10. The Abyſſinica, or Abyſſinian groſsbeak, is about the ſize of the hawfinch: the bill is black: the irides are red: the top and ſides of the head, throat, and breaſt, are black: the upper parts of the body, belly, and thighs, pale yellow, inclining to brown where the two colours divide: the ſcapulars are blackiſh; the wing-coverts brown, bordered with grey; the quills and tail brown, edged with yellow: the legs are of a reddiſh grey. This bird is found in Abyſſinia; and makes a curious neſt of a pyramidal ſhape, which is ſuſpended from the ends of branches like the others. The opening is on one ſide, facing the eaſt: the cavity is ſeparated in the middle by a partition; up which the bird riſes perpendicularly about half-way, when deſcending, the neſt is within the cavity on one ſide. By this means the brood is defended from ſnakes, ſquirrels, monkeys, and other miſchievous animals, beſides being ſecure from rain, which in that country ſometimes laſts for ſix months together.

11. The penſilis, or penſile groſsbeak, (the *Toddy-bird* of Fryer), is about the ſize of the houſe-ſparrow: the bill is black: the irides are yellow: the head, throat, and fore part of the neck, the ſame: from the noſtrils ſprings a dull green ſtripe, which paſſes through the eye and beyond it, where it is broader: the hind part of the head and neck, the back, rump, and wing-coverts, are of the ſame colour: the quills are black, edged with green; the belly is deep grey, and the vent of a rufous red: the tail and legs are black. This ſpecies is found at Madagaſcar; and fabricates a neſt of a curious conſtruction, compoſed of ſtraw and reeds interwoven in ſhape of a bag, the opening beneath. It is faſtened above to a twig of ſome tree; moſtly to thoſe growing on the borders of ſtreams. On one ſide of this, within, is the true neſt. The bird does not form a new neſt every year, but faſtens a new one to the end of the laſt; and often as far as five in number, one hanging from another. Theſe build in ſociety, like rooks; often five or ſix hundred being ſeen on one tree. They have three young at each hatch.

Kæmpfer † mentions a bird ſimilar to this, if not the ſame, which makes the neſt, near Siam, on a tree with narrow leaves and ſpreading branches, the ſize of an apple-tree: the neſt in the ſhape of a purſe, with a long neck, made of dry graſs and other materials, and ſuſpended at the ends of the branches; the opening always to the north-weſt. He counted fifty on one tree only; and deſcribes the bird itſelf as being like a Canary-bird, of a dark yellow, and chirps like a ſparrow.

Fryer ‡ alſo talks of the ingenuity of the *Toddy Bird*, making a neſt "like a ſteeple, with winding meanders," and tying it by a ſlender thread to the bough of a tree. "Hundreds of theſe pendulous neſts may be ſeen on theſe trees."

12. The chloris, or greenfinch, is a well-known bird: the general colour is a yellowiſh green, paleſt on the rump and breaſt, and inclining to white on the belly; the quills are edged with yellow, and the four outer tail-feathers are yellow from the middle to the baſe; the bill is pale-brown, and ſtout; and the legs are of a fleſh-colour.—This ſpecies is pretty common in Britain, and flies in troops during the winter. It makes the neſt in ſome low buſh or hedge, compoſed of dry graſs, and lined with hair, wool, &c. laying five or ſix greeniſh eggs, marked at the larger end with red brown; and the male takes his turn in ſitting. This bird ſoon becomes tame; even old ones being familiar almoſt as ſoon as caught: it lives five or ſix years. Like the chaffinch, it is apt to grow blind if expoſed to the ſun. This ſpecies is alſo pretty common every where on the continent of Europe: but not very frequent in Ruſſia; and is not at all found in Siberia, though it has been met with in Kamtſchatka. It is ſufficiently common both in Cumberland and Scotland: yet in the firſt, it is ſcarce ever obſerved in the winter ſeaſon; but the laſt week in March becomes plentiful, and breeds as in other parts of England.

