a large variety of procedure. Thus Demosthenes (xxii. 25 ff.), having occasion to point out that Solon, in providing different remedies for single crimes, intended to ensure that no law-breaker should escape under a civil right, they became liable to a trial for a sacrilege (σφηκτὴν), or a sacrilege against a temple, or to a trial for sacrilege (σφηκτὴν), or a sacrilege against a temple, and, if convicted, to be sentenced to death. Cf. also art. ADULTERY (Greek).

where the culprit was to be found and requiring them to seize him (ἐσβασθῆναι), by an ordinary indictment (γραφή), or, lastly, by a civil action (δίκη). Similarly, he thinks it difficult to imagine that any one could be proved to have committed an assault and battery could escape punishment at Athens (liv. 17). For, in the first place, an action for slander (κακογραφίας δίκη) had been devised to prevent the commission of the offence at all, or at least to minimize its occurrence; and, if it was committed, in addition to the ordinary indictment for assault (γραφή ἱδρυμα), there was an action for battery (δίκη αἰδρυμα), or, if the offence was so grave as to require it, a prosecution for wilful killing (προσαυξαμα) against the Areopagus (see above). In certain circumstances there was still another remedy. When Demosthenes, acting as choragus at the Dionysia, was grossly assaulted by Midias, instead of contenting himself with a personal suit, he made a complaint (προσελθῇ) before the Assembly in order to obtain the authorization of the people for the institution of proceedings. The object, of course, was to make full use of the prejura which was against the defendant by a decree of the people; and, perhaps, in the case of an aspiring politician, it might be more advantageous to obtain the advertisement of a public debate on his wrongs than to rest content with the less publicized decision of a helastic court alone. But the προσβολή had only a limited range, being confined, according to our authorities, as now interpreted (Lipsius, p. 214 f.), to charges against sycophants, i.e. false accusers, or those who had made improper proceedings in order to extort money, or for some fraudulent purpose, but only when their false professions had misled the people; and against those who committed an outrage during the progress of certain proceedings. Thus, in the case of Dionysia or Eleusina. If a vote was given against the accused (κακογραφομολύτη), the prosecutor proceeded to lay his complaint before the themisteuta (Arist. Resp. Ath. 59. 2), and the trial proceeded in the ordinary way. There was, however, one peculiarity which, according to a recent view, attached to the trial of a προσβολή as distinguished from all other prosecutions in which the punishment was assessable by the court. In the former, the people voted merely whether they approved of the conviction; and if so, the judges were compelled to select one of two alternatives; but, in the speech against Midias, Demosthenes invites the jury to assess any penalty which they think adequate, and implies that this may range from death or confiscation of goods to a penalty fine (§§ 21, 151, 152). (See Goodwin's Demosthenes against Midias, Cambridge, 1906, p. 161; otherwise, Lipsius, p. 218.)

Of the other processes mentioned above, the most important was the arrest, which was applicable to certain classes of offenders, when openly detected in crime. These were known comprehensively as malefactors (κακογραφομολύτη), and specifically as thieves (κλέαρχοι), a term not including every offender of this kind, but only such as stole by night or in a gymnasium, or, if the thief took place by day and under other conditions,所得税 the value of more than fifty drachmas, or, if the crime was committed in the harbours, one more than ten drachmas (Demest. xxiv. 113), kidnappers (ἀδημοστοστάτη), highwaymen (ήομοστάτη), burglars (τοιχοκρότομη), and pickpockets (βαλλαντοστάτη). Such cases came under the jurisdiction of the police magistrates known as the Eleves and the punish ment was imposed by them. If the crime was admitted, punishment followed at once; but, if it was denied, the culprit was kept in durance until trial (Arist. Resp. Ath. 52. 1), unless he was bailed out by three citizens (Antiph. v. 17). The process of arrest
seems gradually to have been extended, so that it was sometimes employed against murderers, as in the speech of Antiphon, de cæde Herodis, and in that of Lysias against Agoranus. An entirely distinct application of the term must be recognized when it was directed against those who, while under disability (άρσα, not usurped the privileges which they had forfeited, and against exiles who had returned home. In the last mentioned cases penalty was assessable, except for those who were already under ban of death. If the intending prosecutor had not sufficient strength or courage to arrest the felon himself, he could fetch a magistrate to the spot and get him to act (παραθετον τελευταίον), as the complement of arrest, and applicable to the same crimes; but the evidence is scanty, and touches only the cases of theft (Demosth. xxii, 26), the harbours of fugitives, and the secret retribution of State property (Suid. s.v.). There is often mentioned, in conjunction with arrest, the process of information (τρεβάζειν). This answers to the second kind of arrest mentioned above and was employed against State-debtors, returned exiles, murderers, and generally all who, being under disability, frequented places or performed acts from which they were excluded by law. In the case of State-debtors the presiding official was the ρεθεδακτης, in other cases the Eleven (Arist. Resp. Ath. 52. 1). The penalty naturally varied according to the gravity of the offence, and was often assessable, as in the case of a disqualified disin making a move to act as such (Arist. Resp. Ath. 52), and if a State-debtor usurped the functions of a public official, he was liable to the death-penalty (Demosth. xx. 156). If a man whose goods had been stolen was either unable or unwilling to use the process of arrest, he might proceed by way of indictment for theft (γραφή κολονίζει, before the themostheütas, as an alternative to the civil action for the same delict. Draco's code had made death the sole penalty for theft (Plut. Sol. 17), but later legislation allowed the court to fix the penalty. Imprisonment might be inflicted in addition to the main penalty, and disfranchisement followed a conviction. For personal injury resulting from an assault, or found dead and incapable of suit to the person of child, woman, a freeborn man, or slave, the appropriate remedy was an indictment for wanton assault (ὑπέργιον γραφήθη, before the themostheütas. The essence of the offence, as distinguished from the latter, which might be made the foundation of a civil action (αἰτία δίκαιος), lay in the motive which prompted the outward act. A mere blow, according to Aristotle (Ethik. I. 13. 1574a, 13), is not necessarily a sign of wantonness, but only when the object to be attained is the disgrace of the sufferer or the pleasure of the striker. The penalty was assessable, and might amount to death in serious cases; but it was subject to the peculiar provision that the vote was taken immediately after the verdict. It was a main issue, without the usual opportunity being given to the parties to recommend their respective assessments (Lipsius, p. 429 f.).

We must next consider offences connected with the unlawful assumption or fraudulent exercise of civil privileges. Pericles had carried a law that an Athenian citizen must be the offspring of a father and mother who were both Athenians (Arist. Resp. Ath. 29. 4); and it was re-enacted in the archonship of Eucleidas with a minor clause to guard against. Any one who exercised the rights of a citizen without being entitled to them was liable to indictment by a common informer as an alien (κρίτης γραφήθη), and, if convicted, sentenced to be sold as a slave. Further, if such a person procured his acquittal by bribery or collusion, he was amenable to the same penalty (διεργασία γραφήθη). Similarly, a resident alien (περιεράω), who neglected to enroll himself under a penalty that could be inflicted, was deprived of the third archon, known as the "polemarch," who exercised over περιεράω the same jurisdiction which belonged to the chief archon in regard to full citizens. It is obvious that the entrance at Athens opened a favourable field for the crime of malicious prosecution, and helped to swell the class of persons who made their living by pursuing the delinquent. Pollux's definitions of the topophanes are full of references to the contemptible class of scyphists which flourished during the latter part of the 5th century, and, in order to protect society from the fullest opportunity was given to proceed against them by indictment or otherwise (Isocr. xx. 22). If the assessment of the penalty was in the discretion of the court.

It is remarkable that the offence of perjury—the only crime which Homer (II. iii. 275) mentions as visited with punishment after death—was considered, if committed by a witness in the course of a trial, to demand nothing more than a civil remedy (προσκαλεσθή το δίκαιον, although disfranchisement was one of the consequences which might result if the witness was convicted, such an action (Isocr. v. 17); and it followed automatically if he was convicted three times. On the other hand, falsely to swear to the service of a summons rendered the perjurer liable to criminal proceedings (προσκαλεσθή αὐτός, in Isocr. xxiv. 23, 24 in other cases the Eleven). The penalty naturally varied according to the gravity of the offence, and was often assessable, as in the case of a disqualified disin making a move to act as such (Arist. Resp. Ath. 52), and if a State-debtor usurped the functions of a public official, he was liable to the death-penalty (Demosth. xx. 156). If a man whose goods had been stolen was either unable or unwilling to use the process of arrest, he might proceed by way of indictment for theft (γραφή κολονίζει, before the themostheütas, as an alternative to the civil action for the same delict. Draco's code had made death the sole penalty for theft (Plut. Sol. 17), but later legislation allowed the court to fix the penalty. Imprisonment might be inflicted in addition to the main penalty, and disfranchisement followed a conviction. For personal injury resulting from an assault, or found dead and incapable of suit to the person of child, woman, a freeborn man, or slave, the appropriate remedy was an indictment for wanton assault (ὑπέργιον γραφήθη, before the themostheütas. The essence of the offence, as distinguished from the latter, which might be made the foundation of a civil action (αἰτία δίκαιος), lay in the motive which prompted the outward act. A mere blow, according to Aristotle (Ethik. I. 13. 1574a, 13), is not necessarily a sign of wantonness, but only when the object to be attained is the disgrace of the sufferer or the pleasure of the striker. The penalty was assessable, and might amount to death in serious cases; but it was subject to the peculiar provision that the vote was taken immediately after the verdict. It was a main issue, without the usual opportunity being given to the parties to recommend their respective assessments (Lipsius, p. 429 f.).

We must next consider offences connected with the unlawful assumption or fraudulent exercise of civil privileges. Pericles had carried a law that an Athenian citizen must be the offspring of a father and mother who were both Athenians (Arist. Resp. Ath. 29. 4); and it was re-enacted in the archonship of Eucleidas with a minor clause to guard against. Any one who exercised the rights of a citizen without being entitled to them was liable to indictment by a common informer as an alien (κρίτης γραφήθη), and, if convicted, sentenced to be sold as a slave. Further, if such a would-be citizen procured his acquittal by bribery or collusion, he was amenable to the same penalty (διεργασία γραφήθη). Similarly, a resident alien (περιεράω), who neglected to enroll himself under a penalty that could be inflicted, was deprived of the third archon, known as the "polemarch," who exercised over περιεράω the same jurisdiction which belonged to the chief archon in regard to full citizens. It is obvious that the entrance at Athens opened a favourable field for the crime of malicious prosecution, and helped to swell the class of persons who made their living by pursuing the delinquent. Pollux's definitions of the topophanes are full of references to the contemptible class of scyphists which flourished during the latter part of the 5th century, and, in order to protect society from the fullest opportunity was given to proceed against them by indictment or otherwise (Isocr. xx. 22). If the assessment of the penalty was in the discretion of the court.

It is remarkable that the offence of perjury—the only crime which Homer (II. iii. 275) mentions as visited with punishment after death—was considered, if committed by a witness in the course of a trial, to demand nothing more than a civil remedy (προσκαλεσθή το δίκαιον, although disfranchisement was one of the consequences which might result if the witness was convicted, such an action (Isocr. v. 17); and it followed automatically if he was convicted three times. On the other hand, falsely to swear to the service of a summons rendered the perjurer liable to criminal proceedings (προσκαλεσθή αὐτός, in Isocr. xxiv. 23, 24 in other cases the Eleven). The penalty naturally varied according to the gravity of the offence, and was often assessable, as in the case of a disqualified disin making a move to act as such (Arist. Resp. Ath. 52), and if a State-debtor usurped the functions of a public official, he was liable to the death-penalty (Demosth. xx. 156). If a man whose goods had been stolen was either unable or unwilling to use the process of arrest, he might proceed by way of indictment for theft (γραφή κολονίζει, before the themostheütas, as an alternative to the civil action for the same delict. Draco's code had made death the sole penalty for theft (Plut. Sol. 17), but later legislation allowed the court to fix the penalty. Imprisonment might be inflicted in addition to the main penalty, and disfranchisement followed a conviction. For personal injury resulting from an assault, or found dead and incapable of suit to the person of child, woman, a freeborn man, or slave, the appropriate remedy was an indictment for wanton assault (ὑπέργιον γραφήθη, before the themostheütas. The essence of the offence, as distinguished from the latter, which might be made the foundation of a civil action (αἰτία δίκαιος), lay in the motive which prompted the outward act. A mere blow, according to Aristotle (Ethik. I. 13. 1574a, 13), is not necessarily a sign of wantonness, but only when the object to be attained is the disgrace of the sufferer or the pleasure of the striker. The penalty was assessable, and might amount to death in serious cases; but it was subject to the peculiar provision that the vote was taken immediately after the verdict. It was a main issue, without the usual opportunity being given to the parties to recommend their respective assessments (Lipsius, p. 429 f.).

We must next consider offences connected with the unlawful assumption or fraudulent exercise of civil privileges. Pericles had carried a law that an Athenian citizen must be the offspring of a father and mother who were both Athenians (Arist. Resp. Ath. 29. 4); and it was re-enacted in the archonship of Eucleidas with a minor clause to guard against. Any one who exercised the rights of a citizen without being entitled to them was liable to indictment by a common informer as an alien (κρίτης γραφήθη), and, if convicted, sentenced to be sold as a slave. Further, if such a
indictment before the *thesmothetar* (τησμοθεταρ*); and any one whose name was wrongly inserted could take similar proceedings against the wrongdoer (φανεγραφον, or if the proper officer did not erase his name after he had paid (βολεβαλον). The general formula defining grades of punishment closely resembled that above quoted, and money payment (δανεια τασαρι Αντωνιαν). Death, as we have seen, was not infrequently imposed by law; but, on the whole, the temper of the administration was lenient, and a death sentence was less frequent in practice than might have been expected from the place which it occupies in the code. A striking testimony to the humanity of the Athenians is the abhorrence excited by any punishment involving torture or mutilation; and the market-place for a time was defaced by the mention in literature except as characterizing the excesses of tyrants or the savagery of barbarians (see esp. *Aisch. Enm. 156 A*). Imprisonment is rarely mentioned as a penalty (Lys. vi. 22; Plat. *Apol. 37*). If we would imagine the criminal for the benefit of society, the Athenian code secured the same end by disfranchisement (φυσαλ) which is the obvious formula for the society. It requires a few words of explanation. For 10 years a manless citizen who had not committed a crime burdens attaching to citizenship than of its privileges, an effort of imagination is needed in order to realize what complete disfranchisement meant to an Athenian. Athens was a comparatively small city, as measured by the standards of to-day, with a proletariat slave-class, and a considerable number of resident aliens; and yet at the same time an imperial city, proud of its past and with a world-wide reputation. An Athenian citizen valued his civic privileges as highly as his life. To be excluded from holding any office or exercising any public function in a community where all citizens aspired to share in the government, and to be forbidden to appear in the court or to take part in any public festival where one lived in the open air, and where the frequently recurring festivals were the chief enjoyments of life, placed a ban upon the convicted man which made him an outcast from all his fellow-citizens. Thus we see that disfranchisement, with or without confiscation of goods, as a normal punishment for all kinds of serious offences, such as sacrilege, treason, bribery, embezzlement, and theft of public property, was the penalty which Athens inflicted on every Athenian, who was sentenced for a breach of any part of the law. It was also adopted against State-debtors as a means of enforcing payment, and was removed as soon as the liability was discharged. There were also cases of partial disability, as when a man was forbidden to speak in the Assembly, or to become a member of the Council (Andoc. i. 75). So, if the prosecutor in a public indictment threw up his case, or failed to obtain a fifth part of the votes, he lost the right of again instituting another proceeding of the same kind (Demosth. xxx. 103). Cf. also art. ATIMIA.

Lastly, it remains to notice the formalities attending the execution of the sentence. If the sentence was one of death, or if imprisonment was involved in it, the convicted person passed under the charge of the Eleven, who had control over the State prisons. Common criminals, known as malefactors (ακασματος), were fastened in a frame and cudgelled to death (αθρωμασαραμα) by the executioners, who were instructed to do the duty of 'throwing into the pit' (εις τη βασανη τημακαι) — a form of execution which was at one time employed for traitors (Plut. *Aristid. 3*; Xen. *Hell. vii. 20*). The more familiar penalty, however, which is mentioned for the first time during the domination of the Thirty (Lipsius, *p. 77*), was to give to the condemned criminal a cup of hemlock-juice (εφασμον), which was administered by an official acting under the orders of the Eleven. If the accused was condemned to be sold as a slave, he was handed over to the *παλαγος* who sold him to the highest bidder. Confiscated goods were sold by the same officer. In order to prevent any concealment, a common informer was permitted to make a schedule (ἄπειραγον) of any property which he alleged to be liable to confiscation, and, if he succeeded on the trial of the issue, he was entitled to retain for himself three-quarters of the value (Demosth. liti. 2). Sometimes, in important cases, a special body of commissioners (γραμματα) was appointed to make an investigation of the property liable to seizure. Fines imposed by the court were collected by the *παλαγος* who handed the money over to the treasury officials (ἄρωκτημα). The enforcement of the negative penalty of disfranchisement was secured by the severe punishment provided for those who ventured to infringe the limitations imposed upon them by their sentence.

7. Such, in rough outline, was the criminal code which was administered in the Athenian law-courts at the height of their power. That a legal system should exist is no peculiarly Greek institution, but its existence within so comparatively short a time is remarkable enough; but the spirit of humanity and enlightenment which it displays, the variety of procedure, the minuteness of subdivision, the multiplicity of punishment, the minuteness of division of crime, and the securities taken against every form of personal violence, alike show that, in the province of law, Greek civilization did not fail so far short of the eminence which it attained in art and literature. The defects of the system as has already been indicated, were due to its faulty administration by the juries, to the absence of a trained legal profession, and to the non-existence of records to secure continuity of decision.

8. Views of Plato and Aristotle. — The laws of Athens were the expression of the best opinion of an unusually intelligent community, and even the most advanced thinkers, who were ready enough to criticize defects in the constitution, found but little to improve upon in the criminal code. When Plato set out, in the 9th book of the Laws, to provide the citizens of his pattern State with a revised series of statutes, the amendments which he advocated were made, not so much from dissatisfaction with a system, that was already reformed, as from desire to preserve intact the essential features of his reformed community. Thus, he objected to the punishment of disfranchisement, and to that of perpetual banishment, because they would interfere with the permanent occupation of the lots which were assigned to the citizens (855 B, C). For similar reasons, fines were to be inflicted more sparingly than was usual at Athens; and a more frequent resort to blotting and the pillory — thus of punishment — was connected with the Athenian mind, however familiar to Sparta (Grote, *Plato, London, 1863, iii. 433*) — was recommended. The motive which prompted these changes, and which informs the whole body of his legislation, is derived from his conception of the real nature of crime and the object which punishment should seek. It should, however, be remembered that, as his citizens were a carefully selected and highly educated body, he anticipated that crime would be less common, and that legislation was needed only by way of precaution against the perversity of human nature (853 C–E). Now, Socrates had taught that virtue was fundamentally a matter of knowledge, and that

1 There are occasional references in Greek literature to stoning as a traditional mode of execution for heinous offences; but it was rather a survival of the custom of human sacrifice than the enforcement of a legal code. See J. Jowett, *Pausanias*, London, 1898, iii. 417; Verrall on *Aisch. Ap. 1107.*
wrongful action necessarily proceeds from ignorance. Hence the paradox that no one is willingly unjust; for, if a man knew the good, he would follow it. To this doctrine Plato consistently adhered in his latest work (589 D, E), and it is obvious that it cuts at the root of the common distinction of juridical crimes and natural evils and wrongs. But Plato did not deny the existence of injustice or of voluntary wrong (εἰσόδων ἀκατάνομα); only he gave a new connotation to these terms, based upon the principles of his own psychology. Thus, injustice is due to the dual nature of the soul of unequal parts—either anger or desire, the stimulus of pain or of pleasure; but if, on the other hand, the emotions are controlled by the reason, it is no longer possible for a man to commit an unjust act, although his action be considered and harmful to others. For, though the reason may be strong to master the lower impulses, yet its successful operation may be impeded by ignorance or prejudice; and in this manner voluntary error is possible (Grote, iii. 399). It follows that the chief aims of the law-giver will be at once by education to subdue the passions, by compensation to make amends to the sufferer, by prescribed penalties to deter, and by the provisions to classify and reform. Above all, the spirit of his laws must be such as to strengthen and guide the rational faculty by prescribing such beliefs as are agreeable to absolute reason. It is only when the evil is recognized as incurable that death is a suitable penalty, because, for the criminal himself, and useful as an example to others.

