Mr. Charles P. Tower, who has been identified with American yachting for many years past, and who has been a close student of the history of the sport, has recently written a most interesting story, entitled "The Story of the America's Cup: How It Was Won at Cowes in 1851 and How It Has Been Defended for Half a Century by the New York Yacht Club." It is really the first condensed, yet complete, book that has been published on the subject, and at this time, when international racing is at its height, this book is particularly apropos, and should meet with a ready sale. Copies can be secured from Thompson & Co., 9 Murray street, New York city, for 25 cents.

One of the finest pieces of marine photography that has been seen this year is a picture of Constitution, recently sent out by Edward Smith & Co., the well-known varnish makers. The picture is printed on heavy paper, and is quite suitable for framing.

The schooner-rigged steam yacht Rapidan, owned by R. Hall McCormick, of Chicago, lies a probably total wreck on the Delaware Capes, at a point known as the Mariner's Graveyard. The yacht left New York Monday, Sept. 9, for Cape May. On arrival off that point late on the night of Sept. 10, the weather conditions were such that it was not safe to make an anchorage, and Capt. Staples concluded to make the Breakwater. A thick rain was on and a strong ebb tide cutting the yacht around the point caused the man at the wheel to get the harbor lights twisted, and he ran the yacht on the point, going full speed ahead. She lies well upon shore, with a heavy list and full of water, and the chances of saving her are slim. The yacht was under charter to J. A. Roebing & Son, of New York. H. G. Roebing, president of the company, and Henry L. Shippey, its treasurer, were passengers on the yacht. There were eight others persons aboard, and all were taken off safely with the aid of a surf boat from the Maritime Exchange station on the Breakwater.

The steam yacht Aileen, owned by Richard Stevens, of Castle Point, Hoboken, was picked up seventy miles out at sea, and towed into St. John, N. B., by the S.S. Sahara, on Saturday, Sept. 14. The craft had been cruising along the coast of Nova Scotia, and was on her way from Halifax to Gloucester, when her machinery got out of order. She was picked up by the Sahara Thursday evening. The party cruising in her was landed at Canso.

Goin' Back.

From the Denver Republican.

I've packed my traps and I'm goin' back where the fields are green and broad, And the colts, with their legs all doubled up, are rollin' on the sod; They'll smile, I s'pose, when they see me come, and they'll, some of 'em, likely say They thought I'd forsaken the farm for good the day that I went away— But let 'em smile—I'm goin' back—I'm sick of the noise and fuss, Where a couple of dollars count for more than the life of a common cuss; They'll nobody notice I've went away—if you told 'em they wouldn't care, But somebody's face'll be full of joy when she greets her boy back there.

I'm goin' back, for I've had my fill—I've saw what there is to see; The city may still be the place for you, but it's lost its charm for me; And won't I be lonesome there, you say, with the people so far apart? Well, mebby they're few and far between, but each of 'em's got a heart; There ain't no hundreds of thousands there to push you around, I know, Not carin' a cent where you're comin' from or where you're tryin' to go— For the one that's jostled day after day, with never a friend to greet, There ain't a lonesomer place on earth than the city's crowded street.

I'm goin' back where the dog's asleep on the step by the kitchen door, With his nose pushed down between his paws—I'm sick of the smoke and roar; There's money to make where the crowds are thick and they're tryin' to rip things loose— There's money to get if you've got the grit; but, dang it all, what's the use? They hustle for dollars all through the day and dream of dollars in bed; And forgive the goug'in' a fellow may do as long as he gets ahead— They hustle and bustle and coop themselves in dark little holes and fret And honor a person accordin' to the money he's managed to get.

I'm goin' back where the poplars stand in tall rows down the lane, Where the bobsled's settin' beside the barn, defyin' the sun and rain; Where the birds are singin' away as though they were bired to fill the air With a sweetness that nobody ever can know who was never a boy out there; I'm goin' back where they'll not expect me, to sit in the kitchen when I'm courtin' the girl I love because I'm workin' for other men— Where the richest among 'em'll shake my hand, instead of lettin' me see That they think the money they've got must make them a blamed sight better than me.

I'm going back, and you'll stay here and rush in the same old way, Goin' to work and then goin' home—the same thing day by day— And you'll think you're havin' a high old time, and I'll pity you, lookin' back (From where I whistle across the fields) at you in the same old track!— I'm going back, but the crowds won't know, and they'll still keep rushin' on; They'll never notice that some one's face is missin' when I am gone— No, they'll never notice that some one's gone—if they did, they wouldn't care— But every tree'll be noddin' to me when I turn up the lane back there.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- Sept. 25-27.—Omaha, Neb.—Sixth annual tournament of the Dupont Gun Club, for amateurs; targets and live birds. H. S. McDonald, Mgr.
- Sept. 26.—Cresson, Pa.—All-day shoot of the Cresson Gun Club. C. Wenderoth, manager.
- Oct. 1.—Huntsville, Ala.—Target tournament of the Huntsville Gun Club. Frank Mastin, Sec'y.
- Oct. 1-4.—Detroit, Mich.—John Parker's annual international tournament; three days targets, one live bird; \$300 in money and trophies; distance handicaps.
- Oct. 2-3.—Greensburg, Ind.—Greensburg Gun Club's tournament.
- Oct. 2-4.—Louisville, Ky.—Tournament of the Interstate Association, under the auspices of the Jefferson County Gun Club. Elmer E. Shaner, Mgr.
- Oct. 2-4.—Eau Claire, Wis.—Tournament of the Eau Claire Gun Club; two days targets, one day live birds; \$300 added. E. M. Fish, Sec'y.
- Oct. 2-4.—Louisville, Ky.—Tournament of the Jefferson County Gun Club; two days targets, last day live birds; \$200 cash and trophies added. Emile Pragoff, Sec'y.
- Oct. 3-5.—Reading, Pa.—South End Gun Club's tournament.
- Oct. 8-11.—Davenport, Ia.—Forester Gun Club's tournament; live birds and targets.
- Oct. 9-10.—Huntington, Ind.—Tournament of the Erie Gun Club.
- Oct. 9-11.—St. Thomas, Ont.—Tom Donley's fifth annual tournament; live birds and targets.
- Oct. 12.—Wissinoming, Pa.—Grand opening target shoot of the Florists' Gun Club. Open to all. Guaranteed purses and added money. T. C. Brown, Sec'y.
- Oct. 15-16.—Greenville, O.—Regular annual tournament of the Greenville Shotgun Club. H. A. McCaughery, Sec'y.
- Oct. 15-17.—Pella, Ia.—Garden City Gun Club's amateur tournament. A. I. Nassaman, Sec'y.
- Oct. 16.—Mt. Sterling, Ill.—Tournament of the Mt. Sterling Gun Club. J. Breidenbend, Sec'y.
- Oct. 16-17.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club.
- Oct. 17-18.—Springfield, Ill.—Fall tournament of the Illinois Gun Club.
- Oct. 22-24.—Raleigh, N. C.—Shoot under auspices of the Raleigh Gun Club. J. G. Ball, Sec'y.
- Nov. 28.—Cleveland, O.—Shoot of the Cleveland Gun Club.
- Nov. 28-29.—Milwaukee, Wis.—Tournament of the South Side Gun Club.
- Newark, N. J.—South Side Gun Club target shoot, every Saturday afternoon.
- Chicago, Ill.—Garfield Gun Club's live-bird trophy shoots, first and third Saturdays of each month. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

CONTESTS AT INTERSTATE PARK.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice. Café and hotel accommodations.

Interstate Park, Queens, L. I.—Weekly shoot of the New Utreshut Gun Club—Saturdays.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The programme of John Parker's eleventh annual international shooting tournament, to be held Oct. 1 to 4, inclusive, Rusch House grounds, Jefferson avenue, Detroit, Michigan, announces that the competition is open to all, that there will be handicaps from 16 to 22yds., and that \$200 in cash will be added. There also will be contests for the international live-bird trophy, international two-man teams, international championship, international expert target championship trophies, and four general average trophies. Shooting commences at 9 o'clock. The ten target programme events are alike for each day, except event No. 6. There are five events at 15 targets and four at 20, entrance \$1.50 and \$2. On the first day No. 6 is the Peters Cartridge Company's international handicap trophy, handicap, 25 targets, 75 cents entrance. On the second day No. 6 is the King Powder Company's two-man team international handicap trophy, 25 targets, entrance \$1.50 per team. On the third day No. 6 is the Peters Cartridge Company's international expert trophy, everybody at 22yds., 25 targets, 75 cents entrance. The fourth day has a live-bird programme. No. 1 is at 5 birds, \$3; 60 and 40 per cent. No. 2 is at 10 birds, \$7; 40, 30, 20 and 10 per cent. Event 4 is the main event, the Gilman-Barnes international live-bird trophy, value \$150. Handicaps 26 to 32yds.; 25 live birds, entrance \$25; \$50 added; class shooting; 30, 25, 20, 15 and 10 per cent. Entrance includes price of birds. It is also mentioned that there is excellent bass fishing and duck shooting on the St. Clair Flats. Ship shells, etc., to Joseph A. Marks & Co., 93 Woodward avenue, and they will be delivered on the grounds free of charge. Extra live-bird sweeps every day. Practice shooting Sept. 30. A handsome diamond trophy for best average in programme events. Parker gun for best amateur programme average, and handsome trophy for Michigan shooter who shoots through the programme. Moneys in target events divided 30, 25, 20, 15 and 10 per cent. All target trophies become the property of the winners. Address all communications to John Parker, 465 Junction avenue, Detroit, Mich.

Dr. W. L. Gardiner, of Orange, and Mr. E. I. Vanderveer, the holder, shot a match for the E. C. cup, emblematic of the championship of New Jersey, at Freehold, on Saturday of last week. The first half of the match was in favor of Vanderveer by a score of 21 to 20, but Gardiner broke 24 to 20 in the last half and won by a score of 44 to 41. On the same day and at the same place the South Side Gun Club, of Newark, and the Freehold Gun Club engaged in a four-man team contest, 25 targets per man. The former won by a score of 87 to 72.

At Bay Shore, L. I., a new gun club was recently organized under the title of the Corinthian-Medicus Gun Club. The officers are: President, C. E. Coddington; Secretary, L. A. McMullen; Captain, Adolph Mollenhauer. The members are all famous sportsmen, being members of the Corinthian Yacht Club. They have excellent grounds for trapshooting near their yacht property, and intend to forthwith install a set of traps. Their competition will be confined to members only.

The Florists' Gun Club, of Philadelphia, announce a grand opening shoot at targets, on Oct. 12. There will be added money, and guaranteed purses. The competition will be open to all. The secretary is Mr. T. C. Brown, 110 N. 50th St., Philadelphia. The shooting grounds are at Wissinoming station, on the New York division of the Pennsylvania railroad.

From Huntsville, Ala., we have received the following communication from John, Jr.: "An attractive programme for an all-day shoot on Wednesday, Oct. 1, has been arranged, and will be pulled off at the Huntsville Gun Club grounds, under the management of Capt. Geo. P. Turner, president of the Huntsville Gun Club, who will be assisted by Messrs. Wallace, Newman, Waddy, Matthews and Lane. The shoot will begin promptly at 9 o'clock, and will consist of eight events of 15 and 20 blue-rocks each, and three matches at swallows. The usual entrance fee will be charged, and the division of the purses will be by the Rose system—in 20-bird events, five moneys; 15-bird events, four moneys; 10-bird events, three moneys. This shoot will be held during the Elks' carnival, and reduced rates can be had from all points to Huntsville on this occasion. Manufacturers' agents can shoot for price of targets only. Ten-bore guns and black powder will be barred. An elegant barbecue will be served on the ground. The blue-rocks will be trapped from a magautrap, and will be thrown at 2 cents each. The Huntsville Gun Club grounds are among the most beautiful in the South, and are ten minutes from the city by electric car. All guns and ammunition expressed to Mr. W. W. Newman will be cared for and delivered free of charge. All kinds of loaded shells will be for sale on the grounds. Any one who desires to communicate with the management concerning the details of the shoot should address Capt. Geo. P. Turner, who will gladly render such information upon application. A most cordial invitation is extended to all shooters to be present and participate in the sport. It is believed that the attendance will be large and that a royal good time will be had." We would call the attention of the management to the fact that it is unlawful to shoot swallows in Alabama.

The seventh and last trophy shoot of the Garfield Gun Club's target season was shot last Saturday. Mr. S. Young won in Class A. Mr. A. McGowan won in Class B. Mr. L. Thomas won in Class C. Concerning the shooting of the club, its secretary, Dr. J. W. Meek, writes us as follows: "This event closes the target shooting on our grounds for this season, and after an interval of two weeks the live-bird shooting begins. Oct. 5 we begin our fall season, and shoot on the first and third Saturdays of each month, until May, with extra shoots on holidays. The club has had an unusually prosperous and active season on targets, and the prospects are very promising for a busy winter's work on pigeons."

A popular sportsman of the Pacific Coast, Mr. Phil B. Bekeart, has been sojourning in New York for several days on a business trip in the East. He is distinguished as one of the skillful artists of the scatter gun in San Francisco, besides being a successful representative in a business way of Messrs. Smith & Wesson, Marlin Fire Arms Company, Hunter Arms Company, Bridgeport Gun Implement Company, American E. C. & Schultze Gunpowder Company, and several other firms.

Fire destroyed the home of Mr. T. W. Morfey, at Interstate Park, on the morning of the 19th inst. The origin of the fire is unknown. Mr. Morfey saved all his furniture. The house was the property of the Interstate Park Association, and probably will be rebuilt in the near future.

The Garden City Gun Club, of Pella, Ia., announces an amateur tournament to be held on Oct. 15, 16 and 17. A. J. Nossaman is the secretary.

The postponed match between teams of the Grand Crossing and Chicago gun clubs will take place on the grounds of the latter, on Sept. 28.

Mr. John Wright announces a merchandise prize target shoot to be held on the grounds of the Brooklyn Gun Club, on Saturday of this week.

BERNARD WATERS.

Trenton Shooting Association.

TRENTON, N. J., Sept. 21.—Fine weather and a light attendance confronted Mr. J. R. Taylor, who had kindly consented to act the role of Pooh Bah in the absence of Secretary at the week-end shoot to-day. Some of the members were after reed and rail birds, and others were fishing and yachting on the river. Some great strings of black bass have been taken in the last few days, and good bags of reedbirds made, the birds being very plentiful on the marshes just below the city. The fishing in the river just now is for sun-fish, grasshoppers being the bait, the size of the fish running very large. Good sport is also had in the ponds and lakes on the outskirts of the town. Some of the best fishing for pike and bass can be had right on our own grounds, Hutchinson's Lake, as pretty a piece of water as will be found anywhere. Next Saturday, 28th inst., the T. S. A. cup shoot for championship of Trenton occurs. Vanarsdale is the present holder, and he says that he intends to hold on to it. The event is open to all residents of Trenton, irrespective of membership in any club, and there will be a good turnout to give Van a run for his money.

One of the best things in the live-bird trap line that the writer has seen is a production of one of our members, Billy Widmann. In the application for a patent that Billy has made, it is called the Widmann electric live-bird trap. The design and electric mechanism are very simple, and the delivery of the bird when called for is instantaneous, and the bird flush with the ground, everything else being out of sight after the trap has been sprung. It will be furnished with either an automatic or individual release. It will be introduced for the first time at the team shoot at the Interstate Fair grounds, Sept. 27. There is no doubt of it being a good thing.

The Interstate Fair Association offers a \$50 silver cup to the winning team, 25 birds per man.

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14
Targets:	20	10	10	10	10	10	10	10	10	10	10	10	10	10
Rowan	16	5	9	8	4	..	6	..	12	6	5	2	6	
Gage	20	6	6	9	10	12	5	7	4	9	
J. R. Taylor	11	7	6	7	9	7	8	..	7	3	8	
Banks	17	8	7	6	..	6	9	..	8	..	3	
Eskay	13	..	8	..	8	12	5	
Satterthwaite	4	4	6	7	2	
Smith	6	5	2	8	..	7	6	
G. W. S.	1	2	
O. P. H.	3	4	4	
Swift	5	4	4	..	12	
Halsey	4	
Maddock	6	10	11	5	8	0	6		
Daly	6	8	8	4	7	1	5		
Kelsey	7		

As will be seen by above, the shooting was of the in-and-out order. Those holding gun below elbow in event No. 13 found whether their gun fitted them or not.

Events Nos. 1, 2, 4, 5, 6 and 7 were shot over the magautrap. No. 3, five-trap battery, expert rules. No. 8, five on magautrap and 5 expert. No. 9, Sergeant system. Nos. 10 and 11, doubles on the five-trap battery. Nos. 12 and 14, reverse pulls. No. 13, gun below elbow. Note the variety.

G. N. T.

The Dean Richmond Trophy.

SYRACUSE, N. Y.—It is being agitated among some of the New York State shooters to have the Dean Richmond trophy shot for on the first day of the tournament, which is held next year at Rochester, N. Y. I think a few suggestions at this early date would be in order, and it might wake up some of the Rip Van Winkles and set them to thinking.

The Dean Richmond event is considered to be the banner event of the New York State shoot, and it also is considered a great honor and glory to the winning team. Then, why not make it worthy of some strife?

I will suggest the following, in hopes of hearing remarks from others:

On the first day of the tournament let each man shoot at 25 live birds (three-man teams; total 75 birds per team), and on the last day of the shoot (same men and teams) shoot at 25 birds each for \$50 per man, \$150 per team; birds could be extra or included—or say, 15 birds per man on first day and 10 birds each on the last day, for \$25 per man, or \$75 per team.

If more than ten teams enter, have the purse divided into three moneys. If under ten teams, divide into two moneys.

I would like to hear opinions of the New York State shooters on this plan, and be prepared for our next meet at Rochester, N. Y., in 1902. I think with a little more of our assistance they will give us a model tournament. No other State has so valuable a trophy for competition.

A MAINE "CARNIVAL."

THERE has been going on in Maine what Commissioner Carleton terms "a carnival of moose shooting," and he makes good the characterization by noting ten or more moose killed and presumably left to rot. This is a most disreputable and disgraceful showing. It indicates moral rotteness, which is a much more serious matter than the mere wanton destruction of game. Whether the killing has been done by guides intent upon securing moose heads in advance to sell to ready-made sportsmen, or by visitors from out of the State, there can be no evasion of responsibility for the atrocities by the Maine guides. The system now prevailing requires a non-resident to employ a registered guide when going into the woods. If sportsmen from abroad did the killing they were sportsmen accompanied by guides. No sportsman would dare to kill a moose out of season unless he were assured that his guide would uphold him in the act and conceal the offense. If the Maine guides were as one man in a resolution that moose should not be killed in the close season, they could protect the game perfectly. So long as an unrighteous complicity shall exist between guides and sportsmen to kill game illegally, not all the detective service in Maine can protect the moose.

The proposition to prohibit the carrying of firearms into the woods in the close season has much to commend it. Such a system has proved a success in Europe, under conditions where the prohibition of arms could be made effective. It should be the rule in America, with certain modifications, in all game country. In particular would the working of such a rule be beneficial as to the game fields near large towns. Whether or not it would prove effective in Maine would depend upon the practicability of enforcing it. The moose and deer wilderness is a tremendous territory; something more than the existing machinery would be required to prevent the ingress of visitors with firearms. Maine is no Yellowstone National Park, where soldiers can guard the entrances to it and patrol the trails and camp grounds. But even if not possible of enforcement with absolute thoroughness such a law would at least decrease the number of guns and rifles taken into the woods in the close season, and would thus in a measure accomplish its purpose.

The most effective agency to protect the moose and deer of Maine would be a right sentiment on the part of the guides. Commissioners and guides should be in accord, animated by a common purpose, and working together. If this harmonious spirit is absent, and in its place exist friction and opposition, no system of laws the most stringent can ever protect the game of Maine.

Why are not the Commissioners and the guides working in harmony to make the Maine close season actually closed?

THE SITUATION IN ALASKA.

In almost every bit of news that comes to us from Alaska are allusions to the absence of government there, and to the upsetting by the influx of civilization—so called—of the natural conditions which prevailed prior to the discovery of gold.

We are told now that the Indians about Nome are likely soon to perish, for no other reason than that the white men, trading whisky to them, have kept them drunk during the season when they should be catching fish for their winter support, so that starvation threatens them during the coming season of cold.

These Indians—who are really Eskimo—are a fine, frank, stalwart race, and but a few years ago were little contaminated by the vices of civilization. Contented and happy, they lived their harmless lives under the Arctic circle, as they had always done, seeing no white people except the whalers. When the miners came among the Eskimo their troubles began. The white men took their women, and by tempting them with liquor took from them whatever property they had, and—what was far more important—took from them the energy to do those things that are absolutely essential to their existence. Incidentally they brought them also disease, which, within a year, has swept them away by thousands, and now the miserable remnant is threatened with starvation.

A few years ago Alaska was a game region practically untouched. Among its rough mountains, in the deep recesses of its tangled forests, and upon its far-stretching tundra there existed more game and larger game than anywhere on this continent. The giant moose, the great

kadiak bear, the largest of the caribou, the white sheep and other important and little-known species of big game were found there. But as Alaska became known, as transportation lines were opened and the far North became more readily accessible, there hurried to this distant region not only miners greedy for gold, but hunters, anxious to kill the big game while it was plenty and easy of access; trophy hunters, eager to secure the record head of one or another species of game; head hunters, employed by taxidermists who engaged them to kill and send out all the big heads they could, and meat hunters, willing to earn a livelihood by butchering game for the mining camps. Today there is being done over again in Alaska precisely what took place thirty years ago along the newly opened line of the Union Pacific Railroad, when hunters took contracts to furnish meat to soldier camps and tie camps for from 2 to 4 cents per pound, and when meat and hides and heads and horns were brought in by wagon loads to the railroad stations and shipped East.

In those days there was practically no government in the West. In these days there is practically no government in Alaska. A Governor there is, a good and sensible man, anxious to do what he can to protect those creatures, whether human or brute, who need protection; but he is without laws, without resources and without men, and is helpless.

Surely it is time that Congress should take up the question of Alaska and handle it with vigor. Here is a territory equivalent in size to one-sixth of the United States which in practice is lawless—except so far as certain communities make laws for themselves—and in which the natural resources of all sorts are a prey to any one who may care to destroy them. The natives, the game, the fur, the fish and the forests, natural resources which are worth many millions of dollars to-day and, properly conserved, should be worth many millions annually for generations to come, are being wasted with a true American disregard for the future.

Is it too much to hope that the new Administration and the Congress which is to meet next winter will take hold of this subject, and try to arrest the shameful waste that is now going on in our northern province?

Among the civilized communities in Alaska there is deep feeling over the injury done them by Congressional neglect. A hundred matters which are so much a part of civilized life as to be taken wholly for granted and hardly to be thought of in older communities do not exist, so far as Alaska is concerned, to the very great hardship of the inhabitants and the serious retardation of the development of the territory.

SNAP SHOTS.

The New York Times last week issued a handsome jubilee number to commemorate the fiftieth anniversary of its founding in 1851. The period covered by the Times' historical review was a momentous one for the city and the country; and the story as here told of the events of those years and of the part the Times had in them is of unflagging interest. From the beginning the Times has held a place of dignity and influence in American journalism; it has stood always for those things which make for good order and progress, and to-day it is second to none of its contemporaries in public esteem. However much on occasion we may differ with the Times in its discussion of the questions of the day and political policies, it is impossible not to have the highest respect for it as a clean and high-minded journal, and one of exalted ideals. That a newspaper conducted on the lines of the New York Times should be so prosperous and so powerful is in itself a tribute to the character of the community which gives it support.

The Times has given its readers a fac-simile of the first number, issued on Thursday, Sept. 18, 1851; and to look through the columns is to immerse oneself in the New York of a half-century ago. We may read histories without end, but there is no history written which actually carries us back to the time and the people as does an old newspaper, for here are chronicled not only those larger events with which the historians concern themselves, and the narration of which they tell us constitutes history; but the trifles, the little every-day incidents and happenings which actually make up human life, and which have for us the real human interest the historians miss. The first Times issue, for instance, not only reports the

promised liberation of Kossuth by the Sublime Porte, the visit of the Queen to Scotland and the candidacy of the Prince de Joinville for the Presidency of the French Republic, but it chronicles a big lobster caught at Hull, Mass., weighing twenty-eight pounds; and here is an item, the like of which, we venture to say, might be found in a Times of any September from 1851 down to 1901:

Ezra Robbins was accidentally shot dead with a rifle, by his son-in-law, John Roberts, in Claremont, N. H., on Sunday. The parties were in the woods, gunning.

Last week allusion was made to the fact that at the opening of the shooting season birds are often too small to be shot. An interesting example of this is given in a note from Connecticut, published this week, which tells of the capture there on the opening day, Oct. 1, of young quail still in the down—so small that they could not even fly. As suggested by our correspondent, the killing of the parents of such a brood would, of course, mean the death of all the young. This was, no doubt, a belated second brood, but there is reason to believe that such late broods are of frequent occurrence, and they should receive protection. The Connecticut law is admirable in that the season for all upland game birds opens on the same day, but the date of this opening is too early. The date of New York's opening, Nov. 1, is on many accounts better. It is true that this date—if applied to all upland birds—cuts off a considerable portion of the woodcock season, but, on the other hand, the very best woodcock shooting usually comes between Nov. 1 and Nov. 15. If the season opens Nov. 1, the late broods of ruffed grouse and quail have an opportunity to grow large and strong, and in the present days of woodcock scarcity the loss of a part of the shooting of that bird is not a serious matter. A combination of the laws of New York and Connecticut, as far as upland game birds go, would be very nearly an ideal law. This would make the general season for upland game birds open Nov. 1 and close Dec. 31.

The Richmond County Fish and Game Protective Association, which is concerned with the game covers and game fishing waters of Staten Island, performed a distinct public service last week when its agents took into custody a crew of piratical Italian net fishermen. The netters had been violating the law with extraordinary boldness, shipping their fish to this city. People were afraid to complain of them, for the Italian poacher in this vicinity has a hard name for violence. The waters of Staten Island must be kept clear of the netters of game fish if they are to afford opportunities for the hook and line fisherman; and no one will seriously question that as playgrounds for the people these waters are worth more to Greater New York than they could possibly be if given over to the netters. The city needs them for the enjoyment and use of its citizens who cannot afford to make distant excursions for fishing.

Rev. C. C. Haskell, D. D., of Corry, Pa., author of the "New Theology," writes the New York Evening Post an extraordinary defense of mobs and lynchings, in which he says:

We should remember that law is simply a means to an end. The means is law—the end is justice; precisely as medicine is a means to an end. The means is medicine (it may be quinine), the end is health. Now if we can have justice without law, we have a right to it, precisely as we have a right to health without the quinine.

The Pennsylvania divine's tenets, it appears, are held by the game protective authorities of Illinois. In that State there is no law against killing or possessing quail (except for sale) at any time, but the game wardens are nevertheless arresting and fining the quail killers, and thus are following out in practice Dr. Haskell's system of securing "justice," law or no law. The "justice" is here all for the quail, since the victim who has been robbed of his money under guise of legal proceedings may hardly be said to have had any share in it.

Our Chicago correspondence to-day reports that two Illinois men have paid fines for having had quail in possession, and that for this reason they question the correctness of the *Game Laws in Brief* in its statement of the law. The Illinois law forbids the sale, or possession for sale, of quail killed in the State, and it forbids the export of quail for sale. Other than these restrictions there is no law as to killing quail in Illinois; the *Game Laws in Brief* states the law correctly. If the shooters referred to paid fines for having quail in their possession otherwise than for sale or export for sale, they paid money, which the authorities had no legal right to exact from them.

The Sportsman Tourist.

In the Ranger Service.

II.—Major Rogers.

BY ROWLAND E. ROBINSON.

FOR some days succeeding this interview, I went wandering in the most sequestered woods, carrying my rifle, indeed, but with no great zest for game, for I was puzzling myself with the question of what to do. Many were the answers, but no one seemed the best, though of them all, the idea of making a settlement in the Northern wilderness was most to my liking. It promised the surest foundation of a home and the material prosperity that we New Englanders are accused of coveting no less than our spiritual welfare. Having established a home, there would be better chance of persuading Mercy to join me in it, and, as for solitude and hardship that must be endured in gaining it, I was not averse to the one while we two must live apart, and I must face the other, whether I chose the loneliness of the wilderness, either as settler or fur-trapper, or the hazards of war, or any vocation that was open to such as me.

Thus pondering, I roamed the woods without much purpose, half in a dream, out of which I was more than once startled by the fancied sound of Mercy's sweet voice calling me from far away, always distant, no matter how I strove to approach it, till proved outright to be only one of the mysterious voices of the forest that is so often heard, but never traced to its cause, which may be but fancy after all. I returned from these daily excursions with so little to show for them that my aunt viewed me with less favor than ever. I had further proof than her sour looks gave when I overheard her telling my uncle:

"Paul never was good for nothin' but huntin' and fishin', and now he's lost his gift for them, or got too lazy to use it. We must set the good-for-nothin' adrift, Jonathan; we've done our duty in raisin' of him, and there can't be more asked of us."

"Yes," he assented; "I hate to, for he's my brother's boy, but I don't see no other way. He must go and cut his own fodder."

"You shall be saved that trouble, good people," said I to myself, more than ever determined to hasten my departure. Yet I was put upon my mettle to prove that I had not lost the skill in which I took much pride, and so set forth next morning for one more day's hunting before taking leave of my kinsfolk.

The bright, cool September day was all that a hunter could wish and game as plenty, so that when, toward noon, I came out upon the highway where it ran for some distance through the woods, half a dozen fine, fat partridges were hanging at my belt. Caring not enough for more to take the trouble of looking further, I took my way homeward. At a turn of the road a fine cock partridge strutted into it twenty rods before me, just as I noticed hoof-beats close behind me. I whistled, and the bird stopped midway in the path, with head lifted high, ruff and tail full spread. In the same instant the rifle was at my shoulder and the trigger pulled with a quick aim, before the coming horseman should alarm the game, and the proud cock was beating the earth in his death struggle, his neck half-severed at the ruff.

"A right good shot!" said a voice of hearty approval close behind me, and, looking over my shoulder, I saw a tall, swarthy man attentively regarding me as he easily sat on the spirited horse that he now reined close beside me.

"No great of a shot, sir," I answered modestly, filling my horn charger and emptying it into the rifle.

"I'll be bound it's a better one than you often make," he said, in a bantering way, which roused my pride a little, so I pointed to the birds at my belt, each with its head half or quite cut off by balls, and said:

"Here are six more of the same sort."

His eyes fell to them a moment from watching the loading of my rifle, returning to it again till I had rammed down the patched ball, and slipped the rod into the pipes.

"For how many shots?"

"Six," I answered.

"H-m-m." That was his comment in a tone that implied doubt and nettled me somewhat, and having primed my piece, I took more time to regard him. In spite of my pique, I could not help liking his looks.

Though the keen, dark eyes that seemed to be noting everything without dwelling more than a moment on anything showed that they could blaze with fierce fire on occasion they shone with a pleasant light now, and his brown, weathered face wore a winning smile. He carried no arms, but was of such a bearing that I was sure the ordinary dress of a traveler poorly disguised a soldier, and no common one at that.

"Let me see you put a bullet in the white spot on the beech tree at the right of the road, the spot at the height of your head, and I'll own you're a marksman," he said, only indicating the direction with a nod, but my eye caught the mark at once, and stepping a little before him, I raised my firelock.

"Look out!" he cried, sharply. "It's an Indian, and if you don't kill him, he'll kill you!" but he did not stir my aim, and I fired as the heelplate was set to my shoulder. "You may be a marksman, but you're no bush fighter, to empty your gun with a stranger in your rear," he said, chuckling a little.

"But you have no arms," I said, rather chapfallen at this, "and we are on even terms now."

"Don't be too sure of that," he said, whipping out a pistol from his pocket and displaying it.

"I'm not afraid of such a popgun," I answered, with more bravery in my tongue than in my heart.

"So? It may be more dangerous than you think," and with the words he blazed away, apparently without aim, at a patch of moss on a near tree trunk, and the dropping shreds of moss proved that the mark was truly hit.

"Well, if I was twice mistaken, I had no reason to be on my guard against you, sir," I said, beginning to reload my rifle.

"There you may be mistaken again," he said, tucking the pistol under his arm, and he poured a charge of pow-

der into his palm, and from that into the barrel, clapped a patched ball atop of it and rammed it home; primed the deadly little weapon, and thrust it back in his pocket, all in less time than I am writing it.

"But let us examine your target; don't forget your bird."

I walked on beside his horse till we came to where the partridge was lying, which I picked up and offered him. "Will you have it for your supper, sir?"

"With all my heart, if you can spare it," and I assured him that I had enough without it.

"Thank you, and it was a neat shot," said he, examining the severed neck and thumping the plump breast. "One good turn calls for another; and will you be good enough to give me a strip of wickopee bark near the beech we just passed!"

There it was, sure enough, though I had not seen it, for all it was on my side of the road, and I could not help remarking how keen his sight was for every trivial object.

"In our trade we have to keep our eyes open to keep the hair on our heads," he said, as he tied the partridge to his saddle-bow with the bark thong. And that wickopee bush might not be such a small thing, either. It would serve to tie your hands if you were my prisoner, as you might have been if I had minded to have you."

"I'm not sure of that," I said.

"Why not, when your gun was empty, and my pistol in my hand, or even now?" He stooped suddenly and snatched the rifle from my shoulder, holding it aloft and smiling down upon me, starting aloof, abashed, and half angry, but not alarmed when I saw no evil intent in his laughing eyes.

"There, take your gun," he said, handing it to me after a moment, "and have better care of it. I was only teaching you a lesson that may serve you some time if you ever take to my trade."

"Thar I don't think I will," I replied, hotly, "for I doubt if it is an honest one," whereat he laughed and said:

"Well, I have His Majesty's commission to practice it. But here's your target with the bullet nigh the center. A very pretty shot, upon my word. You have a quick eye and a steady hand—gifts that you ought to be using in the service of your king and country, rather than wasting them here." His manner was quite changed and he was speaking very seriously. Then he asked me about my family and affairs, and when I told him that I had no near kin, nor any business, he broke out very earnestly:

"Then enlist in the Rangers. It's a noble service, far better than serving in the regulars, or in the rabble of the militia that you are like to be called into any day. Every man in it has to use his wits, and depend more on himself than on his fellows. It's a Ranger's duty to obey orders, as it is every soldier's, but in active service it is every man for himself, whether the devil takes the hindmost or the foremost. It's a free, noble service, compared with any other soldiering, and the usefulest in all the army, and there's a grand chance of promotion for a smart young fellow like you. Then the pay is fair, and a Ranger has the first chance of gathering booty and taking scalps."

I could not forbear a shudder at the cool way in which he spoke of so barbarous a means of increasing one's gains; and, though I said nothing, I determined it should never be employed by me. With all that he had said, and much more that he continued to say in praise of this service, I was fast becoming persuaded to enter it.

"Is it Rogers' corps of Rangers?" I asked, and he nodded, adding,

"It's the only one of consequence."

"The only one I'd care to join," said I. "I've heard much of that brave leader, and would be prouder to follow him than any other; I'd give much to set eyes on him."

"That you shall do this day, if you'll come to the tavern in the village yonder, for I expect him to dine off this partridge with me."

"Then you shall have another," I cried, loosening a bird from my belt.

"No," he said, with a twinkle in his eyes, and an odd smile. "One will be enough. He is a light feeder, like myself. You will come at 2 o'clock? And you will enlist, I am sure. It's a service to make a young fellow's sweetheart proud of him. Bid her good-bye and go on with us in the morning."

With that he put spurs to his horse and clattered down the road out of my sight, leaving me in a daze with the consciousness that I was as good as enlisted; for, somehow, this recruiting officer seemed to have got a hold of me that was not to be shaken off. And why should I not take this chance of making a beginning in life? It was only for my sweetheart's sake that I hesitated, but a little sound reasoning would reconcile her to this choice.

My aunt regarded me with more favor than she had done of late when I brought in the partridges, and said, almost kindly:

"Ah, that's something like, Paul, and will make us a proper good dinner."

"Make the most of 'em, Aunt Becky," said I, setting about cleaning my rifle with uncommon care; "for they're the last I will fetch you; I'm going to leave you."

"Sakes alive!" she cried, in surprise, but not ill-pleased. "And where might you be going?"

"To the army," I answered, as proudly as if I were already a soldier.

"To the army, boy! Sakes alive, you'll be killed. But it's a good thing to serve your king, and we must all die some way."

Making the most of this cold comfort and as cold a bite of the left-over dinner, I made my way to the tavern, where I found my new acquaintance, who pressed me to dine with him, and would not accept my bashful refusals. There were but two plates laid, and between them the smoking, savory partridge, to my hungry eyes looking handsomer in his brown skin than he had in his fine feathers.

"Hasn't Major Rogers come yet?" I asked, and, bowing gravely, he said:

"Permit me to introduce him," and then began to laugh, as I stared stupidly at him, for a moment not comprehending that the noted leader of the Rangers was before me.

Though he was a person of more consequence than

any one I had ever met, he was as companionable as if I were his equal, and soon put me at ease, making intricate inquiry concerning my affairs and entertaining me with accounts of his own adventures, and the tricks of bush-rangin', till I was fully of a mind to take a share of the first and become a learner of the last—a determination which no doubt was promoted by the generous portions of wine that my entertainer plied me with.

The upshot was, that before leaving the tavern I was enlisted in the Rangers and engaged to go to Albany next morning with the Major, and some other recruits who would arrive that evening. I went home considering myself already a hero, and was no doubt as much a patriot as any young fellow who goes a-soldiering out of spite or love, or boy's bravado, and fools himself and others that he does it for the sake of his king or country. Then it was all for the king, God bless him; twenty years after, it was all for the country, the king be damned; and the one cared as much as the other for us poor devils.

At dusk I stole away to the trysting place, hoping to see Mercy again and bid her farewell, but she did not come. I only found a note in a cranny of the wall that was our postoffice, telling me that we were watched, and she knew not when she could meet me, and, ending thus, as I well remember: "God bless you, wherever you go, and whatever betide I will ever be your faithful Mercy."

It was grievous to me, and, I conceived, must be more so to her, that we were deprived of the sad pleasure of saying farewell, yet there was nothing of it now but the cold comfort of written words, whereof I made such use as I could with a pencil and scrap of paper in the dim evening light, telling her of my sudden resolution, that I would let her know where to write to me when I could, making many protestations of eternal love, and bidding her a fond adieu. Of this I made my last deposit in our postoffice, imagining with what tearful eyes it would be read; and, after some vain lingering, and halting often as I went, listening for footsteps that would not come, I returned to the home that was to be mine no longer. When I took respectful leave of my uncle and his family, I could but think how sorry is the parting of kinsfolk when there is no sorrow. It is a pain that one craves for himself, and for them. The only consolation I got of it was the envious looks of my eldest cousin, in whose eyes, as in my own esteem, I was becoming a hero.

III.—A Scout for the Champlain Forts.

I SLUNG my small bundle on my rifle and tramped away to the tavern, where I found three other recruits already arrived. Two of them were young fellows of about my own age, and full of talk of their past, present and prospective affairs; the other, much older, taciturn, between the garrulity of youth and age, and taking to this new venture with the unconcern of a soldier of fortune, as I took him to be. He called himself an Englishman, but his name was Murphy, while he had the speech of a Scotchman.

Next morning we set forth toward Albany at a good pace in charge of Murphy, after Major Rogers had accompanied us a few miles, when he left us, and we saw no more of him till we arrived in the old town of Albany. This was the first town of any importance that I had ever seen, and I was in a daze with all the wonders of it, which I had good opportunity of beholding during the week of our stay, not as yet being under strict discipline, but only required to report at the inn, where our quarters were, at noon and nightfall. It was a strange thing to see houses crowded together like soldiers in the ranks, when there was so much elbow room and breathing space in all the country about, and narrow streets thronged with citizens as well dressed as if for church-going, with not a few of the king's soldiers, whose fine scarlet clothes and mighty airs put us quite out of conceit with our rustic attire and manners.

Murphy was an old soldier, and was hail-fellow-well-met with any of them not above the rank of sergeant.

There was a great horror and indignation concerning the recent massacre at Fort William Henry, on Lake George, where the Frenchmen's Indian allies had fallen like wolves upon the English prisoners of war and butchered them under the eyes of the French commander Montcalm, which had happened but a little while before. There was scarcely more clamor against the perfidy of the Frenchman than against the cowardice of the English general, Webb, who had abandoned the brave Colonel Monroe to his fate, and was now in a great fright for himself, calling for reinforcements from far and near.

Colonial troops were now arriving, and a score of us newly recruited Rangers went forward with a company of them to Fort Edward. On the march I had my first taste of Ranger service, for Murphy had us scouting in front and flank, a squad of greenhorns quite useless to our friends and in more danger of getting lost in the woods or being shot by each other than by the enemy, who were now leagues away at Ticonderoga, licking their chops after the bloody feast at Lake George. But no harm came to us, and Murphy was given a chance to air his military experience, though it had been of quite another sort. He bawled his orders as if he were at the head of a regiment, and we were in no danger of going far astray as long as he held to the route. This was a road cut through the woods broad enough for artillery and army wagons to pass over.

When we came to the fort, I had my first sight of the pomp of war, and a strange thing it was to see all the throng and bustle of a great army hemmed in so close by the solitude of woods, with no outlet from it but the rough thoroughfare over which we had come, that opened its dark gateway into the somber forest to the northward.

We were at once assigned to the quarters occupied by our corps, which consisted now of something more than a hundred men, but were not long permitted to remain there, for our commander, having arrived before us, presently had us paraded and each man equipped with firelock, preferably a rifle, a hatchet or tomahawk, and sixty rounds of ammunition, and soon led us out into the woods to practice our peculiar tactics on an imaginary foe.

We ranged forward in three columns, with scouts thrown out on front and flanks, and the man who spoke above a whisper got himself rated roundly. Those of us who had experience as hunters proved the aptest learners, and I wasn't much behind any comrade of my own age, and when it came to rifle practice, I could

hold my own almost with the older hands. After a few days of this, we were ordered out on a regular scout to William Henry, which even in its desolation continued to disturb General Webb, as well it might, if the ghosts of its murdered garrison could rise before him.

We found nothing to denote any recent presence of the enemy. The silence of desolation and desertion was upon the dismantled fort, that was guarded now but by the new-made graves of the victims of the fearful tragedy, and some few bodies overlooked in the hasty burial, and discovered now, to sicken a young soldier of savage warfare. I was moving apart from my comrades in the edge of the woods, when a crow flapped up suddenly before me, startled, but silent as if he had a secret to keep, and at the next step I came upon the half-naked body of a woman, young and with hair of gold, like my Mercy's. The scalp had been torn from among the disordered locks, and some were clotted over the cruel gash of a tomahawk. I called some comrades and we gave the poor unknown body as decent burial as we could.

Our comrade Murphy went nosing about, very keen for forgotten booty, but keener eyes than his had left scant gleanings. That night we camped inside the walls, and next morning scouted some distance along the lake, but discovered nothing, and so returned to Fort Edward.

Here we were not permitted many hours of idleness, for our busy commander had us out scouting every day in the woods, where we came upon nothing more alarming than the sudden burst of a partridge booming out of a silent thicket beside us, or a startled deer bounding away with long, resounding leaps, while the hateful tell-tale jays loudly proclaimed our whereabouts. Major Rogers seemed to be everywhere at once, instructing, directing, praising, and reprimanding, each one of us in turn, and in every way doing his utmost to make every man of his command perfect in the art of this service, till at last, if we envied the gaily attired regulars of the garrison, their lighter duties of parade and guard mounting, we felt ourselves their superiors in such warfare as we were like to encounter. In return, they despised us for a lot of backwoods bushwhackers, and so there was little love lost between us.

At last, in November, fifty picked men were ordered out on a scout to the northward. Arriving at Fort William Henry, which was yet more desolate with three months' desertion, and there embarking in our batteaux, we went down the lake, whose beauty was so perfect, even in this forlorn autumnal aspect, that I wondered how a blither season could further beautify it. With increased caution we neared the outlet, and in the evening of the second day landed and secreted the boats, and made our camp. We privates were going like men blindfolded, we knew not whither, but now began to guess that it was for an observation of the French forts on Lake Champlain, the more certainly when at early dawn we began marching forward in that direction with particular caution.

Two or three times we heard the firing of great guns forward on our left, and again, much nearer, the report of a musket, which we took to be some hunting party of the enemy. Four of the keenest scouts were sent out on a tour of discovery, and in less than an hour returned, bringing in a Frenchman, whom they had badly wounded in capturing, he having made a desperate fight. The Major asked him many questions, which, as well as the answers being in French, I could make nothing of. When it was attempted to march him along with us, he could not move but by the help of two men, and Major Rogers, being informed of it, said after very short consideration:

"Well, if he cannot go with us he must not be left behind to tell tales. Cutheart and Chamberlain! take charge of the prisoner!"

The two men named stepped to the side of the wounded man, who, faint with pain and loss of blood, sat on a fallen tree. As we moved on in three files, he looked anxiously after us, making an appealing gesture that few saw and none heeded. Chamberlain, a survivor of the William Henry massacre, stood behind him, bending a hard, merciless face upon the helpless man as he drew the hatchet from his belt with a slow, cautious motion.

With a strange fascination I could not keep my eyes from them, and I was glad when intervening trees shut the group from my sight. In the next instant Cutheart and Chamberlain rejoined us.

We began the ascent of a very high mountain, and when we came to the top we saw the French fort they called Carrillon, and we by the name of Ticonderoga or Ticonderoga, lying beneath us like an engineer's plan of a fortification unrolled for our inspection. There were the French soldiers, swarming about the parade like a horde of white ants, along with duskiest figures that we took to be Canadians and Indians, and above them all flaunted the banner of France, vexing the soul of English subjects to see it displayed here in His Majesty's own province of New York.

"By George!" cried the Major, "if we but had one of the big guns of Fort Edward up here we could drop a shot in there, and set the French a-humming!"

Indeed, it seemed an easy thing to do, and it is a wonder that none bethought to try it till the fortress had thrice changed owners.

When Major Rogers had reckoned the strength of the garrison, we moved down to the foot of the mountain and encamped, passing a comfortless night, without fires, for fear of discovery by the enemy's Indian scouts. Next morning we went on over a difficult route to the neighborhood of Fort St. Frederic, and going on to a mountain that overlooked the place, got almost as fair a view of it as we had of the other. It stood on the very brink of the Lake Champlain, where it widens at the place called by us Crown Point. There was a lofty citadel or tower within the walls, also a church, and on a point above the fortress was a windmill, serving the purpose of war as well as of peace, with loopholes for muskets and patereros, but now looking very peaceable, the sails flying merrily in the brisk north wind to grind the people corn. Over toward us, on the shore of a great bay lying between us and the fort, there was a populous village of neat houses, regularly built along several streets, with an extent of outlying fields, in some of which cattle were grazing and in others stood stacks of wheat and shacks of corn not yet husked. Out this way

ran a thoroughfare, along which we observed people occasionally passing, making it a likely place to capture a prisoner, as was greatly desired.

So, when the Major had computed the strength of the garrison, he led us down to the low ground, where he posted the main body and took twenty men, I being of the number, to ambush the road. We had not been posted in cover half an hour, when along came a careless Frenchman singing very blythely an outlandish song of Old France, till he was in the midst of us, and we stepped out before and behind him, when his song ended with comical abruptness. I was glad he was taken unharmed, for it was enough to have one ghost continually haunting me, as did that of yesterday's prisoner. While we were busied with securing him, another appeared, coming out from the village; but, perceiving us, stood a moment dumb with amazement, and then, getting simultaneous use of legs and tongue, ran back shouting lustily, and making such speed that we could not overtake him.

Now, being discovered, we fell to firing the grain stacks and killing the cattle till the drums at the fort beating to arms warned us that it was time to make off, which we did with all speed, but without confusion. We heard the alarm guns bellowing behind us at St. Frederic, and the dull thunder of Ticonderoga's answer echoed before us, but we got safely past that dangerous neighborhood and back to our boats, whence the path to Fort Edward was safe and easy.

[TO BE CONTINUED.]

Old Nantucket.

As you approach Nantucket you see a low line of moorland running east by west for five or six miles. Pretty "tee" gulls are fishing all about the shoaly waters and filling the air with their musical cries. When you round Nantucket light two little jetties run out to meet you and take you in their arms and welcome you into Nantucket Harbor. Arrived there, you immediately fall into a reverie, struck by a subtle influence of the past. You feel you are in contact with a seventeenth-century scene. But you have no time for dreaming now, so, arousing yourself, you go ashore and wander up through old Nantucket. At every step your attention is arrested by something all unfamiliar to your eyes. The decaying wharf, covered with barnacles; the old-time whale-boat and harpoons; the little gray cottage, with the irregular, diamond-paned windows and latch on the door; its larger neighbor, with the platform on the roof which, you are told, was used as a lookout for returning whalers; the primitive well, with the rusty dipper still clinging to the worm-eaten post; the stone steps at the head of the narrow street, worn away by generations of ascending and descending feet; the half-ruined wall, covered with creepers; the tall hollyhocks and blue hydrangeas, the thick ivy hedges and clustering vines—these and similar sights present themselves continually. You drop into the old sea captains' club and find three or four worthies there, smoking their pipes, who arise and receive you with the utmost courtesy. You are asked to sit down, and immediately you are listening to tales ament the past glories of Nantucket—of the whalers and the battleships that congregated there; of the heroes the island sent forth, especially to the war of 1812 (whose echoes seem to be still ringing in the captains' ears); of the great sperm oil industry and the fabulous wealth of the natives; of thrilling rescues off the coast and of this and of that wonder as long as you care to listen. But perchance you grow surfeited, so take your leave of the captains, with profuse ceremony on their part and a cordial invitation to call again, and continue your exploration.

You have not gone far when, perhaps, you run into the town crier, with his bell and horn, calling attention, with

mention turned up his nose at the fare and, after an indignant protest, took his departure. You visit the museum and see the arrow heads, the wampum and other things belonging to the aboriginal Indians, but not, unfortunately, the two beaver hats for which, with a trifle of money, the island was bought of them.

From the museum to the old mill is not far, so you stroll thither by devious, narrow ways. Here it is—the sole survivor of a number of its kind which ground corn for the great-great-grandfathers of the present generation of Nantucketers. How well put together, though rude, it is. With a little lubrication it is conceivable that it might still grind corn. The old sea captain in

ISLAND ARCHITECTURE.

charge will dilate learnedly on it if you have a mind to listen, but you catch a glimpse of the moors through the open window and are drawn thither as by a magnet. Away they stretch to the east and the west, fascinating in their solitude.

But you are not satisfied with a mere view of the moors; you must cross them; so you take a cicerone and set out. As you proceed you notice that the soil is light and sandy, with great patches of bay scrub, or bracken, here and there. Heather also blooms in spots, but coyly and secretly, and is hard to find. To the west a stretch of low woods is seen, and to the east an expanse of scraggy, stunted firs. This is the only timber visible; yet you are told that at one time the island was covered with oaks. It appears that after these had been all cut down for ship building and other purposes, an enterprising native introduced the Scotch fir, but it never prospered. You pass one or two little farmhouses, and see others in the distance, like lonely sentries, scattered about. A sweet, familiar note falls upon your ear: it is the call of the meadowlark. Occasionally a swallow, or a kingbird, flits across your path, or a little brown denizen of the bracken (species unrecognized), rises at your feet. These, with a solitary crow now and then, are the only birds you hear or see. But this is the summer season. Later on the moors will swarm with plover and the surrounding waters with duck. Now you are nearing the end of your tramp

THE LONELY MOORS.

great clanging and vociferation, to an auction sale or some such matter. He smiles good naturedly, but somewhat compassionately, at your open-eyed wonder, and you pass on.

What is this dilapidated, deserted building? This is the jail of Nantucket. The tradition connected with it is that somebody once lodged there, but objecting to the sheep and cattle forcing their way in, to find shelter at night, he left. And this other large, white, lonely building—what is this? This is the almshouse, and this also has a tradition, which is that the only inmate of which there is any

and the air begins to be filled with a dull, booming sound. Is it distant thunder? You regard your cicerone, and he says "Wait!" You wait, and presently you come upon the brow of the moors and behold the mighty ocean rolling in and forming a miniature Niagara for miles. The moors slope their tawny sides down to the strand, which glimmers almost white in the sunlight; the pretty "tee" gulls float about or suddenly plunge head downward; a ship's sail is discernible on the far horizon and you stand there fascinated, with that grand music of the ocean in your ears.

From where you stand to 'Sconset, as the crow flies, is about eight miles, but not having wings you prefer to return to Nantucket and take the train. To be sure, the train has not wings any more than you, but it will save a long tramp, and by this time probably your legs begin to feel a bit weary. You get aboard then and the little engine gives a little shriek and the little car attached begins to agitate violently and off you go. Up and down, up and down, over the brown moors and through the scraggy firs and by the dismal swamp (where the crows build) for half an hour, and then you reach 'Sconset. You are all excitement, for you have been told that 'Sconset is even more curious than Nantucket. And it proves to be so—in a measure, at least. Here we have the diminutive gray cottage, only still more diminutive and vine-covered—not one, but a whole street of them (which is called Broadway, if you please); the whaleboats, the harpoons, the oilskins, gone sadly out of business for aye; the ships' heads, the old guns, the whales' jaw bones; the prehistoric relics, the immemorial pump and ye ancient mariner. And day and night a sweet peace broods over 'Sconset, only broken by the deep organ lullaby of old ocean. "See Naples and die!" it has been said. You will improve upon this and say, "See 'Sconset and sleep!" Yes, you do not want to die after seeing 'Sconset—you only want to sleep (Oh, the delicious drowsiness of the air!), and then awake and see 'Sconset every day and never care if the bank breaks.

Once more you are back in Nantucket. It is evening, and you go up on the hill by the old mill. The sky is a tender gray and harmonizes perfectly with the little village at your feet and the distant waters. You look toward Polpis and see the headlight begin to gleam; then you turn around and look over the moors: all is silent, vague, mysterious. Till nightfall and long after you remain there under some spell, as it were. When you descend into the village you begin to people its quiet streets with returning fishermen; you see their shining oilskins and lumbering gait and hear their bluff talk and hearty laughter. The little cottage doors open to receive them, there are joyous shouts of welcome and—hark! What is that? It is curfew, as it tolled then and as it tolls now in Nantucket. Unique Nantucket. FRANK MOONAN.

Starving on Trackless Seas.

MARINE peril is a commonplace in the South Sea. It is always so possible to anybody that when it does happen it is scarcely deemed worthy of mention. Certainly the world outside hears little of these things.

A large boat went astray in Samoa and vanished. Weeks later the survivors were brought to Apia barely alive. A few out of all the company had been able to bear the agony of hunger and thirst, and the maddening beat of the sun for their weeks of idle drifting and frantic sailing, none knew whither, none knew where. From the pinched and drawn lips of these survivors this account of their wanderings was extracted.

They had set out gaily as a pleasure party. Their home being in Manu'a, they had made a tour of the archipelago as far as Savaii. Here and there they had tarried for long days of feasting. At Apia they had done their trading for foreign wares which were seldom seen in their distant home. The unrelieved idleness of Samoan life affords opportunity for these prolonged visits, which may extend over several months. These "malangas," as the visiting parties are named, are a great evil; they throw back the community from which they start; they are such a burden upon the communities on which they call for entertainment that the visit may well be regarded as a visitation. They foment discord as they go, they leave famine in their track.

Slowly, by reason of the frequent halts for entertainment and for the chance of a fair wind, this "malanga" had made its way homeward, until nothing remained but the passage of the broad Manu'a Strait. At the east end of Tutuila the voyagers had waited day after day in indolent ease, night after night they had expected the west wind which sometimes and at irregular intervals sets in after sunset in opposition to the easterly trade wind which blows by day. It came at last. The boat, a large whaleboat, built by foreign carpenters in Apia, was hauled into the water and loaded with the goods which the travelers had accumulated at the different villages which they had visited. The boat had ten benches for the accommodation of twice that number of oarsmen when it was necessary to travel with that motive power. For use with a favoring wind it was equipped with three short masts, each of which carried a sail in front and a sail behind; seen from a distance, the boat looked very much like a procession of three single-masted sailboats. The cargo was stowed in the bottom of the boat under the benches of the rowers, an open space at the stern afforded cramped quarters for those members of the party who were not actively engaged at the oars. The provisions were the last thing to be put in before setting out upon the voyage. The village which had been entertaining the visitors gave a supply of cold, cooked food, the remnants of the last day's dinner; for water there was shipped an abundant supply of green coconuts, which might easily be tapped when any one was thirsty.

The visiting party numbered twenty-eight, a few being women and a very few children. Being accustomed to do the same work as men, and having a sufficiency of strength, these women were by no means mere passengers; when necessary they shared the labor at the oar. With luck—that is, if the west wind which had set in just after sunset should continue throughout the night—they might expect to be at dawn either at the reef of their own island or within sight of it, and at such a nearness that it would not be difficult to finish the voyage with the oars. On this theory of their voyage they were sufficiently provisioned; all their experience went to show that they were taking no risk worth thinking about in setting out upon this night trip of only sixty miles. They had no compass with them. That is not the fatal omission which it may appear, for if they had carried a compass there was not a person aboard who knew how to use it. These islanders never use the compass; their cardinal points are the place from which the winds come; at night they can make a limited use of the stars. Their chief reliance as to direction is on the winds, a fairly safe guide by day when the trade wind is blowing, by no means so much to

be depended on when it happens to be the counter-trade by night.

When they started, the wind from the westward and favorable for their destination, was blowing rather fresh. This strength lasted for several miles, but as they gradually drew out of the influence of the land breeze caused by the mass of Tutuila, the wind became much lighter, although it remained favorable, what there was of it. There was enough wind to keep the boat steadily moving toward Manu'a, but the leader of the party recognized that with such a light breeze the morning would show them still far from their destination, and with the prospect of a long row against the strong wind of the day. From time to time some of the men rowed to help the boat on, but such efforts were half-hearted at best and soon relinquished. Mostly they slept huddled in such attitudes as promised the least comfort in the cramping quarters of the boat. Some, waking from their uneasy sleep, sat for a while in talk with the helmsman or the sail tenders. From time to time the wakeful ate what food pleased them in the abundant stock which had been provided. As the night passed on the wind grew steadily weaker, and in the last watch had little more than just enough force to keep the boat from falling into the trough of the long ocean swell.

When dawn broke the last puff of wind expired, and the boat lay in a dead calm. Nowhere was a sign of land, neither of Tutuila, from which they had sailed at the beginning of the night, nor of Tau, for which they were bound. As is usual in the equatorial Pacific, the horizon was hemmed in with light banks of clouds which are dissipated only when the day breeze begins. There was now no wind, and it would be useless labor to row before the land came into sight. They were content, therefore, to lie tossing idly on the sea until the coming of the daily tradewind should blow away the cloudbank and disclose the high peak of the well-known mountain of Tau. Meanwhile they said their morning prayer and prepared to eat. They could have no provision of what was in store for them, the prudence elsewhere called ordinary is something which is absent from their dispositions; they spread out the food and ate as much as they individually desired. No one had any other thought than that they would eat the next meal at home. The broken scraps of bread fruit and taro and cold fish were put away in the food baskets to serve as a luncheon for any who might become hungry at the oar. With the same lack of calculation they drank from their supply of coconuts. Breakfast over, they sat smoking, until the trade wind, coming with clock-like precision, should show the course of such voyaging as yet remained for them.

With the rising of the wind the clouds cleared away and left the horizon visible to the furthest reach of the eye. Nowhere in the whole circuit was there any appearance of land. It was disappointing, but according to their past experiences it was not yet discouraging. Under direction of their leader they set the sails and ran before the wind to the westward. Their own home lay eastward, but there were two reasons for refraining from the attempt to reach it. One was the wind, which was contrary and against which this open boat could make no headway. The other was the great probability of missing such a very small mark in the open ocean. But to the westward the three great islands radiated like the sticks of a fan; there was good reason to hope to sight land and wait to make a fresh start. All that day they sailed before the wind. The outlook was incessant; every eye was alert to be the first to catch the spot on the horizon which would show where the land lay. The hours went by, the boat flew westward, not a sign of any land appeared. When the sun set and the calm set in the lost boatload fell to arguing. They judged that their sailing throughout the day had set them back in the neighborhood of Upolu; on that they were agreed. But some were of the opinion that the land lay to the north, others were as confident that it was to the south; each supported its view by long argument. When the night breeze arose they were still uncertain of their position, therefore their course was equally indeterminate. For part of the night they sailed northward and saw no land. Then the other opinion prevailed, and they sailed south until daybreak and the falling of the wind. Though they did not know it, they had probably returned to the place which at sunset they had left. They had spent the night to no purpose. The evening before they had eaten plentifully of the provision which yet remained in the baskets. This second morning there was little left—scraps of vegetables and odds and ends of fruit. They scraped it all together and divided it among the company; after this breakfast there was nothing left, the baskets were thrown overboard. There now remained to them coconuts sufficient to allow each person one. They were still confident of arriving at some land during the day; they felt no alarm at the giving out of their rations. Even if their voyage should be prolonged yet another day, they were in no danger of famine; among the cargo was a considerable supply of tins of corned beef and salmon.

That day and the night which followed they sailed without purpose. As one or another would suggest his opinion that the land lay in this direction or in that, they quartered the sea back and forth. On the third morning the last coconut was used—the water supply was accordingly used up. This was a hardship in itself; it was made harder by the ration of corned beef which was served out from the cargo, New Zealand packing, which is not only heavily salted, but peppered as well. The only thing to drink was the liquor in the tins of salmon. Accordingly they began to use up the salmon rather than the beef—it served the purpose of food and drink in one.

According to the survivors, who had difficulty in recalling events after the first few days, the fourth day was a particularly hard one. While the liquor of the salmon was fluid, it did not quench the thirst—the flavor of the fish only made them more eager for water. On that day many were sure that they saw land, a tiny speck on the horizon, land north, land south, each clamoring that the boat's course be changed to pursue his own delusion, and sinking back dully as the hours of sailing showed no sign of rescue. After that fourth day everything is vague. There was food but no water; the food was all preserved and therefore added new torture to the maddening thirst. On some days there were showers, when water might be caught in the sails. The canvas was thoroughly soaked with the sea; the rain water caught in it was always brackish. But it was wet and it was water. Above all, it

was cold. It is only in the torrid regions of the earth that one can appreciate how cold the drop of water is when it falls from the high heaven. In these undistinguished days they had given up any attempt at sailing in this direction or in that; the only navigation was to cruise so as to intercept any squall within their horizon which promised the water without which they must die. Once at least there was a whole day of rain; they had for once their fill of water; they bathed in it; they filled every can and other receptacle aboard the boat with provision for the rainless days to come. That rainy day put new life in them; with their thirst allayed they ate with a relish and brought back their strength. But it was only a disappointing revival. They were just as much adrift on the trackless ocean. By morning the scanty treasure of water was putrid. In a few days they had eaten the last can of the meat and the salmon which was aboard.

There were all ages among the castaways, from the feeble with age to the boys and girls. The aged suffered most, if there can be any grades of suffering in a trial which bears with equal force on each one. In those undistinguished days after the food was all gone, a new calamity befell—motherhood visited that boat in the empty sea. It was the mother who told these broken recollections of the dreadful voyage. The aged died, the young died, the suffering was too great for men in the prime of life, yet this woman underwent the same suffering under which the others died. She could not remember much—there was a child; it lived some time; it died because there was no food. As she recalls it the infant was the first to die. They said a prayer over it; while it still lived they sprinkled it with salt spray from the sea; when it died they laid it in the sea and sailed away from the spot with prayer. She was sure of that burial at sea—the first of many. She was almost fierce in making it clear that the infant was buried. The food was all gone; they were all dying of starvation and of thirst, but they buried the body in the sea with a prayer, and then they sailed away as fast as they could.

When the woman told of this first death and sea burial the other survivors became almost frenzied in their denials of what they knew was in the thought, though it was not spoken, the horror which must come to starving voyagers in an open boat. "Tell the lady," they cried; "tell her what we ate. Tell her how we tore up our tapa cloth and chewed the pieces for the arrowroot with which it was gummed together; how we ripped out the boards from the bottom of the boat and chewed the splinters. And tell her how they died one after another, but we said a prayer and buried them in the sea and sailed away." On land once more, they felt the worst horror of it; they reiterated their denials of what they had reason to know would be thought. It was pitiful, their mad denial of the rest of that sad voyage.

Twenty-two days after they had set sail from Tutuila to cross the strait which separated them from home, the boat was tossed over the reef of the island of Atafu and washed ashore. The island of Atafu is in the Tokelau or Union Archipelago, nearly a thousand miles from Samoa toward the north. Its people are a kindred race to the Samoans; perhaps the island was populated in some such way of suffering as this. The islanders of Atafu saw the boat as it came drifting to their island; they thought it one of the derelicts which sometimes come drifting in upon their sea. It seemed to have no one in it; there was no sign of life; but it was a boat, and therefore worth saving. When it was thrown over their reef without damage and was seen to be drifting ashore, they followed it along the beach, and were at hand when it touched the sand. Then they found the dying remnant of the Samoan pleasure party. The boat was an empty shell; everything movable had been thrown overboard. Huddled in the bottom of the boat were eight people. They seemed corpses; not one moved when the boat came to rest. The Atafu islanders hesitated at the ghastly cargo; in their superstition there were some who advised turning the death-boat adrift and avoiding the ill luck which would surely be theirs if they had anything to do with the craft of misfortune. But there were others who coveted the boat and were sure that the native pastor could pray the ill luck out of it. These prevailed in the hasty consultation on the sands; they entered the boat to get rid of the corpses. Then they found a last flickering of life in each one. They lifted them out of the boat and bore them across the sandy to the scanty shade of the pandanus trees at high-water mark. There were eight—six men and two women. All bore the marks of the maddening privations of the voyage; they were little more than skeletons, feebly held together. It was days before they recovered consciousness under the ministrations of the community to which they had drifted. Then the John Williams, missionary yacht, opportunely visited Atafu on its yearly round of the stations of the London Mission Society. There were those aboard who could administer medicines, which hastened the recovery of the victims. They took them aboard the vessel and treated them with skill. They brought them back to Apia, where the best of medical skill was devoted to them. Yet two of the eight were beyond rallying, one of the women and one of the men, were beyond all help—they died in Apia. Yet with almost her last breath, the woman who died, the woman who had suffered so much worse than the others on the voyage, made a pitiful plea that no mistake should be made in the story of the voyage, that it should be believed that as they died in turn they were buried in the sea, and a prayer was said over each as the survivors sailed away from the spot. They knew well what reputation has spread throughout the world as to the habits of South Sea islanders. They would not have it thought that even in such dire necessity could they turn to cannibalism; they tried to make it plain that neither now nor ever before could Samoans be cannibals.

LLEWELLA PIERCE CHURCHILL.

He killed the noble Mudjokivis,
With the skin he made him mittens,
Made them with the fur side inside;
Made them with the skin side outside;
He, to get the cold side outside,
Put the inside skin side outside;
He, to get the cold side outside,
Put the warm side, fur side inside;
That's why he put the fur side inside.
Why he put the skin side outside,
Why he turned them inside outside.

Adventures in Tropical America.

I.—Crossing the Bar.

YEARS ago, when scarcely more than a boy, I was sailing down the coast of Spanish Honduras in a little sloop manned by a crew of rough negroes, and carrying a motley assortment of passengers. As we stood along the coast I saw a succession of low, sandy beaches, a tangled growth of jungle beyond, and then a range of blue mountains in the distance.

After three days under a tropical sun the captain informed us that we had arrived off our destination, the inlet of Brewer's Lagoon, and that he would put about for the shore, reminding us that he did not guarantee a safe entrance, and in case of loss the damage was for our account.

Passengers were ordered below, but the captain allowed me to stay on deck, perhaps because I had taken the tiller for part of the time on the way down, and had gotten along fairly well sailing the boat.

"What will happen to us," I asked, "if the boat runs aground?"

"Do you see those big waves?" the captain replied, in the low, deep voice common to the negroes, but with the most perfect enunciation, and no sign of negro dialect. "There are the shifting sand banks; the channel is never the same; it is always changing; if we ground, the boat will be beaten to pieces; our people will swim ashore, but the sharks will eat white men; you were not made for these countries. Don't talk to me now."

Surely a pleasant prospect. I had sailed many a small boat in rough water, and was not at all afraid of a swim; but, then, the sharks, how awful it would be to feel their great jaws close on a leg, and then be torn to pieces by a company of them attracted by the blood.

"Are there really many sharks?" I asked in a whisper.

"Yes; don't talk," answered the captain. A big negro called Tom, a perfect specimen of health and strength, said to me: "See that swirl in the water over there, and see that thing moving just ahead of the boat. They are gathering all around us. Here dead animals float out to sea; that is why they come."

We were approaching the shore now. Great, muddy waves rose up with a threatening comb, rippled into a foaming line along the top, and then settled down again. I could see no sign of an inlet, but still the little boat kept on, the captain now giving orders in his native tongue, a remnant of African memories used all along the coast. The men stood at their places, and then, swinging the sail full to the wind, the captain stood directly for the shore. For a moment we ran quietly before the wind, then a great sigh seemed to rise up among the waves, and with a trembling and dragging the boat went grinding along the bottom. Behind us came a rolling wave, in which, as it rushed toward us, I pictured thousands of evilly disposed sharks; in another instant the boat went staggering on, then it came down on its side, and seemed to be endeavoring to bury itself in the sand; waves were now breaking all about us, and we were not more than 50 yards from the shore. Once more the boat rose up and staggered forward, came down with a bang, that sent us all on our backs; the next instant a wave dashed over us, and then, with a grinding and dragging, while the men shouted out to each other, the boat seemed to make a final effort and floated gently into quiet water behind the bar. Here a current was running out to sea like a mill race, and it was some time before she could be brought around to the wind and started toward the inlet.

"We disappointed the sharks that time," the captain said, while the men began making vows that they would never come again with such a heavy cargo.

Then all the passengers began talking at once, but I felt little patience to hear them, and, going to the bow of the boat, sat on the guard rail beside Tom, who gave a kind of sympathetic rub up against me, a movement expressive of satisfaction, such as a great dog gives at times, and then said, "You needn't look so white and frightened about it; we would have taken care of you anyway."

FRANCIS C. NICHOLAS.

Field and Camp Comrades.

Editor Forest and Stream:

I note with a great deal of interest the article on "Companions on Hunting and Camping Trips," in your issue of Sept. 14, by "Roxbury," and I quite agree with him in the statement that one should give the matter of companions on these trips due consideration; but he does not tell the readers of FOREST AND STREAM who are the proper companions, our grandfathers and wives excepted. The sportsman is fortunate, indeed, who has a grandfather to accompany him on these trips, or even give wise counsel at home; and, perhaps, still more fortunate to have a wife who enjoys the rod and gun well enough to accompany him to the woods and take part in the chase. But, unfortunately, all sportsmen do not possess grandfathers, or wives who "wander back to camp with scalps" of unknown origin. What will the latter class of sportsmen do?

I desire to congratulate "Roxbury" on his discovery of a new name for buck fever, "squirrel on the gun barrel." This explains to me how he managed to miss so many shots last fall. But he is still after big game, and I have no doubt his efforts will be rewarded some time. Let the readers of "Roxbury's" article ask him, who shot that fine specimen of black bear whose skin adorns his home; also the moose, the horns of which hang on the wall? If he tells you the truth, and I am sure he will, you will readily understand why he thinks wives make excellent companions on hunting trips. 45-70.

Take inventory of the good things in this issue of FOREST AND STREAM. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

Natural History.

Coahoma Has a "Kink" Snake.

Editor Forest and Stream:

I have an interesting office companion, who reminds me of a story told by Mr. Horace Kephart several years ago that elicited some comment at the time. Several days ago as I stepped out of the telephone booth in my office, which is immediately on the bank of the Sunflower River, I discovered a snake extended on the floor. He had crawled through an open back door and across the rear room. He is a little over 3 feet long, and belongs to one of the commonest varieties of the constrictors in this Mississippi River bottom country. I don't know his name, species or genus, but in color he is light underneath, with a dark olive ground above, divided into large and regular carpet pattern by a dull orange bordering which crosses the back transversely and is bifurcated on the sides. "Kink" snake would be an appropriate name, as, when extended on the ground in a state of repose, he knots himself into a great number of short kinks. He is also a tree snake, being the most expert climber I am acquainted with among the snake family. In fact, I believe his habitat is essentially arboreal, his food being sought among the branches of trees.

The individual who has taken up his abode in my office seems always ambitious to climb higher in whatever situation he may find himself. The room has a ceiling 14 feet high, and is "hard finished" in yellow pine. There is a moulding at the top of the wainscot 4 feet above the floor, another moulding for hat pegs 2½ feet higher, and a third for suspending picture cords a foot and a half below the ceiling. The mouldings are rounded on the upper edge, except the top one, which has a groove above. The boards on the walls are placed diagonally, above the wainscot, at an angle of 45 degrees. The snake crawls about on the rounded mouldings very cautiously, and

ELK HORN FENCE.

occasionally slips off and flops down on the floor. He makes futile efforts to climb up the smooth face of the walls in the angles of door facings and corner mouldings, and can reach up nearly his length by resting a few inches of his tail on a projection below. He managed to get to the top of a tall door facing through the aid of a transom rod, and then after many efforts succeeded in climbing along the beaded joint between the diagonal wall boards to the top moulding, and on to it, the distance being a little greater than his own length. After crawling around on the top moulding a while, in making an effort to get up to the ceiling, he lost his hold and flopped down on to a table. His repeated falls do not appear to hurt him nor dampen his aspirations to reach the topmost point. A short time ago he got on to the top roll of a wall map, which he found very insecure footing, and was unable to get down from it without falling. I carried a flexible electric light conductor over to the map and attached it. He has crawled up this at a steep angle to the ceiling, where it is suspended, and is now nearly over my head, and appears to be puzzled as to his next move. Yesterday he reposed on top of my desk nearly all day, within 2 or 3 feet of my head.

He is quite an interesting study in his character of an acrobat, exhibiting both great skill and abundant caution when in difficult situations. I have observed that he never retrogresses (to coin a word) in his movements to get out of a tight place, and I suppose his anatomical structure will not permit such movement. When on very insecure footing he occasionally arches a portion of his back and projects his front end forward from the tail "purchase" instead of using his forward feet for progression.

Mr. Kephart's snake (which he killed, and whose ghost is probably still haunting him) performed a great climbing feat after being wounded, but I believe mine is the champion climber to date. I have named him St. Peter.

COAHOMA.

Fences of Elk Horns.

NEW YORK.—Editor Forest and Stream: I inclose you photo of fence made of elk horns, which I took in Livingston, Mont. I found three fences made of elk horns. This fence extends around the house; there are about 140 horns. The owner spoiled the looks of them by painting the horns red and the tips white.

H. W. TREDENICK.

New Snake from Texas.

LAST summer a large and handsome colubrine snake was received at the Zoological Gardens in Philadelphia. It was from Mr. E. Meyenberg, a collector of the Society of Pecos, Texas, and was very different both in color and in the way in which its scales were arranged from any species of genus *Coluber* that had been before collected in the United States. The specimen was captured in the Davis Mountains, fifty miles southwest of Pecos, Texas.

In August, three more specimens were received, two of them living, and an examination of this material has resulted in the description in the Proceeding of Philadelphia Academy of Sciences, by Mr. Arthur Erwin Brown, of a new species, which he calls *Coluber subocularis*. This is a large, handsome snake, between five and six feet long, bright yellowish in color, with two black stripes running down the back from the neck to the tail. These stripes are connected by narrow crossbars of black. The general undercolor is white. A handsome photographic plate, showing the head of the species, illustrates the paper.

Game Bag and Gun.

Squirrel Episodes.—II.

CHARLESTOWN, N. H., Sept. 27.—A glance at "Squirrel Episodes," in this week's FOREST AND STREAM, shows me that my pen ran away with my memories, and that I omitted something I meant to say, mainly of interest to the younger generation of sportsmen, who enjoy the pursuit of squirrels.

First, as to the use of dogs, which was considered superfluous; so it is, when the leaves are thick on the trees, for a squirrel once treed and alarmed, will hide in the thick foliage, and be very hard to find afterward. When the leaves and nuts have fallen, and the squirrels are on the ground, looking for their food, a dog is very valuable, to find and tree them; and then it is that a companion is also desirable; for a squirrel cannot well keep on the opposite side of the tree from both gunners at the same time, though he will often elude one.

I well remember treeing one once, when alone, on a tall, dead, branchless pine, standing alone in the edge of an open pasture, near the woods, on a topmost hill. I saw the squirrel run for the tree, but find him I could not; so, seating myself on a convenient stone, I waited to see if his curiosity could lead him to show his head to look at me. After some ten minutes' watching, I heard "thump!" in the dead leaves, on the opposite side of the tree, and some twenty feet from it, and, springing to my feet, there was Master Squirrel, making a blue streak for the woods, and out of shot, before I could bring my gun to bear. I had thoughtlessly sat down on the wrong side of the tree. I spoke of my fondness for stalking them alone, which was true; in these September days, such as are now with us, not even a leaf had fallen, and they were just beginning to turn yellow. I always enjoyed being in the woods alone, and then, it was my delight to saunter along the old, deserted woodroads, or through the open grassy, or stony glades, with their scattered nut trees, looking for "signs," and by this mean the fallen nutshells, or half-caten acorns, which a gray squirrel scatters profusely. If you spied a large twig which had held half a dozen acorns on it, it was evidence of a "red;" for they cut off the bunches, and come down, pick the nuts up, and store them for winter's use, but the gray one usually eats his in the trees. When "signs" are found, sit down, with your back to a tree, and wait and watch, for there may be a squirrel over your head. I have dropped them so that they struck the ground within twenty feet of me, after a few minutes' patient watching in this way. The great secret in squirrel hunting is to make as little noise, and be as inconspicuous as possible. In my younger days any old clothes answered the purpose for shooting garments, but as I grew older I had a shooting jacket made—the well-known 42d Tartan—and later a green Norfolk jacket, which answered for both trout fishing and early shooting; but for the later months there is nothing like tan-colored duck, with an old, drab felt hat, and a pair of stout, gray or brown trousers. For footwear, it is a mistake to wear too heavy shoes; a light, flexible boot, well greased to keep out fog and frost, with a moderately strong sole, is the best thing I have found.

One of my early companions, an excellent rifle shot, who gave me many lessons, always wore Indian moccasins, although he was a shoemaker himself. He had "a soul above buttons," and did not follow the old Latin maxim of "ne dator ultra crepidam," for he left home soon after I did, and the only time I have seen him since, I met him on Broadway, resplendent in blue cloth and brass buttons, as one of the corps of the late "Jim Fisk," when that worthy was running the Old Colony line of steamboats in naval uniform. Another companion, since then, always wore rubber shoes; but my own feet were too tender for such coverings, and I have found that there was "nothing like leather."

My list of old woods comrades ranges from shoemakers to schoolmasters, and to United States Senators, and many a pleasant day, "by field and flood," have I had in the company of a late judge of the United States Circuit Court. So much for companions. Let me return for a moment to the sunny valley, of which I have spoken. On the far side of it, well up the slope, is a farmhouse, where I have always called for apples and cold water, and, occasionally, for luncheon; and back of that was another piece of old woods, now a sheep pasture, where my brother and I have got many a squirrel; and I well remember, on coming out of the woods one morning, dropping a ruffed grouse, which sprang up before us, as he rose to crop a high rail fence, which divided the woods from the open pasture, on his way to another place of shelter.

There was another favorite old wood lot, about as far from the village—three miles—in another direction, and here we often went. This was not cleared till later, and is now growing up to woods again, and my oldest son has never forgotten climbing a tall hemlock, for a squirrel which I had dropped into his summer nest, and

which he found dead there, and threw down to me. There were other favorite shooting grounds across the river, in Vermont, but they have nearly all been cleared now, and their green coverings converted into furniture—cupboards and matches.

But I am getting garrulous, and will close with the memory of one more shoot, which is more distinct, as it was a short one. About a mile from the village, in a bee line, a rocky knoll of a dozen acres or so rises abruptly from the side of the highway, with a narrow strip of grassy pasture between. There is a cold spring under a rock, by the wayside, shaded by butternut trees, and the side of the knoll next the road is steep and grassy, with rocks and trees scattered over it, with stunted oaks on top, and sloping away more gently on the other side to a broad fringe of old pines and hemlocks around the base.

Starting one morning at daylight, I entered the pasture at the spring, and was soon climbing the slope. I had not gone very far when a squirrel started to run across a bit of a gully in front of me on a fallen tree, but stopped to look around, and was soon in my pocket. Half way up the hill I found another one scampering across the grass, and he followed the first one. Reaching the top, I dropped one from the top of an oak, but did not kill him, and he got into the hollow butt of the tree; laying down my gun, I found a dead branch for a club, and soon had a smudge of leaves and twigs burning in the hollow, into which he quickly dropped, and was secured, somewhat singed, by a blow of the club.

Waiting a little while, till all was quiet, I went down the knoll by another path, and bagged a fourth one, from the top of a tall oak, where he was breakfasting, and, on reaching the pasture level, struck a path round the knoll, by which I started for home; but I had not gone far, before a fifth squirrel came down from the top through some young white birches, on his way from breakfast to his home in the pines, and he was soon added to the contents of my pockets, and I reached home to a late breakfast, with the material for a squirrel pie for the next day's dinner, very quickly and easily secured.

The skins of that autumn's shooting made my mother a winter cape and muff. Vox W.

The Changing Years.

Tempora mutantur et nos mutamur in illis.

How many of the readers of this paper, now in middle life, can look back thirty or forty years ago, raise up their hands and honestly affirm that they never shot a blackbird, a robin or a flicker, alias clasp and highholder? For one, I plead guilty. I may to-day watch the robins on my lawn and admire the undulating flight of the flicker among the oaks, and wonder to myself how, as a boy, I could have done it, yet I certainly did do it, and I confess to taking very keen enjoyment in the sport, if I can so term it. Long Island was not in those days a goodly part of Greater New York. The trolley car was in the distance, and what are now thriving streets were then country lanes, along which the robins found shelter, as the winter blasts approached, in the warm cedars.

I must plead guilty to ensconcing myself under the pepperidge or dogwood trees and, with my single gun, bringing many a robin redbreast to bag. How often have I lain along a recently cut oat field, and, awaiting the coming of the flocking blackbirds, got one shot into them upon the stubble, and another as they arose.

And as to the flickers, they were the big game of the boy hunter, a robin or a blackbird counting small as compared with a highholder. They made a great mark on the wing, but were preferably shot at when perched upon the apex of some blasted tree. I have even nailed long bean poles to the topmost branches of an oak and been repaid for my trouble by having its tempting prominence well patronized by the flickers in their flight south. There were always two or three days in October when the flight was on, when the birds were plentiful, and after which but a stray laggard could be picked up here and there.

I certainly to-day would think this kind of shooting out of place, because it is against the law, and the birds in question are not certainly game birds in any sense of the word. For these same reasons I should lay strong injunctions upon my boy against harming a robin or a flicker, although, if my boy killed it, he could with great truth say, "Why, when you were a boy you shot them by the hundred."

I plead guilty to spending, even to-day, a few moments when passing, watching the robins feeding in the mountain ash trees along the street, and thinking how, as a boy, I would creep up within gun shot and lay them low, doing my best to get two or three into line.

All very wrong as I look at things now, but as a boy I simply commenced on such "game." At nightfall, when I returned home with my pockets bulging with flickers, I was as proud as a man with a score of partridge or woodcock would be to-day.

But the days of the single-barrel gun passed, and then came the double gun, and then the hunting of woodcock from July 4 on—when they allowed summer woodcock shooting—and English snipe and quail, and partridge in the fall, and although the shooting of robins and highholders was not against the law, they ceased to be game to me any more.

But before that time I confess to have hunted them from dawn to dark, and never thought of them being anything but legitimate game. I not only shot them, but I confess to enjoying the potpies that were made with them. It was a case of four and twenty black (and other) birds baked in a pie. And while I am about it, I must confess to slaying innumerable cherry pickers, commonly so called, alias waxwings or yellowtails. In September they flocked and patronized the wild cherry trees in dense flocks, into which charges of No. 10 shot made great gaps. These birds were as fat as butter, and much about the size of a small sand snipe. I see a few of these same birds to-day feeding upon the mountain ash berries, and as I watch their movements close by, for they are quite tame, I look back and wonder how and why I did it. But the fact stands that I did do it, and that I enjoyed myself in so doing, much as I would to-day in knocking three or four teal or mallards out of a swiftly passing flock.

Certainly times have changed, and we have changed with them. CHARLES CRISTADORO.

When Hazels Turn to Russet Brown.

WHEN hazels turn to russet brown,
And hick'ries lose their hoarded gold,
When autumn leaves in shining showers
Are falling from the maples old;

When through the valley's purple haze
The silver birches softly shine,
And over gray and mossy rocks
The woodbine pours its crimson wine;

When, like the burning bush of old,
The sumac flames along the glen,
And autumn weaves her cloth of gold
By reedy stream and lonely fen;

'Tis then that fancy stirs the heart
With memories of other days,
When boyhood strolled with dog and gun
Along the sunny woodland ways.

I see once more the ancient oaks
Where pigeons sat in lines of blue;
The tangled thicket where, at dusk,
The partridge beat his soft tattoo.

The old rail fences, half obscured,
With bramble vines and bitter sweet,
Where in the morning piped the quail
And rabbits found a safe retreat.

I see again the reedy lakes,
Where in the fall the mallards came
To feed upon the yellow rice
While sunset turned the pools to flame.

Once more, as in the olden days,
I see the glossy chestnuts fall,
While up among the golden leaves,
I hear the squirrel's noisy call.

Oh, for a day amid those woods,
With my old muzzle-loading gun
And hunting dog of various breeds—
I tell you that's the kind of fun!

Who would not give his sordid gain,
With all the weary care and strife,
To feel once more that ecstasy,
Which thrilled his boyhood's glorious life?

HENRY J. SAWYER.

The Wilds of Maine.

THE wild region west of Cangomgomoc, and north of Baker Lake, holds many large moose. None but the hardest of sportsmen dare invade this vast solitude, and precious few of them ever see Baker Lake or Chinquasabamtook. This beautiful lake, nine miles in length, lies far west of Churchill. The smoke of the hunter's campfire is seldom seen ascending from its shores. From morn to twilight no sound disturbs the silence of the woods, save the plaintive call of the cow moose, or the weird laugh of the loon. At rare intervals the report of a rifle is heard, borne faintly on the breeze. The owner of the piece seldom appears on the shore of the lake, unless he is a hardy hunter or trapper. Since the Johnson party passed through this region, about 1896, there is no record of any one following in their footsteps. They probably came across from Russell Pond, the source of Russell Brook, that empties into Eagle Lake. The writer has camped near the mouth of the brook, and has been part way up it in pursuit of the speckled. Any party that attempts to reach the headwaters can be assured of having a rocky time of it. There is no good tracking snow in the northwest before November—the best month for the moose, and about the worst for the sportsman. The prospect of getting starved out, or frozen in, confronts a party like grim specters. None but the toughest of sportsmen can live on venison alone any length of time, and do much hunting. Getting frozen in demands prompt action on the part of the guides and party. If the flour is getting low, a move must be made at once. The canoes are almost useless, except on open water, as dragging them through broken ice will ruin them. There is no cause to worry if there is a road or trail to carry out on, but such luxuries are rather scarce in the Bamtook country. There is an old portage road that comes in near the foot of the lake, and trends north; it is probably an old-time relic; in that case it is choked up with fallen timber. The forest growth has almost completely obliterated the traces of ancient lumbering days. There are no camps of any description in the country; if there ever were any they have disappeared long ago and crumbled to dust. At the present day all the lumbering that is done west and north of Allegash Lake is carried on mostly by beavers. The marks of the trapper are often found in the wildest part of the woods. They came into this wilderness long before the old-time lumberman or sportsman gave it a thought. Singly, or in couples, they have penetrated to every section of the forest where fur abounds. An almost Arctic winter shuts them in from the outside world, and, save for an occasional trip to some far-away lumber camp, to exchange venison for flour or pork, they see no human life for months at a stretch. They make the best of guides, as they know the secret of every hidden pond and bog.

To illustrate the light and shade of forest life, let us accompany an adventurous party of sportsmen in their efforts to get in closer touch with nature and moose. Low water is the greatest obstacle they will have to contend with, and, in rarely visited sections of the woods, the streams are choked with fallen trees and other obstructions. Cutting a narrow passage for the canoes, getting down into the brook and clearing it of rocks, heaving aside huge boulders, and frequently being obliged to dig out a channel with the paddles, makes hard and exhausting work for the guides. Nightfall often finds them with only a few miles to their credit. At dawn the attack is renewed, with varying success. Sometimes they are obliged to leave the stream and cut a passage for the canoes through the tangled forest, or else traverse some treacherous bog that threatens to engulf the heavy weights of the party. This is varied by forcing the canoes through almost liquid mud, until not another inch can be gained, then landing the party on convenient tus-

socks, and reaching the timber by using the canoes as a movable bridge. Sometimes this plan will not work. In that case they will have to back out of the pocket and take to the woods. Their gritty attacks on the forces of Nature finally bring them within sight of the promised land, some lonely pond where the moose and deer have found a refuge for years from the sportsman's rifle. The piercing cold of November has no terrors for this hardy band as they track the antlered monarch to his death. Every day is a hunter's feast in more senses than one. They are boys again, and revel in an atmosphere of trout, venison and song, until they have gathered in their full quota of moose. The end comes all too soon. The nights are getting colder. Ice of ominous thickness forms in the camp pail over night; the warning voices of winter, and the guides, bid them depart before they are frozen in. Regretfully they take the hint, and, promising to come again another season and renew their forest joys, they fight their way out to camps and civilization.

Sportsmen of that class worked in ahead of the crowd in Northeast Maine and got the cream of the moose hunting long before the railroad came; they are right at home in the northwest wilderness. Such men can hunt and thrive on what chance supplies; they can glean from the ponds and forests long after the last flipper has disappeared. They will not be driven out by cold or hunger so long as there is a reasonable chance to secure the coveted trophy.

Hidden away in the dim recesses of the forest are many fly places, that are known only to the elect. Wadleigh, Desolation, Mud and Crescent Ponds are right in the heart of the moose country. Mud Pond is a dreary expanse of shoal water and bog. In contrast, Crescent and Johnson Ponds are beautiful gems of the woods in their magnificent setting of hardwood and spruce. All of them are difficult of access, and are seldom visited, except by the wandering trapper. The region to the southwest is much better known than the Bamtook country. The lumberman's axe rang through the wilderness around St. John's Pond and Baker Lake long ago, sounding the death knell of the giant spruce and pine. A vigorous, hardwood growth has now taken the place of the old-time forest.

Baker Lake is situated in the wildest and most inaccessible part of the woods. Surrounded by almost impenetrable forests and bogs, this home of the moose and deer is well guarded from outside intrusion, as it is almost impossible to get a canoe in at low water. There is an old trappers' line, or carry, that runs to the lake from Avery Pond, near Cangomgomoc; no one seems to make any use of it, so any party that attempts to work in here will probably have to hack their way through a tangled forest, with the chances against them. When moose hunting is at its best the approaches to Baker Lake are apt to be at their worst; sometimes the dead water freezes up before the snow comes. A sportsman and his guides were trapped in this manner in the fall of 1899, but not before he had brought down a fine bull moose on Baker stream with his Savage. The North Branch is a terror at low water. The stream is full of gravel bars, large boulders, and other things too numerous to mention. Lugging and dragging are the order of the day, a process ruinous to the canoes and the tempers of the guides. It is about twenty miles up the Branch to Abacotnetic Bog; if the water is low nearly the whole of this distance must be waded. The prospect is enough to cause all but the hardest to wilt. From Abacotnetic Bog sportsmen can get to the lake by way of Baker Brook and Bog; a much longer route is to float down the outlet of St. John's Pond. At low water it is a choice of two evils, with the odds in favor of the Bog route. A hard rain smooths most of the rough places, and sends the sportsman on his way rejoicing.

None but the hardy moose hunter can enjoy life in this vast solitude, with its accompaniments of ice, sleet, and bitter cold. The sportsman must have the endurance of a Leather Stocking to follow the telltale tracks in the snow all day and camp on the trail at night with the temperature close to zero. On such a night some reckless hunters will keep up a racket of chopping and singing, early in the evening, and have an enormous campfire going all night, utterly regardless of the close proximity of the wary game. Not so, the knowing hunter and his guide. In some protected place they start a small fire, putting on a few sticks at a time, Indian fashion, gathering what chance offers, and doing little or no chopping. They take turns watching the fire, and manage to doze a little; but the intense cold and stinging smoke make sleep a mockery. They hail with delight the first faint streaks of dawn that light up the forest. A hearty meal of venison and flippers, with a scalding dipper of coffee, braces them up wonderfully. They take up the tracks as soon as it is light enough, and follow them to what is often a bitter end for the sportsman. No matter how sharp the hunter plays his points he cannot always ward off misfortune. If the bull is standing in black growth, it will require the keen eyes of a woodsman to pick him out. Saplings deflect the bullet; and, oh! how exasperating it is to catch sight of the wily rogue bounding over fallen timber, with an up and down movement that defies all your calculations. You may plant your soft nose close to a vital spot, and yet fail to bring him down; he may drift far back into the woods to die in some inaccessible swamp or bog. If there is no tracking snow the chances of getting him are uncertain, unless you have the best of Indian guides. But, oh! what fierce delight to see the forest king, at the spiteful crack of smokeless, fall, to rise no more. All the hardships and disappointments are forgotten in the joy of the supreme moment. The wind often plays havoc with the calculations of the sportsman and his guide. The hunter may imagine he is approaching the wary game up against the breeze, when, in reality, the bull has changed his course and is lying up to one side of the trail. The conditions are now reversed; he either catches sight of his pursuers, unobserved, or, what amounts to the same thing, gets their scent, as soon as they work up above him. A crash in the undergrowth may announce his departure, or else he may silently steal away at a gait that laughs at pursuit. Therefore, keep a sharp lookout on both sides of the trail, as well as ahead, unless you want to have something to worry over during the long winter evenings. Such are the lights and shadows of a hunter's life. Some heavy-weight sportsmen and guides cannot travel

last enough; they soon become tired and unsteady in their gait, and in their efforts to follow the pace the bull has set, snap branches underfoot that sound like pistol shots in the stillness of the forest; the catlike, stealthy movements of a well-built light-weight are not to be imitated by the guide built on the model of Hercules.

To retreat from the wild northwest, and parry the attacks of the advance guard of winter, will often task the resources of the sportsman and his guide to the uttermost. To work south from Baker Lake is a tough proposition late in the season. He will find it interesting, if he attempts to carry across the divide between St. John's Pond and the head waters of the West Branch of the Penobscot. The easiest way out is to paddle down the South Branch of the St. Johns to the main river, and work his way north to Seven Islands, about two days' canoeing from Baker Lake. This little settlement is the only speck of civilized life in the whole region. Parties used to be hauled across to Long Lake; if the team has been taken off any length of time the axe will have to be used liberally to clear it of obstructions. Once the lake is reached, it is an easy run past Fort Kent, Frenchville, and other Acadian settlements, to Van Buren, on the Bangor & Aroostook Railroad. A party hunting near Crescent Pond can move out by way of Russell Pond and the Forks, unless they have lingered too long; in that case, they had better try the outlet of Chiquasabamtook, which leads into Long Lake. They should take the first good chance that offers to fight their way to the foot of the lake, before they are held up, indefinitely, by furious gales.

Before the last hunter has drifted out of the region the lumbermen have moved into camp, ready to wage a destructive warfare on the hapless forest. There were no cuttings last season west of Allegash Lake. This will not continue long, as they are now firmly established on the edge of the Bamtook country, and are working their way slowly, but surely, into the interior. The east side is being mercilessly stripped of its valuable timber to satisfy the rapacious demands of the saw and pulp mills. Before the railroad came there was tolerably good moose hunting in Northeast Maine, considering the proximity of such large towns as Houlton, Presque Isle and Caribou, with electric lights, waterworks, and all the modern improvements. All the moose that are worth tracking now are mostly found in sly spots, places that sometimes escape the observation of the most experienced hunters. The unwise policy of allowing the undersized bulls to be shot will soon leave nothing in the woods but cows and hunters. It is utterly impossible for the old bulls to recruit their ranks under the present conditions. This arrangement suits most of the camp owners and guides, and helps swell the output at the stations along the line of the Bangor & Aroostook Railroad. Caribou, for some reason, are extremely scarce west of the Big Lakes, and are gone forever from Northeast Maine; but there is no lack of deer in the Katahdin region, and other points remote from the railroad.

The Acadian settlements are very ancient and interesting. Fort Kent was settled in 1755, by refugees, driven out of Nova Scotia. They conquered the forest on the upper St. John's, and founded peaceful homes; clearings crop out here and there, along the river, getting scarcer the further up you go, until they end at the French settlement at Allegash Falls. The country between the Falls and Big Machias Lake, and south of the Musquacook Lakes, is very wild, and difficult of access. The crowd avoids such places, and overruns the Machias and Katahdin regions, where camps abound. The camps close up to the Big Lakes are too far in to suit the army of easy-going sportsmen, who keep within sound of the locomotive whistle, where, naturally, big moose are seldom seen, except in the imagination of the camp owner and his guides.

Experience goes for much; but luck occasionally has its innings. A ridiculous story was told me by a native of a party of sportsmen who came in, on a shortage of guides, supplied with a couple of cast offs. They struck off into the woods. Luck favored them; a lonely old bull, happening to be wandering about, encountered this party of misfits, who promptly saluted him with a volley of rifle shots, and great was the rejoicing of the tenderfoots over the body of the fallen monarch, winding up the proceedings by lauding their incompetent guides to the skies.

The big bulls of the east side are being rapidly disposed of, as, in fleeing down wind from one party, they are liable, without warning, to run into another above. The Katahdin region holds a few good ones, being a hard country to hunt in. The region to the north is comparatively level, and here the crowd runs riot. There is no doubt that many of the moose, driven desperate by pursuit, have fled into the wilderness west of Chamberlain and Eagle Lakes. Here, for the present, they are safe from the deadly smokeless. It takes at least five days to reach Chiquasabamtook from Moosehead. Baker Lake is nearer and tougher. This, and the lateness of the moose season, with its attendant hardships, bars out all but the bravest of sportsmen. The early part of the season is apt to be disappointing; the traveling is noisy unless rain has set in. By this time the moose have left the water and retired to the ridges, where it takes a crack Indian guide to track them. In Thoreau's day, the Indian was more a creature of the woods than he is at present, and was rapidly exterminating the moose, until the law headed him off. Good Indian trackers must be getting scarce now, and the sportsman that secures one has a prize, provided he can divorce him from fire water. Few or no white men can compete with the Indians on their chosen ground.

The sportsman who lingers late in the Bamtook or Baker Lake country, waiting for a good, tracking snow, takes great risks; in fact, he has often to take them, or go without his moose. The closing days of the hunting season see the whole country in the iron grip of winter. The sportsman must be made of heroic stuff to stand his ground while the streams and ponds between him and the settlements are locked in icy fetters. The deep snows will eventually drive him out of the woods, leaving the trapper in solitary possession.

September moose hunting has long been a thing of the past in Maine. It will now be necessary, in many parts of Canada, to close up this month, and then, to many, the romance of the forest will have disappeared. The votaries

of the birch bark horn will sorrowfully hang up the implement of their calling; all their wild wood life relegated to the past. All gone, no more for them the mystery of the moonlight, the wild challenge from the bog, the far-away reply from the darkened woods, the listening silence. Again and again the searching call lures him to his doom, the moonlight floods the little glade, everything is ready for the sacrifice; nearer and nearer, he comes; then halts, suspicious, on the darkened edge. Pouring water fails to bring him out; we'll try him with the coaxer. Careful, one false note will ruin all. The agonized appeal of the cow, that rises on the still, night air, is followed by a crash, as the maddened bull bursts from the forest into the moonlit space, to find himself cheated. He turns to flee; too late. Struck by the leaden bolt, he staggers for a moment, then drifts away into the darkness beyond, to be found by the tracker, at early dawn, stretched out stark and cold, in the woods he loved so well. A few years more and all the wild, weird charm that hovers about the moose caller's existence will be nothing but a memory of a glorious past, gone forever.

W. C. SQUIER, JR.

RAHWAY, N. J.

A Visit to Mexico.

AFTER a most delightful eight days' trip from the foot of Wall street, New York, on the steamship Niagara, of the Ward Line, we landed at Tampico, Mexico, a quaint, old Mexican city, yet having lots of American enterprise, and, in fact, a little more enterprise than the average Mexican city. As you leave the Gulf of Mexico (approaching Tampico) you enter the mouth of the Pamico River between stone jetties that extend out into the Gulf about a mile from the main land, and which cost the Mexican Government about eight million dollars.

Now you have entered one of the greatest streams for tarpon fishing on the American continent. This royal sport can be had on any part of this river for a distance of about fifty or sixty miles. In fishing for this king of fish, it is not a question of luck to have a strike, but simply a question of a baited hook, and the strike is certain. As you go along the Pamico River you constantly see the tarpon breaking through the water or chasing schools of mullet or jackfish. The few men who have had rigs and know how to catch the tarpon have landed from three to four each day, and some weighing over 240 pounds. There was landed on the day of our arrival one that measured 7 feet 4 inches long, but I could not learn his exact weight.

The city of Tampico is located on the river, seven miles from the Gulf, and boasts of a new custom house that cost several millions of dollars, and would be an ornament as well as a pride for any large seaport in the States. The markets there have during the winter all the summer vegetables and fruits, which are raised principally by American farmers. The farms are located just outside the city. However, we were bound for our friend Cathcart's ranch, the Hacienda Multifluores, located just two miles out of the city, and on the banks of the Tamesa River, a branch of the Pamico.

Disembarking at Tampico, we were welcomed by Cathcart, whose natives relieved us of our baggage. Then to the custom house, where the officials took a short view of our goods, which they passed without finding anything contraband. Then by carriage we were whirled to our friend's ranch in about twenty minutes, and just in time to take a view from the bluff at the large flocks of ducks feeding on the river flats. Then we were summoned to dinner. As we were here for shooting, it was decided that we should go for ducks on the morrow; but we simply could not resist taking our guns down to the boathouse, as there were so many chances of getting a shot in passing, and sure enough on reaching the foot of the bluff we saw a small bunch of five canvasback ducks feeding near the edge of the reeds. Then there was a race, to see who could get within range first. Mr. Scott was first to fire; he killed a big drake, and when they rose he got a duck—a nice pair of canvasbacks.

We arranged to start early the next morning before daylight for the big flats, about three miles away. Our host Cathcart, or Jim, as his friends call him, called us at 3 A. M. We were lighted down the bluff to the boats, where we found three natives looking like statues in the dark. Boarding three canoes, Jim advised us to lie down and take a nap while going to the grounds, but this was impossible, as the phosphorescence on the water was so brilliant that we could see every little fish move, and the water was literally alive with them. The large fish, among which were tarpon, were chasing the small ones in a liquid fire. The sight I shall never forget. All of a sudden one of our friends screamed aloud; there had jumped into our boat a tarpon (a young one, though) about 4 feet in length, but before we could capture this beauty he was back again into the water of liquid fire.

We were now nearing the big flat, and everything was still, except the squall of a flock of parrots passing overhead, on their way to their feeding grounds.

Now on the flats, we were taken into a small ditch that emptied into the river, running through a strip of woodland, and on the other side was a flat for about three miles, dotted here and there with a little island of tall reeds. The flat had from 3 to 6 inches of water on it, and as it was just daylight when we got there, I must confess that the sight was simply indescribable.

There seemed to be about all the ducks, geese and snipe in all the world right there within sight. We were just told to walk right in, and as the mud was soft, we would sink nearly a foot each step, and I tell you it was hard work. Jim placed us each one in a blind—a small island of reeds—and told us not to bother picking up our game until we were through. Well, George and the rest of us were shooting away before we got half-way to the blind, for ducks were flying in every direction. I shot away fifty shells in less than half an hour, and I had ducks all around me. I noticed a couple of gray eagles carry off several ducks, so the next time one of these birds came near I killed him. I did not get any geese, although Jim and George were in their flight and got several. At 8 o'clock Jim came along and suggested that we had better go, and as we were all nearly out of shells and had a big lot of game, we called the natives over and carried the game to our boats. As it was still early, Jim suggested we catch a few calico perch, using the inside of a duck for

bait. We were then soon pulling up fish of a pound or over, and such fun was this; I only wish I had the time to tell you all about it, for it was real game fishing to the limit. After catching a good, heavy string, we started for home, arriving there about 11 in the morning, with game for all the neighborhood. Jim has lots of friends here, and always manages to give away game and fish to prevent them spoiling.

After the memorable and glorious sport of this morning, we were all ready to follow the customs of the country and take a siesta, especially as we were to go out at night shooting after deer and the wild boars or hovelinas that were damaging Jim's crops. After supper we sailed out, Jim leading, with a jack lamp on his head; by his side his faithful night dog, Cohoke, a genuine Virginia hound, and a present from Mr. Scott. This night shooting is very fascinating, as one sees only the animal's eyes. We lit up two deer, but did not get a shot at either, although I have no doubt that Jim could have killed both; but there were too many of us and too much noise, so we did not kill anything.

As the natives talk nothing but Spanish here, we had quite a time making them understand when Jim was not on hand, but they seemed anxious to understand, and are very attentive. We all regretted not having tarpon rigs, for we saw so many of the fish. We tried to buy a tarpon outfit in Tampico, but in vain, so we started to get our things in shape for a big hunt after lion, tiger, deer, turkey, etc.

We arranged to go by wagon and camp out nights, taking two natives, Pancho as guide and Antoine as driver and cook. The roads were very rough, and gave us a chance to get out or dismount, and we were instructed that we would have to kill all the fresh meat we needed. We had when we stopped for dinner eight Mexican pheasant and eleven quail, which our cook Antonio served in his own style. We all insisted that we must have the game cooked in American or United States style, but Jim said, "Let Antonio have his way, and if his style doesn't please we will then have your way of cooking." Antonio just got a stick about 6 feet long, took the bark off, then sharpened both ends; cleaned the birds after picking, opened them up the back, laid them open and stuck the stick through them until his stick was a row of birds. The fire was then hot; he stuck one end of the stick in the ground, slanting the birds over the fire, then reversing by sticking the other end of the stick in the ground, until they were broiled to a turn. You can well imagine the rest, and Antonio was voted an expert on cooking game.

After dinner we were ready for anything, but as Jim said we were eight miles from our hunting ground, we started off, and saw nothing larger than a quail until about 4 o'clock, when Jim, who was riding ahead, came back to the wagon and told us there was a big flock of turkeys in the open fields to the left of the trail, and advised us to sneak down along the edge of the woods opposite the turkeys, then he would drive the wagon into the open so that the turkeys would run into the woods. There was a scramble to get there first. Scott and myself got there, when the turkeys took to the woods. I got them in a line and fired, expecting to kill all three; they took wing, and after we had hunted around, all we found was some turkey feathers. As there were about twenty in the flock, Scott and I came in for a good "roast." I then came to the conclusion that the better way would be to shoot them singly with a rifle. We finally reached our grounds, and Jim started to get camp ready, while Antonio prepared supper. Scott and I heard nothing but talk about the nice, fat turkey for supper that we did not get. But we both made a vow to be on the spot next morning and get turkey or die. After dusk we could hear the coyotes barking all around; finally we fell asleep listening to them.

We were awake before daylight, and glad to get up, as we were stiff and sore. After a dip in the stream and a hurried breakfast, we were off again. Scott and I, each armed with our rifles, started to redeem our reputation for turkeys. Pancho and George were to go for deer. Jim went alone for anything worth shooting. After going a short way we had a shot at a running deer, which we both missed; then we saw a single turkey. I took good aim, got my bird and found him to be a nice, big gobbler. We were then some distance from the open, and went along cautiously. Sure enough, on the edge of the opening near this woods we saw a flock of about twenty turkeys feeding. We planned that Scott was to make a big circle and reach the woods, while I was to wait about ten minutes, then sneak as close as possible for a shot. I waited, then got within 100 yards of them, keeping the last bush there was between them. I got a bunch together, took careful aim and fired; they ran into the woods, leaving one dead on the ground. Scott did not shoot nor appear, so I carried my other dead bird and put him with this one when suddenly I heard a report of a gun, then Scott calling to me to come over. I picked up my two turkeys and found I had quite a load. When I reached Scott I found he had killed a big buck. We concluded that we had better get back to camp, so, leaving the deer, each carried a turkey back, and found Pancho and George already in with two deer, and both good-sized bucks. Jim had not gotten back, so Antonio took the horse and with Scott went after the deer and a coyote I had killed. It was then about 11 o'clock, when I walked Jim, telling us he had killed a big tiger. We took one of the mules, and all hands went along to see it, and after going about three miles we came to one of the largest tigers I have ever seen, and so beautifully marked and perfect, shot right through the heart. Jim told us, "I was going along, not having shot anything; I had had several good shots at deer, but was looking for lion or tiger, when right before me, not 25 yards away, lay the tiger. As soon as he saw me he got up and started to walk away slowly, turning around to look at me every few steps. I raised my rifle, but could not see the spot I wanted until he turned the second time, when I fired at his foreshoulder. He dropped, and after a few kicks lay dead with a .45-90 bullet through his heart. I still held on to him with my rifle until I was sure he was dead."

On our road back to camp we saw a bunch of hovelinas or wild boars. We all fired and killed one and wounded another, and with our shooting the mule took fright and ran away, with the tiger fastened to its back. After a chase we caught him and led him back for the dead hovelina; the wounded one we lost. Finally we arrived at

camp with a tiger over 6 feet long and most beautifully striped. Jim, with our help, spent the rest of the day skinning the tiger, and a good job we made of it, saving all the feet and claws, also the head and tail. As we had all the game the wagon would carry, we voted for an early start for home in the morning, for game will not keep long in that climate. We killed two more turkeys and a lot of pheasants and quail on the way home, where we arrived about 5 P. M. We then kept two natives busy delivering game to all Jim's friends.

This is certainly a great country for game and fish. I hear that there is a taxidermist in Tampico who makes a living mounting tarpon. There is some talk here of forming a club for hunting and fishing, where we could have all the conveniences of the North without much expense. What are needed are good, modern gasoline or naphtha launches and gunning skiffs, so as to get around quickly; also good bird dogs, and fox hounds would be very useful also.

As we are going to visit Mexico City, if I find any gunning or fishing there better than here, I will send you an account of it, although I believe Jim when he says this is the best game and fish country on the American continent. I saw here about all the varieties of ducks found North, also all the snipe family from the Esquimo curlew to the little tilt-up, besides several of the snipe family never seen North, one especially about the size of the sickle bill curlew, but with a bill curved upward instead of down. Of course one can find game here all the year round, but the proper time for hunting here is from November to March, as there are thousands migrate North each spring, returning in the fall.

Boston and Maine.

BOSTON, Sept. 28.—Mr. Harry B. Moore, of this city, has just returned from a hunting trip to South Dakota, where he has been with Dr. French, for several weeks. Mr. Moore left Dr. French in that part of the country, determined to try the hunting still further. They hunted about 150 miles from Minneapolis, on the Chicago, St. Paul, Minneapolis & Omaha Railway, in the immediate neighborhood of the Sioux Indians. They had the best of dogs, a good hunting wagon. And such hunting even these adepts had never before experienced. They shot prairie chickens and ducks till they were nearly tired of the sport. These men have hunted in Maine, in the Provinces, in North Carolina and Florida together, and they have never found anything to equal South Dakota. But I am treading on ground that is to be occupied, for Mr. Moore tells me that Dr. French has promised to write an account of this hunting trip for the FOREST AND STREAM.

There are some pretty good reports of partridge shooting in Maine. Portland, Lewiston and Auburn parties go up to Rumford Falls, and from that point go with teams further up into Rumford, Hanover, Andover and to the east up into Mexico, Byron and Roxbury. Rumford Falls reports tell of some nice bags of grouse. Although partridges cannot be legally taken out of Maine, they may be transported from one place to another in the State in open season, if properly tagged with the owner's name. One Rumford Falls hunter came down the line last week with a bag of six, taken in Byron.

Chairman L. T. Carleton, of the Maine Fish and Game Commission, has gone into the woods in the Moosehead region with two of his best game wardens—W. T. Pollard and Frank Perkins. To a daily paper reporter Mr. Carleton said:

"There seems to be a carnival of illegal moose killing all through the northern portion of the State, and we propose to use every effort to put a stop to it. I am here to give the matter my personal attention.

"I won't say that the condition has never been more serious, but I will say that it is serious enough, particularly in the face of the fact that we had come to believe that popular sentiment was rapidly reaching a point where it would be impossible for moose to be killed in large numbers.

"What is more, this work could not be done without the knowledge and assent of some guides. I want to be quoted to that effect. There are some good guides, but there are lots who now have licenses who have got to be weeded out; guides that for a \$5 bill will let a 'sport' do anything.

"At this rate it won't be long before there won't be a deer or moose in our vast forests, any more than there is a caribou to-day. We consider the situation sufficiently alarming to give it our undivided attention for the present. As chairman that duty devolves upon me, and I shall investigate the matter thoroughly.

"A very large number of cases have been brought to our notice; an unusually large number. At Kelley Pond, near Ragged Lake, five deer have been shot and left to rot, and a short distance away, at Barry Brook, is a fine moose. Another moose lies dead at Dole Pond, on the north branch of the Penobscot, and there is another at Prong Pond, near Moosehead Lake. At Moose Brook, right on the shores of this lake, is a dead bull, and there are also dead moose at Eagle and Camcongomic lakes. In addition, among others, there are two dead moose in Washington county, and two more in Aroostook county.

"With our limited appropriation we cannot of course have extended game warden service, and I am convinced that it will be necessary to absolutely prohibit the taking of arms into the woods during the close season. I believe visitors who would not violate the laws are coming to understand this more and more, knowing that it is the only way to protect the game from the lead of vandals, who shoot, for what reasons I cannot tell.

"We have got to put a stop to all illegal killing, wherever it is being carried on, without regard to the persons interested. We have got to stop the use of deer meat in sporting camps during the close season, and we propose to do it. Warrants are already out for several proprietors, which means that we have taken the initiative in this matter, and propose to carry it through."

The above is very important, because it practically acknowledges what many people much interested have for some time known in regard to poaching in Maine. Mr. Carleton also comes down to just what I have for a long time contended through the FOREST AND STREAM and otherwise: that the only way to stop the illegal kill-

ing of game by fishermen and summer visitors is to absolutely prevent the carrying of guns into the woods in close season. If a man were caught with burglars' tools in his possession, and burglary had been committed, he would be the first to be suspected. It is also important because showing that at last the Commissioners are awake to what has been going on year after year, and that they propose to stop it. Mr. Carleton is entirely right about many of his licensed guides, and some of the summer hotel and camp proprietors. I hardly believe that matters in that respect are any worse in the Moosehead region than in many another section of the State. If Mr. Carleton could note, as I have noted for years, the utter carelessness or sang froid with which fishermen, tourists and summer boarders arm themselves with the best of rifles, of deadly caliber, when starting for Maine, when the season is closed on all game, he would be still more confirmed in his opinions as to the amount of illegal killing done, and that the only way to stop it is to deprive the dishonest visitors of the weapons they propose to use.

Sept. 30.—The open season on deer in Maine begins Oct. 1, and a good many hunters are preparing for their early fall shooting. Saturday three gunners passed through the Southern Terminal, on their way to Maine. Each had a dog—a bird dog—and a rifle and a shotgun. They were full of enthusiasm. Their names they did not care to give for publication. If they were successful, they would report their good luck to me. More hunters than usual will early be after the deer, and there comes up again the old fear that hunters may shoot each other. The fatality was terrible last year; may it be less this year. It will be remembered that the State passed a law last winter, intended to reduce the number of these shooting accidents. The principal clause of the law reads: "Whoever, while on a hunting trip or in the pursuit of wild game or game birds, negligently or carelessly shoots or wounds or kills any human being, shall be punished by imprisonment not exceeding ten years, or by fine not exceeding \$1,000."

Another law also provides that non-resident sportsmen may not hunt game in Maine without being accompanied by registered guides. This law does not apply, however, to camp owners, either by lease or purchase; to owners of timber lands, who may hunt on their own lands without registered guides. Greater restrictions than ever are to be put on the shipping out of game; expert wardens and inspectors will be posted at Bangor and all the other big game-shipping points. The Commissioners are determined to stop the shipping of big game into the Boston market. They made a great stride in that direction last year, and will do better this. Again the Lacey bill makes the receiver of game here liable for game illegally killed or shipped. The marketmen generally refused to receive it last year.

SPECIAL.

CHICAGO AND THE WEST.

Fall Game Season.

CHICAGO, Ill., Sept. 28.—The shooting season is under full swing by this time, more especially as regards the water fowl. The abundance of game this fall seems to be very general all over the West, for some unknown reason, and we are having our share, or more than our share, of game in this old corner of the world. The teal flight has hung around Fox Lake all the week, but the great bodies of birds, which came down about ten days ago, have broken up and are scattered around over the country. The teal came in this week pretty much all over the Kankakee country, where there is marsh enough left to furnish food. The old club grounds of the Maksawba Club offered very good shooting all through the week. Few of the members went down, as the Indiana license has put a damper on Chicago enthusiasm. Mel Fancher, one of the best-known pushers of the Maksawba Club, has been anxious to have some one come down to have a go at the birds, but is still lonesome.

Jacksnipe have appeared along with the teal all over the better Kankakee marshes. There are a few jacks in and around the edges of the Fox Lake country. The Skokic marshes north of town have a few jacks and plover. Any one wanting plover would better go to the town of Custer, near the Kankakee, or at least this is given out as a hot tip by Dick Turtle, who is supposed to know.

Off for the Dakotas.

Mr. W. H. Mullins, of Salem, Ohio, manufacturer of the celebrated Mullins metal boats, is in town to-day collecting the last items of his outfit for an extended trip in North Dakota. At St. Paul, Minn., he will be joined by Mr. D. C. Shepard, who takes Mr. Mullins to his private shooting lodge, near Devil's Lake, N. Dak. Mr. Shepard writes that he has never, in his experience, seen greater abundance of wild fowl than is in that neighborhood at present. A gentleman, 74 years of age himself, Mr. Shepard, on one of his hunts last fall, bagged nearly sixty birds in one day. He tells Mr. Mullins that this, perhaps, may be his last hunt, and he hopes it will be a good one. Let us hope that Mr. Shepard may hunt very many years more, and that Mr. Mullins may be with him. The latter is looking well and hearty, and expecting very much of his trip. He likewise threatens to go out to my bear ranch and kill a grizzly next spring. Then he has also lost a moose, and a few other things which would seem to bid fair to keep him interested in life for quite a while yet.

Mr. Chas. Antoine will start for the Northwest about the same time as Mr. Mullins. He goes, however, to South Dakota, after chickens, and not ducks. He will make Watertown his headquarters, and expects to have some fun with the big grouse. In this he is quite correct. Chicken shooting in October is a different and sportier affair than the same thing thirty days earlier. He will probably find the birds all packed, and too wild for work with the dog, but there ought to be opportunities enough to give him good fun.

Illinois Quail.

I heard to-day at a gun store that two gentlemen, who, for obvious reasons, wish their names kept private, last week tried to see whether the Illinois game law would work in regard to quail. It worked. They paid about

\$50 and costs apiece, having been caught with quail in their possession. Now they claim that the Woodcraft Magazine is wrong when it says that quail are not protected. They have got another glance at Woodcraft coming. They will find the law correctly stated there. It seems as though the papers could never make it plain to everybody just how this Illinois law stands. If not satisfied with the law, as it is stated in the Woodcraft Magazine, follow the example of these gentlemen; go out and try the law yourself, and see if it doesn't work. Understand, this is in regard to having birds in possession, and under the old construction of the law, which holds that the former law is still in force in regard to some of its effective features.

As to the quail themselves, they don't seem to care a fig about the law. There are more of them this fall than we ever saw in Illinois. Thus my friend, Warren Powell, writing from Christian county, "There is the biggest crop of quail I have ever seen. I had very fair chicken shooting several evenings, but the chickens are getting wild now. I tried shooting chickens by moonlight, but did not lay up very much money at it. We are trying to observe Nov. 1 as the opening date for quail down here, and I do not think many of them will be killed before then."

Tom Divine Joins the Gun Brigade.

There comes this week a rather startling and wholly interesting item of Memphis information. Everybody knows Tom Divine—dear old Tom Divine—the best-natured and best-hearted railroad man that ever did live. Everybody knows that Tom is, or was, the claim agent in the South of the Illinois Central Railroad. Everybody would naturally suppose that he would live and die in railroad harness. A few friends have known that Mr. Divine's health has suffered from close application to his business. Now comes the advice that on Oct. 1 Mr. Divine leaves his work with the Illinois Central Railroad and joins the big and able corps of experts who work for the Winchester Repeating Firearms Co. One hardly knows which side to congratulate most. Mr. Divine's work will take him out over the South and among the large and continually growing army of shooters in that section. There could not be a better man in that capacity, and that he will make friends goes without saying. Mr. Divine was for a long time captain of the Memphis Gun Club, and was the moving spirit in the famous Memphis tournaments, than which better conducted or higher class shoots were never given in America. Now, if Mr. Divine can forget there ever was such a thing as a desk, or a telegraph wire, or a lawsuit, and if he will go on a prolonged riot of quail shooting for a month or so, he will get into good shape again; and, after that, everybody south of the Ohio River would better keep his hand on his pocketbook, unless he feels like buying a gun.

Gone West.

Mr. D. J. Hotchkiss and wife, of Fox Lake, Wis., passed through Chicago this week, en route for the White River country of Colorado, for a big game hunt with friends who are on the inside, and who will surely make the hunt a success.

Gone South.

Mr. W. I. Spears, of Ingram's Mill, Miss., and manager of the big game preserve which extends from that point almost to Byhalia, stopped at the FOREST AND STREAM office this week, on his way home from the field trials in Manitoba. He has been up there for two or three months in the interest of the Avert kennels, and has gratified his love of the chase by abundant coyote hunting. Mr. Spears is one of the most enthusiastic fox hunters of the South, and he is charmingly located for a gentleman of sporting proclivities, whether he be a lover of the fox hound or the bird dog.

Gone East.

Mr. Alfred Marshall, of this city, has gone to, or will soon start for, Fredericton, New Brunswick, on a trip for moose. Mr. Marshall asked me if I thought he could get a moose out in Minnesota. I told him that in view of the short legal season for moose hunting in that State, I thought he would be safer to go to New Brunswick. He will try to get hold of big Adam Moore, Uncle Henry Braithwaite, or others of the splendid guides who were out at the sportsmen's show here last winter. I advised him to write to Mr. W. T. Chestnut, at Fredericton, as most of the guides are apt to be out in the woods at this time.

As to St. Louis.

Mr. Horace Kephart, that very enthusiastic and well-posted sportsman of St. Louis, is now just recovering from a long and severe illness. Finding that he was going to pieces at his work, he did the sensible thing of taking his wife and going into camp, quitting the city altogether. They camped in the Ozarks for several weeks. Mr. Kephart says that he is feeling much stronger now, and able to go back into the harness. The climate of St. Louis is enough to make anybody want to go to the Ozarks, or somewhere else.

The Elements.

Night and storm and darkness have their might to-day, as they did in the time when the poet wrote of them. On Feb. 27, four duck hunters were struck by lightning while out shooting not far from Ashland, Wis. Two of the party were sons of Prof. Burr, of Beloit College. George Burr was brought to town unconscious. The others were severely stunned, but not fatally hurt.

To cap this freak of the elements comes the story of a party of thirteen men who were drowned by a cloud burst in Texas. The men were out prospecting and hunting, and camped in the dry bed of Alamito Creek, in Presidio county. The cloudburst occurred fifteen miles up the stream from them. A flood of water came down in the night, when all the party were asleep, and every man of them, thirteen in all, met death. The flood was something terrible in its power and destructiveness. In the area of the cloudburst there were gullies cut into the ground fifteen feet deep and thirty feet wide. A cloudburst in Texas, a sandstorm in Arizona, a snowstorm in the Northern Rockies—all these be mighty, and oftentimes fateful things.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Rhode Island Snares.

RHODE ISLAND hunters are credited by the authorities with being true sportsmen. In fact, they are said to observe the close season laws without complaint or the slightest efforts at evasion. Deputies of the Commissioners keep an eye out for the lawbreakers from about Aug. 1 until the open season begins, but it is seldom that arrests are made. Mr. Penney, referring to the subject the other day, said that during the last year the laws had been violated very little. Two or three weeks ago information reached the Commissioners to the effect that two local markets were selling game birds contrary to law. A search of the establishments revealed nothing to back up the information.

"By enforcing the laws and by stopping the snaring of partridges," said Commissioner Penney, "there need be no fear for the abundance of birds in this State for years to come, and the Commissioners are giving particular attention this year to the snares. We are now on the trail of several old offenders. The snares kill ten times the number of partridges taken by the sportsmen. While we have not received a single authentic report of a shooting this year, the same cannot be said of snaring.

"The snarers operate largely in the towns of Foster, Glocester and West Greenwich. These fellows make a business of it. The farmers themselves are bitterly opposed to this class, but many are afraid to openly oppose them. Living in somewhat isolated parts of the country, away from police protection, they naturally dread the vengeance of the disreputable snarer. I recollect the instance of one farmer who came to me with information concerning a case of illegal snaring. He implored me to keep his name secret. 'You never can tell what may happen,' said he; 'if you get these fellows down on you, they are just as likely as not to be the cause of a burned barn or poisoned cattle.' Not one Rhode Island farmer in fifty snares on his own grounds. Hunters here, as well as in other parts of the United States, are being educated to a realization of the fact that unless the game laws are enforced, in a short time there will be no more game."—Providence Journal, Sept. 29.

Late Brood of Quail.

Editor Forest and Stream:

This morning as my farmer was mowing a rowen crop he was surprised to see a number of small birds scurrying away just ahead of his machine. Suspecting them to be young quail, and fearing to cut some of their heads off, he stopped his horses, and as he did so both old birds—cock and hen—flew up and off. The young were unable to fly.

The farmer was able to capture one of the young birds by closing his hands over a tuft of grass into which one of the little chaps had run. Its plaintive cries brought the parents at once to the scene, and they made a great deal of fluttering and noise in their anxiety. The little chick slipped through the captor's fingers, however, and was off in the grass again. The birds could not have been more than a few days old.

The season in Connecticut opens to-day, and at once the thought arises, if a shooter should kill the mother bird, would not these twelve or fifteen chicks perish?

Oct. 15 is soon enough to open the season in this State, and Dec. 15 should close it.

MORTON GRINNELL, M. D.

MILFORD, Conn., Oct. 1.

A Connecticut Deer.

Editor Forest and Stream:

Not far from here on the salt meadows there was found last Friday, Sept. 27, the dead body of a full-grown deer. The animal was a buck, just entering the blue, and his antlers had been removed.

I did not see the animal, and therefore could not learn whether there was anything about it that might have shown what killed it. At all events, it was dead, and apparently not very long dead. The carcass, which is said to have weighed about 150 pounds, was brought to Milford, where it was sold to Mr. James L. Miles.

It will be recalled that last autumn two or three deer were seen in and about the towns of Milford and Stratford whose presence was never accounted for, except on the theory that they had escaped from the private park of a lady living on the Hudson River, about thirty miles from New York.

RAMON.

MILFORD, Conn., Sept. 30.

Elk Weight.

MORGANTOWN, W. Va., Sept. 27.—*Editor Forest and Stream:* By the changing of a single letter an elk story may be converted into a "fish story." In the article "In the Rockies" in this week's FOREST AND STREAM, I said regarding the killing of an elk: "In speaking of weights of game, that was a very large elk, and as fat as they can possibly get, and after the four quarters were trimmed very closely and dried for nearly forty-eight hours, they weighed exactly 500 pounds," etc. In the printing of the article, "four quarters" was spelled "forequarters," which would make a very great difference in the weight of the animal. Kindly make this correction for my sake.

EMERSON CARNEY.

100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

73

While gunning on Dog's Island, about two miles above Anglesea, N. J., Capt. Samuel Chance found lying on the strand a moss-grown, long-necked and tightly corked bottle. On breaking the bottle it was found to contain \$15 in paper money, with the following words hastily scrawled on a piece of wrapping paper: "The finder, whosoever it may be, will use this money as his own. We are sinking. Death stares us in—" Here the note breaks off, and there is no signature; neither is the name of the vessel given. The bottle had every appearance of having been in the water for a long time.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

The Study of Fish Diseases.

BY CHARLES G. ATKINS.

A paper read before the American Fisheries Society.

It is not my purpose in this paper to present an exhaustive discussion of the subject, nor even a general summary of the results of investigation in the field. I shall attempt the humbler task of citing a few passages from my own experience, prefaced by some general observations which I trust may commend themselves to your approval.

While for the complete elucidation of the nature of the diseases of fishes, as well as those of the human race, we must call to our assistance the professional microscopist and the professional pathologist, it is not at all necessary that the lay fishculturist should lie on his oars while epidemics or diseases of more limited scope sweep away his charges. It is quite within his province to observe, to record, to experiment, and quite possible thereby to learn very much about these diseases and the means of their avoidance, control or cure. But it is quite essential that any one attempting such studies should adopt the scientific spirit, and the scientific spirit demands the exercise of great earnestness, great alertness, great patience, great perseverance, and, above all, great self-control. And when I say self-control, I mean especially control of the opinion, restraining one's mind from making itself up prematurely—on insufficient data. To put it in more popular language, one must not jump at conclusions.

I may be pardoned for digressing here far enough to say that in the course of a lifetime spent in this pursuit, I have often had occasion to note that the bane of fishculture has been the disposition to jump at conclusions. It is a trait of human nature. Hardly one of us is free from the foible, and hardly one of us but is suffering to-day from the effects of some mistaken conclusion reached in the past by disregarding some pertinent facts that, if not plainly in sight, might have been easily brought to view by a little more of persistence in the search. Private fishculture and public fishculture are suffering from it to-day. There has been too little of the scientific spirit. And science, I beg to remind you, does not consist essentially in a knowledge of the Latin names of fishes or the minute anatomy of an insect. Such things are not to be despised, but they are only aids and means to something of greater importance; and a man may possess either or both of them and yet be less scientific than a humble layman who holds his eyes and his mind open for the acquisition of new facts, and faithfully restrains his opinions from crystallizing on any half-knowledge.

I think that the importance of this subject is generally underestimated. It is not impossible that many fishcultural operations have been brought to naught by the action of unrecognized diseases; nor that definite diseases have been the cause of many of those great fluctuations in the numbers of wild fishes that history has recorded.

Hardly any of the great commercial fishes have escaped fluctuations, either general or local, which have been of great moment to mankind. Not only to the fresh-water and anadromous species, but to those of the ocean, this statement will apply. For instance, the sudden disappearance of the tilefish some years ago from the grounds where it had been abundant, followed after years by its reappearance; the fluctuations of herring on the coast of Sweden; of the bluefish and the menhaden on the coast of New England. Some of these phenomena may be accounted for in other ways, but the tendency of discovery is in the direction of some destructive enemy or disease to account for very sudden decrease of species.

An official report lying before me gives a list of 104 different diseases from which human deaths occurred in the State of Maine during the seven years from 1892 to 1898. Is there any inherent reason why fishes should not have as many diseases as men? Observation has already gone far enough to indicate the probable existence of a very considerable number of diseases among the fishes we cultivate. At the Craig Brook Station of the United States Fish Commission there have been observed perhaps a dozen different diseases affecting salmon and trout, the majority of which still await sufficient study to warrant us in naming them or assigning definite causes. A rough list of them, not pretending to be complete or exact, is as follows:

1. A spot disease of the sac, appearing in the egg or after hatching.
2. A disease appearing when the sac is about half absorbed, characterized by a whitening of the sac, which begins in irregular white blotches—our most serious disease, known locally as the "sac-epidemic"—attacking several species.
3. Another disease of the sac stage, characterized by a strong, upward curvature of the trunk.
4. A disease of the dorsal fin of a salmon in the first summer of its life, in which the fin is eaten away at its edges until more than two-thirds gone, and then heals up perfectly, with no other apparent injury to the fish.
5. A similar disease attacking the fins of young rainbow trout and steelheads, especially the caudal fin, which is completely eaten away, together with the adjacent flesh, until the extremity of the backbone is bare.
6. Fungus on the egg.
7. Fungus on fry two to four months old.
8. Fungus on adult salmon.
9. Monstrous enlargement of the genital organs of salmon in their second year.
10. Trematode parasites on young lake trout.
11. An epidemic attacking salmon two or three months old.
12. An epidemic attacking salmon four or five months old.
13. A sort of epilepsy in which salmon two or three months old have temporarily lost their balance.

One of the most interesting cases was that of the young lake trout attacked by parasites in 1895. These fish had been hatched from eggs received from Northville, and had apparently been thriving until about the middle of July, when there was a slight increase in the mortality.

A week later the rate of mortality had trebled and by Aug. 10 it had increased more than tenfold. At first it was thought possible that the mortality was due to fungus, and the fish were treated with salt. No benefit resulting, the microscope was brought into use, and, behold, the fish were swarming with living, active parasites, which moved about over the fish after the manner of loop worms or leeches, apparently the creature that has been described under the name of *Gyrodactylus elegans*. In hope of destroying the parasite, the salt treatment was continued, but it was found at last that the parasite could endure quite as much salt as the fish itself. Mr. Seagle, at Wytheville, has since discovered that this parasite is readily destroyed, with entire safety to the fish, by a bath consisting of one part common cider vinegar, three parts water. The mortality went on until the sufferers had shrunk from 39,000 July 1 to 10,000 in November, and the survivors were fish of low vitality, of whom probably not one ever grew up.

No unusual mortality occurring among the fishes of other species reared alongside the lake trout, and under the same circumstances, it was a puzzling problem why the *Gyrodactylus* had made such an attack on the lake trout. The theory was at once suggested that the parasites had been imported along with the eggs, and the occurrence of a few specimens on other fishes in neighboring troughs might easily have been accounted for on the supposition of accidental transfer from trough to trough; but the discovery of specimens on wild fish caught in Craig Pond at the head of Craig Brook, more than half a mile distant, with intervening falls of great difficulty, indicated that the parasite was native to our locality, and suggested that something extraordinary in the condition of the lake trout invited the attack. Indeed, it seems not impossible that the fish died from some other cause—some unknown disease—and that the parasites had merely been feeding on the disintegrated tissues. Verily, this is a case in which judgment must be suspended.

The most destructive disease that has ever come under my observation was the sac-epidemic which raged several seasons at Craig Brook, and in 1892 destroyed 99 per cent. of our young Atlantic salmon. I call it "sac-epidemic" because it raged during the sac stage of the fry, and because the most obvious symptoms were connected with the sac. It would appear about midway of the sac-stage, while the sac was still less than half absorbed. In water of constant temperature, such as pure spring water, I imagine that the disease would appear by the first quarter of that stage. Our water is very cold at the time of hatching—about April 1—and gradually warms up, so that the development of the embryo is at first very slow and later comparatively rapid. The fry hatch about April 1, and before the end of April, in epidemic years, the mortality suddenly increases, and it is found that the sacs of the fry are blotched with white. These blotches spread until the sac is nearly all white, especially the apex. When it reaches this stage the fish dies. Other symptoms are apparent listlessness, indifference to light and outside movements, and in consequence a scattering about on the bottom of the trough instead of crowding into the dark corners, as is the normal habit of the fish.

This disease was first observed in 1890, when it carried off 30 per cent. of our fry, including Atlantic salmon, and landlocked salmon, but did not touch Loch Leven trout or Swiss lake trout. It was, however, observed that not all of the Atlantic salmon were attacked (or at any rate suffered noticeably), and in the lots where it did appear its destruction was quite uneven, in some cases barely noticeable and in others wiping the lot completely out.

It is our practice at the Craig Brook Station to preserve a careful record of the character of every salmon handled at spawning time, to keep the spawn taken each day separate from that of every other day, and to keep up the distinction with the fish hatched through the entire season, and, indeed, as long as the fish remain with us. In some cases, as, for instance, a female salmon of remarkably large or remarkably small size, or an unhealthy appearance of fish or eggs, the product of each fish is kept by itself. The position of each family in the hatchery is also noted. When hatching time approaches, the large lots of eggs (or families) are divided up into smaller lots, of one or two thousand each—sometimes larger—and the origin, location and history of each of these minor lots is recorded. When, therefore, one of our fishes dies, or does anything else remarkable, we are able to follow back its record to the day when, as an egg, it rattled into the pan at Dead Brook, and sometimes to the identical mother that dropped the embryo and the identical father that gave the initial impulse of life. These records sometimes appear, even to us, who keep them, as somewhat laborious and fussy, but in this instance of the sac-epidemic of 1890 they have enabled us to draw some very interesting conclusions as to the influence of heredity in this disease.

It happened that the troughs intended for the summer use of these fish were not quite ready when the eggs were laid out in March to hatch, and they were therefore crowded for hatching into a smaller number of troughs which were for the purpose divided into compartments by fine, close-fitting wire screens. The water, passing first over lot A, would nourish in succession lots B, C, D and so on down the trough.

One of the most noticeable results was that the losses were very unevenly distributed in the troughs. For instance, lot A, at the head of the trough, might be half destroyed, lot B totally and lot C almost wholly escape. When all the results were correlated, it was found that the mortality ran in families, some families being utterly destroyed, some suffering moderately, while in others the mortality would be so light as to warrant the conclusion that the epidemic had nothing to do with it.

Now, what shall we say? Did the germs of the disease come to these little fishes from their parents, or did they inherit merely different resisting powers, so that, though all of them were assailed about equally by the disease germs, some of the families had an hereditary ability to ward them off, while others succumbed? The answer to this question must await deeper study than we have yet been able to give.

Among other deductions to be drawn from the same data is one as to the infectiousness of the disease. Infectiousness would cause the lots occupying the lower parts of the troughs to receive the disease from those lying above them; but the record shows that nothing of the sort happened. The rate of mortality of the lower lots was wholly uninfluenced by the condition of those

above. It was, therefore, not an infectious disease, and did not spread from lot to lot.

It was further observed with reference to this disease that the occasion of its first appearance was coincident with a great reduction in the proportion of lake water in the hatchery supply. A coffer dam had been constructed at the outlet of Craig Pond (or lake) which in the spring shut off the lake water and compelled us to use a much larger proportion of spring water. A second attack in 1892 was coincident with a very low stage of Craig Pond and brook, caused by a scanty fall of rain and neglect of storage measures. It therefore seemed reasonable to turn our suspicions in the direction of the spring water. Measures were taken to insure a fuller supply of lake water during the stage following and immediately preceding hatching, and this has been attended with favorable results.

I earnestly recommend all fishculturists to keep complete records, even to the verge of fussiness, so complete and exact that they can be intelligently referred to after the lapse of many years. Besides many other uses, they may serve to solve some of the puzzling problems connected with the diseases of fishes.

Fish and Game in Western Maine.

CORNISH, Me., Sept. 25.—*Editor Forest and Stream:* Now that the time has arrived for replacing the rod with the gun or rifle, I am reminded that possibly a brief review of the fishing season in this section may be of interest to some of your readers, especially as I partly promised in an earlier number to report the effects upon the trout fishing of the severe drought of a year ago. At that time nearly all our brooks, even the larger ones, went partially dry, some of them for a distance of more than half their length, and it was naturally inferred that very poor trout fishing must follow. Such, however, I am happy to state, was not the case, as these same streams apparently yielded about their usual quota of trout, or would have but for the frequent rains, which kept the brooks at too high a pitch for good fishing most part of the season. When the streams can hold up against such natural drawbacks, in addition to the terrible annual drains of the rod, it would seem to indicate that with due respect for the law, and a little judicious stocking, there is still a long life for trout fishing, even in overcrowded New England.

Of course, to give anything like a detailed account of the numerous strings of trout taken would be impossible. Dr. W. S. Weeks and Ira Garland, clothier, doubtless excel in point of numbers, principally because they have done most fishing, although this implies no lack of skill on their part, as men better posted on the fine points of this sport it would be hard to find. But to Mr. Wm. C. Ayer undoubtedly belongs the honor of "high line" for a single catch, he taking twenty-one beauties in a few hours on Little River, ranging between 9 and 14 inches, the most of them creeping well up toward the latter figure. The writer, as well as many others, had the pleasure of looking at these, and was so excited thereby that he dug worms by lamplight that evening, rose at daybreak and accompanied Wm. to the same stream—and didn't get a bite in a whole forenoon.

Bass fishing has also been good, both in the rivers and the ponds. Mr. L. N. Richardson, proprietor of the Park Hotel, having been in poor health, has been one of the most ardent followers of this sport, and has taken many fish. Another of our business men who take great pleasure in pond fishing is Mr. Erskine L. Watson, who keeps a good boat and plenty of the best tackle, and annually lands many fine salmon and "red-spot" trout. Last week he showed the writer an 8-pound salmon, taken from a near-by pond.

But naturally every sportsman's interest is now centering in hunting, and no one who makes any pretensions of being a hunter is satisfied with knocking over partridges or squirrels, but is firmly resolved on bagging a deer. It is surprising the number of rifles that have been bought—high class, finely sighted arms—since the coming into our midst of the deer, and the talk on various makes and calibers, hard and soft, nose bullets, smokeless powders, etc., fairly fills the air. Cumberland county, which has been under absolute protection for several years, is to be open for shooting during October, much to the delight of our hunters, as deer are known to be plenty in that county. And in conclusion, I may say, to such of my readers as can be relied on "never to tell," that some are getting their aspirations raised even above deer hunting, as the track of a big bull moose was discovered within four miles of this village not two weeks ago, the old fellow apparently making for the wild region about Sebago Lake.

TEMPLE.

An Ohio Sportsman's Experience.

Editor Forest and Stream:

An old fishing and hunting companion in northern Ohio, in a letter, gives some of his experiences of last season as follows: "The fishing with me last summer was almost a failure. I was out a few times after bass and had good success every time, but the times were too far apart. Used bait, and did not cast a fly all summer long, neither did I get down to our old stamping ground near Phalanx. I arranged a couple of times to take a trip there with my folding boat, but something would occur that prevented my going.

"I had several good days after the grouse and quail last fall, but had the misfortune to lose my dog by the carelessness of a friend who was hunting with me. My dog had pointed a quail about 40 feet ahead of F., who flushed the bird and let both barrels go, and killed the dog dead in his tracks. It was the most careless and reckless shooting I ever saw, and utterly inexcusable, as the bird when he fired was 10 feet up in the air. The dog was a splendid son of Champion Croxteth. I raised him from a pup, and he was thoroughly broken. He did something that I never saw or heard of a couple of days before his death. I was out with him, and had scattered a covey of quail and was picking up single birds; he pointed one, which I flushed and brought down; the dog was retrieving him, and on his way back he pointed another bird, with the one in his mouth. I watched him a few moments, and it would seem that he got tired of holding the retrieved bird and laid it down. I had only winged

the quail, and, as the dog let go, it started and walked away. It went about 6 feet, when the dog started and got it, and went back and took his point. If that was not using reasoning faculties, what was it? I have now another promising pup, but never expect to have another dog as good as the one that was killed.

"In regard to the trout, U. told me the same story about the one he saw caught and had put back by the darkey, but I always thought it rather 'fishy,' as I have fished up there considerably, and never saw a trout, but still it may be so, as there was a large one of 3 pounds caught last fall up near the bridge over the creek at Allyn's, near H. station. Fred Allyn was catching minnows for a bass trip, and dropping his bait in an eddy this fellow took it. Fred had quite an exciting time, but succeeded in landing him. He sent me the head, which I was going to forward to you, but it was somewhat decomposed, so I did not. It was no doubt one of the German or brown trout. We were very much elated to know for certain that one had been taken, for if there was one there must be more. It was late in the season, and I did not go up, but shall try them when the season next opens and report. If I remember correctly, it was yourself and Collins that planted the trout in that stream in 1890. There must certainly be some in the other branch in the Udall locality, for it always seemed to me it was the best water—more shade and fully as many springs. I shall try up there also. I hope to see you up here again when the season is open, and we will once more 'take a fall' out of the bronze backs.

The foregoing extract was of especial interest to me, and I trust will prove interesting reading to many of the FOREST AND STREAM fraternity. E. S. WHITTAKER.

CARTHAGE, O.

Salmon Feeding in Fresh Water.

It is not often that a Blue Book attracts special attention, but that published by the Fishery Board of Scotland relative to the feeding habits of salmon in fresh water, in the year 1898, was certainly one of the exceptions which prove the rule. A most elaborate examination some time after death of a comparatively small number of salmon taken from rivers had been made by certain members of the Scotch College of Physicians, and so far as salmon fishers who have been closely following this subject are concerned it is perhaps hardly necessary to say now that the conclusion arrived at was that salmon could not feed in fresh water because their digestive organs were so absolutely out of order that the assimilation of food was impossible. The subject, which had for years been a matter of discussion among salmon fishers, was eagerly taken up by many who announced that at last this vexed question had been solved. Those writers on angling matters who had been of the opinion that salmon did not feed in fresh water joyfully accepted the conclusion of Dr. Noël Paton and his confrères, while those who had taken the opposite view, had their opinion shaken by the publication of the Blue Book. Looking at the question from a judicial rather than from a scientific standpoint, it seemed to me at the time that, while the observations of those who had been inquiring into the subject were no doubt accurate, the conclusions arrived at were not warranted by the amount of evidence adduced. I ventured to say as much in an article in the Field on the subject, but discussion was avoided by those responsible for the report, on the strange plea that the subject was one only suitable for consideration in a scientific publication. Fortunately, in the interests of everybody concerned, Dr. Kingston Barton made similar experiments to those carried out at Edinburg, and very quickly discovered, as was reported in the Field at the time, that the alleged peculiar condition of the salmon's stomach which had been observed, was, at any rate, in a large number of cases, owing to the fish having been examined a considerable period after death. In other words, the alleged "desquamative catarrh" was due to post-mortem changes, and was also to be found in the stomachs of various sea fish examined some hours after death. Mr. Brown made similar observations.

In the recently issued Blue Book of the Scotch Fishery Board Dr. Lovell Gulland gives the results of some further investigations into the subject which were obviously necessitated by the communications of Dr. Kingston Barton and Mr. Brown. He mentions at the commencement of his paper that when the earlier research was begun there was no idea what would be found, and no arrangement had been made or at that time could be made for having the viscera placed in a preservative at the water side. The salmon more recently examined by Dr. Lovell Gulland number only seven, three having been taken from Newtonhille, five miles from the mouth of the Dee, and four from the upper reaches of the Tay. It is a pity, in view of the importance of the subject, that Dr. Lovell Gulland has not carried his experiments further, but he has come to the conclusion from an examination of the data recently obtained, and from the work of Dr. Kingston Barton (which he has verified) and Mr. Brown, that, to use his own language, "the desquamative catarrh formerly described is certainly not constant in river fish." He is not prepared, however, to admit that it is entirely in the nature of a post-mortem change, on the grounds that it appears to occur with considerable capriciousness, coming on rapidly in some fish, and only after many hours in others, without any traceable relation to the state of the weather or other conditions. It is more prone to occur in river fish, and he thinks it may be associated with a lessened power of resistance from diminished functional activity.

The point is one on which I think anglers can throw some light, for most of us have observed occasionally how certain fish will keep good much longer than others. For instance, a trout caught out of a sewage-polluted stream goes bad very quickly, or, to use the language of the report, the post-mortem change comes on rapidly. On the other hand, a healthy salmon, fresh from the sea, will keep good for a considerable time. It is easy to understand that the same fish, after it has lost its condition in fresh water, will not keep so long. There can hardly be a doubt, as I ventured to suggest once before, that the peculiar condition of the salmon's stomach, which has given rise to so much speculation, is largely owing to the fish being unable to get any considerable

quantity of food in fresh water, while, in addition, changes will occur more quickly in the stomach of a fish long resident in fresh water after it has been killed than in one stronger and healthier just up from the sea.

In the dozen pages of formal report to Lord Balfour of Burleigh, the Secretary for Scotland, placed in the commencement of the Blue Book and signed by the chairman and other members of the board, Dr. Gulland's work is thus summarized:

"Entire desquamation of the mucous membrane of the digestive tract is found in organs preserved twenty-four to forty-eight hours after the death of the fish," but they add that "desquamation may also be found in the stomach or intestines of salmon preserved within fifteen minutes of the capture of the fish." This way of putting it is certainly misleading, and it would only have been right to say that a little desquamation was found in one clean fish, but that in the case of two others, in which a small amount of desquamation was found (in the stomach of one and the intestines only of the other), the specimens were suffering from salmon disease, which may have affected them in various ways. In the second fish not diseased there was no desquamation. The report continues: "It is noticeable, however, that the entire digestive tract may be free from the change referred to, and that, therefore, there are fish in the upper waters of our rivers, which, although non-feeders in the proper sense of the term, are nevertheless capable of absorbing nourishment." It is difficult to imagine a more illogical statement than this. When the former Blue Book was published "feeding" was defined as not merely the taking of food into the mouth or stomach, but the assimilation of food. Now it is admitted that there are salmon in the upper waters of our rivers which are capable of absorbing, which I take to be the same word as assimilating, nourishment, and the extraordinary remark is made that the fish are non-feeders in the proper sense of the term. As a matter of fact, the theory of salmon not feeding in fresh water, as set out in the Blue Book, was based mainly on the fact that salmon could not absorb nourishment when in fresh water, owing to the condition of their stomachs, and now it is found that, at any rate, a certain number of salmon can absorb nourishment, the theory is evidently without substantial foundation. It would have been wiser to have admitted the mistake than to place obstacles in the pursuit of knowledge by a vague and contradictory statement. It is very significant that nothing in this report is said as to grilse. In the former Blue Book the particulars of the examination of grilse were excluded, and I have no doubt whatever that when these particulars come to be published, if ever, we shall find that they point to grilse feeding in fresh water. No explanation, too, is given of the 1898 Blue Book theory that kelts become well mended by absorbing unshelled ova. It is difficult to imagine a more thoughtless statement on the part of scientific men, for the fact that male kelts have no unshelled ova to absorb and yet become well mended was entirely overlooked.

JOHN BICKERDYKE.

Hot Stuff.

HAVE you ever handed your flask to your guide in a spirit of companionship and, after he has sampled your ten-year-old whisky, had him hand the flask back to you with a sort of unrequited air that has sort of kept you guessing until, later on during the trip, you hear him express himself in favor of whisky that you can feel all the way down?

When a boy I made my first trip in the Maine woods, and my father, selecting from his cellar some whisky that had been there for years, filled a flask and read me a lesson on its medicinal value if one came into camp wet and chilled through.

I remember giving some of that smooth old whisky to my guide and having him "josh" me because my father had watered it, he claimed, before he would let me have it. He intimated that there was no life to it, and it felt just like water going down. He missed the fusel oil—and craved for it.

Subsequently I visited Maine again, and as there was quite a party of us, I volunteered to supply the whisky and brandy, knowing that I could, out of my father's cellar, get reliable stuff.

In due course we were off. At the end of the railroad journey a long trip by stage followed. It was in September, the night was cool, almost cold, and as the horses pulled up on the crest of a hill we jumped out to improve our circulation. From my grip I took my flask, and in consideration of the arduous work the driver had had with the horse, handed him the flask. I can see him in the moonlight with his head thrown back and can hear the guggle, guggle of the brandy as it flowed down his throat. Removing the flask from his mouth he gave three or four expressive snorts of approval and with the tears running down his cheeks he expressed himself in the highest words of appreciation for the contents of that flask. He said it was the first real fair and square liquor he had had for months. It just simply made itself felt all the way down, and was his idea of what good liquor should be.

His coughing and tears followed by his commendation made me suspicious, and replacing the bottle I took out the other of whisky and removed our chilled condition.

I quietly investigated in a homeopathic way the contents of that brandy flask and left it severely alone.

I found when I returned home that the bottle from which I had poured the brandy was on the lower or bottom layer in the case. I examined the metal cap of the next bottle and saw it had been tampered with. The other remaining bottles in the case were in perfect condition. I looked at the outside bottom of the case and found that at some time in transit or in the warehouse of the dealer the bottom had been carefully taken off and replaced, and as the brandy, with the exception of these two bottles, had been of a standard quality, it was evident that the contents of the two bottles had been removed, some cheaper substitute filled in and the bottles replaced. It was certainly red-hot stuff, and met the approval of our stage driver, who on our return trip suggested that, if I did not mind, he would like a drink out of the same bottle that he had used coming up. And he got it.

CHARLES CRISTADORO.

CHICAGO AND THE WEST.]

Muscallunge.

CHICAGO, Ill., Sept. 28.—Mr. F. N. Wood, of the Chicago Tribune, this city, has recently returned from a two weeks' fishing trip in Wisconsin. He went to Star Lake, but, contrary to earlier advices, found no fishing there at all. He therefore went further into the woods, and located at High Lake. Mr. Wood is a sort of a lone fisherman, and he more especially cares for black bass. Everybody told him he could not get any black bass in High Lake, because none had ever been seen there. Wise enough to doubt the guides, he determined to prove the matter for himself. The question of bait was all that troubled him. There were no frogs, and he did not care for spoon hooks. No other kind of bait was at hand. What to do he could not at first tell; but one morning he saw a series of ripples on the surface of the water, and, going out to investigate, found the disturbance was made by a school of shiners. The reward of his philosophy was apparent. A tiny fly hook, a piece of fish on the same, a careful following along of the school, and, presto! he had more than forty splendid bass baits in his pail. Then he began to fish for bass in the lake which had no bass in it. Rowing along, slowly, with a nice, fat shiner well down in the water, he at last got a strike, and landed a fine, small-mouth bass. At once he dropped over his anchor, and, to make the story short, he pulled into camp with twenty-nine splendid small-mouth bass. The guides seemed to think it was unprofessional conduct of him to catch bass in a lake where there weren't any.

Mr. Wood sometimes had trouble in catching his shiners when the water was too rough to see them when they were schooling. One day he started out when the waves were running high, and he only had one or two big shiners, with which he began to cast along the edges of the brushes. All at once he saw a great rush and splash, and felt something heavy strike his bait. One may imagine it was difficult for him to row his own boat and get his muscallunge out into deep water, but some way he did, and had a beautiful fight of it. The muscallunge weighed 17 pounds. The guides thought it was unprofessional for him to catch it alone.

At Nixon Lake, about twelve miles from Star Lake, a Mr. Lewis and friend, from Chicago, were having very good luck with the muscallunge at the time Mr. Wood was in. When they came out from the railroad they had eight fish weighing from 12 to 16 pounds.

They reported that on Pickerel Lake one muscallunge had been killed which weighed 35 pounds. On Johnson's Lake another party had 12 muscallunge, 13, 16, 18 pounds, etc. Mr. Wood said that when he first went in the wind was from the east and the fishing poor. Then it came around half a gale from the southwest, and everybody had muscallunge.

Frogs and Big-Mouths.

Friend English, of V., L. & A., said he had sold 25 dozen bait frogs at 10 o'clock this morning. Among other frog buyers who started to-day for the Fox Lake chain were Messrs. F. K. Reilly, C. S. Lawrence and several friends, besides Messrs. Miner, Clements, Hanson, Seipes, Winfield, Babcock, and Rice. These gentlemen like to take a fall out of the big-mouths every week, and they say the bass are still rising. Last week the wind was very high and spoiled the fishing.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Staten Island Netters Hauled In.

PRINCE'S BAY, Staten Island, Sept. 30.—*Editor Forest and Stream:* The Richmond County Fish and Game Protective Association is responsible for this article. Last Friday morning at about 2 A. M. Mr. Gable Gill and C. V. Tobin, assisted by Mr. Edgar Hicks, made an arrest of five Italians fishing off the "Sods" at the Great Kills. These Italians had been watched, and when the time came they were taken in with their nets and sloop without much trouble. The start was made at the Excelsior Hotel at Giffords, but thinking that the long distance could be accomplished more easily, the game protectors, Messrs. Hicks, Gill and Tobin, went to a man of the name of Sandbeg and asked him to take them out in his gasoline launch. Mr. Sandbeg being a special protector of the oyster grounds, in the vicinity of the Great Kills, and also a deputy sheriff of Richmond county, the game wardens thought that in him they would have an accessory to their good work; but he absolutely refused to give them aid. His only excuse was that he was afraid that the culprits would do him damage—cut his sloop loose or something like that. But how a man can give such an excuse when he is hired to protect oyster grounds owned by private individuals without State aid I cannot understand. Perhaps that is why so many oysters fail to mature ready for market.

Game Protectors Gill and Tobin, assisted by Mr. Edgar Hicks, the State fish and oyster protector, rowed out from the mouth of the Kills to the Sods and caught the five Italians in the act of hauling their net. They were taken in easily at the mouth of an open-faced arrangement that one of the "army of invasion" had in his hand. The culprits were brought ashore, searched and handed over to the proper authorities. Then the people who made the arrest went back and took up the net and confiscated the sloop Shark (a very appropriate name for a craft engaged in such a vocation) and brought them to anchor in the kills. In the net were found about 600 fish, such as we all like—weakfish from three inches long to four pounds in weight, striped bass from four inches to five and six pounds in weight, fluke, flounders, crabs and lots of kingfish about three or four inches long—in fact, the net contained everything that could be mentioned that comes out of the salt water in this vicinity. The net was one of the best that could be made, and will be taken to court for evidence. I shall try and give the outcome of the arrest later on. I hope the League of Salt-Water Fishermen will open their eyes and break up anything that they can find out contrary to law.

It can readily be seen that these Italians have a grave prospect before them. If the law is enforced as it should be, each one should be fined \$25 for the penalty and an

additional fine of \$10 per fish. But we will wait and see what is the outcome of one of the most open-faced violations of our laws. ***

New England Fishing.

The smelt fishermen are having great sport in many directions off Boston harbor. Mr. S. Henry Emery made a trip to Quincy the other day with the result of eight dozen smelt. Though a great trout fisherman, he says that smelt fishing is good. A clerk at the Boston Fish Bureau makes frequent trips down off Boston Light. He says that he fills his fish basket every trip. Hundreds are down there, he says, though all are not good catchers of smelt. Some of them have whisky bottles at hand, and the taking of smelt is secondary. A good fisherman, who is temperate, and is favored by wind and tide, is sure of good success. The fall smelt off Boston harbor, and along the coast, are large and fine, and the catching of them is growing in popularity. The amount of protection they receive in the close season seems to have added to their numbers; at least, the fishing has been improving of late years.

Still the reports of big trout and salmon, caught in Maine, continue to come in. But it is worthy of note that the big fish have not been as numerous this year as last, while none of the eight, nine and ten-pound monsters of former seasons have been taken. But the number of fish taken is certainly most remarkable, and real lovers of the future of the trout and salmon may well rejoice that the close season is on at last. One may feel certain that the fishing cannot hold out, at the Rangeleys and Mooshead especially, under the destruction of so many fish, unless tremendous restocking is resorted to.

SPECIAL.

The Kennel.

A Simple Matter of Vengeance.

TWICE each year—once in the spring and once in the fall—old Dan Doggett, the veteran hunter, makes the voyage down the river from his solitary cabin on the lake shore, to the nearest settlement, where his miscellaneous stock of skins may be disposed of and supplies for his few and simple wants may be obtained. The trip involves a journey of nearly a hundred miles, and usually occupies four or five days.

It was upon one of these periodical excursions that the initial circumstance occurred, which led to the following adventure.

It was upon one of these periodical excursions that the were swelling and a tender green was beginning to temper the somber hue of the pines. The ice had disappeared from lake and stream, when, one evening, Dan signified his intention of starting next morning for the settlement.

Taking a cargo of skins in the small boat which he had, at some previous time, obtained for the very purpose to which it was now being devoted, he set out early next morning on his solitary journey, leaving me behind to experience for a few days the solitary life which he had led for many years.

After bidding him good-by and wishing him a pleasant and profitable journey, I stood upon the narrow platform of rock which served us for a boat landing and watched him till the measured strokes of his oars had carried him across the lake and into the outlet, whence he waved me a final adieu as he disappeared behind the rising banks of the stream.

During the five days that intervened between the time of Dan's departure and his return, I learned that following the life of a hunter and living the life of a hermit are not by any means one and the same thing. I passed the time in looking after the few traps that at that late season were still out, in short excursions into the forest in pursuit of such game as came in my way, and in fishing in the lake.

In this latter pastime I used Dan's canoe—a dugout affair of the Indian type (and may God confound the genius that invented it) that could cut as many capers as a Texas pony, and execute more deviltry of its own volition than any other inanimate thing in the whole world.

The skill that can successfully maneuver such a craft always excites my admiration; and one of the most essential elements of its successful acquirement is that the novice hold in utter contempt the absolutely certain prospect of being spilled into the water. However, in the hands of an expert, that sort of canoe affords a light, speedy and even safe means of conveyance. As may be rightly surmised from the foregoing observations, my solitary fishing excursions usually terminated in my getting a wet jacket.

As the evening of the fifth day of Dan's absence drew near, I began to look out rather eagerly for his expected return. Night fell before he came, however, and the full moon rose up into the cloudless heavens, flooding the landscape with her subdued brightness, and lighting the rippling surface of the lake with a lambent flame. I had almost become reconciled to the prospect of spending another solitary night, when the welcome sound of the old hunter's loud "Whoo-hoo-o-o!" disturbed the silence and lingered in reverberating echoes among the hills. I looked out across the lake, to see his oars flashing in the moonlight and his boat splitting up the reflected moon beams into ten thousand fiery splinters as it glided rapidly over the surface of the water toward his humble home. From the little landing I hailed him with a shout of welcome as he neared the shore.

"Hello, Kid! How is everything?"

"All right," I shouted back; "but I'm glad to see you home again."

"Git lonesome?"

"Yes, a little."

"Don't like livin' by yerself, eh?"

"No, I'd rather have company."

"So 'ud I; and seein' as how ye hev been talkin' about goin' back to see yer folks, and thinkin' as how ye'd be a up and leavin' Old Dan one of these fine days, I thought as how I'd jist fetch some un back with me to bear me company when ye're gone. We kin make room in the shanty fer another pardner, can't we, Kid?"

"Why, yes, I suppose so." I answered, in what I now know was far from being a cordial tone. Dan observed it, too, for he said, as he stood up in his boat as it slowly approached the landing:

"Look 'e hyar, Kid! Don't ye git the idee that Old Dan wants ye to go. Not a bit of it! We hev sheered each other's comp'ny fer nigh onto two years, and helped each other out of many a tight scrape. Ye hev been a square man and a good friend to me, and I hope I hev not been lackin' toward yerself. It'll be a mighty onwelcome day, the day ye go away, and as long as ye hev a mind to stay," said he, stepping out upon the landing and taking my hand in his honest grasp, "yer as welcome to sheer Old Dan's cabin as ye'd be anywhere on earth. Ye're the first pardner I've hed fer twenty year, and the only one I'd hate to do without. I didn't mean I'd got another one to roust ye out, and when ye see who it is I've fetched to bear us comp'ny, ye'll hev a kinder welcome fer him than ye jist now spoke."

I never felt more humbled in my life than when I met this mild and well-deserved rebuke, and heard these earnest words of friendship, every syllable of which had the ring of deep sincerity.

"I beg your pardon, Dan. Indeed I do! Whoever is Dan Doggett's friend is mine, and if any welcome I may offer can add to the generous hospitality he is sure to meet beneath your roof, he shall have it, with all my heart."

"I knowed it, Kid; I knowed it! I was jist a-jokin' ye a little—jist fer fun."

"Where is your friend?" I asked, for I was unable to discover a passenger amidst the piled-up bundles in the boat.

"He's right hyar, Kid," said he, stepping back into the boat and feeling among the packages. "Hyar, come out hyar! I want to interduce ye to the Kid. He's got a welcome fer ye as big as his own heart, and that's bigger'n ye are yerself," and he dragged something over the side of the boat at the end of a string.

"A dog, by all that's holy!" I exclaimed, when I discovered what it was.

"Pup," said Dan, who laughed immoderately at my astonishment. "Jist a leetle, yaller-speckled dorg pup with a stump tail; and ye were jealous of him, Kid, ye were, by granny!"

"What on earth did you want with a dog?" I asked, regarding his inordinate merriment.

"Well, Kid, seein' as how I didn't want him, I can't say as how I did."

"How came you to get him if you didn't want him?" I inquired, completely mystified.

"I—I reskied him."

"What?"

"Yes, reskied him. That's it; and had to fetch him along to keep him reskied; but let's git inside. The pup's a-shiverin', fer we hev rid considerable to-day, and he didn't hev much chance to exercise. Come along, Stump," said he, pulling the dog after him. "Ye needn't be skeered, fer they won't nobody hurt ye now, so come along."

When he had dragged his charge through the doorway the firelight revealed the wretchedest specimen of the genus canis that I had ever seen. A fox terrier, with the regulation stump tail, and a starved body covered with scratches and scars, covered in abject terror upon the floor, in a dumb and helpless plea for mercy. I looked first at the pup and then at Dan, wondering how he came by such a dog as that. I knew he had not stolen it, and I was morally certain that he had not bought it. His explanation that he had "reskied him" was no explanation at all.

"Ye see, Kid, it's this-a-way," said Dan, reverting to the very question that perplexed me, "when I was down there to the settlement I see a gang of pesky critters as hed a bar'l turned down on its side with a fox tied in it, and they was a-kickin' the pup in on the varmint and a-holdin' him by a rope around his neck, so's he couldn't defend hisself ner git away. It riled me to see a dumb brute treated that-a-way, so I jist tuck him myself and hyar he is, and if he don't git over that pitiful, pleadin' way of his, it'll be because he hes been used too mean to ever fergit it or to hev confidence in human critters any more, and not because he hes anything to fear from us."

He never related any of the particulars attending the transfer of property, but I have a lively imagination of what occurred when he "tuck" Stump from his cruel masters.

Dan's predictions were verified. Kindness completely transformed the little fellow from a pitiful, timid, cowering creature into an admirable conglomeration of friendliness, pugnacity, spunk and fun. As Dan described him: "Jist a yaller-spotted handful o' grit, with a stump tail." His self-importance was wonderful to see. He accompanied the old hunter everywhere, whether on the lake or in the woods, and seemed to think that whatever we did was done for his especial benefit. We both, and Dan especially, grew very fond of him. The old hunter enjoyed the dog's cunning tricks, and watched his amusing capers with rare delight.

At every prospect of an encounter, Stump assumed the fox terrier's characteristic attitude of resistance, with legs well braced and wide apart, feet turned well out, head well up to guard against surprise, and his stump tail suggesting an abbreviated exclamation point to intensify his strong emotion. He was always ready to attack any foe, however dangerous, and his indomitable courage finally proved his ruin.

The winter following Stump's advent into the comforts of the hunter's cabin was very severe, and accompanied by an unusual amount of snow, even for that latitude. The wild beasts, driven by hunger, became unusually bold, prowling sometimes to the very door of our cabin in search of food.

One very cold night Dan was awakened by the dog, which jumped upon the bed, licked his sleeping master's face and immediately jumped down again. Dan roused me with a vigorous shake.

"Look at the pup, Kid! Look at the pup! If the varmint outside gits in hyar they'll be a fight as shore as gunner."

There stood Stump in the middle of the floor, in his customary attitude of defiance, the bristles on his back reminding one of a sort of animated scrubbing brush, his drawn up in a snarl that showed his teeth, and his eyes

fastened upon the door.

Old Dan slipped quietly out of bed, took his rifle from the rack, stepped softly to the door, jerked it open and sprang out. Stump was before him, however, and with a snarling imprecation upon the discovered prowler, dashed to the attack. Immediately there followed a terrible growl of anger, a fearful yelp of agony, a muttered imprecation, two rifle shots in quick succession and the encounter was over before I was fairly out of bed. The darkness rendered both shots harmless, and the old hunter soon returned, bearing in his arms the torn and bleeding body of the courageous Stump, already stone dead, as the result of his heroic night attack upon a prowling panther.

The old man's grief over the loss of his little pet was a touching sight, as he stooped down and tenderly stroked the wiry hair and patted the unresponsive head.

"Listen to me, Kid," said he. "The varmint as done this 'ere is jist the same as dead a'ready. I'll take the trail in the mornin' and kill the critter afore I come back, if I hev to foller it to Canada!" and I knew from his manner that he meant it, every word.

Examination by daylight revealed the fact that there had been a pair of the prowlers, only one of which had come near the cabin; also that they had gone off in different directions, probably as the result of the firing.

Old Dan took up the trail, which began beside the bloody marks upon the snow. I followed the other, which, after an hour or so, I lost in a swamp, where the deep snow and dense undergrowth rendered further pursuit out of the question. Realizing that my picking up the trail again was very unlikely, I turned off in the direction taken by Dan, and caught him up after a couple of hours' hard walking. Together we followed the tolerably well-defined trail, which, with frequent skips among the tree tops overhead, lay along the general course of the river, and proceeded most of the way along the snow-covered ice to where a deep gorge cleft the river bank on the right. Up this winding gully, which was from 10 to 30 feet wide, between perpendicular walls of rock from 6 to 20 feet high, we followed some two or three hundred yards, to where the trail abruptly terminated beneath an opening about 15 inches in diameter in the rock wall, 8 or 9 feet above the bottom of the ravine.

The snow all about the entrance of the den was beaten down by the panthers' feet, particularly at that point where they sprang to and from the mouth of the cavern. We had found the end of the trail, but our intended victim was beyond our reach.

"What now?" I inquired of Dan.

"Lay by till he comes out," said he, with grim determination, as he clambered up the wall opposite to the den.

We took our station at a point whence the opening in the rock was in plain view. We had not been watching long, when I conceived a plan to capture the panther without the necessity of a long wait in the bitter cold.

"I'm going to the cabin, Dan," said I, "and will be back as soon as possible. If you start home before I come, follow my trail and I will meet you."

It was noon when, very tired, I reached the cabin, but hastily securing a strong piece of half-inch rope, about 15 feet long, I hurried back to where Dan was still patiently waiting for the appearance of the panther. Of one end of the rope I made an easy-running noose, a little smaller in diameter than the hole in the rock. The other end was tied securely to a sapling on the bank, in such a position that the noose, which was held open by a small switch bent to the proper shape, hung close to the wall and directly in front of the opening.

Old Dan expressed his approval, but declared his intention to remain and see "if the the critter 'ud come out and git hung fer murder." I expressed my willingness to keep him company, and prepared to watch with what patience and fortitude I could summon.

We had not been settled long when an unexpected circumstance occurred. A panther, doubtless the one I had lost in the swamp, unnoticed by us, had crept along the bottom of the gulch, which was hidden from our view, and attempted to gain the entrance to the cavern. We caught sight of the long, lithe body of the monster feline, as it sprang straight for the opening, dextrously inserting its head into the hole at the same instant that its forefeet caught upon the edge, thus putting both feet and its head through the noose, which tightened with increasing tension as the astonished animal endeavored to clamber into its retreat. A moment only it hung thus upon the edge, and then resisted its arrest with all an angry panther's awful fury.

What a spectacle! Such violent contortions were never seen before. The forest rang with the sound of the terrible squalls and angry growls. The feet, which were tightly drawn up under the animal's neck, prevented choking, but every motion of the struggling beast drew the noose so much the tighter.

I raised my rifle to shoot the whirling ball of fury, but Dan restrained me.

"Wait a bit, Kid; wait a bit!"

Presently we heard the low, anxious cry of the mate inside the den. Louder and louder it grew, until, with a scream of anger, a round head and a pair of feet appeared at the hole in an attempt to seize the swinging rope.

"Crack!" went Dan's rifle, and the newcomer sprang out, mortally wounded, and expired in the bottom of the gulch.

"Now, Kid, let him hev it! I've got the varmint as killed my dog."

I fired upon the hanging panther, which died with its head and feet still in the noose. It was a male, and much smaller than the uncommonly large female which Dan had shot, and from which he stripped the skin with a sort of savage pleasure and vengefully threw the carcass up among the rocks.

The greater part of the distance to the cabin was retraced in silence, for I did not wish to disturb the reverie into which the old man had fallen. At last he stopped, looked thoughtfully down at the panther skin and said:

"Kid it were only a little job. It was desper't easy. I wished it hed been harder," and then silently resumed his way.

To this day the visitor to Old Dan's cabin may see two skins—the one a panther's, the other that of a little fox terrier—and it is a matter of principle with the old man that under no circumstances shall the panther's skin be laid on that of his pet, "Because," says Dan, "I can't a-bear to see it that-a-way." VIVAMUS.

Novel Cure for a Gun-Shy Dog.

"Give a dog a bad name and hang him," runs the old adage, and a worse epithet than gun-shy could scarcely be directed against a game dog. I am aware the disease, if I may so call gun-shyness, is believed incurable; but the manner in which a peasant in my locality ultimately cured a fine setter may possibly encourage the possessors of dogs affected in the same way to "go and do likewise" before destroying their dogs—which is their end almost without exception.

Some years ago a friend, by no means notorious for his generosity, was speaking about shooting, and I observed I shot little, as I had no dog of my own. He told me he could spare one, and would make me a present of the setter any day I should send for him. I thanked him half-heartedly enough, expecting some decrepit animal, useless from old age; but what was my surprise on finding, when the messenger returned, a beautiful young red setter dog of fine appearance. Next day I brought "Grouse" out with me, and he performed well till it came to the firing, when he gave a howl and scampered away across the moor home, fast as his legs could carry him, despite my calls and whistles. Then I suspected the genuineness of my friend's generosity. Next day I tied a long rope to his collar, and all went well till I fired, when he dashed away, dragging me after him, and, finding himself unable to escape, crouched between my legs, howling dismally. I tried everything—tying him to a well-trained dog, beating, coaxing, but to no purpose, so I decided to shoot him.

A few days after a sporting friend of mine came over for a few hours and saw "Grouse;" he was greatly struck with his appearance, and warned me to keep a good eye on him or "he'd steal him." I explained, as I did so little shooting, I had no use for a dog, so he could take him away. It was in great delight truly he took "Grouse," believing, doubtless, the man who would not offer for sale such an attractive animal if he did not require him was surely developing softness of the brain. I had my own prognostications, and was satisfied to await results. A week elapsed, and the post a day or two later brought a letter from my sporting friend, mentioning the setter was the worst case in all his varied experience he had ever met. "Not worth feeding on sawdust and water."

This gentleman had a poor tenant who served as a sort of herd and gamekeeper combined. This man made several attempts to reclaim the animal, but in vain. One day the gentleman and peasant were shooting, and, on a shot being fired, the dog fled across the bog home; my friend, in disgust, asked the man if he knew of any one who would take him, as he did not like shooting the animal. The man replied, rather than shoot him, he would take him himself and try an experiment before the last resource, destruction.

Then commenced the work of regeneration. Finding beating and coaxing were of no avail, this ingenious fellow hit upon a novel plan. When his better half was away he rubbed butter, grease, milk and such like on the barrel of an old gun, which the dog licked off greedily. After a few days of this he put a cap on the nipple, and as the dog licked the barrel, fired. At first he ran and cowed in a corner, but later became more courageous, and ultimately took no notice whatever of the slight explosion. Then the man tied a piece of fried bacon to the barrel, and while the dog ate fired a small charge of powder. At first "Grouse" displayed manifest anxiety and considerable uneasiness, but the bacon was too much for him, and eventually he devoured it, regardless of the noise of the charge fired. More and more powder was daily put in while the dog was being fed in this novel way, and daily the animal's fears grew less and less. Finally the man brought him outside and blazed away at bottles. In a little time his patience was crowned with the most unqualified success. The very instant the man took up the gun the dog barked and frolicked with sheer delight, and would follow him anywhere. Then came the final instructions, and he let the animal understand it was only when he stood game well, and after the bird was shot, the bacon was forthcoming; and his tuition closed by getting the dog to look forward to a feast at home on the final return from a successful day's sport.

About two months later, a shooting party had assembled in the neighborhood, and the man requested "Grouse" should be permitted a chance of distinguishing himself. To his utter astonishment my sporting friend found his working just admirable, and before he left the field the man had disposed of him for £12 to a gentleman of the party, who declares a better dog he has never shot over. I write this in hopes it should meet the eye of one who is possessed of a dog similarly affected, and heartily wish, should he try the efficacy of the remedy this ingenious peasant resorted to in extremity, he may find his efforts crowned with equal success.—London Field.

Canoeing.

'Mid Reef and Rapid.—XXIII.

BY F. R. WEBB.

THE storm increased in violence as darkness fell like a pall upon us in a solid wall of blackness, shutting us out in the night and storm from all human aid and companionship. Great blasts came down upon us, before which the fierce, pelting rain flew like hail, and stung and blistered on cheek and hand, and drifted in long, horizontal streaks of light past the open ends of the fly in the rays of the lantern, which hung, swaying and swinging, from the ridge pole, as the fly surged and threshed around overhead, vainly striving to ride off on the wings of the gale.

We addressed ourselves to the difficult task of getting supper. A cold snack could easily have been evolved from the contents of the mess chest, but we felt that something hot and strong was peculiarly needed under such circumstances, and, after a preliminary decoction of this character from a flask of Mr. Martin's apple brandy, we set to work with a will.

George selected the biggest pieces of wood from the

water-soaked pile stored under the futile protection of the mess table and the fly, and reduced them to kindling wood. Lacy shucked half a dozen eggs, and cut as many pieces of bacon, while I wrestled with the fire in the camp stove, which was placed close to the mess table and under the shelter of the fly, and, from whose little funnel a long train of sparks went skurrying, in a swift, horizontal streak, out into the blackness, and in the course of fifteen minutes or so, by means of a plentiful supply of George's kindling, liberally encouraged with a continuous application of coal oil, we managed to get up a good supper of bacon and eggs and hot coffee, which was speedily disposed of as we sat, wrapped to the chins in our heavy rubber coats, and huddled around the mess table, while the rain beat in under edges and at the open ends of the fly, in our faces and in our plates and on the table, and ran in little rills down the folds and hollows of our rubber coats, the while the lantern, swinging overhead, cast its feeble, wavering light over the interior of the tent, outside of which the black night shut down over us in an inky pall, with the glittering streaks of rain flying past the ends of our little shelter.

Supper over, our plates, knives, forks and cooking utensils were tossed out into the rain to care for themselves until morning, and each man scuttled off to his tent for the night.

Previous to turning in, I took down the lantern from where it was swinging, up under the ridge pole, and placed it carefully on a broad, flat rock at the lower margin of the fly, where I could see it from my tent, to serve as a beacon during the night. As long as I could see it I would know that all was right. If I missed it I would know that the water was encroaching on the camp. This done and my paddle placed on the after deck of my canoe, where I could reach it, I hastily threw off my rubber coat and hat and hung them on the back end of my tent, quickly threw up my tent flap and scrambled in.

Seating myself—wet clothes, shoes and all—on top of my bed, which was well protected by the stout rubber sheet in which it was folded, I struck a match and lit my candle lamp, after which I arranged things for the night, drew off my wet shoes and garments, put on dry things procured from my clothes bag, crawled into my blankets, lit a cigar, got my book, adjusted my lamp by hooking it over the coaming between the page and my eyes, and prepared to spend the evening.

The cosiness of a well-designed and well-constructed canoe tent cannot be excelled by any other form of tent. If properly planned, well built and waterproofed, and securely put up over the canoe, one may bid defiance to the severest storms. The quarters are a little confined, it is true, and one is unable to stand upright in the tent, and dressing in such quarters is not unlike performing the same operation in a sleeping-car berth, but once ensconced snugly in my blankets I find my little cabin deliciously cosy and comfortable, and the more the storm howls and the rain patters on the sides and roof of the tent, the more the coziness and comfort seem increased.

I found it peculiarly so this wild, stormy night—in all my experience undoubtedly the wildest and stormiest. The tent rocked and swayed with the blasts, and the windward side belled far in and out, like the sails of a vessel, as the blasts came at intervals, while the canoe fairly shook and trembled on her sandy bed from the force of the blows. Now and then a few drops of spray flew in at the sheltered ventilator windows, up under the roof at either end, sprinkling my page and my face, but my little lamp burned on as serenely as though in the shelter of a room, and I lay and read and smoked for a couple of hours or so, in comfort and enjoyment exquisite.

Tired of reading, I laid my book on my clothes bag behind my head, slipped my cigar stump out under the edge of my tent, hung my lamp out of the way on the outer edge of the coaming and blew it out, drew the warm, dry blankets well up around my neck and ears and dropped off to sleep, the last sounds that floated through my unheeding consciousness being the rush and roar of the storm as it flew hissing through the trees overhead, and the steady, deep-toned drone of the river, as it came down over the rapids and the big fish dam, at the foot of the Columbia Falls above.

It need scarcely be said that I slept with "one eye open," so to speak, with the threatening river in my mind all night. I woke up several times, at intervals of about half an hour, and drew aside the flap of my tent enough to look out, but my beacon light was still there, glimmering faintly through the sheets of rain like a magnified glow worm. Finally, I went off sound asleep, to wake up with a start of alarm several hours later. I hastily looked out. The rain had ceased, but the wind was blowing heavily, with apparently, redoubled violence, roaring and shrieking through the tree tops, which writhed and tossed in the blasts, while my tent shook and swayed with such force that my canoe fairly rocked on her bed of sand. The moon was shining brilliantly, as it scurried down the sky, through the broken, tattered clouds, which, in great, black masses, edged and lined with bright silver, were whirling and tossing across the sky, as they flew before the gale. The bright beams of the moon, and the shadows of the whirling leaves overhead, flickered and tossed in a weird, fantastic manner over the firm, white sand, with a startling resemblance to tossing wavelets, for which, indeed, for a moment I mistook them.

The river roared ominously loud and deep from the falls above, and I hastily slipped on my rubber-soled, canvas pumps and a little knit jersey and stepped out to take an observation.

My beacon light still glimmered feebly in the moonlight, with the lantern globe half-encrusted and obscured with sand. I hastened down to the river. It rolled and surged by in an angry, muddy flood, while the waves lapped restlessly against the sandy shore like a miniature lake beach. Logs, trees, fence rails and other debris shot swiftly by in ugly, black masses of drift, while the restless surface of the water was streaked with long lines of dirty, muddy foam, which glistened and sparkled in the fitful rays of the moon.

The rise was upon us. The water was up over the spring, and just on a level with the sandy shelf upon which our canoes had lain the evening before, and, as I stood upon the spot and looked, a wider surge than usual sent the water in a thin, flat stream out over the spot and, as I stepped hastily back, the shelf disappeared and the waves lapped restlessly over the place.

I stood and gazed with interest upon the quickly rising flood. As I looked the trees seemed to move out from the shore into the river, and rocks, stumps and bushes disappeared beneath the surface as though drawn into the depths by an invisible hand from below.

I walked back to my tent, which was still some 6 or 8ft. above the present level of the river, and looked at my watch. It was 2:30. With the conviction that the water would hardly reach us before morning, I turned in again. Hardly had I composed myself in my blanket and begun to doze when I was startled by a yell of alarm from one of the tents. I hastily thrust my head out and looked. As I did so I caught sight of George's head and shoulders emerging from his tent.

"What's the matter?" he shouted.
 "I didn't yell." I shouted in reply. "Wasn't it you?"
 Just then the yell was repeated—it was from Lacy's tent.

"Hi, there!" he shouted. "The river's all around us! Turn out! Turn out!"
 "Turn out yourself!" cried George, as we reached his tent, and, pulling aside the flap, looked in.

"How in thunder can I turn out without getting wet?" he demanded.

"Well, how in thunder do you expect us to turn out without getting wet?" was George's not unreasonable rejoinder.

"What's the matter with you, anyhow, man?" I asked. "There's no water around us! Wake up! You're half asleep yet!"

"Well, I declare!" he exclaimed, with a laugh, as he roused himself, rubbed his eyes vigorously and looked out. "I woke up and looked out through my tent flap, and the flickering of the moonlight on the white sand through the leaves of the trees looked to me exactly like little waves and ripples, and I thought the water was all around us, and I—"

"Yes, and you lay there and yelled for the Commodore and me to get out in it, and come and tow you safely ashore," said George, sternly.

"There, there," said I, soothingly, "you'd better go to sleep again; you'll be all right in the morning."

George and I took a turn down by the river again, while Lacy resumed his interrupted slumbers. The river had risen over a foot in the fifteen minutes or so that had elapsed since I had inspected it, and was still rising at the same rapid rate. We strolled along up the bank to the foot of the falls. The water was tumbling down over the rocky pitch with a thunderous roar, which filled the trembling air, while the big surges tossed and splashed their ragged foam crests, glittering brightly in the moonlight, high in the air.

We then returned to the camp and inspected what little high land remained, and noted the quickest and easiest way out in our canoes across the gully back of us—through which the water was now running—and across the fields to the highlands beyond, in case the water reached us, and retired to our canoes with the conviction that the rapid rise would in all probability exhaust itself before reaching us in the couple of hours that remained before daylight, but feeling reasonably secure and safe, even if the water did reach us.

We turned out promptly at 4:30 in the morning, to find the river surging and booming along but a few feet away. The lower pins of the fly were still in the water, and my The lower pins of the fly were in the water, and my still glimmering beacon light had but a few inches to spare.

The river was a sight to behold in the dim gray of the early dawn as it rushed swiftly past us in a surging, brick-red flood, covered with foam and drift, and we made all possible haste to dispatch our breakfast, strike our camp and pack our canoes before the rapidly encroaching stream covered the long, narrow strip of sand upon which they lay, now but a few inches above the water.

The task was accomplished none too soon, and, as the first rays of the morning sun began to dispel the mists which floated over the surface of the river, we lifted the bows of our canoes around into the water and launched them with a gentle push, hastily scrambled aboard, and were caught up and hurled swiftly away like bubbles on the swelling bosom of the resistless torrent.

"Just in time!" exclaimed George, as we straightened our boats out into the stream.

We cast a look back. The last vestige of ground had disappeared, and a smooth sheet of muddy, red water flowed rippling around the trunks of the trees over the spot where our canoes had but just lain, while the great wave masses that came pitching and tumbling down over the foot of the falls up the river behind us were ominously suggestive of what lay before us in the turbid, swollen river, down which we were now swiftly shooting.

[TO BE CONTINUED.]

Yachting.

Our Boston Letter.

BOSTON, Sept. 30.—The racing season of the Yacht Racing Association of Massachusetts having been closed, it now remains to be seen what the association has accomplished and what prospects it has for the future. The season just passed has been one of the most successful, if not the most successful, in the history of the association. For the past three years there has been considerable dissent, and from many sides there have been heard notes of discord in regard to the system of restrictions that has been put upon yachts of from 21 feet to 30 feet waterline.

The season of 1900 was perhaps the hardest for the association. Objections to what were termed arbitrary rules were rife on every hand. The unfortunate circumstance of the famous H. O. class failing to conform to the restrictions that had been put upon 25-footers, and the barring of the boats from racing in that class, was only an incentive to bring out discord that had been lying dormant and had not cropped out before because there was not sufficient ground for supporting the objections.

It was conceded that in Massachusetts Bay, where there are so many yacht clubs that give open races, there should

be some organization which would make rules for all classes, not only for the protection of the smaller clubs that might otherwise be swamped by the larger ones, but also for the protection of the yacht owners themselves, that, under one set of rules for all, they might build yachts that would not be back numbers after one season had passed.

But there was a great grievance expressed by some in regard to the alleged unfairness of the rules and the possible harm they might do to yacht racing. Many attempts were made to have clubs withdraw from the Association, and there was also an attempt to form a new organization. All of these attempts failed, and it must be noted that, from the manner in which the objections were made, there is no doubt that most of the complaints were from those who were desirous of having such conditions prevail as would make them winners at all times, and that the attempt at new organization was solely for the personal aggrandizement of its promoters and to make rules that would be advantageous only to them.

Fortunately, there were men who realized that there must be restrictions of some kind upon certain classes, and that there could be no success in such restrictions until they had been thoroughly tried under all conditions, and the result of the controversy, and the determination on the part of the Association to stick to its rules, gave them the necessary assurance that they would be protected in building new boats. The result was that several new boats were built for the 21-foot and 25-foot restricted classes during the winter which raced during the entire season; and that there is yet confidence in the rules of the Association is shown by several orders for new boats for the restricted classes, to be raced next year.

The number of yachts that have been sailing throughout the entire season, too, was much greater this year than it has been for several seasons past. Two years ago the number of yachts that sailed throughout the season was not promising for the future, but the number has steadily increased until this year there was quite a respectable aggregation.

Another feature that has been proved during the past season by practical demonstration has been that the division of the races sailed under Association rules, during the season of 1900, into three circuits was not beneficial. This season the yachts were obliged to sail at all places along the coast where Y. R. A. open races were given. The competition in the two restricted classes that now represent the Association was so brisk that it was necessary for all to take part in as many races as possible. It was said before that the distance was too great to sail from place to place, but it was noticed that this year the yachts found no difficulty in getting to the races, no matter how far they had to go.

There is one more thing that has developed since the season closed that is very significant and is rather an assurance of further success of the Association. For the past two seasons there have been no representative boats in the 30-foot restricted class. In 1899 there were only two 30-footers that raced consistently throughout the entire season, the Meemer and the Ashmet. Since the racing season closed I have heard that there are as many as nine boats which will be built during the winter for this class. With nine new boats racing next season, the class will again be established, but this time more firmly than it has ever been before. The re-establishment of this class is only a forerunner to future possibilities. It is but one step from the 30-footers to the 35-foot class, which has been abandoned by the Association on account of a lack of boats, and the interest thus gained may lead to the establishment of still larger classes.

In classes D and C, which we will take up this week, the percentages are as follows:

	Class D—25ft. Cabin Yachts.					Total.	Average.
	Starts.	1sts.	2ds.	3ds.	Fins. Bks.		
Flirt	19	7	7	4	1	0	1310 .68 18-19
Calypso	19	10	2	3	3	1	1230 .67 7-19
Chewink	9	1	4	4	0	0	530 .53
Early Dawn	20	4	3	4	9	0	870 .43 1-2
Areyto	4	1	1	1	0	1	265 .26
Marion	4	0	1	0	3	0	110 .11
Jingo	2	0	1	1	0	0	100 .10
Little Peter	5	0	0	1	3	1	80 .08
Tarpon	4	0	0	1	2	1	65 .06 1-2
Cyrella	2	0	0	0	2	0	30 .03

	Class C—25ft. Open Yachts.					Total.	Average.
	Starts.	1sts.	2ds.	3ds.	Fins. Bks.		
Thordis	6	3	2	1	0	0	465 .77 1-2
Hostess	3	2	0	0	0	1	200 .57 1-7
Hustler	4	1	0	2	1	0	185 .46 1-4
Romance	7	1	2	2	0	2	300 .42 6-7
Widgeon	2	0	1	1	0	0	100 .28 2-3
Theodora	4	0	1	0	3	0	110 .27 1-2
Carrie M.	2	0	1	0	1	0	80 .22 6-7
Aeme	1	0	0	1	0	0	35 .10

One of these classes—Class D—is governed by the restrictions of scantling and sail area which have been laid down by the Association. Because there was a cry for classes upon which absolutely no restrictions would be placed, other than waterline length, the Association held the other class—Class C—which is open to yachts of all kinds of construction and sail area. It is of interest to note that in the past two seasons eight new boats have been built for the restricted class, while not one has been built for the class which is open to all.

In Class D, which is therefore the more important of the two, the racing has been hot during the entire season. Flirt, Calypso, Chewink and Early Dawn have done the bulk of the racing, but the others have been around often enough to swell the class on race days and to give the four leaders battle royal. The contest has been warmest between last year's champion, Flirt, and the new centerboard, Calypso. It will be noticed that, although Flirt is credited with the largest average percentage, Calypso has taken ten firsts to her seven.

It would really seem, according to this, that Calypso should logically be the champion, and, as a matter of fact, she has beaten Flirt more times than Flirt has beaten her. But it will be noticed that out of nineteen races Flirt has fourteen, which are either firsts or seconds, while Calypso has twelve that are either firsts or seconds, and seven that are further down the line. It has been shown that Calypso has been best in moderate to strong breezes, and that Flirt has always finished near the top of her class, no matter what the breeze. In one race that went to Chewink, with Flirt second, the open race of the Misery Island Club, Calypso really made the fastest time over the course.

It is now claimed that there is too much percentage given to a boat finishing second, and that is a matter which will probably be discussed at length at the winter meetings of the Association. It was this year that the percentage for seconds was changed from 50 to 65. Under the old rules Calypso's percentage would have been 64 4-19 and Flirt's 61 6-19. There is a protest which was decided against Calypso on July 3, which she has appealed to the Executive Committee of the Association, and if this is decided in her favor she will get the championship.

Flirt, which was the champion in her class for the season of 1900, is a keel boat. She was designed by Crowninshield for F. Wright Fabyan and Frank McKee, and was built by Fenton, of Manchester. She is 39ft. 7in. over all, 25ft. waterline, 9ft. 6in. beam and 6ft. 6in. draft.

Calypso, which is a representative centerboard boat, was designed and built by Hanley, of Quincy Point, for A. W. Chesterton. She is 42ft. over all, 24ft. 6in. waterline, 12ft. beam and about 3ft. draft.

Chewink was also designed by Crowninshield, with the special purpose of beating Flirt. She has at times shown rare bursts of speed during the season, but she has not been nearly as steady as the two leaders. She was built by Fenton, of Manchester, for F. G. Macomber, Jr. She is 41ft. 10in. over all, 25ft. waterline, 10ft. 3in. beam and 6ft. 11in. draft.

Early Dawn, which is one of last year's boats, was designed and built by Shiverick for Com. J. E. Doherty, of the Columbia Y. C. She is more of a heavy-weather boat than the others, and is particularly good at reaching. Under certain conditions she can make them all hustle. She is 40ft. over all, 24ft. 8in. on the waterline, about 12ft. beam and 3ft. draft.

In Class C, open 25-footers, the greatest number of races sailed was seven. This class was not provided for at all meetings, and, as a matter of fact, it is generally provided for only by the larger clubs, which are desirous of getting as many entries as possible. It is made up of yachts that have gone over their required length in the classes below, and also those which feel that they have no chance with the restricted boats.

Thordis, the champion in this class, was designed and built in 1896 by Hanley. She is a Cape cat, 33ft. over all, 24ft. on the waterline, 12ft. beam and 2ft. 6in. draft. She is owned by W. U. Foster, of the Winthrop Y. C.

Hostess, the second boat in the class, is well known to the readers of FOREST AND STREAM as the defender of the Quincy cup for two seasons. She was measured out of the 21ft. class and went up one to tackle the open 25-footers. Had she started in this class earlier in the season there is every reason to believe that she would have won. Out of three entries she won two firsts.

Hustler, third boat in the class, is a Cape cat, owned by Robbins and Whittemore. She is about 22ft. on the waterline, and very little more over all. She was designed by C. C. Collins, and built by Howard Linnell, of Dorchester.

Romance, the fourth boat in the class, and which sailed the greatest number of races, is one of the 21-footers of the class which was made famous a decade ago by the advent of the fin-keel. She is a centerboard boat and is owned now, as she was then, by Loring Sears.

JOHN B. KILLEEN.

Old Mill Y. C.

JAMAICA BAY.

Saturday, Sept. 22.

THERE were fifteen starters in the fall regatta of the Old Mill Y. C., which was held on Sunday, Sept. 22. The boats sailed over the club's triangular course on Jamaica Bay. The starting line was off the mouth of Spring Creek, thence to a mark boat off Little Paul, thence to a mark boat off Little Gofbel and back to the starting point. The cabin cats sailed twice over this course, while all other boats covered the course three times. A fresh W. wind held true throughout the race. The preparatory gun was fired at 2:15, and the cabin catboats were sent away 5m. later. The summaries follow:

Cabin Class Cats—Start, 2:20.			
Mignonette4 07 00	1 47 00	1 47 00
Diana4 14 50	1 54 50	1 49 30
Spray4 13 10	1 53 10	1 49 30

Open Cats—20 to 23ft.—Start, 2:25.			
Halcyon4 14 25	1 49 25	1 49 05
Pauline B.4 11 27	1 46 27	1 46 27
Trebla4 11 53	1 46 33	1 44 23
Folly	Disabled.		

Open Cats—16 to 20ft.—Start, 2:30.			
	Finish.	Elapsed.	Corrected.
Amaranth4 11 10	1 41 10	1 39 25
Pepita4 14 00	1 44 00	1 41 25
Vision4 06 15	1 36 15	1 35 20
So So	Withdrawed.		

Sharpies—Start, 2:35.			
Bill Nye	Withdrawed.		
Lester	Not timed.		
Alert4 14 00	1 39 00	1 39 00
Free4 15 03	1 40 03	1 40 03

The winners were Mignonette, Trebla, Vision and Alert.

Corinthian Y. C.

ESSINGTON—DELAWARE RIVER.

Saturday, Sept. 21.

ELEVEN boats entered in the regatta of the Corinthian Y. C. that was held on Saturday, Sept. 21. It was a most unsatisfactory day for a race, as the wind was light and variable, and at times the boats had barely headway enough to stem the tide.

The race of the day was between Karma and Fareeda, the former being one of the Seawanhaka Corinthian one-design knockabouts. The boats made a pretty race up to the last leg, where Fareeda struck a soft spot and Karma drew away from her fast and won by over 3m. The summary follows:

Half-Raters—Start, 2:35.			
Mae	5 17 18	2 37 18	
Imp	5 05 55	2 20 55	
Nora	5 10 12	2 25 12	
Tadpole	Not timed.		

Knockabout Class—Start, 2:40.			
Karma	5 17 18	2 37 18	
Fareeda	5 20 38	2 40 38	
Gaviota	5 21 32	2 41 32	
Raccoon	5 26 03	2 46 03	
Grilse	5 34 08	2 54 08	

25ft. Class—Start, 2:55.			
Merlin	Not timed.		
Seminole	Not timed.		

The America's Cup.

Columbia and Shamrock II.

COLUMBIA and Shamrock II. were measured on Tuesday, Sept. 24, by Mr. John Hyslop, the measurer of the New York Y. C. Shamrock received the finishing touches in the Erie Basin dry dock, and at about 11 o'clock the water began to run into the dock, and she floated clear of the keel blocks. Mr. Hyslop arrived early, and it was decided to measure the challenger's spars before she floated. On board Shamrock were Mr. Watson, Mr. Jameson, and Mr. W. B. Duncan, Jr., who was to check the measurements for the New York Y. C. Mr. Hyslop first measured the base line—i. e., from a point half way between the jib and the jib topsail stays to the end of the boom. The gaff was next measured, and then a man was sent aloft to hold the tape at the lower side of the sheave of the topsail halyard block, so that the distance from that point to the upper side of the boom could be ascertained. The topmast was the next in order, but as Shamrock has a pole mast, a nice point came up in determining just where the measurement should be taken. Any excess of the gaff over 80 per cent. of the length of the topmast is added to the base line, according to the New York Y. C.'s rule. Early this year the club adopted a rule providing for the measurements of pole masts and determining just what should be the length of the topmast. As Mr. Watson had worked out his sail plan in accordance with this rule, it was adhered to in measuring Shamrock. The rule in question states that the topmast shall be the distance between the under side of the sheave in the topsail halyard block and the under side of the sheave in the throat halyard block. Owing to the arrangement of the throat halyard block on Shamrock, Mr. Watson was able to save considerable, the blocks on the spar being so low that when the sail is hoisted the throat is two blocks. The throat blocks on Columbia are some 4 or 5 ft. higher than Shamrock's are. By this arrangement Shamrock is able to carry a longer gaff without being taxed, and some 3 ft. are saved from being added to the base line, and some 300 sq. ft. of canvas are untaxed.

The spinnaker pole was found to be longer than from the forward side of the mast to the forward point of measurement. It was only a matter of a few inches, and the pole was cut down.

Columbia came off the ways at the Morgan Iron Works at about 11 o'clock, and arrived in tow at Erie Basin at just 1 o'clock. She was warped into the basin and the gate closed. After measuring Shamrock's spars Mr. Hyslop went aboard Columbia, accompanied by Messrs. Watson, Jameson and Duncan. Columbia's waterline was measured with fifty-two men aboard, as was Shamrock, and it was found to measure 89.77 ft. After measuring Columbia's waterline, Messrs. Hyslop, Watson and Duncan went back to Shamrock, while her waterline was measured. The measurements are as follows:

	Columbia.	Shamrock II.
	Feet.	Feet.
Length on load waterline.....	87.77	89.25
Length from after end of main boom to forward point of measurement.....	182.87	184.03
Length from fore side of mast to forward point of measurement.....	73.86	78.28
Length of spinnaker pole.....	73.30	78.28
Length of gaff.....	64.94	66.17
Length of topmast.....	64.64	68.18
80 per cent. of topmast.....	51.71	54.54
Height from upper side of main boom to topsail halyard block.....	134.74	143.30
Square root of the sail area.....	114.94	118.33
Sailing length.....	102.355	103.79

The difference in the sailing length of the two boats is 1.435 ft. This, figured on the time allowance of the New York Y. C., gives an allowance of 43s. to Columbia in a race over a 30-mile course.

Shamrock measures nearly 6 in. shorter on the waterline than Columbia, her length being 89.25 when floating on an even keel, but she will gain length more rapidly than Columbia when heeled.

Shamrock has 14,027 sq. ft. of sail and Columbia 13,211 sq. ft. of sail, measured according to the rule. Shamrock has 816 sq. ft. more sail than Columbia, but this is offset to a great extent by her waterline being shorter than Columbia's.

Shamrock is longer on the baseline than Columbia. From the forward point of measurement to the end of the boom on Shamrock is 184.03 ft. against 182.87 ft. on Columbia. In the forward triangle—that is, from the fore side of the mast to the forward point of measurement—Shamrock measures 78.28 ft. and Columbia 73.86 ft. The area of the forward triangle on Shamrock is 5,622.38 sq. ft., and on Columbia 4,981.94 sq. ft. This allows Shamrock to carry a larger balloon jib and a larger spinnaker. Shamrock's spinnaker pole is the exact length of the forward base line, while Columbia's is shorter by more than 6 in.

From the forward side of the mast to the end of the boom on Columbia is 109.01 ft., while on Shamrock the distance is 105.75 ft. Subtracting the diameter of the mast from those measurements, we have the length of the boom. Columbia's boom, according to this, is some 3 ft. longer than Shamrock's.

The length of the mast from the upper side of the boom to the topsail halyard block on Shamrock is 143.39 ft., and on Columbia 134.74 ft. Shamrock's baseline is shorter, but her sail plan is 8.65 ft. higher than Columbia's. The area of sail aft of the mast on Shamrock is 8,404.62 sq. ft., and on Columbia is 8,229.16 sq. ft., giving 175.46 sq. ft. in favor of Shamrock. It is in the after triangle where the untaxed sail is, and Shamrock has about 500 sq. ft. more in the after triangle than Columbia.

On Thursday when Columbia rounded the weather mark ahead of Shamrock, the din of whistles of the attending craft was deafening, but on Saturday when Shamrock rounded the mark ahead of Columbia one was impressed by the great quiet that prevailed—perhaps one-quarter of the fleet gave some evidence of their presence. This poor sporting spirit was most un-American, and was the cause of considerable comment. The crew of Shamrock are laboring against heavy odds, and as all men work better when they are receiving some encouragement, Americans should show that they appreciate the pluck and ability of the visitors and give them cordial support.

Sunday was a day of rest for the crews on both Shamrock and Columbia. The men lounged about on the tenders of the racing yachts or went ashore. The fine old

schooner America, that won the America Cup just fifty years ago, has attended the races, and on Sunday Sir Thomas Lipton was the guest of her owner, Mr. Butler Ames. In the afternoon Sir Thomas, together with Mr. and Mrs. William Jameson, Mr. Robert Ure, Com. Hilliard, Mr. George L. Watson and Dr. Reid Mackay, went out for a sail on America. There was a fresh breeze blowing and the old craft was at her best. When America left her anchorage she passed quite close to Shamrock, and she looked almost like a toy boat alongside of the English craft. It gave everybody on board an opportunity to make some interesting comparisons and note the development that has taken place in yacht designing during the last half-century.

The old schooner Columbia, that was one of the boats which defended the Cup in 1871, has also been an attendant of the races. She is now the property of a Philadelphia gentleman, Mr. Joseph De Forest Junkin.

Sir Thomas Lipton and his English friends and associates who are now over here to watch or participate in the races, speak most highly of the manner in which the course has been kept so clear. Capt. Thomas D. Walker and his assistants deserve great credit for the splendid judgment shown in handling the big fleet, but it must be said that the majority of the captains of both the steamers and the yachts, have done their part in assisting the revenue officers in their work. The great number of craft that attend the races are bound to kick up considerable wash, but as both yachts suffer equally in this regard, no complaints are heard. Every detail has been taken care of by the patrol, and nothing has been overlooked. Capt. Walker's squadron is made up of two divisions. In the first division were Gresham, the steam yacht Erin, the steam yachts Colonia, Windom, Algonquin and Dallas, with Mr. August Belmont's high-speed steam yacht Scout to act as despatch boat. The second division was made up of Seminole, Mr. J. Pierpont Morgan's steam yacht Corsair, in command of Com. Ledyard, N. Y. Y. C.; the steam yacht Kanana, the steam yacht Duquesne, Onondaga and Dexter, with Mr. Cornelius Vanderbilt's high-speed steam yacht Mirage as scout.

On Thursday, the day of the first race, there were a large number of boats on hand, with sightseers, and it seemed that every available craft on the coast had been brought into service, but on Saturday there were still more boats of every description to be seen, and one wondered where all the boats came from. As a result of the large number of vessels in attendance, there were several trifling collisions, but in addition to these there were two accidents that might have resulted seriously. Sir Thomas Lipton's steam yacht Erin was in collision with the revenue cutter Gresham, and John Jacob Astor's steam yacht Nourmahal collided with the steamer North Star, of the Maine Steamship Company.

Gresham and Erin were some 300 yds. apart just after the competing yachts had rounded the weather mark, and under ordinary circumstances the boats would have kept clear of each other. Erin did not have headway on, her engines having been stopped so that those on board could watch the race. Before Erin could get up headway and turn, the Gresham drifted down on her and struck a glancing blow. The cutter's torpedo tube dented several of Erin's plates just aft of the gangway on the port side. No serious damage was done, and there was no excitement to speak of on either boat.

When in the Swash Channel, bound home from the race, Col. Astor's Nourmahal collided with the North Star, hitting that vessel on the port quarter. Although the blow was a glancing one, it was of sufficient strength to loosen up several of the steamer's plates and make a dent in her side and rip off some 20 ft. of her rail. Nourmahal lost her bowsprit and dented in several bow plates, but further than this she sustained no injury. Nourmahal's bowsprit shrouds fouled a chain on the North Star, and before that vessel's headway could be stopped the yacht was heeled down badly, and the guests on board were well shaken up and frightened.

Mr. E. C. Benedict's steam yacht Oneida ran into the steamer Shinnecock when bound for the city after the race. A hole was stove in the Shinnecock's deck house on the starboard side, just aft of the paddle box. Oneida lost part of her port rail and a launch that was hanging on the davits was crushed. Mr. Joseph Stickney's steam yacht Susquehanna was also in a collision, and lost her bowsprit.