13. The Bengalenſis, or Bengal groſsbeak, is a trifle bigger than a houſe-ſparrow: the bill is of a fleſh-colour; the irides are whitiſh; the top of the head is of a golden yellow; the upper parts of the body are brown, with paler edges; the ſides of the head and under parts rufous white; acroſs the breaſt is a brown band, uniting to, and of the ſame colour with, the upper parts of the body; the legs are of a pale yellow, the claws grey. This ſpecies (thus deſcribed by Mr Latham) ſeems to be the ſame with the Indian groſsbeak deſcribed as follows in the *Aſiatic Reſearches.* "This little bird, called *bayà* in Hindì, *berbera* in Sanſcrit, *bábúï* in the dialect of Bengal, *cíbù* in Perſian, and *tenawwit* in Arabic, from his remarkably pendant neſt, is rather larger than a ſparrow, with yellow-brown plumage, a yellowiſh head and feet, a light-coloured breaſt, and a conic beak very thick in proportion to his body. This bird is exceedingly common in Hindoſtan: he is aſtoniſhingly ſenſible, faithful, and docile, never voluntarily deſerting the place where his young were hatched, but not averſe, like moſt other birds, to the ſociety of mankind, and eaſily taught to perch on the hand of his maſter. In a ſtate of nature he generally builds his neſt on the higheſt tree that he can find, eſpecially on the palmyra, or on the Indian fig-tree, and he prefers that which happens to overhang a well or a rivulet: he makes it of graſs, which he weaves like cloth and ſhapes like a large bottle, ſuſpending it firmly on the branches, but ſo as to rock with the wind, and placing it with its entrance downwards to ſecure it from birds of prey. His neſt uſually conſiſts of two or three chambers; and it is the popular belief that he lights them with fire-flies, which he catches alive at night, and confines with moiſt clay or with cow-dung: That ſuch flies are often found in his neſt, where pieces of cow-dung are alſo ſtuck, is indubitable; but as their light could be of little uſe to him, it ſeems probable that he only feeds on them. He may be taught with eaſe to fetch a piece of paper, or any

ſmall thing that his maſter points out to him: It is an atteſted fact, that if a ring be dropped into a deep well, and a ſignal given to him, he will fly down with amazing celerity, catch the ring before it touches the water, and bring it up to his maſter with apparent exultation; and it is confidently aſſerted, that if a houſe or any other place be ſhown to him once or twice, he will carry a note thither immediately on a proper ſignal being made. One inſtance of his docility I can myſelf mention with confidence, having often been an eye-witneſs of it. The young Hindoo women at Benares, and in other places, wear very thin plates of gold, called *tícas*, ſlightly fixed by way of ornament between their eye-brows; and when they paſs through the ſtreets, it is not uncommon for the youthful libertines, who amuſe themſelves with training bayàs, to give them a ſignal, which they underſtand, and ſend them to pluck the pieces of gold from the foreheads of their miſtreſſes, which they bring in triumph to the lovers. The bayà feeds naturally on graſshoppers and other inſects; but will ſubſiſt, when tame, on pulſe macerated in water: his fleſh is warm and drying, of eaſy digeſtion, and recommended in medical books as a ſolvent of ſtone in the bladder or kidneys; but of that virtue there is no ſufficient proof. The female lays many beautiful eggs reſembling large pearls; the white of them, when they are boiled, is tranſparent, and the flavour of them is exquiſitely delicate. When many bayàs are aſſembled on a high tree, they make a lively din; but it is rather chirping than ſinging: Their want of muſical talents is however amply ſupplied by their wonderful ſagacity, in which they are not excelled by any feathered inhabitant of the foreſt."

14. The nigra, or black groſsbeak, is about the ſize of a Canary bird: the bill is black, ſtout, and deeply notched in the middle of the upper mandible: the plumage is black, except a little white on the fore part of the wing and baſe of the two firſt quills: the legs are black. It inhabits Mexico.

15. The minuta, or minute groſsbeak, is about the ſize of a wren: the bill is ſtout, thick, ſhort, and brown: the upper parts of the plumage are grey brown, the under parts and rump ferruginous cheſnut; the fourth, fifth, and ſixth quills are white at the baſe: the legs are brown. It inhabits Surinam and Cayenne. —It is ſaid to keep paired to its mate the whole year; and is a lively, and not very tame bird. It moſtly frequents lands which have lain for ſome time uncultivated; and lives both on fruits and ſeeds. It makes a roundiſh neſt, the hollow of which is two inches in diameter, compoſed of a reddiſh herb, and placed on the trees which it frequents. The female lays three or four eggs.