Plato recognized two aspects of punishment, the corrective (Adam on Rep. 389 B) and the preventive, both of which are to be distinguished from a purely vindictive exercise of authority (Gorg. 525 A; Prot. 324 A; Legg. 854 B, 834 A). In the same way Aristotle distinguished vengeance, the object of which is the satisfaction of the injurious, from chastisement directed to the good of the criminal (Rhet. i. 10, 1369b, 13; Eth. Nic. ii. 3, 1104b, 16); and, in entire agreement with Plato, he held that, whereas good men may be admonished, others, whose vice is incurable, must be put to death. (815a). The spirit of corrective justice (δικαστήριον δικαίου) as proceeding by arithmetical proportion, indemnifying the injured party by subtracting from the gain of the wrongdoer an amount equivalent to the loss of his victim, was distinguished from the distributive justice, which seeks to establish a geometrical proportion according to the respective merits of the individuals concerned; but in the Polities, where we might have looked for a reasoned treatment of punishments, nothing of the kind is to be found.

It is unnecessary to detail the provisions which Plato recommended for the punishment of sacrilege, homicide, and wounding; but it deserves to be remarked, as showing that he was alive to the defects of the Athenian jury-courts, that he refrained from drawing up precise enactments to fit every possible contingency, because he trusted largely to the discretion of his select and well-trained court, which was established to take the place of the Council of the Areopagus (676 B-E). It should further be noticed that, while generally adopting, with slight alterations, the provisions of the Athenian code, in dealing with the offense of blasphemy (923a), he modified the Athenian forms so as to render himself as best he might, unless he happened to be twenty years older than his assailant (879 C). In thus training the young to endure blows, and in inculcating reverence for age, Plato was showing his preference for the methods of Spartan discipline. But the most extraordinary of all Plato's legislative experiments was the intolerant enactment against religious heresy. He distinguished three classes of heresy: (1) those who believe that gods exist, but do not concern themselves with human affairs; (2) those who believe that the gods may be propitiated by prayers or sacrifice (589 B). Of these classes the third is the most perturbing, but no one who was found guilty of impiety as falling under any of the three classes, even if his conduct was otherwise free from blame, was to be imprisoned for five years; and, if at the end of that time he was still uncertain, a man was sent to death (589 A). Further, if the offense of heresy was found aggravated by bad conduct, the offender must be kept in solitary confinement until he died, and, after death, refused the rites of burial.

Inerrancy. — The chief authority on Inerrancy is J. H. Lipsius, Das atthische Recht und Rechtsverfolgender, pt. 1, Leipzig, 1865, pt. ii., 1868; but, as the work is not yet complete, it is still necessary to refer to the chief authorities for those later decisions mentioned in the former edition of Meier-Schömann, Der atthische Proses, Berlin, 1883-1887. See also C. F. Harnack, Die alte Religionslehre, ed. Thalheim, Freiburg, 1884; G. F. Schömann, Lehrbuch der griech. Alterthümer, ed. Lipsius, Berlin, 1917, esp. vol. i. pp. 325-327; G. Gilbert, Die Staatsalterthümer, Leipzig, 1885, esp. vol. i. pp. 423-497. There are also numerous articles by A. Thalheim, in Paulus-Wissowa. For the primitive beliefs connected with the blood-feud, see E. Rohde, Psyche, Tübingen, 1897, i. 239-277. A. C. Pearson.

CRIMES AND PUNISHMENTS (Hebrew). —Crime, strictly speaking, is an offence against the laws of a State, which the State punishes, as an act against God, and other wrongdoing of which the State takes no cognizance. This idea had not been formulated by the Israelites, and there is no Heb. word exactly equivalent to our 'crime.' A crime was a failure to comply with 'the law' (Deut. 21). In the same way there was no one general term for 'punishment'; it might be denoted by מָאָס (mēās) and other words for 'recompense'; or by פָּרָא (parēa) and other words for 'sin,' 'guilt,' or 'malignity.' (punishment being regarded as an act of God, pāh, visit'). The crimes and punishments recognized by the Israelites may be classified thus (only the more common Heb. words are given).

1. CRIMES: 1. Religious offences: blasphemy (derivative of בֹּל, 'betray') or 'sin,' Lv 20:26-33; breaches of ritual, as to food (Lv 7), uncleanness (7), sacrifice and offerings (19 etc.); idolatry, or the worship of false gods (Dt 13); illegitimate assumption of the priestly or prophetical office (Nu 11).—2. Offences against the State: treason (1 K 21), 2 K 14; bribery and oppression (Ex 23:19).—3. Sexual offences: bestiality (Ex 22:21, Lv 18:22); prostitution (Lv 19:29); incest (Lv 18:22); sodomy (Lv 18:23).—4. Offences against property: adultery (derivative of תנש, nēsh, Ex 20:10); kidnapping (Ex 21:16); leaving pit uncovered, or otherwise causing damage through carelessness (Ex 21:18-19); theft (Ex 21:18); usury (Ex 22:25); seduction or rape of daughter (Dt 22:26);—5. Offences against the person: murder (Ex 20:13); injuries (Ex 21:18).—6. Offences against the family: cursing parents (Ex 21:17).

II. PUNISHMENTS: 1. Religious penalties. — Many ritual offences might be atoned for by sacrifices, seclusion, washings, and other rites: e.g. touching an unclean thing was atoned for by
CRIMES AND PUNISHMENTS (Hebrew) 281

sacrifice (Lv 5:13); eating flesh of an animal not properly killed was atoned for by washing one's clothes, and remaining unclean until the evening (Lv 17:9). Sacrifices seem to be required in connection with all sins which could be forgiven. A person in a state of uncleanness could not be present at the Temple services, or partake of the Passover.

Excommunication was practised in later Judaism, but it is doubtful how far it had any equivalent in ancient Israel. The Priestly Code regards the penalty of 'cutting off from the people' for numerous offences, mostly against the ritual laws, but sometimes for gross forms of immorality. It is evident, from the comparison of parallel passages, that in some cases two offences punished in one chapter by 'cutting off' are punished in another by 'death' (cf. Dt 21:21). In other cases, some offences punished by 'cutting off' seem to us trivial, e.g., omitting, without valid excuse, to observe the Passover (Nu 5:9), but such matters might not seem trivial to the Israelites. It is practically certain that death was never regularly inflicted for the various offences which were to be punished by 'cutting off.'

The difficulty is explained by the history of the Priestly Code; it was compiled by babylonian Jews; its authors had no experience in inflicting death penalties, and no immediate prospect of such experience. They indulged in a theoretical severity, untempered by practical necessities; they used the term 'cutting off,' because it would also serve to describe the excommunication from social fellowship and religious privilege—a penalty within the power of the exiles in Babylon.

Heathen nations stubbornly fighting against Israel were to be subjected to the ban (Lv 26, šerem), i.e., to be massacred in battle, and the land leading to the sea (cf. Dt 7). The leading instance is Jericho (Jos 6:18). In later Judaism, excommunication of varying degrees of severity was inflicted for religious offences; and the ancient name šerem was used for the severest form.

Some laws and historical records show that God Himself was held to inflict punishment on certain occasions by direct intervention—Divine visitation. Thus (Lv 10:6) Nadab and Abihu are struck dead by Jehovah for offering the wrong sort of incense; and the adulteress who has denied her guilt and submitted herself to the trial by ordeal by drinking 'the bitter water' (cf. Nu 5:11). This was done by God with disease—'her belly shall swell, and her thigh shall rot' (Nu 5:7). No instance is recorded.

2. Secular penalties.—(a) Death. This penalty is prescribed without specifying how it is to be inflicted. In many instances the culprit was slain with sword, spear, or dagger, according to the convenience or choice of the executioner (e.g. Elijah and the prophets of Baal, I K 18). There is no lack of clear indications in OT, though the head was often severed from a dead body (e.g. Golith, I S 17:50). In the NT, John the Baptist (Mk 6:26) was beheaded, and James (Ac 12:2) 'slain with the sword.' Hanging is referred to in I Kg 21:25, but in this instance the culprit was publicly exposed after execution (cf. Gn 40:19, Pharaoh's chief baker; Jos 8, the king of Ai). Stoning seems to have been the most usual mode of capital punishment, and burning to death was inflicted for some offences (see below).

The Bible and the Apocrypha refer to other forms of execution practised by heathen nations. Thus 2 Mac, in describing the Syrian persecution, mentions throwing down from the wall of a city (6:5), and being delivered by order of the king (v. 80), and torturing to death with fire (76). Crucifixion, a common Roman punishment, was used in the case of our Lord; and He 11:38 speaks of martyrs being slain as lions (Dn 6). The severity of the death penalty was sometimes enhanced by refusing to allow the relatives of the culprit to bury the corpse (2 S 2:20).

The following is a list of the crimes for which death was to be inflicted; the mode of execution is given in square brackets; where nothing is stated on this point, we have no information:

Various forms of homicide: murder (Ex 21:15, 21); child-stoning (Lv 24:17); execution by burning, and the average blood caught the slayer outside the city of refuge (Nu 35:7). keeping an ox known to be dangerous, if the ox killed a person (Ex 21:29).

Bearing false witness on a capital charge (Dt 19:12).

Insult or injury to parents (Lv 20:9, Ex 21:17, Dt 21:15) [stoning].

Various forms of sexual immorality: incest (Lv 20:14) (burning); unhappiness (Lv 22:20-24) (stoning); adultery or unnatural vices (Lv 20:13) (burning); fornication on the part of a betrothed woman (Dt 22:22) (stoning), Gn 38:24 (burning).

Various religious and ritual offences: witchcraft, magic, etc. (Ex 22:19, 20, 30) (stoning); idolatry (Ex 22:18, Dn 13:19) (stoning); fornication with the priestess of a heathen god (Ex 22:20) (stoning); intrusion of alien into sacred place or office (Nu 15:25, 30) (stoning). Sabbath-breaking (Ex 21:14).

According to Lv 27:25, human beings may be made heretick (Heb. ἁρμονία) and killed to Jehovah; and, if so devoted, must be put to death. Probably only criminals or heathen enemies (cf. above) were subject to such treatment.

(b) Matutilation is involved in the principle 'an eye for an eye,' etc. (Ex 21:21). No instance is mentioned of the application of this law, but we may compare the cutting off of the thumbs and great toes of Adonibezek (Jg 19:7). Matutilation is mentioned in 2 Mac 7, and blinding in the cases of Samson (Jg 16:21) and Zedekiah (2 K 25:7).

(c) Flogging, limited to a maximum of forty stripes (Dt 25:3), was inflicted on a betrothed slave—girl guilty of fornication, and on her partner in the offence (Lv 18:20), and for other minor offences. The penalties in Lev. are generally inapplicable to the punishment, especially for children; and in the NT it is spoken of as used in the synagogues for religious offences (2 Co 11:23). The actual practice in ancient Israel was much more severe than the prescription of the Deuteronomic and Priestly laws. Ex 21:22 deals with cases in which a master flogs a male or female slave to death, and decides that he is not to be punished unless the victim actually dies under his hand (cf. Jg 9, 1 K 12). The Roman system, as described in Josephus, and the various forms of flogging amongst heathen peoples, were much more severe than the Jewish 'forty stripes save one.'

(d) Exposure of the person. The figurative description of the punishment of Jerusalem in Ezk 18 may imply that this punishment was inflicted on adulteresses in Israel; but, as these chapters were written in Babylon, the imagery may have been suggested by heathen practices.

(e) Stocks (e.g. Jer 37:20, manacleth); Ac 16:36, ἔθηκαν.

(f) Slavery, for theft (Ex 22:22), or as a result of debt (2 K 4, Neh 3).

(g) Imprisonment was not appointed in the Law as a punishment. It was used for the detention of offenders before trial, or pending execution, as well as in cases where it was desired to keep a dangerous or obnoxious person under restraint, or to secure the persons of slaves and captives. There is no evidence that terms of imprisonment were appointed expressly as a punishment, except in Ezr 7:24.

(h) Exile was not appointed in the Law; the fugitive from justice might exile himself (Abatlon, 2 S 13:39). Exile was mentioned as a penalty inflicted by the Persians (Ezr 7:3).

(i) Childlessness for immorality is probably a Divine visitation (Lv 20:20).

(j) Penalties in money and goods. — Compensation is required for theft, and in cases where person or property has been injured through carelessness or malice. In cases of mere carelessness an equivalent

1. The Hebrew בְּיִצְרָה (beyc'rah) means literally 'there shall be an examination' (RV 'they shall be punished'). The interpretation given in the text is commonly adopted; but it is probably correct to take the term 'examine' for 'torture.'

2. The Aram. שֹׁרִית (š̄̂ rdîth) or שֹׁרָית (š̄̂ rdîth), interpreted in this sense by RV, etc.
compensation was required (Ex 22:23) but, where there was moral guilt, the compensation was heavier, e.g., for theft the thief must restore fourfold, fivelok (Ex 22:6), or sevenfold (Pr 6:19). Compensation for the killing of a servant, of ox or oxen, is fixed at thirty shekels (Ex 21:29); for the seduction of a daughter at fifty shekels, the seducer to marry her (Dt 22:29); for a false accusation of unchastity against a newly married wife, one hundred shekels, to be paid to her father (Dt 22:19). In some cases fines might be accepted in place of capital punishment (cf. below, III. 5). See also Ex 19:19.

(b) Unspecified penalties.—Numerous acts are each punished without penalty being attached to the breach of the law; e.g., hybrids must not be bred (Lv 19:4).

III. Moral and religious significance.

1. Progress.—We may distinguish, on the one hand, the practice of the Israelite monarchy, and, on the other, the system of law embodied in the Deuteronomic and Priestly Codes. The practice of the monarchy is shown in the Book of the Covenant (Ex 20—25; Deu) and in the references in the narratives concerning the development from earlier times; changes may have come about as the Israelites passed from the nomad period to that of the Judges, and again to the monarchy; but our information is not sufficiently full to enable us to trace the development. Wherever the unanomalous data are meagre; our extant narratives were intended to edify later generations, and references to objectionable features in early practice have probably been largely omitted, especially when they corresponded with later developments that were regarded as representatives of true piety. Moreover, the Deuteronomic and Priestly Codes never had a fair trial as the working laws of an independent State; they always remained more or less religious ideals. Such theoretical codes may be both higher in some respects and lower in others than the actual practice of their own time. For instance, provisions that call for large sacrifices on the part of the powerful and wealthy in the interests of the poor are easy to prescribe on the quibble, but difficult to enforce in real life. On the other hand, the cruel penalties by which enthusiasts seek to promote and safeguard religion are mitigated in their practical application by considerations of human weakness and humanism; e.g., in the quasi-seclusion of his study, or whatever corresponded to a study in those days, might enjoin wholesale massacres without compunction; but he might have shrank from putting into force his own laws on matters of human life, men, and women.

At the same time, the available evidence makes it probable that, if Judah had continued an independent State, the development of its legal system would have been in the direction of humanity and righteousness under the influence of the prophets of the school of Isaiah, Jeremiah, and Ezekiel, and of the priests who shared their views. For instance, according to ancient law, if a man were guilty of a heinous offence, his family might share his punishment (e.g., Achan, Jos 7:24—25, and the kinsfolk of Saul, 2 S 21:9). But Dt 24:6 forbids the practice. Again, marriage with a half-sister was regarded as lawful for Abraham (Gn 20:12 [E]) and for Amnon (2S 13:15 [E]); but Dt 22:29; cf. also Jos 7:25.) On the other hand, the later legislation shows a tendency to religious fanaticism, and towards the subordination of public welfare to the material interests of the priesthood; and probably this tendency would not have been so far defeated if Judah had remained an independent State.

The final redactors of the Torah combined the various earlier and later codes, without attempting to reconcile or co-ordinate them; equal sanction was given to inconsistent laws; crude, primitive customs were placed on the same level as the more humane enactments of later times. Obviously this happened because these Babylonian Jews were preparing a record, and not providing for practical needs.

2. Classification.—There is no formal classification, but certain principles are implied. The inclusion of secular laws in the Torah indicates that all crime was regarded as sin against God, and that the administration of justice rested on Divine authority. This is an axiom of all religions as to the ideal State; but it was more emphasized in ancient times than it is now, because religion and the State were not (literally) as one, but the religious law, recently codified, for instance, receives his laws from the sun-god, Shamash. Ezk 22:30 is a striking illustration of the way in which the actual legal system of Israel was regarded as a Divine institution; even iniquitous laws are imposed by God as a punishment: "Moreover also I gave them statutes that were not good, and judgments wherein they should not live." On the other hand, the protests of the pre-exilic prophets against the corruptions of their times involve the distinction between secular and Divine law; the two might clash.

The modern recognition of purely religious offences, with which the State does not deal, is not found in the OT. As in medieval Christendom, there were prohibitions of such offences that were regarded as religious; the idolater was to be put to death. Again, the Law does not clearly distinguish between human punishment and Divine visitation; the penalties of similar offences may include both; e.g., in Lv 20:1—3 and others where sexual immorality are to be punished with death; in other cases it is said that the culprits will die childless. The prominence given to Divine visitation suggests a distinction between crimes which can be detected and punished by men and those hidden from men, but known to God, and dealt with directly by Him. The imposition of a fine for such offences as homicide and seduction (Jl 2: 19) shows that these were regarded partly as offences against personal piety.

There is a distinction drawn between wrongs done to a free Israelite, to a slave, and to foreigners respectively; e.g., the slaying of a free man is severely punished, but a slave may be beaten to death provided he does not strike the rod (Ex 21:29); if an ox known to be dangerous kills a free man, the owner may be put to death (Ex 21:29); but, if the victim is a slave, thirty shekels are paid to his master (v. 30). The stranger within thy gates (the g'rr, or resident alien) enjoyed the protection of the law, and alliances were maintained with some neighbouring States; otherwise history suggests that might was mostly right along the border; cf. David's doings in the Negeb (1 S 27:5), the Danite conquest of Laish (Jg 18), and the exploits of Samson (Jg 14). 3. Range of offences.—The list of omissions and commissions recognized as crimes indicates a high moral standard. The wrongfulness of ritual irregularities is, indeed, exaggerated by treating them as sins and crimes. On the other hand, the Pentateuch strives to promote moral righteousness in many matters which modern law does not venture to deal with; e.g., Dt 24:12 enjoins the prompt payment of wages, and Lv 19:10 forbids lying. But the difference is only apparent: the Pentateuch combines moral admonition with legislation, and draws no hard and fast line between the two. Again, the comparatively low stage of social development on the one hand excuses many acts as the toleration of polygamy and slavery, and the absence of any full recognition of international morality.

4. Subjects of punishment.—In some cases
animals were put to death; e.g. an ox that had gored a man or woman was to be stoned, and its flesh might not be eaten (Ex 21:28, cf. Lv 20:2). Animals, goods which could be burnt might be destroyed in the karem, or ban (Jos 7:21).

In earlier times the family might be put to death for a crime committed by its head (cf. III. 1), but the practice is forbidden, as already noted in De 21:19.

It is nothing to show at what age young persons became legally responsible for their actions. The census in Nu 1 included all males from twenty years old; and the age at which Levites began their service was thirty, and the twenty-fifth (Nu 8:24), or thirty (40), although responsibility must have begun earlier. Nothing is said as to exemption from punishment on account of mental weakness.

Naturally the legal codes did not recognize the principle that the powerful and wealthy might commit crimes with impunity; but they often enjoyed much licence in practice, as is shown by the narratives of Micah and the Danites; of David and Uriah; Amnon, and Tamar; and the frequent protests of the prophets.

5. Humanity: adjustment of severity of punishment to heinousness of crime.—The legal codes were evidently anxious that the punishment should be just, and be proportioned to the offence, hence the obvious principle of equal retaliation, found in the codes of many peoples, of an 'eye for an eye, and a tooth for a tooth,' and the laws providing for compensation for injury to property or person.