It would be a difficult task to convey an accurate idea of the great numbers of pleasure boats of all descriptions that have followed Columbia and Shamrock over the course. There were hundreds of them, and probably no more beautiful picture could be imagined than that of the gathering of these boats in the vicinity of the starting line. In the matter of steam yachts alone, the cost of which represented many millions, were to be seen the following:

Conqueror, Frederic Vanderbilt; Kismet, J. R. Maxwell; Electra, E. T. Gerry; Sybarite, George J. Gould; Lady Godiva, H. C. Rouse; Bellemeere, S. F. Shaw; Aloha, D. W. James; Wacouta, J. J. Hill; Taurus, J. H. Hanan; Clementina, W. Jennings; Marguerita, A. J. Drexel; Nada, Edwin Gould; Vergana, F. H. Benedict; Zara, H. B. Moore; Virginia, Isaac Stern; Saghaya, H. C. Smith; Irene, W. & L. Lewisohn; Colonia, L. G. Bourne; Gundreda, James Ross; Niagara, Howard Gould; Satanelia, Perry Belmont; Hope, Guy Norman; Scud, E. Randolph; Catania, R. A. C. Smith; Norman, Frank Tilford; Duquesne, J. G. Butler; Alcedo, D. G. Reed; Viva, Edward Eyre; Gunilda, H. A. Hutchins; Tuscarora, Robert Ballantine; Admiral, P. Fisk; Aileen, W. B. Leeds; Susquehanna, James Stickney; Narada, Henry Walters; Emba, J. T. Williams; Anita, Geo. R. Wilson; Altair, E. D. Trowbridge; Duchess, L. G. Busby; Chetalah, Albert White; Elsa, Miss Eloise Breese; Tilly, Frederic Osgood; Felicia, E. W. Bliss; Hiawatha, Julius Fleischmann; Nahma, Mrs. Robert Goelet; Nourmahal, J. J. Astor; Varena, Eugene Higgins; Sultana, J. R. Drexel; Alvin, Chas. Fletcher; Reva, G. A. Roland; Intrepid, Lloyd Phoenix; Kanawha, H. H. Rogers; Oneida, E. C. Benedict; Nerita, W. E. Cox; Surf, C. K. Billings; White Heather, H. T. Drummond; Sagamore, E. C. Lee; Thistle, J. K. Todd; Marietta, R. N. Carson; Buccaneer, Frank Morrill; Cushana, W. Jennings; Majorie, Mrs. A. S. Van Winkle; Maspeth, C. M. Meyer; May, Alex. Van Rensselaer; Parthenia, A. H. McKee; Reverie, J. B. Thomas; Erl King, A. E. Tower; Josephine, J. E. Widener; Aphrodite, O. H. Payne; Pappoose, T. B. Homer;

American, Archibald Watt; Wild Duck, F. V. Greene; Neaira, C. A. Gould; Nydia, F. L. Lisman; Ituna, A. L. Bigelow; Toinette, E. D. Smithers; Pilgrim, L. C. Burnham; Eugenia, J. B. Herreshoff; Narwhal, Chas. Osgood; Aroc, E. B. Douglas; Mindora, C. H. Merrill; Jathiel, C. M. Pratt; Monaloo, C. C. Borland; Carmen, C. A. Starbuck; Arrow, C. R. Flint; Vedette, M. C. Borden.

First Race—Windward and Leeward.

FIRST DAY—THURSDAY, SEPT. 26.

When the boats reached the lower bay there was a long ground swell, which was produced by the sea that had been kicked up on Wednesday by the strong N.E. breeze that had prevailed on that day. Columbia, with Mr. and Mrs. E. D. Morgan, Col. R. T. Emmett, James Parker, Herbert C. Leeds, A. C. Tower and H. M. McGildowney, who represented the Royal Ulster Y. C., on board, dropped her moorings about 9 o'clock and was taken in tow by the tug Wallace B. Flint. When nearly down to Sandy Hook Lightship the mainsail was hoisted. As soon as this sail was set to the satisfaction of those on board, a medium-sized club topsail was sent up in place and headsails were set in stops, ready to break out. Shamrock left her anchorage some fifteen minutes later, and was towed down the bay after Columbia. Shamrock II.'s mainsail was set and a medium-sized club topsail was sent aloft. On board Shamrock were W. G. Jameson, George L. Watson, Thomas Ratsey, Robert Ure, Com. Hilliard and W. B. Duncan, Jr.

The Regatta Committee, Messrs. S. Nicholson Kane, Chester Griswold and Newbury D. Lawton were on board the ocean-going tug Navigator, with Mr. Æmilus Jarvis, Vice-Com. Sharnan-Crawford, of the Royal Ulster Y. C., and Capt. Rhoades as guests. At 10:30 the signal code flag C was hoisted, announcing that the course would be fifteen miles to windward and return. The wind was E. by N., and the code letters D B V, which were hoisted on the committee boat, signified that the first leg of the course to the weather mark would be E. by N. The tug Edward Luckenbach dropped over a log and started to measure off the course. The committee boat dropped a little to the S. of E. of the lightship, making the starting line. While these preparations were going on, the two contestants were hovering around the line; baby jib topsails had been sent up in stops in both boats. Shamrock looked to be a much larger boat than Columbia, and the English boat's sails seemed to be even darker in color than when she first arrived on this side. The difference in color was very pronounced in comparison to Columbia's cream-white canvas.

At 10:55 the preparatory gun was fired from the committee boat, and the blue peter was hoisted. Both boats were then S. of the starting line. Shamrock stood to the westward, while Columbia soon after rounded the lightship and followed Shamrock. Just before the warning gun Shamrock came up into the wind and stood off on the starboard tack, with Columbia on her weather. Shamrock moved very fast and drew out of Columbia's lee. The warning signal was given at 11:05; the wind at this time had a strength of about ten knots, but seemed to be dropping. Three minutes before the starting signal both boats gybed and came back across the starting line, with Columbia still hanging on Shamrock's weather. Both boats headed off to the southward, and Columbia broke out her jib topsail. Columbia was sent around on the starboard tack, followed immediately by Shamrock.

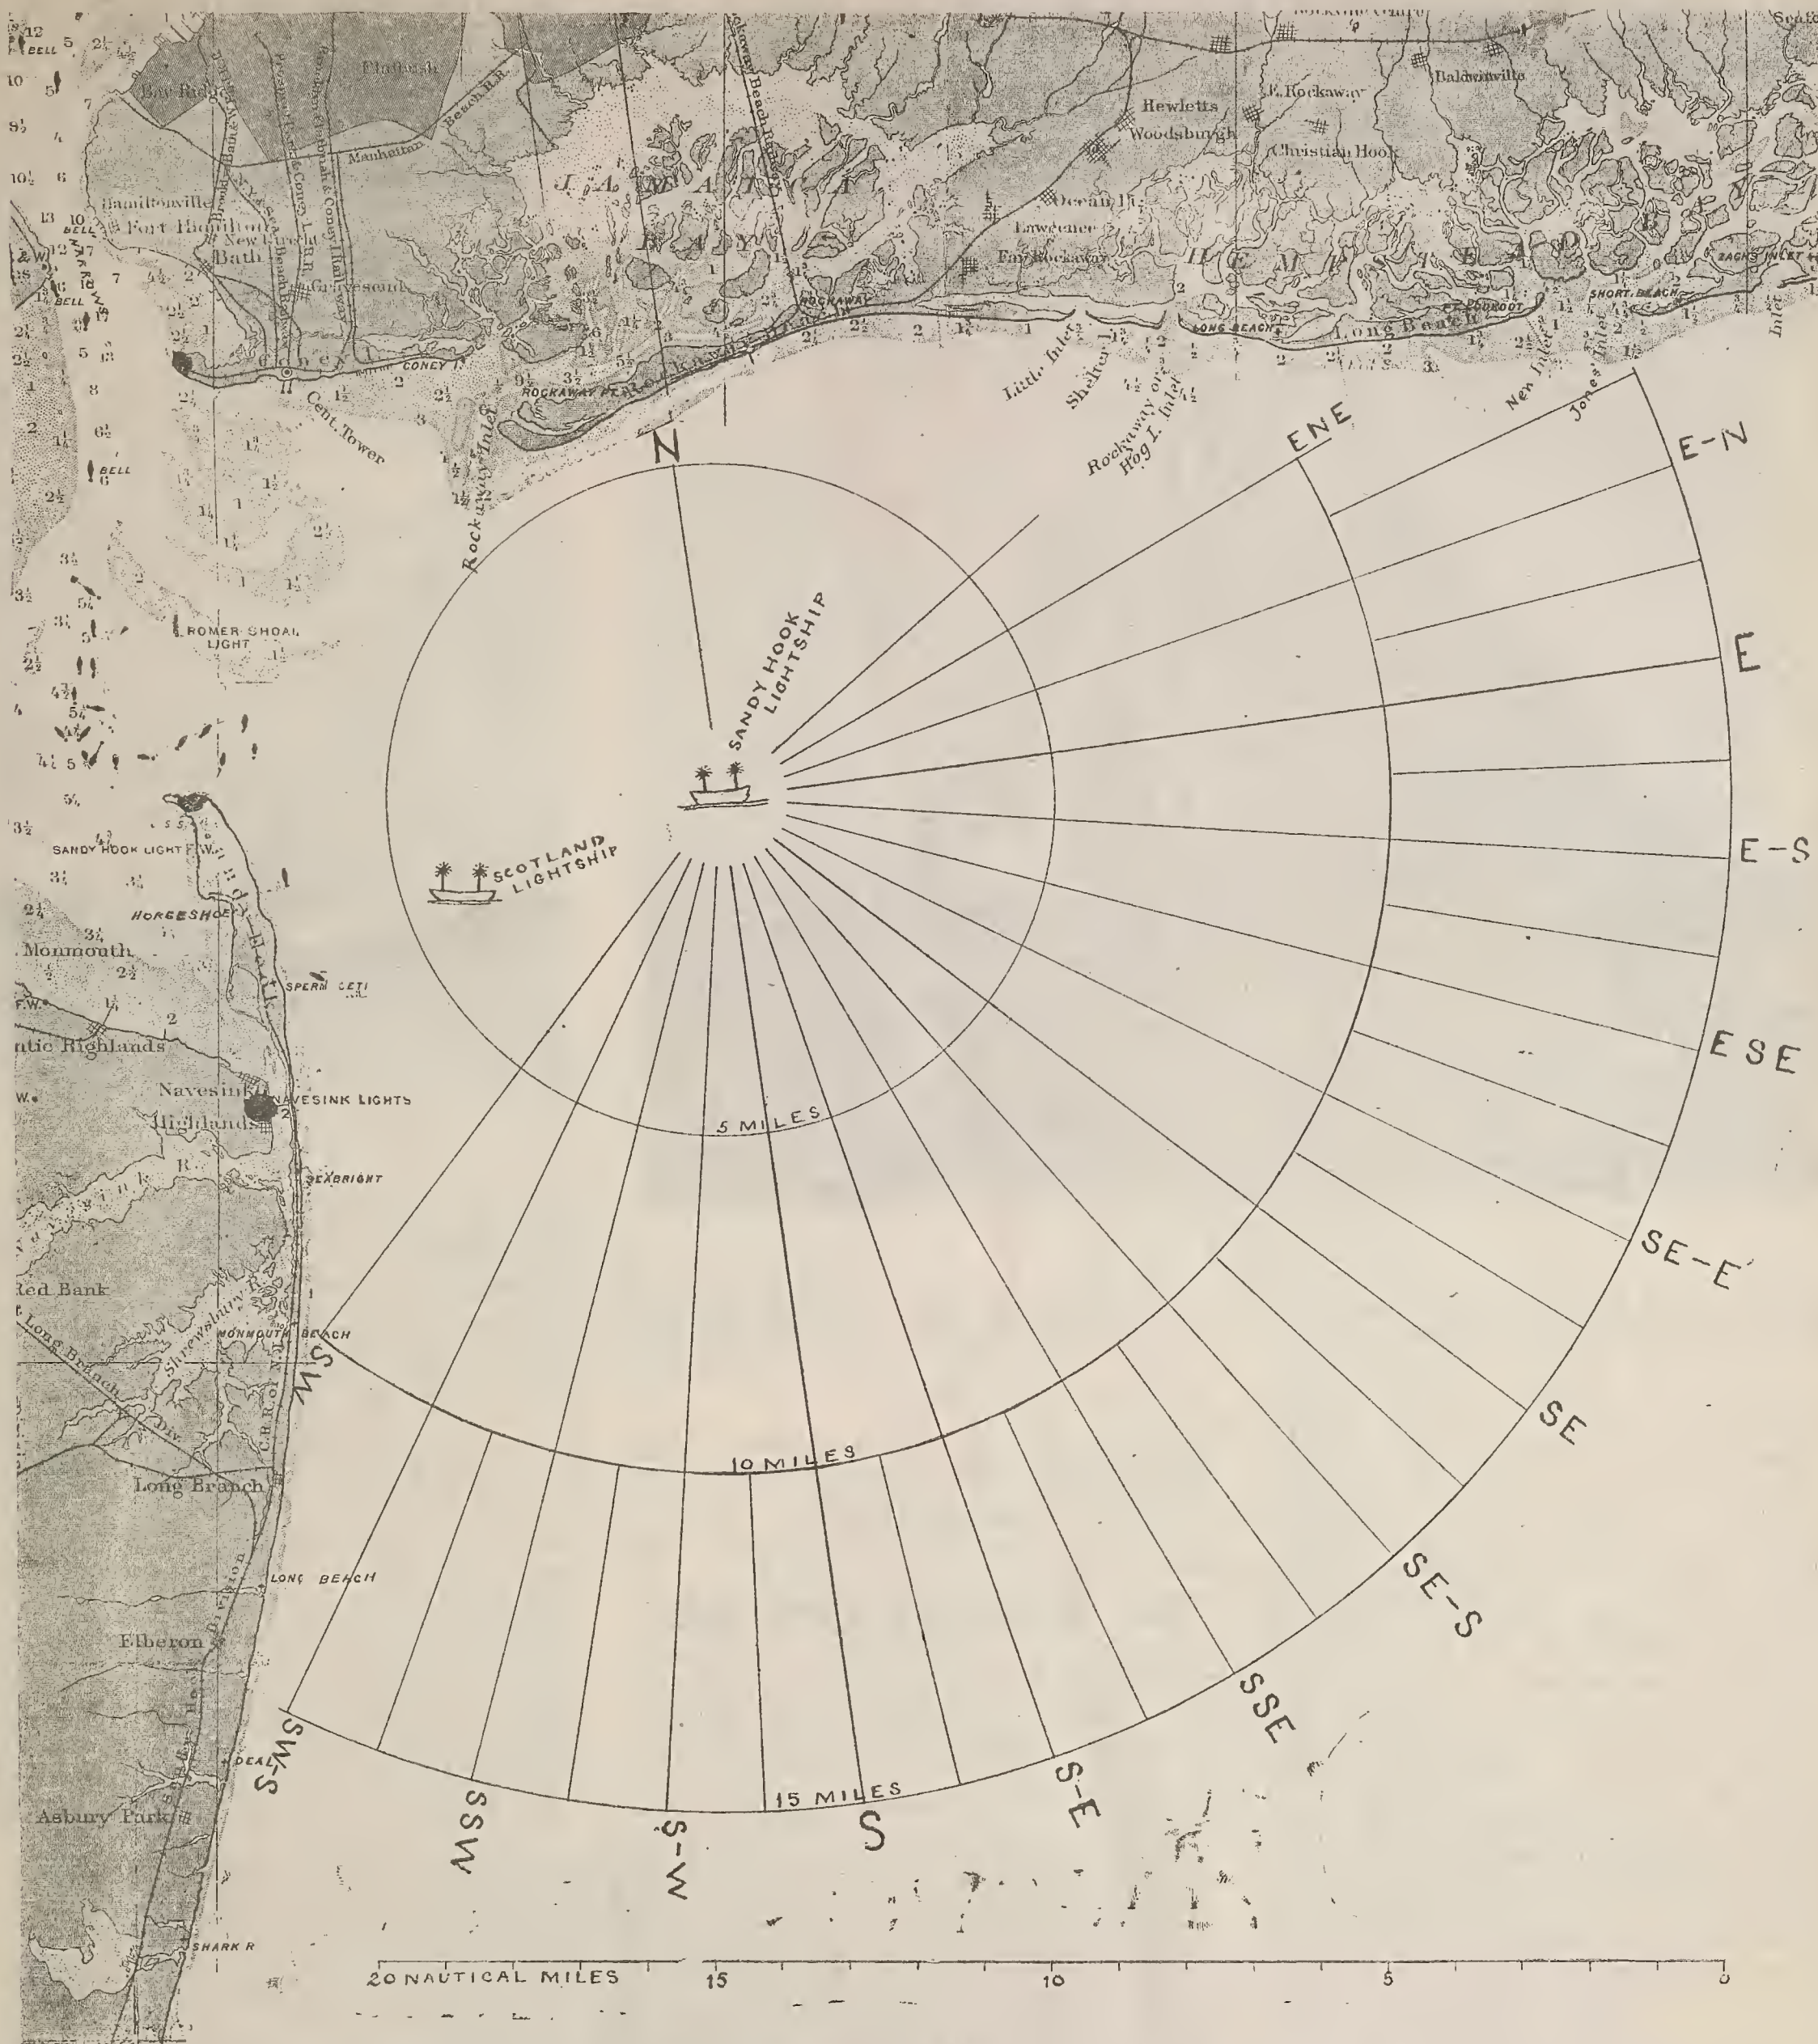

With Columbia to windward both boats were just on the line and in forcing Columbia across before the gun, Capt. Sycamore let his own boat cross. Columbia bore off right on top of Shamrock, and in order to avoid a foul Shamrock was kept off. Having plenty of room, both boats crossed again well up toward the end of the line where the lightship was located. The official times at the starting were:

Columbia 11 10 49 Shamrock 11 11 01

Columbia was ahead and in the weather berth, and Shamrock was swung about on the port tack, Columbia immediately following. Shamrock was given a good full and began to drive out from Columbia's lee. During the early part of the race and when the wind was fairly fresh, Shamrock did some pretty sailing. She moved faster than Columbia, but did not point as high. Shamrock seemed to wallow in the swell and make more fuss than Columbia, but the spray showed up more clearly against Shamrock's bright topsides than it did against Columbia's white paint. Just before 11:30 Shamrock came about, hoping that she might benefit by the breeze that was permitting Columbia to point so high. Columbia came about before the boats got very close together, and both were heading toward the Long Island shore, Columbia ahead, but Shamrock to windward. The wind was now very shifty and baffling, making it very unsatisfactory racing. Columbia went about on the starboard tack after getting all she could out of the favoring puffs when in toward shore. The boats were again on opposite tacks, but Shamrock also received some beneficial puffs and again overhauled Columbia a little. Columbia crossed Shamrock's bow, having some distance to spare. The wind was getting lighter every minute, and every roll of the sea would throw the wind out of the boats' sails. The favoring slants seemed to reach Columbia first, and she was not slow to take advantage of them. Every time that Columbia would break Shamrock's wind the English boat would be kept off and driven through the defender's lee. Men were sent to leeward on both boats to heel them down a little. The boats see-sawed in toward the Long Island shore, first one getting a slant, then the other—Columbia went off hunting breeze, and Shamrock got a favorable puff off the shore, so that just before 1 o'clock Shamrock was able to cross Columbia's bow. Shamrock was now the windward boat and was favored as was Columbia in the early part of the race. The wind was now S.E. by E., which allowed the boats to almost lay their course for the mark. Columbia got a decided slant from the southward, and opened up a good lead, which the English boat had had for more than an hour. The bright tin cone on the weather mark now showed up plainly. Columbia took in her baby jib topsail and set her balloon jib topsail in stops well before reaching the mark. The times at the weather mark were:

Columbia 03 05 32 Shamrock 03 12 47

As Columbia rounded the mark, sheets were eased and her balloon jib was broken out. It had taken her 3h. 54m.

NEW YORK BAY AND ADJACENT WATERS.

438. to cover the fifteen miles to windward, and she had beaten Shamrock to the outer mark 7m. and 38. The jib and staysail were taken in on Columbia and she reached toward the home mark. Shamrock held on to her jib topsail till she rounded the mark, when, after some delay, a reaching jib topsail was set in its place. This proved to be a matter of good judgment, for Columbia was not able to carry her balloon very long, and had to change it for a reaching jib topsail. Reaching staysails were substituted for balloon staysails, and both boats had to sail on a more northerly course to keep their headsails filled. The boats were not making over four miles an hour, and all hope of finishing within the time limit had been given up. Columbia was seven miles or more away from Sandy Hook Lightship when a gun was fired from the committee boat and the signal hoisted announcing that the race had been declared off. Columbia was about three-quarters of a mile ahead of Shamrock when the race was abandoned.

Second Race—Windward and Leeward.

SECOND DAY—SATURDAY, SEPT. 28.

Columbia Wins by 1m. 20s.

Clear weather and a good breeze had been promised for Saturday's race, but the morning was thick with haze, and there was but little air stirring. As the morning wore on, however, the weather cleared and the light air increased to a good sailing breeze.

About 9 o'clock Columbia was towed down the bay, Shamrock also in tow following about a mile behind. No

effort was made to set sails on Columbia, while Shamrock's crew were walking the mainsail up. By 10 o'clock both boats' mainsails had been set and club topsails were being put in place. The wind was E. by S., and shortly before 10:30 the letter C was displayed from the committee boat Navigator, meaning that the course would be the same as on Thursday—fifteen miles to windward and return. The signal letters D C G followed, announcing that the compass course would be E. by S.

Columbia and Shamrock cast off their tow lines at about the same time. Columbia had her jib and staysail set in addition to her mainsail and club topsail, while Shamrock was jogging along with only one headsail broken out—her jib. The committee boat Navigator had anchored about a quarter of a mile to the W. of S. of Sandy Hook Lightship, and at 10:45 the preparatory gun was heard. At this time both boats were headed W., with Shamrock to windward. Columbia went about on the starboard tack, and Shamrock passed under her lee. Some of the stops broke loose on Shamrock's jib topsail, which was now being hoisted. Shamrock came about and headed for the line, and while she passed astern of the Navigator Columbia was going around the lightship, and stood back on the windward side of the line. Columbia again stood away toward the lightship, and Shamrock came about on the port tack and crossed the line. The boats were now quite close together. Columbia now gybed and followed Shamrock. Columbia's jib topsail had been hoisted in stops. Shamrock was swung on to the starboard tack and passed to windward of Columbia, and headed for the line as the warning gun was heard at 10:55. Columbia

now stood toward the committee boat and broke out her jib topsail. As this was done, she was headed up close to the wind on the port tack, with Shamrock to windward and a little behind. Columbia seemed to draw away from Shamrock fast, and was put about on the starboard tack, Shamrock following suit at once. The boats now stood for the line, and Shamrock was a little ahead. Shamrock passed the committee boat to the westward, while Columbia passed it on the east side. Columbia stood down toward Shamrock, and finding that she would not give way, luffed sharply to avoid a foul. Just as the starting signal was given, Columbia crossed Shamrock's bow and both boats hauled on the wind. Shamrock crossed the line in the weather berth, but Columbia was just far enough ahead to let the wind flow off her mainsail into Shamrock's headsails.

The boats were timed at the start as follows:

Shamrock	11 00 14	Columbia	11 00 16
----------------	----------	----------------	----------

To avoid the back draft of Columbia's mainsail, Shamrock was brought about on the port tack. Columbia followed shortly afterward. The breeze now had a strength of about eight knots. The water was smooth, with the exception of the usual long swell. The tide was running out. Shamrock was heading quite as high as Columbia and moving perhaps a trifle faster, and as Columbia was dropping into a position where Shamrock was beginning to back draft her, she was brought about. Columbia's men were lined up on the weather side, and Shamrock, with half her men to leeward, did not heel as much as Columbia. While Shamrock was moving steadily along

COLUMBIA.
Copyright, 1899, by J. C. Hemment.

Columbia was being pinched. When Columbia was brought about the boats were drawing toward each other on opposite tacks; Shamrock was on the starboard tack and had the right of way, and could force Columbia about, which she did. After standing on this way for some time, and while Columbia was doing all possible to get out of a bad berth, alternately luffing and bearing away, but finding these efforts of no avail, Columbia was brought about and again the boats approached each other, Shamrock again having the right of way. Columbia soon came about, and the boats were now closer together than at any time before. Columbia again began to back draft Shamrock, so she was put about on the port tack. Columbia immediately followed. Now that Shamrock was heeled down, she presented easier bow sections to the rolling head sea, and she moved along with apparently as much ease as did Columbia.

At this time Shamrock seemed to be ahead, but Columbia was to windward. The boats held on the port tack for about half an hour, and during this time Columbia was slowly but surely dropping astern. Columbia was finally brought about on the starboard tack, Shamrock following about a minute later. Columbia again took the port tack, and for the third time the boats drew together, with Shamrock still having the right of way. Columbia was forced to tack and both boats headed in toward the Long Island shore. Columbia was sailed very close and again backwinded Shamrock, which boat tacked, followed at once by Columbia. The boats could fetch the mark on this hitch, and although Shamrock was backwinding Columbia, she could not tack on account of the time she would surely lose by such a move. The boats rounded the tug boat, as the mark had met with an accident, leaving it to starboard. Shamrock was pinched well up, and she was able to start sheets and reach down to the mark; in this move she left Columbia fast.

The times taken at the weather mark were:
Shamrock1 25 12 Columbia1 25 53

Shamrock had gained 39s. on the fifteen-mile beat to windward. Both boats gybed their booms over to port after rounding. Columbia went to leeward of Shamrock, which was the better position, as she could always luff if necessary; when near the finish she could head up and make her competitor luff and then reach down to the finish line with increased speed. Those on Shamrock fearing a luffing match after the boats rounded did not set their spinnaker, but after a few minutes Columbia's spinnaker pole was run forward, dropped into the cup and then trimmed aft, and the sail was sent out in stops. Shamrock followed each move, but did not break out her spinnaker until after Columbia's had been broken out. Balloon jibs were now sent up in stops and broken out. Columbia inch by inch drew by Shamrock, and then the challenger would close up the gap. The boats had fought every inch of the race to the outer mark, and it was now evident that it was to be a fight on the run home. Columbia's sails seemed to draw better than Shamrock's. Her mainsail was trimmed a trifle flatter, so that the wind would flow from that sail into her spinnaker, which sail would in turn flow the wind into her balloon. In this way there was no dead wind in her sails. Columbia rolled more than Shamrock did, frequently dipping the end of her boom in the water. It was evident that Columbia was going to have a hard race, for she did not seem able to get a lead of any consequence on Shamrock before she would begin to overhaul her. For the last half hour of

the race nothing was touched on either boat, and they raced down toward the finish line in the increasing breeze.

The times at the finish were:
Columbia3 31 23 Shamrock3 31 58

The table of the race follows:
Columbia11 00 16 3 31 23 4 31 07 4 30 24
Shamrock11 00 14 3 31 58 4 31 44 4 31 44

Columbia beat Shamrock 37s. actual time and 1m. 20s. corrected time.

The Third Race

The third race, Tuesday, Oct. 1, was unfinished because of lack of wind.

First International Yacht Race.

I READ with great interest, as all who commenced it must have done, the able article by Mr. McDonald in the issue of FOREST AND STREAM of April 20, but when I came to the account of Pearl and her doings, my interest became almost personal; and, when reading further, I came to her race with Brenda, I was fain to do a little reminiscing myself.

The Ancient Mariner, of whom this paper has heard not

a little in connection with Podgers and myself, was by profession, or trade, whichever is the proper term, an engraver of great skill, and an artist of no mean ability with pencil, but, like many others, extremely careless about what became of his sketches after he had made them, and particularly given to the reprehensible habit of leaving them unfinished. For reasons not necessary to particularize, I had, many years ago, constituted myself the lawful custodian of all the old sketch books and loose drawings of his which I could lay my hands on, and only a few years before his death I made him go over the collection I had made, and tell me everything he could remember about them, which was not, unfortunately, as much as could have been desired.

Of all the craft with which he had been identified, there was none of which he spoke with such affection as Brenda. She was about 45ft. over all, rigged like a Boston pilot boat, and the property of a friend of his whose name I have been vainly trying to recall—but I shall come upon it yet. Among these sketches I have spoken of, is one quite large one, which, though unfinished, is remarkably

BRENDA IN THE GULF STREAM.

spirited, showing Brenda in a gale in the Gulf Stream in April, 1849. She is running under a double-reefed foresail, the peak lashing of which has just carried away, and the crew of three are preparing to take it in to save it, and set a square sail until the damage can be repaired.

The A. M., at that time a man in the prime of life, was acting as the navigating officer of Brenda. I think, but I am not sure, that there was one paid hand on board the yacht, but the other three were strictly amateurs. They had a rather close call in this Gulf Stream experience, and the A. M. at one time thought that his wife had an excellent chance of realizing on his life insurance policy, but the staunch little schooner weathered the gale and carried them in safety to the Bermudas; and when I look at the map of that section with its liberal, not to say lavish, display of rocks, reefs, banks, breakers and shoals, I am convinced that the A. M. must have been as good a navigator as he was artist, to get safely in and out of such a place.

Here they were made much of, and the flag of the New York Y. C., which she bore, was treated with great courtesy. I think Mr. McDonald has made a slight mistake as to the status of Pearl, as she appears to have been permanently stationed at Hamilton, in the Island of Bermuda. The race took place as he mentions, and was won by Brenda, having been gotten up by the Bermuda Y. C. to do honor to the visitors. The navigating officer of that craft evidently made a good impression, as "Frank Fowks, Vice-President B. R. (?) Y. C." took the trouble

COLUMBIA IN DRY DOCK.

YACHT PEARL—ROYAL BERMUDA Y. C.
Bearing the flag of the Commodore, Samuel Prescott, Esq.

to make for him a copy of a scale draft of Pearl's sail plan, to which he appended the following legend:

- "Yacht Pearl,
- "Royal Bermuda Y. C.
- "Bearing the flag of the
- "Commodore, Samuel Prescott, Esq."

I have made a tracing of the plan, which I send with this article, and which I have followed as exactly as possible, except that the original plan was in pencil, and very faint from age. The legend on the plan states that certain lines are in red, and show the "wager" sail plan, while the lines in black give the ordinary plan; but the plan itself had no red lines, but full lines and broken ones, from which I infer that it was a copy of the original sail draft which had the two sets distinguished in that way. This has led to a little confusion in the jibs in the plan, but I think it quite evident that Mr. Fowks intended to show that under her ordinary rig she carried a moderate jib, but that this was sometimes supplemented by a flying jib, and that the racing jib stay was set at a point about half way between the jib and flying jib stays of the ordinary rig. She evidently shipped a longer bowsprit and boom, as well as mast for racing; and I have made a mistake in drawing the mast above the throat of the topsail in full lines; it should have been dotted in that portion.

The sheet on which the copy was made was a little small for the purpose, and I have carried the lines out to the junctions, indicating by the light bordering line the size of the original.

One cannot fail to notice the tremendous rake of the mast, as well as its length, and there is no cutting away of the lateral plane to save skin friction; notice also the depth of the forefoot. Unfortunately the beam is not stated. The topsail was one which I have never seen used, yet I have seen it drawn in several plans made by the A. M., and the fancy which he took to the Bermudan rig he never recovered from, and to his dying day was ready to demonstrate its convenience and superiority. My own fondness for that rig arises largely from his teachings.

While at Bermuda the A. M. took some measurements and made a sketch of the sloop Corsair, built in 1807. Her waterline was 22ft., over all 26ft., beam 9ft. and draft 6ft.; her bowsprit was 8ft. outboard, and her mast 42.6ft. above the deck, or, in other words, nearly twice her waterline.

Somewhere, probably in Boston, there ought to be a painting representing Brenda in the Gulf Stream, since the sketch, a photograph of which I inclose, shows unmistakable signs of having been enlarged and used for such a painting, either in oil or water colors. I never thought to ask, but it is highly probable that he either painted such a picture himself for the owner, or loaned the sketch to Lane, who was a marine artist of some note in those days, and who was one of the "gang" who sailed in Brenda when she was in her home waters.

I wonder if the records of the N. Y. Y. C. could throw

any light on this early cruise and "first international yacht race," and, by the way, this sketch would seem to indicate that the Royal Bermuda Y. C. must have been about as old as, if not older, than the N. Y. Y. C., which I had supposed was the first on this continent. ***

Small Yacht Construction and Rigging.

BY LINTON HOPE.

XIV.—Cabin Fittings for No. 2 Design.

THE most important parts of the interior work are the bulkheads and lining, or ceiling; and all this part of the work must be completed before any of the fittings can be put in.

As stated in a previous chapter, this should be done before the deck is on, as there will then be more light and room to work than there would be after the boat is decked; but the berths and other fittings are better left till the rest of the work is finished.

All bulkheads should be tongued and grooved, and if they are to be perfectly watertight they should also be lined with painted cotton, which should lap over the skin of the boat, about an inch all around, and be held in place by a wood fillet bent around the angle between bulkhead and skin and well screwed to both. This method will insure a perfectly watertight bulkhead, which is otherwise very difficult to obtain.

If there is not a timber exactly at the place where the bulkhead is to be fitted, an extra stout timber should be bent round at that point and well screwed to the skin, forming a ledge or fillet, to which the planking of the bulkhead may be fastened.

The angle between the under side of the deck and the inside of the shelf and planking is the hardest part to fit, and this should be done at each side first, working from the sides to the center, but taking care that the joints in the planks are vertical, and all the beads on the same side. (V-joints and narrow planks look very well in bulkheads and lining in place of the usual bead.)

For a plain job, ordinary 3/8in. match board, if picked clear of knots, will do very well; but it is very rough and liable to shrink and go out of shape.

Teak, mahogany, Kauri pine and cedar all make very good bulkheads, the latter being very light, and more suitable for racing boats.

The ordinary bulkheads in the cabin and forecabin are not intended to be watertight, so there is no need to take very much trouble over the fitting of the joints except so far as looks are concerned; but the sides and ends of a watertight cockpit require most careful fitting if leaks are to be avoided, and all joints should be well bedded in red and white lead or thick varnish, and either tongued, rabbeted or fitted with fillets at the back. The main joints between floor and sides and ends should also be covered with angle beads bedded in thick varnish, and the floor should be covered with linoleum. It is best to fit the sides and ends of the cockpit first, and put in the floor afterward; a small drain pipe should be fitted from each of the after-ends of the cockpit floor leading through the planking. If this is of lead, it can easily be fitted tightly into the holes in the cockpit floor and planking, and if a quarter-inch is left projecting at each end it can be turned over with the point of a hammer and screwed or nailed to the wood.

The cabin doors should be properly framed, exactly like an ordinary house door, except that there will be only one panel in each door instead of four, and that the frame will be of hard wood.

The top and bottom rails of the door have a groove plowed on their inner edges to take the panel, which is fitted into the groove before the framing is put together. The panel should be about half the thickness of the framing, which ought not to be less than 1 1/4in. stuff, of a width suitable to the size of the door. The joints between the styles and rails of the framing should be mortice and tenon, but a plain halving is much easier, though not nearly such a good job, as they cannot be wedged up after the panel is in, as the others can.

Rabbeted doorposts and a sill must be fitted to the bulkhead to form a doorway; the doors should open outward and shut against

a strip of rubber in the rabbet on the posts and sill, thus forming a watertight joint. The central joint between the doors can be made watertight in the same way, but in all cases where rubber is used it must be carefully looked after, as it soon perishes at sea.

Watertight doors in the cockpit bulkheads are usually fitted with-out hinges, but with two cleats on the back, shipping inside the doorway. The door is fitted with a rabbet all round it, which overlaps the doorway and is lined with rubber. The cleats on the back of the door are cut slightly tapering, so as to draw the door tightly into place when it is closed, and the other end of the door is forced against the bulkhead by means of a cam-shaped button or a thumb-screw.

The seats in the cockpit should be fitted to lift up and give access to the side lockers, which are very useful for wraps, fenders, etc. The seats must have a ledge running round the inside of the opening, with a groove in it under the joint to carry off any water which may come through. This water-course is also fitted around skylights and hatchways, etc.

When the bulkheads and doors are finished, the floor should be laid. This is usually of lin. spruce or white pine, on lin. by 2 1/2in. bearers, spaced 1ft. 2in. apart, and resting on the timbers; it should have two middle planks made to take up easily, for access to the keel; they must be cut at least 1/2in. too small all around or they will swell and stick when wet. These two planks should be fastened together with ledges, so as to come up in one piece, and two good-sized finger holes should be bored, one at each end. The rest of the flooring can be screwed down after it has had a coat of paint on the under side.

The whole of the inside of the boat should have been well painted with at least three coats of best oil paint before any inside work is done. The lining, or ceiling, of the cabins should be done with 2in. planks of 3/4in. cedar or pine, and the edges of the planks should have a bevel, so as to form a V-joint, or else a very small bead worked on the lower edge of each.

There is no need to shape these narrow planks unless the boat is very hard in the bilge, and has a lot of curve in the sides of the cabin. In most cases they can be forced into place easily, and nailed to the inside of the timbers with short, copper nails.

The lining should be carried down the side just below the level of the sofa berths, which will be fitted over the lining.

A space for ventilation between the lining and the planking must always be left at the top. Where the shelf does not come up to the level of the deck, as described previously, there is no occasion for any further ventilation; but if, as in many boats, the shelf is carried right up to the deck, then a space for ventilation must be left. This is done either by piercing holes in the upper plank of the lining, or by keeping a space of 1/4in. between it and the under side of the shelf. The former method, if the holes are arranged in ornamental patterns, is the neatest.

The fronts of the sofa berths can be put in in one piece for each side, fastened to cleats screwed to the bulkheads at each end of the cabin and bent to any required curve by struts from each other. The lower edges will have to be fitted to the curve of the boat where a portion of the side shows between them and the sides of the floor at each end of the cabin. This is done in the same way as described for fitting the edge of a plank, except that in this case the whole board is cut off to the correct length, and bent into its place between the bulkheads and pressed down till some part of it touches the side of the boat; this will probably be the forward corner. See that the board is level with the floor of the cabin, and bent to its correct curve, if any, and then take spilings along the lower edge from each timber, starting at the point where the board is furthest from a timber; and taking that distance set off the same distance vertically above each timber on the face of the board. Having set off all the spilings, cut the lower edge to them, remembering to bevel the edge to suit the curve of the boat's side as nearly as possible. When the two boards are correctly fitted to the timbers, skew-nail them to each timber, and screw the ends to the cleats on the bulkheads. If the ends are not fitted against the bulkheads a small frame must be made of two pieces of lin. by 2in. white pine, halved together, one of them vertical and securely fastened to a timber, and the other horizontal and also fastened to the same timber. Both parts are on edge, the horizontal piece giving the width of the berth at that point, and the vertical piece giving the height above the floor, and also being a firm stanchion to fasten the front to. These frames will be required about every 2ft. along each berth, to support the seat, and they may be put in either before or after the fronts are fixed.

The seats or locker tops are usually of lin. white pine, and made in short, movable sections, giving easy access to the lockers below the sofa. The portion of the locker top next the side of the boat must be fitted or scribed in in the same way as the lower edges of the fronts, and when fitted should be screwed down. A strong fillet should be screwed along the inner edge of this fitted piece, and with them, forming a support to the movable pieces of the top, all of which should have large finger holes for lifting.

Teak, mahogany or pitch pine all make good fronts to the berths, and if desired moulding can be fastened with fine nails to the face of the fronts, so as to give the appearance of panels. It should be of some hard-wood, giving a good contrast to the wood of the front, and may be about 1/2in. in thickness.

The front of the sofa berth is usually left about 1 1/2in. above the locker top to prevent the cushions slipping off, and if false framing and panelling are used, a carving of the same hard wood must be worked over the joint along the top.

Sideboards, or cupboards, are usually fitted at one or both ends of the berths, and these must be framed in lin. by 2in. white pine before they have the sides and top fitted. Some prefer a door at the front and shelves inside, while others have a lid only on the top. The former is usually the most convenient, as, if the top has a small ledge or rail around it it is very useful as a shelf, and the interior, being divided with shelves (each with a ledge on the front edge), will hold a lot of small odds and ends of provisions, bottles, etc., all easy to get at.

The sides of this cupboard should be made in the same way as the bulkheads, and the front must have a doorway and a framed door on brass hinges.

Note.—All hinges and locks must be entirely of brass, many so-called brass locks having steel springs and pins, and the hinges also have iron pins, which soon rust.

Any amount of ornament may be put into the mouldings and panelling of the berths and sideboards, etc., and there is always something to do in the winter evenings after the boat is laid up in making odds and ends of racks, book-shelves and other knick-knacks for the cabin. There is no need to go into detail as to these various small items, except to say that a pair of net racks, like those in railway carriages, are always useful, also a set of book-shelves, while a tin chart case and the binoculars may each have a small rack out of the way.

A good eight-day clock and aneroid should always be provided and fixed to the bulkhead. Two or more swing candlesticks will be required, and of course the necessary upholstery and bedding "Pantastote" or "Pegamoid," stuffed with "Kapok," is about the best form of cushion for yacht cabins, as the cushions are not affected by sea water, and are also life buoys, while they look like leather and keep soft.

The other interior fittings should include a double wickless paraffin stove by Fletcher and Phillipson, of Dublin, similar to the annexed sketch, and all the cooking utensils and plates, etc., should be of the best enamelled ware.

A large fresh-water tank should be fitted under the cockpit floor with a pipe and stock-cock in the cabin and a filling pipe and screw plug in the floor of the cockpit. If an ordinary bicycle air pump is fitted in the side of the tank, so that it can be worked from the cabin, a pressure of air can be maintained in the tank, and water may be drawn off at will, even when the tap is above the level of the top of the tank. All that is required is that the draw-off pipe should lead from the bottom of the tank, and that all joints should be airtight, which is easily secured by greasing all the screws well.

Proper lockers and racks should be fitted for the plates, knives and forks, etc., and the cooking utensils; but as every one has his own ideas on these points they are best left to the owner's fancy.

Specification No 1—Dimensions.

- L.O.A.=22ft. 0in.
- L.W.L.=17ft. 0in.
- B.=6ft. 0in.
- D. (hull)=0ft. 8in.
- D. (plate)=4ft. 8in.

Scantlings.

- Keel.—American elm, 8in. sided amidships; 1 1/2in. moulded; tapered at ends, as shown.
- Stem.—English oak, natural crook; 4in. sided at keel; 2 1/4in. sided at deck; 2 3/4in. moulded.
- Stern Knee.—English oak, natural crook; 1 1/2in. sided; 3in. moulded at throat; 1in. moulded at upper end; 1 1/2in. moulded at rudder case; well fastened to keel and transom.
- Transom.—Mahogany, teak or elm, 3/4in. thick.
- Timbers.—American elm, 3/4in. moulded and 3/4in. sided; spaced 5in., center to center. Steamed.
- Floor Timbers.—Oak, 1in. sided, and moulded as follows:
 - No. 1 (from stem). 1 1/2in. on top of keel, tapered to 3/4in. at ends; arms 1ft. from center of keel.
 - No. 2. Same sizes as No. 1, but with 1ft. 3in. arms.
 - No. 3. 1 1/4in. sided and 2 1/2in. moulded on keel.
 - No. 4 (fore end of case, into which it is joggled). 1 1/4in. sided and 3 1/4in. moulded on keel.

Notes.—All lines and measurements taken outside planking. Sections spaced 2ft. apart, No. 1 section being 2ft. from fore side of stem.
 Buttocks.—A is 2ft. 7in. from center line; B is 2ft. from center line, and C is 1ft. 1 1/2in. from center line.
 Water Line.—No. 1 is 6in. above L.W.L.; No. 3 is 4in. below L.W.L.
 Diagonals.—D1 is an angle of 52° with center line; D2 is 36° with center line.

No. 5 (two half floors at side of case). 1in. sided and 3 3/8in. moulded on keel.
 No. 6 (half floors, same as No. 5). 1in. sided and 3 3/8in. moulded on keel.
 No. 7 (half floors, same as Nos. 5 and 6). 1in. sided and 3 3/8in. moulded on keel.
 No. 8 (aft end of case, same as No. 4). 1in. sided and 3 3/8in. moulded on keel.
 No. 9. 1in. sided and 2 1/2in. moulded on keel.
 No. 10. 1in. sided and 1 1/2in. moulded on keel.
 Note.—Nos. 3 to 10 are all flat on top, and form bearers for the floor boards, so that the length of the arms will be regulated by the width of the flooring.
 No. 11. 1in. sided and moulded, with 1ft. 4in. arms, joggled into fore end of rudder case.
 Center Case.—Cedar, pine or mahogany, 3/4in. thick and 1ft. 10in. wide. Stanchions at ends 1in. thick by 1 3/4in. wide, rabbeted into ends of case. Inside width of case and slot 3/4in. Length of slot, 5ft. 1 1/2in. Length of case over all at keel, 5ft. 6in. Length of top of case, 5ft. 4in.
 Sills.—Mahogany, 1in. thick, and moulded to level of tops of floor timbers and curve of keel; the ends of the half-floor timbers are dovetailed into the sills for half their moulded depth.
 Case Knees.—One at each end of case on the floor timbers. These are of 3/4in. sheet steel, 8in. high and 14in. across the lower arms; they are made by cutting the sheet steel 1in. deeper than the finished size of the knee, and bending the extra inch at the bottom at right angles to the rest of the plate, so that it forms a base resting on the floor timber, the end of the case being well screwed to the center of the upright plate of the knee.
 A pair of steel knees to be fitted to take the pin or bolt of the centerplate. They must be fitted over the sills, and should rest on two false floor timbers fitted to the bottom of the boat and level with the top of the keel, so as to form a firm base for the knee to rest on.
 The arms of these knees to be 1ft. long, the upper arms being swelled to take the plate bolt, and well screwed to the case and sills, the lower arms being through-fastened through false floor and planking. These knees should be 1in. by 3/8in. at angle, tapering to 1in. by 3/16in. at ends of arms.
 Planking.—Cedar, mahogany, teak, or Kauri pine, 1/2in. thick, not less than nine planks a side.
 Deck.—Cedar, yellow pine, American spruce or Archangel white pine, 1/2in. thick, tongued and grooved, and covered with painted cotton.
 Inwale or Shelf.—American elm, mahogany or Oregon pine, 2 1/2in. by 1 1/2in. amidships, tapered at ends, fitted flush with under side of deck.
 Beams.—Kauri pine, Oregon pine or oak, 1 3/4in. moulded by 1in. sided; spaced as shown on construction plan.
 Note.—If oak beams are used the scantlings may be reduced to 1 1/2in. by 3/4in.
 The main beam at the mast is sawn or steamed to shape, and is of oak, 1 1/2in. moulded by 5in. sided.
 The beams are only let into the inwales for half their depth, with a dovetail one side only.
 Carlines.—Same material as the inwales, 1 3/4in. by 1 3/4in.
 The filling pieces between the fore end of the carlines and the coamings may be of any light, easily worked wood.
 Knees.—All hanging and lodging knees and the breast hook to be natural oak crooks, 3/4in. thick and of shape shown.
 Coamings.—American elm, 3/4in. thick; of height and shape shown (add thickness of deck and depth of carline to the heights).
 Rudder Case.—Same material as center case, but all scantling to be reduced one-third (3/4in. sides, etc.). All details of fixing similar to center case, except that no knees are used.
 Flooring.—White pine or spruce, 1in. thick. Shaped at edges to side of boat, with at least two places for baling; the remainder to be screwed to floor frames.
 Seats.—Teak or mahogany, 1in. thick, as shown.
 Centerplate.—Galvanized iron or brass, 1/2in. thick to shape shown hung on a 3/4in. bolt of same material as the plate; all edges exposed below the keel to be sharpened. The plate to be lifted by a wire pendant and tackle from the mast. The wire to be 1in. circumference, and the tackle to consist of a 3in. double block, shackled to a plate on the after end of the case, and a 3in. treble block spliced into the end of the wire pendant, the wire pendant to receive through a 4in. sheet brass single block at mast.
 Rudder.—A steel tube, 1 1/4in. outside diameter, for the stem, split to form a fork on each side of the blade, which is 1/2in. steel. Details of head, etc., as shown in previous chapter.
 Spars.—Natural-grown Norway spars of the lengths shown on sail plan, and diameters in proportions given in the chapters on spars.
 Sails.—Stout union silk or cotton; to sail plan.
 Standing Rigging.—Best plow steel wire rope, 3/4in. circumference (one pair shrouds, one forestay and one roller wire).
 Running Rigging.—Main haliard, best flexible steel wire rope, 3/4in. circumference.
 Jib tack, best flexible steel wire rope, 3/4in. circumference.
 Span on gaff or yard, best flexible steel wire rope, 1/2in. circumference.
 Main sheet, 1 1/4in. circumference; best cotton rope.
 Jib sheet, spinnaker guys and toppinglifts, 1in. circumference; best yacht Manila.
 Main haliard whip, peak haliard, and jib tack whip, 1 1/4in. circumference; best four-strand yacht Manila.
 Roller line and clew outhaul on jib, 1in. cable laid flax line.
 Fastenings.—Planking and deck, 1 1/4in. by 14in. gauge; copper nails.
 Floor frames and knees, 12-gauge copper nails of suitable length.
 Plank scarphs, 3/4in. by 16-gauge scarph nails.
 Keel scarphs, etc., 3-16in. copper rod and stout nails.
 Center case, etc., stout brass screws from 4in. to 3/4in.
 Deck and other fittings, as described in previous chapter.

30 shots off-hand in 6 targets of 5 shots each with .22cal. rifles, on the reduced standard American target. The member having the highest total score to receive a gold medal; all other contestants will receive consolation prizes, awarded according to scores made. Contest to be governed by the club's rules for indoor rifle shooting. Tuesday evening Oct. 8, commencing at 7:30; Wednesday, Oct. 9, from 2 P. M. to 10:30 P. M.; Thursday, Oct. 10, from 2 P. M. to 10:30 P. M.
 All Comers' Matches.—Continuous Prize Match—Open to all. Entrance per target of 3 shots each, 35 cents, or 3 targets for \$1. Re-entries unlimited. The best 3 targets of each shooter made during the three days' shooting will count for prizes, of which only one is obtainable by any one competitor. In case of ties the next best single target will count for place. To be shot on the reduced standard American target, having a 1in. bull, with the 7-ring in the black. One hundred dollars in twenty prizes, as follows: First prize, \$20; second, \$15; third, \$10; fourth, \$7; fifth, \$6; sixth, \$5; seventh, \$5; eighth, \$5; ninth, \$4; tenth, \$4; eleventh, \$3; twelfth, \$3; thirteenth, \$2; fourteenth, \$2; fifteenth, \$2; sixteenth, \$2; seventeenth, \$1; eighteenth, \$1; nineteenth, \$1; twentieth, \$1.
 Bullseye Match.—Open to all. A bullseye target, consisting of a 3in. carton, will be used in this match. Entrance, \$1. No re-entries. Each contestant is entitled to 3 shots, the best single shot by machine measurement to count. The winner of this match will receive a handsome and valuable trophy, presented by Huebner & Foerster.
 Any .22cal. rifle having any sights, except telescopic, will be allowed. In the bullseye match, however, to place all shooters on a more equal footing, the size of aperture in front sight must not be larger than that generally used for ordinary target work. A front aperture having a diameter larger than 1/8in. will not be permitted on this target.
 All shooting is off-hand at 18yds. distance, and all shots must cut through the ring to count in the next.
 Shooters are not permitted to place butt of rifle under coat, vest or suspender.
 Targets can be shot on any of the open matches at any time during that prescribed for these matches.
 Rifles and ammunition can be procured at the range if desired.
 As this will be the last tournament to be held in the club's present range, a cordial invitation is extended to all to participate in the same, thus making its success a fitting climax to the many successes achieved by the club in these affairs in the past.

The Savage Arms Company, of Utica, N. Y., have issued a new catalogue, describing and illustrating artistically the various rifles and their furnishings which they manufacture. This catalogue describes their new .22cal. repeater, and announces also that they now manufacture cartridges. The front cover bears a spirited illustration of a mounted Indian, a savage, resplendent in a highly colored costume. The back cover bears a colored illustration of a beautifully engraved Savage rifle. A copy of their catalogue will be sent to him who applies for it.

Trapshooting.

Fixtures.

- Oct. 2-3.—Greensburg, Ind.—Greensburg Gun Club's tournament.
- Oct. 2-4.—Louisville, Ky.—Tournament of the Interstate Association, under the auspices of the Jefferson County Gun Club. Elmer E. Shaner, Mgr.
- Oct. 2-4.—Eau Claire, Wis.—Tournament of the Eau Claire Gun Club; two days targets, one day live birds; \$300 added. E. M. Fish, Sec'y.
- Oct. 2-4.—Louisville, Ky.—Tournament of the Jefferson County Gun Club; two days targets, last day live birds; \$200 cash and trophies added. Emile Pragoff, Sec'y.
- Oct. 3-5.—Reading, Pa.—South End Gun Club's tournament.
- Oct. 5.—Frankford, Pa.—Third Grand tournament of the Frankford Gun Club. Howard George, Ass't Sec'y.
- Oct. 8-11.—Davenport, Ia.—Forester Gun Club's tournament; live birds and targets.
- Oct. 9.—Clyde, O.—Clyde Gun Club's tournament.
- Oct. 9.—Randolph, N. Y.—First amateur tournament of the Randolph Gun Club. Fred L. Sanger, Sec'y.
- Oct. 9-10.—Erie, Pa.—Tournament of the Erie City Rod and Gun Club; \$100 added. A. N. Aitken, Sec'y.
- Oct. 9-10.—Huntington, Ind.—Tournament of the Erie City Gun Club. A. N. Aitken, Sec'y.
- Oct. 9-11.—St. Thomas, Ont.—Tom Donley's fifth annual tournament; live birds and targets.
- Oct. 12.—Wissinoming, Pa.—Grand opening target shoot of the Florists' Gun Club. Open to all. Guaranteed purses and added money. T. C. Brown, Sec'y.
- Oct. 15-16.—Greenville, O.—Regular annual tournament of the Greenville Shotgun Club. H. A. McCaughery, Sec'y.
- Oct. 15-16.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club.
- Oct. 15-17.—Pella, Ia.—Garden City Gun Club's amateur tournament. A. I. Nassaman, Sec'y.
- Oct. 16.—Mt. Sterling, Ill.—Tournament of the Mt. Sterling Gun Club. J. Breidenbend, Sec'y.
- Oct. 16-18.—Baltimore, Md.—Fall tournament of the Baltimore Shooting Association; two days targets; one day live birds. Added money. Open to all.
- Oct. 17-18.—Springfield, Ill.—Fall tournament of the Illinois Gun Club.
- Oct. 22-24.—Raleigh, N. C.—Shoot under auspices of the Raleigh Gun Club. J. G. Ball, Sec'y.
- Oct. 22-24.—Des Moines, Ia.—Amateur handicap shoot.
- Nov. 28.—Cleveland, O.—Shoot of the Cleveland Gun Club.
- Nov. 28-29.—Milwaukee, Wis.—Tournament of the South Side Gun Club.
- Newark, N. J.—South Side Gun Club target shoot, every Saturday afternoon.
- Chicago, Ill.—Garfield Gun Club's live-bird trophy shoots, first and third Saturdays of each month. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

CONTESTS AT INTERSTATE PARK.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice. Café and hotel accommodations.
 Interstate Park, Queens, L. I.—Weekly shoot of the New Urecht Gun Club—Saturdays.

DRIVERS AND TWISTERS.

The Frankford Gun Club, of Philadelphia, announces its third grand tournament, to be held on Oct. 5, on the grounds of the club, at Summerdale Station, Frankford Branch of the Reading Railroad. The main event is a twelve-man team contest for the championship of Philadelphia and vicinity, and is open to all organized gun clubs of that section. Entrance free. Targets 1 cent each. The silver cup, emblematic of said championship, and won by the Frankford Gun Club on May 4, will again be put up, subject to challenge within sixty days after Oct. 5. A club may enter more than one team. There are also twelve sweepstake events on the programme, 10 and 15 targets, entrance 50 and 75 cents, and \$1. Sweepstakes, 10 o'clock A. M.; team race, 1:30 P. M.; entries to the latter close at 2 o'clock. Rosc system, four moneys, govern. Send entries to Howard George, Frankford, Philadelphia, Pa.

Last week, on the grounds of the Florists' Gun Club, of Wissinoming, Philadelphia, the Keystone Shooting League and the Baltimore Shooting Association held a ten-man team contest. The former won by the narrow margin of 839 to 838. Each man shot at 100 targets. The scores in detail were: Keystone Shooting League—Ridge 86, Landis 89, Morris 76, Wolstencroft 88, Winchester 91, Sanford 78, Hallowell 83, Anderson 89, Stevenson 83, Ross 76; total 839. Baltimore Shooting Association—Hood 74, Lupus 80, Dupont 89, Hawkins 84, Malone 87, Baughman 86, German 87, Burroughs 87, Storr 87, Bond 86; total 838.

Mr. John S. Wright is actively engaged in completing all the preliminary arrangements of his live-bird shoot, to be held at Interstate Park, Queens, on the 9th inst. The main event has a knockabout gun for first prize, and all surplus entrance money over its value will be divided into 60 and 40 per cent., for second and third places. The conditions are 10 birds, \$7.50 entrance, birds included. Three preliminaries at 5 and 7 birds are on the programme, two of which are class shooting: one, high guns. Shooting commences about 10 o'clock.

The Idaho Daily Statesman, of Sept. 27 recounts some phenomenal shooting exhibited by Capt. Geo. E. Bartlett, who represents the Peters Cartridge Company. While at Boise City, as a guest of the local gun club, he, with .22cal. cartridges, hit pennies and other small objects thrown in the air, and with his repeating shotgun kept a tomato can in the air by the rapidity of hits till the magazine of his gun was exhausted. In a shoot at 25 targets, in one event, he scored 24 out of 25.

The Randolph Gun Club, of Randolph, N. Y., announces its first amateur tournament and sweepstake shoot, to be held on Oct. 9, on blue rocks, thrown Sergeant system. There are ten events on the programme at 10, 15 and 20 targets, \$1, \$1.50 and \$2 entrance. Moneys divided 40, 30, 20 and 10 per cent. Targets 2 cents, included in entrance. Shooting commences at 9:30 A. M. The management reserves the right to handicap any shooter at any time during the tournament. Mr. Fred L. Sander, Secretary.

The Herald of Sept. 28 published the following: "Cincinnati, O., Friday.—J. A. R. Elliott, of Kansas City, defeated J. C. Brayles, of Birmingham, Ala., to-day at the Cincinnati Gun Club in a 100-live-bird match at 40yds. The match was divided into three parts, two of 25 birds and one of 50 birds. Elliott won the first, killing 23 to Brayles' 19. Brayles won the second, 23 to 19, and Elliott took the third, killing 46 to Brayles' 45. This record was remarkable at the distance."

Mr. Geo. H. Piercy, of Jersey City, N. J., has challenged Dr. W. L. Gardiner, of Orange, to contest for the E. C. cup, emblematic of the target championship of New Jersey, and has fulfilled all the conditions required in that respect. Undoubtedly his challenge will be accepted. The match should be one of great interest. They are both exceedingly strong shooters, and very near alike in class, except at such times as one shoots better than the other.

Mr. Herbert Taylor, of St. Louis, a well-known representative of the Dupont Powder Company, and famous in shooting circles, is a visitor in New York at present. He, with Mr. Edward Banks, was fortunate in witnessing the great race between the Columbia and Shamrock II, on Saturday of last week. It is probable that Mr. Taylor will return to St. Louis the last of this week—all too soon to do justice to the few merits of the effete metropolis.

Mr. E. D. Fulford, of Utica, N. Y., earnest of work, big of heart and a skillful shooter of record, was in New York on Monday of this week, en route from Philadelphia to his home. In the latter hamlet, on the grounds of the Keystone Shooting League, at Holmesburg Junction, he had installed a set of his famous live-bird traps, after the complete manner of detail in use at Interstate Park, Queens, L. I.

At John Wright's shoot, Brooklyn, N. Y., on Saturday of last week, Mr. H. M. Brigham, of the Crescent Athletic Club and New Urecht Gun Club, made a run of 110 targets straight. Mr. J. F. Sharp, of Salt Lake City, Utah, also performed well, making clean scores of 25 several times. Mr. Bob Schneider, of Schoverling, Daly & Gales, broke 49 out of the last 50 he shot at.

The Eau Claire, Wis., Gun Club has actively promoted the interests of its tournament, which will be held on three days, beginning on Wednesday of this week. A feature of the meeting is a match between Mr. E. M. Fish, secretary of the club, and Mr. L. Fulton, of West Superior, Wis., for the H. C. Hirschly live-bird trophy.

We are informed that the final contest for the Republic cup will not in all probability be shot till some date in November. To make the final competition of more interest, it would add to the cup's prestige and associations if some matches were shot for it in the meantime.

Messrs. D. Bradley and R. A. Welch, of the Carteret Gun Club, leave some day next week for northwestern Nebraska, where they purpose to enjoy a period of prairie chicken and sharp-tail grouse shooting. The birds must rise early and far away to escape these redoubtable shooters.

The Fulton Gun Club, whose grounds are on Crescent street, East New York, will hold a shoot on Oct. 6, commencing at 11 o'clock A. M. For further particulars, address Mr. G. R. Schneider, or Albert A. Schoverling, P. O. box 475, New York.

The nine-man team race between the Page team and the Widmann team, 15 live birds per man, for a silver trophy, donated by the Interstate Fair Association, was won by the former. Score, 109 to 108. The race took place at Trenton, N. J., on Sept. 2.

Mr. John E. Thropp, Jr., challenger, defeated W. F. Vanarsdale, the holder of the silver cup, emblematic of the championship of Trenton, N. J., on Sept. 28, on the grounds of the Trenton Shooting Association, by a score of 21 to 20.

For its fall tournament the Baltimore Shooting Association claims the dates Oct. 16, 17 and 18. Of these, two days will be devoted to targets; one to live birds. There will be added money. The tournament will be open to all.

Oct. 9 has been fixed upon for the county championship contest between Messrs. J. R. Farlee and W. F. Vanarsdale, the challengers. Both gentlemen are members of the Trenton, N. J., Shooting Association.

Mr. A. N. Aitken, the secretary, informs us that the Erie City Rod and Gun Club, of Erie, Pa., will hold a tournament on Oct. 9 and 10, at which \$100 in added money will be a feature of the programme.

At the tournament of the Titusville, Pa., Gun Club, on Sept. 20 and 21, Mr. Harry Kirkover won high average, breaking 293 out of 320 targets shot at.

The dates for the amateur handicap shoot, to be held at Des Moines, Ia., are Oct. 22 to 24.

BERNARD WATERS.

Rifle Range and Gallery.

Programme of Iroquois Rifle Club.

THE fourteenth annual tournament of the Iroquois Rifle Club will be held on Oct. 7, 8, 9 and 10.
 The headquarters and indoor rifle range is at 1717 Jane street, Pittsburgh, S. S., Pa.
 The officials of the tournament are: Shooting Masters—O. L. Hertig, A. J. Huebner. Official Scorers—A. F. Hofmeister, B. Kestner. Secretary and Treasurer—J. G. Graul.
 The programme is as follows:
 Monday, Oct. 7.—Members' Match—Open to members only. At the gallery range, commencing at 3 P. M. Each contestant to fire

Two Eyes in Shooting.

THE subjoined article, taken from "Experts on Guns and Shooting," by G. T. Teasdale-Buckell, is of special interest to trapshooters:

Books on shooting, various methods have been given to show how a shooter may find out for himself which eye is the stronger. We do not think any of these are reliable, for this simple reason: We have seen every one of them fail. It does not concern a shooter whether his right or his left eye is the stronger. What he wants to know is whether he constantly uses only one of them for the purpose of alignment. This is most important for him to find out. It is easily discovered, but the strength of the eye, as tested by an oculist, has not always anything to do with the matter. Some people have recommended that a ring or piece of paper with a hole in it should be taken in the hand, and brought into alignment with a spot in the distance; then the eyes should be afterward alternately closed, in order to see which of the two really affected the alignment. This is very well as far as it goes, but there are cases in which the right eye aligns for the right hand, and the left eye for the left hand. These tests fail absolutely then; and the only way is to resort to test with the gun itself. The want of knowledge that it sometimes makes all the difference; which hand brings up the object for aligning is very likely to lead to error when the gun is not used.

We do not think the test reliable, even if a change of hand is made, and all objects prove to come up to align from the same eye. Even then it may turn out that the aligning eye is liable to neglect its duty when it is so situated that it cannot see the object aimed at and the other eye can see it. For this reason, we would suggest the following test, and we have found it unerring, in order to see whether either eye can, in all circumstances, be trusted to do the alignment. A bird passing straight overhead cannot be seen by the eye which aligns the rib and the sight at the moment of firing, because the gun will be in advance of the bird and will hide it from the eye of alignment. To a pair of eyes properly trained for shooting this makes not the smallest difference; strange as it appears to all who have not absolutely tested it, the left eye will bring the right eye (if that is the aligning eye), already aligning the rib and the foresight of the gun, into alignment with the game, or any point in front of the game, that may be desired. The left eye, moreover, will measure the distance in advance, and keep the gun on the true line that the game is traveling, quite as well as if the right eye could see the object of aim itself. An easy test of this is as follows: Get another man to face you four or five feet away, tell him to hold a sheet of paper so that he cannot see your right eye, but can only see your left. His right eye will now see your left; your left eye his right. Now bring up a gun or other object to the right shoulder and aim at his right eye, visible to your left eye only. This you will align perfectly accurately with your right, although that eye cannot see the object of aim, but can only see the gun and do the aligning on your side of the paper, while the left eye carries on the process on the other side of the obstruction. Ask your assistant now, without moving his head, to shut his left eye and to remove the paper, and to see whether the object you aim with is in fact exactly upon the center of your right eye—that is, in a line between the right eyes of both. It will be so with any one whose eyes are in the habit of right aligning with both eyes open, and if it should not be so then it is a hundred to one that the left eye does more than its share of work in alignment in the field, and a cure is required. All this kind of correcting work ought to be forthcoming at the shooting schools.

Put shortly, you must learn to accurately align with the right eye that which you can only see with the left. But in the field you have to do much more than this; you have to align with the right eye an imaginary point in front of game that you cannot see with that eye; and this is much more difficult to those unaccustomed to it, and impossible for a one-eyed shooter. You not only have to find that line of sight with the left eye for the use of the right eye, but to keep the foresight in a direct line between the right eye and the line of flight of the game, as well as to measure the distance in front for the right eye to point the gun, and all with the left eye. To a non-shooter it looks impossible on the face of it. To many a good shot who has done it unconsciously every time for twenty years, it has come as news; but to those who have made the theory of shooting, as well as the practice, a thorough study, it must be a commonplace, we imagine.

We should add, for the benefit of those who wish to try the experiment, that, as in all shooting, in order to succeed, the shooter must not look for his sight, but focus the object at which he intends to aim. If he once focuses his sight, the sensation of seeing the game through the gun disappears as if by magic. He must bring his foresight and rib, or the pointer he uses for the experiment, up to intercept his apparent line of sight from the right eye to the object of aim. As we have indicated, there can be no such visible line of sight when the gun is in advance of the coming game, or pointing over the mark on the target, but it appears to be there, and we have to believe the appearance, for whatever the explanation may be, the left eye does, as a matter of fact, assist the right eye to this extraordinary extent.

Here the unconscious work of the left eye comes to the aid of the shooter, who without an analysis would not know that the right eye was incapable of all the work that it appears to be doing. There be those who maintain that a similar action, one to the shooter's detriment, is impossible—that as long as the right eye is in line with the false breach at the rib and the foresight, an unconscious placing of the foresight by the left eye between it and the point of aim is impossible. Having the best of reason to believe that we have done this upon occasion, we cannot agree. Indeed, the proof of the possibility of it is much more easy to understand than the converse where the left eye aligns correctly the foresight for the right eye, and does so whether or not the bead is visible to the left eye.

We never fail while experimenting to align with the right eye just over an object only visible to the left eye, as long as it is only practice. We find we cannot trick ourselves into going wrong, and yet, certain we are that upon occasion, in actual work, looking between the triggers, we have seen our game apparently aligned with the foresight, and yet the left eye has put the foresight on the object between itself and the game—not between the right eye and the game. We believe that the occasions when this has happened have been when the gun has been brought up so awkwardly that the foresight has been under the level of the false breach and the eye, and therefore invisible to the right eye, but clearly seen by the left. Certain it is that it is not difficult to deceive one's own optical intelligence intentionally by bringing up the false breach in this way—align it with an object, then by shutting the right eye, without moving the head from its position of alignment, the foresight can be brought to bear on an object between it and the left eye; and then when the right eye is opened again, the optical illusion, said to be impossible, becomes apparent. This is an aim that will send the shot many feet away to the left of the intended mark.

Probably only accident or ill-health would make a man trained to align with his right eye do such a curious thing as that above described; but the case is quite different with untrained eyes. It is in fact a very frequent fault.

A cure for it was attempted some years ago by a Mr. Gilbert. This consisted of a sight extended down the rib so as to have no bead-like appearance to the left eye, but to resemble a line to that optic; whereas to the right eye it appeared like an ordinary sight. It was a good idea badly explained, and carried out clumsily. Later on Mr. Gilbert designed a guard that screwed on to the left barrel for the purpose of obstructing the sight of the game and the foresight from the left eye. This appears to us to have been exactly what was not wanted.

As we have already explained, the shooting from the left eye and shoulder is preferable to the partial loss of sight of the game you wish to kill, and if the latter, as well as the foresight is to be blocked out from the sight of the left eye, then the object of keeping the left eye open at all when shooting from the right shoulder is absolutely gone. The thumb stall, or a modification of the first Gilbert sight, having an ivory bead, the latter protected from the sight of the left eye by a black metal elongation on the left of the center of the rib, are the two best methods of preventing the left eye occasionally doing injury to right alignment.

It is obvious that for a left alignment the reverse of these arrangements will prevent the right eye from unduly interfering. There is, however, a very much more frequent cause of missing than this undue use of the wrong eye. We mean that accuracy of aim is well nigh impossible when both eyes are open, unless there is something at the breach end to indicate which is the exact middle of the rib. Flat ribs are excellent, provided there is the indication we speak of; but it is usually absent. Moreover, the breach of a gun comes so near to the eye that it is never as distinctly visible when the game is focused as the foresight is. It makes a very great deal of difference, ten inches or a foot at forty yards, whether the sight has been taken due down the center of the rib or from one corner of it. It used to be the practice of gun makers to let into the false breach a strip of gold or silver, showing the center; but this seems to have gone out. The best position for any such indicator is not near the false breach, but where the back sight of a rifle is put. There it is much more in the focus,

and much more apparent to eyes that are not, and should not be, searching for it.

We do not mean that any sort of rifle back sight should be used, for the shape of the rib can always be made to indicate the middle, provided an absolutely flat rib, extended all the way to the false breach, is not insisted upon. We have sometimes, in the muzzle-loading days particularly, heard good shots profess a liking for guns without ribs, "so that you can look down a regular ribs at them," said one of them. That was all right, but the external shape of guns was so different. Now they are so much wider in the false breach that, with the eye low enough to align between barrels without a rib, there are some shots that would have to be taken with the game out of sight from either eye. Thus, in making several feet or yards allowance for a bird going to the left, the right false breach would block out the sight of the game from the right eye, and the barrels would obstruct the sight of the left, unless the head were thrown over to make the left eye higher than the right. Even then, if the bird were rising, as well as quartering to the left, there would be a total loss of the sight of it.

ON LONG ISLAND.

Brooklyn Gun Club.

Brooklyn, L. I.—Mr. John Wright, the manager, held one of his old-time mercurial shoots on Saturday of last week, and there was quite a good attendance.

The main event was a handicap at 50 targets for a leather shell case. The conditions of this event were \$1 entrance, targets extra. The scores follow:

Table with columns: Name, Broke, Hdcp., Total. Lists scores for various shooters like Sharp, Brigham, Blauvelt, etc.

Table with columns: Name, Broke, Hdcp., Total. Lists scores for tie shot off, 25 targets.

Table with columns: Name, Broke, Hdcp., Total. Lists scores for second tie, 25 targets.

Table with columns: Name, Broke, Hdcp., Total. Lists scores for match, Brigham vs. Schneider.

Table with columns: Name, Broke, Hdcp., Total. Lists scores for sweepstakes.

IN NEW JERSEY.

Page Team vs. Widmann Team.

Trenton, N. J., Sept. 27.—About 1,000 witnessed the match between the two teams whose scores are appended. Excitement ran high at the finish, it being such a close race. Then all depended on Harper killing his last bird; he failed, although the bird dropped dead out just back of the score, making the Page team winners by 1 bird. The conditions were 15 live birds per man. The prize was a silver trophy. The last two rounds were shot in darkness. W. B. Widmann was manager:

Table with columns: Name, Score. Lists scores for Page Team and Widmann Team.

Table with columns: Name, Score. Lists scores for first event, miss-and-out.

Table with columns: Name, Score. Lists scores for second event, 5 birds, \$5 entrance.

East Side Gun Club.

Newark, N. J., Sept. 26.—The opening shoot of the season on live birds, held to-day, by the East Side Gun Club, had a light attendance. The best shooting was done by Mr. G. H. Piercy, who was one of the two scratch men. The scores follow:

Table with columns: Name, Score. Lists scores for G. H. Piercy, Dr. G. Hudson, etc.

Trenton Shooting Association.

Trenton, N. J., Sept. 28.—The handsome silver cup, emblematic of the championship of Trenton, was won to-day by member John E. Thropp, Jr. Vanarsdale, the holder, tried hard to retain it, but unfortunately for his chances he started off by missing 3 targets straight, finishing with 20—1 behind the winner, who shot a steady race from start to finish.

To Vanarsdale, however, belongs the credit of making the best average for the day, with Thropp a close second. Several amusing things occurred during the shooting, one of which was the scoring by a nervous visitor during a team race in getting the men mixed and scoring goose eggs to those who were congratulating themselves that they were doing good work for their side. When they looked at the score sheet after finishing out there was trouble, with capital letters, for that score keeper, and he promptly threw up his engagement. The next event of importance that is marked for our grounds

is the contest for the \$50 silver trophy, representing the county championship, between Farlee, holder, and W. F. Vanarsdale, challenger, the date being set for Oct. 9. The men are pretty evenly matched and have been aching to get together for some time. Neither side is offering odds, and it is generally conceded that it will be a tight race.

Billy Widmann and his newly invented electric live-bird traps scored a great success at the shoot. The traps proved to be the fastest ever shot over, and they attracted a great deal of attention from the shooting men present. I am trying to get him to donate a set to our grounds for use during the winter season.

Table with columns: Name, Score. Lists scores for various shooters like Wilkes, J. Thropp, etc.

Events 1 to 5, sweepstakes. Event 6, team race. Event 7, sweepstake. Event 8, city championship cup. Event 9, sweepstake. G. N. T.

West Branch Rod and Gun Club.

WILLIAMSPORT, Pa.—Herewith please find scores made at the West Branch Rod and Gun Club's first annual two-day tournament, Sept. 20 and 21. The weather was fine, and we had over fifty shooters from all over the State. One feature was the team shoot for the championship of Central Pennsylvania.

Mr. J. S. Fanning and Mr. C. C. Gerow were here, and convinced some of the boys that Laffin & Rand was good powder. Mr. B. Leroy Woodard showed that Dupont would break a few. We think all had a pleasant time, and hope to do better by them next year.

Championship of Central Pennsylvania, team shoot, 25 targets: West Branch Team No. 1—Lettan 21, Everett 22, Dimick 22, Shibe 23, Pitt 16; total 104.

West Branch Team No. 2—Johnston 20, Talley 21, Piatt 19, P. Flock 14, Poulliott 17; total 91.

Clarence Team—Uzzle 14, Chambers 22, Watson 19, Haines 20, Crissman 12; total 87.

Roaring Branch Team—Sheddins 18, Eversole 17, Brainard 20, Casselberry 14, Lusk 16; total 85.

Ralston Team—Bailey 20, Brand 14, Beach 19, Farrington 13, Kent 20; total 86.

Table with columns: Name, Score. Lists scores for various shooters like Events, Targets, Fanning, etc.

Sept. 21.—Sweepstakes:

Table with columns: Name, Score. Lists scores for various shooters like Events, Targets, Fanning, etc.

Nonpareil Gun Club.

CHICAGO, Ill., Sept. 28.—At Watson's Park to-day the Nonpareil Gun Club held a shoot in which seven members participated. Messrs. S. Palmer and J. B. Barto tied on 15 straight. In the shoot-off Barto killed 6 straight and won first. Palmer missed his sixth and took second. G. Roll was third on a score of 14:

Table with columns: Name, Score. Lists scores for Dr. Shaw, G. Roll, etc.

Ties on 15: Palmer 2212221-9 Barto 2212221*-8 Ties on 29 for quarterly high average: Barto 12112-6 Palmer 21212*-5 Palmer wins first quarterly money, Barto second and E. S. Graham third.

Miss-and-outs, \$5, birds extra:

Table with columns: Name, Score. Lists scores for various shooters like Shaw, Palmer, etc.

Pawtuxet Gun Club.

PAWTUXET, R. I., Sept. 20.—The Pawtuxet Gun Club held its closing shoot of the season. The scores follow, 25 targets, unknown:

Table with columns: Name, Score. Lists scores for various shooters like Corey, Wheelwright, etc.

Titusville Gun Club.

TITUSVILLE, Pa., Sept. 23.—The Titusville Gun Club held a very successful tournament on Sept. 20-21. It was a grand success in every sense of the word. The following clubs were liberally represented: Oil City, Tionesta, Olean, Kane, Cambridge Springs, Greenville, Fredonia and Pittsburg—and a warm crowd these representatives proved themselves to be. H. Kirkover carried off the high average for the complete programme, incidentally \$35 of the \$25 donated by the club. J. T. Atkin was second high, and of course lugged off the remaining \$10. There was a slight breeze blowing the first day, facing the shooters at the score, causing the targets to take not only unknown but unheard-of angles, which accounts for no one getting into the 90s on that day. H. Kirkover, L. B. Fleming, Chlay, J. T. Atkinson, B. H. Clinker, W. W. Kellogg, F. S. Bates, J. R. Hull, Alexander, and E. W. Jordan shot 80 per cent. and better, which is equivalent to 90 per cent. and better under ordinary conditions. On the second day there was an absence of the wind, and the scores improved accordingly. Notable among the day's shooting was the work done by R. C. Lay, 90 per cent.; Mr. Loomis, 98 per cent.; H. Kirkover, 89 per cent.; Alexander, 89 per cent.; Atkinson, 88 per cent.; Bates, 86 per cent.; Fleming, 87 per cent. Scores follow:

Sept. 20, First Day.

Table with columns: Events, Targets, Names (Jordan, Norton, Crozier, etc.), Shot, Broke, Av. Scores for Sept. 20, First Day.

Sept. 21, Second Day.

Table with columns: Events, Targets, Names (Jordan, Norton, Crozier, etc.), Shot, Broke, Av. Scores for Sept. 21, Second Day.

Summary; each man shot at 330 targets: Jordan, Bates, Alexander, Colville, Atkinson, Fleming. Includes Broke and Av. columns.

Notes on the Tournament.

The grounds of the Titusville Gun Club are beautifully situated on the Hydetown road, beside the electric car line, about one mile from the city limits. They have a good background, two-thirds sky, remainder shrubbery; still the conditions are such as to tax the skill of the shooters to the utmost to find the targets. Those visitors who arrived on the 19th to take advantage of a little preliminary practice were entertained that evening by the Elks, who very generously offered their parlors for that purpose. On the evening of the 20th the local club entertained at a smoker at the G. A. R. Hall, where the company was favored with piano music by Mr. F. Theobald, and songs by the male quartette, comprised of Mr. F. S. Fleury, A. J. Fleury, S. F. Foster, E. J. Vinapole. On Sunday evening, W. L. Colville entertained a number of the local club at the Mansion House parlors, with a very interesting discourse on powders and projectiles. Alexander, of Greenville, was a very welcome visitor, and proved to the satisfaction of all that he is a whole club by himself. Although feeling somewhat indisposed the first day, his scores were among the best; and the second day he showed himself capable of taking care of his share of targets in any company. J. T. Atkinson, as well as L. B. Fleming and H. Kirkover, went to work on the "little saucers" as though it were their regular business; but the very best shooting can be credited to Mr. Loomis and R. C. Lay, of Oil City, from whom it seemed impossible for a target to escape. Taken as a whole, it would be hard to collect a crowd of better shots, truer sportsmen, and all-round good fellows, than those in attendance at the Titusville Gun Club's first annual tournament, and we trust that they will be with us to a man and bring their friends next year. E. C.

WESTERN TRAPS.

Mt. Sterling Shoot.

CHICAGO, Ill., Sept. 28.—The sixth annual target tournament of the Mt. Sterling Gun Club, of Illinois, will be held Oct. 16; \$25 average money; 200 targets in the programme; \$5 to the lowest gun; no one barred. In the afternoon there will be a team shoot between Quincy and Mt. Sterling. J. Breidenbend is secretary, and the shoot promises to be a pleasant one. E. H.

Peters Cartridge Company Tournament at Carthage.

CARTHAGE, Mo., Sept. 20.—The two days' tournament given here by the Peters Cartridge Company, under the auspices of the Carthage Gun Club, closed to-night, and was a success in every way. A diamond medal and \$150 were added by the Peters Cartridge Company. The diamond medal was won by Calhoun for high average. The tournament was under the management of Mr. Tom Norton. This was guarantee enough that everything would go off smoothly. Tom is a hustler, and allowed no lag in getting the shooters up to the score. Two sets of traps were used, a magatrap and a set of expert electric pull traps. Sergeant system. About 13,000 targets were thrown. A light rain interfered somewhat on Thursday, but all events were shot out by 5 o'clock. All the boys will welcome the Peters Cartridge Company in their next shoot in this vicinity.

First Day, Sept. 19.

Table with columns: Events, Targets, Names (O'Brien, Wernecke, Williams, etc.), Shot, Broke, Av. Scores for First Day, Sept. 19.

Second Day, Sept. 20.

Table with columns: Events, Targets, Names (O'Brien, Wernecke, Hodges, etc.), Shot, Broke, Av. Scores for Second Day, Sept. 20.

Remington Gun Club.

LIION, N. Y.—The Remington Gun Club gave its third annual shoot recently. Despite the weather, a goodly number of shooters from out of town assembled, and a very enjoyable time followed. The home shooters captured the greater number of prizes, as will be seen by the following scores:

Table with columns: Events, Targets, Names (Tomlinson, Dally, Borgart, etc.), Shot, Broke, Av. Scores for Remington Gun Club.

Mississippi Valley Notes.

Editor Forest and Stream: Will you kindly decide the following question, which the writer had to contend with in a recent Western tournament: A miss-and-out is proposed, 50 cents entrance, winner to pay for birds. Four men enter, and agree to allow two re-entries to each man. A starts out and kills straight up to the eighth bird. B kills to third, misses, re-enters and kills to fifth; again re-enters and shoots clean score to the eighth. C misses first, re-enters, kills to fourth; re-enters and kills to sixth, where he misses and is out. D misses first, re-enters, kills four, loses, re-enters and kills up to eighth. A, B and D being left in the race, all miss the ninth bird. Referee decides that, all having missed, contestants are on equal footing, and must continue. They do so, when A and B each lose the tenth bird; D kills, and referee decides B is out for good, having lost his third chance, but that A has two chances to shoot up to D, as he now stands. A protests that this is unfair, and thinks he should have won on the ninth round. However, he finally agrees to shoot up, misses, and D gets the money. The referee's decision is justified thus: Each man represents three separate scores, and losing one has the right to take up the others consecutively, the four men thus representing twelve entries, provided contestants want to carry them through. Therefore when A and B missed tenth bird B was out, having failed on his final score, D had lost two scores, but had with his third chance defeated A on his first. He therefore won with reference to A's first score, but the latter still had two chances to shoot up, and if he had killed either clean up to the ninth, where all missed before,

he would have won. The matter was finally settled on this basis but A was to the last of the opinion that the question was decided prejudicially to his interests and his rights in the race. Which view is correct? It has been a matter of much comment in the shooting world that in many matches arranged since the late international contest on the American-English plan; that is to say, between teams of individuals with the use of one barrel against two, the one-barreled side representing the American team has always won. This is no longer true. At the recent tournament of the Piasa Gun Club at Alton, Ill., a match was arranged on this plan at 15 targets per man, the American idea being championed by W. R. Crosby, Tom Marshall and Guy Burnside, while T. G. Hall, H. W. Cadwallader, and F. C. Richl took the English side. The two-barrel men user their second nine times, and scored 44 out of a possible 45. The other side went out with 38 kills, losing by 6 birds. This, of course signifies nothing, but the fact may be worth recording all the same.

KILLMORE.

[The referee's decision was strictly according to the terms of the competition, and therefore was correct.]

Ossining Gun Club.

OSSINING, N. Y.—Herewith find scores made at the Ossining Gun Club clam bake, Sept. 25. The clam bake, being the second of the season, was not as well attended as could be wished; but those who came, from a gastronomic standpoint, had nothing to wish for. Mr. Gerow, of the Laffin & Rand Company, represented the trade. He was glad to see his powder take high average in the hands of Mr. Betti, of Mt. Kisco:

Table with columns: Events, Targets, Names (A. Betti, J. Carpenter, J. Read, etc.), Shot, Broke, Av. Scores for Ossining Gun Club.

Scores made by the Ossining Gun Club's shoot, Sept. 28:

Table with columns: Events, Targets, Names (A. Burns, C. Blandford, C. Case, etc.), Shot, Broke, Av. Scores for Ossining Gun Club's shoot, Sept. 28.

Hamilton Gun Club.

HAMILTON, Ont.—At the annual meeting of the Hamilton Gun Club, which was held recently, the following gentlemen were elected to office: Thos. Kipton, President; M. Fletcher, Vice-President; Geo. Crawford, Secretary; Executive Committee, Dr. Overholt, Chas. Byger and Dr. Hunt.

It was decided that the twelfth annual tournament of the Hamilton Gun Club should be held on Jan. 14, 15, 16 and 17, 1902, and we beg that you will place these dates to our credit among your trap fixtures.

The Hamilton Gun Club tournament has always been noted as one of the most successful of the annual live-bird meetings; its prosperity and permanence are all we need ask our friends to consider when making up their minds to visit us in January next.

Our twelfth annual must not be confounded with the second annual tournament of the Dominion Trapshooting and Game Protective Association, which will be held on our grounds during the summer of 1902, on dates to be chosen by the Association, whose annual tournament will be an artificial target meet. We are already making active preparations to insure the comfort of all shooters visiting us. BEN. IT.

The Montpelier Shoot.

CHAMPLAIN, N. Y., Sept. 25.—Editor Forest and Stream: I observe in FOREST AND STREAM, under date of Sept. 21, a notice of a recent tournament held at Montpelier, Vt., written by Dick Swivelmer, who states that "The attendance at this shoot included men from Champlain, Swanton, Rouse's Point and Barre, and in event No. 9 teams made up from the above places competed for a silver trophy, which was won by the Robin Hood men from Swanton, they using for the most part Robin Hood ammunition; the other teams used E. C. L. & R., and Dupont."

I am bound to say that the account of this shoot is misleading in the extreme, as we have an enthusiastic gun club here of twenty-eight members, and with the exception of one man we all use Robin Hood powder. I am authority for saying that all of the Robin Hood team used only Robin Hood powder, loaded in Robin Hood shells, and four out of five of our team employed the same ammunition at Montpelier. WM. FRASER, Pres. Champlain Gun Club.

Answers to Correspondents.

No notice taken of anonymous communications.

C. M. S., Dunbarton, N. H.—What is the best material of which to make a heavy shooting coat, to be used in cold weather when still-hunting deer or larger game? Is the cloth used by the English Army in South Africa (kalki or some such name) suitable winter heavy lining? Is it waterproof and soft, or more like canvas? Where could I get a sample of the same? Heretofore I have used Irish frieze, which is said to be waterproof, and which I found was to a certain extent. Ans. This is largely a matter of taste, and one man may speak very highly of the material that would be condemned by another. We should not recommend kalki, or canvas or any form, on the ground that it is noisy. We should be disposed to recommend Irish frieze, which you say you have used, or macinaw cloth, which comes pretty near being blanketing. Any tailor can get you a sample of kalki.

PUBLISHERS' DEPARTMENT.

National Encampment, Union Veteran Legion, at Gettysburg, Pa.

REDUCED RATES VIA THE PENNSYLVANIA RAILROAD.

ON account of the National Encampment, Union Veteran Legion, at Gettysburg, Pa., Oct. 9 to 11, the Pennsylvania Railroad Company will sell excursion tickets at the rate of one fare for the round trip from all points on its line to Gettysburg. Tickets to be sold and good going Oct. 6, 7, 8, 9 and 10, returning, to Oct. 15, inclusive.—Adv.

ILLUSTRATION SUPPLEMENTS.

We give to-day the first picture in a new series of the illustration supplements which have come to be a feature of the FOREST AND STREAM. "First Around the Home Mark" is a spirited yachting scene, which goes happily with the illustrations of the America's Cup races. Other supplements of the series will be printed:

Nov. 2.—"The Start." A field scene by Edm. H. Osthaus.

Dec. 7.—Mr. and Mrs. Bob White. A portrait of the quail by Edwin Sheppard.

IN CONDITION AND OUT.

THE value of physical exercise is in a general way fully appreciated by all, in so far as it concerns the best health, strength and beauty of the human body, and thereto the best workings of the human mind. Sportsmen, in particular, are sensible of its beneficence.

Any form of diversion which brings the bodily and mental forces into pleasing activity, in a new form and a new environment, differing from those of the regular workaday life, contribute to the recreation and restoration of mind and body.

However different may be the forms of sport, one from another, their good effects to man are alike in kind. Thus, whether one fishes for the alert and cunning trout, casting the fly diligently and deftly to every conceivable point of which line, rod and wrist are capable, or whether one walks sturdily over hill and through valley with gun and dog, or whether one sniffs the bracing sea air from the deck of a yacht, the benefits to the individual are the same—that is to say, diversion of mind into pleasant channels, and exercise of body to its general benefit.

But the average sportsman, he who may be classed as belonging to that large, earnest and desirable group called amateurs, takes his exercise, in practice, in an extremely intermittent way. As a rule, by him sport and business are kept sharply distinct both as to time and practice. When outing time comes there is an unearthing of rods or guns, and when vacation time ends, there is a hurried storing away of them till they are needed again. The two times generally are months apart. There thus is an abrupt transition from business to pleasure, and vice versa.

For this reason, at the commencement of an outing which imposes physical exercise, there is a general loss of skill and physical condition. In the commencement of his outing, the sportsman finds that he is awkward of body, slow of eye and unready in mind. About the time that he has, in his practical work, trained his hand, eye and mind so that rod and fly are manipulated deftly as he desires, or the gun swings promptly as eye, trigger finger and hand work harmoniously in the common purpose to kill the bird, the outing is ended. Starting in thus with a depreciation of skill, there is the added hardship consequent to the unprepared condition of the body for extra effort.

The average sportsman follows a business routine much alike day in and day out from one outing to the next. He takes no preparatory exercise to condition him for the active and prolonged efforts on stream or in field. The consequence is that, in the first few days, whether he walks through field or forest, or fishes from bank or boat, or rides horseback, his muscles are sore, and his efforts for some days thereafter entail much discomfort of body or actual suffering, according to the degree of soreness and weariness. Coincidentally there is a lack of skill to disappoint or disgust him. All the weariness, soreness and loss of skill could in a large measure be guarded against by keeping up physical exercise during the business season.

By daily exercise the dexterity of the hand is maintained, the muscles are kept in condition for prolonged effort, and the eye and mind are kept keen and alert in their decisive judgments. There is thus a general ability of the powers of mind and body to work in part or in whole, as the circumstances may require.

Particularly true is this of the sportsmen who have arrived in the middle years of life and who, when inactive, are prone to accumulate weight.

He whose girth is greater than his shoulder measurement, begins his outing with pains and discomfort that

would end his sport were not the love of it, to him, greater than the fear of pain. It is unwise thus to make business and exercise so distinct and separate. If during the season of business, the sportsman would ride awheel daily, or practice regularly with dumb bells or clubs, or take long walks, or row, swim, shoot at the traps, etc., the benefits of exercise, to mind and body, would then be constant, the beginning of the outing season would be a season of pleasure instead of one of bodily weariness and pain, and when a man reached middle life, he would not need any pretexts for quitting his favorite sport.

DREDGE AND DYKE.

IN his report on "Sea Coast Marshes of the United States," one of the special reports of the U. S. Geological Survey, Prof. N. S. Shaler estimated that the total reclaimable area of marsh between New York and Portland, Me., probably exceeds 200,000 acres; that the money value of the lands when reclaimed would be \$40,000,000, and that the cost of reclamation would not exceed a fifth of that sum. This means that the lands would be converted from marsh wastes into truck and farm lands. It is a commercial proposition. Lands which will yield a large financial return upon the cost of conversion will not permanently be left to lie idle. And this means that shooting grounds which have been hunted over by generations of American sportsmen will be closed to the gunner of the future. It is a process which has been going on from the beginning all along the Atlantic coast and inland. Some of the most famous shooting grounds of this country, such as the Drowned Lands of New Jersey, have yielded to the dredgers and drainers. There is one comforting thought, however, for the shooter who would not see the wild lands subdued wholly to the dominion of the man with the hoe: Prof. Shaler's estimate of 200,000 acres of reclaimable lands does not include all the shore shooting grounds. After engineers shall have rescued all they can there will still remain many square miles of territory which will defy their skill and remain for generations a field for sport.

THE APPALACHIAN NATIONAL PARK.

THE proposed establishment of the Appalachian National Park, as has been stated in these columns, includes the purchase and setting aside of a mountain area in North Carolina, eastern Tennessee, northern Georgia and northern South Carolina. The two chief considerations upon which the Appalachian Park is asked for are (1) that the preservation of the forests which now cover the mountain area is absolutely essential to maintenance of the water supply for the southeastern United States; (2) that the Great Smokies and the Blue Ridge make up one of the most popular health resorts in the country, and the conditions now giving the region this character should be perpetuated for the benefit of the people of the country at large. On the other hand, there are no insuperable obstacles, no serious complications, no grave objections to the plan. All the several States interested have, through their Legislatures and other authorized representatives, expressed not only their consent to the assumption of control of the proposed forest reserve by the National Government, but they have urged Congress to act in the matter. The timber lands may, for the most part, be acquired for the purpose on reasonable terms, and in the case of particular lands not otherwise to be secured the right of eminent domain may be exercised.

During the last session, President McKinley sent a special message to Congress, recommending its favorable consideration of the report of the Secretary of Agriculture on the park project; and Senator Pritchard introduced a bill to appropriate \$5,000,000 for the purchase of the lands. This bill was favorably reported back to the Senate by the Committee on Agriculture and Forest Reservations, but, like many another measure in both houses of Congress, it failed to receive attention in the closing days of the session.

The Appalachian Park scheme is, therefore, in the position of a national undertaking which is without active opposition and requires for its execution only the attention of Congress. This, we believe, may best be secured for it by following the suggestion of Senator Pritchard, that all the enlightened friends of the plan should make it

their duty to communicate with their Senators and Congressmen, in order that when Congress next assembles and the subject shall come before it, the members may be cognizant of the wide public interest felt in the park, and may therefore be all the more ready to take up the matter and put the plan into execution.

MORE ON AN OLD TOPIC.

THE treatment the gunner from town receives in the country depends very largely upon the gunner himself.

The first rule to assure friendly relations and a pleasant time is a recognition of the rights of the landowner upon whose territory the game is found. If the game is worth having, it is worth asking for.

A half-dollar in silver will go further than much vociferous and lurid argumentation and expostulation.

It does not always work successfully to stand too stubbornly upon one's right to shoot, whether or no.

If shooting privileges were arranged for on the same business basis that is usual when one is negotiating a dinner or a lodging for the night, we should hear less of the irreconcilable conflict between the sportsman and the farmer.

SNAP SHOTS.

The charming sketches of Samoan outdoor life written by Mrs. Llewella Pierce Churchill have been among the popular things published in FOREST AND STREAM, and we have had frequent inquiries for them in a more permanent form. It is a pleasure to know that a selected number of these papers are to be included in a volume which Mrs. Churchill is preparing for the press, and whose title, "Samoa Uma," in English "All Samoa," is significant of its comprehensive scope. It might also be called the real Samoa. Like every other people on the face of the earth, the Samoans are interesting to others only if the barriers of reserve have been broken through, so that they may be seen and described truthfully as they are. Mrs. Churchill enjoyed unusual opportunities to study the real Samoa during the years when her husband, William Churchill, was our consul there, and as her FOREST AND STREAM contributions have abundantly demonstrated, she has a vivacious and graphic way of describing what she sees. The book will have an added interest because of the fact that over the picturesque islanders here described the flag of the United States now floats. The new volume will issue from the press of the Forest and Stream Publishing Company.

The two notes from two Canadian fishing overseers, respecting the non-resident angling license, demonstrate the ambiguity of the text of the law. Mr. Wood, of Ontario, tells us that the term "temporarily domiciled" is interpreted in that Province as covering visitors who are boarders and who employ local guides and boatmen. This is precisely the interpretation that had formerly prevailed in Nova Scotia; in that Province the practice, in some localities at least, had been to regard visiting anglers lodging in Canada and employing Canadians as exempt from the license requirement; and it was in the sudden change of a new interpretation and a new practice that the injustice lay. Clearly, a regulation which is susceptible of so widely varying interpretation, and which may all of a sudden be resorted to for the imposition of such treatment as that accorded to Mr. Townsend, is not in keeping with the rest of the Canadian fish and game code, which is lucid and readily understood. We repeat what we have said before, that if the Canadian Provinces elect to tax American sportsmen, that is for them to say; but if the intention is to exact a tax, the requirement should be expressed in plain English, to the end that injustice may not be done to the non-resident who is sincerely intent upon complying with all the requirements.

Mr. James Dickson, Ontario Land Surveyor, has written an interesting monograph on the "Game Fields of Ontario," in which he describes the game resources of the Province and discusses in an intelligent way measures for their conservation. He writes from a wide experience, and a careful study of the subject, and has contributed a really valuable paper to the literature of game protection. We quote in our shooting columns his discussion of the settler's plea that he should be permitted to kill game the year around.

The Sportsman Tourist.

Paths.

I do not speak of paths in any metaphorical way, nor do I intend to branch off into a homily after the introduction is dispatched, for I detest that method; it is so underhanded. I mean to speak of genuine, bona fide paths, such as one is sure to meet when out for a stroll. Almost without exception, the paths in a town are hard, matter-of-fact affairs, and very obviously short cuts; but these same short cuts in the country are quite different. They branch off from the main road with the idea that they are going to show you a shorter way, and at the same time take you away from the sordid road that every one travels. Man, by the aid of the power that distinguishes him from animals, concludes that this path will enable him to gain time. Let him try it and see the results. A straight line is not always the shortest distance between two points. Once entered upon that path, he slackens his speed, and draws a long breath of thankfulness for having escaped the highway. Here the birds do not make him feel embarrassed by stopping their conversation when he draws near, but, instead, they send cheerful messages to each other and sing snatches of dainty arias in such an informal way that he at once feels as if he were one of them. A comfortable spot beside the path invites him in such a hospitable manner that he accepts with pleasure, and then all is lost—that is, all hopes of making quick time by this short cut. Now he can hear the trees talk in their graceful way, and he listens to their low, musical voices, until a bright leaf floats down beside him, and a moving branch betrays the flight of the afternoon.

I met a path of this type the other day, and we immediately became friends. It was a large path, and gave the passer-by the idea that it was a road leading to some gravel pit further in; but appearances are the last things by which to judge paths. This particular one ran in only a few rods, then turned and went parallel to the main road and ended—yes, in the same highway, and not a great distance beyond the other entrance. Of course this was deceit, but it was necessary, if the path was to succeed in its purpose. If there is any one who would condemn it, I say let that person keep to his crushed stone and hard-rolled highways, and leave the pine needle roads alone.

Any one who has studied paths at all knows that well-worn paths are strictly business paths, and are not cheerful ones at all. Stones in this sort of a path are magnified in one's mind at least five times when one is made aware of their presence. Other paths may have large stones, and even branches, in the way, but one never thinks of calling them beastly.

Indeed, a good rule to follow is to shun well-worn paths, and take those which look unpopular; they will repay you. Time was, perhaps, when they were used; but their friends being now gone they have barred their doors, and in the little clearing, their atrium, they have planted snow-drops and other dainty woodland flowers for remembrance sake. After you have gently forced an entrance and come thus far, you take off your hat, tiptoe across the soft, green carpet, and sit down on some rock which is, perchance, the exact counterpart of the one you wearily turned away from back in the road. Here the little flowers nod and smile, and seem to say, "Here we are, blooming for just such as you."

These forgotten paths are the dearest of all; at least, they are to me. They are not forgotten because they are unworthy, but because people are unworthy of them.

It was one of these paths that rendered my summer on a low mountain one to remember with pleasure. It was a mile from the farmhouse to the top, and that meant an hour's climb. On this particular day there was a large party of us to follow the well-worn trail. In descending, a small detachment was a little in advance when we reached a point a third of the way down. Suddenly one of the party stopped. "There is the old, forked tree that was struck by lightning," she said, "and right here there used to be a path that branched off and came out in the sap orchard, back of Hermit John's." Not a word was spoken by the rest of us; it was by tacit agreement that we plunged into the long grass, then fought low, sweeping branches, until there was no fear of the rest of the party catching sight of us and following; then we went more slowly in the half-light of the path, down steep descents, where the brown oak leaves hid the treacherous stones beneath; over tablelands of rock, where moss and pine-needles made safety a subject for immediate consideration; down another steep pitch, where little saplings proved friends in need; then out into a small, leaf-strewn clearing. Our leader turned sharply to the right and eagerly brushed aside the bushes, and there, waiting for our cups of birch bark, was a little spring. Cool and silent it lay there in the shade of the big trees that towered far above it, and oh! so different from its brother spring on the other path, which lay in the sunshine surely half the day and then ran noisily away, chasing a sunbeam that had challenged it to a race! Although this spring had gathered the leaves of last spring around it, and had entreated the low bushes to grow protectingly over it, when it was discovered it freely gave us all it had and accepted our mute thanks in its sad, sorrowful way. The remainder of the path was not difficult, and soon we were out into the lighter green of the maple orchard, and then home.

There is one more kind of path that I want to speak of, and that is the joyous, hurrying path that has a surprise party in store for you somewhere. You probably know just what I mean—a hard fight for a few seconds, then a smooth, velvety stretch, a drive down at terrific speed, only to meet a stony place; now, look out! for here is a sharp turn, and off you go in another direction—oh! the surprise is going to be a grand one—then a hard climb up a cliff of rocks (this is merely to keep you from looking ahead and trying to guess what is coming), for before you realize it you are out on a flat rock, with a beautiful view of the lake stretching blue before you, seemingly stopped only by the rough mountains, with their blurred outlines away over there in the distance. You forget how warm and hard the climb was, as you

stand there gazing at it all, and only remember to assure yourself that you have not paid half as much as you are willing to pay.

Of course, there are many, many kinds of paths that are worthy of mention, but all that one needs remember is that discovery gives in return a feeling of ownership, and a chance acquaintance is always sure to ripen into a genuine feeling of affection.

S. M. A.

Bruin and the Beads.

THE Sault Ste. Marie is a very different place to-day from what it was in 1824 or thereabouts, when old Fort Brady stood, an outpost in the wilderness, amid wild beasts and half-tamed Indians.

No doubt it is improved in the eyes of those who like to see the fair face of Nature seamed with railroads, highways and canals, and her green locks shorn until her poor pate shines bald in the sunlight of civilization; but to those who love the silent spaces of the forests, and lonely water courses, and the virgin surfaces of placid lakes, the contrast between what they see to-day and what imagination pictures of the past, is like the effort to trace the radiant face of the boy in the work-a-day features of the man of middle age.

But there are a few people still living who do not need a stretch of the imagination to picture the conditions that then existed at the Sault, but whose memories recall the old fort and the enveloping forests, where wild creatures lived in peace and plenty, the sad lesson of man's enmity all unlearned, and the red man, his lesson only begun, lingered on in the haunts where his forefathers had trapped and hunted; who recall the noble river that had not yet bent its back, nor put its shoulder to the wheel for man's necessities, and the great, inland sea, whose waters were unruffled, save by Indian canoes and the half-yearly trip of the schooner that plied between Mackinaw and the Fort, bringing the bare necessities of life and news from home to the lonely sentinels of Uncle Sam.

They must have been brave and hardy men, these soldiers and officers at old Fort Brady; and their wives had need of an heroic spark as well, to face the solitude of the long winters, the cold and privations, and the muffled fear of Indians that tugged at their heart strings day and night. Even the children may have caught a spark of the fortitude of their elders, for, in the only two survivors of those far-off days whom I have known, one can trace the steady grasp of soul that comes to those who have faced Nature in her savage fastnesses.

They are old ladies now—the elder over eighty years of age, but the memory of their early youth is clear and distinct in their minds. "Listen," one will say to the other; "do you remember the winter when the schooner was delayed by the storms, and provisions gave out; how the last fitch of bacon was divided up in bits among the married men who had families, and the last potatoes in the last barrel were doled out as if they had been pearls?"

"Yes; and when the roof leaked after the snow melted, how we found our shoes in the morning floating about the floor?"

"And the Indians, too, suffered from famine that winter. They came inside the stockade and danced for the pennies the officers gave them. How fierce and gaunt they looked; and how they lingered near the kitchen sniffing the food, and offering birch bark bags full of pounded maple sugar in exchange for a loaf of bread! But there was little to give them, and we were all hungry that winter till the ship came.

"But we were not always short of food, for, think of the wagons piled high with game that came in to the Fort after a big shoot in the season! Partridge and quail and woodcock, not to mention wild duck, till we grew sick of the very sight of birds, and turned to salt pork and bacon for a relish. And then the venison and the bear's meat! Why, we lived on the very fat of the land; and only vegetables were conspicuous by their absence!"

And then the elder may tell of how her little sister was kidnapped by an Indian. Their father was one of the few officers who spoke some of the Indian dialects, and this particular savage had taken a great fancy to him, and came to pay him visits in his quarters, sitting sometimes for hours motionless and silent, but serene in the consciousness that he was doing the polite thing, according to his code of etiquette. He sat so still that he might easily be taken for a piece of furniture, and on one occasion his host forgot him, and left him alone in the room. The little girl above mentioned, a child of four, toddled in, and the red man, thinking doubtless that politeness need be stretched no further, picked the child up in his arms and slipped, unobserved, out of the Fort, past the sentinel, and into the woods. There was a great deal to do when the loss of the child was discovered, for the relations of the handful of whites with the hordes of red men were a trifle strained just at that time, and it was feared that any appearance of a lack of confidence might precipitate trouble. The child's distracted mother, however, would hear of no diplomatic delays, but breaking in upon the conference which the officers were holding over the ticklish business, she seized her husband by the arm and hurried him with her across the stretch of forest that lay between the Fort and the wigwams of the Indians. Raising the flap of the friendly Indian's abode, they beheld a sight that reassured them. Half the squaws of the village were clustered about the child, who, all laughter and dimples, and stretching out her little arms to one another, was passed on from squaw to squaw amid much chattering and grunts of delight. The man of the wigwam, meanwhile, sat in a corner smoking his pipe in dignified indifference, while the family pappoose hung from a peg in his birch bark coat-of-mail, staring in beady-eyed wonder at the white intruder.

The child was handed back to her parents after the interchange of many compliments, with a string of gaudy beads about her neck, in token of love and amity.

On the long walk home, through the dark forest, the poor little mother hugged her baby close to her heart, and thought of many grim possibilities. But her adventurous baby was to give her another fright before she left Fort Brady, and the string of Indian beads was at the bottom of it. Some soldiers had trapped a half-grown bear, and had him tethered to a stake in a corner of the clearing, out of sight of the quarters.

Here Bruin sat upon his haunches, or walked in a cir-

cle, the length of his chain, in a very bored frame of mind. He saw no company but an occasional soldier, who held out chunks of raw meat to him on the end of a stick, and he missed the cheerful society of his shaggy brothers and sisters, and his haunts in the woods, and the wild honey and sweet, green twigs that had varied his daily fare.

No wonder that he stood up and grinned his most engaging grin when a pretty little girl of four toddled up to him one day, and, without a thought of fear, sat down beside him on the grass.

Bruin sidled up closer, and sat down, too. The child laughed up in his face, delighted with her new playfellow, and Bruin's smile broadened, and his sy little eyes danced with pleasure. Pretty soon the string of shining beads about her neck attracted his attention, and he caught them deftly in his paw and held them up, and dangled them till they glistened in the sunlight.

The child threw back her head and fairly shouted with glee, and her ringing laughter caught the ear of the orderly, whom the exigencies of life at Fort Brady had promoted to the position of temporary nurse to her little ladyship, and who, missing his charge, had been hunting high and low for her. The sight of the child hobnobbing with a savage, half-grown bear nearly paralyzed the man, but he summoned up presence of mind enough to call out to her that her mother wanted her, and the child trotted off obediently, leaving Bruin in possession of the beads.

Poor Bruin was promptly shot, and in due time eaten, but the little girl kept the beads in remembrance of the pleasant Indians, and of the most agreeable wild animal she had ever met.

M. M.

In the Ranger Service.

BY ROWLAND E. ROBINSON.

IV.—Adventures.

A LETTER from my sweetheart was waiting to comfort me with assurance of her constancy and such well-being as she could enjoy while her lover was so far away, and never once upbraiding me for my sudden choosing and abrupt departure.

It was not long now till we were in the dreariness of winter, but we Rangers had more to sharpen the dull edge of the life than our grand comrades, the regulars, for we were out every proper day practicing the trick of snowshoe travel, wherein was much sport for the old woodsmen to see us learners tripping and floundering in our first lessons, and helpless as turned turtles when we got a headlong tumble that choked our guns with snow. When this was learned, we were given our full share of scouting all about the neighborhood of the post, for this was the season of Indian forays out of Canada. But none came, and we saw no sign of worse enemies than panthers and wolves, whose tracks we often saw, as well as bloody records of their havoc among the yarded deer.

Once, with two comrades to share it, I got a great fright, and again had an adventure that came near enough being my last. In the first case, three of us were scouting on the flank, and having grown careless through continued non-appearance of the enemy, drew together and talked neither loud nor low as we walked abreast, till all at once there came as one sound the crack of a rifle and the whistle of a bullet close above our heads. The man at my right dropped so quickly that I thought he was killed, till he went briskly enough crouching to the cover of a tree, as did we two others with all speed. But then our wits were so scattered we knew not which way to look for our assailant till we saw a thin wisp of powder smoke drifting upward among the branches. The woods were deathly still, and we could hear the hollow tap of the ramrod on the bullet the unseen person was driving home; so by this and the smoke we got his direction. With our pieces cocked, we covered ourselves against it, with barely a corner of an eye out, to catch a glimpse of him. Then a raccoon skin cap cautiously showed half its bigness from behind a great basswood twenty rods off, and all three of us blazed away almost together at sight of it. The next moment stepped forth from the cover of the basswood neither a French courier of the woods nor a painted Waubanakee, but our own commander, twirling his cap on the point of his ramrod as he advanced toward us with his rifle across his arm.

We came out of our cover and stood before him, sheep-faced enough, expecting the round rating or severe punishment we deserved for our lack of vigilance; but he only laughed at us for being fooled by so common a trick into delivering our fire at once, and so giving one man the advantage of three.

"And only one bullet hit my cap," he said, smoothing the ruffled fur and then covering his head. "That's poor shooting when a man's own life depends on his shot."

I was quite sure it was my ball that made the hit, and so I thank was he, by the look he gave me; but he said no more, and left us to do our duty vigilantly.

Not long after this, Major Rogers discovered something that made him suspect some movement of the enemy, and I was sent back with a message to the fort. I set forth as soon as it was light enough to travel, which was not very early, the sky being thick, with low clouds, threatening snow. Setting my compass, I went on my course at a brisk rate, the snowshoeing being fair, and my burden only my rifle and one day's rations. About the middle of the forenoon, as I judged, it began snowing, and about the same time I got a fall in crossing an unfrozen mountain brook, and had the misfortune to lose my compass, with my punk, the leathery fungus that woodsmen use for tinder.

For some time I was able to keep my course by the lay of the land, but when I came on to level ground and the snowfall to a thick veil dropped straight as a plummet, with no slant from the wind to guide me, though I judged from the feeling of the still air that it would be southerly if it had motion, I began to get into confusion concerning my route. The snow was falling so thick that trees five yards away were dim as ghosts, and beyond that distance was nothing but a gray veil. I could not see the topmost twig of a hemlock, nor the

moss on the trunks, which some make account of for a guide. With the traveling continually growing more heavy, I wandered blindly on, with the horrible sense that I was lost more and more oppressing me, and was made quite certain of it when I came upon my own tracks not yet filled. How often had I sought the solitude of the woods for comfort and consolation; now how it terrified me with the vastness of its loneliness that offered me nothing but a miserable death! Night came on and I could go no further, nor yet make a camp, for I had no means of lighting a fire, nor even a blanket to wrap myself in, for I had left that behind, thinking there would be no need of it. I ate the last of my rations and set to walking around the body of a great tree to keep myself awake and from freezing. To this round I held the life-long night, casting off my snowshoes for greater ease after a path was beaten, and now and then leaning against the tree out of sheer weariness, often falling into a doze, to awake with a startled sense of peril and then resume my lonely beat.

It was nigh morning when I fell into a longer spell of napping, from which I was awakened by a sound like dull thunder, and came out of a dream, of which it was a part, in time to realize that it was the booming of a great gun and to get the direction whence it came. I was certain it came from some fort, but not so sure whether from our Fort Edward or the Frenchmen's Ticonderoga. But deeming it better to be captured by Christian, though of a poor sort, than to die of cold and hunger, I made sure of my course, and preserving it by taking range by trees, daylight having come and the snow having slackened to a sprinkle, I pushed forward with all the speed I could muster. An hour or so later the light of an opening shone through the trees, and presently I came out on a broad clearing, in the midst of which was a fortified place. I knew it was not Ticonderoga, for the land was level around it, and the English flag was flying over it, a goodly sight to my eyes; but it was strange and new to me. I approached it and walked around on the rear till I came to the gate, where I was hailed by my only acquaintance among the regulars, the surly Tom Watkins, and lo! the place at once put off its mask of strangeness and took on the familiar guise of Fort Edward.

Before the end of winter another letter came from Mercy that among all its endearments had one passage which gave me a pang of jealousy: "Your cousin, Lot, pursues me with such importunate wooing that I am greatly annoyed. My father is continually urging me to marry him, so that I may be left in safe hands while he goes to labor in a new vineyard up in the border of the wilderness, whither he imagines the voice of the Lord calls him loudly. So, between them, they keep me sorely perplexed, and I almost wish I had gone off into the woods with you, as you desired. Alas! that cannot be now, for a Ranger may not have his wife with him. I wonder that I have heard nothing from you these two months, but pray no evil has befallen you."

I could not believe anything would break her troth, but how could I know how long she might have strength to hold out against the siege of such strong-willed men as her father and my cousin Lot, with not a word from me to support her. I wrote to her at once, getting some comfort out of the hope that my letter would comfort her, but yet continued in a troubled state of mind. There soon was such a stir as took my thoughts in good measure from my own affairs.

V.—Lord Howe

The great General Abercrombie was come with a grand army of regular troops to take the French forts on the lake, and then advance on Canada, the conquest of which was now considered certain. There was a continual bustle of arriving troops, boats and munitions of war. Now with fifes and drums playing the brave, martial airs of old England, battalion after battalion of the British line came pouring like a red flood down the channelled forest road into the open ground; now the sober color and looser columns of Colonial levies, now lumbering, rumbling trains, with their burden of boats, tents, baggage and provisions, and stepping so proudly to the strange, wild music of the bagpipe that their feet seemingly disdained this lowland soil, came a regiment of tall Highlanders, gay with fluttering plaids and plumed bonnets, a stranger sight than a tribe of painted Indians to us Yankee folks. So the troops came streaming in till the fort and all its neighborhood were overflowing with them, and some made outlet toward William Henry, now roused out of its deathly sleep to new life by all this stir of warlike preparation. There the boats were hauled, where they were to find their employment.

While our forces were gathering at Lake George, the Rangers were kept in active service, some scouting as far as Ticonderoga and bringing back reports that the enemy was strengthening its position there; but we were all certain that he would not be able to withstand the overwhelming force that was moving against him.

I will remember one day when we were practicing with our rifles a handsome young English officer of high rank came and looked on, observing our shooting with great interest. He was very noticeable among his fine comrades for having his hair cut short and for having so served the skirts of his gold-laced coat that they might not hinder his movements in the woods. If this curtailment of his adornments made him an odd figure among the gaily attired through it also showed his good sense in putting-off holiday finery when he was going into the bush. Seeing that I made as good a target as any one, he said to me, "You shoot remarkably well, my friend. Is it due to the gun or to your skill?"

"Mostly to the rifle, sir," said I, "for it is a very good one, and I am well used to it since I was big enough to aim it."

"Let me try a shot with it, if you do not mind," said he very politely; and I loaded the rifle with uncommon care for him. He took careful aim, hitting quite close to the bullseye.

"Faith!" he cried, "I believe it is in the gun! Here, Somers," turning to a haughty young officer who lounged near by, looking on with affected indifference, "try your hand at it." And he, languidly consenting, I took as much pains for him; but he made a very poor shot, and was laughed at by some of his companions.

"I am better used to gentlemen's weapons than common soldiers' tools," said he, very haughtily. "I wonder you don't don the dress of these Rangers, my Lord Howe," looking very contemptuously at the gentleman's shorn skirts.

"Right gladly I would if by doing it I could gain their skill in bush fighting," said the other, without noticing the young gentleman's insulting manner, and went away, after thanking me with a kindly courtesy.

Another day this young nobleman sought me out when I was off duty and began speaking to me in that pleasant, agreeable manner that endeared him to every one he came in contact with.

"My friend," said he, "I notice you are well skilled in woodcraft, and I wish you would impart some of its secrets to me."

"Anything I can give your lordship is quite at your service," I answered, not a little flattered by his attention.

"Well, then, to begin with, how do you keep your course in these woods, which are all of a sameness to me, so that after a little I know not which way I am going?"

"That is something more born to a man than learned," I said. "I have not the gift, but depend much on the compass. Yet something may be got from the lay of the land and the course of the streams. Here all the ridges run north and south; the brooks run to the rivers; the rivers to the lakes; or, south of us, to the great North River. East of the Champlain the steeper side of the hills and mountains is on the west, as you shall see when we have taken the French fort."

"As I doubt not we shall within a week," he said, smiling very brightly and hopefully, yet with a half sigh and a sudden sobering of his countenance, as I remarked at the time, and afterward wondered if he had a premonition of what was to befall him. A few days later his untimely death was mourned by all the army.

Often have I had forebodings of some dire calamity, but it never yet came to me, and it may be mere chance that fits the one to the other.

Seeing that his lordship was waiting for me to say more, I went on: "Something may be gathered from the moss growing most on the north side of trees, and the branches growing longest on the south side; but they are blind guides to me, and of no help in a great snow-storm."

"These things are worth remembering," he said, writing in his memorandum book, and then saying, "A little while ago some one went this way. Can you tell by his trail what he was? I have heard that you Rangers can read such signs marvelously well."

I examined the ground where there was soft mould to help me, and presently answered, "I think, my lord, he was an Indian, lame in the right heel, that he carries a rifle, and is our Stockbridge Indian, John Mohican."

"Right!" he cried in great surprise and delight, "and now, pray, how did you guess all this if you did not see him?"

"I know it was an Indian by the turning in of the moccasin tracks, and that he is lame by the favoring of the right foot, and the heel more than the toe. As for his gun, the print of the heelplate of a rifle is plain to be seen where he set it down."

"That is all very wonderful," said Lord Howe, going to examine the ground, when he wondered yet more.

"Now," said he, after a little, "get you behind yonder tree—a hemlock, do you call it?—and I behind this, and let me see how you would get a shot at me."

So each betook him to his tree, when I tried to get him to expose himself by the old trick of poking my hat from cover; but he was not to be taken in by this. So I began skulking and crawling from tree to tree, and was soon on his flank, having a fair view of him, peeping out very cautiously. Still I went around him until directly behind him and quite near him, when I spoke to him.

"Your lordship would be sorry to be shot in the back."

He faced me, looking greatly astonished, and, as I thought, a good deal chafallen, but laughed it off, saying he should make but a poor bush fighter. Would to God he had taken as much care to cover himself a few days later! It might have changed the whole fortune of that wretched, ill-managed campaign, which came to naught but slaughter of brave men.

[TO BE CONTINUED.]

Adventures in Tropical America.

II.—Some Brandy and a Little Human Nature.

ONCE, traveling with some rough men on a mining expedition in Central America, the camp went dry—that is, all the spirits had been consumed—in fact, the camp went dry the next day after our arrival. This wasn't my fault, and I was rather well satisfied; but my companions were most unhappy, and the superintendent ordered that I immediately provide the money for a fresh supply. I had all the funds for the expedition, which, in some respects, was fortunate, though I hardly think that expedition would ever have gone to water; yet, except the money had been in my hands, it would never have gone very far.

After thinking for a few moments, I declined to provide more drink, and prepared to face a storm, which came on in good earnest—a wind of words before which I finally weakened. I was still very young then, and had frequently read of the necessity of spirits on an exploring expedition, especially for snake bites, exhaustion, etc.

I decided to go myself to a trading station some miles away, and bring to camp six bottles of cheap liquor—a mixture of alcohol and other things called brandy, which ought to have been more fatal than a snake bite.

Taking two Indians, I started for a long tramp to the trading station. There was little of incident, but much that was beautiful, the influence of which was probably enhanced by the sense of harmony and the satisfaction I had left behind among the members of the expedition. Through dense jungles, the trail led on and on, the Indians never hesitating for an instant, till finally we reached an open savanna, where we stopped to rest, with a beautiful expanse of green before us, containing some square miles of grass, dotted with groups of fine

trees, through which the distant mountains could be seen, a bold outline in beautiful prospective.

Starting on again, we presently came to the traders' camp, where I bought six bottles of brandy, and after resting my men and giving them a feed, started back for camp, each Indian carrying three bottles of the brandy and looking the picture of misery while they trudged along in front of me, endeavoring to get away by themselves. Finally they became worked up into such a state of excitement that for safety I promised to give them each a drink when we got to camp, and after that I could not go fast enough for them.

At sunset we reached camp, and all came crawling around eager for brandy. One bottle was given to the superintendent, who immediately partook liberally himself; and then he began treating all hands, and soon came back for a fresh supply. But I had placed the five remaining bottles in a suitable box, nailed down the lid and put my seal over the cracks, as one does when shipping bullion; then I announced that that brandy was mine, and threatened all the law and prosecution of the courts on any one who dared to break my seal. Then there was a racket, before which I winced and trembled, but would not give in; for, though I was afraid all through, I was mad also, and that helped me out.

It was amusing to see the superintendent look at the impression of my crest on the box, and then turn away doubtfully and consult with the Spaniards; but they seemed to consider that I had the law on my side, and it is remarkable what a little thing will hold men in check. Finally the camp quieted down, and after a cold supper I went to bed. Before I turned in, the cook, a rough fellow named Brown, slapped me on the back and said, "Wal, now, for a kid, that war purty well done," and then he went away laughing. I was very indignant that any one should call me kid, and went to sleep planning how it should be stopped; but that was long ago, and I am not so very old even now.

FRANCIS C. NICHOLAS.

Natural History.

Gen. Sherman and the Monkeys.

DURING the term of President Hayes, the directors of the annual Industrial Exhibition of Cincinnati invited him to preside at the opening ceremonies, and the Zoo Board asked him to spend an afternoon at the garden during his stay in the city. Of course I was expected to surpass all my previous displays in the usual parade given on the open day of the exposition. Discarding the usual exhibition of elephants and camels, the zoo was represented by a female leopard and young one. The mother sat alongside her keeper on the back seat of one of the little phaetons used for conveying visitors around the garden, while the youngster lolled in front of them. It required divers night rehearsals before matters worked smoothly, but we finally succeeded in getting the leopards accustomed to their new surroundings, and the ponies trained to hauling such fearful passengers. In order to prevent an escape of the felincs, they were fastened by collars and chains, covered with leopard skins, so as to conceal the manner of securing them. Dick, the mulatto boy who drove the phaeton, was the most uneasy party of the lot, but continual repetitions finally cured him of his want of confidence. As I hoped, the zoo's turn-out proved to be the leading feature of the great display, and Dick returned to the garden in a highly elated condition.

The day after the formal opening of the exposition the garden was crowded with visitors, and I was constantly on the move, from one portion of the grounds to another, in order to see that everything went on smoothly and satisfactorily with the throng. Late in the afternoon, while passing the restaurant, I recognized, from newspaper portraits, Generals Sherman and Sheridan, with a party of friends, seated at a table in the corner of the portico enjoying their liquid refreshments. Instantly divining that they had not been recognized by the crowd, and judging that they wished to preserve their incognito, I passed on to another portion of the grounds, and did not mention the fact, until after the closing of the gates, when I enlightened the keeper of the restaurant as to the rank of a portion of his customers during the afternoon. He immediately took me to task for not informing him of the fact, when I retorted by saying that he would have instantly made known their identity to all his acquaintances, who would have crowded around and forced the party to beat a retreat.

The next day was the one appointed for the visit of the President and his family. Of course I made the entrance my headquarters until after his arrival, when he was escorted by several of the directors to the restaurant, where a room had been especially fitted up for his particular accommodation. Remaining at the gate a short time after their departure, in order to assist in handling the crowd, which had followed the Presidential party, I was surprised to see General Sherman alight from a street car, and start for the office to purchase a ticket. Divining his intention, I intercepted him, introduced myself and passed him through the gate so quietly that the throng did not recognize him. After getting inside, he informed me that, having been detained by some friends until it was too late to meet the President at starting, he had jumped on to the car in hopes of overtaking the party before their arrival at the garden. I piloted him up to the restaurant, where we found the President and family just starting on a tour of the grounds, under the guidance of the directors. The General joined them, but in a short time they had all clustered around Mr. Hayes, and left the General to follow in their wake. I immediately stepped up to him with the remark:

"General, if you will deign to accept my pilotage, I flatter myself that you will learn more natural history than by accompanying the President and his guides."

"I accept your kind offer with great pleasure, but have a request to make, and that is to make your calculations to spend a greater portion of our time with the monkeys, as from my earliest recollection they have always been an irresistible attraction to me."

Acting as he wished, we paid flying visits to a greater

portion of the collection before reaching the monkey house. The only stop of any duration was in the carnivora building, where I took the young leopard, which had figured in the parade on the preceding day, from its cage and placed it in the General's arms, who was so delighted with such a novel experience, that he reluctantly allowed it to be returned to its anxious mother. Passing along in front of the aviaries and pheasant yards, we finally reached the monkey house. So soon as we entered the General said:

"I am perfectly willing to acknowledge that monkeys always had a particular fascination for me. During my juvenile days the arrival of an organ grinder and his usual simian attendant in my locality always caused my breathless attendance on the pair until they left the neighborhood, and the height of my boyish desires was to possess one as a pet."

The frank acknowledgement caused me to do my utmost to please him. After passing around in front of the dens, I took him into the keeper's passage behind them, where I took several of the tame ones out of the cages and allowed him to handle them as much as he wished. I also called his attention to many points which would escape the notice of a casual observer. He was particularly interested with the difficulty of determining the sexes of some of the capuchins from a cursory examination, but the animal which seemed to give him the greatest pleasure was a fine specimen of the mandrill, christened Mischief, which came to the door and shook hands with him. Our pleasant time was suddenly interrupted by the advent of my head keeper, with the information that the President and party were awaiting the General at the restaurant, in order to receive a marching salute from a volunteer regiment. These tidings immediately put an end to our séance, and we hurried off in order not to retard the military. On reaching the restaurant, we found the President, family and directors on the upper portico awaiting our arrival, in order to give marching orders.

As soon as the military had passed, the President and party started for luncheon, which had been prepared for them on strictly temperance principles, in deference to his views. I said to the General: "As the Governor of North Carolina said to the Governor of South Carolina—"

"You have hit the nail squarely on the head, and I surrender at discretion. Let's hurry down and get back to this dry feed as soon as possible."

During the day I had noticed that the General was clad in evening costume, with a plain, linen duster drawn over it, and was puzzled as to the cause, but during the collation I learned from the conversation that he and the President were going direct from the garden to Clifton, a beautiful suburb of Cincinnati, to attend an evening reception. Knowing that President Hayes had a carriage for his special conveyance, I said, in an undertone, to the General:

"Have just found out that you go from here to Clifton, and as that locality is not reached by street cars, you must allow me the pleasure of rigging up a team for your especial conveyance."

"I submit, under one condition, and that is, that I decline using elephants or camels for the trip."

Slipping out of the room without attracting attention, I hurried to the pony stables, where, with the assistance of Dick, the mulatto driver, I rigged out a makeshift four-in-hand Shetland pony team to one of the pigmy phaetons. At the conclusion of the banquet, it was drawn up in front of the restaurant, just behind President Hayes' conveyance, and as General Sherman seated himself in it, he said:

"Mr. Thompson, in bidding you farewell, I have one wish to make, and that is I hope your large family, particularly the monkey branch of it, will obey the old Biblical law of 'increase and multiply.'"

Lifting his hat to the assemblage, he was driven out of the garden by Dick, who was in high feather at handling the reins in front of such a distinguished passenger.

After a lapse of some years, on my return from a European trip, the pilot, who boarded the steamer off Fire Island, brought the news of General Grant's death. A few days subsequent I was standing on Fifth avenue watching the funeral procession, when there was a temporary stoppage of the parade. Awaiting its renewal, I fell into a reverie, when I was suddenly recalled to my senses by the exclamation of "How are the monkeys?"

Instantly recognizing the voice, I hastily bowed in acknowledgement of the recognition, and in a fast receding carriage caught my last glimpse of the rugged, smiling features of General William T. Sherman.

FRANK J. THOMPSON.

The Eskimo and the Auks.

ROBERT STEIN, of the Geologic Survey, writing in the New York Tribune, gives this account of Eskimo bird netting at Cape York, Ellesmere Land:

The scarcity of life on the plateau is in marked contrast with the exuberance of life on the slopes below. Near my tent was a patch of fat, green grass, a foot and more in height, which could readily have been cut with the scythe. Such patches dot the entire southern face of the cape as well as the western. A herd of, say, ten to fifteen goats could easily find food there from the beginning of June to the middle of September. Reindeer used to exist there, but the natives have killed them off. Within five minutes' walk were four snow buntings' nests, and their merry twitter could be heard all day. The raven's metallic note (his love call) rang from the rocks above; the magnificent white burgomaster gulls kept sailing overhead, now and then alighting on a ridge just west of us, and eyeing the fat morsels lying about the tents. On the day the Eskimos moved away some twenty or thirty of these birds swooped down, and gorged themselves on the offal. All these, however, were insignificant in number compared to the little auks, the *akpadiliahsus* of the natives, a bird a little larger than the robin.

Though Cape York is by no means their favorite breeding ground, yet their number even there must be reckoned by hundreds of thousands. From the end of May to the end of August their ceaseless cries give one the impression of a vast poultry farm. Such, in fact, it is to the Eskimos. The method by which they obtain the birds has often been described, but when seen for the first time it fails not to strike one as an extraordinary spec-

tacle. The birds would be practically secure from capture were it not for a foolish habit they have of flying in large flocks, close to the grounds, past the talus slopes, in whose recesses their nests are hidden; then out to sea and back again to where they started, keeping up this circular movement all day long, under certain conditions of weather. This exercise, probably a mere sport, is to many of them the broad road that leadeth to destruction.

Seated at a point where the birds are apt to pass most frequently and closest to the ground is a man with a net of sealskin thongs fastened to a circular hoop about 18 inches in diameter, which is fixed obliquely on a thin, light, wooden handle some 10 feet long. On each side of him he has built a wall about 2 feet high, called *taluten*. A little further away he has set up a stone or two on edge, to invite the birds to settle on them. This is called *nuyahsaun*. Between the two walls he crouches as low as possible, the net thrust forward, and resting on the ground. A flock of birds approaches; at the opportune moment up goes the net, directly in the path of the victim selected; it is entangled in the meshes; before it has time to escape the man has drawn in the net; he twists the poor creature's wings one above the other, presses its heart for a few seconds between his fingers, and with a piteous little chirp its life is ended; it is now only so much meat and skin—a commodity. In this way I have repeatedly seen a man or even a boy catch about 100 birds an hour. I tried it at Cape York, and caught one in the course of an hour. Two weeks ago I tried it on Hakluyt Island, and caught four in half an hour, and let them go. The proper name for the net is *kaglun*, though the Eskimos often talk of catching the birds with the *ipu* (handle). The word for "dimple" sounds so closely alike to *kaglun* that I am not certain whether there is a real difference. Supposing them to be identical, I invite the reader's admiration for the deep philosophy which defines a dimple as "a net to catch unwary birds."

Natural History from the Northwest Coast.

THE last number (21) of "North American Fauna," which is issued by the United States Biological Survey, under the charge of Dr. C. Hart Merriam, contains some interesting natural history notes on two localities on the Northwest coast. The papers treat of the natural history of Queen Charlotte Islands, B. C., and the natural history of the Cook Inlet region, Alaska, and are by Mr. Wilfred H. Osgood, who conducted biological investigations for the Survey on the Northwest coast during the field season of 1900. The results of his work form an important contribution to the natural history of the Northwest coast.

The first paper has to do with the natural history of Queen Charlotte Islands, which it describes as to physiography, flora, fauna, and life zones. This is followed by a bibliography of the region and an annotated list of the mammals and one of the birds. It appears that the life zones of Queen Charlotte Islands are the Canadian and the Hudsonian; the former including all the area below an altitude of 2,500 feet, while points higher than that are Hudsonian. This definition of the zones is determined almost entirely by plant life. Except for the black bear, which is described as a new species (*Ursus [Euarctos] carlottæ*), there appear to be no large mammals native to the island. The Sitka deer has been introduced, but has not yet thoroughly established itself, though individuals have been seen recently. A caribou (*Rangifer dawsoni*) has been described, but Mr. Osgood is inclined to doubt its existence on the island. At the same time there appears to be some evidence of the animal's occurrence, though, as Mr. Osgood says, it is as yet very unsatisfactory. The sea otter, sea lion and fur seal occur now, or used to do so. Four bats are found on the island. Birds are numerous, and one new species and two subspecies are described.

To the average reader much more is known about the Cook Inlet country in Alaska, which region is quite fully described by Mr. Osgood in the same orderly method.

The life zones found here are the Hudsonian and the Arctic-Alpine. All the low country about the inlet and up the mountain sides as far as timber line is Hudsonian, while the higher peaks are Arctic-Alpine. These zones are established by both plant and animal life, and Mr. Osgood says that, "taken as a whole the plant and animal life of Cook Inlet is very closely similar to that of the Yukon Valley, or in more general terms to that of the interior of Alaska. This condition is more noteworthy, since the fauna and flora of the same coast south of Cook Inlet are in marked contrast to those of the interior in the same latitude."

The giant moose, according to report made to Mr. Osgood, has but recently appeared in the Cook Inlet region. The older Indians declare that when they were boys no moose were found there, and even within the memory of white men it is said that the moose has moved westward, now being known as far out on Alaska Peninsula as Katmai. In the Knik district, and on the north shore of the Kenai Peninsula from Kussilof and Fort Kenai to Point Possession, near the mouth of Turnagain, moose are fairly abundant, and here a few Indians hunt them all the year around, selling the meat in the mining camps of Hope and Sunrise.

Caribou (*Rangifer stonoi*) are said not to be common on the Kenai Peninsula, but are more abundant on the Sushitna River.

The mountain goat (*Oreamnos kenedyi*) occurs in the district between the headwaters of the Knik and Matanuska River. This, so far as Mr. Osgood is able to learn, is the northernmost point of occurrence of the white goat.

Dall's sheep, formerly common in the mountains on both sides of Turnagainarm, has been driven back by the mining to the interior of the peninsula, where it is abundant.

There are wolves in the Cook Inlet region, some of them black.

Black bears are moderately common, while the Kadiak bear, reported ten years ago to be very abundant, have been greatly reduced in numbers. They vary greatly in

color from "white" to very dark brown. They are said to go into hibernation early in October, but the tracks of one are reported to have been seen as late as the middle of November.

These very interesting papers, in which some new species of birds and mammals are described, are illustrated by a map of Queen Charlotte Islands, and by a number of fine half-tone photographs of characteristic Alaskan scenery, of plants and of skulls of bears and weasels.

In the preparation of the papers Mr. Osgood was assisted by Rev. J. H. Keen, of Queen Charlotte Islands, and by many experts connected with the Survey.

A Photograph of Flying Gulls.

HUDSON, N. Y., Aug. 26.—Editor *Forest and Stream*: I inclose snapshot of gulls, by Kerly Jones, Grand Mau-

rice, Minnesota. It appeared to me to be a good subject and fair picture. G. HILLS.

A Grouse in Town.

SAYRE, Pa., Oct. 2.—One day last week a ruffed grouse was caught by Clarence Daly in the Lehigh Valley Railroad's freight car repair shop at this point. The bird had flown into the shop and taken refuge on the steam pipes, located near the ceiling of the building, and these being hot on this particular day, the perch became unendurable, and at the moment young Daly entered the shop the grouse, confused by the noise and activity of the place, plunged into a mass of debris directly at his feet, and was caught. The bird was fully matured, and aside from scorched feet uninjured. It may be interesting to note in this connection that to reach its point of capture the grouse must have covered a flight of fully a mile across a thickly settled part of town. M. CHILL.

Albino Crows.

AT Hurricane, W. Va., last spring, the Wellman boys, of that place, climbed a tree for young crows, and found one as pure white and white as a swan. They threw it from the nest, and, in striking the ground, it was killed.

In the same neighborhood another crow, as pure white as the first, made its appearance. It was surrounded by perhaps three hundred other crows in the most intense excitement and making a din which, with their motions in the air, made the scene one of very great interest. It could hardly be decided whether it was a lynching bee or a grand ovation to the wonderful prodigy. While this aerial exhibition was in progress, a man named John Bartram shot at and wounded the albino, which was taken to Col. Wellman's, Cadetsburg, Ky. E.

The Linnaean Society of New York.

A REGULAR meeting of the Society will be held in the American Museum of Natural History, Seventy-seventh street and Eighth avenue, on Tuesday evening, Oct. 22, at 8 o'clock, when William Dutcher will give a lecture on "Some Bird Studies in Maine," illustrated with lantern slides. WALTER W. GRANGER, Secretary American Museum of Natural History.

Its Alluring Charm.

It may be a matter of interest to you that I have been a reader of *FOREST AND STREAM* for over ten years. With the exception of a few copies, which I lost in some way, I have complete files dating from October, 1894, up to June, 1900. After the latter date I conceived the foolish idea that I could get along without it, but on each recurring Friday I instinctively wandered to the book store, where copies were on sale, and glanced over the contents, just for the sake of old times and the delights it once gave me. Leaving, I was aware of a void that I could hardly comprehend. As soon as the next copy arrived I was found at the news stand again, and the first article that caught my eye was "Reminiscences," by Rowland E. Robinson. That settled it. I then and there purchased that copy, and now can hardly wait for each recurring number. I'll never do without it again. "Chained to business," I can't visit the woods and waters as often as I would like to. In this I am not unlike many another unfortunate mortal. *FOREST AND STREAM* comes in here as a consoler. I can at least read what others do, and experience. It also helps one to appreciate and observe more the little things in nature that pass before one from season to season. T. M. S.

The man who will sit patiently at the butt end of a fishing pole for six hours without a bite is liable to fly right off the handle if his collar button doesn't happen to go through the hole the first time.—Chicago Record-Herald.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise in FOREST AND STREAM.

The Quail Season.

In Connecticut.

NEW YORK, Oct. 4.—*Editor Forest and Stream:* I have been out twice for a few hours' tramp after quail since opening day in Connecticut, and have had all the enthusiasm taken out of me by seeing in the course of two half-days more half-grown and quarter-grown and newly hatched quail than I ever saw in a whole season before. The first morning the dogs stood two coveys; the first consisted of the parent birds and a dozen little ones, that could fly with great exertion, perhaps 20 yards; the second consisted of the two old birds and eight or ten young ones, decidedly not half-grown. On the morning of Oct. 3 the dogs found one splendidly grown covey of birds, as large and vigorous as January birds generally are, another half-grown bevy, and, coming home, near the house, I flushed first two old birds that hovered around and chirped, and, finally, by dint of careful searching in front of the dog's nose, found several downy little things that could not run over a few feet, and which took refuge under the dog when I made the latter charge.

It seems ridiculous and shameful to be quail-hunting under these circumstances. What is the use of having the lawful season open earlier than Nov. 1?

CHARLES D. LANIER.

In Pennsylvania.

EASTON, Pa., Oct. 3.—*Editor Forest and Stream:* Your editorial in reference to the late second broods of quail and the different opening seasons in the different States was of special interest to me, as I had a chance to see an example of this kind on Sept. 22.

The fall-like weather tempted me to give my two setters—an English and an Irish—a run, and so I went back into the country for a mile or two. As I was walking along the boundaries of a weed field I noticed that Bess, the Irish setter, was "acting suspiciously," and she soon swung to point. Her nerves were shortly sorely tested by having a quail go fluttering away with that "disabled wing" motion that we all know so well. Hardly had it gotten any distance when its mate arose with a whirr and passed in front of me. I then went toward where she was still pointing, but as nothing was flushed, called her off. Returning home the same way an hour later, the English setter, Rag, pointed in almost the same place, and I walked up, but as nothing arose was on the point of going on, when I saw a little, brown streak making off through the grass. It was not long before I noticed three more hunting hiding places, and I managed to get my hand over one. As I looked at it, not much larger than an overgrown bumble bee, covered with soft down, with the first sign of pin feathers showing where its future wings will be, the thought came to me that in a little over three weeks the protection of the law would be removed from it. Unable to fly by that time sufficiently well to offer any sport to any one, they would soon be all killed off by some one who hunted for the sake of killing.

This is not the first time that I have started quail, close to the open season, that could hardly "top the brush."

Why could not the opening day be the same as for rabbits, etc., Nov. 1? I am sure every sportsman who goes out for sport and not to kill alone, would welcome such a change. I, for one, think the season is both too long and too early.

H. G. MILLER.

A Squirrel Day.

QUID, N. Y., Oct. 1.—*Editor Forest and Stream:* Several things conspired to make me go squirrel hunting on Sept. 17 last. I had been shut within four walls for a week of hard work. Jack, the beagle, had been on his trolley for the same time, and he begged artistically for one more good hunt. Besides, it was the squirrel season. We are all affected, and hunters most greatly, by conditions which revive memories of former pleasures. Let a hunter pass in sight of a grove of oaks, with the gold of maples and yellow shagbarks intermingled. Even if he be silent, you may guess his thoughts. If he speaks, squirrels will be the theme. That week a maple outside my window began to crimson, and some well-grown hickory nuts on a tree near by began to fall. It was enough. I had to go after squirrels again.

You old-timers know just how I started. I woke with a jump at midnight; again at 2; once more at 3, and of course was sleeping soundly when the roar of that infernal alarm clock broke loose at half-past 4. Some coffee from the oil stove, a search for especially desired articles, which could not be found without opening every door and drawer, the release of Jack, who began whining as soon as he heard me stirring—and we were off.

Going down an old lane toward the lake, a rabbit started out of the weeds, and we had to wait for the breather which Jack insisted on taking. He drove the game through several gardens and corn patches, much to the anger of the house dogs, and presumably their owners. When everything was thoroughly awake in that immediate neighborhood I collared the noise-maker and compelled him to follow, under protest.

It was still dark when I reached my favorite corner, but it was a warm morning, and the grays would be out early. Some writers believe—and I think Burroughs is more than half convinced—that squirrels are nocturnal. However it may be, I had not waited ten minutes, when the crash of a limb attracted attention. A movement on a branch drew a shot, and a fine, gray dropped, while another went sailing through the tops, hardly discernible in the gloom. A hasty crack just as he was poising for a long leap, and I had two.

Next time we'll bring a searchlight, thought I, while returning to the tree of No. 1. There, high up on a dead branch, just visible, was the third.

Then a pipe of contentment followed, while the echoes

died away, and the spirits of the woods came forth from hiding. The call of a plover came out of the meadows in the east, a bunch of crows began to clamor, and I edged along toward the lake, half-expecting to find some black ducks feeding in the shallows. My eye fell on a partly eaten mushroom lying on a stump (do you think it would be safe to use the squirrels as guides to mushrooms?) just as another gray leaped into a tree, over my head. I shot him, Jack pinched him, and he went on the string.

Next the crows aforesaid sent a delegate to scold me. He was promptly folded up by a load of sixes, and then unfolded by Jack.

Then we shifted our base, going carelessly along, when thump! and a splendid squirrel hit the ground behind me. He and the pup started in earnest procession for the nearest hole.

Further on a glimpse of another was had. While waiting for him, that bunch of crows began to assail an old red-tail, whose defiant scream rang through the woods. In a few moments he perched on a dead limb about fifteen rods away. When I fired at him he misjudged the direction, and whirled in a great curve over me. A lucky shot through the leaves brought him crashing to the ground. His stomach contained several skins of those large, green worms that feed on the leaves of the walnut and butternut.

Securing his wings and tail, we went a mile back on the ridge to the corner, where, fifteen years ago, I killed my first gray. As luck would have it, I found another there, and put him on the string, noticing that the pleasure of getting this last one, compared with that of the first, had depreciated at least fifteen times.

Then we came home, feeling quite satisfied and more resigned to another week of the trolley and the four walls.

BENJ. E. BIRGE.

The Kashmir Shikari.

From the Asian.

THERE are few men who have shot in Kashmir to whom the above does not recall recollections of one of the most plausible, pleasant-mannered "frauds" he has ever come across. The "new sahib," or, in other words, one on his first visit to the country, gaining his knowledge by more or less—generally the former—sad experience is the joy and delight of the Kashmir shikari, who looks on him as his lawful prey, a fit subject for all his tricks and petty villainies, though even the old hand does not always escape scot free, up to most dodges though he may be, for to lie and swindle seem born and bred in the native of "the happy valley."

The following is a sketch of what constantly happens: We read in Orders that "Leave of absence is granted to Lieut. New Sahib, Royal Buccancers, from April 15 to July 15, to visit Kashmir." Our hero gets together his kit, and, full of keenness, rushes off at the earliest possible date he can persuade his Colonel to let him away. Being quite new to the business, he is full of tips from his friends, from the advantages of a khaki tent and steel cooking pots down to the delights of desiccated soups, and he has probably written to one of the many agents to provide him with a good shikari, with much emphasis on the good, also for a boat to be ordered to await his arrival. Two days in the train and a couple more, our sportsman, amid the clamoring crowd of shikaris, boatmen, coolies, *et hoc genus omne* at Baramoola, where he is met by his shikari, the obsequious Abdullah, all smiles and civility; the boat, too, the servants and stores, all are ready. Could anything be better? Casting off from Baramoola, they are towed along the river side. Meanwhile Abdullah has been interviewed, has explained his plan of campaign against the bears and ibex, advised where to go to and how to get there, and foretold marvelous sport in store, of the big heads he knows of, until our sportsman begins to wonder if he has brought enough cartridges, and how he shall bring back his many trophies.

Now, as likely as not, the countries Mr. Abdullah proposes to visit in some way suit his little game; either the nullah is near his own or a friend's village, or for some reason or other it is to his advantage to go there. So decide beforehand where you mean to go, and stick to it, whatever obstructions may be thrown into your way. Now comes No. 1 swindle. "Sahib, I have a *chota* shikari, also the sahib will require five or six (or more) *naukar* coolies." Now, it is perhaps best for a novice to allow the imposition of a *chota* shikari, though he is really nothing more nor less than the valet and retainer of his highness Abdullah, does a lot of the work he would otherwise have to do, moreover, probably pays that worthy a portion of his wages in return for being employed. Two to four *naukar* coolies—i. e., men employed by the month—you will require, but Abdullah will try to swell the number to the utmost, as they again contribute to his ease and affluence.

Lieut. New Sahib is probably liberal, so Abdullah "does himself well," also tacks on to his regular wages so much per month for his food, also for each of the understrappers: doubtless this is agreed to, but we trust our sahib himself with his own hands pays the men their wages and food allowance.

Srinugger reached, Abdullah has a great innings. He introduces his friend, the skin-curer, of course—"quite the best in Kashmir; the sahib will send his skins and horns to him for preservation." Now I may state at once that this worthy will attempt to charge his employer the utmost he thinks will be put up with, for on every skin or head you send him he has to pay Mr. Abdullah something pretty handsome; moreover, later on this naturally is an inducement to the last-named individual to persuade his sahib to fire at small heads and half-grown bears, for they all count and represent so many rupees in his pocket. We merely give the skin-curer as an example; the same applies to the dealers in gun and rifle requisites, etc. As a novice, one expects to be bled, and would stand a good deal of it if one got sport in return, but, unfortunately, Abdullah is probably as great a fraud as regards sport as at everything else. He marches his sahib perhaps a week or ten days' march out of Srinugger, persuades him to camp in some nullah years ago shot out and now holding only a few small or very moderate heads, and perhaps a stray bear or two.

All Kashmiris are excellent walkers, and clambering up a mile or two of steep hillside is no great hardship, so the sportsman is daily taken a long pull up to some lofty peak or ridge from which to "telescope" the country for game, which does not exist, or anyhow is scarce; then as soon as the sun gets hot it is remarked that the ibex are now hiding among the rocks for the day, and that the only thing is for the sahib to make himself comfortable and wait till the afternoon, when the game will again be on the move. Meanwhile Abdullah will take the telescope, go a short distance away and watch; perhaps he may be able to find something. This means he gets out of sight, has a "square" feed, then lies on his back snoring till he thinks it is time to see how his master is getting on, returns, saying he has seen nothing, but it is time to move. More hill climbing, then back to camp. New Sahib enters it in his diary as "a blank day."

Perhaps, eventually, a herd of ibex is come across, probably a host of females with perhaps two or three bucks of about 30-inch horns among them, though Abdullah declares them many inches larger. The sahib is only too ready to believe him, besides, being sick of never firing his rifle day after day, so they do a stalk, which Abdullah, probably knowing the ground well, is equal to; the herd is safely approached, and one or more are killed, for New Sahib is a good shot. Great jubilation, and much fulsome flattery from Abdullah—never has he seen a finer shot, never such a good man among the precipices. The sahib, too, is pleased, even though the tape does record the horns much smaller than he expected; it is his first ibex; Abdullah prefers measuring with his hands, or even if he handles the tape that head will be many inches longer than it really is. Much "buck" that evening over the camp-fire, and Abdullah cunningly seizes the opportunity when his employer is in the best of humors to skillfully lead up to how extremely cold the nights are, how much he feels it, having only one blanket, at the same time letting drop casually what excellent ones are made in the neighboring village. Our sportsman has had dinner, is warm and comfortable, thinks of his own ample pile of bedding, and at once tells the wily one to get a blanket and he will pay for it. N. B.—This is a very old "plant;" doubtless Abdullah has any number of blankets in his village thus adroitly "drawn" from his different masters, and though by no means deficient, he purposely has not brought with him more than he actually requires; blankets, clothes, turbans, there is absolutely no limit to his requests if he sees his way to getting them; endless are the "little ways" of the Kashmir shikari, many of them miserably mean dodges to extract goods or money.

Our readers may think we are overstating the case, but we can assure them such is not so, and those who have personal experience of the genus will recognize Abdullah as very typical of the ordinary shikari. Of course, there are a few good men, some excellent as regards sport, marvelous cragsmen, first-rate stalkers, and thorough good sportsmen, but these are few and far between; moreover, they are usually employed by the same man, or his friends, year after year, and the ordinary visitor falls into the clutches of the so-called Kashmir shikari.

CHICAGO AND THE WEST.

Great Teal Season.

CHICAGO, Ill., Oct. 5.—It seems to be without question the greatest fall for teal we have had in this latitude for the past ten years. Everybody has been getting teal, and lots of them, almost every place where there is any water. The flight has been abnormally large and is only now just beginning to scatter and disappear to the southward. The first bluebills and redheads came in at Fox Lake the middle of this week, and the teal are now beginning to be scarce in that vicinity.

From the Point Mouille Club, of Lake Erie, there come this week reports of the heaviest teal shooting known in that famous shooting country for the past seven years. Bags of 100 teal to the gun could have been made by those who cared to make them. It would seem likely that the St. Clair clubs and the Toledo marshes have also been much favored this week by the blue-winged gentry.

Tolleston Club, whose grounds are just over the Indiana line, has had all sorts of shooting in the last few days on teal, and the legal limit of 25 birds a day has been an easy thing; as has, indeed, been the case at many of the better points along the Kankakee.

The old Chillicothe marsh, lower down in Illinois, has turned out good shooting this week on teal, and there should be good stories from the Hennepin Club, also, not to mention Duck Island and other clubs along the Illinois River.

Mayor Harrison and his boon companion, ex-Mayor Hempstead Washburne, left last night for Swan Lake Club, where they expect to meet the teal in good numbers. Another party were to start out on Friday; but they probably started on Friday so they would have a good excuse if they did not bring back any birds. Mr. Washburne, by the way, is keeping his new Goose Lake Club very quiet. He says he does not know whether he has a club or not yet. The preserve is nearly within gun shot of the City Hall, and the grounds are at least a quarter of a mile across. Mr. Washburne got a telegram from the club keeper this week which read, "100 ducks on the lake." That's a good many.

Off for the Northwest.

The Saginaw crowd left Saginaw, Mich., this morning and the private car is due here at 6 o'clock this evening. It will start west from Chicago at 6:15, if all goes well, headed for some point in Dakota not yet determined. The members of the party are as follows: Messrs. E. M. Briggs, Geo. E. Morley, G. D. Seib, C. L. Ring, Farnham Lyon, W. S. Humphrey, T. A. Harvey, Sanford Keeler, W. B. Mershon. Mr. Briggs comes from California and will join the party at Chicago for his annual trip. Mr. Seib comes from New York and will meet the party here. One may well suppose that there is going to be a big time pulled off out in Dakota next week.

Later—The Saginaw crowd pulled out in full numbers, as above, and in fine fettle. They go to Pleasant Lake,

N. D. Congressman Fordney, of Saginaw, accompanied the party as far as St. Paul.

Mr. Walter Dupee, of this city, is talking about taking a trip with his private car, somewhere out in Dakota, provided he can hear of some good goose shooting. If he goes he will be joined by his friend, Mr. Oswald Von Lengerke, of this city. They are thinking about the Turtle Lake country.

Mr. Wade Hampton Yardley, of St. Paul, an all-around outdoor man, is sojourning in Chicago for a day or so. Mr. Chas. Cristadoro, also of St. Paul, and an all-around sportsman, paid this city a visit recently.

Mr. Church, of Elgin, Ill., a member of the Peary relief expedition, has returned to his home, with many trophies and many exciting stories regarding his experiences in the far North, some of which stories we may hope to read in the FOREST AND STREAM one of these days. Mr. Church killed a great many walrus, and he states that he found the .30-40 rifle about the only gun which was reliable on that game. The soft point bullet would not penetrate the heavy layer of blubber, but the full jackets kept on going.

From the Blackfeet Country.

Jack Munroe writes from the Blackfeet reservation that he has been out for a week in the St. Mary's country with Mr. Sexton. They got a couple of fine goats and saw a good many sheep. Mr. Stimson, the partner of Secretary of War Root, is now hunting in the St. Mary's. The weather has been bad. Jack says that he has not heard of any one killing our big grizzly, Old Pete, yet. He was out two weeks on the middle fork of Flathead with a party who got goats. They saw a good deal of elk sign. They were hurried by lack of time. Jack says that any one could get good deer, duck and chicken shooting down the Missouri River. He says that Collins, the hard-working youth who was with us on our bear hunt, is still up in the mountains with a party, where he has been since Aug. 5. Jack says that he could have roped both sheep and goats during the past month, had there been any demand for them from the Sportsmen's Show in Chicago, as there was last year. In order to perform this difficult feat, there must be just snow enough, and not too much. When there is a light crust, through which the sheep will break, but which is strong enough to carry up a dog, a good dog can some times bay up a sheep.

Tips on Deer.

The following are names of some points which might be found worth remembering by any one intending to kill a deer in Wisconsin this fall: Phillips, Fifield, Butternut, Glidden, Penokee, Albertville, Downing, Jewett Mills, Stetsonville, Prentice, and Wooster. Phillips and Fifield are good places to get guides and outfits, and they are both near excellent deer country. Another splendid outfitting place is Ashland, Wis.

"Two Kinds of Deer."

A writer, giving advice on Wisconsin deer shooting, curiously brings up the old idea of the Wisconsin guides that there are two kinds of deer in Wisconsin, one of which is distinguished from the other by being shorter legged, and very much heavier. Of course the blacktail deer is unknown in Wisconsin, and these short-legged deer must be called whitetail deer, just as the others. The writer comments regarding them as below: "There will be noticed two varieties of deer in Wisconsin, which, while some people strenuously contend that they are distinct species, I am convinced are merely variations in the same species. Most deer killed in this region are slim, graceful animals, clean cut and rangy as a thoroughbred horse, standing well up on long, trim legs, but it is not at all unusual for a deer to be killed whose whole appearance is one of aldermanic solidity."

Auction of Moose Heads.

Sam Fullerton, State Warden of Minnesota, this week auctioned off nearly a dozen moose heads, all confiscated from the spoils of illegal shooters. Some were fine specimens.

HARTFORD BUILDING, Chicago, Ill.

Some Swamp Experiences.

Editor Forest and Stream:

This is my thirtieth year with a shotgun and rifle, and having shot most of the different animals from Maine to Florida, I have naturally had some rather novel "fights." My first experience was with a two-year-old buck here in North Carolina. I broke both fore legs and my gun at the same time, and, as I had no dog, my knife was the only remedy, aided by a small hickory club. The victory was not to the deer, but I had to borrow a suit of clothes before I could appear at dinner, and it took a large sheet of court plaster to mend my skin about in places.

My next adventure was with a black bear in the Dismal Swamp, near Lake Drummond. I had only a 14-bore muzzleloading shotgun, charged with buckshot. My first barrel broke the right hind leg, my second the under jaw. There was no time to load, even if I had not lost my powder flask, but the bear was in a hurry to embrace me. The briars and undergrowth were so thick I could not walk—in fact, I had been crawling for a mile or more, following nine little rat dogs, which were constantly nipping at the old bear, and persuading me to follow on if I wanted the biggest old she bear in the Dismal Swamp. I had a long knife and a tomahawk-like hatchet, which I had used for blazing trees, so I could find my way out. We had a lively time of it for perhaps ten minutes, which seemed like ten hours, and the bear was dead. Four days in bed and a new suit of clothes settled this fight; but I haven't lost any more bears, and I am perfectly willing to let the other fellow have them all.

These animals were, of course, wounded, and I did not blame them for fighting, but my worst fight was with a North Carolina wild boar, which came for me before I thought of shooting him, and the worst part of it was that powder and ball would not kill him. If I had to tackle them both again, I would prefer the bear. My experience has been that almost any animal will fight if their young is disturbed by man, or if wounded, but, on the other hand, they all prefer to run away, except wild boars.

MOSE ANOX.

Settlers and Game.

From the "Game Fields of Ontario," by James Dickson.

It is urged by many that the poor settlers in the back country should be permitted to kill deer at all seasons of the year. And without looking into the matter, this sounds reasonable.

As the law is at present, settlers, also Indians in unorganized territories, are not amenable to any of the provisions of the game laws inasmuch as they may kill all they require for their own use or that of their families, but must not otherwise dispose of any. And this privilege is being abused in a manner that no doubt was never contemplated by the Legislature. I have known muskrats and beaver taken under this provision; and when the parties were remonstrated with, they coolly said they had been killed for food. Kill a beaver, destroy a skin worth from \$10 to \$12, for fifty cents' worth of meat. Had the party who trapped them not known where he could dispose of the pelts, those animals would never have been caught.

I submit, and have urged, that the animals that are thus allowed to be taken should be clearly specified in the act, and that they should be restricted to the taking of deer, moose and caribou alone. This is a striking illustration of the wisdom and propriety of hedging around unthinking and improvident persons with such restrictions as will effectually prevent them doing anything the Legislature never contemplated they should do.

As to poor settlers' rights, how many of them, or what percentage of our population ever hunt any at all? There are not 20 per cent. of the settlers in any newly opened townships who ever either fire a shot, handle a steel trap, or set a dead-fall. No doubt there are a number, but they, too, are in a small minority who annually spend ten days or two weeks in the fall of the year in the woods to have a deer hunt and a few days' fishing. But at no other season of the year do those men ever handle either a rifle or shotgun. And not one of such is ever heard complaining that the game laws are too strict. Here let me invite the reader to look around in either town or country and note how small a percentage of the population ever indulge in even this annual outing. I submit that I am well within the mark when I say that not one settler in ten ever hunts any.

Go through any of the townships, even in the heart of the deer and fur country, and ask the first twenty settlers you meet if they kill many deer, and the answer of three-fourths will be "I never shoot any; I have no time for hunting. I find more profitable occupation in improving my farm." Pass through any newly formed settlement, and if you find an ill-fenced, small clearing, with small, dilapidated buildings, a very poor showing of farm implements, but a good, up-to-date rifle, a few rusty steel traps scattered around, with one or two pelts of wild animals nailed on a wall, your approach heralded by a slim-flanked hound or two, not always chained up, and you may rest assured that you have struck the domicile of the poor settler who is so constantly crying out against the stringency of the game laws. At the end of a decade pay another visit to the same locality and you will note the improvements in all the surroundings of the man who devotes his whole time to his farm, while the poor settler, who is ready at all times to abandon axe or cradle for a chance shot at a deer, is still occupying the same tumble-down, primitive, little shack; still uttering bitter invectives against the game laws and all governments in general. I have known some of those to bring down as many as from forty to sixty deer in a single season, but never knew one to produce a large field of fall wheat or any other variety of grain. In this category I do not include the professional trapper, who goes into the woods along with, or a little in advance of, the prospective farmer, with the sole object of living by the fruits of the chase, but only those who style themselves farmers and whose want of success in life proves to a demonstration that farming and hunting are two occupations which, to put it mildly, do not thrive well together. It would prove an unalloyed blessing to all such men and their families if there were not a head of game in the country.

Again, it is being urged, better let the settler kill the deer than have them devoured by wolves. This style of argument is too absurd to be worth discussing, although it may at first sight seem like sound reasoning.

Many deer are no doubt annually destroyed by wolves, but the numbers so made way with are steadily decreasing, as the wolves are undoubtedly growing scarcer each year, and, moreover, lighting a candle at both ends is not the best way to prolong its existence.

The wolf, though a very great rogue, is held responsible for many depredations of which he is not guilty; for numerous crimes committed by the settlers themselves. I have never yet met the man who admitted to ever having killed game out of season or a greater number than the law entitled him to.

A few years ago the writer was sent into one of our remote back townships to do some work. It was in the heart of the deer country, in the month of March. The snow was deep with a heavy crust. The wolves were reported as "killing the deer out of face," to the lasting injury of the poor settlers. I never saw the track of a wolf during the trip; but driving along a main highway one day I saw the newly slaughtered heads of five deer stuck in a row, nose down, in the snow by the side of the road, set up there presumably by the wolves, a casting of the gauge of battle at the feet of the law.

The following day business called me to the home of a settler. His shack stood on the bank of a lake famous for its trout. As I approached the little cabin I was welcomed by the baying of a half-starved hound chained to a stump of a tree. The quantity of deer hair scattered around bore ample testimony to the source of his food supply. The owner, a great, stout, young man, in the prime of life, stood, pipe in mouth, by the side of a hole in the ice, bobbing a short line up and down, fishing for trout—a fair average specimen of the poor settler who is a daily martyr to oppressive game laws, and the wolves. There was abundance of work to be had in a lumber camp within an hour's walk of his home, but he was subject to a chronic attack of illness whenever he essayed to swing an axe or pull a saw, while he invariably enjoyed robust health while either trapping or fishing.

On another occasion I had a professional call into another section of the deer country where there were some

poor, oppressed settlers. Here also the wolves were said to be committing sad ravages. I and my party had snowshoed all day without seeing either a track of a wolf or deer. Toward evening in a small grove of hemlock we came across a dozen or so of old deer beds, but not a single deer. Leading out from among the hemlocks were four depressions or trails in the snow as if a log had been drawn through it. All the trails converged into one, a short distance from the hemlocks, which headed in the direction of a settler's clearing. Need we pause to consider what those trails meant? Here was a small herd completely wiped out by wolves at a season of the year when the hide was utterly worthless, and there was scarcely flesh enough on the bones to hold them together. This is the first instance on record of wolves having drawn the carcasses of deer through the frozen snow to their dens.

A couple of years ago some friends were out on their annual fall hunt; a settler proposed to keep their hounds until the following year. One of the party remarked, "The dogs may not be properly fed." "Oh," replied the settler, "there is no danger of that; we have always plenty of venison to feed the dogs on."

These are only a few specimen cases which might be multiplied to any extent.

Maine Game Grounds.

BOSTON, Oct. 7.—The Maine big game season is on, and it is on in full blast. If the newspaper reports are to be believed, such a season never opened. The papers of that State are emblazoned with staring headlines: "Plenty of Game!" "Deer and Moose More Abundant Than Ever Before!" "Every Hunter Gets His Deer!" "More Partridges Than Ever Before!" etc. All this is very fine. It reads like the patent medicine advertisements—all cures and no failures. I trust that the good readers of the FOREST AND STREAM are not deceived thereby. Thousands will go to Maine this year, as last, and not get a sight of big game, unless they buy it of the guides and local hunters, who will have it "on tap" for them. But there is certainly some good hunting in Maine for the patient and the honest, who desire to shoot their own game, or not have it at all. Thus far, judging from the most reliable reports, the season has opened with an unusual amount of game taken. A Bangor report of Saturday evening says that on Tuesday, the opening day of the season, five deer came through that city on the trains bound west. This was quite a number, and the hunters must have been up early in the morning to have shot their game, dragged it in and shipped it. The same number came on Wednesday, while on Thursday twenty deer arrived. The reports of the season up to Friday night were sixty deer, shipped through Bangor, a gain of sixteen over 1900. Friday was the biggest day, thirty-two deer having been received. Game Warden Neal, on duty at Bangor, is reported to have declared that the season will be the biggest on record for big game. On the other hand, Commissioner L. T. Carleton admits that there may be more moose taken this year, but contends that the number of deer will be less.

A Bingham report is full of enthusiasm. It says that the record for deer shooting so far this season is a very great one. The record closed Saturday evening. In five days twenty-four deer have been shot. The railway trains that day brought about thirty hunters, who scattered over the different stage and other routes into the game country. It will be remembered that Bingham is on the Kennebec, and the present ending of the railroad. There is a vast hunting and fishing region above that point which has gained a good deal of repute within a few years. Rangeley reports are boiling over with adjectives. Many hunters were out at the break of day, Tuesday. Dr. E. S. Hawkes, of Newark, N. J., shot a big deer in the Dead River region, on the opening day. A Mr. Ladd, of Boston, shot two deer at Madrid, the same day. C. N. Prince, of Kittery, Me., shot a big deer at Green's Farm, Coplin, that day. A crowd of hunters have gone into the woods of Rangeley. By the Bemis route a great many hunters have gone into the woods of the Rangeley region, but there are not yet any startling reports of game brought out. There comes a story from the Middle Dam, Richardson Lake, of a young lady of seven summers, out rowing with her guide. The guide left the boat, to cut some twigs on the shore. Out of sight for a moment, he heard the calls of the child, and hurried out, just in time to catch sight of a big, black bear, that had come out of the woods a few rods below, and stood watching the child in the boat. A good deal of hunting has been done for that bear since by the guests, including the child's father.

Partridge hunting has been good there. This partridge hunting has also come very nearly to getting Mr. Andrew Corbin into serious trouble. With two or three other hunters, and a guide or two, he made a day in the vicinity of the Narrows, and it was time to return home. Mr. Corbin, who had insisted on hunting alone, did not come in. The others became alarmed, as night was coming on. Remembering the Richard Knight episode at Bemis three years ago, the party became thoroughly alarmed. Searchers went in every direction. The steamer whistle was blown, guns were fired, but it was nearly 11 o'clock at night before the man was found. He had become bewildered, lost his course, and was traveling directly from the lake, when found, though he had done a deal of wandering about. He could hear the steamer whistles and the guns, but could not bring himself to follow in the direction from which the sounds came, since they seemed to him to be entirely wrong. In the direction he was going there could have been no hope of rescue for him for many miles. But Mr. Corbin may congratulate himself on not being the only man who has been lost on the shores of Richardson Lake since the partridge season opened. A few days before the cook at Birch Lodge, Mr. Bayard Thayer's camps, at the head of that lake, went out after partridges. He had been cooking at the camps all summer, but doubtless knew but little about the woods in that section. At night he did not come in. It grew later and later; still he did not come. All were alarmed. Mrs. Thayer is reported to have taken strong measures to have the man found, when it had passed midnight and he neither came in to any signals that had

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

On Quebec Trout Lakes.

HAVING often seen your notice, "Report your luck to FOREST AND STREAM," I thought I might try my hand with the pen, and hope it will be of interest to some.

The latter part of last May and the first two weeks of June I spent trout fishing in the Province of Quebec, and I can truly say that I had the most enjoyable trip of the kind that I ever took. I believe I am capable of judging what a good trip is, as I began to fish when I was ten years of age, at Bolton, Lake George, with the hotel fisherman, Finckel, and had the pleasure of seeing him take a 6½ pound bass with rod and line—the largest bass I ever saw caught. That was in 1877. Since 1877 I have never missed a year for trout. I fished at Lake George until 1879, then I spent ten years in the Adirondacks, and during which time I fished and hunted in nearly all parts of those woods, but mostly in about Blue Mountain and Raquette Lake region. After this I began making trips to the Maine woods, fishing at the Upper Dam, Rangeley, and some of the ponds about there; then I made a trip in from Moosehead Lake for nearly three weeks. Again I was one of the original members of the Pohoquame Fish Association of Pennsylvania. So you can see I have had plenty of opportunity to judge, and I believe that Quebec is certainly the fisherman's home. It is hard to compare this vast region with the Rangeleys. The Rangeley Lakes have fine fishing, but, like most places, they are a little uncertain. But when it comes to size, Rangeley is first in the land, I believe. Then I was fishing one year with my friend, Dr. Norton Downs, at Camp Bellevue, Upper Dam. The seven largest fish we took weighed 35 pounds.

If you look at the latest map of the Province of Quebec, you will see straight lines running north and south

WHERE THE BIG ONE GOT AWAY.

to the River St. Lawrence, and at the northern end of each district you will see a blank map with no rivers, mountains, or lakes. It was here that I did my fishing. No surveyor has ever put level here, nor woodsman an axe. It is a country full of game—moose, caribou and trout—with all the fur-bearing animals that Canada is so noted for.

One who likes camping and a rough time can find it here. It is not like most districts I have been in, because you can not come out the other side if you travel for a few days. In Quebec you can travel along as you want, and if you go north, the first house you may see will be at Hudson Bay, or east of that you may see no houses, but come out on the Arctic Ocean. So you see, it is a question of how much time you can spend. You do not have to look for a place to get away from your neighbors; all you have to do is to go, and if you go long enough you will be where there is no danger of being shot, and you will not be coming out on the other side.

My friend, Mr. Zimmerman, who is an enthusiastic fisherman and, like all good fishermen, was looking for a place to fish and have a quiet summer, and regain his loss of energy from too hard work during the winter, stumbled into the woods of Quebec and found the place that I am going to write about. There are lots of just such spots as he found and I dare say better ones, so I hope my readers will not ask me the exact location, but if they desire to see fish will try to find one for themselves. The country is large and full of lakes, rivers and streams. Outside of a few preserves and the salmon streams, one can go for miles and fish until tired, and no one will bother. I am told that as you go down the St. Lawrence River the trout fishing improves, simply because it is never fished. At certain seasons in this part the sea trout come in, and they give fine sport, and it is not much trouble to get permission to fish in salmon streams for them, as they bother salmon fishers very much at times.

When my friend Zim told me of this spot of his I began to wonder how it could be. I had my Rangeley trips in my mind, and this was my standard. He was very quiet about it, and careful not to get my hopes up too high; but finally, after we got started, he told me in a very quiet way of his that he would show me more fish than I ever saw, and as the train moved on he began to show more signs of enthusiasm and was growing younger as we traveled north. We were met by the two guides, Joe, an Indian, quick, straight, bright disposition and as strong as an ox; Philip, a French-Canadian, strong,

short, and of heavy build, and quiet, but always in a good humor. Both were willing to do anything in their power to make us have a good time.

Our home camp was on a beautiful sheet of water, four miles long and nearly half a mile wide, having on one side mountains that, in places, were nearly straight up and down. The spot was particularly favorable, because it was a center for good rivers and lakes, and we could go in different directions and not retrace our steps. My friend Zim certainly used a true sportsman's skill in camping here. It is the most beautiful lake I saw; was alive with fish, and afforded fine camping ground. On a point jutting out into this beautiful lake Zim had had Joe and Philip go in during the winter and build a little log camp, so that we could be comfortable in rain or shine. It was rough, but well built, of logs throughout, and had a fireplace which was our special pride. Here we slept and took our meals, but all cooking was done outside. The first night we took enough trout for supper and breakfast. The next morning we left the home camp and pushed through a chain of lakes, connected by a fine river, with the most beautiful pools and rapids that it has ever been my good fortune to see. The water was boiling, roaring, tumbling along at such a rate that it was impossible to hear ourselves shout at the top of our voices, and in these pools we found trout everywhere. We took lunch by the side of a pool that netted us many fine fish, and one that required great skill to handle big fish in. Zim finally hooked the big one of them all, a good 4½ to 5-pounder, and had him for about five or ten minutes. Joe, Philip and myself stood in quiet water, where every little bit he would run in and jump or make a rush for an old tree top, so we had lots of opportunities to see him. He was so full of fight, and so big, we were afraid to put the net under him until he showed some signs of giving up, as he was well hooked, and it looked like only a question of time before he would be on dry land. I suppose all these things were running through his mind, because he played a trick that looked like a last effort, and saved his life. He ran up the foam to Zim's feet, and got right in the worst of it, and suddenly began doing acrobatic feats for about seventy-five feet down stream, and his last jump brought back an empty hook. I never was so disappointed about a fish, and felt sorry for Zim, to think the fish could get the better of him just when we thought he had him all but on dry land. I hope he will be there next May, and if he is, he wants to look out, because Zim has him marked.

After dinner we pushed on down the river, fishing all good pools, and crossing some fair-sized lakes, and finally made camp for the night on the banks of the river and in front of a fine piece of water, where we took many fine trout. I do not want my readers to think that we were "trout hogs," because we were not; we kept only what fish we wanted to eat; the others were unhooked and returned, unhurt. All our fishing was done with a fly.

One thing that made this trip so interesting was the fact that the guides did not know where to fish any more than we did; they knew the country, but only fished for food when in the woods, or for bait for traps in winter. When we would ask them where to fish they would say, "Fish all over, or, lots fish everywhere." I remember when we were going down the river we found a long, still water, for several miles, and Joe was asked about the fish in some likely looking places, and he would say, "Don't guess no fish, never catchum," but that he would look out. We had not gone far when Joe, whose canoe was first, stopped suddenly, and, pointing to a swirl, said, "Me see big trout jump so!" We loosened our lines and began to cast, and at the first cast Zim hooked and landed two fine trout of about 2 pounds apiece; and I was doing business of the same kind. So here, where we least expected it, we took a fine lot of fish, and then pushed on, as we were in a hurry. After this we began to look about to locate them. My method was to let my flies trail on the water, and if we got a rise, to stop and cast; and it never failed. In this way I found two or three fine places. We traveled along like this through lake and rivers, catching trout at all times and all places right in the heart of a wilderness that was a wilderness. It certainly was a glorious time to be there; the trees were just breaking bud, and while we were watching them from day to day, one could fairly see them swell and break. I have often read of spring in the North coming in with a bound, but this was my first sight of it, and it was glorious. One day we would go down a river, the trees and bushes bare, and in a few days go over the same ground and see it all changed to a beautiful, soft green. Besides the coming of spring, we had the joy of listening to the song birds, as they came along—and such songs and notes I had never heard before—I never knew we had such beautiful songsters in America. This certainly was God's country, and just as He made it, full of beauty and full of life; the birds, animals and fish are undisturbed. Some of these lakes do not see a canoe from year to year; and when we did meet a moose he would look at us as if he were wondering what we were, and where we came from. One day we ran across a cow and bull moose standing in a river, and got within seventy-five feet of them; they looked at us long enough for us to try their picture three times; but I am sorry to say, that when the picture was developed the view was beautiful, but the moose somehow were not to be seen; we had missed them. This was the chance of a lifetime.

On our way back to the home camp we revisited the river and lakes and took many trout of good size. We were in a hurry, and did not stop long, as we expected to make this trip again. While we were crossing the last lake toward home, I had my flies trailing in the middle of the lake, when suddenly my reel sang out; this gave us the tip for fish. When we got in position I found we were over a long sand bar, about two feet under water, which suddenly went into deep water. On my first cast I hooked two trout; one weighing 2½ pounds, the other about a pound. After this, whenever we went by this point, we always took a few trout of fair size.

When we got back we took it easy for a few days, fishing along the lake shore at such times as we saw fit. Here we would have fine sport at sundown. Zim was more fond of this than any other spot. It was a beautiful time of day, the birds were singing their evening song, the loons were feeding and constantly making the

been given. She offered a reward of \$100 to the person who should find the man. A strong searching party was at once formed. Steve Morse and W. Mitchel, well-known guides, finally found the lost cook. He was whittling calmly beside a fire that he had kindled. He said he knew that he was lost, and was bound not to stray any further away. He was sure that he would be found some time; was sure that he could not have strayed many miles from camp.

There is nothing like enterprise at the opening of a big game season. This time the Boston markets have eclipsed themselves in this direction. By Saturday night Faneuil Hall Market had six deer from Maine hung up by the heels. That is doing very well, indeed, in four days of open season, considering that it takes at least one day for transportation for even nearer Maine, and then there is the hunting and dragging in—oh, well, there is nothing like having one's agent out. There is nothing in the Maine game laws to prevent a sportsman, returning from Maine, sending his deer directly to Faneuil Hall Market, if he so desires. He may be sure that they will buy it.

The Massachusetts quail season has started in pretty well. Hosts of gunners were out bright and early Tuesday. Many started for their favorite covies Monday, so as to be on hand Tuesday. Mr. J. H. Jones, of Boston, has had a kindly eye on his dog all summer, and has also had in mind two or three broods of quail. He went down to Lynnfield Monday night. Tuesday morning found him in the brush. He shot six quail, one woodcock and one wood duck; considers this making a good beginning. He says: "My dog was wild, and I was worse." A number of Boston partridge hunters have gone to different points in Maine. The region beyond Farmington, in the vicinity of Varnum and Clearwater Ponds, is a favorite resort, and one or two hunting parties are there. In Oxford County, in the neighborhood of Paris and Norway, and farther up the Grand Trunk, to Bethel and Gilead, there is also a large territory of good partridge ground. In the vicinity of Mechanic Falls, Harry Pulsifer shot fifteen woodcock and two partridges in one day last week. Near Sabatis Lake, in Androscoggin County, the gunners are pretty busy, and have secured a great many woodcock and quail. It is reported that the duck are coming into Sabatis Lake earlier than usual this season. A Mr. Fred Meister has shot several black duck already. These birds are expected to reach the lakes near the seacoast later in the season.

Chatham reports say that the week was a good one for the gunners. Old gunners say that it seemed like old times to go out and get a good string of birds at every tide. Mr. Geo. H. Brown made some good bags there Tuesday and Wednesday. A number of gunners went down from Boston Saturday, on hearing the good reports.

Mr. William Garrison Reed telegraphed Saturday, from Arthurette, N. B., that he will be at home, in Boston, on Tuesday, and will bring a fine moose head, a trophy of this hunting trip. Mr. Reed has made several trips to that part of the country, and the above is not his first moose by any means. SPECIAL.

The Sportsmen's Show.

Editor Forest and Stream:

The eighth annual Sportsmen's Show, held under the auspices of the National Sportsmen's Association, will open Wednesday, March 5, 1902, at Madison Square Garden, New York city, and continue until Wednesday, March 19. It will outrival any preceding show, with no exception. The plan as now arranged promises the most picturesque show and one complete in every feature that appeals to the sportsman and every lover of outdoor sport. One of the many new and attractive features to be presented will be the fly-casting contest. This contest will attract to the show not alone the many thousand fishermen in and around New York city, but also those from a distance, so great is the enthusiasm among the lovers of this sport. There will be also rifle and revolver contests.

The trade exhibits will occupy space on the gallery, the main floor being taken up with exhibits of camps, guides, woodsmen and trappers, live game animals, game birds and game fishes, railroads and hotels from fishing and hunting sections, log cabins and new features of life in the woods. J. A. H. DRESSEL, Gen. Manager.

New Brunswick Moose.

FREDERICTON, N. B., Sept. 30.—Yesterday T. G. Strong and party, of New York, passed through the city from a hunting trip on the Miramichi. The party were delighted with their trip and most enthusiastic over New Brunswick as a field for sportsmen. The deer and moose heads forwarded to New York testified to their luck. Mr. Strong was induced to come to this Province through reading the contributions of the late F. H. Risteen in FOREST AND STREAM.

Wild Rice.

MR. CHARLES GILCHRIST, of Port Hope, Ont., who wrote the other day that a storm had devastated the wild rice fields in his vicinity, from which he had expected to gather a crop for export, sends us an interesting photograph of a bunch of wild rice grown in a pot in a back yard. It shows stalks from 5 to 9 feet high. Mr. J. D. Hallans, the grower, reports that every stalk was well headed with large grains. This shows, as Mr. Gilchrist says, that the rice will grow if properly planted.

New Jersey Game.

BAYVILLE, N. J., Oct. 4.—The black duck are beginning to come. The rains have done little harm to the quail crop, as all the flocks are large. Tide-running weakfish are here in goodly numbers, and are very large.

HERB.

wood echo with their peculiar cry, and the lake was like a mirror. At this hour, when all was quiet, we could get into the canoe, and presently a trout would jump out in the middle of the lake, and we would make for the spot and cast over the circle that he made; almost instantly he would take the fly, and then would come the fight. In this way twenty or twenty-five fish could easily be taken before dark.

One day we decided to take a trip up another river to a distant lake, where Joe said it was full of trout of the most beautiful coloring, and so it proved to be. It was a rough trip, and no one had been there for two or three years. After passing through our lake we started up a small river, and finally came to Lake Zim, named after my friend by the guides, because, they said, he was the first white man to fish it. Passing through this we again took to the river for about two and a half miles, with a large bog on either side, about one mile wide, known as the big caribou bog. The bog is trodden down with caribou paths and moose runways. I never saw so many caribou signs before. This is where the Indians get their meat for traps, because it is open country and easy to see game. They generally station themselves at a certain point, and wait until the game walks out in plain view, which, I believe, is not often very long. After passing this we came to woods again, and then another carry and some small lakes, without names, and more carries and rivers, until evening, when we reached the lake we started for. Just where to fish we did not know; but it did not take us long to find out, for the fish were all over the pond; the middle was just as good as anywhere, so we drifted along and cast in all directions, landing many fine trout, none over 1 1/4 pounds; but the colors exceeded any that we saw; they were as cold as ice. The frost had not come out of the ground, and we could hardly drive tent poles down; the springs contained a covering of mud ice. The next morning we took a few more fish and started for home. A few days later we made a second trip up this river, when we saw a bull and cow moose standing in the middle of the river, with their heads together, drinking. It was a beautiful spot, a wide stream, with meadow on either side, and a thick forest of spruce trees for a background. You cannot imagine a more beautiful picture than it made, and to think that after accommodating us with three attempts at their photographs, we did not get them in the field. We had everything in our favor, but luck was against us. I have often seen pictures of wild game, but never a better one than this. We lost the one chance in a lifetime to see a bull and cow together in such open country.

A day or so later we made another trip part way down the first river we fished, and had more fine sport, and noticed an increase of game signs. The flies by this time had begun to get pretty bad, and the moose and caribou were coming to water to get rid of them, consequently the meadows and river banks showed fresh signs daily. Fishing as we did, and traveling as fast as we did, we took six hundred fine trout, and how many more we saw I cannot tell you; if we had fished all day, hard, and counted all we could catch, I would not like to say what the score would have been, and I am proud to say that guides and sportsmen had the same spirit about the killing of fish, and that was to kill no more than we could eat.

One of the most pleasant features of this tramp was the cheerful way that Joe and Philip went to work; their one idea was to please us and make us as comfortable as possible. When night came, it was spent about the fire, if we were off in the wood, or in front of a wood fire in the little log camp, telling the usual stories, and Joe was great sport. He would try first in English, then in French, and then in Indian, and finally, after a good laugh, Philip would do his best to help him out. Joe's gestures were fine, and his deep, rich voice made it very attractive. When the time came to part we hated to leave our guides, for when men like these live together, as men do in the woods, they become very fond of each other. On this little trip I never heard an impatient or vulgar expression of any kind; it was always the same polite, willing reply. There is one thing that I cannot understand, and that is, how men can go in the woods with such guides, and make fun of them and their work; but it is done, and it is such sportsmen that never have the good will of their men. If sportsmen would remember that a guide's work is one of the greatest possible skill and experience, after years of hard knocks and often narrow escapes, that their ways are better than any suggestion that can be made by a man who spends a few weeks or days a year in the wood, I am sure that there would be fewer complaints. These men, to me, are a part of the woods; it is their home as much as it is the home of the moose, the caribou, and all that belongs there, and I love to see them about. I always look on them as some of my best friends and, after being with them for over twenty-three years, I have yet to make a complaint about my treatment. I have never yet employed one that I would not like to see again, and wish it were possible to have them all together and talk over the good old times far back in the woods. So, brother sportsmen, remember not to make fun of such men, either in the woods or at home, because I am sure they will not be mean to you after you have gone, and especially if you have been fair with them.

F. B. GUMMEY.

Long Island Black Bass.

EAST MORICHES, N. Y., Oct. 4.—*Editor Forest and Stream:* We so often hear in your paper of the wonderful catches of black bass in the West that I thought it might interest some of your readers to know that there are some good fish to be taken within easy reach of New York. On Wednesday last Scott Rayer and myself caught five bass and a quantity of yellow perch in the mill pond here. The bass ranged from 1 1/2 to 3 pounds, and the perch many of them 1 pound and over. All were caught trolling with live bait (rillies caught in the bay here), and, with light, split bamboos, afforded good sport.

I may mention that the pond is free, and that boats can be procured from the owner for a nominal fee.

P. S.—Ducks are just beginning to put in an appearance. On opening day one party got eight, the best bag I have heard of.

HY. J. GROWTAGE.

CHICAGO AND THE WEST.

Muscallunge.

CHICAGO, Ill., Oct. 5.—Mr. G. E. Highley, of the American Linseed Works, starts to-night with his friends, Mr. Richards and Mr. E. A. Gilbert, for an extended muscallunge trip along the Manitowish chain of Wisconsin. Mr. Highley is taking along one of the most complete outfits for muscallunge the writer has seen for some time, and I notice that he is partial to big, single hooks, rather than to the triple hook gangs, which, until recently, were almost exclusively used by Western muscallunge anglers. It is no unusual thing now to see a muscallunge angler going out with an outfit not very dissimilar to that for tarpon fishing—long snells of piano wire, big, bronze tarpon hooks, short and stiff rod, with big guides, wide-barreled reel, etc. The conclusion seems to be gaining ground, as stated in these columns, that muscallunge fishing to-day demands a higher art than simple trolling.

Mr. James Keeley, managing editor of the Chicago Tribune, left last night for a muscallunge trip of two or three weeks in Wisconsin. Mr. Keeley goes in at Manitowish, and he has been lucky enough to secure the services of my old trapping friend, Frank Brandis, who is conceded to be one of the best guides in Wisconsin. Brandis has that quality not always found either among guides or other men—absolute honesty and straightforwardness—and hence he is good to tie to. He will take the newspaper man up to muscallunge, if anybody can, and if Mr. Keeley does not have good luck it will be simply because he was unwise enough to start for his fishing trip upon a Friday.

Mr. W. H. Haskell, more commonly known as Bill Haskell, or old Bill Haskell, was another one to tempt fortune by starting on a fishing trip upon the unlucky day. Bill goes to the Boulder and Sand Lake chain, getting off at Woodruff. If he does not get muscallunge, and big ones, or at least if he does not come back telling he has done so, it shall, indeed, go hard. Few anglers there be of this burg who can equal the piscatorial doings of the aforesaid Bill Haskell, as depicted in the recountals of Bill Haskell aforesaid.

By the way, the amiable facility in story telling evinced by the above veteran has occasioned abundant entertainment for the Wishininne Club this week. It seems that Mayor Harrison, of Chicago, has been contributing for the past week or so for the columns of the Sunday Tribune some stories regarding men he has fished with, one of whom Bill Haskell was which. The Mayor went on to repeat, in print, some of Bill's fishing stories, including that famous one in which Bill tells how he was once wrecked on an island in the Mississippi River. He managed to save his gun and powder horn—this was in the old muzzleloading days—but lost his boat and everything else, only swimming to shore with difficulty. Thus he had a weapon, but only half the necessary provender for the same, and starvation stared him in the face. "I do not know what would have become of me," said Bill, "if it had not been that as I looked out upon the hurrying waters I saw a small, dark object come floating toward me. I looked more closely, and saw that it was my shot pouch. I seized it and was saved! After that I killed ducks enough to provide me with food until, at length, I was rescued." This story, with variations, is one of Bill's best. The Mayor insinuated that it lacked certain elements of accuracy. In return Bill has brought suit against the Mayor in the Wishininne Court, for \$500,000, and has engaged as his counsel Mr. Graham H. Harris. The trial is set for an early session, and interesting developments are expected to follow.

Pickereel.

The cold, fall weather has set not only the muscallunge but the big pickereel on the feed. A sportsman, visiting at Crystal Lake, about fifty miles from this city, in the upper part of the State, this week caught a fish weighing 22 1/2 pounds. This fish is called a "pickereel," according to the vernacular of this region, though, properly speaking, it is the great Northern pike. This is the largest specimen of the species reported from upper Illinois for several years.

Chicago Nottingham Style.

Mr. James L. Van Uxem to-day told me something about a fashion of bait casting which seems to be gaining ground in this part of the world. It will be borne in mind that Chicago has been justly famous as the mother of the art of bait casting with the short rod and three reels. Not content with perfecting this system of bait casting, Chicago now seems bent upon elaborating another system quite the reverse, and one which would be stigmatized as highly improper, if not immoral, by all practitioners of the art of bait casting, with the free reel. In brief, the bait caster of this new school uses a cane pole, as long as he can secure. He does not have any reel at all, but at about the place where the first guide would come on a casting rod, he has lashed to his cane pole a big agate guide, whose aperture is nearly as large as a lead pencil. Metal trumpet guides of equal caliber are lashed along the rod, and the tip has an agate guide of the same size. The line used is of hard enameled silk, rather larger and stiffer than can be used in bait casting with the reel. The angler uses a big spoon or a big frog, the weight not making much difference. His line he coils in the bottom of the boat, and then, standing up, with a vast sweep of his fishing engine, he hurls out the bait, to a distance of perhaps 100 feet, the line passing out readily through the big guides. The recovery is done hand over hand, and the line is coiled as before. This style of fishing is an elaboration of the ancient art of the cane pole, with a line of its own length tied fast to the tip. This Long Tom-casting, as it might perhaps well be called, is proved to be successful in killing bass. A number of Chicago fishermen practice it. As an art it was first perfected on Fox Lake, and as it is constantly practiced by the Dunnell boys, well-known shooters and fishers of that locality, it was, perhaps, they, who first perfected it. In the brains of anglers there be many schemes. Not every man can handle a free running reel, especially if it costs \$20, but he can cast with the Long Tom—unless the line happens to get caught on the seat board.

"Chicago Fly-Casting" Club.

Mr. N. C. Heston, the amiable secretary of the Chicago Fly-Casting Club, has completed the figuring of the seasonal averages of the club. The long-distance fly average is captured by Mr. A. C. Smith, with the percentage of 95.05. Mr. Smith also takes the medal for delicacy in bait-casting, 96.63 per cent. The re-entry events for Sept. 7 and 8, not earlier made public, are given below, with the average percentages for the season made by members of the club:

	Long-Distance Fly Per Cent.	Obstacle Fly, Per Cent.	Accuracy and Delicacy, Per Cent.	Bait-Casting, Per Cent.	Delicacy Bait Per Cent.	General Average
H. Ainsworth.....	89.19	94.74	93.87	88.4	86	91.30

Want an Oil Stove,

Mr. J. Edmond Strong and his friend, Mr. Selz, both of the firm of Selz, Schwab & Co., of this city, leave this week for a canoe trip of a few days in Wisconsin. They intend to do a little fishing and a little shooting and purpose camping out at night. They will probably run the Flambeau or Chippewa River. They were looking around this week for some kind of a portable oil stove which would do to heat up a tent at night. I told them they could search me. I have never yet run across a small oil stove which did not have an unfortunate way of smoking, and kerosene smoke in a close tent is not conducive to happiness. But why want a kerosene stove? Are there no branches in Gilead? Is Dan shy of all hick-matack, and is ash utterly run out in Beersheba?

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

A Month at Lake Winnipissaukee.

BOSTON, Sept. 11.—*Editor Forest and Stream:* My friend, Seaver, of East Boston, who owns the cottage at Spring Hensen, Lake Winnipissaukee, being "chained to business" during the first half of August, kindly gave me the keys and told me to make myself at home as soon as I liked. Accordingly, the last day of July saw Mrs. S. and myself, with the necessary female help, take the first train for the desired haven. The groceries and things had been sent on in advance. A couple of hours served to put the house to rights, and we soon settled down for a month's solid enjoyment. The next day the boat house was opened and the cedar lapstreak Henrietta was put into the water, fishing rods set up, and everything was made ready for a journey upon the bass, and any other fish that might come our way.

It was not until Saturday, Aug. 3, that I made my first fishing trip. Mr. J. W. Fitch, a well-known business man, of this city, has a cottage next ours, where, with his family, he put in a long summer, going early and staying late. During July and August he usually divides the time with his son George, one looking after the business end, while the other does the vacation act. It is a capital arrangement, and both seem to enjoy it. On the Saturday referred to Mr. Fitch told me he had discovered a new place for bass, and we took his boat and pulled a good, strong mile directly across from our shore, to Rattlesnake Island. We had grasshoppers and minnows for bait—the former is a favorite with Mr. Fitch, while I preferred the latter. We soon had half a dozen fish of fair size, when they apparently left for other parts of the lake. We pulled the anchor and rowed up to nearly the head of the island, where Mr. Fitch knew of another likely place. And it was here I had an experience such as never fell to my lot before, and I am still speculating as to what I really got hitched to. I have had fish get away from me before now, but I have generally known what kind of a fish it was that refused to come to the net. On this occasion I was using a lancewood fly-rod, with a 6-foot leader, new, and at the end of about 30 feet of line I had a lively minnow. I had about a yard of slack line pulled off the reel, and I patiently waited developments. Presently I observed the slack going through

the guides at a moderate rate, and I pulled off 8 or 10 feet more, and when that had gone I struck, and struck hard. There was no response at the other end of the line, such as I had good reason to expect, and I began immediately to work the reel. I recovered perhaps a dozen feet of line when there was a sudden stop, and before I could think what to do next there was a tremendous pull backward, and when I reeled in my line I found the leader parted in the middle. Of course I am still in the dark as to what kind of a fish I had hold of—had it been a bass or a salmon he would have come to the surface as soon as he could have got there—so I concluded, and that was the judgment of others to whom the incident was related, that it was one of the large lake trout which are plenty in that water. After that experience we did not fish any more that day.

The season all around the lake has been a very successful one—more people than ever before occupied the numerous cottages and camps, and the weather throughout August was delightful; we had plenty of rain, but the showers came mostly in the night. The hotels and boarding houses did a large business. The fishing was good enough for anybody. I did not get any large fish, several of 1½ pounds being the largest that fell to my rod. I did have the pleasure of seeing the biggest and handsomest bass that ever came within my vision—it was a 6-pounder, and was caught by George Fitch, at the place his father had taken me our first day out. As George and a friend were going on a bicycle trip the next day, he gave me the fish, and he was in the pot the same day. A few days after, in the same place, I had caught a number of fair-sized fish, and was reeling in one of about a pound weight; what seemed to be the mate to George's fish followed mine nearly to the surface, when he suddenly turned in toward the shore. As quickly as possible I put on a fresh minnow and cast inshore; I soon saw the fish again, but I could not get him to take hold.

During my stay I heard of quite a number of large bass being taken, the largest being one of 8½ pounds, caught near Centre Harbor. On Aug. 14 Mr. and Mrs. Seaver arrived and the sail was then put on the Henrietta, for Mr. Seaver is an expert yachtsman. My old friend Huse, of Laconia, came down to his cottage several times, and he gave me the pleasing information that his son Walter wanted me to make my next winter's visit to his cottage, on Lake Winnisquam, an invitation Walter verified when I saw him a few days later in Laconia. I was also pleased to meet Ed. Stone, the all-around sportsman; William Wallace, his fishing partner, I did not see; he was busy building a big business block in Bristol. When that job is done they will doubtless get together again, when there will be some fishing, followed by a game of pitch to see who shall clean the fish. We were at the cottage just a month, and never did the time seem to pass so quickly. There were few days when I did not either fish or roam through the fields and pastures gathering all sorts of luscious berries, which were in profusion everywhere. There will be good sport with the gun in that region this fall, as partridges were numerous. It was with reluctance that we began to make the necessary arrangements for leaving the beautiful spot where sits the "Temple Cottage," but on the last day of the month the shutters were put up, we bade adieu to the Fitches, pleasant neighbors, and early in the afternoon were again at home with the complexions of Indians and appetites to match.

WM. B. SMART.

Sport and Etiquette.

I ONCE heard a worthy and learned sportsman-judge read a lecture to a fellow angler upon the enormity and lack of sportsmanship in shooting a muscallonge before landing the fish in the boat. To put a bullet into the head of a spent 'tunge was to him like so much murder. No true angler would stoop to such a thing as shooting his fish; the proper thing to do was to club him; in fact, no other way than clubbing should be used preparatory to hauling a musky into your craft. And yet, for many good and sufficient reasons, one would judge that shooting the fish was better than clubbing. One would judge that clubbing a muscallonge in the water and fast to your line was somewhat of a risky feat unless one is adept with the club as Capt. Williams tried it. One can imagine a queer state of things, and many lost fish, until long practice made one expert. On the other hand the man with the rifle and revolver might preach his sermon on a true sportsman from his side of the fence, and argue that brutality and the club were synonymous.

Then comes the man who scorns gaff, club and pistol, and prides himself upon landing his fish upon the shingle beach, leaving his boat to do. This man would turn his back upon the gaffer, the clubber and the gunner.

Then again, after a fisherman has cast his lure and set the hook in the salmon, or other gamy denizen of the deep, does the fact that the fish is fast to his line give him license to possess the fish by hook or by crook, or is there a recognized but unwritten law that the fish shall be played until "drowned?" Is it sportsmanlike, with your salmon sulking and but quarter killed, to have the guide lean the boat and gaff the fish before the battle is half over? or having hooked him in a sportsmanlike manner by scientific casting with leader and fly, is one licensed to land his fish "any old way"—as long as he gets him? It is very interesting to hear these points argued pro and con.

The man who never used a worm or bait will scout the man who puts the wriggling worm upon his hook to lure the fickle trout, thinking him no better than the man who drops a pickerel hook, weighted with lead, among the spawning trout and drags them to their death.

Then we go a step further and we find the man who casts his fly and lands his fish, and as quickly returns him to the water, consistently refusing to eat trout either at the camp or one the hotel table. There are such men who carry the idea to that extent. The bait and fly fisherman, and the clubber and the gunner, can argue and argue, yet still be of the same opinion, but one point few will disagree upon, and that is, that the fish be given a fighting chance for his life.

Compare the landing of a two or three pound trout by means of a sapling, a chalk line, a blued steel cod-hook, and a strip of salt pork, with the playing and land-

ing of a similar fish on a five-ounce rod, with suitable accessories! In one case it is mere brute killing force, much like striking the waiting steer in the shambles with the death-dealing hammer. Unless the hook tears loose, or the line or rod break—the latter an unlikely happening—the fish must come. Such work, in a cod or mackerel sense, is fishing pure and simple, and I presume the camp cook, enjoined to have a trout dinner for the crew, anchors his boat at the outlet of the brook into the lake and goes about things in a business-like way. He has a score or more of famished timber-fellers anxious for a change over from beans and pork to satisfy, and the idea of sport or playing a fish never for a moment enters his head. To witness such a slaughter would turn a true sportsman's head, even to the extent of a desire to murder the cook in just such a manner as he was murdering the trout.

Then there is the angler who scorns the orthodox muscallonge, or landlocked salmon lure, and who retains the spoon, but only one of the three hooks. He exclaims in defence of his idea that he wishes to give the fish a chance, and if he cannot land his fish with one hook, then the fish can go his way.

Certainly there is method in this man's madness, if any of you will so call it. The late President Arthur once played a salmon for hours—how many I do not now remember—and when the stubborn fish was lifted with gaff over the side of the boat, and lay gasping upon the boat's bottom, the loosening of the tension of the line and the movement of the jaws of the fish were sufficient to allow the fly hook to drop from its mouth. Had Mr. Arthur been obliged to pry from the upper and lower jaws of that salmon a three-pronged hook, how much comparative satisfaction would there have been between the two situations? He could look at his fly-caught salmon and feel no inward pang of consciousness accusing him of taking undue and unfair advantage. The fish had a chance for its life, and this is at the bottom of all true sport. The farmer's boy who creeps around the "sloo," within gunshot of the mallard, but who forces the duck to take wing before firing, instead of potting him upon the water, has in him the making of a sportsman. He believes in giving the bird a show. That boy will never be guilty of emptying two barrels into a bunch of quail huddled into a fence corner. When he has grown to the dignity of manhood, you will be very apt to find a fly-rod and a hammerless gun of good make in his possession.

I am inclined to think that the late Mr. Cheney was just such a boy when on the farm. He knew the lurking place of the trout, and the home of the quail and the partridge, and the corn where the woodcock bored, yet to him I'll opine the set line and the snare were unknown.

Every man to his own ideas as regards the various steps and degrees in true sportsmanship. This is as it has been, and always will be.

The Fountain of Youth.

OUR at my old home in New Jersey we had a famous spring of cold water; a barrel had been let down into the ground for the water, and in this was a huge trout. The fish was exceedingly tame, and we were accustomed, when going for water, to throw in to him bread crumbs and other delicacies, which he would go for with a rush, and on occasion a tremendous strike. One day grandfather came to visit us, a dear, old man, from his farm in Massachusetts. At the dinner table the clear, cold water was the subject of his enthusiastic praises, and he was told of the spring; but no one considered it worth while to say anything about the trout. Later in the day the old man thought he would like a drink of that spring water, so out he went, kneeled down by the barrel, took his hat off, stooped over and rested a hand on either side of the spring, put his mouth down in an easy, satisfied sort of a way to the surface, and had just touched the tip of his nose to the water when there came a whisk, flap and splash, and with a double-back-action handspring the old man just saved his nose. If you had been there to see the agility he displayed you would have agreed with the rest of us that there was nothing more potent to make an old man young again than a big trout in a spring. We named that spring right there and then the "Fountain of Youth."

Canadian Angling Licenses.

TORONTO, Ont., Sept. 24.—*Editor Forest and Stream:* In your issue of the 19th ult. you publish a letter from Mr. J. B. Townsend, Jr., of Philadelphia, who complains that when on an angling excursion in Nova Scotia he had been unjustly treated by the Fisheries Department of this country. The editorial comment you make on the matter would create the impression that this alleged injustice was the result of regulations in force in all parts of Canada. Now this impression is erroneous, as far as the Province of Ontario is concerned. The laws regulating the fisheries laws are administered by Provincial officials, and all fees from licenses or permits are payable to the Province. We never exact fees from people who come here to fish, and who employ our guides and board at our hotels. If, however, they merely cross a boundary river in their own boats, a fee is demanded, as coming to our waters in that way could not be regarded as a "temporary domicile." Now, we have a Province with an area of 222,000 square miles where all are welcome to fish. The only reserve is the Nipigon, where fees are charged to all anglers, Canadian or foreign, and it is well worth the money demanded.

W. R. WOOD, Fishery Overseer.

Fishery Overseer A. M. Hatfield, of Arcadia, N. S., one of the officials concerned in the Townsend affair, sends us a letter published by him in the Yarmouth Herald, in which he explains as to the purpose of the law: "The law first passed excluded all foreigners, which would be unjust, as there are many who are not British subjects doing business in the country, who are temporarily domiciled, such as consuls, agents, miners and many others who perhaps are doing no business at all, but who would be entitled to the benefit of the exemption clause."

Staten Island Netters.

PRINCE'S BAY, N. Y., Oct. 7.—*Editor Forest and Stream:* The five Italians who were caught illegally hauling a net off the "Sods," at Gifford's, on the 27th of last month, were brought to the Court of Special Sessions last week, and the "bunch" was fined \$200. They pleaded guilty, and a strong plea of mercy addressed to the court helped them out somewhat. Their net was destroyed and, take it altogether, it was rather an expensive morning's work for the netters.

100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

74

A cave was discovered in Montgomery county, Kansas, which has been explored to a distance of fourteen miles. No one has been able yet to reach its underground terminus, so it is not known how far into the earth it extends. The party of hunters who made the discovery went into it until they had reached a point fourteen miles from its mouth, as measured by a cyclometer of a bicycle, which they had along. Then further ingress was effectually stopped by a deep and rapid subterranean stream which crossed their path almost at right angles. The cave is about 20 feet wide and 15 feet high. Along the side of and opening into the main hall of the cave are a number of grottos. A chilly wind continually blows from the cave's mouth.

The Kennel.

The Old Black Fox.

MORGANTOWN, W. Va.—*Editor Forest and Stream:* Each kind of sport has its peculiar charms. In reading some very interesting accounts of fox hunts in recent numbers of FOREST AND STREAM, which I enjoyed very much, my mind has gone back to an interesting old fox which baffled all his pursuers for several years.

He looked jet black, especially on snow, and was known as the black fox. His range was along Blacklick Creek, in Cambria county, Pa. My brother and John Fyock, who owned two fox hounds as good as could be found, and myself, journeyed ten miles from our home to this section for a week's fox hunt, as there were a number of gray foxes there. We knew nothing of the black fox or his history at that time. We were joined there by two other parties, each of whom had a hound.

The first morning we started out with three of the dogs, the party with the fourth dog being a little behind time in appearing at the place of starting. All conditions were most favorable. There had been a deep snow, which was crusted over, so that a man could walk over the top, and about an inch of fresh snow on top. We led our dogs and decided not to let them go unless on the fresh trail of a gray fox, for we did not want any such races as an old red fox was likely to give.

We had only gone a mile, when we struck the fresh-looking track of a gray fox. John let loose one of his dogs, which he could call off at will, to determine how fresh the track was. The dog went down through the woods and into the laurel at a rate that assured us it must be very fresh. One of the dogs—Old Moody—which was the one we were especially cautioned not to let loose until the game was started, broke away from Charley C., who was leading him. Charley made a grab after him and caught his long, slim tail, and held on desperately. Old Moody started down the steep hill, peeling forth his "dinner-horn" notes, eager to join the chase, while Charley slid like a toboggan on top of the snow, affording no little merriment for the rest of us. We knew that if Moody ever got off on the wrong trail and happened to strike a red fox, he was gone for all day, regardless of where it went. In the midst of the excitement we received orders from John to turn everything loose, for the fox was started.

Down the creek they went, making music fit for a

king, and we all scattered out and took our stands to await their return. Presently we heard the dog belonging to the other party, who was behind us, coming down through the woods in full cry, apparently on the same trail, but soon I saw the object of his pursuit, in what appeared to me to be a black fox, passing away below me, but too far away for a good shot. As the other dogs were then coming back up the creek with their fox, I knew it must be another fox. I shot at it, but without any effect other than to quicken its gait. As the three dogs drew near to the one, he left his fox and joined them. After a short run a report from John's gun and a whoop told that the chase was over, and that we had our fox.

Then the mystery of the identity of the other fox began to settle around us. I went to where it had passed in my sight, and instead of the track of a gray fox, there was the long and unusually large track of what appeared to be a red fox. As all fox hunters know, there is a very noticeable difference in their tracks. As I declared it was not a red fox, we put the dogs on the track, and the chase was on again.

We followed after for nearly a mile, till we found them circling back, when we scattered and sought likely places for a shot. In about an hour the dogs had circled around us and gone entirely out of hearing. After waiting quite a while without hearing them, we all got together by signals, and one of the boys reported that the fox had come within a very few steps of him, affording a dead sure shot, and his gun missed fire. No one else had seen it; but he said it was "sure enough" black. We waited until about noon without hearing the dogs, and then started to our headquarters to have dinner and reflect on the unpleasant possibility of losing our dogs. Up to this time we knew nothing of the old fox, and naturally were in a deep mystery, as the color of the fox, which we, of course, still thought must be a very dark gray one, and its track and way of running did not correspond.

We had our dinner and spent the afternoon about the house, always keeping an ear open for the faintest sound from the dogs, fully knowing that they would run till night at least, if the fox did not hole.

Late in the evening, about a half-hour before dark, we heard them away across the creek, coming from the north, and headed for the place where the fox had started in the morning. It was a full mile from the house to a crossing, where we all knew well he would cross the pike. It was evidently not over a mile from where the dogs were to the crossing, but a very rough country. There seemed no possibility of getting there ahead of the fox, but the question with us was whether we could reach the crossing in time to take off the dogs.