16. The ſocia, or ſociable groſsbeak, is about the ſize of a bullfinch: The general colour of the body above is a rufous brown, the under parts yellowiſh: the beak and muzzle are black; the legs brown; and the tail is ſhort. It inhabits the interior country at the Cape of Good Hope; where it was diſcovered by Mr Paterſon.—Theſe birds, according to our author, live together in large ſocieties, and their mode of nidification is extremely uncommon. They build in a ſpecies of *Mimoſa* which grows to an uncommon ſize; and which they ſeem to have ſelected for that purpoſe, as well on account of its ample head, and the great ſtrength of its branches, calculated to admit and to ſupport the extenſive buildings which they have to erect, as for the tallneſs and ſmoothneſs of its trunk, which their great enemies, the ſerpent-tribe, are unable to climb. The method in which the neſts themſelves are fabricated, is highly curious. In the one deſcribed by Mr Paterſon there could be no leſs a number (he ſays) than from 800 to 1000 reſiding under the ſame roof†. He calls it a roof, becauſe it perfectly reſembles that of a thatched houſe; and the ridge forms an angle ſo acute and ſo ſmooth, projecting over the entrance of the neſt below, that it is impoſſible for any reptile to approach them. The induſtry of theſe birds "ſeems almoſt equal (ſays our author) to that of the bee; throughout the day they appear to be buſily employed in carrying a fine ſpecies of graſs, which is the principal material they employ for the purpoſe of erecting this extraordinary work, as well as for additions and repairs. Though my ſhort ſtay in the country was not ſufficient to ſatisfy me by ocular proof, that they added to their neſt as they annually increaſed in numbers, ſtill from the many trees which I have ſeen borne down with the weight, and others which I have obſerved with their boughs completely covered over, it would appear that this is really the caſe; when the tree which is the ſupport of this aerial city is obliged to give way to the increaſe of weight, it is obvious that they are no longer protected, and are under the neceſſity of rebuilding in other trees. One of theſe deſerted neſts I had the curioſity to break down, ſo as to inform myſelf of the internal ſtructure of it, and found it equally ingenious with that of the external. There are many entrances, each of which forms a regular ſtreet, with neſts on both ſides, at about two inches diſtance from each other. The graſs with which they build is called the Boſhman's graſs: and I believe the ſeed of it to be their principal food; though, on examining their neſts, I found the wings and legs of different inſects. From every appearance, the neſt which I diſſected had been inhabited for many years; and ſome parts of it were much more complete than others: this therefore I conceive nearly to amount to a proof, that the animals added to it at different times, as they found neceſſary, from the increaſe of the family, or rather of the nation or community."

Journie into the country o the Hottentots p. 133. &c.

17. The tridactyla, or three-toe'd groſsbeak (the guifso balito of *Buffon*), has only three toes, one before and one behind. The bill is toothed on the edges: the head, throat, and fore-part of the neck are of a beautiful red, which is prolonged in a narrow band quite to the vent; the upper part of the neck, back, and tail, are black; the wing coverts brown, edged with white; quills brown, with greeniſh edges; and legs a dull red: the wings reach half way on the tail.—This ſpecies inhabits Abyſſinia; where it frequents woods, and is a ſolitary ſpecies. It feeds on kernels of ſeeds, which it breaks with eaſe with its bill. The name in its native place is *guifso batitò dimmo-won jerck*. Buffon's figure is from Mr Bruce's drawings.

There are 76 other ſpecies of this genus; the whole number, beſides varieties, enumerated in the *Syſt. Nat.* (Gmelin), and in Mr Latham's *Index Ornith.* being 93.

---

† See th Plate referred to at Mim sa.

On Plate CCLXXIV. are given ſpecimens of ſix, *viz.* A, the Cærulea; B, the Longicauda; C, the Socia; D, the Cardinalis; E, the Nigra; F, the Violacea.

LOYOLA (Ignatius). See IGNATIUS.

LOZENGE, in heraldry, a four-cornered figure, reſembling a pane of glaſs in old caſements. See HERALDRY, p. 455. col. 1. Though all heralds agree, that ſingle ladies are to place their arms on lozenges, yet they differ with reſpect to the cauſes that gave riſe to it. Plutarch ſays, in the life of Theſeus, that in Megara, an ancient town of Greece, the tomb-ſtones, under which the bodies of the Amazons lay, were ſhaped after that form; which ſome conjecture to be the cauſe why ladies have their arms on lozenges. *S. Petra Sancta* will have this ſhield to repreſent a *cuſhion*, whereupon women uſed to ſit and ſpin, or do other houſewifery. Sir J. Ferne thinks it is formed from the ſhield called *teſſera*, which the Romans finding unfit for war, did allow to women to place their enſigns upon, with one of its angles always uppermoſt.