The list of capital offences [II. 2. (d)] is a little long, and includes some which, according to modern ideas, do not permit so severe a punishment, e.g. insult to parents, Sabbath-breaking, etc. But, as we have said, it is doubtful whether death was ever regularly inflicted for ritual offences; and, at any rate, the laws are due to an exaggerated sense of the wickedness of such acts rather than to reckless severity. The use of barbarous punishments—burning alive, mutilation, and flogging— is strictly limited; and there is no trace, either in the Law or in the history, of the torturing of witnesses or accused persons in order to obtain evidence.

The principle of blood-money is recognized only to a very limited extent; Ex 21:29 provides that, if there were not dangerous kill any one, the owner shall be put to death, but that 'if there be laid upon him a ransom, then shall he give for the redemption of his life whatsoever is laid upon him,'—in the case of a slave thirty shekels of silver to the slave's owner, or any one killing his slave to death, without the slave actually dying under the rod, is sufficiently punished by the loss of his slave (Ex 21:24); and in the case of injury to slaves the lex talionis is not to be enforced, any mutilation of slaves being atoned for by enanipation (Ex 21:26). So, too, Ex 21:18-19 permits compensation for bodily injury to a free man. On the other hand, Nu 35:23 (1) prohibits the acceptance of blood-money for intentional murder, or, even the release of a man who has committed unintentional homicide from the obligation of remaining in a city of refuge till the death of the high priest.

6. Connexion with methods of administration of justice in other systems.—Israel was always part of the international system which comprised Western Asia and Egypt; and there was a constant action and reaction between the various members of this system. At the outset, Israel was a group of nomad tribes, and the original basis of its Law was the tribal custom of the Bedawin. The position of the qe'dil, the next-of-kin, the avenger of blood, goes back to this source. The settlement in Canaan must have led to the adoption of many Canaanite laws. Now, Canaan and all Western Asia were, from a very early period, dominated by Babylonia; the conquests of Sargon I of Akkad (c. 2700 B.C.) extended to the Mediterranean, so that the institutions of Canaan were partly shaped by Babylonian influence. But, again, both the Canaanites and the Babylonians probably sprang originally from Arabia; so that Israel, Canaan, and Babylonia all drew from Aratian and stock of tribal customs; and it is very difficult to determine whether a law is a purely Israelite survival from this common stock, or has been derived through Canaan or Babylon. Moreover, during long periods the Egyptian laws exercised a certain influence over Syria; and Egypt had its share in moulding the life of Canaan (cf. the Amarna tablets, c. 1400 B.C.). Something, too, may perhaps be due to the 'bondage' in Egypt; but not much, for the Israelite tribes for the most part lived a nomad life in the border provinces.

The recently discovered Code of Hammurabi (king of Babylon, c. 2100 B.C.) shows how much the Israelite institutions had in common with those of Babylon. There are numerous parallels between this Code and the Pentateuch, especially the ancient Book of the Covenant, Ex 20—23. Both, for instance, lay down the principle of 'an eye for an eye,' etc.; both prescribe punishment of death for killing a priest; and both direct that if a man is in charge of some one else's cattle he may clear himself by an oath and need not make compensation. As the Code of Hammurabi was certainly known in Babylonia and other parts of the Empire, the Israelite legislation may have been influenced by it at any time; but the parallels may be largely due to common dependence on the primitive tradition of Arabia.

In comparing the ethical and religious value of Israelite justice with that of other nations, we have to distinguish the practice of the monarch and earlier times, as depicted in the history and Ex 20—23, from the ideal set forth in Deuteronomy and the Priestly Laws. It has been seen that our knowledge of the early practice is fragmentary. It is possible, too, that the redactors of the literature suppressed evidence that was discreditable to Israel, though it is not likely that this has been done to any great extent. But, as far as our information goes, it does not appear that the administration of justice in ancient Israel differed conspicuously from that of neighbouring Semitic nations in the same period, as illustrated, for instance, by the Code of Hammurabi. In matters Israel would compare favourably with Greece, or Rome, or China, or most Christian nations before the close of the 18th cent. A.D.

The Deuteronomistic and Priestly ideal aims at a level of social righteousness which has never been attained in practice, and ranks with the Utopias of modern social reformers. The Priestly legislation is, indeed, disfigured by an undue care for the material interests of the sacerdotal caste; but neither the practice nor the theory of the religious law of Israel includes anything like the Inquisition and similar systems instituted by the Christian Church.

'Law and Justice,' in EEE, and 'Gericht und Recht bei den Hebräern,' in JEB (by Benzing); the relevant sections of the OT Archäologen of Ewald, Benzing, and Nowack; and the standard commentaries on the Pentateuch and other Biblical passages. For the Code of Hammurabi, see the art. on the Code of Hammurabi, by M. S. and A. I. Cook, The Laws of Moses and the Code of Hammurabi, London, 1905.

W. H. BENNETT.

CRIMES AND PUNISHMENTS (Hindu).—I. Most of the terms designating 'crime' or 'offence' in Sanskrit are essentially religious in their nature, and no strict line between sins and punishable offences has ever been drawn. The Dharmasāstras (law-books) contain long lists of the
various degrees of crime or guilt—from mortal sins, such as sexual intercourse with one's mother, daughter, or daughter-in-law, down to crimes merely rendering the perpetrator unworthy to receive alms, such as receiving gifts from a despicable person, subsisting by money-lending, telling lies, and committing bodily injury or causing death, such as killing birds, amphibious and aquatic animals, worms or insects, and eating nuts, or the like. Analogous lists of sins may be found in the ancient religious literature of the Buddhists of India. These sins recur in the accounts of the offences mentioned in the secular laws of the Brahmins. Thus the killing of a cow, the sacred animal of the Hindus, is a punishable offence as well as a crime. The commission of a heavy sexual offence is to be visited on the patient by the king, and at the same time the stain caused by such sin is to be removed by religious atonement. Killing a Brahman, or depriving him of his gold, is a crime deserving capital punishment of an aggravated form, doubt because the religious law affords special protection to the sacred person of a Brahman. Many eccentricities of the criminal law are due to the religious elements entering largely into them. There is a righteous ascetic, who, according to the Vedas comes out in the following rules: a Súdra listening intentionally to a recitation of the Vedas shall have his ears filled with molten tin or lead; if he recites Vedic texts, his tongue shall be cut out; if he remembers them, his body shall be split in twain. The sanctity with which Brahmins are invested has led to establishing the principle that no corporal punishment shall ever be resorted to in the case of a criminal of the Brahman caste. Nor could the punishment of a Brahman be connected with the confiscation of his property, the ordinary consequence of punishment. The Súdras, on the other hand, were treated very badly, because they were considered to have no share in the religious forms, and hence, his guilt is to be visited on the patient by the king, and at the same time the stain caused by such sin is to be removed by religious atonement. Thus a Brahman who abuses a Súdra is convicted of an unholy act; Brahmins are, therefore, forbidden to practise usury. Certain kinds of interest on loans are expressly forbidden. The answer to these and other questions, as detailed in the Vedas must be sought in the Brahmánical law-savours of Oriental despotism, as, e.g., when the forgery of a royal document is visited with capital punishment. The caste system becomes visible in the gradation of crimes and punishments according to the caste of the offender, as will be shown below.

2. 'Punishment' (danda) in the Code of Mann (vii. 14 ff.) is personified as a god with a black face and red eyes, created by the Lord of the World as his lieutenant in the enforcement of his will, in order to assist in the punishment of the wicked, and to reward the good. It is, thus, the punishment of the crimes which are comparable to the gods Varuna, who binds sinners with ropes. If a king does not strike a thief who approaches him, holding a club in his hand and proclaiming his deed, the guilt falls on the king; the thief, whether he be slain or pardoned, is purified of his guilt. The king should first punish by admonition, afterwards by reproof, thirdly by a fine, after that by corporal chastisement (Mann, viii. 129). As a matter of fact, fines are by far the most common kind of punishment in the criminal code of the Sanskrit law-books, and they were equally common, shortly before the times of British rule, in the Hindu kingdoms of Rajputana (Todi), Mysore (Dubois), and others. The fines might extend to confiscation of the entire property of a criminal; but in such cases, according to Narada (xviii. 10 f.), the tools of workmen, the weapons of soldiers, and other necessary implements are to be exempt from confiscation. Capital punishment, in various kinds of aggravations, is inflicted by the high priests, who may be brought to death by the king, and in the case of a most heinous crime, such as an insult to the religious law, by trampling to death by an elephant, burning, roasting, cutting to pieces, devouring by dogs, and mutilations, are also frequently inflicted, even for comparatively light offences. The jix tulonis, tax on infidels, for the purchase of their slaves, becomes especially conspicuous in the punishments. Thus a criminal is condemned to lose whatever limb he has used in insulting or attacking another. The thievish fingers of a cut- woman, and the evil tongue of a lewd mother, to be cut off. A Súdra using insulting language is to have a red-hot iron thrust into his mouth, or boiling oil dropped into his mouth and ears. The breaker of a dille shall be drowned. The killer of a Brahman shall be branded with the image of a headless corpse, a drunkard with the flag of a distillery shop. Banishment, public disgrace, imprisonment, letters, forced labour, beating, and other forms of chastisement are also mentioned. Brahmins, however, are not to be subject to corporal punishment. Nor is this the only privilege enjoyed by Brahmins, who are allowed special indulgences in almost every case, the reduction of punishment in consideration of the rank of the person being one of the most salient features of the Hindu crimes, inculcations, and their punishment. Thus a Kástriya insulting a Brahman must be fined 100 peanas; a Vaiśya doing the same, 150 or 200 peanas; a Súdra doing the same must receive corporal punishment. On the other hand, a Brahman shall pay only 50 peanas for insulting a Kástriya, 25 peanas for insulting a Vaiśya, and nothing at all for insulting a Súdra. A similar gradation of fines may be observed in the punishment of adultery and many other crimes. If a man insults a Brahman, the loss of his forbidden food, he shall be amerced in a heavy fine; and, if he gives him spirituous liquor to drink, he shall be put to death. Another characteristic feature of the Indian penal code is the inclusion of works as punishments for violations of the religious law, as, e.g., when an apostate from religious mendicity is doomed to become the king's slave. King Asoka, as early as the 3rd cent. B.C., appointed censors who were charged to enforce the strict observance of animal life, and the observance of filial piety. King Harsha, in the 7th cent. A.D., inflicted capital punishment on all who ventured to slay any living creature. King Kumārapala of Gajarat, in the 12th cent., is said to have confiscated the entire property of a merchant who had committed the atrocious crime of cracking a loose. A Hindu Rajá of Kolhapur, in
CRIMES AND PUNISHMENTS (Japanese).

—Long before the dawn of Japanese history, Chinese travellers to Japan brought back accounts of that country which contain our earliest information on the subject, dating from the later Han dynasty (A.D. 25-220). One of these notices says: 'There is no theft, and litigation is unfrequent. The wives and children of those who break the laws are consigned [sold as slaves], and for grave crimes the offender's family is extirpated.' Another account says: 'The laws and punishments are strict. There is not much to be learned about crimes and punishments from the mixture of myth, legend, and chronicle which takes the place of history in Japan for a thousand years previous to the 7th cent. A.D., though we hear of a staff or gill of executioners, and of capital punishment by decapitation; and a punishment by fire had its origin at this time, but it was only for such offences—comparatively few in number—as involved ritual uncleanness according to Shinto. An ordinance, enacted in 801, regularized what was, no doubt, an old practice, by which neglect in connexion with the omohime, or coronation ceremony, the eating the rice, and wearing concave clothing in any way with capital sentences, or touching anything impure during the month of special avoidance of impurity, subjected the culprit to an okoharashi ('greater purification'), i.e. he was obliged to provide for the coronation ceremonies of his own purification. This eventually became simply a fine. Other ritual offences which required punishment were incest, wounds given or received, bestiality, and leprosy. Homicide had to be atoned for in the same way, but the ritual character of the offence appears from the circumstance that even justifiable homicide caused uncleanness.

Weipert thinks that in these fines for ceremonial pollution was the first source of Japanese criminal law (quoted by Florence in T.A.J. xxvii. 1899) 57; but, in the opinion of the present writer, this view hardly holds, as the conclusion Weipert's theory does not account for the grave of all punishments, that of death, nor does it apply to robbery, rebellion, adultery, arson, and other grave offences. Moreover, the abolution ceremony was seldom performed for individual offences. The Mikado twice a year celebrated a 'great purification' of the offences of the nation, and similar minor celebrations were usual before all the great ceremonies of Shinto. In such cases, of course, of course, abolution was out of question. There is abundant evidence that a criminal law existed from very ancient times which had nothing to do with the purification of ritual offences.

Eventually the fines for ceremonial offences fell into abeyance, owing to a strong current of Japanese influence which set in during the 6th and 7th cents., and led to the code of civil and criminal law known as the Taikōhō. It was based on the laws of the Tang dynasty of China, though modified somewhat in accordance with Japanese usages. The penalties prescribed were reduced, burglary was punished, executors paid for the death of the deceased, and a capital punishment known as shibōhō was introduced.

A.D. 1716, issued a rescript ordaining due punishment for all those who should be discovered to entertain heretical opinions in his kingdom. This union of Ch'ing and State was actually maintained under the rule of the Manâthá kings; but even in 1875, when Dr. Bühler visited Kârsî, he found the Manâthá eagerly intent on looking after the due performance of the pujiâchottos, or presentations for the good of the deceased, the commandments of the Smârti. The enforcement of these religious punishments otherwise rests with the caste, which levies fines for every breach of the caste rules, and, in serious cases, excommunicates the offender. (See EXPLIATION AND ATTORNEY [Hindu] and greater.)

J. JOLLY.
The result was that, in many cases, torture was freely applied. The commonest device was to bind a man with ropes in some constrained position, or to make him kneel upon a sharp edge of wooden board placed edge upwards, and then to pile weights on his knees. On the whole, the tortures employed judicially in Japan were not so cruel as those used in medieval Europe. A samurai was not sent to prison. If his offence was not grave enough to call for immediate suicide, exile, or decapitation, he was ordered to go into confinement in his own house. There were different degrees of this kind of imprisonment, the most severe of which involved a complete cessation of egress and ingress for himself and his family.

Siebold, writing early in the 19th century, gives a description of the penal code of Japan at that time, which was similar in all essential respects to the Taikōriō, introduced from China 1100 years before. He draws a broad distinction between the punishments of the samurai and those of the common people. In the latter case, the culprit might be simply cut down by the man of higher rank whom he might have insulted or injured, or if he had been caught in the act of committing a grave offence. Decapitation was more usual. Crucifixion, burning, and sawing off the head with a large scythe were the only cruel punishments. At no given community was there an expert spearman stood on each side, and the two drove their spears simultaneously so that they passed crosswise through the vital organs. Death was instantaneous. Burning was a matter of form. The culprit was tied to a stake, which was fastened between two posts, and the fire was lit. Sawing off the head was of rare occurrence, and was limited to such heinous crimes as chief or parent-murder. The name and offence of the criminal were usually inscribed on a board which was set up close to the place of execution. Sometimes the offender was mounted on a sory nag and led round the city, with a similar placard fastened to his breast. The head might be set on a post, and allowed to remain from five to ten days. Social standing was always helpful, and was sometimes linked to a subject on which the samurai might test their skill and the temper of their swords. In later times it might be handed over for dissection. Among minor punishments at this period were branding, the naka-takana, or partial crucifixion, in case of theft. For political offences by men of the samurai class, banishment to an island was the usual form of punishment; and there was an ancient instance of a Mikado being so punished. The term was commonly for life, though there was a minimum limit of five years. Aailer form was an injunction to live under supervision at a distance from the capital. Whilst his case was under trial, the accused was confined to his own house, with the same forms of punishment. But when the offence was committed unintentionally, a partial or complete confiscation of his property might be the consequence. Deprivation of office or incapacity for making office was not unusual. Occasionally the offender was allowed to become a monk of a certain order, known as konsō, who wore a basketball with a small grating in front, completely concealing his face. This was never removed, and practically he was a beggar who roamed the highways as a mendicant, and so to attract the attention of the charitably disposed.

Harakiri.—This well-known institution is of considerable antiquity. It is of purely Japanese origin, and consists in making a cruciform incision on the belly, whence its name, which means 'belly-cut.' The 'happy dispatch' of some writers is only a joke. Sometimes a determined man succeeded in ending his life in this way, or he might complete the act of suicide he had inflicted himself in the throat with the same instrument—a short sword or dagger with a blade nine inches in length. Harakiri might be simply a form of suicide, or it might be the duty of a man of the samurai class under various circumstances, such as hopeless family troubles, lack of loyalty to a dead superior, or as a protest against the wrongful conduct of a superior. For example, when the Japanese Government yielded to the demands of France, Russia, and other European powers, the procession of Liouhtung, forty military men emphasized their protest by committing suicide in the time-honoured fashion. A common motive was to free from punishment the family and relatives of the person involved, who would otherwise, under the old law, have shared his guilt. Very frequently, however, harakiri was no more than an honourable form of execution. It was carried out with great ceremony, the incision being only for form's sake, and the real execution consisting in decapitation by a friend. In 1869, a motion was brought forward in the Japanese Parliament in favour of the abolition of harakiri, and 200 members out of a house of 200 voted against this proposal. Harakiri was legalized by law, though it cannot be said to be extinct.

Vendetta.—A Japanese samurai was permitted by law to avenge the murder of a parent or chief; but, before exercising this right, he was bound to give notice of his intention to the authorities. Among the crimes for which he might cut down his enemy, to repeat some such formula as this: 'I am A. B. You are X. Y., who murdered my father at such a time in such a place. Therefore do I now slay you.' In justification of this law, an ancient proverb is often quoted to the effect that 'a man must not allow the same heaven to cover himself and his father's enemy.' It is now abrogated, but was in vogue up to the Restoration of 1868. A teacher of the present writer's view that the Japanese criminal law had its origin in the imposition of fines on offenders against the ancient law of the samurai, or of punishments by the wearing of the garrison. In the case of Muzzyi (History of Japan, Glasgow, 1906, ii. 114) notices this feature of the former Japanese law.

Extra-territoriality.—When the treaties were negotiated which opened Japan to foreign trade in 1859, the criminal jurisdiction, or part of it, was left to the individual states, and, in most cases, the latter were defendants in a civil case, or the accused under a criminal charge. When in 1868 the Mikado resumed the reins of authority, it was felt that such an arrangement was liable to the dignity of the Japanese nation, and in any case a radical reform was a palpable necessity of the situation in the interests of humanity and good government. A code was, therefore, drawn up and promulgated in 1872. It was simply a selection from the laws of the two Chinese dynasties—Ming and T'ang—modifications being introduced into the amount and nature of the punishments prescribed for different offences. Barbarous modes of execution were eliminated, the death-penalty was greatly circumscribed, merciful and excessive
whippings were abolished, and the punishment of imprisonment with corrective labour was introduced for the first time. A second code was notified in 1874, by which many more and more humane provisions were added. By these codes, an offender who has been sentenced to a term of penal servitude is placed in the penitentiary of the district in which he has been tried and sentenced, and work suited to his age, physical condition, and requirements is allotted to him, so that 'by toil and labour he may be gradually brought to repent of his past misdeeds and be restored to virtue.' The punishment of death was by hanging or decapitation, the latter form being recommended instead in the civil law for ordinary criminals; the prejudice entertained by most Japanese against any mutilation of the body. In certain cases, the pillory in iron stocks within the prison yard was substituted for imprisonment, and fines might be increased inadvertently implicated, aged people, infants, maimed or deformed persons, or females. But these codes still preserved an essentially Chinese character, and they condoned many prolix officials and the samurai class. A husband was permitted to kill the lover of his wife or concubine along with the woman herself, if caught in the act; but, if a certain time had elapsed, the punishment was penal servitude for one year, while under the other law the husband could, in this case, only recover a penalty of no great amount. If a woman who had been guilty of adultery or incest was, on the discovery of her guilt, driven by shame to suicide, the punishment of the male offender was increased one degree, even though he might have had no knowledge of the woman's intention to do so. Masters and parents were punished with much less leniency than their servants and children in the contrary case. Abusive language to an official entailed penal servitude for one year if the person insulted was of the highest rank; for ninety or sixty days if of lower grades. In Jan. 1879, the practice of using oaths to compel confession—rendered necessary by the old principle that confession must precede condemnation—was abolished, and it was enacted that the evidence of witnesses, documents, or circumstances, or the admittance of confessions procured by such means, could alone be taken as bases for determining guilt. It will be seen that, although these codes marked a considerable advance on the Tokugawa system, they still left much to be desired, when viewed from the point of view of modern civilization. New legislation was therefore initiated, after a thorough study of the various systems of European law, with the assistance mainly of French jurists. Distinguished service was rendered by G. Bousquet in framing the new codes, which, after arduous labour and repeated revision, came into operation from 1st Jan. 1882. They have an essentially French character. A further revision of the Code of Criminal Procedure was effected in 1890.