I ran to the house, grabbed my old single-barrel, muzzle-loading, shotgun, without waiting for any ammunition and started for the crossing, out the road a half-mile to the pike, then down the pike to the creek, across the creek and up a steep grade for fifty rods. I was just approaching my stand, gasping for breath and wondering if the chase had gone by (for I had been too busy getting there to stop and listen), when the fox came over the brow of the hill 40 yards away. We were both out in an open field, and, of course, saw each other at the same instant. Two jumps took him back out of sight, but with a last, mighty effort, I got in a shot just as his rear end went out of sight. Running up a few steps, where I could look over the top of the hill, I saw him out in the field, only a short distance away, and making very poor time, but as I had no more shots to give him, I could only watch him.

One hind leg was broken, and he seemed generally used up, but not fatally hurt. Before he was out of sight the dogs came to me where the fox had turned, thus giving me an opportunity to call them to me and catch the two leaders.

I was more pleased when I had a firm hold on the dogs than if I had killed two foxes, for we had about given them up for lost and were ready to vote our hunt at an end. I took off my suspenders and with them tied and led the two dogs, while the third followed me. One of them having given out on the trail, was brought home later on a sled.

We started out early the next morning, and took up the trail where I had taken the dogs off, and in a very little while we had the fox up and going. After an exciting chase of an hour the dogs caught it. We all met after the chase at the White mill, a place where several families lived, and there had a change for a good look at the mysterious fox, and also learned from those living there something of its history. It was an old-timer, known to all the people at the mill as the black fox, which had been chased time after time, but always went so far that their dogs would give it up and come home.

We learned from a party who had seen the chase after they left us on the first morning, that they had crossed the pike ten miles from where it started. As the dogs were fast runners and had a run of at least eight hours after it the first day, the distance covered must have been something wonderful. The real color was a mixture of black, gray and red, the black prevailing, so that it looked jet black at a distance on the snow.

We continued our hunt four days, and started and killed a fox each day, making an enjoyable hunt, but the crowning victory was the undoing of the old, black fox, or cross fox, as he might properly be called.

EMERSON CARNEY.

Points and Flushes.

Prof. Edm. H. Osthaus, whose fame as an artist of field scenes whose theme is dog and gun, is equaled by none, was a visitor in New York two or three days, leaving on Monday of this week for the Pan-American Exposition. Later, he contemplates a visit to the field trials, where the small dog and the quail bird are the observed.

Mr. S. C. Bradley, secretary of the Eastern Field Trial Club, leaves for North Carolina on Wednesday of this week, where he will remain till late in December, or until after the field trials of his club are concluded.

Canoeing.

'Mid Reef and Rapid.—XXIV.

BY F. R. WEBB.

We had frequently had high waters in our several cruises on this stream, but never before had we had an experience so unique and thrilling as we enjoyed for the next two days, in shooting swiftly down the river on the top of this great flood. The river spread high up among the trees, and out over the tops of the bush-lined banks, which could not be seen, as we skirted swiftly past; generally near one side or the other—seldom in midstream. It spread across, in surging, brick-red flood, from one line of trees to the other—rocks, reefs, falls, fish-dams—everything obliterated and deep down out of sight, below the thick, red surface, with not a ripple or break to mark their locations. The river was, for the most part, smooth—and the surface looked still, and flat, and waveless, but was really continually broken into long lines of smooth, crestless swells, which tossed us gently up and down, with a never-ceasing, gently undulating movement, which gave us a curious, half-seasick sensation.

We seemed but as straws, and felt singularly puny and insignificant in the grasp of the whirling flood, which raced us along at a good seven or eight miles an hour. It was exhilarating—the rate at which we swung along—past trees, bluffs and headlands, around whose bases and through whose overhanging branches the water boiled and surged; but it was awe-inspiring, also; and a curious feeling of utter helplessness took firm hold upon our minds as we were carried irresistibly down.

The usual long falls and rapids were completely obliterated—smoothed over by the flood; which seemed to find one general, level, down-hill grade, over pools, rapids and falls, as it rushed smoothly along.

The water, without apparent cause, frequently broke up from below, in great, boiling, fountain-like, surges, which swung round and round in huge circles, like whirlpools, and in which our light canoes were caught up and spun round, end for end, like teetotums, all efforts to change which circular motion with our paddles proving as puny and futile as, though we were using straws or twigs.

The river would occasionally break up into vast rapids, the like of which we had never before seen or imagined on this stream, whose tremendous waves threw their splashing crests high in air. We took good care to avoid these rapids, as far as possible, by skirting along close in under the bank, when one was sighted, and keeping out of the rough water as much as possible; but when caught in one, as we occasionally were, our canoes rode the tremendous waves with wonderful buoyancy, sweeping from crest to crest with remarkable lightness. The experience was a thrilling one, as a canoe would swing up a great, liquid slope and hang balanced an instant on the brick-red, foaming pinnacle of a huge roller, with bow and stern projecting out of the water; then the bow would dip and the canoe slide down the slope, with an inclination which made her astonished crew feel she was pointed straight for the bottom of the river, while the big wave ahead would rear itself up on end, like a hill, until it seemed about to fall upon his devoted head; the canoe would rise, however, and climb the slope, standing on end until her crew would instinctively grasp the gunwales with both hands to keep from sliding out behind, while the spray from the splashing crest ran in sheets down over her inclined decks and hatches.

"Do you note," asked Lacy, after, by strenuous efforts, we had dodged one of these rapids—"Do you note how much difference there is in controlling the canoes on this water? Now, for instance, on ordinary water, if you wish to avoid an obstacle, you dip your paddle into the water, the canoe responds easily and quickly, and with a stroke, or turn, you turn aside, or swing the canoe away from or around the obstruction."

"That won't do on this water!" exclaimed George. "The only way to avoid an overhanging tree, or a rapid, or other object here, is to size it up a long way ahead—100 yards or so—and turn your canoe squarely across the stream from it, and paddle hard."

"I have already noticed it," said I; "and have been working on that plan all along."

"So have I," added Lacy. "That was just what I was speaking about."

Great masses of driftwood—floating logs, fence rails, planks, etc., strewed the surface of the river, and we took good care to give these unwelcome neighbors a wide berth. Occasionally whole trees would be encountered, floating along, nearly submerged, their tops trembling and rolling as the lower branches occasionally caught on the submerged rocks and reefs, many feet below.

We passed over the remains of Long's dam with just a slight downward swoop of the canoes, as we went over, but not a wavelet raised its crest below; and the river swept over the steep, rough rapid, just below the dam, as smooth and crestless as over the still pool which follows the rapid.

We landed at the little white house upon the bluff, a mile below Long's, for a drink of water, and to procure some canteloupes, grapes and apples; and, while ashore, we walked down some 100 yards or so to inspect the old stone dam below, fearing that the water might prove rough, but not a ripple marked the spot.

We reached Massanutton, eight miles below our camp, in an hour from the time we started, and landed alongside the ferryboat for mail and supplies, to the immense astonishment of the natives, who gathered in a wondering, warning group on the ferryboat, and on the high bank above—now not much higher than the water—as we re-embarked and pushed off again.

There was a smooth dip of several feet over the dam at Mauk's mill, around the bend a mile below, and the water broke up considerably below the dam, but we passed over, and through the rough water, without wetting our decks. Not a ripple marked the location of the long, rocky "Pig-path" falls.

As we rounded the bend and bore swiftly down on the Bixler dam, several miles below the "Pig-path," the huge waves below the dam could be seen, tossing their splashing crests high in the air, while the whole line of

the dam was marked by a shower of spouting, splashing foam and spray. We paddled briskly over to near the left bank, however, where we knew the dam to be lowest, and where the shooting crests below looked least, and continued on our way down upon the dam.

When close enough to see over the crest into the seething maelstrom below, we made the appalling discovery that the drop over the dam was six or eight feet deep. The water rolled in a long, smooth incline down into this gulf, while below the whole river stood straight up on end, in a wall, reaching across from shore to shore, parallel with, and fully as high, as the dam itself; the crest of the wall being composed of leaping and spouting masses of water, torn and ragged, and throwing their foaming crests of spray many feet in the air. Great jets of muddy water spouted like intermittent fountains high above the wavering crest of the wall, to fall back in a shower of muddy spray, far and wide. It was forty feet from the crest of the dam down the smooth six or eight feet incline, and up to the overhanging, tumbling crest of the watery wall at its foot.

All this we took in during the brief glance vouchsafed us, as we bore swiftly and helplessly down upon it. We were amazed—horrified—but we were in the remorseless clutch of the flood, and there was no possible alternative for us but to go over; so, with hatches tightly closed, and with aprons drawn up to our chins, we headed our canoes straight down the slope, and took the plunge.

I was a little in the lead; my canoe swooped with a dizzying swing down the hill, while I grasped my gunwales with both hands, and held my apron tightly down at the aft corners of the cockpit, my paddle, meanwhile, balanced across my lap. As my canoe reached the towering wall ahead I firmly closed my mouth and eyes, and held my breath. My canoe buried her sharp nose full in the breast of the wall of water in front, and, with a swish, dived right through. The water rolled in a solid mass a couple of feet deep over my decks and hatches, and passed smoothly off astern, while the light, foamy crest of the wave passed clear over my head, almost carrying away my cork helmet. My arms, shoulders and breast above the apron, as well as my face, were drenched, but I did not ship a pint of water.

As my canoe pitched up and down like a cork on the tumultuous waves below, I turned to have a look at the others. George was pitching up and down a length or two astern of me, and a little to one side, while Lacy was nowhere in sight. An instant later the sharp bow of his canoe broke through the huge wall astern, and was uplifted, so that I got a momentary glimpse along her keel and her black, dripping hull, for half her length, before she shot through and dropped into the red turmoil below, and came, rising and falling, after us.

"Whew!" said Lacy, as he wiped the streaming water from his fame; "I took a bucketful of water there!"

"Bucketful! I took a tubful!" exclaimed George, scornfully, as he wrung out his dripping sleeves.

"The next time we run a mill-dam like that," I exclaimed, "we'll land a mile or so above, and walk down and reconnoiter it first! Let's land at the mill and get a drink!"

The canoes were headed quartering up stream and paddled across the river to the side where the mill and the surrounding houses stood—by brisk paddling we managed to make the shore a quarter of a mile below—after which we walked up to the mill and got a drink, and George kodaked the fall over the dam, while we lay on the bank and enjoyed a little rest.

We noted curiously the changed aspect of the familiar valley, as we bowled along swiftly down it. We were now lifted high above all former levels—high enough to look out of the deep, narrow trough of the river, and see over the banks, and get a view of the country through which we were cruising, much as one sees the country when driving along a road; consequently, the various reaches of the river opened to our view new landscapes and bits of scenery not heretofore known. Fields and farms became visible, where only forests—as indicated by the heavy timber along the river banks—were known before. Houses—only heretofore indicated by roofs or chimneys, or even entirely unsuspected—became fully revealed; and we discovered what we really had known before, but hardly realized, and certainly would never have known from the visible indications along the river—that this part of the valley was really a fairly well settled region, instead of the wilderness it had always appeared to be.

George's bugle was brought into frequent and active requisition, and many were the lusty blasts and ear-piercing discords which he delivered himself of, whenever a farmhouse was sighted within audible distance, while the echoes rang again from the deep gorges and rocky slopes of old Massanutton, towering aloft on our left, ever close at hand. The blasts were sure to be answered with an inevitable "Whoo-ee!" from somewhere inland, and people would be observed flocking to windows, and out of doors, and streaming down into door-yards, to gaze, with hands to foreheads, shading eyes, at our little fleet, as we shot swiftly past; the brightly painted canoes, with the little silk pennants fluttering fore and aft in the breeze, presenting bright little bits of color and movement on the great, brick-red expanse of the river, and always attracting attention and comment; and many were the hails and requests to come ashore which we received; while the adolescent population, of both sexes, and all ages, sizes and colors, would invariably flock down to the water's edge on the run, and accompany us along the bank as fast and as far as intervening circumstances in the shape of fences, cliffs and gullies would permit, meantime keeping up a running fire of requests for "mister" to "please play that horn some more!" with frequent queries as to why Lacy and I did not also carry horns.

In a couple of hours more we reached Goode's dam. The Bumgardner Falls and Keyser's Falls, covering the three or four miles above, being smoothed over in the same general level, and varied by the same peculiar, long, crestless swells and vast whirlpool surges which had characterized the river above all the morning.

Profiting by our rough experience at Bixler's, we did not carelessly swoop down on this big, high dam, but made a landing a quarter of a mile above and walked down to reconnoiter.

We found—as we had long ago noted—that making a

A Summary of the Cup Races for 1901.

THE races for the America's Cup for the season of 1901 are now over, with the splendid record of three straight in favor of the American boat, Columbia. It is not in a boasting spirit that we say three straight, because every race was closely contested over the entire course from start to finish. It is conceded on every hand that never before in the history of yacht racing have there been such splendid contests. The two boats were most evenly matched, and while there was a dissimilarity in their appearances, yet from the fact that but 43s. time allowance had to be conceded by Shamrock, it can be seen that the boats were quite a little alike. It seems astonishing that after many trials during the long period of fifty years American boats have proved themselves better in most every way than anything that Great Britain has produced, and yet, although Shamrock II. is a wonderful craft, Columbia was even better. The contests were closer than ever before, and for that reason were intensely interesting. In no race held during the last half-century was the margin of safety so small as it was in the recent races, for it must be admitted that the Cup was really in danger of being lost.

The first race, or, rather, the first attempt, as the race was unfinished on account of lack of breeze, gave an opportunity to compare the relative speeds of the two boats for the first time. Capt. Barr got the best of the start, which was not altogether surprising, when it is considered that Capt. Sycamore had not been in a race for many weeks, and was therefore a little out of practice. The breeze was fluky and Columbia was favored, and hasty conclusions were reached on all sides to the detriment of Shamrock. These deductions proved wholly inaccurate two days later, when she gave Columbia a severe tussle in a fifteen-mile to windward and leeward race. The result of the first attempt was unsatisfactory, there being no race, although Columbia was well in the lead when the time limit expired. This proved nothing, as the advantages she had gained had been due to her being favored by the fluky breeze that prevailed. On the windward leg of this race Shamrock footed faster than Columbia, but did not point as high, and the extra speed did not offset the leeway she made.

In the race on Saturday, the second time the boats met and in a finished contest, Shamrock's performances won the respect of everybody who witnessed the race. Her windward work was most surprising, and the showing she made going down the wind was disappointing, for it was on this point of sailing that it was thought that she would be far superior to Columbia. This race was indeed a close one. Shamrock got the best of the start and held her lead all the way to the weather mark, beating Columbia to this point by 39s. When Shamrock rounded the outer mark in the lead, it was generally thought that the race was hers, because her larger spread of canvas would naturally take her down the wind fast enough to make the winner. But Capt. Barr had no idea of losing, and he astonished every one, working Columbia to the front and beating his adversary on the run home, and finished a winner by 1m. and 20s. The performances of these boats in the windward leg were the reverse of Thursday, Shamrock pointing higher and footing almost as fast as Columbia. This day's racing demonstrated that there was but little to choose between the two boats on windward work; in fact, Shamrock seemed an almost perfect match for Columbia on every point of sailing.

When the first race was called off by the Regatta Committee, Columbia was in the lead, but on Tuesday, under similar conditions, when that race was abandoned, Shamrock was well in the lead, thus showing of what little value conclusions are when reached under such circumstances.

On Thursday, when the second finished race was sailed, the conditions were most satisfactory for the racing of modern boats. A strong, steady breeze prevailed through the entire day, and sent the boats over the triangular course in record time. Columbia, however, proved herself a better boat than Shamrock, to the satisfaction of all. It was a reach to the first mark, and although Columbia got the poorest position at the start, she gained 22s. on this leg. On the second leg, which was also a reach, with the wind on the starboard beam, she gained 30s. From the second mark to the finish line it was a beat, and Columbia started on this leg to leeward, but slowly and surely worked out to windward and into the lead. On this leg Columbia gained 2m., and again finished a winner by 3m. and 35s., showing conclusively that under the existing conditions of wind and sea she was Shamrock's superior.

The race of Friday was the last and deciding one of the series, and was indeed a rare one, the entire credit of which should go to Capt. Barr. Shamrock outfooted Columbia down the wind, and led at the outer mark. It was at this point that Barr displayed his wonderful skill as a skipper. After a long, hard fight he finally worked his boat to the edge of the better breeze along the Jersey shore, and brought Columbia to the front, notwithstanding the fact that Shamrock had crossed the finish line by 2s. in advance of Columbia, the latter winning on time allowance by 41s. The close finish of this race made a fitting ending for the greatest contests that have ever been sailed in defense of any cup. Columbia's uniform success was largely due to the ability of Capt. Charles Barr and to the wisdom of Mr. E. D. Morgan in not interfering with the sailing master's work. A word of praise is also due to Columbia's crew. It has been said that the men were the equals in discipline and seamanship of the crew of Britannia, the cutter formerly owned by the Prince of Wales.

Probably no feature of Shamrock's performances elicited more admiration than did her windward work, which left nothing to be desired. In a strong wind and smooth sea she pointed well and footed very fast. Off the wind, however, the results were disappointing. Her sail area was much greater than that of Columbia, and it is therefore difficult to understand why she did not make a better showing. One thing could have been done that would have helped her very materially, which was that when running her crew should have been placed about the mast instead of way out on her stern, the result being that the boat seemed to drag her stern and to cock up

hanged!" he exclaimed, "if there ain't the boats under the tents!" It was even so, as closer examination on the part of the entire party proved. I suppose they at first thought we were running the river in one of the heavy, wooden boats moored at our camp—a not unreasonable supposition. The old man who had ferried them across remained after the others had started up the hill. He informed me that he was the man of all work about the place above, and that, from having formerly been to sea, he was familiarly known as the Commodore. He and his wife lived in a little cabin half-way up the hill. He went up and presently returned with the old lady, to whom he showed the wonders of the camp, with a pride and self-complacency in his superior knowledge of boats quite amusing, giving her little bits of second-hand information about the construction or use of this, that or the other thing, which he had obtained from us but a few minutes before, with an air of pride, as though he knew it all himself, and to each and every article shown and explained, from the camp stove to the canoes, the old lady rejoined with an amazed, "Well, u-pun my word an' honor! I never saw anything like that in my life before, and—"

"Did he lift the canoes to show their weight?" asked Lacy, refilling his pipe from a little bag of tobacco, which he took from one of the pockets of his canoe, within reach of which he was sitting.

"Oh, yes!" I replied, laughing. "Of all the exasperating things," said Lacy, throwing the tobacco bag carelessly back into the canoe and striking a match on a rock at his feet, "which camp visitors do" (applying the match to his pipe) "picking up a canoe by one end to feel its weight" (puff, puff) "after you have gotten it carefully balanced and propped for the night" (puff, puff, puff) "is, to me, the most exasperating" (puff, puff). "You have to go to work, and adjust it all over again" (throwing the match away) "and then—"

"Yes," said George, with a laugh, "it is provoking, and there is always danger that the sharp-pointed pieces of wood, under the gunwales at each side, which are stuck in the ground to hold the boat in position, will pierce through the canvas when the canoe is let down again, for it is generally dropped heavily. I once had a hole punched in my boat that way, in one of our cruises. The river is still rising," he continued, as he knocked the ashes out of his little, double-decked meerschaum and sauntered over to his tent, and prepared to turn in.

"Yes," I replied, as I stepped down to the water's edge and took a look, "it has risen several feet since we arrived here, but I hardly think it will reach us, and it will be falling by morning."

"How much of a rise has it been, Commodore, do you think?" called Lacy, from within his tent.

"Well, from 16 to 18ft., I should judge," I replied, as I fixed my lamp ready for reading, and snuggled into my blankets.

[TO BE CONTINUED.]

Yachting.

THE tremendous effort which Sir Thomas Lipton has made on two separate occasions to win the America's Cup has given us something of an insight into this gentleman's character. He has been a most successful merchant, and he attributes his progress in life to his untiring energy and persistency. No such word as fail is to be found in his vocabulary, and he plays as he works, with never a thought of anything except that of winning. His defeat in the second attempt to carry back home with him the much-coveted trophy, instead of discouraging the man, seems to have stimulated his efforts to make a third trial, and it is stated that there is already a possibility of his challenging again. He is certainly the most graceful loser and has shown so much enthusiasm that we could have wished he might have won at least one race.

In the event, however, of Sir Thomas concluding not to make a further attempt, there will be other challengers, it already being rumored that Mr. Peter Donaldson, the well-known Scotch yachtsman, is at the head of a syndicate which stands ready to build a challenger. This would afford that capable designer, Mr. William Fife, Jr., another opportunity to regain his laurels, as Mr. Donaldson has always sailed and thoroughly believes in Fife boats.

Rumor has it also that the Emperor of Germany may forward a challenge, in which case the interest would be intense. A Canadian syndicate is also in the field, so that at this writing it does not seem as though we would be at a loss for challengers, and there is now a possibility of a race during the coming year.

We were much surprised to see the following article in that unusually accurate and splendid publication, Outlook, in its issue of Oct. 5: "It would be hard to imagine a closer race or a more exciting one than that of last Saturday for the Queen's Cup, or, as Americans prefer to call it, America's Cup." The Cup in question was subscribed for by the members of the Royal Yacht Squadron and presented to the schooner America as the prize in a race around the Isle of Wight on Aug. 22, 1851. It is sometimes known as the 100 Guinea Cup.

A sad accident occurred on Thursday to one of the crew of Mrs. Robert Goelet's steam yacht Nahma. The man's name was Hector Hewitt. He was at work with several of the men putting the quarter deck awning in place, when he fell overboard and was drowned. It is thought that Hewitt was struck by one of the propellers of the Chester W. Chapin, which was closely following the Nahma, as the body was not seen afterward. Not a moment was lost in the effort to save Hewitt's life. A gig which hung from the davits on Nahma's port quarter was instantly lowered, and in charge of an officer and three men went to the place where the man fell. There was no excitement, and this was due in no small degree to the splendid discipline that is always noticeable on ships that are manned by English crews. The accident brought to light the fact that Hewitt could not swim, and it is a well-known fact that nearly all sailors are deficient in this most important part of their training. Hewitt was twenty-five years old and a native of Essex county, England.

landing at this stage was an operation requiring great care, and one both difficult and dangerous, as the banks for the most part were overgrown with overhanging trees, whose drooping branches projected far out into the water, which rushed through them with a force which was certain to swamp a canoe if caught in among them.

We found, to our relief, that while the water rushed over Goode's dam in a horrible flood, which was certain to swamp our canoes in spite of closed hatches and aprons, the water flowed over the famous shoot, up under the left bank, in a long, smooth tongue, which promised us a free, safe passage, so, returning to our canoes and pushing out into the flood again, carefully avoiding the water-logged trees and bushes, we dropped down close along the bank and made the shoot without wetting our decks.

Our old Cedar Point camp ground was a mile below this dam, and, as it was 2 o'clock, we slipped in cautiously among the trees and made a landing here for lunch. Our usual camp ground was some 6 or 8ft. beneath our keels, as we paddled over it, but the bank rose steeply up behind it in a high bluff, and a good, clear, dry landing was readily found.

"I say," exclaimed Lacy, with his mouth full of ham sandwich, while he shucked a hard-boiled egg to keep the sandwich company, "what's the matter with camping here? There's no rush; we've made a good day's run to-day, and can easily make Riverton by the middle of the afternoon to-morrow on this water, and it has been rather crampsome, sitting in the canoes all morning."

"Well, it suits me well enough," said George.

"I think it a capital idea, myself," I added. "In fact, it will be hard to find a good camping place for to-night below. All of our old camping places are under water, and I really cannot think of any place else for to-night, and I expect we had better not pass here."

"I think you are right," George assented. "The river's still rising rapidly—it has risen over a foot since we landed here, less than an hour ago," consulting as he spoke a mark he had improvised, in the shape of a stick driven into the ground at the water's edge, which now stood some 3ft. or more out in the water, which was climbing up it at a rapid rate. "This place is both dry and safe, with this bluff behind us," he continued, as he resumed his seat on his camp stool. "We can put the canoes well up the bank out of reach of the water, and we can tie the up-stream painters to the trees, and even if the water does reach us, which isn't at all likely, we will simply float alongside of the bank until morning."

The canoes were in due time carried well up on the side of the high bluff, which here rises in a steep hill, to the height of a couple of hundred feet or more above the river, and the tents erected over them.

Frankie was still leaking a little, and before making my tent up for the night, I turned her bottom upward, and an examination showed that the little cut I had daubed with asphaltum up at the Columbian Falls camp was still leaking. A good, substantial patch was carefully plastered on in the regular manner, and I experienced no further trouble on this score during the remainder of this cruise.

We were well acquainted here. Mr. Fleming's house—a large, two-story frame structure, quite above the average of farmhouses—occupies a commanding position on the summit of the high bluff. After supper we all went up there, and George borrowed Mr. Fleming's cellar for an hour, while he changed his glass plates and kodak rolls.

"I wonder what's become of the Commodore?" mused George, as we were seated around a little blaze of a camp-fire, enjoying our evening smoke, after returning to our camp.

"Who's the Commodore?" asked Lacy, removing his pipe from his lips and blowing the smoke in a long, spiral curl from one corner of his mouth, which he watched lazily, as he spoke. "I thought there was but one Commodore?"

"So did I," I replied, laughing, "until I found out differently. You see, on our cruise of a couple of years ago George and I camped here; our tents were right down there at the foot of this bluff—"

"Six feet under water," observed George, parenthetically.

"I was sitting there early in the morning starting a fire in the camp stove, and George had climbed the mountain to the house for a bucket of water, when I heard a hail from the other side of the river. It was repeated again and again, but, beyond looking up and observing a group of three or four men on the other side, apparently anxious to get across the river, I paid no particular attention to it, and went on with my breakfast preparations. Finally one hailed, 'Oh, Commodore!' 'Hello!' I answered promptly, dropping the potato I was peeling and springing to my feet, while a gratified feeling of merit recognized in being so widely known crept over my inner consciousness. 'Hello! What's wanted?' I cheerfully hailed in reply. 'Bring the boat over, and set us across,' was the answer. Now it didn't suit me to leave my camp stove and breakfast preparations, but, being willing to oblige, I scrambled down to the water's edge and inspected, one after another, two or three big, heavy, half-sunken, wooden punts lying moored to the trees. 'I can't; they're all locked!' I shouted, after ascertaining this fact by personal examination. 'Well, can't you go up to the house and get the key?' was the somewhat peremptory rejoinder. 'Well, yes, I can, I suppose, but I don't have to,' I replied, as I resumed my seat and my half-peeled potato, not relishing the style of the request, and feeling that, while it was flattering to be so widely known, perhaps there was such a thing as being too well and familiarly known—"

"Yes," said Lacy, "particularly as the house is about 200yds. away and almost straight up."

"Just at this juncture," I resumed, "an old fellow came down the hill, and without a word to me, or to the waiting men across the river, he stepped into one of the boats, scooped the water out of it with the end of a board, unlocked it and paddled across the river, presently returning with the men. They landed, and, as they passed, stopped to look admiringly at the camp outfit, the stove, cooking utensils, mess table, etc., coming in for a share of their questions and comments, not to mention the pretty, attractive-looking, little tents, which were still standing over the canoes. After the usual questions had been asked, and due answers returned, the men started on up the hill, when one of them suddenly stopped, transfixed. 'Well, I'll be

COLUMBIA.

SHAMROCK II.

THE START.
First completed race, Saturday, Sept. 28. Shamrock to windward.

THE FINISH.

her bow, thus pushing up a large body of water ahead of her. Another point was the handling of the light sails, which were taken in on more than one occasion long before the rounding of the mark. Her balloonier was taken in several minutes before necessary to do so in the last race. It is never a difficult task to criticise, for it is always understood that the man at the stick acts under impulses that he believes to be the best, and undoubtedly Capt. Sycamore did all that could have been done. He is certainly one of the best racing skippers in the wide world, and while not quite a match for Capt. Barr, yet we believe few men could have made a better showing than he did.

The America's Cup.

Columbia and Shamrock II.

As there was not sufficient wind to enable the yachts to cover the course within the time limit on Thursday, the day of the first race, and on Tuesday, the day of the third race, a repetition of the calm weather experienced during the races in 1899 was feared, and as a result a meeting of the committees representing the New York Y. C. and the Royal Ulster Y. C. was held, and the conditions governing the races were modified as follows:

Strike out clause beginning "The first race shall be sailed on Saturday, Sept. 21, 1901," and substitute the following: "The races shall be sailed on the following dates until the series be completed; namely, Sept. 26, Sept. 28, Oct. 1 and Oct. 3, 1901, and each following day except Sunday; provided, however, that immediately on the conclusion of the race of Oct. 3, and of each subsequent race, the Regatta Committee shall inquire of each

contestant whether he is willing to start the next day, and should either contestant reply in the negative, one day shall intervene before starting the next race. Sunday shall not count as such intervening day."

For the New York Y. C.,

LEWIS CASS LEDYARD, Chairman.

For the Royal Ulster Y. C.,

R. G. SHARMAN-CRAWFORD, Vice-Com.

The accounts of the races, of which Columbia won three straight, are given in detail in another column of this issue. Columbia, which has twice defended the America's Cup, was taken in tow after the deciding race on Friday and brought up to Stapleton, S. I., where she lay with her tender, Park City, for the night. After 8 o'clock on Saturday morning, Columbia, in tow of Park City, started for City Island. Both boats were decorated with bunting. Escorting Columbia was Corsair, Mr. J. P. Morgan's steam yacht, with Com. Lewis Cass Ledyard on board, and leading all was the launch that had been used by Columbia's owner and guests. Every ferry boat, tug, steamer or yacht that passed Columbia on her journey to winter quarters saluted with whistle and siren, while crews, passengers, owners and guests cheered heartily. The whistle on the Park City was kept continually busy answering the salutes. Columbia will be dismantled at once and will be hauled out in the same berth that she occupied before the racing season.

Shamrock was towed to her anchorage inside Sandy Hook after the race on Friday, and on Saturday morning the crew was put to work stripping the boat. Sir Thomas left Erin and came aboard Shamrock II. about 10 o'clock, and after a short chat with Capt. Sycamore, addressed a few words to the crew, thanking them for the excellent work they had done in sailing the boat, and also for the

way they had conducted themselves while in America. The crew heartily cheered Sir Thomas as he left to return to Erin. All those connected with Sir Thomas and the Shamrock were greatly disappointed and depressed over the result of the races. Shamrock II. was taken in tow shortly after noon by the tow boat James A. Lawrence and was brought up to Erie Basin, where she will lie until it is definitely determined just what will be done with her.

The Regatta Committee of the New York Y. C. sent the following letter to the Challenge Committee:

NEW YORK, Oct. 5, 1901.—Dear Sir: We have to inform you that the Columbia has won three out of five races from the Shamrock II. in the match of 1901 with the Royal Ulster Y. C. The America's Cup, therefore, remains with the New York Y. C.

S. NICHOLSON KANE,
NEWBURY D. LAWTON,
CHESTER GRISWOLD,

Regatta Committee.

To Com. Lewis Cass Ledyard, N. Y. Y. C., Chairman of Committee on Challenge.

Third Race—Triangular Course.

THIRD RACE—TUESDAY, OCT. 1.

As was briefly stated in our issue of last week, the third race was abandoned owing to there not being sufficient breeze for the boats to finish.

Shortly after 9 o'clock Columbia was taken in tow, bound out for the lightship. No move was made to set her sails until about 10 o'clock, when she was well down by the starting line. On Shamrock her crew set her new mainsail for a sail of lighter weight, that had been substituted for the one used in the race on Saturday. When

Second completed race, Thursday, Oct. 3. Columbia wins by 3m. 35s.

near the lightship Shamrock's club topsail was sent up and Columbia's jack yarder was set a few minutes later. The wind, that earlier in the morning had had some strength, was beginning to drop perceptibly, and the prospect of the boats finishing within the time limit of five and one-half hours was decidedly poor.

At 10:30 three sets of signals were displayed from the committee boat, indicating the compass courses for the three legs of the triangle. These signals read as follows: D, C, B, making the first leg E.; D, F, K, making the second leg S.S.W. $\frac{1}{2}$ W., and D, G, R, making the third leg N.N.W. $\frac{1}{2}$ W. The wind at this time was E., and had it held true the first leg of the course would have been a beat to windward, while the boats would have had a broad reach, with the wind well aft of the beam on the second and third legs.

Shamrock and Columbia were moving lazily around the starting line when the preparatory signal was given at 10:45. Shamrock broke out her baby jib topsail soon after the preparatory signal, and Columbia, which was following Shamrock, did the same. The breeze now had a strength of about four knots, and the boats were moving very slowly. At 10:55, just when the warning gun was heard, Columbia jibed over and passed S. of the committee boat. Shamrock, on the port tack, stood off under Columbia's stern, and then went about on the starboard tack, Columbia slowly following. Both boats were now standing down toward the line, but being a little too soon, Columbia went astern of Shamrock, jibed over and stood back now on the port tack. Shamrock, in the meantime, had passed to the eastward of the committee boat, which lay about S.W. from the lightship, and jibed over. Shamrock, now on the starboard tack, passed on the S. side of the committee boat. Columbia at this time was on the port tack, headed toward the southerly end of the line. Shamrock was rounded under the stern of the committee boat and was headed across Columbia's bow. Columbia was brought about as Shamrock was crossing her and the end of Shamrock's boom missed the end of Columbia's bowsprit by a small margin. Both boats were now headed down for the line, and Shamrock was luffed sharply up under the stern of the judge's boat and crossed the line a few seconds ahead of the signal. Three whistles were blown on the committee boat to notify those on the English boat that she had crossed too soon, and Shamrock bore off and after getting back on the westerly side of the line, luffed up and crossed again. This miscalculation of time on Shamrock cost them the best of the start, as well as the windward berth, for as Shamrock bore off Columbia was luffed up and crossed well in the weather berth. The boats were timed at the start as follows:

Columbia	11 00 10	Shamrock	11 00 22
----------------	----------	----------------	----------

Shamrock's skipper gave her a good full in the hope of getting clear wind, while Columbia was being pinched. Shamrock continued to sail as close as she could, and she still had the wind from the E., while Columbia got a southerly slant that permitted her to head up two or three more points than Shamrock could, and for several minutes she made a great gain. The crews on both boats were sent to the lee side, so as to heel the boats down a bit, for there was hardly strength enough in the breeze to heel the boats down to any appreciable extent. After fifteen min-

utes or so the breeze that had helped Columbia began to leave her, and Shamrock felt its influence, for she moved along quite smartly for a time, and then it began to head her, while Columbia was left without any, her headsails hanging limp, and she had barely steerage way. It is often the case in these waters that the breeze, when from the E. and light in the morning, works around to the S., and this is apparently what those on Shamrock were looking for, and it proved a wise move. Columbia was a long distance to windward of Shamrock, and seemed to get a lot of puffs that did not reach Shamrock at all. Shamrock finally went around on the starboard tack, heading in toward Long Island. Shamrock was not kept on this tack long, and was brought back on the port tack in the vain hope of getting some of the breeze that was giving the American boat such a lift.

When Columbia went on the port tack a little later, she seemed to be about half a mile to windward of the English craft. Both boats were heading S., while the mark for which they were to round lay E. from the starting line. About noon both boats got into a soft spot, and lay practically becalmed. After nearly 15m. of this discouraging work Columbia was brought about on the starboard tack, but not gaining anything by this move, she was put back on the port tack again. This tack was held for some 20m., when Columbia was again put on the starboard tack, Shamrock following at once. Just after 1 o'clock the breeze came in from the S.E. with a little more strength to it, and it reached Shamrock first. With the aid of this breeze Shamrock rapidly cut down Columbia's lead. The slant did not reach Columbia for some minutes, and during that time Shamrock had made considerable gain. At 1:15 Columbia was put on the port tack and an effort was made to cross Shamrock's bows. The breeze headed Columbia as soon as she was brought up into the wind, and she was put back on the starboard tack. At 1:30 she set her reaching staysail. Shamrock was well on Columbia's weather, and soon drew out in the lead. Columbia took in her jib topsail, and Shamrock's was also taken in, and reaching jib topsails were set on both boats, although Shamrock's was much larger than Columbia's. The wind permitted both to start sheets and still lay their course for the weather mark. Columbia got a favoring slant and began to draw out of the challenger's lee, but this did not last long, for as soon as it reached Shamrock she pulled ahead again. First one boat and then the other would get a slant and move ahead, only to be overhauled. Shamrock bore down on Columbia and took her wind. To avoid this, the defender tacked under Shamrock's stern, but the breeze headed her and she was brought back on the starboard tack. Columbia had lost considerable by this move, and was now some distance astern. The boats moved down on the mark very slowly. Shamrock rounded first, and although the mark was surrounded by the attending yachts and steamers, few whistles were heard, and one would have hardly known of their presence except for the wash they churned up. The times at this mark were:

Shamrock	2 41 33	Columbia	2 44 44
----------------	---------	----------------	---------

Shamrock's gain on the first leg had been 3m. 20s.

It had been evident for some time past that the race could not be finished within the time limit. Shamrock held on to the sails that she carried on the last part of the

first leg, while the only change that Columbia made was to set a smaller jib topsail. Shamrock now had a little breeze, while Columbia was hardly moving. Columbia now set her baby jib topsail, and Shamrock took in her reaching staysail and set the working staysail. Columbia was certainly working out on Shamrock's weather, while the reaching jib topsail on Shamrock seemed to set her down to leeward, and both boats were several points off their course.

At 3:37 a gun was fired from the Navigator, and the signal letter R was set, meaning that the race had been declared off, for it was not possible for the boats to have finished within the time limit. Shamrock was all of a half-mile ahead when the race was given up.

Fourth Race—Triangular Course.

FOURTH DAY—THURSDAY, OCT. 3.

Columbia wins by 3m. 35s.

In a fresh and crisp northwester, Columbia defeated Shamrock II. and made record time over the thirty-mile triangular course. Navigator, the Regatta Committee's boat, took a position to the N. and E. of the lightship about 10:30. Shamrock and Columbia were taken in tow about 9 o'clock, and proceeded down the bay, the breeze at this time blowing about eight knots an hour, and giving evidence of freshening. The letter D had been displayed from the committee boat, meaning that the course would be a triangular one. Both boats had made sail as they were being towed down the harbor, and when they cast off their tow lines each was under mainsail, club topsail and staysails, and jibs were broken out, while jib topsails remained in stops on the stays. A little after 10:30 three sets of signals were hoisted on the committee boat, showing the compass courses for each leg. They read: D, C, F, E. $\frac{1}{2}$ S.; D, F, M, S.W. $\frac{1}{2}$ S., and D, G, S, N.N.W. This made the first two legs of the course reaches, while the third was a dead beat to windward.

The preparatory signal was given at 10:45. The wind at this time was N.N.W., and had a strength of nearly ten knots, the tide being nearly flood and the sea smooth. During the ten minutes that elapsed between the preparatory and warning signals, the boats were running back and forth in the vicinity of the judges' boat, Columbia always being in the weather berth. When the warning gun was heard, both boats were to leeward of the lightship, and they stood across the line, with Shamrock to leeward, but ahead. Shamrock finally bore away and Columbia followed just astern. Shamrock then went on the starboard tack, Columbia following, and both were now standing back toward the line, and they bore around the judges' boat, with Columbia ahead. It was necessary to jibe to fetch the line, and Shamrock was nicely placed in between Columbia and the committee's boat, with the defender under her lee. To get out of this bad place Columbia was brought around just as Shamrock crossed, 13s. after the gun. Columbia was brought back some distance and then headed for the line with great headway on. She was not penalized by this move, for Capt. Barr only took advantage allowed by the 2m. handicap, and was able to cross with clear wind and far more headway on than Shamrock had. This maneuver was worth some seconds to Columbia. Barr, as usual, turned his seeming failure into a successful move. The wind was gaining

strength all the time. As Columbia crossed the line 1m. and 34s. astern of Shamrock, she broke out a No. 2 jib topsail, which seemed to be quite a bit larger than the one carried on Shamrock. The N.W. wind drew down the bay in hard puffs, and some of them laid the boats down in good shape. Columbia seemed to eat out more than Shamrock in these puffs, and, in consequence, was considerably to windward of the challenger. The defender seemed to be steering a little wild and hard, and to remedy this sheets were eased a little. Shamrock apparently drew away from Columbia slightly, and for a time it looked as though she would be more than able to cover the time allowance she had to give Columbia (43s.) at the first mark. But about 11:30, when the flashing cone on the first mark could be distinguished, Shamrock got very much lighter air, and Columbia, holding a strong breeze, was well heeled down, and was fast overtaking the challenger. Both boats were well to windward of the mark, and eased sheets some more and headed for it. Columbia working up on Shamrock, and carrying a fresh breeze along with her. Shamrock rounded the mark at 11:51:10, and jibing over, stood down for the second mark. Columbia jibed around at 11:51:22, 1m. and 12s. later.

First Leg—Reach—Ten Miles.			
	Start.	First Mark.	Elapsed.
Shamrock	11 00 13	11 51 10	0 50 57
Columbia	11 01 47	11 52 22	0 50 35

On this leg of the course Columbia had gained 22s. After rounding the first mark the wind seemed lighter for a time, but it soon breezed up, and Columbia's sheets had again to be eased to prevent her from steering so erratically. The breeze, which had lightened considerably, now began to blow up fresher than ever, and the racing boats were traveling at a speed that put the best of the excursion steamers and yachts on their mettle and left the others astern. Whitecaps covered the water, but still there was no sea to retard either boat's progress. On the second leg Columbia made a noticeable gain, her big jib topsail helping her materially when the breeze lightened up. At 12:20 the second mark was in sight, and it was now blowing about seventeen or eighteen knots, and if anything, a little less puffy. Both boats were heeled well down, but Shamrock carried her larger rig better than Columbia did hers. The men on jib topsail sheets on both boats were easing them in the hardest of the vicious puffs. Shamrock's skipper decided that his boat would do better without her jib header, and it was taken in, Columbia's being also doused 2m. later. The boats did better with these sails taken in, and it greatly relieved the strain on the masts. The boats were both to weather of their course, and as they neared the second mark sheets were eased and the boats bore off. Shamrock rounded first at 12:45:57, and sheets were flattened down as she luffed around. She stood to the westward on the starboard tack. Columbia rounded at 12:46:39, just 42s. behind.

Second Leg—Reach—Ten Miles.			
	First Mark.	Second Mark.	Elapsed.
Shamrock	11 51 10	12 45 57	0 54 47
Columbia	11 52 22	12 46 39	0 54 17

On this leg of the course Columbia had gained 30s. Columbia was put on the port tack as soon as she rounded, and Shamrock followed Columbia shortly afterward. Columbia was given a good full and an effort was made to get her out of the challenger's lee. Both boats

THE START.

were footing very fast, with a strong breeze and a smooth sea. Lee rails were just about awash, and the crews were lined up on the weather rail. The breeze had let up a bit, and was now blowing about fifteen knots, although nasty knock-downs were seen quite often. Just after 1 o'clock Columbia came about on the starboard tack and passed astern of Shamrock, as that boat tacked. Columbia was again under the challenger's lee quarter, and her skipper tried to get free wind. Columbia footed

faster and pointed higher than the challenger and slowly but surely she worked across his bows and to windward. Shamrock's skipper was doing all possible to prevent this, but was apparently helpless. Shamrock took the port tack and Columbia followed. Columbia was now well to windward and ahead, and the lightship was in plain sight. The large pleasure fleet had assembled around the finish line and Navigator was at a point about N.E. of the lightship. At 1:30 the wind strengthened again. It

was nearly 2 o'clock when Shamrock tacked and Columbia immediately followed. Both boats were not on the starboard tack, headed for the lightship. Columbia was to windward and ahead. In an effort to catch Columbia sheets were eased on Shamrock, and although she picked up a little, Columbia's sheets were also eased and the boats were coming down to the finish line at a high rate of speed, with Columbia well in the lead. She crossed the finish line close to the judges' boat, and luffed sharply. It was a magnificent race, and sightseers of the different steamers cheered themselves hoarse. Columbia crossed at 2:15:05, and Shamrock was timed at 2:16:23. Columbia started 1m. and 34s. behind Shamrock, and passed her and finished 1m. and 18s. ahead. In actual sailing, Shamrock had been beaten 2m. and 52s., and the 43s. time allowance made Columbia the winner by 3m. and 35s.

Third Leg—Beat—Ten Miles.			
	Second Mark.	Finish.	Elapsed.
Shamrock	12 45 57.	2 16 23	1 30 26
Columbia	12 46 33	2 15 05	1 28 26

Columbia on this leg of the course had gained 2m.

The summary follows:

	Start.	Finish.	Elapsed.	Corrected.
Columbia	11 01 47	2 15 05	3 13 18	3 12 35
Shamrock	11 00 13	2 16 23	3 16 10	3 16 10

Columbia had beaten Shamrock 2m. 52s. elapsed time, 3m. 35s. corrected time.

Fifth Race—Windward and Leeward.

FIFTH DAY—FRIDAY, OCT. 4.

Columbia wins by 41s.

Those who saw the first two races between Columbia and Shamrock were satisfied that they would never witness closer or more interesting contests than the races sailed by the big fellows on Saturday and Thursday, but the race of Friday eclipsed everything in the history of America's Cup. It was really Shamrock's race, and it was lost through apparent errors in judgment on the part of her skipper and partly through the fickle N.W. wind.

At the time the judges' boat Navigator arrived at the lightship the wind was N.N.W., and had a strength of seven or eight knots an hour. The sea was very smooth. Navigator took her position W.S.W. of the lightship, and soon after signals were hoisted, showing that the course was to be S.S.E. fifteen miles and return. The preparatory signal was given at 10:45. At this time the yachts were maneuvering around the starting line with mainsails, club topsails, jibs and staysails set and jib topsails in stops on the stays. As it was a down-the-wind start, it was evident that each skipper was willing that the other should start first, for under such conditions the rear boat generally has the advantage, being able to run down with clear wind and to blanket the opponent. Both boats used up their 2m. handicap in their anxiety to cross last.

When the warning gun was fired, both boats were on the weather side of the lightship, with Columbia ahead. Both boats were working to windward on the port tack. Columbia went on the starboard tack, while Shamrock took the port tack. Columbia came back on the port tack 2m. before the starting signal, while Shamrock again went on the port tack. Shamrock was now on Columbia's starboard beam. Shamrock filled off on the starboard tack and Columbia followed, the latter boat being ahead. As the starting gun was fired, the yachts were sailing a course parallel to the line, but some distance to windward, with the defender in the lead. Both boats bore off as they heard the gun, and Columbia was on Shamrock's weather bow. The boom on Shamrock was eased off to port, while her spinnaker pole was lowered to starboard, and her balloon jib topsail was broken out. Columbia's spinnaker pole was lowered to starboard; spinnakers were hauled out on both boats, Columbia breaking out her balloon jib topsail just as the handicap gun was fired, and her spinnaker was also broken out. Shamrock's was also drawing when she crossed the line. Columbia crossed 17s. ahead of Shamrock. The times at the start were:

Columbia	11 02 12	Shamrock	11 02 29
----------	----------	----------	----------

The yachts were timed officially as having started at 11:02:00. This is in accordance with the agreement on this point. The boats are given 2m. in which to cross the line, but in the event of the boats crossing after the 2m. signal, they were to be handicapped the time they took to cross after the gun. So, in this case, Columbia was handicapped 12s. and Shamrock 29s. Columbia was on Shamrock's starboard bow. Jibs and staysails were hoisted in stops on both boats. Shamrock's large rig now showed up to advantage, and it was soon seen that she was crawling up on Columbia. Columbia's spinnaker had been slacked well forward, and her mainsail seemed to be just a trifle flatter than Shamrock's. Columbia's crew was fairly well aft on the starboard side, while Shamrock's men were away aft as far as they could get on the counter. Shamrock pulled up on Columbia slowly, until she was just abeam of her. Here she stayed for a moment, and then she began to draw away from the defender, and in a few moments there was open water between them. Shamrock apparently runs better in a strong breeze, for she showed her ability to beat Columbia in this race, while in the race on Saturday, in a lighter breeze, Columbia got away from the challenger. Columbia was worked into Shamrock's wake, apparently with the hope of cutting off the challenger's wind, but she was unsuccessful in this move, and at noon Shamrock was still drawing away and was about a quarter of a mile ahead. The flukiness of the N.W. breeze now made itself felt, for Shamrock ran into a soft spot, and her light sails hung flat. When the breeze came up again it reached Columbia first, and she carried the fresh breeze down with her and materially closed up the gap between her and Shamrock, but as soon as the breeze reached the challenger she drew away again. Shamrock continued to increase her lead slowly and surely, and when the weather mark was about a quarter of a mile away, the challenger's balloon topsail was taken in and the jib and staysail were broken out. Some of the stops on the latter sail would not break out, and a man was sent down the stay to remedy the trouble. The baby jib topsail was set in stops as soon as the balloon was out of the way. Shamrock's crew is a smart one, and it seems as though her sails were always taken in a long time too soon, particularly where a mark is to be rounded. Shamrock lost a great deal by dousing her balloon so soon, and

Columbia overhauled her at a rate that gave promise of passing her. Mainsails had been flattened and spinnakers had been eased a little on both boats, and some 8m. after Shamrock had taken in hers Columbia took in her balloon jib topsail. The gain she had made by holding on to her balloon was a material one.

When Columbia's balloon jib was being lowered it stuck about a third of the way down the stay, and when the spinnaker pole was slacked forward the spinnaker got against the jib topsail stay and one of the snap hooks caught in the spinnaker. A man was sent down the stay to clear things, and when this was done both the big sails came down on the run. The spinnaker, fortunately, fell on deck, but part of the balloon got in the water, and some time was lost in getting it aboard again. While Columbia was having difficulty with her light sails, Shamrock was rapidly approaching the mark. Her spinnaker pole was allowed to run forward, and that sail was taken inboard rapidly. As Shamrock rounded the mark she luffed and her sheets were well flattened down, and she stood off in the port tack. Columbia on rounding the mark tacked and she stood away on the starboard tack, her sheets having been flattened down as she came about. Shamrock was timed at 12:48:46, and Columbia at 12:49:35.

First Leg—Run—Fifteen Miles.			
	Start.	Turn.	Elapsed.
Shamrock	11 02 00	12 48 46	1 46 46
Columbia	11 02 00	12 49 35	1 47 35

On this leg Shamrock beat Columbia 49s.

After rounding the mark Shamrock took in the jib topsail that she had set in stops before rounding. The wind had freshened, and, as Columbia did not set a jib header those on Shamrock thought they would be better off with theirs on deck. A few minutes after rounding Columbia's headsails were flattened down more, and she was put on the starboard tack after Shamrock. Just after 1 o'clock the wind, which now had a strength of fully ten knots, began to head Shamrock, and she was put about on the port tack. The boats were now drawing toward one another on opposite tacks, Columbia having the right of way, being on the starboard tack. Shamrock crossed the defender's bow easily, and continued on the port tack. It was here that it was thought that a bad error of judgment was made, for Shamrock, instead of holding her course, could have come about in a place where she would have backwinded Columbia, but she did not tack until she was well clear of Columbia, and the American boat had perfectly clear wind. Columbia now ran into a favoring breeze of considerable strength, and being heeled well down was footing fast, while Shamrock was rapidly dropping into her wake. Shamrock soon tacked, and ran out of the breeze that was giving Columbia such a lift. Columbia followed the challenger a little later, but the breeze seemed to favor the defender a little, and she was working well out to windward. Both boats now had a lighter air, and Columbia set her baby jib topsail and broke it out. Shamrock's was broken out just less than a minute later. Columbia had a slightly stronger breeze than Shamrock, and was pointing higher and footing faster. Shamrock made her best gains to windward, when on the port tack, while Columbia did better when on the starboard tack. Shamrock now began to draw away from Columbia, and the latter boat began to drop astern a little, as the English boat was footing faster and pointing higher. Just after 2 o'clock Columbia was put on the starboard tack, and Shamrock followed at once. After about 12m. Columbia was put on the port tack, and the two yachts were drawing together again, with Shamrock on the starboard tack, and she crossed Columbia's bows with plenty of room to spare. Shamrock was again in the lead, and her skipper, instead of coming about at once and having Columbia under his lee, held on some distance and then came about on the port tack. A little over a minute after Shamrock had taken the port tack, Columbia was swung on to the starboard tack, and she crossed through the challenger's wake. The breeze was slowly losing strength, and was variable and shifty, and it was now necessary for the skippers of both boats to keep their respective charges in the place where there was the best breeze. Columbia, after getting headed, was put on the port tack, and Shamrock was soon afterward put on the starboard tack, and again the boats drew together on opposite tacks, but before coming very near each other the challenger tacked, and Columbia about a minute later was put on the starboard tack, and the boats were now headed away from one another, Columbia standing to the westward, where the breeze was stronger and more favorable to her. Columbia tacked to port, and 3m. later was put back on the starboard tack. Shamrock was now headed W., following Columbia, but the American boat had the best of the breeze, and was holding higher and moving faster. It was still any one's race, and it was to be a desperate fight all through. Columbia was put about on the port tack and the boats were headed toward each other. It was very hard to tell which boat was ahead, but Shamrock had the right of way. The challenger proved to be ahead, and the defender was forced about. Every effort was made to get Columbia out of Shamrock's lee, but she did not get clear wind until Shamrock was put on the port tack. Two and one-half minutes later Columbia took the port tack. The tack was a short one, and Columbia was soon back on the starboard tack, and Shamrock followed. The Columbia skipper got all there was out of a favoring breeze while on the starboard tack, and she was then put on the port tack, with Shamrock following at once. Shamrock worked some favoring puff while on the port tack, and then she took the starboard tack and with the right of way again she approached Columbia. It looked for a time as though Columbia would cross the challenger's bow, but she was finally forced to take the starboard tack. Shamrock, after forcing Columbia about, split tacks again, and Columbia was put about in chase of Shamrock. The breeze was now so light that the crews on both boats were kept to leeward, and the boats were making little headway against the head tide. The wind began to head Shamrock and favor Columbia, and from this time on she was never far enough away from the American boat to save her time. Both boats were now heading toward the end of the finish line, where the lightship was located. Columbia was given a good full, and kept off in an effort to get headway enough on to cross the line before Shamrock. Columbia could not tack, for Shamrock was on the starboard tack and would have been right on top of her.

Shamrock was kept going until she had just cleared the lightship, and then she was brought sharply into the wind and shot across the line 2s. ahead of Columbia. As Shamrock crossed Columbia tacked and went over. Shamrock was timed at 3:35:38, and Columbia at 3:35:40.

Second Leg—Beat—Fifteen Miles.			
	Turn.	Finish.	Elapsed.
Shamrock	12 48 46	3 35 38	2 46 52
Columbia	12 49 35	3 35 40	2 46 05

On this leg of the course Columbia gained 47s. The table:

	Start.	Finish.	Elapsed.	Corrected.
Columbia	11 02 00	3 35 40	4 33 40	4 32 57
Shamrock	11 02 00	3 35 38	4 33 38	4 33 38

On corrected time Columbia beat Shamrock 41s. On actual time Shamrock beat Columbia 2s.

Our Boston Letter.

Comments on the Cup Races.

BOSTON, Oct. 7.—In the light of that recent great event the successful defense of the America's Cup by that phenomenon of yacht-designing skill, Columbia, which has twice responded to the same call, I must ask the readers of FOREST AND STREAM to ease sheets and bear away from Eastern yachting, for a time, while we look at the cause and effect. For we of the East, although treated by Columbia to a taste of the same medicine she administered to Shamrock II., have been interested in that trophy, not only through patriotic reasons, but also through a profound respect for Columbia's abilities.

It must be truly said that Columbia is a wonder, but, on the other hand, there should be no underrating of the prowess of the yacht from across the seas. She is the nearest approach to a successful challenger that has ever been sent in quest of the cup, but she fell short, and it must be admitted that our designers are still a little farther advanced in the art of producing speed than their contemporaries in Great Britain.

Shamrock is a beautiful boat to look upon. She is a symphony of curves from stem to stern, and from planksheer to the bottom of her keel. It was this abundance of curves, shown when she was first seen in the dry dock, that led me to believe that she would not be successful in her undertaking. They may not have had the effect of making her slower than Columbia, but the methods employed by British and American designers in seeking speed have been diametrically opposite in this direction, and the question of which is the better principle will probably never be definitely settled to the satisfaction of all. The two most eminent designers in the world—both of the same school—disagree on this feature, and each can probably show good reasons for his belief.

Shamrock II. is a yacht that might reasonably be calculated to beat Columbia. She is longer on top, and carries infinitely more sail, but it has been shown that these things are not all that is required. She had a greater draft, thus getting her own lead down lower than Columbia's, and this feature should be calculated to make her stand up well in a breeze. But the combination was in some way misproportioned, for the whole thing was not in harmony. It would seem that she was too stiff, or, rather, that she did not have sufficient life. She is a yacht which requires one breeze and one condition. In a breeze of from 8 to 10 knots, in a smooth sea, she showed at her best. This was where her greater sail plan got in its work. In a breeze of less than 6 knots, she was too stiff to move with Columbia, this undoubtedly because her lead was so low. In the same proportion, when the breeze reached 12 to 15 knots, her great sail plan became a detriment, and she could not take the puffs and sail through them with Columbia. When she did lay out, she was slow to recover. In a steady breeze she would probably have shown up better, for, having got her bearings, and staying there, she would be able to move. It seems that her great draft was responsible for her lack of life, for she was certainly easy enough in her lines to take a heel very quickly.

In the first race to be finished she beat Columbia to the weather mark. This leg was for the most part under conditions that were afterward shown to be her best. She had the best of Columbia at the start, but the white boat made a good fight to get the better position. Three times Columbia split tacks to try and cross her bow, and each time fell short, but she came so close that it was certain there was little difference in the sailing of the yachts in that kind of a chance. It was then, also, that it was shown that either Columbia was faster on the starboard tack than she was on the port, or Shamrock was faster on the port tack than she was on the starboard. It is reasonable to believe that the difference was in Shamrock, for such a thing has never been shown before in Columbia, and it is also more likely that Shamrock, with her many curves, should be the one that was not fair.

The result of that windward leg went long to form the opinion that, in that kind of a chance, Shamrock would not be able to give Columbia 43s. time allowance. The manner in which Columbia held Shamrock on the beat also convinced me that had she started first, in the weather berth, she would have been first at the weather mark. Exactly the same features were shown in races between Columbia and Constitution, where the one which went over the line in the weather position and in the lead would turn the windward mark first.

There was another revelation to be made when that windward mark had been turned. It had been said that Shamrock would show great things at reaching, and there were some who said, unhesitatingly, that she would beat Columbia on this point of sailing. It was inevitable, when they had turned the mark so closely, that a luffing match should follow. They both hauled after they had turned the mark, and this brought them to a point where both were reaching. From the manner in which Columbia at once hauled Shamrock, it was only reasonable to believe that when they should be obliged to sail in this fashion, Columbia would be able to show the same speed again. The jockeying at this point showed Barr to be crafty, indeed, for he employed a trick that is seldom

seen, in trying to induce Sycamore to break out his spinnaker, and he came very near being successful. If the trick had worked, Columbia would have at once been luffed to the position of vantage.

On that leeward leg to the finish line Columbia pulled through Shamrock's lee, or rather, went by her when they were side by side, for Shamrock would have had no windward position unless she were dead astern of Columbia. The breeze had lightened very much when Columbia pulled through, and it was claimed by Shamrock supporters that Columbia was favored by this. She should not have been. They were sailing side by side, and there were no favors in puffs that one received over the other. Shamrock's much greater sail plan, and especially her lofty clubtopsail, much larger than Columbia's, should have been to her advantage, and there was no question as to stability when both were sailing dead before the wind on even keels. That Shamrock did not pull out ahead of Columbia seems to me to be an indication that in those many curves of her underbody there was too much wetted surface. There were too many entrances to the water, and too many places where she left it.

The second race of the series was the most decisive of all. Conditions of wind and water were absolutely in Shamrock's favor all through, or, rather, were such as had been considered would be in Shamrock's favor. Both were handled equally well, with the exception that Barr took the better position at the start, although he did not cross the line first. Throughout the race there was not one single fluke that favored either boat. It was the one race that Shamrock's admirers had been asking for. It was said that she would do best in any breeze over 8 or 9 knots. Everything that was wanted was there, and Columbia beat her on her merits on every point of sailing. This was the greatest race that Columbia has ever sailed, and her greatest victory.

On the third race, I think we can consider ourselves somewhat lucky, but it was a race never to be forgotten. As they were about abreast at the start of a leg dead before the wind, it can hardly be said that there was much advantage, except that Columbia was ahead, a matter of a few feet. When Shamrock had pulled by Columbia, and Columbia afterward held her, and finally gained, a few helpful puffs from astern can be put down as the result. It is true that Columbia was not near enough to break Shamrock's wind, but she was near enough to hold some of it back. It did no good to take in the spinnaker on Shamrock so early, and it did no good to afterward send up a baby jibtopsail and not break it out. Columbia's little mishap, of having her spinnaker catch in her balloon jibtopsail hooks, lost her some time, and also lost her good headway with which to tack around the leeward mark. Both tacked wider of this mark than was good.

The windward leg was the memorable one of the series. Columbia commenced to haul Shamrock after she had settled on the starboard tack inshore. This was seen on Shamrock, and she came across to get the windward position. This was where a serious error of judgment was made on Shamrock, which counted in Columbia's pot of luck. When Shamrock crossed Columbia's bow they were very close. This was made certain from the short space of time afterward that Columbia crossed Shamrock's wake. With Columbia gaining and running toward the better breeze inshore it would have been policy on the part of Shamrock to have tacked on her weather bow, and thus be in a position to blanket her. This was not done. Shamrock headed out and was headed by the breeze, while Columbia was helped, and also ran into a stronger one. When Shamrock had seen the mistake, and tacked after Columbia, she lost ground in both footing and in pointing, and when they tacked offshore again, Columbia was a mile to windward. There is no doubt that she would have caught Shamrock had both kept the original tack inshore, but this big lead can be considered an unintended gift to her.

With Columbia running into the stronger breeze inshore it was thought by some that she should stay on the starboard tack, and get it all, and not tack out after Shamrock, especially when it surely seemed that the breeze was lighter offshore; but I think that Barr was right in going out after Shamrock. If the challenger had received a fluke out there, Barr would have been severely criticised for not taking the course he did. On that long port tack Shamrock did some great sailing and Sycamore lost no opportunity of poking her up farther toward the wind. She gained on Columbia, and when they tacked inshore again, she had the best of the argument, or appeared to.

Then came a piece of sailing that has never been seen in a yacht race before. Barr wanted to get inshore, where he knew there was a stronger breeze. In doing this, and trying to coax Shamrock in after him, he adopted a series of short tacks, the starboard tack, inshore, being held longer than the port tack. Columbia was always kept with her nose the farther inshore of the two, and the result was, that when they got in where the breeze was, she got it first. But there was little difference between them, for in the port tacks that Columbia made to try and cross Shamrock, and in which she fell short, she tacked close enough to backwind the challenger. Shamrock left the Columbia in there to come out for the finish line, and it is said that she did wrong in doing so, but that is open to question. It was hard to tell if Columbia had not turned the tables, and if she had done so, Sycamore would have been justified in trying to get away, as Barr was in getting away from him.

There were two objects in getting inshore, and a good reason for Barr standing on after Shamrock had left him. As the breeze was offshore, the farther in Columbia went the better breeze she would take out, and if the breeze should strengthen she would get it first and would take it out with her. This is what happened. It looked for a time as though it were all over with Columbia, but she was far to windward and took out a better breeze. This was a piece of luck for the defender, but its possibilities were nicely calculated by her skipper. She was almost able to cross Shamrock's bow when the challenger tacked for the line, but failing in this, she did almost as well in throwing Shamrock backwind and stopping her up. Fine judgment was shown in luffing Columbia, and giving all the backwind possible to Sham-

rock. The object now was to get across the line as quickly as possible. It was Columbia's lay to stop Shamrock as much as she could, even though she did not go as fast as she might otherwise have gone.

It was the greatest finish that has ever been seen in American waters, and Columbia did the greatest piece of sailing in the last hour of the windward leg that has ever been witnessed. It was Barr and Columbia that won the race. He had a worthy rival in Sycamore in all the races. It must be said in all fairness that Barr has gained the greater honors, although it must also be said that Shamrock was handled on the whole better than any other challenger. The result stamps Barr as being the cleverest racing skipper in the yachting world to-day.

JOHN B. KILLEEN.

Captain Charles Barr.

From the London Yachting World.

WHILE there seems really less chance of our champion being beaten in America this time than ever there was, should it be our fate to have again to accept defeat, the knowledge that one of the chief agencies in administering the blow was "raised" by ourselves, is bone of our bone and flesh of our flesh—namely, Charles Barr, skipper of Columbia—should tend to soften the bitterness of the experience. If it ever comes that writers of the Smiles kind should draw on the lives of our yachtsmen for illustrations for their pages, that of Charles Barr could not fail to be one of the first to be laid under contribution, for few men in any walk of life have been animated by more honest aspirations, more determination to conquer all obstacles lying between him and his goal, or more tireless tenacity of purpose; moreover, fewer still have reached the very top of their profession from such lowly and unlikely beginnings. A native of Gourock, Barr, in early youth, had such knowledge—no more, no less—of small boats as all boys have whose privilege it is to be reared on the coast. When he was apprenticed, however—in Greenock—to the grocery trade, it seemed as if all he would ever have to do with the sea and ships would be to have a look at them from the beach at holiday times. By a lucky accident his brother John drifted into yachting, and straightway became one of the leading British racing skippers. This success on the part of his brother at once fired the imagination of the young shopman, and soon the counter of a yacht had more attractions for him than that of the grocer's shop. From the very first young Barr became so keenly enamored of the sea that a summer with his brother on the highly successful racing 10-tonner Uclrin so impressed him with the possibilities of his new calling, that instead of going back for the winter to his comfortable shop, he engaged to go flounder trawling on the middle reaches of the Clyde in an 8-ton smack—the wettest, coldest, dirtiest work to which a man can doom himself—so that he might the quicker and the better perfect himself in the difficult art of sailing a cutter-rigged vessel.

Young Barr had not been long on board the smack when it became abundantly apparent that Fate for once wasn't blind when she beguiled this man to the sea. With the exception of himself, the men in the smack were comparatively elderly men, and one bitterly cold winter morning the little boat was caught in a shrieking nor'easterly gale off Portincross, the fishing hamlet on the Ayrshire coast, three or four miles south of Fairlie, that produced the Hogarths. Millport was the natural harbor to make for, but after many gallant attempts to sail the smack there, it became painfully apparent that there was as much likelihood of her flying to it as sailing to it. By this time the older men had become enfeebled and disheartened, when Barr, who had been working splendidly all along, quietly took the tiller and assumed command in general. Having seen how hopeless it was attempting to beat the boat to a place of safety, he boldly put her before the wind and started to run her to Ardrossan. The boat was only half-decked, and he had an awful time of it to prevent her from pooping the bigger of the seas. Off the entrance to Ardrossan Harbor, in spite of all his skill, she so nearly foundered that he abandoned the idea of trying to make this port, and he headed her for Troon, a harbor lying in a deep ocean bay a few miles further south. Ever the weather was becoming wilder and the outlook more desperate. So well did he know, too, that if he missed this harbor it was all up with them that he set himself to rush her in at all hazards. He did, happily, catch the harbor safely with her, but, as is often the case in desperate and deadly ventures, neither he nor his mates could ever tell very coherently exactly how it was done. The owner of the smack, a fine old Clyde fisherman called John Campbell, never wearied of telling, however, that "there was nae doot what'er they would a' have been droon't but for young Charlie's pluck an' skill."

The wild baptism of that winter day seemed to make Barr absolutely indifferent to facing the perils of not only the seas around our own shores, but of the Atlantic as well in small boats, and soon after he saved John Campbell's smack and her company he formed one of the crew who took the last of the noted Clyde plank-on-edge 20-tonners (Clara) to America. The passage was a most tedious affair, occupying, as it did, between thirty and forty days. When a skipper was required to take the Fairlie 40-footer Minerva (the hardest nut the Americans were ever set to crack in the way of a racing yacht) to America, Barr was forthcoming, and he took the tiny craft across the Atlantic pretty much as he would have raced her in the landlocked waters of the Clyde; aye, even to giving her the spinnaker whenever the wind was favorable. The Minerva made the passage from Fairlie to Boston in twenty-eight days. As she ran two-thirds of the distance in eleven days there can be no doubt that if she had not got held up for a time in an awful storm (which she swam through like a duck), fifty miles off Cape Cod, she would have made a passage of something like the miraculous order. One gloomy afternoon a huge ship came out of the haze with no sort of warning whatever, and almost sailed over her. On another evening—one of the witching sort—the warm Celtic imagination of the old Loch Ranza navigating officer, Captain Kerr, was set a-working. Barr and his comrades—who were below trying to snatch a bite of food while

Kerr sailed the cutter—were startled by hearing Kerr saying in a most dramatic sort of whisper: "Come abune at aince, lads—the sea serpent's alongside." Hurrying up, without a moment's delay, they did see, by the fast-failing light of the summer night, a long, whipcord-like creature, wriggling in the wake of the cutter; moreover, keeping up with her easily, although she was stepping it out quite smartly. Alas, for the fathoming of this one of old ocean's choicest mysteries, it was found, on examination, that the fabled monster that had visited the Minerva of Fairlie in mid-Atlantic was only her own spinnaker's brace, which had got adrift; but fascinating as this theme of Charles Barr's career is, I must really belay it for the present.

A Correction.

Editor Forest and Stream:

I notice in the account of the races between Columbia and Shamrock, given in your last issue, it is stated that because of her pole mast and of a recently adopted provision in the rules, to apply in cases where there were no hounds in the old acceptation of the term, Shamrock was measured in a way different from Columbia, with the effect of giving her an advantage to the extent of "300 sq. ft. of canvas untaxed."

As this statement would convey inferentially a reflection on the club's methods, you will, I am sure, be willing to correct the misstatement. In both vessels the spreader, which usually and normally rests upon the hounds, was situated above the gaff, and in the ordinary relation to the gaff and topmast, and was the place measured to without, so far as I am aware, advantage or disadvantage to either contestant, and, in strict conformity with the rules as these stood at the date of challenge.

JOHN HYSLOP, Measurer N. Y. Y. C.

[The above letter received as we go to press this week from Mr. John Hyslop, the Measurer of the New York Y. C., was most welcome, as it clears up a point over which there had been some question.—Ed.]

Rifle Range and Gallery.

Rifle at Shell Mound.

SAN FRANCISCO, Sept. 23.—There has been a lull in rifle work at our ranges since the big July schuetzen festival. However, yesterday there was a good turnout at Shell Mound. The day was mostly devoted to bullseye shooting. Scores:

Germania Schuetzen Club, monthly bullseye shoot: Edward Goetze 43, William Morken 153, L. N. Ritzau 179, Gefken 258, A. Jungblut 537, Louis Bendel 541, D. B. Faktor 604, N. Ahrens 768, F. Brandt 782.

Norddeutscher Schuetzen Club, monthly medal shoot: First champion class—A. Mocker 439. Second champion class—Not won. First class—J. Gefken 405. Second class—Henry Huppert 371. Final, third class—O. von Borstel 512. Best first shot, A. Mocker, 25; best last shot, R. Stettin, 25.

Golden Gate Rifle and Pistol Club, handicap: M. F. Blasse 190. Gold medal—W. F. Blasse 197; D. B. Faktor 216. Silver medal—M. J. White 190; William Ehrenpfort 195, 175, 174; A. Thode 176, 181, 172; A. B. Dorrell 220. Revolver, handicap—Paul Becker 92, 89; W. F. Blasse 71.

San Francisco Schuetzen Verein, monthly bullseye shoot: A. Mocker 110, Louis Haake 181, William Ehrenpfort 325, L. Bendel 345, H. Huppert 357, J. Woebecke 436, J. De Wit 460, F. Koch 603, Herman Huber 622, D. B. Faktor 622, William Goetze 672, J. D. Heise 683, A. Schafer 689, H. Zecher 722, H. Lilkeney 777, F. Boeckmann 843, Otto Burmeister 881, August Pape 893, August Jungblut 944, N. Ahrens 1092.

Red Men's Schuetzen Company, monthly bullseye shoot: Capt. Siebe medal, won by William Dressler, 128; second prize, D. Tamke, 548; third prize, Henry Bach, 790; fourth prize, J. A. Mohr and Herman Schult, 1005.

Red Men's Schuetzen Company, monthly medal shoot: Champion class, William Dressler, 411; first class, Capt. Henry Grieb, 384; second class, J. A. Mohr, 865; third class, Herman Schult, 308; fourth class, D. Tamke, 280; best first shot, William Dressler, 25; best last shot, Capt. Henry Grieb, 23. ROEEL.

Cincinnati Rifle Association.

CINCINNATI, O.—The following scores were made in regular competition by members of the Cincinnati Rifle Association, at Four-Mile House, Reading road, Sept. 15. Conditions: 200yds., off-hand, at the German ring target. Gindele was declared champion for the day with the good score of 220. Weather, clear; thermometer, 80; wind, 2 to 8 o'clock:

	Honor Target.
Gindele	220 214 209 208 199
Nestler	218 210 209 207 201
Strickmeier	217 216 213 202 201
Speth	214 214 214 198 196
Bruns	214 209 204 202 200
Payne	213 206 206 206 203
Jonscher	205 199 176 169 163
Uckotter	200 190 183 183 180
Roberts	194 194 161
Lux	186 183 181 177 172
Topf	184 183 174 175 170
Troustine	183 177

Strickmeier and Bruns tied for first place on the honor target, but the latter took first by having 25 on the end of his score.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- Oct. 8-11.—Davenport, Ia.—Forester Gun Club's tournament; live birds and targets.
- Oct. 9.—Clyde, O.—Clyde Gun Club's tournament.
- Oct. 9.—Randolph, N. Y.—First amateur tournament of the Randolph Gun Club. Fred L. Sanger, Sec'y.
- Oct. 9-10.—Exeter, N. H.—Target tournament of the Exeter Gun Club. A. S. Langley, Capt.
- Oct. 9-10.—Erie, Pa.—Tournament of the Erie City Rod and Gun Club; \$100 added. A. N. Aitken, Sec'y.
- Oct. 9-10.—Huntington, Ind.—Tournament of the Erie City Gun Club. A. N. Aitken, Sec'y.
- Oct. 9-11.—St. Thomas, Ont.—Tom Donley's fifth annual tournament; live birds and targets.
- Oct. 12.—Wissinoming, Pa.—Grand opening target shoot of the Florists' Gun Club. Open to all. Guaranteed purses and added money. T. C. Brown, Sec'y.
- Oct. 15-16.—Greenville, O.—Regular annual tournament of the Greenville Shotgun Club. H. A. McCaughey, Sec'y.
- Oct. 15-16.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club.
- Oct. 15-17.—Pella, Ia.—Garden City Gun Club's amateur tournament. A. I. Nassaman, Sec'y.
- Oct. 16.—Mt. Sterling, Ill.—Tournament of the Mt. Sterling Gun Club. J. Breidenbend, Sec'y.
- Oct. 16-18.—Baltimore, Md.—Fall tournament of the Baltimore Shooting Association; two days targets; one day live birds. Added money. Open to all.

Oct. 17-18.—Springfield, Ill.—Fall tournament of the Illinois Gun Club.
 Oct. 22-24.—Raleigh, N. C.—Shoot under auspices of the Raleigh Gun Club. J. G. Ball, Sec'y.
 Oct. 22-24.—Des Moines, Ia.—Amateur handicap shoot.
 Nov. 28.—Cleveland, O.—Shoot of the Cleveland Gun Club.
 Nov. 28-29.—Milwaukee, Wis.—Tournament of the South Side Gun Club.
 Newark, N. J.—South Side Gun Club target shoot, every Saturday afternoon.
 Chicago, Ill.—Garfield Gun Club's live-bird trophy shoots, first and third Saturdays of each month. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

CONTESTS AT INTERSTATE PARK.

Nov. 20.—Interstate Park, Queens, L. I.—Shoot given by Mr. S. M. Van Allen, who donates a Daly gun; \$20, 20 birds, latter extra; high guns; handicap; all entrance money goes into the purse.
 Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice. Café and hotel accommodations.
 Interstate Park, Queens, L. I.—Weekly shoot of the New Utesht Gun Club—Saturdays.

1902.

Jan. 14-17.—Hamilton, Ont.—Twelfth annual tournament of the Hamilton Gun Club. F. B. Vallance, Cor. Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The programme of the seventh annual trapshooting tournament of the Baltimore Shooting Association, Oct. 16 to 18, inclusive, is now ready for distribution. There are two days at targets; one at live birds. Added money \$100. Handicaps, at targets, 14 to 20 yds.; at live birds, 25 to 32 yds. Division of moneys: Targets, first day, percentage system, 40, 30, 20 and 10 per cent.; second day, Rose system, ratios 8, 5, 3 and 2. The handicap committee members are Messrs. J. C. Hicks, H. T. Ducker and L. German. Grounds will be open for practice and sweeps on Oct. 15. Shooting commences at 9 o'clock. Shells can be obtained on the grounds. Ship guns and ammunition to Mr. J. R. Malone, 2671 Pennsylvania avenue, and they will be delivered on the grounds. Magautraps and blue-locks, and a set of traps, Sergeant system, will be used. Hot lunch on the grounds. There are eleven events on each target day, at 15, 20 and 25 targets. There are six events on the third day—one at 7 birds, \$5; one at 15 birds, \$10, and four miss-and-outs. There are ten high averages each day, reverse system, as follows: First, \$3; second, \$3; third, \$4; fourth, \$4; fifth, \$5; sixth, \$5; seventh, \$6; eighth, \$6; ninth, \$7; tenth, \$7.

The grand opening target tournament of the Florists' Gun Club, at Wissinoming, Philadelphia, Oct. 12, is based on a broader principle of equity in the sport than usually obtains. The purpose clearly is not to make superior skill alone the test of the tournament. The inducements appeal to the average class of shooters who like the sport for its own sake, with some incentive in the way of winnings, yet without paying too high entrance for it. The special features are, money for the 50, 60 and 70 per cent. shots; added money for the 50 and 70 per cent. shots; high average money; low average money. There are twelve events on the programme, Rose system and class shooting governing the division of the moneys. Dinner can be obtained on the grounds. Ship shells to V. V. Dorp, care Shannon & Sons, 1020 Market street, Philadelphia. Targets, 1 1/2 cents, included in all entrance fees; entrance 25, 50 and 75 cents and \$1. All sweeps optional, but those shooting for targets only pay 2 cents. Loaded shells can be obtained on the grounds. T. C. Brown, secretary, 110 North Fiftieth street.

The programme of the first annual amateur handicap, to be held at Des Moines, Ia., on Oct. 22, 23 and 24, provides two days at targets, one at live birds. The target programme is alike for each day—twelve events, at 15 blue-locks, \$1.50 entrance, and \$3 added to each event. The third day is devoted to live-bird shooting, the amateur handicap shoot, an event at 25 birds, \$15 entrance, birds included, high guns, handicaps 26 to 31 yds., \$300 guaranteed; trophy \$150 to first; \$90 to second; \$60 to third. All surplus added. All money in the purse in excess of \$300 will be divided in accordance with the number of entries received. Regular entries close on Oct. 19, and must be accompanied by \$5 forfeit. Penalty entries, \$18, up to the time the first man has shot at his second bird. Shooting commences at 9 o'clock. Dinner on grounds. Grounds open for practice on Oct. 21. Targets, 2 cents; live birds, 25 cents. To those shooting through the programme there are cash prizes for high and low guns. Ship guns and shells to W. R. Milner.

The following communication explains itself: "One of the attractions at Interstate Park, arranged for the near future, is a pigeon shoot that will be held under the management of Mr. S. M. Van Allen, the popular Jamaica expert. The date set for the shoot is Wednesday, Nov. 20, and the conditions will be 20 birds, \$10 entrance, birds extra, handicap rise. As an attraction, and as a reward of merit, Mr. Van Allen will donate a high-grade Daly gun to the shooter making the highest score in the main event. All the entrance money will go into a purse, from which no deductions will be made, and which will be divided to the high guns in the ratio of about one money to every three entries. The conditions of this shoot are somewhat novel, but Mr. Van Allen's offer is a generous one, and his efforts should be equally generously supported."

The Exeter, N. H. Gun Club announce a target tournament, for which they have fixed dates Oct. 9 and 10. There are ten events each day, at 15 and 20 targets alternately, \$1.50 and \$2 entrance. Rose system, 8, 5, 3 and 2. Shooting commences at 9:30. Dinner served on the club grounds. Expert and magautraps. Guns and ammunition forwarded to A. S. Longley will be delivered on the grounds. No. 8 of the first day will be a five-man team shoot; event open to any club in New Hampshire. Prizes for high guns each day; \$5 to first; \$2 to second, and \$5 to highest general average for the two days.

Mr. H. A. Kerr, who not long since was in charge of the Crescent Athletic Club's shooting grounds, at Bay Ridge, L. I., but more recently of the Highland Golf Links, has been engaged to take charge of the target shooting and related interests at Interstate Park, Queens, L. I. Mr. Kerr is thoroughly proficient in such matters, and is quiet and earnest in his work. Mr. T. W. Morley will continue with the Interstate Park Association, as heretofore.

We learn that the Marlin Fire Arms Company have well under way a new four-story brick addition, about 115ft. long and about 50ft. wide, which probably will be completed and ready for occupancy early in 1902, giving about 20,000 square feet of additional floor surface. This will enable them to add correspondingly to their output next season.

The Oceanic Rod and Gun Club (the Cuckoos) will hold their first shoot of the fall season at their grounds at Rockaway Park, L. I., on the first day of next week. Trains of the L. I. R. R. leave foot of East Thirty-fourth street and Flatbush avenue station at 9 and 11 o'clock A. M. Mr. J. H. W. Fleming is the secretary.

The Ideal Manufacturing Company, of New Haven, Conn., announce that their straightline re- and decapper is now perfected, and that they are ready to supply the trade. It possesses many points of excellence, which are explained in minute detail in a circular, which will be sent to those who apply for it.

The Crescent Athletic Club began its winter shooting season at Bay Ridge, L. I., on Saturday of last week. Mr. Platt Adams, not long since an active shooter about New York, was a visitor, and in smashing the targets showed that he still retained his skill with the scatter gun.

The last tournament of the Interstate Association for 1901, held at

Louisville, Ky., last week, was a distinct success. Mr. L. J. Squier won the high average for the two days at targets (Oct. 2 and 3), though he was closely pressed by Mr. J. D. Gay up to near the finish.

Mr. C. G. Blandford, captain of the Ossining, N. Y. Gun Club, informs us that the club, although less than a year old, numbers ninety-four members. That is a most gratifying showing, and is an example of what good leadership will accomplish in making success.

Mr. Herbert Taylor, who represents the St. Louis branch office of the Dupont and Hazard powder companies, left New York on Friday of last week, after a pleasant sojourn therein, and he expressed himself as being pleased with his short visit.

At the monthly shoot of the John F. Weiler Gun Club, at Allentown, Pa., Oct. 1, Mr. Daudt scored 23 out of 25 targets and won the gold medal for the month. Mr. H. Schlicher scored 21 and won the silver medal for the month.

Mr. Hood Waters, of Baltimore, a famous expert trap shot, has accepted an engagement with the Lafin & Rand Powder Company to represent them. Mr. Waters' popularity and ability assure his success from the outset.

Mr. J. A. R. Elliott, the famous expert, was in New York on Tuesday of this week, en route to St. Thomas, Ont., to attend Tom Donley's tournament.

The Dixie Gun Club, of Pensacola, Fla., closed its target season this week, owing to the proximity of the open season on game.

Mr. W. R. Crosby won high average at John Parker's tournament, held at Detroit, Mich.

BERNARD WATERS.

Mississippi Valley Notes.

THE NESSMUK Club, of Alton, Ill., whose annual peregrinations have been for several years recounted in these pages, gave its annual field day outing for 1901 on Sept. 23, to its island preserve in the middle of the Mississippi River, six miles above this city. Since the organizers of the club laid their plans some years ago to maintain a circle of good fellows, who should enjoy frequent communion with nature in her native state, this island has been kept in splendid shape for this idea, and many quiet, happy days are passed by the members in its tranquil retreats. On this occasion some of the numerous yachts belonging to members are put in commission, and all who can possibly get away from the cares of business come aboard for the pleasures of the two-day trip. Camp is pitched strictly a la Nessmuk, and the rules of life in the woods laid down by that authority are closely adhered to and enforced by the older woodsmen, who have by long practice mastered his teachings. Of the magnificent meals served, the flavor of which is enhanced by insatiable appetites, of the innumerable happy incidents of the days and nights, it would require columns to give a detailed account, but suffice it to say that this was the best-attended and happiest convale on the record of the club tomes. Those of the party on this occasion were: H. M. Schweppe, Chief Autocanoe; F. C. Riehl, Chief Manyquills; Geo. D. Hayden, Chief Bullycook; G. A. McMillen, Chief Mendemtooth; W. Fred Quimby, Chief Consenall; J. G. Melling, Chief Windowface; Eugene Gaskins, Chief Underdied; John McAdams, Chief Barkstheberch; Clark McAdams, Chief Diverdeep; J. M. Pfeifferberger, Chief Nimblefoot; Harry Edwards, Chief Turbiebake; R. L. Smith, Chief Growtobac; Howard Tompkins, Chief Milkstheberch; Drury McMillen, Chief Butchersnake; E. M. Gaddis, Chief Bathem-clothes.

The principal feature of the day was a target shoot for the annual trophy. The honor was won by Capt. Schweppe, who shot a splendid race, in order to appreciate which it must be understood that the competition was at targets, thrown from a single unknown trap as far as it was possible to send them, one man up at a time. The scores were as follows: Schweppe 33 out of possible 35; all others at same number of birds: Riehl 32, C. McAdams 28, Edwards 26, Smith 24, Gaskins 23, McMillen 20, Melling 19, Geddis 19. The club is in a most flourishing condition, financially; is talking of buying its island preserve, and looks forward to a bright future.

The Illinois Gun Club offers an excellent programme for its annual fall tournament on the 17th and 18th insts. Blue-locks will be thrown exclusively, there being 210 and 205 each day respectively. Two cents will be charged for targets, and events will be open to amateurs only. Money divisions will be on class system, three in 15, and four in 20 bird events. Secretary Chas. Schuck will cheerfully answer all inquiries.

Several good individual matches at live birds are on the programme for early dates at the Dupont Park range, St. Louis, of which more anon.

Quail shooting promises to be unusually good in Illinois this fall, and all sportsmen are making plans to have their share in the rare sport.

KILLMORE.

Forest and Stream Gun and Rod Club.

ZANESVILLE, O., Oct. 8.—Herewith please find clippings from our daily morning paper. Some of the boys read FOREST AND STREAM and became attached to it, and that is the way the name of our club came about. Sept. 30 about twenty-four enthusiastic sportsmen met at P. McElroy's cigar store for the purpose of forming a gun club. The name Forest and Stream Gun and Rod Club was adopted, and the following officers elected: President, Theo. Barbarow; Vice-President, Charles Hartmeyer; Treasurer, Peter Black; Secretary, Frank Gabele; Captain, George Metzger.

The following well-known trapshooters enrolled as members: Mayor J. L. Holden, H. W. Holmes, Frank Gabele, P. J. Welch, James Carmody, C. W. Morrison, Theo. Barbarow, Harry Miller, C. Bridwell, Charles Hartmeyer, John Hartmeyer, William Dinsmore, H. J. Taylor, Ed McElroy, George Metzger, Frank Brennan, A. E. Ray, Peter Black, Dudley Russell, Lew Hartmeyer, Walter Black, Fred Barrell, Lewis Urban, Herman Mueller.

An invitation from Jake Hartmeyer to shoot at the 'Grey Eagle' for Friday afternoon was received, and the club voted to attend in a body.

The club will hold a shoot on their own grounds next week. The magautrap and experts will be used. All shooters invited.

Oct. 4.—The first shoot of the Forest and Stream Gun and Rod Club was held at the Grey Eagle grounds yesterday and was attended by a large crowd.

The shooting was fast, and some fine scores were made. The feature was Barbarow breaking 43 straight and 49 out of 50. Barrell and Ensign were close second and third, breaking 47 and 46 respectively.

Ed Kemp, being out of form through sickness and lack of practice, shot poorly, but will make amends anon. Competition was strong among the amateurs, Frank Tally going out of his class, winning the amateur prize.

Over 2,000 targets were thrown. The main event was a 50-bird club race, the score of which follows:

Shot at.	Broke.	Av.	Shot at.	Broke.	Av.		
Barrel	50	47	.94	Bridwell	50	35	.70
Barbarow	50	49	.98	Kemp	50	34	.68
Ensign	50	46	.92	J. Welsh	50	34	.68
J. Hartmeyer	50	43	.86	Carmody	50	27	.54
Max	50	40	.80	D. Worstall	50	26	.52
Warner	50	40	.80	Miller	50	26	.52
Metzger	50	39	.78	C. Hartmeyer	50	25	.50
Brennan	50	39	.78	A. Worstall	50	25	.50
Ray	50	39	.78	Babele	50	25	.50
Russell	50	38	.76	Fay Talley	50	24	.48
Holmes	50	38	.76	B. Hartmeyer	50	24	.48
F. Talley	50	37	.74	P. Welsh	50	23	.46
E. McElroy	50	36	.72				

The next shoot will be held on the club grounds, and a hot fight can be expected. The club votes Jake Hartmeyer as a host; the best ever.

Candy Bridwell got lost in the smoke of his 20-gauge gun. J. Hartmeyer and George Metzger broke one barrel of birds with an axe.

Barrell is a staving good one, and from McConnellsville, too. Al Worstall, ex-sheriff, has a glass eye, but it is a good one. Come again, Al.

Ensign is as good as his name. Forty-six will make some of them go away back and sit down. Whoop her up for the next shoot. E. T. GARRETT, Sec'y.

Fort Smith Gun Club.

FORT SMITH, Ark., Oct. 1.—The trapshooting season closed at this place on Sept. 30. The contest for the Peters Cartridge Company's loving cup also came to an end at the same time.

The conditions under which this beautiful trophy was shot for were as follows: Each contestant was required to fire 1,000 or more shots at such distance handicap as was designated by the handicap committee. The handicaps for the most part ranging from 16 to 18 yds., the members of the club were very evenly matched in skill.

Only three members finished out the necessary 1,000 shots, these being Leach, Williams and Boyd, who finished in the order named, though a large number shot up into the hundreds. Indeed, the season was quite a successful one, and it is expected that the next season will be even more interesting.

Leach, shooting from the 18yd. mark, captured the beautiful trophy, and it was a popular win, as he has probably done more for the sport of trapshooting than any man in the State, with the possible exception of Lloyd, of Pine Bluff, or Litzke, of Little Rock.

Leach's high average for the season, nearly .77 per cent., seems low as compared with tournament scores nowadays, but when it is considered that he shot from the 18yd. mark, and that the background, or foreground, as some call it, is very trying, being a dense forest of green trees, and that every shot fired during the season was scored, the showing is not discreditible. The thanks of the club are due and are hereby tendered to Geo. Fishback for the use of his beautiful grounds for shooting purposes; to the Peters Cartridge Company for the loving cup which they so generously donated to the club; and to Mr. Chas. Boyd, of the Webber-Seely Company, for his many courtesies and unvarying thoughtfulness.

Following are the scores up to the close of the season, showing the scores of those who finished out the necessary 1,000 shots; and following this the scores of each man who shot in the cup race, with the average of each for the season:

Shot at.	Broke.	Av.	Shot at.	Broke.	Av.		
Leach	1005	773	.769	Oglesby	110	55	.500
Williams	1125	701	.623	McCorkle	50	24	.480
Boyd	1280	746	.583	Boehmer	90	43	.477
Echels	150	108	.720	Singleton	115	54	.460
Webber	315	214	.677	Moulton	25	11	.440
Kirkpatrick	40	27	.675	Theurer	50	20	.400
Kimmons	640	387	.604	Guelinger	50	19	.380
Knott	75	44	.590	Mattlingly	50	19	.380
McKenna	75	43	.573	Daily	150	56	.373

LEACH.

Garfield Gun Club.

(Chicago, Oct. 5.—The appended scores were made on our grounds to-day on the occasion of the first live-pigeon shoot of the series. Fifteen members put in an appearance and enjoyed a delightful afternoon's sport. The weather was pleasant in every way. The birds were a very good lot, only three failing to fly out of over 300 trapped.

T. W. Eaton carried off the honors of the day by killing his string of 12 straight, and won Class A trophy. A. D. Dorman, a Class B man, was close behind him and won his trophy on 11, while C. J. Wolf captured Class C trophy on 8. The scores:

No. 1.	No. 2.	No. 3.	
Dr. Shaw	1122121*2222-11	11221-6	
T. W. Eaton	112121112122-12	32*200-3	012112-5

J. W. MEEK, Sec'y.

The Hamilton Gun Club.

HAMILTON, Canada, Oct. 1.—During the last few days of our club's shooting in the \$100 event it has been held under hard shooting conditions, and last Saturday proved no exception to the rule. The average of scores on the last 100 birds is very much below the class of shooting done at the beginning of the match.

This match was shot off on twelve regular club days at 25 birds each day; members unable to attend were allowed to shoot up at the next meeting; but no man could shoot at more than 50 birds in this match in one day. Handicap distances of 16 to 22 yds. Those breaking 80 per cent. or over went back 1yd. Those who failed to break 80 per cent. advanced 1yd. The winners were M. E. Fletcher, first; Dr. Wilson, second; Chas. Brigger, third; John Hunter, fourth; John Bowron, fifth; Ben It, sixth; T. Upton, seventh; Geo. Crawford, eighth.

Scores made Saturday, Sept. 28:

Events:	1	2	3	4	Events:	1	2	3	4
Targets:	10	15	10	10	Targets:	10	15	10	10
Fletcher	5	18	Crawford	4	19	5	7
Bowron	7	14	2	7	Upton	6	15	6	6
Dr. Wilson	6	17	Hunt	3	..	2	3
Brigger	10	21	3	7	F. Wilson
Ben It	5	12	High	3
Hunter	7	17	3	6					

Ossining Gun Club.

OSSINING, N. Y.—Herewith please find scores of the Ossining Gun Club, made at the regular weekly shoot, Saturday, Oct. 5. Next Saturday, Oct. 12, will be the first shooting day for the two sets of medals—gold, silver and bronze—which have been offered by the club for Classes A and B, handicaps. It is expected that most of the members will try for these prizes, as they will be handsome, and well worth capturing. We now number ninety-four members, a good showing for a club of less than a year old. A fine club house has been erected, which, with the magautrap, puts us right up to date:

Events:	1	2	3	4	5	6	7	8	9
Targets:	10	10	10	5p	10	10	10	5p	5p
A. Bedell	9	10	10	6	..	9	5
C. Blandford	9	10	8	8	8	7	8	5	..
W. H. Coleman	9	6	..	5	3	6	..	7	4
W. P. Hall	7	1	9	9
H. M. Clark	3	5	6	4	5	3	3	4	6

C. G. B.

The Lehigh Rod and Gun Club.

The Interstate Association at Louisville.

LOUISVILLE, Ky., Oct. 5.—The closing tournament of the Interstate Association's series for the season of 1901 was held at Louisville, Ky., Oct. 2, 3 and 4, under the auspices of the Jefferson County Gun Club.

The first day's attendance was fine, and included some of the leading amateurs of the country. Forty-seven shot during the day, and of that number twenty shot the entire programme. The day was not one for good scores, as the high wind caused the targets to duck and jump, creating difficult shooting. The straight-away and left-quartering targets were bothersome to quite a number, and the contestant who was slow in his time took chances of a miss. The race for first place was an interesting one. Mr. J. D. Gay won out for the day by breaking 155 targets out of the 163 shot at, an average of .939 per cent.; Mr. L. J. Squier was second with 148, and Mr. J. T. Skelly third with 147.

During the day, counting practice and extra events, 6,200 targets were thrown, and the traps worked well. The shoot began at 9:30 and ended at 5:15, with a half hour intermission for lunch.

The second day's attendance was also good. As on the first day, most of the leading trapshooters of Kentucky took part. Mr. J. D. Gay, who made the best total score the first day, kept up the good work in the first eight events, but in the ninth event Mr. L. J. Squier, who was in second place on the first day, took first honors by breaking 20 straight, while Gay broke only 16, thus giving Squier an advantage of 4 targets. In the last event Squier and Gay each scored 13, which gave Squier the general average for both days.

The third day was devoted to live birds; and a good lot of birds they were, as the scores will show. Many good kills were made during the day. The scores follow:

First Day, Oct. 2.

Table with columns for Events, Targets, and Total. Lists names like J C Mastin, A Meaders, J D Gay, etc., with their scores across 10 events.

Second Day, Oct. 3.

Table with columns for Events, Targets, and Total. Lists names like A Meaders, J O Ward, J D Gay, etc., with their scores across 10 events.

Third Day, Oct. 4.

Table with columns for Event No., 7 birds, entrance \$5, four high guns. Lists names like A W du Bray, B Starr, S H Page, etc., with their scores.

Table listing names and scores for the first day of the tournament, including P H Stewart, S Hutchings, W D Thompson, etc.

Dupont Gun Club's Tournament.

OMAHA, Neb., Sept. 25.—The scores made at the sixth annual amateur tournament of the Dupont Gun Club follow:

First Day, Sept. 25.

Table with columns for Events, Targets, and Total. Lists names like Dominic, Bray, McDonald, etc., with their scores across 10 events.

Second Day, Sept. 26.

Table with columns for Events, Targets, and Total. Lists names like Forkner, Bray, McDonald, etc., with their scores across 10 events.

Third Day, Sept. 27.

Table with columns for Events, Targets, and Total. Lists names like Forkner, Bray, McDonald, etc., with their scores across 10 events.

Table with columns for Events, Targets, and Total. Lists names like Rossback, Wainwright, Brucker, etc., with their scores across 10 events.

Trap Around Reading.

READING, Pa., Oct. 3.—The fourth annual fall target tournament of the South End Gun Club, of this city, opened to-day, the attendance being fair. The programme called for six sweepstake events and also the special shoot for the fine Ithaca hammerless gun offered by Old & Co., of this city, to the highest score made out of 50 targets.

Second Day, Oct. 4.

Table with columns for Events, Targets, and Total. Lists names like Pfeager, Jack, Schmeck, etc., with their scores across 10 events.

Third Day, Oct. 5.

Table with columns for Events, Targets, and Total. Lists names like Yeager, Ritter, D S D, etc., with their scores across 10 events.

The scores made in the special event for the Ithaca hammerless gun, 50 targets per man, open to shooters of Berks county, follow: H. Melcher 40, Eshelman 35, Farr 31, Major 32, Bitler 34, Firing 38, Gerhart 44, Schultz 39, Livingood 43, Swoyer 24, H. Miller 29, Snyder 23, Clark 28, Breneiser 23, Ruth 34, Grill 37, Spatz 18, Lutz 38, Thompson 39, Bachman 28, Kurtz 40, I. Clark 37, Irvin 44, Quinter 32, Ritter 38, Jack 44, Zeller 33, Saylor 32, Ball 35, L. Wertz 47, Bortz 21, F. Wertz 31, Dietrich 36, Schaefer 35, Miles 27, Gile 27, Reed 28, Weidner 24, Osborn 34, Heilman 25, W. W. Miller 35, Jones 36, F. K. Miller 33, Fisher 43, Yeager 35, Hunsberger 37, Geo. Miller 27, Fritz 2, Smeeck 38, Lutz 24, Mattnas 34, Sheeler 35, Gieker 39, C. Hoffert 28, Walter 43, Yost 44, Essick 39, W. Hoffert 36, Hite 30, Kerr 41, Earnshaw 31, DUSTER.

Huntsville Gun Club.

HUNTSVILLE, Ala., Sept. 27.—The tournament of the Huntsville Gun Club, held to-day, was a success.

An investigation of the record made at the trap from the first shoot in June to the last shoot in September discloses the fact that Mr. John H. Wallace, Jr., has hit 363 targets out of 425, and that his average is .854 per cent., while Mr. W. L. Halsey is second with 324 hits out of 425 shots, his average being .762.

The greatest number of targets broken out of any 100 shot at was by Mr. John H. Wallace, Jr., who broke 94. Out of seventeen contests at 25 targets each he broke under 20 only twice, winning the weekly trophy nine times.

The members of the club have a pleasant surprise in store for their efficient scorer, Mr. John L. Hay. At the next regular meeting of the club he will be presented with a handsome testimonial as a token of the appreciation by the members of his excellent services.

Following will be found the records made by the individual members of the club from the first week in June to the last shoot in September, both inclusive:

Table with columns for Name, Shot, Broke, Av., and Total. Lists names like H S Bradford, W B Bankhead, R S Dement, etc., with their performance statistics.

Crescent Gun Club.

Chicago, Ill., Sept. 30.—Herewith find the scores of the live-bird tournament held at the Crescent Gun Club grounds Saturday, Sept. 28, and Sunday, Sept. 29. On Saturday the high average went to Mr. Richard Dwyer, who shot in excellent form. On the 29th high average went to Mr. Tramp Irwin. Mr. Irwin demonstrated to the satisfaction of the present generation that he is still with them and a factor in all of the big shoots.

The scores made on Sept. 28 follow. Nos. 1 and 2 had two moneys, \$2.25 and and \$2.50 entrance. No. 3 had three moneys, \$4 entrance:

Table with columns for Name, No. 1, No. 2, No. 3, and Total. Lists names like Dwyer, Irwin, White, etc., with their scores across three events.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1901, BY FOREST AND STREAM PUBLISHING CO.

NEW YORK, SATURDAY, OCTOBER 19, 1901.

VOL. LVII.—No. 16.
No. 846 BROADWAY, NEW YORK

TERMS, \$4 A YEAR, 10 CTS. A COPY.
SIX MONTHS, \$2.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

NAMES.

WHAT'S in a name? Give a dog a bad name and hang him. A good name is rather to be chosen than great riches—and so might be quoted old saws on names to fill a column. The names of fishes and birds and animals sometimes have more effect than we appreciate in determining our attitude toward them. In the East the Mohammedans call the black partridge or common francolin the "Bhugwan tere kudrat," which is their translation of the bird's guttural cry into a verse of the Koran meaning, "O God! great is Thy power!" For this reason the partridge is a common member of the Mohammedan household, and the species has been protected and preserved, whereas in other regions it has become exceedingly scarce.

A rose by any other name would smell as sweet; but as for the little beast called by the Abenaki Indians "seganku," Englished into "skunk," it may be said that its very name is against it; there is something in the simple sound of the word that expresses mingled contempt and detestation; it sounds just what it is. There are other names which have this quality of expressing by vowel and consonant the characteristics of the creatures to which they are applied. What more sharp, abrupt, exclamatory cry than that of "Bear!" could frighten women and children in a mountainside berry patch? Even the Latin form, *Ursus*, must have had something of the same adaptation as a cry of alarm. On the other hand, while grizzly means gray, the name "grizzly" certainly embodies more of the grizzly's nature than the tamer appellation of "gray bear" possibly could.

If there are cadence and grace in "gazelle," the name of the "antelope" rapidly repeated aloud has in it something of hoof beats striking the ground that was in the galloping *quadrupedans* of the Latin. "Buffalo" is heavy, with the ponderosity of the humped herd; whereas in "deer" the hunter who has been vouchsafed only an uncertain glimpse of the white flag may fancy that in the name he finds terse expression of the deer's fleeting nature.

A high-sounding name given to a wild animal may elevate it in our esteem if the animal lives up to its name; but unless the name is deserved it not only fails to give any new dignity, but becomes positively ridiculous. The name "mountain lion," for example, should signify some of those qualities which make the lion the king of beasts; but the actual result has been not to make the cougar more formidable because of its leonine name, but to bring into contempt a title worn so shamefully by such a cowardly brute as the cougar is. Incidentally one effect of the name has been to stimulate the art of fiction and the practice of lying, in and of the Rocky Mountains. Many an individual, who, were there no "mountain lions" roaming the woods, might have been content always to tell the sober, prosaic truth about doing a cougar to death with dogs, has waxed imaginative and creative and eloquent in the relation of his parlor adventures with the "mountain lion." The "lion" slayer sets himself up to do stunts as a hero, when the mere "cougar" killer would find no occasion to magnify his native greatness.

As an instance of what a good name worthily bestowed may do for a wild creature, consider the fish which is known to the ichthyologists as *Thunnus thynnus*. The common names are tunny, horse mackerel, great albacore and tuna. It is a widely distributed species, found on all warm coasts, and north to England, Newfoundland, San Francisco and Japan. The name "tunny" is the ancient thunnos of the Greek fishermen two thousand years ago, and from it comes "tuna." Albacore is Portuguese, from the Arabic, meaning "little pig." "Horse mackerel," it need not be said, is English, and there is no poetry in it, no more than in the "little pig" of the Portuguese.

Of all the old names, "tuna" is the most tuneful and pleasing to the ear, and when Mr. C. F. Holder, observing the feats of the fish as a leaper, called it the "leaping tuna," and made it known to the angling world under that suggestive and poetical name, he did what assured for it an attraction and a popularity which as "horse mackerel" it could never have had. The fish is found on the Atlantic coast; one weighing 600 pounds was taken a month or two ago in a pound-net off the Rhode Island shore at Watch Hill; as a "horse mackerel" it was properly a pound-net fish; as a "leaping tuna" hooked by an angler, it would have given the fisherman the sensation of his life. Not until some one shall hook the horse mackerel and bring it to gaff as the leaping tuna will the species take its place in the list of game fish which challenge the skill and the staying power of salt-water fishermen on the Atlantic side of the continent.

THE FIRST MAINE CASE.

MR. CRISTADORO'S sermon on the shooting of human beings for game in the woods is given immediate point by the report which came in the press dispatches from Maine on Tuesday of this week, telling of the shooting of an eighteen-year-old boy for a deer near Houlton. Two hunters were walking along a brook, when they saw what they took to be a deer lying in the dry bed of the stream. It was a human being, but they did not discover this until too late.

This is, we believe, the first case of the kind under the new Maine law, which reads:

Chap. 263, Laws 1901.—Sec. 1. Whoever, while on a hunting trip, or in the pursuit of wild game or game birds, negligently or carelessly shoots and wounds, or kills, any human being, shall be punished by imprisonment not exceeding ten years, or by a fine not exceeding \$1,000.

The prosecution of the case will be watched with interest. If there is no other way to teach caution in woods shooting, the lesson may be and will be instilled by criminal prosecutions.

Meanwhile, obey the FOREST AND STREAM'S reiterated exhortation—*Don't shoot at a deer until you know that it is a deer.*

LEFT-LEGGEDNESS.

It is a familiar fact that a person lost in the woods or on the prairie wanders around in circles to the right. In an interesting collection of facts and deductions from them, as given in a paper in the October *Woodcraft Magazine*, the reason for a lost man's going to the right is found in the demonstrated fact that the human race is right-handed and left-legged. That is, the left leg is stronger than the right one; and the constant tendency, therefore, because of the greater activity of the left leg and the longer stride taken with it, is to bear to the right. Locomotion is a continuous pedestrian match between the right leg and the left one, and the left is continually getting ahead. As has been said, the left-leggedness complements the right-handedness of the majority of the race; and per contra, it has been demonstrated that left-handed persons are right-legged, and in walking bear to the left. From which may be drawn the useful hint that if a right-handed person and a left-handed person shall yoke up together they will probably steer a straight course through the densest woods or the darkest night; and we commend this suggestion to the thoughtful consideration of Messrs. Avis, Cristadoro, True and others, who are troubled to know whom they shall choose as companions on their outings.

THE PLANK IN MASSACHUSETTS.

THE report of the game conditions in Massachusetts at the opening of the shooting season of 1901 is an unanswerable demonstration of the wisdom of the FOREST AND STREAM Platform Plank—The sale of game should be prohibited at all seasons. The Bay State covers are full of game; and they are full of game as a result of the law which forbids the sale of partridge and the taking of partridge for market. So convincingly has this been demonstrated that gunners who were opposed to the anti-sale law have been persuaded and won over to its hearty support.

It must not be overlooked that the Massachusetts law would have been ineffective unless enforced with decision and thoroughness, as it has been by the deputy wardens

under direction of Commissioner Collins and his associates. The Commonwealth has had the benefit of an intelligent Fish and Game Commission, genuinely interested in game protection; and the results attained by the Commission merit recognition and congratulation.

Now that the closing of the market in Massachusetts has worked so advantageously, we take it that there will be no going back to the foolish system of former years, when, with a market always ready to receive snared grouse there were always grouse snarers to supply the demand. The sportsmen of the Commonwealth may be trusted to preserve the law as it is, and to prevent a return to the open grouse market. The trial law was adopted for two years; now let it be made perpetual.

Massachusetts has always been a favorite field of operations for the grouse snarer; and until his occupation was taken away by the anti-sale law, it was the snarer who got the birds. Now the conditions have been reversed; it is the sportsman who gets the birds. The example of Massachusetts has not been lost on the neighboring State. Connecticut has an anti-sale law this year, and a staff of wardens to make it something more than a mere printed law. If the executive force in Connecticut shall do its duty in the efficient way characteristic of Massachusetts the grouse problem will be solved with like happy results. The New York City market is the bane of Connecticut, as of other States near and far; but in time we shall succeed in shutting it up.

DIDYMUS.

It affords us much pleasure to give such an excellent portrait of our long-time friend and contributor, whose pen-name of Didymus has been for more than twenty years a familiar signature in FOREST AND STREAM. The portrait will be welcomed by a host of readers as of one whom they well know. As a sportsman Didymus has enjoyed a wide and varied experience; and we have his half-promise of some reminiscences of the earlier days in the game fields of the East and West, which were then much richer in attractions for the gunner than they are now, or are likely to be again in the time of this generation. As a writer he is always entertaining because he has some very decided notions about what is right and what is wrong in sportsmanship, and he knows well how to express himself with directness and vigor. We shall none of us soon forget how thoroughly he has before now devoted his attention to some shining sham and exposed it so thoroughly as to leave in place of the shamming only the brazen bravado of one who has been found out.

SNAP SHOTS.

In Pennsylvania last winter the bill to amend the game law contained a provision prohibiting the sale of game, and was defeated by the cold storage people, who put up a large amount of money for the purpose. This is only one of numerous instances where wise measures intended for the preservation of game have been thwarted by the market interests, and it illustrates the general principle that when the market shall have been eliminated as a factor, the problem of game preservation will have been greatly simplified. When that time shall come the Legislature intent upon framing laws as to seasons will be free to adopt the dates best adapted to conserve the supply, without regard to whether or no they shall interfere with the business interests of the dealer. The elimination of the market man from the game committee room will be a decided step in advance.

In the corner of the hillside pasture is a gnarled and knotted and leafless apple tree, every branch and twig of whose unkempt state proclaims that it has long since passed out of the care and thought of the owner of the grounds, if, indeed, it ever had any share in them. And high up on a topmost bough is one scrawny little russet, as knotty and gnarled as the tree that bears it. But if you are country bred, you will lay the gun down by the wall and proceed to pelt that apple off the tree. For it is a part of the lore learned in boyhood days that that undersized and homely fruit, which no respectable tree would give bough room, has peculiar sweetness and spice; and when you get it, and bite into it, the tang is what must have been the flavor of those apples of the Norse goddess, which when eaten by the old warriors restored their youth.

The Sportsman Tourist.

In the Philippines.

SURIGAO, Mindanao, P. I., July 26.—*Editor Forest and Stream:* Early in May the ship came to take us back to the United States, and I found myself once more in command of a vessel on the high seas. But it was only for a short time, as our destination was Cagayan de Misamis, where the regiment was in process of assembly.

Our first stop was at Oroquita, where a fierce little fight had occurred in the previous summer. I was shown where the insurrecto army had rushed in, early in the morning, armed with bolos, to attack the company of soldiers that had landed there only the day before. I was shown where thirty of them had been killed in one pile, and the mound where over ninety were buried. The Filipinos were so sure of exterminating the Americans that a lot of them got in a building near the quarters occupied by the troops, and when the lieutenant in command threw out a skirmish line, they were penned in and killed.

At this post my force was increased by a company, and we steamed on, reaching Cagayan late in the evening.

In the morning I marched my battalion two miles over a shaded road, between nipa cottages and silent crowds of natives, to the headquarters of the regiment.

In a few days the regiment boarded the Pennsylvania, and we bade good-by to the island of Mindanao. Reaching Manila, a telegram from Judge Taft summoned me to appear before the U. S. Commission at the Palace. There I found that I had been appointed Treasurer of the Province of Curigao, in Mindanao. In view of my strong desire to return to the States, this appointment did not assume the importance my friends tried to impress upon me, but I finally decided to accept, and the next few days were spent in settling up my company affairs and in bidding good-by to the associations comprised in my two years of service.

The long, weary wait for a transport to carry me to my post was enlivened by meeting many old army friends; but after the cool, delightful weather experienced in Mindanao, the heat of Manila seemed oppressive.

After reaching my post, I made a trip, in company with the Governor, to Butuan, one of the towns of the province, to see the natives, and to establish civil government. The ride on the steamer Surigao was delightful, especially when we entered the river Butuan, a noble stream, as broad and carrying more water than the Missouri at Sioux City. At one place a moss-grown monument marks the spot where Magellanes first landed in Mindanao.

At Butuan we were met by the usual brass band and escorted to the tribunal, where we held several powwows. The native Malay is indolent, but he is a past master in the art of office work and methods, and takes rapidly to any new forms in that direction.

Along the upper river are gold fields that no doubt will soon attract the American miner. At Surigao I am interested in some placer diggings, and I had heard so many stories about the native workings that I was anxious to see them at work. There are a number of Chinese stores in Surigao, and a good part of their business is in buying gold from the natives. That the natives could go out from town—men, women and children—and in a few hours' work scraping around the rocks, with their little cocoanut shells and wooden bowls, could come back with one and sometimes two pecos' worth of gold, seemed to me incredible.

I determined to go out and investigate for myself. One morning the "muchacho" brought around two ponies and an American horse, and with my associates B. and L. I rode through the quiet town, past the white monument that marks the memory of a former enterprising Filipino citizen, and over the hill to Tlaya, as the Visayans call the open valley beyond. Here the road wound through fields and past nipa farm houses, with forest-clad hills on either side. I noticed a thick growth in the fields that resembled our red clover, but whenever our horses' feet touched it the leaves folded up like the sensitive plant. Some natives on carabao overtook us. These useful animals appear to travel as well as a horse.

After crossing Cansaran Creek, B. showed us some coal streaks in the bank of the creek, which he thought could be traced to the foothill near by. "By running a shaft down," he said, "about twelve or fifteen feet I believe this vein could be tapped; and if the coal proved of good quality it could be shipped in barges to Surigao, where it would be marketable."

Our course now led up the bed of the stream, and as we proceeded, the boulders became larger and the gravel took on the look of a mining country. Arrived at the camp, we found four sluice boxes in operation, a force of ten or twelve natives being employed in shovelling from the bedrock into the boxes. The foreman was a native Filipino who a few months before was an active insurrecto.

The entire creek had at some time been worked by the natives, and the foreman showed us a large boulder that had evidently been propped up by smaller stones.

The Filipinos have no knowledge of mining as we understand it. They pick little holes in the bank, and when they come to a large rock, burrow around it until they have progressed so far that there is danger of the tunnel caving in, when they abandon the working and go somewhere else.

After dinner, which consisted of rice and meat, with coffee, we went to visit some native workings about 300 yards below our diggings. They were working in a slide about 50 feet above the creek, and when we emerged from the slippery trail that wound through the forest we came suddenly upon fifty people—men, women and children—working like beavers. It was a picturesque scene.

In a cutbank were a dozen holes, and in each hole a native working with a crowbar, loosening the mingled clay and gravel which a boy would scrape up with a cocoanut shell into a basket and carry down to the women in the creek bed, who would take it in a wooden bowl shaped like a gold pan, but not so large, and wash it deftly and quickly, in about a minute, extracting

the pure gold, which looked very pretty against the dark wood. I stood near one woman while she washed a pan and watched the operation. It was all done very quickly. She wobbled the pan two or three times, pushing out with one hand the gravel and stones, and finally disposed of the fine sand with one movement, leaving over fifty cents' worth of gold in the pan. One piece alone was worth thirty cents. I said to her, "Mucho dinero?" She looked up with a smile and said, "Poco."

If one person with half a pan of dirt could take out in one minute fifty cents' worth of gold, the possibilities were great; yet this is done right along. Not only there but in many places in the neighborhood. But they are easily satisfied, and when they have gotten a dollar or two they they go home to town to spend it.

There appears to be about ten miles square of this territory. They are getting on to our idea of sluice boxes, however, and I saw some troughs of palm they had manufactured for the purpose of saving the gold. Along the ridges are many of these pits, and some of their workings look to be a hundred years old. L. S. K.

In the Ranger Service.

BY ROWLAND E. ROBINSON.

VI.—Abercrombie's Defeat.

Soon the troops began embarking, and as I watched a regiment of Connecticut men marching down to the boats, I caught sight of an acquaintance, no other than Bill Jarvis, the son of our village landlord, and a devil-may-care fellow, fond of jokes and gossip. Being off duty, I ran down to the landing to get speech with him, and got the chance for a few moments while they were waiting their turn.

"How are you, Billy?" I cried, "and what's the news from home?"

He stared at me a minute before he made me out, grown browner and older looking with nine months of soldiering.

"Why, is it you, Paul? Zounds! you look so like a man I didn't know you."

"Well, you see, there's a chance for you, Billy. But what's the news? How are my uncle's folks, and—the minister's?" I blurted out my question.

"Oh, your uncle's well enough now, but he lost a cow last spring, and it nigh about killed him. He pinches the King's head on every sixpence he gets hold on till it hollers; but he's a-buildin' a house for Lot to live in ag'in he gets married."

"Who's Lot going to marry?" I asked, with my heart in my mouth.

"Hain't you heard? Well, that beats all, for I'd ha' thought you'd heard that! The minister's goin' up into the wilderness to Number Four, or thereabouts, to preach the Gospel to the heathen; but his darter hain't a-goin'. She's goin' to marry your cousin Lot."

"It's a lie!" I cried. "She'll never marry Lot."

"I give you the news as I git 'em; I can't make 'em to suit you," said Billy, looking very honest. "Fact on't is, I s'pose they're married, for the day was set afore I come away, and the minister's wife had bespoke marm to make the weddin' cake."

"Forward! March!" came the sharp order, and the regiment moved on, leaving me dazed and sick at heart as I had never been before.

I said I would not believe the miserable story, yet how could I disbelieve it? Jarvis had lived all his life in the neighborhood that he had left within a month, and always kept informed of its affairs; and what reason had he for telling me an untruth? Furthermore, this story tallied with my jealous fears, and with that part of Mercy's letter that had aroused them, where she wrote of her father's call to the settlements. Five months had passed since I heard from her, and it was because she dare not confess how she had broken faith with me. So, with more and more sickening certainty, the conviction grew upon me that she had proved too weak to withstand the strong wills of her father and the favored suitor and their continual entreaty. A year ago I could not have believed it possible; yet now it seemed reasonable enough, though it was breaking my heart. Ah! why could not I have died before I lost my faith in her? Well, there must be a battle soon, and I only hoped that in it my heartache and life might end together.

With my thoughts far away, I must have been the poorest scout in the company of Rangers that went forward in the advance of the embarked army; but the cloud that was upon me could not prevent me admiring the gallant sight when we looked back from the brow of a bold, rocky promontory and beheld the noble pageant of the advancing flotilla, thronging the lake, with countless craft, whose oars rose and fell in measured beats in time with the martial strains of fife and bugle and droning pipes that the echoes mocked with a wild clamor of reverberation, while the brilliant freight of scarlet uniforms, many-colored plaids and fluttering banners and glittering arms quivered in broken reflections down the rippled lake like downward pointing tongues of flame and falling sparks. Surely I never saw so grand a sight as that proud host sweeping onward with the certainty of victory, alas! to such bootless display of valor—to such utter defeat. The startled eagles wheeled above them in ascending flight; then soared away to remote fastnesses.

Arriving that night at the foot of the lake, the army set forth for Ticonderoga next morning, moving in four columns through the wilderness, and had not gone far when a party of our scouts discovered a detachment of the enemy and engaged them. The firing presently brought some of our friends to us, led by Major Putnam, of our own good colony of Connecticut, almost as famous a Ranger as Rogers, and he was accompanied by Lord Howe, who always desired to bear a part in the most perilous service and share danger and hardship with the humblest soldier. We had but a glimpse of him recklessly exposing his gallant, conspicuous figure, for he was a novice in the warfare of the woods.

There was sharp firing in front, and nothing would serve my Lord Howe but to go and see what it was, though our Major Putnam besought him not to do so. Alas! he went, and with him also Putnam, leading a de-

tachment of Rangers, myself among them. It was woeful to see how recklessly his lordship exposed himself, taking no care to keep to cover of trees, and very conspicuous in his bright scarlet coat. Once I saw him step aside to pluck a rare pink posy, look at it an instant and thrust it in the breast of his coat, for he was very curious in all new, strange things he saw—trees, flowers and what-not. I never saw one of those pink flowers but I wished its like had never blossomed, for I doubt not he then caught the eye of the marksman whose bullet the next instant laid him low, the flower of all that brave army, so untimely cut down. It was he who was the real head of our army, for General Abercrombie was a dull man, so like to an old woman that we Provincials ever after called him "Nabby Crombie." Little wonder it was that with such a leader our noble army accomplished so little.

After a time we routed the Frenchmen, but all the columns had fallen into confusion in the maze of woods, so we were withdrawn to our last encampment, where we passed a heavy night, for every soldier grieved the loss of this best-beloved officer, and, viewed in the gloom of the day's mishaps, the path to victory seemed not so clear as it had in the brightness of morning. However, the army was on the move again, betimes, next morning, and after a sharp skirmish with a French outpost on the right and weary marching in the smothering heat of the breathless woods came before the evening to a line of defenses a mile or less to the westward of the Fort Carrillon or Ticonderoga, and stretching across a neck of high ground from one morass to another. The Frenchman had hedged his entrenchments with felled trees, all the branches sharpened and bristling out toward us like the quills of a hedgehog.

General Abercrombie's engineer went forward with our Rangers to spy out the enemy's outworks, and after some examination was of the opinion that they might be carried by storm. This seemed very hazardous to us bush fighters, both officers and men, for the abattis bristled along the front of a strong breastwork that hid all the Frenchers from our sight, save as now and then an officer exposed himself above it, striving to discover what he might of us, where we were harassed by occasional shots from the Indian scouts. One officer often showed himself above the breastwork, very busy here and there, in his shirt sleeves, but otherwise finely clad in gold-laced waistcoat and breeches. I took him to be their general, Marquis de Montcalm, and tried a shot at him, with the remembrance of Fort William Henry bitter in my heart. My bullet went close enough to make him more cautious, and so did us more harm than good, for he went safe through the fight to get his death at Quebec.

What polite, fine gentlemen they were, yet devils all the same, sorting so naturally with those naked, painted friends, their Indian allies, and taking part in all their barbarities, stopping short of roasting and eating their captives! For my part, I could never abide with them, whether of high or low degree; man, woman or child.

After our troops were deployed in front of this barrier there was for a brief space that seemed very long a hush of awful stillness. The yet half-withered leaves of the lopped branches scarcely stirred the sultry air, and we could hear the changing murmur of the distant stream like the ringing of remote bells, and the sweet song of a little bird that alighted on a high prong of the abattis between the silent armies, a strange prelude to the impending tumultuous clamor of battle.

Then came the sharp, sudden word of command, a wild blast of bugles, a crashing volley of musketry, and our columns charged into the smoke clouds upon the abattis, and the French breastwork all along the crest blazed forth a terrific fire from rattling muskets and bellowing cannon, and beneath the lifting smoke we saw our brave ranks go down like grass before the scythe. Rank after rank rushed on, only to be in turn swept down by the fire of the hidden foe. All above the impenetrable barrier of spiked antlers our columns surged against it, only to break or be beaten back like waves against a rocky shore. Here it was the scarlet wave of the British line; there the Colonial troops; elsewhere the wild Highlanders of the Black Watch, that beat vainly against it. The dogged Englishmen and our own brave countrymen still struggled on in the face of hopeless defeat, and the Highlanders, in a fury of rage, strove to chop a passage through the abattis with broadswords till the half of them were killed outright and the wailing pipes called away the torn remnant of the brave regiment.

If we Rangers gained less glory, we had the greater safety and performed more effective service fighting after our own fashion behind trees, and killing more Frenchmen with our careful, infrequent shots than our regular troops with storm of aimless volleys. You may wonder that, with all this opportunity, I did not seek a chance of being killed, but with the sight of such mangling and maiming and havoc of death before me, men writhing in the agony of frightful wounds among gory heaps of slain, I was of a different mind concerning life, and concluded I would rather live with a broken heart than die of a broken head, and was glad enough when we got the order to retreat. But this did not come till a thousand of our brave men lay dead or mangled on the bloody field. Amid the scattering volleys of French bullets that whistled over our heads, I came upon a grievously wounded American soldier, and, stopping to offer such help as I could give, which was but a drink of water, for the poor fellow was at the point of death, I discovered he was no other than poor Billy Jarvis. He revived a little with the draught, and it was plain he recognized me, for he tried to speak, but I could make nothing of his gasping whisper, and with a great sigh his last breath went out. Then I covered his face with his hat and hurried after my company, wondering vaguely in a whirl of thoughts what it was he would have told me if death had not sealed his lips.

The retreat of our army up the lake was a sad contrast to its proud advance. The torn banners drooped over thinned, dispirited ranks and many a sorely wounded man. The sluggish oars beat no martial strains now, for the verdant shores echoed the melancholy wail of the pipes, lamenting the dead clansmen. The reflections of scarlet coats and red banners reminded one not of flickering fire, but dropping blood.

[TO BE CONTINUED.]

hooting at Something in the Wood Adventures in Tropical America.

III.—A Turtle Hunt in the Tropics.

THE crop of deer-shooting accidents—in the sense of maiming and killing of human beings—is already being harvested. The morning papers record a case here a man up a tree watching for deer had his legs led full of buckshot by a man on the ground—presumably watching for deer also.

And, when you think of it, this portends a very serious condition of affairs—for the deer hunters. With the woods full of men, every mother's son of them, armed with a .30-30 smokeless rifle, the only safe thing for a man to do would be to climb a tree—and, if we can believe the report in the morning papers, that haven of refuge is now being taken away. Hunters have gotten so alert that they even look into the tree tops for deer. In the recent days of black powder conditions were bad enough, and, unless the innocent hunter used due publicity, accompanied by loud shouting, he was apt to be mistaken for a deer and bagged. The waving of an arm or the flapping of an arm covering of the shooting cap a distance away in the undergrowth became a live, moving deer, and appealed to the deadly bullet. This situation was certainly bad enough as the season's crop of maimings and fatalities early proved.

But now is the danger of the situation compounded. There was a limit to the black-powder-propelled ball, but who can tell where the steel-jacketed .30 rifle ball finds its resting place? It is only necessary to run over the files of the daily papers during the deer season to read the story indelibly written in blood. No one is safe in the woods or upon the lake in a deer country infested with hunters armed with the unlimited distance consuming .30-30 smokeless.

How many instances where a rusted, leather-beaten rifle, the tattered remnants of clothing mingled with human bones have been found in the forest after the winter's snows, to tell the tale of the stray bullet, I do not know, but I certainly think the introduction of the small-bore smokeless rifle into the woods has made deer shooting as dangerous for the hunter as the hunted.

How often does a man kill his deer in the woods a hundred yards away? At two hundred yards in the brush or undergrowth how many deer are killed?

If from fifty to one hundred yards is the average distance, then why take an arm into the woods that will kill at perhaps two miles?

On the plains and among the foot hills where three hundred and sometimes four hundred yard shots are made, the smokeless rifle, with its low trajectory, is the right thing in the right place, and results are secured that could not be had from the black-powder rifle.

This shooting at something in the woods that looks like a deer's body by day or a deer's eyes by night will partially cease when such maimings or killings are charged up against the man behind the gun as manslaughter. The plea that "I thought it was a deer" when refused by the coroner and the culprit bound over for trial will bear no weight and prove of no value as an extenuating circumstance.

And in connection with this subject, how strange is it that the buck-fever-smitten hunter, shooting at the real thing with hide and horns, will pump his magazine empty, doing nothing further to the fleeing game than to bark the trees in his wake, and yet let this same Nimrod catch sight through the brush of a spot on the back of a hunter's corduroy coat as big as your hand and ping-g-g, he will send a ball home, hear his game fall, and, running to the spot, have his excited gaze met by a human being rolling in his death throes. There is a fatality about these situations, a sort of dead-shot marksmanship very hard to explain when compared with the skill shown when shooting at the live quarry.

The unknown danger of the woods has kept many from enjoying the pleasure and outing consequent upon a deer hunt. As the season opens in Wisconsin and Minnesota, the number of those killed or maimed by their fellow sportsmen compares favorably with the actual deer killed. The baldest case of accidental shooting I ever heard of was when two hunters had driven in a rig to the timber and had put their horse up in an old, log stable. They had tramped the woods all day and had gotten nothing. Returning to their starting point, as they stepped out into the clearing, they saw ahead of them through the darkness two "balls of fire"—which expression "goes" for a pair of any kind of eyes in the woods at night—and fired. And when they reached the spot they found that their faithful steed had thrust his head outside the stall window in anticipation of an early start for home, and received a bullet squarely between the eyes for his eagerness.

A man to shoot in comfort and safety in the woods during the deer season should either encase himself in impenetrable armor or should carry with him a phonograph tuned up well and charged with the latest rag-time,coon-song music.

Unless you can work your way into the wilderness and there hunt your deer, where you can neither shoot the other fellow nor in turn be shot by him, it would be well to think twice before you tramp through a popular deer country.

CHARLES CRISTADORO.

WHEN one has nothing but corned meat in tins, it is really noticeable with what eagerness one starts on the chase, and when evening came, I was always ready to take my rifle and follow any guide who might be willing to lead the way. This was in Spanish Honduras, on the coast near Cape Gracias. At our camp there was a negro called Big George, who stood six feet four, and knew all the country round about. Frequently, after sunset, he and I would go among the sand dunes looking for deer. We never got anything. Big George said I talked too much, but I am not so sure about that.

One night we determined to follow the beach looking for turtles. It was a beautiful experience; under the intense moonlight the sand looked like a pathway of silver stretching out in the distance, with the ocean and the jungle, one on either hand, each shrouded with the mystery of night; from the ocean the sound of the waves breaking along the shore, and from the jungle the cries of wild animals—weird voices from creatures unseen. Strange surroundings, intensified by the presence of fine semi-naked Indians, who, following one after the other, went like shadows stealing silently along the sand!

DIDYMUS.

On and on we went, our hopes frequently raised, to be followed only by disappointment. Sometimes it was a log glistening in the moonlight; again a patch of shells would so much resemble a turtle that our steps would quicken impulsively. Finally, Big George said it was of no use; the moon was too clear. But just then something unusually bright in the distance caught my attention, and hurrying on, we saw that this time a really large turtle was just before us, resting quietly on the sand. Now all was excitement. Nearer and nearer we crept. The turtle, all unsuspecting, remained quiet; then suddenly its head was raised for an instant only, and it started clumsily for the water. Immediately the Indians were upon it, and for a moment I could not tell which was Indian and which was turtle. In the general confusion one man was sent rolling over and over at a blow from one of the flippers; in an instant he was on it again, and then the struggle was over; the turtle was turned on its back, hauled to a safe place, and we then triumphantly returned to camp.

The next morning four Indians said they would bring the turtle in with ropes if I would loan them. I thought they must be very strong, and rather doubted their ability, but I gave them such things as they wanted, and, taking my rifle, followed, to see what they would do.

After a tramp of about three hours we reached the turtle, finding it unharmed and just as it had been left the night before. The Indians began at once tying up the turtle for the return to camp. I could not help admiring their ingenuity. A rope was tied to each flipper, where the turtle was allowed to crawl back to the water, where the Indians, holding the ropes from the shore, could guide it as they wished. We went toward camp with some enthusiasm at the thought of the supply of fresh meat that was swimming along before us as we walked rapidly over the hard sand.

Presently we came to the mouth of a river, where we all crowded in to a small canoe, one man holding the turtle, and three attempting to paddle. But the turtle was too strong for us, and began at once dragging the canoe down the river toward the breakers on the bar. Here was

danger; around us an ever-increasing company of sharks came, gathering closer; some even brushed against the canoe, rocking it violently, while the efforts of the turtle threatened to upset us every moment, and once in that water there would have been little chance for us. We were now nearing the breakers, and the canoe began to race ominously. I called to the men to cut the ropes and let the turtle go. One seized the latchet, but at that instant the turtle turned down the coast instead of crossing the bar, and this gave the Indians a chance to reach the other shore, and we soon had the turtle hauled up close by camp. That night he was made into soup, a whole turtle stewed in a great iron pot, and it was good.

FRANCIS C. NICHOLAS.

Two Tales and Three Snake Stories

THERE is a notable company of men in Missouri, belonging to the older generation, who may justly be termed paladins of good livers. They are anglers, hunters, travelers, story-tellers, *bon vivants*—real gentlemen of the old school. One of them will travel 500 miles to go a-fishing, and then go as far in the opposite direction to crack a joke. They are a secretive set, for the most part, and yet wherever one goes, and in whatever set of men, in and about St. Louis, he hears vague statements to the effect that "those old fellows know better how to have a good time than any other set of men in the world." It is said that they have hunting and fishing places somewhere in the Ozarks that are practically permanent camps, no sooner vacated by one crowd than occupied by another. They have their own good time, hide it away in their memories and proceed to have another, and no outsider is any the wiser, unless, as was the case the other day, when the Judge sent for me to go with him out to Blanton's, some one of them becomes reminiscent. Perhaps the talk was started when he showed me six long and narrow silver goblets, said to be the best receptacles for mint juleps ever invented, and the like of which I had heard were possessed by others of that ilk for strictly utilitarian purposes, but which in the present instance were valued solely for their ethnologic interest.

He said that one time, many years ago, three of them, so he had heard, were stopping at a primitive summer hotel in the far North, and had not been there long until the hotelkeeper recognized in them certain sportive proclivities, which only needed encouragement and tutelage. Accordingly, he one day proposed to teach them to play poker, asserting that it was the best game ever invented, and one which they were peculiarly fitted to enjoy.

Thereupon he taught them how to play the game, explaining that two pairs beat one pair, threes beat two pairs, three of one kind and two of another beat two pairs, etc., and directly they were at it with a pretty stiff limit and plenty of chips, and with the hotelkeeper in the game. Pretty soon the hotelkeeper got a big hand and raised the bet, the man next him raised the hotelkeeper and the man in front raised No. 2. Nothing loth, their host raised them back, and this procedure was repeated several times, and then No. 2 raised the limit, when No. 3 "laid down" and the hotelkeeper, thinking his remaining opponent must have "fours," reluctantly gave up also, whereupon No. 2 raked in the chips and threw down his hand, face up, as a beginner often does. There was not as much as a pair in it, and the hotelkeeper exclaimed, "Why, man! You oughtn't to bet that way on that kind of a hand. I ought to have had that pot myself. That hand's no good!"

"Yes it is," vociferated the other, "it beats threes. It's two of one kind and three of another—two reds and three blacks."

The trio were not getting as much chicken as they felt they were paying for, so one day one of them said to the landlord: "I will bet five dollars I can kill four chickens at one shot." This seemed not unlikely, and the landlord declined the wager until one of the others took him aside and said: "See here, you take the bet and we'll draw the shot out of his gun. He's been winning our money at that new game you taught us, and we want to get even with him." And they produced his gun—it was in the days of muzzleloaders—from which they drew the shot. The money was staked, and, when the chickens got rightly bunched, the man blazed away and killed and crippled thirteen. The gun had been loaded with two loads of shot. They had chicken "to burn" for a week.

When we were at Blanton's I asked him to tell his big snake story, and he proceeded to tell two of his own, which he vouched for, and another of Uncle Joe O'Banion's, which, I suppose, Uncle Joe will vouch for.

"When I was a chunk of a boy," he said, "my cousin and I were killing rats one day at their corn crib, and, in doing so, were digging in the earth underneath it with sticks, when we saw the tail of a snake in a hole. One of us took hold of the tail and tried to pull the snake out, but it wouldn't come, and then we both tried it, but couldn't budge it. So my cousin said, 'You hold on to its tail while I go to the house for the mattock, and we'll dig it out.' We dug that snake out and killed it. It was a black snake, and had six full-grown rats inside it, and was 10 feet in length. It was the biggest snake ever killed in this part of the country."

"Now, how long," he continued, "do you suppose a snake can go without eating?"

"Two weeks," I suggested.

"Well, this is what happened with me once. I was 'markin' out' corn, and the plow cut a snake clear in two at about the middle, all but a little piece of skin. I turned a big rock over on it and went on, thinking it would be dead before night. The corn was planted, and when it sprouted and was ready to plow, I came along

DON'T SHOOT

until you SEE your deer—and see that it is a deer and not a man.

there and turned that rock over with my plow, and that snake ran off. It had "assembled" itself and grown together again, and as it wriggled away I saw where it had healed and there was a ridge around it there, raised about a quarter of an inch all around. Mrs. Blanton does not like me to imperil my reputation by repeating this story, but it is true, nevertheless.

"I told it once to Uncle Joe O'Bannion, over at Fredericktown, and he said: 'Well, Thompson, I can tell you a snake story that beats that a mile. Do you know my nephew Jim?'"

"Yes," I said. "I've known him as long as I've known you."

"Well, do you know where the old Johnson farm is?"

"Yes," I said: "I've been on it a hundred times, I reckon."

"Well, Jim and I were riding along the creek down there one time and I saw a cottonmouth moccasin run into a drift, and I says, 'Jim, let's get off our horses and kill that cottonmouth,' and Jim says we couldn't get it out of that drift."

"Yes we can," says I. "You get you a good club and stand across the branch and kill it when it comes out," and I touched a match to the drift, and when it took fire, out crawled the cottonmouth and Jim killed it, and there were ninety-nine little cottonmouths ran out of that snake's mouth."

"When Uncle Joe got through I didn't say anything right away, but after a little I says: 'Uncle Joe, why didn't you make that one hundred?'"

"And he turned to me kind of sad and said: 'Thompson Blanton, do you suppose I would tell a lie for one little snake?'"

GEORGE KENNEDY.

Old Cronies.

YOU all know them, but I don't think they are found so often as among the ones who enjoy the sports of forest and stream. There is a bond of sympathy between them that they do not understand themselves. They number members of all ages and nations, and even can be found among the animals. I will write of two men I know of middle age. How or when their friendship originated is a mystery, for they are directly opposite in nature—one quick, nervous and inclined to weight; the other, lean, slow, and I do not believe he has nerves.

Living some distance apart, they don't meet more than twice a week, but every two or three days Jack will begin to look toward Joe's and have spells of absent mind, standing with hands crossed, staring into space, until finally the desire cannot be resisted longer, and off he is to Joe's. The meeting is quiet, and they wander off to some shady nook and will sit for an hour without saying a word, seemingly happy in the silent companionship.

Finally, the silence will be broken by a remark on the weather, then their little troubles are told, confidences are exchanged and the troubled looks will vanish, smiles will come and those kind old faces will look years younger. A momentary stop at the house and he comments on the looks of Joe, Jr.—how ugly, etc.—but Joe takes it as meant, knowing if another were to say such, in Jack's presence, there would be war. Back home again with the burden lifted for a few days he goes, only to return for the consolation of that other presence—one's troubles the other shares, thus mutually smoothing life's rough pathway.

When the troubles came thick and fast, many might come and speak words of sympathy, but the silent company of his Old Crony was the balm of his suffering soul. When the end came and she had gone to her rest—the last, long sleep—then it was Joe who saw that everything was done that mortal could do for one so afflicted. Then came words of thanks to all but Joe—not a word for him. The eyes—that beautiful spirit's shrine—then told a story mortal lips cannot express—the thanks of a troubled soul to the one who had tried to bear its burdens.

Thus sharing life's burdens, those old cronies will go through life, and when that grim destroyer comes for one, the other will wait with impatience for the day when again they can exchange confidences on that other shore.

J. H. PIERCE.

Natural History.

Out of Their Latitude.

IN the notes just published by the United States Fish Commission, of observations at Wood's Holl, Mass., in 1900, Messrs. George H. Sherwood and Vinal N. Edwards record the occurrence in Massachusetts waters of several fish which belong in more southern latitudes. Among the most interesting are these:

TARPON (*Tarpon atlanticus*).—Mr. H. M. Knowles, of Wakefield, R. I., is authority for the statement that a tarpon 5 feet long, and so slender that it only weighed 30 pounds, was caught in a fish trap near Dutch Island Harbor, Narragansett Bay. Another weighing 80 pounds was taken at Martha's Vineyard, and a smaller one in the Fish Commission trap at Wood's Holl. The northern limit of range of this species is southern New England, but it probably does not breed north of Cuba.

SMOOTH PUFFER (*Lagocephalus levigatus*).—During 1900 several specimens of this occasional visitor were taken in the vicinity of Wood's Holl. In the fall two adults were caught in a trap at Cedar Tree Neck. The Rhode Island Fish Commission reports three specimens from Narragansett Bay; the largest, taken Oct. 4, at Tiverton, R. I., weighed 10 pounds; the other two were caught the week before at the mouth of the bay. The smooth puffers are common in the South, but very rare north of Cape Hatteras. Their average length is 2 feet. The young, from 2.5 to 4 inches long, were found by the U. S. Fish Commission in the waters of Porto Rico.

FLASHER, TRIPLE-TAIL (*Lobotes surinamensis*).—The Rhode Island Fish Commission has in its possession a specimen of *Lobotes* weighing 6 pounds and measuring 22 inches in length, caught on Sept. 10 in a trap off Prudence Island, Narragansett Bay. This inhabitant of all tropical seas is a very rare visitor in the waters of southern New

England. Not more than six specimens have been recorded from this vicinity in the last twenty years.

Of the additions to the fish fauna in 1900, Dr. Hugh M. Smith writes:

The already surprisingly large fish fauna of the Wood's Holl region was augmented by four Southern species during the fall of 1900. These bring the total number of known species from the vicinity to 243. Following are the species new to the region:

FLYING FISH (*Exocoetus rondelii*).—This common species of the West Indies and the Mediterranean has been recorded from United States waters only in Florida. A specimen 7.25 inches long was caught in a trap at Menemsha Bight, Oct. 13.

YELLOWTAIL (*Ocyurus chrysurus*).—The normal range of this species is southern Florida to South America. It is an abundant food fish at Key West. On Oct. 4, an example 5.5 inches long was seined in Katama Bay.

PARROT FISH (*Scarus croicensis*).—This is a common West Indian species, the Northern limit of whose known range heretofore has been Key West. Two specimens 3 inches long were taken in Katama Bay, Oct. 20, the water temperature being 57 degrees F.

MUD PARROT FISH (*Sparisoma flavescens*).—This, the commonest species of the genus, is abundant at Key West and throughout the West Indies. It was not known north of Florida until a specimen 6 inches long was found at Wood's Holl on Nov. 13; it had been numbed by the cold and was picked up on the shore of Buzzard's Bay.

Subtropical fishes, observed during the year, are noted by Dr. Smith as follows: Spanish sardine, squirrel fish, snowy grouper, red grouper, marbled rockfish, yellow-finned grouper, short big-eye, gray snapper, schoolmaster, red snapper, muttonfish, butterfly fish, blue tang, tang, cowfish, scorpion fish.

The season as a whole was unfavorable, and compared with 1899 there was a scarcity of tropical species. No Gulf weed was seen in any of the inshore waters, and there was little wind from the direction of the Gulf Stream. Nevertheless, some rare fishes were found, and a number of species which, until 1899, had been considered very uncommon, were taken in abundance. Most of the collecting was done in Katama Bay, which the previous season's experience had shown to be the most favorable locality in the vicinity of Wood's Holl, and only in this body of water were any of the typical Southern fishes found. Large bluefish and flounders were abundant at the inlet of the bay through the summer, and may have picked up many of the small, gaily colored stragglers from the South.

Caribou in Bronx Park.

SEVEN young caribou were received at the New York Zoological Park last week. They came from Newfoundland. The band consists of five does and two bulls.

In this connection it is interesting to recall that the first caribou ever brought into the United States was for Blooming Grove Park, in 1871, from Antigonish, Nova Scotia, by Charles Hallock. It was carefully crated, fed, and personally attended to by Mr. Hallock, and had a smooth passage, by steamer, to New York. It went up the Erie Railroad to Lackawaxen, and arrived at the park grounds in good order. It was turned into the breeding paddock, a mile square, where it seemed to thrive at first, but, after a few weeks was found dead, manifestly from lack of suitable diet.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

The One Incident.

IT is the experience of every man, I fancy, to have some particular incident of each hunting trip leave a deeper impression upon the memory than the total of all his other adventures combined. This is the occurrence that marks distinctively a visit to the Maine woods last fall. The story is simple enough, and relates to a deer which I might have shot and did not.

One day I was walking with my guide along an old wood trail on the lookout for moose, when we spied a young buck deer about 50 yards ahead of us in the trail. He probably never had seen man before—at least, he looked at us very curiously and fearlessly. My guide urged me to shoot, but I refused, for the little fellow's trustful tameness impelled me to spare his life, and besides, we were after larger game, which a shot might alarm. I determined, instead, to see how close I could approach, so I walked steadily forward to within 25 yards. At this point a big tree had fallen across the trail with its trunk nearly breast high. I thought to myself that in crossing this obstacle, where more or less of violent effort must be used, certainly, the deer would take alarm and make off. But not a bit of it; he watched me in the noisy process of clambering up and off the trunk with a look of wise amazement, but without any demonstration of fear. As I further advanced he went on browsing, with an air of calm contentment, now and then glancing up at me with his big, brown eyes. He was a beautiful little fellow, with quite the prettiest head and face of any deer I have ever run across. I may remark here, what every deer hunter well knows, that there is a marked individuality in deer, and some have far handsomer heads and faces than others. Not till I had approached to within 25 feet (I afterward measured the distance) did my confiding forest friend show any trepidation. Even then his sense of alarm was not much exercised, for he merely gave a couple of graceful bounds to a mossy bank alongside and stood there watching me as I still continued to approach him. Again I advanced to within 25 feet, when whoof! he must have got my wind, for with bounding leaps, white flag displayed, he madly sped through the woods as if the devil himself were behind him.

Now the Maine laws allow one bull moose and two deer each season to the successful huntsman, but, as a matter of fact, I shot neither my one moose nor either of my deer last fall. There were numerous opportunities

to shoot deer, to be sure, which I always declined, for I was after moose primarily, but no other deer offered me so certain a shot.

I confess I would like to have shot my lawful quota of both moose and deer, but I am far from regretting that I did not shoot this trustful little spike-horn buck in the wood trail. On the contrary, I rejoice to think that I did not betray his simple confidence in my friendly intentions. The memory of his gentleness and beauty will always remain with me as one of the valued recollections of my woods adventures. The fact that I spared his life is a matter of keener gratification and one more heartily cherished than the recollection of the savage joys of many a successful hunt.

W. N. AMORY.

Moose Hunters' Luck.

A gentleman who has hunted big game in Maine every season for several years hands me the following for the FOREST AND STREAM. He directs me to cut it down or change it, as it may seem best to do, but it contains so much of truth, well put, that I give it entire.—SPECIAL.

A love of nature and an appreciation of her forests, fields, mountains, rivers and lakes, coupled with the remaining traits of the savage which are in our composition naturally, seem to be the only essential requisites for acquiring a full measure of enjoyment in hunting, especially big game. That there is an immeasurable amount of the savage in the personality of the white man, subdued by the artificial life we call civilization, is evident the moment he finds himself in the forest, with rifle in hand, facing fair game. His first impulse is to kill. It is as natural for him as it is to breathe, with the only difference that it is not as easy. Man himself is an uncertain instrument; not half as true as the rifle barrel his eye glances over, but the savage in him is given full swing in his desire to kill. But the killing of game, beyond that which he requires for food or trophies, will, at each succeeding hunting trip, be a lesser consideration, till finally he may come to hunting with the camera only. His frequent contact with nature; with the largeness of things out of doors; with her beauty and bounty, her silence and sombreness, forces a broadening and a new view. He wants to know more of the secrets of things in the great woods. Instead of a desire to kill, he now watches and investigates. He spends hours in attempting to successfully snap a camera on a feeding deer, a wading moose or a brood of partridges. His love for the woodfolk will increase in ratio with his success in learning their habits, and their life-taking will no longer seem necessary to his happiness. Finally, for food only will he kill.

Such is the logical and increasing process of evolution in the composition of the intelligent sportsman. It develops by constant contact with nature. While the transformation of a huntsman into a naturalist is by short and slow steps, and impresses generally only the older and more intelligent, it is nevertheless sure. Its influence can already be recognized in the fact that a huntsman's outfit nowadays is not considered complete without a camera. The use of the camera by the ornithologist or naturalist is without limit, and through its agency the killing of the woodfolk is decreasing in the ratio of an increasing spirit of humanity in the development of the sportsman. Twenty years ago but little was known by amateurs of photography, and the pictures they produced were few in number, and more often failures than successes. To-day the camera, in developing and transforming the sportsman into a student of nature, furnishing him pictures of living mammalia, birds, fishes and flowers, conveys the precise knowledge he desires without resorting to individual anatomy.

An increasing respect for, and better enforcement of, the wise game laws of New England, and several of the other States, are to some extent the educational factors which have led to these conditions. The record may or may not show it, but it is generally accepted fact that game law breakers and poachers are not the visiting sportsmen. The receivers of game in Boston markets can best attest to this statement as the true condition of affairs, up to the last fall hunting season at least. The amount of game illegally shipped from Maine, in open and close season, has materially decreased, however, during the past two years, and by reason of the vigilance of the wardens and prompt convictions in the Maine courts. The convictions and sentences of several registered guides for illegal killing last fall seems to have had a very beneficial effect upon all poachers, and very little illegal game in the shape of market shipments is now attempted. Most of the game received in Boston the past open season came in the form of the trophies of returning sportsmen; the game sent into the Boston markets to be sold. To what extent this game was actually killed by the persons bringing it to Boston is a good deal of an open question.

Large bull moose appear to be decreasing in numbers or leaving the country, while young bulls are more numerous than a year ago. Many of the latter were seen the past fall, but were in the spike-horn stage, and were generally unmolested. It has been a rare piece of good luck and a glory to a sportsman in Maine this year to get a moose head worth setting up as a trophy. It is a safe assertion to make that not 10 of the 138 moose shipped through Bangor last season were above fair specimens. One particularly fine head was shipped from Patten in October. A description of the trip made by the party securing this splendid moose demonstrates the element of luck which enters so largely into moose hunting in Maine. The party consisted of three Boston newspaper men and two guides. The itinerary was to remain in the woods till a good specimen of moose was secured. With a suitable tenting outfit and necessary provisions, with a few luxuries, the start was made from Patten at noon, Oct. 13. Very bad roads, by reason of recent heavy rains, prevented the outfit making over twelve miles by nightfall, and it put up at Shinn Pond sporting camps the first night. An early start the following morning made Sebois at midday, where hunting clothes were put on, guns unpacked, and still-hunting for big game was commenced. A twenty-mile tramp northwest, to the Allagash region, through as beautiful a country as there is in Maine, with the anticipation of getting a shot at game every mile of the way,

added zest to the pleasure a sportsman finds under such conditions. By nightfall sufficient game—deer and partridges—was shot and hung up, to be brought into camp by the following tote teams, to furnish fresh meat for some days. Camp was made that night before a roaring fire, the sportsmen rolling themselves in blankets or sleeping bags, and sleeping on the ground, with no house over them other than the trees. The horses were staked, fed and blanketed, and at 9 P. M. every member of the party was comfortably asleep. At daybreak a hot birchwood fire was boiling coffee, frying venison, stewing partridges and baking cream of tartar biscuits in a Dutch oven; all done by the deft fingers of the guides, who are excellent woods cooks. The long tramp of the previous afternoon and the dry, pure air inhaled, seemed as a tonic which stimulated the appetite of each of the party to an extent that is best appreciated by big-game hunters in the woods. After a breakfast satisfying better than more civilized conditions could, the sportsmen and guides resumed the track into the heart of the best moose country in Maine. A suitable clearing for a permanent camp was reached about five miles further northwest. Springs were plenty, their water pure and cold, and a rushing brook, belonging to the headwaters of the Aroostook River, skirted the edge of the small clearing. The tents were raised, a splendid bough bunk built in each, camp-fires started, and every preparation was made for comfort and hunting. Great sport was anticipated, for many deer had been jumped on the way to camp, a couple of cow and calf moose seen, and partridges were more than plenty. Moose work was abundant, and tracks, apparently fresh, were frequently seen. Our party had brought out a moose from the same section in 1898, and again in 1899, neither of which was entirely satisfactory. Consequently they were after moose again, and were willing and anxious to endure any hardship that contained the element of sport, in order to secure a good specimen of the grandest game the hunter is now generally permitted to draw rifle upon.

From the arm of Chamberlain to Little Millonock Lake is as good a moose country as there is in Maine, and it was this vicinity that our guides settled upon as almost sure to furnish the best sport and game. As ultimate events demonstrated, they were not wrong. About dusk the first night in our permanent camp moose blasts were heard north and south, and the party made plans for the early morning, which was the first day of the open season on moose. Before daybreak breakfast was eaten, and the party separated, one sportsman and a guide going north, and the other going south, both in an endeavor to locate the bull whose blasting was heard the previous evening. After ten hours of constant still-hunting by the entire party it returned to camp at dusk without even a partridge. The next day was a repetition of the first. The third day produced a small doe for food purposes, and while the party was enjoying to the fullest the pleasant weather, the hunters were nevertheless a little crestfallen because of continued bad luck or absence of luck, particularly after the abundant evidence of game noticed on the way in. The fact that fresh tracks, apparently of large bull moose, were found each morning, not a mile from the camp, in no way added to the pleasure of the situation. The tracks were patiently followed each day, and generally led into an impenetrable swamp or had to be abandoned early to give the hunters time to reach camp before dark. After going through such a programme for several days, it was decided to follow up a good fresh if found, and if necessary to camp on the trail of the moose. This opportunity never came, as no fresh tracks could be found till a week later, when a light fall of snow during the night revealed an immense moose track right across the camp clearing. It was immediately trailed, but lost by 10 o'clock, as the sun came out hot, and every vestige of the snow was removed. The trail also soon disappeared, for the sun's heat curled every leaf into a new shape.

Being less than three miles from camp when the trail was lost, the sportsmen decided to return for dinner, and were taking a rest on a blow-down, preparatory to making camp, when a fox was seen and shot at, the bullet taking effect in its hindquarters. It made off, dragging these parts and leaving a good trail in the leaves. The fox was being trailed up and over a little knoll, when all at once, on another knoll not forty rods away, stood the largest and grandest specimen of bull moose seen and killed in Maine the past season. The beast had apparently paid no attention to the rifle report on the fox, for when first seen he was feeding. Not a breath of wind was blowing. The bull had not scented the hunters. Without moving so much as an eyelid they enjoyed the sight of a sportsman's lifetime. There stood this grand animal. With head and antlers uplifted, he was reaching over and bearing down tall young trees for their tender tops, on which these animals feed. Grazing among the leaves for the tenderest shoots, he would sway his mighty antlers from side to side in order to remove from his way the overhanging branches. At intervals he would throw his head back, ears perpendicular, ever on the alert for danger. This monarch of the forest was as grand in his proportions and environments as mind could well picture. Dead moose or those in captivity are not graceful animals, nor pleasing to the eye. They are awry and awkward. A wild moose, in the forest alive, fits in with nature and adds grandeur to a picture that few are ever permitted to enjoy. Ordinarily the keen senses of the animal are more than a match for the skill of the sportsman, and nothing more than a passing glimpse is obtained.

This moose was in fine condition, with a jet black coat, save the usual gray brown about the crown and along his back. He stood side on to the sportsmen, who were well concealed in some low, black growth, and greatly enjoying the sight in silent wonder. Inadvertently one of them eased up a foot. A slight snap of a twig was all sufficient. The moose threw up and turned his head in their direction, like a flash. His ears were up like boat oars, and his dilated nostrils gave a quick sniff, followed by a low blast, which demonstrated a state of nervousness, inquiry or fear. As he was in easy range, with the growth in front sufficiently open for sure shooting, with both hunters ready to draw a bead

on him, a grunting noise was made to start him, it mattered not in which direction. Now assured of danger, he straightened out, extended his nose horizontally, with his back antlers touching his shoulders, and was quickly gaining trotting speed, when a .33-30 bullet slipped into his shoulder and he went down on to his knees. He regained his feet quickly, and made a couple of rods, when a second bullet was placed in his neck, and he went down again. He settled backward, and nearly regained his feet a second time, but a third bullet was lodged in his spine. Then his struggles were over. Examination showed that either of the three shots would have sent him down for good before he could have gone forty rods. He weighed at least 1,050 pounds, as he lay in the woods. After being dressed and five days' shrinkage in transportation, his weight was 800 pounds at the railroad express office. He stood 6 feet 6 inches high at the shoulder; from tip of nose to crown, 30 inches; crown to tail, 7 feet; antler spread, 54 inches, with 23 points, double palmed; length from forehead to back tine, 3 feet; width of palms, 12 and 11 inches; length of bell, 8 inches. He was apparently six or eight years old, and in the finest possible condition. The color of the antlers is a bright golden yellow, shaded to light brown. It was the evidence of thirty or more guides at Seebois Farm that no better head or larger animal had been taken out of that district in twenty years.

Such is luck in hunting. For three successive seasons these sportsmen had been in quest of a good moose head. They had followed the game for days, only to find a poor specimen, a spike-horn, perhaps. This time they had seen five cows and a calf, and had about given up in disgust, when they walked right up to as fine a bull as they had ever dreamed of, and only a short distance from camp.

Game in Massachusetts.

BOSTON, Mass., Oct. 11.—*Editor Forest and Stream:* Many sportsmen and others interested in the preservation and increase of game in the old Bay State have been anxiously looking forward to the opening of the shooting season, on the first of October, for the purpose of forming conclusions as to the effect of the new game law, which was enacted last year. It will be remembered by the readers of FOREST AND STREAM that this law prohibits the sale of partridge and woodcock, and to that extent eliminates the pot-hunter, who caused such destruction to bird life by snaring, and thus decimated game birds to a fearful extent for market purposes.

Reports received from various sections of the State indicate a greater abundance of game birds this fall than has been known for some years, and sportsmen are correspondingly happy. Even those who were bitterly opposed to the law now on the statute books, to which allusion has already been made, have come to see, and have acknowledged, that they were in error, and heartily approve of the continuance of the law. As evidence of this, the following extract from a letter written to the Fish and Game Commission by Deputy John F. Luman, of Palmer, is worthy of being quoted:

"I write to inform you of the success of the first open day on game in this section, and also to let you know that some of the sportsmen have changed their minds considerably from last year, when the law was made tight against the sale of birds. In the section of woods I covered to-day I met no less than seven hunters, and all reported excellent luck. I saw their game, and each had partridge, quail and gray squirrel. I had a few minutes' talk with each of them, and some of those I met were bitter against existing laws one year ago, and said many things about the Commissioners and your humble servant. To-day they acknowledged that they were wrong in their opinion, and said that the Commissioners were doing their duty nobly; they were well pleased with work already done, and hoped that the good work would continue. They all said they had better luck than for five years past, and that all kinds of game were plentiful this season.

"I was in Palmer to-night, when two hunters returned, and each had his game bag filled with game. They said that this section was alive with birds this year, and both said it was due to the Commissioners and their good work in looking after game. They predicted that if game were as closely protected in the next two years as in the past year there would be an abundance of sport for all."

Deputy William N. Prentiss, writing from Milford, makes the following statements regarding game in that vicinity:

"Quail are very plenty. In fact, I never saw as many during the spring and summer, while at the present time there is a covey in every hedge row, and in riding a distance of less than a mile from my house yesterday I flushed three covers of from seven to a dozen. There are more partridges than last year, judging from what I have seen while in the woods at work and looking for hunters.

"There is no doubt the shortened open season, with the markets closed to the hunters, has helped these birds more than anything which has been done for a long time. The woodcock here is only a traveler, there being scarcely any except flight birds."

On Oct. 3 Mr. Luman was in Wilbraham, and wrote that all the hunters he saw had met with good success and reported an abundance of game.

Deputy A. M. Nichols, who was in the extreme southwestern part of the State when the hunting season opened, reports that "there were quite a number of sportsmen out shooting in Monterey and Great Barrington. The sportsmen throughout that section report lots of birds and squirrels."

Similar statements are made from nearly every section of the State, but I will venture to refer to only one more, which tells of the capture of bags of birds in the vicinity of Pittsfield, ranging from twelve to seventeen.

The fact that game is unusually plenty this autumn is a temptation to many to violate the laws, and particularly that which makes Sunday a close season. This is evidenced by the fact that seven arrests were made on the first Sunday in October in two adjoining towns, in the

central part of the State, and in each case a conviction and fine resulted. Except for the fact that the day was so very rough and rainy throughout the greater part of the State that people were kept indoors, it is fair to assume that many other would-be Sunday hunters might have had to face the courts on Monday. The present outlook, however, having in mind the vigorous enforcement of law for the protection of game, is most encouraging, for if the conditions indicated are the result of only year's application of the new game law, it is not difficult to see that its continuance will prove most advantageous to the increase of game in this Commonwealth.

BAY STATE.

Maine Big Game.

BOSTON, Oct. 14.—The game season is certainly booming. Reports from Maine mention the taking of a great many deer in many sections. Bangor reports, Saturday evening, note the passing through that city of sixty-three deer on Friday, the largest day of the season thus far. The same reports mention also a feature peculiar to the season—the greater number of women who have gone into the woods to shoot deer. In very many instances they are successful. The first woman to secure a deer this season was Miss Maud McAlpin, of Winn, Me. Mrs. L. W. Rollins shot a deer on Tuesday that weighed 225 pounds. The report says that she shot him at a distance of 150 yards. Mrs. Walter Willey has shot a deer in the vicinity of Norcross. Mrs. Teft, of New York, has made a trip to Stacyville, and brought out two deer. Mrs. Frank L. Marston, of Boston, brought home a deer last week that she shot in the Mooshead region. Mrs. Thomas Nelson, of Brunswick, N. J., has gone out of the Maine woods with a buck deer. She is said to be the champion woman slayer of moose, her record being seven. She was obliged to go out of the woods this season without having secured a moose. The open season on moose, in Maine, begins on Tuesday of this week, Oct. 15, and there are more hunters than usual after them. The more reliable reports say that moose have increased in Maine the past year, while deer have barely held their own. That more deer are being shot this year than last there is no question. Mr. C. H. Heniken, of Boston, tells a good story concerning deer. He came home on Thursday, with his legal quota of deer. He says that he went into the woods with five other men. They made an early start, and by noon they found that they had secured twelve deer—all that the law allows. His idea is that a man could kill twenty deer in a very short time as well as two. The section where he found deer so abundant is not mentioned, but it is up the line of the Bangor & Aroostook Railroad. Kingfield, Me., reports are very jubilant concerning the number of deer taken. Ten or twelve have already been secured in that town, mostly by local hunters. Several moose have also been seen. Bears are also numerous in that section. Bert Dolbier shot a large black bear last week. Mark Cross and George Kennedy got a bear the other day, and on their way home they saw two others, but failed to get a shot at them. Bingham, Me., reports mention team loads of deer going out almost every day. Fully twenty-five deer have been shot in that section the past week by local gunners, and even more by sportsmen from outside. In one day last week a team load of eight deer came out of the woods, another with six and two or three teams with one, two or three each. Many of these deer were landed at the railroad, to be shipped away. Thomas A. Towne and William Foss, of Bingham, have killed an enormous black bear on Pleasant Ridge Mountain. The monster weighed 597 pounds, "woods dressed." He was 7 feet 10 inches from the tip of his nose to the end of the tail. He measured 30 inches across the breast, and his forearm was 19 inches in girth. It is claimed by the hunters that one shot from a rifle did the business, the missile striking him squarely between the eyes. Mr. Towne is an old hunter and guide, but says that this is the largest bear he has ever seen or heard of. He has a record of nineteen bears shot, besides forty-three caught in traps.

Kineo reports say that over thirty deer have gone from that section since the season opened, killed by visiting sportsmen, besides a good many taken by local hunters. Game Commissioner L. T. Carleton and Judge W. P. Whitehouse, of Augusta, are in the woods at Chesuncook Lake, after deer and moose. Deer are reported plenty in the neighborhood of Skowhegan. Several deer have been taken in the vicinity of Waterville the past week. In the town of Sidney two deer were killed last week. These towns are on the Kennebec, in one of the older farming sections of the State, where a deer twenty years ago would have been unknown and unheard of. The taking of such game, even in the more settled sections of Maine, has set farmers and farmers' boys "crazy." Every man carries a rifle. A gentleman tells me that he met a man ninety-three years old the other day driving along in his wagon in the town of Rumford. In the wagon beside the aged hunter was a rifle. Asked why he carried the weapon, he replied that the boys had seen a deer beside the road he was driving over the day before. "I was a good shot when younger, and that deer will fall in his tracks if I meet him."

Newspaper reports mention a great many partridges in the Rangeley region, the Dead River country, the Bingham vicinity and all over the State of Maine, in fact. It is not easy confirming these reports, since the law is very particular about the transportation of partridges, and the Boston markets dare not sell them. A North Anson report says that partridges have never been as plenty and as tame as this season. Mr. Benjamin Walker, of that town, went down the line of the railroad one morning last week and soon returned, having shot two buck deer. At Solon, five miles further up the Kennebec, a number of deer have been brought in. They have been shot within a couple of miles of the village, and mostly by local gunners.

New Hampshire reports mention partridges plenty, and a good many deer being taken. Eugene C. Coolidge, of Bristol, has shot two deer near Rumney. In the vicinity of the Dorchester lumber camps deer are reported plenty, and Granite State hunters are after them. Good bags of partridges are being obtained by local gunners in the vicinity of Canaan.

Mr. N. G. Manson, of Weston, Mass., came out from his camp—Camp Leatherstocking, head of Richardson Lake—Oct. 1. He has spent many seasons there. He says that he had two days of most remarkable fly-fishing near the close of the season—the best he ever had, in fact. The first day he took trout till he was tired, only stopping because he would kill no more than he could use. He says that the trout were "as nearly alike as peas, weighing about 1 1/4 pounds each." The next day he repeated the sport, and now he feels well satisfied with his season's fishing.

SPECIAL.

CHICAGO AND THE WEST.

Michigan Wild Man.

CHICAGO, Oct. 11.—Crystal Falls, Mich., is enjoying the sensation of a genuine wild man. Two deer hunters of that town, while out hunting this week, met the alleged wild man in the woods near the upper waters of the Deer River, some fourteen miles from Crystal Falls. They state that they were within a few yards of the wild man, and that the latter snarled at them, expressing annoyance and rage, and at once bounded off into the woods, where he soon became invisible. The wild man carried a piece of gun barrel and a tent pole. A posse from Crystal Falls started day before yesterday to look after the fugitive, who is thought to be some person who has been lost in the woods for some time, and has hence gone insane. The stranger gave utterance to one word repeatedly, something sounding like "public, public." It was supposed that perhaps he came from the town of Republic, Mich.

Game Wardens Assaulted.

Three Indiana wardens this week sustained rather severe injuries in the pursuit of their duties. The men, Deputies Wallace Smith, Bid Dunham and Eugene Oldham, were fired upon from ambush by unknown parties. It is supposed that their assailants were of a party of men who had been detected in illegal fishing in the Wabash River, some miles from Logansport, Ind. The deputies attempted to arrest these men, but the latter escaped in the night, and the shooting occurred not long after their escape. It is thought that the matter will not be allowed to end in this manner, and that arrests will follow.

Wild Horses in Utah.

Reports from Kanab, Utah, of yesterday, state that the ranchmen of that territory have united in a big hunt for wild horses, duplicating a hunt of a similar nature which occurred some two years ago. In the former hunt it is stated that 300 mustangs were shot and 1,500 captured. Twenty men, well-mounted and supplied with rifles, are stated to be out this week in the pursuit of the wild animals. The latter are thought to be injurious to the cattle interests, since their numbers endanger the stock-carrying capacity of the open range. For nearly half a century wild horses have been known in this part of the country, and of late years they have multiplied distinctly. The newspaper story goes on to state that one band of horses—about 30 in number—were driven over the brink of a narrow gorge, and 28 were killed by falling on the rocks below. It is difficult to determine what warrant there may be in the ruthless pursuit with fire arms of so noble an animal as the horse. A horse is valuable when alive, but worthless when dead, since it cannot then be deemed a trophy to which any sportsman may refer with pride.

Changes in the West.

The West certainly does present some novel changes in these days. Time was when the Western stage driver was a distinct type. To-day the glory of that type would seem to have departed, or, rather, to have been replaced by a milder and more lovable effulgence. Out in South Dakota there is a stage line between Miller and Westington Springs, a distance of some 40 miles. The stage on this route is driven by a girl not yet out of her teens. There is another young woman who drives stage from Miller to Howell, a distance of 20 miles. It is stated that these young ladies perform their duties with entire satisfaction to everybody concerned. Yet it shore does look as though South Dakota was getting some mild.

The Duke's Bag of Ducks.

The Duke of Cornwall, son of the King of England, who is now touring in America, spent Oct. 6 and 7 shooting ducks on Lake Manitoba, N. W. T., having what was probably the best time he has enjoyed since he disembarked on this side of the water. The royal party set out from York Lodge, seven canoes in all, the Duke of Cornwall being in charge of John Atkinson, a well-known hunter. The Duke had fine sport during the morning, and before 10 o'clock had bagged 52 ducks. He expressed himself as delighted with the quality of the sport which he found.

Game Costs Money in Duluth.

Such is the vigilance and efficiency of executive agent Sam Fullerton and his deputies out in Minnesota that the price of ducks and partridges in most of the largest cities has gone up very sharply. It is illegal to sell this game, but certain lots of it, of course, are offered, not on the open, but on the closed market. Several of the butchers and grocers of Duluth are offering ducks and partridges to their solid and secret customers, but the latter are obliged to put up good, hard coin for their game. The law allows a butcher to have 100 ducks or partridges in his possession, but not to sell them, and Deputy Warden Greene, of Duluth, is besieging everybody to bring him evidence of such sales, which are known to be by no means infrequent, although very difficult to detect. One butcher is stated to have sold 72 ducks in one day. Dealers are reported to pay as high as \$2 a pair for ducks and \$1 a pair for partridges. Nothing like these prices were ever known before, and it is, of course, due to the fact that the merchandise is contraband and sold only under the danger of severe punishment. Meantime, more power to Sam Fullerton.

His First Prairie Chicken.

Mr. A. Poidebard, of West Hoboken, N. J., came West this fall, and, in company with Mr. Charles Antoine, of this city, went out to South Dakota for his first try at a prairie chicken. It was, of course, late in the year for shooting prairie chickens, since the birds were pretty much all packed up and offered very poor sport to the dog, yet the Eastern gentleman and his friend managed during their stay to kill something like 100 birds, mostly by pretty long and vigorous shooting. Mr. Poidebard expresses himself as very much pleased with the quality of this upland sport. The two saw considerable numbers of local ducks, but at the time of their return, a few days ago, the Northern flight had not yet gotten into that country. They heard general reports of great abundance of game, both of grouse and wild fowl.

Illinois Game.

State Warden A. J. Loveday expresses his satisfaction with the state of the game protection in this State so far as he has gone in his administration. He states that considerable numbers of convictions have been had under one or other clauses of the game laws. Three hundred and thirty non-resident licenses have been taken out by shooters who wish to come into this State for their fall shooting. Mr. Lovejoy states that never in his experience have the farmers taken so general an interest in the protection of the quail. Speaking of the much-mooted status of the Illinois game law, he says that he is himself of the belief that quail are protected the year round under the clause protecting "certain wild birds." He states, however, "I am going to allow a shooting season on quail from Nov. 1 to Dec. 20." Now let us lay aside the Illinois quail law, whether right or wrong, whether thus or so, and unite upon these dates of Nov. 1 to Dec. 20. This, as has before been stated in these columns, is practically the policy agreed upon in certain parts of lower Illinois. The tacit agreement of the shooters and farmers of the country will in this way establish a complete protection for our stock of quail, no matter what the law may eventually seem or be proved to be.

Goose Flight On in Dakota.

The regular Northern flight of geese seems to be a few days late out in Dakota. Mr. Mark Cummins, of this city, is just back from a trip to Dawson, N. D., and he says that at the time of his departure the geese were just beginning to come down. He had excellent duck shooting, especially some of the magnificent pass shooting, for which the Dawson district is so famous. One friend of his killed 67 ducks in one day, according to the story, or, perhaps, it was the party who killed 67. The canvasback shooting was very fine.

The Vague Bird.

The vague bird, the jacksnipe, still continues his policy of masterly indefiniteness. Joe Hipper, a Chicago shooter, yesterday killed three dozen jacks. He will not state where he found them, but says it was in Illinois. A few birds have been seen in the upper part of this State, but the scouts who have been out for Chicago gentlemen along the Kankakee for the past week, can locate no satisfactory body of birds. The truth is, the Kankakee bottoms have little water in them this fall, and the shooting is not going to be very satisfactory. I do not think we will have very good jacksnipe shooting anywhere in this district, and, indeed, it is now nearly time for the cessation of that industry.

Change of Flight.

It is an old story, that of the ducks having changed their flight "further West," but this year there would seem to be something in it, except that the flight seems to have changed to the East, instead of the West. It surely is not following the Kankakee and Illinois River system this fall, and it is said that the Mississippi is quite low, so that the flight is not expected to pass down the ancient highway of the wild fowl in any great numbers this fall. Upon the contrary there would seem to be more birds east of here, on the Great Lakes, than is ordinarily the case, and the wise ones say that the flight this fall passed to the east and not to the west of us.

There are some birds still hanging round Fox Lake, principally marsh ducks, although some redheads and bluebills are in now. No body of canvasbacks has yet appeared on Fox Lake. The present cold rain storm ought to bring some shooting, and the lower marshes of the Illinois River should have a flight now for a few days.

Many Sportsmen Lose Dogs.

Never in the history of Chicago have so many gentlemen lost valuable shooting dogs through the rascality of alleged trainers as has been the case this fall. Mr. Eddy Pope, who last spring sent to a trainer at Wheatfield, Ind., a very valuable setter, to be boarded—the dog was perfectly trained and hence valuable—wired his man a few days before the opening day, Sept. 1, to send the dog up to him at once, as he wanted to take him out West on a shooting trip. He has never heard since from either dog or trainer, but inquiry develops the fact that the man has disappeared. It need not be said that Mr. Pope will never see his dog again.

Mr. H. A. Blair, of this city, is another man who trusted an Indiana trainer, sending out for handling a valuable pointer bitch. Just before the opening of the season he learned that his dog had been "poisoned." There were no witnesses, no proof, and, more especially, no dog.

Mr. F. R. Bissell, of this city, was yet another to venture a valuable hunting dog to the tender mercies of an Indiana dog trainer. What would you expect? The dog turned out to be a good one, but unfortunately it also "picked up poison somewhere," and disappeared from the immediate vicinity of the trainer.

Mr. Otto C. Ely is another Chicagoan to lose a valuable dog. In this case there was a little variation in the story. Mr. Ely's dog had the misfortune to get hanged in a wire fence, and so lost his life. No proof.

Mr. Mark Cummins went a little further south than Indiana, but found that methods were somewhat similar

in that part of Tennessee where he selected his trainer. Mr. Cummins' dog did not get poisoned or hanged, but "ran away."

Several sportsmen in Chicago have expressed themselves bitterly at this sort of imposition, and it would seem, indeed, that there ought to be some sort of protection for men who own valuable bird dogs. Of course there is no protection except in the personal character of the trainer. The only counsel to a sportsman is to be personally acquainted with the man to whom he sends his dog. Another good thing to remember is that customarily it is wisest to send a dog to a handler who has not more than two or three dogs to take care of. A trainer who has twenty or thirty dogs in his charge cannot do justice to them all. In several well-known cases such a trainer has been known to pick out the most promising dog and develop it as rapidly as possible. Such a man knows a wealthy sportsman who needs a good shooting dog. He recommends such and such a dog, at a good figure, guaranteeing that it shall be perfectly broken. A trial shows that the dog is well-broken. The buyer takes the dog and perhaps removes it many hundred miles from the place where it was owned. The little fact that the handler did not own the dog in the first place has in several such instances proved no obstacle to the sale. The owner was told that the dog had "run away" or "been poisoned," or otherwise made subject to a dispensation of Providence.

It would be distinctly unjust to make sweeping charges against the trainers and handlers of this country, many of whom are men of ability, character, intelligence and integrity, yet chapter and verse can be given in the instances above cited, and even these few, by no means all of similar cases, would seem quite sufficient for grounds of uneasiness on the part of those sending out valuable dogs for training or boarding. Any trainer who sells a bird dog left in his charge, or who willfully allows it to become diseased, ought to be exposed before the sporting public and after that left alone severely by everybody.

Planting Wild Rice and Celery.

If Mr. Chas. Gilchrist, of Port Hope, Ont., will publish, or, perhaps, republish, in the FOREST AND STREAM full directions for the planting of wild rice, he will receive gratitude and perhaps something else as much to his advantage. In conversation with several gentlemen to-day, some of them stated they had never been able to make wild rice grow, although they sowed it in shallow water, imitating the natural fall of the seed as closely as possible. One friend suggests that the plant reproduces itself not by the shedding of the grain, but by the dropping of the whole stalk down to the bottom, where it then lies in the mud. If some expert can give dates, methods, etc., for planting this beautiful and useful marsh growth, it will be a favor to very many sportsmen.

Still more difficult seems the wild celery problem, and I know of very many clubs who have spent considerably money, only to meet with failure in their attempts at planting wild celery. Mr. Lou Clarke, of the Hibernian Bank, this city, has recently returned from California, and he says that in that country sportsmen plant wild celery almost as they like. They get the bulbs, or roots, and set them out on a dry flat, just as they would domestic celery. Then they throw up a little 18-inch wall around their flat so planted, turn in the water, after the ancient California fashion of irrigation, and, presto! they have a shallow duck marsh full of wild celery. Mr. Clarke says the operation is perfectly certain and simple. In most of the better known wild celery waters the plant grows at a depth of 6 to 8 feet, and that seems to be the favorite feeding depth of the canvasback, although perhaps it would just as soon dive in a foot of water as in 10 feet, provided that the plant it covets has reached full maturity and development.

Now will certain of the wise ones share with us their wisdom in the matter of wild rice and wild celery?

Poet and Sportsman.

Mr. Ernest McGaffey, of this city, is a poet with much more than a local reputation. His "Songs of the Town" would entitle him to recognition had he done nothing else. In "Poems of Rod and Gun," Mr. McGaffey filed his claims to the brotherhood of sportsmen in no uncertain fashion. Mr. McGaffey is a lawyer and a writer. Incidentally, he this summer received, utterly without solicitation, the appointment by the Mayor of the chairmanship of the Board of Public Improvements, a salaried office of considerable importance. His varied duties Mr. McGaffey has discharged honestly all summer long, and now he says he is going to get him down to the Okaw bottoms of southern Illinois the first of November, and shoot quail for one solid, blissful month. There are all kinds of successes in life, whether in poetry, politics or polemics, but I should consider that a man who finds himself able to go on a thirty-day quail hunt is entitled to be called a glittering and howling success.

E. HOUGH.
HARTFORD BUILDING, Chicago, Ill.

Currutuck Game.

CURRUTUCK, N. C., Oct. 10.—Wild ducks, widgeons, sprigs, black ducks, and teal have arrived in greater numbers than I have seen them before in many years. I saw several large flocks of Canada geese on Sept. 25; I have not seen them so early before in twenty years. Currutuck Sound never had such a large crop of wild celery before; so, altogether, our prospects for good sport among the water fowl are excellent. I saw Senator W. H. Bray at Currutuck Court House to-day; he says the season has been just right for quail, and they are abundant; his place will be open for sportsmen as usual this season. L. R. White, of Corrolla, has added more ground to his place, and will also be open on Nov. 10, our opening day for water fowl. I understand the large tract of land owned by Josephus Banus (the old Palmer Island Club) has been leased to a new club, and will not be opened to the public, as last season. There has been a large flight of winter yellow legs during the past two weeks, and some fine bags have been made.

MORE ANON.

A Misunderstood Dog.

BOSTON, Oct. 12.—The gunners for shore birds are having a good time of it. The recent heavy gales, and slightly cooler weather have been conducive to good flights of birds, and the gunners have been at hand. A reliable Scituate report says that Ed Edison shot forty coot Thursday morning, and a boy of thirteen shot seven the same morning. This is early for so good flights of coot, and the gunners say that it counts well for a good season. Anisquam gunners are already getting some good bags of birds. Shore birds do not seem to come into the Boston markets as much as usual. The marketmen seem to think that they are sold on the spot—at Chatham, Scituate, Marshfield and other points—agents of New York market houses being at hand. Chatham reports mention some big bags of birds since the recent gales. T. S. Tomlinson, of Boston, came up from Chatham on Monday, with a good bag of birds. He remarks that he never had better shooting, but the gunners are thick down there.

H. S. Barker, of Boston, has just returned from a two weeks' shooting trip to Newfoundland. He shot two caribou, the largest bearing 33 points on its antlers. He reports caribou very numerous. His place of encampment was near Howley, at the head of Grand Lake. He believes that Newfoundland is soon to become an excellent hunting ground for sportsmen. Good hunting is reported in the Moluncus region, Maine. P. W. Curtis, E. W. Knight, and Charles E. Brett, of South Paris, Maine, have just returned from a hunting trip there, the result of which was a total of five deer killed. Reports from the Dead River region, are of deer abundant. A Boston party has already brought out three—two bucks and a doe. The close time of five years is off from deer in Androscoggin county, and the slaughter has begun. Two have been shot near Monmouth, and one near Sabatis. Many hunters are after them. Partridges are also reported to be plenty in some parts of the same county. Monmouth gunners have taken a good many. A sad story is told of a clergyman, in that part of the country, who went out the other day, with dog and gun. Partridges were to be his game. He had not gunned much for twenty years, but had suddenly become enthused. He borrowed a bird dog, a valuable spaniel. This dog had been trained to "tree partridges." The dog having done little or no work for the season was wild with delight to be out; soon smelled a partridge, and was off like lightning, with the partridge up a tall tree in the thick woods. The day was hot. The dog leaped and frothed at the mouth; barked, growled and whined, jumping into the air all the time. The sedate clergyman could see nothing in the tree; he had heard nothing. The dog refused to be comforted, but only leaped, barked and frothed the harder. "Is he mad?" the man asked himself. Another jump toward the tree, accompanied with a howl, and a whine followed. "Certainly he is mad!" The gunner drew up the gun and put a charge of shot into the neck of the poor dog, and he was dead in a minute. Just then a partridge flew out of the tree overhead with a big boom. The best that can be said for the man is that he paid honorably for the poor, little, faithful fellow, who lost his life for being too much in earnest. Clergymen, or anybody else for that matter, who believe in mad dogs, should never go hunting with such noble animals.

SPECIAL.

Furs of the Upper Yukon!

CONSUL J. C. MCCOOK writes to the State Department from Dawson City, Sept. 9: Dawson is the central market for a vast extent of fur-bearing country, stretching from the Mackenzie Basin to the coast range and from the Porcupine to the Hootalinqua. In this area, perhaps 1,000 men are engaged in hunting and trapping, exclusive of the Indians; and from Dawson, fully 40,000 peltries are annually exported to the great fur markets of London and New York. The industry yields a revenue every year of nearly \$350,000.

The season is now at hand when the hunters and trappers are moving their outfits to the various rivers and streams where they will winter, and men are leaving town almost daily for their long sojourn amid the "great white silence." In most cases, the work of reaching their destination is of an intensely arduous nature, as they must pole their canoes to the head waters of the swiftest streams, make long portages, and penetrate pathless woods. But no hardships daunt these Yukon trappers, and they well deserve the success they so frequently achieve.

In the local fur market, London quotations govern. These are fixed twice a year—March and August—by a board of principal dealers in that city, and prices are gauged according to that scale in all parts of the world except Russia. The present rates, compared with last year's prices, show an increase on bear, beaver, otter and mink, and a decrease on silver-gray fox, marten, wolf, and wolverine. On most other peltries, quotations are the same. A wide difference is often noted between the maximum and the minimum figures; this is due to variations in the shade and quality of the fur, and to the time of the year in which the animal was caught. For instance, pelts of bears caught in the spring, just after the hibernating process is over, are worth much more than those secured in the fall, because their fur is soft and thick, instead of harsh and thin. In all pelts, winter fur commands often three times as much as summer fur in price, and in most cases dark-colored fur is worth much more than the lighter varieties.

Local dealers say the pelts in this vicinity are of better quality and obtain higher prices than those taken along the Lower Yukon and on the Alaskan coast. The hair is softer and more glossy in appearance.

In varieties, marten are the most numerous and black fox the scarcest. The latter is the most valuable of all, a good pelt readily bringing \$300; and muskrat is the least costly, being worth only 4 cents.

The favorite rivers among the trappers are the Pelly, White, Stewart and Porcupine, while game hunters prefer the Klondike and Forty Mile, because of their accessibility to a ready market. The Big and Little Salmon, Hootalinqua, Chandelar, and Selwyn rivers are also fre-

quented by many trappers, while a goodly band is scattered along the Yukon itself. The Peel and other streams flowing into the Mackenzie Basin are also considered choice trapping grounds.

The annual production of the different varieties of pelts, their market value, and special facts distinguishing their distribution, are given as follows:

Bear.—Black, silver tip, brown, grizzly, and cinnamon; found all over the country from March to November; number shipped 3,000; price, \$10 to \$25. It takes an exceptionally fine skin to bring more than the maximum figure quoted.

Beaver.—On all streams, but chiefly numerous on White, Pelly, and Stewart rivers; number shipped, 2,500; price, \$3.50 to \$7.

Mink.—On all streams; number shipped, 1,500; price, \$1.50 to \$3.

Marten.—On all streams; number shipped, 25,000 to 30,000; price, \$3.50 to \$12.

Otter.—On Pelly and along the Yukon, most of the pelts coming from below Dawson; number shipped, 200; price, \$4 to \$8.

Foxes.—Red; number shipped, 2,000; price, \$1.25 to \$2.50. Cross; number shipped, 650; price, \$3 to \$10. Silver gray; number shipped, 25 to 40; price \$100 to \$200. Black; number shipped, 5 to 7; price, \$200 to \$300.

Lynx.—Mostly from along the Dalton trail; number shipped, 2,000; price \$1 to \$2.50.

Wolves.—Black and gray, mainly near the mountains; number shipped, 2,000; price, \$1 to \$2.50.

J. C. MCCOOK, Consul.

DAWSON CITY, Sept. 9.

An Experience with Bear.

Editor *Forest and Stream*:

"A Quest of Bear" in the Sept. 28 number of *FOREST AND STREAM*, brings to mind an outing of two of us some forty years ago, to the forest in McKean county, Pennsylvania, in pursuit of game animals.

Having hunted in the same locality for two falls before, we had noticed plain and well-beaten trails leading from one laurel thicket to others, and that bear constantly followed those paths; but their capture either on bare ground or snow by still-hunting was next to an impossibility, for they kept constantly under cover of brush or thickets too dense to be approached without giving them ample warning.

Before the next hunting season came around, we purchased a Newhouse bear trap, and with the rest of the baggage taken into camp the following October was a horse, supposed to be more valuable for bear bait than for any other purpose.

The morning after arriving at camp the beast was led out and planted within 50 feet of the trail, and the trap was set with suitable clog attached. Every week thereafter up to January, one or the other of us visited the spot, and as the ground was covered with snow quite a portion of the time we had no difficulty in observing the marked reverence a bear has for horse kind.

Bears had followed the trail nearly every week we were in camp, while not one had left it to examine our bait. On our way home we met an old woodsman, who earnestly inquired how we had made it with the old horse-baiting bear. When told, he said, "I knew you could not get a bear to go near it before next March or April, for they will not taste of it so long as there is any mast or other eatables left in the woods that they can procure."

Shack must be very scarce over the Rocky Mountain range in the western Montana, else Bruin in that section of the country has quite different tastes from those found in the Eastern States.

Now a word or two in regard to bear steak. Having sampled cuts from several different animals of the black bear species, I have only once found a piece but that retained that strong bear odor to such an extent as to make it nauseating to the majority, and that piece was from a cub that had fattened up on chestnut and beech mast; I tried to feed it to my two dogs, but they refused to eat of it, even after I had served it up fried or boiled in suitable shape. They seemed to detest it as much as the bear did the horse bait.

OLD SHICARRY.

Signs of Luck.

DUNBARTON, N. H., Oct. 11.—There are many signs observed in the country which are said to predict good or bad luck. Yesterday a neighbor of mine and I went after birds. This man is a first-rate hunter and a good shot. He is the sort of man I like to go with. He has been my companion on all of my hunting and fishing trips of the past few years. We have always had what some of my friends are pleased to call "infernal good luck," whether after birds, deer, bears or big fish. Yesterday was unseasonably hot and hard on both dogs and men. The leaves have not as yet fallen, and it is hard to see a bird or to tell where it goes. We fooled away all the forenoon looking after a large flock of quail, which a neighbor had asked me to try and exterminate, saying that they had eaten up all his peas in a field near his house. Like all New Hampshire quail, they were hard to find, and although we hunted over all the ground in the vicinity of where they were said to be, we never found a sign. About 1 o'clock we both came out where our horse was tied at the roadside; all of us, including the dogs, were hot, tired and somewhat discouraged. My companion said, "Our luck has never failed us before, but I think it will to-day, for I have seen signs which mean bad luck." He said he had seen three squirrels, and they were all running from left to right, and that means bad luck. I had also seen two rabbits, which my dog had started, and they had run the same way (I never shoot either rabbits or squirrels; do not consider either worth killing). It was a question whether or no to give up and go home, but we decided to try a certain cover I knew of. Our luck had always held good, provided we worked hard. Well, we went to this cover, and in a very short time we bagged eighteen woodcock and one grouse. There is nothing like sticking to it in all things, particularly in hunting.

C. M. STARK.

Sunrise on the Bay.

IN darkness and silence, close moored to the edge
Of a low-lying isle, green-covered with sedge,
In our snug, little boats we cosily lay,
And eagerly waited the coming of day.

The splash of an old-wife, just rising for flight,
The whir of a broadbill, first herald the light.
Hark! The scream of a loon far out in the bay!
The shadows are fitting, 'twill soon be the day.

A gunshot re-echoes from Love-Lady's Isle,
The wild geese are coming, file following file;
The widgeons and redheads fly high in the air,
The sea-fog is lifting, the day will be fair.

Faint outlines of beach and dim islands appear,
Dark forms that were distant look now to be near;
Beyond the white sand dunes weird ships seem to keep
A phantom-like course o'er the shadowy deep.

Yon tall, friendly lighthouse yields but a faint ray,
The dawn is fast breaking, the night steals away;
Low in the far East there's a glow in the sky,
Growing steadily brighter, slow mounting on high.

The fierce god of day his strong arm is bending,
His javelins golden far upward is sending;
Bright o'er the smooth bay a pathway is seen,
In crimson and amber and silvery sheen.

Warmth stirs the cool air; where the still waters glow
Light ripples are forming, and soft breezes blow.
From out the great sea bursts the radiant sun,
Blue and gold arch the skies—glad day is begun!

J. T. EDWARDS.

Game Dealing and Opium Smuggling.

THE Duluth correspondent of the St. Paul Pioneer Press reports that Deputy Game Warden Green, of Duluth, is having all kinds of trouble these days. Some of the butchers of that city are selling ducks and partridges, which is illegal this year, and thus far he has been unable to apprehend any of the offenders. Every day some two or three friends of the game laws give the deputy game warden friendly tips that the illegal traffic is in progress, each unconscious of the fact that the others were giving him the same kind of information. Mr. Green is a very active and efficient deputy game warden and his inability to bring about a conviction worries him. He says:

"The discovery that some of the butchers have ducks and partridges in their possession could undoubtedly be made without difficulty, but the law allows a person to have 100 of either of these birds in his possession. What I need to reach these fellows is information that they have sold the birds. I hope to enlist the friends of the game laws of the city to put a stop to the illegal traffic in game birds in Duluth."

It is said that one butcher of this city recently sold seventy-two ducks in one day. The butchers are very foxy and will not sell a bird to anybody except an old and discreet customer. The birds, under the circumstances, bring fancy prices, almost whatever the butcher may see fit to ask. Dealers are reported to be paying as high as \$2 a pair for ducks, and \$1 a pair for partridges. A hunter who could lay down 100 plump partridges in some quiet spot, to be discovered later by some butcher, probably could get from \$60 to \$75 for them. Nothing like such prices ever prevailed before, and they are due to the illegality of the traffic. The traffic in game birds in Minnesota now offers tempting profits, and in this respect takes its place with opium smuggling and kindred pursuits.

Future Work for the Coroner.

HIGHWOOD, Conn.—*Editor Forest and Stream*: While driving along one of New Haven's suburban thoroughfares I was mystified to observe a bareheaded boy, of about fifteen, step into the middle of a front yard, place a small, tin can upon his head, peacefully fold his arms across his breast, strike a bow-legged attitude, and fix an expression of Jack-o'-lantern repose across his face. "What ails him?" thought I.

The mystery dissolved when another boy of the same age stepped out, lifted a rifle to his shoulder, took deliberate aim, fired, and sent the can spinning. Then both grinned like apes, and looked round for applause. The next day I informed the shooter's father of his liability for impending funeral expenses, and of his son's excellent chances of looking through iron grates. A look of parental pride diffused the breadwinner's face, and his answer feased me. He said: "It beats the devil, but Andy's great fer shootin' off a gun!"

Unless some hibernating policeman wakes up long enough to gather in these foolish youngsters, it looks like a future job for the coroner.

W. H. AVIS.

New Hampshire Deer.

I SAW recently in the New York Weekly Tribune (which gave all the game laws) something which may be somewhat misleading. In speaking of deer in New Hampshire, it said "Protected at all times." There was, however, a very small figure attached which explained that the above meant in certain counties. Now, in the lower section of New Hampshire deer (until recently) have been unknown. To-day they are apparently increasing, and are frequently seen. In such sections they are protected (as they should be) at all times. The northern parts of this State—Grafton, Coos and such counties—have open seasons from Oct. 1 to Dec. 15.

C. M. S.

Game in Connecticut.

DANBURY, Conn., Oct. 10.—The hunting season opens too early hereabouts. We have had a late spring, and birds bred later than usual. Partridge and quail are rather small-looking and undeveloped. I killed two grouse and four quail yesterday, and left two bevies of quail entirely, they being too poor-looking fledglings to kill. The season ought to open Nov. 1 and close Dec. 31. I would like to hear from others on the subject.

CHAS. F. BROCKEL.

Black Ducks and Night Shooting. I

CURRITUCK, N. C.—Mr. W. H. Tallett's letter in your issue of Sept. 28 is certainly a very interesting one, and should be seriously considered by all lovers of wildfowl shooting. I am well acquainted with the black duck shooting; have shot them both day and night for thirty years. My experience is that nothing frightens them away from a place half so quickly as night shooting. It is not true that they cannot be shot in the day time. They give fine sport in the day time, especially if it is a little stormy. Nothing decoys better than the black duck when properly protected and not disturbed on its feeding grounds at night. Some of the largest bags of ducks I ever made were black ducks. I shot ninety from 9 A. M. to 3 P. M. here at Currituck three years ago. If Mr. Tallett and his Jefferson county friends stick to their present laws, and see that they are enforced, they will have plenty of ducks for many years to come.

MORE ANON.

Maine Game.

BLAKESLEE CAMPS, Me., Oct. 1.—*Editor Forest and Stream:* As the trout season closes "in a blaze of glory," the shooting season opens to-morrow in several blazes. Deer were never more plentiful; bear enough and partridge galore. The last party left here by buckboard today for Eustis, en route homeward, excepting Messrs. Chas. H. Meigs, of Cleveland, O., and Major George La Rue, who have hung up their rods and tackle and taken out their rifles, the Major uncasing his handsome .45-70 Winchester, so well known in the Maine woods for many years past, while Mr. Meigs is advocating his new .30-30, though his .45-70 companion piece of the Major's is not far out of reach. They have as guide the famous half-breed, Joe St. Ober, and are going up into the Spencer Bog, Tumble Down Mountain, country, as well as the Baker and Rock Pond region, equipped with bear traps and every requisite for a big-game hunt. Their success is a foregone conclusion. The weather conditions are favorable for a fine season.

BLAKES LEE.

Antelope in Wyoming.

MORGANTOWN, W. Va.—*Editor Forest and Stream:* The Saratoga Sun, of Saratoga, Wyo., of Oct. 3, contains the following: "Thirty antelope a week are being killed in the vicinity of Cheyenne. The animals are unusually numerous this year, but very wild and hard to get a shot at. Parties of hunters are leaving the city daily, and the majority of them return with game."

To me this sounds a little strange if true.

EMERSON CARNEY.

An Oregon Game Country.

KELLOGG, Ore.—*Editor Forest and Stream:* This is one of the finest game countries I have ever known. We have deer, elk, bear and smaller game. Not far distant from here is a little river where no one lives, where bands of elk roam the year round. The stream is full of trout, and at its head is a small lake full of fish. This place is not far from Winchester Bay; I can hear the sea breakers on the beach.

W. D. MOORE.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Squeteague and Bluefish.

In the Biological Notes which have just been published by the United States Fish Commissioners, Messrs. Sherwood and Edwards discuss the fluctuations in the supply of squeteague (weakfish) and bluefish, and the relation between the two. They note:

The first squeteague was taken at Cuttyhunk on May 5, and nine days later they reached Woods Hole. Toward the last of May one was caught at Cuttyhunk which weighed 14 pounds. The abundance of squeteague was remarkable. In the Menemsha traps alone 10,000 were taken in a single day—July 31—and, in fact, they were so plenty throughout the season that they ruined their own market, and did not bring enough to pay their shipping bills. Many of the Vineyard fishermen retained the fish in the pockets, waiting for better prices, but a heavy northeast storm tore up the nets in the fall, and most of the summer's catch was lost.

When, a few years ago, a bill to prohibit all net fishing in Buzzard's Bay was presented to the Massachusetts Legislature, one of the strongest arguments of its supporters was that the bay was the natural spawning ground of the food fishes, and therefore their decrease was attributed to excessive trap fishing. A careful study of the records of the movements of squeteague for the last thirty years has revealed some striking facts which have an important bearing on this question. Notwithstanding protective legislation, it is very evident that breeding squeteague have ceased to enter Buzzard's Bay in any considerable numbers; for, while twenty years ago the young could be seined almost anywhere in the vicinity of Woods Hole (at Great Harbor, Hadley Harbor, Nobska Beach, and Quisset), there are now only two localities in Buzzard's Bay and Vineyard Sound where they are found—at Wareham, near the head of the bay, and in Acushnet River, on the New Bedford side. Even in these places their numbers are greatly reduced.

The former abundance of the young was due in all probability to the fact that the adults spawned in the open bay or outside waters, and since the buoyant eggs were subject to the influence of winds and currents, they were carried hither and thither until finally lodged in the protected harbors and inlets. Such conditions would tend to distribute the eggs more or less uniformly along the shores of the bay, and the fry would not be restricted to the present areas. On the other hand, with the remarkable increase of the adults, if they still continued to

spawn in the same places, there would have been a correspondingly large increase of the young.

It may be argued that the spawn is deposited in the same places as formerly, but that the eggs merely drift into the estuaries—Wareham River and Acushnet River. But this does not seem at all probable, since the outward current of these rivers is stronger and longer continued than the inward. A more plausible explanation is that the few adults entering these rivers find conditions favorable, and therefore spawn, while the great majority of the fish seek other localities. The Rhode Island fishermen, who control the sea traps off Seaconnet and Newport, say, that whereas years ago they used to catch plenty of squeteague at the mouth of the bay, very few are ever seen there now. They believe that the fish no longer run in offshore waters, but enter the bays and inlets. Substantiating this is the extraordinary abundance of the fry during the past few years in Narragansett Bay, particularly in its upper part, near Red Bridge and India Point. Even here great numbers of them were killed in 1900 by Peridinium. For two weeks or more in September this small protozoan infested the waters of the upper bay in such numbers that the water was almost a blood-red color, and, as a result, young squeteague, together with fish of several other species, were piled in windrows on the shore. There is but one conclusion to be drawn from the foregoing facts—the squeteague has changed its spawning grounds within a few years, and, judging from the abundance of the young, Narragansett Bay is the more favorable locality at the present time.

The study of the yearly records has also shown that a definite relation exists between the abundance of squeteague and blue-fish. Twenty years ago 100 squeteague were considered a remarkable catch, but now it is not uncommon to take 4,000 at a single draft of a trap. On the other hand, twenty years ago blue-fish were so plentiful that barrels of them were shipped daily, while in 1900 not over 50 were recorded from the bay or sound. There can be but little doubt that the marvelous increase of the squeteague has been made possible by the disappearance of one of its most dangerous enemies—the savage bluefish.

Simultaneously with this change there has occurred another, equally difficult to explain, in the time of the arrival of the bluefish. Some twenty years ago the fish were sure to be taken in the traps the first or second week in May, while recently they may be as late as the middle of June. The presence of large schools of bluefish off Nantucket and No Man's Land all summer makes it evident that they have not completely deserted our coast; but just why so few come inshore, and why they are so much later in their arrival, is not apparent. In spite of the scarcity of mature fish the young have been very abundant everywhere, and particularly at Katama Bay, where, undoubtedly, they have destroyed many of the rare, bright-colored, southern forms referred to in Biological Notes No. 1. The rate of growth of the young, as found in Katama Bay, in 1900, is as follows: July 27, 3 inches; Aug. 8, 3 to 5 inches; Aug. 29, 5 to 7 inches; Sept. 24, 7 to 9 inches; Oct. 3, 8 to 11 inches.

CHICAGO AND THE WEST.

Fishing Season Not Yet Ended.

CHICAGO, Oct. 11.—We are having weather much cooler than prevailed during September, it is true, but none the less mild for this date in the fall, and still too mild to offer good shooting in this latitude for wild fowl, and many of our sportsmen are still sticking to the rod and reel rather than to the dog and gun. Some good takes of pickerel and bass were made in the Lauderdale chain of lakes last week by F. N. Peet and friends, of this city. They state that the big pickerel are just beginning to strike, and believe that the fishing there will be good until cold weather sets in.

Muscallunge fishing in the Minoqua chain of lakes of Wisconsin has been exceedingly good during the past ten days. One party came out with 19 muscallunge, taken during a stay of less than a week. They state that they had magnificent sport.

Wishinnee Muscallunge Luncheon.

Mr. Jack O'Neill, of this city, returned this week from a muscallunge trip in Wisconsin and gave a grand fish banquet to Mayor Carter H. Harrison, and to his friends of the Wishinnee Club. There were thirteen at table, all good men, and true. The Mayor came in, and in his eagerness to display a new umbrella, which he had purchased, opened the latter in the room, which act is also notoriously a sure hoodoo. None the less, nothing fateful happened except to the muscallunge which Mr. O'Neill had presented as the chief feature of this occasion. This fish weighed 25 pounds, and it was served at the club table, unbroken, and in full length. It surely made a magnificent appearance, as it lay on the large plank upon which it was served. There was fish enough for even the hearty appetites of the Wishinnees, and enough for one or two stragglers who came in later in the game.

Mr. O'Neill, when called upon by the Mayor to make a few remarks, stated that his capture of this fish was somewhat singular. He had promised to send the Mayor a muscallunge, and on this morning, when he started out with his guide, he said, "I just want to catch one good muscallunge this morning, and I want it to weigh exactly 25 pounds, because I want to send it to Mayor Harrison, down in Chicago." In less than three minutes after he had uttered this remark he had a good, solid strike. The fish was heavy and loggy, acting very dull, and it was brought to the side of the boat and gaffed in about 15 minutes after it first struck. Weighed on the hand scale in the boat, it weighed exactly 25 pounds. This satisfied Mr. O'Neill, and he at once rowed for the hotel, and as soon as possible took the train home with his trophy.

This was the first general meeting of the Wishinnees for the fall, and is the predecessor of several club sessions which will be pulled off during the cold season, when golf, fishing and shooting are not so possible as they have been of late. It is to be observed that a certain esprit marked this first fall gathering. Mr. J. V. Clarke, president of the Hibernian Bank, was detected

in the act of whispering to his brother, also of the bank. The two were promptly fined for talking shop during lunch time, this latter being one of the offenses against the immutable Wishinnee laws. Mr. Graham H. Harris, undertaking to talk politics, was also fined, as was Bill Haskell for starting to repeat a muscallunge story which had been told at an earlier date. The session was marked by great business energy, as well as distinct activity, in passing of plates for the second helping of muscallunge.

By the way, as comparing the muscallunge and his cousin, the white-spotted Great Northern pike, it may be said that the flesh of this fish was delicate, white and firm, unmarked by any small bones, and distinctly sweeter and more palatable than that of any pickerel or Great Northern pike which any one present had ever eaten.

The Season's Angling Record.

Speaking of angling records, it seems to me that all sorts of records in that line, for big catches, delicacy, accuracy, or anything else, are fairly to be called broken by the season's performance of Mr. Harry Miner, manager of the Crescent Iron Works, of Chicago. Earlier in the season, when I was mentioning the names of gentlemen who had gone out fishing, I found Mr. Miner's name in the lists so often that I finally cut it out, as not having news value any longer. Now—for such a strange thing is news—it does have a very distinct news value. Mr. Miner was not news after the middle of the summer, but he has been steadily getting newsier for the last 30 days.

To-day, Saturday, is a very cold, bleak, rainy day, and in prowling around the sources of information in such matters, I can discover the name of only one man who has gone fishing for bass this afternoon. The name is that of Mr. Harry Miner. Investigation shows that Mr. Miner has not missed a single week since the ice went out, but as regularly as Saturday rolls around has taken his little basket of frogs and his casting rod, and likewise taken the train for Lake Villa, Ill. His order is for three dozen small bait frogs every Saturday morning, the season through. He begins when the ice goes out and stops when the ice comes in. He has outfished all Chicago, and the record surely goes to him.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Sturgeon Hatching in the Lake Champlain Basin.*

BY LIVINGSTON STONE.

(Read before the American Fisheries Society.)

SOMEWHAT of the mystery formerly surrounding the taking and fertilizing of sturgeon eggs on a large scale has been removed, only to be replaced by the appearance of difficulties which seem even now to be almost insurmountable. Only three years ago it was a mystery why the net fishermen, while they caught plenty of parent sturgeon with eggs in all stages of maturity, never caught any with wholly ripe eggs in them. Now that we know the reason of this to be that ripe sturgeons caught in nets, throw all their eggs in their efforts to liberate themselves, the difficulty arises of securing the parent fish before they throw their eggs.

We adopted various devices this spring to accomplish this object. We set trap nets in the two rivers and also in the lake, but the sturgeon would not go into the trap nets. We set gill nets in various places in both the Lamoille and the Missisquoi rivers, and we had these nets overhauled every hour, night and day. We also overhauled and examined all the parent sturgeon in the pens every day, but somehow most of the ripe fish eluded us in one way or another before their eggs could be secured. In some instances, even when we had a night guard on duty, parent fish caught at night by the fishermen, and put in confinement, were stolen before morning, the high price paid for caviar sturgeon (i. e., female sturgeon with nearly ripe eggs in them) being a sufficient incentive to poachers to incur unusual risks in stealing them. At other times ripe fish gilled at night and safely conveyed to the pens by the fishermen would spawn in confinement before morning, thus eluding the spawn takers. At another time—this was on May 13—a large, ripe, female sturgeon of nearly a hundred pounds in weight was found in our Missisquoi River pens. There were three able-bodied men present to handle the fish besides the writer, who stood by, ready with the spawning pan. The fish was no sooner lifted from the dip net by the men on the stripping platform than with two terrible blows with the tail right and left, she sent her eggs flying across the platform to the distance of a rod or two, in the meantime struggling so violently that it required the combined efforts of the three men to hold her. Finally having subsided to a degree of comparative quietness, the few remaining eggs in her—perhaps 20,000—were taken, but though these were successfully hatched, the stripping of the fish was, of course, a failure, as not more than 4 per cent. of the eggs were taken. At still another time, three large female sturgeon, supposed to be fully ripe, were caught. On holding the fish up by the tail, the eggs sagged in the abdomen as with a fully ripe salmon, and in order to ensure our not losing these eggs, as others had been previously lost, two of these fish were knocked in the head and instantly killed, when, to the great dismay of the spawn takers, the eggs were found after all not to be sufficiently mature to be fertilized. To avoid a repetition of this risk, the third fish, which appeared to be the least ripe of all, was put in confinement to ensure the further ripening of her eggs. This fish spawned that very night.