LOZENGES, among jewellers, are common to brilliant and roſe diamonds. In brilliants, they are formed by the meeting of the ſkill and ſtar facets on the bezil; in the latter, by the meeting of the facets in the horizontal ribs of the crown. See FACETS.

LOZENGE is alſo a form of medicine, made into ſmall pieces, to be held or chewed in the mouth till they are melted there: the ſame with what are otherwiſe called *trochiſci*, "troches."

LUBEC, a city and port-town of Germany, in the circle of Lower Saxony and duchy of Holſtein, in E. Long. 10. 35. N. Lat. 54. 20. It ſtands at the conflux of ſeveral rivers, the largeſt of which is the Trave, 12 miles from the Baltic, where it has a fine harbour, and 40 north-eaſt of Hamburg. By the Steckenitz, another of thoſe rivers, it has a communication with the Elbe, and conſequently with the German ocean. The city lies on the ſide of a hill, with the Trave, increaſed by the Steckenitz on the one ſide, and the Wackenitz on the other; and is ſtrongly fortified with baſtions, moats, walls, and ramparts; the laſt of which are planted with trees, and form an agreeable walk. Lubec being formerly the chief of the Hanſe towns, was very powerful in conſequence of the vaſt trade it carried on; but a great part of that trade is now transferred to Hamburg: however, it is ſtill ſaid to employ 150 of its own ſhips, and has a great ſhare of the Baltic trade. It is about two miles in length, and more than one in breadth. The houſes are all of ſtone, but old-faſhioned. Several of the ſtreets have on each ſide rows of lime-trees, with canals in the middle, like thoſe of Holland. The public ſtructures conſiſt of the ancient cathedral of the biſhopric of Lubec, and ſeveral other Lutheran churches; a nunnery for 22 ladies, with an abbeſs and prioreſs; a poor-houſe, an alms-houſe, and houſe of correction; an orphan-houſe; an hoſpital dedicated to the Holy-Ghoſt; a houſe in which poor travellers are entertained three days, and then ſent forward with a paſs; but ſuch as happen to be ſick, are provided with all neceſſaries till they recover or die; the city-armoury, a grammar-ſchool of ſeven claſſes, the Calviniſt church, and the Popiſh chapel. The deputies of the Hanſe-towns uſed to meet here formerly in the town-houſe. An alliance ſtill ſubſiſts between Lubec, Hamburg, and Bremen; and theſe cities, under the name of *Hanſe-towns*, negociate treaties with foreign powers. Here are divers manufactures, and the city's territory is about 60 miles in compaſs. In the diet of the empire Lubec is poſſeſſed of the third ſeat among the Rheniſh imperial cities; and among thoſe of the circle, has the firſt. In the matricula, its aſſeſſment is 480 florins, and to the chamber of Wetzlar it pays 557 rixdollars and 88 kruitzers. The city is a republic within itſelf, and both makes and executes laws in regard to civil and criminal matters, &c. A father and ſon, or two brothers, cannot be in the regency at the ſame time. The famous league of the Hanſe-towns was begun here in 1164. This city had its charter of privileges from the emperor Frederic II. Formerly it carried on wars, both offenſive and defenſive, for ſeveral years, not only againſt the dukes of Mecklenburg, but againſt the kings of Sweden and Denmark; particularly in 1428, when it fitted out 250 ſhips of force againſt Eric X. king of Denmark. There are about 20 churches in Lubec, with lofty ſteeples or ſpires. The Trave brings ſhips of burden into the very heart of the city; but the largeſt unload at Travemunde, *i. e.* the mouth of the Trave, eight or ten miles diſtant. Formerly it is ſaid to have employed no leſs than 600 ſhips. In the famous cellar here, it is ſaid there is wine 200 years old. The church of St Mary's, a noble lofty pile, is ſupported by tall pillars, all of one ſtone each, and has a high ſpire, covered with gilt lead. The town's garriſon conſiſts of about 700 or 800 men. The revenue of its Lutheran biſhop, though he is a prince of the empire, is ſaid not to exceed 3000 pounds.

LUBEN, a city of Germany, in the marquiſate of Lower Luſatia. It is ſituated on the river Spree, and is the capital of a ſmall circle of the ſame name. It is the ſeat of the diets, and of the chief tribunals and offices; and has ſeveral churches, with a noble land-houſe and hoſpital. E. Long. 14. 25. N. Lat. 52. 0.