Punishments for persons accused of crimes committed in the island of Yedo, where they sometimes work in the mines. A person who has suffered further injury by crimes is given his complaint, or, if the prosecutor of any court having jurisdiction over the crime in question, Policemen can arrest an offender whose crime was committed in the precincts of the constituted and actual averes have been actually committed. In all other cases they can arrest by warrant only. Each constable is the direction of the judge. Accused persons are often kept in prison for a considerable time before trial, and no lawyer is allowed to be present at the preliminary examination. The conducting of criminal cases, from the very beginning down to the execution of the criminal, he is left to suffer death, rests with the discretion of the procurator, who often in his own person the functions of public prosecutor and grand jury.'

The reforms of 1882 extended to the judiciary, which was now separated from the executive, judges, proclaiming the abrogation of servitude, and a new system of police, as well as law-schools, were established. Under the new regime there are far fewer capital punishments. In Tokugawa times the number of persons convicted to jail in Yedo, about 7000 annually, and of these over 3000 were executed. At present the yearly numbers of capital punishments for the whole Empire averages above eighty.

It is claimed that, on the whole, the new legislation has resulted in a body of law in unison with the most advanced principles and the most approved procedure of Western jurisprudence—all punishments not recognized as consonant with modern ideas of human civilization have been abolished or made for adapting penalties to degrees of crime (the previous legislation left the judge too little discretion), the rights of suspects and criminals being guarded, and the privilege of appeal guaranteed. This contention is substantiated, though traces of old usage remain. All men are not equal before the law, the military retaining some special privileges. Robbery with violence is still punishable with death, and a man does not render himself liable to banishment or to be sold. Consequently the service of his servant, unless death ensues. The preliminary examination of prisoners is secret, the assistance of counsel not being allowed. This last feature will soon be modified. Trial by jury is unknown. In 1890, after protracted negotiations, treaties were concluded with foreign Powers, by which the extra-territorial jurisdiction was abolished, and all foreigners became subject to Japanese law.

Prisons.—Under the old régime, imprisonment was not one of the recognized punishments. It was not until 1868, though it was necessary to provide some places of detention for prisoners who were awaiting their trials, sometimes for long periods. The inmates suffered very great hardship. The cells were overcrowded, the wooden cages of French specification, the arrangements for sanitation, food, and clothing were of the most wretched kind. The internal discipline was entrusted to the elderly prisoners—generally hardened criminals—with results which may be imagined. Soon after the restoration of the Mikado's authority in 1868, a commission was sent to visit a number of foreign prisons and make a report, and ultimately a complete change was effected. Sir Henry Norman, who recently visited the convict prison of Yokohama (Ashby, 'Treaty,' 1882):

'The dormitories are enormous cages formed of bars as thick as one's arm. There is not a particle of furniture. Thick quilts, or futon (the Japanese bed), are provided for sleeping. The jury holds 90 persons. The sanitary arrangements could not possibly be improved. No vermin could harbour anywhere. It was almost an ideal prison structure. The punishment cells were hardly ever occupied. There was no freezing. Two hundred prisoners were employed making machinery and steam boilers, working nine hours a day. Wood-carving, pottery-making, and paper- and chinoiserie-making are also among their occupations. Only a few are so clueless that stupid as to be employed in pounding rice or breaking stones.'

CRIMES AND PUNISHMENTS (Jewish)

The transition from the Biblical to the Mishnaic period is marked by external and internal limitations in the functions of the Jewish tribunals. Externally, the Jewish courts of justice lost the power of inflicting capital and other punishments,—a power exercised by the Roman procurators and officials,—and in the course of time the limits to the jurisdiction of the Beth Din were still further narrowed. Internally, we note a growing tendency towards the restriction of certain forms of punishment, by making it a matter of difficulty to secure a conviction. In practice, capital punishment was obsolete long before the fall of the Jewish State, and, in all probability, long before the courts were deprived of the legal power of inflicting it. This is shown by such passages as Jn 18, and the Talmud. Thus, in Jerus. Sanh. 184 (p. 228 of M. Schwab's tr., Paris, 1888) it is stated that this right was suspended some forty years before the fall of the Temple, i.e., 38): that the right of capital punishment in questions involving financial matters had been already abolished in the time of R. Simon b. Shetah, that is to say, during the reign of Alexander Jannaeus (67 B.C.E.). Bab. Sanh. 40 brings out this fact even more emphatically. Nor may the trial and crucifixion of Jesus be cited as an instance to the contrary. It is now the generally accepted opinion, among both Jewish and Christian scholars, that the trial of Jesus was conducted in accordance with Jewish law, and that His execution was an act in which Pharisaic Judaism had neither initiative nor share.

Thus Robertson Smith (Ebr. xxii, 512, at end of art. "Synedrion") writes: "The meeting in the palace of the high priest, which condemned our Lord was exceptional. The proceedings also on this occasion were highly irregular, if measured by the rules of procedure which, according to Jewish tradition, were laid down to secure order and a fair trial for the accused." So also Miettien (Synoptic Gospels, i, London, 1894, 147): "Yet the trial of Jesus—if it can be called so—violates that (rabbinic) law in almost every particular. . . . It does not observe the trial of the accused in the law of the Jews, it violates Jewish law in many important points, that therefore the account given of it cannot be true. There have been illegal trials at all times, and the Jewish royal families have been wont to get rid of or subjugate their enemys . . . That there was any meeting of the full Sanhedrin is most doubtful; definite also is the part played by the "merchants" and "wise men;" but that the Sadducean priesthood was at the bottom of the arrest and of the "trial" . . . cannot reasonably be doubted.

In the passage from the Jerus. Talmud mentioned above, R. Simon b. Yokai, a tanna of the 2nd cent., expresses his gratitude for escaping the responsibility of condemning a human being to death. Other passages, as the Eliezer, offer a parallel character, in the Talmud and Rabbinic writings point to the same conclusion—that the Romans took away from the Beth Din the right to inflict capital punishment.

In addition to these restrictions imposed from without, the sentences which, as a matter of fact, were pronounced by the Jewish tribunals were mitigated by various internal and voluntary limitations. It may perhaps be that, in proportion to the severity with which Rome exercised the power removed from the local courts, these felt themselves constrained to act in such a way that they would not offend the gentiles, or fail to secure leniency in other directions. But this tendency to leniency was originally spontaneous, however much it may have developed afterwards in consequence of external circumstances; it began while the Sanhedrin still held the power of life and death. A sentence cannot be given; it is difficult to tell whether and when punishments enacted in the Pentateuchal legislation were carried out in all literalness, and to what extent and with what frequency. Does that legislation represent primitive practice, or did the mitigating force of the Mishnian recensions of these laws at all times modify their execution? The orthodox Jewish belief, which regards the Bible as the "ideal," and all the contemporary interpretations of the Written Law and of equal force, would take the latter view, namely, that the traditions embodied in the Mishna accompanied the practice of all Mosaic enactments. It is, however, held by many that the Mosaic law was new and original; that in early Mishnaic times it was felt that the Pentateuch demanded the death sentence too readily, and that the Rabbis took steps to prevent such sentences from being carried out. This subject need not be discussed here; it is sufficient to show that the death penalty was almost abandoned, without entering into the question of whether this was brought about by new prescriptive or not.

The infliction of death was surrounded by many preliminaries and obstacles. The law demanded not only the presence of two satisfactory eye-witnesses, whose testimony must support vigorous scrutiny (see Mish. Sanh. iv. v., ed. Strack, from which all the passages are taken), but that the person committing the crime, the accused must have received formal warning from the bystanders as to the consequences of his act (377a, b. v. 1; Bab. Sanh. 30b; Tos. Sanh. xxi. 4, ed. Zuckermandel, Passow, note, p. 451). The stringency in examining and in challenging witnesses, the necessity of proving haṭaraḥa, the elaborate and minute questions to which all these, by the Talmud, were subjected, are all tend to show that the infliction of capital punishment must have been practically impossible; and this seems to have been the precise aim which the Rabbis had in view. Makkoth 2a records the story of a Sanhedrin which condemned a prisoner to death once in seven years earned the reputation of destructive (טפוקות): according to R. Eliezer b. Azarya, once in seventy years sufficed; while R. Tryphon and R. Aqiba state that, had they been present, they would always have succeeded in advancing some plea to invalidate the proceedings in favour of the prisoner. Nor was this tendency limited to cases of capital punishment alone; it was extended to other branches of the law, e.g., to the talmudic laws.

The eighth chapter of the Bab. Qamma shows quite clearly that even in early days this command could not have been intended to receive literal interpretation, for a man who had lost his eye could receive no compensation through a similar injury being done to his assailant. Compensation could consist only in the worth of the eye being restored to the loser, and this was estimated by assessing the value of the injured party, it stood as a slave, before and after the accident, the difference representing the amount of the damages (incidentally, cf. Rash. on Ex 21b).

Even when a capital sentence had been pronounced and was about to be carried into execution, every chance of proving his innocence at the eleventh hour was left to the accused. The court remained sitting all day in order to receive appeals, and an elaborate system of signals was devised to stay the execution in the event of any unexpected piece of evidence coming to light (Mish. Sanh. 41a, v. 1). Punishment was to be so arranged as to prevent the repetition of the offence by other parties, in other words, to act as a deterrent, and to secure the extinction of the crime itself and of its consequences ("Then shall put to the wrong from thy midst;" and all Israel shall hear and shall sin no more."). Care had to be taken that no additional suffering or humiliation was incurred...
by the guilty party. Any distinction to the body resulting from the punishment was to be avoided, insofar as was not provided upon the sentence. In executions and in flagellations, particular caution had to be exercised in this respect.

Capital punishment as ordered by the Tēth Din consists of lapidation (53), burning (15), decapitation (15), or strangling (22) (see Mishn. Sanh. vii. 1; and Singer's Prayer Book, London, 1900, p. 262). Crucifixion, as a means of death, was a Roman form. The last two methods are not mentioned in the Pentateuch, where, in fact, stoning is most usual. There seems no reason to doubt that 'ṣqdā and 'ṣṛḏā in the Pentateuch mean what is commonly known as stoning and burning; but the provisions of the Mekh. are still more external in the manner of the execution. In the case of burning (Mishn. Sanh. vii. 2), the criminal was firmly fixed in pitch, up to his knees. A strong cloth, covered with a soft wrapping, was twisted round his neck, and its two ends were not mentioned in the Pentateuch, that the ends of the cloth were pulled so hard that they caused death.

The object of these modifications was, in the first place, to mitigate the horrors of death. On this account a cup of drugged wine and incense (15) was given to the criminal in order to produce insensibility (e.g. Bab. Sanh. 43a, Mek 15a, and other references). The second motive was to avoid desecrating the body beyond the necessities of the death penalty. The pursuit of both these great internal restrictions of the functions of the Jewish tribunal.

The various crimes for which the penalty was death are enumerated in Mishn. Sanh. vii.-x. Lapidation is the punishment for eighteen offences—including being hard of heart, idolatry, the giving of one's children to Moloch, necromancy, sorcery, Sabbath-breaking, the cursing of parents, criminal intercourse with a betrothed virgin, the inviting of others to idolatry, thepersuading of others to idolatry, keeping magic, and for the stubborn and rebellious son. Burning was reserved for a priest's daughter who violated her chastity, and for nine forms of incest—only, however, when committed during the lifetime of the legal wife. The punishment of an apostate city (Dt 13) was beheaded, and the following were strangled: one who beat a parent (cf. Zergil, Ziv. vi. 609), one who kidnapped a Jew's slave, a sabbath-breaker, his superior authorities, a false prophet, one who proscribed in the name of false gods, the adulterer, and one who bore false witness against a priest's daughter.

The number of crimes for which stripes could be inflicted was very large (Makkoth, iii. etc.). This penalty could, with certain restrictions, be imposed by the judges at their discretion, unless the Scripture demanded a specific punishment for some particular sin. In no case could the stripes exceed thirty-nine, and, whenever possible, fewer were given. The presence of the judges was obligatory. (For full details, see Mishn. Sanh. xiv. = Makkoth, iii.; also Abrahams, Jewish Life.) The Mishna (Sanh. 7:2) enumerates a great number of offences punishable by flagellation. Maimonides, in the Yad ha-Hazaziq, gives a far longer and more comprehensive catalogue. A culprit who received stripes was ipso facto freed from excision (15), and recovered all those rights from which his crime might have debarred him (Mishn. Sanh. xiv. 15).

The principle of making the punishment as lenient as possible, sederer in re, operated also in respect of those sins the punishment of which was reserved for the future life. The famous tenth chapter of Sanhedrin gives a list of those who have no share in the world to come, but every endeavour is made to make the list short. The principle is that all Israel are entitled to a share (15, 27:5; 1:27), unless they forfeit it.

He who says that the doctrine of the resurrection is not contained in the Pentateuch (according to other readings, 'he who denies the doctrine of resurrection'); he who denies the inspiration of Scripture; the Epicurean; according to R. Aqiba, he who reads external (i.e. uncritical) books; he who utters enchantment over the ground; ... — viz. those who pronounced the Targumim—but in all these cases reference should be made to the commentary of Maimonides (ed. Heilzer). Seven persons—three kings (Jebusah, Abah, and Mamaseh) and four private individuals (Baham, Beeg, Althokpel, and Gehaz)—are deprived of their future life, but in each case the Rabbis sought for extenuating circumstances in order to find a
CRIMES AND PUNISHMENTS (Muhammadan)

... were theoretical (see Strack's introduction to his edition of Mishn. Sanhedrin-Makkoth, p. 5); consequently we have there recorded the practice of an earlier period. In the Middle Ages there was a great revival of Jewish jurisprudence (see Abrahams, Jewish Life, p. 49, etc.). In Spain (ib.), up to 1379, Jewish courts could impose punishments and even pronounce a death sentence, which was carried out by the civil courts. In Portugal it was a form of punishment adopted by Jews, though it seems probable that they made use of the ordinary prison—once a separate portion of it—for their own offenders. The Jewish Quarter gave the Beth Din greater power and fostered the growth of two principles: (1) that it was unpatriotic for a Jew to cite another Jew before the civil courts; and (2) that no mercy was to be shown to the informer. The gravity of the Jewish tribunal in secular matters can scarcely be said to have survived the breakdown of the Ghettos, though in religious questions its authority remained unshaken. In many instances, plaintiff and defendant have, of their own accord, agreed voluntarily to submit their differences to the arbitration of the Beth Din rather than to the civil judge—a system at present in great vogue in the East End of London. This means many disputes are settled without the intervention of the magistrate. But this does not belong to the domain of criminal cases. Here the jurisdiction of Jewish courts has long ceased.

LITERATURE.—The Mishna, Gemara (Pal. and Bab.), and Tosaphot of R. Joseph Karo and R. Moses Maimonides should be consulted carefully. For the Mishna there are critical editions: (1) with vocab., notes, and trans., by H. L. Strack, Leipzig, 1901; (2) by Samuel Krauss, Leyden, 1899, with introduction, notes, and glossary; (3) for those who are ignorant of Hebrew, a tr., with notes, etc., has been prepared by Hölcker (Fleisch's Series, Tubingen, 1894), with special reference to NT questions; Mandel's comm. is edited by J. Holzer, Berlin, 1901. The Jerus. Talm. is translated by M. Schwab, Passow, I. 3; best edition of the Tosephta is that of Zunz, Breslau, 1889. See articles in Ebr. on 'Synhedrin,' in JE on 'Capital Punishment,' 'Stripes,' 'Excommunication,' 'Crime,' 'Punishment,' 'Hirah,' Admission to the Synagogue.' For the present work, see Avot Yada (Jewish), Pasewalk (Jewish); cf.: I. Abrahams, Jewish Life in Middle Ages, London, 1896; A. Büchler, 'Das Synedrin in Jerusalem und die Todesstrafen der Bibel und der jüdischen Nachbibliothek,' in MoBr., 1906; see also bibliographies in JE Ill., 256, iv. 329.

HERBERT LOEWE.

CRIMES AND PUNISHMENTS (Muhammadan).—I. Introduction. In ancient Arabia, crime was often regarded as impurity, and punishment as purification. In Muslim tradition it is mentioned that a certain adulterer who desired to do penance for his sin was said to the Prophet, taḥkɜr (purify me), whereupon he was stoned to death.1 In the heathen period, manslaughter and other crimes often gave rise to bloody feuds among the Arab tribes. The revenge of the injured party or of the members of his family or tribe extended not only to the guilty person who had killed or injured any one, but also to all who belonged to the same family or tribe. It is true that by this solidarity of family and tribe both the innocent and the wronged respectively benefited; but, on the other hand, there was the disadvantage that many innocent persons had to suffer for the sins of their relatives, and that long-continued blood-feuds often broke off from insignificant beginnings. Usually on both sides an attempt was made to put to death as great a number as possible of enemies of high rank in return for each fallen tribesman; for many regarded as insufficient mere retaliation of greater importance as the Muslim presupposes makes it plain that the penalty of imprisonment could scarcely ever have been inflicted.

It must be remembered that, in the time of which the Mishna speaks, most of the decisions

1 See I. Goldscheider, 'Das Strafrecht im Islam' (loc. cit., infra, pp. 101, 104 n. 2), and Muhammadi Studien, 1889-90, i. 57 n.
In this case the injured person (or his heir) may also give up his right and forgive the injurer.

In cases in which the judge has to decide as to a right of Allah, certain special principles apply. In many traditions it is expressly put in the foreground that God will base His relation to man, above everything else, on compassion and forgiveness; that He has always the right to prevent the covering of His servants with the cloak of love, but only on condition that they also act in this way and cover both their own sins and those of their fellow-men.

On the ground of the circumstances, the judge, the witnesses, and the culprit must all do their best to prevent the infliction of punishment, if it is a harg Allah. The culprit is then not bound to acknowledge his guilt if he is accused; he may even revoke his or his witness's act (see ADULTERY [Muslim]). If the guilty person does not desire to do penance for his crime, and in this way to purify himself from his sin, it is therefore usually impossible to punish him. If, however, his guilt is formally certain, and he is obliged to inflict the hadd precisely according to the regulations of the law.

2. Retaliation (qisas).—According to the Muslim law-books, retaliation is still permitted in only two cases: (1) when any unlawfully unjustly slain, another, the heirs of the latter have the right to kill the murderer; (2) if any one is deliberately and unjustly wounded or mutilated, he has the right to revenge himself on his injurer, if it is possible to make him suffer precisely the same wounding or mutilation. According to Muslim lawyers, this is in general possible only when a hand, foot, arm, leg, ear, finger, nose, toe, tongue, eye, or tooth, or other part of the body, has been cut off or cut in pieces. Punishment for highway-robery (ib. v. 37-38). In other cases, when no special punishment is prescribed, the judge is entitled to inflict such punishment on the guilty person as seems to be the most suitable in view of the circumstances. This form of punishment is called tazir ("correction").

Muslim canon law thus distinguishes three categories of crime and punishment: (1) the so-called jinayat, i.e. misdemeanours consisting of killing or wounding, which must be punished either with retaliation (qisas) or with payment of the dilya ("price of blood") or other damages; (2) adultery and other crimes for which must be punished with a fixed penalty (hadd); and (3) all other kinds of transgressions, which must be punished with tazir ("correction").

According to Muslim canon law, the punishment must be regarded in some cases as a harg Allah ("right of Allah"), in other cases as a harg adwani ("human right"). When, for instance, a Muslim has the right to exact retaliation or the payment of the price of blood, such a case concerns harg adwani, just as when he claims stolen or loaned property, or demands the payment of a sale price.
CRIMES AND PUNISHMENTS (Muhammadan)

(see art. Law [Muhammadan]; according to the Malikites, however, wives cannot exercise any diyas. If the heirs given right to qisas, the guilty person is obliged to pay the price of blood (diya); according to the Hanafites, however, the diya cannot be demanded in this case, if the guilty person does not himself agree to it. If the deceased has left various heirs, and some of them are willing to espouse the guilt, no vengeance for blood may be exacted, but only the diya.