The above instances illustrate how elusive and disappointing the sturgeon were, when an attempt was made to get their eggs, and how many difficulties presented themselves, even after their mysterious character had been removed.

The difficulties did not prove wholly insurmountable, however. All the fishing for spawning sturgeon had been

*The operations referred to in this paper were conducted under the auspices of the United States Fish Commission by the writer, very ably assisted by Mr. Myron Green, in northwestern Vermont, in the Missisquoi River and the Lamoille River, tributaries of Lake Champlain, and in the lake itself.

done this year on the Missisquoi with nets. On the Lamoille we encountered something different. Near the south bank of that river, about four miles from its mouth and half a mile from the West Milton Post Office, Vermont, is a place known to the residents of that neighborhood as the "Sturgeon Hole." Here the main body of the river rushes through a rocky gorge not over 20 or 30 feet wide, with precipitous walls of solid rock on each side. Just below the gorge is a hole about 45 feet deep, apparently shaped somewhat like a boat, in which the spawning sturgeon collect, usually very soon after their appearance at the mouth of the river, but most probably when the water reaches the right temperature for spawning. The water is too deep to spear the fish here, and nets cannot be used, but the sturgeon are taken by twitching them up with hooks. We watched this hole night and day, after the appearance of the sturgeon at the mouth of the river, and obtained many breeders from the "Hole" after they had begun to collect in it, twenty-seven being caught on May 22, the temperature of the water being 68 degrees F. These were all, or nearly all, ripe males, but on the afternoon of May 23 two entirely ripe females were hooked up. The fish not struggling violently at first, the men stopped the flow of eggs by stuffing their handkerchiefs into the vent. The fish were then towed across the river, where the males had been secured, and were instantly killed by being knocked in the head. Their eggs were taken and treated like pike-perch eggs, as to impregnating, mixing with milt, rinsing, etc.

In the meantime a rude hatchery had been constructed on the north bank of the Lamoille, with a battery of twenty-two jars, a short distance from the sturgeon hole. The eggs now obtained were all placed in jars, where they appeared to do finely. The next day the writer took a few thousand over to the hatchery at Swanton, where they subsequently hatched out without difficulty. The remainder were left at the temporary hatchery on the Lamoille. The hatching water for our battery here was obtained from a spring brook which rose, I think, about a mile to the north. Before locating the hatchery at this point, Mr. Green and the writer had many discussions as to whether the water in the brook might not get too cold for the sturgeon eggs. There was no other supply obtainable, however, with the limited means at our disposal. It was "Hobson's choice"—take that or nothing—so we took the hatching water from the brook. For a time, the weather remained fairly warm, and the eggs did well. It was found on examination of the eggs, when the form of the fish first appeared in the embryo, that nearly 90 per cent. of the eggs were impregnated. Then there came a frost one morning, and the water dropped to 50 degrees F. The next night there came another frost, and the water fell to 45 degrees F., and then the sturgeon eggs all died. It was a bitter disappointment. We had struggled against great discouragements, and now we thought were on the eve of a great success, instead of which we were on the eve of a great failure.

A consignment of eggs which had been in the meantime sent to Cape Vincent Station met with the same fate, the water of the St. Lawrence used at this station being also comparatively cold at this season.

We afterward discovered a spawning ground of the sturgeon on the shore of Lake Champlain, a short distance south of the mouth of the Lamoille. Here is a well-protected bay, with a beach sloping very gradually out to deep water. In the shallow waters of this bay, in water not over 3 feet deep, strange to say, the sturgeon come to spawn in the month of June. Here we found them spawning in plain sight from the shore. We set trap nets and gill nets here, and caught many ripe males and several ripe females the first week in June, but did not succeed in collecting any impregnated eggs.

I may add here that the sturgeon eggs that we took averaged 850 to the fluid ounce. They are apparently amorphous as to shape, and of a dull and dirty color, but this appearance is given them by a cobwebby film which surrounds each egg. This film can be easily separated from the eggs by squeezing the egg out of it with the fingers, and the egg is then seen to be spherical, clear and crystalline, like other fish eggs, and not very different in size from whitefish eggs, though, perhaps, somewhat larger.

The eggs come very easily from the parent fish when they are ripe. They are somewhat glutinous, but if taken from a freshly caught fish, they are no more so than pike-perch eggs, and if treated as pike-perch eggs are when taken, they will give no trouble in sticking together, and will easily hatch out 80 per cent. or 90 per cent. of healthy fry.

The eggs taken to the Swanton hatchery hatched in seven days in an average temperature of 65 degrees F. Their mobility was so much less than that of pike-perch eggs that it took a stream of water running through a 3/8-inch rubber tube with about a 6-foot pressure to keep them in motion in the hatching jars. The young fry are hardy and very active, but if they are to be confined in tanks or troughs, the screening must be very tight, as they can work themselves through an extremely small crevice.

Allow me to state in conclusion, as I have already done in my annual report to the United States Commissioner of Fish and Fisheries, that the following points in regard to lake sturgeon and sturgeon hatching may be considered as pretty well established:

(1) The lake sturgeon go up the tributary rivers of Lake Champlain to spawn. They ascend different rivers at different times, the time for each river appearing to be determined by the temperature of the water. The river that the spawning sturgeon of Lake Champlain first ascend is the Missisquoi, in the extreme northwestern corner of Vermont. They go up this river very soon after the pike-perch have finished spawning in the river, which is usually the latter part of April. The largest number of ripe fish appeared about May 13. The spawning sturgeon were all out of the river by May 20.

The Lake Champlain sturgeon ascend the Lamoille, a Vermont river which flows into the lake about thirty miles south of the Missisquoi, somewhat later. This year their first appearance at the mouth of this river was about the middle of May, and they collected in the "Sturgeon Hole" in the greatest numbers for spawning on May 23. They had all left the river by the end of May.

(2) The lake sturgeon spawn in the shallow waters of the lake in June. At least, there is a spawning bed in the shallow water of the bay just south of the mouth of

the Lamoille, where the sturgeon come to deposit their eggs. Parent fish collect in this bay to spawn about two weeks later than they are found in the greatest numbers in the "Sturgeon Hole" of the Lamoille. The largest number of ripe ones was observed on June 4. By June 15 all had left the spawning grounds of the bay.

(3) As far as we have observed, the lake sturgeon will not spawn until the water reaches a temperature of 60 degrees F. In our experience, on both lake and river, we have never found sturgeon spawning in colder water than this. We are consequently led to believe that they require water at or above 60 degrees F., though, of course, this must be accepted only as an inference.

(4) The lake sturgeon spawn at various periods later than they do in the bay just mentioned, as is evidenced by the fact that we caught parent fish in June with eggs that would not have been ripe for a fortnight, and others with eggs that would not have ripened for a month or longer.

(5) The parent sturgeon do not seem to ripen their eggs well in confinement, unless they are very nearly ripe when captured. We found that the eggs of the fish that we kept in our pens caked together and otherwise became very poor if the fish were too long confined, and the eggs would probably not have been susceptible to impregnation even if they had ripened enough to be extruded from the fish. This point must not be accepted yet as conclusive, for it is quite probable, I think, that means will be found eventually for keeping sturgeon in captivity without injuring their eggs till they are ready to spawn.

(6) The spawning season at the various spawning grounds of the lake sturgeon is very short. They are doubtless spawning somewhere all summer, but at any specified spawning ground I do not believe that they are in the act of spawning over three or four days. I have set wide limits in this paper to the period that the spawning sturgeon remain on their spawning beds, in order to be on the safe side, but I think that on a more thorough investigation these limits will be very much narrowed.

(7) Unless some device has been adopted for forcibly retaining the eggs in the parent sturgeon, it seems to be almost useless to attempt to strip a ripe fish after it has once been lifted out of the water alive. A few seconds of time and a few powerful strokes of the tail are sufficient to throw all their eggs to the four winds. If the eggs are ripe it must be ascertained before the fish is taken from the water, or the instant it is lifted from the water. The vent can then be plugged, the fish put in a strait jacket and the eggs taken without difficulty. We adopted various ways of "plugging" the parent sturgeon, but after all the most effective way was to stuff a handkerchief instantly into the vent, and keep it there. If this is done quickly enough it will be a success. If something of the kind is not done, or if the ripe sturgeon is given any time to struggle, if only for a few seconds, the eggs will be lost.

(8) The eggs of the lake sturgeon, once they are taken, are easily impregnated. It has frequently, in fact almost always happened, that when a struggling female has been found, or when the females have been ripened in confinement, ripe males for fertilizing the eggs could not be found. On the other hand, if the ripe females are captured during the three or four days during which they are collected on the spawning beds, ripe males will be found in abundance. When we caught the ripe females in the Lamoille "Sturgeon Hole," we could have taken a quart of milt from the males if it had been necessary.

(9) The eggs of the lake sturgeon are easily hatched. Any of the hatching jars in use for pike-perch and whitefish are suitable for the purpose. Run a stream of water through the jars with sufficient pressure to keep the eggs in healthy motion, and they will hatch without trouble and without much loss. It is highly probable that 80 per cent. or 90 per cent. of sturgeon eggs taken under favorable conditions will be hatched in the future.

Enemies of the Fishculturist.

DEPARTMENT OF FISHERIES AND GAME, Boston, Mass., Oct. 10.—*Editor Forest and Stream:* All who have engaged in the work of fishculture have learned sooner or later that "it is not all beer and skittles" to breed and rear fish. That this is true has been shown by the experience of the superintendents of our fish hatcheries at Sutton and Hadley, in this State.

One day not long ago, while Supt. Wm. A. Tripp was engaged in the attempt to sink a well some little distance from the hatchery at Hadley, and on the opposite side of the building from the pond wherein the brood trout are kept, he chanced to turn in the direction of the pond and saw a large fish hawk just rising from the water with a trout in its claws. The bird had evidently taken advantage of its opportunity, when the superintendent was further away from the pond than usual, to secure for itself a good meal of spotted trout. How many times it had previously done the same thing we do not know. Anyhow, the depredation was considered of sufficient importance for the Commission to promptly supply Mr. Tripp with a double-barreled gun to defend his charges from similar depredations in the future. Undoubtedly that fish hawk will find it unhealthy to venture near the fish pond hereafter.

In one of the small rearing pools, where Mr. Tripp had been endeavoring to raise some trout fingerlings, he noticed that the young fish grew less and less from day to day, but as there were no dead fish on the bottom of the pool he was at a loss to account for the gradual diminution. On two occasions he drew the water nearly out of the pool in the endeavor to discover the cause, but he could find no trace of anything which would give him a clue. But as the trout continued to disappear, he finally drew the pool down for the third time and covered the bottom of it with fine, white sand, thinking that might possibly aid him in securing information which he had previously failed to obtain. He was correct in this conclusion, for the sand led to the discovery of two eels, which were dragged from the mud in the bottom of the pool. One was 16 inches long, and the other 2 feet, or more in length. The discovery of these solved the problem of the disappearance of trout.

While no eels have been seen at Sutton, and fish hawks have apparently not attempted the capture of trout there,

the fish are nevertheless subject to attacks from other enemies, despite the watchful care of Supt. Arthur Merrill.

One day recently, while Commissioner Delano and I were at the hatchery, a kingfisher, which evidently had a longing eye on the young trout in a near-by pool, was caught in a trap which had been set for it.

On the same day a Mr. Wilson, of Worcester, who was out to the hatchery for the purpose of securing some frogs for scientific purposes, succeeded in killing a water snake about 42 inches long and approximately 5 inches in circumference. This snake was killed in immediate proximity to the rearing ponds, near the hatchery, where the young trout are being raised for breeders. When opened, the snake was found to have four trout in its stomach, each ranging from 5 to 7 inches in length. Two of them were Loch Leven trout, one 6½ inches and one 7 inches long, and the other two were brook trout.

Mr. Merrill says that "formerly many of these snakes were killed about the upper ponds, but this year they have been less plentiful there, and not one has been killed. Their absence may account in part for the increased number of fingerlings in those ponds."

From the foregoing it is evident that one who hopes for success in fishculture must not only be skillful in his profession, but must also be on the alert to "see snakes" and other enemies of his finny proteges, and to dispose of them, too, when they are poachers in forbidden waters.

J. W. COLLINS.

Piscatorial Poetics.

OUR own inexhaustible Izaak has declared that "Angling is somewhat like poetry: men are to be born so." Few will be found to have the hardihood to dispute or to deny this; it is a gem of thought, crystallized into a sparkling sentence which will remain a classic quotation as long as our language shall endure. At the same time, it opens a field for speculation as to the extent to which a kinship may be found to exist linking anglers to poets or poets to anglers—the angler to poetry or the poet to angling. Much traveling to and fro on the ocean of English literature would seem to lead one to the conclusion that after all there is not very much true sympathy between the two, and that the combination in one person is only rarely to be found, in spite of the fact that contentment is by common consent regarded as a characteristic of both. Of course our poets, great and small, have often found fine food for pretty similes in various incidents of the gentle craft, and as a rule have dealt skillfully with them. But, on the other hand, it can hardly be maintained that fishers who have sought to sing the praises of angling have achieved any very signal successes. Many piscatorial enthusiasts will doubtless condemn this as too sweeping a generalization, and will perhaps quote instances by which they hope to disprove it, but it will nevertheless be found to be true in the main.

Shakespeare, naturally, in this, as in almost everything, stands first among poets who have brought into play piscatorial pictures, similes, or illustrations to aid in the poetical presentment of an idea. Thus in "Antony and Cleopatra" (Act II., scene 5), the "Serpent of Old Nile" is made by him to say:

Give me mine angle—we'll to the river: there,
My music playing far off, I will betray
Tawny-finn'd fishes; my bended hook shall pierce
Their slimy jaws; and as I draw them up,
I'll think them every one an Antony,
And say, "Ah, ha! You're caught!"

And again, the good gentlewoman, Ursula, in "Much Ado About Nothing," enters into the spirit of Hero's scheme regarding Beatrice, saying:

The pleasant'st angling is to see the fish
Cut with her golden oar the silver stream,
And greedily devour the treacherous bait;
So angle we for Beatrice.

Choice samples, these, of how what I take leave to say is, in its essence, an unpoetical sport, can be poetically treated. In Pope's lines on "Windsor Forest" there is a charming and vivid little sketch of the angler:

In genial spring, beneath the quivering shade,
Where cooling vapors breathe along the mead,
The patient fisher takes his silent stand,
Intent, his angle trembling in his hand;
With looks unmov'd, he hopes the scaly breed,
And eyes the dancing cork and bending reed.

Some of the victims of his wiles are thus tersely described:

Our plenteous streams a varied race supply,
The bright-eyed perch, with fins of Tyrian dye;
The silver eel, in shining volumes roll'd;
The yellow carp, in scales bedropt with gold;
Swift trouts, diversified with crimson stains,
And pikes, the tyrants of the watery plains.

Thomson, whose "Seasons" are somewhat out of season in these days, and are certainly less read than they deserve to be, gives in "Spring" a pretty description of trout fishing, concluding:

But should you lure
From his dark haunt—beneath the tangled roots
Of pendent trees—the monarch of the brook,
Behooves you then to ply your finest art.
Long time he, following cautious, scans the fly,
And oft attempts to seize it, but as oft
The dimpled water speaks his jealous fear.
At last, while haply o'er the shaded sun
Passes a cloud, he desperate takes the death,
With sullen plunge. At once he darts along,
Deep struck, and runs out all the lengthened line;
Then seeks the furthest ooze, the sheltering weed,
The cavern'd bank, his old, secure abode;
And flies aloft, and flounces round the pool,
Indignant of the guile. With yielding hand,
That feels him still, yet to his furious course
Gives way, you, now retiring, following now
Across the stream, exhaust his idle rage;

Till floating broad upon his breathless side,
And to his fate abandon'd, to the shore
You gaily drag your unresisting prize.

In contrast to these impartial attitudes, Byron seems to have indulged an almost savage dislike of anglers and a lofty scorn of their craft. Thus, in the 106th stanza of Canto XIII. of "Don Juan," among the amusements of the guests at a country house-party, he mentions:

* * * Angling, too, that solitary vice,
Whatever Izaak Walton sings or says;
The quaint, old, cruel coxcomb, in his gullet
Should have a hook, and a small trout to pull it.

Adding, in a note:

It would have taught him humanity at least. This sentimental savage, whom it is a mode to quote (amongst the novelists) to show their sympathy for innocent sports and old songs, teaches us how to sew up frogs and break their legs, by way of experiment, in addition to the art of angling—the crudest, the coldest and stupidest of pretended sports. They may talk about the beauties of nature, but the angler merely thinks of his dish of fish; he has no leisure to take his eyes from off the streams, and a single bite is worth, to him, more than all the scenery around. Besides, some fish bite on a rainy day. The whale, the shark, and the tunny fishing have somewhat of noble and perilous in them: even net fishing, trawling, etc., are more humane and useful—but angling! No angler can be a good man.

After this furious fling, he gives the following quotation:

"One of the best men I ever knew—as humane, delicate-minded, generous and excellent a creature as any in the world, was an angler. True, he angled with painted flies, and would have been incapable of the extravagance of I. Walton."

Byron then says:

The above addition was made by a friend in reading over the MS. *Audi alteram partem*—I leave it to counterbalance my own observation.

It was scarcely necessary for Byron to give this word on the other side—his intemperate outburst carries its own self-refutation.

William Basse, a poet little known save for his clever four-line epitaph on Shakespeare (of whom he was almost a contemporary) furnishes us with one of the best pieces of piscatorial praise. Two verses will suffice to show the quaint quality of his "Angler's Song":

Of recreation there is none
So free as fishing is, alone;
All other pastimes do no less
Than mind and body both possess.
My hand alone my work can do,
So I can fish and study, too.
* * * * *
The first men that our Saviour dear
Did choose to wait upon him here
Blest fishers were: and fish the last
Food was that He on earth did taste.
I therefore strive to follow those
Whom He to follow Him hath chose.

Something of the divine afflatus mingles with the spirit of the true sportsman in the universally known song "The Angler," written by John Chalkhill, who was so happy as to be an "acquaintance and friend of Edmund Spenser." The first verse will suffice to remind readers of this most famous song:

Oh! the gallant fisher's life,
It is the best of any;
'Tis full of pleasure, void of strife,
And 'tis beloved by many.
Other joys
Are but toys;
Only this
Lawful is,
For our skill
Breeds no ill,
But content and pleasure.

Allusions to fishing are of course to be found in classic authors. The subject did not escape the comprehensive mind of the stately Virgil, in the first book of whose "Georgics" we read:

Atque alius latum funda jam verberat amnem,
Alta petens, pelagoque alius trahit humida lina;

which Dryden renders thus:

And casting nets were spread in shallow brooks,
Drags in the deep, and baits were hung on hooks;

though doubtless the genial contributor of "Jottings by the Way" prefers Thomas May's version:

Drag nets were made to fish within the deep
And casting nets did river bottoms sweep.

The reader who has accompanied me thus far in these perhaps rather flighty excursions into the works of the more serious-minded poets will perhaps welcome now a specimen or two from those verse-makers who have dealt with the subject of angling in a lighter vein.

In "The Sportsman's Vocal Cabinet," compiled by Charles Armiger, of Melton Mowbray, and published seventy years ago, there is a whimsical ditty, in which angling is brought into comparison with most of the principal callings in life. It is too long for reproduction here, but the first and last verses may be given. It begins:

Of all the recreations which
Attend on human nature,
There's none that's of so high a pitch
Or is of such a stature,
As is the subtle angler's life
In all men's approbation;
For angling tricks do daily mix
In every occupation.

It touches all classes of humanity in turn, from Adam and Eve (for whom Satan went a-fishing, proving himself the first angler!), making comparison with physicians, lawyers, divines, merchants and stock brokers, and even a counterpart of Hans Breitmann's immortal "maiden mid nodings on," and then concludes:

Thus have I made my angler's trade
To stand above defiance,

For, like the mathematic art,
It runs through every science.
If with my angling song I can
To mirth and pleasure seize you,
I'll bait my hook with wit again,
And angle still to please you.

Only some half-dozen others of the numerous songs in the above collection are of any real merit. The one beginning "How happy is the angler's life" shows skill in its composition, as the second and fifth verses will show:

At morning, if the sky be fair,
We leave our couch in quiet,
And selfish fools to die by care,
And wanton rakes by riot.
With bliss supreme we reach the stream,
The busy bleak or perch we seek,
The dace or speckled trout so sleek,
Or else the stately bream.

* * * * *
But if we find the inmates shy
And cautious past enduring,
Full many a skillful trick we try
To draw them to our luring.
For fish, like men, full nine in ten,
Have very strange vagaries,
They'll leap on high to catch the fly,
Then sink to where fresh fare is.

In Richard Alfred Millikin's famous song, "The Groves of Blarney," which has been styled by an enthusiastic critic the "national Irish poem," the fourth stanza concludes thus:

'Tis there's the lake that is stored with perches
And comely eels in the verdant mud;
Besides the leeches, and the groves of beeches
All standing in order for to guard the flood!

"Comely eels in the verdant mud" is surely—to drag in an old "chestnut"—an "elegant" expression not to be surpassed even by Father Prout himself.

Devotees of sea angling, too, have had a share of attention, as well as their brethren of lake and stream. John Lander, the Cork solicitor, to whom the song, "The Praise of Kinsale," is ascribed, though written as if from "Paddy Farrell of Kinsale to his friend at Mal-low," in true Hibernian style, sings:

To do the theme justice exceeds my poor powers,
Then expect but a round and unvarnished tale,
To hook in the aid of poetical flowers
Is not in my line while I sing of Kinsale.

* * * * *
We've a choice set of books for the student who wise is,
The eel of true science to seize by the tail;
At all seasons a skate you can have where no ice is,
Or a sinecure plaice you may get at Kinsale.

These are two of the ten lively quatrains of which the song consists. The answer of "Thady Mullowny, of Mallow" (by the same author), is so full of fun as to deserve quoting entire, but dread of the editorial blue pencil makes me cut it down to the first three verses, which run thus:

Dear Paddy—I got your poetic epistle,
Along with the hake that you sent by the mail;
But what could bewitch you to sing, or to whistle,
In strains so melodious the praise of Kinsale?

In all baits you're well skilled, you cod-dragging curmudgeon,
To hook every fish, from a sprat to a whale;
But your lines shan't catch me—by my soul, I'm no gudgeon
To flounder or starve in the streets of Kinsale.

I know your design is, as usual—sell-fish;
For, catch what you will, my old boy, I'll be bail,
You'll jolt off to Cork your best hake and best shellfish,
And leave barely a claw for the town of Kinsale.

I have now, I think, given sufficient pointers to those readers of the Gazette who may care to follow up this fishing in books for matters of interest to the brethren of the rod and line, and net. If the bulk of the verse cannot lay claim to being classed as poetry, it flows with freedom and is well flavored with fun.—Rodwell Hookham in the London Fishing Gazette.

Rainbow Trout in North Carolina.

HIGHLANDS, N. C., Oct. 10.—I send you a photo of a rainbow trout two years old, caught in one of my ponds here by a young lady in September, 1889, two years after the fingerlings were planted. This shows the amazing growth of these fish under exceptionally favorable circumstances. At the present time some of these fish are enormously large, but none of them has been taken for some years past of large size, as they break the tackle whenever hooked. But schools of them are occasionally seen lying at the bottom when the sunlight is favorable, and in the evening, at times, the surface of the water is broken by their splashing, as they come up for flies. I am very suspicious that they are feeding on the young fontinalis, which are scarce in the pond where they are, but plentiful in another a few miles up the stream. I sent you a photo of a pair of the *Iridei* six or seven years ago, with a 2-foot rule beside them, showing that the larger of the pair was 22 inches long and 7 inches across the side at the larger part. This must have been eight years ago—or ten perhaps. With this growth I am curious to know precisely the size of the oldest now, but get no nearer than an estimate of one I hooked four years ago, which was fully 10 inches across the body, and I should judge 30 inches in length. He broke my tackle when half out of the water. I am curious to know the full size of the fish at full maturity.

The poachers here spear these fish by torch light, having given up the habit of "hooking" them any other way. Any of the friends of FOREST AND STREAM are hereby given cordial invitations to get some of these fish, so that I can send you some snap shots of them. My fishing days, I am sorry to say, are now in remembrance, rather than presence and anticipation.

HENRY STEWART,

Canadian Angling Licenses.

PHILADELPHIA, Pa., Oct. 14.—*Editor Forest and Stream:* I have just read the communications from Messrs. Wood and Hatfield, in regard to Canadian angling licenses, as published in your issue of Oct. 12. While I have no wish to trespass too far upon the valuable space of your columns, or to multiply literature in regard to my unpleasant experience, I must, nevertheless, comment briefly upon the communication of Mr. W. R. Wood, the fishery overseer from Toronto, and in so doing substantiate your editorial comment, as contained in your issue of the 19th ult. As a matter of fact, the "alleged injustice," as Mr. Wood terms it, was directly at the instance of the Dominion officers, and in diametrical opposition to the construction placed upon the law by the Provincial officials, whose instructions to their deputies were in entire accord with the interpretation of the law which, according to Mr. Wood, prevails in the Province of Ontario. It, therefore, the appellate courts sustain the present contention of the Dominion Government, and hold that, while we employed Canadian guides and boatmen, our action in fishing without a license was in violation of the law, such decision will apply to the entire Dominion of Canada, and Mr. Wood will be compelled to exact the payment of license fees from all of those whom, under this construction of the law, he now pronounces exempt.

As regards the letter of Mr. Hatfield, to which you also refer, I cannot but feel grateful to you for your failure to publish the same in full. I have no wish to deny the right of free speech to any one in connection with this matter, but Mr. Hatfield's communication, which I have read in its entirety, is so full of misstatements that its publication might have easily prejudiced the minds of any of those who take an interest in the present discussion. I might add that we are momentarily expecting a decision upon the appeals taken in these cases, the same having been argued in the county court on the first instant. It is somewhat interesting to note in this connection that the gentleman who sat as committing magistrate now appears in the role of attorney for the prosecution in the argument of the appeals.

J. B. TOWNSEND, JR.

West Virginia.

ROMNEY, W. Va., Oct. 9.—*Editor Forest and Stream:* W. P. Hubbard, of Wheeling, caught a 5¼-pound bass at the Roxs recently, and I noticed an article in a Cumberland paper which reported a 10-pound bass caught at Old Fields, which I very much doubt, as there is no authentic account of a bass weighing over 7¼ pounds caught out of the South Branch. Geo. R. Taylor, of Wheeling, bought one that was caught in a fish and eel pot a year or so ago that weighed 7 pounds. Mr. Taylor caught one a couple of weeks ago that weighed nearly 4½ pounds. He has this fish, with two others, in a box to keep to take home with him, and some parties stole the fish one night. It is supposed that the carp have destroyed the bass in this stream.

Can some one tell what it will cost to put fish ladders in a dam across the river? There are two dams across this river, near Springfield, and it is required by law to have a way for fish to get over them. This they have never complied with, and when we get our deputy warden we want to have him enforce this provision of the game and fish law. Capt. E. F. Smith, State game warden, paid Romney a visit recently, and said he would appoint a deputy here soon. It is badly needed, and he cannot appoint one too soon. Our deer season opens Oct. 15, and there are a good many deer in close proximity to this town. A good many wild turkeys have been killed here this season. The partridges and rabbits are thick, and some few pheasants. Non-resident hunters have to take out a State license.

J. B. BRADY.

Fish Commission Papers.

FROM the United States Fish Commission we have received the following advance extracts from the Bulletin for 1900:

100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

75

While W. H. Fitzgerald, of Bridgeport, Conn., was hunting in the woods one mile west of Flat Rock Church, he discovered dishes and cooking utensils, which are supposed to have been left there by a fugitive, Sam Pine. There was a tin pail hanging on a crooked stick, under which a fire had been built. The interior of the pail was covered with grease, showing that meat had been cooked in it. Six loaves of home-made bread lay about, all different in shape; and there were utensils, dishes and packages of groceries. The utensils were of various styles and were apparently stolen from different farmhouses in the vicinity.

Take inventory of the good things in this issue of FOREST AND STREAM. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

The Kennel.

Fixtures.

BENCH SHOWS.

Oct. 8-11.—Danbury, Conn.—Danbury Agricultural Society's annual show.
Oct. 9-12.—Atlanta, Ga.—Atlanta Kennel Club's second annual show.
Nov. 27-30.—Philadelphia, Pa.—Philadelphia Dog Show Association's third annual show.
Dec. 15.—New York, N. Y.—Ladies' Kennel Association of America's inaugural dog show.
1902.
Feb. 4-6.—Providence, R. I.—Rhode Island Kennel Club's annual show. George D. Miller, Sec'y.

FIELD TRIALS.

Oct. 14.—Seattle, Wash.—Pacific Northwest Field Trial Club's second annual trials, at Whidby Island. F. R. Atkins, Sec'y.
Oct. 29.—Seneca, O.—Monongahela Game Association's seventh annual field trials. A. C. Peterson, Sec'y.
Nov. 4.—Washington Court House, O.—Ohio Field Trial Club's fourth annual trials. C. E. Baughn, Sec'y.
Nov. 5.—Portland, Mich.—Michigan Field Trial Association's fourth annual trials. C. D. Stuart, Sec'y.
Nov. 11.—Bicknell, Ind.—Independent Field Trial Club's third annual trials. H. S. Humphrey, Sec'y.
Nov. 12.—Chatham, Ont.—International Field Trial Club's thirteenth annual trials.—W. B. Wells, Hon. Sec'y.
Nov. 12.—Hampton, Conn.—Connecticut Field Trial Club's trials. F. M. Chapin, Sec'y. Pine Meadow, Conn.
Nov. 19.—Robinson, Ill.—Illinois Field Trial Association's third annual trials. W. R. Green, Sec'y.

Dec. 4-7.—American Pointer Championship Field Trial Association's inaugural trials. Robert L. Dall, Sec'y.
Dec. 11.—Glasgow, Ky.—Kentucky Field Trial Club's second annual trials. Dr. F. W. Samuels, Sec'y.

BEAGLE TRIALS.

Nov. 4.—Roslyn, L. I.—National Beagle Club's twelfth annual trials.—G. Mifflin Wharton, Sec'y.
Nov. 5.—Watertown, Wis.—Northwestern Beagle Club's inaugural trials. Louis Steffen, Sec'y.
Nov. 11.—Lexington, Mass.—New England Beagle Club's annual trials.
Nov. 12.—Harrisville, Pa.—Central Beagle Club's annual field trials. A. C. Peterson, Sec'y.
1902.
Jan. 20.—Grand Junction, Tenn.—United States Field Trial Club's thirteenth annual trials. W. B. Stafford, Sec'y.
Feb. 10.—Grand Junction, Tenn.—Continental Field Trial Club's trials. Theo. Sturges, Sec'y.

Brunswick Fur Club.

CONCERNING the thirteenth annual trials of the Brunswick Fur Club, the secretary, Mr. Bradford S. Turpin, of Roxbury, Mass., has issued the following circular letter: The Brunswick Fur Club cordially invites you to be present at its thirteenth annual foxhound trials, to be held at Barre, Mass., during the week of Oct. 21.

The club will make its headquarters at Hotel Barre, where the rates will be \$1.50 and \$2 per day, the latter charge being made for single rooms.

The Derby, open to all foxhounds whelped on or after January 1, 1900, will be run on Tuesday, Oct. 22. Entry fee, \$2.00. The winner will hold the R. D. Perry cup for one year and will receive a silver cup. Entries close on Monday, Oct. 21, at 10 P. M.

The All-Age Stake, open to all foxhounds, will be run on Thursday, Friday and Saturday, Oct. 23, 24 and 25. The entry fee will be \$3, and entries will close on Tuesday, Oct. 22, at 10 P. M.

The first prize winners in the hunting, trailing, speed and driving, endurance and tonguing classes will each receive a silver cup. The hound making the highest general average in all classes will hold the American Field Cup for one year, and will receive a silver cup. The Pope Memorial Cup will be held for one year by the hound showing the best combination of trailing, speed and driving. In addition to these prizes, all winners in the various classes will receive the club's diploma.

The trials will be judged by Messrs. Geo. B. Appleby, C. J. Prouty, J. H. Van Dorn, Eugene Brooks and Bradford S. Turpin.

Comfortable accommodations will be given the hounds. Saddle horses will be furnished at \$2 per day and board. Applications for horses must be made to Mr. L. W. Campbell, Woonsocket, R. I., not later than Oct. 15.

These trials are open to the world, and all lovers of the chase are invited to be present and enter their hounds.

President, Mr. O. F. Joslin; vice-presidents, Mr. A. B. F. Kinney, Mr. R. D. Perry; master of hounds, Mr. R. D. Perry; secretary, Mr. Bradford S. Turpin; treasurer, Mr. L. W. Campbell; executive committee, Mr. O. F. Joslin, Dr. L. Pope, Jr., Dr. A. C. Heffenger, Mr. Randolph Crompton, Mr. L. O. Dennison.

"Training the Hunting Dog."

NEW YORK, Oct. 10.—B. Waters, Esq., care of FOREST AND STREAM Publishing Co., 346 Broadway, New York. Dear Sir: Some time ago I gave one of the large booksellers of the city a carte blanche order to supply me with any book about dogs. I have, in consequence, accumulated quite a library on this special subject. Your previous work I consider the only book of any value for modern methods of training, and I have re-read it many times. Your new book, "Training the Hunting Dog," I think a distinct improvement, but would advise a beginner to have both. Yours truly,

JAMES B. BAKER.

Points and Flushes.

IN a communication to FOREST AND STREAM, Mr. G. Mifflin Wharton, secretary of the National Beagle Club, conveys the information that the headquarters of the club, during its forthcoming trials, beginning Nov. 4, will be at John's Hotel, Mineola, L. I. The annual meeting will be held there at 8 P. M., on the first day of the trials,

Philadelphia Dog Show.

THE following are the judges at the Philadelphia Show, Nov. 27 to 30. Entries closing Nov. 11, all communications should be addressed to Marcel A. Viti, Secretary, Witherspoon Building:

Mr. Charles H. Mason—Bloodhounds, mastiffs, Great Danes, St. Bernards, deerhounds, greyhounds, wolfhounds, English setters, chow chows, poodles, whippets, variety class.

Mr. Edward Wain—Foxhounds.

Mr. G. Muss-Arnolt—Pointers and dachshunds.

Dr. G. G. Davis—Irish setters and Gordon setters.

Mr. H. K. Bloodgood—Sporting spaniels.

Mr. Thomas H. Terry—Collies.

Mr. John Caswell—Beagles.

Mr. William C. Codman—Bull dogs, French bull dogs, Boston terriers and black and tan terriers.

—Airedale terriers.

Dr. Rush S. Huidekoper—Bull terriers.

Mr. William P. Fraser—Fox terriers.

Mr. James Watson—Irish terriers.

Mr. Charles W. Rodman, Jr.—Welsh terriers.

Dr. M. H. Cryer—Scottish terriers, Skye terriers, Bedlington terriers, Dandie Dinmont terriers, pugs, Pomeranians, Yorkshire and other toy terriers and toy spaniels.

Dr. C. J. Marshall, veterinary surgeon; Dr. E. Loveland, superintendent.

Canoeing.

OWING to the unusual press of matter in our issue of last week, due to the elaborate report of the Cup races, we were obliged to omit two most important communications from Mr. Herman Dudley Murphy. We publish in full the letters referred to, and trust that the A. C. A. will not be embarrassed in its action at its next meeting of the Executive Committee.

'Mid Reef and Rapid.—XXV.

BY F. R. WEBB.

When morning dawned we noted the fact that the river had fallen a couple of feet in the night, and was going down as rapidly as it had risen—a fact which we had predicted the day before. It was still 3 or 4 ft. higher than it was when we arrived at Cedar Point, so we gave ourselves no uneasiness on the score of there not being water enough for us to reach Riverton on.

This was one of our supply points, so to speak; so, while the boys were cleaning up, and packing the little furniture, I climbed the bluff to the house, and presently returned with a fresh supply of five dozen biscuits, some butter, lard, eggs, potatoes, etc., all of which had been spoken for the night before.

We found the task of launching and boarding our canoes a difficult and disagreeable one, as the receding waters had left a deposit of thick, slimy, slippery ooze and mud over some 5 or 6 ft. of sloping shore margin:

"We found a little tongue of water putting out into the turmoil below."

and considerable scrambling and balancing on projecting rocks and roots was necessary before we succeeded in getting on board.

The task was finally accomplished, however, and at an early hour we paddled cautiously out of the little cove on to the broad bosom of the swiftly rushing, though rapidly receding, flood, and were soon bowling merrily along down the river again, in the bright rays of the morning sun.

This section of the river, embracing the six miles from the bend at the head of Keyser's Falls to the massive cliffs at the end of the reach above the Golden Rocks, is the curious twist of the river from which the S or emblem of the Shenandoah Canoe Club is taken, and which—carefully enlarged from the chart of the river—is embroidered in white silk, or floss, on the pointed, little red silk pennants that fly from the aft ends of the cockpits of each canoe. Cedar Point is right in the point of the lower bend, so that, in our morning's start, we were nearly half way through the S.

Our experience all day was quite similar to that of the day before. Rocks, rapids, falls, fish-dams—all more or less smoothed over in one general down-hill level by the flood.

We encountered very few rapids, and the only particularly rough water we had to run was at the Golden Rocks, where the river pours down a steep, narrow defile, always swift and more or less rough; and to-day it was appallingly rough, with the water pitching and surging down the incline, and the vast waves spouting their foaming plumes high in the air.

We surveyed the pitch as well as we could, from above—for there was no chance to land and reconnoiter, owing to the bushes and overhanging trees lining the low, sub-

merged banks—and slipped along down the left side, skirting the bushes as closely as we dared, until we reached the rapid, into which we were drawn, and through which we were shot, in less time than it takes to tell it. The rapid was fortunately short, for our experience here was fully as rough as at the Bixler dam.

The Golden Rocks is a massive, imposing precipice, rising squarely from the water, a couple of hundred feet or so; its crest crowned with a frowsy mat of bushes and dwarfed evergreen trees. A great, coppery yellow stain, extending half way down its face from above—the lower edge of which follows the curious convolutions of the broken and twisted strata—gives it its name. A ravine, coming down from the mountains to the river just above, through which rushes and brawls a small creek, which throws itself headlong into the river, is spanned by one of those gigantic, spidery iron viaducts for which the Norfolk & Western road is famous along this Shenandoah Valley line. The massive cliff stands squarely across the river, at the foot of the short, steep rapid before mentioned, and turns the stream abruptly at a right angle to the left; and, to-day, the rush of vast, spouting waves piled high up against the face of the cliff, breaking against the solid wall in brick-red clouds of spray.

As we emerged, dripping, from the rapid, we found ourselves in a huge whirlpool, which rushed round and round, in a dizzying swing, in the inner angle of the bend, the complete circuit of which we were compelled to make before we could succeed, by desperately hard work with our puny paddles, in escaping from the imminent danger of being drawn back into the awful tail of the rapid, and hurled against the face of the cliff, and could get our boats out into the steady, downward flow of the river again.

"Do you notice," said Lacy, as he balanced his paddle across his lap, a couple of hours below the Golden Rocks—"Do you notice that, although the river is higher to-day than it was yesterday, it doesn't seem to run as fast? Our progress is most perceptibly slower than it was yesterday."

"Yes," I replied; "a falling stream runs slower than a rising one."

"I notice another curious point, also," said George, as he brought his canoe alongside, and we drifted swiftly along in midstream, gunwale to gunwale. "It is this: we've been coming steadily along on top of this rise, keeping right along with the water, which certainly has not run ahead of us; yet all day yesterday the river rose steadily under us, getting higher and higher all the time, while to-day, with the same rate of progress, the water is falling as steadily out from under us. Now there's the Hazard mill-dam, which we shot just around the bend there, above: it is not much higher than a good-sized fish-dam, and is built in the same loose, irregular manner; yet, to-day, there was quite a fall over it, while yesterday, or early this morning, not a ripple would have marked it. The water has fallen several feet under us since we left our Cedar Point camp, yet we have been going steadily right along with it. Now how do you account for it?"

"I don't account for it," I replied. "I have been noticing it myself yesterday and to-day, and have often noticed it before, although on not so remarkable a scale. The river seems to swell and rise as the flood comes down, and, instead of our going steadily ahead with the water, in the advance of the flood, as we seem to do, it undoubtedly swells and rises under us, and lifts us up. The same thing is noticeable exactly, on a falling stream, only reversed; the river settles and sinks under us as we run with the water."

"It is very curious," mused Lacy, "but none the less true."

We landed at Milford for a drink of water, paddling our canoes directly over our old '88 camp ground, and over the cornfield, nearly to the foot of the great 200 ft. iron viaduct spanning Overall's creek, but found our spring 10 ft. under water. We followed the lead of a frowsy little ten-year-old girl, whose only garment seemed to be a ragged and dirty calico gown, and who staggered along under the burden of a limp, heavy baby, half as big as herself, for 200 or 300 yds, when we came to a fine, large spring in the bank of the creek, around which was planted a colony of wash tubs, at each of which, working vigorously away, rubbing up and down over the terraced washboards, stood a slatternly, sun-bonneted woman, as ragged, frowsy and unkempt as the child.

"The refining presence of woman, lovely woman, makes itself felt, even in such out-of-the-way places," remarked Lacy, as we turned our backs on the domestic scene, and returned, past the mean-looking houses of the little hamlet, to our canoes, which we found left an entire length inland by the receding waters, in a flat bed of sticky, slimy ooze, and which were only launched and boarded again by means of convenient fence rails, borrowed for the purpose, and thrown out over the mud alongside, to serve as gangplanks.

A furious, heavy, splashing rapid, in the narrow defile around the bend below, was easily skirted close to the right bank, and we bowled merrily along for the next ten miles, until we reached old man Foster's dilapidated little place, where we landed, in a diminutive cove at the mouth of a small run; and, taking the mess chest and our camp stools with us, we followed the run to its source, in a fine spring, 100 yds. up the ravine from the river, for our noonday lunch, smoke and rest.

Returning, an hour later, we found the cove quite inland, and the canoes stranded high and dry in the mud and ooze, some little distance from the river. This time there was no help for it, and we had to wade in, up to our ankles, in the slimy mud, and lift, carry and slide the canoes out into the river again; after which the cruise was resumed, with feet dangling over the sides into the water, to free them from the obnoxious, sticky compound.

The vast expanse of McCoy's Falls was like a lake, through which the current dallied with perceptibly slackened speed, and here and there in its extent, the huge reefs made their presence known by kicking up considerable rough water. The old stone dam and short, steep rapid below, however, were literally out of sight; their location only indicated by a huge, crestless drop in the

surface, many feet in extent, down which we swung smoothly.

"I notice that the river is getting down, now, so that the reefs and falls are beginning to show," said Lacy, an hour later, after we had run half a mile of quite rough water, our spray-splashed decks indicating how we had been liberally sprinkled with the wave crests.

"Yes," said George. "To my mind the most disagreeable stage of the Shenandoah is when it is about 2 or 3 ft. above low water mark. Then the rapids and falls are disagreeably rough. The water will be down to that point by morning, and we will be well out of it by remaining at Riverton for a couple of days, until the river runs down to a moderate low water stage."

"That's my opinion," I replied. "A foot above low water is a very nice cruising stage, and by two or three days it will get down to that. I don't want any more '86 experience in mine, Lacy," I continued, addressing my remarks to Lacy, who was not in that cruise. "We ran the entire river on just such a stage as George describes—some 2 or 3 ft. above low water—and it was a very rough, disagreeable cruise."

"I should say so!" added George.

"I move, then, that we lie by at Riverton until the river runs down," said Lacy.

"That is exactly the intention," I answered.

We landed a quarter of a mile above the Blakemore dam, and, on walking down to inspect it, found it simply horrible—the water having fallen just enough to make the pitch one of the wildest and roughest. We, however, found a little tongue of water putting out into the wild turmoil of waves below, close up under the left bank, and but 2 yds. in breadth, down which we shot, and which while incomparably smoother than the dam, buried us deeply in the foaming wave-spouts below.

Around the bend, below the dam, the towers and pinnacles of the Randolph-Macon Academy at Front Royal loomed up imposingly from the river, and several carriage loads of ladies and children, driving along the shady road by the river bank, who stopped from time to time, to gaze curiously at our little flag-bedecked flotilla as we shot easily along, keeping pace with them as their horses trotted along the road, were indications that the big summer hotel at that place was well peopled.

In a short time, around a bend or two below, the large, white mill at Riverton loomed up into view, alongside of which the big, iron road bridge and the two railroad bridges appeared to close the river vista in an inextricable, spidery maze of wooden trusses and arched iron spans; and in a few minutes more we paddled by the massive iron, boiler-like piers of the road bridge, which stretched its narrow length overhead like a huge ribbon—skirting close in to the left bank, for we were perilously near to the big 9 ft. dam, just below, whose booming was like deep-toned thunder—and effected a landing among the bunch of skiffs and rowboats moored at the bank—most of them with bows high up on the slimy, muddy bank and sterns submerged in the brick-red water.

We moored our canoes to these boats, and scrambled up their steeply sloping floors to the bank above, where we were warmly greeted by our friend, Dr. Blackwell, who, happening to drop down to view the condition of the river—for the Doctor is an enthusiastic riverman—chanced to be on hand just in time to greet us as we landed.

It was 5 o'clock when we drew our canoes up the bank and located them for the night, in position on our old camp ground, where they had often lain before—strung out in a row on the little grass plot between the road and the river, under the shade of the great sycamores—and put up our camp and began our supper preparations. We had had an easy day's run, and were not fatigued, but were fully as hungry as usual; and when, about 6 o'clock, we sat down to a good, hot supper of fried bacon, cheese omelette and hot coffee, it need hardly be said that it was eaten with that keen relish only imparted by a free, open, out-of-door life, like ours.

Riverton, as well as Front Royal, is quite a summer resort; and there are always visitors here from abroad, to whom our camps have always proved interesting, and this one was no exception. Quite a party of ladies and children were on the ground almost as soon as we were, and the process of making up our camp was quite interesting to them. Every one is more or less familiar with the appearance of an ordinary camp, with its well-known wall tents, but a well-constructed canoe camp is something unique and pretty.

As we were to be here for two or three days the dining fly—which is not usually put up at a one-night stand, unless the weather is threatening—was erected over the mess table, at one end of the camp, and the camp stove and kitchen paraphernalia were located close at hand.

From our mail, received here, we learned how general and destructive the great storm had been, as we had also learned, on our way down, how severe it had been all along the river, and how sudden and heavy the flood in the river had been. Dr. Blackwell spent the evening with us, round our little blaze of a campfire, and, to our surprise, he informed us that he had built two canoes without designs, patterns, models or other assistance than the points received last year from inspecting our canoes while we were in camp here, together with what we had told him regarding their construction.

[TO BE CONTINUED.]

Canoe Sailing Race on Mystic Lake.

A RACE was held on Oct. 5 for the Winchester Boat Club's sailing challenge trophy. The following boats were entered: Bug, Paul Butler; Bee, H. D. Murphy; Wasp, F. F. Dorsey, in the second class; and Myra, C. Patch; Drift, F. Abbot; Widgeon, Wm. McLean; Fly, L. S. Drake; V., Wm. Hyde; October, M. P. Ford; Uncle Sam, C. Bell, in the novice class.

The wind was very light and fluky. The novices having 13 m. time allowance, were started at 3:30, and seniors at 3:43.

In the heat to the first mark the seniors overhauled the novices, and at the finish of the first round the fleet was well spread out over the 1¼-mile triangle. Toward the close of the race the wind flattened down and a drifting match was finished in the following order: Bee, Bug, Uncle Sam and Drift.

The racing between Bee and Bug on the first two rounds was very close, and they were both closely followed by Uncle Sam, H. D. Murphy's canoe, built for English racing, but outside the A. C. A. limits.

Races will be held on Saturdays, weather permitting, until Dec. 1, inclusive.

The official times were as follows:

	Start.	1st Round.	2d Round.	3d Round.	Finish.
Bug, P. Butler.....	3 43 42	4 06 02	4 30 42	5 00 22	5 35 55
Bee, H. Murphy.....	3 43 40	4 06 03	4 30 42	4 58 51	5 30 21
Wasp, F. Dorsey.....	3 43 15	4 06 10	4 35 11	5 08 52
Uncle Sam, C. Bell.....	3 32 15	4 06 01	4 33 10	5 05 09	5 41 31
Myra, C. Patch.....	3 31 02	4 08 00	4 40 55	5 13 29
V., W. Hyde.....	3 30 01	4 07 25	4 41 22
Widgeon, W. Mc- Lean	3 30 08	4 06 50	4 35 10	5 08 34
Drift, F. Abbot.....	3 31 04	4 07 10	4 34 55	5 06 22	5 42 10
Fly, L. S. Drake.....	Did not start.
October, M. Ford.....	3 30 04	4 08 15	4 49 06	5 30 55

HERMANN DUDLEY MURPHY.

Communications.

Editor Forest and Stream:

As the Executive Committee meeting of the A. C. A. approaches, the time for attempting to solve the problem of the sailing canoe ripens. There have been many wishes expressed in the past few years for a more stable craft, which would require a less acrobatic performance of its skipper, and permit of cruising under sail with more comfort than in our 16 x 30 ft. sliding-seat canoe.

It is only natural that all who are fond of the latter type should wish to retain it, and I should very strongly oppose any attempt to do away with it, but I realize that there is coming a time when I can no longer jump back and forth from my canoe to the end of a 5 ft. slide, though I hope it is many years off. I am sure that even when that time does come, I shall want to sail some small, fast boat, and, if possible, still race at the A. C. A. meets. This past summer in England I was introduced to the Royal C. C. cruises, and I felt that therein lies the solution of our troubles. It is a healthy type of boat, so well defined by their rule that it is impossible to build a racing machine under the specifications, and of speed just about equal under average conditions with our 16 x 30 ft. canoes. The two classes, cruiser and racer, sail together in the same races, and it is impossible to say which is the speedier. The cruiser is sailed without a slide; carries generally a centerboard weighing about 100 lbs., and about 140 ft. of sail in a sloop rig. The R. C. C. rating rule—waterline length multiplied by sail area, divided by 6,000—not to exceed .03, gives an opportunity for development of design and experiment, and the stable, roomy hull, a sense of security and comfort not experienced in a 16 x 30 racer. Moreover, these cruisers will carry two, and several times at the R. C. C. meet at Langston Harbor trips were made across to Ryde or Bournemouth on the Isle of Wight with ladies. I believe only one of these cruisers capsized during the two weeks, and that carried an extremely light centerboard. I have been so convinced that the adoption of this class here in America would keep many men in the A. C. A. who now drift into half-racers and larger boats that I shall offer the following amendment at the executive committee meeting:

To amend the racing regulations by striking out the present clause in Rule I., under the title "Cruising Class," and substituting the following: A cruising canoe shall be sharp at each end, with no transom or flat stern; any metal keel, centerplate or ballast shall be detachable from her. Dimensions—Maximum.—Length over all shall not exceed 17 ft.; beam not over 42 in. No seat shall be extended beyond the side of the canoe. Fixed draft, including keel, or drop keel when hauled up, shall not exceed 14 in. Extreme length of mast, added to boom, shall not exceed twice the waterline length; in respect of a mast such length of spar will be measured from the waterline to extreme top of mast. Dimensions—Minimum.—The depth inside from deck to skin (to be taken at any distance within 3 ft. from mid over all length and at not less than 10 in. out from middle line) shall not be less than 12 in. Depth outside from top of deck at middle line to under side of keel (taken anywhere up to 2 ft. from either end of canoe) shall not be less than 12 in.

Construction.—There shall be a sleeping compartment between two fixed complete transverse bulkheads of wood, which are to be not less than 5 ft. 6 in. nor more than 8 ft. apart, and not more than 5 ft. from mid over all length, and of such compartment a length of 3 ft. on the flooring shall be clear of centerplate case, and shall extend from side to side of the canoe. To such position of the compartment there shall be a direct hatchway above it of not less than 16 in. in width extending 3 ft. in depth, and any bucket well or covering of any kind fitted in or over such hatchway or any part of such hatchway shall be detachable from the canoe. To each compartment, forward or aft, of the above-mentioned bulkheads, there shall be a door or hatchway of not less than 8 sq. in. opening.

Scantling.—The substance of the skin or planking shall not be less than ¼ in., and of the deck shall not be less than 3-16 in. in its finished state; and the substance of the bulkheads shall not be less than ¾ in. in its finished state.

Rudder.—When an under-body rudder is fitted, it shall be liftable through the body of the canoe until it is above the lower edge of the keel, at such place, and also removable from the canoe.

Rating.—The rating of the canoe—length of L.W.L. multiplied by sail area, divided by 6,000—shall not exceed .03.

Sails.—The certificate of rating shall be given in respect of one type of rig or suit of sails only; and under such certified sails or sail only shall a canoe be qualified to compete, except that a smaller suit may be used. Only one certificate of rating shall be granted to be held at a time by any canoe.

All sailing races of the A. C. A. shall be open to both classes of canoe.

In the prospect that several members of the Royal C. C. may come to our meet next year and bring over some of these cruisers, I hope that the class may be adopted.

Mr. F. C. Kendall-Howard, who was one of the challengers for the R. C. C. sailing challenge cup this year, is coming to America next year to race, and has ordered a 16 by 30 racing canoe, designed by Mr. Linton Hope, who designed the China, which made such a wonderful showing this year. Mr. Howard is a fine sailor, and as he intends to sail at the meet and also challenge for the N. Y. C. C. international cup, his advent will be of all racing canoeists.

HERMANN DUDLEY MURPHY.

Editor Forest and Stream:

Having been appointed to draw up rules to govern the use of the A. C. A. Island in the St. Lawrence, I beg to present to you the following suggested rules. You will kindly peruse the same, make any additions and alterations you consider necessary and return the same to me at an early date, that the report may be presented to the Board of Governors at their next meeting, to be held in Boston, Oct. 28, 1901.

J. H. MCKENDRICK, A. C. A. 633.

A.—The island shall be officially known as 1, Yekawetha, pronounced Ya-kaw-wa-tha—Mohawk for the "Paddling Place." 2, Mecaw Island—Northern, Eastern, Central, Atlantic and Western. 3, Sugar Island—its present name.

B.—No member shall be permitted to erect any building on the island.

C.—No member shall be permitted to cut any trees on the island.

D.—Members shall be permitted to use the island for camping purposes at all times on registering with the overseer, who shall forthwith notify the purser to whom the member belongs. Register—Name, A. C. A., number, home address, club, date of arrival, date of leaving.

E.—Members may invite friends to camp with them. The names of visitors shall be registered, and if such visitors remain more than two nights on the island, the member introducing him shall pay a fee of \$1 each to the overseer. All such fees shall be expended in improving the island.

Editor Forest and Stream:

In accordance with Article 12 of the constitution of the American Canoe Association, I beg herewith to publish in general terms to be voted upon by the Executive Committee at as early a day as possible the following amendment to Article VI., Section 5, of the constitution:

After the word "appropriated," in the sixth line, insert "they shall hold, as trustees, all of the permanent property, both real and personal, of the Association, and shall make such rules and regulations for the care and government of the same as they shall from time to time deem necessary. They shall have full charge of such permanent property and are empowered to take such action as they shall deem expedient to care for and protect the same."

I will have the above amendment proposed at the next meeting of the executive committee, or as soon thereafter as possible.

ROBERT J. WILKIN.

Editor Forest and Stream:

At the executive committee meeting I intend to offer the following amendment to the last article of the racing regulations:

A canoe built under the A. C. A. rules prior to Oct. 1, 1900, shall be permitted to enter all races of any A. C. A. meet, unless alterations of cockpit or bulkheads are made, in which case such alterations must conform to the dimensions and limitations of Rule I.

H. D. MURPHY.

Yachting.

Our Boston Letter.

BOSTON, Oct. 14.—Since the records of the yachts of the 25 ft. restricted class of the Yacht Racing Association of Massachusetts were given in this column, a change has taken place which alters the positions of the two leaders—Calypso and Flirt. Last Thursday evening the judges of the Columbia Y. C.'s race of July 3 gave a new hearing on the protest of Chewink vs. Calypso, in which considerable new evidence was put in. The judges reversed their previous decision, and awarded the first place to Calypso.

This protest was decided last July, and was appealed to the Yacht Racing Association, which refused to act, as it was a question of fact, and referred it back to the club, and, upon the introduction of new evidence, the club gave a new hearing. The principal new evidence was from Marion and Early Dawn, neither of which was represented at the first meeting. This decision gave Calypso 72 12-19 per cent., and reduced Flirt's percentage to 67 17-19, making Calypso champion of the restricted 25 ft. class for the season of 1901.

There is no doubt that this decision will be pleasing to many New England yachtsmen, who have watched the performances of the boats during the racing season, and have felt that the championship should go to Calypso. Not only has she beaten Flirt more times than the keel boat has beaten her, in Association races, but she has beaten Flirt a majority of the races that have been sailed outside of Association rules. The question of the value to be attached to second place in a race still remains unsettled, however, and will undoubtedly come in for considerable attention during the winter.

It has been announced that the October meeting of the Yacht Racing Association of Massachusetts will be held next Thursday evening, at which several proposed amendments to the rules will come up for discussion. Among them will be the question of percentage, it being recommended in the circular announcing the meeting that the old table of percentages be used. It is by no means settled that the amendment will go through, for there are many who still insist that the general showing of a yacht should count more than the number of first prizes she wins, or, at least, as much.

In the 21ft. classes of the Association the percentages of the yachts for the season are as follows:

Class L—21ft. Open Yachts.						
	Starts.	1sts.	2ds.	3ds.	Fins. Bks.	Total.
Circe II.....	1	1	0	0	0	100
Bud.....	1	1	0	0	0	100
Cleopatra.....	2	0	2	0	0	130
Tacoma.....	2	1	0	1	0	135
Problem.....	1	0	0	0	1	15
Average.....						1.00

Class S—21ft. Cabin Yachts.						
	Starts.	1sts.	2ds.	3ds.	Fins. Bks.	Total.
Mildred II.....	14	8	4	1	1	1110
Tabasco III.....	8	2	4	0	2	490
Opitsah III.....	16	4	2	7	2	815
Privateer.....	13	3	2	1	6	655
Zaza.....	7	3	0	2	2	400
Eaglet.....	19	0	7	4	7	700
Harriet.....	4	1	2	0	1	245
Coquette.....	7	0	0	2	4	130
Ramblers.....	2	0	1	1	0	100
Freyja.....	6	0	0	1	4	95
Tarpon.....	2	0	0	0	2	30
Average.....						.79

On account of demands of yacht owners for a class of 21-footers which would be entirely unrestricted except as to waterline length, the Association provided Class L, but with the exception of those skimming dishes which were built to compete for the Quincy cup, there have been no new boats built for this class since 1897. On the other hand, there has always been a chance to get a race in the restricted class. The number of yachts in the class fell off for a few years, but with the assurance that one set of restrictions would be maintained, thus giving the yacht owners protection, there came a renewed interest, and several new boats were built last winter.

It is not often that there is a respectable showing of yachts in the unrestricted class of 21-footers, and it sometimes happens that the class fails to qualify in the necessary number of races to allow a championship. This is what happened this year. Tacoma and Cleopatra sailed two races each, and the other yachts which could qualify on waterline length sailed but one race each. Unless there should be a decided tendency toward revival this winter, it looks as though this class would go out of existence very soon.

Circe II., which shows 100 per cent. for one race, was built from designs of Crowninshield to compete for the Quincy cup in 1899. She is of the skimming-dish type, about 37ft. over all. She is owned by Mr. Fred L. Pigeon, of the Annisquam Y. C. Bud is well known to yachtsman as the champion of the class in 1898. She, too, is a skimming dish, and was designed by John and Sam Small. She is schooner rigged and carries the greater proportion of her sail in her mainsail. In fact, she is only a schooner in what the most technical definition of the word might imply. Her rig is simply to obtain a shorter waterline measurement while still carrying a great spread of sail. Tacoma was also designed by Small Bros., and is also a skimming dish. She is several years old, and was, at one time, the fastest boat in her class. Cleopatra was built for Melbourne MacDowell, and was famous for her races a few years ago in Duxbury Bay and also in the races of the Association. She is now owned by F. F. Crane, of the Quincy Y. C.

In the restricted class of 21-footers the racing has been good throughout the year, and interest has been kept up constantly on account of the uncertainty of what the next race would develop. Several new boats have been built for the class, and the lot are pretty evenly matched. Most of the boats that were built this season are keels, and it is interesting to note that Mildred II., which is a centerboard, gets the championship. This is even a better class than the knockabouts. It is much faster and there is considerable more to the boats. They carry a fair amount of sail, but the spread is by no means great.

Mildred II., champion of the class, is a fine type of the centerboard boat. She was designed and built by Shiverick, of Kingston, for S. P. Moses, of the Quincy Y. C. She is 34ft. over all, 9ft. 10in. beam and 2ft. 6in. draft. She greatly resembles Calypso, champion of the 25-footers.

Tabasco III. is one of the new keel boats. She was designed by Fred Lawley and built by the Lawley Corporation for Vice-Com. H. H. Wiggin, of the Annisquam Y. C. She is 36ft. over all, 8ft. 10in. beam and 5ft. 6in. draft. She did not come out until after the other boats had been well tuned up, but has shown promise of great speed. She is a good, all-around boat.

Opitsah III., which comes third on the list, is another new keel boat. She was designed by Crowninshield and built by Jansen, of Gloucester, for Mr. Sumner H. Foster, of the Corinthian Y. C. She is 35ft. 9in. over all, 8ft. 1in. beam and 5ft. 6in. draft. Her model has all the characteristics of the 90-footer Independence. She is very flat floored, with a minimum of dead rise, and her bilges turn very quickly. She is fast under all conditions, and in the early races showed up very well.

Privateer is a well-known boat, having been raced for several seasons. She is a shoal boat of the centerboard type, and was designed and built by Hanley. She is now owned by John MacConnel, Jr., of the Winthrop Y. C. She made a great showing against the newer boats, especially in the races of the South Shore.

Zaza is also a wide shoal boat of the centerboard type. She is about 35ft. over all, and looks more the skimming dish than any other boat in the class. She showed up well in the first races of the season, but was not raced often enough to make a strong bid for the championship.

Eaglet is a new boat, designed by Starling Burgess, and built by Lawley. She is a keel boat of moderate dimensions and shows more dead rise than the other keel boats in the class. She did not get tuned up early enough to make the showing that was expected of her, but when she did get started, she showed good speed. Unfortunately, her best records were made in races outside of the Association.

JOHN B. KILLEN.

SCHOONER CLARISSA—DESIGNED BY E. B. CROWNINSHIELD FOR WILLIAM F. MAYO, 1901.

The Cruising Schooner Clarissa.

THE popularity of the schooner rig for boats above 35ft. waterline length is plainly shown by the large number of boats of this type that are built every year. At the request of several of our correspondents for plans of schooners from 45 to 55ft. waterline length, we have secured from Mr. B. B. Crowninshield the complete plans of two boats which are rigged as schooners. One is 46ft. long on the waterline, and the other (the plans of which appear in this issue) is 54ft. long on the waterline. Both these boats are fine, healthy craft, with no extreme features and have made ideal cruisers.

A glance at the plans will show that the boat illustrated is devoid of abnormal features, which are too often seen in the so-called cruising yacht. The plentiful freeboard and well-balanced overhangs give the boat a powerful appearance, and the flush deck, which materially strengthens her, adds considerably to her good looks. The good beam and the deck, with the exception of the companionway and skylights, is free from obstructions and gives excellent opportunity to move around comfortably and handle the sails. The rig, while large, is not excessively so, and the boat is able to carry it without reefing through almost any weather that is experienced during the summer along our coast.

Although the cabin plan was laid out to meet special requirements, still the arrangement is excellent, and every bit of room is utilized. The companionway leads from the cockpit to a roomy steerage, which is a splendid idea, for here oilskins can be left when wet and no dampness be carried into the main cabin. In bad weather the companion slide could be left open and the charts could be spread out on the table on the port side of the steerage and referred to as occasion required. Underneath the chart table are drawers, where the charts can be kept flat. A Pullman folding berth over the chart table gives a spare bunk. In front of the chart drawers is a wide transom, and in the after end of the steerage are two large hanging lockers. On the starboard side of the companionway is a large stateroom. This room is lighted by a skylight. Under the wide berth are drawers. A transom runs along in front of the berth, and in the after end of the stateroom are two good-sized lockers. This room is also furnished with a bureau and a stationary wash basin.

The main cabin is 13ft. long, and runs the full width of the boat. There are two berths on each side, with transoms in front. The mainmast, although it runs through this cabin, is of no particular objection, as it is so near the forward end that it is not in the way. A large skylight gives ample light and ventilation. There is a sideboard on the port side of the main cabin. Forward on the starboard side is the owner's stateroom, a large room for a boat of this size. This stateroom is furnished very much the same as the after stateroom, with bureau, clothes locker and set wash basin. Opposite this room on the port side is a bath room, completely fitted with porcelain bath tub, set wash basin and closet. The passageway which leads to the galley and the owner's room is lighted by a skylight. The galley is of good size, and is properly lighted and ventilated, conditions which are invariably overlooked on boats of moderate size. There is a large ice chest in the forward end of the galley on the port side; aft of this are dish racks, etc., and the space for the stove. A wooden sink is placed on the starboard side against the partition, which divides the captain's stateroom from the galley. The captain's stateroom has a full-length berth, hanging locker, etc. Forward of the galley and the captain's room is the forecabin, which is large and comfortable and gives good accommodation for the crew. In the after end of the forecabin on the port side is a water closet for the crew.

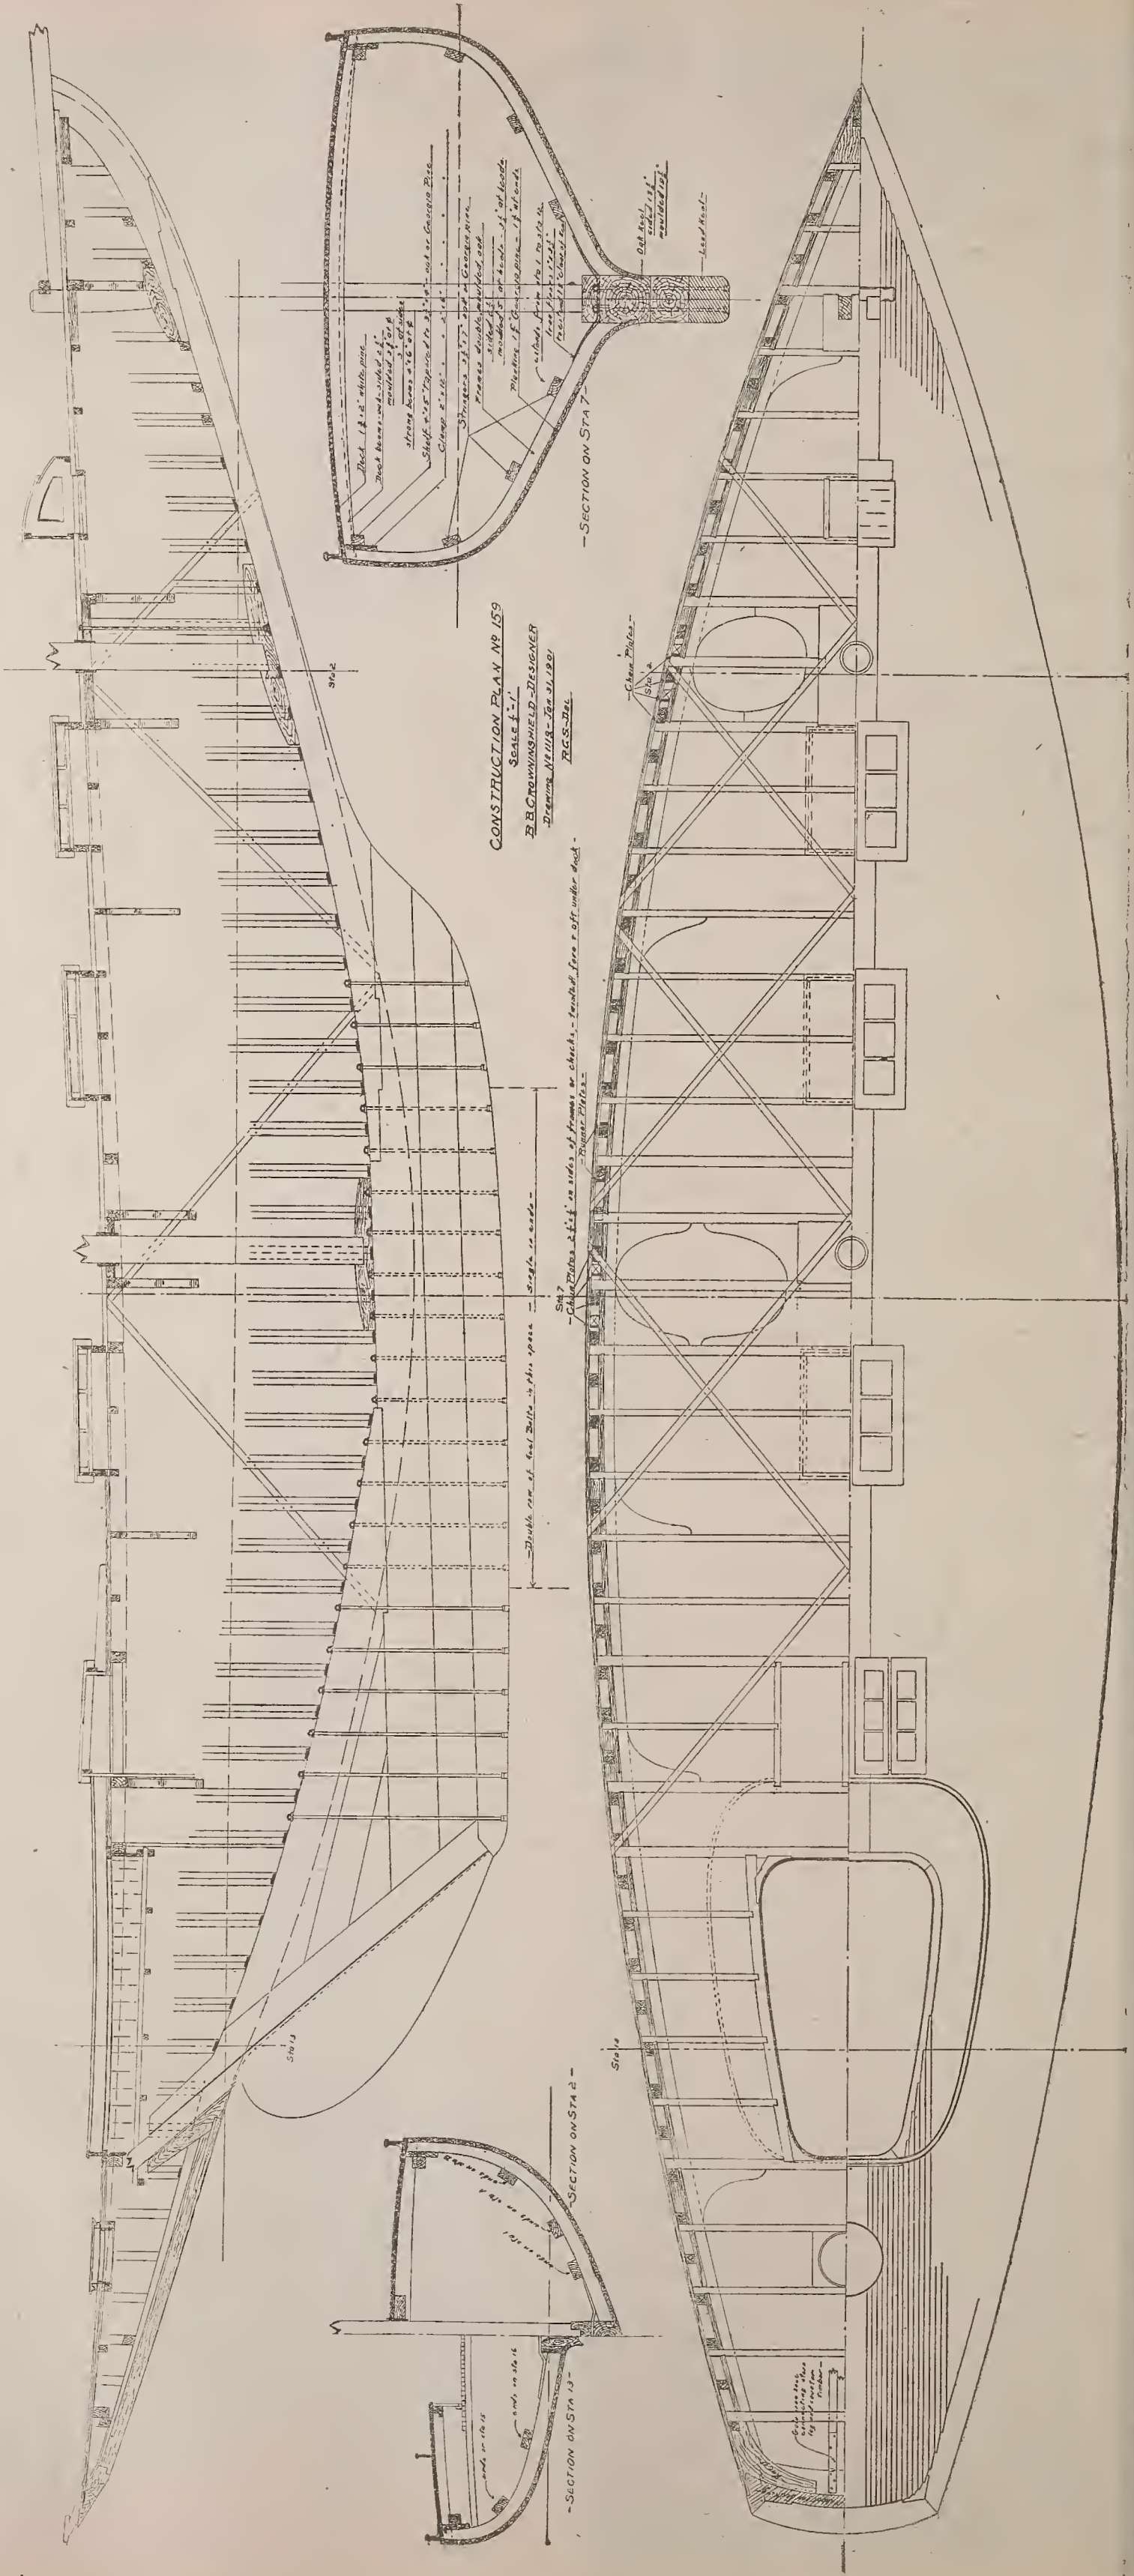

Clarissa was designed for Mr. William F. Mayo, of Boston, and was built by Rice Brothers, of East Boothbay, Me. The boat is splendidly built, and with reasonable care will last for an indefinite period.

Her principal dimensions are as follows:

Length over all.....	78ft. 5 1/4 in.
Waterline	54ft.
Overhang, forward.....	11ft.
Aft	13ft. 5 1/4 in.
Freeboard, stem.....	6ft.
Taff rail	4ft. 3 in.
Least	3ft. 4 in.
Draft, extreme	9ft.
To rabbet	6ft.
Area L.W.L. plane.....	684.4 sq. ft.
Amidship section	59.7 sq. ft.
Displacement	111,270 lbs.
Ballast, outside	24,157 lbs.
Beam, L.W.L.	16ft. 11 1/2 in.
Extreme	17ft. 2 1/2 in.
C.G. outside ballast aft of C.B.	1ft. 5 in.
Pounds per inch at L.W.L.	3,650
Area lateral plane of hull.....	326.6 sq. ft.
Rudder	22.8 sq. ft.
Total lateral plane.....	349.4 sq. ft.
Total wetted surface.....	1,401 sq. ft.
Area sails (four lower).....	2,887 sq. ft.
Ratio displacement cu. ft. to L.W.L.011
Sail area to wetted surface.....	2.07
Length to beam at L.W.L.	3.18
Overhangs to L.W.L.453
Rudder to balance lateral plane....	.07
(Stem to C.B.) to L.W.L.52
(Stem to C.L.R. hull) to L.W.L.56
(C.E. to C.L.R. hull) to L.W.L.041
Displacement (cu. ft.) to L.W.L.539
(C.E. + B.P.) to L.W.L.02

The plans and description of the 46ft. schooner will appear in a later issue.

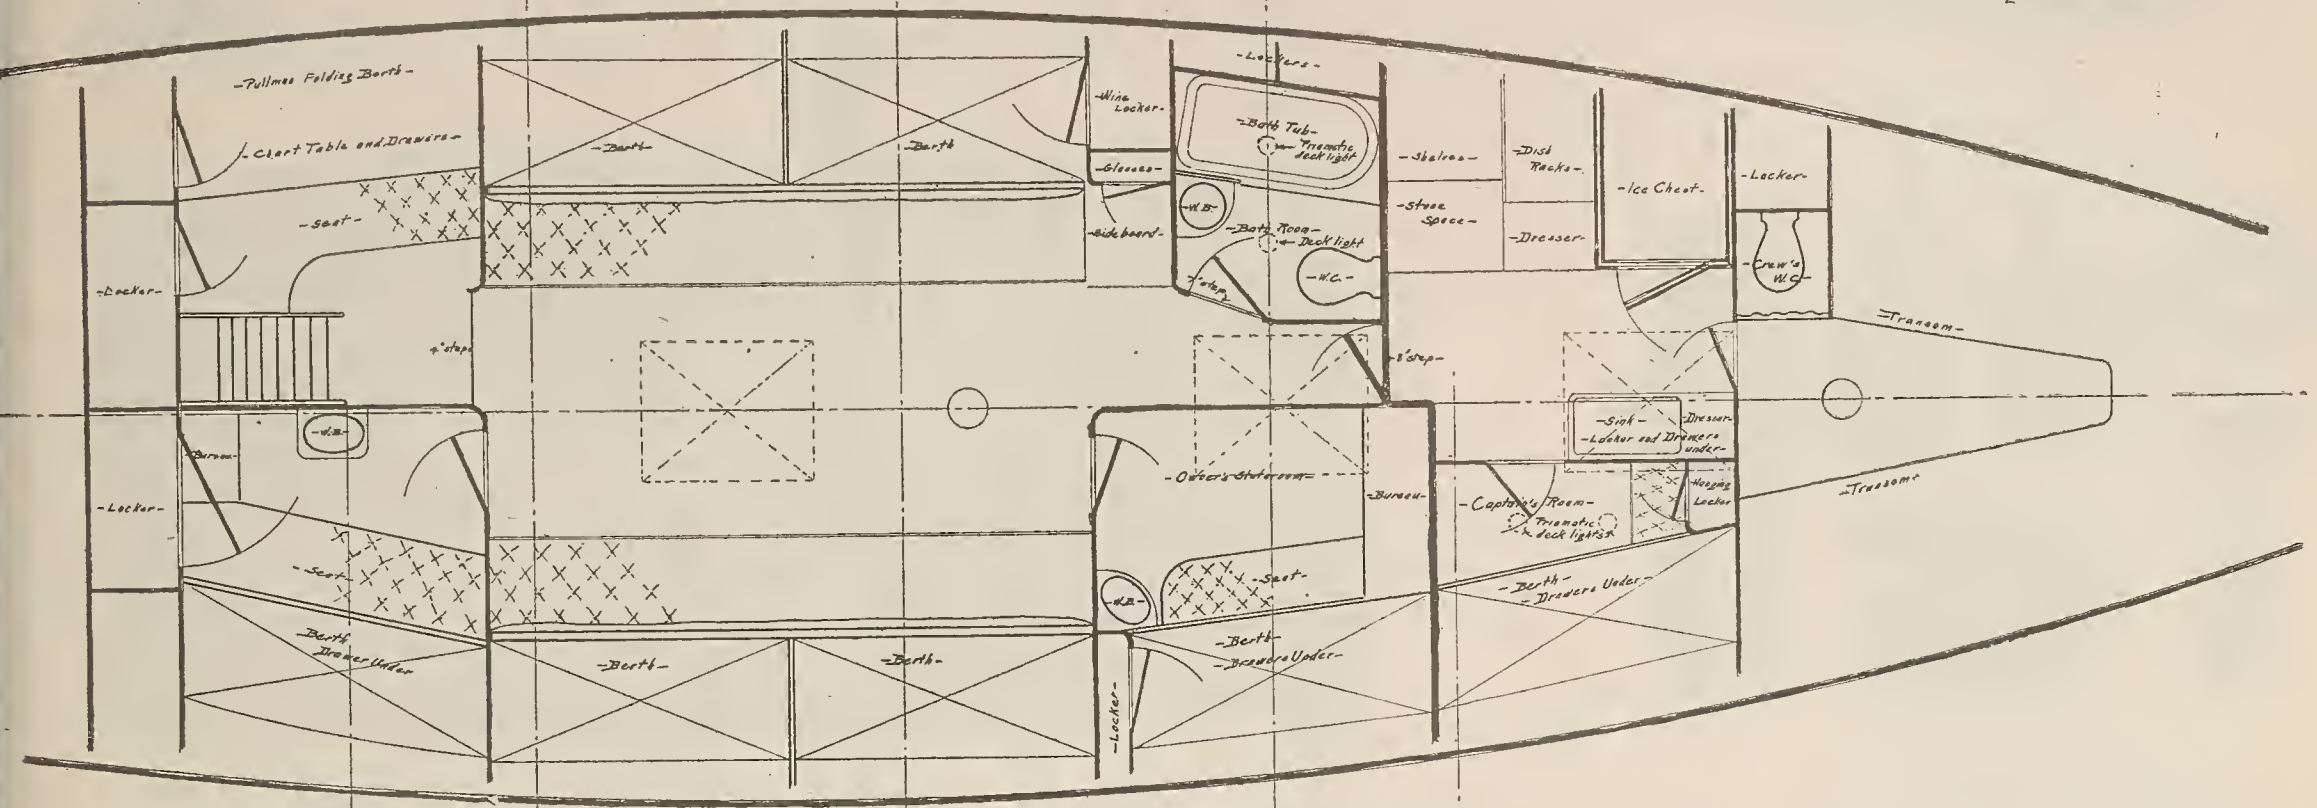

John Curtin, one of the most famous sailmakers in this country, was buried in Hoboken, N. J., on Oct. 1. Fifty years ago Mr. Curtin purchased the famous sloop Maria from Com. John Stevens, and when she did not prove as fast as the schooner America she was used in the fruit trade, running between New York and Cuban ports. On one of her trips she was lost at sea, and nothing was again seen of the boat or her crew.

Chicago Y. C. May Build.

CHICAGO, Ill., Oct. 11.—The long-standing injunction which has prevented the Chicago Y. C. from completing its club house in the outer harbor at the foot of the lake front, was dissolved yesterday by the Appellate Court, which reverses the order issued last summer, under which order the completion of the building was restrained. The original suit was filed by Clarence W. Marks, a property owner on Michigan avenue, who claimed that his rights were affected by the erection of the club house. It may be borne in mind that Mr. A. Montgomery Ward has become locally famous for filing suits of a somewhat similar nature. The Appellate Court held that the decision of the Supreme Court in the A. Montgomery Ward case does not apply in the injunction restraining the Chicago Y. C., as the building of the latter is not erected on the Lake Front Park, but in the outer harbor, and outside of the Government breakwater. Judge Sears in his opinion stated, "No authority is cited which holds that the riparian right owner can protect his view over the water, unless it may be in cases where he is owner of the soil under the water to the center thread of a stream. Such cases do not apply to an owner of riparian rights on Lake Michigan."

Attorney Hacker, who represented the Chicago Y. C. in the Circuit Court, states that he is entirely satisfied with the decision, and adds that the Chicago Y. C. will at once proceed with the erection of its building. It is understood that the club has now secured sufficient funds to practically assure the completion of the club house in accordance with the original plans, and it is to be hoped that a beautiful structure will be added to the fixtures of the royal sport. E. H.

Sporty Yacht Racing at Green Lake, Wis.

"OUR Inland Lake Association isn't much heard of in the East," said a Westerner who came to New York to see the yacht races, "but it has the true sportsman spirit that any part of the country might well be proud of. Why, those fellows—all amateur yachtsmen—will sacrifice anything to win a race. At Green Lake, Wis., where the Association held its annual regatta a week or so ago, the sloop Nokomis, the champion of White Bear Lake, Minn., captured all prizes in her class. And how do you suppose she did it? Her crew, in sailing rig, weighed 504lbs.—500 being the racing maximum for the class. The winds were cold and raw, but rather than risk the chance of losing on a technicality, the crew reduced the surplus weight by stripping off clothes. In that biting air one sailed in his bathing suit, the others, including the captain, were clad

in gauze undervests and white duck trousers. All of them were barefoot. They every one came home with frightful colds, but I think they'd have been that much more ill had they not had the consolation of two beautiful silver cups and the glory of their boat being an all-round winner."

Yacht Club Notes.

At the annual meeting of the Huntington Y. C. the following officers were elected: Com., H. H. Gordon, of Brooklyn; Vice-Com., George Taylor, of Manhattan; Rear Com., Robert L. Cooke, of Brooklyn; Sec'y, Daniel Slot Wood, of Huntington; Treas., John A. Eckert, of Brooklyn; Trustees for three years, George R. Rogers, of Huntington, and August Hecksher, of Manhattan.

The annual meeting of the Yacht Racing Union of the Great Lakes was held on Saturday, Oct. 12, at the club house of the Cleveland Y. C., those present being Com. E. W. Radder, of Cleveland, Chairman; John R. Rathbone, of Detroit, Sec'y-Treas.; Com. Æmilijus Jarvis, of Toronto, J. Frank Monck, of Hamilton, Ont.; C. B. Howes, of Buffalo; E. P. Warner, of Chicago Y. C., and E. T. Balcom, Columbia Y. C., Chicago.

The most important business transacted was the instruction to the Construction Committee to frame a new

CLARISSA—SAIL PLAN.

set of rules governing the classes of yachts. It is the opinion of the delegates that the yachts should have greater living space aboard, and should not be mere racing machines. The committee will report at a special meeting, to be held at Buffalo probably next month.

The Union also took up the case of Arthur Pettie and James Gore, Detroit yachtsmen, who were said to be professionals, sustaining the protests against both. Pettie was one of the crew of the Cadillac in her races against the Canada. Action was taken, however, whereby Pettie may be reinstated within a year.

Officers were elected for the ensuing year as follows: J. Frank Monck, Hamilton, Chairman; John R. Rathbone, Detroit, re-elected Sec'y and Treas. The next annual meeting will be held at Hamilton.

At the annual meeting of the Keystone Y. C. the following officers were elected: Com., John A. Wells; Vice-Com., Frederick K. Walsh; Rec. Sec'y, Dr. E. C. Smith; Fin. Sec'y, Gilbert Baldwin; Treas., J. Robert Laws, Jr.; Meas., Charles A. Schiffmacher. For the Board of Governors for two years the following were elected: John A. Wells, J. Robert Laws, Jr., Gilbert Baldwin and Justice William H. E. Jay.

The Shinnecock Bay Y. C. has filed a certificate with the Secretary of State, at Albany, setting forth that it has been granted leave by the courts to change its corporate name to the Shinnecock Y. C.

At the annual meeting of the Sag Harbor Y. C. resolutions and racing rules of the Yacht Racing Association of Long Island Sound were adopted, and the club will apply for membership in that body. The following officers were chosen: Com., James Herman Aldrich, of New York; Vice-Com., Addison F. Young, Sag Harbor; Sec'y, John H. Hunt, Sag Harbor; Treas., Julien A. Udell, Sag Harbor; Regatta Committee, George Kiernan, J. H. Aldrich, Herbert L. La Mont and J. A. Udall.

YACHTING NEWS NOTES.

Mr. Frank Jay Gould, N. Y. Y. C., has commissioned the Gas Engine and Power Co., and Seabury & Co., of Morris Heights, N. Y., to design and build for him a modern, steel steam yacht. The yacht will be 190ft. over all, 22ft. beam, and will draw 10ft. There will be two deck houses—one forward and one aft. In the forward house there are a smoking and dining room, captain's stateroom, and the steward's pantry. The after house will be used as a music room, and a piano and an organ will be placed in this apartment. A staircase leads from the music room below, where the owner's quarters are lo-

cated, which consist of two large, connecting staterooms, handsomely furnished with brass bedsteads and the usual bureaus and clothes presses. Toilet rooms adjoin both these staterooms. Aft of the owner's rooms leads a passage, with the guest rooms opening from it. Each stateroom has a connecting bath. All the cabinet work and other fittings in the cabins will be plain and simple. Special attention has been given to the lighting and ventilating of the rooms below decks, so that any odor arising from the bilge or machinery will not be noticed. Electric fans are placed in all the staterooms.

The officers' staterooms and the crew's quarters are forward, and aft of these is the gallery, which is connected with the pantry in the deck house by a dumb waiter. The boiler and engine space is aft of the galley. The coal bunkers have a capacity of 100 tons. Ten thousand gallons of water can be carried in the tanks.

The machinery consists of a Seabury triple expansion engine and two Seabury water tube boilers, which will drive the yacht at a speed of about 17 or 18 miles. The yacht will be heated by steam and lighted throughout by electricity. A 26ft. mahogany launch, a 21ft. launch, a 20ft. gig and a 20ft. cutter will be carried on davits. She will be ready for delivery about April 15, 1902.

The Townsend & Downey Shipbuilding and Repairing Co., of Shooter's Island, S. I., have a large amount of yacht work on hand. On Oct. 3 the keel of the new schooner that they are building for the Emperor of Germany, from designs made by Messrs. A. Cary Smith & Barbey, was laid. Mr. Alessandro Fabbri is having built at this yard an auxiliary schooner. She will be 77ft. on the waterline, and was designed by Messrs. A. Cary Smith & Barbey. Mr. Theodore E. Ferris, the well-known designer, who has been associated with the Townsend & Downey Co. for some time past, has designed a cruising schooner that will be 110ft. on the waterline, for Mr. Gibson Fahnestock. This vessel will also be built by the Townsend & Downey Co.

Word has been received from abroad that King Edward has purchased the cutter Britannia (formerly owned by him) from Sir Richard Bulkeley, her present owner.

The outlook for good yacht racing at Bar Harbor next season is excellent. A number of knockabouts will be built this winter, and will be added to the already large class of these boats. The interest during the past season has not been quite as keen as heretofore, and, although good racing has been had, both at the Bar Harbor Y. C. and the Mt. Desert Y. R. A., still, there was hardly as much life in the contests as there was the year

previous. Under the new condition Bar Harbor will find itself with a large knockabout fleet, and the races will have a dozen or more entries. W. L. Greene, Edgar Scott, A. Y. Stewart, Harry Thorndike, and J. M. Sears, Jr., will make over their knockabouts to conform to the rules of the 30ft. class, while new knockabouts for this class will probably be built by the following gentlemen: W. G. Ladd, C. B. Newbold, V. Everett Macy, H. H. Sands, E. G. Fabbri, J. C. Mercer Biddle, F. R. E. Pinchot, W. B. Trevor, W. C. Allison and General Morrell. It was voted that the next season the races shall be begun July 12, and continue twice a week to and including Sept. 13.

Mr. Fred S. Nock, of West Mystic, Conn., has finished the plans of a 30ft. launch for Mr. D. N. Perry, of Wyandotte, Mich.; a 21ft. waterline knockabout for a New Haven yachtsman, whose name is withheld, and a knockabout 35ft. over all, 2ft. on the waterline, 8ft. beam, and 5ft. draft, that will carry 540 sq. ft. of sail, for Mr. Arthur L. Douglas, of Brooklyn, N. Y. Mr. Nock has recently sold the raceabout Baby-Roger for Mr. Frederic A. Chase, of Providence, R. I., to Mr. Geo. Boehm, of Brooklyn, N. Y., and the raceabout Mystic for Mr. Fred E. Field, of Providence, R. I., to Mr. Sanford L. Hotchkiss, of New Haven, Conn.

The schooner yacht Fleur-de-Lis, Dr. Lewis A. Stimson, N. Y. Y. C., arrived at New York on Oct. 6, twenty-eight days out from Gibraltar. The owner and his two daughters were on board, and they have been cruising in the Mediterranean for the past six months.

The schooner yacht Intrepid has been purchased by Mr. Edward Bell, N. Y. Y. C.

The W. & A. Fletcher Co., of Hoboken, N. J., is building a twin screw, steel, steam yacht for Messrs. W. S. and J. T. Spaulding, of Boston, from designs made by Mr. J. Beaver Webb. The yacht will be 162ft. on the waterline, 20ft. over all, and 24ft. 6in. beam. She will be fitted with triple-expansion engines, of 1,200 horse power, and Yarrow water tube boilers. Fifteen knots speed is guaranteed. The yacht will be ready to turn over to the owners about May 1, 1902.

Mr. A. L. Barber, N. Y. Y. C., is having built by Messrs. Ramage & Ferguson, of Leith, a large, ocean-going, steel steam yacht. She will have an over-all length of 300ft. It was originally intended to furnish the yacht with two sets of triple-expansion engines, but work

SWING CANDLE-LAMP. See Chapter XIV.

VARIOUS BLOCKS. See Chapter XIII.

has been stopped to allow of arrangements being made to supply the yacht with Parsons' turbine engines instead. If this idea is carried out, the yacht will be the only one of the kind afloat.

The auxiliary ketch Cero that was damaged by fire and sunk in Greenport Harbor, L. I., has been raised and will be repaired. The accident happened on the afternoon of Oct. 11, when the tanks containing the oil for the engine caught fire and an explosion followed. Two of the crew were blown into the water, and the other two jumped to avoid being burnt. The boat was flooded and allowed to sink to prevent her from being entirely destroyed.

Messrs. Huntington & Seaman have made the following sales through their agency: Schooner yacht Priscilla, Robert J. W. Koons, to F. R. Hoisington, both of Philadelphia, Pa. Knockabout Ruby, Geo. E. Edwards, of this city, to Chas. Longstreth, of Philadelphia, Pa. Alco-vapor launch Medea, Chas. A. Van Iderstine, of Long Island City, to Mr. Thomas Lindsey, of New Rochelle, N. Y.

Small Yacht Construction and Rigging.

BY LINTON HOPE.

Specification—No. 2 Design.

Four Tons T. M. Fast Cruiser of 24 Linear Rating.

ALL materials used to be of best quality, and all timber to be sound, free from sap, and well seasoned.

Dimensions.

L.O.A.	21.50	Draft	3.70
L.W.L.	22.50	Sail area	615.00
L.B.P. for tonnage	26.00	Displacement, tons	2.85
Beam, extreme	6.00	Weight of lead keel, tons	1.25

Scantlings, Etc.

Keel.—Moulded 3in. amidships, and as shown at scarp; sided 8½in. amidships.
 Stem.—Moulded 2½in. at head; sided 2¼in. at head.
 Sternpost.—Moulded at heel 6½in., and at deck 2¼in.; sided 1½in. aft and 2in. on fore edge.
 Counterframe.—Moulded at inner end 2½in., and at outer end 2in.; sided at inner end 5½in., and at outer end 3in.
 Deadwood.—Moulded amidships 8½in.; sided to fit keel and sternpost.
 Archboard or Transom.—One inch thick, of shape shown, and steamed or sawn to curve.
 Timbers.—One inch by 1in.; steamed; spaced 6½in., center to center.
 Floors.—Wrought iron; thickness at throat ¾in., and 3-16in. at ends; width at throat 1in., and ¾in. at ends; spaced at the stations shown on construction plan; the arms to run up to the bilge.
 Shelf.—2½in. by 1¼in., through-fastened at each timber.
 Stringer.—3in. by 1in., through-fastened at each timber.
 Beams.—Moulded 2in., and sided 1in.; main beams sided 2in.
 Carlines.—Moulded and sided 2in.; beams and carlines to be dovetailed to each other and into shelf.
 Breasthook.—Oak crooks, 1in. by 2½in. at throat, to 1in. by ¾in. at ends; 9in. arms.
 Knees.—Oak crooks, ¾in. by 2½in. at throat, to ¾in. by ¾in. at ends; one pair hanging knees at main beam in wake of mast; one pair lodging knees at main beam in wake of mast; one pair lodging knees at quarters from shelf to archboard.
 Planking.—¾in. cedar or kauri pine; all planking to be through-fastened on both edges, at every timber and floor frame; widths not to exceed 6in., except at garboards; caulked with cotton and stopped.
 Deck.—¾in. kauri pine in 2½in. widths, tapered fore and aft; secret nailed and caulked with cotton and paved with Jeffrey's marine glue; the covering board and center plank to be of teak.
 Cockpit.—¾in. teak sides and seats, with lockers under; ¾in. pine floor; sides and floor to be made watertight, and a drainpipe fitted in floor; the floor bearers to be of 1¼in. by 2in. white pine.
 Companion and Hatches.—To be in teak, carefully fitted and made watertight; all hinges and locks to be entirely of brass.

Cabin Top.—To be of ½in. pine, with ½in. by ¾in. bent timbers instead of beams, spaced as shown; the coamings to be of ¾in. teak; the whole of the arched top to be covered with painted canvas.
 Rudder and Trunk.—The rudder to be of oak, with a stem of 1¼in. galvanized steel tube, split below trunk to receive the oak mainpiece; a strap joint and heel bearing of gun metal of the usual form; the rudder trunk to be of kauri pine 1in. thick, with a center piece 1½in. thick.
 Tiller.—Wrought steel, of shape shown, ¾in. square, in section at rudder head, and fitted to it with a square, and a brass rudder cap nut; also an engraved deck plate forming a bearing.
 Lead Keel.—To be cast to shape shown, and to be fastened with Bull's metal bolts at stations shown; the end bolts to be ¾in. diameter, and the others ¾in.; the bolts to pass through keel and wrought iron floors; any excess weight to be sawn off the ends, so as to keep the weight in the same fore and aft position.
 Main Cabin.—To be lined with ¾in. pine or cedar, and fitted as shown, with two sofa berths, with lockers under and teak fronts;

BLAKE'S PATENT HOOK. JIB SHEET SHACKLE. See Chapter XIII.

the doors to be framed in teak and fitted with hooks; a teak companion ladder and teak collapsible table to be provided; two swing candles to be fitted; floor of ¾in. white pine on 1¼ by 2in. bearers.
 W.C.—To consist of a moveable pail, with handles and a fixed seat frame, with lid of teak.
 Forecastle.—Entered by hinged door with hook from cabin; floor and lockers to be of ¾in. pine.
 Galley.—A double Primus stove with set of cooking utensils.
 Deck Fittings.—Binnacle to be fitted at fore-end of cockpit, with spirit compass; jib and mainsheet horses, fair leads, etc., at foot of mast; chain pipe, bollards, shroud plates and all usual iron work on deck and on spars, to be fitted and of good quality. All usual sheet leads and cleats to be fitted as required, including a stout iron cable lead, on side of stem, as shown, and all necessary eyebolts, etc.; also four gunmetal warp leads, one on each bow and one on each quarter.
 Pump.—A brass flush deck pump and suction pipe, discharging into cockpit.
 Tank.—A galvanized iron water tank, to be fitted under floor with filling plug in deck, and brass draw-off pump or air pump.
 Lamps.—A set of side and anchor lamps in brass, with screens, to be fitted.
 Ground Tackle.—One 20lb. Nicholson pattern anchor, galvanized; one 12lb. Derigo pattern anchor, galvanized; 20-fathom, 1¼in. galvanized, close-link, steel chain (tested), with usual shackles and swivels; one 20-fathom, 1¼in. warp of hemp or manila.
 Spars.—A complete set to the dimensions given of clear, grown spars with the exception of gaff, roller, topsail yard and jockey-rod, which are of bamboo.
 Block.—A complete set of best ash blocks (patent sheaves to halliards and sheets).
 Standard Rigging.—Of best galvanized steel wire of suitable size,

properly turned in and served with best quality rigging screws of gunmetal.
 Running Rigging.—Of best yacht manila, four-strand.
 Sails.—As shown on sail plan, of stout union silk.
 Fastenings.—All fastenings to be of copper, yellow metal or brass screws.
 Galvanizing.—All ironwork to be well galvanized, and of good quality.
 Painting.—The whole of the woodwork and spars to receive four coats of best paint or yacht varnish, and to be properly stopped and rubbed down after each coat. The bottom to be coated with Blake's Algicide, copper color. A gold line, in a hollow moulding, to be worked round the vessel, below the covering board.
 Upholstery, Bedding, etc.—The sofas and backs in the main cabin to be properly upholstered in Pegamoid or Pantasote, and stuffed with Kapok. Two colored blankets, pillows and bolsters to each berth.

Part II.—Chapter I.—Rigging.

Rope, Blocks, Etc., and Fitting Rigging.

All rigging should be of the best quality obtainable; and it is very false economy to save a few shillings by using second-rate rope or wire. The latter especially should be good, many a spar being lost through the breaking of bad wire.
 The best wire rope in the market will only cost a few shillings more for the whole outfit than the commonest rubbish. This difference in quality is especially noticeable in the hard steel wire known as plow steel, and used for all standing rigging. Messrs. Bullivant, of 72 Mark lane, E. C., are the first wire rope makers in the country, and their wire can usually be obtained from any good yacht fitter, and if required in any quantity, direct from the makers. A good, flexible steel rope should be of very fine wire and nearly as soft to the touch as hemp rope of the same size. There should be no sharp ends when it is passed through the fingers, and it should be bright and silky, flying back to its original shape immediately on being released after being bent.
 The plow steel should also regain its shape to some extent, but not so much as the flexible wire, and it should be very much stiffer, and composed of coarser wire.
 If the wire bends easily and stays in the shape to which it has been bent, it is usually iron, or very inferior steel, which is even worse than good iron. Never use copper wire rope for any purpose; it will stretch like India rubber and then break with very little weight.
 Phosphor bronze wire rope is excellent for centerplate tackles, as it is not affected by sea water; its strength is about 80 per cent. as compared with flexible steel, and its durability under water is infinitely greater, but unfortunately it is not easily obtainable. The Phosphor Bronze Company, of 87 Sumner street, S. E., would no doubt supply the wire if a large quantity were required; but it is not yet in general use.
 All wire rope will last much longer if it is soaked in linseed oil or well varnished, and all splices should be thoroughly varnished and parcelled with varnish calico before serving.
 Never take a wire rope over a small sheave; the diameter of the sheave for flexible wire should be at least ten times the diameter of the wire, while for plow steel the sheave should be not less than fifteen times the diameter of the wire; even larger sheaves are better, but are usually made too wide in the score.
 In choosing running rigging, a soft, silky, manila should be selected, free from loose fibers and thick places in the strands. It should be a creamy white in color and have little or no spring in it. Four-strand rope is usually used for yacht work, as it is smaller in diameter for a given strength and therefore neater. It is also less liable to kink than three-strand.
 Hemp rope, except for bolt ropes of sails and warps, is seldom used on yachts, as it is very hard, especially when wet. It should be picked with as fine a thread and as smooth as possible.
 Cotton rope is used a good deal in small boats for sheets, where they are often held in the hand instead of being belayed, as it is much softer than manila. Really good cotton rope is very hard to get, most of it being laid up badly, and either kinking when wet or getting too hard. Never get cable-laid cotton, as it is very hard and quite useless for sheets. It may be easily distinguished from the proper hawser-laid rope by the fact that in all cable-laid rope the strands are each of them a hawser-laid rope, and three of them are laid up together, forming one cable-laid rope. In the hawser-laid rope, used for all running rigging, the strands are composed of a number of threads or yarns and not of regularly laid up smaller strands. When splicing cotton or wire, always whip or bind the ends of every strand, and also the rope itself at the point where the splice is to commence. This is not so important with either manila or hemp.
 On very small boats and sailing canoes a very fine, strong line of cable-laid flax is largely used. It does not stretch much, and is about twice as strong as small manila or cotton, but it is 2s. 6d. a pound, while cotton is 1s. 6d. and manila 10d. to 1s.
 In addition to the foregoing kinds of rope, a smaller sort of hemp line called houseline is used for lacing sails, etc., and for serving ropes and splices, a still smaller kind of tarred hemp called marline is required, while sewing twine, either tarred or waxed, is used for whipping the ends of all the ropes and various other small jobs.

TABLE OF OFFSETS, NO. 2 DESIGN.

Table with 17 columns: Stem, No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7, No. 8, No. 9, No. 10, No. 11, No. 12, No. 13, Trans'm. Rows include various measurements like 'Heights from L.W.L. to covering board', 'Depths from L.W.L. to under side keel', etc.

Notes.—All dimensions are given in feet and inches. Sections are spaced 2ft. 3in. apart, No. 1 being 1ft. 4in. aft of stem head. Waterlines are spaced 4 1/2 in. apart. Buttocks—A is 2ft. 6in. from center line; B is 1ft. 10in., and C is 1ft. Diagonals—I. is at an angle of 51 degrees with center line; II. is 38 1/2 degrees; III. is 28 degrees, and IV. is 34 1/2 degrees. All lines are outside planking.

Blocks For No. 1 Design.

Peak Halliard.—One 2 1/2 in. single, rope strop, patent sheave at masthead. Throat Halliard.—One 2 1/2 in. single sheet metal block, patent sheave for wire at masthead. One 2 1/2 in. single, rope strop, patent sheave, spliced into lower end of wire halliard. Topping Lifts.—Two 1 in. cheek sheaves on masthead, one each side. One 2 in. single, rope strop, sized in bight of topping lifts. Main Sheet.—Five 2 3/4 in. single, three-rope strops, and two internal bound shackle lugs—all patent sheaves. Fore Tackle.—One 2 1/2 in. single, rope strop, patent sheave, spliced in end of wire tack. Fore Sheet.—One 2 in. single, rope strop, on aft end of upper boom. One 3/4 in. cheek sheave on fore end of lower boom, starboard side. Foresail Clew, Outhaul.—One 3/4 in. sheave in aft end of upper boom, as near the end as possible. One bullseye in clew of jib. One 3/4 in. cheek sheave on fore end of upper boom, port side. Centerplate.—One 3 1/2 in. single sheet metal block for wire on mast thwart, patent sheave. Two 3 in. double internal bound shackle lugs, patent sheaves.

Blocks For No. 2 Design.

Topsail Halliard.—One 2 1/4 in. patent sheave in masthead. Spinnaker Halliard.—One 2 1/2 in. single rope strop. Peak Halliard.—One 3 in. single metal block, patent sheave, for wire. One 3 in. single rope strop, spliced in end of wire halliard. Throat Halliard.—One 3 in. single sheet metal block, patent sheave, for wire. One 3 in. single rope strop, spliced in end of wire halliard. Throat Purchase.—One 2 1/2 in. double rope strop, spliced in end of manila whip. One 2 1/2 in. single internal bound with shackle lugs and becket. Topsail Sheet.—One 1 in. cheek sheave on gaff end. One 2 1/2 in. single rope strop at jaws of gaff. Topping Lift.—Two 1 1/4 in. cheek sheaves on masthead, one each side. One 2 1/2 in. single rope strop, seized in bight of topping lifts. Main Sheet.—Five 3 in. singles, patent sheaves, three-rope strops and two internal bound with shackle lugs. Fore Tack.—One metal bullseye on bowsprit. One 3 in. single rope strop, patent sheave, spliced in end of wire tack. One 2 1/2 in. single rope strop, spliced in end of whip. Fore Sheet.—One 2 1/2 in. single rope strop on aft end of upper boom. One 1 in. cheek sheave on fore end of lower boom, starboard side. Foresail Clew, Outhaul.—One 2 in. single rope strop in clew of sail. One 1 1/4 in. sheave in aft end of upper boom. One 1 1/4 in. sheave in fore end of upper boom, port side. Runners.—Two bullseye fairleads on deck for hauling parts. No blocks required.

Rifle Range and Gallery.

Iroquois Rifle Club.

PITTSBURG, Pa., Oct. 12.—The fourteenth annual indoor tournament of the Iroquois Rifle Club was held Oct. 7, 8, 9 and 10. A members' match was on the programme for the first day, each contestant firing 20 shots in 6 targets of 5 shots on the reduced standard American target at 54ft. The first prize, a gold medal, was won by L. P. Ittel, with a score of 279 out of a possible 300. The shooting in general was below the average. The scores:

Score table for Iroquois Rifle Club with columns for shooter names and scores across multiple days.

The last three days of the tournament were devoted to the all-comers' matches, with two events on the programme—the continuous prize match and the bullseye match. In the continuous match, first prize was won by L. P. Ittel, with a possible score of 90 to his credit. The conditions of this match were 3 shots per target (reduced standard American); re-entries were unlimited, the best three targets of each shooter counting for prizes; ties were decided by the next best target made by each shooter. Thirty-three contestants took part in this match, and twenty cash prizes,

ranging from \$20 to \$1, were distributed among the following marksmen, the scores being as follows:

Score table for various marksmen including L. P. Ittel, H. B. Pierce, H. L. Born, etc.

In the bullseye match George Huebner won the prize, consisting of \$25 cash, by making the best shot on a 3 in. bullseye cartoon, which was used in this event. His shot was a perfect center, the machine used in measuring these shots not registering any degrees. Thirty-two shooters took part in this contest, the following being the first twenty in the match. The figures beside each name indicate the number of degrees each man's shot was from the center: George Huebner 0, H. L. Born 5 1/2, J. H. Dimling 6, U. Altenburger 11 1/2, L. P. Ittel 14, Val Fisher 16, L. G. Grant 17, W. Riebling 17 1/2, K. W. Zoeller 18 1/2, Dr. C. M. Schaefer 24, L. Kuehneiser, Jr., 34 1/2, H. B. Pierce 34 1/2, C. C. Hofmeister 36 1/2, A. F. Hofmeister 42, Harry Sperling 43, R. Rahm 43, A. J. Huebner 48, M. Bedell 53, G. H. Soles 61, Robert J. Smith 61 1/2.

N. G. GRAUL, Sec'y.

Columbia Pistol and Rifle Club.

Oct. 6.—At the Columbia Pistol and Rifle Club's regular shoot a very bad light prevented high scores. Dorrell led with rifle; Young with pistol; Hovey in Creedmoor match; Brannagan in .22cal. rifle, and Dr. Twist and Hoffman tied for first place with the revolver. Scores, Columbia target, off-hand: Rifle: A. B. Dorrell, 47, 53, 55, 59, 59; F. O. Young, 52, 56, 59, 60, 65; G. M. Barley, 60, 64; E. A. Allen, 70, 123, 150. Military and repeating rifle match: Ed Hovey, 45, 45, 44, 44, 44; E. A. Allen, 44, 43; Dr. Twist, 43. Pistol, 50yds.: F. O. Young, 35, 40, 45, 45, 44, 45, 45, 45; Dr. Twist, 48, 52, 59, 61, 61; F. S. Washburn, 51; H. A. Baker, 56, 66, 68, 82, 86; W. G. Hoffman, 63; E. A. Allen, 75, 77, 99, 104. Revolver, 50yds.: Dr. Twist, 59, 80, 95, 96, 99; W. Hoffman, 59, 71; F. S. Washburn, 68, 76; Dr. Hunsaker, 69, 72, 77, 85. .22cal. rifle, 50yds.: A. J. Brannagan, 24; Hoffman, 26, 27, 28, 31; H. A. Baker, 46, 47; A. Scott, 47; A. H. Cady, 38, 47, 37; C. L. Gimmel, 49, 70, 71; Dr. Twist, 34.

Our vice-president, A. H. Pape, went to the Schuetzen Club prize shoot to-day and got everything in sight, except honorary, and was second in that match. He got best five tickets, \$5 premium, on ring, 73, 71, 71, 68, 68, and beat five on honorary, 70, 70, 70, 69, 69, \$5 premium; first prize, \$40, ring (73) and clampion goblet for best average on ring and honorary, ten scores; \$50 silver set on his 70 honorary ticket. Used his Pope rifle and King's S.S. and Smokeless powders—Young's combination.

SAN FRANCISCO, Sept. 29.—The Columbia Pistol and Rifle Club's regular shoot was postponed to Sept. 29, out of respect to our martyred President. The Olympic and Union gun clubs also postponed their shoots. The schuetzen clubs shot as usual. Pope led with the rifle, but Dorrell made it very interesting for him, both doing phenomenal shooting. Pape, with his rifle, ran one point ahead of the best ten scores with pistol for this year, with a total of 370, or 3.7in. ring average. This is marvelous shooting. Allen tied Hovey in the military match, and beat him by Creedmoor settlement of ties, having the best last shot. He walked home on air, and all hands congratulated him. Becker was high with the revolver, and only 3 points away from club record; and Washburn took first honors in the pistol match.

Dr. Hunsaker and Trego went deer hunting, and Young to the country, while Brannagan went after the first flight of ducks. Hunsaker got two deer and Trego one. Brannagan bagged thirteen ducks.

Scores, Columbia target, off-hand: Rifle, 200yds.: A. H. Pape, 38, 40, 46, 50, 61, 62, 64; A. B. Dorrell, 42, 43, 55, 58, 62, 69, 73; Dr. Twist, 64, 58, 90, 93, 94; G. Mannel, 66, 77, 83; G. M. Barley, 72; F. S. Washburn, 85; E. A. Allen, repeater, 151, 153. Military and repeating rifles, Creedmoor count: E. A. Allen, 47, 45, 44; E. Hovey, 47, 44, 44, 43, 43, 42. Three-shot rifle match: Dorrell, 15, 22, 24; A. H. Pape, 18, 20. Pistol, 50yds.: F. S. Washburn, 40, 52, 54, 59; W. G. Hoffman, 46, 52, 60; G. Mannel, 64, 65, 67, 75; Dr. Twist, 56, 65; P. Sanchez, 97, 103, 112. .22cal. rifle, 50yds.: W. G. Hoffman 28, C. L. Gimmel 62.

F. O. YOUNG, Rec. Sec'y.

Elite Schuetzen Corps.

Score table for Elite Schuetzen Corps with columns for shooter names and scores.

Cincinnati Rifle Association.

CINCINNATI.—The annual prize shoot of the Cincinnati Rifle Association was held on Sept. 29. Conditions: 200yds, off-hand and rest at the standard target. Any rifle not over .45cal., telescopes and jacketed bullets not allowed. The weather and light were fair, and the attendance good. Good scores were much in evidence. We were honored by four visiting members of the Old Kentucky Rifle Club, Messrs. Dodge, Luxon, Rohrer and Wolfolk. These gentlemen captured a fair bunch of prizes, and went home delighted with the result of their trip. The following is a list of the winners:

General prize targets, three best tickets count for first, second and third prizes, and the two best thereafter; all ties decided by the next best ticket:

Off-hand: Roberts, 28, 28, 28; Gindele, 28, 28, 28; Strickmeier, 28, 28, 37; Dodge, 28, 27; Payne, 28, 26; Luxon, 27, 27; Speth, 27, 26; Hofer, 27, 23; Rohrer, 27, 23; Trounstine, 26, 24. Rest: Bruns, 30, 30, 29; Hoffman, 30, 29, 28; Nestler, 29, 29, 29; Payne, 29, 29; Wolfolk, 29, 29; Freitag, 29, 28; Rohrer, 29, 28; Topf, 28, 28; Uckotter, 28, 28; Strickmeier, 28, 26.

Premiums for most points: Off-hand: First, Roberts, 1,008, \$5; second, Dodge, 672, \$3; third, Luxon, 377, \$2. Rest: First, Nestler, 836, \$5; second, Uckotter, 794, \$3; third, Wolfolk, 661, \$2.

For most flags: Off-hand: Roberts, 19, \$1. Rest: Nestler, 35, \$1. For best ticket: Off-hand: Roberts, 28, \$1. Rest: Bruns, 30, \$1. Special prize, three shots, only one entry: Off-hand—Strickmeier, 27, \$1; Bruns, 29, \$1.

E. D. PAYNE, Lieut. C. R. A.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- Oct. 16.—Mt. Sterling, Ill.—Tournament of the Mt. Sterling Gun Club. J. Breidenbend, Sec'y. Oct. 16-18.—Baltimore, Md.—Fall tournament of the Baltimore Shooting Association; two days targets; one day live birds. Added money. Open to all. Oct. 17-18.—Springfield, Ill.—Fall tournament of the Illinois Gun Club. Oct. 22-24.—Raleigh, N. C.—Shoot under auspices of the Raleigh Gun Club. J. G. Ball, Sec'y. Oct. 22-23.—E. Toledo, O.—Fall tournament of the Miller Gun Club. Geo. Volk, Sec'y. Oct. 23.—Muncie, Ind.—Magic City Gun Club's fall tournament. Oct. 23-24.—Taylorville, Ill.—Target shoot and fish fry of the Taylorville Gun Club. Oct. 23-24.—Attica, Ind.—Laumee's target and live-bird shoot. Oct. 22-24.—Des Moines, Ia.—Amateur handicap shoot. Oct. 24-25.—Streator, Ill.—Two-day shoot of the Streator Gun Club; targets and live birds; open to all. Nov. 6-7.—Peru, Ind.—Peru Gun Club's live-bird tournament; handicap; high guns. Nov. 28.—Ossining, N. Y.—All-day target shoot of the Ossining Gun Club. Roast Turkey. C. G. Blandford, Capt. Nov. 28.—Cleveland, O.—Shoot of the Cleveland Gun Club. Nov. 28-29.—Milwaukee, Wis.—Tournament of the South Side Gun Club. Newark, N. J.—South Side Gun Club target shoot, every Saturday afternoon. Chicago, Ill.—Garfield Gun Club's live-bird trophy shoots, first and third Saturdays of each month. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

CONTESTS AT INTERSTATE PARK.

- Nov. 20.—Interstate Park, Queens, L. I.—Shoot given by Mr. S. M. Van Allen, who donates a Daly gun; \$20, 20 birds, latter extra; high guns; handicap; all entrance money goes into the purse. Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice. Cafe and hotel accommodations. Interstate Park, Queens, L. I.—Weekly shoot of the New Utresh Gun Club—Saturdays. 1902. Jan. 14-17.—Hamilton, Ont.—Twelfth annual tournament of the Hamilton Gun Club. F. B. Vallance, Cor. Sec'y.

DRIVERS AND TWISTERS.

The Raleigh Gun Club has issued the programme of the tournament to be given under its auspices in connection with the North Carolina State Fair, Oct. 22 to 25, inclusive. No. 9 of each of the first

three days is a merchandise event. The remaining eight events have added money to each, and are as to entrance based on 10 cents per target. The fourth day has ten merchandise events, of which one is the grand Peters Cartridge Company event. Handicaps 14 to 22yds. Rose system, 5, 3, 2, 1. Magautrap. Money events open to all. Merchandise events open only to North Carolina amateurs. Targets two cents. Shooting commences at 10 o'clock. Guns and ammunition sent in care of T. H. Briggs & Sons and Julius Lewis Hardware Company will be delivered on the grounds free. J. G. Ball is secretary.

The programme of the Magic City Gun Club's tournament, to be held at Muncie, Ind., Oct. 23, provides twelve events, at 10, 15 and 20 targets; entrance \$1, \$1.50 and \$2. Amateur shoot—experts and known 90 per cent. shooters barred. Magautrap rules. Shooting begins at 9 o'clock. Manufacturers' agents are cordially invited to display their goods and to shoot for targets. Bluecocks two cents. Purses divided 40, 30, 20 and 10. Guns and shells shipped to Mr. Claude Stephens, captain, will be delivered on the grounds.

Mr. Harry L. King, of Cincinnati, O., won the Gilman-Barnes trophy, at John Parker's tournament, live-bird day, Oct. 4, at Detroit, Mich. Messrs. Joseph A. Marks, J. A. R. Elliott, Jack Fanning and Mr. King tied on straight scores. In the shoot-off Fanning's bird, hard hit, died out of bounds. Marks went out on the fourth bird. Then the remaining two missed their fourteenth bird. They raced neck and neck to the twenty-first bird, which Elliott lost. King killed his, and won.

The captain of the club writes us as follows: "On Thanksgiving Day, Nov. 28, the Ossining Gun Club, Ossining, N. Y., will hold an all-day clay-bird shoot. Everything which goes to make up a pleasant day's shoot—not forgetting the turkey—will be provided. As has been mentioned before in these columns, Ossining is only thirty miles from New York city, on the N. Y. C. & H. R. R. R. Trolley cars run from the station direct to the grounds. For programmes and particulars, address C. G. Blandford, Capt."

Mr. C. C. Beveridge, well known to all trapshooters as Dominic, informs us that he has business engagements which will keep him in the West another year. His present place of domicile is Fremont, Neb. He is at present taking a two weeks' outing in the sandhill country, after chickens and ducks. We note that he has been shooting in his best form of late. At the recent Omaha tournament he broke 153 out of 160 targets on the first day, and was second high gun.

Mr. Bert B. Adams, the secretary-treasurer of the Limited Gun Club, of Indianapolis, Ind., informs us that his club will hold its annual fall tournament on Oct. 30 and 31. The programme of the first day will have events as follows: Three at 10, and six at 15 target; two at 15 sparrows and the Grand Hotel cup, at 50 targets. On the second day, two at 10 and six at 15 targets, and two at 15 sparrows. For programmes and further information address the secretary.

The fall tournament of Miller's Gun Club, Toledo, O., Oct. 22 and 23, has a programme alike for each day; namely, twelve events at 10, 15 and 20 targets; \$1, \$1.50 and \$2 entrance. Shooting commences at 10 o'clock. To reach the grounds take Ironville car. Handicaps 14 to 22yds. Targets 2 cents. Bluecocks and magautrap. Average moneys. Send ammunition and guns to the secretary, Geo. Volk, Millard avenue, E. Toledo, O.

W. E. Barnard, of Middletown, Del., writes us as follows: "We have organized the Middletown Shooting Association of Delaware, with charter membership of about fifty. Our grounds, sixty acres in extent, are located in the suburbs of our city, near the railroad, and we have installed a magautrap and a set of experts. Most of our members are novices at trapshooting, and our object is to promote an interest."

The Aurora Grata Club, a Masonic organization, which occupies a beautiful club house on Bedford avenue, Brooklyn, N. Y., organized a trapshooting club on Thursday of last week. Mr. E. Blohm was elected secretary-treasurer; Dr. W. A. Little, well known as a trapshooter, was appointed captain. The club is already actively arranging for the future competition.

Mr. J. Hildreth, debonair and popular at all times and everywhere, leaves New York for the Southwest, the territory in which he so ably represents the Winchester Repeating Arms Company. He has been having a rest in New York during some days past, a city so quiet and gentle as to slowly gain fame as being outside the heavy swirl of life.

We notice that in our business columns the Winchester Repeating Arms Company, New Haven, Conn., announce that Winchester rifles and shotguns were the only rifles and shotguns which received gold medals at the Pan-American Exposition, and also that Winchester ammunition received a gold medal.

In a match recently shot at Dupont Park, St. Louis, between Messrs. Harold Money and John Cabanne, 50 birds, 30yds. rise, \$50 a side, the former won by a score of 50 to 43. In the East, when Mr. Money was in his best form, he shot with phenomenal quickness and accuracy, and was rated as first class.

The Union Metallic Cartridge Company, Bridgeport, Conn., announce, through our business columns, that U. M. C. ammunition was awarded a gold medal at the Pan-American Exposition. BERNARD WATERS.

Forester Gun Club Tournament.

DAVENPORT, Ia., Oct. 11.—The fall tournament of the Forester Gun Club, held at their shooting park, in this city, Oct. 8, 9, 10 and 11, was not as well attended as was expected. The first day twenty shooters took part in the programme. The second day they had twenty-six, and the third day, twenty. The fourth day but four shooters showed up in the morning, as the weather was bad and it looked very much like rain.

After shooting a few miss-and-outs at targets it commenced to rain, and the shoot was declared off. Those who had come out to the grounds went back to the city.

The shooting was done from five traps, known traps and angles. Bluecock targets were used, and worked nicely.

But four men shot through the programme, but as Hughes, Nichols and Crautcup missed only one event and shot at pigeons I have figured their averages. Budd is high with .939; Hughes, second, .933. Both shot U. M. C. shells. Budd shot Schultze powder and a Parker gun; Hughes shot Ballistite powder and a Winchester gun.

Marshall, of Keithsburg, came up and shot on the last two days and was high man the second day.

The only change we can see in Tom is in his hair. Outside of this, he is as busy as ever, and a welcome visitor to any tournament. The scores:

First Day, Oct. 8.

Table with columns: Events, Targets, 1, 2, 3, 4, 5, 6, 7, 8, Broke, Av. Lists names like Stephen, Sperry, Budd, Crautcup, Nichols, Hughes, Westleaf, Walrod, Maser, Holden, Wehrend, Siebens, McCord, McCaughey, Denin, Nance, A. Stephen.

Table with columns: Name, Score. Lists names like Black, Kuehl, Graves.

Second Day, Oct. 9.

Table with columns: Events, Targets, 1, 2, 3, 4, 5, 7, 8, Broke, Av. Lists names like Weetleaf, Crautcup, Black, Nichols, Budd, Hughes, Marshall, J. O. Miller, Wehrend, McCaughey, O. Ehrlein, Stephens, Siebens, McCord, Walrod, Holden, Maser, McBroom, F. E. Miller, Samuelson, Grant, Stone, Herr, Hayes, Porter, Price, Kraus.

Third Day, Oct. 10.

Table with columns: Events, Targets, 1, 2, 4, 5, 7, 8, Broke, Av. Lists names like Stephens, Wehrend, Marshall, Hughes, Weetleaf, Budd, Crautcup, Nichols, Siebens, Maser, L. C. Kraus, F. W. Kraus, Speth, Holden, Sperry, Samuelson, Robson, Paddock, Stohl, Wilber.

Table with columns: Name, Score. Lists names like Marshall, Stephens, Paddock, Bush, Budd, Stohl, Slicker.

Budd and Marshall 30yds.; all others at 28yds. General averages, Oct. 8, 9, 10 and 11:

Table with columns: Name, 1st day, 2d day, 3d day, Shot at, Broke, Av. Lists names like Stephens, Budd, Crautcup, Nichols, Hughes, Westleaf, Walrod, Holden, Sperry, McCaughey.

ON LONG ISLAND.

The Knockabout Shoot.

Interstate Park, Queens, L. I.—The live-bird shoot arranged by Mr. J. Wright was a success. The weather was pleasant, there was a good gathering of shooters, and the competition was well sustained from start to finish. Besides the shooters, there was an unusually large attendance of visitors, among whom were Captains McDonald and Van Schaack. Mr. J. I. Arzapalo, of Guadalajara, Mexico, was a participant.

Mr. M. Herrington acted as referee in the main event. Messrs. W. R. Hobart and B. Waters acted as handicappers. There was a moderate wind, varying from 3 to 5 o'clock most of the time. A number of short side races were shot in the forenoon. The scores:

No. 1, 5 birds, \$3, class shooting, handicap: Apple Jack (29yds.) 5, Piercy (29) 5, Super (27) 5, O'Rourke (27) 5, Waters (27) 5, Van Allen (30) 5, Wise (27) 5, Lebohner (27) 5, Morfey (30) 4, Langdon (27) 4, Hopkins (28) 4, Lockwood (27) 4, Lee (27) 4, Arzapalo (26) 4, Capt. Money (28) 3.

No. 2, 7 birds, class shooting, handicap: Money (28yds.) 7, Wise (27) 7, O'Rourke (27) 5, Apple Jack (29) 7, Hopkins (28) 7, Van Allen (30) 7, Lockwood (27) 7, Piercy (29) 6, Lee (27) 6, Super (27) 5, Arzapalo (26) 5, Langdon (7) 3.

No. 3, 10 birds, \$7.50, high guns: Capt Money, 28.....1122111212-10 White, 27.....1221121022-9 Morfey, 31.....121222112-10 Kroger, 28.....21101*222-8 Hopkins, 28.....121111111-10 Von Lengerke, 29.....20222*22-8 Glover, 31.....22222221-10 Lockwood, 27.....1212012000-6 Wise, 27.....22222222-9 Banks, 28.....1210w Piercy, 30.....221121012-9 O'Rourke, 28.....110w Van Allen, 30.....20222221-9 Sanders, 27.....202w Super, 27.....201212211-9 Apple Jack, 29.....0w Lee, 27.....222111011-9

No. 4, 10 birds, \$7.50 entrance. First prize, Knockabout gun and case; all surplus over \$75 divided 60 and 40 per cent. to second and third respectively: Money, 29.....222222212-10 Lebohner, 27.....222022122-9 Lee, 27.....111212111-10 Morfey, 31.....12*221*212-8 Piercy, 30.....222122122-10 Brown, 29.....1210220212-8 Von Lengerke, 28.....221121222-10 Hitchcock, 26.....0111220111-8 Super, 27.....221122122-10 Hopkins, 29.....0202112011-7 Van Allen, 30.....122222122-10 Banks, 28.....120201210w Armstrong, 31.....222222121-10 Langdon, 27.....10200w Glover, 31.....22222222-10 Waters, 27.....2110w Wise, 27.....22222222-9 Sanders, 27.....10w Lockwood, 26.....111112222-9 Apple Jack, 28.....0w

Shoot-off of ties on 10 for gun: Van Allen, 30.....22221222122221112 Armstrong, 31.....222222212222221 Piercy, 30.....12212212221122111* Glover, 31.....12122112120 Money, 29.....2222210 Lee, 27.....121120 Von Lengerke, 28.....2210 Super, 27.....210

Jeannette Gun Club.

Interstate Park, Queens, L. I., Oct. 11.—The Jeannette Gun Club held a most successful club shoot at Interstate Park, on Friday of last week. Three tied in the main event. Job Lott won Class A, and N. Rust won Class B trophy. The challenge medal was won by C. Meyerdiicks with a score of 15 straight. The scores:

Table with columns: Name, Score. Lists names like F. Ehlen, W. Rottman, G. Greiff, Job Lott, W. Koeger, H. Pape, H. Kasterns, C. Meyerdiicks, H. Gerdes, J. Mohrman, H. Nobel, C. Peters, R. Packard, C. Meyer, J. Hainhorst, N. Rust, A. Schumacher, W. Rohlfis, C. Thyssen.

Shoot-off for Class A, 5 birds: F. Ehlen 3, Job Lott 4; C. Meyer missed and withdrew.

Challenge medal, 15 birds: C. Meyerdiicks, 28.....12221122211111-15 H. Pape, 28.....1211220020222-12

Oceanic Rod and Gun Club.

Rockaway Park, L. I., Oct. 14.—The club had a stormy day for its opening fall shoot. The wind blew hard, straightaway from the shooters, making the most difficult of erratic flights and angles. Dr. Bill and Dudley were easily high men in every event, and consequently in the high average for the day. However, the delicious beef stew served about midday was an event in which all performed with equal precision and merit.

The club house, once so isolated near the sandy shore, among the scrub growths of a poor soil, is gradually being brought out to view by the encroachments of the real estate dealers and home seekers. The process of leveling and clearing is pressing nearer and nearer year by year, and if the improvements continue, it is but a question of time till the Cuckoos must seek a new nest. The scores:

Table with columns: Name, Score. Lists names like Dr. Bill, C. Dudley, B. Waters, C. Harris, T. Diffley, S. Charles, J. Jones.

Exeter Sportsmen's Club.

EXETER, N. H.—Following are the official scores of the Exeter Sportsmen's Club's tournament:

October 9.

Table with columns: Events, Targets, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, Broke, Av. Lists names like A. S. Langley, H. K. Ellyson, B. Leroy, W. S. Carlisle, C. S. Lockwood, J. Chase, W. W. Corson, S. G. Miller, W. L. Allen, O. R. Dickey, Grozier, Treaves, Morton, Mitchell, W. Hatch, J. W. Tilton, A. E. Moore, Bickford.

October 10.

Table with columns: Events, Targets, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, Broke, Av. Lists names like Largely, Ellyson, Leroy, Carlisle, Dickey, Tilton, Bickford, Brown, H. True, Maloy, Parry, Moore, Follansby, Pitman, A. True.

All targets were thrown from a magautrap, except the first event of the first day, when expert traps were used.

The Shelbyville Rod and Gun Club.

SHELBYVILLE, Ind.—The first semi-annual tournament of the Shelbyville Rod and Gun Club, Oct. 9 and 10, had both target and live-bird competition, the latter on the second day. The pigeons were unusually lively.

On the first day, out of 135 targets shot at, the following scores were made by those who shot through the programme: King 72, Drummond 85, Megibben 100, Howard 127, Schwartz 100, Trimble 128.

In the 50-target handicap, the scores were: King 29, Drummond 34, Barlow 36, Ensminger 29, Megibben 28, Howard 40, Schwartz 35, Trimble 36, Harcourt 26, Meyers 42, Link 37.

On the second day the live-bird events were as follows: No. 1, 10 pigeons, \$4: Comstock 8, Voris 9, Jacksnipe 8, Howard 8, Lilly 7, Morris 7, Davis 9, Barlow 7, Schwartzkopf 9, Megibben 4, Stillwell 3, Meyers 5, Drummond 7, Powell 6.

No. 2, 15 pigeons, \$6; high guns: Comstock 10, Voris 14, Jacksnipe 14, Howard 11, Lilly 11, Morris 8, Davis 14, Barlow 13, Megibben 13, Meyers 10, Drummond 11, Hill 6, Harcourt 9, Moller 7, Ensminger 10.

No. 3, 20 pigeons, handicap, \$10: Comstock, 29.....12011121021101111121-17 Voris, 31.....122210111121220121-18 Jacksnipe, 30.....220102110221122221-17 Howard, 30.....22222222*02222222-17 Lilly, 30.....220202220102202222-15 Schwartzkopf, 29.....22202122212021210-17 Morris, 29.....01200102212212222020-14 Davis, 31.....2012212222010210111-17 Barlow, 30.....1221112011222222-19 Megibben, 28.....222101121101122011-17 Meyers, 30.....1202141101112201122-17 Drummond, 28.....200001010111020212-12 Hill, 27.....2220022112102100020-13 Harcourt, 27.....2220102211221201210-15 Moller, 30.....222010221122120120-15 Ensminger, 28.....01101220122212001122-15 Powell, 28.....0022110220102202120-13 Trimble, 31.....020222222222222222-18

The "Lilly" or high gun, division of moneys was satisfactory to all shooters. During the business hours of a police court the other day a man came staggering in, carrying another man on his back. Walking across the room, to the astonishment of everybody, he deposited his load on the clerk's table. The sitting magistrate demanded the reason and meaning of such an outrage. "Well, yer honor," said the fellow, "it's like this yere. This man's been to a fishing competition; his name is Gunn, and I've been carrying him about all the afternoon, and as I don't hold a license to carry firearms I thought I'd bring him in here for a rest." "Stand up, Gunn!" said the magistrate. "Ri' you are," says Gunn. "You're drunk!" says his honor. "Not me!" says Gunn. "Oh, well," replied the kindly stipendiary, "this time, Gunn, I'll let you off; you understand? You're discharged."—Fishing Gazette.

John Parker's Tournament.

THERE was a generous representation of the great shooters, among whom were Messrs. Crosby, Elliott, Courtney, Heikes, Fanning and many others, as the list of names in connection with the scores appended will show. The tournament took place at Detroit, Mich., on Oct. 1, 2, 3 and 4.

The main event of the first day was the contest for the Peters Cartridge Company's international handicap trophy, an event at 25 targets. Mr. Charles Caleb, of Flint, won this event with a straight score. This event is No. 6 in the scores.

Oct. 1, First Day.

The live-bird shooting was commenced about 3 o'clock, as soon as the target events were finished. The most exciting race was a sweepstakes event, in which eleven were entered. Six of these—Heikes, Dennis, Crosby, Elliott, Fanning and Longfellow—shot in great form, and not one of them had missed when the event was called off. They had then shot at 14 birds each, while the other five had dropped out by one. The pigeons were not at all lively, however. To offset this the six cracks went back to the 30yd. mark before they were through, but even then they couldn't miss, and so divided the money. Scores at targets:

Table with columns for Events, Targets, and names of shooters with their scores. Includes names like Crosby, Elliott, Heikes, Fanning, Phil, Courtney, Fort, etc.

Oct. 2, Second Day.

There was a strong wind blowing, which had the effect of making erratic flights and consequently more difficult shooting. Nevertheless, while the shooting as a whole fell down somewhat in percentages as compared with that of yesterday, there were a number of excellent individual scores.

The King Powder Company two-man team trophy contest was the main event of the day. It was won by Charles Caleb, of Flint, and Thos. Laing, of Findlay, O., who broke 23 targets each. Heikes made the best score of the event, 24. The teams and their scores were as follows: Heikes and Crosby, 44; Caleb and Laing, 46; Elliott and Phil, 36; Courtney and Parker, 38; Rike and Cox, 42; Waruf and Snow, 32; Toll and Fort, 40; Wood and Scott, 45; Fanning and Bates, 40; Weise and King, 30; Allen and Kirby, 39; Longfellow and Vermilyea, 35; Frank and Klein, 35; Marks and Stanley, 36.

Live Bird Shoot.

The live-bird shooting was better than on the first day. The biggest sweepstakes was between nine marksmen, and Parker, Marks and Bates divided the money after shooting 14 birds straight. The scores:

Table with columns for Events, Targets, and names of shooters with their scores. Includes names like Woods, Scott, Snow, Waruf, Parker, Caleb, Crosby, Heikes, Frank, Cotter, Longfellow, Fort, Vermilyea, Cox, Laing, Price, Scane, Clark, Halliman, Courtney, Phil, Rike, Elliott, Kirby, Bates, Fanning, Dr. Allen, Carpenter, King, Toll, Marks, Stanley.

Oct. 3, Third Day.

The Peters Cartridge Company international expert trophy contest, No. 6 on the programme, was the main event of to-day. Each contestant stood at 25yds. Mr. Stanley Rhoads, of Columbus, O., who shot under the name of Rose, won on a score of 23. The scores:

Table with columns for Events, Targets, and names of shooters with their scores. Includes names like Crosby, Lang, Woods, Phil, Rike, Elliott, Vermilyea, Caleb, Scott, Thomas, Cox, Courtney, Snow, Heikes, Rose, Bates, Dr. Allen, Longfellow, Clark, Kirby, Cotter, Rix, Toll, Fort, Scane, Price, Petite, King, Fanning, Osmun, Finletter, Edwards.

Oct. 4, Fourth Day.

The fourth day was one of increasing interest, the chief live-bird event of the tournament, the contest for the Gilman & Barnes trophy, being on the programme. This was won by Mr. Harry L. King, of Cincinnati, O., who had a keen struggle at the finish with the great champion, Mr. J. A. R. Elliott. The conditions in events Nos. 1, 2, 3 and 4 were as follows:

- Event 1, 5 live birds, entrance \$3, divided 60 and 40 per cent.
Event 2, 7 live birds, entrance \$5, divided 50, 30 and 20 per cent.
Event 3, 10 live birds, entrance \$7, divided 40, 30, 20 and 10 per cent.
Event 4, Gilman & Barnes' international live-bird trophy, value \$150; handicaps 26 to 32yds.; 25 live birds, entrance \$25; \$50 added; divided 30, 25, 20, 15 and 10 per cent.; class shooting; entrance includes price of birds.

The birds were a good lot. Mr. Chas. Caleb, of Flint, won the trophy and gun for the amateur average of the tournament. This trophy was donated by Mr. Joseph A. Marks. The gun was donated by Parker Brothers. Mr. W. R. Crosby, of O'Fallon, Ill., won the diamond trophy for the best average of the tournament. The scores:

Table with columns for Events, Targets, and names of shooters with their scores. Includes names like Ideal, Caleb, Finletter, Bates, Woods, Ray, Mercier, Scane, Cotter, Snow, Caleb, Woods, Bates, Dr. Allen, Frank, Price, Scane, Waruf, Vermilyea, Longfellow, Albans, Reilly, Dennis, King, Hallman, Sutherland, Alexander, Cox, Rike, Kirby, Scott, Toll, Hitchcock, Parker, Husher, Johnson, Clark.

The scores in the shoot-off were as follows, starting after the regular shoot of 15 birds and ending with the thirty-sixth bird:

Table with columns for Marks, Elliott, Fanning, King and their scores.

The Florists' Gun Club.

WISSINOMING, Pa., Oct. 12.—The grand opening tournament of the Florists' Gun Club, of Philadelphia, at flying targets, held to-day, was a distinct success. A total of seventy-six shooters participated in the competition. At great expense, the club had remodelled and refitted the old grounds and equipment, making all the details admirably complete.

There was added money for the 50 to 70 per cent. shooters, and high and low average moneys. There were twelve events on the programme, at 10, 15 and 20 targets. Rose system, class shooting, with different ratios and liberal divisions to a degree that he who could not win something was a poor shoot indeed. Targets, at 1 1/2 cents, were included in all entrances, the latter varying from 25 cents to \$1.

Table with columns for Events, Targets, and names of shooters with their scores. Includes names like Sanford, Stumm, Dotterer, Wynu, Burroughs, Winchester, Colville, Bell, Capt. Money, Eisenlohr, Mink, Burton, Sheeler, Webster, Anderson, L. D. Thomas, Wad, Hines, Weiner, Collins, Bangs, Bower, D. Smith, House, Massey, Mrs. Park, W. K. Park, Van Loon, A. S. Hallowell, W. K. Harris, Torpey, Hobbs, Murphy, Ritter, Coleman, King, Muller, Franklin, Dr. Thomas, Thropp, Maddock, Hamel, J. Edwards, C. Young, Davison, Hunt, Wilcox, Landis, Parsons, Ridge, Leek, Herrington, Gillan, Fairbanks, P. A. Jones, M. Bisbing, Adamson, R. Bisbing, Peden, Felix, Rival, Wilent, J. B. Haywood, Newcomb, Davis, Reid, J. J. Hallowell, Dr. Smith, Barrett, McCaraher, M. R. Smith, Pechin, Reichart, Lawson, Whitaker.

Ossining Gun Club.

OSSINING, N. Y.—Herewith please find the scores of the Ossining Gun Club, made at the regular weekly shoot, Oct. 12. This was the first day of medal shooting, and some fair scores were made. A. Bedell made 15 straight as scratch man. The only other 15 was made by I. T. Washburn, who is acceded two targets in Class A. Several new guns put in an appearance to-day—a good sign.

While one of the squads was shooting a flock of fourteen quail flew across the grounds and settled on a knoll about 30yds. from the score, in full view of the shooters. It was a pretty, as well as a tantalizing, sight. Two dogs were worked out toward them, the birds squatting to a fine point by both dogs. The scores:

Table with columns for Events, Targets, and names of shooters with their scores. Includes names like H. Bissing, I. Washburn, C. Blandford, W. Smith.

Table with columns for names and scores. Includes names like W. Coleman, N. Tuttle, A. Bedell, A. Rohr, Dr. Snow, W. Hall.

Prize events, 15 targets:

Table with columns for Class A and Class B, names, and scores. Includes names like Elandford, Coleman, Hall, Bissing, Rohr, Tuttle, Smith.

Mississippi Valley Notes.

ALTON, Ill.—An interesting live-bird match was shot on Oct. 6 at Dupont Park, St. Louis, between Harold Money and John Cabanne. Cabanne was the challenger, the conditions being 50 live birds per man, at 30yds. rise, for a purse of \$50 per side, loser paying more than an average lot, there being not a single sitter, and neither flush nor balls were used. Money, who had not shown especially good form in the preliminary practice work, steadied down into splendid form, killing his birds in perfect time and doing nearly all the important work with the first barrel. He cleaned up his string of 50 straight, and had not a single scratch in the race. Cabanne, on the other hand, was evidently not up to his ordinary speed, and manifestly labored under a disadvantage from the start. He lost his fourth bird, a straightaway driver from No. 4 trap, and in the first string also the nineteenth, twenty-second and twenty-fifth, while in the second string he dropped the first, twenty-second and twenty-fifth. He had bad luck on three of his lost birds, his gun failing to work properly in ejecting the shell for the second shot. The scores:

Table with columns for Money and Cabanne and their scores.

An unusually spirited contest was shot at St. Louis for the Dupont trophy on the 6th. This fine medal, introduced by Dave Elliott nearly a year ago, had done much to popularize live-bird shooting in that city, and fifteen to twenty entries can be counted on as a certainty at the semi-monthly contests. The scores in the original race on this occasion were: Dr. Gaines 9, Bowman 9, Herbert 7, Rock 9, Dr. Smith 10, Crosby 8, Spencer 10, Eastman 9, Cabanne 10, Dr. Sims 10, Weber 9, Pandy 9, Fink 9, Baggerman 9, Jonah 10, Dr. Ball 7, Fuller 7. In the shoot-off, miss-and-out, Dr. Smith won on 19 straight, Spencer being next high with 18 to his credit.

A match at 100 live birds has been on the tapis for some time between Dr. J. W. Smith and Harold Money, but since Harold cleaned up his 50 straight in the race with Cabanne the Doctor has not been anxious to push the matter. Still there are very few men who can count on defeating Dr. Smith when he is at his best, and he has been doing splendid work during the present season. Should he decide to shoot this race it will be a close and very interesting contest, at short odds.

The boys of the Carrollton, Ill., Gun Club gave a successful two-day open target tournament on Oct. 10 and 11. Attendance averaged about twenty, mostly local shooters. Fred Schiess, of Alton, making the high one-day average.

The Meredosia, Ill., Gun Club will give a target shoot and all-day fish fry at its grounds, on the banks of the Illinois River, on Oct. 23.

The Taylorville, Ill., Gun Club will hold a two-day amateur tourney on Oct. 23 and 24; targets only; Sergeant system; 180 shots per day.

A two-day target and live-bird shoot is announced by the Streator, Ill., Gun Club for the 24th and 25th insts.; 175 targets and 17 live birds are on the card for each day. Good accommodations, and nobody barred.

The gun club at Attica, Ind., will shoot targets and live birds, and entertain all comers at its model grounds on the 23d and 24th insts. One hundred and seventy-five targets, daily, and live birds to shoot. Chas. B. Lamme, secretary, will furnish any information desired.

Unless heavy rainfalls come within a few days, the fall duck flight will net no shooting in this portion of the big basin. The long, continued drouth has left every lake and slough dry, and the birds will either hurry across this stretch of usually good territory or go by some other route. The same has been true of our fall snipe shooting, very few of the birds being killed by even the persistent, wideawake hunters who have beaten the most likely ground. KILLMORE.

WESTERN TRAPS.

Stock Yards Gun Club.

Watson's Park, Burnside Crossing, Ill., Oct. 8.—The scores made at the shoot of the Stock Yards Gun Club, held to-day, are as follows:

Table with columns for names and scores. Includes names like Cunningham, Atwater, Mills, Ottman, Pearl, Lemeon, Kimberling, Gentlemen, White, W. Young.

Garden City Gun Club.

Chicago, Oct. 12.—The Garden City Gun Club's shoot, at Watson's Park to-day, was fairly well attended. In the main handicap event, at 15 birds, Messrs. Bowles, Lefingwell and Barto made full scores:

Table with columns for names and scores. Includes names like Bowles, Ycung, Alabaster, Lefingwell, Amberg, Barto, Gillis, Oliphant.

Miss-and-outs, entrance \$2:

Table with columns for names and scores. Includes names like Amberg, W. B. Lefingwell, Barto, Alabaster, Cunningham, Bowles, Oliphant, O'Brien.

Trap Around Reading.

READING, Pa., Oct. 12.—The Mt. Penn Gun Club's monthly medal shoot to-day was won by Saylor with a score of 20 broke out of 25. Each contestant shot at 25 targets. The scores: Sloat 16, Daubert 14, Strobeck 16, Saylor 20, Osborn 18, Wahl 19, Dietrich 19.

Coatesville, Pa., Oct. 12.—The West Chester Gun Club's team of twelve men to-day defeated the team of the local gun club in a target match, each man shooting at 25 targets, which resulted as follows:

West Chester—Sellers 18, Richards 15, H. Howard 16, Beebe 14, Henry 14, Ferguson 13, Howard 18, Money 14, Note 14, Dale 13, Gill 24, Ford 11; total 184. Coatesville Gun Club—E. Moore 11, Walton 9, Burns 11, G. Minker 9, H. Marsh 12, McCulley 8, Clifton 13, Crawford 5, D. Irwin 16, H. Minker 10, H. Irwin 17, E. Minker 13; total 134. DUSTER.

Speak gently to the herring and kindly to the calf, Be blithesome with the bunny, and to barnacles don't laugh! Give nuts unto the monkey, and buns unto the bear; Ne'er hint at currant jelly if you chance to see a hare! O little girls, pray hide your combs when tortoisies draw nigh. And never in the hearing of a pigeon whisper "pie"! But give the stranded jellyfish a shove into the sea— Be always kind to animals wherever you may be! —Asby-Sterry.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1901, BY FOREST AND STREAM PUBLISHING CO.

SIX MONTHS, \$2.

NEW YORK, SATURDAY, OCTOBER 26, 1901.

VOL. LVII.—No. 37.
{ No. 346 BROADWAY, NEW YORK

THE Methodist Episcopal Church of Clockville, N. Y., we are told, has organized a side-hunt to raise funds for the church's support. The two sides are to be captained by two of the prettiest and most popular young women of the village, and each one of the fair captains has chosen "seventy-five of the crack shots of the neighborhood." If there are actually one hundred and fifty crack shots in Clockville, they should have sense enough to discourage side-hunting. The truth probably is that the town has no such regiment of wonderful shooters, but just the average awkward squad that annually musters for a side-hunt, so that the devastation wrought by the Clockville shooting anniversary will not amount to so much after all. The side-hunt is something that should be prohibited by law. It is a foolish institution, because it results in the killing of both useful and useless creatures for no good purpose.

The fame of the California tuna fishing has gone around the world, and the anglers of other lands have been prompted to endeavor deeds of prowess with the great fish of the sea. We reprint from the Nineteenth Century Mr. W. H. Grenfell's extremely interesting account of the tuna, or, as it is there known, the tunny, in the Mediterranean, and his own quest of it as an angler's fish. His failure, as appears from the narration, was to be ascribed only to the inopportune season of the year. In a more fitting time the Mediterranean fish, now doomed to the death character of the "matanza," may have a place in the annals of the angler's art, along with his relatives of the California coast.

The tuna of Santa Catalina Island is an excellent example of the pecuniary value of a game fish properly advertised. The stories of tuna fishing published in FOREST AND STREAM at once turned the attention of anglers everywhere to the fish, and the result in dollars and cents expended for railroad and steamboat fares, board at hotels, guide and boat hire, tackle, photographs of big fish and their captors, and other things, has been immense. To the question, Does good fishing pay? the tuna of Santa Catalina Island is an irrefutable answer in the affirmative. But the tuna is not the only game fish that pays. Every other one does, or would, if it were given the chance. Consider the Lake Champlain bass, of which Mr. Van Cleef writes to-day. If, instead of jigging the fish from the spawning beds and permitting the net fishermen to capture them for market, the game were kept for anglers, the advantage to the community at large would be much more considerable than it ever can be under existing conditions.

The newspaper report commented upon by Mr. Van Cleef is erroneous in so far as it refers to licenses for seines in Lake Champlain granted by the New York Commission, for while the Commission is empowered to grant such licenses, it has very wisely refused to issue them. The legalized netting is practiced in the waters of Vermont and Canada, and while it is sanctioned by the authorities of both, we believe that all concerned are agreed as to the wisdom of banishing the nets entirely. The reason that Vermont permits netting in its waters is that netting is legalized by the Canadians, and so long as the Canadians persist in netting the people of Vermont are human enough to be unwilling to stand by and see the fish go without getting their share. At the meeting of the North American Association last winter an agreement was made between the Canadian and Vermont officials to abolish net fishing in the lake. Up to the present time this has not been done, and the failure to accomplish it on the part of the Canadians is understood to be because of political complications. The true interest of all those living on Lake Champlain demands an absolute prohibition of the netting of game fish. We trust that the subject may be agitated until such a system of protection shall prevail.

The game reports from every section of the country indicate that the past breeding season has been one of exceptional prolificness. The prairie chicken, the ruffed grouse, the quail and the woodcock alike have shown relative increase of numbers in many widely extending covers. There is here sufficient cause for the planning of where to go; the inspecting of dogs, whether owned by one's self, or to be bought or borrowed; the refurnishing

of guns, airing of old shooting toggery, and broodings over the kinds and quantities of ammunition to take afield. These in turn beget long, grave and oft-repeated conversations with some brother sportsman, the arranging of the outing with others, inquiries for still others who have been lost in the swirl of the world's activity; in short, a general taking up and readjusting of the broken, lost or neglected threads of the web and woof of one's sportsmanship.

In the season of abundance the sportsman is at his best. At such juncture he does not hesitate for a moment to tell his brother sportsmen where the best covers and coveys are to be found, excepting those which he has reserved for himself and friends. And yet, even in seasons when there is a dearth of game, he is equally unselfish, for then he is more inclined to lend his gun or his dog. In matters of generosity, the sportsman is thus in a class by himself. Whether game is scarce or plentiful, his generosity in respect to his brethren is ever in action. Ardent of temperament, ever considerate of the pleasure of his fellows, even to his own loss, and unswerving in his belief and loyalty in the sport dear to his heart, he is above any fluctuations of character or action on account of numbers of birds or their absence. Nevertheless, it may be conceded without any prejudice to the character of sportsmanship in general that in a season of general abundance the shooter or the fisherman will be more openly and frankly in communication in respect to the good places where most game or fish abound than he will be in seasons of great dearth. This peculiarity is no index whatever to a change in his character, although it may be taken as a very good index concerning the status of the game supply. In a season of dearth, if a sportsman only knows of one good place by hearsay, he is not apt to impose a hardship on his friends by suggesting that they investigate the one good place before he can report upon it from personal examination made by himself. In a season of abundance, if he should happen to err in his advice, the contiguous abundance affords means of ready readjustments. The season of abundance thus, besides the sport afforded directly to the individual in testing his equipment and skill against the elusive birds, provides him opportunity to give full play to those benevolent and brotherly traits for which the craft has a world-wide fame.

In default of a quail season fixed by law in Illinois, State Game Commissioner Lovejoy has designated the period extending from Nov. 1 to Dec. 20 as the open season for quail shooting. These are the dates which were named in the former law. While the Commissioner is, of course, without any authority to fix open and close seasons, his designation of these dates may be accepted, and we trust that they will be accepted, by the sportsmen of Illinois as binding, not in law, but in honor. Indeed we think that it would have been far wiser for Commissioner Lovejoy if, when he found that the Legislature had by a blunder omitted quail from the list of protected birds, instead of getting that disingenuous opinion from the Attorney-General, he had accepted the situation and appealed to the good sense and sportsmanship of the shooters of Illinois to refrain from shooting quail except within the period stated. Some more birds might have been killed, it is true, but both the Commissioner and the Attorney-General would have stood higher in popular esteem as officials who themselves have a becoming respect for law.

From many sources come added reports of an unusually immature quail crop this season. The birds are small and unfit to be killed. This may be accounted for in a measure at least by the extraordinary conditions of wet weather which prevailed over a large extent of territory during the breeding season. On the other hand, as we have said before, the wiser course would be to extend the close season through October.

A Philadelphia sportsman who killed a moose on Quaker Brook bog, in the Chesuncook Lake region of Maine, on the night of Oct. 11, four days before the season opened, was visited in his camp on the next day by Commissioner Carleton; the moose was dug up out of the mud where it had been buried for concealment, and

the Philadelphia man settled for his fun by paying over the fine of \$500 and surrendering the head. Thus Nemesis camped on the trail and descended swift and sure. It was one of the record performances of expeditious punishment of wrongdoing in the heart of the woods.

Our Boston correspondence this week records that there have already been three fatal shooting casualties in the Maine woods this year—human beings shot down for game; but we have yet to hear of any enforcement of the law which makes the killing of a man for game a crime. The law reads:

Chap. 263, Laws 1901.—Sec. 1. Whoever, while on a hunting trip, or in the pursuit of wild game or game birds, negligently or carelessly shoots and wounds, or kills, any human being, shall be punished by imprisonment not exceeding ten years, or by a fine not exceeding \$1,000.

It is of vastly greater importance to punish the slayers of men than the close season moose killers, and to be most useful for warning the punishment of the man killer should be quite as speedy as that of the moose killer. The Maine authorities cannot afford to go on any longer treating this man killing as accidental and something to be deplored, but condoned. Let the law of 1901 be enforced.

It was on an elevated railway train. She was recalling with a companion some happy days they had spent in the Rocky Mountains with a pack train, and she was so interested and so enthusiastic in the recollection of it all that the other passengers could not help but hear, as she described the climb above timber line and the gathering around the camp-fire at night, until reaching her station she left the car with the exclamation, "I'd like to do it all over again, but not unless we had an awfully congenial company." That was her summing up of the discussion we have had from time to time in these columns about companions for an outing—they must be "awfully congenial."

Sportsmen who return with game trophies from the Maine woods via Bangor complain that some of the wardens encountered on the trains at that point are altogether too zealous in their capacity as drummers for a Bangor taxidermist. The warden-drummer suggests to the owner of a game head that the most convenient and cheapest plan is to leave the trophy to be done by the Bangor firm; and if the owner assents, everything is made as smooth as possible. If, however, there is any demur, the warden-drummer insists upon the most rigid investigation, and makes it as unpleasant as he can for the sportsman. We have been told of one case where the conduct of the warden-drummer was so annoying that its effect was to turn the victim of it to other game fields.

That "Walk Down South" undertaken by Mr. Spears is something unique in our chronicles of outings. It demonstrates for one thing that he who is intent upon getting back to first principles need not seek the remote wilderness; it lies all about us at our doors. To carry out such an enterprise as here undertaken one needs to have in addition to his pack basket and other accoutrements a goodly stock of pluck, grit, resolution and fortitude; and the reading of this first chapter will abundantly demonstrate that our correspondent possesses all of these. We have in hand further chapters relating to the progress of Mr. Spears toward a warmer zone, and as these shall follow in due course, his plucky tramp will be watched with great interest.

Of all the hours of days in the woods, those which hold a place most gratefully and most vividly in our memories are the ones which reflect the blaze of the camp-fire at night. The entire day may have been filled with enjoyment—the early breakfast, the tramp on the trail, sighting the game, and the true-aimed shot, but the particular scene to which we recur most fondly in after years is that of the evening gathering about the camp-fire.

Ex-President Cleveland has published a defense of fishermen. The natural comment is that fishermen are not in need of any defense; they are conscious of their own rectitude, and can well afford to let the world scoff and call them lazy and mendacious.

The Sportsman Tourist.

A Walk Down South.—I.

FOR a good many years I have wished to make a long bicycle or foot trip somewhere on the North American continent. The desire was only increased when I went from New York to Buffalo on my bicycle, in 1897. At last I saw my way clear to a journey around the Great Lakes, on foot, and made my preparations accordingly, but at the last moment—within two days of the start—I discovered that I would be obliged to deposit a large share of my available cash as a guarantee that I would take my camera, and other duffle out of Canada at the port of entry. This was a difficulty greater than the necessity of paying \$25 for the privilege of hunting in any of the provinces; so I changed my plan entirely. I started south instead of north, and now, after nine days of travel I find that I did more wisely under the necessity than I foresaw during the depression naturally attendant upon an apparently complete wrecking of my designs.

On the morning of Friday, Oct. 4, 1901, I left Northwood, N. Y., in a buggy, took the train at Prospect, and went to Utica. I carried a packbasket of the ordinary Adirondack design, holding "just a little over three pecks," as the maker told me.

In Utica, I went to the gun store and bought a .32 caliber, rim-fire Remington rifle, single shot. I got this rifle because I have always used that action, and one can do better with a familiar weapon than with a strange one. It was not exactly what I wanted. My old .32 was a heavier gun, and when I had it bored out to take a .38-40 it did excellent and sure work. The one I have now can never be bored out. The barrel is too thin; still, it is a take down and can be fitted into my pack, if desired.

After a dinner, I took the trolley to New Hartford, four miles from Utica, got into my harness and started up the long hill that leads out of the village to the southwest, the course upon which I had decided. I had not gone far when I realized that I had a too heavy pack, and yet I have not seen my way clear to throwing away more than six ounces of what I have; in fact, I have added 5½ pounds to the weight, although I have eaten several pounds of the contents. From this circumstance I think that the outfit is about perfect for my needs. I will give a list of my things, with their weight:

Pork, 8oz.; baking powder, 4oz.; oatmeal, 8oz.; flour, 2lb.; beans, 1lb. 8oz.; salt, 4oz.; butter, 1lb.; molasses, 1lb. 4oz.; 2 pails, 1lb. 8oz. (granite ware, 2½ and 1½qt.); cup, knife, fork, 2 spoons, plate, 8oz.; fryingpan, 1lb. 2oz.; hatchet, 1lb. 8oz.; sweater, 1lb.; 2 suits light underwear (woolen), 1lb. 12oz.; 1 pair heavy woolen drawers, 12oz.; 3 pairs socks, 1 pair stockings, 1lb. 4oz.; pair long trousers, 2lb.; sewing kit, 4oz.; tent, 5lb. 4oz.; blue print, 1lb.; camera, 5lb.; camera plate holder, 3lb. 12oz.; hypo, 8oz.; trays to develop and fix in, 8 oz.; 2 doz. bottles (developer), 5oz.; printing frame, 1lb.; 6 dozen cut film (4 by 5), 1lb. 2oz.; 1 dozen plates, 12oz.; dark room lamp, 1lb.; pepsin, Jamaica ginger, vaseline, half pint whisky, 1lb. 4oz.; cartridges, three boxes, over 1lb.; basket, 3lb.; rifle case, 6oz.; writing paper, ink, string, 1lb. 8oz.—in all about 48lbs., without the rifle. It will be seen that 15lbs. consists of photographing materials, over 10lbs. of which is absolutely necessary for making pictures.

I sat down at the top of the hill, just out of New Hartford, and, looking around. It was not a promising country for the camper. The farms looked prosperous, and such wood lots as I could see were thin and of second growth. It seemed especially dreary when it was considered that there was little rifle shooting at game to be had short of forty miles, so I had been told at the gun store. However, after a breathing spell, I started on, and at last raised the grade to Paris Hill; but I did not enter the village. A little patch of woods on top of a knoll looked to be the only possible camping place thereabouts. I went to it, and looked over the ground.

It was nearly sun down. The wind was coming colder and colder every minute, and it swept under the sapling growth in a way that sent the chills through me, for I had sweated under the pack. Twice I circled round the half acre or so of tree growth, and then saw down in the hollow, half a mile away, a better-looking place.

I shouldered the pack again and vainly tried to climb a barbed wire fence with it on. I had to take it off, lift it over, and then crawl under myself. The exertion took my breath. The hollow reached (after three more fences), it proved to be better than it looked. A little brook ran among the thickets of small hemlock and second growth beeches.

My tent is of home manufacture. It is a rubber blanket 6 feet long by 3 feet 10 inches wide. This serves as a top. I cut four poles, and one of these—a five-foot one—I tied to two saplings, horizontally above the ground, about 5 feet up. The other three poles I laid from this one to the ground so that I had the framework of a lean-to camp. I spread the rubber blanket on top of the three poles and tied it taut with string run through corner eyelets. It sloped at an angle of about 40 degrees.

To the two side poles I then made the sides fast. The sides are right angle triangles, made of cotton factory drilling, painted with boiled linseed oil. About every 18 inches on the sides are sewed loops, in each of which a piece of chalk line, 1 foot or more long, is tied. If the poles are set just right, the sides hang plumb when tied to their places. But when I tied the fish lines to the poles the bottoms of the sides were clear of the ground. The poles were too high. However, I did not remedy the defect. I was tired and hungry, and it was getting late. I learned better later on.

The rear of the blanket came down to about 15 inches of the ground. This space, which, in a spruce bark camp is filled with a log, I stopped up with a strip of cloth, oiled, like the sides, about 4 feet long and supplied with loops for tying, on the corners and in the middle of the sides.

The tent faced a big elm tree. It was pitched in a thicket of small hemlocks. The ground sloped away from the tree and, consequently, the fire was higher than my feet and my feet higher than my head, when I came to lie down for the night; but this defect was not apparent when I started my fire, with dry hemlock twigs, kindled it with dry hemlock branches, and fed it with some green maple and beech sapling wood, which I cut with my hatchet. I carried in a lot of fallen branches, up to the size of my arm, and a few dry blocks of wood, which had been left when log ends were cut off.

The fire was warm and cheerful. It flared up delightfully. I put on the three-pint granite ware pail, for which I have a cover, swinging it from a pole. The water in it

it rose 40 yards away, and flew faster than any I ever saw before; even the chipmunks fled wildly.

After awhile I began to get tired; then hungry, and at 10 o'clock I was discouraged. The State line was a long way off—so far that I doubted if I could reach it. At noon I was heart sick; my shoe brace irritated my left foot, and my head thumped. Not even apples, of which I had all I could eat, could revive me. I stopped beside a brook, and, as it looked like rain, put up the rubber blanket on the hillside, and built a fire of dead wood, and boiled some water for beef tea. My courage came back as I drank. A red squirrel came out of a hole in a nearby walnut, but was back in again before I could get my rifle. I ate some bread and drank two cups of the tea, and made ready to start on again. I glanced up the brook, and, on the end of a hemlock stub limb, saw a red squirrel eyeing me. I shot, and it flew back, end over end, and came down in some briars. A glance showed the butternut tree squirrel to be poised over its home entrance. I fired at it, and this one tumbled down, and landed in the brook. I saw it was alive yet, and ran to head it off. But the little beast, though shot through the center of the body with a .32 ball, as I could see, got into a ground hole. The other squirrel, too, was gone, though it bled. My double had changed to a fluke.

At Oriskany Falls I stopped to write some postal cards. Three fine-looking hounds were near the post-office, among other dogs, and these showed great interest in me, barking loudly. I was told that birds were very wild thereabouts, and that fox-hunting was the leading sport. The memory of my cold night in camp caused me to add a 5½ pound blanket to my outfit, and I have not once regretted this added weight.

Just above Sollsville I decided to stop for the night. I went down the sand pit road to the railroad track, where there was a good spring, and prepared to pitch my tent on the hillside, where there was a little shelf. I made some pancakes first—cup of flour, three tablespoonfuls of oatmeal, baking powder, butter, salt and water—and ate them with relish. Butter and molasses went well on them. A glance at the sky, after I was through eating, caused a severe look in that direction. Long threads and streamers of gray clouds were reaching over the land, and some thicker clouds obscured the sun in the west. I promptly recollected an old house down toward Oriskany Falls, a few rods on the main road. I went to it at once, pack and all.

The building had been a dwelling, and there was a cellar under it, an orchard around it, and a good, shingled roof over it. But it had some hop boxes, a cutter, a pair of bobs and, in one end, a mow of hay. It was just the place I needed. At dusk I rolled up in the blanket, drew the rubber blanket over all, and snuggled down to sleep. Before morning it poured down in sheets of rain, and I shuddered to think of myself on that hillside, with the water gathering in a pool on the shelf where my bed was to have been.

About 9 o'clock in the morning I awakened, finally. I saw a mouse in the hay, and, with some misgivings, looked at my pack. Sure enough, the rodents had been in it. They had gnawed into the flour sack and eaten some of the bread crusts. Neither the oatmeal nor the beans had been disturbed. As I carry my flour, beans and oatmeal in cloth sacks, it was easy to patch the hole in the flour sack. But I had learned to hang my basket to a beam, when in barns, especially.

I ate a couple of fine, large apples, and some pancakes for breakfast, about 11 o'clock, cooking between showers, a few rods from the house, by a fence.

The rain and sore feet kept me from moving on. That afternoon I boiled what was left of my beef lunch and the blue jay. A couple of spoonfuls of oatmeal in the broth, with a little salt, made a fine and nourishing food. At dusk I got a pail of water, around by the railroad, and was asleep with the crows.

It cleared during the night, and grew cold. I had reason to be thankful for the blankets then. Not even hay could have kept me warm, with the ice forming on my water pail.

For breakfast I reboiled the blue jay and beef, and added more oatmeal and an apple. The result was nourishing, but to my taste not very good.

I started at 7:40 o'clock A. M., and in a few minutes passed through Sollsville. A boy told me that I was 12 miles from Eaton, which seemed a long way, then, as I had hoped it was not more than 7 or 8 by the map. But at Bouckville, two miles beyond, I learned that Eaton was only 4 or 4½ miles further. The long distance had made me tired to think of it. But the short one made me buoyant. I started on a 3-mile-an-hour clip.

Now and then I met a wagon or rig. Greetings were always passed. At Bouckville my pack basket was recognized as of the backwoods variety: "Where's yer deer?" was the hail. Mostly, however, it was supposed that I was "sellin' sumthin'."

About two miles from Eaton, say at 10 o'clock, I saw an old man and his wife painfully digging potatoes from a half-acre patch.

"How de do," they said, with nods; and I replied with a "How de do," and a nod.

"Ye ain't looking' for work, air ye?" the old man asked.

"No-o," I answered; "I hadn't calculated to."

THE BIRD CLIFFS OF MYGGENOES, FAROE ISLANDS.

soon boiled and a cupful, with extract of beef and salt in it, brightened the aspect of things quite as much as the fire did the thicket. Bread and butter, with some roast beef, made a substantial meal, the need of which I was too tired to feel till I began to eat and drink.

The last glow of the day was scarcely gone when I changed all my clothes, and put on my thick woolens—my sweater and my long trousers—I walk in bicycle knickerbockers. With my rifle in its case, out of the dew, my fire flaring under a new pile of wood, and the wind swaying the sides of my tent gently, I lay down on a bed of hemlock boughs, and soon fell asleep. It was after 7 o'clock.

Suddenly, I awakened with a start. A great, cold wave had swept down my back from my neck. The fire had burned to coals, the heat of which went up the tree instead of coming down the slope into my tent. I fixed the fire again and huddled over it, for I was chilled through. In the interval I prepared for breakfast. I put a cupful of beans to soak in the small pail. After awhile I was able to go to sleep again. I was awakened again and again by the cold, and each time I thought of the woolen shirt, which I had forgotten to put into my pack. It would not have been enough to keep me warm that night, but it would have helped. I took down one side of the tent, and that partly covered me, and I slept longer than before. Still, I was miserable.

At daybreak I put the beans to boiling, with a slab of salt pork, and then tried to shoot a red squirrel I could hear chattering near the camp. I saw it running once, but did not get a shot. It was wilder than some deer I have seen. After a while the beans were almost done, and I began to eat. Something was the matter, but I ate all but a spoonful, and washed the pail in hot water. I remembered then I had not poured off a couple of boilings of water; so the beans were rank to the taste. They were filling and I started out about 7:30 o'clock, feeling pretty good.

I took a course nearly west, overland. I crossed barbed wire, split rail and board fences; passed through stubble corn, oats, pasture, meadow and wood lots. I had tried the rifle on a fence post the day before, at 20 feet. I missed the post. But the sights were out of line. I remedied that, and the second shot was a nail driver. Now I wanted to "bleed the rifle." The chance came in a wood near the Oriskany creek watershed. A flock of bluejays came in range, and I shot one at 20 yards. I skinned and dressed it for supper, and traveled on, down into the Oriskany Creek valley. Once I saw a partridge;

"Well, what'll ye take to help dig these 'taters out here?"

"I don't know," I replied.

"If you don't, who does?" was his next question.

"Mebbe you do?" I asked, insinuatingly.

"Well, now, I'll give ye five shillings to work from now to dark."

That meant two "house meals" and, perhaps, a bed for the night.

"All right," I replied; "but I never dug potatoes in my life."

He hesitated a moment, rubbed the small of his back with a gesture I soon understood; and then I put my pack in the hop house and went to work. It wasn't easy, nor did I make much progress at first. I had to stop and see the proper stroke; and then to learn where to throw the tops back of me and not in front of him in his row. There was a place to put the potatoes—in the hill previously dug. But in five minutes I was going ahead without instructions. For twenty hills he kept up with me, even leading at times; then I hit the right swing for me. After that I did about a third more hills than he did. I judged from the way he looked at me that he was not displeased with my work. Noon came with a big dinner, including apple pie. Then to hoe again. At 4:30 we stopped digging and began to pick up. Even at this I could do more than he and his wife, and I was glad of that—but if he had been 50 years younger I would have been far behind.

That night he said that he would give me an even dollar to stay till noon the next day. I stayed; and the bed was large, soft and comfortable. I did not awaken once all that night. At 6 o'clock we were up; at 7:30 the barn chores had been tended to, breakfast eaten, and I went at the patch again. While I hoed, the old man put out horses, fed pigs and did other things, including smoking by the kitchen stove.

By and by a neighboring farmer drove by.

"Be they rotted much?" he asked.

"No," I said.

"What kind are they?"

"I don't know."

"Are you workin' reg'lar for Mr. Johnston?"

"No; my job's up at noon to-day."

"Don't you want a regular job as farm hand?" he asked.

"I never worked on a farm in my life," I answered.

"What!" he said, looking at the potatoes that were turned out that morning.

Then Mr. Johnston came up and took up the thread of the talk, and I finished the patch; and helped sort and carry twenty-odd bushels to the cellar bins. The rest the old man his wife and daughter thought they could manage, so I ate my dinner, received a silver dollar and at 1 o'clock started on again.

RAYMOND S. SPEARS.

[TO BE CONTINUED.]

In the Faroe Islands.

II.—Myggenoes.*

I MIGHT have waited at Bó for several weeks for the right kind of weather in which to go to Myggenoes, but fortune smiled upon me. After only two days of Western storm and fog, the wind changed to the northeast; the men of B. took counsel together, looked at the glass, consulted the almanac, watched the surf line on the outer islands, and decided that it was "Myggenoes six-man weather," and I could go with the turn of the tide.

Never, not even in Venice during my first ride in a gondola, have I felt so much like a personage as when I started in a large eight-oared boat with six sturdy men, half the adult population of Bó. All were clad in golden-brown, homespun coats and mixed brown and gray knee breeches; these have a row of brass buttons on the outer leg seam, but are always left unbuttoned, and display a bright, striped pair of garters and long, soft, brown stockings. On the feet are moccasins of sheep skin, bound around the ankles with thongs of knitted white wool; on their heads the Faroe "ligoa," or long, soft cap, of hand-woven cloth, dark blue with red stripes, or stripes of black and blue. This has a soft, gathered crown which droops over the ear or rests on the brow. The men had that calm, far-seeing look in their blue eyes that one sees often in sailors and prairie dwellers, and full, fair beards. After the manner of Faroe folk, all talked together and all the time.

I noted with satisfaction their powerful sweep at the long oars, and the perfect time they kept. But the big waves soon reduced me to a humble frame of mind, and I clutched tight hold of the gunwale, and would gladly have exchanged my state for a flat-bottomed boat on a pond. Once under the cliffs of an island, there was a conflict of wind and tide called a "roost," a battering kind of squall beat down upon us from the summit, and the men called out to me that I was not to be afraid, and that it would soon be over. Then out into the open sea we passed with beautiful views of the mountains and precipices of Vaagöe, their bare rocks glowing in the afternoon sun. The first Myggenoeses we met were hundreds of puffins floating on the waves and watching us with the utmost unconcern; then, as we reached them, in a twinkling, up flashed their little red feet, and not a puffin was to be seen.

It was not so long before we reached the eastern promontory of Myggenoes, but we had to go to the extreme western end, and in all that way there was not one place where a shipwrecked man could land and climb the cliffs. A cruel-looking coast it was, of brown, red and ash-gray trap rock, from 150 to 1,300 feet in height, capped and wreathed with the cloud mists. Thousands of auks, gulls and guillemots, puffins, kittiwakes and cormorants flashed back and forth, looking in the far distance like motes in a sunbeam.

At last we reached the western end of the island, and made apparently for the face of a cliff; but it opened to a wide rift, with jagged ledges on either side, over which the surfi was surging and falling back with an ugly, sucking sound. A line of green water lay between, and in we went on that line. There was no surf that day, and

the wind was northeast, so we could come close to the rocks. Then one of my men took me out, gripped my hand fast and slowly towed me upward over the seaweed-covered rocks, then the bare ones, then to rocky slopes, where the boats in summer are kept, then to higher ones to the winter boat houses, then to steps hewn from the solid rock, and so to the village path. I have never seen a more desolate place, or one which showed so forcibly the height and might of the winter seas.

Myggenoes Village, as I found, is not a cheerful place. It has perhaps 150 inhabitants, and there are no houses elsewhere on the island. Around the rocky bed of a brook the cabins are built, and sticks and stones and bones lie about in confusion. There is no attempt at gardening and grass plots. The summer is cold and short, the winds are strong; potatoes barely grow, and are small and soggy; the few little patches of barley never fully ripen. But wherever the ground is drained and cleared of stones, there the grass grows thick and long; the one sweet and gracious thing in Myggenoes—fragrant as sweet clover and adorned with pink catch-fly, daisies and saxifrage. Good grass and puffins are the compensations which Mother Nature bestows upon her Myggenoes children.

I am staying with Herr Abrahamsen, one of the chief men of the village. The first evening after my arrival he and his brother Paol went with me to see the nearest bird cliffs; first to neighboring outfields, where thousands of puffins have their nests in burrows between great boulders, and in grassy hummocks. Others live in grassy ledges on the cliffs, and in dangerous, grassy slopes, and a rope is necessary with which to reach their nests. I pointed to a hole, and asked Herr Paol if he thought there was a nest in it. "We will soon see," he replied, and lying down flat he inserted a long arm. A puffin was at home. I heard Herr Paol's exclamation as he was bitten, and an instant later he wriggled up, holding a struggling bird, the prettiest thing, with snow-white breast, clean, little, shining feet, and a big bill, which was a "symphony" of violets and green-blues and soft reds. I admired it much, and stroked its back, and was about to ask Herr Paol to put it back, when he wrung its neck before my horrified eyes. Of course I knew it is a puffin's fate to have its neck wrung, and I think I ate that one next day, and will probably eat thirty or forty more before I leave; but there is a sentiment about one's first puffin.

Then we went to see the homes of the "havhest" or gray gulls, climbing a long, steep, grassy slope, where Herr Paol thoughtfully walked below me so I could step by the side of his big feet; and we lay down and put our heads over a sharply sliced-off cliff and looked over and down ledges where the beautiful gray and white birds sat on their nests. The fog was milling up from the sea I don't know how far below, and the sun struggling through the clouds turned it a glory of fantastic wreaths. Then to the guillemot and "rita" or kittiwake cliffs, where hundreds of guillemots sat bolt upright in rows like china figures on a chimney piece. The dainty little kittiwakes were nesting above them and making an astonishing noise, quite at variance with their pretty looks and manners. "He makes as much noise as a rita of the rocks," is an expressive Faroe proverb, applied to a noisy, talkative man. Having taken a general survey of the neighboring bird cliffs, so I could know where and how to go another day, we all returned to the village, and I went to sleep under a feather puff containing ten pounds of puffin feathers, and had the most awful dreams of rolling down grassy slopes and going plop into the sea; of sitting on narrow ledges that crumbled and gave way beneath my weight; of catching at things that snapped in my hands, and having boulders whiz past my ears. Indeed every night I fall off of something in my dreams, and have come to dread these inevitable nightly adventures. After a week on Myggenoes, one longs to be on a flat and flowery Western prairie and walk miles and miles in a straight line. I told my fears and dreams one day to an old sea dog of a Myggenoeser who was sitting on a cliff, and he assented sadly, and I found afterward that I had better have confided in any other man, for this one had had one son killed on the cliffs a fortnight before, and another drowned at sea in April.

A fine set of men are the Myggenoesers; hardy, athletic, brave, skilled cliff men, daring boatmen, proud and reserved to strangers, cheerful and very talkative among themselves. Their power of speech was a marvel to me; they had known each other intimately all their lives, are often weeks in the summer time and months in the winter time without one new idea coming from the outside world, and yet the stream of words can flow unceasingly for eighteen hours out of the twenty-four. It was, to me, one of the wonders of Myggenoes.

The young girls, who work out of doors a good deal, are bright and healthy, but most of the married women look worn and sad. Their anxiety about the men must weigh upon them. Storms are sudden and violent; the coast and the landing dangerous. Boats have gone out for a day's fishing, have been obliged to take refuge in Bó or Sorvag, and for weeks and sometimes months the women did not know if their men folk were alive or dead. Not long ago a boat's crew of men stayed three months and a half in Sorvag before possible weather came, and the standard of a man of Myggenoes regarding the weather is not yours or mine. Bodies of men drowned in these waters are seldom found. But last spring when a boat was lost the fishing net drifted to the Vaagöe shore to tell the tale.

There is a little church here painted white, and sodded with turf on the roof. Service is held thrice a year, between April and October. A winter visit is not to be expected. Last autumn a young Myggenoeser was so inconsiderate as to plan to be married in November, so the pastor ventured to go. But a great storm arose, the boat was crushed in landing, and the occupants had a narrow escape. As for the dead, the people sing a psalm or two at their graves, and there they lie until the pastor's next visit, when a funeral sermon is preached in the churchyard. A desolate place, even in June, is that graveyard. No attention whatever is paid to the graves; there are no flowers, no grass, no headstones—only little posts with the numbers of their record in

the church books. Over all, and growing high above the churchyard wall, is a horribly rank growth of Angelica, and a bare spot, where it has been cut away, marks a new-made grave. Every Sunday the people meet in the church, and Herr Abrahamsen reads a sermon, and the people sing the psalms. These sermons are appointed to last two years. At the end of that time it is supposed that the first sermons have been forgotten, and Herr Abrahamsen begins over again. Bare floors, bare bench seats, a little white-covered altar, a beautiful antique brass basin, of fine repoussée work, large enough to hold triplets, two contribution boxes with handles, marked respectively, "For the school," and "For the poor of the land"—this is all the church contains. In the entry I saw a little shovel with long, carved handle, which the pastor uses in the burial service, casting earth on the graves three times, and saying, "From earth art thou come; to earth shalt thou go; from earth shalt thou rise again."

The school house is close to the church. We are having the June holidays of two weeks' duration, to enable the children to help in drying and bearing the peat. But if it is a stormy day, from my window I see the school master (who keeps bachelor's hall above the school room) open the casement and toot on a nondescript tooter. Then, since the children cannot work, they must go to school and study. What would our young Americans think of such an arrangement?

In August they will have another two weeks of these so-called holidays, when hay-making begins.

As I stand by the churchyard gate I can see the small boys and girls climbing and descending the hills with the peat racks on their shoulders; their chattering sounds like a chorus of titlarks. They will grow up and emulate the conversational powers of their forbears. They are sturdy little men and women, and as they wear the same costume as the grown-ups, I am often deceived while watching the fjelds, thinking that a little boy not far away is a grown man at a greater distance. I would gladly spend much time on the peat moors, but there ranges a bull—an ungracious animal, quick to note and disapprove a "fremmed folk" or stranger. It is silly to be afraid of Faroe bulls, so my Faroe friends tell me, and then they forget me in talk among themselves.

"Do you remember that time Sigmund was chased to the edge of that precipice, and lunø on as long as he could and then dropped?"

"Was he killed?" I gasp.

"No, not quite; he did live, but he was pretty badly smashed." And then they go on, "Was it last year that man was killed on Fuglöe?"

"No; you're thinking of that case on Kunöe; Fuglöe's was year before last," etc.

It was a beautiful, calm morning at 8 o'clock to-day, and eight boats went to sea for fishing. Then in about two hours a great surfi arose; no wind, but probably the after effects of a storm at sea. Back came the boats, hurrying to get to shore before it grew too strong; but it was too quick for them, and they retreated to the open sea beyond the reefs of the rift. And there, while waiting for a lull, the men sang the home-coming song. I could hear their voices rising above the roar of the sea:

"Praise be to God,
Father in Heaven,
Who all things has created,
And praise His Son forevermore,
Who saves us all from danger;
And praise be to the Holy Ghost,
Who gives us of His Grace;
This praise has been before all time,
And shall be without end,
God us His mercy send!"

Then the first boat charged in, neared the rocks, found it could not land, whirled back to the lea of a cliff; there watched the waves and rushed in once more. Men on shore were waiting to help, the crew sprang out, all seized the boat, some being carried from their feet and dragged in the water, and it was swept on and over a ledge into a pool just as a mighty wave crashed down. One after another of the boats came in, the surfi increasing, all on shore helping, watching the seas and giving the signal when to dash for the rocks. Then the women came trooping down with hot coffee, and the men sat down quietly, drenched as they were, and cleaned the fish they had caught. ELIZABETH TAYLOR.

Brigands and Their Ways.

THE abduction of Miss Ellen M. Stone, the American missionary, by brigands for a ransom, has turned the attention of the entire civilized world to the brigands and their ways. The following account of Greek brigands, written by a ransomed captive, gives an insight into brigandage as practiced throughout the East.

With the green leaves of spring, the brigands, who have been skulking in holes and corners all the winter, begin their season. The difficulties of movement in winter, the facility with which their steps might be traced in the snow, or their camps upon a bare hillside detected by the smoke, are over. Wood cutters, charcoal burners, herdsmen, and shepherds, who keep to the lower grounds in winter, now commence to spread over the hills in pursuit of their several callings, and become available as confederates and purveyors. For the next eight months the marauding bands have it all their own way on the mountains—not, as in former days, in small parties of five or six, indifferently armed, but numbering thirty, sixty or a hundred, armed with the best modern weapons. They sweep over the country, requisitioning the villages for provisions and money, and carrying off and holding to ransom any one whom they may ascertain to have the means of buying his life at their hands.

The connection of political ends with the savage excesses of brigandages must always be kept in mind. It was under the guise of supporting insurrection that filibustering parties landed on the coast and ravaged the district lying around Mount Olympus in 1878, distributed arms and ammunition among the peasantry, forced them from their homes, and finally left the worst of their numbers to form the nuclei of the bands which now devastate the country.

*For first paper see issue of March 2, 1901.

The impunity with which brigandage is carried on, and the consequent demoralization of the country, render easy the task of recruiting for the ranks of the various bodies. To organize a band is a process somewhat similar to shipping a crew for a voyage. It is bruited round that such and such a captain proposes to take the field and needs recruits; and among those who respond, if the chief is famous, not all are novices. Members of one band go over to another, according to their fancy. Accurate accounts of expenditure are kept, and a portion of all loot being put aside for expenses, each member is entitled to his share from this general fund on quitting. In dividing their booty a part is put aside for this expense fund, then the captain takes one-tenth, and the remainder is shared. Jealousies therefore exist among the chiefs, who do not care to see perhaps their best men joining a more popular captain. Brigands can never act without their spies and confederates, who obtain all the requisite information, leaving the enterprise itself to be carried out by the band. Implacable in their vengeance on any confederate who may betray them, they command what services they require. Frequently the non-compliance with the demand to be supplied with provisions has been visited with the most condign punishment.

It is one of their unalterable rules that no prisoner must be recaptured alive. This law it was that caused the massacre of the unfortunate Englishmen at Oropos, who were murdered as they tired and so became unable to keep up with the retreating band when troops were in pursuit. Therefore, in the captive's own interest, pursuit should be suspended pending the negotiations for ransom. Another of the unwritten laws by which they are inexorably guided, and which always lean toward ferocity and bloodshed, is that no captive must escape without satisfying the demands of the band. The following story, told me under circumstances which gave it thrilling interest, will show how pitilessly this law is carried out:

An unfortunate doctor, returning to his home at Yantina, fell into the hands of the brigand band under Catakis. On being asked his means, he said he had £200 out at interest in Constantinople, and £180 which he was waiting to convey to his home when a safe opportunity occurred. The brigands agreed to take the £180, and the man with whom the doctor had been traveling, and from whom his horses were hired, was sent to bring the money. Time passed, the doctor treated several wounded members of the band and earned their gratitude, but the ransom arrived not. At last a message came from the trusted envoy, saying that he had been robbed of the money on the road. A meeting of the band was held, and the execution of the law decided. I asked the narrator of this tale whether they had no compassion for one who had done so much for them. He replied: "Some of us wished to spare him, but the captain would not hear of it." I asked him how the law had been executed. Nothing, I learned, was said to the doctor; but, on passing a deep ravine, his attention was drawn to something down below. As he looked he was struck from behind and fell on the rocks.

In September, 1879, the famous chief Niko perpetrated a crime as hideous as that which a civilized world has always declared Ed. About went too far in imagining. Niko entered a village, and, in the absence of the father, carried off two little girls, aged eleven and seven respectively. The father made up and sent a sum of money, which Niko accepted as ransom for one child. The wishes of the band were to release the younger, and three times the lots were drawn, each time in favor of the elder, who was accordingly released. A further demand was made on the father, which he would not meet, and, at the expiration of the time allowed, he received an intimation that he would find his child at a place named. The poor little thing lay there dead, with its throat cut and a bunch of wild flowers still grasped in its hand.

After capturing a prisoner, the band will march for some days in different directions, with a view to baffling pursuit; and then the captive, being confided to a trustworthy guard, is taken to a place tolerably secure and utterly unknown to the other members, excepting the chief and one man, who brings the supplies. Thus the capture of any of the outposts, on which duty the remainder of the band are employed, would be useless as a means of discovering the captive. Supplies are obtained from confederates, and are brought long distances.

No band is complete without its tame sheep, one of a jet black color being preferred, as not easily visible at night. This animal, taken from the flock when young, and brought up among the brigands, becomes much attached to them. I have been told of cases where the instinct of the sheep has given intimation of the presence of troops in ambush or approaching. But its chief use is to take charge of and lead the sheep carried off for provisions. The brigands will sometimes seize twenty to thirty at a time, herding them in some remote valley high up in the mountains, and consuming them as required, thus rendering themselves independent of supplies from below.

The favorite weapon of the day among the brigands is the Gras rifle; but it can only be obtained of deserters from the Greek army. Other weapons with which they are armed are the Milonas or condemned Greek rifle, and some few have Martinis. Besides the rifles they carry a short sword or yataghan, a hanger or smaller weapon of the same kind, a revolver, and an assortment of knives—as they avoid eating their food with the knife used for murder. Their ammunition is worn in bandoliers on their chests, and slung around them. Every man carries a wallet containing cleaning things for his rifle, perhaps for himself, needles and thread, and odds and ends. There are also some spare wallets to contain the general property.

The fustanella or plaited kilt is usually worn, and before being put on it is soaked in oil, which makes it of the neutral color required, and renders it less pliable to retain parasites. A large cape with a capote or hood, and made of wool and goat's hair, completes their equipment. Some are foppishly inclined, and adorn themselves with most gorgeous gold-embroidered garments, while others cover themselves with silver ornaments, of which a man will wear some thirty pounds' worth on his person.

Flint and steel are carried by all; and they are very clever at making fires—one especially without smoke. Very dry wood is necessary for this purpose; it is care-

fully split, and the pieces laid crossways on each other, something in the fashion of the altars in "old saints;" light is applied on the top, and the sticks burn downward, giving out much heat, but no smoke.

Strong drinks being avoided when on business, brigands become great connoisseurs of water, preferring streams that run through beech forests to those where oak or pine leaves drop into the current. They also have their favorite springs, on the merits of which they descant as some people do of wine.

Though many of them are ignorant savages, others are not wanting in education. It is common among them to read and write their native Greek, and several speak other languages. The chief Niko has learned to read and write since he took to the life of a brigand, and in summer he carries a small selection of books about with him; in winter his library is limited to a school edition of the life of Alexander the Great, and a manuscript of some of the miracles of old saints. Superstitious as all the class they belong to, these ruffians hold the Church in considerable veneration. They never omit to cross themselves at their meals, though their conversation is mingled with the most hideous blasphemies. When one of their number is killed, or too badly wounded to keep up with the band, his head is cut off and carried away, partly with a view to escape identification, and partly that they may be enabled to bury it within the precincts of the church yard, a custom they invariably endeavor to carry out.

Natural History.

Bird and Fish Migration.

In every age and clime, and before the extent of their annual pilgrimage was known or surmised, men marveled at the recurring flight of the winged wanderers of the tenuous air. They came and went; none beheld them, nor knew whither they sailed; naught of farewell did they give, but silently floated away into viewless space. With a knowledge of the wanderings of the feathered host, greater has become the marvel and deeper the mystery of their far-stretching flight, yet the journey of the plumed caravans, however worthy of the admiring praise bestowed in prose and verse, falls far short, in long-suffering privation, hardship and danger, of that imposed upon the migrants of the deep.

We cannot lift the veil that shrouds the abyss of waters; we only know that, somewhere from out its mysterious depths, there emerges, at regular intervals, a marine courser of graceful lines, which, with arrowy speed, plunges into the rushing current of our Northern rivers. This creature, cast in elegant mould, stirs the admiration of its supreme enemy, not so much by its symmetry of form, beauty of armor, or savor of flesh, as by its self-imposed privation and sacrifice, its dauntless energy, its magnificent physical prowess.

The kingly salmon, fresh from the ocean's boundless pasturage, and nourished into condition fit for the terrible ordeal that awaits it, is a vital engine of wondrous power. Man's utmost cunning cannot shape a device that will move, or even lie, in the water as it will, nor can his subtle mind explain the dynamic relation of its various postures with the resulting motion. Up, through a plunging, watery avalanche, its lithe and supple body cleaves its way; or, with the tenuous and mobile element as an unstable base, it is flung, in lofty arc, through the incumbent air. Yet these, and other impressive exhibitions of force, are effected by thin and delicate membranes, of action as diverse as the shifting pinions that the skill of the mariner adapts to the zephyr's kiss, the breeze's strain, or the tempest's rending blast.

In shapely curves, gently tapering toward either extremity of the body, are masses of muscle, braced and supported by a flexible framework of ribs and spinal column, that, with pliant lateral sweeps, urge it forward with amazing power. These masses of flesh are divisible into flakes, that, for the most part, may be considered as separate intercostal muscles, constricting the ribs, and effecting bodily flexures varying in degree. At the outset of the salmon's trivial journey, upon quitting the ocean's brine, these flakes are separated by films of fat, not only serving as a lubricant to the intervening muscles, but also as a fuel, and furnishing, with other deposits, a store of energy to the organic engine that, in its far wanderings, knows no source of supply save the fruitful mother of waters from whose bosom it departs. For the finny migrant, in its arduous pilgrimage, the end of which, with many colonies, is death to each and every individual, finds, or at least seeks, no sustenance in the alien element to which, in all-absorbing parental anxiety, it is irresistibly impelled.

This abstinence is the seeming outcome of a stern and inflexible evolutionary process, remorseless to the individual, but kindly to the race, which it seeks to conserve. In the formation and growth of the migratory instinct, especially when involving the attainment of remote spawning places, it is obvious that a seasonable arrival would be oftenest affected by such fish as hastened most to their destination. Delay would hazard the full development of the spawn, and its enforced deposit in barren places; or, if cast in suitable localities, the resulting progeny, in competition with earlier and more vigorous hatchings, would be the weaker in the struggle for existence, and thus afford fewer survivals. Moreover, the departure of the young fish is taken at a definite period, and such as lacked a proper degree of development, if joining the main body, would soonest succumb to the hardships and dangers of the long seaward journey. If remaining behind, and undertaking later the descent of their natal stream, their lesser number, and, perhaps, a more unpropitious, but certainly a more untimely season, would inure to their greater disadvantage. Such influences, exerted generation after generation, and, with pitiless operation, ever sifting out the laggards and conserving the expeditious, would necessarily tend to develop a race in which the breeding impulse would be-

come paramount, extinguishing both the desire and the capacity for food, and followed to exhaustion and death.

With the king or quinnat salmon, and probably with all species, both in the Atlantic and the Pacific, a modification of the alimentary organs seems to be effected upon the entry of the fish into fresh water. The gullet contracts and the stomach shrinks, so that the retention or even the swallowing, of food would be difficult. At the Pacific breeding stations the streams are barricaded so as to arrest the ascent of the salmon, and thus to hold them pending the requirements of the hatchery. A relentless impulse, bred in their dull brains through the winnowing ages, chains the struggling fish to their place below the barrier, where, for weeks and even for months they blindly breast the river's current, its steady flow yielding them no rest, nor bearing them appreciable sustentance. From three to five months is the usual period of detention, and, when it is considered that, through all that time, the fish, unenriched and unrefreshed, are engaged night and day in holding their ground, the feat may be regarded as one with scarce a parallel in animate nature.

Its accomplishment, however, involves a fearful drain upon the physical powers, for, from the moment that the armored pilgrim emerges from the brine, he, to all appearance, subsists upon his own substance, consumes his own flesh and blood. The vital current that, in rich and abundant flow, strengthened every muscle and steered every nerve, slowly and steadily diminishes, and at last almost disappears. Day by day, the inter-muscular layer of fat diminish, and finally vanish, the rosy hue of the wasting flesh turns to a dirty white, and even the scale fall away and appear to be absorbed into the body. Into the alimentary furnace of this wonderful organic engine is everything apparently cast that will feed the flickering flame of life, until the worn and ravaged enlacement, like a dismantled hulk, drifts, without guidance or impulse, at the mercy of the descending waters.

The finny caravan, at the outset of its fateful pilgrimage to the cradle of its race, breasts the ocean in a massive host, the burdened females, with anxious care for the promise of the future, proceeding behind a vanguard of the largest and strongest of their brethren. In their armor's silvery sheen, no joint unloosened, no plate displaced; in their gay coloring, flashing with rainbow hues in the swelling curves of their shapely forms, as, with buoyant grace and eager bound, they course the sparkling waves, those knightly pioneers betoken a fullness of preparation for their mission of hardship, danger and death. Sad, indeed, is the contrast presented later, when, with thinned ranks, and frames battered, distorted and emaciated, they feebly and ineffectively seek to return to the far-off fountain of their strength.

Keeping close to the coast, perhaps as a partial protection against a multitude of enemies, the approach of the embattled array is discernible at a distance, their dense ranks surging forward over the heaving ocean. So assiduously do they seek the cover of the land that, when encountering a deep bay, they have been observed to follow its indented curves in preference to taking a straight course across its mouth. Watchful of marine assault, but unwary of other dangers that enmesh their shoreward path, they speed along, and only as they near their destined estuary do they become otherwise circumspect. Carefully reconnoitering, they suspend their advance perhaps with a view of effecting a satisfactory identification; perhaps to determine the presence of dangers feared, but unseen. After this preliminary halt they enter the estuary's confines, and where the ocean's brine mingles with the alien element to which they shrink from committing themselves, a longer halt is made. Here, upon the border between fruitful and barren waters, they may tarry a week or more, gaily disporting themselves in a medium that lends to beauty of form every grace of motion. Their vacant brains cannot be prescient of coming privation and suffering; they cannot linger because mindful of the tragedy to which their present joys form only a mocking overture. Perhaps they await a proper adjustment of the temperature of the effluent waters; perhaps a due development of their quickening burden; but, more likely, a adaptation to an unaccustomed element. Day by day, however, their parental anxieties deepen and soon common and an overwhelming impulse urges them forward into a valley of death whose rushing waters become the fruitful nursery of a new life.

Sometimes to wondering, sometimes to incredulous ears, there have been borne tales of the finny wealth of Alaskan waters; but, as a matter of exact information, may be mentioned that upon Aug. 2, 1889, the canner nets at the entrance of Karluk River took in, by actual count, 153,000 salmon of an average weight of 20 pounds. That was the number of quinnat, or king salmon, yielded in one day, by a little island river but a score of yards in breadth at its mouth, and scarce as many miles in length. From the single fact that instanced, it will easily be inferred that, in vastness of number, in orderliness of movement, and in absorption of purpose, the fluvial advance of these finny hosts forms a deeply impressive spectacle. Against the river's ebb there flows a countenance but a living tide that, filling its bed from bank to bank, surges upward in dense and compact array, seeking, with fervid resolve, to attain the life-giving upper reaches of the opposing stream. These are gravelly beds, in shallow waters, whose rapid flow and limited depth admit to the deposited germs an abundance of air and sunshine that quickens them into active life. Within these beds the parent fish scoop hollows that receive the ova, while they then cover with gravel; but the accomplishment of the unquenchable aim that, through weeks or months of toilsome endeavor, has sustained them, seems to bring no abatement of parental concern. Little, very little, can they now do to further the development of their precious brood, rocked in bright and sparkling waters, whose every motion bears to the loosely covered germs the need of vitalizing oxygen. Nevertheless, though thus kindly nurtured, the anxious parents seem loth to qu-

¹The abundance and size of North Pacific fish is amazing. Cod, herring, halibut, salmon, etc., average greater weight than those of the Atlantic. Salmon have been caught exceeding 100 pounds.

²It is said that the incoming mass of salmon so choke some of the smaller streams as to cause them to overflow their banks. Atkinson's Travels on Amoor River in "Cruise of the Marchesa" F. H. Guillemard, 1886, says that thousands perished in the Kachkatka rivers by being forced upon the banks. These small streams are doubtless overcrowded by reason of their accessibility, and thus many are driven to spawn in the upper tributaries of the large rivers.

their cradled offspring, and their deeply sunken eyes watch, with perhaps anxious solicitude, the place of burial. But the glad day of resurrection is not for them; their fins, worn white and ragged and crippled by a fungus growth, feebly hold them against the current. Gradually they succumb, and, though borne downward, it is with heads turned toward their buried brood, save occasionally, in some mad flurry, they may rush a short distance with the hurrying stream. Parasites invade their gills, and thus, with impeded respiration and enfeebled body, the end draws near; a violent thrashing of the water, perhaps a dart into the air, and it is only another dead fish floating down to the distant and all-receiving sea.

At all distances exceeding 500 miles, it seems certain that none of the fish regain the ocean alive, and that within such distance the survivors form but a small portion of the original host. It follows that in the upper waters of the Columbia, whose remoter spawning beds are far beyond that limit, that the finny pilgrims immolate themselves to the last individual. This great river was not always known as now; its former and more impressive designation, when it traversed an unknown wilderness, is embalmed in Bryant's lines:

"Where rolls the Oregon, and hears no sound
Save his own dashing."

The poet's language implies that, even within a few years of its discovery, it was known to be a turbulent stream, and such it is to-day. From its remote source to near its mouth, its course is marked by a swift current; its navigable reaches broken by fierce rapids, impassable to vessels. Vainly, however, is the might of the furious river exerted against the indomitable salmon, that, with masterful strength and activity, overcome each and all of the varied oppositions of the shouting waters. If confronted with a foaming rapid, where the chafed and angry flood, in mazy whirls, darts hither and yon, the fearless adventurers, undismayed by the mad riot of confused and opposing currents, fling themselves into the fray.³

There is in all creatures whose habits confront them with peculiar exigencies a wonderful adaptation thereto, the mode of accomplishment being often inscrutable. The chamois of the Alps, the Rocky Mountain goat, and the argali, if suddenly facing an unlooked-for danger, will plunge down a precipice and, alighting upon a narrow ledge, will again and again repeat the startling performance, until reaching the bottom. Here is a wonderful correlation of propulsive and restraining effort, an accurate and instantaneous adjustment of momentum to weight, accomplished with certainty of result, though under stress of sudden alarm. If the animal puts too much effort in his leap, he will overshoot his little mark, and fall headlong; but landing, he must at once arrest his momentum, preparatory to another bound, else his impaired balance would entail disaster. With his precarious footing and narrow lodgment, he automatically determines the amount of restraining force, exerting it gradually, and then expanding it into another propulsive movement, of like mathematical accuracy, he bounds downward like a rubber ball. An expert gymnast, by frequent experimental effort, might ascertain the precise degree of force necessary to perform a single step of the series mentioned; but the chamois, in fear and discomposure, at all the different stages of descent, varies its expenditure of energy with a nicety of precision that would seem to imply powers of perception almost verging upon a distinct sense.

Some such apprehension or sense, if sense it be, must seemingly be attributed to the royal salmon, who, in the turmoil and tumult of wildly seething waters, discerns ways and means of progress,⁴ not open to our scrutiny, or, perhaps, to our understanding, even if revealed to our wishful eyes. With careful venture, the finny acrobat slowly climbs the water steeps, and, in his advance, nurses his strength by tarrying in every pool, or reach of slackened water; even the depths of a boiling cauldron may afford him needed rest, for, amid the roar and riot, his occult sense perhaps reveals the neighborhood of hidden waters of comparative quietude.

Within two hundred miles of the Columbia's mouth there are two effective obstructions to navigation, the first known as the Cascades; the second, forty miles beyond, the Dalles, through which latter the river, narrowed by vertical walls, rushes with tumultuous speed. In each of these dangerous reaches, perhaps many salmon meet with grievous injury, for skill and adaptiveness may not guard against every manifestation of wildly erratic waters. Beyond are yet other rapids, and, with the passage of all, there follow foaming cataracts,⁵ whose vertical plunge confronts the toiling wayfarers with loud-voiced defiance; but the wasted, yet undaunted, band assails the barrier. Again and again, in graceful vault, they hurl themselves against the water's thundering front; if beaten back, bruised and lacerated by jagged rocks, the assault is renewed until exhaustion, defeat, or success, crown their endeavor. Thus struggling onward and upward, ever battling with the varied outbursts of the contending stream, they attain, at last, its shallows, where, if the depth be insufficient to float their worn bodies, they force

themselves along upon their sides, or, with straining effort, hop along until deeper water is attained. Now do they near the bourne of their long and arduous pilgrimage; beyond is their natal bed, the very cradle, where rocking waters ushered them into existence. "As a bird that wandereth from her nest," so does the attenuated pilgrim from the far-off sea know the place, the identical spot, of his birth, and he regains it but to die.⁶

Among the various tributaries of the Columbia it is difficult to determine the fittest attainment of the salmon; they ascend to the Bitter Root Mountains, far up in Idaho, to Spokane Falls, Lower and Upper Kettle Falls,⁷ and, perhaps, beyond, for the extreme limit attained in the days of departed abundance is not now known, but was probably not far from a thousand miles of toilsome ascent.

Against the mighty ocean that thunders upon the Western coast of our hemisphere there is uplifted a mountainous wall that, with varying elevation, stretches from the border of the South to that of the North polar zone. Nearing the latter, it no longer opposes its soaring peaks to the retreating sea, but, with drooping crest and diminishing base, loses itself in wide wastes of frozen soil, to which an Arctic summer lends a passing flush of green. Across these barren tundras there winds a flood of waters, gathered from the landward slope of the snowclad Rockies; a rolling tide that forms our Continent's largest Western outflow. This river is the Yukon, that in length and in volume exceeds the lordly Columbia, and, also, in the wealth and in the range of its salmon. From its remote beginning in the Pelly Lakes, to where it meets the embrace of the welcoming sea, the eager river hastens over an oft-vexed and troubled course of 2,300 miles. Between these far distant points, and through the long, intervening stretch of fiercely opposing waters, do the toilers of the widely Sundered sea struggle to accomplish the supreme end of their brief and unthinking lives.⁸

In ascending a large river, having a number of tributaries, the first of the arriving shoals are usually those that strike for the remotest waters. Next may follow those bound for a lower and a nearer tributary, and, so, in due order, the various "runs," as they are called, make their successive appearance, and it may be some months before the last of the mailed legions crosses the bar of its fateful Rubicon. In the Sacramento the first "run" ascends leisurely, perhaps averaging but two or three miles a day, reaching the head waters, near Mount Shasta, in five or six months. In the Columbia the movement is more rapid, and in the Yukon it is the speediest of all. To effect the deposition of the spawn by the first of November, the seasonable period, requires, of course, an expedition of movement corresponding to the remoteness of the destination, and thus the Yukon salmon need to be far more active than their brethren of the Sacramento, who probably prolong the daily sestas that they take in quiet pools. In the Yukon the run begins in June and lasts but five weeks, so that in about four months the head water fish attain their far distant bourne. It would almost appear as though these timely voyagers possessed an itinerary of the route, the fish of one river knowing that a daily jaunt of two or three miles would suffice; the others, that they must set for themselves a task five or six times as great. It would seem, however, to be probable that each school of fish starts with an inherited impulse to perform the daily average that the distance calls for; it being, moreover, evident that the fish conserve their strength to the utmost, and extend their journey to the full limit of the time that is required. This nicety of adjustment is the accomplishment of the race, not of individuals. For thousands of years the route has probably been traversed, and those of each generation whose effort was most economical and most timely, were those that maintained their species, but for those that dallied, or blindly stumbled into divergent paths, the penalty was that of the Mosaic law. "Ye shall sow your seed in vain."⁹

In his descent of the Yukon the explorer, Schwatka, found its current impetuous and rapid, much of his downward drift being accomplished at the rate of four miles an hour.¹⁰ In what he styles the "Grand Cañon of the Yukon," the river enters a chasm, with vertical walls, between which it is compressed to a tenth of its former width. Through this narrow cleft the tortured stream rushes in a foaming, billowy mass, its angry roar, reverberated from the inclosing walls, being thundered afar; but the salmon, braving the wrath of the maddened waters, penetrate the gorge and emerge upon the smoother reaches beyond.¹¹ Other rapids are passed; other dread obstacles overcome; day by day the implacable current's wearing flow is mastered; many droop and

³ Well-ascertained fact.—U. S. Fish. Bull., 1893, p. 99.