LUBIENIETSKI (Staniſlaus), a Poliſh gentleman, deſcended from a noble family, and born at Cracow in 1623, was educated by his father with great attention. He became a celebrated Socinian miniſter; and took great pains to obtain a toleration from the German princes for his Socinian brethren. His labours, however, were ineffectual; being himſelf perſecuted by the Lutheran miniſters, and baniſhed from place to place; until at length he was baniſhed out of the world, with his two daughters, by poiſon, his wife narrowly eſcaping, in 1675. We have of his writing *A hiſtory of the reformation in Poland; A treatiſe on comets;* with other works in Latin.

LUBIN (Eilhard), was profeſſor of poetry in the univerſity of Roſtock in 1595: and ten years after, was promoted to the profeſſorſhip of divinity. He wrote notes on Anacreon, Juvenal, Perſius, &c. and ſeveral other works; but that which made the moſt noiſe is a Treatiſe on the nature and origin of evil, intitled, *Phoſphorus de cauſa prima et natura mali*, printed at Roſtock in 1596; in which we have a curious hypotheſis to account for the origin of moral evil. He ſuppoſed two co-eternal principles; not *matter* and *va-*

cuum, as Epicurus did; but God, and *Nihilum* or *Nothing*. This being publiſhed againſt by Grawer, was defended by Lubin; but after all, he is deemed better acquainted with polite literature than with divinity. He died in 1621.

LUBLIN, a handſome and conſiderable town of Poland, capital of the palatinate of the ſame name, with a citadel, a biſhop's ſee, an univerſity, and a handſome Jewiſh ſynagogue. Here the judicial courts for all Poland are held. It has three fairs, frequented by merchants from all nations. It is ſeated on the river Byſtrzna. E. Long. 22. 31. N. Lat. 51. 26.

LUCA, (anc. geog.), a town of Etruria, on the river Auſer; a colony and a municipium. Now *Lucca*, capital of the republic of that name, near the river Sechia. E. Long. 11. 20. Lat. 43. 45.

LUCANIA, a country of Italy, and a part of Magna Græcia; bounded on the north by the river Silarus by which it was ſeparated from the Picentini, and by the river Bradanus by which it was parted from the Apuli Peucetii; on the ſouth by the Laus, which ſeparated it from the Bruttii; on the eaſt by the Sinus Tarentinus; and on the weſt by the Tuſcan ſea. *Lucani*, the people, deſcendants of the Samnites. *Lucanus* the epithet, (Horace). *Lucæ boves* denoted elephants; firſt ſeen in Pyrrhus's wars in Lucania, whence the appellation (Pliny).