Vengeance for blood is carried out personally, under the supervision of the judge, by those who have instanced the proceedings against the guilty person. If there are several who demand it, one of them is appointed to carry out the punishment.

2. The price of blood for manslaughter (diya).—The price of blood for manslaughter may be demanded: (1) when anyone has been killed deliberately and unjustly, and his heirs give up their right to exact the qisas; (2) when any one has been killed unintentionally. In both cases the diya consists of 100 camels, or 100 dinar of gold, or 12,000 dirhams of silver (according to the Hanafites, however, 10,000 dirhams of silver). But in the first case the so-called ‘heavy,’ and in the second case the ‘light,’ price of blood is incurred. In the jihād it is accurately decided what sort of blood can be exacted, as given in case (2). If gold or silver is paid in place of camels, according to some Muslim lawyers a greater sum may be demanded for the ‘heavy’ diyas than for the ‘light,’ but according to others it is not so; and, according to the latter interpretation of Shafi’i, the fixed payment of gold or silver is due, but the worth of 100 camels. The ‘light’ price of blood must be paid within a period of three years by the so-called ‘qiyāla,’ i.e. by those who pay the ‘eqd’ (price of blood) without distinction according to the Hanafites and Malikites, all ‘asabāt (i.e. the male relations on the paternal side) of the culprit, and according to them he must also himself pay part of the sum incurred; according to the Shafi’ites, on the other hand, neither the culprit himself nor his blood-relations in the direct line belong to the qiyāla.

When the Muslims after the great conquests established themselves in Egypt, Syria, Persia, and Arabia, the Old Arab family-organization partially lost its importance, and there arose a new grouping of persons who had the same interests to defend. According to the Hanafites, the same rules concerning the payment of the price of blood are applicable to these new groups as to the blood-relations of the guilty person; according to them, therefore, all persons belong to the ‘qiyāla who are bound to give their mutual support to each other (among others, neighbors with the same profession, those who belong to the same army-corps). The ‘heavy’ price of blood, on the other hand, may be demanded only from the culprit himself; and, according to most faqihs, he has no right to postpone payment. However, he also is only obliged to pay the sum within a period of three years.

(3) Besides the cases in which any one is killed either intentionally or accidentally, Muslim lawyers distinguish a third case in which the culprit did, indeed, attack the deceased intentionally, but without meaning to kill him. In that case the qiyāla must pay the so-called ‘heavy’ diya. They are also obliged to do this, according to some Muslim lawyers, if he has killed another accidentally, either in the sacred territory of Mecca, during one of the four sacred months (Muharram, Rajab, Jumada el-Awwal, and Dhu’l-qi’dā, Dhu’l-hijja); further, if the deceased was a mustawri (i.e. a relation whom it is forbidden to marry) of the culprit; according to others, however, they are in this case liable only to the ‘light’ diya.

For the death of a woman only half the price of blood can be demanded. For the death of a woman or a Jew, according to the Malikites, also half the diya, according to the Shafi’ites only one third, but, according to the Hanafites, the full price of blood. If any one kills the slave of another, according to most Muslim lawyers he must make good to the owner the full value, even though this cost more than the diya for a free man; according to the Hanafites, however, the owner has never a claim to more than the value of 100 camels decreased by one dinar. If the culprit was under age at the time, the price of blood must be paid out of his property by the guardian or curator; if the culprit was a slave, his master is responsible, but he can free himself from all further obligation by giving up the slave.

In addition to the qisas or the diya, manslaughter demands a kaffāra (atonement by sacrifice); and, according to Qur’an, iv. 94, this must consist in the setting free of a Muslim slave, or, if this cannot be done, in giving to two men of 80 poor persons, which in some other cases of kaffāra may take the place of fasting, is in this case, according to most faqihs, insufficient. According to the Hanafites and Malikites, this kaffāra is incurred not only when one has killed by accident (on the ground of the words of Qur’an, iv. 94); but, according to the Shafi’ites, also if the culprit has acted intentionally.

4. The diya and other damages for wounding.—The wounded person, as he has already been noted, if he gives up his right to qisas, claims the diya in place of it (according to the Hanafites, only if the guilty person agrees). The full diya is incurred when, because of the wound, a part of the body is lost (e.g. an eye, ear, hand, foot) or when there is a loss of property (e.g. silver). In the full price of blood is incurred for an eyelid, for a hand, and for a foot; in other cases they must be fixed by a legal sentence (hukūma), according to the loss suffered by the injured. An expert has then to estimate what value the body of the wounded person would have had before his injury. If it appears that the value of his body was diminished by, for instance, the judge sentences the culprit to pay half of the full diya. If any one has been wounded simultaneously in several places, he may claim damages for each wound separately, and therefore in some cases may receive even more than the diya for manslaughter.

5. Misddeeds which must be punished with a badd.—For the badd in consequence of zina, see art. ADULTERY [Muhammadan]. The punishment for apostacy from Islam, which is regarded by some Muslim jurists as a badd, is treated in art.
CRIMES AND PUNISHMENTS (Muhammadan).

APOSTASY (Muhammadan). We have therefore here to treat only of the other fixed penalties, viz. those for *qadifi*, wine-drinking, theft, and highway robbery.

(1) *qadifi*—By this the Muslim canoon law understands only such slander as is meant in Qur'an, xxiv. 4. Since only slander of *'honourable'* women is mentioned there, the crime of *qadifi* consists, according to Muslim lawyers, and the accusation of fornication brought against a man as is said to be permissible to address proof by four male witnesses of the slandered woman and the husband, if he is guilty of this crime must be punished with 80 stripes if he is a free man, and with 40 if he is a slave. This *hadd* is not enforced if he is under age, or insane, or if he is the husband of the slandered woman and avows that she is guilty, invoking Allah by means of the so-called *wilân* (see art. LAW [Muhammadan]). According to some Muslim lawyers, the slandered person has the right of the anxious punishment of the guilty, but not according to others; there is also a difference of opinion as to whether the heirs of the slandered person have the right of exacting this *hadd*.

(2) The *hadd* for the drinking of wine and other strong drinks consists of forcing the criminal to confess in public what he has drunk for 30 days, or in public stripes, on the ground of the tradition as to the way in which the Prophet punished drunkards in Medina. As to the number of stripes, there is a difference of opinion: according to the Shafi'ites, the punishment consists of 100 stripes; but according to the Hanafites, of 89 stripes for a free man, and of half that number for a slave. The guilt of him who is accused of this crime can, according to canoon law, be proved only by two male witnesses, or by the confession of the guilty. Moreover, the punishment is not applicable to minors, insane persons, and unbelievers.

(3) The *hadd* for theft depends on the command given in Qur'an, v. 42, 43, 'From the man thief and woman thief cut off the hands, as a warning example from God.' According to the Shafi'ite and the Malikite doctrine, a thief after his first theft must lose the right hand, after the second the left foot, after the third the left hand, after the fourth the right hand, and after the fifth the thief is to be put to death. In the case of following thefts he must be punished by *ta'zir*. According to the Hanafites, however, the thief must never lose more than the right hand and the left foot; if he continues to steal after his second offence, he must be kept in prison until he is reformed.

Theft is, however, punished with this *hadd* only when the stolen article had been put away in a proper manner, and, moreover, had a certain value (the so-called *night*). According to the Shafi'ites, the *hadd* is applicable only if the value of that which is stolen is at least 2 of a *dirham* (about 3 shillings); according to the Hanafites, only if the worth was at least one *dirham*, or 10 *dirhams*; according to the Malikites, 4 of a *dirham*, or 3 *dirhams*.

The *hadd* for theft is also not applied if the thief was under age or insane, or if he could make good a certain *dirham* worth of the stolen property. The latter is the case if one of those who have taken part in a battle steals something from the booty before it has been divided among the troops, or if a Muslim steals from that which was intended for the general use of Muslims. If one of a married couple steals something to the injury of the other, according to some Muslim lawyers the culprit must be punished with *hadd*, but not according to the opinion of others.

The person whose property was stolen has the right to reclaim the stolen article; and, if this has been lost, the thief must pay damages in its place. According to the Hanafite doctrine, however, the thief is not obliged to make such payment of damages if the *hadd* for theft has been applied to him.

(4) The *hadd* for highway-robbery is deduced from Qur'an, v. 57, 38:

'The punishment for those who fight against Allah and his apostle, and pass through the land spreading disaster, shall be that they shall be slain or crucified, or have their hands and feet cut off crossways, or let them be hanged up. Moreover, unless they reform before they fall into your hands, God is forgiving and compassionate.'

Since, therefore, this *hadd* was not accurately defined, there is much difference of opinion among Muslim lawyers as to the punishment of highway-robbers. The various opinions cannot all be mentioned here in detail. According to the Shafi'ite doctrine, four cases must be distinguished:

1. If the culprit has only made the road unsafe, he must be banished;
2. If he has also practised robbery (namely, in the sense that he would incur the *hadd* for theft if he were not a highwayman), his right hand and left foot are cut off (in the case of a repetition of the offence, the left hand and right foot as well);
3. If he has deliberately murdered any one, he must be put to death, even though the hands of the murdered person were not taken; moreover, he has as a highway-robber robbed and killed, not only is he punished with death, his corpse is exhibited for a time on a cross.

According to the other madhabs, regulations obtain which are partially different, according to the other figh-schools, however, this is not permissible.

When the robber repents before he has been captured, the special *hadd* for highway-robbery is no longer applicable to him, but he remains, for instance, obliged to restore that which has been stolen; and, if he is convicted of theft, the heirs of the latter have, just as in other cases, the right of exacting the *qiyâs or diya*.

6. *ta'zir* ('correction').—When no special punishment is prescribed, the judge, as has already been noted, must condemn the culprit to the punishment which seems to him to be the most suitable in view of the circumstances. He may, for instance, send him to prison, exile him, or sentence him to be publicly put to shame or scourged, etc. He may in the difficult cases of the first theft to the Malikite doctrine, if he is even entitled in this case to condemn him to as many stripes as are prescribed in the case of *hadd*, or even more; according to the other figh-schools, however, this is not permissible. According to them, too, the *ta'zir* must always be more severe than a *hadd*. The *ta'zir* is, among other things, applicable to a thief when the stolen property has not so much value that the culprit must be condemned to the *hadd*; furthermore, in general, to all kinds of transgressions for which no other kind of punishment or any special atoning sacrifice (*kaffâra*) is prescribed.

The judge is not always obliged to apply the *ta'zir*; according to the Shafi'ites, only if the injured person expressly requires him to punish the culprit; and, according to the Hanafites and Malikites, also when he is convinced that the latter will not reform without punishment. A *hadd* can, on the other hand, must always be waged against the guilt of the culprit if it has been proved, because this punishment is expressly prescribed in the canoon law.

CRIMES AND PUNISHMENTS (Parsi).—

From the list of the contents of the original twenty-one novels of the Zend-Avesta, the bulk of which is irretrievably lost, we find only seven of them consisted of the dātik, or 'legal' literature (Dinkert, viii, 1, 11). Of these the Vendidad, 'the Leviticus of the Iranians,' is preserved in its entirety, and this work, with some other parts of the Zend-Avesta, forms the chief source of our information on the criminal law of the ancient Persians.

Offenders against law are punished, first, in this world, according to the penalties laid down for violation of the rules of sanitation and hygiene; for it is said that the man who violates these rules imports or furthers epidemic, and endangers human life. The punishment for the ill-treatment of the various classes of dogs is exceptional, and is calculated to ensure good treatment of this faithful animal, who as a sentinel guards the flocks of the faithful, and protects them from the attacks of wolves and other wild beasts, as also from the depredations of thieves and bandits. Thus, if a dog is found by the owner of the body, he must be given in order to be useful. If the dog is eaten by the owner of the body, he will be put to death. The penalty increases proportionately with the repetition of the crime, and, on the eighth committal of the same, the man is termed a pēšgān, 'of sinful body,' and is to be punished with two hundred stripes (ib. 18-21).

The second class of offences is committed by those who do not prevent or repel the assault wherein a man brands a weapon with the intention to strike a blow, he becomes guilty of this crime (Vendidad, iv. 17). He receives ten stripes for the first crime, and the maximum penalty of two hundred stripes is prescribed in his case if, without attempting for his previous crimes, he repeats the same three times (ib. 22-25). (3) oredāt, 'wound.' The penalty for this crime begins with fifteen stripes, and makes the culprit liable to two hundred stripes on the repetition of the same for the sixth time (ib. 30-33). (4) avahr, 'sacrifice.' This is punishable with thirty stripes for the first crime, and two hundred for the fifth repetition (ib. 30-33). (5) tacot, 'bloody wound.' The penalty is fifty stripes for the first offence, and the culprit liable to two hundred stripes on the repetition of the same for the sixth time (ib. 32-39). (6) asto-bēl, 'bone-breaking,' begins with the punishment of seventy stripes for the first offence, and closes with that of two hundred stripes for the third (ib. 32-39). (7) freza-bēl, 'rendering unconscious or causing death.' The punishment for this crime is ninety stripes for the first offence, and two hundred for the second (ib. 40-42).

The Parsi Shāyestān (Zend-Avesta) variously speaks of eight crime classes of crimes (i. 1, xi.1). The farman and sraoš-carvānā are the additional sins mentioned here. Certain degrees are assigned to the various crimes, and the bodily punishment is converted into fines. Thus the degree of the smallest crime, farman, is estimated at four stars (a star being equivalent to four dirhams). The degrees of the crimes rise in proportion to the gravity of the offences, until the tanafar sin is estimated at three hundred and twenty dirhams (ib. 23-24). Haoma is invoked to warn the faithful of the cunning movements of the thieves (ib. 21), and Rashnu, the angel presiding over truth, is spoken of as the best killer, slayer, and destroyer of the thieves and bandits (Yashna, viii. 41, 71). The sacrifices offered to Khusrāw, asking him to help the pious to withstand these evil
forces, is said to be equivalent to offering the same to Ormazd (Yt. vi. 4; Ngush. i. 14), and Ardvahra is invoked to pour down her waters as a source of torment to theบรรษัท (Yt. vi. 8). The routing of the thieves and robbers is eagerly prayed for (Ys. ixi. 3). The man who takes a loan from another, with the evil intention of not returning it, is a thief; and the commentator explains that, if he bluntly refuses to restore it, he becomes a robber (Vend. iv. 1).

The culprits had either to pay fines, or their ears and hands were cut off, or they were imprisoned. If a man stole a dirham (about 7½), he had to pay twice the value of his lent money, ten hundred dirhams, with a stick were inflicted upon him, and he was imprisoned for some time (Sad Dar, lxxiv. 2–3). If he stole another dirham, four dirhams were fined his fine, he had to forfeit his other ear, to receive two rods, and to repay with a period twice the length of that inflicted at the time of his first crime (ib. lxiv. 4). The third repetition of the crime was punishable by cutting off his right hand (ib. and 6), and the fourth, in destroying his evil work, he finally stole five hundred dirhams, he was to be hanged (ib. 6). The bandit who had robbed a person of something by violence, had to restore to the owner four times as much as he had taken, or he was to be hanged (ib. 11; ib. further, on theft, Dinkhurt, viii. 20. 123. 21. 1–14).

3. Breach of contract.—The man who lies to Mithra is guilty of Mithrā-drayj, and brings death to the whole country (Yt. x. 2). The faithful are exalted not to violate contracts entered into with any one. The six important forms of contract are: (1) word-contract, (2) hand-contract, (3) the contract to the value of a sheep, (4) the contract to the value of an ox, (5) the contract to the value of a man, and (6) the contract to the value of a field (Vend. iv. 2). The penalty for breaking these contracts begins with three hundred stripes with aspa-āstā and an equal number with vrašo-carrānt, for the violation of the first class of contract, and rises to the maximum punishment of a thousand stripes each in case of the breach of the final contract, namely, the field-contract (ib. 11–16).

4. Crimes connected with the defilement caused by the dead and dead matter.—The earth, being one of the sacred elements of nature, is to be kept pure from defilement. Ahriman created the sin of interring corpses in the earth, for which there is no atonement (Vend. i. 13, iii. 39), and it is the duty of a good man to disinter the dead bodies, wherever possible. If a man lets a corpse remain buried, and neglects his duty to dig it out within six months, his punishment is five hundred stripes with each of the two punishing rods. The penalty is doubled in the case of a corpse remaining buried for a period of one year, and if it is not disinterred within a period of two years, it makes the man guilty of uipa-kretha, for which there is no atonement (ib. iii. 39–39).

Under no circumstances may a corpse be carried by a single person, lest he should be defiled. Capital punishment is meted out to him who violates this precept. The culprit is to be removed to the remotest land and to be kept there until he grows old, after which his head is to be cut off (ib. 15–21). The man who does not properly observe the rules of removing the corpse to the top of a mountain, and fastening the body with brass or stones by the feet or head, to prevent the dogs and birds from carrying the dead matter t water and trees, is to be punished with two hundred stripes (ib. vi. 471). If a man, happening to touch a corpse in the wilderness, approaches water and trees without cleansing himself, he receives four hundred stripes with each of the two instruments (ib. viii. 104–106).

Wilful carrying of the dead matter to water or fire makes one worthy of death (Sad Dar, lxxii. 1). Unnecessary work of being deprived, or a man who throws more cloth on the corpse than is essential has to suffer the punishment of four hundred stripes, rising to one thousand stripes with both the whips, in proportion to the quantity thus wasted (Vend. viii. 25–25).

Among the worst crimes created by Ahriman is that of cooking corpses, for which there is no atonement, and of which the penalty is death (Vend. i. 17, viii. 73 f; Strabo, p. 732). The punishment of the man who is cooking on a man makes one unclean for ever, and it is prescribed that the heart of the man guilty of this crime shall be torn out, and his eyes put out (Vend. vii. 23; Sad Dar, lxxi. 2; Grand Rûsyüt, P. 129).

The ground on which a dog or man has died is not to be tilled for a period of one year. The man who does not observe this rule is punishable with two hundred stripes. The man who tills the ground without cleansing it of the bones, hair, urine, and blood lying on it becomes a pešôtânu, and receives two hundred stripes with the two instruments of punishment as a penalty (Vend. vi. 81 f). It is sinful to throw bones of a dead dog or a dog's skull in the open earth, or to throw the marrow flowing from them pollutes the ground. The penalty of throwing a bone of the size of the top-joint of the little finger is thirty stripes, and rises proportionately, to the maximum penalty of one thousand stripes when the body of a dead dog or a dead man is thrown on the ground (ib. vi. 10–25). Bringing back fire into a house in which a man has died, within nine nights in winter and a month in summer, is punishable with two hundred stripped with each of the two instruments and with the two hundred with the vrašo-carrānt (ib. v. 43 f).

5. The crime of ill-treating the dog.—The Iranians held the dog as the sacred animal created by Ormazd, and rigorous punishments are prescribed for his ill-treatment. The giving of bad food to various classes of dogs is punishable with fifty to two hundred stripes, in accordance with the importance of the class of dogs (Vend. xii. 24–27). Seven hundred stripes with each of the two implements is prescribed for a bitch that is with young (ib. xv. 50). Fifty hundred to one thousand stripes are the lot of those who kill various kinds of dogs (ib. xiii. 4, 12–15). The murder of a water-dog is to be atoned for by ten thousand dirhams, or by the payment of thirty thousand loads of sweet-scented wood to the fire, or an equal number of barson twigs, or by carrying the same number of xothrou libations to the waters, or by killing as many snakes and other noxious creatures, or by helping to contract marriage between the faithful, and by doing various similar redeeming works (ib. xiv. 1–18).

6. Crimes relating to women in menses.—Elaborate rules are laid down for the period of the menstrual purification. Under no circumstances may a woman be exposed to the dangers of the outside world. If she is detained in seclusion, the violation of which is generally punishable in the next world. Intercourse with a woman during this period amounts to wilful murder, burning of the life-giving semen, and as a result, as the man has to pay his sin by an additional performance of meritorious deeds, as those of killing about nine thousand noxious creatures such as snakes, frogs, and ants (ib. xviii. 67–74). If the woman who has brought forth a still-born child drinks water for the good of her own health, she
becomes a pàdâma—his offence is punishable with two hundred stripes (ib. vii. 70-72).