⁴ Lord, in his "Naturalist in British Columbia," p. 74, says that he has seen fifty salmon in the air at one time, struggling to surmount Upper Kettle Falls, which, except at highest flood, were impassable. After every futile effort they would take refuge in comparatively still water, behind a rock, or in a hollow, to rest before renewing the attempt.

⁵ The height of a salmon's leap, as officially determined by the Norwegian Government, is 16 feet. Swainson, Chap. IV., "Habits of Animals," says on the Irish river Liffey there is a 19-foot fall that has been cleared by salmon. In Labrador 10-pound fish have been observed to vault 18 feet, presumed to need a preliminary velocity of twenty-three miles an hour. It is not unlikely that the giant salmon of the Pacific, with sufficient water to exert their fullest energy, could exceed these leaps; but such fish as probably cleared both Lower and Upper Kettle Falls will never do so again, for they have been practically exterminated.

⁶ Warburton's "Through the Sub-Arctic Forest," p. 175.

⁷ Those who have followed Schwatka have not been so moderate in their estimates. N. A. Beddo, president of Yukon Trans. Co., and contractor for carrying the mail, is quoted as saying that for 500 miles the Yukon current averages eight miles an hour. A letter from a corporal in the Can. Mtd. Police states that below the rapids it averages at least seven miles an hour.—London Times, Aug. 17, 1897.

⁸ Various voyagers differently describe the cañon as from 30 to 60 feet wide, but join in saying that the terrible velocity of the current leaps its waters in the middle, where it is much higher than at the sides. One correspondent (N. Y. Sun, July 25, 1897) says he shot through this "hell of waters" three-quarters of a mile in two minutes ten seconds. Another (Leslie's Weekly, New York, Jan. 20, 1898) accomplished it in two minutes twenty seconds. A third (Cosmopolitan Mag., September, 1897) says two minutes twenty-nine seconds; but the poet Joaquin Miller bears off the palm with a passage of one minute forty-five seconds, or about twenty-six miles an hour.—N. Y. Journal, Aug. 30, 1897.

⁹ How long it takes the salmon to overcome these rapids is an interesting speculation. Among the other rapids are the White Horse, known as the Miner's Grave, and which are described as being more dangerous than those of the cañon.

downward drift, but the dwindling caravan struggles unflinchingly on, a trail of death behind, but before the goal of a dawning life.

The brief Arctic summer is past; the awakened winter, with a grasp of his icy hand, has closed the gateway of the far-flowing river; then, firmly fettering each successive bend and branch, follows southward in the wake of the ascending fish. For the remoter voyagers, those that have attained the upper waters, there can now be no retreat, but of that no suggestion can find lodgment in their barren brains. The followers of the Prophet that journey to his tomb over deserts whitened by the bones of generations of predecessors have not a tithe of the purpose that sustains these hurrying, witless pilgrims. The utmost fervor of religious zeal is not comparable to the tyranny of a remorseless instinct that lashes its straining victims to their doom. The salmon of the head waters may be regarded simply as an exquisitely devised automaton, sensible of but one end, one purpose, the attainment of its place of oviposit; to that consummation it devotes the last spark of its energy, and then ceases to exist.

The river's source attained, the bourne that becomes at once a cradle and a tomb, it is but a portion of the wasted remnant that fully accomplish the object of their being. Yet they linger, ghastly reminders of departed strength and ravaged grace, until, one by one, they are borne down in the swirl of the stream, and thus, with the uncertain foundation of the coming, the present generation passes away. Still, the Frost King, careering wide, is sweeping down from the North; but a few days and the breath of his desolation will fall upon the land. Then this brawling stream will be still and dumb, and these tiny caskets of an incipient life lie beneath thick armor of ice and deep drapery of snow; for, eye by eye, the waning sun droops lower in the south. It sinks, and nature, hushed in sheeted sleep, awaits the distant day when the returning orb, with brighter glow and wakening call, shall deeply stir her latent life. Its fetters riven, the pulseless stream will lift its voice again, and, with wild tumult and exulting rush, speed to its furthest bound. Such joyous resurrection may not be that of the embosomed germs; these may be whelmed beneath the wilful torrent's changing bed; but, if undisturbed, may then be nurtured into life. Doubtful is this apparent boon to the tiny creatures flung into a pool of perils, for they escape the freshest to become the prey of a multitude of enemies, of both fin and feather. Comparatively few survive; it may even happen that none reach the far-distant sea, and then vain was the parental toil and travail, and barren the long pilgrimage, with its strain of suffering and death.¹²

Upon arriving at the mouth of the great river, whose tumultuous course they may have followed for over two thousand miles, the young salmon of the head waters find themselves confronted with the chill obscurity of the Arctic Ocean. Without halt or hesitation, unguided and undirected, save by a mysterious impulse, the tiny voyagers plunge into the far-stretching gloom, and, holding no doubtful or uncertain course, attain their destined goal. That goal is certainly not in the frozen sea, but must be in the distant Pacific, whose vivifying waters abound with the sustenance whereupon the pigny starveling may develop into the giant salmon. The accomplishment of this marine journey, through, probably, nearly a thousand miles of shadowy depths, by young, tender and untutored fledglings, to whom every foot of the long way is unknown, or, at least, strange, is the most bewildering incident of a most marvelous pilgrimage. The feathered voyager that, with wanton wing, speeds through the upper deep, carols gaily as the green world glides beneath him, but the finny migrant has no panoramic view, he toils in darkness his allotted and unerring way.

For twenty-six hundred miles or more the salmon ascend the Amoor River, a great stream flowing into the Okhotsk Sea, which is frozen over for nearly half the year, and thus their progeny need, when emerging thereupon, to traverse its length and gain the ocean beyond, the same adverse conditions, in equal or in greater degree, opposing the issuing salmon of most of the Kamchatka rivers, as well as those of Russia that empty into the Arctic Sea.

That the migrating salmon project their uncharted course with absolute certainty and directness, can only be inferred, not indubitably proved; but from the mass of collateral evidence may be cited that of the former migration of the Ontario salmon. Seventy years ago, not only all of the hundred and odd tributaries of the St. Lawrence, but every affluent of Lake Ontario, affording reproductive facilities, abounded with salmon.¹³ From the far-distant sea, each of the numerous ascending colonies fought its way through the many swift rapids of the great lacustrine river, and, traversing Ontario's broad expanse, attained its natal stream. At the western extremity of the lake are three rivers—the Credit, the Humber and the Rouge—all in the vicinity of Toronto, each, in its day, containing an abundance of salmon. In the initial voyage of their lives, the young fish, upon quitting the parent river for the remote ocean, encountered in the waters of the inland sea a problem of navigation substantially as difficult as that facing the emergent migrants of rivers discharging into the great deep. Two hundred and fifty miles away was the great lake's effluent, fifteen miles broad, with a sluggish and scarcely perceptible current, and thither the finny travelers pursued their uninstructed but, probably, undeviating way. At the base of an escarpment, extending along the northern lake bottom, the water attains its greatest depth, 600 feet, and it is most likely that over these deeps the seaward course was projected. Similarly, it is recorded that the salmon were formerly plentiful in Otter Creek, Vermont, a stream emptying upon the easterly shore of Lake Champlain. In this case, as in the other, the seaward bound fish, upon meeting the still waters of the broad lake, had no longer a current to follow; they, however, turned to the north, descended the lake's distant effluent, followed it to the St. Lawrence, and upon reaching the great gulf of the latter river, still held their course for the ocean, and,

¹² It has been definitely ascertained with respect to English salmon that about one-half of the hatching goes to sea the first year, nearly one-half the second year, and the small remainder the third year. It is also confidently believed that the adult fish only ascend the streams every second year, and the same habits are probably incident to all salmon, being protective acquisitions of obviously great value to the race.

³ When a barrier is reached, salmon charge it repeatedly and persistently without regard to the injuries they sustain.—U. S. Fish. Bull., 1892. As evidence of their dauntless purpose, it is related that at the hatchery upon the McCloud River, Cal., a stout, wooden barrier was assailed by them so violently as to enable a few to force a passage. Over a hundred a minute were counted hurling themselves through the air and striking the structure with a great shock.—U. S. Fish. Com. Report, 1878, p. 745.

⁴ A trout will zigzag up a vertical fall so swiftly that the eye can only follow with difficulty his movement; but if a fin happen to project beyond the edge of the cascade he drops to its base. A salmon, by reason of his greater size, cannot resort to the same tactics. A vertical fall of water, of sufficient thickness and breadth to immerse his body, and give it freedom of scope of motion, is very rare, and such fall could probably be more easily leaped than swam. The water at the foot of a vertical fall of 16 feet should attain a velocity of eleven miles an hour; but, if there be a sufficient depth of water, the fall can be approached with a rush and a bound that may enable the fish to clear it. Unless with such deep water, the salmon cannot gain the requisite impetus, and in acquiring it he exerts his utmost energy, his tail vibrating with exceeding rapidity.

⁵ At Lower Kettle Falls there is a vertical descent of 10 feet, followed by 20 or 30 feet of a boiling, seething rapid. Here the salmon have been observed to dart out of the water like an arrow, sometimes sustaining themselves for 20 feet in the air, then dropping into the seething cauldron at the base. Sometimes he strikes the vertical portion, but rarely impinges near the crest, and then, with every muscle strung to its utmost tension, his body quivering in every inch of its length, he fights the descending current.—U. S. Fish. Bull., 1895, p. 253.

doubtless, somewhere within its depths, found the accustomed abiding place of their species. Again; the shad hatched in the Connecticut River, upon arriving at the Sound, follow the river's effluent waters to the westward, then, doubling upon their course, make for the eastern entrance to the Sound, and, entering the ocean, strike for the deeps beyond the edge of the continental plateau.²²

It may be urged, in explanation of these mysteriously infallible movements of migrating fish, that they result from the operation of an inherited memory; that, at various points of the untraveled route before them, the finny pilgrims encounter certain features, a distinctive formation of sea bottom, marine currents, or local water temperatures that awaken dormant impulses and induce the habitual ancestral action associated with such impressions. It cannot, however, be assumed that fish in their ocean journeys are guided by local features. Tagged salmon have been found 500 miles or more from their native rivers, and in their wanderings doubtless far exceed that distance. In the ocean absolute darkness prevails at a depth of 200 fathoms, and great obscurity at less than a fourth of that distance. The bottom characteristics cannot, therefore, be discerned; moreover, the range of the piscine eye is very limited. Furthermore, salmon, and many other fish, cannot, by reason of the pressure exerted, descend to great depths, like herring and other deep sea fish, having, apparently, no special organic provision to that end. Nor can a fish, upon entering a marine current, determine the fact, for every surrounding object partakes of the motion. Local variations of temperature are, of course, inconstant; but a final argument against the guidance of the finny migrant by these various deductions is that they involve a degree of intelligence that cannot be predicated of such lowly creatures;²³ the accomplishment being, to all appearances, that of an unreasoning instinct. This argument also operates against the assumption that the direction sense is due to a perception of the magnetic current that points the needle to the pole, for the determination thereby of a remote locality, deviously approached, implies constant inference and comparison. Without a knowledge of the latitude and longitude, such determination, even by an intelligent and experienced navigator, is exceedingly difficult; for, with all the aids of modern science, it took Pribylov eighteen years to discover the breeding islands of the North Pacific fur seal that now bear his name. Even then his prolonged and diligent search was only rewarded by the accidental hearing of the assembled seal herd's tremendous roaring, that was borne to his ears through the impenetrable mist. Dogs are almost continuous during the breeding season, but the seal, however remote his wandering, however thick the veil that overhangs the unvaried expanse, directs his certain course to a particular spot upon a particular island. With the requisite development of their young, the herd quit the grounds, and journey southward, in mid ocean, the outgoing and incoming routes describing a wide ellipse of probably five or six thousand miles. This annual migration has been performed for ages, and the dumb voyager's infallible chart is certainly not projected by the aid of magnetic currents, for the needle's direction changes from year to year; it is, moreover, different at the same time in different places, and the human navigator needs to make allowance therefor.

Innumerable instances might be given of various animals, large and small, being carried long distances, by devious routes, sometimes inclosed in boxes, bags, etc., but in all cases under circumstances affording the imprisoned creature no opportunity of topographical observation; yet it, when released at an unwelcome destination, was enabled to take a direct course to its accustomed abode.²⁴ In these many familiar cases, the perception of the remote locality so readily attained must be distinct and clear, and, although no visual image is projected, the bourn is sought with the same confidence and reached with the same certainty as though seen. Evidently, therefore, there is some mysterious sense in operation taking cognizance of some equally mysterious property of matter.²⁵ The constitution of the latter is unknown to us; but we do know, however, that to the six forms of energy with which we were previously acquainted, we have lately added three, viz., the Roentgen, the Hertz and the Becquerel rays. It is not impossible, indeed, that the manifestations of energy may be as varied as those of elementary matter, and that the latter are simply centers of

²² In Oswego county, N. Y., are three neighboring streams—Salmon River, Deer and Grindstone creeks—each having formerly a distinct type of salmon.

²³ The ocean voyages of large fish are equally mysterious. Many of the swordfish spawning in the Mediterranean cross the Atlantic and summer on the southern New England coast. The swordfish is also seen occasionally in New Zealand waters. The Mediterranean tunny, or albacore, also visits the New England coast to feed upon the menhaden, and there can be little doubt that some fish, like birds, are world wanderers.

²⁴ Only in birds and mammals, but not yet in fishes and reptiles, the inner ends of the nerves of vision become connected with the great cortex of the brain by an immense number of nerve fibres, and therefore it is only a creature so endowed that understands what it sees, and interprets it in connection with previous experience.—"Brain Structure," Krapotkin, XIX Cent., July, 1897.

²⁵ In Axon's "Field Naturalist," p. 3, it is stated that some crabs were caught at the Lizard, in the English Channel, and taken to Falmouth, twelve miles distant, in a box, after being branded with the owner's mark, where upon arriving, the box was broken and many of the escaped crabs were found, three days later, at the Lizard, to reach which involved a devious course in harbor and channel waters.

²⁶ In ascending a Scotch stream called the Oykel, the young salmon meet a terraced cascade, upon each stage of which is a pot hole, emptying itself in a vertical fall. Although never having made the leap before, the salmon, without a moment's hesitation dart confidently into the air, and fall headforemost into the hitherto invisible basin. Had they been the daily habit of resting in these watery chambers, they could not perform the leap with greater precision or grace.—Blackwood's Mag., Vol. 54, p. 80.

A Scotch fisherman had a pet gull that, except during its annual migratory absence, he fed daily. During one of these absences he moved to South street, Arbroath, and there, some time later, his returning pet found him out. In view of the fact that gulls wander far out to sea, and their direction sense is probably very acute, this story is credible. See London Spectator, July 9, 1898. Livingstone, in his "Travels in South Africa," Chap. XIV., p. 278, after dwelling upon the cognizance by wild animals of dangers not perceivable by their ordinary sense, asks, "Have they a guardian spirit over them?"

From the ocelli of marine creatures, little spots, sensible only of light and darkness, to the graduated telescopic vision of certain birds, there is every degree of visual perception. If there are mysterious material emanations, cognizable by a separate sense, the latter would probably be evolved in degree of efficiency corresponding to the exigencies of the case, and perhaps the perfection of attainment is very rare.

the former. Sir William Crookes, President of the British Association for the Advancement of Science, and, also, of the Society of Psychical Research, after stating, in a recent address to the two bodies mentioned, that knowledge may enter the mind without being communicated in any hitherto known or recognized way, sustains Faraday's view of the matter, namely, that it is not only penetrable in the mass, but that each ultimate atom is also mutually penetrable; that, so to say, while retaining its center of force, it extends through all space; in other words, certain impulses are indefinitely propagated outward from material particles that thus become substantially in touch with one another.

Our visual impression of an object, or sense, is impressed upon only a tiny portion of our organism, receiving certain radiations dispersed from the exterior of the thing viewed; but it is conceivable that every particle of the object seen is also dispersing radiations, of which the sensory apparatus, as a whole, may take cognizance. These unknown material impulses may be simultaneously projected upon the brain and upon every nerve of the body, and the receptiveness of such impressions may be dependent upon the volition of the individual, just as by listening or watching we may be enabled to hear or perceive. Such amplified area of sensibility should greatly extend its range of operation; therefore, extravagant as it may appear, a fully developed impressibility might become sensible of an object thousands of miles away, and it is seemingly only upon such theory that the phenomena of the direction sense can be adequately explained.

With the "light tenants of the sky," that voyage the thin and transparent air, these phenomena are seemingly less mysterious. Equally, however, with the travelers of the dark corridors of the sea, their performances are irreconcilable with any theory of inherited memory, or impartment of knowledge from older to younger birds. For the latter often form the vanguard of the migrating host. While the journeys of birds of passage may not exceed in extent those of the sperm whale, or of large marine fish, the attainment of their remote bourn, guided by the same unerring impulse, is equally assured. Among the most striking of these feathered pilgrimages is that of the Kuaka, a sort of snipe that summers in North Siberia. Leaving New Zealand in April, the departing flocks assemble in vast numbers at Cape Reinga, the end of the tongue of land forming the extreme northerly point of the island. From thence, at the close of the southern summer, they set out upon their 8,000-mile voyage over Norfolk, New Caledonia and other islands; thereby attaining the east coast of China, much of which they follow to their far home laved by the icy waters of the Arctic Sea. The Knot (*Tringa Islandica*) is an Arctic bird that also wanders to the remote south from far beyond the 82d parallel, having, probably, its breeding ground in the vicinity of the North Pole. There, secure beyond an icy rampart, against which the might of our civilization has been vainly flung, the young of these wide wanderers are cradled into existence. Then, gaining size and strength upon probably abundant stores of food, they set out in a few months upon a wondrous journey, whose ultimate verge almost attains the opposite polar zone. For New Zealand, Australia and South Africa is the remote bourn of these aerial couriers, whose tireless beat of wing in the far heights of our upper atmosphere sweep beneath them, in a moving panorama, the upper and nether lobes of the Eastern Hemisphere. Its wings apparently fixed and motionless, the wandering albatross sails the Southern seas with wonderful ease and grace, now rising high, now skinning the crests of the waves; but, with all its unceasing changes of movement and direction, it never loses touch with a lone little island,²⁷ in that watery desert, and be it a thousand of miles away, it betakes itself thither at nesting time.

Of the very few birds that breed in the Antarctic, one is the Wilson's petrel, which nests on Desolation Island. In the southern winter it comes north, and is one of the commonest birds observed in the Atlantic by summer voyagers. This errant bird's existence may be said to be a perennial summer; for, with that season's waning warmth, it quits the Northern Hemisphere, and hastens to trans-equatorial seas, where, under another sky, but an unchanged clime, it swiftly skims the austral waves. The bold, little navigator, uncharted and uncompassed, roams, in hardy confidence, the wide ocean at will, no doubt oppressing, no hesitation halting, the unwearied beat of its wing. With the dawn of parental solicitude, it bears its course to its barren island, and there, in the solitude and silence of the great South Sea, it rears in security its tender brood.

A. H. GOURAUD.

BROOKLYN, N. Y.

²⁷ Campbell Island, lat., 52.53; long., 169.8.

The other day a reporter called upon a man prominent in politics who had particular reason just then to be exasperated at the newspaper this reporter represented. Sending in his card, the reporter waited in the ante-room until a small office boy beckoned him to step inside. The politician sat at his desk, his hands gripping the arms of his chair and his eyes staring straight ahead with the stern, fixed expression for which the man is noted. The reporter asked a question, but the politician took no heed. The question was repeated. Then the politician sprang to his feet. "Jim," he called, and a muscular clerk rushed in from the outer room. Then slowly, and in tones of icy distinctness, "I want you to bring my rifle." The last word came in a sort of burst, apparently of anger. The use of a rifle to repel the attacks of reporters was a new idea to this one, and he scarcely knew whether to stand his ground or fly for his life. But the politician, in his suavest tones, solved the problem. "Excuse me for keeping you waiting," he said. "I was a trifle preoccupied. I'm getting ready to go to the Adirondacks to-morrow. Now, what can I do for you?"—New York Evening Post.

Memories.

In reminiscent mood—after reading a copy of your ever-welcome paper—I venture to write as memory dictates. I am almost the last one of a group of men whose shooting haunts during the later 60's and through the 70's comprised the waters of Long Island Sound, the Great South Bay, and the swamps and uplands between. Shivering in floats for broadbills on Little Neck Bay, or coot shooting from a string of boats on "the Sound," or poling in the early morning through the creeks to duck and snipe points on the Great South Bay; tramping the swamps and swales for summer woodcock—under the old law, now, happily, repealed—or following the whistle of his wings, with a snap shot, as he rose among the alders or chestnut sprouts on an autumnal hillside.

Just here I will tell the story of a market-shooter, R., who sometimes went with us, and seemed to know exactly where to find the birds, whether by his nose or instinct I never knew. F., one of our party, had often wished to see a woodcock on the ground, so one July day (they being out together), the dog pointed, and R. looking cautiously over a bush saw the bird, and, while looking, saw others, until he counted five. Motioning F. to look over his shoulder, to see the birds, he said: "Mr. F., if you can get two when they flush, we will get all five." Drawing his ramrod, he leaned forward, killing one bird with it; as they rose, F. killed two and R. shot the others. F. was a good shot, while R. was deadly, and is a most truthful man.

October days would find us among the ragweeds and buckwheat fields, following the dogs, as with switching tails and high heads they quartered their field up wind in a canter. What a picture rises before me as memory brings back the scene—our dogs backing and drawing on their mate—the envied finder of a bevy of quail, who, stiff as a stake, awaits our coming. How we hurry up, and, as the birds flush with whirring wings, the sharp reports, the falling brown bodies and feathers floating down wind tell the story. August found us on Hempstead Plains after grass plover, sitting in an old wagon, driving in ever-diminishing circles, about the sitting birds, who restlessly watched and more often got up at long range, straining our guns to down them. Perhaps some old sport may remember Conk Vandewater's. What pleasant trips we made to his old tavern, how we demolished the hot waffles, and, oh! such fried eels; and then, while some, smoking and toasting before the great wood fire, arranged with the baymen for a duck shoot in the early morning, others would sing, dance breakdowns, play draw, and, alas, drink whisky. Then to bed and sleep, only to be called before daylight to go "in the bay." Tough Old Tony, a high old sport, on being called one cold, March morning, grumbled about having been restless and feverish—perhaps it was whisky—saying the bed was so short and his room so small, that when he woke his feet were out of the window, covered with sleet.

Sometimes we would go to Billy Chadwick's on Barnegat Beach; what a place that was for all kinds of water fowl! Heavy flights of bay snipe of every kind entered the bay through a slough near the house, while numberless geese and redheads passed the blinds on Northwest Point.

But, alas, all this is but a memory now! I can no longer tramp all day through the brush and scrub, nor stand the cold and wet in a float or blind. A short walk and a shot or two, over—I must say—as good a dog as I ever saw, suffices, while about an hour's fishing sends me home with an aching back. But I ought not to grumble, having had my share, and so I must reconcile myself to the mild sport that a little shooting and fishing plant on Barnegat Bay affords me.

Two hundred acres of upland, woods and meadow comprises my domain. On a slight elevation, well shaded and close to the meadow, stands a plain, little, rectangular house, with large, paned windows on every side, and this is what I see from them: Far to the south looms up Barnegat light; to the east a creek leads from my door to a large oyster pond, which empties into Barnegat Bay, whose waters, blue as the sky above, wash the ocean beach, along which a coasting steamer throbs and puffs, a line of smoke trailing behind her. The bay is now filled with oyster boats, drifting about with loose sheets and shaking sails like a great flock of sea gulls. I once counted sixty. Overhead a fish hawk poises, suddenly he drops to the water with a splash, and seldom fails to strike and land his fish. Landward lies a swamp where tall pines and oaks are mingled with holly trees, whose leaves glisten and glow with berries red as blood. Shooting? Yes, a little, and fishing, too. A few quail, an occasional bunch of duck, some English snipe, now and then an upland plover, squirrels, rabbits and sometimes good flights of bay birds. One afternoon last August, seeing that birds were flying, I took a chair and a few decoys, locating in a bunch of sage bushes, not over five minutes' walk from the house. I shot five curlew, and twenty-six big and little yellowlegs, bagging fourteen the next morning. Weakfish abound, while at times a run of striped bass affords fine sport.

How tame all this would seem to the deer hunter or fly-fisher of the North Woods, and yet I have known some of them who could not, to save their lives, down a quail or fall woodcock in the open, much less in cover. I remember one good fellow, who used to go with us; he could tell a good story, play draw and talk shoot; but, oh my! how he could miss birds and disgust dogs! Deserting us, he took to the North Woods, whence he wrote beautiful letters, telling of his exploits, how moose, deer and partridge fell to his unerring rifle, at the same time pitying us of the "scatter-gun" fraternity. "I guess them moose, deer and partridge were settin' or sleepin' or mebbe his guide held 'em," said Old Tony. And now having spun my yarn, I will say good night! F.

CHICAGO AND THE WEST.

Chicago Men in Minnesota Toils.

CHICAGO, Ill., Oct. 19.—One of the most interesting and in some of its bearings one of the most important arrests made under the game laws for a long time was that which took place within the past week at St. Paul, Minn. The facts are these: Messrs. Harry B. Clow and A. B. Eaton, both of Chicago, went out to Bradley, S. D., for some prairie chicken shooting. It is understood, or supposed, that they complied fully with the laws of South Dakota with reference to license, licensed guides, etc. They packed fifty-six prairie chickens in two trunks, inclosing in one of the trunks their two shotguns, one of which, owned by Mr. Clow, is a Greener gun valued at \$400. They checked their trunks straight through Minneapolis, not tagging their packages as containing game, and not accompanying the same, but apparently leaving them to take their course in the hands of the railway authorities at Minneapolis transfer station. At Minneapolis, in some way best understood by himself, Deputy Warden S. E. Johnson gained a suspicion that the trunks contained game, and, as they were not openly tagged in accordance with the requirements of the Lacey act, he felt himself at liberty to open the trunks by force, and did so, breaking the lock of one trunk, the other lock being sprung by a locksmith. He found in the two trunks fifty-six prairie chickens. There was no name attached to the baggage in any way, and no one to aid in the seizure of the game. Later, after the game had been sent to cold storage and the trunks and their contents taken to the office of State Agent S. F. Fullerton, friends of the travelers gave their names, after the name of Mr. Clow had been discovered printed upon his gun case. As soon as the shooters discovered what had become of their goods and chattels, they raised a considerable outcry, and enlisted the services of local friends in securing possession of their property. Had it not been for the officious nature of the local friends, Mr. Fullerton might have been willing to let the property go through, on the supposition that the violation of the law was through ignorance, although that itself is no excuse for a violation of the law. However, the Chicago gentlemen seem to have placed their case in the hands of Mr. S. H. Findlay, of Minneapolis. Mr. Findlay went to the father of Mr. F. C. Hale, the attorney of the Fish Commission. He did not see Mr. F. C. Hale himself, but consulted with his father, who is also an attorney. The latter gentleman, however, volunteered the information that the trunks could not be held under the law. At once Mr. Findlay wrote rather an impertinent letter to Agent Fullerton, stating that he had been so advised by Mr. Hale. This aroused the fighting blood in Fullerton, and he decided to fire attorney, friends and all if the facts were as stated to him in regard to the opinion. Mr. F. C. Hale finally discovered the real fact, namely, that he had not expressed any opinion to the effect that the seizure was illegal.

The whole matter was unfortunate, so far as the interests of the Chicago men were concerned, for Agent Fullerton thereafter stood strictly on the letter of the law, and also stood on the trunks. Meantime the two Chicago men, who seemed very much aggrieved, began to move heaven and earth and to bring all kinds of pressure to bear upon the energetic hustler who is handling the protective matters in Minnesota. On Tuesday the writer saw the confiscated articles of these gentlemen among other interesting outfits collected by the State Game Commission of Minnesota. Mr. Clow's gun is a very good one—too good to inclose carelessly in a shipment of game through so dangerous a territory as that of St. Paul or Minneapolis.

Deputy Johnson, who made this important seizure, at first thought the trunks contained Minnesota game. He then looked up the Dakota law, and held the game by virtue of the Lacey act. Mr. Clow is quoted in a Chicago paper to have stated that one trunk contained twenty-two birds and the other twenty-three. They would seem to have multiplied, at least, to some extent, for there were fifty-six in the two trunks, most of them being packed in one trunk. It is stated by Mr. Clow and Mr. Eaton that Deputy Warden Lewis, of Bradley, checked the trunks through to Chicago himself. It was stated by the clerical force of Executive Agent Fullerton's office last Tuesday to the writer that the birds would probably be sold and the proceeds of the sale returned to the Game Commission of South Dakota. The disposal of the guns and other material will be a matter for later consideration.

While one cannot blame the Chicago sportsmen for disliking to lose their personal outfit, yet there cannot fail the warning that the laws are planned for every one and are plain to all, and that it is no longer safe to take chances in the hope that everything will go through all right. Warden Fullerton is a man who knows the law perfectly well, and he is the best warden that stands on leather to-day. It is no use trying bluff him or scare him. The way to do with him is to do what is right—that is to say, to observe the game laws strictly. This is not the first instance in which game coming through from Dakota has been seized, nor is it the first instance in which the Minnesota Commission has confiscated outfits employed or connected with the illegal handling of game. Chicago papers did not in all regards report this matter correctly, but the facts given herewith are taken from the office of the Executive Agent of the State of Minnesota in person.

Auction of Confiscated Goods.

The auction held last week by Agent Fullerton at St. Paul, offering for sale a lot of material confiscated from lawbreakers of the State of Minnesota, did not prove to be much of a success so far as the disposition of the collection of moose heads was concerned. There was a job lot of firearms of all sorts, some twenty-five or thirty kinds in all, and, strange to say, these brought better prices at auction than they would have commanded at first hand in sporting goods stores. There was one old, single-barrel Zulu gun which sold for \$6—double what it would have cost new. In the collection there was one flintlock musket—something of a curiosity in its way and worthy of preservation. The moose heads, some of which were good specimens, were held for prices ranging from \$40 to \$150, and the Commission saw fit to retain these, pending better propositions.

The Minnesota Fish and Game Commission has secured between sixty and seventy convictions this season, has confiscated some thirty guns, six or eight dogs (few of them good ones), and some hundreds of dozens of birds, not to mention considerable amounts of moose meat and venison. They have pulled pretty much all the swell restaurants of St. Paul, including Carling, Newman, Magee, etc. Mr. J. E. Platt, a big commission dealer of Minneapolis, is up now for a big case. The State Commission is prosecuting him for alleged violations of the law, the fines connected with which would amount to several thousands of dollars if inflicted as permissible by the statute.

The Non-Resident License.

One feature of the game laws of our Northwestern States deserving of special attention is that of the non-resident license. Here is an instance: A well-known shooter of Chicago, in company with certain friends, went out to Ortonville, Minn., for a prairie chicken trip last month. They had very good success, and to-day the Chicago man was very enthusiastic over that section of the country. I asked him if he had taken out a non-resident license, and he said, "No, it was not necessary. We owned the town. The town marshal and the leading citizens went out with us." When told that since he was a resident of Illinois the non-resident law of Minnesota would apply against him, he said that had he been caught up by any of the authorities he would have at once purchased his shooting license. Now this is a little error which might as well be corrected here as anywhere else. It is not enough to get your license after you find you have need for it. The license must be with the shooter and should be taken out before he begins his shooting trip. Had things not gone fortunately for him—perhaps they would not have been so fortunate had Agent Fullerton got wind of it—he might have been subjected to an expense greater than that of the original \$25. We might all just as well make up our minds to it. This non-resident license has come to stay. It is a game law, and one which in many ways is a good one, and as such it should be observed by all of us. This is the second party of whom I have heard who went into Minnesota and who did not pay any non-resident license. I do not doubt there were many others, as Minnesota is a big State. Yet the experience of the two Chicago men who lost their trunks so unexpectedly may serve as a gentle hint to others who perhaps ignore, or evade, or compromise with the laws on the dangerous ground of Minnesota.

The Warden and the License.

Still another instance of the growing vigilance of the wardens of the Northwestern country is related to-day by Mr. C. E. Willard, who has been spending part of the summer at Oconomowoc and doing a little shooting at odd times this fall. He killed a few partridges and a few plover from day to day, and one day he was accosted by a pleasant-looking stranger, who asked him if he had a shooting license. This was the first time that Charlie had ever thought of the license matter, but he realized how serious might be the situation. Evading the question and securing the promise of the stranger to call on him at the farmhouse later, Mr. Willard hastened to a Justice of the Peace and got a license as quickly as he could. A few days later, while shooting, he was accosted by the same stranger, who announced then that he was a game warden. One may imagine with what joy Mr. Willard was able to reach into his pocket and pull out the coveted slip of paper!

Fish Scales and Hickory Nuts.

Now here is one more proof of the fact that this country is no longer the land of the free, and that the game laws are becoming odiously active. Mr. Willard put up a box of hickory nuts which he wanted to send to the loved ones at home here in Chicago from his place near Oconomowoc. He had something like a bushel of the nuts in the only box he could find, and, as it chanced, could discover no board handy to make a top to the box, excepting a piece on which the hired man had been cleaning fish. Thinking this would serve at a pinch, he nailed it on, clean side up, and shipped his hickory nuts by express forthwith. The nuts got as far as Milwaukee Union Station, and then the vigilant eye or nose of some warden, perhaps Valentine Laeth, detected the ancient and fish-like smell. It would have been a pleasure to have seen the eagerness of the warden as he tore open this box, and perhaps as pleasurable to have witnessed his consternation when he pulled off the fishy board and discovered underneath no illegal shipment of Wisconsin's finny wealth, but only a painful or so of innocent hickory nuts, such as used to be known at the fireside in the days of our forefathers.

Northwestern Game.

Now all this business about supervigilant wardens and exacting game laws and un-American non-resident laws has one corollary, which is not in the least so unsatisfactory. The same shooter who this year went from Chicago to Ortonville, Minn., has been going to that country for fifteen years, and he says that there were more chickens there this year than there were fifteen years ago. The same story is repeated in regard to almost every game locality of the noble State of Minnesota. There are more ducks and more chickens, three or four to one as an average all over that State, than there were ten years ago. To what should be attributed this increase of the game supply? True, there are such things as good game years and bad game years, but, after all, is it not a possible thing that the watchfulness of the Minnesota wardens has had much to do with the increase in the game birds of that Commonwealth?

Specifying as to localities, the general tenor is that Hallowell, Kittson county, Minn., is one of the best localities for all-around shooting—geese, ducks, grouse and snipe. This information was volunteered by employees of the State Warden's office. Mr. Fullerton himself is not only a warden, but a sportsman, and was absent four days this week on a scouting and hunting trip of his own to a locality which is not mentioned.

One notable feature of the increased game supply in the upper part of the Northwest is the great increase of quail. Every one says that quail are very abundant all over lower

Minnesota, and I was advised that the quail belt extends as far as 100 miles north of the Twin Cities.

In Wisconsin the game supply seems to be at least up to the average this year so far as can be told, and we are going to have a good fall in Illinois. Telegrams to-day from the Hennepin Club to Mr. J. V. Clarke, of this city, state that the ducks are in on the Illinois River marshes, and request members to come promptly. Similar advices are at hand from Swan Lake Club, lower down on the Illinois River.

As to the jacksnipe, there was a good body in two days ago at the lower end of Calumet Lake, just below Chicago. During the middle of this week, near Romeo, on the Desplaines Bottoms, Billy Cutler, of Evanston, had two very fine bags of snipe—seventy one day and forty the next. There are a few snipe also to the north of us, around Fox Lake.

Western Men in the East.

Dr. D. W. Greene and J. R. King, of Dayton, O., have returned from a successful hunt on the Miramichi River of New Brunswick. Dr. Greene killed a fine moose and a caribou, both in one day, and Mr. King also was fortunate enough to get a good moose.

N. F. Depauw, of New Albany, Ind., is another Western man to make a trip to New Brunswick this fall. He got a good moose head.

Quail.

All kinds of quail in Illinois this fall. Remember Neoga on the Illinois Central. Effingham, just below Neoga, is another good point.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

The Maine Season.

BOSTON, Oct. 21.—The Maine moose season is on. Faneuil Hall Market, this city, had a fine moose on exhibition Friday, though the season opened on Tuesday. It was said to have been killed by a fortunate hunter, who shot the animal near Greenville, about 6 o'clock Tuesday morning, the opening day. Thursday eight moose passed through Bangor. Moose are reported much more plenty in the Rangeley and Dead River regions than last year, while deer are not as plenty. The record of the first sixteen days of the game season shows eight shooting accidents, of which five have proved fatal. Sportsmen are positively afraid to go into the woods this year. Hunting is growing more and more popular with women. Among those fortunate enough to secure deer may be noted Mrs. William McKay, of The Forks, Me., who shot a large, white deer in that section a few days ago. Mrs. Cole, of Boston, shot a deer in the Dead River region last week. Miss Eva Whittier, of Boston, is out of the woods in the country north of Sherman, Aroostook county, with a buck and a doe of her own shooting. Deer are very plenty in that country. Miss Trask, of Boston, has shot a deer in the Moosehead region. Mrs. J. B. Garland, of Worcester, has shot a deer in the Roach River region, where she has been hunting with her husband. Mrs. P. H. Plaisted, of Waterville, has shot a fine buck deer in the Moxie region. E. S. Farmer and niece, of Arlington, have just returned from a hunting trip to the Milnochet region. They brought home two deer, one a particularly fine buck with a good head, which is to be mounted. A party of railroad men from Lexington and vicinity have gone into the Maine woods after big game. In the party are W. H. Green, of Lynn; O. M. Gove, Dr. Gibbons and Thomas Anderson, of Lexington. They are in the Moosehead region.

Really the hunting season is particularly a dangerous time in Maine, even for those who do not go out with guns and have no idea of hunting. It is related that the other day a man, who had been to the hospital at Lewiston, to have a wound dressed, was returning to his home at Mechanic Falls. A piece of metal was included in his bandages, to keep his wound in place, the wound being in his side. Sitting in a passenger car, at a station, he suddenly felt something strike the piece of metal. Examination showed it to be a rifle bullet. It had passed completely through both sides of a freight car that stood by on a siding, before passing through the passenger car and hitting the metal in the bandage. It is suggested that the bullet must have killed the man but for the fact that its force was spent by going through the box car before it entered the passenger car. Hunters were known to be in the vicinity at the time, and the stray bullet is attributed to their careless shooting.

The coot shooters are having good sport along the South Shore, at Scituate and Brant Rock. Last week was the best of the season. Gunners who are accustomed to the sport and know the ropes, find it easy to make bags of twenty and up to twenty-five and thirty birds in a day. There is considerable rivalry as to being high line among the coot shooters at this point. Annisquam gunners have been having good sport. Still, some better flights are looked for in November. At Biddeford Pool and further down the Maine coast the coot gunners are having good success. O. H. Smith, of Boston, is back from a week's trip after coot. Good bags of birds were made each day. They sailed down as far as Fort Popham some days and back in the evening. At Chatham birds have been plenty for the week, but there have been but few gunners, giving those that were on hand an excellent chance. The late flight of yellowlegs came along early in the week, and some good scores were made. Duck shooting is expected to begin early at that point, and gunners for the present week should be prepared for that sport.

There are still a few beaver left in Maine. Game Warden Houston, of Caribou, passed through Bangor on Thursday, with three live beaver. He was taking them to the Central Park, New York Zoo.

Still the smelt fishermen are having good sport along the South Shore. At Hingham, Quincy, Weymouth and many other points the sport is good, with the smelt large. It is gratifying to those who have had the protection of smelt in hand to note the amount of wholesome rod and line sport that has grown up, whereas, formerly about all the smelt were netted, and the stock exhausted. F. A. Rein, of Boston, goes down almost every week, and his catches include from ten to forty dozen in a day. He

always takes some fishing friend—never but one at a time—and fortunate is the fisherman who gets the advantage of Mr. Rein's experience.

SPECIAL.

A. B. F. KINNEY, the first Worcester sportsman to return home from the big-game regions of Maine since the opening of the hunting season, traveled with Mrs. Kinney through the Megantic Preserve, so arranging his trip as to reach Moosehead Lake in time to have a week of trout fishing before the law went on trout and off deer. "I never had any finer fly-fishing in my life," declared Mr. Kinney, enthusiastically to a Telegram reporter, "than I found in the Roach River at Moosehead. I never fish with anything but flies, and found the sport superb. I took out as many trout as I could use, without the slightest difficulty, and landed an exceptionally big one on Monday morning, Sept. 30, the last day of the trout season.

"The next morning I went out in search, not of trout, but of deer, and had been gone only a little while when I saw exactly the kind of a deer that I wanted to bring home. This was the only deer I attempted to shoot, for I wanted to bring home only one, and the deer that first came within my range was in every way satisfactory. Some of the sportsmen at the hotel shot several during the time I was there, and what deer they did not care for themselves were used as venison at the hotel, where there were nearly twenty-five guests all the time.

"The day I shot my deer I also saw within 100 yards of me a handsome bull moose, but I didn't shoot it for two reasons. In the first place the law does not go off moose until the 15th of this month, two weeks later than the law is off deer, and then, too, I have shot all the moose I care to, and am perfectly willing to leave what moose I see for other sportsmen who may have been less fortunate. I have four beautiful heads at my home, and believe I have done my share of moose shooting.

"From the observations I made in the Megantic region and at Moosehead, I am confident in saying that there is going to be no lack of deer this season. Deer are not on the decrease, as is occasionally asserted. As for moose, they are far more numerous than I ever saw them before in Maine. Everywhere there were signs of the presence of moose, and it was a daily occurrence to see from the veranda of the hotel where we stayed one or two moose, and sometimes more.

"I was especially interested to note the large number of women who are rapidly becoming enthusiastic Maine woods huntsmen, or more properly speaking, huntswomen. At Roach River there were ten or twelve women who had their own guides, and tramped about the woods, showing no more signs of fatigue than the men, and getting exactly as much genuine enjoyment from shooting and hunting as their husbands. Where ten or fifteen years ago one woman went into the woods in search of pleasure, there are now fifteen or twenty. Big-game hunting for women appears to be rapidly becoming a fad.

"I met while away two of the best women shots I have ever seen. They were Mrs. Courtney, of Boston, and Miss Trask, a friend. Miss Trask is a particularly fine shot, and brought down on the opening day of the season a nice buck. She is equally enthusiastic over partridge shooting, and Monday morning, as I was coming out from the woods on a buckboard, I saw her make a double with all the skill of an expert trap shooter."

Late Broods of Quail.

SEATTLE, Wash., Oct. 15.—*Editor Forest and Stream:* Your issue of Oct. 5, to hand this morning, contains an account of a late brood of quail found by a Connecticut correspondent. "That reminds me." Last summer while walking in the neighborhood of City Park, within our city limits, my dog pointed a quail sitting on her nest, which was built on the ground in low brush. I was greatly interested, and with members of my family visited the little mother quite frequently. She would remain on the nest if not too closely approached.

Just before hatching, the nest contained eighteen eggs, but one morning I found the mother and her brood gone and two eggs left.

Shortly afterward I met with the family again in the neighborhood of their birthplace, and was surprised to find the covey contained two white birds. One is apparently pure white; the other shows small, brown points on the wing, and tail feathers. Curiosity has prompted me to pay them a weekly visit, and almost invariably I find them on the same clearing. I have some recollection of reading in your paper many years ago an account of an albino quail by a Southern correspondent, and would like to know if such are of frequent occurrence. I have thought some of trying to trap this pair; shoot them I couldn't.

Last Sunday afternoon (Oct. 13) I went out to see how they were getting along—they are located about ten minutes' walk from my home. My dog, who knows them about as well as I do, came to a stand in front of a small huckleberry bush. Walking up to him I saw another brood of little ones, not over a week old, and altogether too small to fly, scurrying away in all directions from the opposite side. The old brood was found some distance further, and the two white ones are still flourishing, but they will not lie to the dog any more. I have disturbed them so often they fly to cover at his approach. These are what we call out here valley or swamp quail and are mighty, cunning, swift, little chaps.

Quail have been protected in this State for five years, and both species, mountain and valley, are very plentiful. It was generally understood among sportsmen that this fall was to be open on those birds, but the Daniels who sit in our legislative halls and frame the game laws omitted quail entirely, and no one, not even our game wardens, seems to know just how the law stands. After seeing these little chicks on Sunday I am of the opinion that the New York law would be about right for this State.

BROADWAY.

Late Nesting Quail.

MILFORD, Conn., Oct. 14.—*Editor Forest and Stream:* A friend of mine found yesterday a quail nest of twelve eggs, with the hen bird setting. How do you account for this, and the fact that most of the bevies found so far are but one-quarter grown, and many unable yet to fly? Did

the torrential storms of June and July kill the first or second broods?

A full-grown this year's partridge (ruffed grouse) blew against a window at the back of my house yesterday and killed himself. The accident occurred at 6:30 o'clock on a dark and misty morning. The house stands far from the swamps, on a knoll, and the bird seems to have flown from a small clump of cedar trees back of the mansion.

MORTON GRINNELL.

Massachusetts Quail.

SALEM, Mass., Oct. 10.—The quail season opened Oct. 1. While they are more plentiful than usual, owing partly to the very little snow last winter, they are very small. I found four bevies one day, three of which could just take wing; one bevy could not have been hatched over three or four days, as they were about the size of bumble bees. In fact, I have found but one bevy fit to shoot since Oct. 1. From Nov. 1 to Dec. 15 would be about early and long enough season for quail.

W.

In North Carolina.

KINSTON, N. C., Oct. 20.—Our season on quail opens on the 1st proximo, and I don't see how our gunners are to find their sport so soon. There are many birds, but every covey I have seen contains young ones hardly able to fly. I saw two old birds last Sunday, with a brood apparently but just out of the shell. They made no attempt to fly.

TAR HEEL.

In New Jersey.

BAYVILLE, N. J., Oct. 20.—There are lots of quail, but many young birds that will be too small to shoot Nov. 1. I saw nine bunches yesterday; three of them could just fly. The ducks are coming and a few geese, which are very late. I struck a few jacksnipe yesterday—the first I have seen this fall.

HERB.

Sunday Shooting Trains in Rhode Island.

PROVIDENCE, R. I., Oct. 20.—*Editor Forest and Stream:* The Evening Telegram of to-day says, editorially:

"A gentleman called at the editorial rooms of the Telegram this morning and voiced a protest against the action of the Providence & Danielson Railway Company in advertising to run a 'special hunting car with dogs' on Sunday, and asked if this was to be permitted. This is a matter that interests many others. Railroads are not always respecters of the laws unless they are made to respect them, and if public opinion is against hunting on Sunday, hunting on Sunday can be made to cease. Hunters are in a minority, whatever day they may hunt. Moreover, the law, as we understand it, is against them when they hunt on Sunday, as well as against the railroad that would aid and abet them in lawbreaking. Section 3, Chapter 110, of the General Laws of Rhode Island, reads:

Every person, not being at the time under military duty, who shall discharge any rifle, gun, musket, blunderbuss, fowling-piece, pistol, air-gun, spring-gun, or other small arms, or any contrivance arranged to discharge shot, bullets, arrows, darts or other missiles, except upon land owned or occupied by him or by permission of the owner or occupant of the land on or into which he may shoot, within the compact part of any town or city, or not being at the time on military duty, shall anywhere discharge any of such arms or contrivances on Sunday, shall be fined not exceeding twenty dollars.

"Evidently it must be a still-hunt or be performed under military duty or the hunters will each have 'not exceeding twenty dollars' to pay provided any one makes the proper complaint to the proper authorities."

Last Monday morning in the District Court at Bristol, before Judge Bosworth, Gienuto Giniuto was tried on the criminal charge of violating the game laws in killing a quail during the close season. He was fined \$20 and costs, which aggregated \$24.20.

Tautog fishing in the deep channels at the south ends of Prudence and Hog islands, in Narragansett Bay, is improving every week, and several very large catches were reported last week.

W. H. M.

Minnesota Licenses.

THE statement in the *Game Laws in Brief* respecting Minnesota non-resident shooting licenses may not be sufficiently explicit. License requirements are of two kinds.

First—A license (fee \$25) is required of all non-residents for shooting deer, elk, caribou or moose. This license is required whether the visiting sportsman comes from a State which has a non-resident license law or not. This is the license noted on page 52 of the *Brief*.

Second—A license to shoot any kind of game, large or small (fee \$25), is required of non-residents coming from States which have a non-resident shooting license provision in their laws.

Residents of Ohio, for instance, which State does not demand a license of non-residents, may shoot birds in Minnesota without a license, but must take out a license for deer shooting. A resident of West Virginia, which State has a non-resident license law, must take out a license for shooting any kind of game in Minnesota.

One license covers all game. That is to say, a non-resident need not take out one license for shooting deer and another license for shooting birds.

Virginia Game Fields.

CHASE CITY, Va., Oct. 19.—*Editor Forest and Stream:* While busy at my desk answering many questions from sportsmen in various parts of the country, it occurred to me that I might do this more effectively through the columns of your paper, and that in doing so I would reach a larger number of inquirers. The season for quail and turkey shooting has only been open since Oct. 15. Consequently but little hunting has been done, just about enough to demonstrate the fact that the crop of game is an unusually good one in this section. I have reported to me anywhere from ten to twenty coveys of quail found in the course of a day's hunt. These coveys are of good size, ranging from fifteen to twenty or more in each.

The best time for hunting, however, will be on and after the first of November, as so many of the birds are but little more than half-grown at this time. Since I began this letter, within the last ten minutes, two wild

turkeys and a nice string of quail have been handed in to me, the result of a hunt within a few miles of this place. Deer are also quite numerous, and afford rare sport in hunting them.

W. D. PAXTON.

New Brunswick Moose.

PERTH CENTRE, N. B., Oct. 19.—*Editor Forest and Stream:* I think we can get any sportsman a moose here as quickly as any place in New Brunswick and without a doubt. I think I have my camps in the best moose country in New Brunswick; the quickest and easiest to get to. We have up to date got eleven moose and two caribou and one bear. Our largest moose had a spread of 60 inches, with thirty-four points and 16-inch blades. There have been, as near as we can tell now, sixty-five moose heads taken from the Tobique region up to now this fall. This has been a poor fall for moose hunting up to this time.

GEO. E. ARMSTRONG.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

The Mediterranean Tunny.

From the Nineteenth Century.

THE Mediterranean tunny is a classic and important fish. Like many other important fish, however, his habits and his life history are but little known. In this he much resembles the salmon, though the great attention which has of late years been bestowed upon the salmon has in its case given us a store of information which is at present lacking in the case of the tunny. The tunny is, at any rate, a fish of noble proportions. The most valuable of the mackerel tribe, to which the bonito and the albacore also belong, he frequently attains the weight of 1,000 pounds, many of this weight being caught in the fixed nets off the Ægadian Islands; while Cetti, the natural historian of Sardinia, mentions a specimen caught on that coast which weighed 1,800 pounds, and I saw one captured this year which weighed 500 pounds less. In Sardinia they classify the tunny according to weight; a tunny of less than 100 pounds is a scampirre; a tunny from 100 pounds to 300 pounds is a mezzotunno, and a tunno properly so-called is a fish that weighs over 300 pounds.

The natural history of the tunny has from the earliest times been a subject of much dispute. Aristotle, in his *History of Animals*, devotes some space to it, and seems to have been the earliest writer to attempt any scientific description of it. The range of the tunny is a very wide one; Dr. Günther, a high authority on the subject, distributes him from the south coasts of England to the shores of Tasmania. His food consists of herring and pilchard, and other small fish, on which he thrives and grows with amazing rapidity. Cuvier records that at his first appearance on the Mediterranean coasts after the hatching season his weight is two ounces, which he doubles in a fortnight, and at two months old he weighs two pounds, and continues to put on weight with a corresponding rapidity, till, in some instances, he reaches the great size of 1,800 pounds, recorded by Cetti.

The industry of catching tunnies is a very ancient, as well as lucrative, one. Allusions to it run through the classics. Two hundred and twenty-eight years before the Christian era Athenæus took the trouble to prove that a brother scribe had made a mistake in attributing a panegyric of the tunny to Hesiod, and modern scholars have agreed that the first authentic classic reference to the tunny is by Herodotus. That the capture of the tunny was a familiar feature in the daily life of these times is proved by the story related by Herodotus, who tells us how Pisistratus, returning to Greece after his second expulsion, pitched his camp opposite to that of his adversaries, near the temple of Pallas, at Pallene. Here a soothsayer, Amphilytus by name, moved by a divine impulse, approached him and uttered this prophecy:

"Now the cast has been made, the net is outspread in the water, Through the moonshiny night, the tunnies will enter the meshes."

Pisistratus grasped the meaning at once, accepted the oracle, fell upon the Athenians, defeated them, and returned to power. Æschylus, also, in the *Persæ*, makes the messenger describing the battle of Salamis say

"And they, as men spear tunnies, or a haul Of other fishes, with the shaft of oars Or spars of wrecks went smiting, cleaving down."

The tunny has been the theme of historians, of poets, and of naturalists, almost since history in Europe began; and from Herodotus downward the ancients have sung his praises, dedicated him to their duties, stamped his effigy on their medals, and used the methods of his capture to point their illustrations.

The chief tunny fisheries of the ancients were carried on at the eastern and western extremities of the Mediterranean, and in narrow waters, where migrating fish were obliged to concentrate. The Black Sea was certainly a favorite breeding-ground, perhaps, as Cuvier opines, because of the great rivers which flow into it. Pliny confirms Aristotle in this particular, and mentions the huge shoals of tunnies which made their appearance in the early summer in these waters. But there is much historical allusion to other great fisheries in the western portions of the Mediterranean, and even in the Atlantic. The Phœnicians certainly established tunny fisheries, both on the Atlantic and Mediterranean coasts of Spain, and have left effigies of the fish on their medals of Cadiz and Carteia. Ælian writes of the fisheries carried on by the Gauls at Marseilles, where the tunny was caught "with great hooks of steel"—that is, gaffed and dragged on shore when netted, as he is at the present day. The Sardinian fisheries were especially celebrated in Roman times; the Roman epicures, indeed, esteemed the Sardinian fish above those of the Bosphorus, and Salsamentum Sardinicum was the Roman name for the preserved article. The Spanish salted tunny was also famous, and connoisseurs professed to detect in it a peculiar nutty

avor, which, they held, was derived from the acorns of the small oak which in those days overhung the coasts of the Peninsula. Famous fisheries also existed then, as well as now, on the shores of Sicily.

It was the fishery of the Bosphorus, however, which attracted the most notice, both in classical and mediæval times, and its importance is measured by the number and detailed character of the descriptive passages.

In later times the Black Sea seems to have lost its distinction as the favorite haunt of the tunny, while the industry has developed in the more central waters of the Mediterranean. The western fisheries held out longer. The Atlantic fisheries of tunny were important industries till the middle of the eighteenth century. The Duke of Medina Sidonia owned the most famous ones, and drew a large part of their revenues from them; they found employment for 500 men. But they gradually fell into mismanagement and decay, and by the middle of the century had declined into quite unimportant industries. One reads but little of them after 1755, except a kind of obituary notice, which declares that the earthquake of that year, which converted Lisbon into a heap of ruins, so altered the configuration of the Spanish coasts that the tunnies which had frequented them sought elsewhere for more congenial breeding grounds.

A fish so historic, so valuable, and of such goodly proportions may well be worth the angler's attention; a finny prize of 1,000 pounds, or even 500 pounds, is not to be despised, and if the tunny can be caught in the Mediterranean, why journey to the far-off Pacific? There, indeed, at Santa Catalina, on the Pacific coast, tunnies, or, as they are called, the flying tuna, are caught with rod and line every year in May and June. The bait used is a flying fish, in pursuit of which the tunnies appear every spring in large numbers, churning the sea into foam, and leaping in the pursuit of their flying quarry—whence the name of the "flying tuna." The tackle used is similar to that employed for the capture of the tarpon, the king of the herring, as the tunny is the king of the mackerel tribe. The fish make their appearance in May, and the angling continues till August, the best of it beginning about June 15, and lasting for a month. Judging from those that are caught with the rod, the Pacific tuna does not seem to attain to anything like the same proportions as the tunny of the deep sea waters of the Central Mediterranean. Some 250 pounds weight is the record of the Tuna Club, which has the strictest rules and regulations with regard to membership. The rod used by a would-be member to kill his fish must not be of more than a certain length or weight, nor the line of more than a certain thickness, and the aspirant, if he would qualify for membership, must wield the rod the whole time with his own hands; the captain of the club for the year being the member who catches the largest tuna of the year under these conditions. The fish are very exhausting to play, sometimes taking as much as six hours, or even more; but a little practice with the rod wonderfully shortens the time required to kill the fish, when muscles have got accustomed to bear the strain, and skill has come with experience. At first it seems absurd to attempt to land anything of the size, strength, and activity of the tuna with a frail rod and line, but, nevertheless, it can be done. The fish, as a matter of fact, tires himself out if he be not allowed to get his second wind, and the greatest possible strain is kept on him without relaxation all the time.

It is almost incredible what monsters of the deep can be landed with the rod and line; black bass and jewfish of preposterous dimensions can, with strength, time, and skill, be gradually worked up from the depths of the ocean; 700 pounds weight of struggling fish life has been successfully brought to the gaff in the shape of Mr. Vom Hofe's swordfish, and a swordfish is no mean fighter, besides being a lightning swimmer; and I, myself, when in Florida, in 1899, had an experience that the rod and reel were mightier than the chain and rope. Boca Grande Pass was swarming with sharks, a large number no doubt always living there, and a large number being collected by the tarpon fishing. Every night, from the little yacht on which we lived, we used to put out shark tackle, with hooks and chains of portentous size and thickness, and every night the sharks used to break them and carry them off till they were all gone. Nevertheless, at the close of my stay at Boca Grande, with a rod and line I caught a shark which was bigger than any I saw besides. He took a tarpon I was playing, an average-sized fish in a year in which the fish ran large, of some 120 pounds, and whether he swallowed the whole fish or only the head portion of it I do not know, but certainly he got well hooked, and, after a violent engagement, which lasted about forty minutes, he was gaffed and lay still by the side of the boat, than which he was, to all appearance, very much longer—so much so that all idea of pulling him into it was given up, and the yacht being some four miles off, it was not considered worth while dragging him there, so, after a few pats on the head, he was let go. This episode is only alluded to as an instance of the size of fish which can be captured with a rod; and if these things can be done in the Atlantic and in the Pacific, why should they not be feasible in the Mediterranean?

That is a problem which I and a companion set out to solve this spring with a proper equipment of rods, hooks, and lines. From all accounts, the tunnies off the Ægæan Islands, on the west coast of Sicily, were those most worthy of attention, running, as they were reputed to, and, indeed, did, up to 1,200 pounds, and not the lesser fry of the North African and other coasts of the Mediterranean, small fish from 150 to 300 pounds. So, to Trapani we went, the chief town on the mainland, within easy hail of the islands aforesaid and the tunnies which they sheltered. That the fish were there we soon had ocular demonstration, for, steaming out in our little launch to the fixed tunny nets, off the island of Formice, we were allowed by the Reis, or head man at the fishery, to row over one of the net chambers in which the fish were confined, and to look down upon some hundreds of them quietly swimming about below, unconscious of the doom that was awaiting them in the Camera del Morte, a few chambers off. But besides allowing us to see the fish, for which we were grateful, the Reis imparted to us a piece of information which considerably dampened our piscatorial ardour—namely, that at that

time of year the tunnies ate nothing at all; they are in love, said the Reis, and they eat nothing. They wander round in large shoals and enter the nets, and are quite happy, their motto for the time being, "the more the merrier;" in fact, frequently in the night the tunnies inside the nets were joined by tunnies from outside, which forced their way through the unsubstantial network of the outer chambers, and, when once there, remained contentedly, without employing a similar method of exit to regain their freedom in the open sea. Further investigations from young and old inhabitants served, alas! only to confirm this theory, which was strengthened by the fact that when the thousands of tunny which are caught at this time of the year along the Sicilian coasts were opened no traces of food were found inside them. Later on they would take; after the feast of St. Peter, men caught them trailing behind the sailing boats, and desperate fights they had with them, ending in the local hospital—but with good, thick ropes, and three men to pull, not with wretched little lines and reels, such as we had, which no self-respecting tunny would take the smallest notice of. This information appeared to be as accurate as it was disappointing, and, in other surroundings, would have been distressing; but at Trapani, as, indeed, elsewhere in Sicily, there is so much that is curious, interesting, and, indeed, exciting, that a week spent there is not ill spent, even though the tunnies in May will not take a bait. The bay shaped like a sickle, which gave its name to Trapani, the ancient Drepanum and the celebrated Temple of Venus Ericyna, on the summit of Monte San Giuliano, have seen many strange sights and a long procession of fresh conquerors and changing civilizations since the first great regatta. Trojans, Athenians, Syracusans, Carthaginians, Romans, Vandals, Saracens, Normans, French, Spaniards, and Austrians have all fought around them, and many have left their mark, which lasts to the present day.

Before leaving Sicily, however, we saw a dire revenge taken on the tunnies which had despised our allurements. At Favignana, where a slab attached to a door of a church in the island records a famous catch which took place more than 400 years ago, there is still the most lucrative tunny fishery in Sicily, and through the kindness of its proprietor, Commendatore Florio, to whom most things in Sicily belong, we were the privileged spectators of more than one "matanza," and a "matanza" is a sight well worth seeing. The fish are guided into the chambers, which open one into the other, till they end in the chamber of death, by long arms of coarse netting, which stretch out on either side to intercept the shoals which pursue a regular course, and cause them to coast round till they find the opening into the chamber, which they unsuspectingly enter. These arms are sometimes some four miles in length, one being known as the "coda," or tail, and the other as the "costa," and they both end in the "campile." The tunny is a gentle and a curious fish, and is apparently not alarmed at finding himself in confinement, and never seems to make a dash through the nets, which at this stage he could do without much difficulty, but only follows them round till he finds his passage unimpeded. The nets are kept in position by a hawser at the top, called a "sommel," which is kept afloat by large pieces of cork, and a hawser at the bottom, called the "piombo," which is weighted with large pieces of stone; the vertical lines which connect the two are called "modellari," and the whole is made secure by anchors placed at stated intervals. Men in barges are constantly on the watch over the nets, and by long practice can state with absolute precision the number of fish that have entered the chambers. They can be passed from one chamber to another by opening the door, which is done by letting the net over the aperture drop, and closing it again by pulling it up after they have gone through. If the fish are unwilling to move as required, advantage is taken of their curiosity, and something bright exhibited at the opening, and when one has passed through to see what it is all the rest follow. So they are moved on, and when there is a sufficient number collected in the penultimate chamber preparations are made for the "matanza." The last chamber is the chamber of death, and no tunny once across its fatal threshold comes out alive. It is formed of much stronger netting than the other compartments, each of which also has its separate name, and its bottom, too, is made of netting attached by thick hawsers to large bundles of cork, known as "cagnazzi."

When the day of the "matanza" arrives, the fish being secured in the "camera del morte," three sides of it are inclosed by huge barges, while another huge barge, crammed with men, beginning at the distant end of the compartment, slowly approaches them broadside on, dragged forward by means of the bottom net, which is thus brought to the surface and dropped as the barge passes on. In the middle, during the whole time, there is a head-man in a boat directing the raising of the net beneath him. The whole operation is carried on to the accompaniment of weird cries from the multitude of men who are hauling up the net. For some time there is nothing to be seen, but as the moving barge approaches there is suddenly the great swirl caused by the first rush of the empty fish to the surface, which is by far the finest sight in the day's work. Soon after this, as the fatal net rises, the whole of the water is one sheet of foam and spray flung high over the barges, which inclose it on all sides. Here and there a swordfish is seen darting this way and that in the extremity of terror, and the great forked tails of the tunnies lash the water in their futile struggles to escape. But soon the spray, which was as white as snow, gets tinged with red, and finally becomes more red than white, as the iron hooks attached to short poles are driven into the sides of the unfortunate fish, which, with incredible rapidity and scant ceremony, are dragged up over the gunwale of the barge, and fall into its capacious hold with a resounding thud. Each man is a trained hand, very often with inherited ability, and occupies his allotted post, and in a very short time the two end barges begin to sink in the water with a load of some 700 tunnies, averaging more than 500 pounds apiece. Meanwhile, as each fish is tumbled in, an old man, with a long spear, thrusts at them just behind the pectoral fin, to make the blood flow, and the great tails, thumping the bottom boards, scatter it in jets. It is not a very pleasant sight, the last scenes of a "matanza," and it is

not sport—it is merely catching tunnies, and the tunny is a valuable fish. When the last of the catch has been hauled in, and none escape, a short chant is sung to the Blessed Virgin, and the long line of laden barges sets out toward the shore, where a hard day's work awaits the men employed. The destination is a huge factory, filled with every possible appliance for dealing with the catch, however great. Here the fish are dragged up an inclined plane, laid in lines, and their heads cut off by a headman, with a long axe, who performs the operation in two strokes, the intestines are removed, and the roe and milt carried off in wooden troughs and placed in brine. The fish is then hung up by the tail for about eight hours, after which he is cut up and boiled in copper vats, and then the pieces are carefully placed in tins, fitted in like a child's puzzle, the tins are filled with oil and soldered down. Every part of the tunny is used, and has its particular name. There are four different qualities preserved in oil. The heads are boiled for oil, and the bones and ashes are sold as manure, a use being thus found for every portion of the unfortunate creature's anatomy. A good tunny fishery is a valuable possession, the heavy fish of Favignana being worth on an average some £4 net, and ten to twelve thousand in the season is by no means an unprecedented catch. The largest individual caught this year weighed 1,300 pounds. One of the most striking features is the great number of men employed at the factory, and the discipline and rapidity with which they work. There was at Favignana the usual convict establishment, and the convicts are employed in the packing of pieces of tunny into the tins, which are also made on the spot. Italy, and especially Genoa, is the greatest customer for the finished article, which is protected by high duties from the competition of the Sardinian and Spanish fisheries.

The tunnies are certainly there in large numbers and of great size; perhaps, when they are no longer in love, and the feast of St. Peter is safely past, those that have escaped the dread portals of the "camera del morte" might be induced to take a bait, even as they do in the Pacific, and then, indeed, an Homeric struggle would ensue. A 500-pound tunny would undoubtedly take some catching on a rod; he is, from all accounts, a strong though timid fish, and goes straight away from you in desperate, long runs. In this he differs from the tarpon, with a hundred of whom I have made intimate acquaintance within the space of three weeks—a most impetuous fish, who will rush anywhere when he is hooked, and even fling himself into your own boat, as I have seen happen on more than one occasion. But this prize of the Ægæan Islands will not be brought to the gaff without the help of those tutelary deities of the sea who have before now helped sportsmen in difficulties on this historic spot in the brave days of old.

W. H. GRENFELL.

Nets in Lake Champlain.

Editor Forest and Stream:

I send inclosed an article which appeared recently in the Albany Argus. Of course I do not vouch for its correctness, and the facts may be exaggerated especially as to the employment of a steam yacht to take boats to the spawning beds of the black bass, for, from the information which I have obtained, those who take the spawners from their beds do so from rowboats, hired, borrowed or hooked from persons living on the shore.

There are two evils referred to in this article which, however, do exist, and unless they are stopped, and that speedily, anglers will very soon bid good-by to Lake Champlain.

The western portion of this lake is in this State, and our law does not permit game fish to be taken at any time with nets; the eastern portion lies mostly in Vermont, and the laws in regard to the use of seines are not at all strict, and such as they are, are seldom enforced; the extreme northern end of the lake lies in Canada and includes immense spawning grounds for the pike-perch, and here licenses to use seines are so freely granted that fish are taken in enormous quantities during the spawning season and sent largely to New York.

As one of the results of the free use of nets in the Vermont and Canadian waters, the landlocked salmon which were placed in the northern part of this lake some years ago, and which, for a while increased, have almost entirely disappeared—simply taken from their spawning beds with nets.

Another evil referred to in that article, and perhaps the more serious of the two, is the taking of bass from the spawn beds in May and the fore part of June. I sent an article to FOREST AND STREAM in regard to this last year, but refer to it briefly again.

The principal grounds for the small-mouth bass are in the eastern part of the lake, near the north end, and from the lack of streams, they are forced to construct their beds near the eastern shore, where, when the water is quiet, they can readily be seen and taken from boats by simply dropping a line with a gang of hooks upon it alongside of the fish, and jerking it into the boat. This is not only done by those living on the shore who want a bass or two for their supper, but it is quite a custom for a number of people living in St. Albans, which is some six miles from the finest bass grounds in the lake, to go to it on still days and take large numbers of bass, many of them weighing as high as 4 pounds, and on their return send messes to their friends.

I think it but fair that I should state that I have obtained this information from persons living on the shore and also from several residents of St. Albans, who freely told me of their violation of the law, and said that they proposed to continue it so long as the authorities winked at it.

J. S. VAN CLEEF.

The inclosure sent by Mr. Van Cleef reads: ANGLERS who for years have enjoyed the sport on Lake Champlain are justly indignant over the laxity of the enforcement of the game and fish laws up that way. It is asserted by reputable anglers that the natives both from the New York and the Vermont shores of the lake are accustomed to come out in the spring as early as the black bass reach the spawning beds and fish for them with great

success, in violation of the law, which forbids fishing for black bass until June 16.

Last May a launch from St. Albans was observed to sail out to the bass beds towing nine rowboats, which were used to fish from, off the reefs. The bass during the spawning season, especially the females, bite at anything, even a bare hook. Hence it was no trouble for the pirates to capture enough to fill eight or ten barrels and sail away with them for shipment to the New York or Boston markets. This method is employed each year with great success. The real sportsmen and anglers who come later during the legal open season for taking bass are finding each year that the bass are smaller and harder to find. Howard Fuller, of this city, who owns a cottage on North Hero Island and has fished in the haunts of the Champlain bass for a dozen or fifteen years, says he has not heard of a bass being caught in Lake Champlain in many years that weighed over 5 pounds, and he has failed to catch many of late years that weighed over 4½ pounds. He attributes the scarcity of bass and their small size to the wholesale destruction of the bass by the fish pirates and the netters, who get a license from the State Game and Fish Commission to use seines in Lake Champlain to catch eels, suckers, bullheads, pickerel and catfish from June 1 to March 1.

If something is not done before long to stop the catching of game fish out of Lake Champlain by other methods than angler's rod and line, there will be no game fish to catch. The natives, who either indulge in the wholesale destruction of game fish or wink at the illegal practice of others, will soon find themselves deprived of the goodly revenues they now get from the anglers and their companions each summer.—Albany Argus.

CHICAGO AND THE WEST.

Fishing.

The weather just now is delightful in this part of the world, though liable to break up at any time. The heaviest of the Northern flight of wildfowl is not yet down, owing to the mildness of the weather, but the fishing is at its best. This would be a splendid time to go after muscullunge in Wisconsin or Minnesota. Col. Cooper is just back from a successful trip in the lakes around the headwaters of the Mississippi in Minnesota. One or two Chicago parties are in on the lakes of Wisconsin. Mr. C. E. Willard, just in from Oconomowoc, says that three days ago he caught thirty-one bass in one of the Oconomowoc lakes, nine of them being red-eyed smallmouths. Mr. F. B. Huntington, traveling auditor of the Wisconsin Central Railroad, of Milwaukee, is in town to-day and advises me that the bass are biting in fine shape at Gill's Landing, on the Wolf River, of Wisconsin. He states that muscullunge, wall-eyed pike and bass are all biting well this week in the Fifield chain of lakes.

I presume every one knows how difficult it is to get a fish nicely mounted. At the State Warden's office, in St. Paul, I saw a 7¼-pound big-mouthed bass which was the best specimen of fish mounting I ever saw in my life. It was done by a local taxidermist. The fish was mounted in full body, curved as though in the act of striking, and the whole expression was one of energy and activity. The body colors were finely rendered.

Dr. C. W. Carson and his friend, Dr. Miller, made a fishing trip for bass to the Mississippi River, but seem to have gotten into the wrong part of the country, and do not report any glittering success.

Mr. J. D. Hawks, President of the Detroit & Mackinac Railway Company, whose home is in Detroit, writes me this week that he had some good trout fishing last August and was lucky enough to catch some grayling.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Parasites in Fish.

ASHTABULA, O., Oct. 18.—*Editor Forest and Stream:* Hereabouts during the summer and fall months most of the black bass taken from streams are wormy along the back fin. I am told by others that but few of the Lake Erie black bass are so affected, and of the other river and lake fish, none at all.

So far as I could find, Henshall's first book of the bass does not refer to this, so will you kindly inform me if the second book does cover diseases of fish, and if this wormy condition is the result of a sickness or disease in the specimen, or are the worms or maggots hatched from the eggs of some insect, to whose attack the bass is more vulnerable than other fish? The affected bass seem as lively on the line as the others, and there is nothing about their surface appearance that marks them off.

How about their eating quality, for, of course, none of us eat the ones in which worms are found? What are the conditions as to temperature and water that develop this pest, and does it prevail generally in Southern rivers for a longer period yearly than in the Northern States?

Though now the middle of October, and after weeks of unusually heavy and cold rains, the proportion of fish affected seems as large as a month ago.

J. C. H.

[We repeat as here applicable a note appended to a communication of like tenor published in a recent issue: Various parasites are known to infest the flesh and intestines of black bass and trout and game and food fish in general, but, though not appetizing, they are considered harmless. Cook your fish thoroughly, make no deep scrutiny, give imagination no play, and enjoy the good things set before you.]

Salmon in the Oswego River.

OSWEGO, N. Y., Oct. 19.—*Editor Forest and Stream:* On Oct. 15 a man fishing below the first dam on the Oswego River saw a great many fish swimming about near the apron and trying to get up the fall. He finally caught one with a "barnyard hackle," which was afterward shown at a local fish market. It was apparently a "land-locked salmon" and looked more like an Atlantic salmon in its shape than an ouananiche from Lake St. John. The length was 17 inches, girth 8½ inches, weight 2 pounds 1 ounce; a perfect salmon head and a square tail, this last showing it was not a grilse, as many thought it. Curiously it had lost both pectoral fins, but the wounds were per-

fectly grown over. It was dark blue-black on the back, with very brilliant silver sides and belly, and marked with the little crosses always found on mature salmon. It was a female and the roe was fairly developed.

Before the dams were built on this river it was a great salmon stream, and salmon have visited the river as lately as twenty-five years ago. Fishways were placed at each dam a number of years ago, but were poorly constructed, and two years ago, when the dams were raised in height, were taken down and not replaced. Fifteen years ago 30,000 Atlantic salmon fry were placed in the river; could it be that they have been in the habit of going oily to Lake Ontario and so have not attained the full growth of the true salmon?

Mr. M. C. Worts, the Assistant Chief Game Protector, says many of these fish have been seen jumping in the mouth of the river, and in the mouths of near-by creeks emptying into Lake Ontario. He notified the fishermen and dealers that no more should be taken, as this is the close season. I forgot to say the flesh of this fish was a light pink—about the color of the flesh of the Lake St. John ouananiche—and the flavor much the same—not quite so rich as the Atlantic salmon. When more is known of the habits of the fish when in the lake, we hope to find we have a new game fish which will rise to the fly.

The Royal Buckhounds.

MANY will regard with mixed feelings the announcement of the abandonment of the Royal buckhounds, which, for seven hundred years, have been associated with the sovereignty of England. There are some who will miss much the accustomed run, when they were always sure of a quarry and a gallop over the fields and heatherland of Berkshire, and had not to depend for their sport upon the eccentricities of foxes, the good will of keepers, and the acquiescence of game preservers. Others there are, keen riders and good sportsmen, who have never entered the ranks of enthusiastic faddists, and are doubtful about the alleged cruelty of stag-hunting, and yet have never considered the hunting of the carted deer as real and legitimate sport, and regard with equanimity the abandonment of the Royal buckhounds. The lovers of ancient customs will, however, view the death of the royal pack with some feelings of regret, and cast their eyes back on the long association of the buckhounds with the sovereigns of England, and love to refresh their memories with regard to its many distinguished masters. The mastership was, for nearly three hundred years, an hereditary office, and was held for a long period by the distinguished De Brocas family, who came from Gascony in the time of Edward II.

During this long period of service many accidents, other than those which frequently befall riders to hounds, happened. In modern times politics have had much to do with the mastership, and a change of government has closed many a promising career. In the time of Henry IV, politics cost a De Brocas his head and his lands. His successors wisely preferred to study woodcraft rather than statecraft. One notorious master, Sir Pexall Brocas, suffered an appalling accident, and was compelled to do penance at Paul's Cross garbed in a white sheet for certain breaches of social amenities. A great change was effected by Henry VIII., who started a privy pack of buckhounds, quite separate from that kept by the hereditary masters. The master of this royal pack held office by the King's pleasure, and these hounds were the forerunners of the pack which has now been disbanded. Queen Mary, of evil memory, did away with her father's innovation, but the privy pack was revived by Elizabeth and James I. For years the old and the new systems contended against each other; but, after the fashion of human affairs, the new gradually supplanted the old, which became obsolete, and finally disappeared.

Good Queen Anne was fond of hunting, and built the

kennels on the present site at Ascot. In her early days she was the Diana of the chase; but length of years do not improve our riding; we go not so surely or so straight as of yore. Hence Queen Anne abandoned her saddle for her gig, and caused rides to be cut and bogs drained in Windsor Forest in order that she might follow the chase safely on wheels. The first two Georges were no sportsmen; and, though they occasionally hunted, the buckhounds languished under their patronage. Sir Francis Negus, who was appointed master by George II., had a variety of duties to perform. He had to feed wild turkeys in Bushey Park and manage the royal menagerie in Hyde Park, as well as attend to his hunting.

At this period the dangers of hunting were vastly increased by "the gentlemen of the road," who feared not to attack a master of buckhounds any more than the frightened occupants of a stage-coach. Did not Claud Duval once "hold up" the master returning from hunting, tie him to a tree, and purloin his watch and valuables? Another master, Lord Tankerville, used to sally forth attended by a guard of retainers and armed troopers.

George III. infused new life into the moribund pack. He was a keen hunter in spite of his nineteen stone, and by his constant attendance at the meets, his love of sport, and his eagerness for the chase, gave the buckhounds a new lease of life. No day was too long, no run too lengthy for his Majesty. Woodcraft was more congenial to him than statecraft, and history tells us that the hunting world owes much to King George III. In his time the Enclosure Acts in Berks and Bucks "hastened the dawn of civilization in the shape of the deer-cart," as the latest historian of the buckhounds happily expresses it. However, the King's long illness was a great discouragement to hunting, and a writer in the *Spotting Magazine* of 1814 states that "Men, horses, and hounds had dwindled by rapid degrees from splendor to decency; from decency to poverty, from poverty to inability. Those which don't eat are going mad, and those which are not going mad can only eat." With George IV. come new men and new manners. The old order changes. Much obsolete ceremonial is abandoned. The old, slow hounds are exchanged for a fast fox-hunting pack, of Goodwood lineage; and, moreover, Charles Davis, the pricer of huntsmen, is installed at the Ascot kennels, where he reigned so long.

It would be a long story to tell of all the illustrious, gentle and noble men who have held the office of master, and done their duty in the saddles to which royal favor or party politics have called them. I need not now record their names, for has not Lord Ribblesdale, that most courteous of masters, who writes as gracefully as he rides, already told their history in his famous book? He tells us of George Bolcyn—who was the brother of the ill-fated Anne and shared her fate—the first master of the privy pack, started by the much-married and sport-loving Henry; of Lord Leicester, the favorite of Elizabeth; of Colonel Graham, renowned as much for his skill in gardening as for his stag-hunting; and many other of Lord Ribblesdale's predecessors. Lord Lichfield, appointed in 1830, the Earl of Chesterfield, Lord Rosslyn, Lord Granville, Lord Hardwicke, Lord Suffield, the learned author himself, and Lord Coventry, the last of his illustrious line of masters, have all done their duty in their day, and upheld the ancient honor and welfare of the royal hunt.

And now the boots and spurs, whips, caps, and coats, of the royal huntsmen must be put away and preserved as heirlooms or sold as curios. *Sic transit gloria mundi.* The empty paddocks at Swinley tell their own sad tale of the slaughter of the famous red deer. Usually the herd numbered about five and twenty. Of these many were never hunted, only the good deer—those who would and could go—being utilized for the chase. Some of these became quite famous. There was Guy Fawkes, who was a great favorite, and possessed quite as much guile as his namesake; Lord Clanwilliam, who ran his pursuers out of daylight; and Runaway, who earned his name by a remarkable exploit. Half an hour after his first arrival at Swinley, started by the crack of a whip, he jumped out of the paddock, clearing eight feet of oaken paling. He enjoyed his liberty for some weeks, and was at length taken after a hard run. The most reliable of stags was Bartlett, who ran six times in one season, and never had a scratch. Blackback was another brave and gallant animal, who led many a long chase, and never showed any signs of terror, or even anxiety. They have all gone now. The carted deer is no more. May they rest in their graves, and know no fears in the "happy hunting-grounds!"

It is a mournful task to the lover of ancient manners to record the death of old-established customs and institutions; but apart from other considerations, the death of the staghounds was only a matter of time. Railways, wire, Enclosure Acts, the spread of villas, are fast altering the character of the country in which the royal pack hunted. We shall all soon dwell in the suburbs of London, the vast city that extends its giant bulk in all directions and absorbs everything. Hunting will soon be impossible in the King's country. To many of us, less active than of yore, the joys of remembrance are our only sport. The remembrance of many a famous run, of good comradeship, of courteous masters, and happy days of hard riding must console us for the death of the royal pack and the abandonment of an institution so long associated with the monarchy of England.—P. Hampson, in *English Illustrated Magazine*.

Beagle Trials.

CHICAGO, Ill., Oct. 19.—The field trials of the Northwestern Beagle Club will be held at Watertown, Wis., Nov. 5 and following, on the grounds known as Camp McKinley, than which it is stated no better grounds for rabbit work are to be found. The drawing takes place Monday evening, Nov. 4. Any owner unable to attend may be sure that his dog will receive good handling, if he cares to enter it, and a hearty welcome has been extended to all fanciers of the little hounds and to sportsmen in general to be present at the trials.

E. HOUGH.

We have applications for a French bull dog, a well-trained setter and two spaniels broken for grouse.

"Many Sportsmen Lose Dogs."

PHILADELPHIA, Pa.—*Editor Forest and Stream:* I read in FOREST AND STREAM of Oct. 19, under the caption "Many Sportsmen Lose Dogs," the statement made by Mr. E. Hough, as follows: "Never in the history of Chicago have so many gentlemen lost valuable shooting dogs through the rascality of alleged trainers as has been the case this fall," etc. Then he enumerates five cases, in which trainer and dog both disappeared—two were poisoned; one was hanged in a wire fence, and one ran away. It is a fair presumption that all of Mr. Hough's information is founded on hearsay, in so far as it concerns this matter. Is not that rather inadequate testimony on which to make so broad and grave a charge? Are not dogs poisoned, or lost by death, when they are in the charge of their owners? Are they not lost, or stolen, when in the charge of their owners? Is it to be assumed that because a dog is in the charge of a trainer, such dog is immune from loss, accident, or death?

There is one feature of Mr. Hough's sweeping accusation which is particularly deplorable. By omitting the names of the trainers whom he charges with "rascality," he places every trainer more or less under suspicion. Is it not a fair presumption that the good names of the honest trainers are as dear to them as Mr. Hough's is dear to him?

In my opinion it is, on his part, flagrantly unjust to a reputable class of men, who are pursuing a useful profession, to cast, or rather attempt to cast, a stigma upon them by such a general accusation, to say nothing of the absence of any good authority for making it at all.

If we assume that Mr. Hough is justified in arrogating to himself the authority to pass on each case which concerns owner and trainer, in fairness both sides should have a hearing. Nothing is more unjust than to make a public accusation on ex parte evidence.

Moreover, as a general proposition, a business matter between two or more people is generally conceded to be their own affair. If there is any important wrong done to either, there are courts, for the special purpose of dealing out justice, and in the procedure therein both parties have a full hearing, in which hearsay and conjecture have no place.

I have had some dealing with both trainers and owners. Trainers have their grievances, as well as owners. The same human nature is found to exist among them. Dishonesty is not confined to any one class. The misdeeds of the few should not be charged to the whole. ART.

Training the Hunting Dog.

TOLEDO, O.—*Editor Forest and Stream:* I read "Training the Hunting Dog for the Field and Field Trials," with great enjoyment and profit. I read the chapters of it in FOREST AND STREAM as they were first published, but, of course, one derives more benefit from reading them in the consecutiveness of a book. It is fine, not only to a man who wishes to train a dog completely, but also to those who wish to keep a dog in training after he is once broken.

Not the least valuable part of the work is that which teaches the trainer to train himself. I recommend the work most strongly.

EDM. H. OSTHAUS.

Points and Flushes.

The Brandford (Can.) Kennel Association, the secretary, Dr. Babcock, informs us, will hold its first show under C. K. C. rules, on Thanksgiving Day.

Canoeing.

'Mid Reef and Rapid.—XXVI.

BY F. R. WEBB.

THE time drifted very pleasantly by us, here at Riverton. As a matter of fact, by referring to my log, I find that we spent two whole days in camp here; but in an idle camp life like ours—idle, yet not idle, for in writing letters, bringing the log up to date, reading, overhauling canoes, camp outfit and duffle, and in resting, one is hardly idle—I say, in a camp life like ours, time seems to have no well-marked divisions; and morning, noon and night, while they come and go with their accustomed regularity, leave no such impression as when one is regularly occupied with one's usual routine of daily duties; and, while the time certainly did not drag on our hands, it seemed to stand still, as it were, and we seemed to remain here an indefinite period—to quite become residents, as it were, as we passed to and fro, back and forth—to postoffice, store and where not—on various errands, before we folded our tents and silently drifted away, as we had come, on the bosom of the ever-flowing river.

The river ran down very rapidly, but as it was still red and muddy we, of course, had no fishing. We spent an evening at the Kenner House, where our fair visitors were boarding, and George and I entertained the guests with some piano and violin music.

Lacy and I had intended going over to Front Royal on the last day of our stay and taking dinner at the big hotel there, but a heavy rain set in, and we spent the forenoon cuddled in our respective blankets and tents, smoking, reading and dozing.

About 12 o'clock we were aroused by a hail, and on looking out we beheld Dr. Blackwell, attired in rubber coat, hat and boots, come down through the rain, to invite us up to dinner with him at the Kenner House, where we spent several hours very pleasantly, George and I playing some more duets, which the Doctor and a friend varied by performing some banjo and guitar selections. It rained more or less steadily all the afternoon, and after leaving the Kenner, we returned to our tents, our pipes and our books.

Toward evening the Doctor again appeared in camp, juggling his canoe, balanced across the hurricane deck

of a wheelbarrow. He cut such a figure, coming down the middle of the road under a full head of steam, that George promptly gathered him in with the kodak.

He had his tent and camping outfit packed in the canoe, and had come, at our invitation, to make camp with us and spend the night. His boat was placed in the river, and duly tested by all of us before his tent was made up. It was a very creditable piece of work, indeed, barring the fact that he hadn't given it beam enough, and it was consequently rather crank.

Lacy, who had gone out to visit some friends after dinner, returned about the time that the Doctor joined us, and we found that, while out, he had in some manner—surreptitious, no doubt—become possessed of a chicken. Our suspicions were confirmed when it was ascertained that the chicken was ready dressed and cut up for the frying-pan, and we had no doubt but that, on taking his departure from his friend's house, he had slipped out through the kitchen. He made a plausible statement to the effect that the chicken was given him by friends, for the use and behoof of the party, which statement, considering Lacy's well-known fluency and readiness where anything to eat is concerned, we placed no confidence in, although, per force, constrained to accept. However, it was no concern of ours. We had not lost any chickens, and as it was a welcome addition to our larder, we thought it the part of wisdom to accept his statement at its face value, along with the chicken, and keep our doubts and misgivings to ourselves, and, accordingly, the chicken occupied a prominent place in our supper bill of fare.

"Doctor, have you had many big floods in this river?" asked George, as we sat comfortably around our brightly blazing campfire, enjoying our evening cigars. It was a beautiful, clear night, after the day's rains; the clouds had all cleared away and the stars were shining brightly. The air was crisp and cool, and perfectly still. Not a leaf stirred overhead. A church bell, tolling in the village near by, sounded soft and mellow on the night air, while the lugubrious howling of a dog came at intervals across the fields. Near at hand the deep, pervasive drone of the big dam, which stretched across the river just opposite us, as we sat enjoying the cheerful light and warmth of our campfire, below the fly, fell, solemn and impressive, on our ears. The fly gleamed brightly, just above us, in the glare of the blaze, in whose fitful light the more distant canoe tents loomed up, ghostly and indistinct, in a receding line. The paddles leaning against a tree stood out from their dark background, and the provision bags, hanging on the tree trunks out of reach of prowling "varmints," gleamed whitely in the flickering light. Out between the trunks of the trees the placid surface of the river lay like a black, polished mirror, reflecting the stars in its mysterious depths, while the wave-crests in the rapids below the dam gleamed faintly white, with here and there a dancing twinkle of a star; and the lights shining brightly from the windows, here and there, on the bluff-like bank across the river, were caught up on the restless waters and carried across, in long, undulating lines.

"Well," the Doctor replied, "the flood of 1870 was the greatest ever known. The flood of '77 was just 40ft. high, on the side of the mill—7ft. less than the flood of '70. The trestle work approaches to the Southern Railroad bridge below the mill there were carried away in this flood. They were also carried away, and the bridge, too, in the flood of '70. There was high water three times in '70, and each time these trestles were carried away."

"The railroad was playing in hard luck, that year," George remarked.

"Yes," replied the Doctor; "there was also high water in 1889. The water rose 37ft. on the side of the mill, and got the railroad trestles again."

"Was the dam ever carried out?" I asked.

"No," replied the Doctor; "it was badly damaged in the flood of '80, and a big hole was broken in it; and, after the water went down, it made a large whirlpool, or suck-hole above the dam; really so large as to be dangerous of approach. An amusing incident occurred in connection with this suck-hole. One of our local celebrities—a waterside character, Peter Harmon by name—was fishing from a boat above the dam, and carelessly got too near this whirlpool. His boat was caught in the current and began to swing round and round, approaching the suck-hole in the center at each gyration. Peter got rattled and completely lost his head, and jumped overboard to swim ashore. He was, of course, promptly gathered in by the suck, and after two or three preliminary gyrations he disappeared. The horrified spectators of course thought he was drowned, but in a few minutes he popped up about 50yds. below the dam, spitting, spluttering and cussing, with all the breath he had left. As soon as he could find wind enough he yelled at the crowd, 'Why in h— and several kinds of foreign nations haven't you got a boat here for me! Do you take me for the Apostle Peter?' A boat was speedily manned and sent out, and Pete was picked up and brought ashore, not much the worse for his trip.

"That's a good one!" exclaimed George, after the laugh had subsided.

"I'd like to shoot that dam," Lacy remarked, as he refilled his pipe, and borrowed a match from the Doctor, which he lit by holding it to the embers of the fire, and then applied to his pipe.

"Why, you couldn't do it safely, could you?" asked the Doctor, in surprise.

"Oh, yes; I think so," Lacy replied. "There appears to be a deep flow of water over the edge of the dam, and the water is deep below, and I think there would be no danger. I feel strongly tempted to try it, anyhow."

"But the undertow!" insisted the Doctor. "You would most likely be drawn back up under the dam and carried down by the fall!"

"I think not," Lacy returned.

"I think there is great danger of it," the Doctor insisted. "There was a man drowned out there, under that dam; in that manner, some years ago."

"How did it happen, Doctor?" I asked. "I have heard that, some years ago, a boat was drawn up under the fall over the dam and a man drowned. Tell us about it; how it happened."

"Well, I think it an open question whether he was

drowned or whether he died from heart failure. At any rate, he lost his life there, from the boat being drawn up under the fall of the dam and swamped. It happened this way: Dr. Williams and Mr. Smith Turner, of Front Royal, our present Congressman from this district, you know, succeeded Governor O'Ferrall—"

"Yes," I replied.

"Well," he continued, "they were fishing below the dam, in a large fishing boat they owned, well-fitted for fishing, with good anchors at each end, and other conveniences. Dr. Williams was quite elderly—something upward of 70, but was quite an ardent and expert fisherman—one of the best posted men in all points pertaining to fishing in this region, which is saying a good deal, in this land of expert fishermen. Well, they had an anchor at each end of the boat, as I said before, which were lying on the decked ends of the boat, where they could be quickly dropped overboard when the proper time came. The Doctor was paddling, and they were working for position, close up under the dam and broadside to it, so as to fish right up under the fall. The boat was worked up too close, and, in an instant the undertow, boiling up from below, caught it and carried it right up, broadside on, under the heavy fall. The boat was instantly swamped, but, being of wood, of course did not sink. Both anchors, however, rolled off into the river as the boat careened, and, as they were rove up short, they held the boat right there, under the fall. Turner shouted to the Doctor to jump, threw himself on his back in the water, on the down stream side, and, bracing his feet against the side of the boat, he gave a vigorous shove, which carried him clear of the undertow and into the swift current below, which, in a few moments, carried him down into the shallow water of the rapids, where he regained his footing and easily got ashore. The Doctor, however, who was also an expert swimmer, remained with the boat a few minutes, keeping afloat by holding to the sides of the boat, while he tried to secure his fishing tackle. He took a great deal of interest and pride in his rods and tackle generally, and naturally tried to save his rod. However, he at last got clear of the boat, and, as Turner reached the rapid and secured a footing and turned to look for the Doctor, he was observed to be standing on a large, flat ledge, for which he swam—being well acquainted with its location—in water not quite up to his waist. As Turner looked the Doctor waved his arms, as if to assure Turner of his safety, and that he was all right. Turner then made his way ashore, and when he again turned to look for the Doctor he was nowhere to be seen. Search being promptly made his body was found, close to the ledge; but as he was in shallow water when last seen, it has been supposed by many that he was not drowned, as was popularly accepted, but that he died suddenly from heart failure, consequent on the sudden excitement and shock. He had had one or two attacks of this character before, and had been warned that the next one might prove fatal, which, perhaps, confirms this theory. At any rate, whether his death resulted from heart failure or drowning, the fact remains that it was due to his boat being caught in the undertow and swamped."

In the morning Dr. Blackwell was given an opportunity to sample one of our famous breakfasts of fried bacon and a scramble of fried potatoes, fried onions and eggs, and he improved the opportunity to the utmost.

We were quite sorry that he could not join us for the remainder of our cruise to Harper's Ferry, but the condition of several of his patients was such that he could not leave them at this time.

It was a bright, beautiful morning after the rains. The river—now run down to a most beautiful canoeing stage, some 12 or 15in. above dead low-water mark—caressed by the fresh morning breeze, rippled and sparkled in the bright sun, which was reflected from every little wavelet, and from the bright foam crests of the rapids below the big dam, while the rain drops glittered and twinkled in countless diamond points from every leaf, from which they fell in dewy little showers of living light, as the boughs were gently swayed by the breeze.

Overhead, a few snowy masses of clouds drifted across the sky, behind whose light, fleecy folds the sun was occasionally obscured, and his rays tempered, and it was with bright anticipations of the day's sport that the canoes were carried down upon the low, sloping platform which served as a wing, or anchor, to the end of the dam, and there packed and launched. With cordial good-bys to the Doctor, and waving of hats and handkerchiefs to a little group of our fair friends, gathered on the bridge just above the dam, we stepped down into our canoes, took our seats and pushed out into the stream, and were speedily dancing down over the rapids on the final stretch of our cruise, with Harper's Ferry, at the mouth of the river, as our objective point.

We passed under the bridge of the historic old Manassas Gap Railroad, dropped on down past the mouth of the North Fork, whose bulk and volume considerably augmented the river; passed under the long bridge of the Norfolk & Western Railroad, shot down the steep little rapid below and swung around the short, sharp, little bend to the left, and Riverton and the upper river were left behind, and we were fairly embarked on the lower river.

The Shenandoah is as beautiful a river from as far up its triplet head streams—North, South and Middle rivers—as I have ever seen, to its final, swift union with the Potomac at picturesque, Gibraltar-like Harper's Ferry, but nowhere is it so lovely as in the fifty-five-mile section embodied in the main river from the union of the North and South Forks at Riverton to the Potomac—the section on which we were now cruising. Broad, deep and majestic, it swept on its way, around bluff and lowland, past massive cliffs, whose beetling brows overhung the black, fathomless water, which lay still and mirror-like at their bases, and in whose mysterious depths they were darkly reflected; past lofty, tree-clothed bluffs, whose rugged heights, softened by the rich, green mantle of verdure upon their shoulders, smiled back up at us from the placid depths below, their soft masses wrinkled and distorted by the long lines of water diverging from the prows of our deliberately moving canoes, and the gentle swirls from our paddle blades in our wakes, past low, wooded

banks, which sloped gently back into smiling fields and verdant meadows, dotted here and there with humble cabins, comfortable farmhouses and stately mansions. The broad, swelling slopes and domes of the Blue Ridge towered aloft imposingly, close at hand on the right, except where the river, in its serpentine wanderings, meandered away into the valley, only to return again and flow humbly and caressingly at the feet of its great spurs and foothills, while light cloud wreaths, like torn masses of fleecy, lingered lovingly around the brows and adown the sides of the towering summits.

The water flowed deep and still, though always swift, for the most part, and, although broken by frequent long chains of rapids and falls, down whose wave-crested slopes we shot with exhilarating speed, was not nearly so difficult to navigate as the upper river. Frequent islands, many of them of large extent, containing groves of trees and cultivated fields, appeared, dividing the river into two smaller streams, down which, as we passed, it was easy to imagine ourselves transported back up the river a hundred miles.

It was an ideal cruising stream, and an ideal cruise, even to the day, which, while bright and sunny, was not too hot, while the air was rendered still more fresh and agreeable by a brisk breeze, which played caressingly over the surface of the river, breaking its otherwise smooth surface into miniature wavelets, dancing and sparkling in the sun, and lapping up under the bows of our canoes with a musical tinkle. It rustled merrily through the trees, which swayed gently to and fro under its influence, while, with a musical murmur, the trembling leaves displayed a hundred different shades of green, and our bright, little, silken pennants fluttered merrily from their staffs, and stood out flat in living undulations.

There were no mill dams to delay us, and the occasional falls, many of which were both long and rough, as well as the broken-down fish dams, offered no obstruction at the present stage of water, and we passed steadily on down the river, round bend after bend, down long, rocky rapids and over smooth, swift reaches, and mile after mile was covered without pause or landing of any kind. "See that peculiar hole or cave in the cliffs up there?" said Lacy, as we swung out of the narrow channel around the foot of a long island, into the broad, reunited river, which flowed abruptly into the face of a huge cliff, which seemed to oppose its progress by towering squarely across its course, and which it escaped by swinging around abruptly to the right. A large, smoke-blackened aperture loomed up in the fact of the cliff, half-way up its side, while the bank rose, steeply sloping, to its entrance.

It was well trodden down, and under the two or three big trees standing guard at the entrance were scattered a table, one or two chairs, some boxes and other camping appliances, while, half-furled up across the mouth of the cave, hung a great sail-cloth awning.

"Some one is evidently camping there," I replied. "A fishing party, I should judge," said Lacy, as his glance took in the large fishing boat moored at the bank a short distance below the cave, and the miscellaneous collections of rods, buckets and other fishing appliances scattered around.

George promptly seized the inevitable bugle, and made the welkin ring with his usual discordant blasts. In a few minutes his efforts were rewarded by the inevitable "Whoo-ee!" from somewhere inland, and we presently caught sight of an elderly man hurrying along down the bank with the assistance of a cane, keeping pace with us as we drifted rapidly by on the smoothly flowing river and hailing us to come ashore.

As hails of this character were of almost hourly occurrence, we, at first, paid no special heed to it, beyond politely declining to land, and continued on our course, but, after a little conversation, carried on at the top of our mutual lungs, we noted that this was something more than the usual curiosity hail, and, changing our course, we rounded in to the bank and drew alongside of the big fishing boat, and, stepping ashore, were shortly exchanging greetings and mutual introductions with Mr. George Tucker, of White Post, in this vicinity, who, as he informed us, was camping here in the "Boatmen's Cave"—as the place is termed, from the fact that it was a favorite camping place of the old-time, flat-bottomed boatmen—on fishing bent. His friends were away for the afternoon and he was alone in the camp. They had been here for about three weeks, and expected to remain until the first of October. As he expressed it, his wife was at the World's Fair, and he was here, having a good time after his own heart.

"Are you the fellows," he asked, after we had exchanged a few mutual particulars over a glass of something cheering, and while George, Lacy and I were gathering around our mess-chest preparatory to lunching—Mr. T. had had his dinner and declined to join us—"are you the fellows who have been cruising up and down this river for the past few years, and writing about it in *FOREST AND STREAM*?"

We admitted that we were the guilty parties; making the reservation in our favor, however, that, up to date, we had done no cruising up the river to speak of, our trips having been invariably down.

"Well, it's all the same," said he, with a little laugh. "I've read about your various trips with a great deal of pleasure, and hope, some day, to read an account of this trip."

As Mr. T. proved to be an expert fly-fisher, and something of an enthusiast on the subject withal, he and George found many points to discuss, and an interchange of ideas, and a mutual inspection of rods, fly-books, etc., interspersed with a liberal swapping of yarns, detained us here pleasantly for a couple of hours; and it was well on to 3 o'clock before we re-embarked and resumed our cruise, with many warnings and ominous shakes of the head from Mr. Tucker, who begged us to be careful in running the rough water in the Harper's Ferry vicinity, as it was highly dangerous.

We found the big spring at the "White-horse" a mile below, to which we had been directed at Riverton, without trouble. We had expected to lunch here, but as we had already performed that duty, we stopped only for a good, refreshing drink of water instead.

It was a nice place for a camp, barring the fact that it was by the side of a much-traveled public road, and the trampled, littered condition of the ground indicated

that it was a popular picnic resort, and had been used at no distant period for this purpose.

The "White-horse" is a huge sandstone boulder, evidently of glacial deposit, grayish white in color, and half as big as a house, lying in the water's edge, close to the right bank, in the bend of the river a mile or two below the boatmen's cave. From a little distance above it looked not unlike a huge white horse, in a recumbent position, and minus his head.

The region herabouts is a famous fishing ground, and we learned from Mr. Tucker that he and his party had been meeting with great success until the rains descended and the floods came, and reduced them to a condition of masterly inactivity. The water was now clear again, however, and they had resumed their fishing, with fair success.

We easily shot the remains of the old, stone "Sharp-rift" mill-dam, half a mile below the "White-horse," and went spinning down the rapids below at an exhilarating rate, while the crests of the waves washed our freeboards without more than sprinkling our decks.

We passed Berry's Ferry—the usual wire cable contrivance—and dropped down the long, narrow channel past Burrell's Island, which is three miles long, and contains quite a little farm, being connected with the Burrell estate on the left—to which it belongs—by a private ferry. The channel, broken here and there by little rifts, reminded us strongly of North and Middle Rivers, one hundred miles above.

While resting at the "White-horse" Spring George and I rigged up our fishing tackle. I attached a collar of flies to my line, while George put on one of those barbarous contrivances known as a "phantom minnow." We fished as we passed down this narrow channel, and each scored several rises. My success was fairly good, and out of every rise I now and then scored a capture; but George's diabolical contraption—studded, as it was, with gangs of hooks—proved to be a deadly attraction to the bass, for, if one came within a length of it, he was sure to be hooked somewhere—in the gills, back, tail, or where not—everywhere except in the mouth, where a decent, self-respecting bass ought to be hooked. George's method of using it was simple; he had but to cast it lightly out, some twenty or thirty yards, to one side or the other, and reel it gently in. It proved a deadly lure, for if there was a bass in the river anywhere within a quarter of a mile of it, he was sure to make a dash for it, and every dash meant a certain capture. He took one bass weighing about 3½ pounds, about half way down this narrow channel, which seemed to teem with bass, besides several others nearly as large.

We found a delightful little nook for a camp up on the high bank, in the rear of the old Tilt-hammer mill, which, by the way, like all of the mills down in this section of the river, derives its motive power from a small, side stream falling into the river, and not from the river itself. This little stream, which rejoices in the unpoetic appellation of Spout Run, drops into the river over a worn, honey-combed ledge, some six or eight feet in height, forming a charmingly beautiful little waterfall, into a sheltered little basin, just back of our camp.

Our arrival created the usual little ripple of excitement in the quiet, little hamlet, and we were, as usual, cordially received and treated by the few residents of the place.

The evening was chill, and we enjoyed our after-supper smoke around a cheerful little blaze of a camp-fire, in whose flickering light the tented canoes stood out in bright relief, and the weather-beaten, moss-grown side of the mill loomed up like a wall, until lost in the gloom overhead, while the musical tinkle of the waterfall sounded a soothing lullaby in our ears.

[TO BE CONTINUED.]

Western Division, A. C. A.

CHICAGO, Ill., Oct. 19.—The meeting of the Western Division of the A. C. A. was held at the Great Northern Hotel in this city at 4 P. M. to-day. There were present in person or by proxy four members from Milwaukee, four from Chicago, eight from Peoria, one from Detroit and one from Wyandotte, Mich. Entertaining addresses were made by Mr. Jupp, of Detroit; Mr. Campbell, of Wyandotte, and by different members of the Milwaukee fraternity. In the election of officers, Mr. F. B. Huntington, of Milwaukee, was chosen Vice-Commodore; Mr. A. W. Friese, of Milwaukee, Rear-Commodore; Mr. E. H. Holmes, of Chicago, Purser. Mr. F. W. Dickens, of Milwaukee, and Mr. Franklin S. Catlin, of Chicago, were constituted members ex-officio of the Executive Committee. Mr. H. C. Morse, of Peoria, continues to represent the Western Division in the Board of Governors of the A. C. A.

The meeting cannot be said to have evinced so large and general a revival of canoeing interest in the West as it did proof of the fidelity of the best men who have been identified with that sport in this vicinity. We shall hardly solve the problem of Western canoeing by juggling the terms A. C. A. or W. C. A. The thing to do is to build fundamentally and create an interest in the sport itself. That interest still survives in the bosoms of some of the Old Guard of the W. C. A. There cropped out to-day a strong feeling for the old meets at Ballast Island. The question of a Division meet for 1902 was referred to the Executive Committee of the Western Division, and that committee is practically instructed to cast its vote for Ballast Island and a meeting some time next summer. Every effort will be made to bring out the old-timers who made the earlier meets of the W. C. A. at Ballast so pleasant, and so successful. The Old Guard will be there, and if all goes well, it may be they will bring with them younger members and show them how things used to be done, and how they can be done to-day, in the matter of a sailing meet and a beautiful, social time.

No report of the Secretary-Treasurer was filed to-day, but Mr. W. C. Jupp, Vice-Commodore, from Detroit, verbally reported that the books show a membership of about sixty-six and a balance in the treasury of about \$100. The new officials are very enthusiastic, and it seems agreed that the only hope for the sport in the West rests with some of these old-timers. It is therefore very well that a quorum of the Executive Committee goes to Milwaukee—Messrs. Huntington, Friese and Dickens. Mr.

Holmes and Mr. Catlin, both of Chicago, are near at hand. Hence, there will be a practical working body at the head of affairs in this part of the world.

It is not thought likely that any members of the Western Division will be present at the A. C. A. meet at Auburndale, Mass., on Oct. 26. One or two of the members have recently returned from the East and find that they are unable to make a second trip at so early a date.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Yachting.

ON the eve of his departure for England, Sir Thomas Lipton states that he will not challenge for the Cup next year, but thinks it very probable that he may do so in 1903. He intends, however, to put Shamrock II. in commission and race her in American waters during the season of 1902.

SHAMROCK II. is lying just outside the big dry dock at Robbins', South Brooklyn. She has been stripped of everything above decks, and all her spars, sails and other gear have been placed in one of the big storehouses. A shed is now being built in which the challenger will spend the winter. Capt. Sycamore will stay until his charge is in her winter quarters, when he will leave for the other side. Six of the boat's crew will be left in charge, and will act as watchmen and ship's keepers. Erin has been at Erie Basin for some time past, where the plates that were damaged when she was in collision with the revenue cutter Gresham are being hammered into shape, and some interior braces are being replaced. After filling her coal bunkers, Erin will leave for England.

THE following article indicates very clearly the growing interest in the matter of house-boats equipped with auxiliary power in European waters. Up to this time there has been but one serious obstacle in the development of this delightful feature of outdoor life, and that has been the matter of propulsion of this type of craft, for hitherto they have been dependent on either an inadequate sail plan or on tow boats. Now they are independent of both, and it is to be hoped that American house-boat owners will come together and form a similar organization to the one that is now being promoted by Mr. Ernest Archdeacon, the account of which is taken from the Paris edition of the New York Herald, for in this way owners can be of great assistance to one another, not only in the development of the house-boat itself, but also regarding good cruising grounds.

Mr. Ernest Archdeacon, a well-known chauffeur and balloonist, who spent his honeymoon in a house-boat, announces his intention of forming a house-boat club. The members are to form a caravan of floating domiciles to visit French, German, Dutch and Belgian rivers and canals.

Mr. Archdeacon declares that the gasoline motor, which has been perfected through the impetus of long-distance automobile racing, has revolutionized the house-boat. It can be adapted astern without loss of space, thus dispensing with the nuisance of towage companies.

Design for a 21ft. Raceabout.

THE plans of the 21ft. raceabout which appear in this issue were drawn by Messrs. J. F. Small & S. N. Small for Mr. C. H. Chapin, of Boston. The boat was intended primarily for afternoon sailing, and nothing was sacrificed for speed; but she has proven fast and comfortable under all conditions of weather. The construction plan shows so clearly how splendidly the boat is put together that no further comment is necessary. The cockpit is water tight, and is very roomy, with transoms running around three sides. There is considerable room in the cabin under a low house, and, although the centerboard trunk extends into the cabin, it is a convenience rather than an objection, as it gives a place for a folding cabin table, and the trunk is so short one can cross the boat either fore or aft of it with perfect freedom.

Aft on either side are good-sized hanging closets, and the space under the step leading from the cockpit to the cabin is utilized as an ice box. The transoms are 12ft. long on each side, giving room to sleep four very comfortably—two on a side. Considering the boat is only 21ft. long on the waterline, she has a remarkably large amount of room, both on deck and below. There is 4ft. 4in. headroom under beams in the cabin. The dimensions are as follows:

Length over all.....	31ft.
L.W.L.	21ft.
Overhang, bow.....	4ft. 9 in.
Stern	5ft. 3 in.
Beam, extreme	9ft.
L.W.L.	8ft. 6 in.
Draft, to rabbet.....	1ft. 3 in.
Extreme	3ft.
Board down	6ft. 9 in.
Freeboard, bow.....	2ft. 8 in.
Taffrail	1ft. 11 in.
Least	1ft. 8½ in.
Sail area, mainsail.....	462 sq. ft.
Jib	115 sq. ft.
Total	577 sq. ft.
Ballast, inside	500lbs.
Outside	2,000lbs.

The English-built steam yacht Tuscarora, which has been under charter to Mr. R. F. Ballantine during the past summer, has been purchased by Mr. Walter Jennings, N. Y. Y. C. The price paid is said to have been \$165,000. Tuscarora was designed by Mr. G. L. Watson and built by Messrs. Scott & Co., at Greenock, Scotland, in 1897. She is 170ft. on the waterline, 26.8ft. beam and 14.55ft. deep. The yacht is lighted by electricity, and has two decks. All deck houses, etc., are finished in teak. She has triple expansion engines, with cylinders 16in., 26in., and 42in. in diameter, by 27in. stroke.

N^o 49

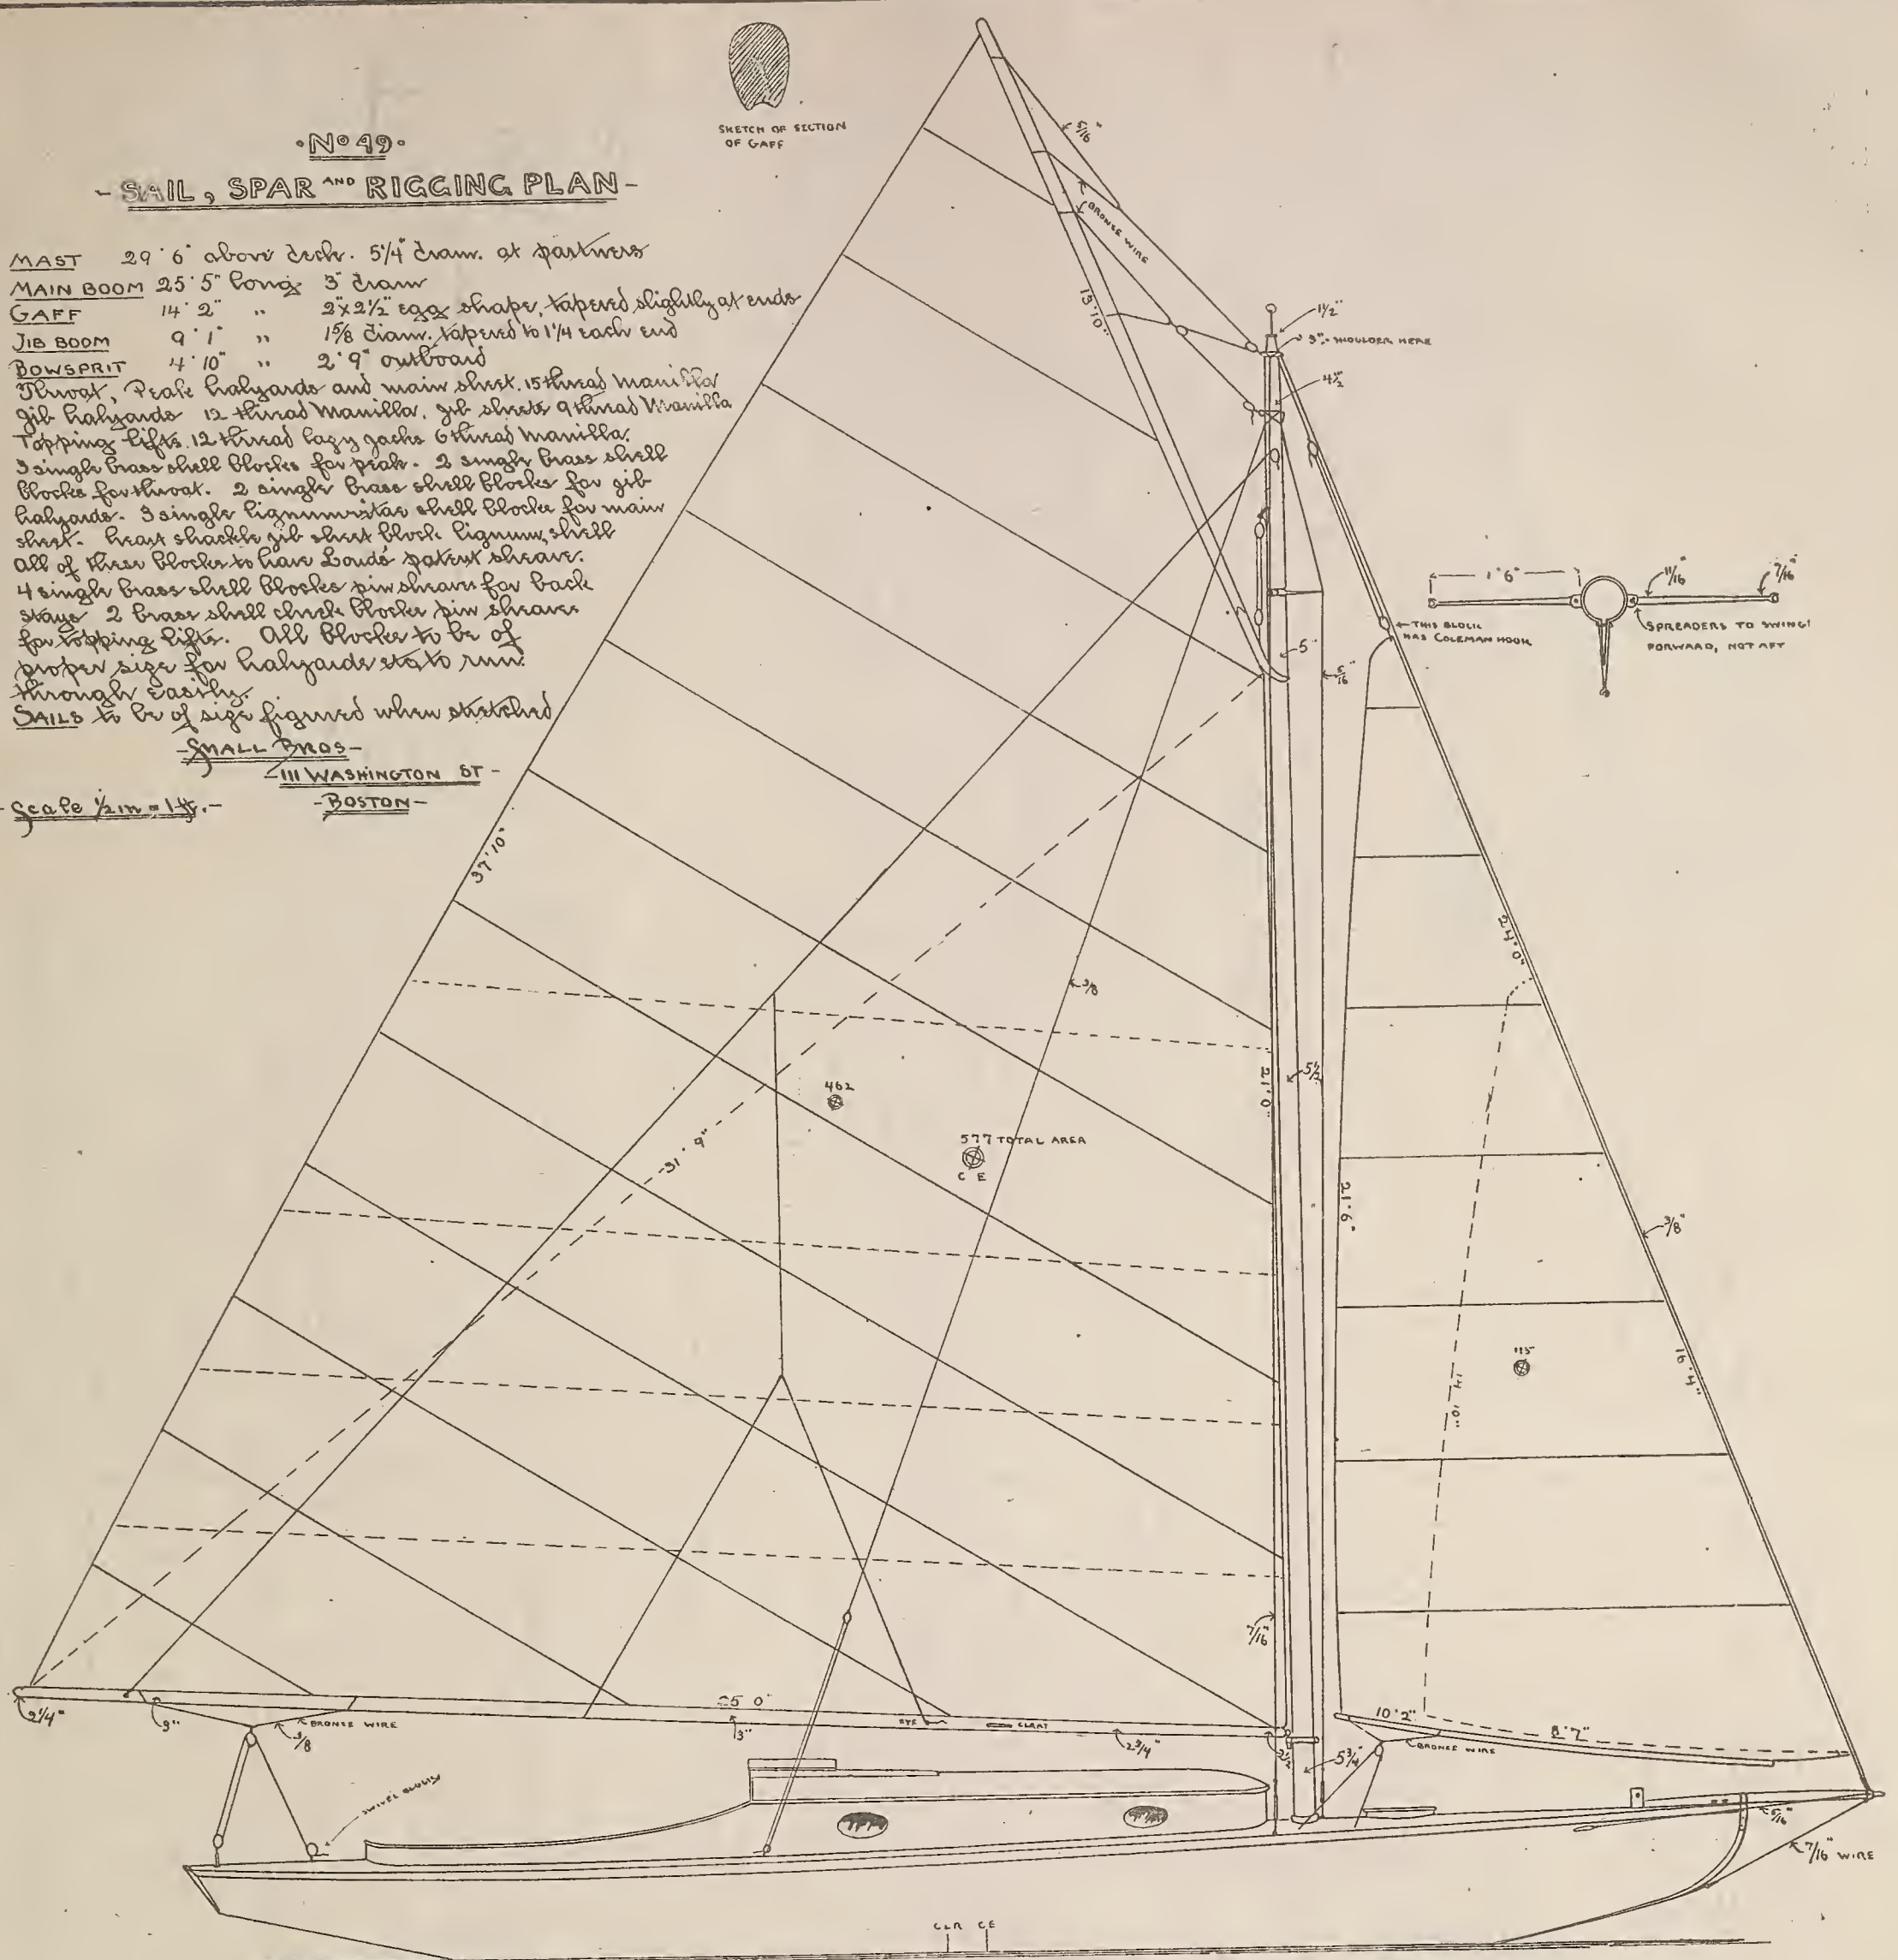

SAIL, SPAR AND RIGGING PLAN

MAST 29' 6" above deck. 5/4 diam. at partners
 MAIN BOOM 25' 5" long 3" diam
 GAFF 14' 2" " 2 1/2" egg shape, tapered slightly at ends
 JIB BOOM 9' 1" " 1 5/8" diam. tapered to 1/4 each end
 BOWSPRIT 4' 10" " 2' 9" outboard
 Throat, Peak halyards and main sheet. 15 thimble manilla
 jib halyards. 12 thimble manilla. jib sheet 9 thimble manilla
 Topping lifts. 12 thimble lag, gaffs 6 thimble manilla.
 3 single brass shell blocks for peak. 2 single brass shell
 blocks for throat. 2 single brass shell blocks for jib
 halyards. 3 single lignum vitae shell blocks for main
 sheet. brass shackles jib sheet block. lignum vitae shell
 All of these blocks to have Lonsdale patent sheave.
 4 single brass shell blocks in chain for back
 stays. 2 brass shell shell blocks in chain
 for topping lifts. All blocks to be of
 proper size for halyards etc to run
 through easily.
 SAILS to be of size figured when stretched

 BOSTON

Scale 1/2 in = 1 ft.

TWENTY-ONE-FOOT RACEABOUT-SAIL PLAN.-DESIGNED BY SMALL BROTHERS FOR C. H. CHAPIN, 1901.

Our Boston Letter.

BOSTON, Oct. 21.—Before going into details of the records of the 18-footers of the Yacht Racing Association of Massachusetts, I desire to correct an error which was unintentionally made in regard to the records of the 25-footers. In my last letter I said that in races outside of the Association Calypso had beaten Flirt more times than the keel boat had beaten her. This statement was the result of a hasty survey of the records, and, if allowed to remain, would be doing an injustice to Flirt. After having looked carefully over the outside races, I find that Flirt beat Calypso five times, while Calypso beat Flirt three. In one of the races of the Corinthian Y. C. Flirt was disqualified for having been sailed by a professional, but she finished second, and Calypso finished third on actual sailing. Even allowing her only last place in this race, I find that on figuring percentage for the outside races, under the same basis that is used in the Y. R. A., Flirt has a good margin to her credit.

The percentages of the yachts in the two 18ft. classes of the Association are as follows:

Class T—18ft. Open Yachts.						
	Starts.	1sts.	2ds.	3ds.	Fins.	Bks.
Fantasy	5	0	0	0	0	0
Plunger	5	3	2	0	0	0
Lobster	5	1	1	2	0	1
Cathryn	1	0	1	0	0	0
Flip	1	0	1	0	0	0
Hector	4	0	0	2	2	0
Pioneer	3	0	0	1	1	1
Class I—18ft. Knockabouts.						
Malillian	10	7	0	2	1	0
Aspinquid	13	5	3	2	1	2
Bacchante	12	2	4	3	2	1
Comforter	8	2	1	2	2	1

In the unrestricted class of 18-footers there has always been good racing, which was in danger of being spoiled by the introduction of yachts of abnormal length over all, which used trusses to hold up their ends, and which, on account of the movable trusses, were supposed to sail on various lengths of waterline. Two of these yachts, Dauntless and Circe II., were the cause of considerable dissatisfaction on the part of the other yacht owners of the class. Each of these yachts was about 37ft. on top. Circe II. was originally called Thelma, and raced on 21ft. waterline in 1899 for the Quincy cup. A truss was put in her which, on being set up, pulled up her ends until her waterline was under 18ft. Dauntless had a similar truss. Early in the season, both of these boats were remeasured, under protest, and it was found that their waterlines had increased to such an extent that they were over the class limit. They were immediately declared out of the class, and the others commenced to feel more interest in the racing.

The little Fantasy, which had kept aloof from Association races while the two larger boats were in, now took a hand in the game, with the result that out of five races she took five straight firsts, thus getting the only clean score that qualified for championship in any of the classes. Fantasy is rather a peculiar model. She is the maximum of flat floor, little dead rise and hard bilges, being square sided and a pronounced skimming dish. Her counter is drawn in so that she might properly be called a double ender. Her owner has been very persistent in racing her, and she has taken a number of valuable prizes. She is always fitted out with everything that can make her go in the matter of sails, and is kept in thorough condition all the time. She was designed and built by her owner, William Allerton, of the South Boston Y. C. She is 28ft. 8in. over all, 15ft. 6in. on the waterline, 7ft. beam and 10in. draft.

All of the other boats in the class are skimming dishes. Plunger is another boat whose waterline has been made shorter by pulling up the ends. It is understood that she is one of the Crane boats which raced for the Seawanhaka

cup. Lobster is one of the strongest built boats in the class. She is about 30ft. over all, and is noted particularly for the reversed curves at her ends. She was built in 1899 by Howard Linnell, of Dorchester. Cathryn is a very beamy skimmer, designed and built by Messrs. Ruddleick and Young, of the Columbia Y. C., last year. She has rather too many curves to be extremely fast, but she is very substantially built, and is an admirable cruiser.

This was the first season that the 18ft. knockabouts raced as a class under Association rules, and the result promises success for future seasons. The scantling and sail area rules of this class have been printed many times, and the majority of yachtsmen are familiar with them. They are limited to 450 sq. ft. of sail, and a minimum displacement of 4,000lbs. The boats are fine, single-handers, and for afternoon sailing are without equal. They can show a fair turn of speed, and can stay out in all kinds of weather. They run from 28ft. to 33ft. over all, so it can be seen that there is considerable more boat than their 18ft. waterline might imply. Only three of these boats followed all the circuits throughout the entire bay—Malillian, Aspinquid and Bacchante.

Malillian, which takes the championship, is not one of this season's boats, like most of the others, but was one of the bunch which was designed for Duxbury Bay last year by Crowninshield, and built by Jansen, of Gloucester. She did not get started as early in the season as some of the other, but she made a great showing after she had got going. She is a semi-keel boat, 28ft. over all, about 7ft. beam and 2ft. 6in. draft. She is owned by B. S. Permar, of the Hull-Massachusetts Y. C.

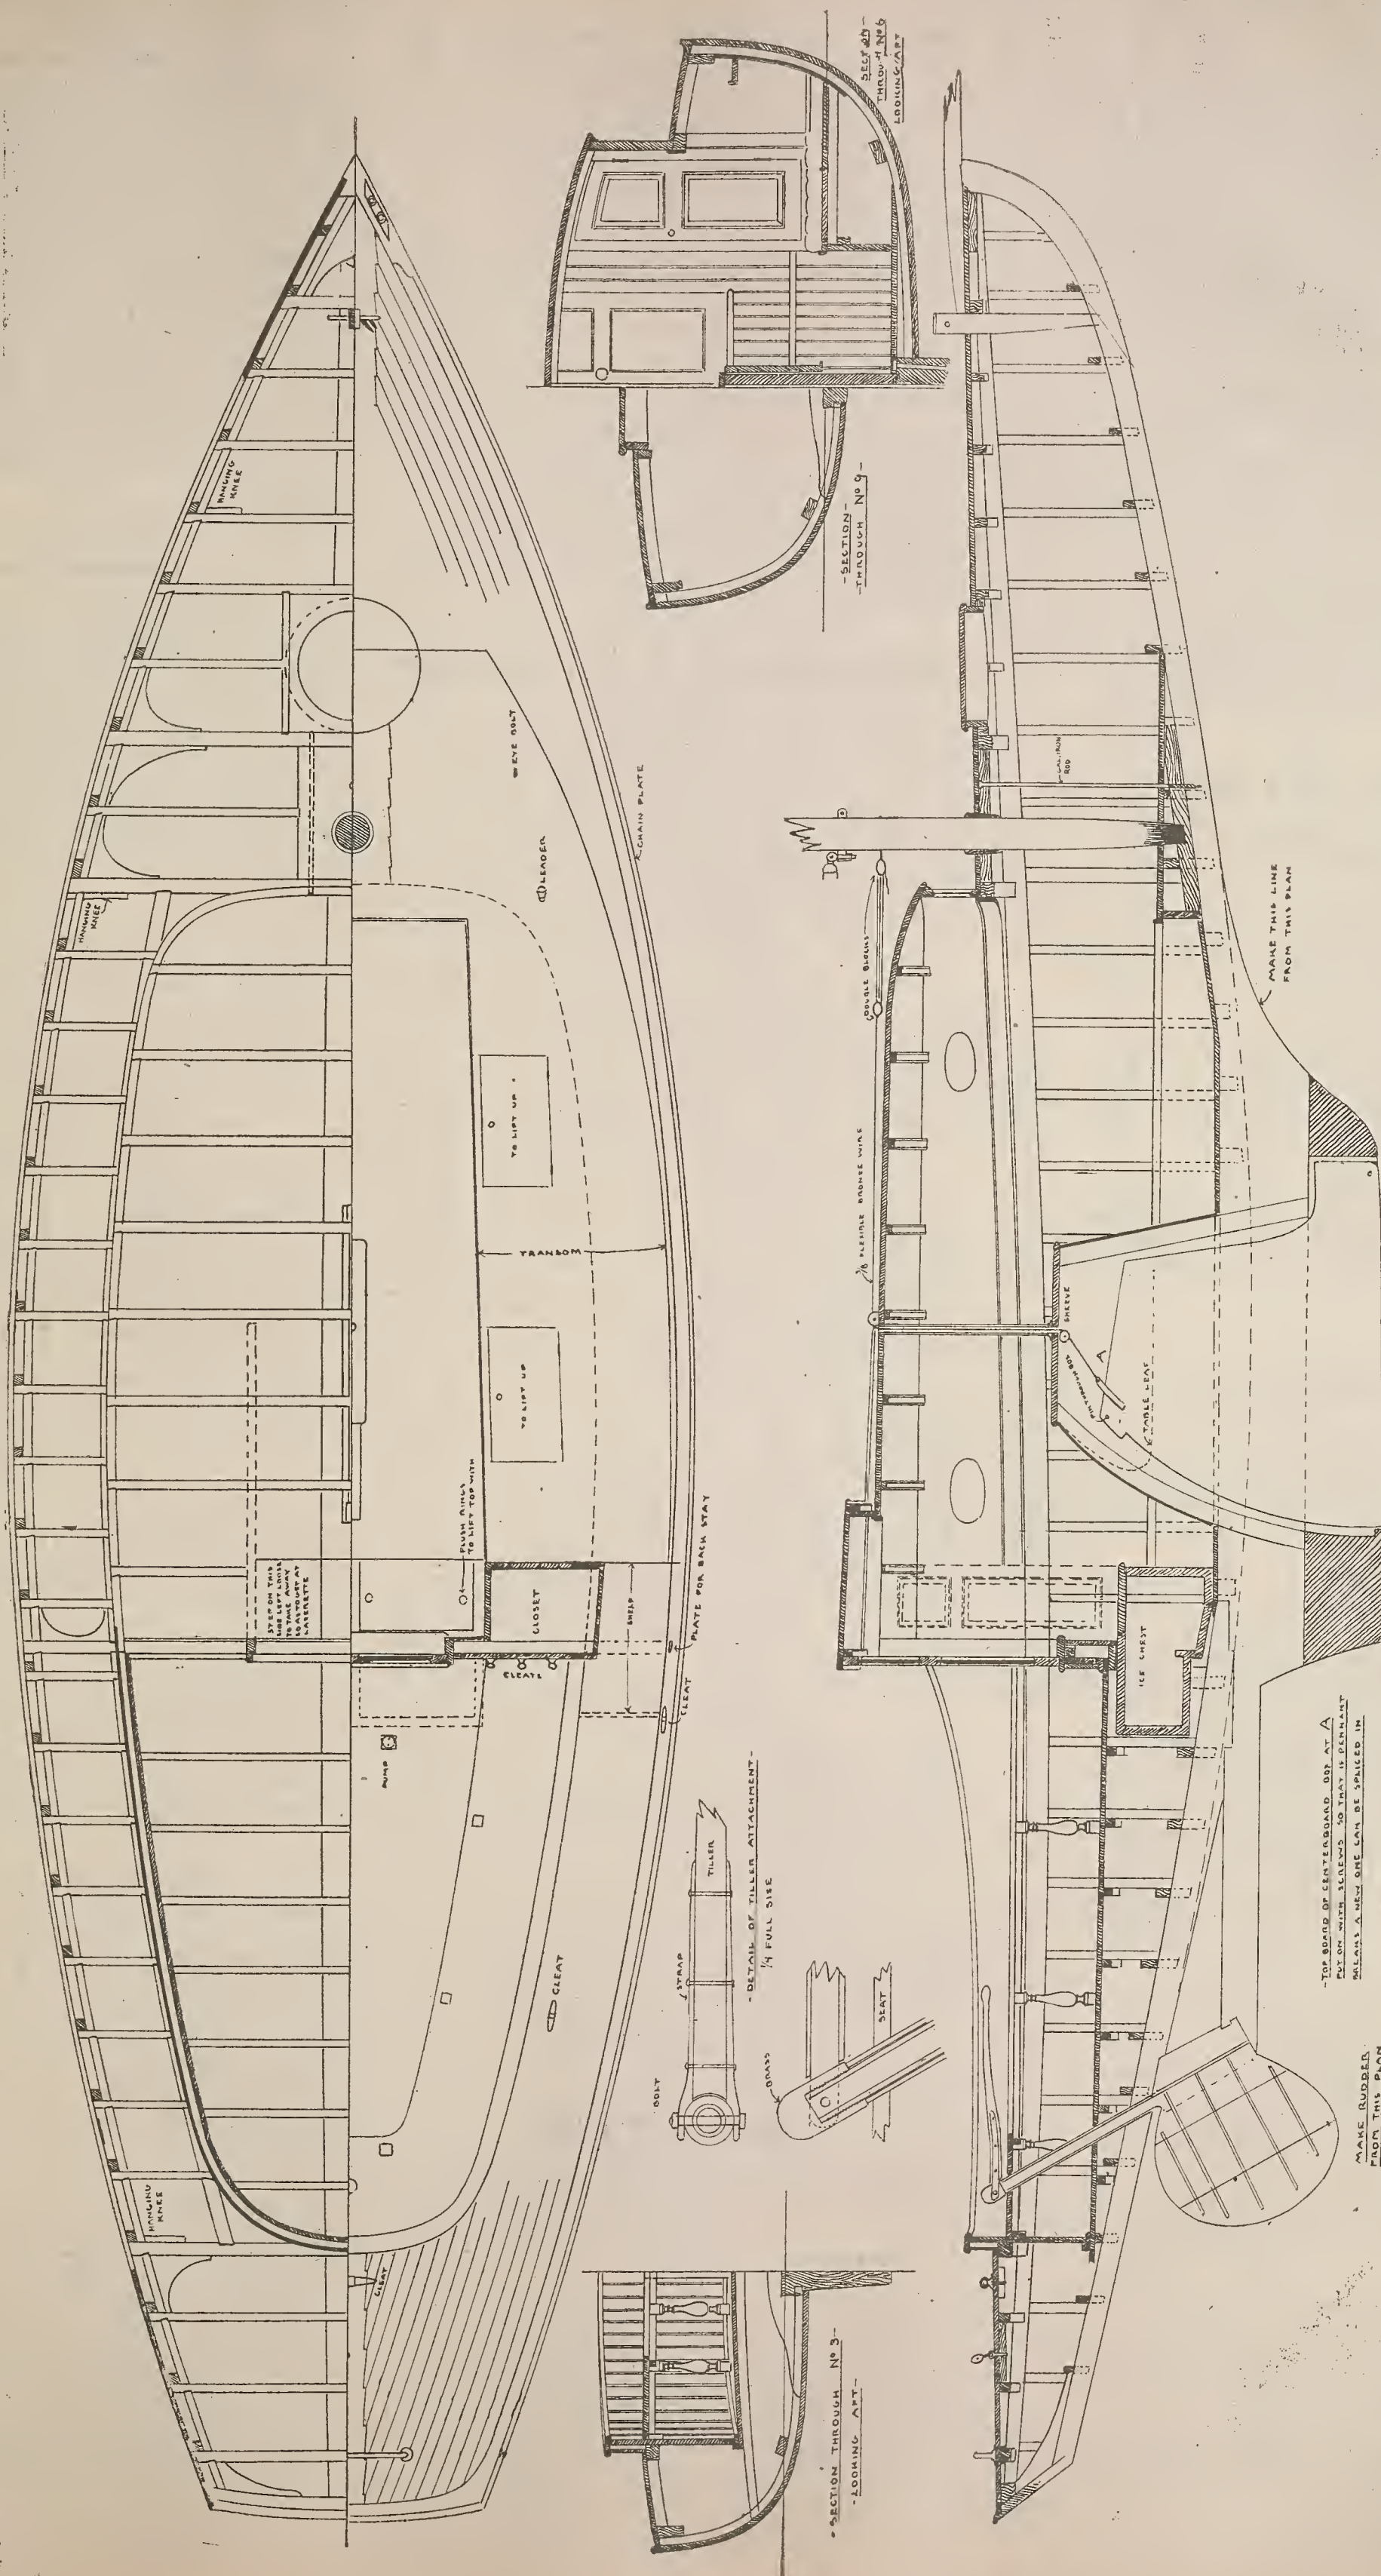

Aspinquid is a new boat, designed and built by Shiverick, of Kingston, for W. A. Comey, of the Hull-Massachusetts Y. C. She showed up well in the first races of the season, and was one of the hardest propositions of the lot in a strong breeze. She is 30ft. 3in. over all, 7ft. 9in. beam and 2ft. 10in. draft. She is also of the semi-keel type.

Bacchante was the only out-and-out centerboard of the

lot. She did not carry a pound of ballast outside. She was designed and built by Hanley for J. T. Humphrey and C. E. Lauriat, Jr., of the Hull-Massachusetts Y. C. She is 30ft. 3in. over all, 7ft. beam and 2ft. 9in. draft. Like the general Hanley model, she is very flat floored with fairly hard bilges. She was a bit too stiff for light airs, but in a very heavy breeze she always showed up well.

At the first winter meeting of the Yacht Racing Association several amendments to the racing rules were brought up, some of which found favor; others were held over for deeper consideration, and others were lost altogether. It was decided that the distinguishing racing flags can only be carried during a race, and it was also voted to increase the size of the flag to 18x18in. An amendment was brought up by which a yacht entering in a class would be obliged to race in that class during the entire season. It is possible at present to enter a yacht which has been built for the restricted classes in the open classes, and the majority thought that this privilege should be maintained.

An amendment was brought up by which the much-discussed trusses would be eliminated entirely, but the delegates would not have it. This question will again be brought up at a special meeting, to be held Thursday evening, as will also an amendment by which the height of the cabin in restricted classes will be definitely determined. A number of amendments were brought up regarding restrictions on sails, but the subject, as presented, was rather complicated, and will be heard from again at the special meeting. The percentage system was brought forward, but was considered too weighty to be enacted upon without further deliberation, and it will be another feature of the special meeting. It was decided that a yacht which has not been measured and which wins a prize in a race shall be measured within seven days from the day of the race or forfeit the prize.

JOHN B. KILLEEN.

The America's Cup Record.

THE history of the America's Cup is told in the inscriptions upon it, which read as follows:

100 Guinea Cup, won Aug. 22, 1851, at Cowes, England, by yacht America, at the Royal Yacht Squadron Regatta, "open to all nations," beating cutters, Volante, 48 tons; Arrow, 84 tons; Alarm, 193 tons; Mona, 82 tons; Bacchante, 80 tons; Freak, 60 tons; Eclipse, 50 tons. Schooners, Beatrice, 161 tons; Wyvern, 205 tons; Ione, 75 tons; Constance, 218 tons; Gipsy Queen, 160 tons; Brilliant, 392 tons.

Schooner America, 170 tons; Commodore, John C. Stevens; built by George Steers, of New York, 1851.

Presented to the N. Y. Y. C. as a challenge cup open to all foreign clubs, by the owners, John C. Stevens, Hamilton Wilkes, Geo. L. Schuyler, J. Beekman Finlay, Edwin A. Stevens.

1870.

Challenged to be sailed for over N. Y. Y. C. course, Aug. 8, 1870, by Mr. James Ashbury, with schooner yacht Cambria, representing R. T. Y. C. Cambria, beaten in the following order by schooner yachts: Magic, Idler, Silvie, America, Dauntless, Madgie, Phantom, Alice, Halcyon.

1871.

Oct. 16, 1871.—Schooner Livonia, James Ashbury, Esq., owner, vs. schooner Columbia, Franklin Osgood, Esq., owner. Columbia winner by 27m., 4s.; N. Y. Y. C. course.

Oct. 18, 1871.—Schooner Livonia vs. schooner Columbia. Columbia, winner, by 10m., 33s.; outside course.

Oct. 19, 1871.—Schooner Livonia vs. schooner Columbia. Livonia, winner by 15m., 10s.; N. Y. Y. C. course.

Oct. 21, 1871.—Schooner Livonia vs. schooner Sappho; Wm. P. Douglas, Esq., owner. Sappho, winner by 30m., 21s.; outside course.

Oct. 23, 1871.—Schooner Livonia vs. schooner Sappho; Sappho, winner by 25m., 27s.; N. Y. Y. C. course.

1876.

Aug. 11, 1876.—Schooner Countess of Dufferin, Chas. Gifford, Esq., owner, vs. Madeleine, John S. Dickerson, Esq., owner; Madeleine, winner by 10m., 59s.; N. Y. Y. C. course.

Aug. 12, 1876.—Schooner Countess of Dufferin vs. schooner Madeleine; Madeleine, winner by 27m., 14s.; outside course.

1881.

Nov. 9, 1881.—Sloop Mischieff beat sloop Atalanta; Bay of Quinte Y. C. (Canada); 28m., 39 1/4s.; N. Y. Y. C. course.

Nov. 10, 1881.—Sixteen miles to leeward from buoy 5, Sandy Hook and return, sloop Mischieff beat Atalanta 38m., 54s.

1885.

Sept. 14, 1885.—N. Y. Y. C. course, sloop Puritan beat cutter Genesta, Royal Yacht Squadron of England, 16m., 19s.

Sept. 16, 1885.—Twenty miles to leeward of Sandy Hook Light Ship and return, sloop Puritan beat cutter Genesta 1m., 38s.

1886.

Sept. 9, 1886.—N. Y. Y. C. course, sloop Mayflower beat cutter Galatea, Royal Northern Y. C. of Scotland, 12m., 2s.

Sept. 11, 1886.—Twenty miles to leeward of Sandy Hook Light Ship and return, Mayflower beat cutter Galatea 28m., 59s.

1887.

Sept. 27, 1887.—N. Y. Y. C. course, sloop Volunteer beat cutter Thistle, of Royal Clyde Y. C. of Scotland, 19m., 23 3/4s.

Sept. 30, 1887.—Twenty miles to leeward of Scotland Light Ship and return, sloop Volunteer beat cutter Thistle 11m., 48 3/4s.

1893.

Oct. 7, 1893.—Sloop Vigilant, N. Y. Y. C. vs. cutter Valkyrie, R. Y. S.; 15 miles to leeward and return; Vigilant won by 5m., 48s.

Oct. 9, 1893.—A triangle 10 miles to a leg; Vigilant won by 10m., 35s.

Oct. 13, 1893.—Fifteen miles to windward and return; Vigilant won by 40s.

1895.

Sept. 7, 1895.—Defender, N. Y. Y. C., vs. Valkyrie III., R. Y. S.; 15 miles to windward; Defender won by 8m., 49s.

Sept. 10, 1895.—Triangle, 30 miles, Valkyrie III. disqualified.

Sept. 12, 1895.—Fifteen miles to windward; Defender won; Valkyrie III. withdrew. Time of race 4h., 43m., 43s.

1899.

1899.—Columbia, N. Y. Y. C., vs. Shamrock, Royal Ulster Y. C.

First race, Oct. 16, 15 miles to windward and return; Columbia won by 10m., 8s. Time of race 4h., 53m., 53s.

Second race, Oct. 17, triangle, 30 miles, 10 miles to a leg; Columbia won; Shamrock disabled, lost topsail. Time of race, 3h., 37m.

Third race, Oct. 20, 15 miles to leeward and return; Columbia won by 6m., 34s. Time of race, 3h., 38m., 9s.

1901.

1901.—Columbia, N. Y. Y. C., vs. Shamrock II., Royal Ulster Y. C.

First race, Sept. 28, 15 miles to windward and return. Columbia won by 1m., 20s.

Second race, Oct. 3, triangle, 30 miles, 10 miles to a leg; Columbia won by 3m., 35s.

Third race, Oct. 4, 15 miles to leeward and return; Columbia won by 41s.

Gravesend Bay Y. R. A. Percentages

THE first season of the Gravesend Bay Y. R. A. is now at an end, and the results of the fifteen regattas held under the auspices of that organization have been far more encouraging than the most sanguine members had expected. The Association has done much to revive interest in racing, and, although there were comparatively few new boats built this year, still, the owners of the old ones, finding that the racing was going to be good took more interest and kept their boats in better shape than ever before. Even though the season is just over, new boats are already being talked of, and the classes will, undoubtedly, be better filled and the racing keener next season than it has ever been on Gravesend Bay. Aside from the better racing that has prevailed under the Association rule, it has done much toward bringing the different clubs and their members more closely in touch with one another, and a very friendly feeling now exists between the several clubs on the bay.

In Class M, for sloops 30 to 36ft., Akista, owned by Mr. George Hill, the winner in this class, was far and away ahead of Bonito, the boat that was second. Squaw, owned by Mr. N. J. Heath, was placed first in Class N, sloops 25 to 30ft., beating Vivian by only one point. In Class P, sloops 21 to 25ft., Mr. E. F. Luckenbach's Song and Dance won out. Cockatoo, owned by Mr. Hendon Chubb, being second. Wraith, owned by Mr. Calvin Tompkins, had an easy time of it in Class Q, sloops 18 to 21ft., winning by 70 points. In Class R, sloops 15 to 18ft., Pebble, owned by Mr. R. W. Speir, won handily, as did Mr. W. K. Brown's Kelpic, in the Marine and Field Club's one-design class.

The following table clearly shows the different boats standing after the season's racing:

Sloops—Class M, 30 to 36ft.	Points.
Akista, George Hill.....	71
Bonito, Haviland Brothers.....	29
Vivian, S. F. Vernon.....	28

Western Yachts.

CHICAGO, Ill., Oct. 19.—Sir Thomas Lipton has impressed Chicago as he did New York with the fact that he is a very good sort of fellow. Sir Thomas has been entertained as best this city could arrange, has been banqueted by the Athletic Club, taken out to view the sanguinary attractions of the Stock Yards, and has received others of those attentions peculiar to this village. He expresses himself as much pleased, and declares his intention of returning here next summer.

An accident came near ending the career of the famous Cup challenger during his visit at Chicago. To-day, after his visit to the Columbia Y. C. club house, he went aboard the Dorothea, the naval reserve training ship. A little excursion was made into the lake under a rather stiff wind. An accident to the machinery of the Dorothea came near causing a collision with the stone abutments of the Government pier. The Dorothea went aground, and Sir Thomas was taken ashore on the tender Ruth. Yachting

enthusiasts regret that there was nothing doing in their line at this time of the year, but they told Sir Thomas all about how Invader lifted the Canada cup. At this Sir Thomas looked some thoughtful.

Inland Lake Yachting Association.

A special meeting of the Inland Lakes Y. A. was held to-day at Milwaukee, Wis., to consider proposed amendments to the constitution. The meeting was held at the Hotel Pfister, and every club in the Association, except Minnetonka and Wauwassee Lake, of Indiana, had representation. The following amendments were passed: That the Executive Committee shall select the measurer for the annual regatta; that no yacht shall be sailed by any but bona fide members of the club it represents, except in case of sickness, when the Executive Committee may permit one person to be substituted; that a yacht may be jockeyed or luffed as long as she is in the lead, but must stand on her course when overlapped. A resolution was passed providing for certain unimportant changes in centerboards. A long discussion ensued over the question of Corinthianism, and an amendment was proposed which makes it impossible for a fisherman, boat builder or any one engaged in manual nautical labor to take part in the regattas. This discussion was going on at last reports from the meeting.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Communications.

Editor Forest and Stream:

We arrived here Oct. 6 at 7 P. M., making the trip from New York in just eleven days, and Com. Munroe says we have made a record. We left Southport Oct. 3 at 11 A. M. with a N.W. gale after us; intended to run as far as Jacksonville, Fla., if it would take us that far; if not, there were plenty of harbors along the coast to run to. We passed Charleston Lightship at 2 o'clock next morning. Distance run by log, 120 miles. On the evening of the 4th, at 10 P. M., we hove to off Jacksonville, Fla., and waited until daylight, with the intention of going in to the harbor, because it looked like we would get the wind from the S.E., and the weather looked bad.

We waited until 6 o'clock on the morning of the 5th and went close to the bar to see if we could go in, but it was impossible to do so. It was then blowing a gale from the N.E., so there was only one thing left to do, and that was to proceed on to Miami. We were all pretty well tired out, but made the best of it, and arrived in Miami in just thirty-six hours from Jacksonville, it being the record run between that place and Miami. Distance run by log, 320 miles; by rail it is 365 miles.

During the night of the 5th we ran a distance of 13 miles in twelve hours, making an average of eleven miles an hour, that distance being taken between two lights of the coast. Savalo sailed that night as far as she will ever sail under any conditions, and she stood up to it as well as any boat could possibly do, and she is certainly a remarkable or exceptionally strong built boat, and is surely built of good stuff.

Not many boats of her size and rig would have stood what she stood, and we arrived here in as good condition as when we left New York, without losing or carrying away one single thing, and there are very few ships of this kind made without something carrying away, especially in a gale like we had. Now I did not expect to try to make a record or to make very long runs, there only being three of us on deck. I did not get the extra man to go with us. I was compelled to carry on sail while it was blowing hard, especially coming from Jacksonville, down the wind being from E.N.E. to E. by N. most of the way, and that wind is right on the shore, so the were only two things to do—to carry on sail and drive it take in sail and drift, and then we would drift on the beach. Well, from the hard sailing she had those few days, she never made a drop of water, so that shows she is tight and well put together. Hoping to hear from you concerning your future plans for Savalo, yours truly,

J. C. JAKOBSEN.

Editor Forest and Stream:

I will be obliged if you will inform several readers your valuable paper in the coming issue as to the condition of Independence—that is, if she is only laid up for the season, or is she being broken up or only having some rusty bolts replaced? INQUIRER.

[Independence is really being broken up, and all the material which was used in her construction is being carefully preserved by direction of the owner.—ED.]

Capt. Hall His Own Crew.

SOMETHING new and daring in seamanship is being tried just now on the New England coast, says the New York Sun, and all the sailors from Quoddy Head to Kitter Point are waiting to see what comes of it.

Capt. Parker Hall is owner and master of the 88-ton 49-year-old schooner Angler, and he ought, by good rights and the customs of coasting, to have at least three men to help him sail her.

But Cap'n Hall is a little queer and very spunky, a lately when, being ready to sail from Quincy, Mass., Calais, Me., to get a cargo of lumber, he found himself unable to get any sailors, he said:

"Well, let 'em sail, an' I'll sail this hooker down E. myself."

He then ordered himself to get up the mainsail, which he did; then the foresail, and after that he hove the anchor short, put the wheel in a becket while he got the jib her, and away she went, with Cap'n Hall at the wheel; the coffee pot a-boiling in the stove down below.

When the Angler put in at various places along the coast of Maine and people saw that she had only one man, there was much talk, and the general opinion was that the schooner's skipper was a little off his reckoning. But the Angler got down to Calais all right, and after had taken 77,000ft. of lumber, it occurred to Cap'n Hall that he might as well ship a couple of men, so that could get some sleep on the passage to Boston. He did, after a long hunt, scare up two green hands, but they deserted the same night, and he made up his mind to it alone once more.

People along the wharves laughed at Cap'n Hall when he said that he was going without any crew, but he grinned back at them, saying: "Crew? Huh! S'only one man in a hunderd s'any good, anyway, 'n' he ain't allers to be got. Can't git 'im now, leastways, 'n' I ain't a-goin' to let this yere schooner hang up to the wharf all summer a-waitin' fer help. I brought her down here, an' I kin fetch her out ag'in."

And he did. When the Angler had got under way something happened that came near ending the one-man trip, right there in the river at Calais. Somehow or other Cap'n Hall fell overboard, and as he cannot swim a stroke he would have drowned but for a tug boat that came along. The tug's crew fished the lone mariner out, and after he got dried and rested a bit he took the wheel again, headed her down the river and away she went for Boston.

Whether or not she will get there is another question. Captain-mate-cook-and-crew Hall says she will peg along all right with the best of them, and maybe she will. It is supposed that the lone skipper will leave her to, Dago style, at night, and thus be able to get some sleep. "He's got good grit, but hang his judgment," say the coast sailors.

Proposed Yacht Basin in Gravesend Bay.

Mr. GEORGE E. HILL, who represents a syndicate of New York yachtsmen, purchased on Oct. 17 for his clients a tract of land comprising 175 acres fronting on Gravesend Bay. This property is to be dredged and improved, with the ultimate view of making one of the largest and most complete yacht basins in the world. The names of the buyers have not been given out, but it is stated that many of those interested in the deal are well-known yachtsmen who are members of the Atlantic Y. C. and the other clubs which are located on Gravesend Bay.

For more than a century the property in question has been known as Harway Basin, and some years ago an effort was made to establish a yacht basin there, but after a few cribs and docks had been built, work was abandoned and the scheme given up. At one time the city contemplated turning the land into a seaside park, but the idea was not thought favorably of, and this plan was also set aside.

The property has a frontage of 4,500ft. on Coney Island Creek and 3,200ft. on Gravesend Bay. Fifty acres of the land are upland, sixty-five acres are salt meadow and sixty acres are submerged. The tract runs from Bay Fortyninth Street to Coney Island Creek, and lies between Stilwell avenue and the pier line. Harway avenue, a continuation of the Shore drive, runs through the property and connects with Sea Gate and Surf avenues, Coney Island.

In the plan laid out to develop the property, it is proposed to dredge out a basin having an area of sixty-five acres, which will be 2,500 by 1,800ft., to a depth varying from 12 to 30ft., which would be sufficient to keep afloat at all times the largest pleasure boats in the world. The soil taken out in the dredging will be used for filling in behind the cribs and bulkheads. There will be 7,000 running feet of wharves. Dry docks, marine railways, repair shops, foundries and sheds for the storage of spars, sails and all other gear, will also be erected.

The promoters of the scheme hope to give employment to nearly two hundred men all the year around. The price paid for the land is said to be \$300,000, but this seems excessive.

There is a report current that an effort is being made to persuade Thomas Ratsey, the English sailmaker, to establish a branch of his business on the property.

Yacht Club Notes.

At the annual meeting of the Hempstead Bay Y. C. the following officers were elected for the ensuing year: Com., Hiram R. Smith; Vice-Com., Willis A. Hutcheson; Rear-Com., Frederick K. Walsh; Sec'y, De Witt C. Titus; Treas., Carman R. Lush; Official Meas., Frederick C. Southard.

Board of Governors.—The six officers of the club, with R. H. Mayland, Charles H. Southard, M. H. Tracy and Isaac N. Carman.

Regatta Committee.—M. H. Tracy, C. H. Southard and Robert W. Nix.

The Treasurer's report showed a balance of \$19.01. The total receipts for the year were \$1,541.85, and during the season the club spent \$238.76 for prizes.

Fifteen new members joined the club during the year, making the total of 95.

The racing length of third-class boats was changed from 20 to 21ft.

YACHTING NEWS NOTES.

MacConnell Bros., the Boston yacht brokers, have sold through their agency, the 25-footers Cygnet to C. S. Cook; yawl Penguin, to W. S. Johnson, of Mamaronneck, N. Y.; schooner Betsy, to C. M. Washington, of Locust, N. J.; 25-footer Orphan, to Claude Smith, of Ithaca, N. Y.; 21-footer Freyja, to J. M. Linder, of Boston; 25-footer Aeolus, to Baldwin & Gray, of Hartford; the Don, to G. A. Randall; Sally Brass, to C. M. Keep, and the 15-footer Ray, to G. R. Fryer, of Stratford, Conn.

George F. Lawley Son Corporation, South Boston, has closed contracts for three schooners—one 70ft. waterline, the second, 62ft. waterline, and the third 52ft. waterline. This corporation is now building a 46ft. waterline schooner for Mr. Arnold Lawson, from designs made by Mr. Clinton H. Crane, of the firm of Messrs. Tams, Lemoine & Crane. A 46ft. waterline yawl is also under construction at Lawley's.

Sagitta the English-built steam yacht, which has been under charter during the past summer to Mr. Joseph R. Delemar, has sailed from New York for England.

Mr. E. A. Boardman, a well-known Harvard man, and stroke of the '97 crew, has associated himself with Mr.

B. B. Crowninshield in the yacht designing brokerage business. Mr. Boardman will take Mr. Frank N. Tandy's place, who recently went in business for himself. For a number of years past Mr. Boardman has been sailing boats at Marblehead, and he is considered one of the most skillful helmsmen in that part of the country.

Mr. Crowninshield has been commissioned to design three 21-footers for the Massachusetts Y. R. A. restricted class; one is for Mr. Richard Hutchinson; another for Mr. Charles Francis Adams, 2d, and the third for Mr. C. H. W. Foster. He is also working on the plans of an 18-footer for a member of the Hull (Mass.) Y. C. The keel of the seven-masted schooner that is being built at the Fore River Engine Works, at Quincy, Mass., from Mr. Crowninshield's design, has been laid and the frames will soon be in place.

A member of the New York Y. C., whose name is not given out, is having built by the Gas Engine Power Co. and Seabury & Co., at Morris Heights, a steel, twin screw, steam yacht, 115ft. long. Work is well advanced on the yacht, and the cabinet work will soon be put in the cabins. Forward there will be a good-sized deck house, which will be used as the dining saloon. In the after end of this house is the pantry, which is connected with the gallery by a dumb waiter. Forward of the machinery space, on the lower deck, is the galley; next forward are the officers' rooms, with the fore-castle forward of these. Aft of the machinery and boiler space are the owner's quarters, which consist of two large, connecting staterooms, with a bath adjoining. Aft of the owner's room are a large stateroom and bath for guests. There will be a low cabin house over the cabins aft, and all the deck fittings, deck house, etc., will be finished in teak. The yacht will be furnished with triple expansion engines and a Seabury boiler, and she will have a speed of about 17 miles. The bow and stern of the yacht will be detachable, so that she may pass through the canals in going up to the Lakes.

A Boston gentleman, who is a member of the New York Y. C., has ordered the Gas Engine Power Co. and Seabury & Co. to design and build for him a steel cruising schooner. The yacht will be 118ft. over all, 79ft. on the waterline, 22ft. 6in. beam, and will draw 13ft. She will be finished and ready to turn over to her owner early next season.

The steam yacht Osceola, owned by Mrs. Julia M. Curtis, was damaged by fire, while in her winter quarters at Tebo's basin, foot of Twenty-third street, South Brooklyn. The fire was discovered by a watchman at 5 o'clock on the morning of Oct. 12. An alarm was immediately turned in, and the fire was extinguished, after it had done considerable damage. The loss amounted to about \$500, and was covered by insurance. The cause of the fire is unknown.

The 70ft. yacht Iola, owned by Mr. Nicholas Armstein, of New York City, went ashore on the breakwater at the mouth of the Housatonic River, which is a few miles east of Bridgeport, Conn., late in the afternoon of Oct. 13, and was a total loss. The keeper of Stratford Light telephoned to the town of Stratford, and in response to his message several oyster boats went down the river and rescued the owner, his nine guests, and the three men who made up the crew. Iola pounded herself to pieces during the night. She was built at Newberne, N. C., in 1885. Further than this no details regarding the boat are procurable.

As a result of the collision between the steam yacht Nourmahal and the steamship North Star, when the boats were returning from the race between Columbia and Shamrock II., on Sept. 28, Col. John Jacob Astor filed a libel in the United States District Court on Oct. 12 against the steamer in question for \$15,000, which Col. Astor claims was the amount of damage done to his yacht.

Mr. Anson Phelps Stokes, N. Y. Y. C., has purchased the schooner yacht Sea Fox.

Mr. Clifford V. Brokaw, N. Y. Y. C., has purchased through the agency of Messrs. Gardner & Cox, from Mr. W. L. Ward, the cutter Dorwina, the champion in the 43ft. class on Long Island Sound.

Mr. Henry C. Rouse, N. Y. Y. C., has bought the English-built auxiliary Lady Godiva. The yacht has been under charter to Mr. Rouse all the past summer. She is built of steel, and was designed by Mr. St. Claire Byrne, and built by Laird Bros., at Birkenhead, in 1890. Lady Godiva is 138ft. long on the waterline, 23ft. beam, and 13.35ft. deep.

Mr. Frederic H. Benedict, owner of the steam yacht Verzana was killed on Saturday, Oct. 19, in an accident which happened by his losing control of an automobile which he was running from Tuxedo to West Point. Mr. Benedict had been identified with yachting for a number of years past. He was elected a member of the New York Y. C. in 1888, and a member of the Seawanhaka Corinthian Y. C. in 1892.

The highest waterfall in the world, geography tells us, is the Cerosola Cascade, in the Alps, having a fall of 2,400 feet; that of Arvey, in Savoy, is 1,100 feet, and the falls of Yosemite Valley range from 700 to 1,000 feet. But higher yet is the waterfall in the San Cuayatan Cañon, in the State of Durango, Mexico. It was discovered by some prospectors ten years ago in the great barranca district, which is called the Tierras Desconocidas. While searching for the famous lost mine, Naranjal, a great roar of water was heard. With great difficulty the party pushed on, and up and down the mighty chasms, until they beheld the superb fall that is at least 3,000 feet high.—Land of Sunshine.

Rifle Range and Gallery.

Rifle at Shell Mound.

SAN FRANCISCO, Oct. 14.—Yesterday was a delightful day at Shell Mound range, and there was a large turnout of riflemen, especially of the militia. Some good shooting was done by the latter. F. F. Carson made the possible at 200, 300 and 500yds., 25, 25, 25—5-shot scores.

The schuetzen marksmen did very good work also. Scores: Swiss Rifle Club, monthly bullseye shoot: First prize, F. Suter; second, Edward Suter; third, A. von Wyl; fourth, J. Leeman; fifth, Alfred Gehret; sixth, C. Bacala; seventh, J. Scheibli; eighth, La Croix; ninth, Charles Bachmann. Monthly medal shoot: Champion class—Alfred Gehret, 442; first class—Robert Hauser, 377; second class—F. Suter, 364; third class—Edward Suter, 354.

Germania Schuetzen Club, monthly medal shoot: First champion class—D. B. Faktor, 231; second champion class—F. Rust, 207, 202; first class—F. Brandt, 203, 188; second class—L. N. Ritzau, 210, 204; third class—William Doell, 187, 178; best first shot—D. B. Faktor, 22; best last shot—D. Salfeld, 24.

Golden Gate Rifle and Pistol Club, semi-monthly shoot, handicap: M. F. Blasse, 210, 193, 208, 204, 197, 199, 200; A. Gehret, 226, 228. Gold medal, J. F. Bridges, 204; silver medal, M. J. White, 192, 189; A. B. Dorrell, 219, 214; E. L. Riemenscheider, 191, 182; W. Ehrenpfort, 173. Pistol handicap—W. F. Blasse, 82, 83, 78, 79. Revolver handicap—J. W. Tompkins, 73, 61; P. A. Becker, 83, 85, 83, 87, 86, 85. Silver medal—S. C. Hinkel, 72; J. R. Trago, 75.

Norddeutscher Schuetzen Club, monthly bullseye shoot: Herman Huber 236, William Doell 414, A. Mocker 443, C. F. Rust 733, G. Schulz 770, L. Lankenau 783, F. P. Schuster 815, L. N. Ritzau 835, Otto Lemcke 844, H. Meyer 1021. ROEHL.

Presque Isle Rifle Club.

ERIE, Pa.—The Presque Isle Rifle Club held a club handicap in connection with its regular shoot, Oct. 19. A strong wind faced the shooters and kept their house filled with smoke. The day was very dark. Standard American target, 200yds., off-hand.

Uncle John Stidham scored highest, with Shafer and Parker a tie for second place:

J. Stidham.....	75 70 69—213	A. Mount.....	69 63 62—194
G. Shafer.....	72 69 66—207	E. Kent.....	57 52 47—156
W. Parker.....	70 69 68—207	J. Almeda.....	52 45 44—141
Capt Ferguson.....	71 65 63—199	E. D. Allen.....	54 44 37—135

The handicaps were figured from the season's average, and the points are added to each string in the totals. Scores:

Parker, 6 points.....	70 69 59—216	Kent, 15.....	57 47 46—195
Mount, 9.....	62 56 63—203	Almeda, 18.....	52 45 41—192
Ferguson, 5.....	71 61 54—201	Stidham, Scratch.....	68 61 61—190
Shafer, Scratch.....	72 65 62—199	Allen, 14.....	44 37 37—160

Match shoot:
Ferguson..... 7 6 3 8 6 4 3 10 7 5—59
Mount..... 9 4 6 5 6 2 6 6 7 6—57

It might be well to add that this club has not shot in three years, and a number of the new members are novices.
W. A. PARKER, Sec'y.

Cincinnati Rifle Association.

CINCINNATI, O.—The following scores were made in regular competition by members of the Cincinnati Rifle Association, at Four-Mile House, Reading road, Oct. 13. Conditions: 200yds., off-hand, at the standard target. Gindele was declared champion for the day with the good score of 87. Weather, partly cloudy; thermometer, 64; wind, 4 to 7 o'clock, gusty:

Gindele.....	87 84 81 79 77—408	Honor Target.....	8 9 8 10 7—42
Payne.....	85 85 84 83 82—419		7 4 8 9 8—36
Strickmeier.....	85 81 80 80 79—405		8 9 7 8 7—39
Bruns.....	84 82 82 76 74—338		6 9 7 10 7—39
Roberts.....	84 80 79 79 76—398	
Lux.....	81 75 79 73 75—378	
Hofer.....	78 75 73 65 —291	
Drube.....	78 75 71 69 65—356		5 4 8 8 7—32
Topf.....	77 69 68 64 63—341		8 5 4 10 9—36
Ehlerding.....	60 56 45 —161	

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- Oct. 23.—Muncie, Ind.—Magic City Gun Club's fall tournament.
- Oct. 23-24.—Taylorville, Ill.—Target shoot and fish fry of the Taylorville Gun Club.
- Oct. 23-24.—Attica, Ind.—Laumee's target and live-bird shoot.
- Oct. 22-24.—Des Moines, Ia.—Amateur handicap shoot.
- Oct. 24-25.—Streator, Ill.—Two-day shoot of the Streator Gun Club; targets and live birds; open to all.
- Oct. 26.—Bulls Head, S. I.—Contest for challenge cup for championship of Richmond county, under the auspices of the Chelsea Heights Gun Club. J. S. Lewis, Sec'y.
- Nov. 6-7.—Peru, Ind.—Peru Gun Club's live-bird tournament; handicap; high guns.
- Nov. 22-24.—St. Louis, Mo.—Contest for the St. Louis Republic championship cup (Nov. 23) and three-day open tournament. Herbert Taylor, Sec'y, 1004 Chemical Building.
- Nov. 28.—Ossining, N. Y.—All-day target shoot of the Ossining Gun Club. Roast Turkey. C. G. Blandford, Capt.
- Nov. 28.—Cleveland, O.—Shoot of the Cleveland Gun Club.
- Nov. 28-29.—Milwaukee, Wis.—Tournament of the South Side Gun Club.
- Newark, N. J.—South Side Gun Club target shoot, every Saturday afternoon.
- Chicago, Ill.—Garfield Gun Club's live-bird trophy shoots, first and third Saturdays of each month. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

CONTESTS AT INTERSTATE PARK.

- Nov. 20.—Interstate Park, Queens, L. I.—Shoot given by Mr. S. M. Van Allen, who donates a Daly gun; \$20, 29 birds, latter extra; high guns; handicap; all entrance money goes into the purse.
- Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice. Café and hotel accommodations.
- Interstate Park, Queens, L. I.—Weekly shoot of the New Utesht Gun Club—Saturdays.

1902.

- Jan. 14-17.—Hamilton, Ont.—Twelfth annual tournament of the Hamilton Gun Club. F. B. Vallance, Cor. Sec'y.
- May 13-16.—Oil City, Pa.—Annual meeting of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. F. S. Bates, Cor. Sec'y.
- May 30-31.—Union City, Ind.—Spring tournament of the Parent Grove Gun Club. O. E. Fouts, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 246 Broadway, New York.

Mr. C. R. Stevens, of Moline, Ill., is earnestly promoting a great live-bird handicap, as mentioned in these columns some weeks since. The conditions are: "The race to be at 100 live

pigeons, \$100 entrance, birds included at 25 cents each; Watson's Park rules, same distance handicap as awarded at the Grand American Handicap of 1901; high gun division of money, three places to every ten entries; shooters who were not entered in Grand American Handicap of 1901 will be handicapped by a special committee selected from among the most popular shooters, and who will endeavor to place every man fairly on the mark where he belongs. The range of the distance handicap will be from 25 to 33yds. The race will take place on John Watson's grounds, Burnside, Ill.

The Homestead Gun Club, of Pittsburg, Pa., announces that to the programme of its fall tournament \$75 will be added. Shooting commences at 9:30. Loaded shells can be obtained on the grounds. Shells shipped care of Kilgore & Atkinson, Homestead, will be delivered on the grounds. Magatrap and electric motor will be used. At the corner of Fourth avenue and Smithfield street, Pittsburg, take Homestead car and get off at Mesta. The shoot will take place rain or shine. The Rose system will govern the division of the purses. Targets 2 cents. There are high averages for the first, second and third high guns, and for the first, second and third low guns. There are ten events, alternately 15 and 20 targets, \$1.50 and \$2 entrance. All paid representatives may shoot for targets only.

The beautiful Daly gun offered by Mr. S. M. Van Allen, of Jamaica, L. I., to be shot for at Interstate Park, Queens, on Nov. 20, is on exhibition at the latter place, and excites much interest. It is the most generous shooting offer which has been submitted to the shooters in a long while. The conditions are 20 live birds, \$10 entrance, high guns, birds extra, handicap. All the entrance goes into the purse. All pertinent information will be furnished by Mr. Van Allen on application.

We are informed that the South Side Club, whose preserve is one of the features of the South Shore of Long Island, is having a new steel shooting tower constructed, from the top of which targets will be thrown after the manner sometimes used in England. The flights of the targets from the top of such tower is much more difficult for the shooter than are the ordinary flights.

Mr. G. G. Williamson, of Muncie, Ind., writes us as follows: "Please state in FOREST AND STREAM that the Parent Grove Gun Club, Union City, Ind., will give a tournament on May 30 and 31, 1902. Annual shoot of the Trapsshooters' League of Indiana, at Muncie, Ind., June 10 and 11, 1902. Fall tournament of the Magic City Gun Club, Muncie, Ind., Sept. 1, 1902.

Mr. W. L. Colville, of the Dupont Powder Company, made a short visit in FOREST AND STREAM office on Friday of last week. He looked in good condition, notwithstanding a season of arduous travel and activity at the traps. At Trenton, N. J., recently he scored 50 straight in a 50-target event, at a shoot of the Trenton Shooting Association.

A two-man team match has been arranged to take place at Interstate Park, Queens, on Thursday of this week between Dr. Wm. Wynn and Mr. T. W. Morley, on one side, and Messrs. Ed. Banks and B. Waters on the other; 60 live birds a side. There also will be handicap sweepstake shooting on that afternoon at that place.

Mr. Herbert Taylor, secretary of the Missouri State Game and Fish Protective Association, informs us that the final contest for the absolute possession of the St. Louis Republic championship cup will take place at Dupont Park, St. Louis, Nov. 23. In connection with this event, there will be a three-day open tournament—Nov. 22, 23, and 24.

Mr. F. K. McBroom, of Spokane, Wash., won the individual championship at the Washington State tournament by breaking 47 out of 50 targets. This equals the highest score previously made. In the three-man team contest Spokane No. 1, whose members were Ware, McBroom and Flint, was winner.

Mr. John S. Wright informs us that he will give a merchandise shoot on the grounds of the Brooklyn Gun Club on Saturday of this week. The main prize will be a beautiful toilet set. Full particulars may be obtained of Mr. Wright, at 318 Broadway, at Messrs. Von Lengerke & Detmold's store.

Messrs. Harold Money and John Cabanne, of St. Louis, Mo., have arranged to shoot a return match at live birds in the near future. In his previous match with Mr. Cabanne at 50 birds, Mr. Money killed 50 birds straight. In the return match he is very likely to return to the same score.

Mr. F. S. Bates, secretary of the Oil City, Pa., Gun Club, informs us that his club claims the dates May 13 to 16, 1902, for the annual meeting of the Pennsylvania State Sportsmen's Association. The meeting will be held in Oil City. Special pains will be taken to make an attractive programme.

Mr. J. S. Lewis, the secretary, informs us that there will be a live-bird shoot, Oct. 26, at Bulls Head, S. I., under the auspices of the Chelsea Heights Country Club. The main event will be the contest for the challenge cup, emblematic of the championship of Richmond county.

The shooting at live birds by Messrs. Creamer and Lockwood at the shoot of the New Utrecht Gun Club, Interstate Park, last Saturday, was most pleasingly skillful. The former shot at a 96 per cent. gait; the latter, a 94 per cent. gait.

Mr. W. R. Crosby, shooting from the 22yd. mark in the target events at Tom Donley's tournament, St. Thomas, Ont., made an average of .938 per cent. Mr. R. O. Heikes, shooting from the 21yd. mark, was next with .897 per cent.

The American E. C. & Schultze Gunpowder Company, of New York, in their advertisement in our business columns this week, call attention to the excellent records made by Messrs. Heikes and Crosby in recent tournaments.

The regular contest of the Oceanic Rod and Gun Club will be held at Rockaway Park, L. I., on the first day of next week. Trains leave East Thirty-fourth street and Flatbush avenue at 9 and 11 o'clock A. M.

At the shoot of the Sheepshead Bay, L. I., Rod and Gun Club, Mr. Henry Montanus won the club badge in the main event with a straight score. There were seventeen contestants.

The secretary of the Parent Grove Gun Club, Mr. O. E. Fouts,

Union City, Ind., informs us that his club claims the dates May 30-31 for its spring tournament.

The Nonpareil Gun Club, of Chicago, holds its next regular shoot on Saturday of this week.

The next shoot of the Richmond Gun Club, of Silver Lake, S. I., will be held on Nov. 2.

BERNARD WATERS.

Garden City Gun Club Tournament.

PELLA, Ia., Oct. 17.—The Garden City Gun Club tournament closed to-day. The attendance was light, only seventeen taking part on the first day, and ten finishing the programme.

The second day thirteen shooters were on hand, and six shot in all programme events.

The third day the programme was not followed, and miss-and-outs at live birds, with one or two sweeps, were shot. No record was kept of the live-bird shoots, as there were but few entries. J. M. Hughes and Selbbers did some good work and won most of the money. For the two days' target shooting Hughes was high. He used U. M. C. shells and Ballistite powder. Selbbers was second, Linell third, Steege fourth, De Gooyer fifth and Geo. Marshall sixth.

On Wednesday evening the club gave a smoker to the visiting sportsmen, and there was much doing and some smoking. The entries at the smoker were much larger than at the traps, and the targets were very easy, and several long runs were made. The scores:

First Day, Oct. 15.

Table with columns: Events, Targets, Selbbers, Hughes, Powell, Stege, Crisman, Linell, Marshall, De Gooyer, Windsor, Sheehy, Koopmans, Brownie, Ten Hagen, Veidnet, Walker, Mansdam, Butts. Includes 'Broke.' and 'Av.' columns.

Second Day, Oct. 16.

Table with columns: Events, Targets, Hughes, Linell, De Gooyer, Butters, Stege, Ross, Sheehy, Walker, Ramsey, Johnson, W Butts, Koopmans. Includes 'Broke.' and 'Av.' columns.

General Averages.

Table with columns: Hughes, Selbbers, Linell, Stege, De Gooyer, Marshall. Includes 'Oct. 15.', 'Oct. 16.', 'Broke.', and 'Av.' columns.

HAWKEYE.

Nebraska City Gun Club.

NEBRASKA CITY, Neb.—The second annual tournament of the Nebraska City Gun Club took place on Oct. 16 and 17. The scores follow:

First Day, Oct. 16.

Table with columns: Events, Targets, Cunningham, Bray, Nicholson, Moine, Adams, Taggart, Lentz, Brust, Harlan, Colglazier, Schreifer, Glasgrov, Boyd, Mutz, James, Pond, McDonald, Townsend, Gilman, Wright, Kite, Brihm, Halliday, Armstrong. Includes 'Shot at.', 'Broke.', and 'Av.' columns.

Second Day, Oct. 17.

Table with columns: Events, Targets, Bray, McDonald, Townsend, Simpkins, Carter, Brust, James, Taggart, Cunningham, Halliday, Edwards, Nicholson, Kite. Includes 'Shot at.', 'Broke.', and 'Av.' columns.

Contest for the Dickey Bird cup: McDonald, Taggart, Bray, Townsend, Nicholson. Includes 'Broke.' and 'Av.' columns.

Special event, 10 targets, \$5 entrance, high guns, handicap: McDonald, Nicholson, James, Townsend, Bray. Includes 'Broke.' and 'Av.' columns.

Table with columns: Bray, Townsend, McDonald, Brust, Taggart, James, Cunningham. Includes '1st day.', '2d day.', 'Shot at.', 'Broke.', and 'Av.' columns.

WESTERN TRAPS.

Universal of Chicago.

CHICAGO, Ill., Oct. 19.—The semi-annual tournament of the Universal Gun Club, of Chicago, will be held Nov. 3. There will be a live-bird shoot on the grounds of the same club on Sunday, Nov. 17, to which every one is welcome. The club holds its regular target shoot to-morrow at the grounds, 4636 Archer avenue. To reach these grounds take Archer and Brighton cars.

Garfield of Chicago.

Garfield Gun Club, of Chicago, holds the second shoot of its series on live birds to-day. Entries closed in the trophy event at 3 o'clock. The membership is, as usual, divided into three classes—A, B and C—as in target shooting, and there is no distance handicap. The trophy shoot is at 12 birds. It need not be said the Garfield Club will have one of its regular, good times.

Glenview vs. Exmoor.

Glenview Golf Club is a famous institution north of Chicago, and Exmoor Golf Club is another organization of which quite the same may be said. These members sometimes wish something a trifle more strenuous than chasing the gutta percha ball, and there is a threat now that there will be a five-man team shoot between these two clubs, probably at 100 live birds per man. Mr. Geo. Thorne and Mr. Osborne are two of the probabilities for the Glenview team and Mr. W. L. Wells, Mr. J. V. Clarke and Mr. C. S. Dennis would probably be on the Exmoor team, should the match be concluded. The betting rather favors the Glenview Club, but the Exmoor golfers pooh-pooh the idea that any one can beat them at any sort of game. The chances are that the shoot will not come off; but it would be very interesting if it did mature.

In Town.

The gun brigade of the traveling men is beginning the regular fall pilgrimage. Charlie Willard and W. H. de Wolf were both on the market in Chicago to-day. Another traveling man, Jesse Pumphrey, of Columbus, O., is also in the village, and the three will meet on the bloody sands at Watson's this afternoon. Chas. Cristadoro, of St. Paul, was here yesterday.

E. HOUER.

HARTFORD BUILDING, Chicago, Ill.

Garfield Gun Club.

Chicago, Oct. 9.—The appended scores were made on our grounds to-day on the occasion of the second trophy shoot of the series. H. N. Delano carried off the honors of the day and with them incidentally Class A trophy. P. McGowan and A. D. Dorman tied for Class B medal and E. W. Eaton won Class C.

The day was rather a pleasant one for pigeon shooting until toward evening, when a chilly north wind sprang up, making it too cold for comfort.

The birds were a good lot, and had enough real screamers among them to keep the shooters guessing.

Owing to the game season being on a good many of our regular shooters are away after chickens, quail and ducks; still seventeen put in appearance, which is not so worse.

Table with columns: Dr Meek, De Wolf, L Thomas, T W Eaton, Ed Eaton, C H Kehl, P McGowan, A McGowan, Dr Shaw, Mrs Shaw, Smedes, Delano, McDonald, C J Wolf, Lecte, Dorman, Keck. Includes 'Broke.' and 'Av.' columns.

DR. J. W. MEEK, Sec'y.

Audubon Gun Club.

Chicago, Ill., Oct. 14.—Of the six who shot, four were visitors at the shoot of the Audubon Gun Club, held at Watson's Park to-day. The scores:

Table with columns: Jones, Felton, Sellers, Pumphrey, Thompson, Shellenburger, Visitors. Includes 'Broke.' and 'Av.' columns.

Mississippi Valley Notes.

JOHN CABANNE, of St. Louis, has challenged Harold Money for a return match at live birds, to be shot at the local grounds during the fall. Mr. Money will accept, but has not yet named dates.

As one of the officers charged with the enforcement of the Illinois game law, the writer can substantiate the statement of Mr. Iough, in his delightful letter of Western sporting notes in the current issue of FOREST AND STREAM, that quail in Illinois are being protected, in spite of the flaws in the new game law. Farmer and sportsman have formed a mutual compact with the officers to protect the birds, and I do not think that there ever were fewer violations in the history of game protective work in Illinois. It is a striking example of the effect of moral force when public sentiment is united to accomplish an end.

The Rawlings target handicap medal at St. Louis was won on Oct. 12 by Dr. Sims, who made the only straight score.

Mr. C. R. Stevens, of Moline, comes forward with about the warmest shooting proposition that has ever challenged the attention of trap followers in this country. He has sent out the trivial number of eighteen hundred circulars inviting replies and comments to a proposal to shoot 100 live birds, for \$100 per centry, at Watson's Park, Chicago, early in December. The entrance fee is to include price of birds at 25 cents each, and moneys to be arranged in the Grand American Handicap plan, at the ratio of three moneys to every ten entries. Mr. Stevens bases his proposition on the presumption that many lovers of trapshooting are getting tired of the you-win-you-lose system which has so generally prevailed of late, and in this idea he is doubtless correct. The writer understands that almost enough assurances are already in to guarantee the success of the scheme. It is a bold step, to be sure, but it will, if consummated, give to the world such a shooting match as will challenge the attention and respect of all lovers of good, clean sport. Such a contest, if it filled to the extent of 100 men, would require the best part of a week to pull off, and it would bring to Chicago such a gathering of shooters as the West has never had. Mr. Stevens is vice-president of the Illinois State Sportsmen's Association, is one of the newly chosen Indians, and with Uncle John Watson as his right-hand bower, is just the man to carry this enterprise through in splendid shape. Success to "The Flying Dutchman."

The Twin City Gun Club, of Piassa and Pekin, gave a successful all-day tournament on the 20th.

Guy Burnside won high average at the recent tournament of the Roadhouse Gun Club. Guy has been very busy with that Willie Cashmore of late, landing his full share of averages on the Illinois circuit.

Late rains have materially enhanced fall duck shooting prospects on the Mississippi and tributaries. Some fair bags of mallards and teal have already been reported.

John S. Fanning, of the Laffin & Rand Powder Company, was in St. Louis on the 18th, hale, happy and enthusiastic, as is his wont. Mr. W. Fred Quimby has purchased the famous Roderigo setter dog Dick Bland, and is looking forward to some killing quail hunts this fall.

Mr. John Hunter, Jr., of the Hunter Arms Company, was in St. Louis on the 18th and 19th, calling on the trade in the interests of that popular make of gun.

KILLMORE.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., and not to any individual connected with the paper.

Tom Donley's Tournament.

ST. THOMAS, Ont.—Tom Donley's big, annual shoot was held at St. Thomas, Ont., on Oct. 9, 10 and 11. It terminated successfully, although the attendance was not what it should have been.

The most important events were the grand international handicap for the Gilman & Barnes trophy, and the Canadian handicap for the Donley trophy.

Rolla Heikes, of Dayton, won the international event with a straight score of 25. Mr. J. Stroud, of Hamilton, won the Canadian handicap, having also a straight score of 20.

While the attendance was not up to the mark, the shooters were of the right material, and kept pegging away. Each event was closely contested.

J. A. R. Elliott was particularly unfortunate in drawing hard birds. Fanning drew a screamer for his twenty-fifth in the international handicap, which he missed.

The birds were a strong lot, and could not have been improved. The weather on the first day was unfavorable, being dull and rainy; but the two succeeding days were all that could be desired.

The target events were discontinued after the third event of the second day, at the solicitation of the shooters, who were anxious to commence at the live birds.

The following are the most noted shooters who took part: Rolla Heikes, Dayton, O.; U. M. C. Co.; J. Fanning, Jersey City, LaFin & Rand Powder Co.; J. A. R. Elliott, Kansas City, Mo.; Winchester Repeating Arms Co.; B. H. Norton, Hazard Powder Co.; E. C. White, Ottawa, Can.; Robin Hood Powder Co.; A. G. Courtney, New York, Remington Arms Co.; W. R. Crosby, O'Fallon, Ill.; E. C. Powder Co.; J. Parker, Detroit, Peters Cartridge Co.; E. C. Fort, Fostoria, O.; Robin Hood Powder Co.; P. H. Willey, Danville, N. Y.; J. E. Cantillon, Clinton, Can.; G. E. Dollic, Clinton, Can.; F. Westbrook, Brantford, Can.; J. Stroud, Hamilton, Can.; G. Stroud, Hamilton, Can.; H. D. Bates, Ridgetown, Can. (twice winner of the Gilman & Barnes trophy and once of the Grand American Handicap); D. Bates, Ridgetown, Can.; G. McKetchie, Ridgetown, Can.; D. Mackinnon, Ridgetown, Can.; W. Eustes, Wallacetown, Can.; W. Hollingshead, Dutton, Can.

There were also a number of local shooters who took part. The genial Jack Parker, of Detroit, representative of the Peters Cartridge Co., managed the shoot in a most efficient manner, and it is due much to his hustling qualities that the affair was such a success. Mr. Parker was well to the front in the events in which he took part. Mr. Thomas Donley is to be congratulated on his success. He is well pleased with the outcome, and promises that the shoot of 1902 will offer better inducements than ever.

Wednesday, Oct. 9, First Day.

Table with columns for Events, Targets, and scores for various shooters like Crosby, Mitchell, Westbrooke, Heikes, Fanning, Elliott, Courtney, Bates, Cantillon, Emslie, Fort, Dr. Dollic, White, Coffee, McKay, Norton, Seane, Hollingshead, Eustes, G. Stroud, Hudson, George.

Live birds: No. 1 was at 7 live birds, \$5 entrance; No. 2, 10 live birds, \$7 entrance:

Table with columns for No. 1 and No. 2 live bird events, listing shooters like Heikes, Fort, Crosby, Fanning, J. Stroud, G. Stroud, Seane, Cantillon, Norton, H. Bates, Courtney, Elliott, Dr. Dollic, White, Emslie, Donley, Parker, Hollingshead, Westbrooke.

No. 3, Canadian handicap and Donly trophy, 20 live birds, \$14 entrance:

Table with columns for No. 3 Canadian handicap and Donly trophy, listing shooters like G. Stroud, J. Stroud, Seane, McRitchie, E. G. White, Tyro, Westbrooke, Emslie, H. Bates, D. Bates, McMaekon, Street, Donley, Hollingshead, Mitchell, Cantillon, George.

Thursday, Oct. 10, Second Day.

Table with columns for Events, Targets, and scores for various shooters like Heikes, Courtney, Crosby, Fanning, Elliott, Westbrooke, Bates, Fort, Emslie.

Live birds: No. 1, 7 live birds, \$5 entrance: Elliott, Crosby, Heikes, Fanning, Fort, H. Bates, Westbrooke.

No. 2, international live-bird championship and Gilman & Barnes trophy, 25 live birds, \$25 entrance:

Table with columns for No. 2 international live-bird championship and Gilman & Barnes trophy, listing shooters like Heikes, Crosby, Elliott, Fanning, Norton, Fort, White, Parker, H. Bates, Seane, Emslie, Donly, D. Bates, McRitchie, McKay, Westbrooke, Hudson, Cantillon.

Table with columns for Tyro, Jones, Rolla Heikes won with 25 straight.

Friday, Oct. 11, Third Day.

Table with columns for No. 1, 10 live birds, \$7 entrance: Parker, Crosby, White, Fort, Elliott, Heikes.

Table with columns for No. 2, 15 live birds, \$10 entrance: Elliott, Heikes, Crosby, Fanning, Fort, Parker, Donley, Norton.

Table with columns for No. 3, 7 live birds, \$5 entrance: Heikes, Fort, Fanning, Crosby, McKay.

Table with columns for General averages at targets, first and second days: Crosby, Heikes, Courtney, Fanning, Westbrooke, Elliott, Bates, Fort, Emslie.

ON LONG ISLAND.

Emerald Gun Club.

Brooklyn, L. I.—The club event of the Emeralds for October, held on the 15th inst., had a good entry as to numbers. Of the twenty-one contestants, two killed straight. The scores:

Table with columns for Dr. O'Connell, A. Schoverling, Dr. Hudson, F. Kall, J. C. Henry, J. Moore, S. Van Allen, E. J. Roberts, G. Warfield, C. Wash, Dr. Stillman, T. Short, O. Brown, A. Doncourt, H. Anderson, Dr. O'Donohue, W. J. Amend, H. Dressel, F. Hansman, W. Sands, B. Amend, Jamaica, M. Van Allen, S. M. Brown, W. J. Amend, F. Hansman, B. Amend.

Mr. B. Amend's score for October does not count. The following September scores were shot: S. M. Van Allen, 30yds., 10; O. Brown, 25yds., 7; H. Anderson, 25yds., 10; Dr. O'Donohue, 28yds., 7; W. J. Amend, 25yds., 7; F. Hansman, 25yds., 10; B. Amend, 30yds., 8.

Sheepshead Bay Rod and Gun Club.

Sheepshead Bay, L. I., Oct. 19.—Mr. Henry Montanus won the badge with a straight score, as follows:

Table with columns for R. Smith, E. Voorhies, I. McKane, G. Morris, F. von Fricken, H. Montanus, A. Soeller, A. Busch, M. Rauscher, F. Lundy, H. Koch, H. Freyler, Dr. O'Connell, D. J. Heffner, Dr. Wood, L. E. Allen, Paul Suss.

Crescent Athletic Club.

Bay Ridge, L. I., Oct. 19.—The shoot of the Crescent Athletic Club to-day was distinguished by some extraordinarily good shooting. Mr. H. M. Brigham was high man in the contest for the October cup, an event at 50 targets; 25 from expert traps, 25 magatrap. He scored 48 with his handicap. Mr. Edward Banks, scratch man, was close up with 47. Capt. A. W. Money was in fine form.

In the contest for a trophy, at 25 targets, magatrap, four tied on straight scores: namely, Messrs. Brigham, Money, Marshall and Palmer. In the fourth shoot-off of the tie Messrs. Brigham and Palmer were still in, and as it was too dark to continue further the remainder of the tie was postponed till next week.

October cup, 50 targets; 25 expert, 25 magatrap: --Expert-- Hdcp. Broke. --Magatrap-- Hdcp. Broke. Total

Table with columns for E. Banks, H. M. Brigham, L. M. Palmer, A. W. Money, W. W. Marshall, Platt Adams, C. G. Rasmus, H. L. Meyer, H. M. Brigham, Capt. A. W. Money, L. M. Palmer, H. L. Meyer, W. F. Fowler.

Trophy, 15 targets, expert traps, handicap: Capt. Money (2) 14, H. M. Brigham (1) 13, Edward Banks (0) 12, W. W. Marshall (5) 10, L. M. Palmer, Jr. (8) 6, H. L. Meyer (8) 3, C. G. Rasmus (5) 2.

Trophy, 25 targets, magatrap, handicap: H. M. Brigham (1) 25, Capt. A. W. Money (2) 25, W. W. Marshall (6) 25, L. M. Palmer, Jr. (14) 25, C. G. Rasmus (6) 24, E. L. Rhett (6) 22, E. Banks (0) 19, H. L. Meyer (14) 9, W. F. Fowler (10) 7.

Shoot-off, same conditions: H. M. Brigham (1) 25, Capt. A. W. Money (2) 25, W. W. Marshall (6) 25, L. M. Palmer, Jr. (14) 25.

Shoot-off, same conditions: Capt. A. W. Money (2) 25, H. M. Brigham (1) 25, W. W. Marshall (6) 25, L. M. Palmer, Jr. (14) 24.

Shoot-off, same conditions: Capt. A. W. Money (2) 25, H. M. Brigham (1) 25, W. W. Marshall (6) 14.

Shoot-off, same conditions: Capt. A. W. Money (2) 25, H. M. Brigham (1) 25, Twenty-five targets, expert traps: Brigham 21, Money 22, Marshall 18.

Twenty-five targets, expert traps: Brigham 21, Marshall 19. Fifteen targets, expert traps: Banks 11, Brigham 9, Marshall 6, Rasmus 5, Meyers 3.

Ten targets, expert traps: Maltby 6, Meyer 3. Ten targets, expert traps: Maltby 4, Meyer 1. Sweepstakes, 10 targets, expert traps: Brigham 10, Banks 9, Money 7, Marshall 6, Palmer 6, Rasmus 4.

New Utrecht Gun Club.

Interstate Park, L. I., Oct. 19.—Some close competition marked the weekly club shoot of the New Utrecht Gun Club to-day. Mr. R. W. Haff captured the first event, killing 7 straight, then winning in the shoot-off.

In the next 7-bird event, Ramapo and ex-Sheriff F. D. Creamer had a most interesting contest in the tie. They, with Mr. Haff, had killed 7 straight. The latter lost his second bird dead out in the shoot-off. Ramapo lost his eighteenth. Creamer killed and won. He also won in the fourth event, and his shooting for the day showed the excellent total of 50 killed out of 52 shot at in the club events, and one was dead out. The shooting of the other contestants was quite good also. The shoot-offs were miss-and-out. The scores:

Table with columns for No. 1, 7 birds, for club prize: C. A. Ramapo, R. W. Haff, Shoot-off: Haff 1, Ramapo 0. Half won. No. 2, 7 birds, for prize: C. A. Ramapo, R. W. Haff, F. D. Creamer, T. W. Morfev. Nos. 3 and 4 were at 7 birds, for prize: C. A. Ramapo, R. W. Haff, F. D. Creamer, T. W. Morfev.

Table with columns for B. Waters, H. Edey, W. G. Brown, 2101221-6, 220**1-3, 1221220-6

Shoot-off of No. 3: Ramapo 3, Creamer 2. Ramapo won. Shoot-off of No. 4: Ramapo 1, Haff 2, Creamer 3, and won.

IN NEW JERSEY.

Fort Lee Gun Club.

FORT LEE, N. J., Oct. 17.—Herewith find the scores of the Fort Lee Gun Club's shoot at live birds. There were ten men shooting at 11 birds per man: Eickoff 10, Cathart 8, Morrison 6, Elison 8, Merrill 6, Ennet 11, Rowe 3, Glasser 8, Dedrick 6, Truax 8. JAS. R. MERRILL, Sec'y.

Trenton Shooting Association.

Under date of Oct. 18 the following was published in a Trenton, N. J., daily: The Trenton Shooting Association held its annual meeting last night at the office of Treasurer Dr. E. H. Ginnelly.

The members of the Association were given an excellent report by the officers.

Secretary George N. Thomas surprised the members by declining a re-election. The doctor refused to reconsider his action, and only upon Dr. Thomas' word that his business interests made it impossible for him to continue in office was the resignation accepted. In Dr. Thomas the Association loses a strong and able worker. His untiring efforts made the Trenton Shooting Association a power among the clubs of the country. Dr. Thomas promised to lend his aid to the furtherance of the T. S. A. When all efforts to re-elect Dr. Thomas failed, the members searched for another secretary who would take charge of the business. Elmer E. Applegate, of E. S. Applegate & Co., a well-known lover of the sport, was tendered the office. "Shorty," as he is better known, will make a first-class secretary.

The other officers elected were: President, Elmer E. Barwis; Vice-President, J. E. Thropp, Jr.; Treasurer, Dr. E. H. Ginnelly; new members to the Board of Directors, W. H. Harding, Charles B. Colc and Charles O. Lutes; Captain, Charles Maddock, Jr.

The Board of Governors decided that F. W. Thropp shall notify all members who are six months in arrears of dues. The Board will suspend them from membership in the club if they fail to pay up.

The city cup championship shoot for the handsome trophy donated by former Secretary George N. Thomas has the following conditions:

- 1. The trophy shall be known as the Trenton Shooting Association Team Challenge Cup. 2. It shall be contested for by teams of five men each, who will appoint one of their number as captain. 3. The winning team will appoint their captain as custodian of the cup, and he will hold same subject to challenge. 4. All challenges must be sent to the secretary of the Trenton Shooting Association, accompanied by \$5 in cash. 5. The winning team will receive both cup and cash, and the losing team will pay for the targets in the match. 6. Each team shall shoot 250 targets, divided 50 targets per man, unknown angles. 7. All members of the Trenton Shooting Association and residents of Mercer county will be eligible to contest for the cup. 8. The winning team shall give some satisfactory guarantee as to the safe-keeping of the cup, and produce same when required for contest.

Hudson Gun Club.

Jersey City, N. J., Oct. 21.—The shoot of the Hudson Gun Club had twenty contestants, and of these Mr. Carl von Lengerke was easily the high man, breaking 117 out of 130 shot at, an even 90 per cent. No. 8 was a walking match, and he made the excellent score of 24 out of 25 in this event. The scores follow:

Table with columns for Events, Targets, and scores for various shooters like C. von Lengerke, Banta, Boek, Wildes, Van Dyne, Nagle, Shields, Tommy, Randell, Doods, Conny, Kelley, Lambeck, Whitley, Ratigan, De Long, Brewer, English, Boothroyd, Muller.

Causes of Bursting.

JUDGING from our experience of the past few weeks we think that a word of advice to shooting men will not be out of place, especially as this sport is now in full swing. Several guns have recently been submitted for our examination, the barrels of which have been burst between the muzzle and fore end. In some instances we are asked to arbitrate as between gun maker and sportsman, and in others the inquiry is made as to whether this is a common experience with one or another of the smokeless powders. Generally speaking, we have only one answer to give, which is that practically every barrel made is sufficiently strong to withstand any ordinary pressure, say from 9in. from the breech onward to the muzzle, and therefore that accidents which arise must be due to causes apart from the quality and quantity of the metal used. As an inspector once pointed out in reporting on an explosion, the cause which produced it disappeared in the process of maturing into an effect. In the same way the particular cause which produces a burst at the forward part of a barrel can only be deduced from the nature of the injury sustained. When such cases are brought to our notice we can only suggest that bursts of this character are the result of some sudden arrest of the forward motion of the shot in its travel up the barrel, and that there is no evidence to show how the arrest of movement was caused. There are many promoting causes for the sudden change in the character of the bullet's movement. Obstructions which tend to bring about a momentary arrest of the forward moving shot may be due to several causes, but the main thing for the shooter to realize is that, no matter what may be the strength of his barrel, it is one of the ordinary risks of shooting for that barrel to burst if a dent, or the presence of some foreign body in the barrel, is sufficient to cause a momentary check in the travel of the shot. There is at least one satisfactory feature about accidents of the kind referred to, viz., the singularly small number of cases in which the shooter receives injury. In fact, more often than not he is unaware of what has happened until his eye tells him that something must have gone wrong during the firing of the previous shot.—London Field.

Peru Gun Club Tournament.

PERU, Ind., Oct. 17.—Editor Forest and Stream: The live-bird shooters of the country should bear in mind the coming tournament of the Peru Gun Club, which will be held at our club grounds, Peru, Ind., on Nov. 6 and 7. This will be a strictly live-bird tournament, given upon the lines of the Grand American Handicap, all purses divided high guns, open to all and all handicaps will be 26 to 32yds.

Our grounds are among the fastest in the country, and we will have only good, country birds; not a cooped bird will be trapped. The tournament will be under the direct management of Mr. John Parker, while your humble servant will endeavor to render Mr. Parker what assistance he may need in keeping the Indians tame, and Mr. Parker may select his handicap committee if he needs one from among those present.

Our tournament, along these lines last year, was something of an experiment for the West, but proved such a success in number of participants and satisfaction to those present that we have decided that no change is necessary as to division of moneys, management, etc.

The programmes will be out about Oct. 24, and may be had by addressing Mr. Frank Dunbar, the club secretary, at Peru, Ind. J. L. HEAD.

Shooting Schools.

THE following is a chapter taken from that interesting and instructive work, "Experts on Guns and Shooting." It presents the matter of target shooting from the English point of view, besides touching on the distinctions between field and trap shooting:

Of late it is becoming the fashion to turn gunmakers' shooting grounds into what are called shooting schools. We are not inclined to accept these schools as different, except in degree, from the old form of gunmakers' grounds. The difference between the school, on the one hand, and the old-fashioned fitting-range on the other, is not, in our opinion, one that has introduced practice for the accomplished sportsman, although we know that a few of the best sportsmen and shots have used the clay-bird towers for practice, for arm exercise, and for the cultivation of rapid changing of guns. We are aware that crack shots at clay birds extol the difficulty of it as beyond that of live-pigeon shooting. But the whole objection that can be urged to it is not summed up in its greater or less difficulty, but in its difference from living game.

We have avoided regular practice at clay-bird shooting for two reasons; first, because we wished to remain impartial to every new phase of practice with the gun that might be brought out, and try it as a game shooter only, and, second, and of much more importance to ourselves, but of none to others, because we feared that it might spoil our shooting at game if we made a regular practice at it.

In America clay-bird shooting is a sport in itself. It is not so here, and we do not think it can ever become more than a means to an end in this country, although it is an end in itself in America. What is the end, then, that is possible to get out of practice at clay birds? We have instances where a good pigeon shot has been formed out of a clay-bird shot. We do not know of a single instance where a first-class game shot has been so formed. Pigeon shots were usually good game shots—we think that they usually are so now, although we are well aware that the practice of dropping birds close to electric traps is as different from game shooting as the former is different from clay-bird shooting. There may be improvements later on, such as will bring clay-bird shooting nearer to game shooting than it is at present. We think that the greatest possibilities for it consist in the high, overhead and coming, shots thrown over tall trees; but as far as we are able to judge, these are not very good imitations of the flight of pheasants, partridges or grouse yet. We think that the cause of this is that the clays go like a flash from the traps, and begin to slow down their pace at once. No doubt if the shooter stands close up to the trees they come fast enough; but then they are not visible long enough before the shot should be fired to enable the shooter to do with his gun what he does at game. There is, for instance, no possibility of swing when the game is over the gun before it is seen. Then, if he stands further back, the slowing down has taken such effect that no "swing" of the gun is necessary. Stronger springs, and the guns placed further away from the points of departure of the clays, might meet these difficulties somewhat, but at present we have never seen a clay thrown overhead that tested the sportsman's ability to meet and overcome actual pace. We must repeat here that we are not talking of snap shooting. Snap shooting is one thing; the killing of down-wind pheasants, grouse or partridges has nothing necessarily of snap shooting about it; the best game shooting is not the most difficult, for there are shots and stands that are impossible. We have been posted under the brow of a hillock, within 20yds. of the first sight of the grouse, and in such a situation, when a moderate wind has prevailed upon the flat, the draught created by the shoulder of the hill has brought the grouse far past our heads before we could put in a shot, and we have then found that the only plan was to turn our backs on the coming grouse and try the retreating shot—never very satisfactory; and the faster it is the worse it becomes, because it leads to more wounding. The most difficult possible shots (other than chance shots), then, are where the shooter sees his approaching game at from 40 to 70yds. away, and when a real good wind is behind it. Under such circumstances he sometimes does not see his second bird until after he has fired his first shot. In the case instanced there is but one difficulty to contend against; it is one that game shots, during the past twenty years, have set themselves to deal with. So much is this the case that a good shot will measure the pleasure of a day's shooting precisely by the pace at which "possible" birds come for him. He might get snap shots at his birds by going in near, as in the case where he sees his driven game for the first time some 20yds. in front, but when game is going some sixty miles an hour (an average speed in the hills, whatever may be the case on the flat moors of Yorkshire), no amount of snap shooting practice at clay birds will help his bag very much in such circumstances. We have it on the best of authority (measurement and scientific calculation), that when a grouse is going from forty to sixty miles an hour, an allowance must be made, according to its distance from the shooter, of anything from 2ft. 4in. at 15yds. away, and forty miles an hour, up to 23ft. in front of the game that is traveling at sixty miles an hour and is 60yds. off. Does any snaphooter in the world believe he can estimate 23ft., even on a still surface, at a guessed distance? If he does, and will try, he will soon be convinced that it would be absolutely futile to begin to guess distances of this kind in front of grouse going at the speed indicated above. No man can guess the distance of a thing in the air with any certainty whatever, and a mistake in 10yds. means a difference of "allowance" of 4ft. 6in. at 60yds., at the speed of sixty miles an hour.

No man can guess the allowance to within 15in., which is all the permissible error allowed in a spread of shot of 30in. in diameter. No man can guess the pace of a bird coming over him. Yet successful snap shooting presupposes not only one but all of these three guesses being accurate.