7. Crimes regarding the purificatory rites.—Capital punishment is meted out to him who officiates as a cashier without himself being well versed in the rites of cleansing. His hands are to be bound to a wooden stake, and his head cut off, and his body is to be thrown to the vultures (Vend. i. 47-49). A later work prescribes that he shall be nailed with four nails, his skin taken off, and his head cut off (Fres. Privyent. p. 398, as quoted by Darmesteter in SSE iv. 183 n. 2, and Le Zandt in ib. Le Zendt, ii. 170, n. 55).

8. Unnatural crime.—Zoroaster denounces this deed as the worst crime against morality (Ys. li. 12). Ahriman is its creator (Vend. i. 12). There is no sin greater than this, and the man practising it becomes worthy of death (Sad Dar, ix. 2). This is the only crime which entitles any one to take the law into his own hands, and to cut off the heads of the sodomites and to rip up their bellies (ib. ix. 31). The Dictating-i-Dénik (lxvi. 3) modifies this, and states that, before taking the law into one's own hands, one should try to impress the heinousness of the crime on the minds of the wicked sinners, but, if that is of no avail, one may kill them (lxvi. 9). This is to call a demon, a worshipper of demons, a male paramour of demons, a female paramour of demons, a wife of demons, as wicked as a demon; he is a demon in his whole being while he lives, and remains so after death. Reasonable men, that is, faithful should not have any intercourse with such a man, except by way of attempting to reclaim him from this inexpiable crime (Dictating-i-Dénik, lxvi. 10). The crime puts one on a par with Ahriman, Afrasiyab, Zohak, and other wicked ones (Sad Dar, ix. 6), and greatly increases the joy of the Evil Spirit (ib. 6). Eight hundred stripes with each of the two rods is the penalty for him who has been forced by violence to this crime, but there is no atonement for him who voluntarily submits to it (Vend. viii. 96 f.). The same crime committed with a woman is equally heinous (Sad Dar, ix. 7).

9. Adultery and abortion.—See Adultery (Paris) in vol. i. 135 f., and Feticide.

MANOEJKI NUSSEVANJ DIBALLA.

CRIMES AND PUNISHMENTS (Roman).—Roman law never acquired on its criminal side the clearness and precision which characterized its civil applications, in an ever increasing degree, until the collapse of the Empire came. Among the many causes for the imperfect development of criminal law, the most important is the comparatively large influence which political conditions exercised upon the definition and punishment of crime. Under the democratic system, when the assembled citizens were in theory sovereign, evolution proceeded with such slow and uncertain steps that the fixing of the criminal code was made more systematic. For the purposes of our brief exposition, three sections of the subject have to be distinguished: the notions attached to crime, the gradual abridgment of the guilt between criminal law and morality, and the widening jurisdiction of the State over offences. The second branch concerns the procedure leading up to punishment; the third, the nature of the punishments inflicted. Needless to say, the boundaries between these three divisions cannot be perfectly drawn.

In the earliest days of the Roman community, most of the functions of the State were rudimentary, and there was little scope for the public punishment of actions committed by citizens, even when they shocked the family decency. Much was left to the vengeance of heaven, and in some cases any citizen could make himself the champion of the offended gods. The close-knit organization of the family (patria) and the clan (gens) also greatly restricted the scope of criminal law; and, though the framework of the gens early fell to pieces, that of the familia retained many of its primitive elements until Roman civilization succumbed. Survivals in the historical period clearly show that the head of the family (paterfamilias) once possessed uncontrolled authority (imperium) over the lives of all who were in his power. The wife, the child (born in the family or brought into it by adoption from without), and the slave were in this respect all equally subject to the family custom (mos maiorum), powerful in every age of Rome, restricted in practice the exercise of this authority, though in principle it was absolute, and required it to be used with a certain formality and within the scope of the law so as to be protected to an increasing extent the freeborn members of the family. New forms of marriage enabled the wife to escape from the absolute imperium of her husband. Examples of the execution of women in criminals are found in the 2nd cent. B.C., and of men in the 1st; but the bare right of the head of the family to put to death those subjected to him was only removed by Constantine, and the cruel exposure of newly-born children was permitted long after his time. Even the slave was protected by the Imperial legislation. See art. CONSTANTINE, above, p. 90.

In so far as the State corrected crime, the supreme magistrate, whether known as rex, dictator, consul, or praetor, was, in the remote age, in the same position as the paterfamilias, that is to say, his imperium was, within its own sphere, in principle unlimited, though he would often have to submit, in the case of citizens, to the force of the imperative decision of the Senate and of that of treaty obligations. The Republic introduced, as one of its few fundamental innovations, the right of appeal (provocatio), which entitled every citizen to a trial by his fellows in all weightier matters. Only in special circumstances, which will be described later, was he subjected to arbitrary treatment during the Republican age. The protection afforded by the provocatio was at first valid only against magistrates who administered the city and a thousand miles outside, but it was gradually extended to Italy and even to the provinces. The changes which were brought about by the Empire were profound. As in other departments of government administration, the Emperor became supreme. From the first his autocracy was practical, and in the end it was undisguised. Apart from the traces of primitive practice preserved in later institutions, the most complete and well-organized system afforded to the criminal side of Roman law is given by the fragments of the Twelve Tables. Punishment of individuals by special enactment (privilegium), i.e. by an act of attainder, is forbidden. The State recognizes as offences against itself only these three—treason (perduellio), aggravated murder (parricidium), arson, theft of grain from the soil, lampooning, and possibly false witness.
The definition of crimes was vague, especially (as was natural) in the case of treason, but later legislation gave more precision to treason and extended the range of criminal inquiry. Sulla carried out a great codification of criminal law, and grouped crimes under eight or nine heads. To each group a separate court (prætorian) was assigned, each with a fundamental law, dealing carefully with the substance and the forms of its jurisdiction, and Sulla’s regulations were further elaborated by Julius Caesar and Augustus. The courts set up by Sulla dealt with the following crimes: (1) embezzlement of public funds (repudianum); (2) theft to the detriment of the gods (sacriilégium); (3) murder and offences akin to it—brigandage, misuse of criminal procedure in capital cases, poison, magic, arson, and wrecking; (4) public bribery; (5) treason (now termed maiestas); (6) forgery (falsum); (7) the infliction of bodily damage (injurin); (8) public violence (vex); and (9) kidnapping (plagium).

The crimes mentioned are only the principal ones ascribed to the founders, but they also dealt with many other outrages (such as sexual offences) by direction of particular statutes, under conditions which are difficult to determine. Augustus established separate courts to deal with (1) adultery, which was generally regarded as a public crime; and (2) usury, against which many Republican statutes had been directed (mostly in vain), and the offence of artificially raising the price of corn. Later on, many forms of wrongdoing, e.g., debt recovery, were the concern of the praetors, which latter citizens were subject to. Thus, the time of the early Empire, a multitude of deeds, not formerly punishable, or punishable only by fine, came to be included in the category of crimes, which might even be considered a public offense. The idea that the government might withdraw from the commander in the field the right to impose the death penalty, rests on a wrong inference from a passage in Sallust (Jug. 39). The statute which conferred power on Sulla, and which, with the Tribunician powers, was handed over to the dictator, was not bound to guarantee an appeal, but he was placed in the same position as other magistrates by a lex Valeria, enacted in 301 B.C. Military rule naturally excluded the provectio. But there was no provision for the use of this last appeal against the death penalty, except that the Senate, on the advice of the Court, might order that it be suspended.

The Senate from time to time claimed the right to authorize the magistrates to inquire into offences and to punish them without regard to the assembly. The earliest recorded example of this usurpation is afforded by the suppression of the so-called Bacchanalian conspiracy in 186 B.C., when, in a time of panic, many citizens, as well as members of the Decemvirs, had been put to death on mere suspicion. The Senate, however, withdrew from the commander in the field the right to impose the death penalty, rests on a wrong inference from a passage in Sallust (Jug. 39). The statute which conferred power on Sulla, and which, with the Tribunician powers, was handed over to the dictator, was not bound to guarantee an appeal, but he was placed in the same position as other magistrates by a lex Valeria, enacted in 301 B.C. Military rule naturally excluded the provectio. But there was no provision for the use of this last appeal against the death penalty, except that the Senate, on the advice of the Court, might order that it be suspended.

The earliest recorded example of this usurpation is afforded by the suppression of the so-called Bacchanalian conspiracy in 186 B.C., when, in a time of panic, many citizens, as well as members of the Decemvirs, had been put to death on mere suspicion. The Senate, however, withdrew from the commander in the field the right to impose the death penalty, rests on a wrong inference from a passage in Sallust (Jug. 39). The statute which conferred power on Sulla, and which, with the Tribunician powers, was handed over to the dictator, was not bound to guarantee an appeal, but he was placed in the same position as other magistrates by a lex Valeria, enacted in 301 B.C. Military rule naturally excluded the provectio. But there was no provision for the use of this last appeal against the death penalty, except that the Senate, on the advice of the Court, might order that it be suspended.

The Senate from time to time claimed the right to authorize the magistrates to inquire into offences and to punish them without regard to the assembly. citizens and their property. In these instances the citizens were deemed to have passed judgment on their offenders, and (lex Calpurnia) in 49 B.C. established a special court (questio), with delegated authority to try governors who were charged with robbing the provincial subjects of Rome. As has been stated above, Sulla placed all recognized crimes under the sway of such standing courts, and, though recourse to the more cumbersome process before the comitia was still possible, it was rarely attempted. The questio were exempted by law from the operation of the magistrates' veto (interesse). Occasionally temporary courts were established to deal with particular offenses. In this way the men who had trafficked with Jugurtha were punished, and Clodius was tried and acquitted by special judges. The jurors were originally drawn from the Senate, but after 70 B.C. the two bodies shared the privilege with men of a somewhat lower station. Both qualifications and procedure were varied from time to time. The comitia centuriata was established to continue till the 3rd cent. A.D., but the parallel jurisdictions which the Empire introduced continued to exercise their authority until they were extinguished.

There were few of punishment which did not depend on an arraignment before a criminal tribunal, properly so called. The censors of the Empire could penalize the citizens in many ways, degrading them, and even inflicting on them the stigma of the equestrian order. The criminal statutes, and took cognizance of moral and social offenses which were outside the parsive of the laws. But succeeding censors were not tied to the decisions of their predecessors. The forms of civil law were employed to vindicate some breaches of public order, and also to provide redress for certain forms of fraud which could not be adequately punished by executions in money. Not only in Italy, but in every municipality, there were fines which were recoverable by civil process, on the public behalf. In some private suits, the defendant, if condemned, incurred additional penalties which were not pecuniary. The judgment inflicted on him a stigma of infamia) which impaired the value of his citizenship and left him under many disqualifications for public life. The circumstances were such that the losing litigant was held to have been specially bound to honor the decision, and that in business he had cheated another, or a guardian defrauded his ward. Theft, when practised by one citizen against another, without violence, was technically not a crime, but condemnation in a suit for damages in pursuance of their carried ignominy with it. The same stigma rested ipso facto upon men engaged in occupations regarded as degrading, that of an actor, for instance, or a public auctioneer (praxer), or a gladiator.

The Roman jurisdiction over offenses was exercised at first only as far as the Romanus ager extended, that is to say, in the regions of Italy possessed of large rights. Outside this pale foreign law prevailed. After the Social War (91–89 B.C.), Italy was parcelled out among Roman municipalities, and there had to be a division between the local jurisdiction and the central courts in Rome. Little is known of the principles on which the discrimination was based, but we read with some surprise that the statute of Sulla relating to murder restricted the court at the capital to cases arising in Rome. Before the end of the Republican period, the rule was established that a Roman citizen outside Italy could claim to be tried in Italy for any serious offense, and in the provinces the authority of the provincial governor in matters
of jurisdiction tended perpetually to encroach upon the autonomy of the municipalities and peoples. As is well known, the Roman government granted special privileges to the Jewish communities.

The advent of the Empire brought about a great transformation in the criminal law of Rome, as in all other parts of Roman politics. The paramount authority of the Emperor, and, in particular, his power of pardoning, led ultimately to a complete recasting of criminal procedure both in Rome and outside it. At Rome, new officials, especially the praefectus urbi and the praefectus praetorio, gradually acquired a large jurisdiction; and, in the end, practically all important charges were to be tried by officers who were Imperial nominees. As the world became Romanized, local diversities in privilege disappeared, until the celebrated decree of Caracalla was promulgated, which conferred the franchise on the whole Empire, and led to uniform, or nearly uniform, legal practice all over the Roman dominions. In the early days of the Empire every citizen had a right of appeal to the Emperor in any important case, by the practice of St. Paul (A.D. 259), but by the 3rd cent. each pro-
vincial governor received from the Emperor the right of the sword (iudicium), which enabled him to dispose of the lives of provincial citizens, except those belonging to members of the municipal senates (decltures). After the accession of Augustus to power, the Roman Senate became a high court of justice, trying for the most part senators who were charged with the more serious offenses, just as Caracalla. But some senatus were ultimately destroyed by the dominance of the Emperor, so the jurisdiction of the Senate was reduced to municipal powers under the monarchy established by Diocletian and Constantine.

And certainly, in improving the extent of local autonomy possessed by the different cities and peoples who were subject to Rome varied greatly while the great process of assimilation was being carried out. The tendency, however, to increase the authority of the Roman government was strong from the first, and in the end nothing but a limited control in matters of police, and in other minor affairs, was left to the municipal courts, Italy being placed in this respect on the same footing as the provinces. The history of police jurisdiction, at all periods of Roman history, is obscure. During the Republican period, citizens of the criminal class at Rome seem to have been dealt with severely, but a regard for the public peace. Indeed, the value of the provocatio greatly depended on the willingness of the magistrates—in the last resort, of the tribunes—to secure it to the burgess, while the red-
handed assassin or the thief taken in the act set the lones Valerius and Porcig were of little avail.

The nature of the punishments inflicted by the Roman State varied greatly in the course of its history. We can clearly discern a time when the crimes of a Roman citizen were inflected by the penalty of death and no other. Under the system of trial before the comitia, this was the only punishment which the chief assembly, the comitia centuriata, could assign. But the custom was carried into cases of robbery after the final verdict was given, could shake the dust of his country from off his feet and go into exile. In this case, at the final hearing the plea was put in that 'he had changed his soil with a view to exile' (sedem evertisse exilii causa), whereupon the assembly passed a resolution known as interdictio aqua et igni (in the full form tecto addo), refusing the offender (now no longer a Roman) the right to receive the chief necessities of life—shelter, water, and fire—within Roman territory, as technically defined by the phrase Romanus ager, which for this purpose was never deemed to extend beyond Italy. The questions, in the case of the more serious offenses, followed the earlier practice of the centuries. Exile was such a common incident in the early civic community that many treaties made between Rome and other States included a clause binding the contracting parties to give harbourage to outlaws. Until the time of the Empire, which led to the enfranchisement of Italy, a Roman could find a refuge no further away than Tivoli (Tivoli); but Milo, condemned for the murder of Clodius in 52 B.C., had to place himself beyond the bounds of the Empire. At this time, a law within the Romanus ager could be warned to quit it by the magistrates, unless international agreement stood in the way. This form of removal was called relegatio. But after the Hannibalic War the feeling of unswayed disregard of treaty obligation, and the repeated indiscriminate expulsions from Rome of Latins and other Italian allies did much to bring on the great Social War. This form of banishment was extended to Roman citizens in 87 B.C.

The relegatio was merely ordered to live in a particular place during the Emperor's pleasure. This was the only restriction on the person's privileges as a citizen, and Ovid, banished to Tomi, was careful to insist that he was a relegatus, not exilii.

Cicero laid it down in the year 66 B.C. (pro Ccec. §101) that exilium was not a punishment known to Roman law, but a means of escape from punish-

ment, yet he himself broke through this technical principle through the lever of the statuata, and for a time, when, as consul, he passed a law to check public bribery. Thereafter exilium was freely used as a penalty, and new forms of it were devised in the Imperial age. The old interdictio aqua et igni totally fell into disuse, and for it was substituted the deportatio in insulam, rendered familiar to us by Tacitus and Juvenal, who describe the islets of the Egean as crammed with exiles.

The death penalty, except in the military sphere, was, as we have seen, hardly ever exacted in the Republican age, but in the more important cases it could not be so escaped under the Empire. Probably nothing else so fostered the bitterness entertained against the nobles against the Empire, as the system of its first institution. Yet infliction of death was exceptional in the first two centuries, and was confined chiefly to the more important crimes which came before the Senate and the Emperor. But in the times of the Antonines, when the lawmaking power, and were not bound by statute, as were the regular courts. From the succession of the Severi (A.D. 193), capital punish-

cement became more and more common, and the number of offenses to which this technical method was continually increased. In the end not only treason and murder, but arson, magic, coinage, kidnappinng, aggravated violence, and a number of other wrong-

ful acts might be treated capitally. The forms of execution were also changed and extended.

Originally, as a rule, the offender was tied to a stake and flogged, then released and beheaded. This was symbolized by the bundles of rods (jovacis), each containing an axe (scorpius), which were carried by lictors in front of a magistrate invested with the unimpaired imperium. In the city the axe was laid aside. Beheading by the axe was common in the earlier Imperial age (cf. Rev 20), but was forbidden later, when the sword was sub-

stituted. The old method was confirmed with the pass-
ing of a death sentence by the comitia centuriata; show that, before the time when escape into exile was permitted, the condemned criminal was sometimes flogged and crucified. The procedure was revived by the Empire, 'according to the custom of our ancestors' (more maiorum), as the saying
CRIMES AND PUNISHMENTS (Tentonic and Slavico)

went. During the main part of the Republican period, crucifixion was restricted to slaves, except in rare instances, such as the case of men convicted of misconduct with Vestals. A quaint early method of disposing of one who had slain a man or had committed other hideous crimes, was to draw him up by a neck with a cock, an ape, and a serpent, and then to drown him. The Vestal was walled up, and died of starvation. In both these cases the sentence had originally a domestic character, and we have in this strong family resemblance the primitive objection to the shedding of blood within the domestic circle. The Vestals were the daughters of the great State family, and were condemned by the Pontifex Maximus, who stood to them in the relation of paterfamilias. Something of a religious character attached to the spilling of the criminal's blood by the community. But the gods of the family could receive no such offering. Later, when the paterfamilias executed a member of his family, he was regarded as the deputy of the magistrate. The cross was used against free men without scruple by the Imperial administrators, until its employment was abolished by Constantine on religious grounds. The equally cruel death by crucifixion was also frequent in Imperial Rome. This form of punishment was applied, by a crude sort of homoeopathic retaliation, in the age of the Twelve Tables, to the citizen guilty of arson, and, later, it was occasionally a form of vengeance for military crimes. The killing of the citizen by the Tarpeian rock was condemned, and, later, it became one of the commonest forms of execution, and it lasted into the Christian period, being still in use in the time of Justinian. Malefactors who were executed in prison, like the Catilinarian conspirators, were usually strangled by the cornifici, or public executioner, under orders from the city commissioners of police, the tresviri capitales. We hear also, in Republican Rome, of wrongdoers being hurled from the Tarpeian rock on the Capitoline hill; and the same thing happened occasionally later, in order of the Senate; while the Twelve Tables prescribed this form of punishment for bearing false witness. The application of it in the age of the Empire seems to have been restricted to no particular offenses, or prisoners of war. But later it became one of the commonest forms of execution, and it lasted into the Christian period, being still in use in the time of Justinian. Tacitus, and, as may be inferred from the affinity of A.S. *smeri,* 'water,' with Skt. *svarana* (cf. BLOOD-FEUD [Aryan], vol. ii, p. 734), it goes back to the primitive history of the Teutonic race. From that remote age come also the terms O.H.G. *birna,* O.Sax. *boila,* O.Norse *bol,* 'wine,' which represent it in the slavic as *vino,* 'better,' 'best,' and originally signified 'repair of damage.' Likewise Goth. *sulda,* skulda, 'debt,' 'debut,' O.H.G. *sculda,* skulda, A.S. *scylt,* which are all derived from Goth. *skulda,* skuldan, 'to be owing,' and metaphorically the obligation to pay, (wergold or fine), and then, figuratively, in general, whether before God or man (cf. art. ARYAN RELIGION, vol. ii, p. 499). For the Goth. *dulga,* 'guilt,' etc., see below.