We know the utmost pace of a rabbit, and we know that of a clay bird, and in each case we can pitch up our gun and shoot a yard or so in front with pretty certain results without any sort of swing or jerk, or even going with the game physically or mentally. But this does not meet the problem of the differences of pace and distance of winged game, and a system that teaches the snap shot, when applied to pace, and nothing but pace, in game is liable, in our opinion, to come to lamentable grief.

There are good shots who are entirely unconscious of doing anything more than putting up the gun before the game and firing; but if their guns are watched, they will be observed to tell a very different story. It is not necessary that "swing" should be done after the gun is at the shoulder, but we are assured that in some form swing or going with the game is necessary to the successful shooting of all very fast shots. We do not say for a moment that swing to be successful must not be combined with judgment of pace of the game, distance and allowance. We believe that it is generally so combined, for we do not think it would be easy to swing as fast as the game flies without at the same time swinging faster.

For practical purposes in connection with this matter of "swing" the shooter is a pivot, round which his gun and the game are traveling. If, therefore, the alignment is kept upon the game, it is obvious that the gun muzzle is traveling very much slower than the game, as it is nearer the axis round which both are traveling. We do not know how quickly a man may be able to move his gun, but if he could make his muzzle move as fast as his game it is obvious that he reduces "allowance" to a question of inches instead of feet, as he would give a sideways motion to the shot as it left the muzzle equal to that of the game. But if any one tries this he will find that a tremendous jerk is necessary. The usual practice of those who jerk is to get the gun aligned with the game and then to jerk. This does not of course necessitate so much pace in the muzzle of the gun as has been contemplated above, because the gun jerked in front of the game is an equivalent to more or less allowance in front, as well as effecting a variation of the direction of the shot in the way the game is going. To test the pace of the gun against the pace of the bird it would be necessary to come from behind up to the alignment with the game, and then let off without stopping the movement at the instant the gun passed the game. We believe that any one who tries this upon really quick grouse will find that it cannot be done, which means that it is impossible for a man to move a gun muzzle at the rate of forty or sixty miles an hour.

We think we have made it clear that the absolute judgment of distance necessary for "allowance" in front of the bird is impossible, and that swing or jerk at the rate of speed required to make allowance unnecessary is also impossible, and therefore we have a right to assume that to become a good shot at really fast game one must race the bird with the gun in some way—that is, swing or jerk, according to and set by the pace of the game, and make allowance according to judgment also.

We have said nothing about "personal equation" and the time the shot takes to leave the barrel, because, although these troublesome factors may mar the progress of a bad shot, a good one, such as we are considering, has learned to "time" himself necessarily or he would not be good. He and his gun are in touch, and he does not pull his trigger when he is satisfied with his aim, but the instant before, when he sees that he is going to be satisfied with his aim. To prove this it is only necessary to point out the many times a good shot will fire at a bird another has killed before the good shot has pulled trigger. The latter will admit at once

that the bird was dead before he pulled. It is obvious that if the muscular movement to pull the trigger were initiated after the aim had been got it would not be pulled at a dead bird.

The object of "swing" is to reduce the necessity of accurate judgments of speed, distance and to some extent of "allowance" to their equivalent by means of a very simple physical movement. This latter "swing" or "jerk" is assisted by more or less "allowance," the latter varying little or nothing with the pace of the game for similar distances, not varying because the speed of the gun varies, according to the speed of the game and should be set by it. We shall perhaps be told that this is the condemned practice of following the game round, but really we need hardly say that it is nothing of the kind. We would rather call it hastening to catch the game up. We do not think it necessary that the muzzle of the gun should travel far; perhaps only inches, perhaps feet; but travel it has to, not necessarily when at the shoulder; perhaps when coming to the shoulder.

In order that "swing" should be possible, there must be a considerable length of time elapse between first sight of the game and the shot, and this necessity has hitherto beaten the advocates of clay-bird shooting. They cannot give a good, long sight of a quick target. They can give you a quick target overhead, and they can give you a good, long sight at a target overhead, but the two cannot be, or, rather, have not been, done together. When one occurs, the other is absent.

It will be observed that shooting schools have their limitations, therefore; they are not so entirely stock-fitting grounds as they used to be, because it is possible to train shooters up to a certain point at them. We are, however, inclined to doubt whether the majority of them begin in the right way. We do not believe in the teaching of snap shooting as an early lesson, and yet most of the arrangements are made specially to teach snap shooting or else no shooting. It is easy to understand why gunmakers prefer to test for bend and cast-off and length of stock at snap shots. They must do so in order to get rid of the possibility of the shooter bringing alignment to the correction of his gun stock. It is, however, one thing to say that snap shooting is right for stock fitting, and another that it is the primary necessity for a shooting school, in which one of the essentials is practice with a stock that does fit. Snap shooting, as a lesson, should not, in our opinion, ever be given until after the pupil is perfect in every other form of shooting. It is the most difficult of all; something has to be done that is not necessary in any other kind of shooting, and we say it should only come last, because great experience is necessary to accurate judgment in throwing up a gun and firing into space or thick bushes, a guessed distance in front of game you possibly cannot see at all when you shoot.

Clay-bird shooting is snap shooting, but the snap shots are of an easy kind, and it must not be supposed that being able to pitch up the gun in front of the clay and breaking it in style would indicate the possibility of slaying a blackcock gliding over a few feet of ride in a Scotch cover, at an apparently quiet pace of fifty or sixty miles an hour. If snap shots at the clays could teach this we should have no word of praise high enough for them.

We fancy that the person who started out to learn shooting by practicing such snap shots at clays would be very uncertain, and have no chance of improvement. Everything now in the actual sports of the field depends upon speed in shooting. The modern gunner is unhappy unless his skill is tested by speed—tall pheasants, because when they are tall they are fast also, and grouse and partridges driven down wind—that is the fashion, and it is useless to oppose fashion unless you are prepared with a new one, and a better one. It is, therefore, somewhat out of the fashion to talk of practicing for game shooting at clay birds, more especially when the latter are not thrown overhead. We agree that something may be learned at them, provided an expert stands by to tell you exactly where you shot on every occasion, and why you shot there. This, however, has nothing peculiar to the shooting school about it, and is just as easily done at game. It is the expert that does the work, not the appliances, in both cases.

If you are a good game shot you will probably shoot much too far ahead of clay birds thrown overhead, for the reason that you judge their speed before you shoot, and they are slowing down all the time. It becomes a question whether, this being the case, it is good to go on practicing at them. It is obvious that if you learn the trick of them you must not apply it to living game, or you will assuredly shoot behind it.

But there are, all the same, many bad tricks in shooting that a really clever onlooker can find out by watching a very few shots, whereas the shooter himself might shoot on for years without being any the wiser. In the first place, an expert is no use unless he can see exactly where his customer shoots in respect to his game. (Here, we should remark, that, unfortunately for the experts, most men who miss much never miss twice alike. What is the unfortunate expert going to do in such a case as that?) It is the opinion of Mr. Purdey that the try-gun is no good, and he gives as a reason that when it is thought that an error has been detected in stocking, and better work is being done, then suddenly, for some unknown cause, it happens generally with poor shots that they do exactly the reverse of what they have been doing, and the try-gun has to be altered back again. This up-and-down work will proceed a whole afternoon, and five hundred cartridges have been known to be uselessly expended in trying to get the shooter to mount his gun twice alike, or to pull the trigger twice in the same time.

Everything—or nearly so—as we have explained, is laid out at shooting schools in order to find the right bend and cast-off to give a man. That is not everything—use will make a man shoot well with nearly any stock, provided that he has shooting in him. A constant change of stock is never advisable, and it is far better to stick to a stock that all the experts declare manifestly wrong than to change from that which long custom has made successful.

Although fit of stock is so much talked of nowadays, there are some points in shooting lessons that we hear far less about than we used to forty years ago. And yet we venture to say that some of those are of much greater importance to a shooter than shape of stock, because the latter depends upon the habit of the shooter. The first of all is the teaching of how to throw up the gun so that it invariably comes exactly in the same spot with neither bump nor jerk; the second is to pull the trigger before the gun touches the shoulder, so that the shot shall leave the muzzle as the butt comes home, and before reaction or jerk takes place. The third is the cure of gunshyness, a fault from which most bad shots suffer as well as all beginners. Gunshyness may show itself in nothing more than blinking the eyes, but it frequently effects a movement of the body, also, out of keeping with the idea of good shooting. These appear to us to be the elementary lessons for a shooting school to teach even yet.

We would make one other observation, and it is this: that we do not agree with the statement that all the aiming should be done with the left hand. There are fashions flying about, the result of hearsay evidence. But if any one wishes to discover that the right hand is of use in aiming, let him try to aim at a rocketing pheasant with his right hand in his pocket and a string attachment to the trigger. We will undertake that he will not kill his rocketers in his best form, and we shall be prepared to bet on the bird every time. Another mistake is the forward position of the left hand for every person alike. It is very excellent for pigeon shooting, whence it came; but everybody and every shooting school will do better by studying varying length of reach than the pictures of other people's ideals. All men are not cast in the same mould; and it is obvious that a broad chest gives less forward reach when both hands clasp the same object than that permitted by a narrow chest.

Keystone Shooting League.

HOLMESBURG JUNCTION, Pa., Oct. 19.—The regular weekly live-bird shoot of the Keystone Shooting League was well contested. Three of the contestants made straight scores in the club handicap event, at 10 live birds. There was a stiff wind and good birds, conditions to well try out the skill of the shooters.

Club handicap event, \$2.50 entrance: Russell, 28.....122202220—8 Bower, 26.....111220212—8 Hensley, 29.....200222222—8 Smith, 27.....0111221000—6 Budd, 29.....210202121—8 Van Loon, 28.....2011110011—7 McCoy, 29.....222222222—10 Huttenlock, 27.....1012201022—7 Geikler, 29.....22222222*—9 Fitzgerald, 28.....1212121222—10 Darby, 27.....222212222—10 Rothaker, 28.....22*2220122—8 Davis, 27.....0211020111—7

Sweepstake event, 7 live birds, 28yds. rise, \$2.50 entrance, three moneys: Budd 8, Darby 4, Davis 7, Van Loon 6, Russell 7, Geikler 5, Rothaker 5, McCoy 7, Henry 6, Bower 5, Smith 3, Fitzgerald 4, Huttenlock 3.

Second event, 7 live birds, handicap rise, \$2 entrance, three moneys: Bower, 26yds., 5; Smith, 27yds., 5; Fitzgerald, 27yds., 5; Budd, 29yds., 6; Darby, 29yds., 6; Russell, 26yds., 7; McCoy, 29yds., 7.

Third event, 25 bluerocks, 16yds. rise, \$2 entrance, three moneys: Stevenson 23, Russell 23, Dr. Darby 21, Van Loon 20, Davis 20, Geikler 19, Cowan 18, Henry 17.

Baltimore Shooting Association.

THE seventh annual tournament of the Baltimore Shooting Association, Oct. 16, 17 and 18, Baltimore, Md., did not have so large an attendance as was expected, yet the competition was sustained staunchly.

The first two days were devoted to target shooting; the third to live birds. There was \$100 added money. The handicaps in the target competition were from 11 to 20yds. Live-bird handicaps, 25 to 32yds. Division of moneys first day, percentage system—40, 50, 20 and 10 per cent.; second day, Rose system—8, 5, 3 and 2.

Oct. 16, First Day.

The magautrap was used for the first time on the club grounds, and gave satisfaction to the contestants. The weather was delightfully pleasant. Winchester (A. H. Fox), was high man in the averages of the day, shooting from the back mark, 18yds.

Following are the scores: Events: 1 2 3 4 5 6 7 8 9 10 11 Targets: 15 20 15 20 15 25 15 20 15 20 20 Lupus 11 16 15 17 13 21 12 19 14 17 16 German 12 18 12 19 13 22 14 19 15 18 18 Hicks 12 14 11 16 15 21 10 12 14 16 17 Winchester 14 18 15 17 13 22 15 19 14 16 20 Dupont 12 13 12 11 8 18 19 Von Lengerke 11 16 15 17 14 22 13 14 13 17 15 Malone 11 16 11 17 14 23 11 16 13 16 16 R E S 13 16 14 16 14 23 13 18 15 18 15 Collins 13 17 11 17 10 22 13 16 15 17 17 Cowan 12 8 10 16 Baughman 12 14 13 18 12 22 11 14 Leland 12 13 Hazel 14 19 15 18 13 21 14 17 12 16 17 Steubner 9 18 14 18 12 16 8 18 14 15 19 Bond 14 14 15 16 13 24 13 17 15 15 15 Storr 13 15 15 19 12 20 14 18 11 19 19 Thomas 10 16 11 13 17 14 14 9 18 17 Hullihen 12 17 14 14 19 15 George 7 18 6 Dixon 13 20 12 16 13 17 Stansbury 16 8 Paul 14 14 Edwards 13

Oct. 17, Second Day.

A heavy wind, prevailing throughout the day, was unfavorable for good scores. It blew much more stiffly toward the close of the day's programme, and affected the scores unpleasantly. Messrs. Malone, Winchester, and German shot from the 18yd. mark; the others from the 16yd. mark. German was high man for the day; Malone second. Scores:

Events: 1 2 3 4 5 6 7 8 9 10 11 Targets: 15 20 15 20 15 25 15 20 15 20 20 Lupus 11 15 13 15 15 22 13 16 12 18 15 German 14 16 15 19 13 23 12 17 13 17 11 Hicks 8 15 9 16 9 21 12 9 12 17 19 Winchester 13 18 13 20 11 21 12 16 12 15 16 Malone 11 16 12 17 15 25 10 19 14 18 14 Leland 12 17 14 15 13 24 13 17 12 13 17 R E S 14 17 13 17 14 23 12 13 14 16 17 Collins 12 12 9 19 13 13 12 8 11 13 17 George 12 14 10 16 13 18 11 14 12 16 15 Seitz 17 10 15 14 13 16 Dupont 17 10 15 14 13 16 Smith 20 14 15 13 18 Alburger 16 7 Hullihen 11 9 15 12 Tracy 15 15

Oct. 18, Third Day.

This was live-bird day. A stiff wind favored the birds, and made a more severe test of skill on the part of the contestants. Mr. Malone was not feeling well, and was not, in consequence, shooting in form. Bond made straight scores in both of the main events: Leitz killed straight in the 15-bird event. The scores:

Fifteen birds, entrance \$10, class shooting; three moneys, 50, 30 and 20. Ossining Gun Club.

OSSINING, N. Y., Oct. 19.—Herewith please find scores of the Ossining Gun Club, made at the regular weekly shoot, Saturday, Oct. 9. A strong, driving wind pulled the averages down somewhat:

Events: 1 2 3 4 5 6 7 Targets: 10 10 10 10 15 5p 5 H W Bissing 4 5 5 6 5 4 N Tuttle 6 3 6 4 C G Blandford 9 8 7 8 13 1 Geo Edgers 3 3 1 W Fisher 3 2 5 6 5 Dr Snow 3 2 5 6 5 P J Doyle 6 5 4 4 3 E D Garnsey 6 5 4 4 3 J Willi, Sr 5 4 4 L Travis 2 3 2 S McBeth 2 4 4 Hutchins 2 2 W S Smith 4 4

Prize event: Class A—Blandford, 12, 14. Class B—Tuttle 6. C. G. B.

Richmond Gun Club.

NEW BRIGHTON, S. I., Oct. 12.—The club shoot of the Richmond Gun Club, held at Silver Lake, S. I., resulted as per the appended scores. The next shoot will be held on Nov. 2:

Events: 1 2 3 4 5 6 Events: 1 2 3 4 5 6 Targets: 10 10 20 10 20 Targets: 10 10 10 20 10 G Bechtel 8 5 10 1 9 5 L Albrecht 9 5 11 F Schoverling 9 7 12 7 8 J J Schenck 5 2 Schwarzman 3 4 P J Crystal 3 2 J Keppler 9 8 7 A. A. SCHOVERLING, Sec'y.

PUBLISHERS' DEPARTMENT.

Winter Tourist Rates, Season 1901-1902.

THE Southern Railway, the direct route to the winter resorts of Florida, Georgia, the Carolinas and the South and Southwest, announces excursion tickets will be placed on sale Oct. 15 to April 30, with final limit May 31, 1902. Perfect Dining and Pullman Service on all through trains. For full particulars regarding rate, descriptive matter, call on or address New York Office: 271 and 1185 Broadway; or Alex. S. Thweatt, Eastern Passenger Agent, 1185 Broadway.—Adv.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., and not to any individual connected with the paper.

SIX MONTHS, \$2.

Like the race of leaves
The race of man is: The wind in autumn strews
The earth with old leaves; then the spring the
woods with new endows. Old Homer.

ILLUSTRATION SUPPLEMENT.

EVERY copy of the FOREST AND STREAM to-day should contain an extra sheet with the illustration "The Start," by Edm. H. Osthaus. This is the second of a series of which the first one, "First Around the Home Mark," was given in the issue of Aug. 12, and the third, "Mr. and Mrs. Bob White," will accompany the issue of Dec. 7.

NEW WOODS AND NEW COVERS.

We spoke the other day of the diminution of shooting territory consequent upon the extensive reclamation of marsh lands along the Atlantic coast and elsewhere. Another movement continuously in progress is the extension of wooded areas, and this in turn means an increase of game country, and is of direct benefit to the game supply.

The prevailing notion of forestry is that the enterprise of tree planting is one of which the profits will go to succeeding generations. The average land owner is intent upon seeing something come of an investment during his own lifetime, when he can have the benefit of it, and he is therefore reluctant to devote time and labor and to lock up capital in that which must be of very remote advantage to himself personally. There are conditions now prevailing, however, which make certain the profit of tree planting within such short periods of time as to encourage general participation in it, with confidence on the part of the planters that they may themselves reap a harvest.

In a survey of forest extension in the middle West, which forms a chapter in the Year Book of the Department of Agriculture, Wm. L. Hall describes the conditions now prevailing over a large extent of territory which insure profit on investments in tree planting, and the revenues from which may be looked for within a comparatively short time. The chief factor of the situation is the rapid diminution in the available supply of timber for fence posts, trolley poles, telegraph poles and railroad cross-ties.

In the middle West the diminution of timber has been very general, and over large areas the supply is practically exhausted. The effect has been to put up the price of posts to such figures that the prices now exceed the cost of growing; the difference is such as to insure profit in timber growing, and this profit will increase in the immediate future, keeping pace with the demand and supply. The use of posts is enormous and is on the increase. The telegraph lines of the country require nearly 600,000 annually, at a cost of not less than \$1,000,000; while the telephones and the electric car lines and lighting systems use as many more. The prices of poles for such uses range from \$1 to \$50 each, and in the next fifteen years a very great advance may be expected. The railroads use 620,000,000 cross-ties, and 90,000,000 are required annually for renewals, taking the timber from an estimated area of 200,000 acres. Nothing has been found to take the place of wood for the purpose, and railroad officials realize that the tie timber is becoming something of a scarcity, and assert that prices are rapidly rising; and it is certain that timber-growing for railroad cross-ties will prove very profitable. Mr. J. Hope Sutor, General Manager of the Ohio & Middle Kanawha Railroad, estimates that the value of cross-ties will, within the next fifteen years, increase to about 50 per cent. over the present prices.

Owners of land in the middle West have been taking advantage of this growing demand for pole and tie timber, and the area of planted timber already aggregates many hundred thousand acres. Within the last year hundreds of plantations have been established in co-operation with the Division of Forestry. A tract of land thus set aside for tree planting is examined by an expert from the Division, and a plan is prepared for the establishment and management of the plantation. The tracts are small, for the most part ranging from five to fifty acres. Some railroads have undertaken, on their own account, to provide for their own cross-ties. More trees were planted in the spring of 1901 than have ever been planted before in a single year; but Mr. Hall is confident that the number planted will fall short of the requirements; he

declares that if 500,000 acres of timber should be planted annually, well distributed throughout the middle West, the production would be inadequate to meet the requirements of the country, and the planters could still hope for liberal profits.

All this means, as we have said before, that the game conditions over vast areas of country are undergoing a change. For cover will be found both on prairie land, where it does not exist, and on other land, where it has been destroyed.

A change of the same nature is going on in the East. It will be recalled that the Connecticut Legislature last winter provided for the taking over by the State of idle lands capable of being restored to woodland, to be managed by a State Forester and administered in such a way that they may serve as object lessons in tree-planting and the proper management of forestry. The Legislature appropriated \$2,000 for two years, and provided that lands could not be bought for more than \$4 per acre. State Forester Mulford has advertised for offers of land to be given over to his management for these purposes. The act provides that having acquired lands, the State Forester shall be authorized to plant them with seedlings of oak, or chestnut, and such other trees as he may deem expedient, and that the territory so administered shall be fenced and protected from trespassers, forest fires and the destruction of game, fish and timber. All this public forest land in Connecticut then constitutes a series of game and fish reserves, the benefit from which to all the adjoining country will be very great as a factor in maintaining and increasing the supply of birds. It is putting into practice the scheme advocated by Dr. Van Name, of game refuges established by the State.

"THE START."

IN this issue of FOREST AND STREAM we present to our readers, in supplementary form, a spirited portrayal of a hunting scene, from the masterly brush of Mr. Edm. H. Osthaus, whose fame as an artist is well known. As with all other of his field scenes, this is in perfect accord with the theme which it depicts. The nervous energy and dash of the dogs; the eager recklessness with which they jump or scramble over all obstacles to begin the quest for the game birds; the calm poise and sharp alertness of the gunners, have a realism which all sportsmen will recognize at a glance. The setting of woods and fields, beautiful in themselves, and suggestive of the haunts of quail or ruffed grouse, appears to the sportsman through association, for who, at some outing or another, has not had some moments of sport so fast and fine that it rewarded hours or days of effort?

To Mr. Osthaus the sportsmen of America are indebted for the invaluable added beauty, dignity and refinement which his genius has added to the sports of field and stream.

DON'T

POINT your gun at a person.
Point your gun at yourself.
Look down the muzzle of your gun.
Pull your gun toward you muzzle first through a fence or out of boat or wagon.
Shoot until you see that it is game and not man.
These are Don'ts not difficult to observe. They should constitute a part of the shooting creed of every one who goes into the field or the forest with firearms. The observance of them will insure safety to the man with the gun and safety to his companions. Their disregard often results in the death of the shooter or of some hapless victim.

As certain as the shooting season comes around, the question arises of the bringing of game out of New Jersey, and of carrying it through the State. Owing to the convenience of the New Jersey covers to the large cities of Philadelphia and New York, great numbers of shooters go out from these cities into the New Jersey fields. The law forbids absolutely the exportation of game, so that visiting sportsmen are debarred from taking home the fruits of the hunt. This is generally and quite reasonably regarded as a personal hardship, the severity of which is not justified by any necessity of it to secure the ends desired. Many States restrict the export of game, and hold it down closely to legitimate bounds, while

giving permission to the visiting sportsman to take home what he himself has killed, the amount being limited and provision being made for necessary labeling and carrying in company with the owner and open to view. This very effectually prevents the export for market purposes, inasmuch as the amount allowed to each person to be carried by him is so small that there is no profit in the traffic for the market-hunter. Regulations of this character appeal because of their justice and reasonableness, where a law like that of New Jersey, which forbids absolutely the export of game, entails a decided hardship upon the individual and is resented.

There is another phase of the New Jersey law which is obnoxious. Sportsmen from New York city going to Orange or Sullivan counties, N. Y., and returning thence with quail and partridge, and passing through New Jersey, on the way home, have their game confiscated under the New Jersey non-export law. Thus to rob them of New York game killed in one part of New York and in progress of transportation to another part of New York is an injustice which cannot possibly have any appreciable effect upon the game of New Jersey. The law might well be changed to correspond with others which accomplish their purpose without absolute prohibition of export.

The activity of Commissioner Collins, of the Massachusetts Commission, in inspecting waters on which there are saw mills, is bearing good fruit. As is told in a communication to-day, the Commissioner has personally visited between forty and fifty mills and has ordered the owners to keep the water free of the sawdust nuisance. In other words, Mr. Collins has undertaken to make the streams fit habitations for trout, and in doing this he has vastly increased the possibilities of the fish supply. As an indication of the good work intelligently undertaken and strenuously accomplished by the Massachusetts Commission, the letter of our correspondent is illuminative and encouraging. The abatement of the sawdust nuisance is only one feature of the work which in the waters and in the fields is restoring to Massachusetts something of its depleted resources of rod and gun.

In the Yarmouth County Court of Nova Scotia, Judge Savary has handed down a decision in the non-resident license case, in which the ruling is made that the phrase "temporarily domiciled" does not apply to foreigners who visit the Province for fishing. If Judge Savary's decision shall be adopted as a guide for practice elsewhere the exaction of licenses will be made in districts wherein heretofore the law has not been so construed. As so much uncertainty on this point has existed in the past, it will prove a decided advantage to have had this case settled as a precedent. We question the advantage to Canada of the angling license exaction, but, as we have said before, that is something for the Canadian authorities to determine for themselves.

Those Boston shooters who defy the Sunday shooting law and talk about having a "moral right" to shoot on Sunday may occupy an impregnable position, but we are curious to know how they would show any difference between their moral right to shoot on Sunday and the moral right of other people to shoot in close season the year round. Their contention appears to be simply the common plea of the individual who believes that game laws were made for everybody else, but not for him; or who contends strenuously for the strict enforcement of all the laws except the particular one which interferes with his own pleasure.

That old story of the greenhorn who is taken out by the local "sports" and stationed in a lonely spot with a candle and an open bag, which he is to hold open while the other snipe hunters go off to drive the game into it, has been current for generations. There are some who question if the actual "snipe hunt" ever takes place, but we have heard of it in different localities with such detail as to justify the belief that more than one unfortunate victim has been made the butt of the coarse, practical joke, and the Tennessee case cited elsewhere is not the only one that has gone so far as to get into court.

The Sportsman Tourist.

Adventures in Tropical America.

III.—Indians and Mosquitoes.

CROSSING Brewer's Lagoon on the Mosquito Coast of Central America, one sees a group of coconut trees floating, as it were, above the water. It marks one of the principal towns of the Mosquito Indians, a place where dark stories lingered—tales of the Indians and their cruelty.

Arriving at this place one evening, I saw a low, muddy shore, and groups of huts clustered together among the trees. As we came up to the landing women and children crowded about, talking eagerly, and anxious to see everything we had. Climbing over the side of a great canoe, I stood for the first time on the native land of the Indians, and it would have been hard to tell who were the most interested, I or the Indians crowding about me. The girls were graceful; the younger ones beautiful. The children were bright and pretty, like little fairies, almost; but the older women were worn and bent by labor. The men showed all too clearly the signs of unrestricted dissipation. They were of rather dark skin, and among some there were marked traces of negro blood. These huts were oblong, rounded at the ends; they were made by driving palmetto trunks into the ground and covered with a thatched roof of palm leaves. The children wore but little clothing; the women used a short skirt and little shawl, and the men wore pantaloons and a short coat, only partially covering the abdomen. All were friendly, and in a very short time willing hands took our supplies from the canoes, and then made us welcome, with presents of fruits and game. All our things were stored in one of the larger huts, and we were given a place near by, in which we were to live—a very comfortable hut, with mahogany boards for the floor.

Soon people grew tired of looking at us, and went about their own affairs. The women busied themselves preparing food, and presently seated before the huts were groups of people, eating, talking and laughing, evidently secure in the abundance of the present and the promises of the future, with no care at all.

In a little time the family groups began to disappear, and laughing and talking could be heard from under heavy canopies; and from the surrounding jungles a distant hum, rising up and dying away, could be heard constantly growing louder, and seeming to be drawing nearer. Most of the people had disappeared by this time, and the chief now shouted to us, "Get under the mosquito canopies; don't you hear them coming?"

We had been provided with canopies before leaving the settlements, and finding that the Indians had been careful to hang them in our hut we hurried under cover. For a time I lay awake, listening in wonder to the myriads of mosquitoes that came swarming about. This was the Mosquito Coast, and I began to understand how, at night, the mosquitoes are a real danger, and to sleep without a heavy canopy would truly mean death.

IV.—Canoeing with the Mosquito Indians.

Once, in the early morning, when the fog was thick among the marshes, and the mist hung low over the water, I left the little Indian village under the coconut trees on Brewer's Lagoon and began a long journey, canoeing up the Rio Potues of Spanish Honduras. I had been pleasantly entertained at the village, but my late friends were apparently so indifferent at my going that I began to lose faith in the Indians, while stories that I had heard of their cruelty and treachery were constantly suggesting themselves to my thoughts. My white companions were rough, boasting, quarrelsome men, not pleasant traveling companions; and from them I separated myself, and found a comfortable place in one of the smaller canoes alone with three Indians, about whom I really knew nothing. Soon the Indian village was lost in the gray light of the morning, and then we were surrounded by fog and desolation. Along the shores of the lagoon were dead or dying trees, gaunt and naked; about us were quantities of water fowl, and in the water were many watchful alligators. Our progress was slow, for the shallow water was choked with plants and decaying vegetation. About noon we made a branch of the Potues River, where a volume of muddy water came pouring out of a narrow channel, surrounded by great stretches of marsh land covered with tall reeds and extending for miles. Progress was slow, and the clumsy boat designed by the superintendent of the expedition could scarcely be held against the current.

By nightfall we had made perhaps one or two miles, and then, the mosquitoes appearing, we were forced to prepare a hasty camp on a mud bank. Such a night! Before my mosquito bar was up I had caught a net full of them and as the hours wore away held a boxing match with myself, and perhaps killed some mosquitoes; but I am not sure; in that country mosquitoes are different from the harmless little insects at home. They are like rubber; to kill them one must use force enough to cause some inconvenience, and that night I punished myself severely. Next morning came with fog and light rain, just the weather for mosquitoes; and the Indians predicted that we would have a bad time. We didn't stop to eat much, and were soon under way again, making better progress than on the day before. I traveled with my three Indians, who were working vigorously to keep up with the larger boat. They were almost naked, and the quantities of mosquitoes made their flesh quiver; yet they bent determinedly to their work. Presently we passed under a group of willow trees, and I picked a bunch of soft withes to keep the mosquitoes from my hands and face. One of the withes was very long, and I found that by using a little energy I could send it gently over the backs and shoulders of my suffering men, and at the same time protect my own face and hands. Presently my white companions noticed my efforts, and from the larger boat set up a derisive shouting, saying, with many unpleasant words, that it was no use to do anything for an Indian, I would learn quickly enough. The Indians said nothing; neither did they make any sign of thanks, though at each derisive shout and taunting re-

mark I noticed an ugly light flash in their eyes, but there was no other change of expression. Then we fell behind the big boat, and I was alone with them. Dinner time came; the big boat was far in advance of us and my men had nothing to eat. Their leader asked me, "You eat now?" and on being told that I would stop the canoe at a convenient point and spread out the bountiful lunch that had been provided for me. Then they went back to the canoe and sat in stolid dejection, waiting for me to finish. I immediately called them, proposing to divide what food I had equally. They came with some hesitation; each took the offered food, but made no sign of thanks, not even an expression of gratitude on their faces. My dog received a share of the food, and it laid its head affectionately on my knee and wagged its tail in appreciation; but the Indians simply ate, and made no sign. I was disgusted. Truly there was reason in all the derision of my white companions. We started on presently, but there was a sort of misunderstanding among us. I sat in the canoe, brushing the mosquitoes from my hands and face, and let the men shift for themselves, thinking that there was no use doing anything for an Indian; but common humanity could not bear the sight of their quivering, naked flesh, and the next moment I was brushing the mosquitoes from them, as before, wondering at their strange, unfeeling natures.

Late in the afternoon we overtook the large boat and found that preparations were being made to camp on a high, wooded bank, that promised well for the night. I got out my mosquito bar, meaning to arrange it early, before the mosquitoes came; but no sooner had I started for the shore than the leader of my men gave the youngest a savage cuff across the ear and pointed to the bundle, which the young man immediately ran to take from me. I was well tired, and only too pleased to give it up, and scarcely noticed that my men were busily at work arranging it for me—and they did it well, too. When supper was ready and we sat around eating as best we could hard-tack and canned corned beef, with strong coffee, one of my men came softly behind me and put a fine piece of roasted turtle on my plate, and went away, not even waiting for thanks. Of course, I shared it with my white companions, and we all found it a welcome addition to our limited supply. Then the mosquitoes drove us under our nets, and we tried to sleep; but a fierce storm, now rapidly approaching, made us anxious, and we lay awake waiting. The perspiration was trickling down my face; then for a moment a breath of cool air came, blowing through the net, followed by a crashing and roaring as the storm closed in around us—wind, thunder, lightning and torrents of rain. No tent could turn such a volume of water, and presently it was coming through in streams. All the place was drenched, and pools of water formed where my companions had made their beds; but where I lay the ground had been banked up, and no water collected, and for some unaccountable reason no water came through my part of the tent, though long, bitter curses, coming from my companions, showed how they were faring; yet I was cool and comfortable and presently fell asleep.

Morning came bright and clear after the storm, and on scrambling out from under the tent I saw that my Indians had left their beds, and in all that storm had collected quantities of big leaves and arranged them on the tent over my bed that I might sleep unharmed. Truly their ways are not as our ways, and it is of some use to show kindness to the Indians. I understood them after that, and we were the best of friends. Through all that journey I had but to express a wish, and eager hands were ready to serve me. Of course I shared my provisions, and kept the mosquitoes off them; but that was not much to do, and they gave in return of fruits, game and all that they had; nor were they ever contented till I had taken the best of everything that they secured; yet never an expression of thanks in their silent faces, only now and then a light in their eyes that shone for an instant and then disappeared. Through all that trip up the river the water was at full flood, the rainy season on in force, and all nature at its best. Each turn of the river opened to new delights of tropical luxuriance, a wall of green on either hand, a torrent of muddy water crawling, chafing and filling the air with a subdued, but ominous, murmuring; bands of dark, forbidding clouds, beating showers, with alternate periods of bright sunshine, and everywhere the fragrance of countless blossoms. Of all that was beautiful, the most striking were the masses of yellow jessamine flowers that in some places, where the vines had mounted to the tops of great trees, were seen in bold outline above the forest, a crown of glory and fragrance. It was beautiful, but no place for a white man. Below the dense luxuriance of the jungle were swamps and poisoned air, and all that region was solitude, given over to wild animals and primeval forests.

Camping in such places was not pleasant, and each night we made the best convenience we could on a mud bank, and though my Indians did everything possible for me I was beginning to be quite miserable, when my head Indian said, "Don't sick; we sleep dry to-night, and tomorrow reach houses!"

Our camp that night promised to be the most unpleasant of all, and to my surprise the Indians did not arrange my bed and mosquito bar as usual. I soon found they had not forgotten, for after supper they came to carry me on their strong backs two miles through the swamp to a village of their people. My white companions objected, saying, "You are a pretty fellow, going to leave the expedition, making up to the Indians and deserting your friends. Suppose the river rises, and everything exposed to it." I stopped, not that I cared much about my "friends," but I felt some responsibility for the goods we carried. The Indians were disappointed, and the youngest of my three men was told to stay with me. Of this there was no need, and I sent him, to be comfortable, with the others. Then night settled down about camp and the sorrows of darkness began—rain above, mosquitoes around and mud below us.

At last morning came, and the Indians returned from the village looking fresh and rested; but we, who had stopped on the mud bank, were a sorry appearing lot. That day it did not rain so much, and the Indians worked with a will, so that by noontime we reached an open savannah, where a collection of board houses and a ruined saw mill were lonely evidences of an enterprise of some kind that was a failure. Here we were to stop

for a few days, until arrangements had been made with other Indians to take us further on. Our supplies were soon unloaded, and then the Indians turned away and left us, my own men going without a word or a look. I hurried after them to say good-by; and when I called they stopped, took my proffered hand with a surprised expression, and then went on again. A moment or two later the boats disappeared around a bend in the river, and I never saw any of them again.

A circumstance of no little sadness in irregular traveling is the passing intercourse with many people. Some are bad and not regretted; others strong and loyal, with whom one goes through hardships or pleasures, and on parting thinks he will see them again; but one never does.

FRANCIS C. NICHOLAS.

A Walk Down South.—II.

SOON after I left Johnston's I climbed the ridge which divides the Susquehanna from the Mohawk Watershed. Three potatoes added nearly four pounds to my pack, but I traveled easily under the load. I began to feel stronger as a result of the exercise, though I was a long way to a fit condition for such a pack as mine.

As the afternoon waned, I watched for a place to camp. The road, as a rule, was many rods from woods, but as I began to go down the pitch into the valley where Lebanon lies, I spied a little brook at the foot of a hill off to the left. I went across lots to it, and about 5 o'clock, two miles short of Lebanon, I went into camp. It was a clear-water stream, but not the Adirondack kind. The stones were covered with clay, ferns and strings, the sediment from the fields through which the brook flowed from its source in a patch of woods above the road on a hill. On a bank was a scale rock cliff several feet in height.

On a bit of level a couple of rods back from this cliff I pitched my tent, using two poles instead of three, with a supporting stick at each end of the blanket. I did not try to find forks of the right size to hold the side poles, but tied them fast to a couple of saplings with string—a quicker and better way. I did not swing the tent so high either. The sides lapped under the hemlock bed and kept out the wind, as did the rear drop, which was adjusted with care. A dry, beech pole fire, with a green birch "bottom," was so warm that it alarmed me for my rubber top, but it did not melt. I drank a little beef tea, not being hungry, and soon after the bluejays and crows stopped their cries I went to sleep. Once I awakened to tend the fire; the next time I roused up there was scarcely a spark left. I did not bother to rekindle it, but rolled up tightly in my blankets and slept till a red squirrel yelped his amazement on discovering my tent near his home tree. It was a joy to have a red squirrel ring the get-up bell over one's head in the morning. I built a fire, fried some potatoes in the grease of fried pork, and then packed up carefully. It takes skill and experience to get a basket filled well. Done one way, a pack hangs lopsided, is topheavy, swings back from the shoulders, rattles and holds about half of one's duffle. On the Sunday I spent above Sollsville in the old house I packed and repacked my stuff to find the best way to do it, and each day since I have added a little to the experience there gained, taking especial pains to group the articles—flour, salt and baking powder scattered to the four corners of a pack make confusion at every meal. And at night I know of nothing more irritating than to have to go to the bottom of the pack for the tent cover, and to the middle of the clothes rolls for the string.

After my pack was all ready, and when I had looked carefully around for stray articles, I started again, but went only a few rods. While I was cooking breakfast I had shot a spying bluejay, tearing it beyond the possibility of eating. I wanted to kill some red squirrels; so I went up over the hill, leaving my pack by the road. I spied two on one hemlock tree. They were very wild, and climbed to the top of it out of sight; so I sat down and waited. In ten minutes one of the animals came down into sight and I fired, missing. The next shot, however, killed.

I dodged Lebanon by going over a great hill and many fences. A cold in the head and hunger again made me lonesome. But down in a swamp a fire with some fire-light pancakes, changed the hue of things. Fried squirrels were good to eat, even though they were red squirrels.

The desire to hear from home grew rapidly as I approached the first station where I was to get my mail—Newark Valley, in Tioga county. But my feet were sore with the steady striking of over two hundred pounds on each of them. Every twenty minutes I stopped to rest, and when I started, the blisters were more and more painful.

I passed through Otselic on Tuesday, and two miles below that place a small hay barn down in the lot looked so attractive that I went to the owner of the farm and asked if I could sleep there.

"Do you smoke?" he asked.
"No," I said, and offered him my match box to boot. He didn't take it, and I went down to the barn to sleep. To get into it I had to climb an outside perpendicular ladder and go through a loft doorway. It was hard work with the heavy pack, after the ten miles.

About milking time, 5:30 P. M., I went to the barn and bought two quarts of milk, which I drank warm on the spot. It was delicious and satisfying. Taking another quart for breakfast, I went back to the barn and slept all night long, save that a shower of rain roused me two or three times. In the morning I drank my quart of milk and started, invigorated, down the Otselic Valley, in spite of the showers of rain, which came at intervals during the day. I put the rubber blanket over my pack and head so that I was kept dry.

Corn in the shack rattled in the wind, and leaves from the trees fell to the road from wayside maples. The crests of the ridges on either side of the valley seemed to grow gray as I looked at them. It was probably not all optical illusion, for the trees were shedding their leaves in clouds at each wet gust of wind.

Very few people were in sight, and the presence of strangers did not make this part of the trip any less lonesome. I longed for a companion of some sort. I wished some dog, like Nessmuk's Pete, the dog without pedi-

gree, would come to me. I even had base designs on some hound astray, if I should meet one.

I plodded on mile after mile, and wrote pathetically in my diary. "This is the worst part of the trip, I am sure." I went through Otselic Center, and at last reached South Otselic. The hotel there was clean-looking, and it was not fifteen minutes of noon and dinner. I dropped the pack on the porch, stood my rifle against the door casing, limped into the office, and signed for dinner. The proprietor was interested to know that anybody should walk where a ride could be had, and the idea of camping out, as I was doing, was a novelty. A good wash, a good dinner and a good talk with men who did not ask if I wasn't selling trinkets turned a dismal morning into a bright one.

I was about to start on when I heard that the stage to Cincinnati was to go in half an hour. Cincinnati was ten miles down the valley, and that much nearer my mail. I just had to take the stage; and so I did.

The driver was talkative. "Last year," he said, "gray squirrels were plenty along the Otselic River, but no one had seen any this year." He believed they traveled in droves, in that region at least, and would probably come when the squirrels, wherever they were, learned how plentiful beechnuts were in the Otselic Valley.

"You're picking up gingseng a little, I s'pose?" he inquired of me. I told him I was not, but wished I could find the plant.

"Well, sir, so do I," he said. "There's two fellows from South Otselic goes down into Pennsylvania every year, just as you be, camping out and digging sang. They live all summer and it don't cost nothing in the woods, and all winter they don't do nothing at all, just sit round. Why, they clears up six hundred to a thousand dollars a year that way. One of them's a good carpenter, a first-class man at his trade, too. He says he don't have to work any more—just dig sang."

I walked a couple of miles below Cincinnati and received permission to occupy an old barn there for the night, after it was learned that I did not smoke.

"Most generally folks that come along sleeps where they want to without asking," I was told. I had visitors in the barn after dark. The three boys on the farm and the carpenter came out to talk to me and see my outfit. The younger had a camera, and pronounced mine a "dandy." Another had an idea of going deer hunting this fall, and wanted to know about guns and duffle for the purpose. The carpenter was inquisitive as to who I was, why I had traveled, and if I hadn't been pretty good on a bicycle. At 9 o'clock they went home, leaving the lantern for me to go to bed by. The day which had been so hard in the morning was cheerful at night. I slept the best of all till morning, when I made a breakfast on milk. Returning the lantern, I started down the west bank of the river for Whitney Point, thirteen miles away. For the first time a wagon upon which I might have ridden came up behind me. The driver did not ask me to go with him. In a few minutes another came up behind me. He was going only a few rods further, as he explained. Then there was a third disappointment. I sat down by a brook at 10:30 o'clock and fried some potatoes and pork, covering the pan with my granite-ware plate, and ate a hearty dinner, which I followed with beef tea.

After a while I came to Upper Lisle and passed through one edge of it. A wagon far ahead seemed to be going slow, but I did not overtake it till it turned into a yard. It seemed as if it were to be a day of disappointments. It was Friday. My mail was still more than a day's trip away, but not two days off. I wanted to get it on Saturday if possible. Just as I was about to give up hope of making Whitney Point that day a man drove up.

"Have a ride?" he asked. He was going to Lisle, and that was nearer to Newark Valley than Whitney Point. Would I ride? Well, rather.

The man looked to be fifty-five years of age—he was seventy-seven. He had hunted deer in his day; was lost once in Potter county, Pa., and shot a deer by the light of the fire he built to keep warm by that night. He had shot gray and black and fox squirrels, too, and owned a musket, captured from Burgoyne, with which his grandfather had helped kill off the deer of central New York in the early part of the nineteenth century.

My feet were still sore when I left him at Lisle, and I was tired, but now my mail was in sight. I started over the hill out of Lisle. It was up and up, till I staggered under my pack. But there was no place to stop in that side hill. I came to a vacant house, but it was locked. At last I came to a farm, with several barns and an unpainted house upon it. The owner refused to let me sleep in one of them; so I went on, hoping to find a place where I could camp. Rod after rod I climbed or went down into gullies. At last I came to an old horse barn, about the size of a chicken coop. It was impossible. The road ahead showed another hill, with a neat-looking farmhouse and barns half-way up. I headed that way. It was late, and I decided to roll up in my blanket in the woods above the house. There was a big hay barn in the lot, as I could see, and seeing the man I asked to sleep in it.

"Well," he said, "you're all right, aren't ye?"

I hoped so, and then I was told to go into the house and make myself comfortable, put my pack in the parlor and stand my rifle in the corner.

"Listen!" said the man. "Hear that dog running up there on the hill? Say, hasn't he got a dandy voice? Runs rabbits all day up there."

There followed a supper of large size, and a talk of comforting sort, a sleep that rested me more than any that I had had before. Pancakes and sausage and potatoes and milk and coffee made up a breakfast I'll not soon forget. I heard of squirrel hunting and rabbits and foxes. As soon as the sun was bright enough I took photographs of the fine hound, which had returned from hunting, and of the big cat, which Connors and his wife say are the finest thereabouts.

It was worth the four miles of toil from Lisle to find such a place as that. I reached my mail at noon, riding four miles on a load of potatoes. I walked five miles out of Newark Valley, and decided that as I had once ridden from New York to Buffalo, passing Owego, to Waverly, on my bicycle, I would skip this portion of the

road; and so I took the cars at Fleming's Village and came to Sayre, Pa., on them, where the first stage of the trip ended on Oct. 12.

RAYMOND S. SPEARS.

In the Ranger Service.

BY ROWLAND E. ROBINSON.

VII.—Lieut. Frederic.

BEFORE the end of summer General Abercrombie gave portions of his army more profitable employment in the western part of the province, and in one way and another the Rangers got their share of service.

A year passed, during which I got no tidings of my unfaithful sweetheart. I had become able to bear my sorrow with some degree of resignation, for time had eased the constant pain of the wound to occasional pangs, and I found myself as often inventing excuses for poor Mercy as blaming her for yielding to the importunities that must have beset her; and if I was not warmed by the old fervor, I was still aware of a tender and pitying affection. The solitude of the woods continued to give its comfort and consolation, and this my service gave me opportunity to seek.

The next summer found us again moving against the Champlain forts in the army of General Amherst with less pomp and parade, with greater assurance of success in its deliberate advance, than had attended the last expedition. As we drew near Ticonderoga there was a skirmish in which we lost a Colonial officer and some men, but met no further opposition. The abbatis had become harmless in the first stages of decay, the deserted breastworks were as silent and lifeless as the last year's graves that lay before them, and when we came to the fortress as deep a silence brooded over it, though the banner of France still floated above its untenanted walls. Such an ominous silence pervaded the place that no one dared to enter it, and an hour of waiting proved the wisdom of the caution, for then there was an upburst of fire and smoke and timbers, and a thundering explosion, that shook the earth; and before its echoes died, and almost before the shower of debris ceased falling, our troops swarmed through the open gate and set to quenching the kindling flames.

When we had set things in order there, our deliberate General moved upon Fort St. Frederic, to find it also abandoned and the rearmost transports of the enemy but specks and white clouds on the far horizon. We were full of curiosity concerning a place that had been a frontier stronghold of the French nigh on to thirty years, and when we were assured that no mine was waiting the creeping spark of a match to blow us nearer to heaven than a Frenchman is likely to get we rummaged the place from the black dungeons, where many a poor English prisoner had pined, up to the flagstaff tower, where the red cross of England was now planted in the place from which the French lilies were banished forever. We went down to the water gate, from whose wave-washed threshold the last white-coated soldier had so lately departed, and into the chapel, where the odor of their Popish mummeries still lingered; in short, into every nook and corner inside the walls, and outside, to the windmill that had ground its last grist for its first owners, who were themselves now between the millstones of fate. Then we went to the village whence two years before we Rangers caught our prisoner; a desolate place now, with no living things in it but a forsaken cat, lonely enough, but still loth to make friends with Englishmen, and one brave Gallic cock, that crowed defiance at our whole army. In one house a kettle of pea soup still steamed over the embers, but for all its savory odor we dared not taste it for fear of poison. A little way off was a graveyard where their dead were left to sleep forever, far from countrymen and kindred.

Out in the fields that we Rangers had harried two years before were acres of ripening wheat that the hurried departure of the French had not given them time to destroy, but left it to be garnered by other hands than the sowers. We wished the grain had got so far as the threshing.

As we beheld all this scene of desertion, we might have pitied those who left behind them pleasant homes, built with infinite toil; fields grown dear and familiar through years of labor, and the graves of their beloved—if they had not been Frenchmen. But our hearts were hardened against them for their perfidy, and the murder and rapine they and their cruel allies had wrought on our people. We rejoiced in keeping everything they left us but the Popish name, which we dropped for the honest English name, Crown Point.

Our army had not been long established here, when our General broke ground for a new and larger fort on higher ground, and further from the water than the French fort. The skill of the best military engineers was taxed to plan these new works and to improve the fort at Ticonderoga, and a fine road was laid between the two. Fortification was our General's favorite pastime, and he gave it full play here at a cost of three million pounds sterling to His Majesty, and all for nothing, as it turned out.

VIII.—The St. Francis Expedition.

In the midst of such affairs General Amherst thought to write out chastisement to the pestilent tribe of Indians harboring on the St. Francis River in Canada. Years before they had been gathered there from all northern New England by an old governor of the French province long since in perdition. Thenceforth, full of hatred of the English, they had been the constant terror and frequent scourge of our New England frontier, whither the Lake Champlain and Connecticut River gave them easy paths in all seasons. They were known to us as the St. Francis Indians, but called themselves Sooga-gese, which, I have been told, means the Little Nation, or the people who went apart from the others, for they were all of the great nation of Waubanakees.

When General Amherst sought a proper instrument for the punishment of these blood-thirsty scoundrels, he could not have chosen a better one than Major Rogers, for he was as learned in the cunning tricks of the savages as if he were born to their manners; his bravery was

tempered with a just prudence, and he was not apt to err in the respect of too tender mercy, any more than were his men, most of whom were of New England, and many of whom had tasted the quality of Indian mercy. Upon many of their homes these red wolves had descended out of the black forest like lightning from a cloud, slaying or snapping up their victims, then gone with captives and booty, swallowed out of sight in the maw of the woods, swift as the flame of the fires they kindled, silent and trackless as their path.

On Sept. 13 two hundred Rangers embarked from Crown Point at night, according to custom of our leader when setting forth on an important enterprise. Bastions and citadel dissolved in the darkness behind us, into which the gloomy shores receded on either hand till we seemed launched upon vergeless space, voyaging we knew not whither, and like an army of ghosts, for no one was permitted to speak above a whisper. With us there was no sound but the occasional splash of an oar and the soft chuckle of ripples against our bows, and the shores were silent, though from the far depths of the forest we heard the dismal wail of wolves calling and answering one to another.

How our guides in canoes leading the bateaux kept their course after the glimmer of the fort's lights faded out behind us, I do not know; but they brought us safely, about daylight, to a landing at the mouth of the Otter Creek, which the Waubanakee Indians call Wonakake-took, having the same meaning, and sometimes Peconk-took—the Crooked River. It was one of their chief thoroughfares to the English settlements, for it comes from far back among the mountains nigh to a river that flows into the Connecticut. These streams, with the carrying place between, made what was known in those times as the Indian road, whereon many a captive went the weary way to Canada. Here we lay all day, very quiet, and at night set forth again. No one could know when or where the sharp eyes of the Indian spies might be watching us to guess and frustrate our design, so to evade them we voyaged only by night, even then keeping from the shores to avoid ambush.

For a time we saw the black steeps of a mountain looming up on our left, and then came on the same side the lake, to a rocky point, which was cleft quite in twain, to the bay on the other side of it, to a width sufficient for a canoe. I was told that the Indians called this place Lobapskwa, the Pass through the Rock, and a point that jutted from the east Kosoapskua, the Long-Story Point. Here the lake becomes much broader, and as we held nearer to the eastern shore we saw only its headlands, while on the other hand there seemed nothing but endless space.

In the morning we made our camp on a great point or cape of the eastern shore, which the Indians call Quineaska, and a river emptying into a bay behind it, Quineaskatook. But beyond this point a singular, naked rock rises out of the water thirty feet or more, a very notable landmark to voyagers, and held in great awe by the Indians, for in it, they say, dwells a mighty spirit, who controls the lake and raises storms to vex any who venture to pass his abode without making some offering to propitiate him, whom they call Wojahose, the For-bidder. Some say that this was the rock that marked the bounds of the Iroquois country; others that it extended no further than the cleft rock, Sobapskwa, and this was the belief of some Stockbridge Indians, who were with us. They told us that the Mohawks called the cleft rock Rigiochne. When we passed the rock a little after nightfall, we did not offer the terrible spirit so much as a pinch of tobacco, but if he owed us a spite for our neglect he did not set the wind upon us, but paid it in a storm of our own raising.

To the east of us a fine, broad bay opened, with a beautiful wooded shore sloping down to it, and far away, behind the crest of the slope, above the gathering gloom, the last light of day lingered on the peaks of Ta-wah-be-de-e-wad-so and Mo-zo-e-wadso, the loftiest mountains of the region. Nigh here I was told the Winooskitook emptied, which our people called the French River, because the French and their Indian scoundrel allies used it so much as a road to our settlements. A little beyond, the Wintook, or Narrow River, empties, and still further, almost at the end of the lake whither we were going, the Azzabattacook, the stream that turns upon itself. We call it Missisquoi River, but that name, or, rather, Missapski, the Sound of Arrow Flints, belongs to the country, not the river. When I remember how the savage solitude which, like a spell that would never be broken, then lay upon the shores, whose only peace was that of desertion, and behold now what the hand of civilization has wrought, it is all like a dream till I see how swift the changes still go on.

Two fine, large rivers enter the lake from the great western wilderness, named Popoquamanatook and Sen-halenatook, the last entering near the great Cape Scanton; but we went nigh neither, keeping nearest the eastern shore. Often we came upon such countless swarms of waterfowl that were loth to take flight when our boats ran into the midst of them as was a sore vexation to the heart of one who loved fowling not to have a shot at them. Every day we saw deer, and once a mighty moose, so close that the fingers of many a hunter itched for the trigger; but we were not permitted to fire a shot save for necessity.

We passed the islands which the French call the Isles of the Four Winds, and the Grand Isle, coming to parts very unknown to most except our guides, who were trappers that had run all risks in the wilderness for the sake of gain, and some Stockbridge Indians, who had been here in war parties against the Waubanakee; but our voyage continued very propitious till the tenth day out from Crown Point. We were encamped for the day, having our boats hidden and keeping very close, for we were now fairly in the enemy's country, though not beyond the rightful possessions of the King. We saw smoke on shores not far distant, which we knew must be from the camps of French or Indians. We were galloped in close ranks, waiting a distribution of powder, a keg of which was being brought up from one of the boats by a careless fellow, who did not know that it was leaking out a thin dribble of its dangerous contents along the earth. Another fellow, as thoughtless, observing it, rapped out the fire of his pipe on to the chance-laid

train. A sudden sparkling flame flashed along it, leaped up the dropping grains to the keg, and then came a terrific explosion, that hurled the ranked men far asunder, scorched and maimed, some writhing and groaning in torment, some past speech or motion, full forty in all, too badly hurt to go further.

We were in great consternation from the disaster, not only from the injury done to so many good men and the weakening of our force, but that the great noise of it and the singular cloud of smoke arising from it must apprise the enemy of our presence if they were in our neighborhood. One might fancy Wajahose had taken his revenge on us. The disabled men were sent back to Crown Point under such guard as could be spared, and at nightfall we went on our way.

Five days later we came to the end of our voyage at the head of Missisquoi Bay, and secreted our boats very cunningly where they, with the provisions, were left in charge of two Stockbridge Indians. The object of the expedition was now well known to all. In the first light of morning we set forth in good spirits on our long march through the forest, some animated by the love of adventure, some by the desire for revenge, and others as much by the hope of plunder, for it was thought that these Indians had gathered a deal of spoils in their raids on our settlements. Continuing our march while daylight lasted, we encamped on high ground if possible, the better to prevent surprise, and half the force was kept awake while the other half slept. As early as we could see our way, the march was resumed, always in three single files at some distance apart, and the file in very open order, with scouts in advance and on either flank. Looking across from rank to rank, as each moved silently forward, it was as if we saw our shadows cast by a level light on an impalpable screen, through which were seen the gray trunks fading away in the continual twilight or gloom of the forest.

At our second night's encampment the two Indian boat guards came up with us, bearing ill news. The boats and provisions had been discovered and taken by the enemy, and a party of French and Indians twice our number were seen in pursuit of us. Our commander promptly decided to push forward with all speed, and strike the contemplated blow before our pursuers could overtake us, and then withdraw by another route to some point on the Connecticut. He then dispatched a trusty lieutenant with a small guard to Crown Point, to request that stores should be sent up the river to meet us. Now, we were afoot still earlier than before, and at night halted later, after traveling all day at the topmost speed possible on such difficult ground as we presently came to. This was an immense spruce swamp or drowned land, for the water was often to our knees; and we slipped and stumbled on unseen roots and fallen trees through lengthening miles of weariness and discomfort, to come at night only to such rest as we could get on platforms that we built of boughs laid on forked stakes above the water and sodden ground. Surely it seemed we could not be in more wretched plight; yet there was worse in store for us, which, if we had foreseen, we could not have had heart to endure this.

As it was, some had already lost heart, among them my old first comrade in arms, Murphy, and strange enough it was, for he was always so glum, it seemed that there could be nothing to make him more so. One night we were sharing the misery of wet clothes in the chill night air on a couch of poles and boughs, when he began talking in a melancholy fashion:

"Oh, mon, we'll ne'er set eyes on the civilized world again. We'll a' be drowned or murdered an' scalped by yon Indian devils. 'Twas an ill day that iver we came on this wild goose chase, like geese oursel's, a-paddlin' through the puddles just to be scalpit. We'll ne'er see yon fort again, mon, I'm sure. Wal, maybe some on ye will, but it'll not be me. I feel it in my ackin' bones, an' I'm a-thinkin' o' a' I ever done, gude an' bad, an', the Lord forgive, the's a muckle deal the maist o' the last. I'll be murdered and scalpit if I'm not drowned first like a bitch's whelp, in these domned quagmires, an' it's a shame to me after all the bonny fightin' I have done. De'il tak' this warrin' wi' heathen; there's nather profit nor glory in it. I thought we'd gather some gear o' yon Indian wolves, but they'll just get my scalp, an' that'll be all about it."

He fell to smoking his pipe as if he would get all the comfort he could while he might, listening in silence to my arguments against his forebodings till he knocked out the ashes that dropped hissing into the water beneath us, and then, expressing himself unconvinced in a grunt, went to sleep.

Presently I followed him, for I was tired enough to have slept a-standing. I do not know how far the night was spent, when I awoke with a start, hearing my name called in Mercy's voice, as plain as ever I heard it in my life, yet in a very mournful tone, as if in warning, or for help. It was so real that before I was awake I sprang off the pole hammock, half to my knees in the cold water and stood listening agape with held breath, to hear nothing but the restless movements of my comrades and the dismal hooting of an owl afar off. When, after a time, I fell into an uneasy sleep I was again awakened by the voice calling my name, and so thrice that night it was repeated. It haunted me all the next day as we splashed and stumbled on through that wretched swamp, till I was as heavy hearted as poor Murphy, with forebodings of our fate, but at last we came to higher ground, out of the black shadows of the spruces and with gleams of sunshine falling upon us through the brightness of autumn leaves, and my spirits rose. This was when we came to the St. Francis River, after nine days of swamp travel.

The stream was five feet deep, and running very swiftly, so that to ford it we formed in lines abreast, joining hands with the tallest man upstream, and so waded across without loss, except some guns, most of which were recovered by our Stockbridge Indians, who could dive like muskrats.

Not long after this, we got the good news that we were near the end of our journey outward, for our commander, mounting a lofty tree, discovered the Indian town not many miles away. When we were come within a mile of the place after nightfall, Major Rogers and two officers disguised to such likeness of Indians as to fool many of us, went on a spying tour into the

village, and could not have hit on a better time, for it happened that the people were gathered to celebrate some pagan festival, and making such a pother with drums, rattles and shouting that a troop of horse might have ridden in on them unheard. Returning to us after gaining complete information of all the approaches, our commander laid his plan of attack, to be made from all sides in the very early morning when the Indians were in deep sleep after pow-wow.

Natural History.

An Outing in Acadia.—IX.

BY EDWARD A. SAMUELS.

(Continued from page 145)

FROM the hill we descended to the meadows, where the Doctor collected a few aquatic plants, which he said were quite rare in a locality so far north of their usual habitat. "How could they have found their way here?" I asked, examining the specimens with interest.

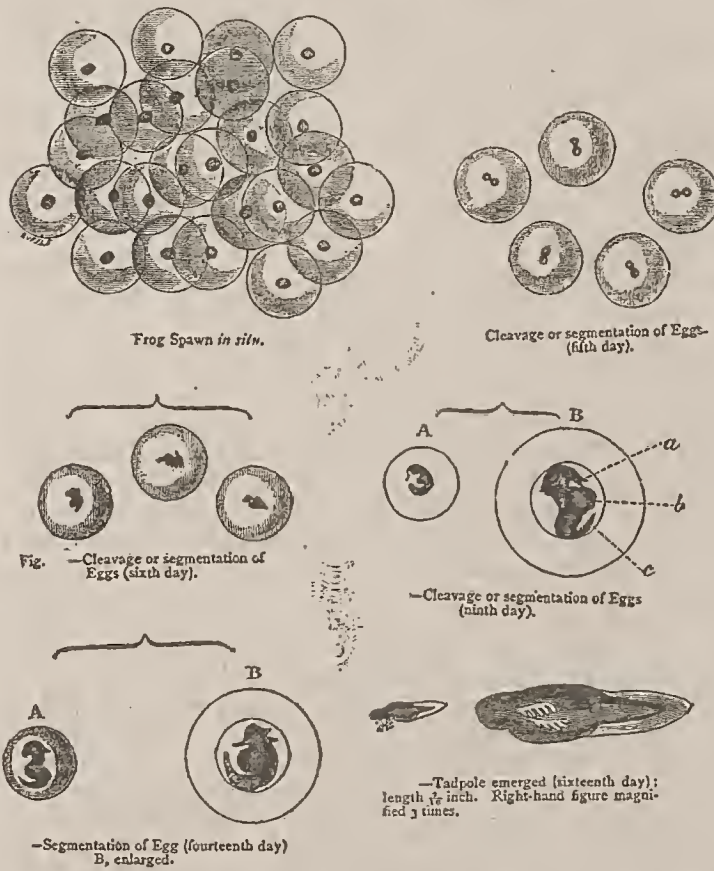

"Probably they were brought here by the birds. You remember that I tried to throw a little light on this subject yesterday, when the heron joined us at the falls?"

"Yes, I have not forgotten what you said, and these plants were, no doubt, brought here by the birds, perhaps long ago, since they are now so abundant, but I should think the severe winters here would kill them."

"Not necessarily; the seeds fall into the mud beneath the water, where they lie, effectually protected, through the winter. It has been proved, however, that most seeds are not injured by even the most intense cold, and these have thus become thoroughly acclimated."

"As you have a microscope, we might carry some of this mud back to the house and perhaps make some interesting discoveries."

A strip of the bark was soon cut in the proper form and the two corners of one end were folded together and firmly affixed in the end of a sapling, which the Doctor split to receive them. This made a capital scoop. The birch cup was quietly sunk into the mud and then lifted out for our inspection. There was a myriad of wiggling

things; the mud seemed alive with them. There was a triton squirming in the mud, a tadpole and water insects without number.

"There seems to be an abundance of life in this deposit," said the Doctor, "and here is an interesting specimen with which we can begin our investigations."

The little creature crawled around on the Doctor's hand, but made no effort to escape. It was one of the many-spotted newts, sometimes called tritons, or salamanders, and its beautifully marked brown and vermilion coat, dotted with yellow and reddish spots, made it an attractive-looking object.

The species is a common one in Northern and Eastern waters, where it feeds on aquatic insects and their larvæ. In the aquarium it makes an interesting little pet, becoming acquainted with one very quickly and accepting flies and other insects when offered it on the point of a grass stalk. I have frequently captured specimens and given them a home in my aquarium, where they afforded good opportunities for studying their habits.

In the tank their antics are often very grotesque and amusing. Sometimes they sit erect at the bottom, where they watch for their insect food. After a while they move midway between the bottom and the surface, where they remain almost motionless for a short time or keep their position by "treading water." Suddenly, as if seized with a new desire, they dash rapidly about in every direction, acting as if they were determined to make a wild break for liberty. Their favorite food is a small angleworm, and when one is captured it is seized with a quick snap of the jaws and swallowed by a series of snaps and gulps quite comical to witness.

"I have often wondered, Doctor," said I to my friend, who was examining the newt as it moved slowly about on his hand, "how these little creatures breathe in the water; they evidently need atmospheric air to maintain life."

"They come to the surface for air, but the young or tadpole newt has gills, and with these it breathes in the water just as the tadpole of the common frog does."

"But this tadpole has no gills," I added, turning over the little squirmer that wriggled about in the bark dish.

"No, it is too old for that; it has passed the gill-breathing period, for the hind legs are perfectly developed and

the forelegs are just coming through the skin. In a short time the tail will be completely absorbed and the frog in its perfect shape will appear. In fact, this tadpole should have become a frog long ago. I cannot imagine why it is so late in changing its form."

The metamorphoses of the frogs and newts are very interesting, and are well worth the attention of students and observers. The spawn of the frog is often found in pools of fresh water, being deposited in masses or clusters which are glued together by the albuminous covering that surrounds them; if we lift one of these masses we find it is astonishingly heavy. The deposit of frog's spawn may readily be distinguished from that of the toad, which, although often dropped in the same pool, instead of being arranged in lumps or masses, is strung along, two or three at a time, on a sort of gelatine rope.

If we closely examine the newly deposited spawn of the frog we find that each ovum forms a central black speck about one-twelfth of an inch in diameter in a transparent, albuminous globule, nearly half an inch in diameter, which is covered by a delicate membrane. For the purpose of

—Dorsal aspect of Tadpole, nat. size and magnified (seventeenth day). In this figure and *a* shows external gills; *b*, nostril; *c*, rudimentary mouth having rapid ciliary action.

—Dorsal aspect of Tadpole (twentieth day) magnified; *d*, first appearance of membranous sheath through which the posterior limbs protrude.

studying these ova, we can keep a dozen or two of them in a shallow vessel containing water, in which must be placed a liberal supply of aquatic plants, which would be likely to afford the tadpoles a sufficiency of infusoria, upon which they seem to subsist to a considerable extent after devouring the gelatinous egg mass which appears to form their first food. They are thorough scavengers, and any decaying matter, either animal or vegetable, is eagerly eaten. We find that the ovum changes but little until the fifth day, when a cleavage or segmentation becomes apparent.

The progress of this segmentation from now on may be easily followed, and it is very interesting. On the ninth day a striking change is manifest; the embryo assumes the form shown in the illustration, where A represents the natural size of ovum and B the same magnified four diameters; at *a* are the rudimentary external gills; the inner circlet *b*, surrounding the embryo, is the vitelline sac or zona pellucida, itself an object of singular tenuity and crystalline transparency, and at *c* is the protruding tail.

A change is now perceptible daily; the gills and tail grow rapidly, and the nostril becomes conspicuous, and on the fifteenth day some of the tadpoles will emerge and lie upon the gelatinous egg mass, upon which they continue to rest until it is completely eaten by them. Fig. 7 represents the appearance of a tadpole after emergence, its length being seven-sixteenths of an inch.

On the seventeenth day the nostrils, *b*, Fig. 8, are well developed, and a rapid ciliary action is apparent at the immature mouth, *c*, from which the water is driven backward in a current to the gills. On the twentieth day the gills extend almost to the tail, and the membranous sheaths, through which the posterior limbs protrude, are plainly visible, Fig. 9, *d*.

The changes in the structure of the tadpole are many; the anterior limbs are elbowed out beneath the gill coverings, and the posterior ones become more and more perfect; the tails grows longer and thinner, and finally it is absorbed, together with the lips and secondary gills, and the body assumes the perfect frog shape. This usually occurs at about the one-hundredth day, if the weather is bright and warm. The foregoing illustrations are reproductions of drawings made by M. H. Robson, the eminent English microscopist.

Unlike the spawn of the frog, the eggs of the newt or spotted salamander are laid singly, each being deposited in the fold of a water plant, which is bent by the female to receive it.

Mr. James Fullagar, who saw a female newt deposit her eggs in his aquarium, describes the operation as follows:

"The laying of the egg is a curious operation to witness, as each egg is laid singly, and is folded in a leaf. They are laid at intervals during a month or five weeks, so that I have had the young of all ages and sizes, from those just escaping from the egg to a month old. When about to lay an egg, the newt would examine several leaves before she found one to suit her. In some cases the leaf was too stout for her to bend with ease, and after vainly trying to fold it, she would leave off, and for this reason the leaf of the water-ranunculus, being large and easy to fold, was most used. The manner of operation was this: After examining several leaves, and making choice of a suitable one, she would place that part of her body whence the egg was about to protrude on the leaf, and with her hind legs fold the leaf over and around that part in such a manner as to enable her to receive the egg into the leaf between the two legs, the body being bent forward for that purpose. As soon as the egg is deposited, the body is slightly raised from it, to give room for the further and complete folding of it in the leaf, and is then held in that position for about three minutes, to insure its firm adhesion to the leaf. The newt then swims

away. I have sometimes seen her return to the recently laid egg, and, as if not satisfied that all was as it should be, she would take the folded leaf, together with the inclosed egg, into her mouth and press it gently to make sure it was in a proper and safe position.

The eggs of the newt are oval in shape and transparent, so that the nucleus of the egg is plainly seen, and the development of the germ may be witnessed day by day. Fig. 11 shows the newly deposited egg enfolded in a leaf of a water plant at 1, the embryo just beginning to take form at 2, the same more developed at 3, and the embryo still further advanced and showing the branchial

tufts at 4 a, b, c, d. The continued development is shown in Figs. 12, 13, 14 and 15, all of which are greatly enlarged.

In commenting on the difference in the metamorphoses of the frogs and tritons, or newts, a correspondent* of a scientific journal in summing them up says:

"Thus we have in the frog an animal furnished with three sets of breathing apparatus, four legs, and a tail at different stages of its existence. 1st, external gills as a tadpole; 2d, internal gills like a fish; 3d, lungs adapted for breathing air. The gills and tail, no longer needed for aquatic existence, are absorbed, not lost; the animal steps out of the water a true lung-breathing vertebrate. Next come the tritons, with external gills for three months instead of three days; lungs appear, and the four legs and tail are retained throughout life. The animal is amphibious, living mostly in the water, but dies for want

of breath if kept there, and prevented from coming to the surface to breathe. Next below comes a curious animal, the American axolotl (*Siredon pisciformis*), shining like a huge, black tadpole 12 or 14 inches long, with four legs, a tail and a set of external gills, which are retained throughout the whole of its existence. For some time it was supposed to be merely the tadpole, or larval form of some terrestrial animal, but I believe it is never known to leave the water voluntarily, and breeds freely in this condition, laying quantities of eggs, which are easily reared. Strange to say, although it never breathes by anything but gills, it has rudimentary lungs. This tendency to variation, and shadowing forth of higher forms, side by side with persistent types, is intensely interesting, as forming links in Darwin's endless chain of evolution."

The newts, both the young and those which are fully grown, change their skins, occasionally the old one coming off like a glove from one's hand; usually it comes away in fragments, although sometimes it peels off in one entire piece. Those who have had these little creatures in their aquaria have no doubt witnessed this casting of the skin and know how interesting a performance it is, particularly when the skin has got down to the hind legs and the newt pulling one foot and then the other out of the covering seizes the thin garment in its mouth and swallows it with two or three gasping gulps.

*Anonymous.

Hawk and Crows.

KINSTON, N. C., Oct. 20.—*Editor Forest and Stream:* My friend, I. M. Tull, proprietor of Tower Hill Dairy Farm, reports a singular incident which he observed yesterday. While squirrel hunting in the woods of the river bottom, he shot and killed a crow, which, in falling from the tree top, lodged in a grape vine which festooned the tree. It was a long shot, about 200 yards; and other crows near by not being alarmed by the shot, Mr. Tull waited quietly where he was for another chance. Very soon another crow pitched into the treetop and was also killed, falling to the ground.

In a few minutes a hawk came and seized the dead crow in the grape vines, but was followed by a flock of crows searching for him. He hid under the wings of the dead crow until the other crows left the neighborhood, when he emerged from his hiding place, took the dead crow in his talons and bore it to a stump about 300 yards away and proceeded to make a meal from it. Mr. Tull then crept up on the hawk and killed him.

This makes an interesting little yarn; in my estimation, more so by reason of the fact that the narrator is trustworthy. TAR HEEL.

Seaboard Air Line.—VI.

Report to November, 1901.

Now had the season returned, when the nights grow colder and longer,

And the retreating sun the sign of the scorpion enters.

Birds of passage sailed through the leaden air, from the ice-bound, Desolate Northern bays to the shores of tropical islands.

—Longfellow.

A FEW nights since, about 10:30 P. M., while the moonlight was drawing clear-cut shadows of the trees and shrubbery upon the grass, as it lay glistening under the heavy dew, I heard the signal Honk! Honk—"down brakes"—from a party of Canadas coming down at top speed through the northern skies. Honk! Honk! My, how they were coming along. I had to stop to hear them, for I could not, of course, see them. But why signal "down brakes"? Why slacken speed? Wait; I'll tell you presently. Now, I essay to give them a passing welcome, Ar-ronk! Ar-ronk!—how it made my bronchial tubes ache, so unfamiliar has the language become to me of late. Mortifying silence was the result of my first hail. I knew they were almost overhead; my sense of their speed and direction told me that, but not even the soft W-ish! W-ish! of those great wings that annihilate space, and were even now driving them so swiftly on, came to me. Once more I hailed. Maybe it was a something of appeal in this second effort that compelled recognition—indeed, I did feel a bit badly over the deadly quiet that reigned above—for suddenly a ringing chorus made reply. Honk! Honk! A-ronk! Honk! Aronk! as though they said, "Why! Why! there's the old man again, boys." You had better believe I talked with them after that, till they were beyond the reach of my voice, and then wished I had a megaphone to prolong the conversation. Wild geese are sociable creatures when they learn to know you; many a friendly chat I've held with the decoys in their coop just outside the cabin door on stormy nights spent on Champlain. They always grow restless and loquacious on stormy nights. To many their varying intonation conveys no meaning, but once learn to know them as some do, and you will soon find they will talk to you, and tell you things. "Old fool," did I hear you say? Well, as I have the last word, I will tell you if you think so, don't say so, for you really don't know whereof you speak. Hark! Honk! Honk! far to southward "down brakes" again. Now I'll tell you I've a notion those fellows intend to pass the night in Gravesend Bay, hence that signal. Sure enough! A day or so afterward an old bayman shouted as I passed, "Oh, say! I heard a gang of geese come in the other night 'bout 10 o'clock; they left ag'in 'fore daylight"—my friends, evidently. I meant to start right in on my Seaboard Air Line report, but as you see, I've taken you off on a veritable wild goose chase instead. Now I will get right down to subject matter and try to stay there.

Autumn travel has been very heavy all through these beautiful, rich-colored days. The lithe, feather-clad forms have been darting through the sunshine in throngs on their way south. Owing to prevailing high winds the flight by day has been at a lower level than usual, and it was interesting to see many of the small fellows hesitate at the open spaces—where they were sure to feel the full power of the blast—before crossing. When they did try it, it took a quick eye to distinguish them from falling leaves at times, so rudely were they driven by the buffeting winds. The variety in travel was much as usual, both as to numbers and species, with the exception of the flickers (*C. amatus*).

It was like old times to see them come bounding and clipping along in such numbers, and to hear their slogan thrill on the crisp, morning air. When their flight is on with us, a northwest wind over night will bring them in hordes next morning. If the breeze is moderate and steady, the flight is close along the shore line. If the breeze is heavy and steady, the flight is further inland. Each day's flight consists of two sections, the first about daylight, the second at between 8 and 9:30 A. M. If the breeze be steady as above, the birds pass along; there are but few left-overs for next day, but if the wind dies away, they scatter about the country for a few days, till the next favoring breeze bears them away. There are always two flights of these birds each autumn, that are markedly in excess of numbers as compared with their general flight. At times these occur within a few days of each other, again a week or two may intervene. What times some boys I used to know once had with wild pigeons and flickers hereabouts, in years gone by. The breezy, red sunrise in a carefully built blind, the swaying pole, the Wicker! Wicker! Wicker! as bird after bird alighted, then the proud feeling that came when one had mastered the art of stopping the bounding creature in full flight—it was no easy shot I can tell you, by the way. But I will not continue, lest some one take me to task for past transgressions. I learned the folly of indiscriminate slaughter early in life, and have always believed and worked for proper protection, though in those days we never heard the word as applied to birds. I know the foolishness of it all now, but somehow do you know we used to have awful bright sunrises then. The bean-shooter, a weapon never used against birds in my younger days, is now causing a very high death rate among them. When a flight of birds is on, and a diminishing wind scatters them as described above, you will find boys, aye, and full-grown men, prowling along the hedgerows, or squatted under the dogwoods, busily engaged in noiselessly potting the feeding migrants. Buckshot is used as ammunition, and it is wonderful how expert some of these beggars are, in knocking down their victims, or innocently pulverizing some chestnut burr when you appear unexpectedly and questioningly on the scene.

On Sept. 28, when Columbia was outside, busy with Shamrock, there came a time when both yachts, close hauled, were standing to the east almost abreast, and but a short space apart. Away they sped over the crinkling waters, under the bluest of skies, a great billow of white cloud floating high above them, when, Whirr! a huge flock of white-winged coots flashed by under the cloud, and apparently just above the topsails of the yachts. That, to me, was the finishing touch to a beautiful marine picture. In short, there is always something doing on the

Seaboard Air Line, and I trust that these chronicles it has been my privilege to make for a few seasons past will bear fruit in pleasure to some, who may be prompted to look and see for themselves what is passing almost at their own doors. WILMOT TOWNSEND.

The Fall of the Leaf.

ONE of the most interesting of the structural changes in the twigs of trees during the year is that which precedes and causes the fall of the leaf. The phenomenon which annually strips our deciduous trees is no more an indication of death and decay to the tree than is the annual shedding of its hair by an animal or of its skin by a snake. It is rather a result of development and a sign of life. The leaf which dies and falls is not an individual, but only an organ that has a temporary function to perform, and is got rid of when it has performed that function. When a leaf dies and does not fall, it may be assumed that the twig to which it is attached is itself dead, and that the death of the leaf is the consequence of the death of the twig. Every careful observer of trees must have noticed that twigs which have been injured or broken when in full leaf, and which remain hanging to the tree, retain their dead leaves permanently, and that it even requires the exercise of some force to detach such leaves from their twigs. It is well known that boughs and twigs gathered while in leaf do not lose their leaves, however long they may be kept after they are dead. To make the fall of the leaf an emblem of decay and death is of the nature of a blunder due to ignorance.

It may be remarked here that the leaves of all living trees fall sooner or later, and that the only difference between evergreen and what are known as deciduous trees is that, in the former case, the leaves remain on the tree more than one season, while in the latter case they fall at the end of their first and only season. Some evergreens retain their leaves two, some three, and some many seasons. Hence, though an evergreen is never without leaves, it loses every year a season's leaves. We owe to the microscope the discovery of the structural change which involves the natural fall of the leaf. When the leaf is first produced, it is an integral portion of the stem. There is a continuity, not only between the more delicate cellular structure of the stem and the leaf, but also between the fibro-vascular tissue of the two. Bundles or strings of this latter tissue pass out of the stem into the veins of the leaf, and when they are matured they possess a strength comparable to that of threads. It needs the exercise of some force to break a leaf from a twig in the summer time. If at that time a twig is gathered, it dies with the thread-like fibers connecting it with its leaves still intact, and the leaves die with the twig without detaching themselves from it. The leaves of the victor's laurel crown remain a part of the crown as long as the crown exists, whereas, had the laurel twigs not been plucked, the leaves would have fallen from them in the course of two or three seasons.

What the plant has to do in order to get rid of its leaves when they are no longer needed is to sever both the cellular tissue and the bundles of fibers that tie them to their twigs. As these bundles of fibers are also the channels through which much of the sap and of the various vegetable products pass into and out of the leaf, and as the cutting of the fibers is accompanied by a similar stoppage of absorption through the cellular tissue, it follows that the process necessarily starves and kills the leaf. [The beauty of autumn color in the foliage of trees and shrubs depends on this process, and similar results follow "ringing," or partial injury to the branches.—Ed.] One of the first stages of the process is the formation of a thin layer of cork cells between the base of the leaf stalk and the stem of the twig. At first this layer simply affects the soft, cellular tissue and leaves the vascular fibers intact. Cork cells are thin-walled, but impervious to water. Another stage in the process is the formation, outside of the layer of cork cells, of a layer of cells which gradually break away from each other and become merely round bodies lying side by side instead of forming a continuous tissue. The slightest force, perhaps the shrinkage of the leaf-stalk on account of the diminution of the supply of sap, will now break off the leaf.

But the fall of the leaf leaves a healed wound on the stem of the twig. Were all the leaf-cicatrices on a tree left unhealed, the tree would suffer seriously. But the broken ends of the vessels wither, and the cork layer already formed closes over them, covering the cicatrice with a coating of impervious cells sufficiently thick to prevent the passage of sap from within, and to protect the newly exposed parts from the frost and other injurious influences without. This protective process, subsequent to the exposure of the cicatrice, is not altogether peculiar to the phenomenon of the fall of the leaf; some similar process occurs after any accidental injury. What is special to the fall of the leaf is the anticipatory formation of an initial cork layer and of a dividing layer of disintegrating cells. This part of the process is somewhat analogous to the growth of a new skin on the snake previous to the casting off of the old one.—London Field.

More Grouse in Town.

SAYRE, Pa.—Mrs. Harding, of Chemung street, Waverly, N. Y., returned last week from a visit to find the 60-inch front window of the family residence broken and the premises invaded by an unexpected guest. Investigation disclosed a ruffed grouse reposing on the parlor carpet, dead, awaiting the eye of the cook and the simmer of the kettle.

A year or two ago a grouse flew through an open window of a residence located in this same neighborhood, passed through an open bedroom door and was later caught alive under the bed.

Should these manifestations of wild life continue to disturb the pulse beats of Waverly society it is expected that a number of Sayre sportsmen will purchase Waverly and the adjacent wilderness and convert it into a vast game preserve, from which politics and polecats will be rigidly excluded. M. CHILL.

EVBWEH

The Wild Pigeons.

JAMES MARLIN, of Bloomington, Ind., writes to the Springfield Republican about the absence from that region of the countless flocks of pigeons that formerly frequented the woods there in the late fall and early spring. Every one who is forty years old, he says, "remembers to have seen millions of them, while no person less than twenty-five years of age has ever seen a single bird. When I say millions, I speak deliberately. In 1855 I saw a single flight of these birds that must have numbered many millions. Densely covering the whole sky as far as the horizon either way, they flew straight east for fifteen minutes by the clock. My father made a record of the occurrence on the fly leaf of a little book that I still have in my possession. Allowing the very moderate estimate of two pigeons to the square rod, this flight must have contained 9,000,000 or 10,000,000. On two occasions that I remember they had roosting places in this vicinity. They also made nests in the same place, and so numerous were the birds and the nests that many large branches were broken from the trees by the weight. Hundreds of acres of woods were literally crowded by these vast communities. Now, I am not at all surprised that these birds are less numerous than formerly, but why have they so suddenly and so completely disappeared? I regret their departure. To me they are one of the lost glories of an abundant land. I should be glad to learn from any of your readers who can tell where they are now, if they exist at all, and why they have so utterly passed away from their old haunts. Were they known in New England as they were in the West? And have they as completely disappeared?"

What Mr. Marlin says of the absence of pigeons in Indiana is true of this section of New England. Up to about forty years ago pigeons were numerous in this region. They came quite early in the fall and remained until about the middle of October. Sometimes they were here in the spring also. Many were caught in nets and many more were shot by hunters. The writer was one of two hunters who shot sixty-two pigeons in one day in the oak woods of Augustus Clapp, just east of Meadow Park. It was not uncommon for a hunter to shoot one or two dozen in a day's hunting. They came here in flocks of several hundred and fed largely upon acorns. A hundred flocks a day were sometimes seen. In late years they have wholly disappeared. Where they have gone to no one knows; nor does any one know why they have gone. There is the same variety of food for them here now as formerly. Perhaps they will appear here again.—Hampshire Gazette, Northampton, Mass.

Snake Swallowing Young.

WINSLOW, Ark., Oct. 21.—FOREST AND STREAM of Oct. 19 contains an article in which one of a party of Missouri sports tells a snake story, in which he says he saw ninety-nine little cottonmouth snakes run from the mouth of an old one he killed. Now, I take it that this is meant as a joke; but I can tell a true snake story in which this kind of thing did actually occur. During my boyhood days I attended school at the old Cranford school-house, near my home, on the west fork of White River, near where Brentwood now is on the St. Louis & San Francisco Railroad. One day I was going down a hill to the creek, when, some 30 feet from the water's edge, I saw lying in the sun on a ledge of large rocks a snake, and around it were quite a number of small ones. I picked up a stone and threw it at the large snake, when, to my utter astonishment, the small snakes began to run into the mouth of the large one, and soon were all gone. I called some other boys, and we killed the large snake and cut it into two pieces, when the small ones, seventeen in number, rolled out on the ground, and we killed them. They were about 6 inches long, of a dark brown color, the same as the large one, which was a rusty black or brown, and between 4 and 5 feet long.

My father once killed a rattlesnake in a log near the same place, and found it filled with small snakes, which were as lively as they could be; but he did not see them enter the snake. But I saw the ones I killed crawl into the mouth of the large snake, and killed them all. I have told this to a number of people, who looked at me in the most incredulous manner, and refused to believe my snake story, but it is true in every particular.

J. E. LONDON.

A Word from the Philippines.

MANILA, P. I., Sept. 8.—Greeting from "the uttermost parts of the earth." Have missed my copies of FOREST AND STREAM of late. My first mail just received. Latest letter from home dated July 26. Pacific Ocean several sizes too large for my purposes. Came via Honolulu, Yokohama and other Japanese ports (300-mile journey by rail overland). Shanghai and Hong Kong. Very hot and moist here. Great experiment going on. My book on the Philippine question not yet ready for the press, and I've been here over a week! Have hoped to get time to send you some notes, but have not found it, and really haven't seen very much that was very noteworthy from a strictly FOREST AND STREAM point of view. Will send you something later. Hope to get away for home in a few weeks and to get my "back numbers."

C. H. AMES.

In England, Wales, Ireland and Scotland fox hunting is carried on through the medium of close upon 200 packs, and there are very few acres in rural England whereon the fox is not hunted. Where miles and miles of grass and small coverts are found, thither do strangers congregate to enjoy the best of riding and the best of companionship; and where houses are few and far between, the country given over to the plough, or where great, rolling hills exist, there we also find fox hunting, though the fields be recruited solely from residents. In the Lake country, where hounds are necessarily followed on foot, men, and ladies, too, walk and run all day rather than not hunt at all; while in Devon and Cornwall, where formidable banks are found, on downland, and in all sorts of countries which would not be to the liking of the grass-fed man, are keen masters, capable huntsmen and hunting enthusiasts generally.—London Field.

Treed by a Moose.

"Now for a story! Come, you can't get out of it; no use in trying!"

"Say, were you ever scared in the woods—lost, chased by wolves, treed by an old bull moose?—anything, as long as it is one of your stories."

And there I sat, completely cornered by a half-dozen rollicking hunters, as completely treed, I might say, as I was years previous up in a cedar, while an old bull moose pranced and pawed at its base.

We were a jolly lot that evening as we sat about the blazing fire and related our day's doings, and as I was by far the oldest, both in years and in woods life, I was very courteously assigned the seat of honor, which consisted of the best chair that the camp afforded, placed in the center of the group.

"Now you gaze right into that fire and think and think and think! It will come, all right. Don't bother him, boys!"

Was I ever scared in the woods? Oh, yes! Was I ever lost? No! But I have found lost men, and judging by their appearance I was always perfectly willing that they should be the ones so bewildered.

Was I ever chased by wolves? No. But thirty years ago, away up on Wadleigh Brook, I was in a crew of lumbermen, when the boss, as he returned from visiting a neighboring camp one evening, was startled by hearing something in the road behind him. Quickly turning, he saw two wolves. The instant he stopped they stopped, and began to howl. Poor John! He thought discretion was the better part of valor, and immediately began to sprint; and from his appearance when he reached camp—hatless, coatless and trembling—we came to the conclusion that the inside of the camp with the door well barred was the proper place for us.

Was I ever treed by an old bull moose? There, now, boys; you've struck a story, for sure, for I've not only been treed by an old bull moose, but I've had my right of way through the trackless forest disputed by an old cow moose. Gee whiz! I can see that old bull even now as he faced me with mane erect and his little, pig-like eyes glaring at me. Was I scared? Somewhat! You see, it happened this way:

It was late in October, and I had a line of traps over on the Allegash. The trapping was good, but the hunting was poor, and we needed fresh meat badly. Many of my traps I visited by canoe, as they were in the little brooks and streams running into Allegash Lake.

Quietly paddling along one day "to look" my traps, I saw an enormous old bull moose standing on the edge of the lake, almost knee deep in the water, among the lily-pads. Every now and then he would move his immense head, surmounted by a set of superb antlers, slowly from side to side, and gaze about him, looking for some hidden foe. Occasionally he would plunge his head into the water and throw quantities of it over his back and shoulders. Apparently he was watching the woods, and did not expect any trouble might possibly come from the water. As soon as I was within shooting distance, my rifle was at my face and at work. Spat! spat! spat! and the old fellow wheeled and was out of sight. Paddling my canoe as quickly as possible to the shore, I soon found his tracks, with now and then a drop of blood.

Drawing my canoe out, I was soon on the trail of the moose. A quarter of a mile from the lake there he stood in his grandeur, made terrible by his wounds and my approach. He had wheeled, and was watching his back tracks and anticipating my appearance.

Ugly? He was a perfect demon in appearance as he stood there with lowered head, forelegs well apart, and anxious for the charge. One look at the old fellow was all that I wanted. A hasty sight along the rifle barrel at his chest, and I pulled the trigger.

Well, boys, when I come to die I hope that I shan't be as scared as I was then, for there was no report, only the dull click of the hammer upon the firing pin, and I found that I had not another cartridge about me.

He seemed to realize my predicament, for with a rush he was at me. I was young and nimble then, and of all the tree shinning that you ever saw the greatest was done that day. Up into a cedar I went, and sat there in the lower branches, looking at His Lordship. His Lordship returned the compliment.

It was easy enough for me to see that he was hard hit, and that it would be a question of only a short time before he bled to death.

When I was thoroughly assured of my safety I laughed long and loud. There I sat in that tree like a monkey, absolutely helpless. Fifteen minutes of this tree business and His Majesty lay down, never to rise again. Quietly he laid his noble head on the beautiful green moss, and with a sigh almost human he breathed his last.

Well, boys, it taught me a lesson, and whenever I've hunted since I've been pretty fussy about the number of cartridges I started from camp with.

Guess I'll turn in now. Good-night.

"No you don't! Here, now! Tell us about that cow moose."

Oh, yes! But I am afraid I am getting tedious. You know what Thoreau says: "I should not talk so much about myself if there were anybody else whom I knew so well." So you must excuse the oft-repeated "I."

Our camp was ten miles from a post-office, and it was one day decided that I ought to go out after the mail. With my natural aptitude for cruising through the woods instead of following the road around I proposed to take a bee line over the mountains, and thus save miles of travel. Starting at break of day with luncheon and axe, I was soon on my course. It was a beautiful, clear day in June, and I stopped for a rest on the summit of the mountain. Never shall I forget the view I enjoyed that day. To the west were plainly to be seen the White Mountains; to the north, grand old Katahdin; to the

south and east, the Mount Desett hills—one vast panorama of mountains, lakes and streams, as far as the eye could reach. But this is not going for the mail, I soliloquized, and reluctantly resumed my journey.

I had proceeded but a short distance, when I caught sight, directly in my course, of Her Worship.

Now, one of the main characteristics of the feminine gender is fixedness of purpose, and some way or other this old cow moose decided that my rights on that hill were limited, and no persuasion of mine would budge her, not a little bit. I halloed, I threw rocks, all to no purpose. I beat about that mountain like a ship at sea with a head wind; every tack I made she headed me off, nor could I at all understand it. At last I had the extreme pleasure of seeing a calf moose spring from behind a blowdown and scamper down the mountain side. Instantly the mother left me for her offspring, nor was I at all sorry. She had feared for her calf, and had kept me from approaching it.

Of all things in this world, mother love is the grandest, the noblest, the most sacrificing and the most daring, be it in the human race or animal kingdom.

That old cow moose had daringly faced danger, even courted death, and willingly showed a spirit of self-sacrifice for her calf.

With a woods experience of thirty-one seasons, these are the only cases of animal pugnacity with which I have come in contact in Maine. The moose is the animal to be dreaded at certain seasons, and really the only one.

And now, boys, I've spun my yarns; let's turn in, and to-morrow night we'll enjoy another camp-fire, and some one else shall be the story-teller.

JOSEPH A. THOMPSON.

BANGOR, Me.

More Maine Manslaughters.

BOSTON, Oct. 25.—Cases of accidental shooting in the Maine woods are multiplying in a manner most appalling. To date there have been nine cases of accidental shooting—men for deer or birds. Five are dead and three seriously wounded. The dead are: John G. Weeks, Lewiston, mistaken for a deer while hunting near Jefferson; John G. Leonard, sixteen years old, of Frankfort, killed while hunting near that town by the accidental discharge of a shotgun in the hands of a companion; William Bowley, of Skowhegan, seventeen years old, mistaken for a deer while fishing near Moro, and shot by a couple of hunters going up the stream; Henry McPheters, forty years old, mistaken for a bear while gathering apples in an orchard not far from some lumber camps in Monson; Frank Ripley, aged forty-five, of Waite, accidentally shot while hunting near Brookton. The wounded are: Dana Levitt, twenty years old, shot while gunning at Bridgton by George Robinson. A charge of bird shot entered the abdomen. His condition is very critical. Eugene Wilson, of Jonesport, mistaken for a bear, wound not necessarily fatal; Daniel McInch, of De Wolf's Corner, mistaken for a deer while hunting near Calais; Edward Metcalf, of Rockport, mistaken for a deer while hunting deer near that town. The new law does not seem to have any effect in stopping these terrible fatalities. They are more than double what they were a year ago without the law. In most instances there seems to be a disinclination to enforce the new law. The men who do the shooting are most decidedly penitent, and regret what they have done more than anybody else. In only two or three cases have steps been taken toward enforcing the new law. The person who shot Wilson is under bonds for appearance at the next criminal court in Washington county; Leslie McPheters, who shot Henry McPheters, has been held for the February term of the Grand Jury at Dover. The story is out that the Maine Fish and Game Commissioners have been applied to for the enforcing of the law against accidental shooting, but that they do not think that it comes in their province. It is certain that the terrible danger from this accidental shooting is preventing both hunters and lumbermen going into the Maine woods. In one case where a hunting party has been planned by four or five merchants in this city, two of them have backed out decidedly; the risk is too great. A timber land owner told me yesterday that he had some prospecting to do, but did not dare to go into the woods. He started the other day, but hearing the crack of rifles, he came out of the woods and took the next train for home. It is a feature worth noting that so far the accidental shooting has been done by Maine gunners, and not by outside sportsmen accompanied by guides.

SPECIAL.

Editor Forest and Stream:

You have already reported the killing of William Bowley by a Houlton man, who mistook his hapless victim for a deer; but this report of the affair, as printed in a Bangor paper, should go on record:

William Bowley, of Skowhegan, was accidentally shot at Moro Sunday, on West Hastings Brook. The shooting was done by E. L. Vail, Esq., of this town. The affair is a particularly sad one, and was purely accidental. Mr. Vail is one of the most careful hunters of the country, and for fifteen years has been getting his share of game, and this is his first accident. The man was sitting with a companion in some long grass in the bed of the brook, which was nearly dry. He had on a slouch hat, turned up at the ends in such a manner as to represent perfectly a deer's ears.

As Mr. Vail and a friend came down the brook he saw the movement of the hat 100 yards away. Nothing more was visible. Not for a minute believing that a man would be sitting among the grass in the brook bed, and naturally thinking it was a deer standing in the long grass, he took aim and fired.

The bullet entered the right cheek of Bowley and lodged in the back of the head, killing him instantly. The dead man's companion jumped to his feet and cried out. Mr. Vail immediately rushed to the scene, and there his feelings are more easily imagined than described. Mr. Vail aroused the lumbering crew to which the dead man belonged, and did all he could do under the circumstances to hunt up the man's people.

W. W. Brown, foreman of the lumber crew, and the men employed, attach no serious blame to Mr. Vail. It is simply one of those inevitable accidents which follow the sporting season. Had the deceased been on the side of the bank instead of sitting in the long eel grass he would undoubtedly be alive to-day. Mr. Vail brought the dead man to the undertaker at Smyrna Mills, and is putting forth every effort to locate the man's relatives.

It is the most bare-faced attempt to shift the blame of shooting a man through sheer carelessness from the shooter to the man shot I ever read. In the first place, Mr. Vail was breaking the law in hunting on Sunday, and liable to a fine and loss of his gun if he shot it on that day. Next, it is about an impossibility to twist any hat

so as to look like a deer's ears. It is called an "inevitable accident," and Mr. Vail is spoken of as being so careful for fifteen years that this is his first accident. Just as if every hunter who did not kill a man in fifteen years was a model of carefulness. The law is that the one who shoots a man shall be punished. If the lumberman had shot the lawyer, there would at once be a demand for the law to be enforced, but it makes a great odds whose bull is gored. The law was passed to meet just such cases of sheer carelessness as this; but you will see that every means will be used to try to clear this man.

For some fifty years, when we had thousands of deer killed, we never knew of but one man being shot by accident. Now, for the last eight or ten years, from five to six or more are shot every year. I know of three being shot within the last twenty days, besides one wounded for a gray squirrel. In every case it is sheer carelessness.

I have barely escaped being shot by a man, who said he mistook my hat for a partridge. I was in plain sight from my waist up, with not a twig or weed in the way. I had spoken to the man, and called him by name, and he was not over thirty feet from me; and still I barely escaped being shot. Most men who have hunted much here have had several chances to be responsible for such "inevitable accidents" had they not been careful. I once had a chance to fire at the black head of an Indian who was sitting down digging roots. It showed just above a windfall every time he rose up. I could not see any ears or brown nose, and so kept creeping up till I was within ten feet before I could tell what it was. I once lost a deer by waiting to be sure, but I never fired at a man.

BANGOR.

Moose Hunting on the Tobique.

HAVING followed with a good deal of interest the discussion which has been going on in your paper for the last few weeks as to the best companion to take hunting, I concluded the proper one was one's wife, so on Sept. 10 my wife and I left Moncton, N. B., bound for the Tobique Valley after pleasure and the "king of the forest" and any other game we might have the good fortune to bag. Leaving Moncton at 2 P. M., our next stopping place was Fredericton, where we spent the night and found very comfortable quarters at the Queen Hotel. The following morning at an early hour we drove to St. Mary's, which is across the St. John River, taking the so-called express on the line of railway known as the Gibson Branch. The rate of speed was slow, and the cars were uncomfortable, but the country scenery and the country people always afford some amusement, so after four hours' rather tedious journey we arrived at Newburg Junction, where a stop of twenty minutes awaits the traveler, and a thoroughly good and substantial dinner is to be had. In due course we took another express on the Canadian Pacific, which is an improvement on the Gibson Branch; after an hour's ride we again left the train at Perth, taking still another branch line, which landed us about 6 o'clock at Plaster Rock, which ends the railway journey; the remainder is by carriage and canoe. Having made arrangements before with Mr. Weaver, of the Weaver Hotel, he met us at the station; after some delay in collecting our baggage, we drove to the hotel, two miles from the station, over a road which is a disgrace to the community, being both rough and dangerous. Arriving at the hotel, we were agreeably surprised, it being an exceptionally comfortable house, and Mr. Weaver did everything he could for us.

The following morning we boarded a large express wagon. There were eight of us, all bound for Riley Brook, twenty-six miles from Plaster Rock, en route to various hunting grounds. We drove the distance in four hours, which was fairly good time. From Riley Brook our destination took us seven miles further up the Tobique River to a supply lumber depot camp, known as the Forks, which we reached about 4 o'clock P. M. There we found our guides, Mr. Chas. Crimmen and David Edwards, of Scotch Lake, York county, N. B., and last, but not least, the cook, Fred Edwards, with three canoes.

For the convenience of sportsmen, I may add they can secure licenses from Mr. Miller, whose house is three miles from the Forks. We pitched tent that evening on the bank of the river, and after an early tea, which had all the flavor of an extensive dinner at home, and a short chat over the events of the day, we retired, as an early start was demanded by the guides, and, of course, we obeyed orders without a murmur. The morning start was not as early as the promises and conversation the evening before would lead one to believe, but we were on the move by 8 o'clock. We were three days going forty-seven miles up the river; the water was very low, and the canoes were poled and dragged a great part of the distance.

There are excellent camping grounds all along the banks of the river. On the morning of the third day, Sept. 15, we were at the entrance of Lake Nictaw, which is about three miles long and two miles wide. The morning was perfect, being fine and clear. It was with a feeling of thankfulness we felt the canoe gliding quietly through the water, after two days' dragging with, in many places, three inches of water. Arriving at the head of Nictaw Lake we had to be poled up a small brook about 300 yards, the land which divides Nictaw and Mud Lake, on which our "haven of rest," our log cabin and home for the next month, was situated. The cabin surpassed all our expectations; it was large (15 by 26), with a good stove, heavy, birch-bark roof, two large windows, standing 50 yards from the shore of Mud Lake, and surrounded by beautiful shade trees. We at once made ourselves at home. After everything was arranged I tried the lake for fishing, and was successful, getting five dozen nice trout. After that I kept the camp supplied with fish.

My wife hunted on Mud Lake; I took the deadwaters five miles on each side of the lake. On the morning of the 17th I saw a large bull moose, distant 200 yards. I fired three shots, missed first two, but the third hit him; he fell, apparently dead, but got up, fell again and up again, to fall on his knees a third time, and up and off before I could fill my magazine. My gun was a .30-30 Winchester, and, at that distance, unless you hit him in a vital spot, I am of the belief they are too small. It took me several days to get over my disappointment. A few

days later the guide, through excellent work and calling for three hours, got one out in the lake for my wife; she fired and missed. However, about a week after her first miss another came out into the lake, and this time she was more fortunate, killing him with one shot at 75 yards. The horns had a large spread, 48 inches, and were very long. To say she was justly proud hardly expresses it. I was still without a moose, and hunted continuously without success, until just two days before we were leaving, when I was fortunate enough to secure a fork-horn or two-year-old—a small but pretty head.

Before closing I would like to say a few good words for our guides, Crimmen and Edwards. We were with them for a month, and found them all attention and kindness from the first to the last day. In fact, I cannot too highly recommend them to any one who may intend visiting this land of the moose. We saw about twenty moose, cows and bulls, and one caribou, on the trip.

J. W. Y. SMITH.

MONCTON, N. B., Oct. 21.

A Strenuous Game Warden.

ST. PAUL, MINN.—*Editor Forest and Stream:* As a general proposition, nine out of ten sportsmen, if asked the definition of a game warden, would answer, one who holds down a soap box in the country cross roads store and draws his salary once a month.

Where and when he was most wanted there was he not to be found—as a rule, a sort of flesh and bones scarecrow, who did not scare.

We have much to boast of in this State, "Pillsbury's Best," turned out at the rate of 10,000 barrels a day in our suburbs; to wit, Minneapolis. Butter to go with it conceded to be as fine, if not finer, than any ever produced in either Orange county or Elgin.

Then comes our Minnesota pine, unfortunately being slaughtered at such a rate as to promise absolute denudation in a few years. Our Mesaba iron mines—the wonder of the mining world. Then our stock raisers, who are bold enough to claim precedence of quality over the choicest steers from far-off Wyoming. I think I read a few days ago in a New York paper of the excellence of the peaches grown in southern Minnesota. Peaches from a State popularly supposed to be somewhere near the North Pole and where the thermometer goes out of sight during the winter!

The above may be things to be proud of in their way, but we have another product we are more than proud of, and that is our State Game Warden—simply because he is a game protector who protects.

Quail is a bird that, unless he is potted in a bunch in the corner of a rail fence, is apt to thrive and multiply. And certainly that is just what the quail are doing, for of late they have been seen repeatedly in our city traversing our sidewalks and crossing our asphalted streets. In the residential district of the city they can be heard at break of day giving their peculiar "Co-hee! Co-hee!" so different from the "Bob-Bob-White!" of the early spring. Only this morning I was awakened at daybreak by the calling of a scattered flock of quail. It is unnecessary to recite how it took me away to the woods and fields and along the hedgerow as I listened for fifteen minutes to those scattered birds as they ran together. Naturally I ascribed this situation to the fact that in reality the quail and other game birds were plentiful because they had been protected.

And to cite the way Warden Samuel F. Fullerton works. Up at Heron Lake three market-hunters were slaughtering the ducks by day and by night and shipping them into Chicago as "squabs" or "young turkeys," etc.—all of which made them amenable to the law. Some one put Mr. Fullerton next. Instead of writing them a letter under the official seal of the State Game Warden, ordering them to desist, etc., Mr. Fullerton went himself *in propria persona*. He seized their game, their boats, their dogs, their tents, their provisions and their guns—five in number—and if I mistake not got them fined in the bargain. Now, if this be not strenuous game protection what is it? As long as Sam Fullerton holds his job as Game Warden will those three bold hunters ever patronize the sloughs of Minnesota again during the duck flight? I guess not. How many men can stand up against such game protection as this?

It was only a few weeks ago that this same Fullerton got next to a moose and deer tannery trust up in the northern Minnesota woods and cleaned it up in quick order. Black Friday could not have wiped out the market value of that trust stock any quicker than did Mr. Fullerton. There were moose and deer heads to the number of a score or more seized, and many hides undergoing the process of tanning were taken.

News of this kind travels far and wide, producing a wholesome effect. It will become generally understood that unlawful hunting in Minnesota is rife with much risk, so much so that the game actually becomes not worth the candle.

I am writing this article *pour encourager les autres*. If other States had more Fullertons, with the dog-gun-and-boat-collecting fever well developed, things in some localities would be different as regards the game. And yet when you sum the whole case up, it is simply the difference between doing one's duty and not doing it at all. So we'll close by saying that our game warden has very clear ideas as to what his duty is—and is doing it.

Another peculiar idea this Sam Fullerton has, is that it is against public policy to grant deer hunting licenses to minors with .30 smokeless rifles or any other kind of rifle. And perhaps Fullerton is right in preventing the young idea from shooting. It is evident that deer shooting has become recognized as dangerous to both man and beast—the hunted and the hunter.

CHARLES CRISTADORO.

THE following letter from Executive Agent Fullerton was written to Mr. Charles Cristadoro, who rightly considers it of general interest, and sends it to us for publication:

STATE OF MINNESOTA, Board of Game Commissioners, St. Paul, Oct. 22.—My Dear Cristadoro: The article that you have written in regard to deer is indeed very timely. This year no licenses will be issued to minors, which is all right as far as it goes; but you know as well

as I do that there are many adults who ought not to be allowed to pull a trigger. They are careless and rattle-headed, and they will shoot at anything that comes along—in fact, if they see a bush move, will come to the conclusion that it is a deer and fire at it. To have the crime of manslaughter held over their heads is not enough, they ought to be denied the privilege; but that, of course, is impossible as long as all are supposed to be created equal, and are equal under the law.

I just returned this morning from Heron Lake; perhaps you have seen something in regard to it in the papers. They tell me on good authority that over 12,000 prime canvasback ducks were shipped from Heron Lake and Lakfield last year,* and it was done openly, and when a man in St. Paul drew the attention of the Game and Fish Commission to it, the Executive Agent made the remark that it was very hard to enforce the law on Heron Lake, as over two-thirds of the lake is in Iowa. I thought it was a made-up story, but verified it on this trip, and it was vouched for by a man who I know would not tell an untruth. To give you an idea of the kind of ducks there, we seized forty-three canvasbacks, and they averaged over four pounds apiece. I understand they got from \$8 to \$12 a dozen for them in Chicago last year, depending altogether on the quality and weight of the ducks.

I assure you I appreciate your work in regard to game protection—you and the other men who take a deep interest in the matter. You don't know what a help it is to the Commission and what a help it is to the wardens who are trying to enforce these laws. The moral support is indeed a great help, and its value cannot be estimated.

Anything that comes under your observation in regard to any violations, I assure you we will esteem it a great favor if you will drop me a line or 'phone me.

Yours very truly,

SAM. F. FULLERTON.

*Another game warden under former State administration; Mr. Fullerton just went in this year.—C. S.

Incidents of a Hunter's Life.

MORGANTOWN, W. VA.—*Editor Forest and Stream:* A very small proportion of those who now take their outings in the woods, hunting, have had opportunity to know anything of the pleasure and gratification connected with the hunt, except from the standpoint of a sportsman, who hunts solely for pleasure. To the pioneer, who lived amid an abundance of game, and who had neither the opportunity nor the money to buy domestic meat, we can imagine a two-fold pleasure would come in his pursuit of game, feeling, as he would, that in the pursuit of that which was in itself a rare pleasure, he was performing a necessary part of his daily routine of life; and when successful in bringing down a choice animal, then especially would his gratification be two-fold. Being near his own home, where he could go out as the weather conditions were favorable, and could save and utilize every particle of his game, he could at the same time watch with interest and gratification the live game all around him, and know that it would be around when he needed more. At such times and amid such surroundings, game was killed at seasons of the year which would be unlawful under present conditions, but no persons are or have been more solicitous for the preservation of game than such as were dependent upon it to a great extent for their livelihood, killing only such as were not essential to their increase.

Roosevelt, in his "Wilderness Hunter," has fittingly said, "Hunting in the wilderness is, of all pastimes, the most attractive, and it is doubly so when not carried on merely as a pastime. * * * The fact that the hunter needs the game, both for its meat and for its hide, undoubtedly adds a zest to the pursuit."

When one goes out from his city home for a stay in the woods, especially a person of limited time, he feels, naturally, that his friends expect him to return with a good account of himself; and that he has much to accomplish, in a short time. In words, he says he does not care anything for the game he may kill, or whether he kills anything or not; that he does not expect to kill anything; that he only wants the benefit and pleasure of a camping trip; that he does not propose to hunt much—just to wander around in the woods and enjoy walking through nature's furnished parlors; but, after this has all been said aloud, with an air of indifference, away down deep in his heart he thinks to himself, "I must kill something which I can be proud to show to my friends. I only have a few days to be in the woods; I have merited this vacation by a year's hard work, and I must make it count; I must hustle." As he tramps through the woods, after the time for his stay is more than half gone, and has, as yet, been unsuccessful in killing anything, he catches only passing glimpses of the real beauty of his surroundings. He is tired; he sits down in some spot, beautiful in its rugged wildness, and tries to enjoy it; but not his ambition will not allow it; no animal life is in sight; each hour lessens his chance of getting the coveted game he so much desires to take home; he is up and off again, and comes in at night tired and discouraged; and each successive day of disappointment finds him more impatient and worn out, and thus less capable of success.

To be in the woods where other hunters are in the same vicinity, of whose presence we are made painfully aware by the occasional report of a gun, creates a feeling of uneasiness, both from the possible disturbance of game on our course, and the danger of stray bullets. To the real hunter, who has an inbred nature which longs for the woods and wild life, nothing but being away in the solitude of the wilderness absolutely alone, without the possibility of another hunter spoiling his opportunity, can fully satisfy.

Having hunted under all the various conditions, I have marked the difference.

Hunting on a tracking snow, where there is a hunter or more for every deer, we find a fresh trail, but instead of following with the proper caution, we are constantly thinking of some one else striking the trail ahead of us, and, in spite of ourselves, hurry just enough to spoil our chances of success.

On the other hand, when we get into a forest where

we know we are alone, and strike a fresh trail, with how much more deliberation and satisfaction we can follow it; taking time to observe every little detail of animal action, as we see it recorded on the snow, and thereby deriving the full and complete joy connected with the hunt, which is too often lost by over anxiety to kill.

At such a place, and amid such surroundings as the latter, it was my glorious privilege to have many a hunt.

Beginning about eighty rods above my cabin in the Rockies, and extending many miles up into the mountains, was an immense body of green timber, composed of steep mountain sides, sharp ridges, deep ravines, level flats, old beaver dams and swamps, and every variety which goes to constitute a good deer country, most of which was open timber and easily traveled.

For several years in succession it was my habit to go up into this green woods on the morning of the first tracking snow in the fall, for a deer hunt.

Leaving home at or before the break of day, I would be up in the best of hunting grounds about three miles, in time to find the game feeding; and never a fall did I miss getting one or more deer on the first day of snow-hunting; as they were seemingly more unwaried at that time, not having been disturbed from the fall before, and then very rarely, as I was about the only one who ever went there to hunt. In the fall of 1892 I went up there early one morning for my regular hunt on the first snow of the season.

As I was trailing a little bunch of deer quite early in the morning, about three miles from home, I heard a slight rustle in the brush, and a couple of very faint and muffled "thumps," across a ravine on the top of a ridge ahead; while it was so slight as to have been unnoticeable to one not familiar with such sounds, I knew well what it was. Crossing over I found what I expected—the snow ploughed up where they had made their big jumps. They started out along a steep mountain side, and I followed rapidly while keeping a sharp lookout, although it was the least of my expectations to see them short of a half hour or more.

My experience has been that if they are frightened by seeing or hearing a hunter, they are apt to stop at any time within a very short distance to investigate, while if they are startled by getting the scent, they put a good distance between themselves and their pursuers before they stop. I had gone but a very short distance when I saw a buck standing at about 60 yards, on the steep mountain side, directly above me, headed as if going back the opposite direction, and watching me.

In less than three seconds the .45-90 cracked, and the buck staggered a few steps down the hill and fell dead. After dressing it, I dragged it—or rather guided it and kept it from running over me and let it slide—about 100 yards down the hill to the bottom, where was a little flat along a stream of water, where it was easy of access with a horse, and there I hung it up on a tree.

He was a fine fat two-pronged buck, probably a two-year-old, and presented a picture, hanging there on a tree in the dark evergreen, snow-covered forest, which would make the heart of any hunter glad. To me the dark grey color of deer with back ground of snow composes a harmony of colors which cannot be equalled by any combination.

After feasting my eyes on the picture, I went to investigate how it all came about; I found this buck had left the others and walked back about 50 yards along the side of the mountain, and above their trail to watch for danger, and also found that there were left a doe and two fawns. They had gone on some distance from where he had turned back, and waited until the shot, and then started again on the run, as the tracks showed.

Circumstances made it necessary to leave the buck hanging there about a week before going after it; when I went after it late one evening with a pack-horse, I found one entire hind-quarter eaten out by martens, as their well-beaten paths showed, and at first I felt provoked; but it was only for a moment; I saw where the loss could be turned to good account. Hastily packing on the horse what was left of the buck, I made long and lively strides for home.

I wanted to set traps for the marten, and to insure success I must get my traps there that night.

Just a few minutes before sundown I got home with my deer; I put the saddle on a fresh horse, and taking two steel traps and some bait, started on a race against night. I set one trap at the root of the tree where the deer had hung, and another a few rods away, by the side of a log, and rode leisurely home in the dark, feeling a satisfaction and contentment peculiar in itself, and hard to define, but which certainly does not come in the ordinary walks of life, surrounded by a throng of people as most of us are.

The next morning on going back I found a marten in each of the traps which had the finest fur and brought the highest price of any I ever caught. I reset my traps but no more came; I have never known before nor have I since of marten coming so far down toward the settlements in that belt of timber. Thus does the following up and accomplishing of one pursuit, in the hunter's life as elsewhere, open up new opportunities for profit or pleasure, making even a life of solitude in the wilderness full of interest.

EMERSON CARNEY.

Pennsylvania Grouse and Other Game.

SAYRE, Pa.—Ruffed grouse are being found in plenty throughout all this northern Pennsylvania country. In fact, one can scarcely go amiss of good grouse country hereabouts. The same statement applies to much of the cover lying adjacent to the State line. Gray squirrels are not plentiful. Rabbits are in evidence everywhere.

Barring the illegal shooter, the quail season will disclose a fair supply of birds abroad the Chemung and Susquehanna bottom lands.

Wild geese are moving south by easy stages. Ducks are furnishing some fair shooting on Cayuga and Montsumma marshes, but the best shooting on these birds is destined to come later on.

M. CHILL.

English Pheasants and Farmers.

AMAGANSETT, N. Y., Oct. 25.—*Editor Forest and Stream:* Most farmers are beginning to see the value of birds to protect the crops, yet there are some in this neighborhood who insist that the English pheasant, which our Amagansett Sporting Club let go, do more injury than good. I would like to read in your paper an article on this subject.

DIMON CONKLIN, Sec'y.

We quote as the best information on the subject the following paragraphs from W. B. Tegetmeier's work, "Pheasants; Their Natural History and Practical Management":

Like the domestic fowl, which it closely resembles in its internal structure and its habits, the pheasant is an omnivorous feeder; grain, herbage, roots, berries and other small fruits, insects, acorns, beech mast, are alike acceptable to it. Naumann gives the following detailed description of its dietary on the Continent: "Its food consists of grain, seeds, fruits and berries, with green herbs, insects and worms, varying with the time of year. Ants, and particularly their larvæ, are a favorite food, the latter forming the chief support of the young. It also eats many green weeds, the tender shoots of grass, cabbage, young clover, wild cress, pimpinell, young peas, etc. Of berries: the wild mezeureum, wild strawberries, currants, elder-berries from the species *Sambucus racemosa*, *S. nigra* and *S. ebulus*; blackberries, mistletoe, hawthorn. Plums, apples and pears it eats readily, and cherries, mulberries and grapes it also takes when it can get them. In the autumn, ripe seeds are its chief food; it eats those of many of the sedges and grasses, and of several species of *Polygonum*, as *P. dumetorum*; black bindweed, knot grass and also those of the cow-wheat, and acorns, beech mast, etc., form a large portion of its food in the latter months of the year. Among forest plants, it likes the seeds of the hemp-nettle, and it also feeds on almost all the seeds that the farmer sows."

To this long catalogue of its Continental fare may be added the roots of the common silver weed, and those of the pig-nut or earth-nut and the tubers of the common buttercups, which are often scratched out of the soil and eaten. Macgillivray states that "One of the most remarkable facts relative to this bird that has come under my observation was the presence of a very large quantity of the fronds of the common polypody in the crop of one which I opened in the winter of 1835. I am not aware that any species of fern has ever been found constituting part of the food of a ruminating quadruped or gallinaceous bird; and if it should be found by experiment that the pheasant thrives on such substances, advantage might be taken of the circumstance."

Thompson, in his "Natural History of Ireland," recounts the different varieties of food he observed in opening the crops of ten pheasants—from November to April inclusive. In seven he discovered the fruit of the hawthorn, with grain, small seeds and peas. In one no less than thirty-seven acorns. Another had its crop nearly filled with grass; only one contained any insects, the period of examination being the colder months of the year; in summer the pheasant is decidedly insectivorous; all contained numerous fragments of stone. He also records that in the spring the yellow flowers of the pilewort are always eaten in large quantity, as are the tuberous roots of the common silver weed, when they are turned up by cultivation. Mr. Thompson adds: "While spending the month of January, 1849, at the sporting quarters of Ardimersy Cottage, Island of Islay, where pheasants are abundant, and attain a very large size—the ring-necked variety, too, being common—I observed that these birds, in the outer or wilder coverts, fed, during mild as well as severe weather, almost wholly on hazel nuts. In the first bird that was remarked to contain them, they were reckoned, and found to be twenty-four in number, all of full size and perfect; in addition were many large insect larvæ. Either oats or Indian corn being thrown out every morning before the windows of the cottage for pheasants, I had an opportunity of observing their great preference of the former to the latter. I remarked a pheasant one day in Islay taking the sparrow's place, by picking at horsedung on the road for undigested oats."

Among the more singular articles of food that form part of the pheasant's very varied dietary may be mentioned the spangles of the oak so common in the autumn on the under side of the leaves. These are galls caused by the presence of the eggs of a species of gall-fly, which may be reared from the spangles if they are collected in the autumn, and kept in a cool and rather moist atmosphere during the winter. About the fall of the leaf these spangles begin to lose their flat, mushroom-like form and red, hirsute appearance, and become by degrees raised or bossed toward the middle, in consequence of the growth of the inclosed grub, which now becomes visible when the spangle is cut open. The perfect insect makes its appearance in April and May. Some few years since Mr. R. Carr Ellison published the following account of their being eagerly sought after and devoured by pheasants in a wild state: "Just before the fall of the oak leaf these spangles (or the greater part of them) become detached from it, and are scattered upon the ground under the trees in great profusion. Our pheasants delight in picking them up, especially from the surface of walks and roads, where they are most easily found. But, as they are quite visible, even to human eyes, among the wet but undecayed leaves beneath the oaks, wherever pheasants have been turning them up, a store of winter food is evidently provided by these minute and dormant insects, with their vegetable incasement, in addition to the earth worms, slugs, etc., which induce the pheasants to forage so industriously, by scratching up the layers of damp leaves in incipient decay which cover the woodland soil in winter. Not only have we found the spangles plentifully in the crops of pheasants that have been shot, but, on presenting leaves covered with them to the common and to the gold pheasants in confinement, we observed the birds to pick them up without a moment's hesitation, and to look eagerly for more."

The value of pheasants to the agriculturist is scarcely sufficiently appreciated; the birds destroy enormous numbers of injurious insects—upward of twelve hundred wireworms have been taken out of the crop of a pheasant;

if this number was consumed at a single meal, the total destroyed must be almost incredible. There is no doubt that insects are preferred to grain; one pheasant shot at the close of the shooting season had in its crop 726, wireworms, one acorn, one snail, nine berries and three grains of wheat. Mr. F. Bond states that he took out of the crop of a pheasant 440 grubs of the crane fly or daddy longlegs—these larvæ are exceedingly destructive to the roots of the grass on lawns and pastures. As another instance of their insectivorous character may be mentioned the complaint of Waterton, that they had extirpated the grasshoppers from Walton Park. They also occasionally eat molluscous animals. Mr. John Bishop, of Llandoverly, records that he killed a pheasant on the coast of Islay whose crop was filled with the colored snails abounding on the bents or grass stems on the coast.

Lord Lilford, in his magnificent volumes on the "Birds of Northamptonshire," writes: "The pheasant, where not preserved in unreasonable numbers, is a good friend to the farmer, from the enormous number of wireworms and other noxious insects which it devours, to say nothing of its liking for the roots of various weeds; but it would be absurd to deny that grain forms its favorite food, and a field of standing beans will, as is well known, draw pheasants for miles. It is very much the fashion to feed the birds with maize; but, in our own opinion, the flesh of pheasants which have been principally fed upon this corn is very far inferior in flavor to that of those who have found their own living upon what the land may offer them."

Like their allies, the domestic fowls, pheasants are occasionally carnivorous in their appetite. A correspondent writes: "This morning my keeper brought me a pied cock pheasant, found dead (but still warm) in some standing barley. The bird was in finest condition, and showed no marks whatever, when plucked, of a violent death. On searching the gullet I extracted a short-tailed field mouse, which had doubtless caused death by strangulation." And a similar instance was recorded by Mr. Hutton, of Northallerton. The Hon. and Rev. C. Bathurst, in a letter published in London's Magazine of Natural History, vol. vii., p. 153, relates that Sir John Ogilvy saw a pheasant flying off with a common slow-worm; that this reptile does sometimes form part of the food of the pheasant is confirmed by Mr. J. E. Harting, who recounts, in his work on "The Birds of Middlesex," that "on examining the crop of a pied pheasant, shot in October, 1864, I was surprised to find in it a common slow-worm, which measured eight inches in length. It was not quite perfect, having lost the tip of the tail; otherwise, if whole, it would probably have measured nine inches."

The Maine Game Country.

Oct. 27.—If one is doubtful about the importance of Maine as a resort for big game, let him read the Bangor record for the week—472 deer, 32 moose and 5 bears. These figures only represent the game shipped through Bangor toward the west, and are but a very small part of the game actually killed in eastern Maine. This is especially true since the great interest in big-game hunting that has grown up within a few years among the Maine farmers and lumbermen. Local hunters are getting twice the game that falls to outsiders. The Bangor record for the corresponding week last year was 423 deer, 43 moose, showing a gain of 49 deer this year and a loss of 11 moose. The record for the season, up to Friday night, was 1,076 deer and 46 moose; same time a year ago, 1,000 deer and 56 moose. This year the gain is 76 deer, with a loss of 10 moose. It is certain that the number of hunters this year is a good deal in excess of a year ago. Women hunters are decidedly in greater numbers than ever before noted. Mrs. S. W. Whillden, of New York, has had good success in the neighborhood of Greenville. From a week's hunting she brought out a moose and a deer, both good specimens. Other ladies who brought deer through Bangor last week were Miss Lucy Hobbs, of Milo; Miss Esther Durgin, and Mrs. E. F. Dallas, of Bangor; Mrs. A. Davis and Mrs. W. Briss, of Oldtown; Mrs. F. L. Wood and Mrs. J. A. Tabor, of Corinna. Boston hunters seem to be getting their full share of Maine big game, though the number of moose and deer reaching the markets is unusually small. Only two or three moose have been received. One was received at Faneuil Hall Market Thursday that barely cleared the law. He had horns with only two tines; not antlers at all, but round, like cow horns. Evidently he was a two-year-old. A market man of many years' experience told me Saturday that not half the deer are coming in that were coming in a year ago. If hunters are getting them they are not sending them directly into the market. He says that there is now no shipment of Maine game into Boston by underground railway, what is received coming directly from the hunters. Often, perhaps, the shippers do not kill the game themselves, only bring it out. But they have to make oath in Bangor that the game is their own, and false statements are dangerous, since the wardens are watching closely. Now it is proposed to have an examining station for game at Portland, since big game is coming from a vast territory, that does not come through Bangor at all. Four live deer passed through Bangor on Wednesday. They were from the Kineo region, and consigned to C. W. Dimmick, of Boston, and doubtless will be shown at the Sportsmen's Show here next spring.

A great many deer are leaving the region of Kineo daily, the hunting conditions having been good. Many hunters secure the full limit of the law—two deer. T. Sedgwick Steele, of Hartford, Conn., left Kineo last week, after a two-weeks' trip into the West Branch region. He took out a white deer, a very beautiful specimen. A. L. Young, of Auburn, Me., shot his moose the other day, from the piazza of the Chesuncook club house, at Chesuncook Lake. William M. Davis, of Newton Highlands, shot a large bear last week, in the vicinity of Big Stream-Brook, where he has been hunting in company with A. A. Soule. The bear was an old female, very gaunt and large, and must have weighed 500 pounds when in flesh. Mr. Soule secured a moose with a fine head. Morton L. Dennis, of Skowhegan, Me., shot a moose at Dead Water, on Austin Stream, last week—the first

moose of the season in Bingham region. A party of Boston hunters left Friday night for a big-game hunt. In the party are S. L. Noyes, J. W. Smart, E. A. Norton and Messrs. Mann, Cobb, Currier and Mason, all merchants, several of them from the big markets. They go to Jackman, on the Canadian Pacific, and thence into the woods for Heald Pond camps and some camps beyond. They are well-fitted for a hunting trip, have four of the best guides in that part of the country and naturally they expect big game. Their guides have written that the ground has already been covered with snow, and that they may expect snow for tracking. One admonition of the leader of the guides is worth remembering by all hunters who are going into the Maine woods, "Remember, gentlemen, before you get here, and all the time afterward, that you are to shoot moose and deer and not men. If you can come with that idea, do so; otherwise, stay in Boston." More big game is being shot in the Rangeley region this year than last, but not a great deal of it has fallen to Boston hunters. C. P. Stevens and party have been at Camp Vive Vale, Narrows, Richardson Lake, and secured their full quota of deer.

It was a big week with Chatham gunners for coot and shore birds. Dudley Hall, of Boston, made a big record there. He returned on Wednesday with a bag of 140 birds, including beetleheads, English snipe and a few black ducks. Added to these were 105 grass birds. Will Guild secured forty big shore birds on the Monomoy grounds last week. Dr. Robert Amory, J. Montgomery Sears and Willard T. Sears have been on a shooting trip to Chatham and vicinity, with good results. At Hyannis Fred Henderson and John Nickerson have made a big day, securing fourteen black duck. These birds are reported more plenty than usual at this season all along shore. Monday was a great cooting day. At Chatham Henry Phillips shot 47; G. S. Joselyn and A. W. Phillips got 29; Fred Packard, 20; Charles Low, 18; Charles Newton, 23; Joe MacCosland, 23; Bill Frazier, 19, and many others smaller bags. About half a mile off shore at Brant Rock is the favorite location for coot shooting. Every morning a line of dories may be seen out there, the location being very near to the course of most of the flights.

SPECIAL.

CHICAGO AND THE WEST.

Back from Colorado.

Mr. D. J. Hotchkiss, of Fox Lake, Ill., is in town today on his return from a deer-hunting trip in the White River country of Colorado. Mr. Hotchkiss was the guest of Mr. George A. Morrison, of Emma, Colo., who has an extensive ranch in that country and who lives in baronial style. This gentleman and Mr. Hotchkiss, with one or two of the ranch people, made up the hunting party. They killed six deer without any trouble, Mr. Hotchkiss getting two very good bucks. He says that the bucks were just beginning to join the does, and that in the early days of their hunt they saw many bands of deer, composed mostly of does or spike bucks. Of the abundance of deer there was no question. On one day Mr. Hotchkiss counted eleven bucks, and on another day he saw more than a score of deer in different bands. He says that potatoes grow so big on Mr. Morrison's ranch that he could not check one home to show his friends without paying excess baggage.

Any one in search of elk would do well to remember the tip which Mr. Hotchkiss gives. He says that Burro Mountain, near the White River, is good elk country and can occasionally show a bear. Frank Hays, a guide of Newcastle, Colo., says that he would guarantee to get an elk in two days.

They Could Just Touch Bottom.

Four duck hunters of Des Moines, Iowa, went out this week to slay ducks at Twin Lakes, Iowa. Their names are Charles F. Fox, Frank L. French, Henry F. Gross and Carl C. Proper, all good men and true. Messrs. Gross and French were first to take boat for the enterprise of duck hunting, and a little later their friends heard them calling and discovered that they were not in their boat, nor on shore; neither were they aware whether they were on foot or on horseback. Their boat had sunk and they were standing in the icy water up to their necks, their feet resting on the sunken boat. Now came the strangest part of the adventure. Messrs. Fox and Proper had a very poor boat of their own, one which would not safely carry four. It was agreed that Proper and Fox should take the half-drowned hunters ashore one at a time, or rather take Gross ashore first. Fox then to return for French. The first passenger, Mr. Gross, was taken aboard with some trouble, but it looked too dismal for French to be left out there in the middle of the lake all alone. He made a grab at the boat as it passed him, and was lucky enough to land on the gunwale. The result was that he upset the boat; and then, instead of there being two men in the icy water up to their necks, there were four, and instead of being one passenger boat there was none. The hunters discovered several things of interest; first, that the water was very cold; second, that it was too deep to wade when they got off the hulls of the sunken boats; third, that there was no manner of refreshment. One of the party, it seems, had a bottle of something soothing in his boat, but it was at the bottom of the lake. Between shivers he kicked about in the mud, and at last was gratified to see the bottle of something soothing bob up to the surface of the water. This helped them out a little bit, but it did not solve the problem of transportation. They were in the water for four hours, and were at length rescued by a band of farmers, who thought evil spirits had taken possession of the neighborhood. It is stated that Twin Lakes are much deeper this year than ordinarily, owing to the extensive drainage of portions of the neighborhood. It is very lucky, indeed, that these Des Moines gentlemen found the water no deeper than it was. Their experience, although somewhat amusing to a man not in it himself, might easily have proved a fatal one. While it is supposed to be improper to refer to spiritous liquors in the columns of high class journals, the bottle of something soothing referred to herein may perhaps come in under the head of "Queer Finds by Sportsmen."

At It Again.

My friend, the daily reporter, is getting busy again these bright days of autumn. This time he telegraphs to a St. Paul, Minn., paper from Metropolis, Ill. It is all about a horrible panther fight in which one young man was killed and another seriously wounded. No names are given, it being stated that "at this hour it is impossible to learn the name of the victim." It seems that this young man, while out hunting near Glendale, was pounced upon by a panther which was crouching in the limbs of a tree above him. By the time the second young man had arrived the first young man was mostly dead and eaten. The second nameless hunter fought the savage beast for some moments, employing a butcher knife. At last the s. b., "with a savage growl, turned and fled into the woods." This animal is thought to be the same one which has been seen recently near Metropolis, and which has destroyed numerous hogs, dogs and cattle. On the whole this is quite a decent panther story.

The Student and His Dog.

My friend the Student has received his new hunting dog, and it would appear that this was the only thing lacking to make him perfectly happy. He regretted to state, however, in describing the arrival of his new acquisition, that Mr. Stephens, of Detroit, Minn., of whom he purchased the dog, had neglected to send either the pedigree or the dog whistle which he had promised. I asked the Student what sort of dog this was, being by this time very much interested in the matter, and he replied that the dog had white feet, white on the end of his tail, and was in respect to the rest of his body color a curly red. Hearing this I advised him not to bother about a pedigree, but to rather confine his efforts to securing the whistle, as I imagined it would be of more service to him.

The Student, as I understand it, never owned a bird dog before, and he is having a good time. He says the dog is the most friendly thing he ever saw in his life, and would rather be licked than left alone. He celebrated his advent into the Student's household by making a tour around the breakfast table, and neatly extracting all the bread and butter from the plates around the table. He is doing a great many other things best known to bird dogs and their owners, and it seems sure the Student is going to have an interesting time with him this fall. We are going to take the pup out somewhere this fall, and shoot a few quail over him, or under him; that is to say, if we can get the whistle.

Ducks Meet in Mid Air.

The following story of a very unusual incident is told by Mr. George French, of Waterloo, Iowa, who last week was shooting ducks at Blue Lake, near Onawa, Iowa. I question if it has ever been duplicated in the experience of any sportsman, however possible and indeed probable it may appear under certain circumstances:

Mr. French was in his duck blind one morning, and just at daybreak saw a good flock of mallards coming toward him. These birds were almost within range, when another flock of about fifty mallards came on from the opposite direction, going at a great pace and apparently intending to drop down into the lake. The two flocks of mallards smashed into each other in a head-on collision. Mr. French says that the "rattling and crunching" sound could be heard for quite a distance. He states that the ducks were all mixed up together. After the confusion was over he found two ducks upon the ground, one quite dead and the other with a broken wing. Yet others which flew away seemed to be damaged by the collision, but not sufficiently so to knock them down. Mr. French picked up the two victims of the collision. This story is vouched for by Mr. J. C. Hartman, of Waterloo, who says that he has known Mr. French for many years and that the latter is not given to hunting yarns.

The incident is something which might occur easily, especially in the semi-darkness of early morning. It is not altogether an unusual thing for wild birds to fly into stationary obstacles and stun or kill themselves. In Iowa in the early days, it was not unusual for us to pick up prairie chickens which had flown against telegraph wires. I once knew a quail to fly against a barn and kill itself stone dead, and in another case a quail flew through one of the hay loft windows of the same barn, on my father's place, and found itself a cripple and a captive in the hay mow. I think it was from Michigan that I once reported a case of a flock of quail which rose to the sound of a gun and flew headlong into the side of a farm building, something like 100 yard away, several of the bevy being killed. It is one of the mysteries of nature how a ruffed grouse gets through the wood at the speed it attains and does not kill itself against the trees. Mr. French's duck story, therefore, although curious and wonderful, is not to be supposed beyond the realms of probability.

Iowa Ducks.

Duck shooting is better in Northwest Iowa this year than it has been for many years. Messrs. H. C. Luce, George Herr, Jesse Scott and Bert Richards, of West Liberty, Iowa, shot last week on Elbon Lake, seven miles northwest of Dickens, Iowa, and the daily average of the above gentlemen for six days was sixty-eight ducks per day to the party. They also got some prairie chickens. Trumbull Lake and Elbon Lake are popular points this fall, as well as other waters in Clay, Dickinson and Palo Alto counties.

Illinois Game.

As to the game of Illinois, we are now beginning to say good-bye to our jack-snipe and ducks, and are looking forward very eagerly to the quail season, which by common consent will begin next week, November 1. It is a curious fact that the peculiar lack in the Illinois law seems not to have made any very great difference in the surviving quail. This all goes to prove the excellence of Bob White as a game bird. When we have a duck flight it is a matter of a few days and then it is all over. A little wisp of woodcock come up and are gone inside of forty-eight hours, and a body of jack snipe

lasts not more than a couple of days. The prairie chicken season lasts but a couple of days, for the birds are cut down as quickly as the law will allow. With Bob White the matter is different. The first day or the second week does not clean up the bevy, for the hardy creatures are able to take care of themselves. Indeed they learn the art of self-defence with every day of the season, so that before the end of the season, before the middle of December, after a month of harrying, there may still be quail enough left to offer abundant opportunity, and these survivors will be of such quality as to tax the best skill of the shooter. We might count upon very fine shooting at quail in the State of Illinois this fall. Indeed, if it were not for this quail shooting, what could we depend upon for our sport in this once prolific State? Our prairie chickens last for a couple of days; our ducks go somewhere else. If we go to Michigan we cannot bring a bird out with us legally. If we go to Wisconsin it costs us \$10. If we go to Minnesota it costs us \$25. If we go to Missouri we are put in the penitentiary, and if we go to Arkansas we are liable to get hanged. These be parlous times in sportsmanship in the Mississippi Valley. It recalls the old story of the ham and the mustard. If one does not like ham he can help himself to mustard. Fortunately the alternative in this case leaves us intimately concerned with one of the finest game birds that ever offered sport in any country, and it is matter of congratulation to feel that, in spite of foolish game laws, we at least have plenty of quail.

Lumber Jacks and Game Laws.

There comes down from the pineries of Northern Minnesota this fall, the customary story of outrages against the game laws, committed by the lumber jacks employed in the wholesale timber operations of the wilderness country. Moose and deer are being slaughtered without any regard whatever to the game laws. These depredations are committed in so remote a district that it is almost impossible to secure convictions. It would take an army of wardens to thoroughly stamp out these violations of the game law, although now and again one hears of an arrest and fine. Most of the meat of this sort of slaughter is perhaps used about the lumber camps, but in many cases moose are killed and left to lie almost unutilized, as the hide and head are not brought out to serve later as incriminating evidence.

North Dakota Game.

Mr. J. B. Whittemore, writing from Galesburg, N. D., says: "You should have come up and visited me and Gorkey this year. There were more ducks and chickens than for many years and a much handsomer landscape, too. There are now a good many geese, ducks and snipe around."

Lost and Found.

Mr. E. K. Stedman, of Mt. Carroll, Ill., gives an incident or two of his recent vacation trip in the Mississippi River bottoms. He found that he could get lost, and also found something which some one else had lost, describing the matter below:

"It was land I had hunted over since a boy, but I had not hunted it much the past few years. Some unrespecting, dollar-worshipping son of Mammon cut the timber down and a dense shrubbery has grown up in its place. It was a mile due east from my starting point to the place I desired to reach. I walked half an hour and came to the starting point, having made a circle to the left. How's that for a fellow who has hunted all his life, and over ground he was raised on?"

"In the matter of 'Sportsmen's Finds,' I found a good-sized tackle box. It had evidently been lost a good while, being quite rusty and weather-stained. It was full of tackle, hooks, line, leaders, trolls, floats, etc. I left it at the club house for the use of the boys.

"Saw lots of quail in the timber; every scrubby brush pile seemed to harbor a bevy or two. The boys are not shooting them, but say they will shoot at them the weeks corresponding to the open season last year.

"Do not look for many ducks down the old 'flyway' this season, owing to the scarcity of water and feed. The boys are banking on getting a bluebill flight about the 25th. Hope they do; they deserve it.

"They've got a great place, these boys—a large island in the middle of the Mississippi; a club house with gasolene and heating stove, bunks for eight people, four extra cots and full equipment to accommodate twenty at least.

"The lower end of the island is fitted up for a blind, the willows growing there making an excellent place for one to exercise his artistic abilities in the matter of blinds. In the blind is a large float or raft. They bring their chairs with them when the flight is on. The float can accommodate twelve shooters. They have a flock of about 100 decoys. The ducks flying up and down the river can see them from any direction, and 'tis safe to say that if ducks are trading at all, the boys can account for their end of the bag. When I arrived home I found my friend the fish warden had been having some more fun in this vicinity."

Bidding for Contraband Game.

Oct. 24.—A friend living in North Dakota sends to me a circular letter, issued on the letter head of C. F. Bumann & Co., general commission merchants, 197 South Water street. It is presumable that these circulars are sent out to many persons in Western States. The naive and cold-blooded fashion in which C. F. Bumann & Co. take for granted violations of the game laws, and assist in such violations by means of definite instructions thereon, is proof enough of the character of South Water street as a market for Western game. The matter is something which should be taken up at once by State Warden Lovejoy, of Illinois. Perhaps the canny commission firm may not care to have quite so much promotion and publicity enlisted in their behalf, yet here is a paragraph of the circular, and it surely speaks for itself:

"Game is bringing extremely high prices this year. Following are the prices we are returning to-day: Mallard ducks, \$5 per dozen; redheads, \$4.50; bluewings, \$3; \$2.75 for greenwings, \$2 for mixed, \$2.50 for jack

snipes, plover; grouse, \$2.50; grass, \$2; yellow legs, \$2; rabbits, \$1.25 per dozen. Game is shipped in egg cases with a layer or two of eggs on top so as to avoid confiscation.

C. F. BUMANN & Co.
E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Ho'ding the Snipe Bag.

HERE are two stories of the snipe bag. The first one is from a Chattanooga, Tenn., paper; the second is told by a correspondent of the Chicago Inter-Ocean:

I.

The young Southerners offered to make him one of the party, and explained the method of trapping the unsuspecting birds. Two stout coffee bags were obtained. They were half-filled with pine kindling wood, and early in the evening the party—five in number—trudged a mile or two away and turned into a small, open, half-timbered wood. Young Bascom was told that, not being used to driving the birds, he might hold one of the bags. A good natured New Yorker was impressed into the service to hold the other:

A roaring fire was built for Bascom, and the boys went away to drive in the game. He watched the bag diligently and kept piling the wood on the fire to attract the birds into the snare. The birds were diffident or sleepy, for they were slow to arrive. Bascom burned up all the wood within reach, but not a snipe had got up in its night clothes, slipped on a pair of pantaloons and some one else's shoes, and run to the fire. The last ember grew pale before Bascom made up his mind that the hunt was a failure. He searched the wood for his companions, but they were at home waltzing in turn with the star lady boarder. Not finding them, he started home across plowed fields, thick undergrowth and knobby pastures. He went south; Hot Springs was north. He finally sought shelter at a farmhouse, but a dog threatened to make a meal of him and he ran away as fast as he could. Four miles away he found a farmer, who took him in and gave him a bed. The joke and the early day dawned on him at about the same time. Bascom had been frightened nearly to death. He declared that he heard the wild, despairing, human cry of a panther shrieking for b-l-o-o-d, and the dismal howl of the white-fanged wolf. He ran until his chest protector melted in the heat of his emotions.

He caused the arrest of the entire party and threatens to sue for damages. The fright and exposure probably will affect his present health, as he was under a doctor's care.

The trial of the snipe hunters was before Police Judge Smith, misdemeanor being the charge. Judge Smith is an Ozark Mountain gazelle in build. His legs are long and slender, his arms slender and long. His thin face, tapered to a point at the chin has nothing more to spare in fatty tissues. His cheeks are sunken, and a pair of blue eyes are set under heavy brows like hall lamps behind storm doors. A heap of iron-gray hair lies idly on his forehead and a long, thin beard hangs from his jaws and chin. Judge Smith's entire make-up is lean and bony—from hair to fingers—from face to feet.

City Attorney Townsend thundered his assertion that the supposed joke was an outrage, in the tones of an Ozark Mountain storm. He drew a sketch in black colors, showing how Bascom had been chased by dogs and wolves; how the lad had climbed trees to escape the dogs, and fences and hills to get out of the forest. The judge listened patiently to this recital and then bit a hunk off a piece of Arkansas twist and told the defense to saunter in.

Another Lawyer Townsend arose and denied that a joke had been intended.

"Your honor," he said, "knows that this is one way of hunting snipes. This young man did not attend to his business. If he'd held the bag long enough he'd caught the snipes."

"I'm not he'ur to give you fellers pointers 'bout ketchin' snipes," interrupted the judge, with a serious wrinkle in his forehead and a long-range rifle shot at a sawdust box. "Git deown ter bizness."

The attorney for the defense proposed to offer expert evidence showing that snipes could be bagged, but the witnesses called denied that they had ever hunted game with coffee sacks.

Young Bascom told his story in a frank, innocent, candid manner that set the crowd chuckling, and at one time the venerable justice swept his long, pipestem fingers across his iron-gray moustache to conceal the smile that trembled on his thin lips. The victim mistook the frequent snickers in the crowded room for amusement at his graphic description and the hard rubs he gave the defendants. He said they came from small towns, were not used to city ways, and thought such a joke smart. He thought it was an outrage.

Judge Smith jabbed his sharp elbows into the desk, dropped his face into his hands, and listened with evident amazement. Bascom told how he held the bag and watched for the game until the wood for the fire was all gone.

"Young feller, did you r'aly think them snipes wuz a-goin' inter that thar bag?" asked the judge, slowly and deliberately.

"Certainly I did. I believed what they told me," responded the witness.

The judge let a twinkle slip out of his eyes, but they speedily fell back into the glassy stare of judicial reflection. He sternly rapped the outburst into silence and the trial went on.

An adjournment was finally taken until last Monday, when the case was dismissed.

II.

"SPEAKING of duels," said the big man of the crowd, "recalls to my mind a mock duel that I had a hand in some eight or nine years ago. There was a serious ending to this one that has never allowed the affair to escape my memory."

"It was in Lawrence, Kan. One day a new man came to town. He put on more airs than the fellows considered the proper thing, and, as a consequence, a job was put up

on him. He was to be initiated into the old, time-worn game called snipe hunting, and from the earnestness with which the victim entered into the spirit of the proposition many of the conspirators believed that he was up to the trick, and that it would be a failure.

"However, as the sequel proved, the poor fellow had never been on a snipe hunt, and the result was that at 3 o'clock in the morning he was left at a fence corner about ten miles from town, calmly holding a sack and a candle and waiting for the snipe to come up and be lighted into the bag.

"The conspirators rushed back to town, and when the morning newspaper came out it contained an account of the whole affair, dished up in true Western style.

"The victim held his bag and candle until the latter had burned up, and then he began to wonder if a job had not been put up on him. He called to his companions, but there was no answer. Finally he wandered about the prairie until he found a farmhouse. After some trouble in convincing the honest occupants that he was not a horse thief, he was taken inside and cared for until daylight, when, for a consideration, the farmer drove him into Lawrence.

"Of course he got quite a reception. The conspirators had arranged that part of it, which made the victim very angry. He thought the matter over, and concluded that the proper thing to do would be for him to challenge the chief conspirator to a duel. This was just what was wanted. The challenge was carefully accepted and double-barrelled shotguns selected as weapons. The affair was to culminate at a grove near the town the same afternoon, and when the time came there was a crowd there that would have done credit to any event. The seconds were careful about their preparations. They put only small charges of powder into the gun barrels, and after being searched for breast plates or knives or revolvers, the combatants took their positions.

"Meantime, the victim was in the dark. He meant business. There was no joke about it to him. He meant to kill his antagonist, and when he looked at the doctors, with their instruments and lint and bandages, it only served to screw his courage still higher.

"The signal was finally given. Two loud reports rang out, and both men stood still. Then they raised their guns again, took careful aim, and blazed away once more.

"Then came an unlooked-for occurrence. The young conspirator staggered back, dropped his weapon, threw one hand to his forehead, and as he fell, the horror-stricken spectators saw a thin stream of blood pour over his face and down on his white shirt front.

"Men looked at each other and gasped. Unknown to the seconds, somebody had slipped in a charge of shot into the gun of the snipe hunter, and what had been planned as a farce was turned into a horrible tragedy.

"Finally some of the crowd summoned up courage enough to go to where the body lay. As they bent over the prostrate form they were shocked once more, for very distinctly it could be seen that the supposed corpse was really convulsed with laughter.

"An explanation followed. The young man had executed a neat little surprise of his own. He had secreted in the palm of his hand a small rubber sack, filled with aniline dye, and when the second shot was fired, he had done the rest. When the truth dawned on the crowd that the whole matter was a well-planned joke, there was a good laugh, and somebody looked for the snipe hunter, to whom it was considered a full explanation was due. He had disappeared. As completely and effectively as if wiped off the earth he had gone. And to the best of my knowledge he never was seen or heard of in Lawrence again. He was sought for years, but no trace of him was ever found. He firmly believed that he had killed the man, and in the confusion that ensued made good his escape.

"I have often wondered if he ever learned the truth, or is still an exile, laboring under an impression that he killed a man in a duel."—Chicago Inter-Ocean.

The Blooming Grove Park Association.

PORT JERVIS, N. Y., Oct. 22.—Yesterday Dr. Joseph Kalbfus, Secretary of the Commission, and State Game Warden Joseph Berrier, went to Glen Eyre and met a wagon just driven up to the station from the Blooming Grove club house. In the wagon were N. S. Smith, President of the Park Association; Reber Bretnell, of Newark, N. J.; Robert Post and his brother, of Jersey City, and John Kusser and Benjamin Kusser, of Trenton, N. J. Dr. Kalbfus demanded that they open their grips, despite their protest that they contained nothing contraband, and in them were found, wrapped in papers and otherwise concealed, several English and native pheasants.

Upon Mr. Smith's assurance that they would all appear when called upon to answer to charges, they were permitted to return to their homes.

Soon afterward Thomas J. Barry, of New York city, was apprehended with a bag of game, and he, too, will be proceeded against.

The game seized was sent to the Lackawanna Hospital, to be served to the patients, in accordance with the law. The cases will be prosecuted in a United States Court, under the Lacey law, recently enacted by Congress, which prohibits the transportation of game from one State to another unless properly labelled with the address of the shipper and consignee, and stating the contents therein. Dr. Kalbfus has made his complaint before United States Commissioner J. Hixon Vanetten, of Milford, Pa.

The contention of the Blooming Grove Park Association members is that their charter gives them the right to make their own game laws, and that this right cannot be invalidated by the general State game legislation.

Michigan Quail.

HARTFORD, Mich., Oct. 22.—The season for quail opened on the 20th, and with dog and gun I promptly started, and at evening returned with eight quail and two woodcock. Quail are plenty, but dry leaves and thick covers protect them. Some St. Jo parties, with two dogs and three guns, got thirty-one quail and one snipe to-day.

SULLIVAN COOK.

Gun Flints.

CHARLESTOWN, N. H., Oct. 18.—Editor *Forest and Stream*: Some two years since you published an inquiry for gun flints from one of your Pacific coast correspondents, Orin Belknap. Now, I have just come across a new and very interesting book, "Highways and Byways in East Anglia," by William A. Dutt, published this year by the Macmillan Co. It is an account of a bicycle trip of exploration among the quaint, old towns of the extreme east of England, where many very old and beautiful churches mark the places of the earliest Christian settlements, and old mounds and ruins show the spots where Saxon, Dane and Norman battled for centuries for supremacy, and where are still standing the homes of many well-known English worthies of the Elizabethan ages.

In the course of his rambles, Mr. Dutt reaches the quaint, old town of Thetford, and makes an excursion from there to the Flint Pits, about six miles distant, where the prehistoric inhabitants of the Stone Age made their axes and arrowheads, and where the manufacture of gun flints is still carried on. Caught in a shower, the writer takes refuge in a flint cutter's hut, and I quote from him as follows:

"While I am an unwilling loiterer in his shed, the 'knapper' initiates me into the mysteries of his craft, so far as concerns the making of gun flints. Taking up a flint so large that it requires two hands to lift it, he first 'quarters' it—that is, breaks it into sections 5 or 6 inches in thickness. This he does with a hammer such as a blacksmith would possess; but the next process, called 'flaking,' which consists in breaking thin strips or flakes off the 'quartered' sections is effected with a smaller hammer. So skillfully, and with such a curious knack, is this flaking done, that it leaves each flake with two sides shaped as in a gun flint, and the 'knapping' it then undergoes, is simply the breaking of it into sharp-edged squares. This is done by resting it on an iron tool like a blacksmith's hard chisel fixed upright on a bench, and splitting it twice with two blows of a small hammer. The processes are difficult to explain, but look very simple.

"Gun flints are made in four sizes—for muskets, carbines, horse pistols and single-barreled pistols. That a market can still be found for them is surprising; but I am told that the Arab tribes of northern Africa purchase large quantities, and that since the opening up of the Congo country a considerable trade in gun flints has been done with the Central African tribes."

The whole book is very delightful reading. It takes the reader off from the usual routes of travel into those old Norfolk and Suffolk towns from which many of the first settlers of this country came, and whose names, such as Lynn, Norwich, Brandon and Framingham, they brought with them. I think it would delight Mr. Talbot, Coahoma and Didymus, whose photo I am glad to see in this week's FOREST AND STREAM. It looks like the "Old Roman" which his criticisms show him to be.

Deer are getting plenty; they have been seen by many this summer, and two were seen last week within half a mile of the center of the village. Squirrels are scarce, but ruffed grouse (partridges) are plenty, so the boys say.

VON W.

The Game Fields of Virginia.

LUMBERTON, Sussex County, Va.—Reports are coming in from north, south, east and west of the numbers of quail and wild turkey found in the game fields of the State this season. Here in southeastern Virginia game is certainly more plentiful and the cover heavier than for many years past.

This is said to be owing to the dry spring and early summer conditions peculiarly favorable for the breeding of young birds, too often drowned by the heavy rains and dews in May and June. This season the rains held off till July and August, and then "made up for lost time." The result was a wonderfully rapid growth of weeds and grasses in the fields, the scant cover growing from knee high to head high in two or three weeks, and thus affording feed and cover for the young birds and protection from their natural enemies—foxes, hawks and owls. No estimate can be made of the destruction of small game by these all-the-year-round hunters.

It is useless to make laws for the protection of game when these ruthless hunters are allowed to hunt the covers unmolested. They begin at the egg and never leave off as long as there is a bird in the covey. One fox, with a nose keener than that of the best dog that ever ranged a field, can destroy more birds from one Thanksgiving Day to another than all the sportsmen in the country in the three months in which they are permitted to hunt. Every nest of eggs broken up is a covey wiped out of existence, hence the Reynard is a "game hog," a "pot-hunter" and a professional. He never leaves off, and, like Death, "He has all seasons for his own."

Just when the fledgling has grown swift and strong enough to elude his pursuit, it becomes the prey of other enemies, as destructive and indefatigable as he. It rises from cover only to be pounced upon by the wary hawk, with hungry talons and piercing eyes ever on the alert.

At night the old bird hovers the scared covey in the open field, only to be seized by the silent-winged night hawk, or owl, from whose great eyes the friendly darkness is no protection.

Ten thousand times ten thousand birds and rabbits are thus destroyed every year, and then the scarcity of game is attributed to the breechloader and the pot-hunter! If these alone were to blame, the game fields in remote places would teem with game, but these are the very haunts of the fox, the hawk and the owl. Years ago, when the clearings were small and the settlers few, when the forest was vast and its wild denizens numerous, there was enacted a wise law in the Old Dominion giving a premium on every fox, hawk and owl scalp presented to the boards of supervisors in the counties. It was repealed by the politicians of a later day, who cared less for noble sports than for the spoils of office. In their desire to fill the coffers of the State, they failed to note how false was this economy; how great the loss in barnyard products alone. One housewife informs me that she has lost one hundred or more fowls by hawks and owls this season. Multiply this by the hundreds of homes in

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Jess t' Fish.

From the Denver (Col.) Times.

LIKE t' sit aroun' an' fish
Where the pleasant waters swish;
Like t' lie
With my eye
On th' fly
An' jess watch th' trout begin
Tumblin', rollin', fallin' in;
Where th' pleasant waters swish,
Like t' loaf aroun', an' fish.

Like t' leave my cares behind
An' escape th' daily grind;
Like t' dream
By th' stream
Where fish seem
Jes' t' gleam
Underneath th' summer sun
Where I've got 'em on th' run;
Like t' leave th' daily grind
An' my care an' work behind.

Like t' take myse'f an' go
Where the waters, sweet an' low,
Tumble 'round
On th' ground
An' surround
Seven-pound
Trout that's playin' in th' stream,
Where th' spotted beauties gleam;
Where th' waters, sweet an' low,
Like t' take myself an' go.

Like t' go out jess t' fish
Where th' waters swirl an' swish;
Like t' set
By th' wet
An' forget
Every fret;
Like t' set 'round an' dream
While I whip th' tumbling stream,
Where th' waters swirl and swish;
Like t' go out jess t' fish.

Sawdust in Trout Streams.

BOSTON, Oct. 28.—*Editor Forest and Stream:* Many an ardent angler can recall how he has suffered in mind when he has felt powerless to prevent the ruin of trout fishing in some favorite brook, wherein, year after year, sawdust has been poured, to such an extent that spawning beds have been destroyed and the abundance of fish has sadly decreased in consequence. Because of this it has been found necessary in some States to enact special legislation to control this peril to fish life streams. Eleven years ago the General Court of Massachusetts enacted a law to limit or prevent the pollution of trout streams with sawdust. This provided that whenever the Fish and Game Commissioners should decide "that the fish of any brook or stream * * * are of sufficient value to warrant the prohibition or regulation of the discharge of sawdust from saw mills * * * and that the discharge thereof from any particular saw mill materially injures such fish," they could restrict the pollution by an official order. The penalty for violation of such an order was fixed at \$25.

It will be evident from the foregoing that the enforcement of a law like this entails a lot of work on the Commissioners, for a proper consideration of the requirements of the act compelled a personal inspection of miles of streams before orders were issued. It may not, then, be wondered at that, until recently, little has been done to make the act operative, and as a result the mill owners have practically forgotten there was such a law. The reason for this is found in the fact that the mills are usually located in more or less remote and out-of-the-way places in the wooded areas, but almost without exception they are on the banks of streams that formerly teemed with trout. To get to them it is generally necessary to take a long carriage drive over country roads, and, when several mills are visited in one day, a trip of thirty or forty miles is a common experience. At each stopping place it is on the programme to inspect the mill and the streams, and to acquire all practical knowledge of the condition of both, and especially concerning the feasibility of disposing of the sawdust so that it will not go into the water. Of course, where there has been no legal restriction, all water-driven mills discharge the sawdust into the streams. Thus the bottom of a brook, and especially the deep pools and eddies, is covered with the slimy, decaying stuff, which renders the stream more or less unfit for fish to breed and thrive in. Some of the best trout brooks in the State have suffered seriously from this evil, and the wonder is that any fish are left in them.

During the last two years much has been done by the Fish and Game Commission of this State to correct this evil, or to arrest its development to the point where many streams will be made utterly barren of fish life. Mr. Collins, chairman of the Commission, has, I learn, personally visited between forty and fifty saw mills in various sections of the State, and, with few exceptions, the owners of these have been ordered to keep their sawdust out of the brooks. Trips to these mills are always to be classed as hard work, involving long hours, irregular meals and occasional experiences which are not entirely agreeable. A trip recently made may serve as an example.

Leaving Boston on Thursday afternoon's express, a ride of about three hours brought Mr. Collins to an interior town, where he was met by a deputy who had been ordered there because he knew the location of the mills. Next morning the temperature had dropped nearly to freezing, a stiff northwest gale was blowing, with passing hail showers, that continued throughout the day. A

drive of forty miles and an evening ride on an electric car to another town finished the day. Waking at 4 o'clock Saturday morning, another forty-mile drive, a late supper, on a night train, delayed by a wreck on the road, and getting home at 2 o'clock Sunday morning, completed a brief but somewhat strenuous trip for the preservation of fish in our trout streams.

Of course the mill owners don't like this; it would not be reasonable to expect they would, and they maintain that there are not fish enough in the streams nor ever will be to justify the action taken. But there is a difference of opinion, and the following statement of fact will indicate there is reason for it:

The owner of a mill who was ordered last year to keep sawdust out of the brook on which his plant was located, stoutly urged that the order was unwarranted because of lack of fish in the stream. It is quite possible he felt justified in this, for the sawdust probably had kept trout from coming up the brook. In the early part of last July, however, two old anglers who had fished in Maine and New Hampshire, and were familiar with the streams of those States, started out one morning to fish the brook referred to. The result was that, together, they took thirty-three square-tail trout, that ranged in size from a little over nine inches in length to a weight of one and a half pounds. In all their experience in other States they had never seen so fine a string of brook trout, so they declared. Is this sufficient to justify the attempt of the State Commissioners to save our trout streams from further pollution by sawdust? BAY STATE.

Canadian Angling Licenses.

THE non-resident fishing license cases in the County Court of Yarmouth county, N. S., have been decided adversely to the defendants. Judge Savary filed the following opinion, in which he sustains the judgment of the stipendiary magistrate, upon the grounds taken by the fishery overseer:

COURT HOUSE, YARMOUTH, OCTOBER TERM, 1901.

The King, on the complaint of A. M. Hatfield,

vs.

Charles Townsend.

The same,

vs.

Charles Murtagh.

The same,

vs.

J. Barton Townsend.

I certainly think there is an appeal to this Court from these convictions, as from other summary convictions. The appeal to the Minister of Marine and Fisheries given by the Act, Chapter 95, Revised Statutes of Canada, Sec. 18, Sub-division 6, does not take away the general appeal to this Court under the Criminal Code, Sec. 879. My duty is to decide whether these parties were properly convicted. If my decision should be against them they can still appeal to the Minister and procure the remission of the penalties if he thinks the enforcement of the law a hardship in the particular case.

The conviction in each case is for a violation of certain regulations made under Sec. 18 of the Fisheries Act, respecting fishing by foreign sportsmen in the inland waters of Canada.

These regulations are first an order in Council of June 30, 1894, of which the object is stated to be "the more efficient protection of game, fish and the prevention of abuse by foreigners angling in the inland waters of the Dominion," and it proceeds to ordain that no person other than a British subject shall angle for, fish for and take (besides other fish specified) trout in Canadian waters without having first obtained an angler's permit issued by the local fishery officer in each district under the authority of the Minister of Marine and Fisheries; and that each person not a British subject shall pay for such angler's license a fee of \$5 for a period of three months or \$10 for a period of six months. On the first day of the following August a further order in Council was passed, with a preamble stating that it was deemed advisable to amend the regulations of June 30, so as to exempt under certain conditions foreigners domiciled in Canada from the regulations requiring permits, and proceeding to ordain as follows: "Foreigners where temporarily domiciled in Canada and employing Canadian boats and boatmen shall be exempted from the regulations requiring permits."

The argument was on the meaning of the words "temporarily domiciled," and counsel on both sides seemed to agree that this was a self-contradictory phrase; an inartistic and inconsistent term, barely capable of a sensible construction. On full consideration I must say I cannot altogether concur in this view, but on the contrary it may be that no other language could be found which would more adequately express the intention of the enacting authority. Foreigners "visiting Canada," or "temporarily residing" in Canada might have included some whom it was the policy of the law to exclude from the privilege of fishing in our waters freely and on the same terms as our own people. It was laid down by an old authority that "the word 'domicile' has many meanings, according as it is used with reference to succession and other purposes. A person may have retained a foreign domicile for many purposes, and yet may be domiciled in England, so as to give jurisdiction for divorce."—Fisher's Digest, p. 3187. So in the case of regulations under the Fisheries Act the word may be used in a sense not strictly technical, but one which renders the adjectives "temporary" and "permanent" by no means inconsistent or inapplicable. It may, for instance, mean living in the country for a limited period under such conditions as would give the foreigner a domicile here for all purposes, if such evidence were, or were intended to be permanent. In the case of *Le Mesurier vs. Le Mesurier et al.*, in Appeal Cases, 1895, p. 517, Lord Watson (at page 540) speaks of the domicile for (the time being) of a married pair, and in another places quotes from Lord Westbury in *Gould vs. Gould*, L. R. 3 H. L. 85, the expression "permanent domicile," showing that these terms are not so very anomalous or self-contradictory, but that the expression "temporarily domiciled" must be construed and given effect to under the ordinary rules governing the construction of statutes and with a view to the object and policy of the Legislature. In *King vs. Foxwell*, 3 Chap. Division, p. 318, Jessel, M. R., asks himself the question,

our State, then compute the loss in eggs, add this, and you have a loss in foodstuff simply tremendous—a waste that no community can afford.

I commend this problem to the lawmakers; to the true sportsman I would say, "Think of the unprotected game in the fields for which there is no shelter, and for which no watch dog gives warning of approaching danger; think of the hungry foe ever on the trail, and consider if we can better protect our game than by the enactment of the good, old law which at once converts the "man with a gun" prowling the woods into a game warden, instead of a poacher, who will hunt for scalps on which a price is set, rather than for the game which he cannot lawfully sell.

Let our sportsmen and lawmakers consider this.

L. P. BLOW.

The Gun Borrowers.

Editor Forest and Stream:

Now is the time when the mushroom sportsman is in evidence. I don't mean one who is out after mushrooms, but I have in mind the kind of sportsmen who spring up in a night. They have lived ever since last fall in a dormant state; have thought nothing of dog, gun, hunting coat or anything else until now. But now they come to their friends bright and early in the morning and say, "Lem'e take yer gun, will ye? And say, have yer got any more of them good shells left I heard you had last fall?" If they can get a gun, then they want to see if your hunting coat will fit them. If they can get your gun they keep it for a week without cleaning, stand it up out in the woodshed or some other convenient building, and when you ask for it they forgot all about it, promise to buy it and "Where can I get one like it?" and "It's a dandy, ain't it?" If it had not been a dandy it would not have been asked for, for these mushrooms that spring up in a night do not generally ask for a poor article.

Sportsmen of this kind will sit around the grocery store in the evening, make their plans and each one tell whose gun he is going to (try to) get and what kind of shot to use; and if they can't borrow shells loaded with buckshot for rabbits, some miserable cuss is to blame for not keeping such shells on hand. I have been through all this. I have had my gun go out bright and clean, to be sent back to me all pitted with rust outside and in. But I have given up the practice of lending to this class. I think if a man can afford to lose time from his regular vocation to go shooting, he can afford to have his own tools. If not, he had better steal them right out and out. I have two very nice guns—one I always have at a friend's house, and the other I can't lend, because I always want a gun around the house. There is an article in the Constitution of our country which provides that I am entitled to keep it for my own use.

Will some one back me up in what I have said? I may be harsh, but I know truthful, in this article. ***

New Hampshire Grouse and Woodcock.

DUNBARTON, N. H., Oct. 21.—Some of the accounts in the FOREST AND STREAM report grouse as plenty in some parts of Massachusetts and Maine. In this section they are very scarce. About all I have found so far were very much scattered, with seldom over three in a cover and often but one. Last summer there were practically no blackberries and a very light crop of apples. Ordinarily I have on my place over one hundred and fifty bushels of what is called natural fruit, and some fifty or more barrels of grafts. This year I had just half a bushel of grafts and I do not think I could have found a bushel of other apples. Our grouse have always acted as though they depended on a good crop of blackberries. We would find them during the early part of the season on such grounds. Later they were around the apple trees. This year they seem to have deserted such grounds, and, to a great extent, all others. I am finding some, but I have to go over a great deal of ground, and they are very few and far between.

There seems to have been quite a flight of woodcock, but they steer clear of what have been good grounds. About a week ago two of us shot in a very small cover one afternoon eighteen woodcock and one grouse. To-day we tried the same place again, and bagged twenty-four woodcock and one grouse. During the forenoon we killed twenty-nine birds (twenty-four woodcock and five grouse), letting six rabbits run past without shooting. In times past I have often found quite a number of woodcock in a day's hunting, but I never found so many in so small a cover. To-day they would get up entirely too fast. Standing still with our dogs at heel we had seven cock and one grouse down before we could let the dogs retrieve one.

I like to get shots at any game I am hunting, but I do not want them to come as fast as they did at one time this morning. C. M. STARK.

Massachusetts Shore Birds.

BOSTON, Oct. 25.—The shore bird gunners are in trouble. Last Sunday the flights were large, big bunches going southward all day. At Brant Rock and other points the temptation was too great, and several Boston gunners went out with their guns and shot a large number of coot and other ducks. They hired dories and went out half a mile or more, and found the shooting good. None of the resident gunners disregarded the Sunday law, and now they are complaining and asking that the Sunday law be enforced. Boston gunners do not deny that they broke the law, but say that the flight was too good to lose. One of their number says that he shall stand by this moral right to shoot on Sunday; that he should do so again, under like circumstances. The smelt fishers are out every Sunday, openly, with all their tackle in sight, and they are not troubled by the officers of the law. What is the greater harm in gunning? The gunners will stand prosecution, if the officers desire it, while they believe that fines would be merely nominal, since they know that at least one of the local justices is in sympathy with them. SPECIAL.

"What is domicile?" and answers in effect that "a man in order to change his 'domicile of origin' must choose a new domicile by fixing his sole or principal residence in a new country with the intention of residing there for a period not limited as to time." If this is quite in accord with the definition of the term "domicile" given in Wharton's and Bowerie's law dictionaries, and therefore surely in order to decide whether a party is "temporarily domiciled" in Canada, it is only necessary to inquire whether he has fixed his "sole or principal residence" in the country for a period limited as to time. I do not see how I can hold that these parties had either their "sole" residence or their "principal" residence in Canada during the time they were here merely for the purpose of enjoying a few weeks' fishing, even although they may have erected a building at more or less expense, not as a home, but for additional convenience and comfort in the prosecution of their sport. They were not owners or tenants of houses here, occupying them with their families for the summer months, as quite a number of their countrymen do, nor guests at any of our hotels, as so many with families are, as well as many single, even without families, but according to the case laid before me, they come here every year expressly and solely for the purpose of sport and leave as soon as it is over.

Let us suppose some point on the frontier, where it takes but an hour or so to cross the boundary line and reach a stream or lake on the Canadian side, and two American gentlemen come over for the purpose of fishing, both employing Canadian boats and boatmen, but one of them having his tent erected on the American and the other on the Canadian side of the line. I cannot see in the obvious policy of the regulations any reason why the last-mentioned should be allowed to fish without a permit, while the other is prohibited. The enacting authority could never have intended to attach the idea of domicile to a building intended and adapted merely to facilitate and render more comfortable the fishing operations of a party who comes here for no other purpose than to fish, whether such an erection cost \$5 or \$500.

I am not called on to say what conditions of residence by a foreigner would constitute a temporary domicile under these regulations. It is sufficient for the purpose of this case to say that those disclosed in the evidence and in the case stated do not. It is not my duty to inquire whether, in view of the restrictions, if any, placed on Canadian sportsmen using American waters, the regulations before me are or are not unduly restrictive or inhospitable; nor am I sportsman enough to know whether these regulations are more or less exacting in proportion to the privileges bestowed, than the Provincial legislation, which requires a license fee of \$30 from any one not domiciled in Nova Scotia to hunt moose in the Province. Nor am I called on to say whether a foreigner actually domiciled here is shut out by these regulations, and therefore in a worse position than a mere visitor, as suggested. It will be time enough to decide that when the occasion requires it.

Of the several questions submitted to me, Nos. 2, 3, 6 and 7 are all that require to be answered.

2. The defendants under the amended order in Council of Aug. 1, 1894, were not exempt from the previous regulations requiring permits.

3. The defendants were not temporarily domiciled in Canada within the meaning of the amended order.

6. The defendants were guilty of violating the Fisheries Act.

7. The defendants were properly convicted.

The convictions will therefore be confirmed and the appeals dismissed with costs.

CHICAGO AND THE WEST.

"His Trout."

CHICAGO, Ill., Oct. 26.—The writer of the appended story of a straight-away trout fight is a youth of about 14 years of age. He says, "I look forward to my FOREST AND STREAM each week, and read about the doings of other sportsmen, so I thought I would do a story for them to read." He calls it "My Trout," and it goes as follows:

My Trout.

On this camping trip we had a large party, twenty-odd in all, two doctors with their families, two other families and two visitors, to which already large outfit we had three guides. During our stay of six days the stream was well monopolized, and we had some great sport. The second day of our stay was the most eventful for me, raining a little and cloudy. That morning a party consisting of my father, Tappan and Stephen Gregory, Gratiot and Ted Washburne and myself, walked up stream by a logging road and cut into the stream a couple of miles up. Here we got our tackle ready and commenced to fish, going up stream, but we found no good fishing, although there were some good places. So we retraced our steps and started down stream.

We fished along not catching much until I went to a good-looking place, and as I started to fish there my father told me to leave the place to Ted, my youngest brother. I went on with Tappan, catching a few small fish, when a shout from our rear showed that some one had a good one on. It happened that Ted had caught a trout of 1½ pounds, his largest, and was very proud of his fine fish. Pretty soon we came to our boat, and we all got in because the water was pretty deep here.

I suggested that we troll with our trout spinners and worm the rest of the way to camp. On the way down we came to a place where a small clump of alders overhung the water. It was no different from the numerous other clumps of bushes we had passed. But as my spinner was under those bushes, I felt the tug which every trout fisherman recognizes as the strike of a big trout. I dropped my rod back and then struck; then and there the trout determined to get me into trouble as he dashed this way and that, but the rod was an elastic split bamboo of five ounces, which kept a killing strain on him.

From all around me I could hear advice shouted at me, no two people giving the same piece of advice. The trout crossed the stream several times, trying to reach snags and roots, but each time the strain brought him nearer to the boat. At last he came in sight, only to rush off again and to be carefully brought back. He did this several times until my father jumped into the water with a landing net, the boat in the meantime having drifted into shallow water. At the sight of the net the trout made a last dash, only to be brought back again and the net put under him. We weighed him immediately on some correct scales, and he weighed just 4½ pounds. He was a silvery fish from lying in the open water, and he put up a game fight. That is my record brook trout, and I was well pleased, I can tell you, to get him.

After that day I took no especial interest in the fishing; although I went I felt I had my luck and was willing to quit fishing for awhile.

Interesting Angling Gift.

Mr. George F. Knapp, of 714 Sheridan road, Evanston, this week made a present to his neighbor and long-time companion, Mr. Jack Wiggins. To-day I saw the gift, and it is so interesting and curious as to deserve comment. In brief it was a long, leather-covered case, something like the old trunk-shaped gun cases which were once popular. Opened out, this case disclosed itself to be a receptacle for all sorts and conditions of angling material. Mr. Knapp himself is one of those curious beings who can do all sorts of things with tools, and it is his delight to make things with his hands. The case contained four brass casting rods made on rather new lines. Each, as Mr. Knapp explained, was made of historic wood. The hand pieces were made of dark oak and black walnut, some of which was taken from the rails split by Abraham Lincoln. One piece came from an oak which formerly grew on Halsted street in Chicago, a tree which scientists declared to be 2,000 or 3,000 years old. Yet other pieces of wood came from the beams which formerly supported the old Liberty Bell in Faneuil Hall, Boston. Mr. Knapp himself was custodian of the Liberty Bell during the World's Fair, when it started on its journey around the world. He had in other sections of the rod pieces of cedar from Tennessee, of osage orange from the Western States, of cocoa palm from the Indies, of lancewood and other woods. The rods were not toys, but perfect tools for their purpose.

I noticed one invention which Mr. Knapp has used which ought to be adopted by all bait-casters. It is a sort of spur or trigger, like the finger-hold of a revolver grip. The curved projecting metal is placed on the grip of the brass casting rod opposite to the reel and a little way to its rear. The fingers of the hand fit into it and enable one to get a perfect control over the rod, leaving the thumb entirely free for thumbing the reel. The device is very simple and is very much worthy of wider use. Rod makers should see Mr. Knapp about this. As to the other contents of this notable fishing case, the casting reels, lines, hooks, etc., were in part the gift of the children or friends of Mr. Wiggins. There were nets, gaff hooks, line spindles, etc., in abundance. There were wire fish stringers, threading needles, skinning knives, fish scalers, disgorgers, weighing scales, together with clever devices for keeping hooks, flies, etc. in place. There was even a club, something like a short billy or policeman's club, to be used for knocking a large fish in the head. All these different articles were provided with lanyards and snap hooks, so that each could be attached to the boat and be found again in case the boat should be overset. Of repairing tools there were pliers, screw drivers, vises, etc., together with compass and full mending kit, a "housewife" with buttons and needles and a hundred other things which would take much space to specify. In all there were 187 pieces comprised in the equipment of the wonderful angling kit, and of this, every piece, whether of wood or metal, was made by hand by Mr. Knapp himself. There was no shop work or duplicate pattern in the whole outfit, from start to finish. The work could not have been duplicated by the most expert specialists in their respective lines, and Mr. Knapp thoroughly proved not only his patience and kindness, but his rare mechanical genius, in turning out this singularly complete angler's case. It cost three months of labor, and it was presented to Mr. Wiggins at a little house party the other evening. To-day Mr. Wiggins had Mr. Knapp bring it over to the FOREST AND STREAM office, as he felt so elated regarding the gift that he thought everybody ought to know of it and be advised yet more fully of the loving care which can be possible at the hands of one fond of the gentle craft. It was certainly a unique and valuable present, and one which it need not be said Mr. Wiggins will cherish all his life.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

A Worthy Disciple of Walton.

THE Westminster Gazette is responsible for the following apocryphal fish story: "A remarkable illustration of the ruling passion strong in death" has been furnished by the president of a provincial angling club. By his will he left £25 to provide an outing for the members of his club, at which he hoped that good sport would be enjoyed and no mourning worn. He further directed that his ashes should be carried in a bait can to the riverside, and, before a line was cast, scattered from a boat over the surface of the stream. By a felicitous coincidence, the combined catch of the club on the day when these directions were carried out was nearly double their previous record. Plato, in the 'Phædo,' pictures Socrates as desiring death for the pleasure of conversing with Homer. But what a meeting there must have been in Hades between this enthusiastic angler and old Izaak Walton!

"What a meeting, indeed! Walton would have broken his fishing rod over him had he ever come across such a desecrator of rivers. Fancy, if all anglers' ground-baited with their remains in this way, how the public and the water companies would howl about anglers' rights."—R. B. Marston in London Fishing Gazette.

Colonel.

NEWCASTLE, Pa., Oct. 24.—When the inevitable end comes no man could desire to die gamier than did old Colonel. He was a Lubrick-Llewelyn, and was the most famous dog in western Pennsylvania. For an even dozen years he was in demand by the hunters of the community. During the last days of the famous dog the spirit was unbroken and the desire for the chase was consuming, but his strength would not permit. However, the dying efforts of the old-timer were devoted to a run which those who thought most of him could not deny him.

Colonel had a record to be proud of. Coming from dogs that stand at the head of lists of distinguished ones, the subject of this sketch maintained the standard established by his sires. But of all the exploits in which he had taken part, there was none in which the owner and the admirers of the dog took greater pride than his last hunt. It was shortly after the beginning of the season that Will H. Hill, of Newcastle, Pa., Colonel's owner, decided on a day's hunt. His course led him past his father's country home. Here the last days of old Colonel were being spent. The welcome the old dog extended his master was touching. It was not demonstrative, because the weakened old legs would not permit wild caperings. With a piteous whine and trembling with emotion the aged hunter sat on his haunches and looked steadily into his master's face. He would move up and rub his nose on the gun and with a meaning look would whine anxiously as if begging consent to be included in the party to the chase.

Colonel's pleadings won the consent desired. He was taken into the rig and carried to the hunting ground. He was assisted over fences. The younger dogs were scurrying aimlessly in every direction. Colonel took in at a glance the possible hiding places of the birds, went there directly and had made a stand within five minutes after the guns had been taken from the cases. The privilege of bringing in both the birds was reserved for the old veteran. His delight was evident. He endeavored to caper as friskily as the younger dogs, but his legs went down in under him.

The second stand in Colonel's last hunt was made within a few minutes of the first success. He was fast becoming weak, and the bird was brought in by another of the dogs. It was when the party stopped to give the old dog a rest that he dragged himself toward a clump of elders and there made his last stand. This was in reality no stand, for he was resting on his haunches. The effect, however, was that one bird was shot. Then old Colonel dropped on his side and was overcome with exhaustion. After a while he raised himself, but was unable to walk. Slowly he began to stiffen, and it was evident that the end was near. He appeared to be suffering from the effect of the over-exertion. After a brief period, during which the old fellow's suffering did not come to an end, it was decided that he should be assisted across the great divide. It was not the owner who did the job. Colonel had been in Mr. Hill's possession for ten years, and he was greatly attached to him. A sound coffin and a little square in the corner of the garden adjacent to the Hill home is the Colonel's last resting place.

This dog probably retrieved more birds than any other dog in Pennsylvania. It is to his credit that in one year, at matches, he retrieved more than 2,000 birds. He was the dog selected to do the retrieving at the famous \$1,000 match of several years ago between Buchanan, of New York, and Braden, of Lawrence county, Pa. This match was held at the Beaver County (Pa.) Fair Ground.

The grandsire of this dog was the \$10,000 Llewelyn, and the grand dam was once the property of President U. S. Grant.

W. H. HILL.

Lost Dog.

DR. C. H. KEOGH, in a personal letter, takes up the question of dogs lost through carelessness, dishonesty and otherwise. The gentleman's letter is subjoined: "Any one who has lost a small Llewelyn setter bitch,

SUPPLEMENT TO FOREST AND STREAM, NOV. 2, 1901.

color white, ticked, markings black, tan on muzzle, may communicate with me. This dog, I am informed, was (probably) picked up in the neighborhood of Aurora in the month of September during the chicken season. It is now on a farm near that city. I ran across this one in looking up a pointer of my own which a trainer lost. My dog was actually lost by a trainer, and he has since recovered the dog for me.

"Dog No. 2 is a rather tall, thin, white and liver pointer dog—lots of liver—ticked. Yesterday, in looking after snipe, I ran across this dog. A farmer near Worth, on the Wabash R. R., near this city, picked him up eight days ago. The farmer says the owner came to him and told him the dog was lost, and that later if the farmer should see the dog, the owner would make it all right with the farmer if he would feed and care for the animal until the owner came back for the dog. This was eight days ago, and the farmer is getting tired of feeding the animal, and he asked me if dog was any good. I told him the animal was a valuable-looking pointer, and to keep him for owner by all means. He said he would.

"Some dogs are lost, and many are lost in the corn country, where looking for them is usually attended with about as much success as looking for the old needle in the haystack. Some trainers are honest."

Philadelphia Dog Show.

THE following specials have been received by the Philadelphia Dog Show Association for their show—Nov. 27 to 30:

A silver cup for the best brace of bulldogs, entered and owned by one exhibitor, to be won outright. Open to all, offered by Miss Ellen Drexel Paul.

The Poodle Club of England offers, open to all, a silver medal for the best poodle dog and bitch, respectively.

The Bull Terrier Club of America offers the Tommy Tickle Cup, the Dunston and Kennelly Cup, the Frank H. Croker Cup and its club medals. These prizes are open to members of the Bull Terrier Club in good standing on Nov. 20, 1901.

Attention is directed to the following errors in the premium list: The Cochran Challenge Shield, offered by A. De Witt Cochran, Esq., for the best Airedale dog, is inserted as the Carnochan Shield. The silver cup for the best brace of toy dogs is offered by Miss Mary Astor Paul, instead of Mr. James W. Paul, Jr., as announced.

The Fox Terrier Team Medals should read: Medal for the best team, smooth. Medal for the best team, wire.

Prize schedules and entry forms may be obtained by application at the office of the Association, 320 Wither- spoon Building. Entries close Nov. 11.

Points and Flushes.

A remarkable proof of a dog's homing instinct is reported by a Welsh correspondent, and as the canine traveler is a celebrity, we readily give prominence to her latest performance. Followers of sheep-dog trials will remember Old Merry, a very smart bitch, owned by Mr. C. Rice, of Llangurig, Montgomeryshire. Although in her fourteenth year, she had, up to quite lately, shown winning form, twice having won the Frank Thomas Cup at Ely. But a few weeks ago, Mr. Rice being in Cardiff, over a hundred miles from his home at the foot of Plynlimmon, left Old Merry with a friend, being convinced, now that her working days are over, that she would have a comfortable home in the metropolis of South Wales. Old Merry, however, thought differently, for the other day she turned up at her old home, having found her way, unaided, from Cardiff. How she did this is a mystery, but Mr. Rice is quite determined that he will not again attempt to get rid of her.—English Stock Keeper.

Official organ, FOREST AND STREAM.

'Mid Reef and Rapid.—XXVII.

BY F. R. WEBB.

So late in the summer in this mountain climate, the nights are cool, no matter how hot the days may be, and last night was unusually so, and when I crawled out of my tent, rather early, on this bright Sunday morning, having, for several hours, been unable to sleep for the cold, and undressed myself for the day, I pulled off a stout coat, a pair of long trousers, a heavy sweater and an extra flannel shirt, before reaching my full, daily attire, which had also been put on early in the night. I had also been sleeping in a tightly closed tent, under two blankets and a rubber coat (and "still I was not happy," George remarked, as he stuck his head out of his tent and saw me peeling off all these garments; he said it reminded him

of peeling the different layers off an onion). There was a thick, heavy, white dew on everything which stood in beads on the tops of our tents, and on the decks of our canoes, and lay like a frost on the grass, which was as wet as a rain could have made it.

I found Lacy out ahead of me. He was clad in his usual attire, plus a heavy, white sweater, and was curled up on his camp stool out in the sun, with a book in his hand and his everlasting little briarwood between his teeth, trying to extract what warmth was to be had from the early morning rays. When I started a fire in the camp stove with a view to breakfast, we were all three fain to huddle around it and bask in its grateful glow.

"The river's rising again!" I proclaimed, as I climbed up the steep bank, after performing my matutinal ablutions.

"Oh, pshaw, you don't say!" was George's disgusted exclamation.

"Yes, it has risen 6 inches since last night," I replied; "but it isn't muddy and it doesn't seem to be coming up very fast, and I guess it isn't much of a rise."

"I hope not," said Lacy.

"So do I," added George; "we've got a beautiful stage of water now, and the fishing's getting good, and a rise would spoil everything."

A quiet, restful Sunday in camp is a luxury, and we greatly enjoyed the Sunday spent in our pleasant camp here, although we found, as usual, plenty of occupation. Blankets, mattresses, etc., were hung in the sun. Mess chest and cooking utensils were overhauled and given an extra cleaning and scouring. Shaving materials were produced and used, and canoes and outfit generally given an overhauling and a general putting in order. Letters were written to the ones at home, and the log brought up to date.

Most of the afternoon was passed in our respective tents, with books, pipes and cigars, and we all of us enjoyed a prolonged siesta. The day was a pleasant, enjoyable one, and night came all too soon.

We made a leisurely start on Monday morning, as we had but a ten-mile cruise in view. As the result of a little correspondence from Shenandoah and Riverton, the boys were expecting some young lady friends from Berryville to visit our camp at Castleman's Ferry, and the intention was to drop down to that place and go into camp for a day or so, and wait for developments; so about the middle of the forenoon the canoes were packed and slid down the steep, high bank and launched in the lovely little basin below the waterfall, and we were again afloat.

We had a quiet, uneventful, though very pleasant three hours' cruise, and reached our destination about 2 o'clock in the afternoon. We were rejoiced to find the rise but trifling, and the river was already falling again, and the fishing was as good as ever, as we proceeded.

The river was swift, with several long reaches of bold, rocky rapids which, while rough, were tolerably free and open, and gave us no trouble, while affording us fine sport. A mile above Castleman's we passed a large camping party, occupying several tents, which were pitched on the right bank, in a beautiful location.

George's inevitable bugle brought many of the people, both ladies and gentlemen, to the doors of the tents, who gazed curiously at our bright, little, flag-bedecked canoes as they glided rapidly past, but we received no hail and did not land. We afterward learned that the party hailed from down near Washington.

We found a beautiful, little spot for a camp at Castleman's Ferry, on a turfy bank across the road from Mr. Osborn's fine, old-time residence, which is located right on the bank of the river, and permission was readily granted us to pitch our camp there, and, after partaking of a somewhat belated and therefore unusually ample lunch, the canoes were unpacked and leisurely carried up the bank, and the camp put up, including the fly.

The afternoon was passed pleasantly and quietly. We received letters and papers here, and had letters to write in reply. I took a walk up the pike for a mile, toward Berryville, until I had surmounted the long hill which sloped gently back from the river, when I was rewarded with a view of the beautiful country surrounding us—nowhere more beautiful than down in this part of the broad, smiling, well-tilled valley. The old Castleman mansion, not far from the road, was very interesting to me, and I was strongly tempted to invent some errand or other to take me up to it and get a closer view of it.

While rambling across the grounds fronting the old mansion, a little inclosure containing a few grave stones, shaded by a few old locusts and surrounded by a worm-eaten, old, picket fence, attracted my attention, and closer inspection revealed a flat tombstone covering a grave, on which was the following inscription: "Sacred to the memory of Mrs. Betty Carter, dau. of Mrs. Betty Lewis, who was a sister of Gen. George Washington," etc., "died 1830, aged 60 years."

When we landed alongside of the ferry boat, on reaching here, we noted several punts and rowboats moored under the stone wall just above the ferry, one of which, a wretched, little affair, sharp at both ends, and with very little beam and too much depth, in which George and I would hardly care to risk ourselves to cross the river, was afterward pointed out to us as the boat from which Rev. Mr. Brown, the unfortunate Front Royal Methodist minister, was drowned last June in Watson's Falls, a few miles above Harper's Ferry, while attempting a fishing trip from Riverton to Washington.

He and a son were in this boat, and Mr. Maurice Castleman and two other gentlemen were in a second boat. The river was up a few feet, as it is always liable to be in June, and Watson's Falls—at all times a peculiarly rough and dangerous place—was particularly so at this stage, and utterly unsafe to attempt in any kind of boat, particularly an open boat. This party attempted it, however, and Mr. Castleman, with the assistance of one of his friends (the other man wisely declined the falls, and went ashore and walked around), succeeded in getting his boat through, although filled with water. Mr. Brown, however, did not succeed in running the falls. His boat—already half swamped—struck a rock about half way down, and was capsized, and he and his son were thrown out. They hung to the boat, and were carried down the falls some 50 or 60 yds., when the boat again hung on the rocks near the foot of the falls, and they were torn from their hold and swept down the remorseless rapid. Both were ex-

pert swimmers, but all the skill a man might possess would avail him but little in such water. There was a life preserver in the boat, which, previous to the descent of the falls, the father had insisted upon the son buckling around him. The son, in some manner—sustained, most likely, by the live preserver—succeeded in getting ashore, but the father was unable to maintain himself in the horribly rough water, and was drowned.

The evening was spent quietly and cosily around a bright, little blaze of a camp-fire, which served to render our evening pipes and cigars the more enjoyable. The calm, quiet night was impressive in its beauty. Across the road the lights gleamed brightly in the Osburn mansion. People came and went, and the pleasant tones of voices in conversation on the ample veranda, mingled with merry laughter, which, with the bright strains of music from an excellent piano, whose keys were caressed by a well-trained performer, added a cheeriness to the camp scene quite out of the common. The tents gleamed brightly in the firelight, in which the sloping roof of the fly loomed up in relief against the darkness and the paddles, leaning against the great timber anchor, around whose windlass was wound the heavy, wire, ferry cable, stood out prominently in the flickering light, while, outside the little, illuminated circle, the trees loomed up in vague, black masses against the sky, and the river flowed still and mirror-like, reflecting in its calm bosom the countless stars in the firmament above, while, gently pervading, and mingling with the other sounds of the night, the musical murmur of the swift-flowing water, as it gurgled around the outer end of the ferry boat, fell in a drowsy, unending monotone on our ears.

Next morning's mail hack brought, among other letters and papers, a letter for the boys, stating that their Berryville friends would arrive that afternoon, and about 2:30, to the great pleasure of all of us, a carriage drove into the camp, from which alighted Major Moore, the Misses Moore and Miss McDonald. In such pleasant society the time flew rapidly, and at 6 o'clock, on seeing a lunch basket approaching from the carriage, I got up steam in the camp stove and prepared a large pot of coffee, some bacon and a cheese omelette, which, with the chicken fixings and other supplies and delicacies discovered in the lunch basket, made an ample supper, which rapidly dwindled away under the combined, spirited attacks of the party.

After supper the young ladies turned to with a will, and washed up the dishes, to the great delight of George and Lacy, to whom belongs the job of a dishwasher. Their efforts were much facilitated by the big bucket of hot water I prepared for them on the camp stove while we were engaged in eating supper. Their amusement over the little dish-swab contrivance used by the boys was great, and their disdain for the squeamishness which led to the use of such a contrivance, in preference to the feminine method of putting their hands in the dish water, was expressed with much freedom and vigor. It was observed, however, that they used it, and, before dish wash was over, its merits and advantages were so obvious that they were fain to admit that perhaps men knew a thing or two after all in regard to women's work.

They made an attempt to wash the melted resin, coal oil, etc., out of the iron ladle used more for purposes of refreshing the fire and patching the canoes than for culinary or domestic purposes, but, after persistent and unavailing use of soap and hot water, they perforce gave it up, with many expressions of wonder and disgust at the use of such a vile cooking utensil.

In due time the horse was hitched to the surrey and the party prepared to return to Berryville. The round of gayeties at Berryville held out in bright colors by the young ladies, including a card party to-night, a tournament to-morrow and a german to-morrow night, coupled with the cordial invitations of the fair visitors and backed by my own urging, proved too much for the boys, and when the party drove out of the camp, homeward bound, George and Lacy and the bugle went with them, after promising to forego the pleasures of the tourney and the german, and to positively return in the morning hack, leaving me alone in charge of the camp for the night. The little surrey was only built for four, and as it meandered slowly off up the hill the feet, legs and arms of the boys seemed to pervade the adjacent atmosphere in alarming proximity to the wheels on every side.

Major Moore cast wistful glances at the tents before starting—the camp instinct remaining as strong as ever with him—and their snugness appeared so inviting to him that it would have taken but little persuasion to induce him to remain; and I would have been glad of his society and could have put him up comfortably in Lacy's boat, his boat being the beamiest of the three. I did not urge him, however, for I feared that, at best, he would find the narrow, coffin-like accommodations afforded by the canoe entirely too circumscribed, and I also feared that the sharp, cool, September night would be felt by him too much, so he drove reluctantly away with his party.

"There now, I knew it," I exclaimed, as I walked slowly back from the road to the camp, "if those trifling girls in their cleaning up haven't gone and left that frying pan, which they used for a dish pan, unwashed and full of stale, greasy water! A nice lot of housekeepers they'll make. I don't think! It's the most disagreeable thing in the whole outfit to wash, and I'll have the job of doing it myself. Well, I won't bother with it now; I'll wait till morning and wash it while preparing breakfast. I ought, by rights, to use the other frying pan and leave this one for the boys to clean, after they get back, but I won't play such a mean trick on them."

So saying, I lit the lantern for the night, and hung it in its accustomed place, at one end of the fly, and, after my evening cigar, I walked over to Mr. Osborn's, where I passed a couple of hours very pleasantly, listening to the excellent piano playing of Miss Osborn, and contributing a little in that line myself. At 9:30, I bade good-night to my kind entertainers and returned to camp, where, after snugly ensconcing myself in my little cabin with book and cigar, I lay and read for an hour, and a half before I dozed my glim and went to sleep for the night.

I did not turn out particularly early next morning, having slept better than usual, owing to the fact that I had had the presence of mind to borrow Lacy's blankets the night before, and it was considerably after 7 o'clock when

I sat down to my solitary breakfast of fried bacon, eggs, potatoes and coffee.

While I was preparing it, Mrs. Osburn came across the road from the house with another large basket of hot rolls, having kindly sent us a basketful the day before. She also brought a little jug of cream and an invitation to come over and take breakfast with them. The rolls and cream were gratefully accepted, but the invitation to breakfast was declined, as mine was already sizzling away to a finish on the stove.

After the cooking things were put to rights and the camp tidied up for the reception of visitors, the Osburn ladies came over and inspected it. They took great interest in the various objects as I showed them around, from the compact and comfortable sleeping arrangements to the unique and original cooking outfit. Their wonder was great as to how so many things could be gotten into such small boats, and they looked on with great interest and amusement while I packed the kitchen ware, to illustrate partly how it was done, explaining, as I packed, how the different articles—frying pans, kettles, buckets, coffee pot, plates, etc.—nested together, one inside the other, until the whole outfit was finally contained in the one big bucket, which, in turn, found place in the up-turned camp stove, in which was also found room for stove pipe, coal oil can, tin cups and divers and sundry other small articles.

About 9 o'clock the mail hack rolled up to the door of the store across the way, to leave the mail sacks, and I was not surprised to note that the boys were not in it, as, in spite of their assurances that they would return in the morning without fail, I felt confident that the attractions of the tourney and the german, coupled with those of their fair friends, would prove too much for them. I had, however, but barely given them up when I was roused by the familiar, dulcet blasts of George's bugle—George, I think, sleeps with that instrument of torture under his pillow—and, in a few minutes more, they walked into the camp, having gotten out of the hack at the top of the hill and walked down.

Mr. Osburn was much disappointed last night that George had gone away, as he had been very desirous of having us play some more piano and violin duets, so this morning, after the canoes were packed and ready to launch, George and I spent an hour in the parlor, rendering such duets as we could extemporize from Miss Osburn's stock of songs, and it was 11 o'clock when we finally slid the canoes over the side of the ferry boat into the river and embarked.

With cordial adieus and well wishes from our newfound friends—whose kindness and cordial hospitality had made our little stay here a delightfully pleasant one—we turned our prows down the river and were soon out of sight.

The day's run, though uneventful, was a delightfully pleasant one. Lacy was not feeling quite well, so we dallied lazily along in the shade of the overhanging trees as much as possible. We were in no hurry, as we only intended to cruise as far as Shannondale Springs for the day—quite a short day's cruise on the present good water—so as to have the whole of to-morrow in which to pick our way through the rough, dangerous water with which the river ends its course, our camp at the springs taking us within two or three miles of the beginning of this rough water.

The river, always beautiful, became more and more so as we proceeded. Broad, deep and majestic, it flowed for the most part, broken, as above, by frequent, long, beautiful rapids, which, at the present stage, while long and rough, gave us no trouble, as the boat channels were good and plainly apparent, in whose strong, deep flow the sparkling wave crests scarcely wet our decks. Frequent broad, low, turf banks and lawn-like slopes swept gently up from the river, shaded with fine, old trees and dotted with comfortable, mansion-like farmhouses, replacing the almost-continuous bluffs which had seemed to line the river above, and which still appeared at intervals—massive, picturesque and imposing, towering their rocky fronts above the black, reflective depths of the river, as it washed their bases.

The water, which had been clearing steadily ever since we left Riverton, was of marvelous purity, rivaling the clear, amber, trout streams of the mountains, so transparent that every rock, reef and pebble on the bottom, in 8 or 10 feet of water, was distinctly visible through the deep, blue haze, through which the rays of light penetrated in long, slanting lines, and a curiously giddy sensation was produced in all of us, when, standing up in the canoes to reconnoitre a rapid or fall, as we glided along over the abysmal bottom, with the great chasms between the uplifted reefs, apparently suspended in air.

Sometimes for miles we shot along on swift, shallow water, not over a foot or two in depth, over a gravelly bottom, which gleamed with a warm, amber tint through the glassy medium as though covered with a thin sheet of varnish, and the sensation of swiftly gliding along just above the ground, without touching anything and without effort, was deliciously novel, and more like flying than anything I have ever experienced.

The curling wave crests in the rapids gleamed with a pearly whiteness, while the ever-present limestone ledges assumed a blue-black hue through the transparent medium.

The paddle blades assumed a peculiar, obtuse angle with the shaft, or loom, and gleamed with a yellowish indigo tint through the deep, blue water of the pools, and a long, funnel-shaped line of pearly, bluish bubbles gleamed deep down in the water after each stroke, and curled and wreathed upward to the surface in beautiful little, spiral whirlpools, and lingered to dance awhile in our gently swirling wakes, before dissipating into the air.

The fishing was, of course, excellent. Below each reef or line of falls George and I would round in on the slack water on one side or the other of the swift tail, which poured through the gap in the reef down over which we had just shot, and make a few casts right and left, while Lacy drifted lazily on the slackened current below, as he waited for us. Our casts were rarely unrewarded with a rise, and my flies were satisfactorily alluring, while George's diabolical phantom was as deadly as ever, and his canoe became fairly encumbered with the weight of fish dragging alongside in his stout, twine fish bag long before we made our evening camp.

[TO BE CONTINUED.]

A. C. A. to Meet on Cape Cod.

CANOEISTS representing the entire Eastern part of the country and a part of Canada attended the annual meeting of the Executive Committee of the American Canoe Association at Newton, Mass., on Oct. 26. The host was Com. Louis Armitage Hall, and the entertaining club was the Wawbewawa, of Auburndale. The gathering extended over Oct. 27.

The features were the selection for the first time of an Eastern site for the next national meet, on Cape Cod, probably Chatham, Aug. 8 to 22; the announcement of the purchase of a permanent camp, Sugar Island, in the St. Lawrence River, and the adoption of a new type of sailing canoe to conform with that of the Royal C. C.

The last-mentioned change came through the suggestion of Herman Dudley Murphy, of the Winchester C. C., who failed to bring back the Royal Canoe Challenge cup from the other side this summer.

The new name for Sugar Island, which is not yet confirmed, is Ya-ka-wa-tha.

Francis J. Burrage, of the Wawbewawa Club was chosen Secretary-Treasurer, and H. H. Smythe Library Custodian.

Red Dragon Canoe Club.

THE annual fall paddling trophy race of the Red Dragon C. C., of Philadelphia, was held over the Delaware River course, at the club's house, Wissonoming, Pa., Saturday, Sept. 28. In addition to the paddling race, a swimming contest was held.

In the paddling race, one-half mile, M. D. Wilt won first by a few inches. E. D. Hemingway second, H. E. Davis third. McLeod withdrew.

The swimming race was won by H. E. Davis, McLeod second. Denison withdrew.

In the evening a supper was served in "Snug Harbor," the Rathskeller of the club house. During the evening the trophies offered by the Commodore were presented to the winners.

The club members have enjoyed many cruises this summer, principally day trips on the several narrow, winding creeks within a few miles of the club house, the Rancoas, Pensauken and Pennypack being the favorite runs. On the first-named stream several two-days' trips were made, in which the wives of some of the members formed part of the crew. This has been a canoeing year for the Red Dragons, and the sailing interest appears less than for several seasons. W. K. P.

Yachting.

THE very interesting letter that appeared in our issue of last week under the heading "Communications," signed by J. C. Jacobsen, was received by Mr. F. Grey Griswold, owner of the cruising ketch Savola, who sent the letter to us for publication. The letter was written by the sailing master of the yacht on his arrival in Florida waters, informing the owner of the boat's safety after a bad passage down the coast. The boat's performances under the most trying conditions were remarkable, and fast time was made on the run.

Savola was designed by Mr. Ralph M. Munroe, of Coconut Grove, Fla., and was built by Messrs. A. C. Brown & Sons, Tottenville, S. I. The yacht is 67ft. over all, 50ft. 6in. waterline, 17ft. beam and draws 2ft. 10½in. Her least freeboard is 2ft. 6in. The area of her lower sails is 2,026 sq. ft. Savola is equipped with a 16-horsepower International gas engine.

MESSRS. TAMS, LEMOINE & CRANE, the well-known yacht designers and brokers, have announced that Shamrock II. was put on their sale list by Sir Thomas Lipton shortly before he left America. The news was something of a surprise, as Sir Thomas had intimated that he would challenge again in 1903, and that being the case, Shamrock II. would have made a most valuable trial boat, as she was so evenly matched in speed with Columbia, and it now looks as if Sir Thomas had given up the idea of having another try for the America's Cup. No price was set on Shamrock II., her owner simply saying that he wished to be advised of any reasonable offers that might be made for her. It is unlikely that she will be sold to an American, as she would be an unsuitable boat to race in these waters. Unless Columbia and Constitution were put in commission she would not have a competitor, and the expense of running these big boats is so great that they are now seldom raced, unless there is a challenge for the Cup, and as next year bids fair to be an off year for that great event, it is not probable that any of the big fellows will be seen in the racing.

As Mr. William Fife and Mr. George L. Watson have both put themselves on record as not wishing to undertake the task of designing another Cup yacht, the London Field in the following editorial runs over the situation and comments on the possible English designers that might be competent to turn out a successful boat in the event of there being another English challenge issued:

The question naturally arises, if another challenge is made, who will be the designer of the yacht which will represent a British club in the contest for the America's Cup? Shamrock I., designed by Mr. Fife, tried and failed in 1899, and now that Shamrock II., the outcome of Mr. Watson's labors, has also been beaten by Columbia, to whom can any syndicate or individual intrust the work of thinking out the lines of a new challenger? A number of names at once occur of designers to whom this thankless task might be allotted. First of all, we have that eminent young designer, Mr. Charles E. Nicholson, of the firm of Camper & Nicholson, at Gosport. Mr. C. E. Nicholson has more than once struck the keynote of success with an entirely new departure in yacht architecture, and it must be remembered that it is only a new departure in design that will win the America's Cup—the trophy will not leave New York in the locker of a vessel which is merely a replica of a Herreshoff yacht. We may try year after year with mere copies of former

American productions and emulate the evolutions of Mr. Herreshoff's brain *ad infinitum* without hope of success, but if we want to win we must strike out a line of our own, cast off the mantle of convention, and make a bold bid for originality. Next to Mr. Nicholson—we are not attempting to enumerate our designers in the order of their merit, but merely mention the names as they occur to us—we have Mr. A. E. Payne, of Summers & Payne, at Southampton, whose racing yachts built during the last few seasons have been prettier vessels than any of those launched on the Clyde; in fact, it is not too much to say that some of Payne's best boats have known no equal for beauty on either side of the Atlantic.

Mr. Crowninshield, the originator of the scow yacht in America, was given a chance to build a Cup yacht to defend the trophy when he constructed the ill-fated Independence for Mr. Lawson, even though for divers reasons the vessel was not properly tried. Mr. Crowninshield was essentially a small-boat man, but many yachtsmen in America still believe that, given a fair chance, he could give Mr. Herreshoff points at his own game of designing 90ft. racers. We have at Cowes in Mr. C. Sibbick, of the Albert Yard, an equally original and, to our mind, even more skillful designer of small craft, and it would be a matter of momentous importance in the history of yachting if he were given a chance of designing a yacht to contest for the America's Cup. Mr. C. Sibbick has literally designed hundreds of racers, and although among them there have been some bad sea boats, and others with various troubles and faults to be recorded against them, they almost without exception have been winners. Sibbick's boats are proverbially fast, and when light displacement is left unchecked, as it is under the rating rule of the New York Y. C., Mr. C. Sibbick is to be seen at his best. If the enterprising owner of the Albert Yard at Cowes could put on the water a 90ft. Sakuntala, which could be handled as easily as that vessel, Columbia would be completely outclassed.

While considering who is the best man to design the next challenger for the America's Cup, we cannot help feeling that there is room for a young designer to come to the front at the present time, and in addition to the claims of the before-mentioned gentlemen, those of Mr. J. M. Soper, Mr. Mylne and others to distinction in their profession should not be disregarded.

During the past season the most successful designer in this country has been Mr. Fife, and we think if he were given another chance of drawing the lines of a challenger for the America's Cup it would be found that she would take a somewhat different form from Shamrock I. and Shamrock II. It has been said that Mr. Fife was partly responsible for the design of the second Shamrock, but such a saying is totally inaccurate and without a vestige of foundation. Mr. Fife most loyally gave Mr. Watson the lines of his Shamrock I., and afforded him all the information he was able about the vessel, but he had nothing whatever to do with designing Shamrock II., which was solely produced by Mr. G. L. Watson. When thinking out the new linear rating rule, Mr. Fife certainly struck some fresh ideas, and if they were evolved in the first instance more with a view to saving a little here and there in the new system of measurement—or shall we say evading the girth tax?—rather than with the idea of finding a new form capable of attaining a higher speed in relation only to length and sail area, it is by no means certain that practical results have not shown that something more than was originally contemplated has been accomplished. By this we mean that Magdalen, Piccolo and Zinita, now called Sorais II., do not owe their success merely to the fact that they saved a bit on their 4d measurement, but the form of these flyers is in itself a departure in the right direction. If a 52ft. Magdalen could so easily beat a Senga, why should not a 90ft. Magdalen be proportionately faster than a Shamrock? We hope that Mr. Fife may have an opportunity of solving this problem in the near future.

Buzzard's Bay One-Designed Class.

IN a recent issue of FOREST AND STREAM, mention was made of the new class of one-design boats for Buzzard's Bay yachtsmen. In this issue we are able to reproduce the cabin and sail plans of these boats.

One-design classes have been anything but successful in American waters, and as they are detrimental to the science of yacht designing, it has been our policy to oppose them. The only really successful one-design class that has stood out prominently in yachting history is the Newport special thirties, and conditions have always been in favor of these boats, being owned as they are by members of the wealthy Newport summer colony. The owners, coming to the same place year after year and being men of leisure, are able to race almost every day, and in that way the interest is never allowed to flag.

The Buzzard's Bay one-design class was suggested by the success of the Newport thirties, but even though the Herreshoff Manufacturing Company is to design and build them, it is hardly probable that the new class will be as good as the Newport boats. It is barely possible that the new boats will be as fast and weatherly as the Newport specials, for in designing those boats Herreshoff hit upon a combination of speed and ableness that he has never since reached in boats of that size.

The syndicate of yachtsmen that was formed to build these boats is rather an exclusive one, with laws of its own, amendable only by the rules of the Beverly Y. C., but that the rules have met with general approval is shown by the fact that twelve boats are to be built. The following is the agreement entered into by the members of the syndicate:

"It is mutually agreed that the present owners shall reserve for themselves the right of admitting to participation in their races, by unanimous vote, any new boats constructed after June, 1902.

"It is still further mutually agreed that in case of sale by any member of the syndicate to any one not a member of the Beverly Y. C., the present owners shall reserve the right of admitting or not the new owner to participation in their races, also by unanimous vote.

"As the object to this class is to combine comfortable cruising with racing, it is mutually agreed that no part of the equipment, as received from the builders, shall be removed from the boats previous to any races.

30 FT. Cruising Class for Buzzard's Bay.
HERRESHOFF MFG Co. BRISTOL, R.I.

BUZZARD'S BAY ONE-DESIGN CLASS OF THIRTY-FOOTERS.—DESIGNED AND BUILT BY THE HERRESHOFF MANUFACTURING COMPANY, 1901.

"It is still further mutually agreed that the boats shall be hauled out not oftener than once in two weeks and shall not remain on the ways more than three consecutive days, except in case of necessary repairs."

It is understood that the members of the syndicate have agreed that the racing crew shall consist of five, of whom two may be professionals.

The plans of the boats give one a very good, general idea of what the boats will be. In appearance they resemble Effort, Spasm and Leda, with the exception of the cabin house, which is a narrow one. This is an improvement, as it adds to the boat's appearance, and gives far more room on deck, yet it does not cramp the cabin. There are six large, rectangular lights in each side of the house, so that the cabin will be well lighted. The cabin trunk is 13ft. long and 4ft. wide. The cockpit is watertight, and of good size, the inside measurement being 8ft. 6in. It was originally intended that the boats should steer with a horizontal wheel, but this idea was abandoned and a tiller substituted. On deck forward is a small capstan in place of the usual windlass. The compass is placed in rather a unique place. The coaming of the cockpit runs by the after end of the cabin house

and sweeps in, abutting against the trunk about 18in. further forward; the space made by this arrangement is utilized on the port side for the compass.

The centerboard is of the dagger pattern and houses under the cabin floor. The pennant for raising and lowering the board runs through a pipe, which is placed in the corner of the lavatory, up to the top of the cabin trunk, where it connects with a tackle on the starboard side.

The rig is a good one for this type and size of boat, and the only exception we take to it is the topsail, which is a useless sail, as shown in the drawing, for it could hardly be made to draw except when sheets were well started, to say nothing of its extremely ugly appearance. Besides the working sails shown on the plans, the boats will be equipped with the usual light sails, also a trysail and storm jib.

The interiors of the boats are well arranged, and have a very fair amount of room. On each side of the companionway is a wide berth 6ft. 3in. long, about half of which runs under the deck aft. Under these berths are lockers. A good-sized water tank is placed under the companionway. Forward of the after berths are two

more, one on each side, with two drawers under them. In front of these forward berths are transoms, under which are lockers. On the starboard side of the cabin forward is a full-length, hanging locker. On the port side, opposite, is the lavatory, which contains a set basin and closet. In the galley there is full headroom over a space of 2 sq. ft. The stove space and a cupboard are placed on the starboard side, while the refrigerator is on the port side. In the forecabin there is one pipe berth on the port side and plenty of room for another on the starboard side. A hatch located just aft of the capstan lights and ventilates the forecabin. There are two hatches on the cabin house, one over the lavatory and galley and the other over the main cabin. There is 5ft. 6in. headroom under the cabin house, and 6ft. clear under the hatches. The cabin floor is 2ft. 8in. wide.

The dimensions are as follows:

Length—	
Over all	45ft. 9in.
L.W.L.	29ft. 4in.
Overhang—	
Forward	7ft.
Aft	9ft. 5in.

Gaff	22ft.
Bowsprit outboard	8ft. 6in.

Rhode Island Y. C. One-Designed Class.

In the early part of this year several members of the Rhode Island Y. C. decided to establish a one-design class of raceabouts, to be 18ft. on the waterline. Mr. Fred S. Nock, of West Mystic, Conn., was commissioned to design the boats, and after a season's racing and cruising the owners are unanimous in their praise of them. The first trip that the boats made was from Noank, Conn., to Pawtucket, R. I.; the wind was strong from

RHODE ISLAND ONE-DESIGN CLASS.

the E. to start, and as it had been blowing from that quarter for more than a week, consequently there was a nasty sea on. The race was started off Watch Hill, and nine of the boats entered. When they reached Point Judith the wind hauled to the N.E. and blew with increased velocity, making the entire course a beat to windward. The run was made in ten and one-half hours—very good time, considering that the weather conditions were so bad and that the boats were untried. The only accident that happened was the breaking of the tiller on Flying Fish. Mr. Howard E. Barlow's Vim was the winner.

Another one of these boats, Baby Roger, owned by Mr. F. A. Chase, made the trip from Noank, Conn., to Bristol,

RHODE ISLAND ONE-DESIGN CLASS.

R. I., close hauled the entire way, in six and one-half hours, a remarkable run for so small a boat. The two photographs which accompany this article give a good idea of the appearance of the boats regarding both their general design and rig.

The dimensions are as follows:

Length—	
L.W.L.	18ft.
Over all	28ft.
Overhang—	
Forward	4ft. 5½in.
Aft	5ft. 6½in.
Freeboard—	
Stem	2ft. 9 in.
Taffrail	2ft.
Least	1ft. 1 in.
Draft—	
Board up	2ft. 7 in.
Board down	5ft. 11 in.
Beam—	
Extreme	9ft.
L.W.L.	8ft. 3 in.
Area lateral plane, including rudder and centerboard	36.71 sq. ft.
Displacement	3,920lbs.
Ballast, on keel (iron)	1,500lbs.
Mast, deck to shoulder	27ft.
Boom	23ft. 4 in.
Gaff	13ft. 6 in.
Area—	
Mainsail	403.25 sq. ft.
Jib	101.75 sq. ft.
Total	505.00 sq. ft.

INDRA.

Photo by N. L. Stebbins, Boston, Mass.

The keels are of oak gin. wide amidships. Stem sided 3in., planking is of cedar ¾in. thick when finished. Frames are of oak 1in. square, spaced gin. on centers. Decks are of ¾in. pine, covered with canvas, as is the top of the cabin house. The cockpit is watertight, and drains out aft. The centerboard is raised and lowered from the forward end of the cockpit.

is not measured, shall be triangular. No spinnaker shall extend above the spinnaker halyard block, or beyond the end of the spinnaker boom. No jib shall extend above the highest jib halyard block, or beyond the end of the bowsprit.

Sec. 13. The official measurer shall be provided with the correct sail plan of any boat to be measured, and previous to the measurement the owner should cause distinguishing marks satisfactory to the measurer to be placed on the spars as follows: On the masts at the tack and at the throat of the mainsail, there to be but one mark each for throat and tack, foresail and mizzensail respectively; on the boom at the clue of the mainsail, foresail and mizzensail respectively. These marks shall be black bands not less than 1in. wide, painted around the spar in a manner satisfactory to the measurer. The inner edges of the bands shall mark the limits to which the sails may stretch without exceeding the sail area allowed. No part of any sail shall extend beyond these marks or beyond the point limited for spinnaker and jib halyard blocks in Sec. 12.

There are several things in these changes that are commendable. In Sec. 10 the change is made of measuring the actual area of the headsails instead of the area of the forward triangle, as formerly. This gives the yachtsmen an opportunity of placing headsails where, in their opinion, they will do the greatest amount of work. It gives greater amount of leeway in rigging, while the proportion of the headsails to the mainsail remains the same. The official markings on the sails are an admitted necessity.

In figuring out the limits of the spinnaker and balloon, under Sec. 12, measurements were taken from existing boats, and also from experimental sail plans. The rule governing the limits of the spinnaker makes the area of that sail 2.75 times that of the working headsails, while the restrictions on balloon make its area 1.5 times that of the working headsails. As the proportion of sail area is governed by the beam of the boat, it will be seen that this rule is likely to be fair to all.

The rule governing percentage was again brought up, but was again considered too weighty for hasty consideration. It was proposed, however, that the percentage table of the Beverly Y. C. be adopted, and it is likely that at the next meeting of the Association this will be accepted. By doing this the percentage for second place instead of becoming smaller will become greater. The Beverly Y. C. percentage rule is one that will commend itself to all. It is based on a sliding scale, and the amount of percentage depends upon the number of entries, but all yachts racing are given a mark. Under this rule a yacht which has beaten another yacht the greater number of times is sure to get the greater percentage. It compels a yacht to sail if she wants to get a look in at the championship.

It has been rumored that one or more Seawanhaka cup yachts are to be designed in Boston, but a thorough search failed to reveal that any such designs have yet been started. It was gathered that such news would not be beyond the bounds of possibility at an early date, as some talk has been made with one Boston designer.

Crowninshield is at work on a 30-footer, Long Island Sound Yacht Racing Association rating, for Mr. W. C. Allison. She is to be raced at Bar Harbor. Mr. Allison's 32-footer, which was designed by Crowninshield and built by Lawley this season, has been fitted with a new set of spars. Crowninshield is now at work on the lines of another fisherman for W. J. Emerson. She will be 80 tons, net, and will probably be built by Story, of Essex.

Starling Burgess has just turned out a 21ft. cruising knockabout for Mr. Leland Powers. She will be used for fishing around Block Island. There is considerable body to this boat, and she is well cut up. She is of the semi-keel type, with the centerboard below the cabin floor. He is also at work on the lines of a 28ft. Y. R. A. yawl.

Our Boston Letter.

Boston, Oct. 28.—A special meeting of the Yacht Racing Association of Massachusetts was held Thursday evening, at which several amendments, that were laid over from the regular October meeting, were brought up for further consideration. The matter of entries under Rule III., Section 1, was amended by striking out the words "It must be accompanied by a certificate of measurement, club measurer's certificate accepted subject to protest, such entry to answer for one season," and to add, "Such entry to be sufficient for one season," and "A yacht may enter in all the classes to which she is eligible." The principal feature of this amendment is in allowing a yacht to race in all classes to which she is eligible. This privilege is enjoyed now under the rules, and the offering of the amendment was simply to obtain the opinion of the majority as to whether the custom should be continued.

The matter of allowing any kind of freak boats to race in the unrestricted classes was again brought up, although defeated at the regular meeting. The same general feeling was evident Thursday night—that is, that freaks are not desired. The movement to abolish the use of trusses entirely was also brought up, but with no better success than before. The racing men in Massachusetts are strong in the use, or misuse, of trusses for the purpose of lengthening or shortening the waterline, but they realize that, in certain boats of the unrestricted classes, trusses are almost a necessity, and they are willing that they should be used, provided they are used rightly.

Under Rule VIII., Sections 6 and 7, governing scantling restrictions, it was voted to insert the words "above the cabin floor" after the words "floor space" in both sections. By this amendment it becomes possible to locate the cabin floor and the cabin headroom permanently, a thing which has bothered the official measurer during the past season.

Sections 10, 11, 13, 14 and 15, of Rule VIII., governing sail area, were amended, and as the new rules which were adopted to take their places may be of interest to racing men in other sections, I quote them in full. They are as follows:

Sec. 10. The actual area of the sails allowed in Rule XII., except balloon jib and spinnaker, shall be measured by the official measurer. The number of square feet in each sail shall be stamped on each sail by the official measurer in full, round, black figures, not less than 3in. high. This number shall be known as the official number of the sail, and shall always be visible. Any yacht using a sail not bearing the official number shall be disqualified, any rules to the contrary notwithstanding.

Sec. 11. In no case shall the area of the mainsail and maintopsail exceed 80 per cent. of the entire area allowed.

Sec. 12. The distance from the center of the mast to the outer end of the spinnaker boom when the latter is at right angles to the fore and aft center line of the yacht, multiplied by the height of the spinnaker halyard block above the deck, shall not exceed 550 per cent. of the actual area of the working headsails.

The distance from the forward end of the bowsprit to the center of the mast, multiplied by the height of the highest jib halyard block above the deck, shall not exceed 300 per cent. of the actual area of the working headsails. Spinnakers and all headsails, the actual area of which

for his uncle, Vice-Com. Walter Burgess, of the Boston Y. C. Besides these, he has an 18ft. cruiser of 9ft. beam and 16in. draft, which, it is thought, may develop some speed.

JOHN B. KILLEN.

The Three-Masted Cruising Schooner Shenandoah.

WORK on the three-masted topsail schooner yacht building for Mr. Gibson Fahnestock at the yard of the Townsend & Downey Shipbuilding Co., at Shooter's Island, S. I., is well under way, and the yacht is now nearly plated.

Shenandoah, for that is what the yacht is to be named, was designed by Mr. Theodore E. Ferris, who is Superintendent of Construction for the builders. She is 135ft. long over all, 10ft. on the waterline, 27ft. beam and draws 14ft. The yacht resembles in many ways the craft now building at the same yard for the German Emperor. In design the yacht shows that she is intended solely for cruising, and has no abnormal features in her make up. The midship section is easy and well-turned, with full garboards. The bow sections are easy, being just full enough to prevent diving and taking solid water on board. The yacht has a raised quarter deck, an arrangement similar to that on Mr. Tod's schooner Thistle. All the deck fittings are of teak and are designed to stand heavy strains. Six boats will be carried, also two life-boats, two gigs, a cutter and a launch.

The rig is a novel one, and in a way is an experiment. By putting in a third mast the size and weight of spars all through were reduced greatly, permitting the yacht being put under shortened canvass in much less time and with fewer men than if she were rigged as a two-master.

Shenandoah is very roomy below deck, and her cabins are laid out to the best possible advantage. The main saloon is 15ft. long and extends the width of the boat. This room is fitted with an organ and a fireplace, in addition to the usual furniture. The main cabin occupies the central part of the vessel; aft of that department come two staterooms, each 10ft. by 12ft. These rooms are furnished with double beds, bureaus, hanging closets, wash basins, sofas, etc. On the starboard side opposite is another stateroom and a bath room. Next aft on this side is the owner's bath room; adjoining is the owner's stateroom, which is 11ft. by 25ft. Aft of the owner's room on the starboard side is the sailing master's room, and opposite is the chart room. The main companion-way leads from the passage running aft from the saloon to a small deck house, which will be used as a sort of an observatory by the owner and his guests in bad weather. The boat is decorated in the Colonial style—all the trim, base boards, wainscoting and paneling being of white pine, finished in an enamel cream-white, while all doors are of mahogany. This scheme of decoration gives a light and airy appearance to the cabins.

Forward of the saloon are the pantry and galley, and still further forward come the officers' quarters and the mess room. A large fore-castle is in the extreme forward part of the boat.

Shenandoah will be launched in December, and will be finished and ready to turn over to her owner early in January. The yacht will be taken by her owner to the West Indies first, and later to the Mediterranean.

A Comment on Yacht Measurement on Great Lakes.

Editor Forest and Stream:

The current number (Oct. 19) of the FOREST AND STREAM contains a virtual confession of the failure of the measurement rules of the Yacht Racing Union of the Great Lakes to secure or encourage the building of a satisfactory type of yacht in the action taken of instructing the Construction Committee to frame a rule to secure greater living space on board yachts.

In considering this question, the right of every yacht owner to a liberty of choice or of individual action should not be infringed by arbitrary requirements which would make a yacht unsuited to his purpose. On the other hand, the general principle should be recognized that, to have good racing it should be impossible, by any sacrifice of seaworthy qualities, room or strength, to obtain an advantage over competitors that is not in some way compensated for.

The general principle to be followed, as has often been stated, is to encourage the building and racing of fast, seaworthy, strong yachts, which purpose will be secured if the yachts have moderate sail areas, good displacement, reasonable draft and moderate ratio of ballast to displacement.

This will, I believe, be admitted by the thinking yachtsman as broadly true; there is, however, one feature of design concerning which there is likely to be a question raised, and that is unrestricted overhangs, whereby a vessel of full ends can increase her length and decrease her beam when heeled to her usual sailing angle. I would suggest that this case is one that, with our present rules, enables a yacht owner to get an advantage without paying for it if he wants a racing machine.

It can only be met by abandoning the length feature measured when the yacht is on an even keel and substituting in its place the measurement of the yacht when heeled to the usual sailing angle. To frame a rule which will meet the conditions existing to-day is extremely simple if considered broadly; the difficulty arises when we attempt the impossible. Some years since I suggested through your columns a rule which meets every condition, and I submit it again, hoping it may provoke intelligent discussion.

In each class fix the following features:

Sail Area—Not more than a certain number of square feet of actual area.

Length—Not more than a certain length on the L.W.L. when the yacht is heeled to her usual sailing angle.

Draft—Not more than a certain amount; centerboards not weighted may drop below this limit.

Displacement—Not less than a certain number of pounds.

Ballast—A certain percentage of the displacement.

As a concrete example, take the 35ft. class:

Sail area, 1,600 sq. ft.

Length, 36ft.

Draft, 7ft.

Displacement, 18,000lbs.

Ballast, 6,000lbs., or 33 1-3 per cent.

These dimensions leave the designer absolutely free to produce any form of hull he desires; the yacht will be as speedy as any yacht at present in the class when carrying the same sail area and displacement, and might easily be faster. She would have excellent accommodations even if a fin-keel with low trunk, but little advantage would be gained if the owner made her flush deck. The construction could be substantial and a full cruising outfit carried. In general terms, the only advantage one yacht could have over another would be that due to superiority of form or rig, the two things yachting is presumed to foster.

The skill of the designer would be shown in these two points; of the owner and sailor in the use he made of them.

It would be easy to fill your columns with arguments showing that this rule is being approximated more nearly to each year; that it contains every good feature of any present rule, with none of their bad features; that it is impossible to "beat" it except through false swearing, and then only for a short time; that the measurement can be more easily obtained than for any present rule; that it can be modified to meet any desired feature; that it gives practically equal opportunities to own winning yachts to the man of moderate means and to the millionaire, and finally to show the complete failure of all of the present rules to secure the building and racing of decent yachts in full classes.

GEO. HILL.

Oct. 22.

N. Y. Y. C. Fifth General Meeting.

THE fifth general meeting of the New York Y. C. was held at the club house on Forty-fourth street on Thursday evening, Oct. 24. The Challenge Committee made its official report on the result of the recent races. Ex-Com. S. Nicholson Kane offered the following resolution:

"The New York Y. C. is again called upon to express to Com. J. Pierpont Morgan its grateful appreciation of his continued interest in the club. For several years its honored head, Mr. Morgan, has, by his sportsmanlike spirit and his many lovable qualities, won the esteem and the affection of his fellow members.

"In 1898 he presented to the club the land upon which the present club house is erected. In 1899 he built Columbia, equipped and maintained Defender, and with the former successfully defended the America's Cup. In the present year he again placed Columbia at the disposition of the club, and that vessel being selected to represent the club in the race with Shamrock II., for the second time added a victory to the long list of successful contests for the prized trophy."

It was resolved that the Secretary be instructed to transmit to Mr. Morgan a copy of this resolution, suitably engrossed.

On the motion of Mr. W. B. Duncan, Jr., the club thanked Com. E. D. Morgan for his services as manager of Columbia in the races against Shamrock II.

The thanks of the club were also voted to Vice-Com. August Belmont, Col. Oliver H. Payne, Mr. Henry Walters, Mr. Frederick G. Bourne and Mr. James Stillman for building and maintaining Constitution to aid in the defense of the America's Cup. Mr. W. B. Duncan, Jr., was thanked for his services in managing Constitution during the past season.

It was resolved that a committee of three be appointed by the Commodore to procure suitable pieces of silver to be presented by the club to Com. J. Pierpont Morgan, Com. E. D. Morgan and Mr. W. B. Duncan, Jr., with suitable inscriptions, as tokens of esteem and affectionate regard of their fellow members.

A resolution was also passed expressing the appreciation by the club of the long and faithful services of Treas. F. J. W. Hurst, who is about to relinquish his office after an uninterrupted term of fifteen years.

On the motion of the Secretary a committee was appointed on art and trophies. This committee is J. V. S. Oddie, Thomas B. Clarke and George A. Freeman.

This committee to nominate officers for the coming year were elected: E. M. Brown, E. D. Morgan, L. Seymour Husted, Jr., Henry Walters, Henry S. Redmond, F. W. J. Hurst, C. Oliver Iselin, Charles T. Minton, J. Searle Barclay and Robert Bacon.

These were elected members: James W. S. Clelland, William J. Rose, Lieut. J. P. J. Ryan, U. S. N.; Lieut. Olaf H. Rask, U. S. M. C.; Charles N. Welsh, Major C. H. Lauchheimer, U. S. M. C.; Samuel Henry Vandergrift, F. W. Brown, Gibson Fahnestock, George Isham Scott, Paul J. Rainey, Lieut. A. Shives Williams, U. S. M. C.; Clarence Whitman, Assistant Paymaster J. W. Morse, U. S. N.; Lewis Iselin, Ira D. Warren, Middleton S. Burrill, Hugh M. Inman, Nathan M. Flower, Edward Patterson, Ensign Edgar B. Lorimer, U. S. N.; Andrew B. Graves, George D. Cross, Robert Moore, Charles B. Alexander, George M. JACOBS, Lyman E. Warren and Surgeon Clement Biddle, U. S. N.

Mrs. Emma F. Banigan was elected a flag member.

Indra.

THE schooner Indra, a photograph of which appears in this issue, was designed by Mr. Fred D. Lawley, and built by the Geo. Lawley & Son Corp. in 1900 for Mr. John M. Richmond, of Providence, R. I. Indra is 71.5ft. over all, 45.8ft. on the waterline, 15ft. beam and 10ft. draft.

YACHTING NEWS NOTES.

John M. Sawyer, well known as a maker of yacht sails, died at Huntington, L. I., on Oct. 19. Mr. Sawyer was sixty-eight years old, and it was his interest in yachting during his early life that led him to take up sail-making as a business.

The 177ft. steam yacht Revolution is nearing completion at the plant of the Gas Engine and Power Co. and Seabury & Co., Morris Heights. The yacht will be propelled by Curtis' steam turbines, and her boilers are of

the Seabury safety water tube pattern. It is stated that she is to have a speed of at least twenty knots. Considering the large amount of space taken up by the engines, the boat has considerable cabin accommodation. The dining room is in the forward deck house, and the after deck house will be used as a living room. The main saloon, owner's and guests' staterooms are on the lower deck and are large and roomy.

The success of the steamer King Edward, which is fitted with a turbine engine, has attracted the attention of yachtsmen, and two yachts have now been ordered which are to have turbines as the propelling agent. One of these is for A. L. Barber, of this city, and the other is for Sir Christopher Furness, and is to be built by Alexander Stephen & Sons, of Glasgow. This yacht is to be between 700 and 800 tons, and her accommodations, fittings and appointments will all be of the very highest class. The steamer King Edward in her season's work on the Firth of Clyde showed that she could easily get up and maintain a speed of twenty knots on a coal consumption of about 25 per cent. less than would have been required by a paddle-wheeled vessel driven by the older-fashioned style of machinery.

Messrs. Huntington & Seaman have sold, through their agency, to Mr. Conrad Stein, of this city, for Mr. De Ver H. Warner, of Bridgeport, Conn., the yawl Genevieve. She was designed by B. B. Crowninshield, built by Howland, Monument Beach, Mass., July, 1901. She is 6ft. 8in. over all, 39ft. waterline, 14ft. beam and 8ft. draft.

Small Yacht Construction and Rigging.

BY LINTON HOPE.

Part II.—Chapter I.—Rigging (Continued). Rope, Blocks, Etc., and Fitting Rigging.

THE blocks chiefly used in this country for yacht work are of ash, with internal stops, or bindings, of steel or gun metal. These are suitable for manila, cotton or hemp running gear; but not for wire rope. For this purpose sheet metal blocks with large, flat sheaves are the best; these sheet metal blocks are stronger and lighter than the wood blocks, but are a trifle more costly. Blocks of this sort, similar to the illustration, are also suitable for any kind of rope, and if the edges of the shell are slightly turned outward, so as to avoid sharp angles, they will not wear the rope, as the American bronze blocks do. These latter are very neat and well finished, but are heavier than a sheet metal block of the same strength and size, and are much more expensive.

All good blocks should be fitted with patent roller sheaves; this is especially important for haliards and sheets, or for any heavy work, as these sheaves reduce the labor to a very considerable extent.

Where internal-stopped blocks are unsuitable, as for topsail sheet, throat and peak haliard purchases, etc., ash blocks, with a score for a rope-stop, should be used, and before stopping, the end of the rope should be sewed where it passes around the block. If a rope-stop is required, for any purpose, where the block is not spliced directly into the end of a rope, such stops should always be grommets of steel wire rope, well varnished, parceled and served, or leathered.

When fitting out a yacht or boat, all the blocks should have the pins withdrawn and greased; and if a wood block, a little black lead may be rubbed inside the sheave holes in the shell.

The leading blocks for the main sheet should have swivels in the stop, so as to turn freely in any direction.

Never use the small cast-iron blocks so often seen on badly fitted boats; they cut the rope and run very badly; also avoid elm or beech blocks, as they are not of good color, to start with, and do not clean up well when dirty.

Always choose blocks fully large enough for the rope to be used; nothing is so unseamanlike or so liable to lead to bad accidents as small blocks and big rope. The rope, when rove through the block, should have a clearance in the sheave hole of at least one-fourth of its diameter, when dry—that is to say, a rope of 1/4 in. diameter should have 5/16 in. sheave holes in the block. Do not forget, when arranging the blocks for a purchase, that the hauling part should, if possible, be from the traveling block, and not from the standing block. Thus, if two single blocks are used, and the hauling part is from the fixed block, then the power is only doubled; but if the hauling part is from the traveling block the power is trebled (minus the friction of the blocks, etc.).

The rigging of No. 1 boat will be fitted as follows, and will be suitable for any small boat if the sizes of the rope and blocks, etc., are kept in proportion.

Standing Rigging.—One plow-steel shroud a side and a forestay, each with separate eyes over masthead resting on hounds and bolsters, with a manila grommet under the eyes of the rigging. All of these may be set up either with rigging screws, steel wire or hemp lanyards. All eyes, etc., should be well varnished and served with yacht marline.

The method of fitting the roller wire will be described in the chapter on roller headsails and reef gears.

Running Rigging.—The main haliard will be a flexible steel wire rope running through a sheet-metal block at the hounds. One end is shackled to the jaws of the gaff, and the other end has a single wood rope-stop block spliced into it. Through this block is rove a manila whip, with the standing part fast to the mast thwart; or, if more purchase is desired, this end can be rove through a cheek sheave at the heel of the mast, and lead forward to a purchase under the deck, consisting of a pair of 2in. single blocks, one of which may be shackled to an eye in the keel.

The peak haliard is a single part of manila, rove through a single wood rope-stop block at the mast head, and shackled on to the wire span on the gaff. The peak haliard block should be stopped with a thimble, in which is another thimble stopped around the masthead, so as to allow free play in all directions to the block. The stop around the mast should be placed under the eye of the forestay, or it may be pulled off the masthead by the sail if it is at all loose.

The topping lifts are shackled to the revolving plate on the boom end, and are all one piece of rope, being rove through a pair of cheek sheaves on the masthead, so as to leave a bight on the fore side of the mast. A single block is seized in the center of this bight, and a whip is rove through it. A light span is attached to each topping lift, so as to hang loose under the boom at about its center, the use of this being to catch the sail when lowered. Two or more of these spans may be used if desired.

The main sheet is double-ended—that is to say, it can be hauled on either or both ends. The chief advantage of this form of sheet is that when one end only is hauled on, the whole of the purchase of four single blocks is used; but if it is to be got in quickly, as in a gybe, then if both ends are hauled in at once there is only half the purchase and twice the speed. The two blocks shackled to the boom are fast to the claw ring and to the revolving plate on the boom end, and one of the three blocks on deck is on a horse, being stopped to a round thimble traveling on it, while the other two are stopped in a similar manner to eye-bolts on the deck.

These eye-bolts should always be in a line drawn from the center of the mast through the ends of the horse.

These sketches show various methods of reeving main sheets in small raters.

The fore-tack (if a roller foresail is used, as shown on both sail plans) is a single wire, rove through a gun-metal fair-lead or bullseye on the deck close to the stemhead, its outer end having an eye spliced in it, and the wire being passed around the fore end of the lower boom and through this eye, then aft through the bullseye, and having a single block spliced in the after end, care being taken that the wire is long enough to allow the boom to be squared right off when the foresail is used as a spinnaker. A manila whip is rove through the block with the standing part fast to an eye-bolt or deck plate, except in the case of very small boats and canoes, where the tack is merely a single part of manila or flax, without any whip or purchase.

The fore sheet is arranged to tend itself in going about, and to

SAIL PLAN OF NO. 1 DESIGN.

do this a second upper boom is used, as shown; also a horse for the end of the sheet to travel on. By means of the clew outhaul, from the clew of the sail to the after end of this upper boom, the sail can not only be rolled up in the ordinary manner, but the sheet lead can be perfectly adjusted, so as to get exactly the right proportion of strain on the leach and foot of the sail.

The sheet is spliced around a thimble traveling on the horse, and is then rove forward through the single block on the upper boom, and down and aft through a cheek sheave on the fore end of the lower boom, and aft to the cockpit.

The clew outhaul is spliced to a ring traveling along the upper boom, and rove aft through a bullseye or block on the clew of the sail; then down through a sheave in the bare end of the upper boom; forward and down through another cheek sheave in either the upper or lower boom (but on the opposite side of the sheet lead), and aft to the cockpit, like the sheet.

The roller line is fast to the drum of the roller, and led aft through a thimble seized on the lower boom near or on the gooseneck of the upper boom.

The spinnaker guys are endless, being fast to the fore end of the lower boom, where the wire tack is made fast; then passing aft outside the shrouds and through two small eyes in the deck, one at each after corner of the coamings, returning to the end of the boom on the other side in the same manner. By this arrangement, when the fore tack is let go, and the sail hauled round as a spinnaker, the guy overhauls itself and leaves enough slack to belay on a jamb cleat on deck, but at once becomes taut when the boom is amidships and the tack hauled down again.

A light pair of signal halliards should be rove through a small screw-eye in the top of the masthead, or through a truck; but the latter is very clumsy on a small boat with a stump masthead. These signal halliards are very useful for hauling the cover up the roller foresail, as it is laced or hooked on; as by this means a roller foresail can be kept clean and dry as easily as any other sail.

The centerplate is lifted by means of a wire fast to the arm of the plate and rove through a large metal block on the mast thwart, and spliced around a double block, to which the standing part of the tackle is made fast, the other double block being shackled to a deckplate or eyebolt on the after end of the center case, a manila fall being rove through the two.

The chief differences between the rigging of the No. 2 boat and that of No. 1 are that there are several extra parts, consequent on the greater strain and the extra sails of the larger boat. They are as follows:

Standing Rigging.—One shroud a side from the hounds and one shroud a side from the masthead, through the arms of the cross-trees. These are set up with rigging screws to two separate shroud plates each side.

One runner a side, from the four-eyed band, to which the peak halliard block and the roller foresail are attached. These runners are cut to reach to within an inch of the runner plate, and the end is shackled to a horizontal wire rope, stretched tightly between the runner plate and the after shroud plate, so that the shackle will travel freely fore and aft along the wire, but will not come right up to the runner plate. A small manila line spliced to the end of the runner and led through a bullseye on the runner plate serves to haul the runner aft, and consequently tightens it to any required tension with very little effort. The sketch fully explains the method of fitting.

A topmast backstay should also be used for racing purposes, and would consist of a light steel wire cut to exactly reach the lower end of the runner when the latter is hauled aft. One of Blake's patent hooks is spliced into the end of the wire, also a manila line similar to that on the runner, but of smaller size.

The backstay is kept hooked into the eye of the runner when not in use, and is slacked off with it by the one action. When, however, the backstay is required, it is unhooked from the runner and the manila line belayed on a strong cleat on the side of the coamings, as shown on the sail plan. This method is only suitable for a small craft, like the 24 linear rater; as, on a larger boat, sufficient strain could not be put on the backstay to set it up, in this case there would be a small snatch block on the backstay, and after taking the line under the cleat it would be taken over the snatch block and brought back to the cleat again and set up.

For cruising purposes these backstays will not be required, as the large spinnaker and topsail would not be in use.

Masthead.—The fittings of the masthead will, in addition to the hounds and bolsters used in No. 1 boat, consist of the following: A pair of American elm cross-trees, 4ft. wide and 1 1/2 in. by 1 in. in section at the center.

A four-eyed mast band resting on a 3-16 in. shoulder at the point shown, and with a rivet through the masthead. This band carries the peak halliard block; runners and the roller foresail.

There is a large sheave at the masthead for the topsail halliards; also a small single block for the spinnaker halliards. Above this is the short pole and truck.

A slightly different method of fitting the masthead gear was shown in the chapter on spars, and either of these may be used:

the sail plan shows the neater of the two, perhaps. Gaff.—This is slung at quite a different angle to that of the smaller boat, and has a cheek sheave for the topsail sheet; the peak halliards are of wire, similar to the throat halliards, and both of these are fitted as for the smaller boat.

The only other differences between the gear of the two boats are that the larger boat is fitted with a bowsprit, and this has a short steel rod as a bobstay, set up to the bowsprit end with a rigging screw, which is shackled to a small two-eyed band, to which the forestay is also set up.

STEEL "SADDLE" GAFF JAWS.

LIGHT SHEET METAL, DECK-LEAD BLOCK, PATENTED SHEEVE.

The fore tack is led through a gun-metal bullseye stopped to the bowsprit with a stout wire grommet.

The spinnaker and topsail entail some extra running gear, but that for the topsail is apparent in the sail plan, and consists of a halliard, sheet and tack, all of manila and all single ropes. The tack should always be belayed on the opposite side of the mast to that on which the sail is set, so as to keep the heel of the topsail yard close to the mast. The halliard and sheet are bent to the yards with a rolling hitch.

The spinnaker gear consists of a halliard guy and sheet, the latter being a short piece of small manila spliced into the clew of the sail and made fast to the lee rigging. The halliard is a single manila rope with a large spring hook spliced into each end and cut to such a length that the hooks just reach the shroud plates each side and are hooked into them when not in use.

The guy also has a spring hook in the end, which is hooked into an eye in the end of the long, spinnaker boom, and into the tack of the sail.

In case ordinary fore sheets are preferred to the automatic arrangement I have shown on the sail plans, they should be either shackled into the clew of the sail with a jib sheet shackles (as illustrated among the fittings), or they may be attached directly to the sail; the best method of doing this is to work a ring in the center of the sheets through the clew cringle of the sail, and made in exactly the same way, from a strand of the same sized rope used for the sheets, which should be of cotton.

Trapshooting.

Fixtures.

Oct. 31.—Dalton, O.—Live-bird tournament of the Dalton Gun Club. H. Santmyer, Sec'y.

Nov. 6.—Peru, Ind.—Peru Gun Club's live-bird tournament; handicaps; high guns.

Nov. 22.—St. Louis, Mo.—Contest for the St. Louis Republic championship cup (Nov. 23) and three-day open tournament. Herbert Taylor, Sec'y, 1004 Chemical Building.

Nov. 23.—Ossining, N. Y.—All-day target shoot of the Ossining Gun Club. Roast Turkey. C. G. Blandford, Capt.

Nov. 28.—Cleveland, O.—Shoot of the Cleveland Gun Club.

Nov. 28-29.—Milwaukee, Wis.—Tournament of the South Side Gun Club.

Newark, N. J.—South Side Gun Club target shoot, every Saturday afternoon.

Chicago, Ill.—Garfield Gun Club's live-bird trophy shoots, first and third Saturdays of each month. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

CONTESTS AT INTERSTATE PARK.

Nov. 20.—Interstate Park, Queens, L. I.—Shoot given by Mr. S. M. Van Allen, who donates a Daly gun; \$20, 20 birds, latter extra; high guns; handicaps; all entrance money goes into the purse.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice. Cafe and hotel accommodations.

Interstate Park, Queens, L. I.—Weekly shoot of the New Utrecht Gun Club—Saturdays.

1902.

Jan. 14-17.—Hamilton, Ont.—Twelfth annual tournament of the Hamilton Gun Club. F. B. Vallance, Cor. Sec'y.

March 31-April 5.—Kansas City, Mo.—Interstate Association's Grand American Handicap at live birds. Edward Banks, Sec'y; Elmer E. Shaner, Manager.

May 7-10.—Interstate Park, L. I.—Interstate Association's Grand American Handicap at targets. Edward Banks, Sec'y; Elmer E. Shaner, Manager.

May 13-16.—Oil City, Pa.—Annual meeting of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. F. S. Bates, Cor. Sec'y.

May 30-31.—Union City, Ind.—Spring tournament of the Parent Grove Gun Club. O. E. Fouts, Sec'y.

DRIVERS AND TWISTERS.

From Mr. Edward Banks, secretary of the I. A., we have received the following: "The Interstate Association, in response to a popular demand, some time ago decided to hold the Grand American Handicap at pigeons for 1902 in some Western city, and at a meeting of the stockholders of the Association, which was held Monday afternoon last, the 28th inst., in New York city, selected Kansas City, Mo., as the place for the great shoot next year. The dates fixed upon are March 31 to April 5, inclusive. Mr. Shaner, the Association's manager, was recently sent to look over the ground and spend a few days in Kansas City; on his return to Pittsburg he reported very favorably on the outlook for a big G. A. H. shoot next year. It is understood that there will be four sets of traps and ample accommodation for 350 to 400 shooters. The hotel accommodation in Kansas City cannot be beaten, and street car communication with the shooting grounds is easy, frequent and cheap. The Interstate Association has also claimed dates for its Grand American Handicap at targets, which will be held at Interstate Park, Queens, L. I., N. Y., May 7-10, inclusive. It will be noticed that this event has been brought forward to a much earlier date than usual, the change having been made at the suggestion of a very large number of intending participants."

In his report concerning the matter of the G. A. H. at live birds, as it pertained to the West, Mr. Elmer E. Shaner, who was a visitor in that section last week, stated that the greatest enthusiasm was manifested by the shooters of Kansas City in respect to holding it at that place. After the meeting of the Interstate Association on Monday of this week, at which it was decided to hold the G. A. H. at Kansas City, a notification by telegraph was sent by Mr. Ed Banks to Mr. R. S. Elliott, who on Tuesday replied by telegraph as follows: "Kansas City feels highly complimented, and will meet every requirement." With such interest and active energy in evidence, the G. A. H. of 1902 should be a record-breaker.

It is gratifying to note that the Grand American Handicap at live birds for 1902 will be shot in the West, at Kansas City. The Western shooters have felt for a long while that this great contest should be held in the West, though they sometimes forgot that it was an incident of several great manufacturing interests, and under the individual control of an association which represented them. However, it is now an incident of the West, and affords a pleasing opportunity for the Western brethren to rally and make it the largest and best shoot of the kind in all history.

From Atlanta, Ga., under date of Oct. 25, Mr. Frank E. Butler writes us as follows: "We finish our seventeenth year with the Wild West Company next week, at Danville, Va. Annie Oakley [Mrs. Butler] will visit some friends at Buffalo, N. Y., for a few weeks' rest, which she needs badly, having shot more than 40,000 smokeless shells this season. She will return to Nutley Nov. 1, when she will turn her attention to trapshooting again."

A match was arranged to take place at Interstate Park on Wednesday of this week between ex-Sheriff Creamer and Mr. T. W. Morfe on the one side and Messrs. C. A. Lockwood and Edward Banks on the other, 25 birds per man, \$100 a side. It is a handicap event, the contestants standing at distances, as follows: Morfe, 30yds.; Creamer, 28yds.; Banks, 25yds.; Lockwood, 27yds.

Mr. Justus Von Lengerke, of the firm of Von Lengerke & Detmold, spent a few days in the ruffed grouse section of Sullivan county, N. Y., last week, and succeeded in making a good bag of those elusive birds. He is eminently skillful with the shotgun in cover or open, or at the traps.

At Interstate Park, L. I., on Thursday of last week Messrs. E. Banks, G. Percy and Mr. Herrington arranged for the third match between teams of New York and New Jersey, and fixed upon Dec. 11 as the date. Each team has one win to its credit.

Messrs. Tatham Brothers, of 82 Beckman street, New York, have published a brochure of rare interest, in which is set forth a full history of all the essentials of the Anglo-American trapshooting match, from its inception to its conclusion. No detail is omitted. The scores made at both targets and live birds, loads, shells, etc., are all noted with painstaking care. It concludes with a most interesting article, commenting on the match, from the London Field. It will be sent by Messrs. Tatham to all who apply for it.

Dr. George N. Thomas, the popular and energetic member of the Trenton Shooting Association, has accepted the position of general manager of that organization, with Mr. William Widmann as assistant manager. The Association will hold a shoot on Thanksgiving Day of greater scope than any held theretofore. The Association is to be heartily congratulated on securing the active participation of Dr. Thomas in the management of its affairs.

Mr. W. A. Clark, Jr., son of Senator Clark, of Butte, Mont., the latter known more generally to the public as the Copper King, became the possessor of a beautiful Frantz gun of the \$450 grade, purchased of Messrs. Von Lengerke & Detmold last week. It is truly gratifying to observe that the wholesome sport with the shotgun appeals to gentlemen of means and leisure.

Mr. Noel E. Mancy, well known to American shooters as a skillful shot and a charming gentleman, is still in South Africa engaged in active army life as an officer. He has achieved gratifying distinction. The Distinguished Service Order, an honor next in importance to the Victoria Cross, has been bestowed upon him, and all his friends will rejoice thereat.

Messrs. R. A. Welch and D. Bradley, eminent trapshooters, returned to New York on Thursday of last week, after a successful chicken shoot in the best chicken region of Nebraska. They had abundance of good sport, and a corresponding degree of good enjoyment. They demonstrated that good trap shots may also be good field shooters.

We are informed that the machinery of the American Arms Company, of Boston, Mass., manufacturers of single and double shotguns and revolvers, under the management of the late Geo. H. Fox, has been purchased by the Marlin Fire Arms Company, and is being removed to New Haven, Conn., to be added to the Marlin plant in that city.

In the match of Dr. W. Wynne and T. W. Morfe against Messrs. Edward Banks and B. Waters, 50 birds per team, from the 30yd. mark, the former won by a score of 40 to 38. It is not unlikely that a return match will be shot some time in the near future, at such time as all the contestants can gather courage.

Wednesday of this week was the day fixed upon for a match, probably 50 live birds each, between Messrs. Gus Greiff and John Ryan, at Palisades Park, N. J. The match will begin about 11 or 12 o'clock. The park can be reached readily from New York by way of Desbrosses street ferry and Fort Lee trolley cars.

At the monthly shoot of the Nonpareil Gun Club, at Watson's Park, on Saturday of last week, Mr. E. S. Rice won first, and Mr. W. B. Leffingwell won second, both having killed straight in the main event, Mr. Leffingwell missing his fourth bird in the shoot-off. Mr. J. R. Graham won third.

Mr. J. S. S. Remsen, the popular president of the Brooklyn, L. I., Gun Club, also a member of the Cartaret Gun Club and Crescent Athletic Club, suffered a great bereavement in the death of his father, which occurred on Monday of last week.

In the city championship contest of the Trenton, N. J., Shooting Association, held last Saturday, Messrs. Wilkes and Maddock scored 21 each out of 25, making the highest score of that competition. In the shoot-off, Maddock won.

Mr. L. W. Budd won the challenge cup on the grounds of the Keystone Shooting League at Holmesburg Junction last Saturday. He made a straight score. There were eleven contestants in that event, which was at 10 live birds.

The October cup, presented by the Crescent Athletic Club, for weekly competition on their grounds at Bay Ridge, L. I., in October, was won by Mr. H. M. Brigham, who has developed into a shooter of rare skill.

Mr. C. R. Stevens, the promoter of the great 100-live-bird contest, \$100 entrance, has received forty-three entries. It is fixed to take place in December at John Watson's Park, and is now among the probabilities.

Mr. Geo. Roll, shooting from the 30yd. mark, won the 25-live-bird handicap at Des Moines, Ia., on Oct. 24. He was the only one to kill 25 straight. There were thirty-seven contestants in this event.

A correspondent informs us that the Des Moines, Ia., Gun Club has sold its shooting grounds to the city for park purposes. It contemplates securing new grounds in the future.

The Dalton, O., Gun Club announces through its secretary, Mr. H. Santmyer, that it will hold its pigeon tournament on Oct. 31.

Mr. C. A. Young, of Springfield, Ill., and Mr. J. E. Hicks, of Columbus, O., were visitors in Sportsmen's Row, New York, last week.

BERNARD WATERS.

IN NEW JERSEY.

Trenton Shooting Association.

Trenton, N. J., Oct. 26.—A pleasing feature of the Trenton Shooting Association's gathering to-day was the good attendance of visitors. The city championship cup excited special interest. The recent withdrawal of Dr. George N. Thomas from office was severely felt by the Association; and friendly pressure was brought to bear on him to return to active leadership. It will be remembered that Dr. Thomas, though urgently invited to accept, declined a re-election to the secretaryship at the Association's recent election. The members positively refused to dispense with his services in an executive position, and to that end they created the office of general manager, and tendered that position to him. The board of governors drew up a set of rules that would govern the position of general manager and presented them to Dr. Thomas. He decided to accept them, and will start to act in that capacity forthwith. His acceptance will be hailed with great delight by the members. Concerning his new office he is quoted as saying: "I accepted the position, as the members of the club were after me continually. I am jeopardizing my personal affairs seriously; but I like to see this city at the top of the shooting world, and for that reason I have taken the general managership of the Association. I will have William Widmann as my assistant manager." The club will hold a prize shoot Thanksgiving Day that will be without an equal in the history of the Association. Manager Thomas is working on the event at present, and expects to have it in shape shortly. The team shoot championship did not take place Saturday, as expected, but was postponed until a later date. The city championship cup of the Association was shot for Saturday, and provided considerable sport for the crowd, which was the largest of the season. Eight contestants made a trial for the cup, and a hard-fought contest took place for the honors. Maddock and Wilkes tied for the prize, each breaking 21 targets out of the 25. On the shoot-off

Maddock won, and will retain the championship trophy. The scores were high, and every one of the leaders had to go some. The fifth event was the city championship shoot. The summaries were as follows:

Events:	1	2	3	4	5	6	7	8	9
Targets:	10	15	10	15	25	10	10	10	10
J. Thropp	10	11	..	13	20	2	8	10	7

ON LONG ISLAND.

Trap at Interstate Park.

Interstate Park, L. I., Oct. 24.—A high wind and good birds made extremely difficult shooting. The match between Wynn and Morfe vs. Banks and Waters was won by the former by a score of 40 to 33 out of 50. Many of the lost birds were hard hit, but being very strong, escaped out of bounds. Dr. Wynn drew some particularly fast, strong birds. The sweepstake events were closely contested. Considering the quality of the birds and the strong wind, the shooting as a whole was good. The scores:

Morfe and Wynn vs. Banks and Waters:

Morfe, 30	22212221110122212*22222-23
Dr Wynn, 30	1211012221002210*121*022-14-40

White vs. Highland.

GORGAS STATION, Pa., Oct. 26.—The S. S. White Gun Club and the Highland Gun Club shot a match on the grounds of the latter, the former winning by a score of 241 to 197. The conditions were twelve men on a side, 25 targets per man, 10 targets allowance to each of the White team, 16yds. rise, unknown angles. The scores:

S. S. White Team—Hinkson 29, Hawksworth 11, Denham 26, Harper 29, Parry 12, Cotting 18, Lodge 22, Stahr 25, Heise 17, Kendall 16, Witterden 22, Heite 14; total 241.

Highland Team—E. Wintz 21, Dunlevy 20, Davis 17, Everett 18, Pinkerton 13, Dreakley 16, Fertsch 20, Jay 19, Dr. Wentz 17, McMichael 18, Schaeffer 9, Hammel 9; total 197.

Club medal event, 25 targets, 16yds. rise, unknown angles: E. Wintz 21, Dunlevy 20, Fertsch 20, Jay 19, Everett 18, McMichael 18, Dr. Wentz 17, Davis 17, Dreakley 16, Pinkerton 13, Schaeffer 10, Hammel 10.

The Meehan cup event, 12 targets, 16yds. rise, unknown angles: McMichael 11, Schaeffer 8, Hammel 10, Dunlevy 9, Casey 5, Jay 7, Everett 9, M. Wentz 10, E. Wentz 10.

National Gun Club.

MILWAUKEE, Wis., Oct. 25.—The following scores were made at the shoot of the National Gun Club to-day:

Sweepstakes:

Bogart	2202001111-7	Clark	2021200212-7
Schusardt	120212102-8	Reed	1122010102-8
Becker	2100122101-7	Bush	2022222202-8

Regular monthly prize shoot:

Rehfeld	0220211112-8

LINDLEY COLLINS, Sec'y.

Amateur Handicap Tournament.

DES MOINES, Ia., Oct. 24.—This is the last day of the amateur tournament held on the Des Moines Gun Club grounds, in this city, Oct. 22, 23 and 24.

The programme the first and second days was at targets; the third day, a live-bird handicap.

The target shooting was done from two sets of traps, Sergeant system, and each day's programme called for 180 targets—twelve 15-target events. Thirty dollars was given to the five high guns, and \$18 to the three low guns.

Twenty-seven took part on the first day, and on the second day forty-two shooters faced the traps. The targets were thrown about 50yds.

The scores were very high, and we think the professionals can congratulate themselves on being barred—from a money standpoint.

In event No. 5 on the first day there was but one straight score; Mr. W. Wettleaf winning first money alone.

Something over 13,000 targets were thrown in the two days. Mr. F. C. Whitney had charge of the office, and this means that the office part was well handled. Mr. C. W. Budd had charge of other matters pertaining to the shoot, and the programme was finished by 4 o'clock each day.

Wednesday evening Mr. George Macartney entertained the sportsmen at the Kirkwood Hotel Club rooms. George knows how to entertain as well as shoot, and about fifty sportsmen were on hand to enjoy Mr. Macartney's hospitality.

Among the shooters present from outside the State were Tom A. Marshall, Guy Burnside and Geo. Roll from Illinois; J. M. Hughes, Wisconsin; Mr. Shenewell, Colorado; G. Brucker, Dan Bray and Mr. Taggart, Nebraska, and Mr. Thornton, Joplin, Mo.

First high average in the target events was won by J. M. Hughes. He used U. M. C. shells and Ballistite powder; White, second; Wettleaf, third; Bray, fourth, and Tom Marshall fifth. First low average was won by D. Tripp; second by McFarland, and third was divided between Texas and Stege.

The third day's programme called for a 25-live-bird handicap, 26 to 31yds. rise, \$300 guaranteed, trophy and \$150 to first high gun; \$90 to second high gun, and \$60 to third high gun, should there be more than thirty and not exceeding forty entries. All moneys in purse in excess of \$300 divided 34, 33 and 33 per cent. to fourth, fifth and sixth high guns.

The birds were a good lot, and Geo. Roll, shooting from the 30yd. mark, was the only one to score 25 straight. He took the cup and first money, \$150. He shot a Parker gun and U. M. C. shells. Sheehy at 27, Nichols at 28, Brucker at 27, Selbers at 23 and Tripp at 27yds., scored 24, and divided the second, third, fourth, fifth and sixth moneys, getting a little over \$44 each.

After the handicap was finished miss-and-outs, entrance \$2, birds extra, were shot until dark. About 750 live birds were trapped.

Mr. Milner is to be congratulated on holding so successful a tournament, and will no doubt hold another about this time next year.

The Des Moines Gun Club have sold their shooting grounds to the city for park purposes, and another ground will have to be secured in the near future.

First Day, Oct. 22.

Raleigh Gun Club Tournament.

RALEIGH, N. C., Oct. 26.—The Raleigh Gun Club tournament held Oct. 22, 23 and 24, was well attended, considering it was the first attempt of the club to give a tournament.

The club proposes to give a big shoot next October, when Col. J. T. Anthony, the genial sportsman of Charlotte, N. C., will be interested, and the added money for each day will be sufficient to induce many of the best shooters of the country to be present.

The tournament was under the management of Mr. Lewis D. Thomas, of Laffin & Rand Powder Company.

The following trade representatives were present: Mr. A. H. Fox, Winchester Repeating Arms Co.; Mr. C. M. Lincoln, U. M. C. Co.; Mr. H. P. Collins, Dupont Powder Co.; Messrs. H. B. Lemcke and T. H. Keller, Jr., Peters Cartridge Co., and Lewis D. Thomas, of Laffin & Rand Powder Co. We also had with us our genial friend Col. Anthony and Messrs. Carrier, Brewer and Hawkins.

Mr. Carrier, of Asheville, N. C., won high average for the three days, using 40grs. Laffin & Rand smokeless powder, and shot from the 18yd. mark the last two days. Mr. Fox made second average, from 18yd. mark. Several of the local men shot well. Ten events were shot on Oct. 25 for merchandise prizes, open only to North Carolina amateurs.

Oct. 22, First Day.

Table with columns: Events, Targets, 1-8, Broke. Lists scores for Winchester, Lincoln, Lemcke, etc.

Oct. 23, Second Day.

Table with columns: Events, Targets, 1-8, Broke. Lists scores for Winchester, Lincoln, Lemcke, etc.

Oct. 24, Third Day.

Table with columns: Events, Targets, 1-8, Broke. Lists scores for Winchester, Lincoln, Lemcke, etc.

Table with columns: Name, Total Three Days, Per Cent. Lists totals for Winchester, Lincoln, Lemcke, etc.

At the Raleigh, N. C., Gun Club's tournament, held on Oct. 22, 23 and 24, Mr. Carrier, of Asheville, N. C., was high average. He shot from the 18yd. mark and used Laffin & Rand Smokeless. Mr. A. H. Fox, the famous expert of the Winchester Repeating Arms Company, won second high average, also from the 18yd. mark. Next October the club contemplates a tournament on more national lines of inducement.

WESTERN TRAPS.

Mt. Sterling Shoot.

Chicago, Ill., Oct. 24.—The tournament of the Mt. Sterling Gun Club, held last week, was a very successful affair. The team shoot between Quincy and Mt. Sterling resulted in another victory for the latter town, this being the third successive time the Quincy team has met defeat at the hands of their brethren. The following are the scores of the team shoot:

Quincy Team—Grimmer 22, Towne 20, Pennoyer 20, Scott 18, Black 16; total 96.

Mt. Sterling Team—Parkes 24, Nyc 23, Vandeventer 23, Estes 22, Avery 20; total 112.

The entries in the target events run about a couple of dozen, which is a good many in these days. The whole tournament was a pleasant affair.

Trap at Watson's Park.

Chicago, Oct. 26.—At Watson's Park to-day a miss-and-out took place, as follows:

Table with columns: Name, Score. Lists scores for Shaw, Roll, Barto, etc.

Nonpareil Gun Club

Chicago, Ill., Oct. 26.—The monthly contest of the Nonpareil Gun Club, at Watson's Park, was won by Mr. E. S. Rice, Mr. W. B. Leffingwell winning second. Mr. J. R. Graham won third. The conditions were \$5 entrance, high guns.

PUBLISHERS' DEPARTMENT.

Proctor's Theatres.

MANAGER F. F. PROCTOR is arranging a strong campaign of vaudeville and comedy for the winter season at his theatres in New York, Albany, Montreal and Newark. There will be an enlargement of the vaudeville scope of his amusement scheme as the season advances, and some of the best European acts, as well as all the American headliners, will appear in conjunction with the Proctor Stock Company.

By Thanksgiving Day it is expected that his Newark Theatre will be ready to open, and at that house straight vaudeville will hold attention. His Montreal and Albany theatres will also present variety bills exclusively during the next few weeks, while at his four New York houses the Stock Company will continue the revival of well-known comedies, with vaudeville interludes between the acts.

Joseph Arthur's celebrated comedy drama, "Blue Jeans," is scheduled for an early revival, with all the original scenery and mechanical effects, while David Belasco's beautiful production of "Mme. Butterfly," with Mile. Pilar-Morin as Cho Cho San, will continue for several weeks a ruling attraction on the Proctor Circuit.

Sandow, the strong man, was one of the first of a long line of great European vaudeville attractions which are booked to appear at these houses, and with some of the best American specialties already engaged the vaudeville department will be particularly strong. Sunday concerts have been resumed at all of Manager Proctor's New York theatres, and the talent for those occasions is especially selected.

They Each Had It.

NEW YORK, Oct. 23.—Editor Forest and Stream: Six gentlemen from different parts of the country recently met at a club on the Atlantic Coast; none of them had seen each other before. Each of them was telling about the gun he owned, how well it shot, how superbly it balanced, how well it was fitted, and how nearly perfection it was. None of them knew what make of gun the other had; so they decided that each man take his gun out of the case and lay it on a table, and then compare makes and argue merits of each gun. After the guns were laid out, the gentlemen looked them all over and found there was "no room for argument," as they were all Charles Daly guns. VERITAS.

Winter Tourist Rates, Season 1901-1902.

The Southern Railway, the direct route to the winter resorts of Florida, Georgia, the Carolinas and the South and Southwest, announces, excursion tickets will be placed on sale Oct. 15 to April 30, with final limit May 31, 1902. Perfect Dining and Pullman Service on all through trains. For full particulars regarding rate, descriptive matter, call on or address New York Office: 271 and 1185 Broadway; or Alex. S. Thweatt, Eastern Passenger Agent, 1185 Broadway.—Adv.

"Training the Hunting Dog."

READERS of Mr. Waters' new book, "Training the Hunting Dog for the Field and Field Trials," continue to write in commendation of it:

CHARLOTTESVILLE, Va., Oct. 21.—Dear Mr. Waters: I have just finished reading your new work on dog training, and consider the work very plain and simple for the amateur to go by. The system described for training a dog is very thorough, and entirely the correct one. C. E. BUCKLE.

MUNCIE, Ind., Oct. 21.—I congratulate you on having written the most complete and at the same time the most concise and truly excellent work on the training of dogs for field and field trial work that I have ever had the pleasure of reading. It is pleasant to take, too. I wish you every success with the book, and otherwise. G. G. WILLIAMSON.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1901, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR, 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, NOVEMBER 9, 1901.

VOL. LVII.—No. 19.
No. 846 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

TRAP AMATEURS AND PROFESSIONALS.

THE question of professional and amateur, as their competitive interests relate to each other in the trapshooting world, is one of constantly recurrent interest. The merit of recognition which they should be conceded as competitors, or whether they should receive any at all, is a matter on which opinions are distinctly and positively divided.

In respect to the value of these opinions, it may be observed that very few of them are based on the theory of the greatest good to the greatest number. That large class of shooters commonly known as the eighty per cent. men in most instances consider the professional as being distinctly inimical to their interests, and, therefore, by an illogical process of reasoning, as being distinctly inimical to the interests of the sport as a whole. The novice class and other classes also are prone to believe that the interests of themselves and their fellows are paramount in the sport, and essential to its best development and continuance. In short, matters as they appeal to the self-interest of each class have respectively been considered as being for the best interest of the whole.

As in all other matters of general public interest, there undoubtedly is a happy medium to be found between the two extremes of conceding a free hand to the professional and conceding to him nothing at all. Undoubtedly the professional shooter whose skill at the traps is the specialty by which he holds his position with his employers, has a distinct advantage over the amateur or the amateur-professional who shoots intermittently.

Let us consider the common ruling against the professional; namely, he is informed by the management of the average tournament that he may shoot for targets only; that he can have no part in competition for the purses, but that he may have every opportunity to display the goods of his employers. On analysis of this it is found that nothing whatever is conceded, but that the arrangement in almost every particular accrues to the benefit of said management. The club makes a profit from every target shot at by the professional under this arrangement. The professionals, by their attendance, give a certain interest and prestige to the tournament which they attend, which in turn adds to the attractiveness of the event and to a greater attendance. This again is a gain to the tournament.

The ruling, as generally in force, thus arbitrarily classes all manufacturers' agents as professional shooters. A man may be a manufacturers' agent and yet have but little skill or no skill at all with the shotgun. It is quite absurd, therefore, to class a man as being expert with the shotgun on the question of occupation alone, particularly if the occupation is distinctly apart from shooting.

Furthermore, to entirely bar the professional does not in the least protect the average amateur, for the reason that there is a class of amateur experts which is quite equal to the highest class of professional experts, so that the average shooter is pitted against precisely the same degree of skill even when the professional is barred. He has to contend against the same high-grade competition called by another name. That is the only true distinction.

Nor does the status of the shooting world admit of the same degree of discrimination which obtains in many other forms of sport against the professionals. If we consider the professional baseball player, bicycle rider, jockey, football player, etc., we note that those forms of sport have great money-making resources in the way of gate money, large salaries, etc. If we consider the trapshooter in the same relation, we note that the matter of gate money is hardly worthy of consideration. Salaries also are smaller. The action of trapshooting competition and the units which make up its substantial sum total do not admit of the sharper distinctions between professional and amateur which are drawn in the other sports enu-

merated. Both professionals and amateurs are needed to sustain the competition.

Moreover, to entirely bar professionals from a tournament, detracts correspondingly from the competition, as it appeals to public consideration. A horse trot at a county fair would hardly engage the attention of all the county residents, but a race between such horses as The Abbot and Cresceus would engage the attention of the nation. This in a way serves to illustrate the loss to a tournament's importance which results from the total disbarment of the professional.

Recognizing the value of the factors of trapshooting competition, it is much better to harmonize and preserve them, through establishing certain principles of equity in the competition by virtue of handicaps.

The contestants, whether they be amateur or professional, vary greatly in the matter of skill, and, as in all other forms of sport, the handicap is essential to the equalization of the differences.

The principles of the handicap are a constant feature of every other important branch of sport, such as horse racing, either running or trotting; bicycle racing; sprinting; yachting, etc., and there is every reason for the best interest of the sport of trapshooting that it should be recognized as a part of it instead of being an incidental experiment.

THE BLOOMING GROVE CHARTER.

THE seizure reported in our columns last week of certain game which was about to be taken out of Pennsylvania by members of the Blooming Grove Park Association has served to direct attention to the peculiarly liberal charter of that organization. The Association was formed in 1871 for the purpose of establishing a shooting and fishing preserve in the townships of Blooming Grove, Green and Porter, in Pike county. The territory comprised hills and mountains, valleys and undulating plateaus, streams and lakes, with fine forests and a stock of the animals indigenous to the region, from black bear and deer to squirrels and hares; while the waters were already stocked with trout, or were waiting for the introduction of trout and bass. The park was in a veritable wilderness, where slight attention was paid by the people to game laws or trespass laws; and the promoters of the enterprise believed that if they were to secure for themselves the benefits of the preserve and were successfully to protect their own properties from trespass, together with the outlying territory of which they had leased the shooting rights, they must make their own fish and game laws and provide their own special police to enforce them. They accordingly secured a charter empowering them to do this. The charter provides:

"It may make its own game laws through its Board of Directors, and may add to, repeal or change the same from time to time. Such game laws shall be applicable only to the land actually owned or leased by said corporation, or to the territory over which they have obtained the right to shoot, fish or hunt." Provision is further made for game wardens appointed by the Association and deputized by the sheriff of Pike county. Penalties are provided for entering upon the land to shoot or fish, for killing deer and other game or fish. The penalties so prescribed are separate and distinct from those provided by the laws of the State relating to game and fish, and offenders are declared to be liable both to the special penalties and to those of the State law.

Under the liberal provisions of its charter, the Blooming Grove Park Association has been a law unto itself. It has fixed its own game and fish seasons, and has hunted deer with hounds, for example, in ways forbidden by the State. It has introduced game and fish, and in general conducted its preserve in a way calculated to give its members good fishing and shooting. The special privileges accorded to it in the charter have been the subject of invidious comment, but there is reason to believe that without such authority to make and administer its own laws the Association could not have succeeded with its preserve. The people among whom the Blooming Grove Park was established were many of them as wild and untamed in all that relates to hunting as the Pike county bears. Without its own police the Association would have had serious difficulty in protecting the territory, if, indeed, protection would not have proved absolutely impossible.

Whatever may be the constitutional aspects of those sections of the charter which empower the Blooming Grove

Park Association to make its own open and close seasons and its fish and game laws, there can be no serious claim, we believe, that such special privileges are in force outside of the club territory. While the Association may kill game as it pleases, there is nothing in the charter to warrant its exportation of game in a manner contrary to the State law.

We published last week a communication from a Boston correspondent, in which it was told that Commissioner Collins of the Fish and Game Commission had personally visited between forty and fifty saw mills to insure that the owners should keep their sawdust out of the brooks, and we added a note commenting upon the activity of the Commission in this respect. This prompts another correspondent to point out that the work of keeping the trout streams free from pollution is only a portion of that which has been undertaken and carried through by the Massachusetts Commission in their determination to increase the fish and game supply. In addition to the other work of the summer, Commissioner Collins has taken soundings and temperatures in twenty-one ponds and lakes, besides making a less careful examination of many others with reference to their fishery capabilities. The Commission has had built within the past two years sixteen new fishways, and has caused six or more fishways to be rebuilt. It is estimated that this has had the effect of increasing fully four times the possibilities for breeding and rearing fish. The fishways have been built under the special direction of the Commission, and Mr. Collins has personally examined the site for every one that has been built or rebuilt, or is to be built. It is a pleasure to chronicle such activity so intelligently directed.

The autumn of 1901 to this writing has been remarkable for a succession of bright days, now run into weeks of perfect weather for outdoor life. There has been inspiration in the air, in the sunlight, in the flaming foliage, in the purple haze of the distance. This period of delightful weather conditions has followed a breeding season which has been in many parts of the land exceedingly fruitful; the game supply is almost everywhere abundant. Surely in this year of 1901 the man with the gun has little to complain of in game and weather conditions. Even the duck shooter, who is notoriously a rough-weather fowl, rejoicing when the Weather Bureau prognosticates the coming of a storm, has this year enjoyed good shooting, even without the tempestuous accompaniments. On the uplands the continued mild weather has protracted the season of heavy cover, and this has in a measure made shooting difficult; but a heavy frost or two will correct this.

The second series of Fred Mather's "Men I Have Fished With" has just issued from the press of the Forest and Stream Publishing Co., under the title "My Angling Friends." This title is simply to distinguish the second book from the first one. The chapters Mr. Mather wrote from week to week for FOREST AND STREAM readers have by no means lost their freshness; they are as readable, as overflowing with kindly humor and sentiment, as fascinating and absorbing, to-day as ever. The volume will have a place with the first one in many an angler's library.

As an interesting side light on the antiquity of angling, Mr. Charles Hallock cites the reference in Isaiah xix: 8, 10, where the prophet, in foretelling the woes which are to fall upon the Egyptians, pictures these evil days for anglers: "The fishers also shall mourn, and all they that cast angle into the brooks shall lament, and they that spread nets upon the waters shall perish. . . . And they shall be broken in the purposes thereof, all that make sluices and ponds for fish." From which it appears that the anglers of old had troubles of their own.

Some cities have elections annually, others once in so often; but with the coming of November every year without a break the Cincinnati Cuviers dine in annual banquet. The date this year will be Nov. 20.

The map of the United States is dotted with names which have in them—if only we stopped to think of it—a reminder of the wild life of the old days. Mr. Van Cleeef's interesting notes on the Beaver Kill are in point,

The Sportsman Tourist.

Created as They Are.

"SAY, bub, I don't like to hear you make such talk as that," remonstrated Joe Lacoot. He deftly flipped a piece of ham in the spider, and as it sputtered away in the hot fat he looked at me reproachfully through the blue trail of smoke from the camp-fire. That trail of smoke rode on the morning breeze out over the Second Joe Mary Lake in northern Maine. Joe shifted his kneeling position on the sand of the beach and continued, "Don't ever say that a moose is 'homely.' People who call this and that animal homely are trying to fit little human rules of beauty on to creatures that God has created as they are for a purpose. You hain't the only one as is sayin' that the moose is homely. I saw a piece in the paper the other day, and the writer made all sorts of mean flings at Brother Moose's Hubbard squash nose, his tailboard lip and his wire-spring hair. The feller who wrote that piece was never formally introduced to Mr. Moose in the depths of the woods. In the woods is where the moose gets on his dignity. He belongs there. You can't expect him to look pretty hung up before a market for the folks to finger as they pass. His mounted head over the sideboard doesn't look like a bust of one of them Roman statues."

"Now, take yourself! There you are, in rough clothes, head shaggy, not shaved for a week, your hair full of spruce spills and your face dirty. Now, wouldn't you be a spectacle walking down street at home in the city? The idea is, ev'ry critter to his own surroundin's. I'll bet you are slick enough when you are at home."

"You just meet a bull moose face to face in the woods! You don't think he's homely then. Of course, if you have the grit and the gun you'll shoot. But first of all he will awe you. If he feels that he doesn't inspire enough awe he will turn and trot off. For he is a modest chap. You will notice that his hair isn't rough and bristly then. It has been nicely slicked and polished by the cedar and the swamp maple. When you walk around a stuffed moose you may think that his legs are too long. But gracious me, you ought to see old Brother Bull expressing it through the woods when there are two feet of light snow on the ground. And those splay feet come in handy then. If you happen to see him at home in his 'yard,' you will not wonder that his nose is of the roamin' kind. If he ate ham for breakfast, the same as you and I [and Joe hooked out my portion on a tin plate], that nose would be something to laugh at. But you watch him gather in the twigs and sprouts as he browses in the yard, or hook on to the lilypads and roots in the edge of a lake and you'll say he 'nose' his bus'ness," and Joe cackled at his bit of a pun.

"I'll bet when he stands in a lake in a lilypad patch and looks down on his reflection in the water he is pretty well pleased with what he sees there. He would be more pleased with a snap shot of himself railroading through the deep woods at top speed, with his great antlers laid back on his shoulders, his nose sniffing at the air ahead, his great stride taking him over fallen tree trunks and through the underbrush without hitch or pause. Those antlers are not in the way then—they protect his shoulders from the scrape of the bushes."

"And his eyes—say, I've had a bull moose look at me at a time when he didn't think I was worth tackling."

"I never realized before what contempt in a creature's countenance meant. I was out after basket stuff and had only my hatchet. I wasn't thinking of moose that day. All at once I stumbled through some undergrowth right into a yard where a big moose was browsing. I looked at him. He slowly lowered his head and looked at me. The only thing I could think of was a man staring at me over his spec's. The bell under his neck and the bristle of grizzled hair around his head gave Brother Moose the appearance of wearing whiskers. His first look of amazement changed to one of the most supreme contempt, and at last he snorted, and lifting his fore foot made one disdainful jerk in my direction, as though he would say, 'Scoot!' But instead of scooting, in my excitement I brandished my hatchet and ran toward him. That moose might then and there have made it mighty unpleasant for me. But he simply lifted his chin a bit higher, sort o' pointed the horns of his antlers at me derisively and jogged away, not even waving adieu with his tail. But the look in his eyes as he turned told me what he was thinking. It was, 'So 'long, old boy; you're too slow. I lunch fifty miles further up the trail. But I'll not keep the table waiting. With those short legs and big feet you'll never get there!'"

We had finished the ham and the coffee, and Joe, in the invariable ten minutes of leisure following a camp breakfast, filled his pipe, lighted it and quacked at the stem until the smoke rolled about his ears.

"The only critter in the whole Maine woods that I'll sling a slur at," said he, "is the chap that I call the undertaker. Phuh! He does give me the fidgets of the worst sort."

Joe noted the look of inquiry and added, "Other people call 'em loucivees, bobcats, and such like. But undertakers is the best for 'em. You'll understand all about it when you have an experience with one."

"While ago I was in the Brassua region alone. I built a handful of fire at the end of a log and boiled my tea. While the tea was boiling I got my spider out and fried some pork. Well, the fat was sputtering and snapping, and I didn't try to listen to anything around me. But all of a sudden I had that queer feeling—you know what it is—as if some one was boring a look into the back of my head. I'm sensitive to those things. I always turn round in a crowd when I feel some one looking at me. It's a sort of an itchy feeling. So, still scooching on the ground, I turned my head. Squatting just as nice and quiet as ye please on the other end of that log was one them undertakers. I looked at him. I felt just as if he was sizin' me up an' figgerin' on how many steaks I would make, providin' I was cut skillfully. Did ye ever look right into loucivee's eyes when he is makin' it his bus'ness to look at you? Honestly, they seem as big as sassers. After you look for a time it seems as though the eyes were stickin' right out on his cheeks. He never winks. There's no larkin' nor playin' about that look of

his. He's as sober as a deacon. I never got sociable enough with a loucivee to talk with him, but I should judge that bein' hungry is a blamed serious piece of bus'ness in his case.

"Now, you understand that I've been in the woods long enough not to be scared at sight of a bobcat. They'll never tackle a man unless he corners them and drives 'em into a wrastle."

"So, after my first jump at sight of that cheerful old undertaker there on the log, I just scooched and stared back at him. As a starrer I wasn't in it with him; but I did the best I could. I didn't try to drive him away. I'm not the sort of a chap, bub, that shoots ev'rything in the woods on sight. The critters I don't need I don't trouble. I felt that undertaker on the log had just much right there as I had. Furthermore, he rather appealed to my sympathies, with those hungry eyes."

"I munched my dinner, and still gave him the look right into the eye. Those sassier eyes stayed just as round and bright. I commenced to projick on what he was lookin' at me for. Finally I decided there were two things that kept him there; he begretched ev'ry mouthful I was eatin' or else was hopin' that I would choke to death on some chunk of meat, and that would give him his undertaking job. That last made me nervous. I was hungry when I set down to eat, but that famished stare took my appetite away. I can't bear to eat with other folks hungry around me. I couldn't enjoy a Christmas dinner if I thought that in the next house some poor critters were eatin' only potatoes and salt cod. Well, thinks I, 'I'll be decent with ye, even if I don't like your lack of table manners. So I chucked a biscuit at him. He could have caught it easy; but he simply ducked his head to one side, and the biscuit went past him into the bushes. He still kept those glassy eyes fixed right on me—never made any move to get the biscuit. Then says I, 'Try a piece of my pork, old man. It's good.' But he just scrouged his head to the other side, and the pork scaled past. And still them eyes bored me. And solemn! I could imagine that he wore squeaky shoes and had a screw-driver and a handful of coffin nails down behind the log somewhere."

"Now, about that time I got a little vexed. I concluded that grub good enough for me ought to be good enough for a bobcat that slept in a tree and never heard a dinner bell once in six months."

"I suppose you up with your rifle, Joe, and put a slug through the chap with that pair of starers?"

"Not a bit of it," retorted Joe, rapping the ashes out of his pipe and scaling our dishes together, preparatory to lugging them to the lake. "Not a bit of it! A bobcat has rights in the woods that I respect. I simply bundled my traps together and went away. Undertakers are all right and all that, but to have one sitting around in his professional capacity will spoil any man's appetite, even when the undertaker wears a fur coat and has tufted ears and a bob tail."

HOLMAN F. DAY.

AUBURN, Me.

A Walk Down South.—III.

THE steady tramping under the heavy pack was too much for the cords of my feet to bear comfortably. They became exceedingly painful, and at Sayre, Pa., I sat down over Sunday and all day long tried to reduce the swelling with witch hazel. Monday morning found me still lame, but ready to start on again. I took the trolley car to Athens, two miles south, and left it at the bridge over the Chemung River and crossed to Greene's Landing. There was a cut-off across a grain field and corn patch, which I took. There were three fences on the way, in each of which the generous owner had put a V-gateway, which gave men free way, but stopped cattle. I took this as a sign of a generous people, and the thought made my pack a little less burdensome. Before I was clear across, a team came near to the end of the path, drawing a light wagon upon which was a calf crate. The driver was a negro youth, and his companion a colored lad of say thirteen years.

"Hey, Boss! load pretty heavy?" asked the driver.

I said it was.

"Well, then, don't ye want a ride?"

I did, and mounted to the seat beside the driver, the boy climbing back on the calf crate.

"Where ye goin' with all that?" I was asked.

I said I was heading for the coal mine country, and that Ulster was my destination on that day, as I expected mail there.

"Sorry 'bout that, for we turn off at Milan and go to Smithfield."

Smithfield was nine miles on my way, and after a moment I said I would go to Smithfield and have my mail forwarded to Canton. It was a streak of luck to get a ride so far.

"Shooting much?" the driver, whose name was Harry Griffin, wanted to know.

I said I had killed enough red squirrels to eat.

"Say," he said, "you know, I like to hunt. It's more fun than mos' anything. A lot of us fellows went out from Towanda once. Towanda's got lots of hunters in it; more'n up here. I think there's more guns and dogs there than there is people. Most everybody hunts. We went up on a side hill, and 'bout eight dogs went rumaging 'round, and they jumped rabbits in every brush pile. Such shooting you never hear. A great, big, white fellow (varying hare) came by me—say, he was going now; ten feet every jump. I couldn't stop him. It made my eyes stan' out to see him go, I tell you. But we shot so much that we got some rabbits and the girl cooked them for us. Um-m! She ust to live down South an' knew how. Just the same with possum and coons. She cooked um so's you'd leave your teeth behind next time an' 'like 'em just as well. We got three, four possums. It seem like I haven't had nothin' to eat since, just to remember how she cook'd um."

"So you go all alone, eh? Think you'd get lonesome. But some kinds of company ain't so good as when they're gone. I'd just like to make that sort of a trip. You heard 'bout that colored man what shot a detective over there the other day to Waverly? He got caught with bloodhounds out near Canton, where you're going. He was pretty tough. They shot him twice in the

leg or he'd never been caught; but his leg went back on him. I know how to fix them bloodhounds—a fellow from down South told me. He said when you're being chased just put some red pepper in your tracks, and then the way the dogs cuts up is comical, and they can't smell nothing no more. You just remember that, if anybody gets after you some time."

I promised to remember.

"There isn't much game around here any more. Rabbits and birds gets eat up by foxes; lots of them. But down 'round Towanda that's where a man gets game. I'd like to go down there and eat some more coon like I had there once. She baked it, you know, and kept turning it over and over in the oven. I feel just like I could eat the whole coon and the dressing, the way she cooked it. The coon climbed a big hemlock and got away out on the end, where he couldn't hold on, when one of the boys shook him. One of us had a ball bat, and when that coon came down he hit him on the fly, mashed his head right in and broke a dog's back, too; so we didn't hunt no more that night."

Three red squirrels in one tree caused the boy to leap wildly to the ground from the top of the crate. He landed on all fours. When he reached his feet again his hands were full of stones, with which he drove the animals scolding to the top, where they would have been pretty shots with my rifle. The team, however, was too skittish for that, so we drove on.

At Smithfield I left the two, and buying a pound of beefsteak took to the road again under my pack. A couple of miles out I built a fire beside a little brook and fried the steak. It was exceedingly good, with a slice of bread and a handful of chestnuts, which the darkies and I gathered under a couple of roadside trees. I drank a cupful of coffee, also boiled over the fire, and then started on.

My left foot bothered me more and more; so as I neared Harkness, three or four miles further on, I decided to stop there for a day or two at least, giving my feet absolute rest. I thought I could stay in a farmhouse without difficulty. I was mistaken. There was no place at Harkness. I went on to Springfield, limping; more and more at every mile. At Springfield there was a hotel, but no one was in it. It had been closed for weeks. At neither store could I hear of a place where boarders were taken. I was told that I might get board at some farmhouse. Then I began to look for a place to camp over night—a barn to sleep in or a bed. At the top of one hill was a farm, with many buildings, but the folks were going away. At the foot of another hill was a vile swale filled with cat-tails. The woods, which are always in sight in some direction, were far away, up steep hills or too thin and scraggy for a camp. I stopped at last, and was about to roll up in my blanket behind a stone fence, when the black tip of a cloud showed through the dull, twilight sky. To sleep out with one's ankles giving way and a storm coming up seemed foolhardy; so I went on again.

The next house was "full of company"; the next was not prepared to keep travelers; at the next a man's thin voice called through locked doors to say that there was a hotel over the hill, at Crossroads.

It had begun to rain. It was so dark that I could merely see that there was a road ahead. I stepped in ruts, I bumped into the sides of cuts, I stumbled to my knees on stones, and was thrown violently from side to side by clods of dirt breaking under my shoes. Up a hill that seemed interminable, I started down again through dense woods, as it seemed, staggering and even groaning at sharp pain in both ankles. I met a team of horses, which shied sideways into the ditch and nearly ran into a dark horse, which reared to its hind legs and walked backward down the hill for several steps.

But at last I got to Columbia X Roads, where there was a hotel. I entered it and sat down, a position I scarcely left for the next three days. But it was a worth while delay, for the "boy" of the hotel had worked in lumber camps for many years, and could tell so much about the Pennsylvania lumbermen that I became interested in them and wished to see how the Pennsylvanians did their work of slashing the forests.

On the 15th the Pennsylvania squirrel and pheasant (ruffed grouse) season opened. One of the hunters came to the hotel that night. He was perhaps thirty years old, tall, thin and of alert appearance. He carried an old muzzleloading rifle with a barrel at least 30 inches long. Its sights were very low and close to the barrel. The weapon was topheavy in my reach, but it balanced in his grasp. He had killed nothing. A squirrel had led him half-way across the big patch of woods up the valley and escaped. A pheasant or two had raised and flown away, but that was all; still, he had had a good time. He remembered one day, when squirrels were plentiful last fall, and the memory was game enough till he had another successful hunt. He put the muzzle of his rifle on the floor and twisted a leg around the barrel, while he leaned on the butt and against the wall. He did not sit down. Other hunters had killed six birds, three black squirrels and one gray, but they used dogs. Dogs didn't appeal to this rifle user. He preferred such still-hunting as he could get in shoes with soles half an inch or more thick.

There are men throughout this region who trap skunks for their fur. While I was in the hotel office on my second day at X Roads a trapper came in with the skin of a great full-stripe skunk which he had taken the night before. The barkeeper, however, would not allow him to stay long enough to even get a drink. The trapper usually lives alone, and strange tales of the things they eat are heard if one listens. Muskrats and skunks and wild herb roots known best to themselves are among the delicacies with which they pamper their tastes regularly. Of course game of all sorts finds its way to their cool boxes over the brooks on which their homes are usually located. They talk of killing a gray squirrel or a fox with as much animation as other hunters tell of their deer and bear. Judging from all that I have heard, it must take nearly as much skill to get a gray squirrel in "scarce" years as to kill a deer on a far-back Adirondack ridge.

The first ill-natured word spoken to me on the trip was at X Roads, on my second night there. A drink-ugly man who had talked pleasantly enough during the

day came and said flatly that he did not think I was there for any good. I told him he was privileged to think what he pleased—that was all. He subsided into a stupor soon.

The boy who had been in the lumber camp was enthusiastic about making long trips. His specialty was rides on freight trains. He had been almost to Buffalo, through Pittsburg, down near Harrisburg; in fact, he had been pretty much all over Pennsylvania and part of New York on the luggage cars. A telephone inspector who was at the hotel over night said that Elmira boys had the same fashion of making vacation tours. They would go West or South for a week or even three or four weeks, and by doing a day's farm or other labor now and then keep themselves supplied with a little cash for food. Usually two or three lads develop the migrating instinct and travel together.

I received a hint at the hotel which proved of great value. My shoes, which seemed to have heavy soles when I started, seemed like paper when I had my attention called to the manner in which they bent at each step. At Troy, on the 17th, four miles south of X Roads, on Sugar Creek, I had a thick leather sole laid on over the old one. This increased the thickness to a little over half an inch, and the improvement was so marked that I was able to walk with considerable comfort.

The road followed the valley, but in places went over the hills. From the top of one ridge about half-way from Troy to Canton I had my first view of real Pennsylvania mountain scenery. I saw Mount Pisgah from Smithfield to X Roads, but it was a mere knoll of great height, with a farmhouse on top, whose proprietor is said to charge five cents a look from an observatory on his house; but now I saw steep, wooded hills without a suggestion of thirtiness on their summits. The valley before me was of the broad, sweeping kind, exceedingly beautiful to look at. The autumn-colored leaves were nearly all fallen, and there was a preponderance of dark brown not so noticeable in past views, when yellow and even green were to be seen.

It was getting on toward night, and a cold shower of rain drove me to the refuge of a horse barn for an hour. While I was there a boy came over a hill on the run from some of the ridge woods. Over his back in a grain bag was a peck of chestnuts.

The rain over, I passed on, and at the foot of a hill came to a deserted old house, a great barn and a small horse barn. In the horse barn was half a ton of hay up in the corner of the loit. To this I made my way, my appetite satisfied by two quarts of milk purchased half a mile back; and rolling up in my woollen blanket, and drawing the rubber blanket over me just as the last evening ray of the sun found its way through a crack to my bed, I was ready to sleep.

I dreamed that tramps were shouting in my ears, but it was only the rustle of the wind and hay. I curled in closer to the center of my blankets and soon slept again. In the morning, when it was light, I awakened and put my head out to see. It was so cold that I promptly tucked myself into the blanket again, and then I slept till after 8 o'clock, and the sun had begun to warm the air. I changed my thick woollens, in which I sleep, for thin, walking ones, packed my basket and started.

No wonder it seemed cold! There was an inch of snow on the ground under the trees where the sun had not yet thawed it. The hills were black and white under its semi-covering. My thirteen-odd hours of sleep left me fresh and strong. I thought it was four miles to Canton, and looked along for a place to make my breakfast.

"How far is it to Canton?" I asked a man.

"Just under the hill, there," he replied.

He looked like a hunter, and he proved to be an old fox driver. He knew the runways, and had seen them under all conditions, from moonlight to that of the sun. He explained the Pennsylvania non-resident law by the fashion in which the game of the region was stripped out by New York and other sportsmen. "I have seen a party down at the railroad with 150 head of game—rabbits and squirrels—going away. They had their pointer dogs, and the moment a bird raised they fired and killed it. Now it's different. Railroads don't transport game like they used to, and a man can't have only so much."

The selfishness of "sportsmen" has embittered many of the native hunters against visitors, especially the natives who hunt for pleasure.

At Canton I ate breakfast and got my mail. That was what I had looked forward to for days. The mail box marks the route better than anything else a traveler has to go by.

RAYMOND S. SPEARS.

In the Ranger Service.

BY ROWLAND E. ROBINSON.

IX—The Raid.

THE deep silence of early dawn pervaded the scene as we awaited the signal of attack. Out of the doomed town there arose not so much as the barking of one of the horde of dogs, and among us was heard no sound but whispered words or the dull clash of a powder horn against a gun stock. I felt almost a qualm of pity for the poor, unconscious wretches upon whom the hand of vengeance was about to fall, but when I bethought me how strange such a feeling had ever been to their savage breasts my heart grew hard, and I doubt not my face showed as little of the quality of mercy as those about me.

Now from beyond the further side of the village came the hollow hoot of an owl, which was answered on our side and in the other two quarters, and at this signal we closed in on all sides. At the first house we came to, it being, like all the others, a very snug, comfortable abode for an Indian's quarters, the first man who reached it pointed up to a singular ornament over the door, which a closer examination showed to be nothing less ghastly than a dozen scalps strung upon a pole. The hair of many was of such Saxon colors as plainly showed them to be our own people's, and there were the long tresses of women and the fair curls of little children. These hideous trophies, to the number of more than two hundred, were displayed on all the principal houses, and the sight of them set all our hearts ablaze with rage;

so that we fell to our bloody work of retribution as relentlessly as might these savages themselves. My three companions and I burst in at the door upon as many Indian men, who started up with a yell of terror out of their deep slumber, only to sink back groaning under the blows of our hatchets into the deeper and everlasting sleep of death, while their women, some dumb, some shrieking with fright, covered in the corners, striving to shield their children with their outstretched arms. Mostly they were spared, for such were General Amherst's orders; yet his merciful injunctions were more than once forgotten or unheeded in the fury of that morning's slaughter, and squaws were stricken down as relentlessly as if they were she wolves. We ransacked the house for such plunder as was worth carrying off; then raked the covered embers from the hearth on to the floor, and piling the readiest combustibles thereon, hastened forth in search of more victims.

Out of the depth of silence what a wild confusion of sounds a few moments had brought! From every side rose shrieks of terror, groans of wounded men, shouts of command, intermingled with a dropping report of fire locks as shots were fired at fleeing victims, or now and then at one who stood sullenly at bay, whereunto was presently added the crackle and roar of flames, for each house was fired as soon as it was sacked, now flushing the growing day with lurid light, now darkening it with black clouds of smoke that for one moment veiled and in the next disclosed the scene of devastation and its fleeing or dying victims and their ruthless assailants. There the lifting cloud would unveil the swift figure of a red warrior running for life toward the river; no sooner seen then he became the target of a Ranger's rifle, perhaps to go down in a headlong fall, for our men were mostly very expert marksmen. There, would be seen an Indian mother scurrying away with her brood of brats, like a scared wild duck with her ducklings, and likely to get no worse than a bullet screeching just over her head to hasten her flight; and there a withered, old hag fighting tooth and nail like a mad cat for some treasured household article.

Such sights I saw but in a fleeting glance as I sped on to the next house, one of the largest and neatest, but as yet unmolested. Entering it in advance of my comrades, I saw the legs of an Indian on the ladder leading to the chamber whither they were following his body; and lest I should get his tomahawk in my skull if I attempted to pull him down, I made sure by letting fly a bullet into his hip, and he came down clutching at the rungs till he fell in a heap on the floor. He hurled his tomahawk at my head, but a dodge saved me, and though he drew his knife and slashed savagely at me I soon put him at peace with this world, though I knew not his attitude toward the next.

Now I had time to look about, and observed more closely two women whom I had seen only out of the corner of an eye. The one standing nearest me, very erect and firm, though with a terrified face, was a white woman with golden hair, and evidently young, though the hardships of captivity had worn the bloom and roundness off her cheeks. Partly behind her an Indian girl crouched, staring out with the half-defiant look that you see in the eyes of a frightened wild animal.

"Do not hurt her," said the white woman, in a low, sweet voice. It was a voice that had not its like in all the world, yet unlikely to be heard here, as in the depths of the black morass where I had been so sure it had called my name. A moment later I marveled that I could have failed an instant to recognize either face or voice.

"For God's sake, Mercy!" I cried, "how came you here?"

Even before I spoke she knew me, though much exposure and a full beard had greatly changed my face since our sad parting by the sumacs. With an inarticulate cry of joy and surprise she came forward, stretching out her hands to me. I was shaken by conflicting emotions, by the old love rekindled, by pity and by resentment of her faithlessness. If the first seemed the stronger for a moment, the last as quickly arose to hinder its expression, and I made no responsive movement, for I would show her that I would do no more for her than for any other woman in like strait.

Her arms dropped, and she drew back to the side of the Indian girl with an abashed, grieved face, that wrenched my heart; but I could not be tender to one who had forsaken me, and was now another man's wife.

"You are greatly changed," she said, in a choked, constrained voice.

"When hearts change, why should not faces?" I answered; and she said no more till I asked her again what chance had brought her here. She told me in a few words that the Indians had made a descent upon the frontier town where her father was settled, had killed him with several others and brought away some captives, herself among them, and here she had been for six months, not unkindly treated, though very wretched concerning the uncertainty of her fate. It was a pitiful story to hear my lost sweetheart telling of herself; but I kept outwardly cool and unmoved as I listened, and when my comrades rejoined me, after searching for booty. I said, "You will stay under guard of our men till the job's finished; the squaw is a prisoner, but she will not be harmed;" and so we went out, she edging past the dead Indian with half-averted, horrified face, and I left her and the Indian girl in charge of a very good and true man, Jackson by name.

The work of retribution was well nigh accomplished; every house in the village save three holding a store of corn, now a necessity to us, was a bonfire or smoldering ruin; every warrior slain or a homeless fugitive, and such women and children as were not captured were hiding in the woods like coveys of scared partridges. Our three wounded were cared for; our one killed, Sam Mohican, a Stockbridge Indian—and a very good man—buried decently, and we departed, prisoners and captives, with what provisions we could carry and a considerable booty of silver ornaments and a silver image found in the church. It was a most desolate scene that we turned our backs upon, ruined, silent and deserted save for one abandoned, homeless, masterless cur, howling disconsolately from an overlooking knoll.

Looking Backward.

ST. AUGUSTINE, Fla., Oct. 30.—*Editor Forest and Stream:* I fumble over FOREST AND STREAM, and as I read the accounts of rambles by my brethren through the Northern woods, filling their bags with princely woodcock and lordly grouse, all my old-time love for the fun comes back to me in spite of my wrinkles and white hair.

Old Father Time is chuckling over the thought that he has got me down, but by Jingo! "I'll turn a corner Jinken and cheat him yet."

As soon as I get my screws tightened and my where-to-go determined, I mean to have a crack at our diminutive brats of quail, and may be I'll turn over a snipe or two by the way. But my favorite bird, the October beauty—not the flabby July imitation—I never expect to molest again. I've seen but two in twenty years and I got all of them.

The noble grouse is not in our parish.

While the younger tribe can chuckle over their well-filled bags, I have the satisfaction of knowing that the glory of my shooting days compared to theirs is something like an electric light to a fallow candle.

In the jolly days when I was young I did not need a dog to put up woodcock, for "the woods were full of them," and grouse were so thick that they would put themselves in my way on purpose to get killed, because there was not food enough to fill them all. Quail were too numerous to mention.

There was no need of game laws then. I have bagged wagon loads of prairie grouse when they were numerous enough to destroy the farmers' crops; I have enjoyed the very cream of duck shooting—though not much of it—and, take it all in all, if any man of the present generation has had a better time than I have had let him speak "or forever after hold his peace"—by which I do not mean his "fowling piece."

I have had my day—Selah!

Your private brotherly suggestion that it would be nice and jolly to send out a drag-net and haul in a lot of the chief scribblers of FOREST AND STREAM for a big game feast and flow of soul seems on the surface a good idea, but would they come?

For instance, "Ransacker" wouldn't leave his bees and come tramping down from Shasta Mountains merely for a little fun; and, as to your amiable old humble servant, why no! He has lots of reasons why he could not, comfortably, make one of such a crowd.

But first let me suggest that if you should resolve to try it on, you put up over the door of the feeding room in gold letters:

"Behold how pleasant a thing it is for brethren to dwell together in unity."

In case of such a meeting there would be all sorts and sizes, and among the sorts might be some members of the clubs with which I once waged horrid war! Now "war is hell," and hell has nothing fraternal about it; consequently I might suffer, for "revengé is sweet," and if one of the club men aforesaid, whom I have charged with selfishness in wanting to grab all the lakes in the Adirondacks and fence in all its broad and gamy acres on the pretext of protecting and preserving game and fishes (for themselves) should ask: "Who is that rusty looking old cuss in the French cap at the right of the President?" and his neighbor should answer: "Why, that is Didymus," then a cold quail like a "froze cat" might come flying down my way and light against the side of my head. Then some witty member might remark that he wouldn't quail before an antagonist who used such ammunition as that, and ask, with a serious face, if my wound was serious—which would be annoying. I am afraid such a gathering would give opportunity for ventilating cheap wit and unbrotherly badgering.

Another reason would be that I'm quite deaf, and while I would hear nothing of the conversation I might be maligned to the bitter end by mine enemies.

I could not join the fight in my own defence; and, if toasted, the toasteer might insult the toaster by innocently ignoring the compliment. So you see I cannot second the motion for a call of contributors.

Still that is no reason why you might not call in a few of the near-by scribblers and have a "feast of reason and a flow of —" game, with no Didymus, though it might seem a little like the play of Hamlet with the main chap out!

But I have had my day, and all I ask is to be let alone.

Didymus.

Natural History.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., and not to any individual connected with the paper.

Weights of Game Birds.

CURRITUCK INLET, N. C.—*Editor Forest and Stream:* I will endeavor to give you the weights of different birds, as observed by me, as follows:

The male swan, about two years old, weighs 30 pounds, the female 22 pounds; a year-old male weighs 17 pounds. Wild goose, male, 12 pounds; female, 10 pounds. The white brant or Canada goose, male, 8 pounds; female, 6 pounds. The black brant, male, 5 pounds; female, 4 pounds. The black duck, male, 3 pounds; female, 2½ pounds. Mallard, drake, 3½ pounds; hen, 3 pounds. The sprigtail, or pintail, male, 2 1-3 pounds; female, 2¼ pounds. Widgeon or bald pate, male, 2 pounds; female, 2 pounds. Teal, male, 1¼ pounds; hen, 1 pound. Red-head, male, 3 pounds; hen, 2½ pounds. Spoonbill or shoveler, drake, 1 1-3 pounds; hen, 1 pound. Hairy-crowned widgeon or sawbill, male, 1½ pounds; female, 1 pound. Ruddy duck, male, 1½ pounds; female, 1 pound. Waterwitch, male, ½ pound; hen, 12 pounds. Mudhen or crow duck, male, 1¼ pounds; hen, 1 pound. Sheldrake, male, 3 pounds; hen, 2¼ pounds.

The weights given are of birds which have been killed by me, and were weighed by me. All these birds might vary in weight according to gain or loss by reason of conditions of food; but the figures probably would not change very much.

L. R. WHITE.

Natural History Notes.

BETWEEN TWO bluffs, one on the Arizona and the other on the California side of the Colorado River, electric wires have recently been stretched. These wires are probably 75 feet above the surface of the water and 510 feet long between the supporting poles. They are of copper, and are naked their entire length. Under the overhanging bluff, on the Arizona side, a colony of mud swallows (*P. lunifrons*) are yearly located. During the past season they were unusually numerous, and throughout the nesting months they would occupy several hundred feet of the wires without a break. Particularly was this true during the early hours of morning. The weather hereabouts during the summer months is inclined to be a little warm. It has no fixed figure to go by, but generally jogs along anywhere from 105 to 116 degrees in the shade, and probably 20 to 30 degrees higher in the sun. One afternoon during the latter part of July I exposed a thermometer to the sun. Unfortunately it registered but 135 degrees, and when that figure was reached it was taken under cover, as it was feared the bulb would be broken if further exposed. Now, I do not make this statement for the purpose of inducing immigration in this direction, nor of setting forth its many advantages as a summer resort, as other places as good can probably be found nearer home; but to call attention to the great degree of heat the feet and bodies of swallows are capable of sustaining without apparent injury; for, notwithstanding the great heat, they gathered at intervals along the wire in bunches of two, three or twenty, and having apparently rested a sufficient time they would suddenly drop, skim over the surface of the water, many of them touching it in their flight, and again gather on the naked wires. There was not a half hour of the day in which more or less of them could not be so seen. Just why it did not fry their little bodies as they sat is something I do not comprehend. It is barely possible that the evaporation from the surface of the water, say 75 feet below, was sufficient to maintain a low temperature in the wires; but of that I do not know. It is however, the only explanation to the matter I can offer. With the exception of a few small colonies, these birds have scattered over the valley for the season. In 1899 they opened the nesting season about April 14. On March 23, 1900, the spring migration had about reached its maximum. During the spring of 1901 they did not make their appearance till about the first of April. By the 7th I thought them all here, but two days later I saw hundreds of them skimming over a field of barley. This was about 10 A. M. The owner of the place told me that he was pleased to see them, as they were feeding on insects that were injurious to his grain. He said they had just come in, as he had been through the field about an hour before and they were not there at the time.

Because of the long, hot summer in this section of the country, there is a superabundance of insect life. To one unfamiliar with the facts the quantity is difficult of conception. At night they swarm about the arc lights in incomprehensible numbers, apparently rising to and falling from them in clouds that dim the light. Thousands of them fall to the ground, where they form the food of a small army of toads. These toads come from the wet bottom at the conjunction of the Colorado and Gila rivers, and grow to an immense size. Among the peculiarities of insect life is a small, black beetle (kindly identified by Dr. Howard, of Washington as *Blapstinus longulus*), which produces enormously. They make their appearance above ground during the night. They will overspread everything in their vicinity, and in favorable locations they will cover the ground three and four inches deep. They can be gathered by the double handfuls, as one would gather grain from a bin. Unless disturbed, they move about only during the night. They "swarm" not less than three times a year, generally in June and July, when they form one of the staple foods of the toads above alluded to. The toad crop is of yearly growth, and each recurrent spring sees a new crop of diminutive hoppers. One can almost see them grow, and by the end of the season, which largely closes toward the latter part of August, even the smallest has attained aldermanic proportions. Their excretions, which I have frequently seen $3\frac{1}{2}$ inches long by $\frac{3}{4}$ of an inch in diameter, was a mass of various-sized beetles, but more commonly made up of the black beetle referred to and a smaller brown beetle. Much of this mass was of live, undigested material, which, upon freeing itself from the husks and wings of its less fortunate companions, went its own way as before. This was a common, everyday observation; the toads simply ate more by 50 per cent. than they could assimilate. Frequently they could be seen sitting apparently motionless by a "swarm" of a gallon or two of beetles, with corpulent bodies and a very self-satisfied appearance; the result was that they could not digest half of what they ate.

Two Agassiz tortoises (*Zerobates agassizi*), male and female, have been kept at the Territorial Penitentiary for the past eight or ten years. The male is among the largest of its kind. They are without fear, and take pleasure in allowing their heads and necks to be scratched. In the way of food, they are commonly fed on meat and vegetables, and frequently on the leaves of the mulberry tree, of which they appear to be very fond. At least three-fifths of their time is passed under the old floor of a carpenter's shop, and so far as I know, without food of any kind. Throughout the winter months they are never seen, hibernation commencing about Nov. 1 and ending early in March. The male usually leads the way by a few days. Thus in 1899 the male came out and was fed March 5 and again on the 7th; the female came out on the 8th. Neither was again seen till the 15th, when both were out. On the 31st they again came out and mated.

March 7, 1900, the female appeared. She ate sparingly and went back to her quarters under the floor. On the day following the male appeared, and two days later both were out and mated. Feb. 16, 1901, the male came from under ground; but as soon as fed and watered went back, but again came out on the 20th and mated with the female. Her first appearance had been made on the 18th. On July 20 three young ones came from under the floor. They were about $1\frac{1}{2}$ by 2 inches across the shell, and were mighty interesting little fellows. They were the first known to have been hatched here. When courting the female is passive, but the male is very aggressive. If walking by her side his head and neck will be stretched in front of her, almost at right angles with his body. His eyes at such times have a snaky, vicious expression. If she refuses to stop or submit to his inclinations he will bite the edge of her shell and bump her into submission by striking her with the point of his lower shell. He will sometimes strike her so hard as to lift her partially from the ground. The only noise he makes is a sort of coarse grunt. Oct. 3 they again mated, and occasionally are still to be seen about the yard.

A positive annoyance is to be met with in swarms of crickets. They are in evidence much of the year, but in August and September they are equal to one of the plagues. The young ones make their first appearance late in July. At that time they are gray in color; when half grown they are brown, and when fully matured are black. At night, because of them, nothing but a protected light can be used. They are flyers, jumpers and creepers. There is apparently no place they cannot get. Throughout the day they are mostly hidden, but the shades of evening mean a materialization of their coming.

YOUNG MOUNTAIN GOAT.
In the Philadelphia Zoological Gardens.

Stragglers are always late in getting home of a morning, and they manifest an absolute fear in their haste to cross an unprotected area. For the past month between twenty-five and thirty Arkansas fly-catchers (*T. verticalis*) have occupied points of advantage, covering an area of not more than 100 feet square. They sit panting in the sun, with their mouths open and a pair of eyes that can see a cricket where apparently nothing else can. Not being molested, they have become quite bold; and if a cricket be thrown in their direction it is almost invariably caught before it reaches the ground. Often two or three will dart for it at the same time. H. B.

YUMA, ARIZ., Oct. 1.

Philadelphia's Mountain Goat.

THE ZOOLOGICAL SOCIETY OF PHILADELPHIA, Oct. 23.—*Editor Forest and Stream:* I send you a photograph taken by Mr. R. D. Carson, of the Zoological Society of Philadelphia, of a young mountain goat which has lately been added to our collection. The mother was killed near Field, British Columbia, on May 29 last, by Christian Hasler, a Swiss guide, who is employed during the summer at that point. The kid was then about two weeks old, and with great care has been raised by Hasler on the bottle. It was secured for the Zoological Society through the kind interest of Mr. George Vany and his sons, and was brought to the Gardens by Hasler himself on Oct. 1.

It now feeds well on milk, hay and carrots, and is thoroughly tame, and appears to be healthy. The height at shoulder is 2 feet, and the horns are $1\frac{1}{2}$ long on the anterior face. The weight is 55 pounds.

No definite conclusion can yet be reached as to the possibilities of domesticating this alpine species in our climate, but it was sufficiently evident that a few damp days of comparative warmth, which occurred shortly after its arrival, had a depressing effect. Alive or dead, however, the specimen is of great interest, for one of the many gaps in exact zoological knowledge will be filled by its complete dissection. At present we know little or nothing of the soft anatomy of this curious and aberrant antelope. ARTHUR ERWIN BROWN.

The Linnaean Society of New York.

A REGULAR meeting of the Society will be held at the American Museum of Natural History, Seventy-seventh street and Eighth avenue, on Tuesday evening, Nov. 26, at 8 o'clock. C. William Beebe will lecture on "Notes on Birds in the New York Zoological Park." WALTER W. GRANGER, Secretary.

Animals Living Without Water.

THE repetition in "Great and Small Game in India," etc., of the statement that the black buck inhabiting a spit of sand near the Chilka Lake do not drink has given rise to letters in the columns of the *Asian* in which it is sought to impugn the accuracy of the statement in question, and also to discredit the fact that any wild animals can exist for long periods without liquid nourishment. One writer says: "Mr. Lydecker makes the astonishing assertion that the black buck can exist perfectly well without taking liquid food is demonstrated by the existence of a herd on a narrow spit of land between the Chilka Salt Lake in Orissa and the sea, where, for a distance of thirty miles, the only fresh water obtainable is derived from wells. Is there no one acquainted with the locality in question who can give us some further information with regard to this herd? Personally, I have no doubt whatever that it will be found that there are troughs or irrigation channels where the animals can obtain water."

The statement in question was originally made by Mr. W. T. Blandford in the "Fauna of British India Mammalia." It is not indeed mentioned whether this statement is made on the evidence of personal observation; but Mr. Blandford is not in the habit of making assertions without sufficient evidence to support them, and his statement certainly cannot be traversed by the suggestion made in the letter just quoted.

As regards the capacity of the black buck to exist without water for long periods, the above appears to be the only or chief published testimony; but there is ample evidence in favor of the existence of the same power of abstinence from drink in other wild animals.

Writing, for instance, of the giraffes in the great Kalahari Desert, Mr. H. A. Bryden ("Nature and Sport in South Africa") makes the following observation: "For three-fourths of the year giraffes can exist without water; and as I can personally testify they are nowadays usually only to be encountered in an absolutely waterless desert, the nearest portion of it from twenty to forty miles away from any river or fountain."

Again, when treating of the same animal in the same locality in "Great and Small Game of Africa," Mr. Bryden writes as follows: "Its most favorite country at the present day, south of Zambesi, is undoubtedly in the vast, waterless, giraffe-acacia forests of the North Kalahari. Here, far from permanent water, in country where even native hunters can scarcely penetrate, large troops of giraffes still roam. In this, the most waterless portion of South Africa, giraffes have the faculty of being able to exist for long periods—six or seven months at a time—without drinking. This faculty they share with the eland, the gemsbok, hartebeest, dinker and steinbok, all of which are to be found ranging these dry and remote solitudes during the months of the African winter, when not a drop of surface water is to be found over hundreds of miles of country."

Similar testimony in favor of the abstinence from water of the giraffe is offered in the same volume by Mr. A. H. Neumann, whose experiences were obtained in East Africa. He writes as follows: "These creatures (giraffes) of course feed exclusively upon the leaves, tender shoots, and sometimes the seedpods of trees and shrubs. Although they undoubtedly do drink sometimes, they are certainly able to go for considerable periods without water, and are found in the driest country, long distances away from any possible drinking place."

Equally conclusive testimony is afforded by Count J. Potocki ("Sport in Somaliland") with regard to the thirst-enduring habits of the great game of the Somali country. For instance, he writes as follows: "In spite of this lack of water, there is a large amount of game in the Haud. Immense herds of antelopes find their permanent pasture in this desert, where there are more lions than in any other part of Somaliland. It is a phenomenal peculiarity of the local fauna to be able to exist so long without water, especially (as we had occasion to remark more than once later on) since the antelopes on the Haud seem in perfect condition, and as fat as if fed in the richest pastures."

On a later page of the same work Count Potocki discusses this subject more fully in the following paragraph: "To return once more to a subject which I have touched upon several times in the course of this journal, and which has become an enigma to me, I may add a few words regarding the existence of the animals of this region in the absence of water. Nowhere did I convince myself more completely than in Dumbereli that all the animals of this country can exist for months absolutely without water. Numerous species of antelopes and various kinds of beasts of prey go entirely without drink from November till March; and yet in spite of this the former are fat, though the grass is dry and parched like ashes, so that it cannot be nutritive food for them."

"How it happens that the organization of these animals, which, moreover, differs in no wise from that of their congeners living in neighboring regions, can endure so long without water, I am unable to explain, and I regret that no naturalist (not excepting Brehm) has turned his attention to this wonderful peculiarity of the fauna of the high plains of Somaliland."

Many other passages from different writers might be cited, but the foregoing prove up to the hilt the fact that in many parts of Africa a large number of large herbivorous animals subsist for long periods at a time entirely without drinking. And what is true for the animals of Africa may equally hold good for some of those of India, such as the black buck and the chinkara.

But it is not only wild animals that can do without water. As every flock master knows, sheep will live without drinking for long periods, even in dry districts where little or no dew falls at night; and guinea pigs can be kept without water even when they are given only a very small allowance of green food.

The statement of Count Potocki as to the non-nutritious character of dry grass is an error. Domesticated cattle, with a sufficiency of water, will often thrive better on parched pastures than on those in which the grass is soft and "waxy." And as every sportsman is aware, the wild sheep of Ladak and Tibet, like many of the African antelopes, grow fat and sleek on sparsely scattered tufts of dry herbage that look insufficient to support a rabbit. —R. Lydecker in the *Asian*.

Coahoma Visits a Snake Charmer.

When Mr. George Kennedy sent us the snake stories which were printed in our issue of Oct. 19 he sent this note, which, having been forwarded to Coahoma, has brought out the response printed below:

Editor Forest and Stream:

I enclose you two tales and three snake stories. Your snake editor will no doubt pronounce them truthful snake stories—the only kind which FOREST AND STREAM gives countenance to. I do not pretend to such intimacy with the species as Coahoma, but when I hear of a true snake story I can't rest, some way, till I tell it broadcast. Nevertheless, it seems to me if I got to seeing them crawling around on the picture mouldings, and falling off and crawling up again, and standing on their tails, I would consult a physician, and if the worst came to the worst I'd swear off.

GEORGE KENNEDY.

Editor Forest and Stream:

I have read with interest the note of Mr. George Kennedy which you kindly sent me with his permission, and which I enclose herewith. In this note Mr. Kennedy casts imputations upon me, and I have been trying to "sober up" long enough to reply to him in appropriate terms.

I think his charges, or rather innuendos, are serious enough to call for a court of inquiry. I therefore have to request that you print his "precept" along with my defence.

In the first place I have thought seriously about his proposition to "swear off," and find that a great deal can be said upon it both pro and con. I am disposed to take the con side of the argument, and leave the pro to Mr. Kennedy.

In this connection I would ask Mr. Kennedy if he proposes to deprive me of the gratification I experience in looking upon and studying the agile movements of the ophidian family that come athwart my vision, which affords me a degree of satisfaction that is alone worth the price of the liquid, as any lover of snakes, and snake antidote, must admit. I have an example directly in point. Since writing to FOREST AND STREAM a description of my own particular snake and his fantastic antics on my desk and around picture mouldings in my office, my vision along these lines has been so enlarged that I have beheld a whole box full of reptiles of various sorts and degrees. There were several dozens of them—rattlers, copperheads, chicken snakes, garter snakes, pine snakes, bull snakes, coach whips, etc., etc. In the midst of the snakes sat a woman, sitting on a smaller box within the larger one. The woman wore slippers on her feet, which reposed on the bottom of the box, in contact with the snakes. When she wished to single out some particular snake to pick up and exhibit to inquirers she would grab a handful of the others and rake them aside as if they were so many broom sticks.

One old rattler remained near the woman, and would rear his head up to be scratched under the throat, which he seemed to enjoy.

Amid the half dozen rattlesnakes in the box there was one alone that was untamed and intractable. This one was a "black Mexican rattler" that the woman was very cautious about, keeping him in one corner of the box by means of a light stick that she had for the purpose. Finally she drew out of the box she was sitting on a remarkable-looking reptile fully five feet long, of a glistening black color above and dark underneath, that she called an Egyptian viper. About all the other snakes the woman talked in a natural and unaffected manner; but for the "viper" she evidently had a set speech that she had memorized, setting forth that it belonged to the same species as that which Cleopatra had applied to herself in order to join Antony in the realms beyond; stating that this specimen was of monstrous size, as this species attained a length usually of twenty to thirty inches, and calling attention to the form and size of its scales, being rounded like those of a fish and much larger than those of American snakes. On being questioned about its dentition she partly opened the snake's mouth with her fingers, which operation was passively resisted by the snake, and showed me that it had no fangs, but two elongated projections of the jaw bone with knifelike edges, the ends of which nearly met at the front of the mouth, leaving a narrow cleft between, through which she said the venom was ejected from the mouth and injected into the wounds made by the knife edges. She kept the viper in the small box, for the protection of the other snakes, which she said it would kill in short order if allowed its liberty among them. She showed me two parallel wounds transversely across the under side of one of the snakes, made by the viper. She also said that it ate fragments of raw meat, and masticated its food before swallowing.

Now this woman was of course a "professional," but she was an illiterate person and talked with candor and good sense about the snakes, making no mystery about her power over them. She said that the venomous snakes were not divested of their fangs, as is popularly supposed, and that it would do no good if they were, as the lost fangs would speedily be replaced by new ones. But their docility was due to the fact that they had become accustomed to her and knew that they need fear no injury at her hands. She rightly said that venomous snakes have no disposition to bite unless alarmed or excited, and that the venom with which they are supplied is not for their defence but to capture their prey. This fact becomes obvious when we reflect that the venom of a snake affords it no protection from its enemies; and that it is invariably killed when attacked, notwithstanding any injury that it may inflict with its fangs upon the attacking party.

Returning to my own snake, a recital of whose movements raised Mr. Kennedy's suspicions of my "hydraulic stability." I disposed of him by placing him in a jeweler's show window, where he remained until the public ceased to take interest in him, when at my request he was liberated on the bank of Sunflower River.

I trust, Mr. Editor, that this, my defence, will be considered sufficient, and the court will render a verdict accordingly.

While I should be loath to make any counter charge against Mr. Kennedy, I will venture to ask why those two innocent Iowa bull snakes were ruthlessly slain instead of being utilized as first-class rattlers about the farmer's barn, where they might have done a vast deal of good and no possible harm.

CLARKESDALE, Miss.

Game Bag and Gun.

Fixtures.

March 5-19, 1902.—Eighth Annual Show of the National Sportsmen's Association at Madison Square Garden, New York.

An Hour With the Grouse.

"I'm going down to the old place to-morrow to thresh out some beans," said Will, "and after the job's done shall have time to do a little hunting. What say to going down with me?"

The "old place" was a lone farm and buildings about four miles from the village, where Will had formerly lived, and where, as I well knew, he had enjoyed many a successful hunt. Game had sadly diminished in the vicinity, he frankly told me, during the few years that had elapsed since he moved to the village; but a desire to at least get a look at some of the covers of which he had told me so much, rather than any expectations of finding good sport, influenced me to promptly accept my friend's offer as above. The following forenoon found us, with guns, dinner pails and Will's little red spaniel dog, bumping along the road in a hayrack (for Will had decided to seize the occasion to get a load of hay as well as exercise his muscle on the beans), on our way to the solitary farmhouse, where we arrived about 10 A. M., after an uneventful though rather anxious journey, owing to the constant care necessary to keep the various articles of our outfit from sliding out of the somewhat jolty vehicle.

Will thought I'd better take gun and dog and strike out at once, but I decided I'd like to get an insight into the mysteries of manipulating the flail first, so seated myself in the open barn door, in the sun, while Will went on with preparations for the work; at the same time giving me glowing accounts of the days when game was plenty in the neighborhood. Nearly every feature of the broad landscape visible through the big barn door seemed to suggest some pleasant experience with the gun. On that mountain in the distance he had shot hedgehogs and raccoons; on the ridges intervening, among the oaks and birches, grays had been abundant; in the thickets fringing the clear pastureland, and along the brook bottom, many a partridge and rabbit had fallen to his gun; and once he had trapped a sly old fox that he had found was in the habit of crossing the brook on a log. Then there had been ducks in the river flowing just back of the house. What scraps he had had with them, sometimes shooting them without a dog, and following the fallen birds down stream for miles before finally bringing them to bag. Such tales, of a time when game was plenty, were more entertaining, I thought, than actual hunting when there was little game to be found; so the hours passed on, Will alternately chatting and wielding the flail; noon came and dinner was eaten on the grass, and the work of threshing resumed and finished, and I had hardly thought of my gun.

"Now," said Will, "we'll put on the hay and get our load already for starting, and then we'll try our hand at the game." In a few minutes we were accordingly on our way to the nearest wood. It was not a great day for hunting, the wind blowing briskly, and the fallen twigs and leaves so dry as to crackle loudly at every step. The dog got a little distance ahead of us, and put out some birds among thick pines on the side of the hill. We hurried to the spot, glancing sharply among the trees (we are "pot hunters" here, all of us), but not a bird was to be found. The wind blew so the dog was unable to mark them down. Climbing up a bit higher, where there were a few oaks, we sat down in hopes to see a squirrel; but none appeared, and we soon crossed the road, thence pushing on across a field toward a wooded slope falling gently away to the river.

Beyond the field the dog jumped in among some low pines filled in with little poplars and birches, and put up a single bird. He sang out lustily as she struck, puttering, in a tree right over his head. Over the wall we scrambled, my heart at least going at a double-quick. Will was a few steps ahead. When he got within about thirty yards of the tree, whir-r! out she went, starting off like lightning through the thick tops. Will threw up his gun, jumped back a step, squirmed his body quickly to the right—bang! I thought I heard a thump away down the slope. Will dashed ahead, stopped—bang! then on again. When I reached him he had the bird, still fluttering. He had downed her the first shot; she had risen again, and he had finished her with the second barrel. Pretty good work? I thought so, and wondered how I was going to get any game with a man who could shoot like that.

After this we pushed on down the river, when we separated, I taking an old road following the river bank, Will, with the dog, which was working like a beaver, moving off to the right. "If any birds come down this way don't let them cross the river," said Will as he left me. I pushed leisurely down the road, keeping my left eye out for ducks, and my right roving about under the trees for signs of grouse. The wind was going down now, but night was coming on and I saw that our hunt must soon be brought to an end. Presently I heard the dog give tongue, and the distant whir of wings. I got

my gun ready, hoping that they might come my way. None came, but the dog continued barking, and soon Will's old Parker spoke. I wondered whether he had killed or missed, but did not holler for fear of frightening the game. I moved on a little further, when the dog sang out again, and Will shouted something which I did not quite catch, but which I concluded was a warning that it was time to be starting for home. Instead, he had said, "Look out—bird coming your way!" and before I had gone far after turning, this bird got out of a birch near the road. She had a long lead of me, and I remember thinking as my gun went up, "It's too far." I had actually started to drop my piece when, like a flash, Will's parting words came back to me—"Don't let them cross the river." I pulled, and she fell almost at the water's edge. She had crossed the silent river.

Will now joined me. He had killed his second bird, his dog having put it up in an apple tree, making three plump birds for two guns. Brief as it was it had been a very pleasant hunt, and although we had to poke home after dark as a consequence, we felt not the slightest degree of regret for the hour we had spent with the grouse.

TEMPLAR.

CORNISH, Me.

The New Jersey Game Seizures.

Editor Forest and Stream:

Permit me to add a suggestion to your comments in the issue of last week upon the hardships entailed upon New York and Pennsylvania sportsmen by the non-expert clause, so called, of the New Jersey game law. I agree with you in what you say about allowing hunters to openly convey under their personal charge such game as they are permitted to kill. I think that the cause of game protection in this respect is not promoted by prohibiting to actual sportsmen the right of conveying out of the State a limited quantity of game; and while the literal interpretation of the law prohibits so doing, that is not the evil which is sought to be remedied; and the incorporation into the law of that State, as well as into the law of New York and Pennsylvania, of such an exception would do no injury, but it should be reciprocal; that is, so long as New York, for example, prohibits export in like manner with New Jersey it is scarcely fair to say that the latter alone is at fault.

In regard to the other question, that of bringing through New Jersey game killed in New York, my belief is very strong that the seizure by the New Jersey authorities of such game while openly in transit is illegal; that neither the letter nor the spirit of the law applies to such cases. It would be just as reasonable for the New York officers to claim that the clause of our law prohibiting export was violated by taking such game out of our State, through New Jersey and back into this State again. In fact, that may be a technical violation of the law, but no court would hold that such an act violated it in spirit. My impression is very strong that New Jersey has no right at all to interfere with game killed in New York while openly in transit through the former State to a point in the State where killed; and that any interference in that respect is a trespass, rendering the person doing the act at least civilly liable. There would be no possible question if the game were in the possession of an express company, properly marked, for the New Jersey law expressly so states, and there is no good reason why the same rule would not apply when the game was openly in the possession of the hunter while going through the State. In such a case no law of New Jersey is violated. Game laws should be fair and reasonable to meet general approval, and they should be enforced in the proper spirit.

It would seem that the Lacey act has no application to this case, for, assuming for the moment that game can be a commodity of interstate commerce, it is not made so by being taken from one part of the State to another, even though in so doing it passes through another State. Such transportation is not in any sense interstate commerce. If, however, the game under such circumstances does become an article of interstate commerce so as to make the Lacey act applicable, and if such movement of the game is an export thereof within the meaning of the New York law, it would still be true that prosecutions for such act would rest solely with the Federal or New York State authorities, and would be a matter with which the New Jersey State authorities would have absolutely nothing to do, as no law of that State had been violated. As there is no provision in the Lacey act for a seizure or confiscation of the game, the only penalty thereunder being fine or an alternative of imprisonment, any such seizure is unwarranted.

JOSEPH B. THOMPSON.

NEW YORK, November.

In Maine Woods.

BOSTON, Nov. 1.—Maine game is coming into the markets here in greater abundance than previously noted. I counted 10 deer at a single round of Fanueil Hall and Quincy Markets Friday. Six or seven moose have been received by the marketmen, till now they don't seem to want to buy them. Clayton Grant, of Columbia Falls, Me., came through with a moose weighing 650 pounds the other day. It had a good head and was in prime condition, but the owner had a rather hard time selling it. H. S. Fisher, of Boston, is out of the woods from Moluncus, where he hunted for a couple of weeks. He brought out a good moose and two deer. He is much in favor of that locality for hunting. It is not hard to reach—fourteen or fifteen miles over a good road, from Matawaukeag station, on the Maine Central. He is pleased with the guides and the board. Mr. Fisher now has a record of two Maine moose. C. A. Barney, Vice-President, and L. Dana Chapman, Treasurer, of the Megantic Club, are just back from a business trip to the preserves. They went to look after their fish hatchery, and are much pleased with the fact that they found perhaps a dozen trout in the tanks at Big Island Pond, but when they left there were over 100. They are satisfied that Big Island has a good supply of breeding trout to get spawn for the hatcheries from. They succeeded in finding the spawning beds. Trout were taken with nets

and with the fly, including some good sport with the taking of trout for breeding purposes. They left the taking of trout and salmon for spawn-taking with the men, and are satisfied that good work will be done at the hatcheries. The stewards left the various camps Nov. 1, but care-takers will be on the grounds all winter. Mr. and Mrs. D. C. Pierce and Mr. and Mrs. A. W. Robinson were at their camps at Chain of Ponds, and were to remain till after the first of November. Mr. H. W. Sanborn is also at the preserves on a hunting trip. Mr. Harry B. Moore has a hunting party in charge for the Maine woods. In the party are R. H. W. Dwight, Charles M. Howell and Leroy S. Brown. They go to Holeb, on the Canadian Pacific, and found it last year one of the best of big game grounds. Mr. F. A. Jones, of Boston, has had great success in the Sottel (or Sawtelle) Brook region, eight or nine miles from Shinn Pond and twenty-one miles northwest of Patten, Me. This is the celebrated region where Mr. W. C. Harding and Mr. Theodore Ripley got the grand old moose last year, already described in the FOREST AND STREAM, and concerning the taking of which an account was published in a recent number. Mr. Jones made the trip with his brother, C. W. Jones, of Augusta, Me. They wore red hats and red sweaters in order that they might not be "mistaken for deer." They tracked their first big moose into a swamp, where he stood waiting for them. Mr. Jones says that the big fellow paid no attention to the guide whatever, but gazed wonderingly at his red costume. He gazed too long and unwisely, giving Mr. Jones time for an excellent shot. His two deer were easily secured, and with them he started for Boston, leaving his brother in the woods, as he had not then secured his moose. But he also was successful a day or two after, securing his moose and two deer. Mr. Jones remarks "That when the guide pointed the moose out to me he was standing in plain sight, in a good light. His burnished hair shone brightly, but soon began to bristle, either with fright or rage. I stood for a moment in wonder. Didn't he look big! I could have sworn he was bigger than a church and higher than the steeple—a sight that paid for the whole trip!"

Mr. W. C. Harding has been out with dog and gun into the woods of Winchester and Woburn. He found several flocks of partridges, one or two of eleven or twelve each. Partridges are really more plenty than usual in the woods not far from Boston, doubtless the result of market hunting having been stopped last year. Men were giving their whole time to hunting these birds for the market before the law was passed preventing their sale. Now their occupation is gone, and partridges have shown a wholesome increase. Mr. Harding saw very few quail, and I have the same report from other Boston gunners.

SPECIAL.

CHICAGO AND THE WEST.

The Arm of Illinois Justice.

CHICAGO, Ill., Nov. 2.—The arm of justice in the State of Illinois seems one of considerable longitudinal extension, when we come to reflect that Illinois is a State that has not been able to get a quail law on her statute books after several months of serious endeavor to that effect. She does, however, have a non-resident license law, and is able to use \$10 bills which come from Iowa, Missouri, Indiana, Ohio and Kentucky. Hitherto it has been the course of most States carrying non-resident license acts among their laws to take such \$10 bills as came without much exertion, and not to push the matter too curiously in case of reluctance upon the part of the hunter to purchase the proper license. So far as one is advised at this moment, there has never been an instance of a State undertaking to follow up a hunter to his home in another State, and to extract \$10 from his pocket to pay for a license which he ought to have purchased, but did not. Early this week Governor Yates, of Illinois, issued requisition papers on the Governor of Kentucky for the apprehension of three men named Meacham, Aaron and Cartwright. It seems that these gentlemen live in Kentucky, but came to shoot in the lower part of Illinois and returned home without ever having procured the proper hunting license. Whether the Governor of Kentucky will allow his erring children to be brought back to this State is a matter of some doubt, but should he do so and should the extraordinary precedent thus be established, what a trembling there would be in the boots of many sportsmen who have gone into other States, evaded the non-resident license law, and returned to the bosoms of their families, carrying about their hearts the glow of satisfaction at a deed well performed! I can number among my acquaintances several gentlemen who have been out this fall and who have come back without having taken out licenses in the State where they were hunting. Suppose the Governor of North Dakota, Minnesota or Wisconsin should begin to get busy and send out requisitions for some of the leading citizens of Chicago who have been shooting where it "did not cost anything," methinks that would be one of the biggest jars that ever happened in the shooting world.

It all goes to show that the game laws are growing in importance. Perhaps we cannot make a requisition stick just yet, but if we can scare a few hundred fellows who think that a requisition may stick at some future time, or under some future Governor, we are doing that much more toward a proper respect for the game laws, which, of course, ought to be respected just as much as any other class of laws upon our statute books.

Common Sense as a Law.

It is not a correct attitude which presupposes that every citizen is anxious to break a game law, that he has condemned such laws or that he is careless in regard to their benefits. Upon the contrary, there is a very large and swiftly growing class of citizens who prove their right to the title of citizen in its best sense by using their own love of justice and sense of fair play by setting up a game law of their own, in the absence of any such law being set up by the professional law makers who are hired to attend to such matters. In regard to the actual status of the Illinois quail law, every one of us, from the Attorney-General down to the commission men, is entitled to his own guess, and there seem to be many opinions as to the law or lack of law and the bearings of the same upon the quail supply of Illinois. Meantime in

very many, and, indeed, in the majority of the better shooting districts of this State, the sportsmen, farmers and others, have tacitly set up a law of their own. Nov. 1 is the quail law in Illinois this year, pretty much as it ever was, statute or no statute. There come in reports from very widely separated parts of the State to the effect that the farmers are standing together for Nov. 1 as the quail date, and that the sportsmen in the outlying communities have banded together and made it unpleasant for those who have shown a disposition to go out and shoot quail ahead of the accepted date. There may be different definitions of the word "law." Under all the wisdom and all the foolishness and all the omissions of our Legislature, there seems to be resting that law which is born of united common sense on the part of the American people. Our good folk were agreed that we needed quail in Illinois, and hence needed a law. We have had one. Next year there will still be quail a-plenty left in this State.

Effect of License.

The foregoing may be qualified by the statement that we are going to have much more shooting in the State of Illinois after Nov. 1 than has customarily been the case. This Indiana non-resident license law is going to throw thousands of guns into Illinois for quail shooting this fall who would otherwise have gone to Indiana. This will constitute a heavy tax upon the quail crop of this State, and without doubt there will be more quail killed by shot-guns in this State between now and Dec. 20 than have been killed in any year of the last twenty. This will prove more dangerous to next year's quail supply than the deplorable omission to place a quail law upon the statute books of Illinois. At Custer Park, Ill., there has been some early quail shooting, but I cannot learn that very many communities have done much "sooner" shooting this fall.

Ducks.

As to the duck flight, no one in the world, or in this part of the world, at least, knows where in the world it is. Perhaps some of the south-bound birds have slipped below this latitude, but hardly in any very great numbers, and the likelihood is that the Northern flight is still far to the north. The weather is simply heavenly for all purposes except those of duck shooting, and all the Northern waters are open, so that the birds can live in peace and plenty. We may have a storm any day, and in that case, should it mean a freeze up north of here, we ought to have a sudden and very heavy flight of wildfowl. There are a few birds—teal and more ordinary species of marsh ducks, hanging about some of the clubs like the Tolleston, Swan Lake and Hennepin, but the wise ones of those clubs are holding back for the "big shoot" which they know will come a little later.

The shooters who went out into North Dakota and upper Minnesota seem to have met a very good flight of ducks, but in some parts of North Dakota the geese are not yet down. Mr. George Cook and party, of Chicago, who are just back from a three weeks' trip in North Dakota, killed 600 ducks, but found no goose shooting at all. Mr. Cook had a weird experience with one canvasback, which was shot eight times by the party, and then had to have its throat cut before they could kill it. It was an enormous canvasback, and every one supposed it would be something princely on the table. In reality, it appeared to be the toughest old fowl that ever defied the softening influence of the basting spoon. Mr. Cook says he never saw so big a canvasback in his life, nor one alike so hard to kill and so hard to eat.

Quail.

The exodus of quail hunters began Oct. 31, and the first of next week will see a great many guns afield. There is reason to believe that the season will be shorter than usual—that is to say, that the beavies will be broken up and their numbers cut down in less time than is ordinarily the case. We have as yet had no frost to lay low the heavy vegetation, but there are some parts of this State where the cover is not too heavy to admit of good work with dogs to-day, and in all such places the guns will be making merry music for the next few days.

Around Bloomington, Ill., there is still good quail shooting to be had, but the wise ones say it is best to go out about thirty miles one side or the other of that thriving community. Mr. W. P. Mussey left for Bloomington and will shoot there for a few days.

A much-touted place is Neoga, just this side of the large town of Effingham. Drs. Carter and Miller made their tremendous bags of quail last year in the vicinity of Neoga, and this and other successes of a similar nature have started every one for that point this fall. Oswald von Lengerke is going down there to-day for a whirl.

Last fall we found the farms close to Effingham very closely posted, and I would council every one to go a little beyond Effingham, and get off at Watson. Here Mr. William Green can be chartered, with a bird dog, and a very practical one at that, and if any one wants to make a quail hunt, I hardly know how better to direct him. At least this was a good tip last year. This is a good way down in the State, perhaps too far for many Chicago shooters. It is safe to go almost anywhere along that same railroad from fifty to a hundred miles south of this city. Ramsey, still further down in the State on the Illinois Central line, is one of the best quail points in lower Illinois.

A part of the country which is not very much visited by Chicago shooters is the corn belt along the Mississippi Valley, bordering, for instance, on the upper county or so of Illinois. In the bottom lands and along the little creeks which come down from the benches of the bottoms through the farm regions, there is some very good quail shooting to be had. It is an odd thing, but most of our shooters seem to go either north or south for their shooting and fishing. The east and west belt is mostly patronized by those who want to make long trips far out into the Western States.

The Okaw bottoms of lower Illinois are in a good shooting country. The C. & E. I. Railroad passes through some very good quail country, and its officials will be willing to give more specific advice, no doubt.

Out of Springfield, Ill., in almost every direction beyond a radius of a dozen miles, there may be found good quail shooting, and between the two legs of the Illinois Central system, at about that distance from Chicago, there

has always been a good grain country, where Bob White has increased and multiplied.

The Kankakee Valley, both in Indiana and Illinois, is lined with farms, and there is quail shooting practically throughout its length. Remember always the license law in Indiana.

Doves.

Mr. J. V. Clarke, president of the Hibernian Banking Association, of this city, is just back this week from a day's dove shooting near Columbus, O. He and a friend killed 145 doves on their hunt. They shot in the corn-fields. Mr. Clarke says that the shooting was very easy, so that he did not miss any bird at all, although he killed over forty to his own gun. The shooters stood up in the tall corn, and the doves feeding on the fields would come along close to the tops of the corn, and not flying at any very great speed. Mr. Clarke conceives the idea that dove shooting is easy work, something in regard to which very many shooters will differ from him. A dove geared up to about 180, coming down wind in its search for food or water, is a far harder bird to stop than the Bob White quail put up ahead of a point.

Mr. Clarke says that the Ohio sportsman hardly dares to call his soul his own, as the Farmers' Leagues have practically made some sections of that State air tight. They met a little difficulty in their own brief experience, but were treated decently after all by the farmer who figured in the matter. It seems that over large tracts of that part of the country the farmers have signed an agreement to allow no shooting whatever on their lands, so that when a farmer hears guns anywhere near him, he knows that it is shooting done without permission, and all he has to do is to get over and make trouble for the shooter as promptly as possible. Mr. Clarke says that they saw very many quail during their day's shooting, but did not molest them, as it was against the law to do so.

Mr. Ernest Freeman and his friend, Mr. Mitchell, of this city, left early in the week for a quail and dove shoot somewhere to the south of here. They were rather leaning toward Evansville at first, but may switch off toward Watson on the Illinois Central.

Game in the East and West.

Once in a while I read about the delights of woodchuck shooting with the rifle in the New England States, and the installation of the woodchuck as a big-game animal has always seemed to me to be one of the awful things in sportsmanship. Yet what right has the West to find the note in its brother's eye? Out here we are beginning to shoot mudhens in the place of ducks, and not only shoot them, but eat them. A few years ago the finger of ridicule was pointed at any shooter lately arrived in this country who had the hardihood to expose openly in his bag a number of these insignificant fowl. To-day shooters come home and tell about good times they had in mudhen battues, in which a line of boats worked up a big body of these fowl and everybody took a hand in the shooting. Then again you will hear a fellow stating that he has brought home a few mudhens "just to try them, you know." The shooting-resort hotels have got far beyond that. At first they served mudhens surreptitiously. Now they do so openly and do not care who knows it. Presently we shall not only be shooting mudhens out here as an accepted form of sport, but eating them as a prized article of diet. Surely the times have changed when Fox Lake, Ill., once famed for its canvasbacks, now prides itself upon its mudhen shooting!

How to Plant Wild Celery.

Mr. Joseph B. White, of Water Lily, North Carolina, writes very entertainingly of matters in the Currituck Sound country, giving definite and authentic advice in regard to the best way to plant wild celery. Mr. White's advice in this matter will prove of value to the very many sportsmen who have not had good luck in their attempts to introduce this favorite duck food in club preserves. Nearly all the clubs along the Illinois River which have tried to introduce wild celery experienced difficulty in getting good results on this plant. Mr. White's advice and his generous offer to be of assistance as he can to sportsmen, bespeaks himself the sportsman that he is. His letter follows:

"I noticed your inquiry about wild celery. I hardly think it is to be found in such abundance anywhere in America as in Currituck Sound. I have been experimenting during the past summer for some friends, and find if the seeds are gathered in June and planted in any depth of water from six inches to ten feet, it will bring forth a fine crop of celery in August. It grows very rapidly and if bottom is soft, it is very hardy and strong. The crop at Currituck is so heavy this season that in many places—even in six to eight feet of water—one can hardly push or pull a small boat. Clubs or individuals wishing to grow wild celery should secure the seed in June and sow as soon after as possible if desired for duck food in the fall. Or it can be had in September, October and November for the spring, but if once started it soon spreads and may be transplanted at any time.

"I can put any friend of FOREST AND STREAM in the way of obtaining the seed, and will be glad to answer a reasonable number of letters if I can be of any service to a brother sportsman.

Respectfully,
"JOSEPH B. WHITE."
E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Alabama Quail and Ducks.

HUNTSVILLE, Ala., Oct. 20.—Quail are plentiful now in Alabama. The Tennessee River at the Mussel shoals is teeming with ducks and geese, stopping over on their southward flight. Foxes are abundant, and the welkin nightly rings with the melted music of the pack in pursuit of swift-footed Reynard.

JOHN, JR.

New York Partridge.

SMITHVILLE FLATS, N. Y., Oct. 26.—The shooting is very good in this vicinity. Two sportsmen from New York and myself killed forty partridges and woodcock last week.

P. A. PURDY.

Some Timely Hints.

From "611 Hints and Points for Sportsmen."

Hanging Up a Deer.

AFTER inserting a gambrel in the hind legs of the animal in the usual manner, cut a couple of crotches about eight feet long, then bend down a springy sapling and insert the top under the gambrel. Now place your crotches, butt outward, at right angles to the sapling, hook one of them into the sapling, just below the gambrel, and place its butt so it will not slide; now, with the top of the other crotch in your hand, lift up on the sapling, pressing it against the crotch at the same time. When as high as you can get it, insert the other crotch above the gambrel. If the sapling is not strong enough to hold the weight of the deer, carry the foot of this crotch toward the other and the thing is done. If the deer is very large, or your muscular energy small, you can start with crotches three or four feet long and then use longer ones.

Pinnated Grouse.

Pinnated grouse (prairie chicken) will be found in the stubble fields in the morning and evening, and near sloughs or in cornfields in the middle of the day.

Quail Hunting.

Don't start out too early in the morning; the birds are then seeking their feeding grounds—are running, and will never stand well to be pointed. Wait until the sun has dried off most of the dew, and you can hunt with decidedly more comfort to yourself, as well as to your dog. The birds will have finished feeding in a great measure in the meantime, and will be quietly resting in some grassy covert in their feeding grounds, or immediately contiguous thereto. Their flight will not be so long, and their movements more sluggish after taking flight, which, however, they will do very reluctantly.

Dogs in the Field.

Do not feed too much before starting out for a hunt. Look after your dog's feet after a day's hunt. Leave no burrs on over night. Feed at night after hunting. Don't allow them to fill themselves with water while hunting.

Portrait of an Elk.

SOME kind friend connected with the office of the FOREST AND STREAM mailed me some literature, accompanying which was a "Portrait of an Elk," photographed by one Wallihan. The literature refers to sundry other portraits, twenty in all, of live animals other than elks, which, judging from the work in front of me, must be very fine and fully worth the price asked. I have put the portrait of the elk in the recess of my desk and have between times admired him as he stands in all his glory upon the snow-covered ground. He looks at you and gives out from his nostrils the breath of life. You can run your hand over his hide and feel the frosty particles adhering to the hair. To rub your hand through the standing hair along his spine would set free millions of icy atoms adhering thereto.

Protruding from his mouth is a small blade of dried grass that he has just cropped from the growth before him. This particular elk, although shot by the camera upon his stamping ground on the boundless plains, stands at attention as one would imagine an elk to stand within a fenced paddock at peace with his mortal enemy—man. He certainly "hears and sees something," but if he was alarmed, when the shutter snapped, he has not yet shown any evidences of his fright. He stands there an elk in all his natural grandeur and beauty, sleek and graceful, head poised upon his shoulders in a way no taxidermist could equal, a beautiful, living, real thing. You can almost hear the dry snow crunch under his poised hoof as he brings it down. Between the man who slew his elk with leaden bullet and whose antlered head now graces the dining hall and the man who shot this elk with his bloodless camera, transferring him a living, breathing thing for all time upon his plate, perhaps the greater glory and pleasure is with the latter.

Photographically speaking, this particular shot at an elk was a great one—a shot ever to be remembered and to be proud of for years to come.

CHARLES CRISTADORO.

Quail in Town.

MORGANTOWN, W. Va., Oct. 30.—*Editor Forest and Stream:* This morning, while taking a little stroll out in the suburbs of our town, I saw a fine covey of fourteen quail not over 250 yards from the court house, and within the city limits. I sat down and watched them for several minutes, at a distance of about 40 yards, and had a good opportunity to count them as they walked from one patch of weeds and brush to another. This, however, is nothing new here, as they can be seen within the town limits at almost any time, and during the summer months their cheerful Bob White can be heard all day long from any point in town. This, in a town of 5,000 population, we consider rather rare, and it shows what a few years of close time on game will do. After to-morrow they can be killed, and no doubt some good sport will be had.

EMERSON CARNEY.

Skunk Farming.

PINE BUSH, Orange County, N. Y.—*Editor Forest and Stream:* I am thinking of starting a skunk farm, and am anxious to secure all the information possible on the subject before undertaking it. Can you give me the names of any parties successfully engaged in the business? If not do you know whether there are any? Or whether it can be made a profitable business? Do you know of any books or papers treating on skunks or their habits? Do you know whether the fur of skunks raised in confinement is good? I have been told that it is not.

H. J. C.

[We have read many reports of skunk farms that were gold mines, but we have never been successful in finding them. The nearest we ever came to it was in the case of a man in Pennsylvania, who claimed that he had

solved the problem, but he wanted to sell his secret for a sum which would buy all the skunks in the country. In a report by Dr. T. I. Palmer, Assistant Chief of the Biological Survey, it is written:

"Misled by the statements about the rapid increase of skunks and the high prices paid for their skins, many persons seriously considered the experiment of starting skunk farms. For several years a list has been kept of such farms located in various parts of the country, but so far as can be learned most of them have been abandoned.

"Raising fur-bearing animals for profit is not a new idea. The industry, however, has apparently never advanced beyond the experimental stage, except in the case of the farms for raising the Arctic or blue fox, established on certain islands of the coast of Alaska.

"Minks and skunks breed rapidly in captivity, but the low price of skins makes the profits rather small. Last season the highest market price for prime black skunk skins from the Northern States averaged about \$1.45 each, but white skins sold as low as 15 to 20 cents apiece. Skins that have much white or which are obtained from the Southern States usually bring less than a dollar each, a price that leaves little margin for profit after paying the expenses of raising the animal in captivity."

Game in Town and Out.

HUDSON, N. Y., Oct. 31.—*Editor Forest and Stream:* Noticing several articles about game in towns, I add another instance. A Hudson woman walked out of the back door of her house one morning last week, and on the clothes reel there sat a ruffed grouse. She called the members of her family out to see it, and they walked within a very few feet of it, when it flew away, apparently not in the least frightened. The following week one of our business men stepped out of his front door on the street, and, hearing an unusual noise, looked across the street and saw a bird fluttering. He walked over and picked up a full-grown grouse that had struck against the brick building with such force as to kill it. This happened on Sunday morning, and it may be that the bird was so annoyed by the Sunday shooters that he concluded to come to town, and mistaking the building for a church, met death in this way.

Still another. The grounds surrounding the Home for the Aged were visited by a flock of sixteen quail, and they were there for nearly two hours, apparently as much at home as they could have been in the thickest cover they could find.

We have more quail in Columbia county this year than have been for many years, and the sportsmen are hoping to get a great many birds, but they may be disappointed, as we have shooters here who have been out for grouse every day since Sept. 16, and have hunted in open lots where grouse are never found, and where several broods of quail were raised; and the chances are that the quail are cleared up by this time. Reports show that there are a great many half-grown coveys. We can only account for this by the supposition that the early season was so wet that they have been lost, and these are the second brood.

H.

Birds of the Newfoundland Caribou Country.

THE yellow-legged curlew, great gray sea gulls, shield ducks, black duck, willow grouse, ptarmigan, crows, hawks, ravens, the red-throated loon, the white-throated sparrow, woodpeckers, a few dull-colored, tuneless small birds, and the great Northern diver were the most notable representatives of the bird tribe. Occasionally a marsh harrier was seen beating the meadow, with a design, I believe, on our merry little friends the curlews, or "twilicks," as the men called them. A constant visitor was the ubiquitous "whisky-jack," or Canada jay, which invades every forest camp, and is not satisfied with the most astounding gorging, but takes choice morsels which he cannot swallow. I cannot say that I appreciate the presence of birds when executing a wary stalk on a deer. More than once have I been defeated by the warning given to the game by the wild burst of the willow grouse from the moor or the untimely cawing of some sentinel crow. On several other occasions a flock of ducks or wild geese, hitherto unobserved, rising with a fright and clangor from some tiny lakelet, have created a sudden panic. Birds in an undisturbed solitude are supposed to be very unsophisticated, but I must say that the reverse of this appears to me to be the case, for I have always found them more wary than near the haunts of man—and ever on the lookout for danger. There is, seemingly, one exception to this, the camp robber or whisky-jack; but he is everywhere a close companion of mankind.—London Field.

Deer in Rhode Island.

MANTON, R. I., Sept. 18.—*Editor Forest and Stream:* Here is another exemplification of the old saying, "It is the unexpected that always happens." In this case it was a deer, seen in my pear orchard; and when I first saw her (it was a doe) she was within 50 yards of the house. She did not appear at all wild, trotting quietly about the orchard, then through my garden to the boundary wall, and after a moment over the wall and away. Possibly it is an escaped tame deer, although I know of none such about here. Providence city line is only a mile away!

W. A. SPRAGUE.

Wisconsin's Skitter Snipe.

MADISON, Wis., Oct. 30.—It is a great year for snipe out here. A good shot can easily bag twenty-five or thirty a day. I grieve to say that I am not in that class. "The cussed things skitter too much," as a native once said to me.

FAYETTE DURLIN.

An Ohio Successful Hunt.

TOLEDO, O., Oct. 28.—Prof Edm. H. Osthaus and I went on a little hunt last week for two and a half days and had, as usual, a very nice time. We got fifty-eight quail, ten partridges and three woodcock—a very nice mixed bag.

C. A. D.

The Gun Borrower.

Editor Forest and Stream:

The article in this week's issue of FOREST AND STREAM, under the heading, "The Gun Borrowers," treats of a subject which deserves attention. Many of us, no doubt, have been victims of gun borrowers before now. That there are different kinds of borrowers, however, goes without saying.

It is to be regretted that the individuals described by your correspondent are greatly in the majority of gun borrowers; at least, it has been my luck to find this to be the case. But there is an individual to whom it affords one pleasure to lend a gun. I refer to the born Nimrod who loves a good gun and the free outdoors, but who cannot afford to buy a modern gun. I know a few such persons, and I can truthfully say that my gun is in hands more careful of its welfare when they use it than when I use it myself. Then there are a few friends who can afford to own several guns to whom I do not hesitate to loan a gun. But I have reached that stage where I do not lend a gun indiscriminately to all who invite me to do so.

I have one gun, a rifle (resting on antlers overhead as I write), that was presented to me, that—that, well—my admiration for our President, Theodore Roosevelt, is so great that I might lend it to him; but there is no danger, for he doesn't know me, and he has guns of his own to burn

WILLIAM H. AVIS.

Another Ruffed Grouse Vagary.

ELMIRA, N. Y., Oct. 27.—*Editor Forest and Stream:* Referring to September changes in your paper of Sept. 28, I had the idea of the birds having a crazy spell during this month brought to my notice last month at Corning, N. Y. I was about to enter the Dickinson house there, when a boy called my attention to a grouse he had in his hands, and asked me if I did not want to buy it. I questioned him as to where he got it, and he said it flew across the river and struck a bank of earth, and he, being near, picked it up. It seemed to be alive and in good shape, but did not seem to know enough to fly from the boy's hands as he held it out to me.

All honor to Brother Tallett, of Watertown, N. Y., for getting the spring shooting stopped in Jefferson county.

E. H. KNISKERN.

Long Island Ducks.

EAST QUOGUE, Long Island, N. Y., Oct. 25.—Mr. Lemuel Quigg and friends visited this village the past few days, duck shooting. Yesterday's bag was eighty-one black, mallard and sprig ducks; to-day's bag five geese and seven ducks. Large bags of mallards were made last week.

E. A. JACKSON.

Ducks are reported in large numbers in the South Bay, Sayville, L. I. Good bags have been made throughout the entire week.

New Jersey Quail.

BAYVILLE, N. J., Nov. 3.—The season opened yesterday with lots of birds; but out of nine flocks found I only shot into two; the others were too small. Lots of rabbits.

HERB.

An Indiana View of New York.

FOUNTAIN CITY.—*Editor Forest and Stream:* Your little note was duly received, and it was almost like shaking hands with you. Your mentioning that you thought while crossing the Brooklyn Bridge that it was almost time for another letter from me started a train of thought in my mind. I saw you in a crowded car, seats all full, every strap grasped by a hand and the people so crowded that those who had no strap to hold on to could not fall because there was no room for them to fall in. Hundreds of other crowded cars preceded, and hundreds followed the one you were in, and all crowded as the one you were in, and on the other track was an endless procession of nearly empty cars, returning to be crowded again with people hurrying to their toil. If it was between 6 and 8 in the morning, the vast majority of these people were under a life sentence to "work every day or starve." These people would resent the insinuation that they were not their own masters, and free to do as they please, but the fact remains that they are under taskmasters as much as was blind Sampson, and will be so to the end of their lives, and the curious thing about it is that many of them know what green fields and freedom are, for they were bred in the country. Why did they turn their backs on it? Because they did not know but that all was gold that glittered, and, like the ignorant savage, were ready to barter their freedom for shining tinsel. Later, there come in these same cars the taskmasters of the great procession that preceded them. These are no more free than others. The luxuries of the poor are none, and the things that the poor call luxuries are, to those who are rich, the bare necessities of life. If their incomes are larger their necessities are larger. In the city it is all grind; if two women are grinding at the mill and one is taken, the other still grinds. When night comes, the harness is taken off and the animal is turned into the stable and fed. When morning comes the harness is put on again so surely as the morning comes.

Now, in the country all is different. There nobody works all the time. The pressure is not great enough to compel it, and there are seasons of rest, in harmony with the rest of nature. There is something to rest the tired eyes besides piles of bricks and mortar. The ears are not all the time assailed by rush and roar. The nerves are not continually set on edge by all the thousand jars and jostles of mind and body that go on and on all the time. The nose is not disgusted by a thousand vile smells, nor the body brought into close contact with all manner of disagreeable things animate and inanimate. I am glad—more than glad—that my lot is cast in the country, and I grow more glad every year that it is cast in the country. It seems to me, after the free life I have led so long, that if I were shut up to an endless task in a house, in a city, I would live no longer than a wild bird in a cage.

H.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

An Evening on the Old Creek.

O Clifty Creek! how oft the spell
Of thy enchantment touched my heart
In boyhood days when murmuring swell
'Long pebbly ways where ripples start
Led my bare feet a-wandering down.

Again I go 'long mossy banks
'Twixt rock and cliff with creviced frown
Where spans the bridge, and serried ranks
Of flag soft shelter make for bass
And chubb.

Then on to Powell's Ford
Where the town cows, old Pide and Lass
Stand hunkers deep contentment stored
In their soft eyes.

Now on below
Where Boner's Branch comes bubbling in
Its wealth of cadence to bestow,
Here sycamore and beech and linn,
A verdure-crowned and vine-clad band,
Shut in the stream on either side;
Proud, honored sentinels they stand
Round sylvan beauty glorified.

The startled crane in ponderous flight,
With slow, majestic sweep of wing,
Swings down the narrow lane of light;
The halcyon sits wondering.

Then on to Mobley's Ford I go,
Through watery beds of peppermint.
Complaining geese, reluctant, slow,
Make way for me, but without stint
Expression give to their contempt
For my bare feet.

Here islet splits
The ribboned stream, and half unkempt
Like parted shepherd's flock there fits
Into these waters ever mild—
This lily-bosomed, quiet stream—
The frolic spirit of the child
Waked by soft music from sweet dream.

Too soon the notes of whippoorwill
Come throbbing round the wooded bend,
And faint, from far, and fainter still
Sound tinkling bells as homeward wend
Old Webber's herds.

Now purringly
The waters whisper—quiet are;
The waking frogs concurringly
Salute with zest the evening star.

INDIANA.

WM. J. BECK.

A Reminiscence of the Beaverkill.

Editor Forest and Stream:

The anglers who whipped the streams in the Catskills in the early fifties can whip them now no more. Their buoyancy of youth and the vigor of middle age are gone, but we can at least live our lives as anglers over again in memory, and there is no stream in this country so full of pleasant memories as the Beaverkill. The most of those who for years frequented this noted stream have entered into rest, but some of us still survive to sing its praises, even though we cannot any longer wade its waters.

Forty years ago it was the general belief that any one who visited this stream could fill his basket with trout, and it is probable that more "swelled heads" have been reduced to their normal size on this stream than on any other stream in the country by a severe personal experience.

There are always some incidents in an angler's life which he never forgets, but unfortunately he cannot usually relate them without a pretty large admixture of the "ego," and in this case I must crave a pardon in advance.

In June, 1862, I started for Murdock's, on the Beaverkill, taking the Erie Railroad at Greycourt and bound for Callicoon, where I had arranged to be met by Murdock's three-seated buckboard. Just after taking my seat in the car I noticed four gentlemen two or three seats in front of me. The eldest man of the party had his two daughters with him, both of them charming young ladies; and my wife, who was taking her first trouting trip, soon made their acquaintance; but the four anglers showed so clearly their desire to ignore all brother anglers that I was content to sit very quietly, and as I was near by I of course heard them criticize my basket, a little brown from use, and my rods because the cases were a little ragged from wear; and then they congratulated themselves on the splendid outfits which they had just obtained from Conroy. Each had a rod claimed to be Mitchell's best. They overhauled their flies in the car, and they had apparently been furnished on the theory that "the bigger the fly the bigger the trout," and then looked admiringly on their new 15-pound baskets, with fancy straps, while a glance at mine, which had many a time held 24 pounds, and which had a broad strap, seemed to fill them with disgust.

I need hardly say that during our trip in to Murdock's I did not say anything which led them to think that I had ever caught a trout in my life.

In due time we reached Callicoon, then a very small station. Murdock's team was there, but no team for the party of six. I introduced myself for the purpose of offering to take the young ladies and one of the gentlemen in my wagon, as I had three spare seats, which was readily accepted, and the other three had to scurry around for a two-horse wagon, which they finally obtained, and then followed us. It was dark when we reached the end of our journey, and as soon as supper

was over we all turned in for the night, tired and weary.

On the next morning we all met at breakfast, and notwithstanding my slight courtesy of the day before I was still utterly ignored; the leader of the party proposed that they would select their grounds, which resulted in the appropriation of the stream from a couple of miles above, to nearly as far below Murdock's—and he then said to me that he had not thought to consult my wishes, and asked me what I would do, to which I simply replied that I would not interfere with their choice of the stream.

On their way to the stream Mr. Murdock met them, and in his quiet way said, "Boys, look out that he don't beat the whole of you."

"He don't know anything about trout fishing," was the reply.

"Look out that he don't beat you," was Mr. Murdock's response.

This was the first suspicion they had that they had met an old angler. They were in the stream a full hour before I was; but they soon learned that they were quite mistaken in their belief that the trout were so abundant and so anxious to be caught that they fairly tumbled over one another in their efforts to take the fly. They fished faithfully, in order to falsify Murdock's prediction, but with a "zeal not born of knowledge," and when they came in about dusk their united catch was a little over 12 pounds, but they exulted over what they considered their assured success.

My favorite ground was further down the stream. The day was an ideal one for the fly; the wind blew very gently from the south, not hard enough to prevent casting a good line, and the natural flies were very abundant. When the sun was more than an hour high my basket was so full that I had to forego the evening fishing, and I started for the house, carrying 24 pounds of trout on my back between four and five miles. My catch was about double their united catch, and the average much larger; and it added a little to their chagrin when I stated that if my basket had not been so small I would have brought in over 30 pounds of trout. For the first time the ice was broken, and during the rest of our trip these gentlemen were as delightful companions as I ever met. I took them one by one and taught them "the gentle art of angling," and had the pleasure of meeting nearly all of them more than once on the same stream.

On this trip I had an experience not unusual in those days. I was fishing with one of the party less than a mile below Murdock's on a warm afternoon, the mercury being above 70 degrees, when we suddenly felt a change, and looking at the high mountains north of us we saw that a northeast storm would soon sweep down the valley; and before we could reach home we were drenched with rain and the mercury had gone down about 30 degrees. It is different now, but forty or fifty years ago the northeast storm was the dread of the angler in the Catskills.

POUGHKEEPSIE, N. Y.

J. S. VAN CLEEF.

How the Beaver Kill Got Its Name.

POUGHKEEPSIE, N. Y., Oct. 31.—I am just in receipt of your favor of yesterday in which you raise the question as to the proper nomenclature of the Beaver Kill; that is, whether it should consist of one word or two.

I find in looking in the U. S. Postal Guide that this is written as one word; but that counts for nothing and rather indicates that it should be written as two words, as the Post Office Department claims, or at least has the credit of availing itself of, every opportunity to write our proper names incorrectly. Certainly we cannot look upon this department as authority when it issues orders that our neighboring city of Newburgh, whose name indicates its origin, shall hereafter be written as one word with the *h* left off.

Some years ago the Hon. Lewis Beach was the representative from the district including Sullivan County, and he desired the department to immortalize his name by changing the name of the post office at Shin Creek, on the Beaver Kill, to Lew Beach, and it so far complied with this request as to give this post office the name of Lewbeach, and any department that will do this will do anything. And it is a fair presumption that in every case where it is possible its nomenclature will be wrong.

In a very old post office directory which I have all offices containing the word Beaver are in two syllables; as, for instance, Beaver Dam or Beaver Meadows.

What is more interesting in this connection is the source from which the Beaver Kill derived its name.

The Willemoc, which unites with it at Westfield Flats, is named after a tribe of Indians of that name; and the Neversink, which is a stream near by, derived its name from Indian sources and should probably be called the Navesink, after a tribe of that name.

I am not aware, however, that we have any information as to its name. I am familiar with the entire stream except a small portion at the extreme upper end, which no one ever visits; and have never seen any indications of a beaver dam on the stream, and, as I understand the habits of the beaver, it never constructs a dam on a running stream. But there is no question that many years ago there were one or more colonies of beavers near the stream, from which it probably derived its name.

On the grounds of the Willemoc Club, which were located about three miles south of what is now known as Weaver's, on the Beaver Kill, there was an old beaver dam which had been constructed originally for the purpose of flooding a marsh of about 15 acres. This dam was about 6 feet high, 30 or 40 feet long; 6 to 9 feet wide at the base. When the club acquired these premises this dam had been partially broken down at one end, and in order to drain the marsh more fully, as it was a menace to our health, the opening in the dam was enlarged under my direction, and I then found in its foundation the trunks of trees 6 or 8 inches in diameter in an excellent state of preservation, which had evidently been placed there by the beavers.

The indications were that this had been a very large colony, and it certainly was near enough to the Beaver Kill to give it its name.

There are no indications of beaver dams at Tunis Lake, about one-eighth of a mile from the upper Beaver

Kill; or Balsam Lake, about one mile from the stream; or Thomas Lake, now called Beecher Lake, about four miles; or Murdock Lake, about a mile from the stream. But none of these lakes would ever have been likely to attract the beaver, and I have never heard that there have been any indications of there being a colony of beavers anywhere near the Beaver Kill except the one to which I have referred.

I am inclined to think that the existence of this colony of beavers to which I have referred, and which was evidently a very large one, was well known to those who first settled along this stream, and that this accounts for its name.

J. S. VAN CLEEF.

Do Fishermen Lie?

The Editorial View of the Toronto Star.

It is the custom to call the veracity of fishermen into question, but we are inclined to think that they are, after all, a truth-loving class, and deeply wronged by the aspersions cast upon their veracity. It was probably only in jest that fishermen were first credited with being unreliable in what they said about the fish they caught, or nearly caught. If so, we rise right here to remark in the interest of all fishermen that the joke has been carried too far. We make protest against it. What is there to warrant the belief that men who go fishing are untruthful in relating their experiences?

If a man comes in with a half dozen black bass of moderate size and tells a circumstantial story of having hooked a 5-pounder, which after a hard fight got away, his word is doubted. But why should it be? It is harder to land a big fish than a small one, and quite naturally the big ones usually get away, either by breaking the tackle or by writhing free from the hook. The inexperienced fisherman becomes very much excited when he hooks a big one, too excited to handle his rod as well as he does with a smaller fish, while the fish itself is doubly strong and trebly resourceful in its efforts to get away. It is not surprising that the big ones get away. No man's reputation for truth-telling, therefore, should be injured because he brings home pounders and tells of nearly catching others as long as his arm.

Is it reasonable to suppose that a man would go fishing again and again if he were not encouraged by almost capturing those splendid big fellows that he talks about?

The few and paltry fish that he brings home do not reward him for his time and trouble. But he goes back day after day to struggle, usually in vain, with giant fish that would be mighty well worth the catching if he could but get them into his boat or high and dry on the rock.

There are big fish. This will be admitted. It will also be conceded that there are as good fish in the sea as ever were caught. Now and then a big one is caught, bagged, photographed and made much of; why should we doubt that still bigger ones are hooked, striven with and lost?—lost simply because they are too huge to be handled by the ordinary rod and line in the hands of the ordinary person.

We unhesitatingly declare our belief in big fish. If there are horses and cows and other large animals on a hundred-acre farm, why should any one doubt the existence of 20 and 24 pound lunge in a thousand-acre lake? The surprising thing is that still larger fish are not hooked.

When a big fellow, after whipping the water into suds, gets away, the fisherman excitedly talks aloud to himself and the scenery, and states what he believes the weight of the fish to have been. Perhaps he makes too generous an estimate—perhaps a fish splashing in the water looks as big as two in the bottom of the boat—yet the man is not a liar because he speaks of the fish as having been a 4-pounder. He believes it to be true. He has no intention of deceiving. He feels in his heart that he would not be far wrong if he spoke of it as a 5-pounder, but he keeps on what he considers the safe side. For this, instead of derision and contumely, he merits public respect; for, in losing the fish, he has had trouble enough. Moreover, it generally is the beginner who tells of hooking the big fish. With experience comes still greater caution of speech, thus showing that the pastime of fishing, instead of causing a man to lose veracity of speech and exactness of judgment, really makes him more truthful and exact than it found him. The experienced fisherman says very little about the big fish that get away, for three reasons: (1) because he cannot endure the aspersions that will be cast upon his veracity, (2) because to tell of it will discredit his skill with the rod, and (3) because he intends to conduct some further negotiations with that particular fish in the days to come.

Considering the whole matter, it appears that fishermen are not only free from the vice of lying, but that fishing may be recommended as a cure for untruthfulness in those who previously have not fished.

Also the View of a Star Reader.

I read with very great pleasure your interesting article in the Star headed "Do Fishermen Lie?" in which you very properly call in question the prevailing custom of doubting the veracity of fishermen.

I have been a fisherman in the Province of Ontario, mostly in the Muskoka district, for over forty years past, my first notes being dated in 1858, with yearly records ever since that time; and I have naturally been in the habit, on my return home, of relating to sympathizing friends some of my experiences; and, although I have the reputation generally of being a truthful man in ordinary matters, still I have often noticed evidences of incredulity in my friends when I have told them of the fish I have caught, and of others much larger that I have lost after having nearly brought them to land. Of course, it is, as you remark, these large fish that so often get away, and it is simply because they are large, and the larger they are the more apt they are to get away; but that is no reason why an honest fisherman should not be believed when he gives a careful estimate of the size of the fish he has lost.

A few years ago one pleasant summer evening I sat on the veranda of a hotel at the Thousand Islands, enjoying a visit with a couple of friends, one of them from Boston and the other from New York; and we talked, among other things, about fishing. I told them of a brook trout I had once caught in our Muskoka

district, which when opened was found to contain a full-sized chipmunk. My Boston friend's cigar dropped out of his mouth and he looked over at our New York friend and asked him if he had ever heard before that our Canadian brook trout climbed trees? I had to explain that the chipmunk was probably crossing the stream squirrel fashion and was gobbled up en route by the trout, which was a perfectly natural thing to be done; but it was of no use.

A few days after my return home I received a set of cartoons from my friends, a joint concoction, one of which represented a party of three friends, one of whom, an elderly man, was evidently relating a story of some kind, to which the others were eagerly listening. Another one represented this elderly man fishing in a trout stream, and another represented the same old fisherman on his way to the camp with an enormous pot-bellied fish hanging on a string by his side, and some miserable doggerel underneath these cartoons indicating that all fishermen, without exception, young or old, were simply liars.

I kept these pictures for some time with my fishing records; but not long ago, looking over these "memos" of past years I came across them, and concluded it better that they should be destroyed, lest they should hereafter fall into other hands and create a false impression as to my reputation.

I was fishing in a salmon river in July last year, with some friends of mine, one of them manager of a large financial establishment in Toronto, a man of most undoubted veracity in all ordinary affairs; and after we had all gathered in camp one night, had our supper, lighted our pipes and were relating our day's experiences, he told us of a salmon that had risen to his fly on his way down the river, and of the size of that salmon's mouth, which he plainly saw, and which indicated that the salmon must have weighed at least 60 pounds; and to prove it he drew a rough sketch from memory on a large sheet of paper of the salmon's mouth. What better evidence could we have had of the size and weight of that salmon which got away? It is quite true that none of the salmon we caught (or, rather, killed) during our trip weighed over 21 or 22 pounds; but that is no evidence that there were not plenty of salmon in the river weighing 60 pounds or even more. My friend's flask was empty on his return to camp; but "that is another story."

It is to be hoped that your article may give fishermen fresh courage in relating their experiences whenever so inclined, and that they will not be deterred, as they so often are, from giving full play to their imaginations—of course, only so far as they may consider the facts will warrant.

As a humble member of the gentle craft, I feel deeply grateful for your vindication of our reputation for veracity, more especially as it is the first instance on record that I am aware of.

D. W.

In Tennessee Hills.

JAMESON, Tenn., Oct. 12.—*Editor Forest and Stream:* Last spring my friend, Walter Hadley, and I planned a fishing trip for two weeks. We finally got started on May 30. Now, I live where the hills and valley meet, and facing toward the east one beholds as beautiful a stretch of country, perhaps, as there is in the wide world. On the west the hills roll back for many miles, and among these hills are beautiful trout streams, running cold and clear on their way to join the larger waters of Duck River. So among these hills is where we meant to fish. Walter lives a mile down the valley, and in order to get an early and even start he came up and spent the night with me. That night we packed the bundles. The cook was up early the next morning, and by daylight our breakfast was eaten, the little chestnut mare Kate was hooked to a light wagon, and just as the sun was rising we turned her head up hill and were off.

Our friends had geyed us, and said we would catch nothing; but we replied that we meant to enjoy the trip from the very moment we left home, and we did. We entered the woods at once, and these were beautiful with the fresh, full growth of sweet springtime. The trees were full of fluttering, flying, singing birds, and wild flowers grew in great profusion by the roadside. We expected to see squirrels jumping, so carried a light shotgun, with which we popped and banged along the way.

The day had dawned beautifully bright and warm, but by 10 o'clock rain was falling. Anticipating this, we had carried our gum coats, which gave perfect protection from the weather. We rather enjoyed the rain. Its soft patter among the leaves was like innumerable voices murmuring, "Fish are biting."

We were nearing the end of our journey, however. The trappy-gaited mare had carried us along rapidly and we soon drew up in front of the home of Col. Warf, to whom we had been directed. The place and the people were strangers to us, but we made friends readily, and were soon comfortably located.

We rigged up at once and started for the creek. There is a dam at this point, and it is so fixed between the hills that the water backs up a long distance and spreads out something like a lake. There are small islands, clumps of willows and great weed beds, and it is an ideal home for the trout. I was ready first, and made the first cast. There was instantly a tugging at the end of my line. The reel whizzed, and a 14-inch trout broke the water 20 yards away.

After a brief struggle this one was landed and proved to be a beauty. It was my purpose to put him on a string, but before doing so I baited my hook and dropped it back into the water. Before I could get the first one strung there was a great splashing under the bank, and I had hooked another. This also was landed and was a nice one. I was almost beside myself and tried to shout, but had left home with a cold and hoarseness which was not improving in the heavy weather.

I told Walter if I did not catch another I would feel well repaid for my trip over. After that they did not bite so rapidly; but we continued to pick up one from time to time until we had a nice string of them. Our catch consisted almost entirely of trout, though Walter caught two black perch that were beauties. One of these he caught while fishing from a bluff, and though he was

using a light bamboo rod he lifted it bodily from the water. As he did so I made a snapshot picture, which I inclose, and in which you may catch a glimpse of some beautiful Tennessee scenery.

Col. Warf is himself a fisherman, and said he was going to fish against us for numbers; so with a can of red worms he fished for perch.

One afternoon, when I was tired of climbing the bluffs and tramping up and down stream, I went and sat beside him on a log, one end of which lay out in deep water. He has quite a fund of anecdotes, and while he told one story after another, and chuckled all the while, he pulled twenty perch out from under that log.

We fished two days, and before starting for home I gathered a great armful of flowers and ferns from the bluffs and banks of the creek.

That night at home I placed them in spring water, and the next morning sent them to my sweetheart. This sweet girl dearly loved flowers, but the sad part is yet to be told. She made one of our camping party in August. Soon after her return home she was taken quite ill, and when the autumn flowers began to fall she died.

But I have just returned from another trip to Col. Warf's. This time Walter could not leave his business, so I went alone. I carried on this trip a light boat. With the boat I could get out to the clumps of willows and beds of weeds. But the scene is changed now. The woods are no longer fresh and green, and the birds do not sing so joyously as they did.

I found the Colonel and his good wife at home. They were making sorghum, and were busy; but he found time to go fishing with me. I spent a couple of days most delightfully, and caught a splendid string of trout.

Thus ended pleasantly another trip to the hills.

ED BARR.

Lake Hamlin.

CHICAGO, Ill.—*Editor Forest and Stream:* Returning from my usual fishing trip at Hamlin Lake, I dropped off at Ludington, Mich., to see my old friend, George Ackersville, who bears the enviable reputation of being the best sportsman on the lower peninsula of that State. As usual, George had plenty of good news for me, having located a number of places where, as he says, quail will be thicker than fleas on a tramp dog this fall. But the best information he had to impart was the return of wild pigeons to Michigan. If anybody knows a wild pigeon when he sees one, Ackersville does; and it can hardly be possible that he is mistaken in this matter. I was incredulous, however; but he declared he saw them himself—three flocks of them—and was not relying on anybody else's say so. Not only does his description of the birds he saw tally with the old-time wild pigeon, but he will endeavor to secure from the clerk of Mason county a license to shoot a couple of the birds for scientific purposes, and if successful will ship them to FOREST AND STREAM, so that you may pass judgment on them yourself. Wild pigeons, if any exist in Michigan, are protected until 1910, but Ackersville thinks he will have no trouble in securing the necessary permission in order to establish his claim.

Fishing at Hamlin Lake was better this year than I have ever seen it before, but the season was backward, the bloom from the lilies remaining in the water a great deal later than usual. More muskellunge were taken from the lake this season than in any two years previous, but few of them tipped the scales over 15 pounds. The run of bass was greater than usual, small and big mouthed varieties taking frogs with a voracity heretofore unknown in these waters. Several big fellows were taken, one that I saw, caught by Dick Steffens, the photographer, tipping the scales at 6¼ pounds.

Hamlin Lake is fast becoming too prominent as a fishing resort, and I am afraid it will only be a matter of a few years when there will be more fishermen than fish in that neighborhood. For a great many years, however, a few Chicagoans have had a monopoly of the sport at Hamlin, and I guess it is only fair that the rest should come along now and have their share of the fun.

WILLIAM P. CORNELL.

An Owl with a Penchant for Law.

THE Indian summer days are upon us, and if anywhere in this broad land the Minnesota Indian summer can be excelled I would like to know where, with their dryness of air, with just a touch of chill to it when you get in the shade, but when out in the bright, clear sun like one continuous draught of champagne—exhilarating, but not intoxicating.

We are working in our shirtsleeves alongside of open windows, and through one of these windows, left open and belonging to a prominent lawyer's office in town, did a small brown owl (genus unknown) fly in during the night.

When the office was opened in the morning high up on the uppermost shelf of the bookcase perched the owl.

His gaze was so fixed and his pose so steady that without exception the clients pronounced him a most natural example of taxidermy. Only at very long intervals did he blink, which convinced the onlookers, against their wills, that he was a live, instead of a stuffed, bird. During the livelong day he kept his perch, and save for an occasional blink or a slight ruffling of his feathers, he remained absolutely motionless.

When the shades of evening began to fall it was decided to give him his liberty, and after much poking and shooing he was finally corralled in a waste-paper basket, and in due course deposited on the window sill, when he instantly made himself scarce.

Yesterday morning I took advantage of a perfect day, and with a friend went on the cars twenty miles down the Mississippi River to a small riverside hamlet called Prescott to try the small-mouthed bass, large catches of which had recently been made at this point. The river is narrow here, but deep in spots, and where the piling is driven do the large bass lurk. Then there were the wing dams, ledges of broken stone leading out from the shore into the river to direct the current over one and the same route from month to month and year to year. For minnows to do any migrating they must pass around the corners of these wing dams; and how well the bass

know it! When the bass are taking a fly one can always get good fishing at these wing dams. At this time of the year minnow casting is the proper way to take them. One can go above the dams and allow the minnow to gently float down until it strikes the swirl at the end of the dam, when instantly something happens to which the singing of the reel usually adds interest.

These dams are very close together at this point, and one after another in succession can be easily fished in rotation.

The fishing was good, and the bass fully kept up their reputation for life and pugnacity. Lost hooks now and then and once a broken line satisfied us, as usual, that the largest and heaviest fish remained uncaught.

We enjoyed every minute of the outing, the warm, October sun tempering the otherwise sharp breeze to the temperature of a spring zephyr.

The river was alive with lumber rafts and steamboats. Logs in great rafts were being rushed down the river to the saw mills lower down. It was quite interesting to see the steamers guide these great and unwieldy aggregations of logs through between the bridge piers without an inch to spare. It seemed as if the great raft's width had been measured with a pair of calipers.

Withal, it was a delightful day, just such a one as many of my readers have spent on the sunny Connecticut sidehills, among the scattered birches, with the woodcock. But instead of dog and gun, we plied our rods, and enjoyed the fishing in the sunshine.

When Sept. 1 comes in the country a man instinctively drops his fishing rod and grabs his gun; but fishing is not by any means over on Sept. 1. The bass and muscallonge are then at their best, even if the former may prefer minnows to flies. They are full of fight; more so than during the spring and midsummer.

One thing impressed me yesterday, and that was the fact that we were never away from the village more than a few minutes' rowing; in fact our guide asserted that when the fish were eagerly taking the bait he could easily fish the adjacent wing dams and be back to the landing with a dozen fine bass all within a single hour's time.

The fishing yesterday was so close at hand and easily obtained that it savored of a bass preserve at one's back door. And yet there are hundreds of our boys who will spend two or three hours on the cars and will fish lakes where big-mouthed bass and pickerel alone can be had, and where the water is warm and the fish are lazy, and overlook this small-mouthed bass fishing in the Mississippi River at their very doors.

I started in to tell about a wayward owl that flew into the clutches of the law, and I have wandered off about small-mouthed bass fishing at Prescott on the Mississippi River.

CHARLES CRISTADORO.

Nets and Game Fish.

WATERTOWN, N. Y.—*Editor Forest and Stream:* Speaking of experiments, in 1898 a bill was introduced by Senator Brown, which at the time was opposed by the anglers, and the Senator and myself were accused of being in league with the net fisherman. My arguments for the bill and personal pleadings with the anglers secured their consent to a trial, and the bill was passed. The bill became a law, and the result is that we have the best small mouth black bass fishing in the State, and it is getting better each year. On the St. Lawrence River, where no netting is allowed, the fishing is getting poorer each year.

Parties drive from Clayton to Chaumont Bay to enjoy our splendid bass fishing or go into Canadian waters. It seems very strange to me that the Anglers' Association of the St. Lawrence River should be so blind to their own interests as to permit that grand river to fill up with fish that the angler does not want or cannot catch with a hook and line.

In the early period of my life I lived for twelve years at Clayton. At that time the river was full of black bass and muscallonge; now it is full of pickerel, perch, bull heads, eels, catfish, sturgeon, rock bass and sunfish, but the black bass and muscallonge are conspicuous by their absence. This is not a theory but cold fact, very easily proven by a few days' fishing at Clayton and at any point in Chaumont Bay. I inclose a copy of the law that has made Chaumont Bay the best black bass waters in the State:

Sec. 74. Nets in Chaumont Bay and Adjacent Waters.—The waters and bays of Lake Ontario, in the county of Jefferson, within one mile of the shore, between Horse Island, in the town of Heunfield, and the town line between the towns of Lyme and Cape Vincent, except the waters within one mile of Stony Island or of the Galloup Islands, are so far excepted from the provisions of this act as to permit the taking of fish by nets therein from Oct. 1 to April 30: Provided, That a net shall not be set until license therefor has been granted by the Commission. The Commission shall, on the execution of a satisfactory bond, conditioned for the payment to the people of the State of the sum of one hundred dollars if the holder of the license shall violate any of the provisions of this section as to black bass or muscallonge while the license is in force, grant such a license unless the applicant has been convicted of violating this section or his bond adjudged forfeited. The license fee shall be one dollar for a net, and a single license may be for five nets. All black bass and muscallonge caught in nets set pursuant to this section shall be immediately returned to the water alive, and without unnecessary injury.

And here is the law that has made the St. Lawrence River the poorest:

Sec. 317. Fishing by Certain Devices Prohibited.—No fish shall be fished for, caught or killed in any manner or by any device except angling in the waters of the Thousand Islands, except that it shall be lawful to take minnows for bait in the manner provided for by Sec. 145 of this act; Provided, however, That if any black bass, pickerel, pike, wall-eyed pike or muskellonge are taken in such nets they shall be immediately returned to the waters alive. Whoever shall violate or attempt to violate the provisions of this section shall be deemed guilty of misdemeanor, and in addition thereto shall be liable to a penalty of \$100 for each violation thereof.

I have been asked by a great many of the sportsmen who have cottages on the river to secure the same law for the river that we have for Chaumont Bay; but I have been very reluctant to make any such effort in opposition to the Anglers' Association, hoping each year that they would see their mistake and correct it.

However, if nothing is done by them the coming winter I shall make an effort next year to secure a law that will (inside of three years) restore to the grand old St. Lawrence the magnificent black bass and muscallonge fishing for which this river was once so famous.

W. H. TALLETT.

The Lake Trout.

THERE has been some discussion of a fish sent by Mr. C. B. Rosevear, manager of the New Algona Railroad, from waters lying north of Sault Ste. Marie. It was supposed to be a new variety; and for determination a specimen was, by Mr. Rosevear's courtesy, forwarded to the FOREST AND STREAM.

THE trout sent for identification is a lake trout (*Cristivomer namaycush*), which is described and figured in many recent books, as well as in De Kay's "New York Fauna, Fishes," page 239, plate 39, figure 123. De Kay, however, calls it *Salmo conifinis*. Richardson gives a good figure of this trout in his "Fauna Boreali-Americana," Vol. III., page 179, plate 79, under the name *Salmo namaycush*.

All recent books upon the game fishes of North America describe the lake trout either as the *Salvelinus namaycush* or *Cristivomer namaycush*, the fact being that the common lake trout and the common brook trout are very closely related. The principal difference between them is in the disposition of teeth in the middle of the roof of the mouth. In the brook trout these teeth are few in number, and they are arranged in a little, roundish cluster on the head of the vomer (a small, boat-shaped bone in the middle of the roof of the mouth). In the lake trout the teeth in question are not in a cluster, but in narrow, double line, which is four times as long as it is broad, and which is not placed upon the vomer proper, but on a raised crest above the shaft of that bone. There is also a long and well-developed band of teeth at the base of the tongue, whereas in the brook trout these teeth are either absent or only slightly developed in a minute patch.

Perhaps this method of distinguishing between brook trout and lake trout may be difficult for some anglers, and for them it may be best to rely upon other characters, such as the deeply forked tail fin of the lake trout and its roundish, pale spots on a grayish or blackish ground. The pale color of the ventral and anal fins, the absence at all times of a black line behind the white front margin of those fins, and the entire lack of small, roundish, red spots upon the sides and of reticulated markings on the body and fins.

In Bulletin 47, U. S. National Museum, page 461, Jordan and Evermann say of the lake trout genus: "Species spotted with gray, without bright colors;" and of the brook trout genus: "Species red-spotted, the lower fins with bright edgings." These statements should be reconstructed, for the lower fins of the lake trout in the breeding season are vermilion, and some individuals have a white outer edge at the breast and belly fin and on the front of the anal fin. A specimen from Newfoundland Lake, N. H., had also a white tip to the lower lobe of the tail fin and on the top of the back fin. These bright colors are present in both sexes.

The lake trout is found throughout the entire northern part of North America, as far north at least as the Arctic Circle, and south to Maine, New Hampshire, New York, the Great Lake region, Henry Lake in Idaho, and the headwaters of the Columbia. It has been described under many scientific names, and is equally favored in the number and variety of its popular appellations, which include salmon trout, Mackinaw trout, red trout, gray trout, lunge, togue and tuladi.

CHICAGO AND THE WEST.

A Grand Muscallunge.

CHICAGO, Ill., Nov. 2.—Mr. W. R. Caldwell, of this city, returned this morning from a few days' fishing trip in the little St. Germaine County of Wisconsin, along the C. M. & St. P. Ry. Mr. Caldwell is the same gentleman regarding whose preparations for a big muscallunge campaign I wrote at some extent a few weeks ago. I described then his theory regarding big bait, and his different spoons, tandems, buck tail baits, etc., which he was then preparing. He did not at that time get away for his trip, but left last week, and is back now with abundant proof that his theory regarding the habits of the giant muscallunge is an exceedingly correct one. He brought back with him to-day a magnificent specimen of muscallunge which weighed 43 pounds, and which was in many ways the most remarkable fish that ever came out of Wisconsin. The length of this fish we could not make to be over 50 inches from tip to tip, yet about the shoulders it girded 21 inches, and about the middle of the body it showed the tremendous measurement of 24 inches. Its back was extraordinarily thick along its whole length, and the fish seemed to be fat and in splendid condition. You will often hear of muscallunge which measure 52, perhaps 54, inches, yet do not come anywhere near such a weight as 43 pounds. Mr. Caldwell has known a 24-pound muscallunge to measure 50 inches.

This fish was a perfect monster in appearance, and it put up a fight quite in accordance with its tremendously stocky, heavy, bulldog frame. Indeed, all the fish taken in the little St. Germaine lake seemed to be in perfect condition. Mr. Caldwell had another muscallunge of 24 pounds weight, two of 12, and others of less weight, but these seemed babies compared with the giant 43-pounder. There was any quantity of pickerel in these waters, and certainly the muscallunge seemed to be feeding on something which makes them exceedingly fat this fall.

As to the quality of the sport, Mr. Caldwell says that he could not call the trip a very lucky one outside of the capture of the big fish above mentioned. The weather was simply vile all the time, cold, stormy, and with so high a wind that the lake was almost unsafe to fish even in the milder parts of the day. At the time the big fish was struck the sea was running so high that it was dangerous to be out in a boat. Mr. Caldwell was trolling with one of his bucktail baits, the full-sized tail of a deer, a bait fully a foot in length. When they got the strike they hardly knew what to do, for there was enough on hand to keep the boat right side up. The oarsmen started the boat against the wind, and they went up the lake twice, the fish being played for something like an hour and a quarter. When the boat was running before the

wind of course the fish was towed swiftly. Going the other way it was almost impossible to make any headway at all. The big fellow struck at a tandem gang when he bit the buck tail, and the large hook was driven quite through his upper jaw, so that it was impossible for him to escape. The fight under the circumstances was a long, stubborn and highly interesting one. To land so big a fish as this in so wild a sea was something of a sporting undertaking, and Mr. Caldwell says he never expects to have a more vivid experience. Every railroad conductor who saw the fish says that it was the biggest one that has come out of Wisconsin in the last twelve years.

One of the smaller muscallunge, a 12-pounder, bored down to the bottom after striking, and got mixed up in a sunken tree top. When at last it broke free it appeared with a big section of the tree top, which it carried to the surface. It was wedged in among the limbs so that it could hardly fight, and lay there almost spent. On reeling in, it was found that the line was fastened about some of the branches, and when the fish made a run to get away from the boat it cleared off a dozen feet of line on the outside of the floating snag. Here was something of a predicament, for of course the line could not be reeled in, and the fish was too deep down to reach with gaff or gun. There was some pretty tall figuring for awhile, but at last they got the fish close enough to deliver the *coup de grace*. This fish was caught on a tandem with the pork trailer, as were the other smaller ones, only the big fish rising to the buck tail. The argument of all of which is that it pays to try a whole lot of things in muscallunge fishing, and not to be afraid to use a good, big bait.

Wisconsin Fish Laws.

If you are fishing in Wisconsin look out how you pack your fish. The warden at Appleton is getting to be pretty nearly as bad as the one at Milwaukee, and the latter is a perfect Hawkshaw. The wardens construe the law not to permit any single fish weighing over twenty pounds to go through, and they have been confiscating every box containing more than twenty pounds of fish. The law states "two fish, or twenty pounds." It looks as though one would have to cut a 43-pound fish into three pieces in order to get through with it. Whether this was the intention of the statute seems a matter of doubt, or at least so claim certain citizens who have turned up in Chicago shy of the muscallunge which they had fondly hoped to bring through with them. It is just as well to have an understanding in these matters of game laws and wardens. Above all, do not go on a sporting trip nowadays on the basis that you can skin through, evade the laws and not get caught. The best thing to do is to go square up to the rack and take your medicine.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Potomac Notes.

GOOD weather has brought the water of the Potomac into good condition for black bass fishing, and during the past ten days anglers have been out in large numbers. Quite a large party have fished the river at Edwards Ferry, within a week, among others Messrs. Tappan, Curtis, Newman, Patterson, Graff, Bergling, Johnson, Morrison, Sypher and Major Carter. The chief complaint was that the fish ran small in size; many of those taken had to be thrown back into the river. Mr. Curtis caught the largest bass, 4½ pounds by the scales, but he was unfortunate enough to lose it in an attempt to transfer it to the live box.

Major Strong and Attorney-General Knox were booked to go to Riverton, but we have no report of their trip.

Mr. Eaton caught ten bass on a recent outing to Point of Rocks. Mr. Cameron, at Pennifields, caught thirty bass, averaging 1½ pounds each. Mr. Coburn caught ten bass at the same place.

Messrs. Tassin, Landgraff and Copper have been fishing from Dead Run to the Feeder. Many of the fish hooked were too small to keep, and were returned to the water. Their record bass weighed 2 pounds 2 ounces, 2 pounds 4 ounces, 3 pounds, 3 pounds 6 ounces, 4 pounds 2 ounces, 4 pounds 8 ounces. Mr. Copper had the pleasure of landing the largest. These gentlemen have found "mill roach" the best minnow bait. Fly-fishing yielded very small fish.

A few ducks have been seen on the river above the city, and a large flock of geese passed southward about 5 A. M. one day midweek.

Quite good-sized catches of large-mouthed bass have been made; Mr. Charles Laird took twenty-two in the neighborhood of Long Bridge, and Mr. Ehrmantrout caught eighteen bass and one pickerel, and shot a brace of ducks at Occoquan last week.

Large-mouthed bass are plentiful in the canal, and are found far up stream, and at the same time carp are "as thick as pigs" in the canal. The "Potomac bass spinner" is proving a taking lure. It is similar to a Paw Paw spoon, but the revolving spinner seems to be much more fetching than the spoon.

The lean condition of the bass in the Potomac this season is remarkable. Fish that are long and deep enough to weigh 3 pounds weigh but 2 pounds. Some of our anglers think that the muddy condition of the water all summer long prevented the fish from finding their food.

BON.

Black Bass Weights.

KANSAS CITY, Mo.—Will you please advise me through the columns of your paper of the weight of the largest black bass caught in the United States? There is a fish sold in the markets here as black bass that weighs as much as 18 pounds. Is this the true black bass? They are shipped up here from Louisiana. In a competition for large black bass could they be entered?

WILSON ASKERBERG.

[We have in our office the head of a large-mouth black bass which weighed over 25 pounds. It was caught in Florida. The fish you mention are presumably large-mouth black bass, and could be entered in a competition.]

Black Bass Culture.

Editor Forest and Stream:

Why have artificial fish breeders failed to propagate bass? Why is it necessary to bodily transplant grown bass from one spot to another instead of spawning and artificial hatching?

CHARLES CRISTADORO.

It is necessary to transport the fish because it is impracticable to take the eggs and milt for artificial culture as with other fishes. These paragraphs, from Fred Mather's "Modern Fishculture," put it in a nutshell:

"Their culture consists in planting them and protecting the water for a few years. They sweep nests in the gravel, lay their glutinous eggs in them and watch the nests, fighting off all intruders and fanning the eggs with their tails for circulation. The eggs hatch in four to six days, according to the temperature, and remain a day or two on the nest, plainly visible as a dark mass. Then, when the sac is about to be absorbed, they rise, and the old fish remains under them until they disperse to seek food. We cannot take their eggs, and hatch them, and as the parents do so well at it there is little need to try it. If young are needed for stocking, the nests should be watched and the young taken in dip nets, which are lined with millinet or cheese cloth."

The Dennys River Salmon.

IT will be recalled that the Dennys River, in Maine, is a stream which formerly afforded capital salmon fishing, as it would do to-day if freed from the nuisance of the sawdust and other saw-mill refuse deposited in it by the Dennysville Lumber Company's works. Dr. Robt. T. Morris, who has written of the river, tells us that it would now be possible to secure complete control of the river and to restore it to its pristine state as a salmon water. This would, of course, involve the expenditure of a considerable sum of money, but the fishing to be gained would warrant the expense; indeed, the milling enterprise might be continued and the fishing yet be preserved, so that the stream as a salmon river might be self-supporting.

Forestry and Fisheries at Paris.

THE United States exhibit in the Department of Forestry and Fisheries at the Paris Exposition is the subject of an illustrated report by Dr. Tarleton H. Bean, the director. It is published separately as an advance of the report of the Commissioner-General.

Nov. 12.—Harrisville, Pa.—Central Beagle Club's annual field trials. A. C. Peterson, Sec'y.

"Training the Hunting Dog."

THE new work on dog training, entitled "Training the Hunting Dog for the Field and Field Trials," presents a system which has been eminently successful through several decades of practical trial, and which in the main is used by the most eminent professional trainers of the present day. While containing all the essentials of the art as practised by the professional, it is presented in a manner so simple that the tyro can readily understand it. In particular, the peculiarities of dog nature are extensively treated, for without such knowledge the beginner can hope to succeed but ill. He must understand the limitations, the capabilities and the incentives of the dog's life before he can assume to teach the dog successfully.

The system inculcated is based on giving the pupil the most ample practical experience, supplemented with both kindness and punishment. Experience and kindness develop the dog's powers and teach him to work on the lines desired; punishment teaches nothing progressively; it merely checks the pupil from doing undesirable acts. The method which is founded on pure kindness and the method which is founded on force are fully treated, and as distinct methods are shown to be fallacious. They are a part of one method. Mankind in his efforts to learn is subjected to them. He has the incentive of rewards for good performance, and punishment—not necessarily always corporal—for bad performance.

Official organ, FOREST AND STREAM.

'Mid Reef and Rapid.—XXVIII.

BY F. R. WEBB.

We were struck with the number of eagles seen in this lower river. We have never made a cruise on the Shenandoah without seeing one or more of these great birds, but on this cruise, since leaving Riverton, we have noticed two or three every day, and generally at unusually close range. One was sighted on the morning's run, perched on a reef in midstream but a foot or so above the water, apparently engaged in fishing; if so, he didn't get a strike, for on our approach he flapped his great wings and sailed away, fishing tackle and all, disappearing through the tree tops on the left bank, to again reappear and disappear, as we rounded the bend to the left and entered upon the next reach.

A few miles below Castleman's Ferry we crossed the line into West Virginia, and about 12:30 we landed at Rock Ferry, where we lay by until 2 o'clock for our noon-day lunch and siesta. It was not a particularly attractive place, Rock Ferry, but it answered our purpose, and we made ourselves tolerably comfortable there.

"There's a good snap for your kodak, George!" exclaimed Lacy, as a couple of stylishly dressed, pretty girls came tripping lightly down the high bank, and took their places in the roomy, flat-bottomed punt moored alongside of the ferry boat, where they were joined by an awkward, half-grown boy, in tow-linen shirt and trousers and not much else, who, standing up in the stern of the boat, poled them slowly and steadily across the river, their parasols, hats and costumes standing out in bright relief on the steely blue surface of the river, which gave them back in wimpling reflections as the long lines of ripples spread away from the blunt bow of the slowly advancing boat.

The kodak, however, was in the canoe, and the canoe was 50 or 60 yds. away from where George lay, flat on his back on his mattress, with his book in his hand and his little, double-decked meerschaum in his mouth, too indolent and comfortable to rise and so the attractive snap was not secured.

We swept around a stately bend to the left, a couple of miles below. A handsome residence, embowered in trees, stood on top of the sloping bank on the outside of the bend, with a ferry boat moored to the shore. George brought the inevitable bugle into play when the house was in sight. There was no answering "Whoo-ee!" this time. Instead, a couple of tastily attired, girlish figures appeared, hurrying down the path leading from the top of the bluff to the ferry, evidently intent on running out on the boat to see us glide by.

"Jerneys!" said George, laconically, as, with a strong sweep of the paddle, he sent his canoe close in to the outer end of the ferry boat, and reached for the kodak, intent on securing a shot as he passed. His disreputable appearance, however—for George is anything but a prepossessing youth when clad in his canoeing habiliments after he has been out a week or two—stayed the further progress of the girls, and they remained timidly on the bank among the trees, until we have passed, and had dropped some distance below, when they appeared, statuesque, on the extreme outer end of the ferry boat, where they remained until we passed out of sight down the rapids and around the bend below.

Shannondale Springs occupies a beautiful location. The river sweeps, broad and majestic, in a great horseshoe bend around three sides of a long point or tongue of land, heavily wooded and beautifully turfed, which rises in a gentle slope to a considerable height from the water. Across from the point, on a beautiful, gently sloping eminence, the old Rouss mansion stands, embowered in trees and with its beautiful, well-kept lawn sloping gently down to the river. A quarter of a mile below, located on a commanding bluff, the elegant summer villa of millionaire Charles Broadway Rouss, of New York, stands. The modern structure, with its towers and gables, its statuary and flights of white stone steps leading from terrace to terrace of its ample, beautifully kept grounds, presents an imposing appearance from the river; but I found the classic old family mansion above much more interesting.

Shannondale Springs was a favorite resort for the gentry of northern Virginia for many years in the good, old, ante-bellum times. The buildings, consisting of a main hotel building, surrounded by kitchen, stables and a group of cottages, are nicely located on the well-shaded side of the gentle eminence sloping up from the river, on the lower side of the tongue or point of land.

The lawn slopes down in a beautiful sweep from the buildings to the river, where it terminates in a high, steep bank, some 20ft. above the water.

The main hotel building was burned years ago, and the

springs fell into a state of innocuous desuetude, save for the visits of yearly camping parties, who pitched their tents on the lawn or occupied some of the more habitable cottages.

Recently a small but comfortable hotel building has been erected on the foundation walls of the old building, and the Springs are now occupied and open as such once again.

We landed at the boat house above the rapids, and Lacy and I walked up to the hotel to obtain permission to camp on the place, for, although it was yet early, this was the place decided upon for our night's camp. After stopping on the way to take a drink of water from the principal spring on the place—a strong chalybeate spring incased in masonry under the shelter of a small, wooden pavilion—we approached the hotel and mounted a long flight of wooden steps leading up to the ample veranda in front of the structure. The only occupant of the veranda was an elderly gentleman with a gray moustache, whittling away industriously upon an axe handle. To my modestly preferred request for the individual in charge of the place, he replied, as he continued his whittling, that he was in charge of the place just at present, and intimated a desire to know our errand. I briefly outlined our expedition and asked permission to camp on the river bank at the foot of the lawn. He looked up from his axe handle a moment and his eyes rested upon Lacy. I ought to have known better than to bring Lacy along, but he seemed to want to come, and I could not, of course, say no. That glance settled it. He was sorry. He would like very much to oblige us, but they were obliged to make it a rule not to allow camping parties of any description on the springs grounds. It wasn't far to Bloomery, and we would find a good location there for our camp, he further informed us, as he applied himself with renewed vigor to the axe handle.

Now, I didn't want to go to Bloomery. In fact, I had no intention of going there, so I brought my persuasive eloquence to bear upon the elderly gentleman with such effect that the desired permission was finally obtained, and in fifteen minutes more the canoes were dropped down over the head of the rapid, and, with the assistance of a couple of passing teamsters and a colored gentleman from the hotel—all of whom felt amply repaid for their kindly services by a pull from a medicinal flask discovered in a pocket in one of the canoes—they were carried up the high bank, and deposited for the night in probably the most picturesque camping place we had occupied during the entire cruise.

The hills across the river approach and break off abruptly in bold cliffs and rugged precipices, the broken and twisted strata of which present curiously diversified lines. The river, which is very broad, breaks up into the most beautiful and picturesque rapids, which extend as far down as the eye can reach, and whose musical murmur fell on our ears in rising and falling cadences. All around us the well-turfed lawn stretched away, dotted with fine, old trees, and sloping gently upward to the hotel building and the abandoned, half-ruined cottages around it.

While I was attending to my professional duties at the camp stove, a party of ladies and children were discovered approaching, accompanied by the elderly gentleman of the axe-handle proclivities. Lacy and I were at once recognized and cordially greeted by one of the ladies, whom we had formerly known before her marriage as a shining light in Staunton society, and who introduced us to the other ladies and to Major Kearsley, the business manager of the springs. They took great interest in our camp and outfit, and informed us that most of the guests of the place had departed, as the season nominally closed Sept. 1, although some few still remained. They expressed great regret that we had not arrived a week earlier, as our unique, pretty camp would have proved highly interesting to the guests.

We had an elegant fish supper, and, just as we gathered around the table to enjoy it, a fresh irruption of visitors from the hotel arrived.

"Commodore," exclaimed George, with his mouth full of bass, "you're the best-looking man in the party and possess the best qualifications for the job. You'll have to do the honors of the camp."

There was no gainsaying this self-evident proposition, although the motive which prompted it was plainly apparent, so I left my scarcely tasted supper and showed the visitors around, and explained everything, with great credit to myself and the club, while George and Lacy got away successfully with the bass.

After supper Lacy and I spent the evening at the hotel, while George remained in camp to take a bath, in which laudable and commendable enterprise Lacy and I felt justified in giving him all possible encouragement.

It blew great guns in the night, while a severe thunder storm fairly shook the earth, and I thought for a while that the heavy wind and rain would lift us bodily clean out of the county, the storm got such a sweep at us in our exposed position, right on the margin of the high bank, provided, of course, we were not first struck by lightning.

Our day's cruise—the last of the trip—was short as to miles, but by far the most eventful and exciting of the whole trip, and when, at 6 o'clock, we finally paddled out of the Shenandoah into the broad Potomac and went into camp on the rocky bank of that stream, 100 yds. below the mouth of the Shenandoah, it was with feelings of relief and thankfulness that we had gotten safely through without accident, for we had not reached our destination without adventures, thrilling and exciting, compared with which most of those above were tame, nor without surmounting difficulties and shooting falls and rapids in comparison with which the entire upper river was but child's play.

Our friends from the hotel were down early to see us pack and start, and the Major, who proved to be a genial, kindly gentleman when you knew him, gave us many points about the river below which we found both accurate and useful—qualities which, more often than not, we have found quite lacking in most of the information about the river procured from the dwellers along its bank.

The three miles to Bloomery were quickly and easily run. The rapids opposite, and extending for a mile or more below our camp, gave us a splendid run, and

The work contains 281 pages, and all essential branches of the subject are fully treated. It is subdivided into twenty-one chapters, treating on subjects as follows: General Principles; Instinct, Reason and Natural Development; Punishment and Bad Methods; The Best Lessons of Puppyhood; Yard Breaking; Hill; Pointing; Backing; Reading and Drawing; Ranging; Dropping to Shot and Wing; Breaking Shot; Breaking In and Chasing; Retrieving—the Natural Method, the Fore System; Gunshyness and Blinking; the Tools of Training; Field Trial Training and Handling; Field Trial Judging; Kennel Management.

The field trial features of the work present information of special value to those who contemplate field trial competition. The general training features present information which will enable any man to train his dog, if he has any natural qualifications for his work.

Whether one desires to train his own dog or not, he without question desires to handle him well, concerning which most ample information is presented.

This work is published by Forest and Stream Pub. Co., 346 Broadway, New York. Price, \$1.50.

A Dead Dog in Court.

In a late Indiana case (*Vantrese vs. McGee*, 60 N. E. Rep., 318) the complaint, which was in replevin to recover the body of a dead dog, contained the following allegation: "That said body was at the time of said unlawful taking and detention and at the time of the beginning of this action of the value of \$2, in this, to wit: That the hide is of the value of \$1; that the carcass, exclusive of the hide, is of the value of \$1 for fertilizing purposes. That said body was not taken by any execution or other writ against the plaintiff; that said dog had been long in plaintiff's family, the members of which were very much attached to it, and desired the possession of the body of said dog that they might give it a burial on their own farm in accordance with the affection in which they held it as a useful house dog and pet." The Court held that the allegation stated facts sufficient to constitute a cause of action under the Revised Statutes of the State, which provide that "when any personal goods are wrongfully taken or unlawfully detained from the owner or any person claiming possession thereof * * * the owner may bring action for the possession thereof." The dog was property, it was held, the title to which was not lost by its death. The Court said: "The demurrer admits the property in appellant, its value, and wrongful taking, so that, unless it is conceded that the owner of the animal loses all dominion over its remains when dead, or that he can be deprived of his right or interest therein by the unauthorized acts of another person, the complaint must be held good. It cannot be reasonably maintained that the owner of such property, by the mere fact of its death, loses title to whatever value remains in the body. The change of form does not deprive the owner of title to or right of possession of property. Whenever it can be identified, replevin may be sustained."—*New York Times*.

Some Beagle Sales.

THROUGH FOREST AND STREAM the Harkaway Beagle Kennels, of Wheaton, Ill., have sold to Dr. W. Seward Webb, of Shelburne Farm, Shelburne, Vt., the following beagles: Minocqua, Clyde II., Harkaway's Bessie, Fleetwood, Baron, Busybody, Nellie, Brilliant, Clio, Fleetwing, Pilot K., Bannerboy and Sport.

Points and Flushes.

The premium list of the first annual dog show of the Colorado Kennel Club may be obtained of Mr. W. H. Kerr, Denver, Col. It contains a liberal list of merchandise and cash prizes. The show will be held in Coliseum Hall, Denver, Col., Nov. 21, 22 and 23. Mr. W. Ballantyne is superintendent.

"Training the Hunting Dog."

WEST POINT, Miss., Oct. 28.—I have carefully read "Training the Hunting Dog for the Field and Field Trials," and can honestly recommend it to all as a clear and concise treatise on the art of training, without useless frills or furbelows.

It should, on its merits, at once take its place as the leading work in its line, as it no doubt will. W. W. TITUS.

TOLEDO, O.—I have been reading "How to Train the Hunting Dog." It certainly covers every point in the most concise form. I think every sportsman-shooter should read the book, for it is a fact that very few hunters know anything about handling a dog in the field; and in this book there are many lessons that should be taught to every shooter who owns a dog. C. A. DRAPER.

NORTH EASTON, Mass., Oct. 21.—I have just finished reading "Training the Hunting Dog," and it is certainly the best book of its kind I have seen. HOBART AMES.

PITTSBURG, Pa., Oct. 12.—I have just finished a very careful reading of the most valuable book, entitled, "Training the Hunting Dog for the Field and Field Trials," and unhesitatingly commend it to all lovers of a hunting dog. The amount of useful information the author has collected within its pages is of much value to every person interested in the proper working of a dog in the field. The novice training his first puppy, or the professional handler, would do well to read this work.

ELMER E. SHAFER.

"Bullfrogs are about as voracious as anacondas," said Keeper Thompson, of the Zoo's reptile house. "What do you suppose a full-grown bullfrog especially likes? Birds. The clumsy-looking, sleepy frog is a marvel of swiftness when it comes to capturing a meal. He will lie motionless along the banks of a pond or stream, and when birds come down to drink or bathe they are swallowed in a twinkling if they get within range. A bullfrog is just like a snake. He can gulp down a meal as big as himself. Let an unwary sparrow venture within a few inches of the motionless frog and there will be a lightning-like leap, a gulp, and the frog again assumes his immovable attitude, but he will look as if he had swallowed a mattress. Of course if birds can't be had, bullfrogs will appease their appetites with insects."—*Philadelphia Record*.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., and not to any individual connected with the paper.

afforded us no trouble, and the long, straggling, semi-circular mill dam around the bend below the foot of the rapids was easily passed, by running the lively boat shoot close up under the left bank, whose location had been described to us by the Major.

The river is singularly beautiful down along here—broad, still, majestic and imposing. One would never suspect it was so soon to break up into such violent, un-governable fury.

There is a big fish dam around the bend below, but an open shoot in it passed us through without difficulty. Capt. Conrad, of Bloomery, seems to do considerable boating in this vicinity, and he keeps the shoots open. We expressed a hearty wish that the Captain could be induced to extend his operations to the upper river, between Shenandoah and Riverton.

We passed to the right of the island opposite Bloomery, and the low, straggling dam presented no difficulty to us. The broad, lake-like expanse of Newcomer's Eddy—nearly half a mile wide by three times that length, with the crumbling walls of the old stone factory—burned years ago—visible at the end of the vista, was strikingly beautiful, and we dallied along its still, reflective reaches, and along the grassy margin of its sloping, lawn-like banks, loth to pass out of it into the turmoil below. While we were passing along its beautiful expanse, we were hailed at different times by men on the bank engaged in fishing, road mending, etc., who warned us that the falls just below at the bottom of the "eddy" were dangerous, and that we risked our lives in attempting to run them.