In the conception of crimes, however, blood-revenge and its remission by wergold and fine were treated as something more than the private affairs of the families concerned. The injured group, instead of exacting blood-revenge, might, as is implied, renounce it (Tacitus). This was decided under a term common to Greek and Sanskrit, viz. *skulda* (A.S. *sakde*), O.Norse *sak* to the public assembly. The compensation paid by this tribunal was regarded as in some sense a penalty, and the amount was shared between the parties (this relation) on the one hand, and the chief or (in republican States) the community on the other.

If we regard the intervention of the public assembly as involving no more than the attempt on the part of the tribe to bring about a peaceful settlement of such feuds as were especially dangerous to the common weal, then the germs of the procedure among the Teutons may be referred to a very remote age. In the main, however, the offences dealt with by the assembly (Goth. *ma;f*), A.S. mecol, O.H.G. *nahdal,* O.Norse *mal,* in its judicial capacity would be, alike in antiquity and in the time of Tacitus, those which are included under a term common to Greek and Sanskrit, viz. *skulda* (A.S. *sakde*), expressing an idea that must go back to the dawn of Aryan history (cf. art. ARYAN RELIGION, vol. ii, p. 50).

Of the primitive Teutonic terms applied to crimes against the gods, of their affinities, and religious unions, the most important is the series O.H.G. *birna,* A.S. *birna,* 'crime,' which is the nearest equivalent to Gr. *Skulda* (A.S. *sakde*). *Birna* (O.H.G. *birena,* A.S. *brine,* O.H.G. *finea,* 'crime,' 'sin'), of these the first three are the first series (O.Sax. *sundor,* O.Norse *sundor,* etc., probably related to Lat. *sancus,* 'guilty'), and the second (Goth. *fransurfs* originally signifying 'being liable') is seconded by the primitive connotations of these words, we must, of course, guard against introducing Christian ideas; yet the fact that the Church selected precisely these terms to express the conception of sin, i.e. transgression against God, shows that even in that heathen antiquity they must have implied some notion of trespass against the gods. The third series (Goth. *faina*), has not as yet been satisfactorily explained. Some connect it with Lat. *per in periture,* *perperon,* Gr. *περιπατείων,* and interpret it as 'a deed that goes beyond,' i.e. beyond the crimes usually entailing blood-revenge; others connect it with Goth. *feorin,* 'snearer,' O.H.G. *feirn,* 'sneering,' and regard it as signifying an offence involving the element of secrecy. It is in any case certain, as appears also from the language of Tacitus, that in the early period drawn relatively fine distinctions within the general idea of wrongdoing. Among the various groups of words thus employed are the forms with the prefixes *mein-* (esp. O.Norse *meinir*), *Amur-* (O.H.G. *unamur*), O.H.G. *mein-eit* (Germ. *Meineid,* 'perjury!') and *missat-* (Goth. *missatdeis,* O.H.G. *missatell,* '误解'), implying respectively the attributes of deceitfulness and perversity in conduct. This deepened sense leads to the Teutonic dialects with the forms *sborna,* 'sense of shame,' and O.H.G. *Looster,* O.Norse *lotr,* 'error,' 'vice,' 'disgrace,' from *lotan,* 'to blame' (cf. also O.Irish *locht,* 'error'). The primitive word *lot* (Loth), which has been found in the series: O.Norse *ult,* M. Eng. and Scots *wite,* O.H.G. *wizzi,* it is related to Goth. *frowohtan,* 'avengé,' O.H.G. *wizzen,* 'punish,' and O.Norse *forwizza,* 'to wish,' and, as connected with the root *vid* (Lat. *viduo*), seems to be equivalent to the Lat. *animadverttere* in aliquem, 'to proceed against one.' A form peculiar to the Western Teutonic dialects is the O.H.G. *karvan,* i.e. something imposed as a disgrace (O.I.G. *karvan,* A.S. *karwan,* O.Slav. *svorou,* Russ. *soromu,* 'disgrace'). The O.H.G. *antion,* *anadorn,* 'punish,' 'blame' (cf. O.H.G. *auto,* 'indelible offence') is exclusively German, and its etymology is still etymologically obscure words M.I.G. *strofe,* 'punishment,' and *veime,* 'vehme.'

(2) Slavie. — Turning next to the Slavs, we note that, apart from the treaties of Prince Oleg (A.D. 912; Jireccek, no. 1) and Prince Igas (A.D. 945; Jireccek, no. 2) with the Greeks, the earliest Russian document of a legal character is the collection of ancient prescriptive laws, decrees of princes, and Christian Byzantine enactments, known as the *Tatulov* file of laws; which, as we are used to the terms of the modern and ancient Slavonic, and their etymology, as also the later and still etymologically obscure words M.I.G. *strofe,* 'punishment,' and *veime,* 'vehme.'

1 Germ. 12: 'Distinction poenarum ex delictio.' Diversitas supellicii illius respectu, tanquam sedet estendit oporteat, dum puniuntur, 'demonstrate.'
2 Nestor, Chron. xii., 'Their lives each with his kindred (родей), and upon his own territory, every one ruling over his own kindred, and his form of government was pure democracy, and the decision of all questions rested with the public assembly.'
3 Germ. 21: 'nee implacables durant [inimicitiae]; liitor enim eum easque [inimicitiae] invigilantur.'
4 Germ. 12: 'Licit apud concilium accurare quoque et dis- crimine capitis inter se.'
5 ib. 'equorum peccatorum numero convexit multatum; pars suae eligere regi et civitatibus, i.e. eum, qui vindicetur, vel proprias eum, excusavit.'
6 Germ. 21: 'periculeosiores sint inimicitiae justa libertatem.'
As among the Germans, the legal relation of the various clans to one another was based upon the laws of blood-revenge, of which the primitive Slavic designations are found in O.Slav. svant:, Russ. vstot, 'revenge,' and O. Russ. vretstv, Vel. svstot, sver, 'criminal.' The practice of blood-revenge persisted among the Slavic peoples until the dawn of historical tradition, and among the Southern Slavs, indeed, until recent times, has been known in BLOOD-FEUD (Slavonic), vol. ii. p. 783 ff. There is no doubt, however, that in very ancient times the blood-revenge could be adjusted by means of the wergeld, and this holds whether the Russ. term for wergeld, viz. vito, is of cognate origin with the above-mentioned Skr. svart, or A.S. svært, or serv. kve (Russ. krot, 'blood'), all of which mean both 'homicide' and the 'compensation' paid therefor.

In process of time blood-revenge was gradually abolished, and superseded by ransom (Russ. svatok), which on its older form sanctions blood-revenge only in cases of murder or serious bodily injury, and confines it within certain degrees of kinship, brings us to this stage, as in other cases it substitutes for blood-revenge, the thousandfold, 'money-payment for an offence,' viz. 'sale,' (of vengenance?). The prodicta either fell to the chief alone, or was shared between him and the injured party. That for which compensation was paid was usually called 'goods,' but it should be noted that obrok is the common term for slava, and is not limited to its modern sense of 'insult.' The classical tongues were then drawn upon for words to express the idea of compensation; thus we find O. Russ. eax, and A.S. eorh, for was borrowed from one of the Teutonic dialects. If the latter alternative is the right one, the original Slavic term must be looked for in such words as Czech knava (Russ. godov, 'head'), Pol. serce, or Serv. kve (Russ. krot, 'blood'), all of which mean both 'homicide' and the 'compensation' paid therefor.

The question arises, however, whether in the case of the Slavs, as in that of the Teutons, the conceptions of crime and punishment in general did not spring from the narrower ground of transgression against the community and its tutelary deities. Of Slavic terms for 'crime' there is only one, and that is not peculiar to the various Slavic dialects, viz. O.Slav. grčká, 'sin,' a word etymologically obscure (cf. Berneker, Slaw. etym. Worterb., Heidelberg, 1908, p. 350 ff.). It is certainly the case that this word, as used in a literary tradition under Christian influence from the first, is, in general, practically equivalent to 'sin against God,' precisely like the O.H.G. suntan and Goth. framwrits (see above); it always signifies a transgression in the ecclesiastical sense, while a civil offence is called studejand, which should be borne in mind, however, that, as grčká is found in all the Slavic dialects, it must go back to heathen times; and it is natural, therefore, to see in this word the Slavic (as in suntan or framwrits the Teutonic) equivalent of the Gr. ὑγεῖα = Skr. āgna. And since, as we saw above, all matters were referred for decision to the public assembly, and as there is also evidence for a primitive Slavic word signifying 'tribunal' (O.Slav. svrto), it will hardly be counted rash, the present writer thinks, to assume that here too, as among the Teutons (for the concilium, see above), and also the Macedonians,2 the trial assembly was a court which might deal inter alia with offences (grčká) against the community and its gods. That such infringements of the public interest are not mentioned in the Russkaja Pravda is explained by the fact that the latter is not, and does not purport to be, a code. The practice of blood-revenge for murder, for instance, was in the first-named group goes back to a primitive form karat, which is found, with or without derivatives, in many Aryan languages, and means 'army' and 'war' (O. Pers. karā, 'army,' Lith. kari, 'war' and 'army,' Ger. kriegen, O. Russ. karjai, Irish cairt, 'army'). If this series be correctly interpreted as originally denoting the national army drawn up for war (cf. Schrader, Sprach. u. Kultur v. O. Russ., 1901, p. 349 f.), one is tempted to take the further step of connecting karatī, 'punish,' with the judicial functions which we have conjecturally ascribed to the Slavic 'assembly' (cf. also adver = eŭma in Hesychius).

2. Particular crimes and punishments.—As it cannot be expected that the present article should deal with the entire criminal law of the ancient Teutons and Slavs, the writer proposes simply to emphasize the fact that this is a great lack of preparatory works in this field, particularly on the Slavic side, so that only a few of the more important points can be referred to. We saw above that the Teutonic and Slavic races from the very first drew a distinction between those offences which, as directed against the community, had to be punished by the community (i.e. the public assembly, and subsequently the State), and which, bearing merely on the individual, were found in all the various Teutonic tribes. Even at a very early period, however, we find that penal offences coming under the latter category, such as murder or flagrant theft, were really assigned to the former, so that it is impossible to make the distinction. The question of the principle of an exact classification of crimes. But we can hardly doubt that the species of crime referred to by Tacitus (Germ. 12), viz. cowardice in war and treason,2 was always clearly discriminated from that which embraced personal assault, ordinary homicide, robbery, etc. The original Teutonic word for 'cowardice' would seem to be found in the O.Norse orgr, A.S. earh, Lombard orga (a term of abuse), O.H.G. orga, 'cowardly'; while an old term for 'treason' appears in O.H.G. heriz̄, 'desertion from the army.' An O.Russ. term for a related crime was perevet (cf. Russ. oreti, 'answer,' O. Russ. vodo, 'public assembly,' O. Russ. vudati, 'speak'), 'secret treasonable communication of intelligence,' for which, of course, as for the crimes mentioned by Tacitus, the penalty was death (Pokrovskaja Grammar, Jirecek, ix. 14).

We shall, therefore, treat of the various offences, apart from those against honour, under the following:

1 For the Teutons, Grimm, Deutsche Rechtsetalter, p. 74 ff., is still the best guide; 2 Ignati et imbelles, proditores et transuges.```
CRIMES AND PUNISHMENTS (Teutonic and Slavonic)

(1) Crimes against the person.—It is creditable to the Teutons that they discriminated between killing in general and murder, i.e. (according to the ancient point of view) the wilful and secret (or, in other words, taking by human life) crime denoted by the following series of words: Goth. maunri, O.Norse morð, O.H.G. mord, cognate with the Lat. mors, morītis, 'death,' though it should be observed that Ulflas (MK 17) uses the term in a sense more nearly corresponding with Barabas who is said to have committed a maunri (ψάρον) in the insurrection (τοῦ ψάρου), and, therefore, not in secret. The idea of secrecy receives its first distinct expression in the exclusively German forms compounds with mäh, viz. mählwerk, mählhärte, meuchelmaord; cf. O.Irish firmángthle, 'alsconditás.' A somewhat different shade of meaning appears in the Slav. razboj, which is the usual word for 'murder' in several of the Slavic languages, and which in Old Russian means both 'highway robbery' and 'ambuscade.' According to the Russkaja Pravda (Diyerec, iv. 4 and 5), one who kills another openly in a quarrel or at a feast may be punished only if he has assembled a band to commit razboj without any quarrel, the people shall not pay a fine for the razbojnikā, but shall surrender him absolutely, with wife and child, to the polokā and the razgrabliāri (for these punishments, see below). Of the above Teutonic terms for the infliction of bodily injury only the Frisian dolch need be referred to here. In the Lex Frisorum it is the most comprehensive term for wounding of all kinds. A familiar phrase is dath uus, 'you killed,' of which, e.g., in O.H.G. noch tolk noch töt. Dolch comes from Goth. dulgis, 'debt,' related to O.Slav. dílig, 'debt,' and O.Irish díliged, 'debt,' 'duty,' 'law,' 'right.' There was thus a term signifying 'debt,' 'obligation, commonly to all the Slavic languages of Northern Europe, and this acquired the special meaning of 'obligation to pay compensation for bodily injury,' and eventually that of the 'injury' itself. Beyond this, however, no rigid distinction was made between homicide and wounding, and O.Norse words like vig, är, and drep may signify either. In the Russkaja Pravda the only difference is that the fine for homicide is termed vira, while that for wounding is termed prolota (see above). 'Slander' and 'false accusation' are also crimes of this description: death shall he pay to [the prince] three grijvenicks, and to the person injured one grijvenick, and money for the doctor; but, if he does cause death, the vira must be paid' (Diyerec, iv. 24).

(2) Crimes against property.—Of all crimes the first to acquire a precise terminology was theft; this takes us back to primitive Aryan times—cf. Skr. stena- and tává-, 'thief,' O.Iran. tává-, 'thief,' O.Iran. táv- 'thief,' O.Slav. tati, O.Irish táid, 'thief,' and also Gr. κλέπτας, Lat. clandest, Goth. klifin, and Gr. χλεπή, Lat. fur. A form common to all the Teutonic dialects is represented by Goth. stilen, while all the Slavic languages, have also terms corresponding to O.Slav. kradó, krasči, 'steal.' The fact that in all these languages the words connoting secrecy are related to the terms for 'thief,' 'theft,' 'steal,' (e.g. Skr. stàyat, 'secret,' to stend-, O.Slav. toj to 'thief,' to kradó, etc.) clearly shows that it was the element of concealment which distinguished theft from open robbery (Goth. birmanůn, A.S. régfan, O.H.G. ræðfan; and O.Slav. grába, Russ. gráblin, Pol. gróbil, etc.). As robbery, however, was not in primitive times counted dishonourable (cf. Schrader, Reallex. s.v. 'Raub'), and as, even in historic times, theft was often punished more severely than robbery, it is obvious that the ethical ideas of later ages must have undergone a complete transformation. The horse-theft was punished with signal severity by Teutons and Slavs alike. It is recorded, e.g., in the Vitae Legiudri, i. 26 (ed. Brouer), that by order of Duke Witiza a horse-theft was put to death by stoning, while the above-quoted passage of the Tovkóvaja Gramota puts the horse-theft (koneyog tati) and the incendiary (začinjnikāh, cf. O.Fris. mortbrond) on a level with the persecutions (see above); they are all liable to the penalty of death. In the ancient Teutonic codes the general term 'theft' comprises a large number of subordinate species with distinct names, for which, so far as the present writer is aware, the Slavic codes furnish no equivalents. Thus we have O.H.G. wetlcrvnkp, A.S. wealcf, 'stripping of corpses,' and O.H.G. herirecta, etc., 'ravaging,' i.e. 'the perpetration of crime—especially robbery—in bands. Closely allied to this is Heinsmechung (O.Fris. heinsmeche; in Scots Law, hameswucken), 'douis invasion in aliquam familiam,' which, however, may be committed by a single person, and in that case resembles the modern Hausfriedensbruch (Lombard 'curtis ruptura,' quod absque inest obversa lex).

(3) Crimes against morality.—In marked contrast to the class of crimes against property, the class embracing what would now be reckoned crimes against morality has a singularly meagre vocabulary. This is best illustrated by the change that has taken place in men's ideas regarding sexual morality (see also art. CHASTITY [Teut. and Balto-Slav.]).—A change for which, alike in Teutonic and in Slavic countries, the way was opened by the Christian Church. It may be noted, first of all, to incest, the Teutonic family of languages, so far as the present writer knows, has but one specific term applicable to this crime, viz. A.S. sib-leger, 'lying (i.e. cohabitation) within the family,' which points unmistakably to family exogamy. In Anglo-Saxon glosses the Lat. incestum is rendered hærwæ, which, however, means caušsī simply—lawful or unlawful, or even adulterous. No O.Russ. term for 'incest' (modern Russ. juxtaćenij, 'blood-mixing') is known to the writer. Any such term would, of course, bear the stamp of the Church. We find, for instance, that the metropolitan Johannes II. imposed penance upon marriages between persons as far apart as the fourth degree of blood, but in no cases where there cause death, he shall pay to [the prince] three grijvenicks, and to the person injured one grijvenick, and money for the doctor; but, if he does cause death, the vira must be paid.'
is rendered by thiueverifin, theorifa, 'women-stealing'; cf. also O.H.G. nötzgoi, 'to abduct forcibly,' nötvanf, notvanf, A.S. nylægme, O.Norse nôthhtkt (not is lit. 'force'). In Old Norse also, nôthhtkt, 'violence,' is also used for the crime of rape.

It would be interesting to know the Teutonic name for the corpse infames, who, according to Tac. (Germ. 12), were punished by being submerg- ged in a barrel. It seems probable that the reference is to sodomy (O.Norse sorðinn, storðinn, 'mulicbria passus'). There seems to be no recorded evidence regarding the Slavic practice in this respect.

B. PARTICULAR PUNISHMENTS.—Here we distinguish (1) capital punishment and outlawry, (2) corporate punishment, and (3) abridgment of personal freedom.

(1) Capital punishment and outlawry (banishment).—The peculiarity of this penalty of death, as decreed by the public assembly, was known to the Teutons is shown by Tac. (Germ. 12).1 The commonest form of execution was hanging, and the root-word denoting this penalty is common to both the Teutonic and the Slavic languages. O.H.G. Gulg, O.Norse gylg, A.S. gealga (Eng. 'gallows'), O.H.G. gylgo. In ancient Russia likewise, according to the passage already cited from the Školskaia Granulda, the perpetrators of most serious crimes, whether by order of the public assembly (veče) or of the chief, and in this case also resort was usually had to the gallows (Sreznevskij, s.v. 'Povešenije, Pověšatíĕ').

According to the Teutons, 'outrawly' (banishment, exile), i.e. expulsion from the tribe, was in its effects practically equivalent to capital punishment. The most ancient word applied to a person so proscribed is retained in the Lex Salica as hæring, 'hanging, as, hoc est expulsus de codicem pugio' (cf. Goth. gwerorgan älataen, 'to condemn to death,' O.Norse vørg, 'wolf' and 'outraw', A.S. wæorg, 'the malefactor sentenced to the gallows or to outlawry,' etc.). He was altogether outside the law (O.Norse vægr, A.S. ñægr), and any one who met him might kill him, and was, indeed, bound to do so. This penalty was often combined with 'laying waste' (O.H.G. wœosten); i.e. the members of the judicial community assembled together to burn or ravage the criminal's house and property. The term 'outrawly,' supplemented thus by the idea of ravage, corresponds with the potoku or potoká and rozpravbienie of the oldest Russian legal documents. The latter word means 'striking,' 'hitting,' which should possibly be translated 'expulsion,' 'banishment,' (Russ. tociti, lit. 'to cause to flow, tekâ, 'flow'). The penalty affected not only the criminal, but his wife and children also, and was inflicted for murder with robbery, horse-stealing, arson (see above, p. 309), and Sreznevskij, s.v. 'Potoku'), and similar grave crimes.

For the special objects of this article it is a question of great importance whether the execution of criminals among the Teutons was— as the foregoing observations regarding their conceptions of crime suggest—a religious ceremony, i.e. whether at bottom it was designed to operate like a sacrifice in appeasing the wrath of the gods. The affirmative has the support of such distinguished writers on the history of law as H. Brümer (Deutsche Rechtsgeschichte, i.), R. Schröder (Lehrb. d. deutschen Rechtsgeschichte), though E. Mokg (ASGO xxviii. Leipzig, 1890) 17 has recently called in question the practice of hanging among the Teutons. In any case there is the evidence of a passage in the Vita Wulfharii to show that among the Frisians executions were performed at the festivals of the gods (cf. Müllen- hoff, Deutsche Altertumskunde, Berlin, 1870-1890, ii. 244). With regard to this practice the present writer has no evidence to offer.

(2) Corporal punishment.—Punishments involving mutilation of the body—cutting off the nose or ears, severing the hands or feet, blinding the eyes, or even severe floggings—could not possibly be regarded as punishment solely preliminary to the death penalty, were in all likelihood introduced at a relatively late period. In primitive times, among Slavs and Teutons alike, even the infliction of bodily injury was generally made by private revenge, and the practice survived till the time of the Russkaja Prawda (cf. Jireck, iii. 2: 'if he has been beaten till blood comes or till he is blue, it is not necessary for him—this man —to seek an eye-witness. If he cannot avenge himself ([mistiti], he shall receive for the crime [za obidu]; see above) three gryvniw, but the doctor [receives] the wages'). Such vengeance would, of course, be carried out according to the principles of the lex talionis, and cannot, therefore, be regarded as punishment in the technical sense. In course of time private revenge for wounding was superseded, both among the Teutons and among the Slavs, and partly in consequence of their mutual relations, by the infliction of penalties prescribed by public authority. A more difficult question to decide is when and how corporal punishment found its way into the ancient codes. On the one hand, such penalties were probably first of all inflicted upon slaves and serfs, who, of course, could pay the regular fine. The Lex Frisiorum, for instance, recognizes corporal punishment only in two cases, viz. (a) as merely antecedent to the penalty of death, for those who had been taken in the act of robbing a temple (cutting off the ears and castration), and (b) as meted out to a delinquent serf whose master refused to pay the fine. Similarly the Russkaja Prawda (Jireck, iii. 16): 'if a serf (cholopî) strikes a free man, but takes refuge in the house, and his master refuses to give him up, then let [another] serf be taken, and the master shall pay twelve gryvniw for him. But if afterwards the man who was struck finds him, he shall beat him' (dix bijatt ego). So far as the present writer knows, this is the only example in the criminal codes of Russia of the infliction of a corporal penalty. On the other hand, the credit of introducing corporal punishment must be assigned to the clergy, as is proved with special clearness in regard to Russia. In point of fact, the clergy and the church could give what the state could not—new ideas, such as, e.g., that it amends the evil will, deters others, and the like. For the attainment of these ends they believed—after the example of the Byzantine legislation, which had elaborated this system with great fullness—that such bodily penalties as blinding, severance of hands, etc. (many of them on the Mosaic principle of 'an eye for an eye'), and floggings formed the appropriate means. According to Jaroslav's Ustâr, —the ecclesiastical counterpart of the Russkaja Prawda,—a sorcerer, e.g., must be punished (kazniti) after conviction, and she must further pay a fine (penija) of six grynviw to the metropolitan. The nature of the kazniti appears from a warrant of the Russian metropolitan Johannes (1089-89), according to which the officers shall 'smartly chastise' (jaro kazniti), i.e. beat her, 'but

1 Mos eva... ut corpora hominum damnatorum in morum sollemnis decorum... sappiscit diversis literar modis; quosdam valorisque sunt personae sacrantur, alios patribus appendunt, alios laevis acerbissimis vitam extendunt, proterae et alios marinarum sive aquarum floribus submersantur.'

not to death, nor cut off her limbs.' It is a well-known fact that under the power of the clergy, the Church, and the State, they would do, as well as in the illegality of those who, out of aim and effect, had no repressive influence on crime, the numbers of those in penal servitude at that time being more than three times as great as in 1910. No real and steady fall in crime took place till in 1879 the Summary Jurisdiction Act put an end to these long sentences. Almost simultaneously a uniform system of prison administration and treatment was inaugurated, and all local prisons were handed over to the State. The coincident fall in crime, which began then, and has steadily gone on since, may fairly be ascribed to a large extent, to these two reforms, which may be said to combine mitigation of penalties with uniformity and certainty of application. From time to time, however, the treatment of offenders oscillated between extreme severity and extreme laxity; but, when both these principles were rendered in the same way—denoting instability of administration—the very worst results ensued. About the year 1870, as punishments were more freely passed and not inflicted, the convict population of Great Britain, with its population of 15 millions, consisted of no fewer than 50,000 persons, some in hulks and prisons at home, others in penal settlements abroad. The necessity of punishment, which was enormous, was surpassed only by the futility of the system of punishment. Subsequently the Penal Servitude Act of 1853, and the refusal on the part of our Colonies to receive convicts, put an end to the system of convict transportation. The number of convicts meanwhile declined, till in 1862 it was 17,000; and in 1878, when the local prisons were handed over to the State, it amounted only to 10,000. At present (1910) the number is about 9,000.

Receding severity in punishment occurred now and then, as, for instance, when flogging was freely resorted to in order to put down garrotting; but on the whole the tendency of our criminal law, since the Prison Act of 1865 at all events, has been in the direction of leniency in prison treatment; and the results have been satisfactory. To a large extent this spirit of leniency may be regarded as in itself a reflection of the improvement in the character and conduct of our people, which, again, depends largely on the general advance in civilization, together with the spread of education, intelligence, temperance, and other influences designed to elevate the penal code. To 1848 (the year of the primitive Russian law); Encyclopaedia Dictionary of Old Russian; St. Petersburg, 1882: V. Kinevskii, Course of Russian Penal Code, 1870; V. Kinevskii, History of Russian Law (Russian); O. Schrader, Die deutsche und russische Recht., 1880; V. N. Kinevskii, Geschichte der Rechtsgeschichte der Russischen (containing a treatise by M. von Puschkin).—The chronological development of the general conceptions of crime and punishment in ancient Russian law; and one by V. N. Kinevskii on the criminal law of the peninsulary, with an amble history of English penal law. —The chronology of the criminal law of both sexes, and of all ages and varieties, and the total neglect of the authorities to bring any religious or moral influences to bear upon the unhappy inmates, produced an inevitable crop of profligacy, moral and physical corruption, widespread disease, and death. When at last she woke up, and found that proper sanitary buildings and separation of prisoners were essential to reform, and when Pentonville Prison was built in 1842, an impetus was at once given to same administration. Since then England has been amongst the foremost of
the nations in the search for some equitable, moral, and scientific scheme of prison treatment calculated to reconcile the rights of society with the rehabilitation of the criminal so as to enable him to return to a law-abiding life. It is, however, to the United States that we must look for the progressiveness of experiments in this direction. No methods of reform and no social experiments appear too costly or troublesome to the indefatigable philanthropists of America who take up this subject, if only they are reasonably likely to reclaim criminals. Starting with the root-idea, which may be over-sanguine, that no one is absolutely irreclaimable, they have established at Elmira, and other prisons, or 'State Reformatories,' a system based on the indeterminate sentence, combined with conditional liberation on parole when the prisoner gives satisfactory evidence of reform. A somewhat strict discipline, with drill of a military character; instruction in skilled industries; moral, religious, and secular education, united with various kinds of amusement, are expected to alter character, and turn the subjects into good citizens. Further, every one is enabled to profit pneumatically by his own work, and is expected to demonstrate his fitness for discharging the homes in which he is confined, but he must first find employment. Probation officers supervise and help those on parole, and misconduct leads to forfeiture of licence.

From this sketch of the system, which is a type of American prison reform, it can be seen that Elmira is practically a reformatory for adults, who are received up to the age of thirty. All are known as 'inmates,' not prisoners, though they are under sentences of from one to a possible twenty years. Considerable success is claimed for the Elmira system, but statistics are not convincing as to the number of reclaimed cases, originally alleged to be 80 per cent. According to a report of the New York Prison Association, which recently analyzed the cases on parole from Elmira, 'probably not over 70 per cent of men paroled can be classed as reformed,' while some other authorities put the percentage at 50. 'Society is best protected,' they say, 'by the reform of the criminal.' One point emerges, however—the actuality of the incorrigible, of whose too frequent appearance at Elmira they make complaint. The tracing and following up of the reclaimed is difficult in so vast a country, with unlimited facility for travel.

Generally speaking, in the United States a unit of the best and most progressive prisons, it has also many of the worst in Christendom. Race prejudice against the negro, who is held to be either irreclaimable or not worth reclaiming; Labour Laws which, in many of the States, either prohibit altogether or restrict the sale of prison-made goods, and so keep prisoners idle, or employed in unproductive work; constant changes of the wardens or governors as political parties come and go; public apathy and parsimony in regard to prisoners; and the general desire to make prisons pay their way—these are the conditions which make the state of most of the county and city gaols fall very far short of modern ideals. The lamented Howard Association, Mr. Edward Grubb, made a tour of some of these prisons in 1904, and found them very unsatisfactory, and in startling contrast to the State Prisons and Reformatory. He says:

These institutions (county and city gaols), designed for the mere keeping of prisoners awaiting trial, or for the serving of short sentences by misdemeanants, are, with little exception, far from satisfactory, even in the Northern States. The best I saw was at Baltimore, Pennsylvania, and at Cleveland, Ohio, to say nothing of the South, the gaols were, for the most part, far from clean, and the prisoners were shut up together, with no chance to reform. Neither had they no occupation (as Mansfield they were engaged in making bricks) nor opportunity to corrupt each other. Either they had no occupation (at Mansfield they were engaged in making bricks) or opportunity to corrupt each other. They were employed in the House of Corrections, where they were working in a very half-hearted manner.' He describes the state of the convict camps as seeming with abuses—indiscriminate association, negro women 'constantly having babies,' terrible cruelties and even murders, and bad encouragement and conditions (see the pamphlet published by the Howard Association).

Even in the better class prisons, many of the privileges enjoyed in Europe are curtailed in order to secure a freedom which would probably be unsuitable for the class of habitual. Buying and selling, the free use of tobacco for smoking and chewing, card-playing, cinematograph exhibitions of prize-fights, and so on, are too advanced expedients for moral improvement to appeal to British sentiment.

Like everything else in the United States, crime is on an immense scale. A country so huge in itself, containing such a varied population, black and white, and receiving every year hosts of immigrants from everywhere, is, in the nature of things, a hunting-ground for criminals. Further, it has almost as many penal systems as it has States, so that it is difficult to estimate the general effect on crime of any special penal measure. In practice it is by no means universally adopted. The magnificent modern prison built by France at Fresnes has been designed for separation, but there is considerable scope for association also, in order to prevent overcrowding. It may be said that the principle of cellular confinement on the separate system, which was established by law in England in 1865, finds favour with all European nations, as it does with all British Colonies, and with progressive Japan; but in practice it is by no means universally adopted.
applied by each country. For purposes of comparison with our own results it has been found impossible to arrive at any definite or valuable conclusions. If murders only were reckoned as a test of the amount of crime, Great Britain would certainly rank high; but this would give a false idea of the temper of the population, for murder is not a crime which prevails. Offences against the person are much more common in some countries than in others, while offences against property form the bulk (as in our own country) of the crime in others. There is, however, another division which can be drawn from the general survey. Recidivism is rampant everywhere. In France it has been specially prevalent, and the recrudescence of crime, particularly amongst the Apaches, or bozilgan class of youths, who commit flagitious and even more flagitious crimes, is, of sinister omen, and has already led to a revival of capital punishment. Whether or not these phenomena are to be regarded as only temporary manifestations of a prevailing state of general social unrest, of which we shall presently speak, in the strike-riots in France, Germany, and Wales, it is certain that a heavy responsibility rests on those who preach anarchy. It is well they should remember that crime is not, like disease, contagious, and that it cannot be said that criminology is yet by any means to be reckoned amongst the exact sciences. Human nature with its faults and foibles may be the same all the world over, but the different phases of criminality, the different methods, the different idioms and temperaments which characterize various races, all tend to modify our pre-conceived ideas as to the possibility of repressing crime, as a general evil affecting the world at large, by any remedy, or by any system of remedies designed as a preventive, reformatory, or punitive in intention, which can be held to be of universal application. It is well to understand that there is no royal road to the solution of complicated problems of this kind. We can only hope to avoid the creation of more or less disparaging comparisons between our own methods and those of our neighbours in matters of social reform. Introspection of this kind is undoubtedly a national characteristic that is highly advantageous, tending, as it does, to check complacency and stimulate progress; but we must not lose sight of the fact that many features of the judicial procedure and the penal systems in force amongst Continental nations are utterly foreign to our ideals, and ill-adapted to our use. The well-known practice, for instance, of 'interrogating' accused persons, which in our eyes, amounts to heckling of a particularly cruel and vindictive type, is to foreign eyes the main sine qua non of our criminal law, which holds every man innocent until his guilt is proved, that we could not, if we would, fit so incongruous a practice into our scheme of things. In the same way, the lifelike interest that we take in the lives of our criminals, with some Continental nations, by the side of which our brief terms of mitigated separate confinement seem unheroic and contemptible, are so repugnant to our national sentiments of justice and humanity that we decline even to look at them.

It has been said that every country has the government it deserves. The dictum applies with equal cogency to its laws, to its administrative machinery, and to the penal and disciplinary measures which it deems necessary for the guidance and control of its citizens. We may assume, in fact, that every country knows best the main lines on which its subjects can be kept in order; and it will be found that national barometers of crime, punishment, and national temperaments are factors which have much more to do with the shaping of penal systems and codes of moral discipline for peoples than the degree of civilization to which these peoples have attained. We find, accordingly, that the civilized countries generally differ very widely from one another in the matter of criminal law administration, that the range of variation is almost as great as that which distinguishes civilized from savagery in its methods of control —all due weight being given, on the other hand, to the consideration that indigenous plants do not always thrive in foreign soil.

It would appear, then, that very little is to be gained by comparing or contrasting one penal system with another when they are not really parallel, and much less by trying to glorify one at the expense of another. We may feel convinced that our own system, which has been evolved from our experience, is so well adapted to our circumstances that it cannot be said to approach rashness, is fairly adapted to our present-day requirements; but it is very doubtful whether it would meet the wants of different states of society in other countries, or even in our own under the social conditions that prevailed half a century ago. The criminals of that period would undoubtedly have been attracted, rather than repelled, by the comparative amenities of life in a modern prison. Hosts of them would have taken a long vacation without incurring a penalty, or being unable to enjoy it, while taking a retreat, seeking compensation, in a restoration of their health and energies, for any inconvenience or boredom they might have had to put up with while undergoing moral repairs. It must seem strange to those who are unfamiliar with our British moods of self-deprecation and pessimism that the very confident theorists who are never tired of reminding us that we are on an entirely wrong track, and that our system is a farce, should practically all be found in our own camps, the ex-criminals take by no means so disparaging a view. Recognizing, as they do, the enormous reduction that has taken place in recent years in our number of criminals, they look somewhat fixedly with a rhetorical explanation, which is frequently resorted to in similar cases, that improvement has come 'in spite of the system'; they regard the system, as a matter of fact, with a much more favouring eye.

Further, it is a fact that in very large measure the after due allowance has been made for the effects of family tradition, our progressive and up-to-late younger brothers in Australia, who are neither visionaries nor dreamers of dreams, follow very closely our procedures and practice. The fashionable outcry against modern penal treatment is really traceable to the fluent pens and forensic accomplishments of ex-criminals, who by their
ex parte allegations seem to have captured the greater part of the press and a considerable portion of the general public.

In *Crime and Criminals* (1910) the present writer made an effort to stem the tide of delusion and misrepresentation on the subject, but it still advances. The basis of this pessimistic outcry is complete fallacy. Prison treatment, we are told, is a failure because 'it neither deters nor reforms the habitual criminal.' But all the authorities are agreed that the distinguishing characteristic of the habitual criminal is that he actually prefers his vocation to the humdrum alternative of a steady and active working life. The writer's own intimate and first-hand acquaintance with the living evidence enables him emphatically to confirm this doctrine. We are warned over the hideous criminal's vicious propensities are innate or acquired, it is certain that his habits, when he reaches maturity as we find him in prison, are practically ineradicable. The spirit of the road seems to have already developed into fixed habits, so that he is, to all intents and purposes, a hopeless incorrigible. Here lies the difficulty. No system yet invented can fairly be expected to alter a person of this type. To carry out this theory appears to be a feat analogous, both in sound and sense, to squaring the circle. We are not, however, without some means for dealing with him. If methods of cure are not feasible, prevention and restraint will do as well to use as treatment for the incipient habitual, and preventive detention for the veteran, typify these two modern prison expedients respectively. For the present, however, the writer is more concerned to point out the fallacious reasoning on which the theory of failure is based. No notice whatever is taken of the important fact that the number of habitual criminals at present in business has been brought within such manageable figures that it may quite reasonably be said that we have them in a ring fence. The same set pass in and out of prison with apparently unvarying regularity, and, for the most part, for the same kinds of offences. Specialisation in crime, indeed, has become so marked in our time that the police authorities of Scotland Yard claim that they can, in most instances, tell, from the manner in which a clever burglary or robbery has been planned, the name of the individual who committed it. We might fail to expect that the reduction of a standing convict population of 10,000 persons in 1880 to 3000 persons in 1910 would be considered a respectable achievement under any system, and would give rise to some doubt, if not disbelief, in the minds of thoughtful and intelligent people, as to the truth of the failure theory. The current of general opinion, however, if we are to judge from the press, sets in quite the opposite direction; and we are led to believe that we are going from bad to worse. The apparently habitual and incorrigible, although they decrease steadily enough in numbers, decline to amend their ways, or to vanish en masse into the obscurity of some honest calling. It is well we should cherish no illusions on this subject. Our repressive measures stand in constant need of tightening up for this intractable class of criminal, and our reformatory methods in like manner need constant widening in scope, if we are to arrive at better results; but no conceivable combination of them will ever succeed in totally eliminating those obnoxious persons from the community. In regard to the system itself, it is not claimed that the mere absence of failure denotes the presence of perfection. It is quite conceivable, and perhaps even probable, that not more good might be accomplished in other countries by a different set of principles and machinery; but it is claimed that our own system has produced fair practical results, and that it is better suited to our national requirements than any exotic system with which we are acquainted.

4. Theories of punishment.—But, if public opinion is unsound in regard to the treatment of the criminal, the classic and purely theoretical dichotomy to the one side of the prison or on the other side of the fence is being put by our authors in its stead the fantastic substitute of a collective guilt. Prison, as comprising the whole body politic, is a pernicious feature of our time. Surely a more demoralizing doctrine, destitute alike of the sanction of religion, morality, law, and common sense, has never been invented. The prolific crime that our system has given rise to is the result of throwing together a motley bag of the lowest and most degenerate and self-respecting people. Those who aspire to regenerate society by this egregious piece of social philosophy are hugging a very vain delusion. It abolishes at a stroke the exercise of free will, which is the foundation on which even the very thing it is outside the realm of logic. If any sane individual in the community be permitted, even in the name of philosophy, to divest himself of his social and moral responsibility by the simple process of being put in prison, he is seemingly open to any, or all of the other individuals of whom society is composed to claim a similar privilege. A premium is thereby placed on evil-doing, and every man is tempted to become a law unto himself. The practical result is a sort of self-administered, partial relaxation of our moral code would undoubtedly be that the maintenance of social order would be rendered difficult, if not impossible; we should find ourselves retracing our steps in the direction of barbarism; and, incidentally, we should find the world a distinctly unpleasant place to live in.

It is not to be supposed, however, that the theory of personal responsibility is to be applied ruthlessly to those who are, at present, delinquents and the incapacitated, but incapable of fully appreciating the significance of their offences, and who are, to this extent, not answerable for social conduct. It should be the aim of any humane system to apply disciplinary methods very sparingly, if at all, to those unhappy class, who at present amount to 3 or 4 per cent of our prison population. Hitherto these hapless offenders—"weak-minded, but not insane," in the language of the Courts—have been a source of much anxiety to the authorities, and few, if any, have had to deal with them, as well as to prison authorities who are constantly receiving them on short and useless sentences. In prison they have been treated under a very modified form of discipline, and efforts have been made to improve their conduct and condition. Medical protection has shielded them from actual physical detriment, but the atmosphere of a penal institution is by no means conducive to their moral improvement, nor is it one in which they would be compelled to live even for short periods. The Royal Commission on the Care and Control of the Feeble-Minded has fully recognized this weak spot, and legislation is now urgently needed to carry out their recommendations.