We appreciated the kindness which prompted these people to warn us—strangers to the river, apparently—of the danger into which we were heedlessly drifting; but, assuring our friendly monitors that we were familiar with the falls, and had run them before, and had no intention of blindly drifting into them, we passed on down, and finally reached the lower end of the "eddy."

We landed at a safe and respectful distance above to reconnoitre the falls. The reach terminated in a long, irregular line of broken ledges extending clear across the river, and which appeared to block it like a dam, while below masses of scrubby trees and bushes appeared to fill the bed of the river.

The long, sloping hills on the left side, where we landed, closed in in mountainous bluffs, which towered along the left bank as the river swept in a stately semi-circle around their bases, while a mile further down the mountain heights across the river closed in, and swept around in a majestic curve to the left, closing the prospect.

"Great Scott!" exclaimed Lacy, fairly aghast, as we stood under the crumbling, blackened stone walls of the old Newcomer factory and surveyed the head of the famed and dreaded Watson's Falls.

At this place the river begins its descent to the level of the Potomac, six miles away and roof-t below, and nothing that we had encountered on the river above, in the way of rapids or falls, was even a suggestion of what was discovered in store for us here. A great limestone ledge, some 10 or 12 ft. high, blocks the river, which cuts its way down across the ledge, forming a furious rapid or cascade of about a quarter of a mile in length. It is not a smooth, open descent, but the eroding process of the water has worn the face of the ledge into countless fissures, seams and crevices, of all conceivable sizes and shapes, down through which the water rushes in innumerable channels, more or less deep and broad, while huge masses of stone, innumerable in number, grotesque in shape and countless in variety, cover the slope. Scores of bush-grown islands, some of them of considerable extent, are scattered profusely around in the bed of the river up and down the falls, while the river as it slips insidiously down over the head of the falls, increasing in power and violence as it goes, is speedily lost to sight in the chaos of rocks, reefs and islets, and the bottom of the falls—although so short a distance away, cannot at any place be seen from the top. The heavy roar, which made conversation difficult, sufficiently proclaimed the difficult and dangerous character of the place, without the additional evidence of our eyesight.

"Great Scott!" exclaimed Lacy. "You don't mean to say that flat boats ever ran through here? Why, there is absolutely no thoroughfare!"

"The boats went down a canal back of the factory. There's the old lock now," I replied, pointing with my pike staff to a shallow, dry ditch running along at the foot of the bluff behind us, and which led into a well-constructed stone lock, the gates of which had long since fallen into decay and been carried off by the floods, no remnant of them remaining, while the lock itself was choked and half-filled with drift, logs and flood debris.

"I have been told," said George, moving along over the rocks toward the blackened stone walls of the old factory, destroyed years ago by fire, "that the old race-way leading down through the fore bay of the mill might afford us a quick, easy passage."

"Well, there it is," I replied, pointing as I spoke to a narrow, little channel close up under the walls of the old factory, down which the water shot in a furious torrent. "You see, it is entirely too rough, even were that fish trap not in it. It would certainly be quick enough."

"Yes," assented Lacy, "whatever may be said as to its safety. It might do though, but for that fish trap," he continued, after studying it attentively. "It reaches the bottom of the fall all in one plunge, as you can see by that long, narrow neck of slack water coming up from below. Wouldn't it make a rattling, lively plunge, though?"

"There is absolutely no thoroughfare on this side," said I, as I led the way back to the canoes. "Suppose we cross over and study the falls from the other side, getting a good look down the middle as we go. We can't begin to see all the falls from any one side."

This proposition being assented to, we once more embarked and paddled slowly across the head of the falls, looking attentively down the boiling slope as we did so. Bristling with ledges, great masses of rocks and bush-grown islets, it offered no possible opportunity for a passage not instantly fatal to our frail canoes until near the right bank, where a broad, open lane of water was discovered, leading swiftly and wildly down among the bristling rocks for some distance, when it disappeared among the innumerable small islands.

"This might do," said I, as I paused to survey it, "if we could only see how it comes out below. Suppose we

drop down it a way, as far as we can see. We can then land on one of those islands on the right and reconnoitre."

"It won't do," said George, decidedly. "How are we going to get back if we find we can't get through below?"

This argument being unanswerable we paddled slowly on over to the right bank, but found nothing more encouraging there.

"We seem to have reached the foot of navigation," said Lacy.

"Commodore," exclaimed George, struck with an idea. It isn't often that George meets with an accident of that character, and when he does he is obliged to relieve himself at once, otherwise the consequences might be serious. "Commodore, you remember in our '86 cruise we paddled back up around the head of this island and then came—"

"What island?" interrupted Lacy, in bewilderment. "What are you talking about?"

"Why, this is an island, right here ahead of us," replied George.

"I thought it was the other side of the river," replied Lacy, still further bewildered. "Where in the the deuce is the other side, if this isn't it?"

"The other side is further over, beyond this island," replied George, laughing at Lacy's confusion. "You remember," he continued, resuming his conversation with me, "we paddled up around behind this island and slipped down over part of the falls over there, where it was not so rough as outside? Well," he added, after my verifying this fact, "I think our only chance is to do it again."

"It looks so," I replied. "Suppose we get out on the island and take a look over there, and see what it is like?"

We accordingly made a landing and all got out and went on an exploring expedition. A few minutes' scramble through the dense mat of bushes took us across the island, when we found ourselves on the bank of a broad, still channel, leading swiftly down toward the falls.

"Now, this looks promising," said Lacy.

"Wait until we reach the reefs," I replied; "we are still above the falls."

We continued on down until about opposite the head of the falls outside in the main stream, when we found the same reefs continuing across the channel in front of us, as we had expected, breaking it up into a rough series of falls, like those outside, though not rough.

"Pretty rough, but rather more promising," said George, laconically, as he stopped to light his pipe. "Let's go on down and see how it comes out."

Ten minutes' further scrambling through the bushes brought us out on the rocky point of the island, where the two streams reunited.

"Whew!" exclaimed Lacy in dismay, as we got a look down the falls from this point. "That's a wild river below there! Can we run it safely, do you think?"

At this point the smaller, right-hand stream united with the outside shoot from the main stream we had before noted, and which we saw might possibly have afforded us a passage down, although a rough and risky one. Below, the united streams poured in a furious shoot of a hundred yards down a rock-studded defile, where the waters dashed from ledge to ledge, foaming and rearing into tremendous waves, whose spout-like crests broke high in the air, while, at the bottom, could be seen the broad, open river again.

"I don't know," said George; "it will take us clear through the falls if we can run it safely; but it's horribly rough, and we'd better bring the boats up around the island and land on the further shore and walk down and examine it from below before we attempt it."

"That's a sensible suggestion," I assented. "Once started down that shoot, no earthly power could keep us from going through, and we'd better see what's at the bottom before getting in at the top."

We accordingly returned to the canoes, and re-embarked, and paddled up stream 100 yds. or so, to the head of the island, which we rounded and then dropped down the inside channel until we reached the ledges at the head of the falls, where we landed on the further shore.

"You fellows go ahead and examine it; I'll take your word for it," said Lacy, as he filled his pipe, adjusted his back rest and mattress to a flatter angle, laid his feet out over the hatch in front of him, procured his book and prepared to make himself comfortable for half an hour in the pleasant, shady, little nook in which he found himself.

"All right," George replied, as, with pike-poles in hand, he and I picked our way through the underbrush and started off down along the river bank.

We presently found ourselves out on the river, some distance below the falls, down which, as we looked up, the water rushed and roared from a point considerably above the level of our heads, the upper end being lost to view amid the chaos of reefs and islets.

All around us, to a great breadth, stretched the bare, rocky, bush-grown bed of the river. Never had we seen rocks worn and gullied into such fantastic shapes by the action of water, which had eaten out the softer portions of the great, solid ledge, leaving the harder parts standing up in irregular masses.

Great, shell-like projections towered many feet above our heads, while huge, boulder-shaped masses loomed up as big as small houses, with fissures and crevices between, many feet in depth, and varying from a few inches to many feet in width, running here, there and everywhere.

We scrambled back up along close to the water's edge (if there could be said to be any water's edge, where every fissure and gully was a running stream of water, so interlaced with each other and running into and out of each other in a manner so bewildering that it seemed impossible to tell where the river really left off and the woods began); over this remarkable expanse of rock, everywhere overgrown with straggling, hardy bushes, whose roots found a firm grip among the crevices of the rock.

The whole bed of the river was composed of this same honey-combed, fissured ledge, and the water rushed through the crevices, and roared over the smooth, round heads of boulders and ledges, while higher masses stood up out of the water, which raged and roared around their sullen, black summits.

A ragged, frowzy collection of islands lay along the middle of the river, extending the entire length of the

falls, through and among which numerous small channels led down. The river in front of us, between us and these islands, prevented a tolerably open, but very swift and fearfully rough channel.

"Well, what do you think of it?" queried George, as we finally paused on top of a huge mass of rock as big as a small house, from which we got a comprehensive, bird's-eye view of the entire channel from the foot of the island above, behind which our canoes lay, and which seemed to extend about half-way down the falls to the foot of the falls below.

"Well, we seem to have about reached the foot of navigation, as Lacy remarked," I replied, "but we've got to get through somehow. It looks very risky, but I believe if we can get our canoes down that inside channel above there and out behind that point there at the foot of the island, so as to place us out in line with the middle of this channel, it can be safely done."

"I think so," George replied, "but it's the wildest shoot we ever tackled."

"I should say so," I answered. "The principal point to make is to get fairly between those two big rocks out there."

"That's the pinch of the falls," said George, indicating, as he spoke, a narrow place in the channel between two great masses of rock, where almost the entire volume of water in the channel was compressed to a fourth of its width, with a fall of several feet, down which the water shot with great power and violence, and below which the huge waves plunged and tossed their shaggy crests to a height not seen by us before, in our experience in the rapids above.

"We've got to make that narrow shoot, for if we bring up against either of those big rocks it will be good-by canoe," he continued.

"Yes, and good-by canoeist, too, most likely," I replied. "That's the rock on which poor Mr. Brown, the Front Royal minister, was wrecked," I continued, pointing to the left-hand one, looking down the river. "I recognize it from the description of its location."

"Great heavens! No wonder his boat was swamped!" exclaimed George.

"The boat struck that rock and was instantly swamped," I replied. "It then drifted down that rough water there with Mr. Brown and his son clinging to it, and struck again some distance below, probably on those black rocks there, in the middle of the channel, just at the foot of that line of big waves—by the way, a sharp twist to the right will be necessary to avoid them—as I was saying, the boat struck again, probably on those rocks, and he and his son were both torn loose from their hold on the boat and carried down the river. The river was several feet higher than it now is, and correspondingly rougher. The son managed to get ashore, but the father was drowned."

"No wonder!" said George; "it would be impossible for even the best swimmer to hold up in such water. What are those fellows doing over there, I wonder?"

He pointed to a group of four or five men and boys busily at work at the foot of one of the frowzy islands across from us, their long, low punt moored at the foot of the falls some distance below.

"Putting in a fish trap in one of those small channels among those islands," I replied, after inspecting their proceedings. "They evidently don't see us."

"No," was the reply, "and quite as evidently can't hear us in all this roar of the water."

We scrambled back up along the rocks until we rejoined Lacy, whom we found dozing over his book, and who remarked that he had about arrived at the conclusion that we had decided to walk to Harper's Ferry, and must be half-way there by this time.

We imparted the results of our observations to him, and, seating ourselves in our canoes, addressed ourselves to the critical task of running the falls.

We had a troublesome time of it, picking our way out through the reefs to the foot of the island, but it was finally accomplished, by slipping around in and out among the rocks and through crevices and over falls and ledges, occasionally getting out to lift the boats over some impassable reef, or to swing them by hand around some particularly perilous corner, until finally the more open water immediately above the junction of the two channels lay before us.

"Now," said George, as we paused under the lee of a towering mass of rocks, to reconnoitre, "we must push across to that point there below, at the foot of the island, and hang up there while we survey the course ahead. I am not sure that it wouldn't be safer to slip the boats by hand down that shoot between those two rocks; that water's frightfully rough below."

"We can tell how the water sets when we reach the point," I replied. "I don't propose to take any chances, if it looks too risky. If we can get squarely in line with the shoot, it's all right, even if the water is rough; but if we can't get in line, we'll have to contrive to make a portage somehow."

George let go, and at once shot down the swift channel, paddling swiftly across as he went. He reached the point and backed his canoe up under its lee, where, by holding on to the overhanging bushes, he held it stationary. I followed, and just as I was within a boat's length of him my bow hung on a submerged rock, and I swung around across the current. In an instant Lacy ran into me, and we lay there in confusion and in imminent risk of a capsizing apiece. Lacy finally got clear, and worked back up under the bushes, while George got hold of my stern painter, and, aided by my vigorous prods and shoves with my paddle, pulled me clear of the rock.

"Just hold on a minute," cried I, as my boat swung to and fro in the fierce current, "while I get a good look." We lay just at the junction of the two streams—my canoe the lowest. The furious current from the open riverside of the island, and the scarcely less furious current down which we had just arrived, mingled their seething waters and rushed in a deep, smooth, powerful stream straight away for the ledge, above which the two rocks reared their black, threatening heads, wet and dripping from the spray which showered ceaselessly over them, while between and below them the stream surged and pitched in a great fall, below which a seething mass of white breakers and black rocks filled the sloping bed of the river for 100 yds., like a huge boiling toboggan slide. Once in the grip of that remorseless tide no earthly power could prevent a boat going through

to the bottom of the falls.

A keen glance satisfied me. I was in line with the shoot. I tightly closed my hatches, pulled my apron up to my chin, tucked the corners well in aft and grasped my paddle.

"Let go!" I shouted. "Throw my painter well up on my deck!"

"All free!" shouted George, in reply, as he flung my painter in a coil, close up behind me on my aft hatch, and gave my canoe a parting push.

"Look sharp, now!" he shouted after me, as I was caught up in the remorseless whirl and hurled swiftly away.

The rush of water set straight for the two rocks, and without even dipping my paddle in the water, my canoe shot squarely between them, and plunged over the fall. The canoe seemed to leap bodily out of the water, and to land flat, full length at once, fairly in the breast of the huge wave below the fall, whose whitened crest towered high above my head, and whose spray blinded me for an instant, as the wave rolled bodily over my boat from stem to stern as she dived through.

Pitching and tossing, rocking and tumbling, with the big waves smashing into spray on my decks, and rolling in solid sheets breast high over my closed hatches, leaping from ledge to ledge, with the black, ugly, grinning rocks shooting swiftly up stream by me on each side, I made the rest of the fall, and it was all over, and I was safely rocking up and down on the smooth, undulating water at the foot of the falls before I had time to breathe more than two or three times, and with a big yell of triumph and relief I rounded to in the lee of a gigantic mass of rock to see the other two come down the hill, meanwhile wiping the water from my face, eyes and hair, and wringing out my dripping sleeves as I waited, feeling as happy and exuberant the while as a boy who has just made his escape from the dentist's chair with his erstwhile aching molar in his pocket.

Down they came, Lacy next and George not far behind, their boats plunging and leaping, and throwing themselves out of the water, until I could see half the length of their keels along their glistening, black hulls, while the water ran in sheets off their decks. With shouts of triumph they joined me, and Watson's Falls were run.

"Well," exclaimed George, as he scrambled up out of his canoe on to the massive ledge in front, and gathered in a comprehensive view of the falls above with his kodak, "it took us over two hours to reconnoitre this fall, and not over two minutes to run it."

"Yes, and it was worth the entire trip," enthusiastically exclaimed Lacy. "Let's go back and do it over."

"I'd willingly do it again, if it were practicable, for no other reason than to send that muttonhead of a George down first to kodak the rest of us as we came down," I responded.

"I don't know what I was thinking of that I didn't do it," replied George.

"The truth is, we were all so excited and rattled that no one thought of it until too late," said Lacy.

"That's about the size of it," I replied.

In the meantime the natives, working on their fish trap opposite, attracted by my yell, looked up from their occupation in time to see George and Lacy come down the falls, and, wild with excitement, they danced up and down, and gesticulated frantically, and shouted words of warning to us, inaudible in the roar of the water, and then making a rush for their boat, they came bowling across the swift water below the falls as fast as a long, lank, leather-lunged specimen of the *genus homo*, standing in the stern and wielding a long push-pole, could shove it, all the while shouting warnings to us, coupled with scraps of breathless, fragmentary information as to the river below, in reply to my queries, all carried on at the top of his lungs, oblivious to the fact that by this time my canoe was dancing lightly up and down on the swells directly alongside of his own big boat, whose ample gunwale loomed up high above my wet, shining decks, as I grasped it with my hands, the occupants of the boat meanwhile regarding with wonder and distrust my frail, diminutive craft.

"You'll never git thar in God-a-mity's world!" he yelled, when I informed him that we were bound for Harper's Ferry. "Them little boats is too light! They'll be smashed into kin'lin' wood long afore ye git thar. Them falls above thar ain't nothin' to what they is below."

With the assurance that we would try and make the boats hold out, we paddled on down the swift river, and left him still shouting.

[TO BE CONTINUED.]

Yachting.

Dorwina and Effort.

ONE of the most remarkable boats of the year is Dorwina, the champion of the 43ft. class on Long Island Sound. Although there were practically but two boats that participated in continuous racing in the 43ft. class, the other boat being Effort, a new Herreshoff production. Dorwina wound up the season by an almost unbroken series of victories, Effort coming out a poor second. Credit must be given to Mr. Addison Hanan, owner of the ill-fated cutter Astrild, for the splendid manner in which he handled Dorwina. Mr. Hanan was in charge in almost every race, and in consequence Effort was outsailed on almost every occasion. Dorwina could go up to the 51ft. class and more than save her time over Altair and Humma in any weather, and several times she has beaten them, boat for boat.

Dorwina was designed by Mr. William Gardner, of the firm of Messrs Gardner & Cox, for Mr. W. L. Ward, of Port Chester, N. Y., and was built by Mr. Frank Wood at his City Island Yard. Dorwina is a semi-composite boat, having steel frames amidships, and wooden ones in the overhangs. Mr. Wood gave much attention to the construction of the boat, and as she stands she is one of the finest built boats in America to-day. Dorwina is one of the handsomest boats that

DORWINA—Designed by Gardner & Cox. Built by Frank Wood.

Mr. Gardner ever turned out, and has been a matter of considerable comment. She has a large amount of interior accommodation. Going down the companionway into a roomy steerage, there is a berth on the starboard side; opposite on the port side is a roomy stateroom with hanging lockers, transoms, etc. The main cabin has two long transoms, with lockers behind. Forward on the port side is the lavatory, with a closet and folding basin, and on the starboard side is the galley. The forecabin has ample room for the four men that were carried as a regular crew. Heavy partitions separate the several apartments on the boat, and she was seldom stripped for racing; in fact, the boat was in cruising trim all summer. There is full headroom in the main cabin, stateroom and steerage. The cabin house is low and narrow, which leaves plenty of deck room on either side. At the after end of the cabin house two deck beams run across the boat, which materially stiffen her. Dorwina is 59ft. over all, 36ft. waterline, 12ft. beam and 8ft. 6in. draft. She was recently purchased by Mr. Clifford Brokaw, who will race her during the coming season.

Effort was designed and built by the Herreshoff Mfg. Co. at Bristol, R. I. She is planked with mahogany and has an oak cabin house. The rig and spars on Effort were in bad shape during the early part of the season, and underwent many changes before they were finally made satisfactory. The boat was practically open from stem to stern, there being no partitions or bulkheads, and she was kept constantly stripped during the season. She is 59ft. over all, 36ft. on the waterline, 11ft. beam and 8ft. 7in. draft. She is owned by Mr. F. M. Smith.

The House-Boat Rancocas.

THE outboard profile and cabin plan of the house-boat Rancocas, which are published in this issue, were designed by Mr. Clinton H. Crane, of the firm of Messrs. Tams, Lemoine & Crane, for Mr. Clarence R. Dolan, of Philadelphia, Pa. The boat was intended for use on Chesapeake Bay, and in order that the many tributaries of the bay might be accessible, it was necessary to keep

EFFORT—Designed and Built by the Herreshoff Mfg. Co.
Photo by James Burton.

the draft of the boat down to less than 3ft. To design a boat roofft, on the waterline with a draft of only 2ft. 9in. and make her seaworthy is a serious problem, but the designer has met this contingency, along with several others, with the result that Rancocas is a very seaworthy, roomy and good-looking boat.

Going below from the upper or promenade deck one lands in a sort of vestibule. On the after side of the vestibule is a door opening into stateroom No. 5, a good-sized room nearly 7ft. square, and fitted with two beds, bureau, set basin, etc. The gun rack is in a handy place at the foot of the cabin stairs in the vestibule, and opposite is a door opening into the main saloon or living room. This apartment is very large, being 16ft. wide and 18ft. long. It is amply lighted and ventilated by six good-sized windows. The fittings are most complete, there being a fireplace, a piano, desk, china closet, sideboard, sofa and bookcases. Opening from the forward end of the main cabin is a passageway which leads to the principal state and bath rooms. Stateroom No. 3 is first reached; this room is 10ft. long and 7ft. wide. The apartment is fitted with a bed 3ft. wide, set wash basin, wardrobe, chiffonier, etc. On the starboard side opposite is stateroom No. 4, which is fitted up in the same manner as No. 3. Next forward come two bathrooms, one on either side. They are 5ft. 6in. wide and 6ft. 6in. long. In each of these rooms is a porcelain tub 5ft. long, water closet and set marble basin. Forward of the bathrooms and in the bow of the boat are staterooms Nos. 1 and 2. These rooms are 10ft. long and 7ft. wide. In each there is a wide bed, chiffonier, wardrobe, set marble wash basin, etc.

A door on the port side of the main cabin leads aft into the pantry, which is fitted up with dressers for china, etc., sink and draining boards, and a linen closet. Further aft and connected with the pantry by a swinging door is the galley, where there are a French range, two ice boxes, one for game and the other for regular stores; a sink, dressers, etc. Aft of the galley is the engine room, 11ft. long by 16ft. wide. On the port side of the engine room is the crew's water closet. Aft of the engine room is the ward room, which is 6ft. long and extends the full width of the vessel. On the after partition on either side are two gas-pipe berths for the crew. Aft of the ward room on the starboard side is the valet's room and opposite on the port side is a trunk room. Next aft come two staterooms, one on each side. They are 6ft. 3in. long and 6ft. wide. The one on the starboard is for the captain and engineer, while the one on the port side is for the steward and cook.

There is 8ft. of deck aft of the cabin house, and 15ft. forward of it. There is an unobstructed space 18ft. by 85ft. on top of the cabin house. This deck is covered by an awning. The boat is steered from the forward part of the upper deck.

Her dimensions are as follows:

Length—	
Over all	108ft.
L.W.L.	100ft.
Overhang—	
Aft	7ft. 6in.
Forward	6in.
Freeboard—	
Forward	6ft. 8in.
Least	3ft. 9in.
Taff rail	4ft. 8in.
Beam	17ft. 6in.
Draft	2ft. 9in.

Rancocas has twin screws and is driven by two 75-horsepower Standard motors. Her tanks have a capacity of 1,500 gallons, and with this amount of fuel can cover one thousand miles. The boat is lighted throughout by electricity, and is heated by steam. The crew comprises eight men—namely, captain, engineer, steward, cook and four sailors. Two boats are carried on the davits—a launch on the starboard side and another boat on the port side.

The above outline account shows the possibility of securing in this type of craft the maximum of comfort and luxury at a minimum of expense.

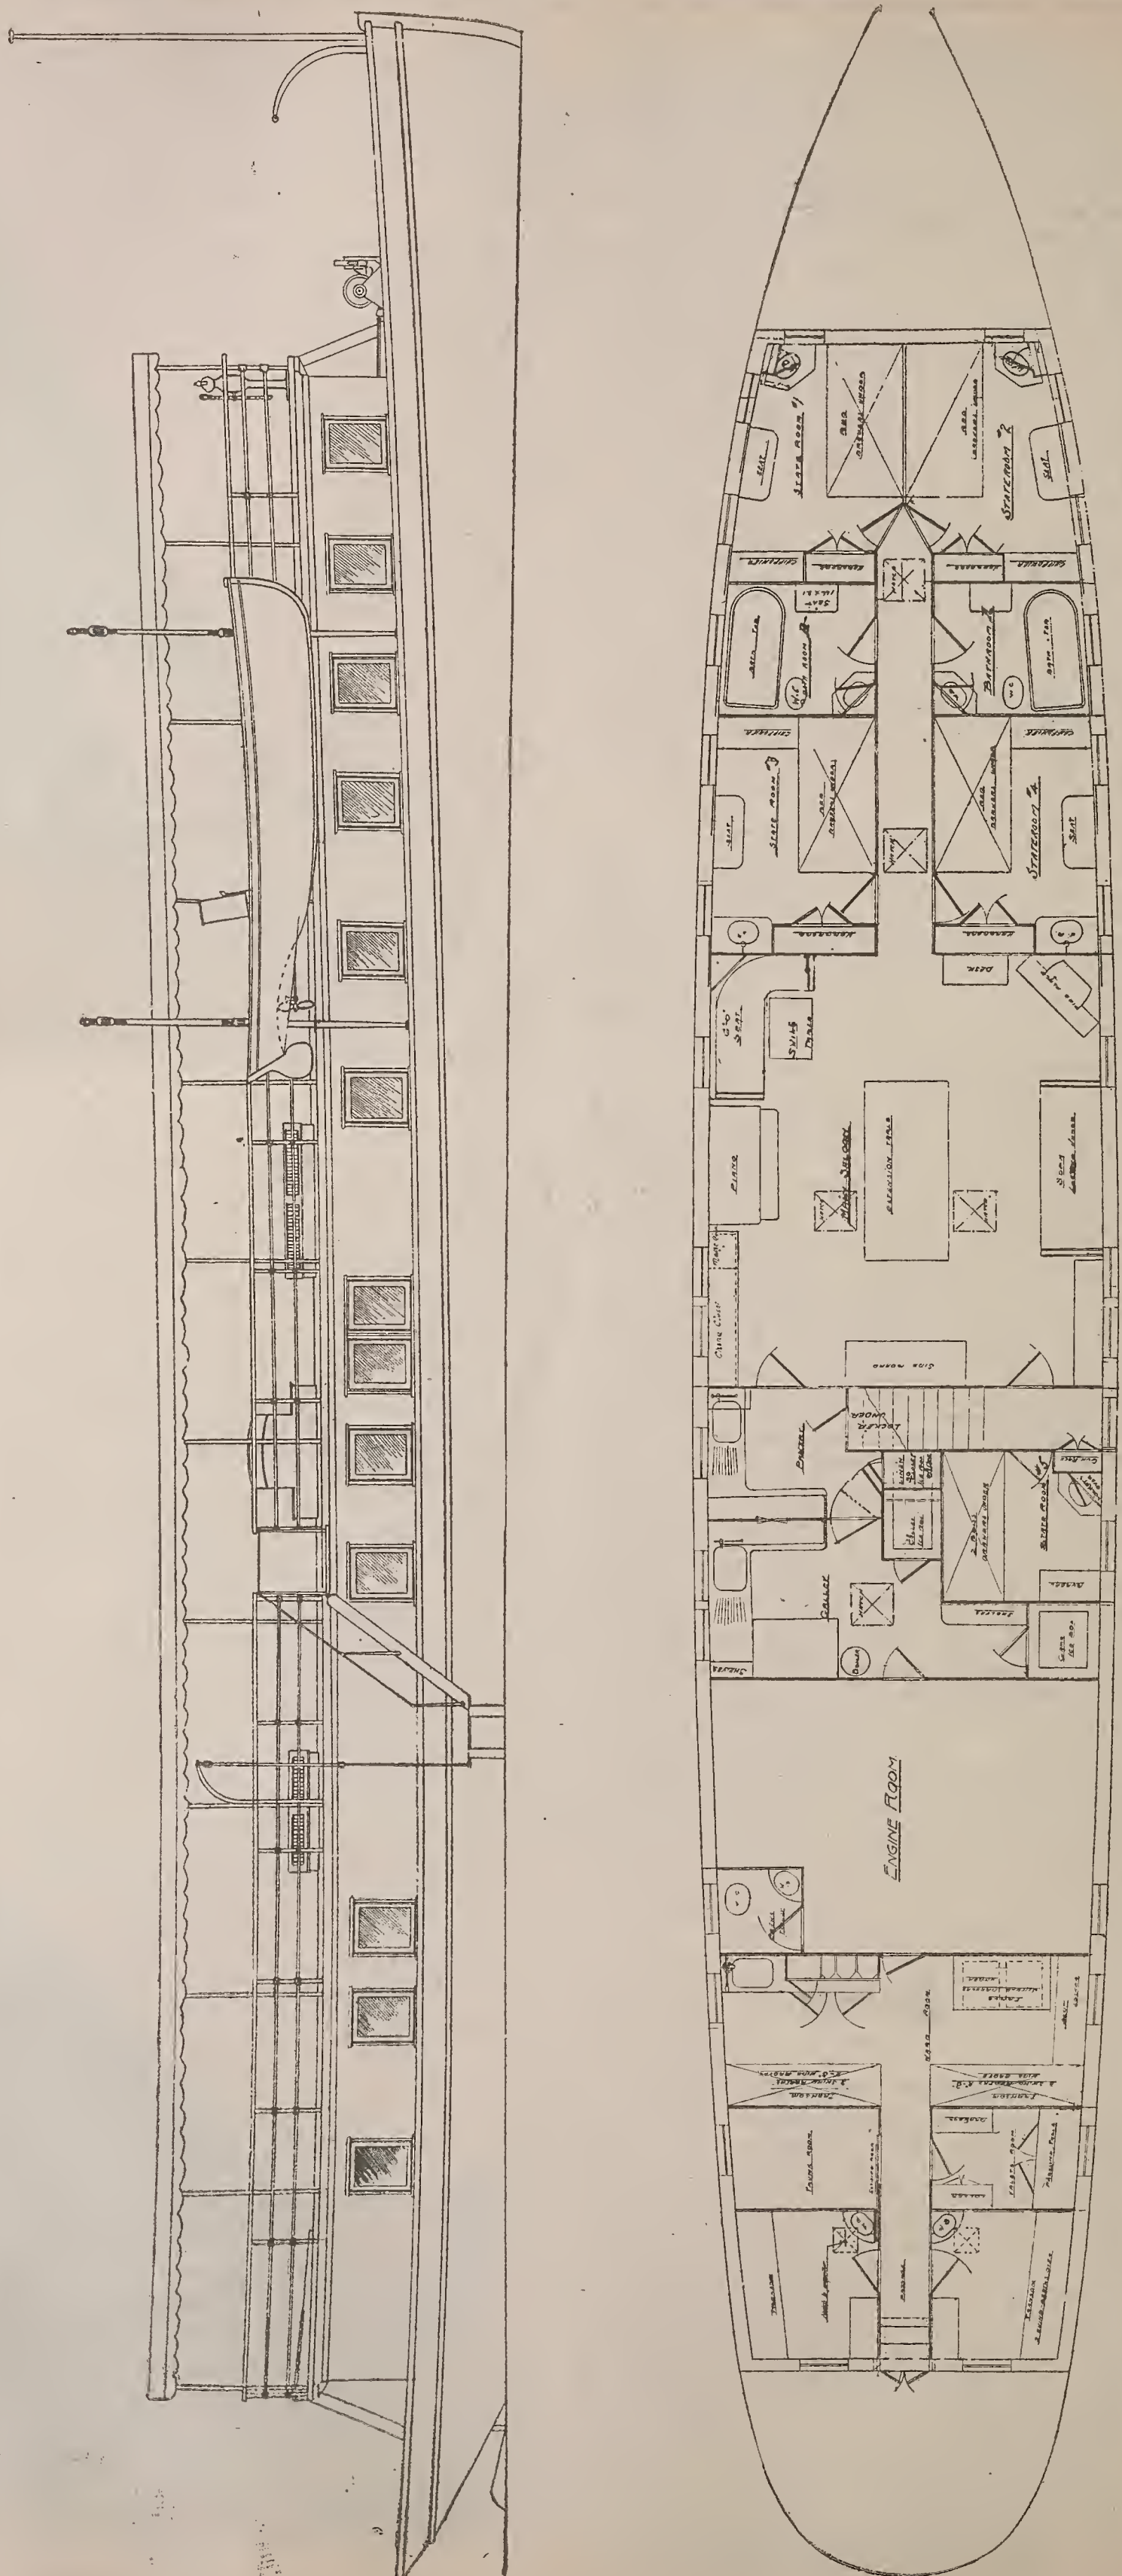

Our Boston Letter.

Boston, Nov. 2.—Although there are still many yachts in the water, many of which are likely to stay out for many days, active preparations are being made for next season's yachting, both racing and cruising. There is not a yacht designer in Boston who has not work on hand, and the orders for new boats are coming in thick and fast. The builders have already started in, and, at the rate new ones are being ordered, it is possible that some of the yachts cannot be turned out until the season has opened next year.

Never since its organization have the prospects been so bright for the Yacht Racing Association of Massachusetts. The restricted classes have at last found favor with the majority of yachtsmen, and there is no doubt that they will be well represented during the coming season. It has been a hard fight for the Association to convince the yachtsmen that restrictions are as necessary for their protection as the Association itself, but the fight has been won, and the system of the Association, governing these classes, stands out, we believe, second to that of no other association in this country.

It is well known that simplicity in rules is most likely to make them most binding and less likely to be evaded by technical distinctions. In the restricted classes of the Massachusetts Yacht Racing Association the yachts are measured for racing length on the waterline only, but there are rules which govern the sail area in ratio to the beam, the freeboard, the area and location of the cabin floor, the height of the cabin trunk and the headroom. These are all simple, and take the place of complicated formulæ for obtaining racing length, the intricacies of which do not insure accuracy, and are more or less temptations to play tricks on the official measurer.

It was expected that the 30ft. restricted class, which has been idle for the past two seasons, and quite indifferent for some years, would be revived next year. A combination of Marblehead yachtsmen had considered the matter, and it was thought that as many as twelve 30-footers would be built; but for some reason, it was decided to abandon the project, and there is now little likelihood of any 30-footers being built this winter. But,

OUTBOARD PROFILE AND CABIN PLAN OF THE HOUSE-BOAT RANCOCAS DESIGNED BY TAMS, LEMOINE AND CRANE FOR CLARENCE R. DOLAN, 1901.

although by this decision, the Association loses the opportunity for a decided revival of that interesting class, it will not lose yachts. For the majority of those who contemplated building 30-footers are going to build for the 25ft. and 21ft. restricted classes.

One thing that is calculated to bring out a great interest in the 25ft. restricted class is the advent of a yacht from Herreshoff's board for Lawrence Percival, of the Corinthian and Burgess yacht clubs. For some years none but Massachusetts designers have been represented in this class, and it is interesting to know just how the local men will fare against the avowed invincible. They do not seem to have any fears of the Bristol man, but, on the contrary, are very anxious to compete with his models.

Burgess and Crowninshield are the only ones, at present, who are at work on Y. R. A. 25-footers. Burgess has three and Crowninshield one. It is not known that Hanley has one in prospect, but it would not be surprising if both he and Shiverick are represented before the season opens. So keen is the competition for next season's racing that most of the yachtsmen who have placed orders have given strict commands that their names be not to be divulged. There seems to be no valid reason for this except that they wish to figure as dark horses. One of the Burgess boats, a 28ft. yawl, rating 25ft., is known to be for Vice-Com. Walter Burgess, of the Boston Y. C., but the other two still remain in the dark. Crowninshield's 25-footer is for F. G. Macomber, Jr., of the Corinthian and Burgess yacht clubs, who is very desirous of boating the class. Mr. Macomber was the owner of Chewink, which showed up well in last season's races.

But the star class will be the restricted 21-footers. As in the larger class, some of the prospective owners of new ones wish to be unknown at present, but there are enough on the list of open ones to insure the greatest number of entries the class has ever known. It is known that nine of these boats are to be built, and there seem to be prospects for more. Four of the new 21-footers will be designed by Crowninshield. They are for Charles Francis Adams, 2d; C. H. W. Foster, Richard Hutchinson and Charles Hayden and Arthur H. Parker. Burgess has two—one for Sumner H. Foster, who raced Optisak III. during the past season, and the other for a dark horse from Marblehead. It was learned to-day that Small Brothers are to design two, but the owners are not known. Vice-Com. H. H. Wiggin, of the Annisquam Y. C., has said that he will build a new one to take the place of Tabasco III., and there is little doubt that Fred Lawley's order is from him. It is possible that Reginald Boardman, of the Manchester Y. C., will order a new one.

Burgess, Crowninshield and Small Brothers have orders for 18ft. knockabouts, and there is little doubt that this class will be as much in favor as during the past season. The members of the Knockabout Association have got the Corinthian bug, and at their meeting Friday evening, it was voted that a new rule be established, making it compulsory for the yachts to be sailed by amateurs, each of whom must be a member of the club in which the yacht is enrolled. The final outcome of this measure will depend on whether the Yacht Racing Association of Massachusetts will adopt it in its rules governing the class. If the Association should not adopt the rule there would likely be a combination of professional and amateur skippers in the open races.

The yacht yards are commencing to fill up; Borden's beach is nearly full, and Hanley has a number in the basin and on the beach, while Lawley's basin and yard are filled. In Lawley's basin are the steam yachts Valda, Dreamer, Cloelia, Aquilo, Peregrine, Telka, Avenel, My Gypsy, Attagum and Elida; sailing yachts, Hildegarde, Senta, Alert, Clarissa, auxiliary schooner Idler, Hope Leslie, Ivanhoe, Alborak, Jubilee, Charmer, Coronilla, Petrel, Ventura, Elaine, Gorilla, Verande, Indra and Triton. On the beach are the steam yachts Monoloe Ilybius, Iris, Sally, Eugenia, Anago and Apache; sailing yachts, Sybil, Gundred, Gloriana, Shark, Milicete, King Philip, Vidofner, Sirona, Heron, Halaia, Rowena, Oeewa, Hullabaloo, Anaqua, Suzette, Helene, Bobs, Rip, Paola, Helen, Brigand, Melusina, Idle Hour, Handzel, Vraik, Babs, Chapequoit, Julnar, Hyperion, Virginia, Oriana, Tabasco III., Ursula, Aspinette, Dixey, Squeteague, Sally Parsons, Pepper, Guide, Kate C., Edith, Melma, Polly, Wafreda, Hulda, Minister and The Wind.

There is to be a class of one-design sailing dories at the South Boston Y. C. The design has been drawn by Samuel Coupal, of Crowninshield's office, and the boats are likely to be built by Graves, of Marblehead. A class of these boats were sailed at the Dorchester Y. C. during the past season with much success, and there is good prospect of interclub racing next season. Six new ones have been ordered by members of the South Boston Y. C., and it is expected that more are to follow.

Crowninshield has an order for a 35ft. launch for F. W. Merrick and a 12ft. fin-keel scow for George Lee.

Small Brothers are designing a 50ft. auxiliary yawl for C. C. Warren, of Sandusky, O.; a 31ft. cruising yawl for F. C. Rogers, of Providence; an 18ft. knockabout, two 21-footers, Y. R. A., and a 23ft. cruising yawl.

Isaac B. Mills has an order for one of the largest cruising schooners that has been designed here for a number of years. She will be 104ft. on the waterline, 123ft. over all, 25.3ft. beam and 12.5ft. draft. She will be built at Gloucester, and, like the fishermen that are turned out at that port, she will be very heavily timbered. She will have all the interior fittings of the modern cruising schooner. Mills also has an order for a 30ft. cruising yawl.

Fred Lawley is working on designs for a 46ft. auxiliary yawl, a 50ft. auxiliary schooner, a 21ft. auxiliary knockabout, a Y. R. A. 21-footer, an 18ft. knockabout and a 25ft. speed launch.

JOHN B. KILLEEN.

Y. R. A. of Long Island Sound.

On Thursday, Oct. 31, delegates of the different clubs belonging to the Yacht Racing Association of Long Island Sound met at the Hotel Manhattan, New York city, to discuss the advisability of accepting the new racing rule that has been recently adopted by the Larchmont and Seawanhaka Corinthian yacht clubs.

The meeting was called at the suggestion of the Seawanhaka Corinthian Y. C., the members of which club felt that unless all the clubs and the Association

race under one rule there would be constant friction and trouble. The majority of the delegates representing the different clubs are not in favor of the rule, but all felt that it would be disastrous for the two largest clubs on the Sound—namely, the Larchmont and Seawanhaka Corinthian—to race under one rule while the Association was racing under another; and rather than have this state of affairs exist, it would be better for them (the Association) to adopt the rule, even should it prove a poor one for them to continue under the present rule.

Some amendments were suggested, and it was finally agreed that the Executive Committee of the Association should confer with the Larchmont and Seawanhaka Corinthian yacht clubs with the idea that some modifications could be made that would make the rule suitable to all. On Friday, Nov. 15, another meeting will be held, and at this time the committee will report as to the result of the conference.

It is greatly to be regretted that the present unfortunate state of affairs exists, and it is due in a measure to the fact that the Larchmont Y. C., the largest and most influential club on the Sound, does not belong to the Association. Their strength is so great that the Association is forced in many ways to await any action that the Larchmont may take, and make their arrangements in accordance. If the Larchmont Y. C. belonged to the Association all this would be obviated. The Larchmont Y. C. can get along without the Association better than the Association can get along without it, and that club feels by joining that it has nothing to gain, and perhaps something to lose. The Association should be supported, and not until all the clubs on the Sound are united can there be harmony and success.

At the City Island Yards.

ALL the builders at City Island with the exception of Hawkins have had a very busy fall hauling yachts and getting them berthed in their winter quarters. The autumn has been so open and the weather so perfect for sailing that a number of owners have deferred laying up their boats till the last minute, and there are several boats still in the water.

At Hawkins' yard there are but four boats, and the beach looks bare. The cup defender Columbia is there; she has been entirely stripped and her mast removed. A shed has been built over her deck, and her topsails and bottom will be protected by canvass. The 70-footer Mineola, the 46ft. fin-keel cutter Carmita and Departure complete the list at Hawkins'.

At Robinson's yard, which adjoins Hawkins', are the following: William Ringer's steam yacht Comet and the steam yacht Pioneer. The sloops in the yard include Bradley Eaton's Tomah, T. W. Satterthwait's Olga, James Paul, Jr.'s Momo, J. R. Collin's Rambler, T. Hubbard's Marjorie, William Wood's Ladona, M. W. Bronson's Trochilus, W. W. Hall's Nautus, R. Dryer's yawl Clytie, William Anderson's yawl Active, T. M. Hall's catboat Pastime, the cutters Carita and Hispaniola, and the catboat Juanita, and Jessie, Mignon, Nomad, Flora, Mystic, Ventura and Ondawa.

Robert Jacobs has in his basin and yard already some fifty steam yachts, schooners and sloops. In the basin are these steam yachts: Archibald Watt's Golden Rod, E. H. Townsend's Bo Peep, and G. Hansel's Alemeda. Other steam yachts in the yard are: Howland Leavitt's Rush, Charles J. Miller's Mariquita, Clark Miller's Wolverine, John D. Crammins' Christine, and E. H. Weatherbee's Twinkle. Mr. Jacobs also has William Brewster's schooner Elmira, W. G. Brokaw's schooner Amorita, C. H. Clemens' yawl Adventurer, and William C. Whitney's bath-boat.

Among the sloops are L. H. Smith's Queen Mab, George E. Ide's Cara, Joseph Fallert's Scapha, William M. Fleiss' Josephine, George F. Parker, Jr.'s, Raznataang, William Jackson's Walre, John Woodbury's Adelaide, William Putnam's Hussar Jr., R. T. Wainwright's Natakka, H. G. Noble's Gwendolen, H. O. Havemeyer, Jr.'s, Esperanza, R. N. Ellis' Hera, Charles Stewart's While Away, J. D. Billard's Tempus, Frank Toucey's Nirvana, J. M. Ellsworth's Lorelei, R. H. Eggleston's Sunshine, William Barnum's Ala, M. W. Barball's Tona, T. D. Young, Jr.'s, Chipmunk, J. M. Laidlaw's Geraldine, M. Vernon's Vivien, Clifford Brokaw's Mab II., A. H. Landon's Lucille, Charles M. Pratt's Shrimp, Charles Hart's Simita, F. L. Rosenwald's Irex, David Gregg, Jr.'s, Possum, John Hyslop's Fern, E. H. Weatherbee's Bubble, Charles Johnston's Arna, Dwight Braman's Fredonia, Charles Pratt's O'Shima, and the Hester, the Indra and the Atala.

Mr. Jacob is building for Mr. Grier Hirsh, of York, Pa., from designs made by Mr. C. D. Mower, an auxiliary cruising yawl. This boat is now being planked, and will be completed about Dec. 1. When finished Mr. Mower will take the boat, with several friends, to Florida, where she is to be used. She is 27ft. on the waterline, 38ft. over all, 11ft. 6in. beam, and 18in. draft. The sail plan contains 850 sq. ft. She is equipped with a five-horsepower Snedeker motor. There is 6ft. headroom in the cabin, which is 8ft. long with a berth on either side. Forward on the port side is the lavatory, and opposite is the gallery. The boat has oak frames and is planked with yellow pine.

Mr. Jacob will also build an auxiliary cruising schooner from designs made by Mr. Henry Winteringham for Mr. Frank St. John, the present owner of the 46ft. cutter Nautilus.

The English cutter Queen Mab is to be partly rebuilt. Her copper has been taken off, and she is to have a new deck and some new planking and frames. This work is being done by Mr. Jacob.

At Wood's yard are the following boats: J. B. Mills' Kestrel, Roger Maxwell's Hummer, Harry Maxwell's Leda, J. S. Wood's Infanta, and Clifford Brokaw's Dornina.

The cruising cutter that Mr. Wood is building for Mr. George Bullock, of Cincinnati, from designs made by Messrs. Gardner & Cox, is now in frame. She is a handsome boat of a healthy type, and will make a fine cruiser. She is of semi-composite construction, and Mr. Wood is putting most superior work in her. The boat will be finished by the first of December, and will be

taken to Nassau, Bahama Islands, her owner intending to use it for winter cruising in the West Indies.

A. Hansen, whose South Brooklyn yard has been absorbed by the Morse Iron Works, has moved to City Island and taken a yard there. Mr. Oswald G. Villard's Hilgarda, Mr. George Matthews' yawl Escape, Mr. George Rockwood's schooner Minta, Mr. F. S. Turner's schooner Rowena, and the 70ft. sloop Eleanor are laid up at this yard.

Pantooset.

PANTOOSSET, the steel, ocean-going steam yacht, building at the Bath Iron Works, from designs made by Mr. W. J. J. Young, for Mr. Albert S. Bigelow, of Boston, is now in frame, and the builders hope to have the yacht ready for delivery to the owner by May, 1902. Mr. Bigelow contemplates a trip around the world as soon as the yacht is completed.

Pantooset will be 175ft. on the waterline, 212ft. 6in. over all, 27ft. 2in. moulded beam, 16ft. 6in. moulded depth, and 13ft. draft. The yacht is being constructed under survey of the United States Standard Shipbuilders' and Owners' Association, and all her scantlings will equal or exceed their requirements, and she will therefore receive the highest classification.

The interior of the vessel is well laid out, and the following description is taken from the Boston Herald:

The dado of these rooms will be finished in Hungarian ash, above which the sides will be covered with cretome. The ceilings will be finished in white gloss. Just forward of the owner's rooms are located two staterooms. These two rooms will be finished in birdseye maple. The officers' quarters are situated between the collision bulkhead and the owner's rooms. They consist of a room for the captain, a stateroom for the mates and a stateroom for the steward and chief cook. A bathroom is also provided for the use of the officers. A double fore-castle is located in the extreme forward portion of the vessel.

Abaft the machinery space are located the main saloon and accommodations for guests, consisting of four staterooms and two toilet rooms.

The forward end of the deck house contains the vestibule, with stairs leading to quarters below. Abaft the vestibule a commodious dining room, finished in mahogany, is situated. It is furnished with the usual tables, chairs, sideboard and buffets. Adjoining the dining room the pantry and galley are located, which are fitted with all the necessary conveniences. The officers' mess room is situated in the deck house, between the boiler and engine rooms, over the transverse coal bunker, and is connected with the galley by a passageway. The quarter-master's room and the deck storage room are located just aft of the officers' wardroom. The chief and assistant engineers are quartered in the deck house, aft of the engine room, and the doors are so arranged that they lead to the metal balcony over the engine room, thus keeping the engine room officers near their stations. The deck drawing room and the after vestibule are located in the after portion of the deckhouse. They will be finished in mahogany, and the drawing room fitted with set pieces of furniture.

The chart house will be built of teak, and all fastenings will be non-magnetic. In the forward part the wheel room will be situated, and the after part will contain the navigator's room, which will be furnished with all the necessary facilities. The top of the chart house will be carried out to the sides of the ship, forming the navigating bridge.

The motive power consists of a vertical, triple-expansion engine, which, under forced draft, will develop 1,100 indicated horse-power. The cylinders are 16 by 26in. by 42 by 27in. stroke. Steam will be furnished by three Army water-tube boilers. The speed of the vessel will be about fourteen knots. She will have a bunker capacity, when full, of 145 tons. A double bottom under the fire room forms the reserve feed water tanks. Besides the usual auxiliary equipment, the vessel will have an evaporating plant.

The Pantooset will be commanded by Capt. Alex Corkum, and the chief engineer will be Mr. Fred C. Bailey. These gentlemen are superintending the construction of the hull and machinery.

Small Yacht Construction and Rigging.

BY LINTON HOPE.

Part II.—Chapter II.—Bending and Setting Sails.

THE art of bending sails and stretching them properly is very little known among amateurs, and can only be thoroughly acquired after many years' experience. Even among professional yacht skippers there are many who cannot stretch a new sail properly.

Most sails are spoiled by hauling out the head and foot too tightly on the spars. A new sail should only be hauled out on the spars till the bolt-rope is just "hand" tight; and when it is laced it should be slack enough to just admit one's finger-between the spars and bolt-rope. More strain can be put on the luff of the sail than on the head and foot, as the roping is stouter, and in most modern racing sails it is of wire, so that there is no fear of overstretching it.

To bend a gaff mainsail shackle the throat cringle to the jaws of the gaff; or if the sail is very high-peaked, like a gunter lug, seize the cringle to the jaws with a little drift, so as to allow a small amount of vertical movement when the gaff is well up and down the mast.

Reeve the peak lacing through the hole in the end of the gaff and haul out gently, as described above; pass about four turns through the lacing hole and peak cringle, and as many more around the gaff, finishing off with two half-hitches round the lot. All the lacings must be spliced, either directly into the cringles on the sail or else have an eye-splice in one end and be rove through the cringle and their own eyes. The latter method enables the lacing to be easily detached from the sail without cutting the splice.

The head of the sail has now to be laced to the yard, and the lacing must be made fast, as above, to the throat cringle, and not to the first lacing eyelet, as is usually done. The object of this departure from the old custom is that if the lacing is made fast to the first eyelet it is always tending to drag that portion of the sail round the spar; whereas, if it is fast to the cringle itself, the strain on all the lacing eyes is equal. This should be especially borne in mind in reefing a luff lacing round a mast. The head lacing should have a marline hitch at each turn. Seize the tack cringle with wire to the eye on the reef gear at the fore end of the boom, and get it down as closely as possible or it will not roll up well. Reeve the clew lacing through the reef gear eye on the after end, and haul the foot of the sail out in the same way as the head was done, but passing the turns of the lacing round the boom backward and forward instead of round and round. The object of this is to prevent the sail from twisting round the boom when

fast to the mast, and run the boom forward till the jaws can be shipped on the mast well up from the deck; then square away on the guy, and the sail is set.

To set a jib hook the tack on the hook of the bowsprit traveler and haul out; hook the halliards on the head of the sail and the sheets on the clew; then set the halliards up as taut as possible.

To stow a mainsail lower away on the halliards till the gaff or yard is resting on the boom; take the leach of the sail as far forward as it will go, and roll the bunt or body of the sail up till it stows snugly. Before lowering get the sail tyers ready along the boom. With a racing sail it is best not to take the leach forward, but to stow the sail as it falls on the boom; but it does not make such a neat stow. See that the boom is firmly in the crutch. In covering the sail unhook the halliards and lace the cover round the mast; then haul the cover aft and lace it, or hook it under the boom, hooking the peak halliards to a canvas band passed round the stowed sail, and set up hand taut.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- Nov. 4-7.—Pera, Ind.—Pera Gun Club's live-bird tournament; handicap; high guns.
Nov. 20.—Sistersville, Va.—Fall tournament of the Sistersville Gun Club; \$60 added money. Ed. O. Lower (Dade), Sec'y-Treas.
Nov. 22-24.—St. Louis, Mo.—Contest for the St. Louis Republic championship cup (Nov. 23) and three-day open tournament. Herbert Taylor, Secy, 1004 Chemical Building.
Nov. 26-28.—Phoenix, Ariz.—Ninth annual tournament of the Arizona Sportsmen's Association, under the management of the Phoenix Gun Club. W. L. Pinney, Sec'y.
Nov. 28.—Ossining, N. Y.—All-day target shoot of the Ossining Gun Club. Roast Turkey. C. G. Blandford, Capt.
Nov. 28.—Cleveland, O.—Shoot of the Cleveland Gun Club.
Nov. 28-29.—Milwaukee, Wis.—Tournament of the South Side Gun Club.
Newark, N. J.—South Side Gun Club target shoot, every Saturday afternoon.
Chicago, Ill.—Garfield Gun Club's live-bird trophy shoots, first and third Saturdays of each month. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

CONTESTS AT INTERSTATE PARK.

- Nov. 20.—Interstate Park, Queens, L. I.—Shoot given by Mr. S. M. Van Allen, who donates a Daly gun; \$20, 20 birds, latter extra; high guns; handicap; all entrance money goes into the purse.
Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice. Cafe and hotel accommodations.
Interstate Park, Queens, L. I.—Weekly shoot of the New Utesht Gun Club—Saturdays.

1902.

- Jan. 14-17.—Hamilton, Ont.—Twelfth annual tournament of the Hamilton Gun Club. F. B. Vallance, Cor. Sec'y.
May 6-9.—Interstate Park, L. I.—Interstate Association's Grand American Handicap at targets. Edward Banks, Sec'y; Elmer E. Shaner, Manager.
May 7-10.—Interstate Park, L. I.—Interstate Association's Grand American Handicap at targets. Edward Banks, Sec'y; Elmer E. Shaner, Manager.
May 13-16.—Oil City, Pa.—Annual meeting of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. F. S. Bates, Cor. Sec'y.
May 30-31.—Union City, Ind.—Spring tournament of the Parent Grove Gun Club. O. E. Fouts, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

THE programme of the Sistersville (W. Va.) Gun Club's fall tournament, to be held Nov. 20, is ready for distribution. Of the twelve target events nine are at 15 targets, \$1.50 entrance, and the remaining three at 20 targets, \$2 entrance. Each event has \$5 added money. Shooting will commence at 9:30 o'clock. Blue-rock sand magautrap will be used. Some crisp information is presented as follows:

- "We have ordered nice weather, but don't get angry if it's something else.
"Shooting will commence promptly at 9:30 A. M., even though the sun be shining.
"Blue-rock targets thrown from a magautrap at the same old expense.
"Listen, you shooters: The referee's decision shall be final under all circumstances. This is no kid.
"Any contestant detected dropping for place willfully and maliciously will be required to prove it.
"The one entering and shooting through entire programme and making the lowest average will be presented with a fine silk umbrella by Hon. Geo. E. Work. Not necessary to break them all to win here.
"The J. Y. McNaught system of handicapping—16yds. for everybody—will be used at this tournament. We have tried it to our entire satisfaction. Don't insist upon standing at a greater distance, as you may miss a few as it is.
"Division of money something new: 40, 30, 20 and 10 per cent.
"It will be the fault of Dr. Jas. R. Stathers, our club machinist, if any targets are broken by the trap, and he should be held personally responsible.
"Dynamite and other explosives sent in care of the secretary will be disposed of as he deems advisable; but he's a good fellow.
"At 1 o'clock Mr. Ed O. Bower, otherwise 'Dade,' will defend the Olin V. Neal trophy, emblematical of the State championship at targets, Mr. W. A. Smith, of St. Marys, being the aspirant for championship honors. This race will be at 100 birds.
"All manufacturers' agents will be taken to and from the shooting grounds in automobiles; but they cannot share in the division of the purses.
"Every man, woman and child in the United States is requested to read and study the advertisements in this programme and patronize our advertisers. We sold them all a 'gold brick' and must square ourselves in some way. Don't forget that it's three thousand miles to the next town."
Mr. Ed O. Bower is secretary-treasurer.

The programme of the ninth annual tournament of the Arizona Sportsmen's Association, under the management of the Phoenix Gun Club, Phoenix, Ariz., Nov. 26 to 28, presents an attractive list of competition. On the first day there are eleven events, at 10, 15, 20 and 25 targets, entrance based on 10 cents per target, excepting Nos. 4 and 6, the former the field medal shoot at 15 targets, entrance \$2.50; the latter the individual blue-rock championship at 25 targets, entrance \$4. The moncy will be divided in some instances according to the equitable system; in others the Rose system and high guns. On the second day there are eight events, of which the last is the two-man team shoot, \$5 entrance per team. The third day has three live-bird events; one at 7 birds, entrance \$3.50; one at 15 birds (individual championship medal event), entrance \$6.50; one at 12 birds (McVeagh handicap), entrance \$5. All targets thrown from magautrap. Interstate Association rules. Professionals may shoot for targets only. Lunch free to participants. Targets 3 cents; live birds 25 cents. Excursion rates. Shooting commences at 8:30 each day. Ship guns, etc., to W. L. Pinney, secretary, 40 North Center street, Phoenix, Ariz.

The trapshooting season of the Huntsville (Ala.) Gun Club closed in October, and the trapshooting paraphernalia was stored away till the next season's trap competitions begin. Mr. John Wallace, Jr., on the last day, in one event, broke 25 straight, a feat which theretofore had never been accomplished on the club grounds.

Mr. Edward Banks, secretary-treasurer of the Interstate Association, informs us that the dates of the Grand American Handicap at targets have been changed from May 7 to 10, to May 6 to 9.

The South Side Club, of Oakdale, L. I., has installed a new

shooting tower. We are informed that it is 90ft. high, and has two different floors, one 60ft. from the foundation, the other on the top, from each of which targets will be thrown. This style of shooting gives practice in overhead shooting, and in so far as trapshooting can do so gives a schooling in shooting at higher flights. By way of making the subject clearer, we present in our columns an illustration of one used in England. In the report of the Crosby-Faulds contest, an incident of the American-Scottish team contest in Scotland, Mr. Banks, FOREST AND STREAM'S correspondent on that trip, described the tower as follows: "This [the partridge tower] was an erection protected by sheet iron, behind which were two traps, one throwing a target to the left directly parallel to the score, the other throwing a similar target, but to the right. The tower was about 20ft. high, the traps being probably 25ft. from the ground. The target to the left only went about 40yds., while that to the right luzzed away fully 60yds., if not more."

Mr. Frank E. Butler was in New York on Friday of last week, after an arduous season with Buffalo Bill's Wild West. He and Mrs. Butler (Annie Oakley) had a narrow escape in the wreck of the Wild West train, which was wrecked in a head-on collision with a freight train at Linwood, N. C., on the morning of Oct. 29, about 2:30 o'clock. At that hour all were asleep. Mr. Butler's car was the second or third from the collision points, and it reared on end in the crash. Mrs. Butler was slightly injured, and Mr. Butler escaped unhurt. Bad as was the shock and danger, Mr. Butler is deeply thankful that it was no worse. The company was en route to Danville, Va., where it was billed to appear that day, and that show was to have been the last for this season. The date was necessarily cancelled. The engines were totally wrecked, and 110 Wild West horses were killed. Mrs. Oakley's guns, which were mixed up in the worst tangled debris, were found to be uninjured.

The illustrations in our trap columns portray two different epochs in the history of the Hudson Gun Club, of Jersey City, N. J. A few lovers of the sport, about six years ago, began competition with two traps presented by Mr. Al Heritage, and they held their shoots in the first year without any house. First in the open air served to contribute to their comfort in the cold weather. At the end of the first year the smaller club house was built. About two years ago the second club house was built, much of it by the members in person. The first officers of the club were as follows: President, H. Bock; Secretary, T. Kelly; Treasurer, F. Altz; Shooting Captain, J. Hughes.

Seldom has a match evoked more interest, aside from those engaged in by the leading professionals, than that which took place on Wednesday of last week between ex-Sheriff Creamer and Mr. T. W. Morley on the one side, and Messrs. C. A. "Ramapo" and Ed. Banks on the other, at Interstate Park, L. I. The conditions were 25 live birds per man, handicap distances. The former team won by a score of 45 to 43, Creamer being high man with a score of 24 out of 25.

The daily papers of New York on Friday of last week made mention of the death of John L. Chartrand, secretary of the Hackensack River Gun Club, of Hoboken, N. J. He was manager of a skating rink on Fourteenth street, Hoboken. He was thirty-two years old. At the time of his death he was preparing to leave on a hunting trip. A pistol, in the hands of his wife, who was kissing him good-by, was discharged, with the lamentable result above mentioned.

Mr. J. D. Gay, the famous Kentucky trap shot, won the Kentucky State championship, after shooting off a tie with Mr. Hutclings, at the recent tournament of the Kentucky Gun Club at Louisville. The Kentucky handicap was won by Mr. C. W. Phellis, of Cincinnati, who is a representative of the Hazard Powder Company. Each of the three gentlemen before mentioned used Parker guns.

There will be a four-man team race, 25 birds per man, at Interstate Park, L. I., on Nov. 7, on the arrival of the 11:01 train from Flatbush avenue station, and the 11:10 train from Long Island City. These trains reach the park at 11:41 A. M. The contestants are well-known trap shots. After the race there will be a 25-bird handicap, \$10 entrance, birds extra, high guns.

There has been an unaccountable change in the matter of matches at the traps, in respect to the percentage, which have been shot. Heretofore, about one per cent. of the total made has been shot; now, about 100 per cent. of those made are shot.

The American E. C. & Schultze Gunpowder Company, Limited, 318 Broadway, New York, have recently issued artistic folders, in which are set forth the qualities and manner of loading the "New E. C." and "New Schultze." Copies will be sent to all applicants. BERNARD WATERS.

Mississippi Valley Notes.

In the semi-monthly contest for the Dupont trophy, at St. Louis, on the 20th, Dr. J. W. Smith won the honors. The Doctor shot in splendid form, and in the shoot-off killed his 20 straight in pretty style, Fred Fink being the runner-up with 17. The scores in the preliminary at 10 live birds were: Dr. Gaines 10, Fink 10, Jonah 16, Kenyon 10, Spencer 10, Dr. Smith 10, Fuller 8, Bowman 9, Barrie 8, Herbert 8, Crosby 9, J. Cabanne 8, Rock 9, Dr. Sims 7, Frederick 7, Weber 9.

Carson and Dr. Bell shot a match at 10 live birds at Dupont Park on same date. Carson won by 1 bird. The quail shooting season opens with us in Illinois this week, and many usually steady fellows will be mysteriously absent from office, desk and shop at short intervals during the ensuing six weeks.

The St. Louis tournament anent the final contest for the Republic cup next month promises to be quite an important meet. It is not improbable that the Republic trophy event will be made an open 25-bird sweep, aside from the main contest for the final possession of the cup.

The proposition to bring the Grand American Handicap of 1902 to the West, at Kansas City, Mo., will be hailed with delight by the shooting fraternity of this great midcontinental region, and the officers of the Interstate Association who have decided upon this step need have no fears as to the success of this new move. It is freely predicted already that the entry list will be the largest in the history of this world-famous event; and it is doubtful if a city could have been selected where more home enthusiasm and support would have been given to the enterprise than at Kansas City, which has long ranked as the first and foremost trapshooting center in the big valley.

The quail shooting season opened auspiciously on Friday last. Some excellent bags are already reported by the ardent shooters who were first in the field, indicating that former estimates of a plentiful supply of the birds were not amiss.

KILLMORE.

Take inventory of the good things in this issue of FOREST AND STREAM. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

Rifle Range and Gallery.

Turkey Shooting in Tennessee.

To many people there are few things more enjoyable and exciting than a turkey shoot. Let us imagine a bright, sunny day in November; say a day or two before Thanksgiving. The air is crisp with the breath of frost, and as we proceed on our way nothing is better than a foot race to send the blood tingling to every nerve and to warm and steady us for the work soon to begin.

Arriving at the shooting range, we find twenty-five or thirty fat turkeys, weighing from 15 to 40lbs. each, and fit to grace the table of a king. The manager quickly steps off 90yds. and digs a pit that will conceal the body of the largest turkey. In this the bird is placed, and then covered with two wide, heavy planks. In the joining edges of these planks a notch is cut that will receive the turkey's neck, without allowing the head to be withdrawn. The head forms the target at which we are to shoot 90yds., off-hand, using rifles with plain open sights. While the turkey is being put in the pit another party has tied a 40lb. gobbler to a stake 350yds. away, its whole body being exposed. The string which is tied to its leg is 6 or 8ft. long, allowing it to stand upright and to change its position. Everything is now ready; so look out! Everybody behind the line!

The shooters line up and the clerk takes their names in order. Let us now take a look at the guns before the match begins. At the head of the line are four .32-20s, Marlin and Winchester. Next are three .32-40s. After these, two .25-25s. On the right are two .25-36s, the most powerful guns on the field. A .45-70 Winchester completes the armament arrayed against the innocent and unsuspecting turkey.

But it is too late to moralize now. The excitement is irresistible; and at the call of his name a tall, slender young man steps to the line, a .32-20 in his hand. He raises his gun and takes deliberate aim, but at the moment of pulling trigger, we observe that his "shooting eye" closes suddenly, and the bullet flies wide of the mark. He simply "dodged," which, however, is fatal to rifle shooting. He steps back with a look of chagrin on his face, but his determined eye and firmly set jaw speak better for him next time. But he need not feel so downcast, for the last man has just lowered his gun, and the turkey still holds the fort, bidding defiance to the enemy. We begin to fear for him, however, and not without reason, for that tall, young man fires again, and at the crack of the gun we find that half the turkey's bill has been shot away. But he quickly rallies and is still game. After this several shots are fired without effect. Finally a keen-eyed, middle-aged man steps to the mark. Raising his gun, a .25-25, he fires quickly, and as the smoke drifts away, we are conscious of a blank somewhere. Presently we hear a fluttering noise, and the body of the turkey emerges from the pit, its powerful struggles throwing off the heavy planks that confined it. This was due to the fact that the terrific force of the little bullet had torn the head into fragments, thus releasing the body, which directed its strength against one of the planks only. This bird, at 10 cents per shot, brought the owners \$1.50, although many others brought as much as \$4 each.

There are many things that seem easier than they really are, and killing turkeys dead at 90yds., off-hand and with plain sights, is one of them. Several turkeys having been killed in the pit, the guns are now trained on the big gobbler 350yds. away, its body looming up very conspicuously. Any of the guns named are strong enough to reach and kill at this distance; but the .25-25 and .25-36 are specially adapted to this range. There, as before, plain, open sights are to be used. To kill at this distance requires good nerve, keen sight and a knowledge of gauging and windage.

The first to fire shot a .32-40, which was seen to strike the ground 10ft. in front of the turkey. In quick succession came the reports of the other guns, the bullets falling to the right and to the left, in front and behind the turkey, while one of them cut the string which held. A chase now ensues, but he is soon caught and placed again at the post. Again the bullets fly, and the fine marksman strain every nerve to "bring down the game," without avail. Presently a large man, carrying a .45-70, takes his stand, and at the report of his gun—which is like that of a small cannon—the turkey falls. The bullet tore a hole through its shoulder large enough to receive the barrel of the gun. The big man was cheered heartily for defeating the crack shots, with their fine guns. But he wasted much ball and powder in his vain efforts to add another bird to his string, while the others fully redeemed themselves before the sport was over. In the contest, the .25-25 and the .25-36 developed the strongest shooting powers, and proved the ideal guns for the purpose. The .25-20 and the .32-20 and .32-40, however, carried off a fair percentage of the prizes. There are many things to see and learn at a turkey shoot, and I am sure many of your readers would be induced to indulge were my poor pen able to do the subject justice. D. B. CHENAULT.

CASTALIAN SPRINGS, TENN.

Cincinnati Rifle Association.

CINCINNATI, O.—The following scores were made in regular competition by members of the Cincinnati Rifle Association, at Four-Mile House, Reading road, Oct. 27. Conditions, 200yds., standard target. Gindele was declared standard for the day with the good score of 89. Weather, cloudy; thermometer, 58; wind, 2 to 3 o'clock:

Table with 2 columns: Name and Score. Gindele 89, Strickmeier 88, Payne 88, Nestler 87, Bruns 84, Roberts 80, Hofer 76, Uckotter 75, Enderbrook 74, Drupe 74, Hoffman 71, Topf 70, Lux 75.

William S. Saunders, the proprietor of the Congamond Lake House at Southwick, lately caught in the lake, a short distance from his house, a golden carp weighing 21 pounds and 9 ounces, 34 inches long, 9 inches deep, and 5 1/2 inches thick. The scales near the tail were 2 3/4 inches wide. This is by far the largest fish ever caught in Massachusetts. Bass weighing 10 pounds have frequently been caught in the lake, and these fish were supposed to be the largest found there. The State stocked these ponds years ago with carp.—Hampshire Gazette, Northampton, Mass.

"Your friend Bumbunter was out gunning again to-day." "Yes, and he had great luck." "Nonsense! he didn't bag a thing." "I know; but the last time he was out he bagged a cow."—Philadelphia Press.

HUDSON GUN CLUB'S FIRST CLUB HOUSE.

WESTERN TRAPS.

Jubilee in the West.

CHICAGO, Ill., Nov. 2.—There is a general jubilation in the West over the news of the location of the Grand American Handicap in 1902. There is little reason to doubt that the total entry at Kansas City next spring will closely rival that of the big event in its past years in the East. Whether it will be as nearly a national event as before is a hazard of opinion, of course; for it is scarcely to be supposed that the Eastern men will come to Kansas City in the same ratio of population as the West has contributed to the entry at Interstate Park. Upon the other hand, there will be more Western shooters who can visit Kansas City than were ever able to visit New York. Among these will be many younger shooters of that growing class which it is the aim of the schools of trap-shooting to reach. As to the quantity and quality of the entertainment to be met with at Kansas City in this big annual fixture, here need be no doubt whatever on the part of any man, live he East or West, North or South. There is only one thing to do, and that is to come to the Handicap. Kansas City is the shootingest town of its size on the face of the footstool, and there is not a no-account man inside her confines. The hotel accommodations will be good, the pigeons will be better than can be found at that latitude anywhere in America, the grounds will be run properly, and everything will show that Kansas City knows how to handle a big trap shoot just as well as a smaller or middle-sized one. There will be a hot time on the banks of the Kaw.

Prospects for the Chicago Handicap.

Mr. C. R. Stephens, of Moline, Ill., vice-president of the Illinois State Sportsmen's Association, writes under date of Nov. 1 that he has secured forty-eight signatures of the "big guns" of the shooting world to enter the proposed \$100 handicap at Watson's Park early in December. He says he thinks he can get one hundred, all right, and believes that a week more will enable him to tell in regard to the matter. This would be a warm proposition, and it is truly to be hoped that the boys will rally to the support of Mr. Stephens in his big undertaking here, which will jar the firmament for some surrounding parasangs. E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Garfield Gun Club.

Chicago, Nov. 2.—The appended scores were made on our grounds to-day on the occasion of the third trophy shoot of the season. H. N. Delano won Class A trophy, making a straight score, while A. D. Dorman did the same thing on the same score for Class B. C. J. Wolff and C. H. Kehl tied for Class C trophy on scores of 9 each.

The day was a perfect one for shooting, being warm and pleasant, and just enough southwest breeze blowing across the traps to make the birds lively—and they were lively, being by far the best lot of birds I have seen trapped this season:

Table with 2 columns: Name and Score. Includes names like C. H. Kehl, Dr. Meek, C. J. Wolff, Dorman, Delano, Pumphrey, McDonald, Young, P. W. Eaton, E. Eaton, Wilson, and Dr. Shaw with their respective scores.

Table with 2 columns: Name and Score. Includes names like Mrs. Shaw, J. Wolff, Barnard, Pollard, Lete, L. Wolff, Dr. Mathews, *Luther, Richards, and *Visitors. Signed by Dr. J. W. MEEK.

Stock Yards Gun Club.

Watson's Park, Chicago, Oct. 29.—Following are the scores made by members of the Stock Yards Gun Club, at Watson's Park, to-day:

Table with 2 columns: Name and Score. Includes names like Atwater, McGuire, O. T. Man, and Wilson.

Six-bird sweeps:

Table with 2 columns: Name and Score. Includes names like Wilson, Dimes, Lemeon, McGuire, Maple, O. T. Man, Daly, Dimes, and Maple.

Saturday, Nov. 2.—Practice:

Table with 2 columns: Name and Score. Includes names like J. B. Barto, W. B. Leffingwell, and Elbert.

ON LONG ISLAND.

Creamer-Morfeys vs. Ramapo-Banks.

Interstate Park, L. I., Oct. 30.—There was a good attendance of sportsmen to witness the friendly match between the two-man teams, whose members were the popular and skillful sportsmen ex-Sheriff Frank D. Creamer and T. W. Morfeys against C. A. "Ramapo" and Ed. Banks. It was a close and interesting race. At the end of the tenth round Banks-Ramapo were 2 in the lead; at the end of the fifteenth round they were 1 in the lead, but losing 3 from the fifteenth to the finish, while their opponents killed straight, made the score 45 to 43 in favor of Creamer and Morfeys.

Mr. Creamer, who was shooting a new, beautiful Daly gun, shot in fine form, catching his birds quickly, and centering them with rare precision. His fine score of 24 out of 25 no doubt had much to do with winning the match. Morfeys drew the hardest birds by far, and the luck of the draw was decidedly against him.

The weather was exceedingly pleasant. The sun shone warm and bright; a soft, thin, blue haze toned down the light, and there was almost a perfect calm. The birds were an excellent lot. They started from the traps quickly, but there being no wind to help them they could not well escape the skillful shooters on the matter of speed; but they were strong and vigorous, and required hard hitting to keep them from struggling out of bounds. It was a handicap race. Several other events were shot. The scores:

Table with 2 columns: Name and Score. Includes names like F. D. Creamer, T. W. Morfeys, C. A. Ramapo, and Ed. Banks.

Table with 2 columns: Name and Score. Includes names like Sweepstakes, Fifty-five, G. H. Piercy, T. W. Morfeys, R. W. Armstrong, E. Banks, Wm. Hopkins, J. P. Kay, F. D. Creamer, McConville, and C. A. Ramapo.

Dalton Gun and Rod Club.

DALTON, O., Nov. 1.—Dalton Gun and Rod Club held their third annual live-bird tournament Thursday, Oct. 31, advertising 700 live birds. The day, being fine, the attendance was all that could be desired. The contestants expressed themselves as being thoroughly satisfied with the management of the tournament. The birds being very lively there were very few slow risers. There was one

TARGET-SHOOTING TOWER.

continuous round of firing from 9 A. M. until dark, of which the following are the scores:

Table with 2 columns: Name and Score. Includes names like F. Reily, C. Myers, C. A. Cabbut, P. A. Taggart, E. P. Scott, A. Davids, A. Stewart, F. E. Gibson, and R. Valentine.

Table with 2 columns: Name and Score. Includes names like F. Reily, H. C. Foltz, J. A. Smith, H. Santmyer, C. Renne, C. Buttermore, C. Daul, A. Villard, W. H. Becker, and S. Davis.

Table with 2 columns: Name and Score. Includes names like F. Reily, H. C. Foltz, J. A. Smith, H. Santmyer, C. Renne, A. C. Oberlin, A. Stewart, C. Daul, A. Villard, W. H. Becker, P. A. Taggart, and C. J. Harrold.

HUDSON GUN CLUB'S PRESENT CLUB HOUSE.

Review of Tournaments.

APPENDED herewith is the review of the tournaments of the Interstate Association for 1901, issued by that body:

Grand American Handicap at Live Birds.

The inaugural tournament for 1901 was the ninth annual Grand American Handicap at live birds, which was decided at Interstate Park, Queens, L. I., N. Y., April 1, 2, 3, 4 and 5. The Interstate Association guaranteed \$1,500 (and all surplus added) in the main event, which was shot under the following conditions; viz., 25 live birds, \$25 entrance, 50yds. boundary, with a dead line at the 33yd. mark, handicaps ranging from 25 to 33yds., high guns to win, and moneys to be divided in accordance with the number of entries received.

In addition to guaranteeing \$1,500, the Interstate Association presented to the winner of first place a sterling silver trophy commemorative of the win.

The system of dividing the moneys which prevailed in 1896, 1897, 1898, 1899 and 1900 was adopted again for 1901. The entries numbered 222, of which number 183 were regular entries, 12 were penalty or post entries, and 22 were forfeits, making the total purse amount to \$5,120. There were 22 straight scores of 25 made, which took the first 22 moneys. Forty-five tied on 24 out of 25, and divided the remainder of the purse. The 22 men with straight scores of 25 shot off the tie, miss-and-out, for the silver trophy. This was won by Mr. E. C. Griffith, of Pascoag, R. I., on the 18th round. Following are the scores of the money winners:

Twenty-five straight: C. C. Nauman (28) 25, J. G. Knowlton (29) 25, H. H. Fox (30) 25, R. L. Peirce (29) 25, R. B. Bond (27) 25, J. L. D. Morrison (29) 25, W. D. Townsend (27) 25, R. Rahm (27) 25, Henry C. (28) 25, Chris. Gottlieb (29) 25, F. E. McKay (27) 25, J. L. Alabaster (27) 25, R. R. Merrill (29) 25, E. S. Johnson (28) 25, J. B. Barto (28) 25, F. S. Parmelee (30) 25, C. W. Feigenspan (30) 25, C. A. Lockwood (26) 25, H. Trumbauer (28) 25, G. E. Greiff (28) 25, E. C. Griffith (28) 25, Ed A. Hickman (28) 25.

Ties on 24: Franklin Stearns (28) 24, Alf Gardiner (28) 24, G. McG. Morris (27) 24, W. R. Crosby (32) 24, Wm. Hopkins (27) 24, J. S. Duston (26) 24, Jim Jones (27) 24, Teal (28) 24, A. B. Dover (27) 24, C. E. Mink (27) 24, Sim Glover (29) 24, 13-27 (28) 24, Dr. E. Duncan (26) 24, W. W. Hassinger (27) 24, F. W. Cooper (29) 24, Fred Gilbert (32) 24, J. H. Voss (27) 24, E. Emmers (27) 24, O. von Lengerke (28) 24, C. D. Linderman (28) 24, Edward Banks (27) 24, L. E. Parker (28) 24, J. H. Hallock (26) 24, Leroy (28) 24, C. R. Stephens (27) 24, W. F. Quimby (27) 24, W. J. Buzby (27) 24, A. W. Money (28) 24, H. Schimmell (27) 24, J. W. Hoffman (27) 24, J. R. Malone (31) 24, G. A. Comstock (27) 24, F. D. Alkire (28) 24, E. C. Fort (28) 24, Wm. Wagner (27) 24, A. Woodruff (28) 24, Phil (27) 24, C. E. Geikler (26) 24, Sen Sen (26) 24, E. A. Geoffroy (27) 24, J. von Lengerke (27) 24, W. P. Brown (27) 24, H. C. Hirschy (28) 24, J. W. Knevels (27) 24, Thos. Martin (28) 24.

Shoot-off for trophy: E. C. Griffith (28) 18, J. L. D. Morrison (29) 17, R. Rahm (27) 14, J. B. Barto (28) 11, Chris. Gottlieb (29) 10, J. G. Knowlton (29) 8, R. R. Merrill (29) 7, H. Trumbauer (28) 7, C. C. Nauman (28) 6, R. B. Bond (27) 6, C. W. Feigenspan (30) 6, Ed Hickman (28) 6, G. E. Greiff (28) 5, Henry C. (28) 3, F. S. Parmelee (30) 3, E. S. Johnson (28) 2, J. L. Alabaster (27) 1, A. H. Fox (30) 0, R. L. Peirce (29) 0, W. D. Townsend (27) 0, F. E. McKay (27) 0, C. A. Lockwood (26) 0.

Two hundred and thirty-six shooters took part in the tournament, and \$14,237.90 was divided in different purses. The total number of live birds trapped was 13,963.

The Land of Flowers.

The second tournament was given at Jacksonville, Fla., April 17 and 18, under the auspices of the Jacksonville Gun Club.

Best averages first day: J. S. Fanning, first, 94.5 per cent; Edward Banks, second, 89.0; F. C. Wilson, W. J. Jeffords, Jr., and B. H. Worthen, equal third, 84.8.

Best averages second day: Edward Banks, first, 90.0; J. S. Fanning and F. C. Wilson equal second, 86.0; W. J. Jeffords, Jr., third, 85.4.

General averages both days: J. S. Fanning, first, 93.3; Edward Banks, second, 93.0; F. C. Wilson, third, 85.4.

The total number of shooters taking part in the tournament was 37. Average entry first day, 18.5; average entry second day, 22.8; 7,580 targets were trapped during the tournament.

In the Forest City.

The third tournament was given at Cleveland, O., June 19, 20 and 21, under the auspices of the Cleveland Gun Club.

Best averages first day: L. J. Squier, first, 96.0; Sim Glover, second, 94.2; F. D. Alkire and Harris, equal third, 93.7.

Best averages second day: L. J. Squier, first, 96.0; F. D. Alkire and Chas. Stanley, equal second, 95.4; F. H. Snow, third, 93.7.

Best averages third day: Sim Glover, first, 97.1; D. A. Upson, second, 94.8; F. E. Mallory, third, 94.2.

General averages three days: L. J. Squier, first, 95.1; Sim Glover, second, 94.2; F. D. Alkire, third, 93.9.

The total number of shooters taking part in the tournament was 69. Average entry first day, 46.7; average entry second day, 50.1; average entry third day, 47.7; 28,329 targets were trapped during the tournament.

Our Canadian Friends.

The fourth tournament was given at Sherbrooke, P. Q., Canada, July 1 and 2, under the auspices of the Sherbrooke Gun Club.

Best averages first day: E. C. Griffith, first, 93.3; E. C. Fort, second, 91.5; H. D. Bates, F. H. Conover and C. Thompson, equal third, 85.4.

Best averages second day: E. C. Griffith, first, 94.5; H. D. Bates, second, 92.2; E. C. Fort, third, 90.3.

General averages both days: E. C. Griffith, first, 93.9; H. D. Bates, second, 91.2; E. C. Fort, third, 90.9.

The total number of shooters taking part in the tournament was 22. Average entry first day, 16.1; average entry second day, 15.1; 6,435 targets were trapped during the tournament.

On Lake Chautauqua.

The fifth tournament was given at Jamestown, N. Y., July 10 and 11, under the auspices of the Jamestown Gun Club.

Best averages first day: F. E. Mallory, first, 94.3; B. D. Noble, second, 93.1; L. E. Mallory, Jr., third, 91.8.

Best averages second day: J. F. Mallory, first, 92.5; L. B. Fleming and W. Morris, equal second, 91.2; L. E. Mallory, Jr., third, 90.0.

Best averages both days: J. F. Mallory, first, 91.5; F. E. Mallory, second, 91.2; L. B. Fleming and L. E. Mallory, Jr., equal third, 90.9.

The total number of shooters taking part in the tournament was 55. Average entry first day, 30.5; average entry second day, 26.8; 9,965 targets were trapped during the tournament.

Grand American Handicap at Targets.

The sixth tournament was the Interstate Association's Grand American Handicap at targets, which was held at Interstate Park, Queens, L. I., N. Y., July 16, 17, 18 and 19. The Association added \$1,000 to the purses.

The first day was devoted to sweepstake shooting, of which ten events were provided—five at 15 and five at 20 targets, entrance based on 10 cents per target. Each of the remaining three days had five sweepstake events and a special event at 100 targets, the Preliminary Handicap, the Grand American Handicap and the Consolation Handicap, these handicap events being the only parts of the competition open to all manufacturers' agents, paid representatives and amateurs. Thus, in the main, the competition was devised for the amateur and carefully safeguarded in his interests. Of the twenty-eight events provided in the programme, for the four days, twenty-five of them were for the amateur. Manufacturers' agents and paid representatives were permitted to shoot for targets only in all events save the handicaps, in which all the contestants were assumed to have a competitive equal chance by virtue of the handicap. The purses in the regular events were divided in the ratios of 8, 5, 3 and 2, Rose system. In the handicap events the purses were divided among the high guns, the number of moneys being determined by the number of entries.

Regular Events.—Best averages first day (manufacturers' agents, paid representatives, etc.; for targets only): W. R. Crosby, first, 94.8; Fred Gilbert, second, 93.7; A. H. Fox, third, 92.0.

Regular Events.—Best averages first day (amateurs): Sim Glover, first, 95.4; D. W. Sawin, second, 90.2; J. M. Hawkins and Franklin Stearns, equal third, 89.7.

Regular Events.—Best averages second day (manufacturers' agents, paid representatives, etc.; for targets only): W. R. Crosby and Fred Gilbert, equal first, 97.6; Edward Banks and L. J. Squier,

equal second, 95.2; L. Z. Lawrence, J. S. Fanning, J. J. Hollowell and E. C. Fort, equal third, 90.5.

Regular Events.—Best averages second day (amateurs): Sim Glover, first, 95.2; J. A. Flicks, second, 94.1; Hood Waters, C. E. Mink and J. S. S. Remsen, equal third, 92.9.

Preliminary Handicap—Open to All.—This event was shot under the following conditions: 100 targets, unknown angles, \$7 entrance, targets included; handicaps 14 to 25yds., high guns, not class shooting; \$100 added to the purse. The number of moneys into which the purse was divided was determined by the number of entries received. There were 78 entries, and first place was won by Mr. E. D. Fulford, Utica, N. Y., who stood at the 18yd. mark and scored 95.

Regular Events.—Best averages third day (manufacturers' agents, paid representatives, etc.; for targets only): W. R. Crosby, first, 100 per cent.; Fred Gilbert, J. S. Fanning, B. Leroy Woodard and A. H. Fox, equal second, 91.7; R. O. Heikes, Edward Banks, J. R. Malone, L. J. Squier, E. D. Rike and T. E. Doremus, equal third, 89.4.

Regular Events.—Best averages third day (amateurs): Franklin Stearns, first, 96.4; Charles Wagner, second, 91.7; D. Longnecker, James Cowan and J. A. Flick, equal third, 90.5.

Grand American Handicap at Targets—Open to All.—This event was shot under the following conditions: 100 targets, unknown angles, \$10 entrance, targets included, handicaps 14 to 25yds., high guns, not class shooting, \$200 added to the purse. The number of moneys into which the purse was divided was determined by the number of entries received. In addition to first money, the Interstate Association presented to the winner of first place a sterling silver trophy commemorative of the win. There were 75 entries, and first place was won by Mr. E. C. Griffith, Pascoag, R. I., who stood at the 19yd. mark and scored 95.

Regular Events.—Best averages fourth day (manufacturers' agents, paid representatives, etc.; for targets only): W. R. Crosby, Fred Gilbert and A. H. Fox, equal first, 96.4; Edward Banks and L. J. Squier, equal second, 95.2; J. S. Fanning, third, 94.1.

Regular Events.—Best averages fourth day (amateurs): Sim Glover, first, 97.6; Franklin Stearns and F. H. Snow, equal second, 95.2; E. C. Griffith and H. K. Ellyson, equal third, 94.1.

Consolation Handicap—Open to All.—This event was shot under the following conditions: 100 targets, unknown angles, \$7 entrance, targets included, handicaps 14 to 25yds., high guns, not class shooting, \$100 added to the purse. The number of moneys into which the purse was divided was determined by the number of entries received. There were 57 entries, and first place was won by Mr. F. D. Kelsey, East Aurora, N. Y., who stood at the 19yd. mark and scored 95, tying with Mr. W. Morris, Baldwinville, N. Y., and scoring 18 to Morris' 16 out of the 25 in the shoot-off.

Regular Events.—General Averages for four days (manufacturers' agents, paid representatives, etc.; for targets only): W. R. Crosby, first, 96.7; Fred Gilbert, second, 94.6; Edward Banks and A. H. Fox, equal third, 92.3.

Regular Events.—General averages for four days (amateurs): Sim Glover, first, 94.1; Franklin Stearns, second, 91.6; Hood Waters, third, 90.0.

The total number of shooters taking part in the tournament was 107. Average entry first day in regular events, 80.1; average entry second day, 90.6; average entry third day, 92; average entry fourth day, 58.6. The total amount of money divided in purses was \$5,510.04; 59,432 targets were trapped during the tournament.

Little Rhody.

The seventh tournament was given at Providence, R. I., Aug. 7, 8 and 9, under the auspices of the Providence Gun Club.

Best averages first day: B. Leroy Woodard, first, 93.1; Edward Banks and Hood Waters, equal second, 92.5; O. R. Dickey, third, 91.4.

Best averages second day: Sim Glover, first, 93.7; J. S. Fanning and L. H. Schortemeier, equal second, 93.1; Edward Banks, Chas. Floyd and F. Inman, equal third, 92.5.

Best averages third day: L. H. Schortemeier, first, 96.0; B. Leroy Woodard, second, 95.4; Charles Floyd, third, 94.8.

General averages three days: Edward Banks and J. S. Fanning, equal first, 92.7; L. H. Schortemeier, second, 92.5; B. Leroy Woodard and O. R. Dickey, equal third, 91.4.

The total number of shooters taking part in the tournament was 85. Average entry first day, 52.4; average entry second day, 49.7; average entry third day, 31.5; 24,490 targets were trapped during the tournament.

Among the Pines.

The eighth tournament was given at Auburn, Me., July 21 and 22, under the auspices of the Auburn Gun Club.

Best averages first day: Neal, first, 97.7; Samuel Preble, second, 95.4; Chas. Lambert, J. S. Fanning, Sidney Greene and M. A. Cutler, equal third, 93.1.

Best averages second day: E. C. Griffith, first, 94.2; O. R. Dickey, second, 93.7; William Stobie, third, 93.1.

General averages both days: William Stobie, first, 92.8; G. R. Hunnewell, second, 92.5; E. C. Griffith and H. E. Getchell, equal third, 92.2.

The total number of shooters taking part in the tournament was 72. Average entry first day, 53.5; average entry second day, 35.7; 20,020 targets were trapped during the tournament.

In Old Kentucky.

The ninth tournament was given at Louisville, Ky., Oct. 2, 3 and 4, under the auspices of the Jefferson County Gun Club.

Best averages first day: J. D. Gay, first, 93.9; L. J. Squier, second, 89.6; J. T. Skelly, third, 89.0.

Best averages second day: L. J. Squier, first, 96.3; J. D. Gay and T. H. Clay, equal second, 89.6; C. E. de Long, third, 87.2.

General averages both days at targets: L. J. Squier, first, 93.0; J. D. Gay, second, 91.8; C. E. de Long, third, 85.4.

Best averages third day at live birds: C. E. de Long, first, 96.2; W. W. Watson and G. H. Robertson, equal second, 92.5; J. D. Gay, Samuel Hutchings, W. D. Thompson, T. H. Clay and S. H. Page, equal third, 88.8.

The total number of shooters taking part in the tournament was 65. Average entry first day, 30.5; average entry second day, 27.6; average entry third day, 24.5; 12,300 targets and 815 live birds were trapped during the tournament.

Recapitulation.

In the table as outlined below will be found a summary of the work accomplished during the season of 1901:

Shooters taking part..... 748

Live birds trapped..... 14,778

Targets trapped..... 168,551

Season 1902 Tournaments.

Clubs contemplating holding tournaments during the season of 1902, and desiring the assistance of the Interstate Association, should have their applications in the hands of the manager by Dec. 10, 1901, in order that they may be presented to the tournament committee for action thereon at the annual meeting of the Association Dec. 12, 1901.

Communications relating to inanimate target tournaments should be sent to the manager's home address: Elmer E. Shaner, 111 Fourth avenue, Pittsburg, Pa.

Mr. B. Fletcher Robinson tells some good shooting stories in the current issue of Pearson's Magazine. This is one of many: The owner of a shoot, a short-tempered, apoplectic colonel, was very much annoyed at a prolonged wait which followed the beating of a small wood. "What in the name of fate, are you doing, Thompson?" he bawled to the keeper. "Get your beaters on to the next covert, man, and don't stand staring there like a stuck pig." "Beg your pardon, sir," said Thompson, approaching his master with a solemn air, "but there's a boy been shot." "Well, what if there has?" yelled the colonel, purple with fury; "put him in the bag, you idiot, and say nothing more about it."

A story is told in the Globe of a gentleman who owns a large estate in Ireland, and who, when out fishing the other day, had the misfortune to fall heavily, breaking both his legs. An Irish boy who was out with him did not quite know what to do, but felt that a few words of comfort would not be out of place. "Shure, yer honor," he said, consoling, "now isn't it lucky that it's only your legs that are broken? Whoy, it might have been yerself!"

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., and not to any individual connected with the paper.

Kentucky Gun Club.

THE old Kentucky Gun Club, of Louisville, Ky., has again had one of its annual two-day pigeon shooting events, with an attendance that exceeds that of any previous year. On the first day, Oct. 26, the Kentucky handicap was shot, this event being open to all, and on the second day, Oct. 27, the championship of the State came off, open to residents of Kentucky only.

Beautiful weather went far toward making things pleasant for every one. The birds were, as a lot, unusually good, and barring a little lagging in the trapping everything went off as it always does on those well-appointed grounds and in that admirably managed club.

By referring to the scores below it will be seen that Mr. C. W. Phellis, shooting under the name of Phil, was the only man to go straight in the Kentucky handicap, though he had five men, some of whom were very dangerous, close up behind him. Mr. Phellis has not had much experience pigeon shooting, but it is clear that this young gentleman has in him the making of a splendid shot. The writer saw him score 48 out of 50 in a match on the Cincinnati Gun Club grounds, which, on those birds and on that day, would have been very hard indeed for any one to beat.

The Hazard Powder Company, for whom Mr. Phellis travels, is to be congratulated on having secured the services of so competent, agreeable and thoroughly well bred and polite a young gentleman, who makes friends wherever he goes, both for his company and for himself. I predict we will, barring accident, hear a good deal of Phil as time goes on, and it will all be in this same strain, and that is the best of it.

On the second day the Blue Ribbon event of the year for Kentucky pigeon shots was fought out, and that long, lean, redoubtable Kentuckian, winner on many fields, again showed how well he can shoot, and the man who can year in and year out show a better average on pigeons than this same Mr. J. D. Gay, must indeed be a topnotcher of very first flight.

Mr. Sam Hutchings, as usual, put up a splendid score, shooting with that grace and admirable style that have made him so conspicuous during his whole shooting career. Some of his second-barrel kills on that day brought out unstinted applause and reminded the old-timers of the grand work Dr. Carver and Edgar Murphy do on their good days.

One naturally compares him with these two famous shots, as he resembles their attitude at the score, as well as in build and consummate skill in handling his weapon. Unfortunately for him, the match itself was finished at dusk, and by the time congratulations had been extended both of the fortunate contestants, etc., etc., it was really almost dark.

Under such conditions Mr. Gay had of course a great advantage, being a much younger man. Still, as Mr. Hutchings declares he saw the birds he missed quite distinctly, why, perhaps the waning light did not operate against him so much after all. Every true sportsman admires the man who gracefully accepts defeat, for, after all, when two men ride one horse, one of these must ride behind. See?

A glance at the following scores will show how well most of the contestants shot, and what a warm and formidable set of men vied with each other on both days.

The only regret a man can have after attending a Kentucky Gun Club shoot is that there are so few of them, for if fair treatment, a good ground to shoot over, and the watching of a lot of genial, manly, sturdy sportsmen counts for anything, then by all means commend me to that club and its members.

It may be of interest to know that Messrs. Gay, Phellis and Hutchings shot Parker guns.

First Day, Oct. 26.

Table with 2 columns: Name and Score. Includes Kentucky handicap scores for Le Compte, Gay, J O Ward, T H Clay, J T Page, M Starr, Dr Hansboro, B Starr, G W Clay, D L Miller, Robertson, Phil, Du Bray, A B Duncan, W D Thompson, W Dale, Churchill, W W Watson, Alf Clay, Dr Carver, Gilbert, Schultze, Culp.

Second Day, Oct 27.

Table with 2 columns: Name and Score. Includes State championship for a silver cup scores for M Starr, Le Compte, Robertson, Gay, T H Clay, W Lowe, Dr Culp, H J Lyons, Dr Duncan, Buckner, Dr Fallis, Dr Carver, B Starr, W W Watson, J T Page, Hansbrough, Alf Clay, Hutchings, Schultze, G W Clay, J Q Ward, Lee, D L Miller, W D Thompson, W C Churchill, Charles Ballard.

INDIAN TERRITORY LIVE QUAIL EXPORT.

THE transplanting of quail from States where they are abundant into other States where the supply has been depleted, has grown to large proportions, and of late years has been stimulated by the establishment of numerous game preserves. One of the principal dealers in live quail for stocking purposes is Mr. E. B. Woodward, of this city, who for several years has drawn his supply chiefly from the Indian Territory. He found formerly no question as to the lawfulness of the capture and export of the birds, but upon the enactment of the Lacey Act the Department of Agriculture instructed the United States marshals in the Territory to prevent the further export, on the ground that it was in violation of the law relating to the Indian Territory and of the Lacey Act. His business in live quail thus broken up, Mr. Woodward appealed to the Department for a modification of its order. In reply he has been advised that as the prohibitions of the shipment of quail are contained in acts of Congress, the executive branch of the Government cannot alter nor ignore them, and has no option but to enforce them. Dr. T. S. Palmer, Assistant Chief of the Biological Survey, who is charged with securing the enforcement of the Lacey Act, writes:

The question is one of considerable interest to us, and one to which we have given some attention during the past year. In several instances we have made special efforts to have provisions, which would permit export of live birds, incorporated in State game laws. In the case of the Indian Territory, the best remedy for the present difficulty seems to be that suggested by Hon. John F. Lacey, viz., an amendment which will authorize trapping of birds for propagating purposes under proper supervision, rather than an attempt to nullify the existing law.

And Hon. John F. Lacey writes to Mr. Woodward:

There is now no way that you can ship quail from Indian Territory without a modification of the local law of that Territory. I should think the proper remedy would be to get an amendment to authorize the Secretary of Agriculture, in his discretion, to allow the trapping of some reasonable amount of quail for propagation in that Territory, and in his discretion he can limit the amount so as not to be destructive to these birds beyond what the propagation there would justify. The quail of Indian Territory breed fast, having usually two broods a year.

I should think the law might be modified so as to give the Secretary discretion, which he would not exercise beyond reasonable limits, and he could make such regulations as would prevent the use of these privileges by those marketing the birds for food.

While it was true that gentlemen had been shipping live birds from that Territory in good faith for propagation, they were also being captured and shipped in violation of law for market purposes.

At any time in the past this law could have been enforced in the Territory. Under the Lacey Act, it can be enforced anywhere in the United States, wherever the birds may be found, thus making the local law operative where heretofore it was disregarded.

From all of which it appears that there is confusion as to the Indian Territory law and the application of the Lacey Act.

In the first place, it is to be said that there is nothing in the Indian Territory law to prevent the trapping of quail by Indians for export; and in the second place, the Lacey Act has no application whatever to the export or import of live quail from or into any State or Territory. An examination of the text of the two laws will lead to this conclusion.

The Indian Territory law under which the Department of Agriculture has acted, reads as follows:

Revised Statutes of the United States, 1878.—Sec. 2,137. Every person, other than an Indian, who, within the limits of any tribe, with whom the United States has existing treaties, hunts or traps, or takes and destroys any peltries or game, except for subsistence in the Indian country, shall forfeit all the traps, guns and ammunition in his possession, used or procured to be used for that purpose, and all peltries so taken, and shall be liable in addition to a penalty of \$500.

The law was originally enacted in 1832, and was re-enacted in 1878. Its purpose was to secure to the Indians the right to and profit from the game on their reservations. It was never intended to interfere with the Indian's right to take game and to sell it to the whites; on the contrary, it was designed expressly to assure that right to him, in order that he might have the profit accruing from the capture of game and peltries. It did not mean in 1832, nor does it mean in 1901, that the Indians of Indian Territory might not trap game and send it out of the Territory or barter it at the trader's store for export from the Territory. There is in this law no warrant for the interference of the United States marshals in the capture by Indians and shipment of quail, dead or alive, from the Indian Territory.

Nor has the Lacey Act any application to the case. That Act declares:

Sec. 2. That it shall be unlawful for any person or persons to import into the United States any foreign wild animal or bird except under special permit from the United States Department of Agriculture. * * * The importation of the mongoose, the so-called "flying foxes" or fruit bats, the English sparrow, the starling, or such other birds or animals as the Secretary of Agriculture may from time to time declare injurious to the interests of agriculture or horticulture is hereby prohibited.

The provision prohibiting the transportation of game reads:

Sec. 3. That it shall be unlawful for any person or persons to deliver to any common carrier, or for any common carrier to transport from one State or Territory to another State or Territory, or from the District of Columbia or Alaska to any State or Territory, or from any State or Territory to the District of Columbia or Alaska, any foreign animals or birds the importation of which is prohibited, or the dead bodies or parts thereof of any wild animals or birds, where such animals or birds have been killed in violation of the laws of the State, Territory, or District in which the same were killed.

The articles of which the transportation is forbidden by this section are "any foreign animals or birds, the importation of which is prohibited," and "the dead bodies or parts thereof" of native game unlawfully killed. The live quail shipped from the Indian Territory are neither "foreign birds, the importation of which is prohibited," nor are they the "dead bodies or parts thereof of any birds killed in violation of the law," consequently they do not come within the category of birds with which the Department of Agriculture by virtue of the Lacey Act has to do.

Under these circumstances it is not too much to ask that the Department of Agriculture should withdraw its mistaken instructions to the marshals of the Indian Territory, to the end that what is not prohibited by statute may not be prevented by the arbitrary act of the Department.

SOMETHING TO THINK ABOUT.

To him whose knowledge of game shooting, big or small, comes from a perusal of press recountals, the appalling yearly lists of violent deaths consequent to every conceivable kind of "accident" from the use of the rifle and shotgun in the open season on game, the sport might have a significance more of death and bereavement to mankind than of pleasure and recreation. The average reader of such gruesome recountals further might justly resolve to eschew a sport which is apparently so prolific of loss of life and limb, even if he did not condemn it entirely on the ground that, being so fatal, it could not be a sport at all.

In any form of sport, accidents which neither care nor wisdom can guard against, will happen even though the most skillful are engaged in it. But, if to the skillful performers there be added a host of ignorant and unskillful, then accidents result in a far greater ratio than the mere addition of numbers would suggest. Place a gun in the hands of a person ignorant and unskillful in its use, and that man, however amiable or learned otherwise he may be, if unrestrained, is forthwith a menace to his fellows and in a lesser degree to himself. He is not intentionally dangerous, but he nevertheless is dangerous from his ignorance. If he is warned that his loaded gun is pointed at one companion, in shifting it away he is quite likely, unconsciously, to train it on another. He may not be able to climb over a fence with any degree of certainty even when his hands are free; with a loaded gun in them, then, danger threatens everywhere.

In the presence of game, or its anticipated presence, the average novice is in a high state of excitement, and may then do any senseless thing, from discharging his gun prematurely in any random direction, to mistaking for a deer the friend of a lifetime.

It should require no argument to prove that before a novice goes afield with the shotgun and rifle, he should have an accurate knowledge as to the proper manner of safely handling them, as well as some discipline in their practical use.

The "accidents," so called, are not the result of any natural perils inherent in the sport itself so much as they are the result of ignorance or criminal carelessness in the use of firearms. No one would consider it other than a criminal act if a man, entirely ignorant of engines, were placed in charge of an engine either stationary or locomotive; and the same might be said if a green man were placed in the position of a pilot on a steamboat. On engineer and pilot and on the members of other professions also, society imposes the most stringent legal re-

strictions for the safety of life and property; yet on the other hand a man may take a gun in hand and though ignorant of its use and powers, may sally forth with it in a settled community, with all conceivable possibilities of accident.

If a wholesome, earnest public opinion were aroused, not against the sport or against properly disciplined sportsmen, but against the practices of the undisciplined, improperly equipped beginner, a step toward correcting the evil at its source would be taken, instead of accepting the fatalities as being truly incidental to the sport as a whole.

As they concern shooting, the conditions at the present day have changed greatly from what they were some years ago. At that time game was more uniformly distributed; the country was more thinly settled; the shooters were mostly schooled from boyhood, and firearms were inferior in many respects, though more in keeping with the special uses to which they were applied in practice. At the present day the game sections are much smaller, the numbers of shooters have increased many thousand fold, firearms and ammunition have been improved, but, unfortunately, many shooters begin their schooling and their shooting together, in actual work afield. Not infrequently the deer hunting novice selects a high-power rifle with a range of over two miles to use in a settled neighborhood. A rifle with an accurate range of 200 yards would be more than ample, for most of the beginner's shots would be less than 100 yards, though that would be a much greater distance than he could skillfully shoot at. But if the novice shoots at a deer twenty yards away, and with his long-range rifle, kills a man two miles away, can such a calamity be classed as an "accident"? Common foresight and prudence could easily have guarded against such happening. Therefore, instead of being an accident, such an event would be the result of criminal carelessness.

Of course there are certain happenings, dangerous to life and property, such as the bursting of a gun, the striking of a rock by a boat, etc., which no human foresight could foresee or prevent, and there are true accidents, but the calamities which are in a way invited are quite distinct from them.

Our greater population and consequently our more closely settled country with its much lessened game sections, and the great multiplication of hunters year by year, impose greater standards of skill and care on the part of the users of guns afield. Where the life and limb of others are involved, he who uses the rifle or shotgun should be a master of it. While society may not require that he must have a license from the proper authorities as a guarantee of his fitness to handle the gun, as it does in respect to the engineer, pilot, druggist, etc., to follow their vocation, there is nonetheless the same underlying obligation to observe the rights of the public. If the novice does not heed this obligation, it is only a question of time when he too must have a license which is a guarantee to the public that he is a safe man when gun in hand he wanders about where men, women and children also have a right to wander about, and therewith to live in peace and safety.

Before getting into a wagon it is no more than common prudence and foresight to remove the shells from one's gun. It also is but the task of a moment. If the horses should run away, if the wagon should break down, if the shooter should slip and fall in getting in or out, there is no possibility of death from the discharge of his gun. If the same precaution is observed when crossing a fence, there again can be no "accident" from the gun. If one keeps one's gun pointed in the air or entirely away from the person of others, even if the gun should be discharged when in hand, there again could be no accident. If the gun is placed against a tree, the cartridges being first withdrawn, then, if the dog knocks it over, or if it falls down from any cause, there can be no accident. If the shooter takes care to know absolutely what kind of animal is moving, he cannot by mistake shoot a man for a deer. It is quite as easy to think that a deer is a man as it is to think that a man is a deer. Wait till you know definitely, then you will not afterward have to tell what you thought, with the added knowledge that a man does not remotely look like a deer, and that all regrets cannot restore a life. In short, the matter of "accident" may depend on the matter of care and foresight more than on the unforeseen. Think about these things; and think about them before, and not after.

The Sportsman Tourist.

A Ride on a Bull Moose.

MR. PAUL LIBBY, of New York, has recently returned from a two-months trip through the Maine wilderness, in which time, in company with his friend Mr. Charles Wake, he traversed nearly one thousand miles in canoes and over carries. This was Mr. Libby's first trip to the Maine woods, and he is enthusiastic in praise of the country and the opportunities it affords sportsmen. The party saw a great many deer and moose, counting as many as twenty-five in one day; but as the trip was made in the close season, they had to content themselves with snapshots of the game, and they have a number of exceedingly interesting views.

The most novel incident of the entire trip, and certainly the most exciting, occurred on the morning of Aug. 20, when Mr. Libby, in answer to a "defi" from his guide, leaped from the boat and rode on the back of a bull moose in the waters of Churchill Lake.

The party, consisting of Mr. Wake and his guide in one canoe, and Mr. Libby and his guide in the other, had just paddled into Churchill Lake from Eagle Lake, when Mr. Libby, whose canoe was behind that of Mr. Wake, saw ahead a bull moose feeding in the shallow waters of the lake. Wishing to obtain a picture, Mr. Wake asked his guide to bring him close to the animal, and the guide cautiously and slowly paddled up to the moose, between it and the mainland, and Mr. Wake got a good picture. The moose started to swim across the lake, with Mr. Libby and his guide following closely in their canoe. The guide, intending to have some sport with Mr. Libby, offered to wager that he could not ride the animal, and Mr. Libby promptly accepted. Both parties went in pursuit of the moose, and getting him between the canoes, in the center of the lake, it was now "up to" Mr. Libby to make good his part of the wage. His canoe was paddled close to the moose, and Mr. Libby, who is an athlete, jumped from the canoe and landed fairly and squarely on the back of the moose, which becoming frightened dropped to the bottom of the lake, taking the rider with him. Both came to the surface simultaneously, and the moose promptly made for the shore. Mr. Libby managed to climb into his canoe, but he was not satisfied with his brief experience, and Mr. Wake had not had the opportunity of obtaining a picture, so the canoes were again started after the moose, to drive him into deep water and force him to swim. This time Mr. Libby landed on the back of the animal nearer the neck, and held on to an ear. He then had the unique experience of riding for some distance on the back of a swimming moose, a feat which few men, if any, can claim to have accomplished.

Mr. Wake, from the canoe, obtained the interesting picture of the performance, which is here reproduced. With the photograph in evidence, Mr. Libby can look his listener in the eye while relating his experience, for here is absolute proof of its genuineness.

The photograph is remarkable in itself. The canoe in the picture, the bow of which is clearly shown, was in full motion, as was also the canoe from which Mr. Wake took the picture, and the speed at which the moose, with the rider clinging to his back, was traveling, can best be judged by the disturbed condition of the water as he ploughs his way toward shore.

G. F. D.

A Walk Down South.—IV.

I LEFT Canton about 2 o'clock P. M. on Oct. 18. The road to Waterville, my next post-office, was very hilly as far as Liberty, or Blockhouse, so I was told. I walked down the Sugar Bush Creek road nearly a mile, and was near the forks, where I was to begin going over a great ridge, when an oldish man drove along with a two-horse, light wagon.

"Are you a peddler?" he asked. When he found that I was not, he asked if I wanted a ride. I did, and his team drew me almost to the top of a mile-long hill. That was a lift to start one's courage. When the driver reached his home, I shouldered my pack and walked along a rising grade for half a mile or so, when a single-horse milk wagon came up.

"Want a ride?" was the question. I did, and for nearly four miles I traveled with a creamery skimmer, whose father liked to hunt, and always kept a bird dog to shoot over. He served as guide sometimes to visitors, and killed much game every fall. But the skimmer did not care so much about hunting. He had killed game, of course, some gray squirrels and birds, but always with a shotgun. He wished he had learned to shoot with a rifle, for that was "cleaner shooting" than with a shotgun. It appealed to him to have a single bullet do the work of many pellets. But the shotgun had spoiled him for rifle work; and, anyhow, skinning milk and drawing it to the churn six miles had kept his mind off shooting topics for some years back, except an occasional hunt.

At Taylor's Corners we parted. I walked on and came to Ogdensburg, along the side of a ridge 200 feet high. I got occasional views up creek gullies and distant views of mountains. There was nothing within fifty rods of the road, however, to suggest hunting.

The skimmer told me of an old barn three or four miles away, beyond Ogdensburg. As I went down into a hollow a hundred feet deep, a gun shot up the brook there suggested game. But the stream was not fit for cooking or drinking, though it looked all right close at hand, save for a farmhouse and barn far up on a distant hillside in the stream's watershed. I did not camp there, as I would have liked to have done.

At the top of a hill beyond I found the old barn. A look in disclosed a luxurious pile of straw. I went to the next house and asked who owned or controlled the place.

The man of whom I asked the question owned it. Could I sleep there?

"What you sleeping out for?" he asked.

"It's as comfortable as any other way," I replied. "I don't like to pay hotel bills."

"Do you smoke?"

"No. Here's my match box, if you want it."

He didn't want it. Then I wanted to buy some milk. He wouldn't sell, but gave me a couple of quarts to drink. I went back to the barn, and, because the night looked cold, I dug a hollow in the mow, banked it around with three-foot sides. With the woolen blanket, the tent sides and the rubber blanket over me, and a woolen shirt tied over my head for a nightcap—a most necessary article for exposed sleepers—I soon found my way into the land of Nod, whence I was summoned by the near and loud cawing of crows soon after daybreak. The birds were within six rods, picking up grain that had fallen during the too late harvest, and were having lots of fun over it.

The crows I have seen were not always so peaceful as these grainers appeared to be. Hardly a day has passed during which I have not seen crows in swift and apparently angry pursuit of each other. Often these disputes seemed to start in woods, where there were beech or chestnuts, so I suppose the search for food among the sable harvesters is accompanied by much strife in the common granaries of nature.

I went to the house to take a photograph with which to pay for the milk I had received the night before, and received a full-fledged breakfast of bread and milk, apple jam and butter, and a cup of hot coffee. With that I started on, intending to fry sausage for lunch. A patch of woods looked so like red-squirrel country that I

A RIDE ON A BULL MOOSE.

stopped to see if I could not get one or two. I saw none, but found some great hemlocks on a side hill. That was cheering. The hemlock is an Adirondack tree, and, with some spruces I had seen the day before, rendered the trip less lonesome than it had been. It was homelike.

No sooner was I under the pack than I was overhauled by a light wagon drawn by a big, black horse.

"What'll you give for a ride from here to Liberty?" the driver asked.

"I'll take your picture if you'll trust me for it." Then I saw a mail bag, and knew it was the stage. I asked the price, and it was 25 cents for six miles, so I got in and rode.

We were talking about the scarcity of gray squirrels this year, when the sun faded out of sight in a mist, the west grew black and the wind rose rapidly and grew colder. To the north I could see the rain sweeping over a great ridge there, and we prepared for a shower. I wished I hadn't ridden then.

It sprinkled, and then it poured. My rubber blanket shed the water beautifully, however, and by crouching I was able to keep out of the wind behind it. Nevertheless it was a long three miles to Liberty during the shower, and we got there just at noon. The dinner bell rang as I left the wagon, and I ate at the table of one of the hotels. It was a good meal, and drove out the hardest thoughts brought on by the rain, which is nearly always discouraging. When the meal was over, the sun was shining again, and the road seemed clear and good to follow once more. The direction was "right down the creek" and I couldn't lose my way.

Block House Run is the stream's name, so-called because the first building upon it was built of great wood timbers, which resisted the weather for sixty years, but succumbed to fire twenty years ago.

At the hotel my rifle was examined with the general and awkward handling which men unused to firearms bestow upon weapons. They asked if it would kill a bear—a .32 rim-fire, I had my doubts about it—so they said I'd better look out, for the bears were thick down that way, crossed the road every night, it was said, and often by day. Of course all this was taken with seasoning; nevertheless it was encouraging to learn that the farm country was being left behind and real woods were soon to come in sight.

A little over a mile down the creek the stream suddenly dipped down into a deep, narrow gully, while hills, rather two long ridges, loomed up on either side. Along the side of one of them the road struggled for a while, then pitched, with utter abandon, one might say, down into the hollow.

It was a new kind of country to me. The valley was like the letter V, with the bottom filled in for a few rods. I learned later that each leg of the V was from 500 to 1,000 feet long. The tops were forest-crowned, but

nearly all of second growth. In another year it will be all second growth. The road led past a farmhouse or two lost in the depths. Then I came to Butterwood, an unpainted village of one-story houses. In the road side path I spied the mark of a lumberman's shoes. His soles had the thirty-six odd "corks" with which he grips the slippery log or the smooth rock every time he steps. Nothing that I had seen since I started was quite so thrilling as this track. It was like the trail of a friend. A mile further I asked a man where the lumber camp was.

"Right down the valley 'bout a mile and a half," was the reply, and I started down the valley, feeling better than for many days.

That was late on Saturday afternoon. I reached the camp about 5:30 o'clock. It was a hemlock board structure, with dining room, lobby and kitchen downstairs and the dormitory upstairs—and there were hearty woodsmen ready to say "Howde do!" and a boss ready to say, "Come in and spend the night."

As usual, I was believed to be a pack peddler—a novel sort of one, because I had a rifle. I ate a hearty supper—potatoes, bacon, lima beans, bread and tea, but not the strong Kreutzer cheese. I talked with the boys till nearly 9 o'clock, and then went to bed. I heard that it was possible to get a job. In the morning I asked for work, for I was reluctant to leave so cheerful a place. The jobber was Marshall Carson. When I asked for work he looked at my bicycle trousers and repeated in surprise.

"A job?"

And then I got it.

It was a bright autumn Sunday. Red squirrels were chattering down the road, and the leaves falling to their winter graves. Nearly all hands went after chestnuts "up on the hill." One of them took my rifle for luck, when I consented. They tied meal sacks under their left arms with a strap or string over the right shoulders. At noon they came back, some with only a couple or three quarts, others with nearly a bushel.

They wanted to try my gun. One wanted to buy it. We fired a few shots. It was then that I became acquainted with Daddy. Daddy was the oldest man in the camp. For forty years he had been a woodsman and a hunter. He had killed many big deer. It was a pleasure to see him draw up the little rifle and fire as the sights came level; it was also pleasing to see two when our bullets struck less than a quarter of an inch apart at seven rods. That showed a certain affinity.

Daddy has a camp over toward Laurel Hill, where he hunts deer every fall, and traps skunks during the winter, as well as shoots foxes. That is his vacation from a summer's toil in a lumber camp. He kills deer and enjoys life as much any one one; "civilization" has no charms for him; the lumber camp is as near as he cares to come to the clearings, now that his wife is gone.

In the afternoon many went chestnutting again. Daddy took my rifle and an empty dinner pail, but he gathered only a few chestnuts. He heard a black squirrel, and a squirrel was more to him than picking up the forest fruits. It was much more to him than the night's meal. He kept Johnny Elliott and me out till it was after dark, and we all three caught harkie because we were too late for supper—which made extra work for the jobber's wife, who was cook.

One morning soon after daybreak, as I followed the teams to the bark pile to help load, a great "pheasant"—my "partridge" or a book's ruffed grouse—roared noisily from out over the valley, which lay two hundred-odd feet below, then circled back to its native hillside, only further on. It was a sight to make one dizzy—that heavy bird so far up in the air. On the next day I was near the top of the ridge, with a descent of nearly 1,000 feet to the creek bottom, when Daddy, over the next gully, stopped "fitting" logs to look up. His ears had heard the honking of wild geese. One by one the saw crews ceased their rasping and the nosers stopped rounding off the edges of log ends with their axes. For a few moments the destruction of the forest ceased that a flock of sixty-odd wild honkers might be seen far overhead among the cirrus clouds as it appeared. I worked for two and a half days as "Buddy" the boy, and then quit because the boss wouldn't let me take half a day to get photographs. But I did not have to leave at once—not with a camera. I got all the pictures I needed and came away. Daddy shook my hand:

"I wish you could go over to my camp with me this fall," he said, as he turned away, and that was the most pleasing thing I heard all the while I was there. The old woodsman was willing to risk his fall hunt's pleasure on me.

Down the valley, through a red-squirrel country, I reached English Town or English Center. I met William Wentz there. He has read the FOREST AND STREAM for years. Both he and his mother are field sport enthusiasts. Only the day before he had killed three mallard ducks, three pheasants and a gray squirrel—the best string he ever made. He got the ducks over a point by his dog across the water straight into the sun's reflection. He could not see them till they got down stream a way, and then he fired twice. He got two birds at once, the third he did not know he had hit till the dog came down stream with the bird in his mouth.

Within twenty minutes' walk of the bridge, Wentz said there were deer tracks sure to be seen. On the hills round about were wildcats, which no one ever hunted; foxes, a few of which fell before dogs, and bears that sometimes were met in the roads. Deer are protected from hounds by public law, local prejudice and the rattle of oak leaves. Few are killed these days. Large game is more numerous than small. I saw six buggies on the way from English Center to Waterville, and in five of them were guns or rifles. Even a pair of sweethearts clasped hands over a rifle and divided the attention of their eyes among the wood, the hillsides and each other's face.

The hills are steep, slide rock; on top it is said to be a level country, with few gullies; all is grown to brush and saplings. The briers make still-hunting practically im-

possible, consequently it is believed large game is increasing rapidly now that deer hounding is forbidden by law and sentiment.

Wild turkeys, pheasants and other lesser game have fared worse in the lower valley of Little Pine Creek, into which Block House Run empties above English Center, than have the deer and bear. Wildcats are ever increasing, it is believed. Their tawny hides are seen in the thickets occasionally, but few dogs will pursue them. They range and prey unmolested upon the favorite game of the local and visiting sportsmen.

Every hill seems to have been swept by fire in this village, for on them all I saw charred stumps. When the hemlocks were cut off, the bark chuted down the mountains, and the logs run down the gullies on the soft snow—gullies so steep-sided that I slipped down ten and even fifteen feet several times while scrambling, as a green hand, around the bark piles on dry leaves—following this destruction came the dry summer and the swift-footed fires, which laid bare the rocks and made way for acres of the beautiful fire weed and the subsequent growth of scrub oaks and other trees.

RAYMOND S. SPEARS.

In the Ranger Service.

BY ROWLAND E. ROBINSON.

X.—The March Through the Woods.

WE marched at the best speed we could maintain, with the prisoners and recovered captives between the center and flank files, and taking a course to the eastward of the lake, which the Indians call Mem-frow-bow-gook.

I saw little of Mercy now, but gave her such assistance as I could when opportunity offered, for I would not have her think my resentment made me capable of an unmannerly spite. She made no more than the commonest and necessary speech with me, more than I with her, yet I often caught her looking at me in an inquiring, troubled way that puzzled me more than that her eyes would drop abashed for shame when they caught mine.

We went on for some distance without adventure or molestation, and began to hope that the captors of the boats had given over pursuit, when presently they or some other force of the enemy were discovered by our rear guard, whereupon Major Rogers ambushed our trail, and when the French and Indian wolves came sneaking and nosing their way along it, we fell upon them so hotly that they gave us no trouble thereafter.

But there was a more unconquerable enemy lying in wait for us. We soon got into a very difficult and dismal region of alternate swamps and mountains, where our guides were at fault, and we wandered wildly, sometimes following a deluding ridge, sometimes trusting to the guidance of a treacherous rivulet, till it was swallowed in the black mire of a swamp, and mocked us at our backs with the merry chuckle of its free course down the heights. Our stock of provisions, consisting mostly of the corn taken from the Indian town, was running low, and there was apparently no game in this desolate wilderness nor a fish in its streams to eke out our scant fare. Starvation was confronting us, and, to lessen the chances of such a wretched plight, Major Rogers set free the Indian prisoners save one boy, to whom he had taken a great fancy, and the girl for whom Mercy had interceded, who would not leave her, to make their way back to the remnant of their people as best they could. Then, to increase our chances of finding subsistence on game and roots, he divided the force into small parties, with instructions to make for the Coos Meadows, where he doubted not we would find ample stores awaiting us, sent up from Number Four by General Amherst.

The two women were put in the care of my party of four Rangers at my earnest request, for there was no one whose safety I so much desired, and I felt there was not a man of our force who would so faithfully care for them. I was mindful that Mercy should not know that I had been at any pains to have her with my party, but it was evident that she was glad it had so fallen out and that the young squaw, Angelique Wadso, attended her. Having received our meager share of corn, we separated from the others, and shaping our course as well as we could determine, set forth on the journey, which was to be so desperate to all, so fatal to many.

My old comrade Murphy was one of the party, and had committed to his charge a considerable share of the valuables taken from St. Francis, principally, I think, because of his well-known avariciousness that would make him hold on to the last to the treasure, and partly that his toughness and expertness in woodcraft would make him as likely as any to carry it through safely. Since coming unharmed out of the attack, he had recovered something of his spirits, but began to be oppressed with gloomy forebodings as rations grew scantier and the way more wearisome.

"It's no use, Paul, now, we'll a' be starved and leave our bones in the wilderness," he would say, as he trudged doggedly on, yet still holding on to his precious burden, that was worth less to us now than quarter its weight of the commonest food. "Why did I ever set foot on this cursed continent?" he would say again and again. "Wae's the day I left my ain England"—I could never understand why he kept up the sham of being the Englishman his face and speech so openly belied.

As we marched now, two guarded the women and two skirted out and forward in search of game—a search that was seldom rewarded by anything larger than a red squirrel, for this wilderness seemed given over to the abomination of desolation, almost deserted by all living things save our forlorn selves. Once we got a hare and once a spruce partridge, and once we were tantalized with the sight of a fresh deer track, so lately made in the moist mould that it was not yet filled with the water slowly oozing in. That night every one of us dreamed of bountiful feasts of roast venison, just ready to be partaken of, and then vanishing in the chill mist of dawn as we awoke shivering from our cold beds to divide the unsatisfying ration of pounded, parched corn. This we eked out with such edible roots as we found, being greatly helped therein by Angelique, who was very wise in the knowledge of them, as all the Indian women are. But we were all getting weak, and so near starvation that when we made our camp at night and sat around the fire, which was our cheap comfort, we could regale ourselves with promises of full fare when we came to civilization again.

For one true Yankee it was to be pork and beans; for another an endless supply of his mother's pumpkin pies, but I remember that Murphy craved not roast beef and plum pudding, as an Englishman would be apt to, but "laggis," which, I believe, is an outlandish dish that only a Scotchman can abide.

I cannot describe the woeful days of wandering in the desolate wilds, where the continual shade of the interminable black growth seemed to deepen about us at every weary step. It was as if each were visibly taking us down into the valley of the shadow of death, and our ears were strained in the vast, deathly silence for some sound of other life than our own, which was like soon to be at one with the universal, awful stillness. The croak of a raven, the howl of a wolf, would have been cheering sounds.

One morning two of our men—Nat Borden and Nathan Porter—awoke light-headed, and went staggering off through the woods, and did not rejoin us. I was very weak in body, but still kept my poor wits and held our course by the compass, doing my best to encourage Mercy and give her some help in the worst places. There was yet so much life in me that the touch of her hand thrilled me with delight, so that I thought in the midst of our misery and in the face of death, love outlives the weakness and fickleness of life, and asked myself, Does it outlive life itself? And I wondered that with such likelihood of being near the end of it, she did not confess or excuse herself. Could she think that I did not know how false she was to me, and was she merely using me as the help-fullest means of getting back to her husband? That was a hard thought to hold of this sweetheart, once so tender and true. I was many times on the point of confronting her with it, yet it seemed a wanton cruelty in such a strait as she was in, and I held my peace.

After the next dismal night poor Murphy lost his head and plunged away into the black shades at a staggering run, holding fast to his worthless cumber of brooches and coins. After trying in vain to call him back, I went in quest of him, and at last came upon him kneeling at the foot of a great tree, digging a hole with his hatchet to bury his treasure. When I spoke to him he struggled to his feet and made at me savagely; then, as suddenly, turned and ran at such a pace I could not keep him in sight, and I gave over following him. Presently a crow began cawing not far off, and I set about stalking him with anxious caution and devoutly as a sinner might for a shot that would a little longer ward off starvation, for the last of our corn was gone two days since, and all the day before we had had but half a dozen ginseng roots and as many tallow balls—the root of a kind of orchis—to divide among us.

At last, when he had led me a long roundabout, I had the luck to get aim at him on the top of a dead spruce, and I never was so nervous over a shot at a moose. My heart stood still in this instant that I pulled trigger, and then gave a great bump of joy when through the powder smoke he came tumbling all asprawl to the earth. I pounced upon him before the breath was gone, and plucked him at once, so that his feathers should not betray him to Mercy. He was fat, as crows are apt to be in the fall, I dared not think on what manner of fare. I had followed him in such a wandering course that when I undertook to make my way back to my companions, I went all astray, and so wandered for what I judged might be two hours, till I came upon a most ghastly landmark. It was Murphy, lying stiff and stark beside his buried treasure, from which death had not parted him then, nor, doubtless, has yet, for there I left the poor body, decently covered with a blanket, being too weak to give it burial. I found two roots of ginseng in his pocket, worth more than twice his hoard of silver, and having now recovered my direction by so fearful a sign, soon found my way to Mercy and the Indian girl, the first being in great distress over my disappearance, though Angelique was trying to persuade her that she could lead her to the Coos Meadows.

My bird, when broiled, gave us a more satisfying meal than we had eaten for some days, and the only one who knew what it was not being nice, it was relished by all. We resumed our journey in better heart, and toward nightfall came to a pleasanter country and a stream of some size, which the Indian girl declared would bring us soon to the Long River, or Connaatecook, as she gave it. Here were birches, maples and elms, bright with autumn colors as a summer garden with flowers. It was like sunshine after clouds and storm, that did much to lighten our hearts after the depressing gloom of the black growth.

"Cui Bono?"

CHARLESTOWN, N. H., Nov. 7.—*Editor Forest and Stream:* I may lay myself open to the application to myself of the old Latin proverb which I quoted in a letter a few weeks since, *Ne sutor ultra crepidam* (which your types mangled by printing it *dator*) if I touch on the subject of yacht racing, but your quotation in last week's FOREST AND STREAM from the London Field inspires me to ask the above question.

I am no yachtsman, but I am not unfamiliar with salt water. I have enjoyed more or less fishing excursions along the coast of New England, have rounded the Atlantic coast from Nova Scotia to New Orleans, and crossed the Atlantic under canvas, returning but a few weeks before the America brought home the well-known cup.

It seems to me, as a "looker-on in Venice," that it is time to put that cup in "cold storage," and open a fresh deck for a new deal. Horse racing has been always defended on the ground that it tended to improve the breed of horses, but the contests for the Cup have only succeeded so far in developing a class of "racing machines," which are utterly useless for any practical purposes. They can neither carry a cargo, nor enter a port where there is much less water than is required to float a man-of-war; and they take the crew of a three-master to hoist their enormous canvas. They have not the accommodations for a pleasure yacht, and dare not cross the ocean except under a "jury rig." They require a millionaire or a syndicate of millionaires to build and sail them, and are utterly worthless when the race is over!

Now, my suggestion is this: Let the New York Y. C. select the best schooner in their fleet—say the Constellation—and offer a handsome prize to any foreign-

built schooner that will come over under her own canvas, without the help of a tug, and beat her; and if they can do it, get the Herreshoffs to build another and send it over to bring it back again. Let the boats be of a practical and useful size, 200 or 300 tons, and good for after uses, as the old America is to-day. I stipulate schooners, for she is one, and one of my ancestors, Capt. Andrew Robinson, of Gloucester, Mass., has the credit of being the inventor of that rig. Such a contest might develop something new, but, as the Field says, it is not worth while to keep racing boats which are merely close copies of Herreshoff's models. What earthly use is there in racing boats which need a pendulum of the weight of a locomotive engine hung from the keel to prevent their tipping over?

The financial collapse of the Pan-American Exposition at Buffalo, calls for another application of my question. What is the use of spending millions of dollars in the construction of tawdry, lath and plaster, gingerbread show palaces, which are only to be destroyed after the show is over?

The original Crystal Palace in Hyde Park, of which I saw the opening, still does duty at Sydenham; the Centennial buildings at Philadelphia were taken down and the materials used over again in different parts of the country; but what has become of the White City at Chicago? or will become of the City of Light at Buffalo? Nothing but debt and disappointment?

Let me change my topic: The chapters of Mr. Robinson's "Life of a Ranger" in last week's FOREST AND STREAM remind me that I was called a few weeks since for some information relating to that expedition to St. Francis. A lady in Massachusetts wrote me to ask for the date of it, as she said her grandfather (named Aldrich) was one of the Rangers, and went with a company from this town. I found by the town records that a company was gathered here and marched across Vermont to Crown Point, just in time to joint that expedition, Sept. 13, 1746. Our "Town History" gives quite an account of the sufferings of the return march after losing their boats, as described by Mr. Robinson. Just after I had looked up this question I got another letter, asking me for the date of the death of Capt. Phineas Stevens, who defended the old Frontier Fort No. 4 at this place against a large force of French and Indians for three days, finally repulsing them. This, I found in the village cemetery, and the inscription is worth recording, viz.: "Capt. Phineas Stevens, died at Chagnecto, N. S., Feb. 16, 1756, who had been for many years in the wars, and was Commandant of the Garrison in this town, and at different periods had many combats with the French and Indians."

Speaking of Indians, I found a very fine Indian "tom pestle," such as they used to crack their hominy with, lying beside the railroad tracks, about half a mile from the village, a few days since. It had probably come in a carload of gravel used for leveling up the track and taken from a great gravel bank about a mile north, on the edge of Beaver Meadow, said to have been a favorite Indian cornfield.

A fine buck, with horns just budding, was brought into town last week from across the river in Vermont by one of our young sportsmen from the base of Skitsewauke Mountain, directly opposite this same Beaver Meadow. I wish the Vermont law-givers had continued their prohibition a little longer.

VON W.

In North Carolina.

RALEIGH, N. C., Nov. 9.—*Editor Forest and Stream:* The hunting season for partridges (no one resident in North Carolina ever says quail) began in almost all the State Nov. 1. Birds are plentiful enough. The weather has been dry and unseasonably warm, and they have kept in thickets along branches to a great degree. More grain and peas were sown than usual. Northern sportsmen know only a few localities in this State as points where good shooting is to be had, but they will find partridges in two-thirds of the counties. Deer are more abundant than in a number of years, and so are turkeys and bear. The east is the best place for these, with the New Bern section as a center.

One of the strangest accidents on record in this State occurred not far from Salisbury. Frank Miller was 'possum hunting. A covey of partridges, flushed by the hunters, and scared by the men and dogs and dazzled by the light they carried, flew against Miller, striking him such a blow in the forehead as to knock him down, while the bird, its neck broken, fell dead at his feet.

Warren Carver, of Cumberland county, nearly seventy years old, but erect and alert, and still the best fox hunter in the State, with a great record for chases and good hounds, never goes anywhere within twenty miles of his bailiwick unless he has his horn and a few of his dogs. He went to Wilmington the other day with his pack, and joined the local fox club in a chase. On the return one of the club asked him how many foxes he had caught during his long career. He pulled out his notebook and offered his best hound to the president of the club if he would guess within 100 of the record. The president guessed 1,200 and won the dog, much to the surprise and chagrin of Carver, who said he had "taken the brush" of 1,281 foxes.

For some unknown reason, this year, most of it so very wet, has been notable for big snakes in this State. The largest rattlers ever killed were shot by B. B. Mallison at his farm, near Wildwood Station, Craven county. One had forty, the other thirty-six rattles. Both were a trifle over 6½ feet in length. One weighed over 16 pounds. The negroes of the neighborhood asked Mallison to give them the snakes. After taking the rattles and skins, he did so. The negroes carefully cooked the snakes and had a feast. They declared the "meat was jes' as good as chick'n." The flesh was very white and the negroes seemed to enjoy their feast.

FRED A. OLDS.

Weight of Quail and Woodcock.

The average weight of quail is about 6¼ ounces; of woodcock a trifle less. Quail run from 4 to 7½ ounces; woodcock seldom weigh less than 5, and sometimes 8¼ ounces, but their mean weight is a little less than that of quail.

Natural History.

The Okapi.

THE London Times has this description of the okapi, the newly discovered African antelope: That extraordinary new mammal, the okapi, discovered by Sir Harry Johnston in Central Africa, is now to be seen at the Natural History Museum, Cromwell Road, on the ground floor. The skin brought home by Sir Harry has been admirably mounted by Mr. Rowland Ward, and the public have now the opportunity of forming their own conclusions as to this singular animal, which, after remaining hidden from the gaze of naturalists, hunters, and the civilized world generally until the beginning of the twentieth century, has suddenly been brought to light.

Having had considerable experience of African animals in the wild state, the writer was naturally anxious to obtain an early view of the new animal. It is beyond all doubt a most curious beast, one of the very oddest forms of animal life in a country teeming with strange and singular creatures. To any one who knows the fauna of Africa, the okapi gives at once the impression of being a blending of three different mammals—antelope, giraffe and zebra. Its shape and general body coloring remind one very much of the members of that well-known group of antelopes, which includes the hartebeests and bastard hartebeests; its head is distinctly giraffe-like, and the curious, horizontal stripings upon the forelegs and hind-quarters are, again, very zebra-like. Yet the okapi is, beyond all doubt, a true species, and is not a hybrid or a "sport" of any kind. That the new animal has affinities with the antelopes and the giraffe cannot be doubted for a moment by any one acquainted with these animals. That—in spite of its stripings—it has any kind of relationship with the zebras, as was supposed when pieces of the skin were first brought to Europe, cannot, on the other hand, be imagined for a moment. The zebra-like markings are a mere chance resemblance, and the okapi has no sort of kinship with the splendid striped equidæ peculiar to Africa.

The impression one gains of this strange creature, after a prolonged examination, is that it is decidedly more akin to the antelopes than to the giraffe. Standing some 5 feet in height at the withers, the new specimen gives one very much the impression, as I have said, of being allied to the bastard hartebeests and hartebeests. It has the same high withers, and slopes away toward the tail in just the same drooping, ungainly fashion. Its body coloring resembles most nearly, I think, that particular group of antelopes known as the bastard hartebeests, called by naturalists *damaliscus*. In this group are to be found the korrigum, or Senegal hartebeest, the topi of East Africa and tiang of Senaar, Kordofan and Bahr-el-Ghazal provinces, the bontbok, blesbok and tsesseby of South Africa, and Hunter's antelope, another East African species; and of these animals the okapi in its body coloring most nearly resembles the tsesseby (the bastard hartebeest of the Boers) and the topi and tiang of East Africa and the Sudan regions. The body coloring is, in effect, of a deep chocolate or reddish brown, the forehead somewhat brighter in hue, as are the large and singularly broad ears, which remind one in shape very much of the koodoo. I should judge that the okapi, like the koodoo, is a beast of preternaturally quick hearing and of singularly vigilant and suspicious habits. The antelope-like character of the okapi is again to be noticed in the clean and shapely legs, which look like carrying the animal, nathless its forest surroundings, at as good a pace as that compassed by many of the fleet antelopes of the Dark Continent. The stripings—purplish-black on a creamy ground—are found on the upper portions of the forelegs, while on the hindquarters they extend from the root of the tail to the hocks. The lower portions of the legs—the forelegs especially—are curiously pied and marked in black and white, reminding one somewhat of the bontbok, or pied antelope of South Africa. The hoofs, like the legs, more nearly resemble those of the antelope's than of any other animal. The stomach is blackish.

The dark chocolate-hued neck is fairly long, but certainly bears no great resemblance to that of a giraffe; in fact, it resembles much more nearly that of an antelope than of the tallest quadruped in the world. When we come face to face, however, we are at once confronted by distinctly giraffe-like characteristics. The cheeks are of a yellowish-white, or cream, color, and the reddish coloring of the forehead is succeeded by a dark line, which runs down the center of the face. The muzzle is sepia colored. Not in the coloring, but in the conformation of the head, however, is the okapi's resem-

blance to the giraffe conspicuous. The long, prehensile muzzle and lips, the narrow, elongate nostrils, and the general look and shape of the head remind one wonderfully of the giraffe. As with the giraffe, the prehensile upper lip is manifestly exactly fashioned for browsing upon the leafage of trees and bush. The giraffe plucks its nourishment from the spreading acacia tree which bears its name (*Acacia giraffæ*); the okapi doubtless gathers its food from bushes and shrubbery and possibly the lower branches of squat trees. Wandering as it has done during long ages of the past in the dark and remote forests of the Congo Hinterland, the okapi has undoubtedly sought and found its food supplies from these sources for uncountable generations. Its lips are the lips of a woodland feeder and not of a grass-cropping denizen of the open plains. And yet, during all these ages, the animal has retained the coat of a tsesseby, which, as all African sportsmen know, is an animal of the sunlight, a denizen of open plains, checkered with bush. One cannot account for this fact, or for the bizarre stripings, or, in fact, for the new animal's strange and somewhat contradictory appearance.

The giraffe has been well called "a most fantastic form of deer"; the okapi may be designated with equal truth "the most fantastic form of antelope." Although, as I have said, the head is in some respects strongly giraffe-like, the eye of the okapi scarcely bears out this resemblance. The giraffe's eye is large, tender and melting, soft brown in hue, and shaded by long lashes. The eye of the okapi is, on the contrary, small, dark, protruding and unlovely. It has none of the beauty of the giraffe's liquid eye, and is set somewhat lower in the head.

Ages ago Pliny remarked that from Africa there is

THE OKAPI, THE NEWLY DISCOVERED AFRICAN MAMMAL.
The mounted specimen in London.

always something new. The Dark Continent continues, to the latest hour of its history, to maintain this pre-eminence. It will be extremely interesting to hear further facts concerning the habits and life-history of this strange animal. At present we are very much in the dark as to the range and manner of life of the new species. It may be hoped that Sir Harry Johnston, to whom we are all indebted for this new and most interesting form of animal life, will shortly be able to procure what the lawyers term "further and better particulars."

Upon the whole *Okapi johnstoni*, as the scientists have labeled it, can scarcely be called a handsome contribution to the fauna of Africa. It lacks the magnificent appearance of the eland, the koodoo, the sable and roan antelopes, the gemsbok and others of the nobler forms of antelope. It lacks, too, the unique and stately beauty of the tall giraffe. Its prototype would seem to have been some creature of the long remote past, when the ancestors of the giraffe and antelopes were much more nearly allied than are these animals at the present day. It may, perhaps, like the tapir, be looked upon as a singular and bizarre instance of arrested development.

Albino Squirrels.

MR. JESSE S. KEYS, of Madison, N. J., has sent to Mr. Fred Sauter, of this city, for mounting, three albino red squirrels. The animals are perfect specimens of albinos, two of them being a beautiful snow-white, without a speck of color. The other is not quite so clean in appearance; the skin is of a grayish-white color, but also without a spot. They were killed in New Jersey.

Adventures in Tropical America.

V.—Experiences with Wild Animals.

CAMPING in the jungles of Central America one is certain to encounter wild animals. Of these only the jaguars and sometimes the panthers are dangerous, and the Indians tell many stories of wild encounters. From their description, an old female jaguar, with an acquired, discriminating taste for human blood, must be a creature dreadful indeed.

During a journey in Spanish Honduras, some companions and myself were forced to remain about three months at a deserted lumber camp in the very center of the jungles. Here every night jaguars, panthers and tiger cats came prowling about the camp, filling the air at intervals with their strange cries. The tiger cats were not dangerous, but the jaguars and panthers caused us some alarm. Of all the sounds in the tropical forests, the cry of the jaguar is the most awe-inspiring. From all the tangled growth of the jungle, a myriad of minor voices constantly fills the early hours of the night; then a volume of sound breaks in on the harmony of sound; a roar ending in a sudden choking and all is still; from the forest no sound arises, the jaguar has cried out on his pathway, and all nature pauses as if in fear, then, reassured, the voices of the minor animals begin again, and presently are heard as before.

One night I heard the voice of an unusually large jaguar coming nearer and nearer to camp; then presently its deep cry was heard close by the houses, and all was still. It was probably coming in, but where? Of course

not from the place where it had last cried out; perhaps it would sneak along the river front, or come crawling in through the long grass of the savannah. While I waited listening a soft footfall was heard just by the house, and then a stealthy step coming through an open room or piazza. It is preparing to attack, was my first thought. My bed was most exposed—in fact, nothing but a door covered with cheese cloth to keep out the mosquitoes, separated me from the piazza. I sat up listening and fancied I heard a deep breathing. I called softly to my companions, got up, found my pistol and stood waiting. Everything was still. Then I whispered, "Let's go out and try for a shot."

My companion whispered assent, and then said he would open the door, and cautioned me to be ready if the jaguar should spring through it. Then he whispered, "Ready?" opened the door and—got behind it. A breath of fresh air blew in my face, a shiver went down my back. That was all. An instant I stood waiting, and then stepped out. But the animal had gone as stealthily as it had come. Then out came my companion, all big words and flourish. Together we went about the camp for a time, hoping for a shot. Then

the mosquitoes drove us in and we went to bed again.

As time passed, wild animals became more troublesome. One night we were awakened by a great outcry and cursing coming from the cook's quarters, and on hurrying out found the cook with a big club in his hand, and two or three frightened Indians standing behind him.

"Them animals beats everything I did see," he said, as we came running up. "But the cheek of the brute! It sneaked right past my mosquito net and went to eating at the meat I had saving for breakfast. I drove at it with this club and it got away, through a hole, I take it."

"What was it?" we all asked.

"Panther—yellow and big enough for me anyway," and the cook looked at us as if to say, "Those animals are not dangerous; it's all Indian talk." We advised him not to attack panthers with a club at night, but if the thing came again to call us. Then, after talking a little, we hurried to our mosquito bars, not having noticed till then how the insects were swarming around us.

Next morning the cook said to me: "Mr. Frank, I thought it was a lot of rats or I wouldn't have done it, but I ain't telling that to them men," pointing to my companions.

The next night, shortly after we went to bed, we heard the cook calling again, and hurried from our quarters to his aid. As we came running up his voice greeted us from under the mosquito bar, saying, "That panther has come again, bigger this time, and it's gone in the cook house."

We went cautiously and stood looking in at the open door, where there was quite a large room, now perfectly dark. We stood there a moment, then I told the engineer to hold a torch over my head and I would go in the room and try for a shot at the panther. There was but one door, and I felt sure of a shot this time.

The engineer called me a blank, blank fool, a kid, a tenderfoot, and said he would hold no light at that door. "Well," I said, "I'm not going to miss this chance. I'll go in without a light."

Game Bag and Gun.

The Vermont Deer.

Editor Forest and Stream:

The inclosed list shows the number of deer reported to the Commissioners by postmasters as having been killed in Vermont during the last ten days in October. These statistics are obtained by furnishing every postmaster in the State with postal cards addressed to the chairman of the Commission, the back side being printed blank, so that the postmasters can fill in simply the number of deer, the town in which killed, the person by whom killed, and his residence. They then state the weight as received, and whether estimated or actual. The same table also gives the number of deer reported by postmasters for each year since the open season on deer. From these statistics it may be gathered that in 1898, which was the first open season in about twenty years and extended through the month of October, 131 deer were reported as killed; in 1899, 89; in 1900, 127, and in 1901, 181. It is probable that the statistics for 1901 by actual report will be raised to about 200, as the reports straggle in from the backwoods for at least a week after the open season.

Vermont Deer Killed in 1901.

In 1898 the open season extended throughout the month of October. The report for 1901 includes those reported up to Nov. 6. There are several not yet reported. Open seasons for 1899, 1900 and 1901 were for the last ten days in October.

The Commissioners estimate that about 25 per cent. more deer are killed in the open season than are actually reported. Out of this 25 per cent., a number of does may be included. Some of these does are dressed and utilized, but frequently the man who shoots one leaves it to rot on the ground where killed. The actual statistics for the last four open seasons, by comparison, may be taken to show that the deer have increased in spite of the open season, but not in the same proportion as the increase in the number of deer annually reported as killed. There were undoubtedly more hunters in the Vermont woods this year than during any previous year. Many of the residents of Vermont who had not hunted deer for many years equipped themselves with rifles. More visitors have come in this year than in the previous years. Most of the deer killed, however, were killed by residents of Vermont; not over 5 per cent. were killed by non-residents.

In making up any report as to weight of the deer killed, it is difficult to make actual statements, because the weights may have been inaccurately reported. For example, it is reported that on Oct. 31 in the town of Pownal a deer weighing 530 pounds was killed by Fred Peckham, a resident of Pownal. This weight seemed too large for belief, although the report stated that it was the actual weight. It has since been reported that the actual weight was 236 pounds.

Among the lucky ones who killed deer weighing over 250 pounds may be mentioned these: Dr. Galvin, of Londonderry, killed one weighing 366 pounds before it was dressed, in the town of Mount Tabor. Elwin Leach, of Rutland, killed, in Bridgewater, a deer which weighed 300 pounds after the inwards were removed. This deer was weighed at the post office in North Clarendon, to obtain the above report, and measured, from tip to tip, 8 feet 3 inches. I should estimate that this deer would compare very closely with the one killed by Dr. Galvin. Geo. H. Soule, of Fairfield, killed in his own town one which weighed 328 pounds. Harry B. Ladd, of Island Pond, killed in that town one which weighed 325 pounds. Joseph Guyette, of Marshfield, killed in the town of Peacham a five-pronged buck

weighing 311 pounds. Alden Olmstead, of Hardwick, killed in the town of Woodbury a 300-pound deer. A 300-pound buck was killed in the town of Grafton by Mr. Turner, of Grafton. A 288-pound buck was killed in Fayston by N. L. Boyce, of Waitsfield. A deer weighing 255 pounds after being "hog dressed" was killed by Wm. H. Gardner, of Weathersfield, in the town of Cavendish; this buck would have weighed probably over 300 pounds when alive. Chas. W. Streeter, of Weathersfield, killed in his own town a buck which weighed 279 3/4 pounds. Hiram Moore, of Pomfret, killed in the town of Sharon a buck weighing 277 pounds. D. P. Mills, of Ripton, killed in his own town a deer weighing 274 pounds. Chas. Blake, of West Concord, N. H., killed in the town of Stockbridge, a deer weighing 249 pounds after it was "hog dressed." W. H. Vaughn, of Middlesex, killed in his own town a deer weighing 276 pounds, with an 18-inch spread of antlers. Geo. Bryan, of Sharon, killed in his own town a 280-pound buck. A. J. Durkee, of Duxbury, killed in his own town a 265-pound buck, with a 21-inch spread of antlers. W. Gardner, of Weathersfield, killed a 255-pound buck in the town of Cavendish. Ed Lucas, of Bridgewater, killed in his own town a 250-pound buck. Lindsay Turner, of Grafton, killed in his own town a 250-pound buck. V. S. Thayer, of Readsboro, killed in his own town a 250-pound buck. Undoubtedly there were many other bucks killed which would weigh 250 pounds or over. These are the statistics obtained from the reports where the animals were actually weighed.

Will the deer continue to increase under these conditions? Undoubtedly yes. Ten years ago the Commissioners did not have any reports about the deer being killed by dogs more than once or twice a year, and perhaps the same number of cases to investigate where poachers had violated the law outside of Essex county. As time has passed by, the increase in number of these animals has been made apparent to the Commissioners from the number of letters received about them. Not a week passes without the Commissioners having something relating to deer to investigate. Sometimes it is a case of dogs running at large chasing deer. This complaint comes at all seasons of the year; but the practice is most offensive and harmful when the crust will hold the dog but not the deer, and as the snow is leaving in the spring when the does are heavy with young. Many deer are undoubtedly killed by those who carelessly allow their dogs to run at large at this time. Many deer are found wounded, some of which have been killed and some of which have been cared for until sufficiently recovered, to be turned loose. Many reports come in regarding damages done by deer. Some of these complaints are well founded and some are based upon slight damages that are not worthy of passing notice, and perhaps the claimant does not approve of the protective law and wants the privilege of killing the deer. Some of these complaints are curious forms of letters. I quote a sample such as have occasionally been received:

"Dear Sir—The deer have damaged my crops to the extent of \$25. Please call and settle or you will hear further. Yours truly,

Many misunderstand the existing conditions and laws. They do not seem to be aware that the animals are the property of the State, and not either the property of the Fish and Game Commissioners or the Vermont Fish and Game League. No damages can be paid except by provision of the State Legislature, and it is probable that if the present policy of protecting the deer continues and they continue to increase, some provision will have to be made.

Why are not more deer killed in Essex county, from which county the appeal comes at every session of the Legislature for a longer open season?

Simply because the people do not hunt the deer during the last ten days in October, and very few hunters are out. The woods are less accessible and convenient to get at for the outsider than the covers of New Hampshire and Maine. Many of the residents prefer to get their deer in cooler weather, when they can be kept better, and when they can be more easily captured. Of course it is contrary to the law, but they get them just the same. From letters received by the Commissioners at various times as to the tracks and yards seen at various times, it may be inferred that there are as many deer in Essex county as in any other county in the State, proportionate to its wooded area. The deer are slaughtered there in great numbers and eaten in the lumber camps, and in spite of the fact that it is done openly, no complaint comes to the Commissioners about the violations. Of course the Commissioners could stop it by sending a special officer to inspect the camps frequently, but this method is expensive and the State does not provide the funds with which to do it.

Will the bucks hold out if constantly killed so that the does can all be made fertile each year? Yes, I think there will be plenty of bucks to line all the does for a few seasons to come. Our law permitting the killing of bucks only is not an unusual one except as applied to deer. In Maine and in Canada it is unlawful to kill the cow moose, and only bulls are taken by the hunters. It is found that the stock of moose improves because the old bulls are gotten out of the way, they being the ones sought by the head hunters. Perhaps the same condition will apply with reference to the deer.

Changes in the law I would suggest are: That it specify that no buck with horns less than 4 inches in length can be killed. Some hunters shoot from salt licks, and kill anything that is a buck, even if it is nothing but a six-months old creature, on which the horns have not yet started through the flesh. I should also have the law changed so that if a person brings in a deer without the head or the parts which indicate the sex of the animal it should devolve upon him to prove that the animal had horns when alive.

Do I recommend any further open season? I hardly know what to say yet. The Commissioners have not discussed the matter jointly. I am inclined to think that ten days are enough, except for the northern part of the State. Essex county is peculiarly situated on the border of New Hampshire, and New Hampshire has a longer open season. I think it would be well to give Essex county a longer open season—possibly lengthen out the season a trifle throughout the State. JOHN W. TITCOMB,

"Yes," sneered the engineer, "tenderfoot, fool, kid. Don't you know better than that, going in a room with a panther? You never saw one before, that's plain. Any mothers' baby would know better."

I stepped up to the door, saying, "Are you going to hold that light?"

"Here," he said, "give me a torch. Now go in and let the panther maul you; it will serve you right."

He held the torch at the door, and I stepped cautiously into the dimly lighted room. At first I saw nothing and stood for what seemed a long time, the engineer telling me to come back while I could, and that the brute was only hiding. I didn't like it very much, and had just determined to back cautiously out, when I heard something stir, and then over in the corner above a pile of flour bags two burning eyes appeared, glared at me and were motionless. There was the game. My chance had come. I raised the big .44-caliber revolver, took careful aim, shot, and then repeated, aiming at the same place. Something fell heavily to the ground, the engineer gave a sort of gasp, and exclaimed, "The tenderfoot kid, he did kill it." Then everybody crowded into the room.

We searched with great care, but could not find the animal. The general opinion was that it had been badly wounded, and had crawled in behind some of the stores, and we could get it in the morning. I moved a barrel and caught sight of a tawny fur, and made a grab for it, but one of the men caught my arm and held me back, saying, "Those animals have more lives than a cat; better be careful." However, the beast lay perfectly still, and I wanted to see it that night, and I put my hand down, feeling it carefully for a moment, then took hold with both hands, braced myself, laid my strength on for a big lift, and went over backward as if I had lost my hold. But I hadn't. My grip was good enough, and so had been my aim; but in my hands I held an unfortunate opossum, and not a very large one at that, except its eyes, and they were too big for its face.

I didn't mean to hurt that opossum. It wasn't fit to eat. I had nothing against it. Why couldn't it have gotten out of a hole in the roof before I shot, and have made big noise getting away? Then I would have had a thrilling tale to tell of adventure with a panther. As it is, I only killed a night-prowling opossum, of the kind that smell badly when one gets too near them.

FRANCIS C. NICHOLAS.

Collisions in Mid Air.

CURRITUCK, N. C., Nov. 5.—Editor Forest and Stream: Seeing Mr. Hough's account of a flock of mallards meeting in mid-air and killing each other, reminds me of an experience some years ago at night.

I had been in a habit of going to a certain pond to shoot geese by moonlight. On this occasion I reached the pond just before the moon came up. Seating myself on a bunch of dry rushes, I lighted my pipe and waited for the first honk of a goose. It was exceedingly dark, and I had begun to fear I had not made the right calculation about the hour. I had heard the peculiar whizz of the ruddy ducks' wings as they passed very near my head, and while thus meditating I heard a loud report overhead, which sounded about like one clapping one's hands together while forming a hollow in each, followed immediately afterward by two splashes in the water. I was only a boy, and began to wonder if this was the spirits of the departed geese which had been shot by me around this same pond, haunting me.

But the moon finally came and likewise the geese. While wading out to retrieve my first goose, I found side by side a ruddy duck and a widgeon. The widgeon was so smashed up that it was unfit for food, but the ruddy was very little damaged, and went to the larder with the geese.

Three years ago I saw two flocks of redheads meet in the daytime, when one of them was wing broken, and I retrieved it. These are my only experiences along this like in thirty years of duck shooting. MORE ANON.

Some Points.

From "811 Hints and Points for Sportsmen."

Weather in Bay Bird Shooting.

THE most favorable wind for bay snipe shooting in the summer and autumn is one that blows steadily from the southwest. The birds that are coming from the north, and flying against it, lower their flight and skirt the bars and meadows, and see the stools more plainly and decoys much better than when traveling with the wind in the clouds. A wet summer is also found to produce the best shooting, as the meadows afford plenty of feed, and should the birds arrive early in the season, they stop and make the large marshes their home, flying north in the morning and returning south toward evening. This flight baymen call "a trade."

Killing a Wounded Bird.

Many gunners bite its neck with the teeth. This will not break the skin. Others squeeze the bird on both sides close under the wings and at the same time press the forefinger over the wishbone. This stops heart and lung action and causes almost instant death, but it is impracticable to kill large birds in this way.

Preserving Dead Birds.

Draw and stuff with green grass; cover bottom of box with a layer of coffee grounds, then pack a layer of birds; then another layer of grounds, then birds, and so on until all are packed. The grounds should be perfectly dry.

Preserving Killed Game.

Take a supply of paper sacks (such as grocers use), just large enough to put a chicken into and tie snugly. Draw the birds and hang by the head until they have thoroughly dripped and the natural heat has left them. Stuff fresh leaves or grass inside; put into the sacks heads first, and tie sack tight enough to exclude air. Put them in a cool, shady place until ready to ship. Birds packed in this way have kept over fifty hours, and when used were sweet and fresh, and this during the hottest weather of August. Never put game on ice unless you can keep it here until ready to use, for it spoils in an almost incredibly short time after being taken off.

A Narrow Escape.

THERE is so much in the papers nowadays relative to the awful waste of human life in the woods, caused by the careless use of firearms, together with the demand for more stringent laws bearing upon this subject, that I feel it a duty to write this sketch. While we deplore the fact that many hunters have been taken for deer, shot and killed, let us, if possible, have some charity for the man who all of his life must carry this awful burden of having killed perhaps his best friend unintentionally.

Three of us started out one beautiful day in October a few years ago after deer. We were the best of friends; two of us were hunters and one was new at the business. After traveling a while, we struck an old woods road, and although one of my companions—the one who was well versed in woods craft and the rifle—proposed traveling just back of the road a few rods, and parallel to it, so that if there might be a deer about he would be most likely to jump right into the road when startled, thus affording us a good shot, I did not agree to it, knowing its dangers. This plan I always had objected to, and so told him. It affords the possibility for an awful mistake.

"Let's keep together," I said.

A little later we were traveling through a beautiful clump of spruce, when, as quick as a flash, a deer jumped over a small ridge to our left and disappeared.

"Hold on! He has gone into that little ravine, and he will follow it," said my companion.

"Don't you remember where the road crosses that piece of swale just beyond? Now you are so much quicker on the shoot than I, let me go and drive him down that run, and when you see a piece of him as big as your hand, let drive."

"No, don't worry," said he, as he saw my hesitancy. "You can't hit me, for the ridge will be between us. You are too careful, you are."

Well, he went over into that ravine, and seeing nothing of the deer, would you believe it, he followed that run right down into the swale, where he said the deer would be, without a sign or halloo. He had on one of those dead-grass-colored shooting jackets—and, by the way, I have never put one on my back since, and would advise others to follow my example.

Standing at ready with my rifle at full cock, I was waiting for a snapshot, when I caught sight of what I supposed, of course, was the deer in the swale.

Remember that this was in a wild country, where there was no possibility of any others being about.

Now, I knew my man; of course he wasn't fool enough to be down there. Just that instant's hesitation while this thought passed through my mind was all that saved his life and my peace of mind.

Grasping my rifle more firmly and bringing it to my shoulder I took dead aim, and had already begun to press the trigger when I caught the outlines of his hat. Instantly throwing the muzzle of the rifle to one side, I began to grow first hot, then cold; I trembled, I vomited, and, although a man full-grown, in my excitement I cried like a child, and the hardest tramp that I ever took in my life was my trip back to camp.

Unmanly you may call the nerve collapse if you will, but don't judge too harshly till you've been there.

Silently my companion joined me, and we slowly wended our way back to camp. The occasion did not demand very lively conversation, and the latter was conspicuous by its absence.

He was never able to give a reasonable excuse for his action.

Had my friend been killed, who would have been at fault?

Would I have deserved a term at State's prison for my mistake?

Twice since then have I myself been mistaken for deer and saved an accident to myself and, at least, embarrassment to the other man by a quick, sharp halloo, and, although angered by the carelessness, my own experience made me very charitable, for I could very easily put myself in the other fellow's place.

J. A. THOMPSON.

A Visit to Mexico.

(For first paper see issue of Oct. 5.)

To continue our little hunting excursion through Mexico, I will give you, as promised, our trip from Tampico to the interior of Mexico and return via Tampico to New York city.

After a most charming stay at the ranch of our friend, Jim Cathcart, we left Tampico by the Mexican Central Railroad on the morning of March 27 for Mexico City. Of course we all had our guns and plenty of ammunition, and the party was a congenial lot of good fellows. Our only regret was, that our old chum and crack shot, Scott, was not along, but we shall hear more of him by and by. We reached Mexico City on the second day. I shall not try to tell you of the many little incidents that happened during our trip at sight seeing in the several cities we visited, nor will I undertake to tell you of the beauty and grandeur of this wonderful republic. I have never read anything relative to Mexico that has been exaggerated in the least. After spending several most delightful days in Mexico City, we went to Guadalajara, where we joined a friend, Mr. Blewit, who was to take us to Lake Chapella, a beautiful sheet of water just south-east of Guadalajara. The next morning we were off for Chapella, the ride being several hours by train to a little station called Ocotlan, and thence by stage to the lake.

We had planned to stop at one of the several small hotels on the lake, but to our surprise both were full. People had been turned away for several weeks. We first intended camping, but when we found that guides were not to be had at any price, nor boats, we were certainly disappointed. Of course, the hotel guests had all the guides and boats in sight, and we had to abandon the plan of what we had so much anticipated—a royal hunt. We finally secured quarters by the loan of tents from several natives, and spent two days on the lake, going each day for a short journey in a naphtha launch. Of course we carried our guns, etc., but you cannot hunt ducks and geese to any advantage in a naphtha boat, especially when it makes the noise of a locomotive, as this

one did. We saw ducks by the thousand flocks, and lots of geese also. We saw every kind of duck that one could possibly mention, except the canvasback and spoon bill; even these had been here all through the winter. The natives tell us that the canvasback is found in larger numbers, though, on the coast, and especially on the Gulf side. We shot any number of ducks, especially mallard and teal.

There are all sorts of large game here, such as deer, which are very easy to get at. We saw on the first day's trip up the lake seven deer at the water's edge, and in one lot of this number there were five in a bunch. The second day we all carried along our rifles, and George got three and Jim one very large buck. We were awfully proud of this bag, because it so happened that one party had been out for three days after deer and only got two, but had wasted much ammunition. We bade adieu to Chapella with much regret. It seems hard to leave a place when you know there is so much game around, and you can't get at it, simply because you can't get guides and boats. It's really worth the trip to Chapella from New York or any city in the States, if one is a sportsman, just to see the game that is brought in to the two small hotels by the sportsmen every evening—ducks of all kinds, snipe, turkeys, pheasants, tiger cats and very often tigers. I saw a skin before we left that measured 8½ feet, and was most beautifully marked.

Not having had the hunt we expected at Chapella, Jim proposed that we should take another hunt on his ranch. The motion was adopted unanimously, and we were once more in old Tampico and at the ranch of our old reliable Jim Cathcart. We got there on April 14, and as the steamship Niagara was to sail on the 19th, we had four good solid days to enjoy Jim's hospitality.

By the time breakfast was over the next morning, the sun was away up high, and the temperature about 75 degrees. It looked a little warm for ducking, so we all sat on the front porch to discuss the matter and help to burn Jim's cigars. Before we left Mexico City Jim had telegraphed his overseer at the ranch that our party would be here about the 17th or 18th, and to have everything in shape. Well, as we were puffing away the good cigars on the porch, we saw a native on horseback approaching. He alighted and handed to Mr. Cathcart the message he had sent from Mexico City just nine days prior to its arrival at Tampico. We all concluded that when we had any more messages to send in Mexico we would carry them along ourselves.

We all go now to the rear of Jim's house, which overlooks the great duck flats, and discuss whether it is too hot or too late in the day to go ducking. It really is too hot, yet every one is only too anxious to go, because they can actually see ducks by the thousands, and the flats are literally black with them; but Jim knows best and decides we won't go to-day.

Scott arrived this morning, and he and Jim decided that we should go pigeon and dove shooting. After luncheon we set off on foot to the northwest of the ranch, where the flight would soon be on. We took certain positions so that there would be no danger, and the rule was to leave all pigeons and doves on the ground until after sunset. We waited for nearly two hours before there were any signs of this fascinating sport, though now and then there would be a straggler, but always out of range. But by and by they began to come. It's a pity we didn't have our camera; flock followed after flock, extremely swift in their flight, and they seemed to be in flocks of from fifty to a hundred. We kept firing until Scott called out in a little while and said his gun was too hot to hold, and George asked if the reports didn't sound like the battle of Gettysburg. The birds did not seem to mind it at all—they took a straight course—and seldom varied. When the shooting was over the game counted was as follows: Scott, 39 pigeons, 3 doves; Jim, 32 pigeons, 21 doves; George, 28 pigeons, 6 doves; myself, 21 pigeons, 19 doves. In summing up the separate lots, I found among George's kill three yellowhead parrots, and Jim had one. Jim was aware that he had killed a parrot, but George could not explain. These flocks of pigeons and doves feed in the big swamps, and come over every evening; but no one here ever cares to shoot them. Jim sent nearly all the birds to his neighboring friends.

By 4 A. M. the next day we were again in the skiffs in the large lagoon and off for the grounds, and the waters were as before alive with fish. We soon reached the flats, and as day dawned the ducks began to fly, and as soon as we were in our allotted places we began to open fire. We all killed in two and one half hours 107 ducks, 65 of which were teal and 22 the regular summer duck, the rest pintail and spoonbill. As the flight north had been on for the past month, it looked as if all the canvasback and mallard had gone, although we saw one bunch of mallards passing very high. We did not use any decoys at all, and I do not think it at all necessary. We also killed quite a number of snipe. The snipe we killed were mostly cycle bill, yellowleg, curlew, willet and graybacks, and several snipe that I have never seen before.

The remainder of the day was spent in a trip to the beach, several miles distant, where we had a sea bath, and returned home again in time for dinner.

With an early breakfast next morning, we were off before day to the big woods. Everybody scattered except George and myself, who did not care to venture far alone, as this is the cub season with the tiger, and no one knows what will happen. We hunted for five long hours and saw nothing but several flocks of turkeys, and they always found some way to get out of range of our guns. Scott turned up about 3 P. M. with the prettiest little fawn I ever saw, and told us that he had killed the doe, though he did not intend doing so—only that three deer jumped at once—and he picked this one, and the fawn was so young that he had no trouble in catching it. It was so weak that it could hardly stand. Finally Jim came in with a native and relieved Scott of the fawn. Jim said he had killed three turkeys, two pheasants and a small tiger cat, and soon the native turned up with the game on his horse. Nearing home Scott killed a very fine buck, and I got one turkey, and had several other shots, but missed. Reaching home we helped Jim skin his tiger cat, while Scott borrowed Jim's manager's baby's nursing bottle to give his fawn milk, and the little fellow took to the bottle at once. Jim is very much of a taxidermist, and has a number of birds and skins which he

has mounted and cured and will carry to the States.

On the last day we went fishing, but as we had no tarpon rigs, we could only fish for small fish, though we made a fine catch. That night Jim entertained us at the final dinner. It was simply a dinner that you couldn't buy. During dinner the wind blew out the lamps, but as soon as they were relighted Scott said, in his usual way, that the sudden darkness reminded him of an old darkey who had never been on the railroad train before. He told us the story: As he boarded a train one day in Virginia for Norfolk, he noticed a very tidy old colored woman in the car, who seemed to be very nervous, and upon inquiry he learned that she was going down the country to attend the marriage of a young lady whom she had nursed when a baby. As she had never been on a railroad train before, she seemed to be frightened at every noise. When the train started, she commenced to mumble to herself the following: "I never did want to ride on dese yere cars nohow. Dey never was made for colored folkes. I knows somepins gwine to happen, from the funny way dis thing shakes. Lordy, I done most fell right out de seat what I sittin' in." She looked around at a gentleman opposite and said: "Mistah, does you think day's any danger in dese steam 'gine cars?" All of a sudden the train entered a long tunnel, and the old darkey exclaimed: "Fo' Gord, it done got dark all a sudden; dese her steam engines ride you clean out a day into the night time, and I know 'tis gwine suppen happen, sho." By this time the train was out of the tunnel and on a bridge, and a very high one, too, and the old auntie looking up said: "Lord, I knows I's foolish, but 'twas shortes' night I ever seen." And suddenly looking out from the train and seeing the ground so far below, she exclaimed, "My, if we ain't flying. Yes, sah, flying dis like a bird." As the train reached level ground the old darkey gave a long sigh and fell back in her seat and said, "Thank God we done lit. 'Tis de curioses travelin' I ever did."

With all our traps and the little fawn, we were off to Tampico to catch the steamer Niagara, and soon were once again on the good ship. Of course we were all welcomed aboard, and especially by the captain and the purser, who are always in the best of humor. As the ship would not sail until the morrow, on account of the heavy norther blowing outside, we went down to the beach to see the surf and maybe kill some snipe. On the beach we saw lots of snipe, especially cycle bills and graybacks, and could have had good shooting but for the wind and sand pelting us in the face so fiercely. In Tampico we saw some very fine tarpon that had been mounted by a taxidermist. Scott purchased a very fine one, measuring just 7 feet 1 inch.

We were off the next day for New York via Havana, and reached New York city Sunday morning, April 28, after one of the most delightful trips on record. All in our party have traveled quite a little, and we cannot recall the incident when we were better taken care of than on the Niagara. We offer many, many thanks to the good captain and the purser, who understand the wants of their passengers and try to make them happy and enjoy a sea trip as it should be. We shall never forget their funny stories and the songs the purser sang in good, old negro fashion.

DICK HAWKINS.

Boston and Maine.

BOSTON, Nov. 9.—The finest string of deer ever seen in Boston markets was on exhibition in Clinton Market Wednesday. There were eighteen of them, the majority large bucks. They came from about 30 miles beyond Jackman, Me., and were brought out by a party of nine hunters, mostly Boston merchants and marketmen, who have been quartered at Henderson's camps in that region. In the party were Messrs. Stillman Noyes, of Somerville, who really had the party in charge; C. A. Currier, H. M. Munroe and G. A. Vickery, of Lexington; E. S. Lock, of Roxbury; W. F. Cobb, of Allston, and J. W. Smart, of Arlington. Each man brought out his two deer, and such seems to be the fashion this year, whether they shoot them or not. It was a most remarkable piece of good luck in hunting that should have given each man his two deer, especially considering that hunting conditions were bad, by reason of the noise of the fallen leaves, as dry as powder, and making a big noise at every step of the hunter, and it is a wonder that eighteen were secured in so short a time—only seven days. Deer are remarkably plenty in that section. The largest was a buck of 240 pounds weight, shot by Mr. Cobb. Mr. Noyes also killed one of 225 pounds. Two of the party got lost after hunting late one afternoon. There was a dispute as to whether the compass was right or wrong, and one of the lost men attempted to lead the other out of the wilderness. He led him into a blow-down instead. Then he decided that he could not find the way. Three shots were given—the signal of distress—and quickly answered by the boys at camp. It was not answered by three shots, but by "What's the matter there?" from a voice close at hand. The lost men were not more than 100 feet from the camp.

Deputy Game Warden Elsmere arrested six men last Saturday for dogging deer in the vicinity of Third Machias Lake. They were taken to Machias and arraigned in the Municipal Court. Chief Warden Ross was present and assisted in the prosecution. After a hearing each man was sentenced to pay a fine of \$40 and costs. They appealed and furnished bail in the sum of \$100 each to appear before the Superior Court. Wilbur Day, one of the party, was also arraigned on the charge of keeping dogs for dogging deer, and also for guiding without a license. The total amount charged to his account in fines is \$400. He waived examination and furnished bail.

BOSTON, Nov. 11.—Last week was a poor one for the deer hunters, owing to the dry weather and fallen leaves, and hunting parties have had poor success, as a rule. A party of four Boston hunters spent most of the week in the vicinity of Shelburn, N. H., but got no deer. One of them remarks that he could hear his brother hunters' footsteps at the distance of 50 or 100 yards, as they moved over the dry leaves. Bangor makes a poor showing of deer shipped through for the week, the number being 350, and nine moose. This shows that the record for the season has nearly reached 2000, by far the largest number of any other year. Up to Saturday 125 moose

CHICAGO AND THE WEST.

Death of Buffalo Jones.

CHICAGO, Ill., Nov. 9.—That well-known, unique, and picturesque western character, C. J. Jones, better known as "Buffalo Jones," died last Wednesday at Salina, Kansas. Thus there passes away one more of those large figures of Western life who have been for some years lingering on the stage of their early activities, surviving in a land which now contains few of the characteristics which once made it dear to them.

Buffalo Jones is well known to readers of *FOREST AND STREAM*, and also to a large audience who have read his book, "Forty Years of Adventure." To the writer, who knew this man familiarly and has shared with him the wilderness bed on the hard ground of the hunter's trail, this news comes with startling impressiveness and carries a deep regret.

Buffalo Jones was born in Tazewell county, Illinois, in the year 1844. His father was Noah Nicholas Jones, a man who possessed somewhat of the determination and resolution which made C. J. Jones famous in his later day. The elder Jones was once concerned in a lawsuit in which he was defended by no less a personage than Abraham Lincoln, who charged him \$10 for his services as attorney. This part of Illinois was in these days wilderness country, abounding in game.

The youthful hunter had abundant opportunities for taking lessons in the chase and in the capture of wild animals. When, as was decreed in the stars for him, he set his face toward the western sun, he was already well equipped with the education most useful to him on the plains. He engaged in different lines of business in the State of Kansas, being now nurseryman, now real estate agent, now farmer, as occasion demanded, in the fashion of those swiftly moving western days. He was once a member of the Legislature of the State of Kansas, and later in life we find him sergeant-at-arms in the Legislature of Oklahoma. Successful in the boom days of Kansas, he at one time held title to no less than eighty sections of land, and was rated a wealthy man. All his ventures were large ones, and he took his fortune or misfortune in the philosophical fashion of those days. In the day of the buffalo it was almost perforce that he joined the skin hunting parties, and it was in these times that he gained his great reputation as a buffalo hunter.

There was perhaps never in all the great army of plainsmen a better plainsman than C. J. Jones. His was the instinct by which he could travel by night scores of miles across the untracked prairie, reaching infallibly the point for which he had set out. He had, beyond any man known to the writer the instinct of locality and direction. He was never lost under any circumstances, whatever. Moreover, he had a natural instinct for long range rifle shooting which personally I have never seen surpassed. He never used the rear sight of his rifle, but shot with the fore sight, raising or lowering his aim as he saw the bullet strike too high or too low. An antelope at 400 yards he was pretty certain to get before it could escape, and I have seen him make shot after shot, before the days of the more modern Winchester rifles, which would seem matters of luck were the sequences not so long.

In 1885 Buffalo Jones got four buffalo calves, the beginning of his once famous buffalo herd. The writer and a friend joined him in 1886 on his next buffalo hunt in the Panhandle of Texas and New Mexico. There were 13 calves captured on this hunt. Then Jones met with such success that he bought the Warder Bedson herd, of Stony Mountain, Manitoba. For a time Jones held these buffalo in Nebraska, where he managed to become involved in a heavy irrigation deal which practically cost him all he had, including his prized herd of buffalo. He sold some of the buffalo to real estate dealers in Salt Lake. Others went to parties in England, and three head were sold to the Czar of Russia, all these exported buffalo bringing very large prices. Jones himself crossed the Atlantic twice on these trips, and he is perhaps the only man who ever declined an invitation of the Prince of Wales to meet him. The Kansas hunter sent word that he had bought his ticket home and could not afford to wait for the convenience of the Prince.

The swiftly passing years of the last decade made many changes in the West and the old plainsman saw much of his early vocation gone. Still eager in his ambition, we find him now building a railroad from Galveston to Beaumont, across that very country now so fabulously rich in oil. Then in 1898 we find him returning from his wildest trip, that in which he undertook to bring out alive, musk oxen from the Barren Grounds of British America. This trip of 18 months from Edmonton to the Great Slave country, thence down the McKenzie River and back to Seattle did more to age Jones than any ten years of his life. He came back wrinkled and broken.

There have been several parties who have gone into the Barren Grounds after musk ox, but the story of most of these is tame compared with the experiences of Jones and his sturdy partner, John Rea. These men were absolutely alone, without any native guide, on a journey of 39 days to the northeast of the Fish River and the Doobaunt River, taking their fuel with them most of the time, handling a pack of half savage sledge dogs, and running entirely by the compass. They returned over their trail across this frozen and unknown region, and only missed home by a couple of miles, surely proof enough of the wonderful resources of this born explorer and adventurer. The story of their hunt for musk oxen, of the capture of their musk ox calves and their continual battle with the wolves, has been printed in *FOREST AND STREAM* and is given in full in Jones's story of his own life. He writes thus regarding his experience after they had the five musk ox calves tied out on the long anchor line, precisely as we used to tie the buffalo calves in the Panhandle:

"No sooner had the king of day passed beyond our vision, than we heard a pack of wolves just over the ridge. It appeared as if they had not found the carcasses of the animals we had killed, but drew nearer and nearer our little live ones. Our dogs were loosened on the supposition they would be in danger as long as we remained outside with them, but little 'Scrapper,' one of our best

shepherd heelers, anxious to measure his strength with them, dashed over the divide after one, and that was the last we ever saw of him. Doubtless he was devoured in a minute by the pack. It was warm and pleasant that evening compared with others we had experienced; so I took my stand at the end of the rope farthest from the tepee; Mr. Rea at the other. We both had our guns and plenty of cartridges, and one by one we rolled the white monsters over as they appeared. We never pretended to shoot when they were more than forty yards away. Sometimes they would come singly, then in howling groups, two to a dozen in a pack. All night long—about nine hours of darkness—the crazy fools would trot up to be slaughtered; most of them running as soon as shot, unless we put a ball in the head or breast. Those wounded would drag themselves away, to be instantly devoured by the others. When morning came they were just as numerous as during the night, and the sun was high in the heavens before they commenced to skulk away or attempt to get under cover. About noon we determined to try to get out of the horrid place."

Jones told me that during the attack of these great wolves he was scared for the first time in his life. This expedition came nearly being fatal, for they ran out of ammunition and food and barely got through safely. The expedition failed of its original purpose, but gave a grand proof of the daring and vigor of this man's nature.

Personally, C. J. Jones was an example of the most tireless energy. There was never a man more utterly confident of himself nor more absolutely independent of the aid or counsel of others. He never asked advice, and rarely gave it. On the hunt he was disposed to be silent, apparently sullen or morose, always intensely pre-occupied. He was nowhere daunted except in the great cities. He admitted that when he came to publish his book the city men were too much for him. Then it was for the first time that his supreme self-confidence received check.

Some would have called Jones egotistical. Indeed, so are we all egotistical. Jones was frankly and ruggedly interested in himself, and he surely had basis enough for his confidence in himself. Underneath his somewhat cold exterior there was the warm and generous heart of the frontiersman. He was the type of the daring, fearless, resourceful settler of the western wilderness, nor shall we soon find another his equal in these days of swift and startling changes. The old breed is dying out.

Buffalo Jones made fortunes and lost them, carried out big enterprises and failed to execute them, was successful and was cast down. In all likelihood he died a disappointed man. Yet after all that man cannot be called a failure who prevails over the surroundings in which he finds himself. Hard, cheerless and rugged were those surroundings by choice of his own. In a day of heroes, he was a hero. One may be pardoned the wish to lay upon his burial place the tribute of a personal regard.

Fall Shooting Season.

To-morrow opens the deer season in Wisconsin and the bird season in Indiana. As to the latter State, Chicago seems not to take very much interest in the opening of the season. At the gun stores the clerks are busy advising the outfitters in regard to the conditions in Indiana, and hardy indeed is the shooter who can stand the statement of a \$25 license, no hunting on Sunday, and only 24 birds a day to the gun. Indiana ought to be chuckling to herself and rioting in the fat luxury of abundant game this year. So far as can be learned from the infrequent shooters who are back from portions of the State this fall, the bird crop is a good one, as indeed it is generally good all over this part of the West.

As to the deer hunting in Wisconsin and Michigan, it is much the old story. There have been parties of deer hunters from Ohio camped out in the Fifield Lake country of Wisconsin, on the Wisconsin Central railway, for more than a week. This I learn from Mr. Randall, who is just back from that part of the country. He says that if these gentlemen are doing any early shooting he has at least heard of no detection in the act. Non-resident hunters say that they intend to observe the laws, and will not do any shooting until the 10th of the month. It is to be presumed they just went in there a week ahead of the opening date in order to be on hand plenty early.

Yet it is not a bad plan to go into camp on a deer hunt enough ahead of time to learn the range of the deer, the runways, etc. The same informant states that there has been some use of hounds in Wisconsin this fall, but mostly by residents. We shall hardly see the time when the running of hounds will be entirely abolished in Wisconsin or Upper Michigan. Mr. Randall says that the reports indicate abundance of deer, but he says that all agree that the "deer are going." They are going gradually to-day, but presently they will go all at once, just as the pigeons and the buffalo went. Then we will ask what became of them.

There are probably, according to Mr. Randall's estimate, over 100 shooters now in the Fifield country. I have seen in southern Illinois the agents of these northern railroads employed in the deliberate rounding up of parties of hunters in Indiana, Illinois, Ohio, etc. When these excursions get fully under way one may believe that the woods will be literally full of hunters. Mr. Randall says that he talked with a guide who had arranged to take out a number of parties from Fifield. The guide said he intended to get these parties headed right and then hunt out a hollow made by some fallen tree trunk, or place back of some exceedingly thick tree.

Presently we shall begin to hear of the casualties among the deer hunters. It does not serve to appeal to the reason of those who have not reason. If we could lynch a few of these people who accidentally shoot their fellow men, we might perhaps jar the anatomy of this sort of person to the extent of rendering their ilk more careful for at least a short time on the next deer hunt which they take. As to writing about them, cautioning them and advising them—it comes to nothing. A great many of these people never saw the inside of a sporting paper. The best way to reason with them is by means of a club, or better still, a rope.

The state of affairs at Fifield is duplicated, or will be, at everyone of a dozen or a score of the most popular

had passed through Bangor for the season. Moose are very plenty in the near vicinity of Bangor. One passed through the University of Maine campus the other day. Some of the students were quickly out with a rifle, but it proved to be a big cow moose, and they dared not shoot. A moose was shot Friday at Clifton, only a few miles from Bangor. Game Warden Neal seized a moose on Friday consigned to a Boston firm, and shipped by a guide under a special tag. The shipment was illegal under the fact that it was being shipped to parties who had not killed the animal. A deer passed through the streets of Bangor about 2 o'clock Friday morning, and was seen by policemen and others. The animal was going towards Veazie at a high rate of speed.

The Harry B. Moore party came out of the Holeb woods Saturday. They have been camped at Birch Island and have had great sport and remarkable success. They brought out their full quota of deer, two each, including several good bucks. Mr. C. M. Howell had the most remarkable success, shooting the largest bear killed in that section for years. In the party were H. B. Moore, R. H. W. Dwight, C. M. Howell and Leroy S. Brown. Their camp is near to the Canadian border. They found partridges plentiful. The weather was simply delightful. They attribute their success to having the best of guides, and have had some experience in the same section.

The hunt of the Ohio party, in the Maine woods, has ended in a terrible disaster. W. C. Tuckey, of Collinwood, O., has been accidentally shot and killed by J. G. Hostatler, of Toledo, O. It appeared in the evidence at the coroner's inquest, at Bangor, that Mr. Hostatler had actually seen a deer, which he shot and killed, the bullet killing his fellow hunter after it had passed through the deer. One of the hunters states that the shooting was purely accidental, and nothing but what any most careful hunter might have done. But the entire party of 32 is grief-stricken over the accident, and the hunt will be abandoned.

High winds have made a dull week with the off shore gunners. Several Boston parties have been down to Chatham, and other points along the Cape, but high winds have prevented shooting. J. A. Phipps and party have been in camp at Monomoy, but their success was poor, getting only a few coot and a duck or two. Mr. Augustus Nickerson and a party of shooting friends were at Chatham early in the week, but gave up the hunt, owing to high winds and few birds.

Kingfield deer hunters made a rather small record last week, although 12 deer came out over the Franklin and Megantic in one day early in the week. It seems that the game was mostly taken the week before. Dry weather and fallen leaves have made it slow finding big game. Mr. and Mrs. A. W. Robinson are out from the Megantic Club preserve, and Mr. R. E. Traiser comes out with them. Mr. and Mrs. D. C. Pierce are still in camp and Mr. Harry Sauborn, Mr. and Mrs. Robinson bring out a couple of nice bucks, and Mr. Traiser a buck and a doe.

SPECIAL.

Deer in Cumberland County, Me.

THE close season comes on to-morrow, Nov. 1, in Cumberland county, Me. The hunters were given the month of October to shoot deer for the season of '91, and they improved it. There had gathered a bunch of deer in the northern towns which had thrived by protection to quite a respectable number, but they have been scattered and shot out during the month. Here are the numbers up to date as far as I know: Leon Moody, one buck; Clyde Rand and Lewis Harmon, one between the two, all of Standish; Mr. Johnson, of Gorham, one; Carlton Marten, of East Sebago, one; Will Marten, of East Sebago, one; Geo. Shaw, of East Sebago, one; Loney Burnell, of East Sebago, two; Wilson Burnell, of East Sebago, one; Will Cole, of Standish, one; Geo. Seaton, of Standish, one; Mr. Tripp, of Standish, one; Charlie Shaw, of East Sebago, one; Edwin Spencer, of West Baldwin, one; Daniel Sanborn, of East Baldwin, one; Gilbert Emery, of Standish, one; Horatio Nason, of Baldwin, and Mr. Weeman, of Portland one; Harry Huntress, of Hiram, one; Gustine Thompson, of East Madison, N. H., one. I am sorry to say that they failed to follow up four of these deer at different times, and did not find them until spoiled. Moral—When you shoot at a deer follow until you know you have hit or not. Geo. Young, Freedom, N. H., one; Mr. Ridlon, of Kegan Falls, Me., a large buck, shot in Sandwich, N. H.; John Mitchell, of Naples, Me., one. And I have heard of three being shot in the town of Bridgton, but do not know the names; and another gentleman, of Standish, shot two deer.

Murray Watkins and Daniel Chaplin have just got home from the Moosehead region with four deer (one a noble buck that dressed 215 pounds) and a good bunch of ruffed grouse.

The hunting about this region is mostly on small game, which is very wild and not very plenty; it consists of ruffed grouse, gray squirrels, Northern hare, occasionally a fox, coon, a few ducks and once in a great while a deer. Trout fishing the same. Once in a while the sportsman gets a good one and a good string, but more often a slim string. This is speaking of Cornish and vicinity.

HUNTER.

Currituck Mallard Flight.

CURRITUCK, N. C., Nov. 4.—Never in my recollection were there so many mallards seen at Currituck as at present. They began to arrive about Oct. 15 in large flocks, and came from the southwest, until there are thousands upon thousands of them. There are hundreds of thousands of other kinds of ducks, too, but I never saw so many mallards before anywhere. I cannot understand why they should come from the southwest, unless they have found it too dry in Tennessee, Georgia or Texas. Blackheads are also here in great numbers; we have had very few of them at Currituck before in four years. The little ruddy ducks came a month earlier than usual, and are also more plentiful than last season. Wigeon, sprig-tails, black ducks and teal literally cover the shoals. Our season opens Monday the 11th, and if it is a good day for duck shooting, there will be some of the largest bags made that were ever heard of at Currituck.

MORE ANON.

deer hunting localities in the State of Wisconsin. Star Lake on the C. M. & St. P. in another popular point. This week several parties have started for that place, among these the party of J. Verner Ewan, of Cincinnati, who goes accompanied by Mr. Fred E. Harrison and Mr. Chas. Gray. They will be in the woods for a couple of weeks or so. There is any amount of good deer country left in the hardwood and pine country of Wisconsin, and there will be deer for some time to come. The influx of deer hunters is something remarkable, and indeed the numbers who naturally go into the woods after deer amount to a total of far greater magnitude than is generally supposed. It is mere guess work. There may be 10,000 hunters out next week in Wisconsin or there may be 20,000. Sometimes over 1000 licenses are taken out in a single county. This, it will be remembered, is not the non-resident license, but the common or garden license which costs one twenty-fifth of the amount which the State of Wisconsin exacts from aliens.

Mr. D. J. Hotchkiss, of Fox Lake, Ill., suggests that the Colorado law forbidding the shooting of any deer without horns is one which ought to be enacted by the State of Wisconsin. He thinks that the search for horns on a deer might save the life of many a man. Quite aside from this, it is high time that the disgrace of killing a doe should be legally promulgated by this State while there are still left some does to protect.

Ducks.

The duck flight is working South and just now it is principally mallards which are occupying the attention of the lucky ones. This week, at the Hennepin Club, Mr. Phelps Hoyt, of Chicago, killed 71 mallard ducks in a single day's shooting. It would seem that this ought to keep the wolf from the door of Mr. Hoyt for a few brief moments.

Mr. Harry Clark, also of Chicago, has returned from the Hennepin Club this week. He had very decent shooting and bagged 35 nice ducks in all, expressing himself quite contented with his sport.

At Senachwine Lake and in the Swan Lake country the water is low, and there was a freeze early in the week which temporarily sent the ducks out. Later in the week a very heavy flight was reported near Chillicothe, Ill. This Chillicothe country is perhaps the best natural duck marsh that ever lay out of doors in the West. The best part of the marsh is what is known as the "Rice Field," which has for some years been held as a game preserve by six gentlemen, all residents of the town of Chillicothe. They have a duck preserve which is simply priceless in its value and they handle it wisely and conservatively, not shooting every day in the week, but getting something every time they care to go after it.

Far to the south of our Illinois River country, in the timbered region of Arkansas, the flight of mallards is scattering down on its southern flight. Joe Irwin writes from Little Rock that a big flight has been in around that country, but that there is not water enough to hold the birds. The latter is a common complaint ever much of this part of the West.

About Wild Rice.

One has perhaps overlooked, if it has been printed in FOREST AND STREAM, instructions in regard to the art of planting wild rice so that it will make a stand of feed for a duck preserve. I was talking to-day with the veteran duck hunter, Mr. Abe Kleinman, of this city, and he says that the reason for the failure of duck clubs to raise wild rice on their grounds lies in the fact that the seed is usually sown in places where there is a channel or current of water in the spring time, or where the whole tract of sowing grounds is under the spring inundations. "The wild rice plant has a way of coming to the top of the water," said Mr. Kleinman. "If the water is shallow, the roots stay down, but if the water is deeper, you will notice that the roots seem to rise, the whole bog in which the roots lie apparently floating or coming up off the hard bottom below. Now, in the spring, the water finds these roots nearly detached and not fast in any hard bottom. The plants are frozen solid in the ice. There comes the rush of the freshet, perhaps the whole bottom being overflowed. The ice simply draws out the whole mass, vegetation, roots and all, and all you have left is a few struggling plants along the edges where the water is not so swift. The best places for wild-rice are always those with little or no current, and the plant grows the best in protected arms or coves where the ice does not sweep out with the current of the stream."

There may be something in what Abe says, and certainly he is a mighty well posted man in everything pertaining to ducks and duck feeding. This tip may be worth something to those who intend to plant wild rice on game preserves. Plant it in the stillest places possible and keep it protected from freshets or the grind of the moving ice field. Also plant buck brush and chinquapins.

Duck Calls.

There was a big argument at the Wishinnee Club the other day about the original invention of the so-called Illinois River duck call. Bill Haskell claimed that he was the first man who ever made a round barreled duck call with the tongue fixed at the bottom of the call. There were about a dozen who challenged his statement promptly.

Mr. W. L. Wells stated that he had in his possession a duck call made by Fred Allen more than 30 years ago. Fred Allen himself, as I understand it, does not claim to be the originator of the duck call, but only the first extensive manufacturer. Yet another gentleman thought that Tim Wood, of the Swan Lake Club, was the first inventor, and this is perhaps closer to the mark. Abe Kleinman says, and his experience dates back to the early days of duck shooting, that Horner, a brother-in-law of Tim Wood, made a duck call before Tim experimented in that line. Tim Wood told me that the first duck call he ever used was made from a section of cane, to which he fastened a brass reed. Then he got to wrapping these canes with twine, and then to making them of wood. The earliest duck call of which the writer has any recollection was made of wood with a bell-mouthed horn mouth piece. The barrel was sawn com-

pletely through longitudinally. This call I remember to have seen previous to the year 1870. It was not very effective, although in those days ducks were not so highly educated as they are now.

Bill Griggs, the famous market hunter, told me he thought the best duck call made was that turned out by Nick Glodo, of Paw Paw Junction, Mo. Glodo now wants \$10 for one of his calls. He used to get \$5. The legitimate trade price of the duck call is about \$1. Bill Haskell has taken a sudden spurt of energy and is now manufacturing 500 duck calls which he intends to put on the market one of these remote days. There are a dozen different varieties of duck calls already purchasable in the sporting goods stores. Nearly all of these need retuning, and some of them can be made to do service in the hands of an expert caller. The fact is that most duck callers call too much, and with too poor an imitation. A poor duck call in the hands of an industrious shooter is apt to scare away more ducks than it brings in to the decoys.

Abe Kleinman says that one of the best duck callers he ever saw was made out of the handle of an old tin dipper. It had a loud but accurate note. As for himself, he used to call ducks with the unaided mouth, but he says this is very hard work if one manages to produce a loud note. I have heard several market hunters along the Illinois River produce a very good imitation of the mallard call, and with the unaided mouth.

The probabilities are the artificial calls for the wild duck, like those for the wild turkey, antedate the hunters of this generation. One imagines that the first call was made by the southern hunter, out of a section of cane, just as Tim Wood made his first call on the Illinois River. Upon the contrary, Abe Kleinman states that he began hunting in 1851 in the Calumet River country, near Chicago, and that at that time he had never heard of a duck call. He seemed to think that the idea came from somewhere south of us, perhaps the Illinois River country. Upon the whole, the consensus of opinion seems to be that Bill Haskell was not one, two, eight in the invention of the instrument above specified.

Quail.

Mr. J. L. Jones, of this city, is now absent on a quail hunt at Neoga, on the Illinois Central railway, this State. Dr. Shallenberger, of this city, is also out in that vicinity. Mr. Oswald Von Lengerke is just back from the same point. He killed 41 quail one day and 48 the next, having a local guide who had with him three good dogs. Mr. Chas. S. Dennis, Mr. J. V. Clarke and Mr. W. L. Wells are contemplating a quail hunt, and will probably go to Watson, in the same district as Neoga. It is the general belief in that country that the quail did not breed three times and perhaps not even more than once. The last week has shown windy, dry weather, and the birds have been hard to handle, running ahead of the dogs like so many blue quail. The sport has not been of the best, but there has been enough shooting for those not too unreasonable in their demands.

The young son of Mr. J. G. Drennan, District Attorney of the Illinois Central railroad, goes to-night for a little trip on his father's lands near Taylorville.

Mr. W. A. Powel and myself, accompanied one day by Mr. Estill Harner, of Taylorville, had a pleasant little shoot near Sharpsburg, in this State, early this week. We found some very large bevs of birds, numbering in several instances over 30, but on the other hand found in that part of the country someone had been shooting ahead of us, the bevs being cut down to one-half their numbers, sometimes only a half dozen being left to the bevy. We did not care to kill all of them at once, but usually got from two to three dozen birds when we went out.

As to Mr. Powel himself, and his dog Dorothy, and the dog Rock, son of Dorothy, it is to be said only that they are, as ever, the best on earth. Dorothy does not grow older with the years, but can still eat three square meals a day, and wear out the average hunter at that. Mr. Powel himself is, if possible, a little longer in the leg and a little more tireless in the wind than he ever was before. I can recommend him to anyone needing physical training. As a quail shot, I think he improves as the years go by, and surely he frequently makes discouragingly long runs of straight kills.

In the matter of shooting quail, it is an odd thing, but I hear of all kinds of people who can kill all the quail they shoot at. One man writes a nice story about himself killing 15 or 20 straight. Another tells of a story told him by his father, who saw his uncle or cousin kill 40, 50, or 60 straight. Somehow I never have been around when these things were happening. Warren Powel is a good quail shot, yet he and I agreed that a man who bags half his birds is doing pretty well. For amusement I kept track of my own shooting for a while, and found that the score stood 2 birds out of 2 shots, 2 out of 4, 2 out of 6, 4 out of 8, 5 out of 9, 6 out of 11, 9 out of 19. Then it grew gradually darker and my gun did not prosper so well. If I recollect correctly, I pocketed only 10 birds out of 26 shots that day. The following day was very windy and cold and the birds were so wild that I did not get half my shots, and I think it puzzled Powel himself to account for half his birds that day. Incidentally I made a string of straight misses so long that I do not care to put it on record. On that windy day we found Bob White at his best as an enigma. Time after time we would put up a Levy and try our best to mark it down, but if we picked up more than two or three singles out of the scattered birds, we figured we were doing well. I never saw quail run so far or lie so badly to the dog. Dorothy was disgusted with the birds and once or twice bodily ran in after them, just to see if she could get close enough to smell them good and hard. We could absolutely see the annoyance on her countenance.

Doubles.

It is easier to talk about killing a double on a bevy rise than it is to do the same. Once in a while Mr. Powel and I would do this act, and on three different occasions we executed a little stunt which is rare when two guns shoot together. On three different bevy rises we each killed a double, bagging 4 birds each, each

killed by the single shot. When two shooters fire at a bevy rise they will nearly always double on one or both of their birds. I think 36 was the greatest number of birds we brought in but we had more than \$36 worth of fun.

Mr. Powel himself is as irrepressible as ever, and an exceedingly hard man to get away from. "I don't want you to come down here just to stay a couple of days," said he, "but want you to bring your wife, dog and furniture and spend the winter. What's the use of working? There is nothing in it."

Shooting with him and his friend, Mr. Sharp, over near Sharpsburg, I said that in such tall corn, with the wind blowing so strongly, I was a little bit nervous about shooting, lest I might land a few shot on Mr. Sharp unbeknown to myself. "Oh, don't mind him," said Powel; "shoot him all you want to. Don't pay any attention to him at all. If you did shoot him he would just think it was a joke. We want you to feel that you are getting near to the edge at least of southern hospitality." I should think as much, although, on the whole, I concluded it was best not to pattern my gun on Mr. Sharp's anatomy. He was a tall man, and very husky, and I was afraid that he might not agree with Mr. Powel in his estimate of the pleasure involved.

The Old Dog.

The saddest thing in a sportsman's life, if indeed, it is not the saddest thing in the world, is the sight of his faithful old hunting dog getting too old and too crippled to longer accompany him afield. On the morning when Mr. Powel and I drove out of town for our little hunt, we looked around and saw old Put, his ancient hunting companion, waddling along behind us in the road, whining piteously and begging us as plainly as dog language can, to wait for him. Put is one of those grand old gentlemen of dogdom which now and again turn up. Nearly every fellow has had one best dog in his life, one which did things which none of the others could do, one which was just a little dearer to him than all or any of the others. Dorothy is as grand a shooting dog as ever man could ask, yet ever Mr. Powel becomes reminiscent and tells what Put used to do when they were afield together. Put was a shooting dog, a meat dog; that is to say, he would never have won in a field trial, yet was one of the dogs on which one would put no price whatever. Tall, big boned, heavy framed, placid, equable and sagacious in disposition, old Put never needed much training, and after he reached his majority could give the average shooter much advice in the art of hunting birds. He always knew where to find the game, and he always knew how to handle it in just such a way that the gun would make the biggest possible bag.

Now here was old Put, a dozen years old, broken down with rheumatism, swollen out of all proportion with dropsy, just upon the verge of death, yet eager to go out with the gun just one more time before he laid him down to die. All summer the old fellow has been content to stay around the yard, never venturing outside the gate. On this morning, when he saw Dorothy taken into the buggy, and saw the guns go in under the seat, the old fire revived in his heart. He managed to push open the gate, and to waddle down the sidewalk, and when we heard his piteous voice, he was doing his best to overtake the vehicle. He followed us for nearly half a mile, and then Mr. Powel, just a little bit uncertain about the throat, got out of the buggy and gently led him back toward the house. He could not reproach the old fellow, and he took his own time about the pace of the homeward march. I suppose this was the last time in Put's life that the ancient fire is to kindle up with a trace of the old time vigor. He will hardly follow the guns away again. Pretty soon we will hear of his death. There is not anything much sadder than this, and so nearly any shooter can testify.

Lived up to Her Principles.

The papers print all sorts of things. The Audubon societies resolve all sorts of things regarding the iniquity of women wearing bird plumage on their bonnets. So far as is known, no kind-hearted but fashionable lady has ever been influenced by all these preachments, and there has been no recorded case of a milliner refusing to order the accustomed quantity of mounted birds for the heads of her patrons. Yet this week Miss Spanum, a milliner of Stoughton, Wis., did an act which is worthy of emulation by all those who believe in certain principles, and who ought to practice what they believe. Convinced that the use of these mounted birds was wrong, she packed up and shipped back every such article included in her stock. Now, there was courage for you, as well as wisdom. It is sincerely to be hoped that this milliner will receive the patronage of every lady in her town, just as she ought to receive the approbation of every Audubon society and newspaper writer and every professor of good principles in this broad land of ours.

HARTFORD BUILDING, Chicago, Ill.

E. HOUGH.

"With the Cougar Hounds."

BRETHREN OF THE FOREST AND STREAM, if there be any among you who have not read "With the Cougar Hounds," by our President, delay not in doing so. It will be the best hunting trip you ever had. When I was a boy I was preparing for a hunting trip, which I never took, because I was "taken down" with typhoid, and during the weeks which followed I dreamed I was in the Rocky Mountains, camping in a snow-bound valley, through which ran an ice-bound stream. I was continually chopping a hole in the ice and drinking the blue-black, delicious, icy water. I suppose that when the doctor lost my pulse and my breathing stopped and they thought I was dead, I was only down on my belly drinking out of that hole in the ice, and that when I got up I began breathing where I had left off. It was only a dream, but it was like Heaven—and "With the Cougar Hounds" was like dreaming it over again. It may be presumptuous to praise the President, but if the likes of us can't do it, who can? We'd speak well of Shakespeare and Izaak Walton and Oliver Cromwell if we wanted to.

GEORGE KENNEDY.

Two Have-Beens Try It Again.

Editor Forest and Stream:

Bostwick and I are in the "sere and yellow leaf" of shooting life. Years ago we wrapped our sporting blood up in brown grocery-store paper and laid it away in the archive of the "have-beens." Time and again the odor from that parcel would bring back memories that would carry us back, down through the corridors of time, to the days of our youth—the old swimming hole, where we plunged in abbreviated costume and dressed on the bank, allowing our skin to dry on us; the old shooting ground, where we pulled the rabbit out of the "hollow" with a forked stick, and worried the opossum's very life out of him by making him 'possum too often. A cantilever-suspension bridge with a trolley car track has crossed the old swimming hole, and town lots 20 by 40, with paved streets (on paper), have desecrated the shooting ground. Yea, the old tree that we pulled a rabbit out of has been felled to make a post to make one of those town lot corners, and Bostwick says the sign "Keep off the grass" is supported by a tree he pulled "simmons" from.

But last Christmas week we thought we would try again and see what the "have-beens" could do, and we got out our old guns and went to J. H. Gafford's farm in Baskerville, Va. We did our hunting on horseback, and Bostwick says the hardest work on the hunt was getting on and off his horse; that he always felt rich when he finally did "arrive" in the saddle, for the reason that he was "better off." To get off of his horse he would have to use both hands and feet, and he would always throw his gun down on the ground and then let "gravitation" do its work with his 185 pounds avoirdupois. The fall of Bostwick and his 9-pound gun generally scared everything in shooting distance. Bostwick said his gun weighed 9 pounds when he bought it. Bostwick was young then. Gafford tried to weigh it on the store scales, but a 10-pound weight was all the storekeeper had. Half of our time was spent in extricating Bostwick up and down from his horse. And then he would swear about the high horses in that country.

He caught one of Mrs. Gafford's tame turkeys, cut the "whiskers" off and mailed it to one of his friends in New York as the whiskers off of the biggest wild turkey that he killed. He gave Griffen, the old negro who did chores about the farm, fifty cents for an opossum, brought it back to New York and had a "possum and taters" dinner, and talked for six hours how he caught that "possum." He said the water down there didn't agree with him. The water he brought gave out and he rode six miles one night for "more." When he got back to New York, he sent Griffen his last "century" dress suit, and the very next Sunday morning Griffen went to church with a dress suit, white vest and silk hat.

But the hunt—well, if we (Bostwick and I) had killed a quail (I came very near saying all we shot at) every time we fired, we would have done very well.

Gafford, however, is a fine shot, a gentleman of the old school, and he loaned us the birds he shot to send home, and which were plenty. (Bostwick says Gafford looks like Buffalo Bill.) A more hospitable place could not be found. Every comfort and plenty of quail and turkeys for those who can hit, and dogs that not only find the birds, but hold them when found.

TERRY SMITH.

The Moso's Gun.

THE long-looked-for time had come, and we were on the train en route to the game fields of the Sierra Madres in Mexico, each with a .30-30, fitted with Lyman peep sights, Colt's six-shooters and knives—in fact our outfit was all that could be desired, and we were actually thirsting for wild animal gore. At the terminus of the railway we secured a guide and a moso (a moso is a Mexican servant of the peon class), and hired saddle and pack animals. I noticed that Louis, our moso, had a cartridge belt with four cartridges in it, and I asked him if he had a rifle. "Oh! yes, Señor, I have a very good one." "Where are your cartridges, then?" He pointed to the four. Think of it, going on a three weeks' hunt with four cartridges in a country full of big game. And then the gun—it was an old '73 model .44-40 repeater, the iron was gone from the stock and the wood-work cracked and minus varnish, made the gun look a century old, and caused quite a laugh when he produced it, but Louis swore by it, so I said, "Boys, we must get him some cartridges." And get them we did, though they cost 5 cents apiece down there. He was immensely tickled. For four days we had pushed westward, and then went into camp one noon. All went out for a hunt, leaving Louis washing dishes. When I returned it was sundown. I was tired and hungry, and had not had a shot. Arriving in camp, there hung a fine deer. "Who was the lucky man?" I cried. No answer. Finally the Colonel said, "Well, you see—why, it was that blamed moso, and here within 200 yards of camp, too!" The look of disgust on the Colonel's face was too much for me—I roared.

We were out two weeks, and every day that boy with that old blunderbuss bagged game; and when the hunt was over there were not over a dozen empty loops in his belt, while we had refilled our belts several times.

When we got back to the station, I took Louis into the store just as he was ready to leave for his home and bought him a full box of cartridges. Another one of the boys bought him a pair of shoes, and we gave him the provisions we had left—enough to last him a month; and blamed if I didn't almost feel like presenting him with my .30-30, for he had never mentioned the fact that he killed a single deer or turkey. Who would have thought that old blunderbuss would kill anything?

I. J. B.

EL PASO, TEXAS.

In Rhode Island.

PROVIDENCE, R. I., Nov. 2.—*Editor Forest and Stream:* A party of hunters from Wickford recently returned from Maine, where they enjoyed excellent shooting. One of the party sent home a handsome 675-pound moose.

Reuben J. Brown, of Chepachet, wrote the Providence Journal the past week that in the last few days with his dog, Ben, he has killed three foxes, and within the year,

according to the town clerk's record, he has killed twenty-four, and he doesn't consider himself much of a fox hunter after all.