LUCANUS (Marcus Annæus), a Latin poet, born at Corduba in Spain, about A. C. 39. He was the ſon of Annæus Mela, the youngeſt brother of Seneca; and was conveyed to Rome from the place of his nativity at the age of eight months: a circumſtance, as his more indulgent critics obſerve, which ſufficiently refutes the cenſure of thoſe who conſider his language as provincial. At Rome he was educated under the Stoic Cornutus, ſo warmly celebrated by his diſciple Perſius the ſatiriſt, who was the intimate friend of our poet. In the cloſe of his education, Lucan is ſaid to have paſſed ſome time at Athens. On his return to Rome he roſe to the office of quæſtor, before he had attained the legal age. He was afterwards inrolled among the augurs; and married a lady of noble birth, and of a moſt amiable character. Lucan had for ſome time been admitted to familiarity with Nero, when the emperor choſe to contend for poetical honours by the public recital of a poem he had compoſed on Niobe; and ſome verſes of this imperial production are ſuppoſed to be preſerved in the firſt ſatire of Perſius. Lucan had the hardineſs to repeat a poem on Orpheus, in competition with that of Nero; and, what is more remarkable, the judges of the conteſt were juſt and bold enough to decide againſt the emperor. From hence Nero became the perſecutor of his ſucceſsful rival, and forbade him to produce any poetry in public. The well-known conſpiracy of Piſo againſt the tyrant ſoon followed; and Tacitus, with his uſual ſarcaſtic ſeverity, concludes that Lucan engaged in the enterprize from the poetical injuries he had received: "a remark (ſays Mr Hayley[*], who has endeavoured to refute the imputation) which does little credit to the candour of the hiſtorian; who might have found a much nobler, and, I will add, a more probable motive for his conduct, in the generous ardor of his character, and his paſſionate adoration of freedom. In the ſequel of his narration, Tacitus alleges a charge againſt our poet, which, if it were true, muſt lead us to deteſt him as the moſt abject of mankind. The hiſtorian aſſerts, that Lucan, when accuſed of the conſpiracy, for ſome time denied the charge; but corrupted at laſt by a promiſe of impunity, and deſirous to atone for the tardineſs of his confeſſion, accuſed his mother Atilla as his accomplice. This circumſtance is ſo improbable in itſelf, and ſo little conſonant to the general character of Lucan, that ſome writers have treated it with contempt, as a calumny invented by Nero, to vilify the object of his envious abhorrence. But the name of Tacitus has given ſuch an air of authority to the ſtory, that it may ſeem to deſerve a more ſerious diſcuſſion, particularly as there are two ſubſequent events related by the ſame hiſtorian, which have a tendency to invalidate the accuſation ſo injurious to our poet. The events I mean are, the fate of Annæus, and the eſcape of Atilla, the two parents of Lucan. The former died in conſequence of an accuſation brought againſt him, after the death of his ſon, by Fabius Romanus, who had been an intimate with Lucan, and forged ſome letters in his name, with the deſign of proving his father concerned in the conſpiracy. Theſe letters were produced to Nero, who ſent them to Annæus, from an eager deſire, ſays Tacitus, to get poſſeſſion of his wealth. From this fact two inferences may be drawn, according to the different lights in which it may be conſidered:—If the accuſation againſt Annæus was juſt, it is clear that Lucan had not betrayed his father, and he appears the leſs likely to have endangered by his confeſſion the life of a parent, to whom he owed a ſtill tenderer regard.—If Annæus was not involved in the conſpiracy, and merely put to death by Nero for the ſake of his treaſure, we may the more readily believe, that the tyrant who murdered the father from avarice, might calumniate the ſon from envy. But the eſcape of Atilla affords us the ſtrongeſt reaſon to conclude that Lucan was perfectly innocent of the abject and unnatural treachery of which Tacitus has ſuppoſed him guilty. Had the poet really named his mother as an accomplice, would the vindictive and ſanguinary Nero have ſpared the life of a woman whoſe family he deteſted, particularly when other females were put to death for their ſhare in the conſpiracy? That Atilla was not in that number, the hiſtorian himſelf informs us in the following remarkable ſentence, "Atilla mater Annæi Lucani, ſine abſolutione, ſine ſupplicio, diſſimulata;" thus tranſlated by Gordon: "The information againſt Atilla, the mother of Lucan, was diſſembled; and, without being cleared, ſhe eſcaped unpuniſhed."

The preceding remarks will, our author hopes, vindicate to every candid mind the honour of Lucan, whoſe firmneſs and intrepidity of character are indeed very forcibly diſplayed in that picture of his death which Tacitus himſelf has given us. He was condemned to have his veins cut, as his uncle Seneca had before him. Lucan, "while his blood iſſued in ſtreams, perceiving his feet and hands to grow cold and ſtiffen, and life to retire by little and little to the extremities, while his heart was ſtill beating with vital warmth, and his faculties nowiſe impaired, recollected ſome lines of his own, which deſcribed a wounded ſoldier expiring in a manner that reſembled this. The lines themſelves he rehearſed; and they were the laſt words he ever uttered." The critics differ concerning the

---

[*] In the *Notes* to his *Second Epiſtle on Epic Poetry.*

verſes of the Pharſalia which the author quoted in ſo memorable a manner. The two paſſages he is ſuppoſed to have repeated are the following; of which Lipſius contends for the latter.

> Sanguis erant lacrymæ: quæcunque foramina nova
> Humor, ab his largus manat cruor: ora redundant,
> Et patulæ nares: ſudor rubet: omnia plenis
> Membra fluunt venis: totum eſt pro vulnere corpus.
> Lib. ix. 814.
>
> Now the warm blood at once, from every part,
> Ran purple poiſon down, and drain'd the fainting heart.
> Blood falls for tears; and o'er his mournful face
> The ruddy drops their tainted paſſage trace.
> Where'er the liquid juices find a way,
> There ſtreams of blood, there crimſon rivers ſtray.
> His mouth and guſhing noſtrils pour a flood,
> And e'en the pores ouze out the trickling blood;
> In the red deluge all the parts lie drown'd,
> And the whole body ſeems one bleeding wound.
> Rowe.
>
> Scinditur avulſus; nec ſicut vulnere ſanguis
> Emicuit lentus; ruptis cadit undique venis,
> Diſcurſuſque animæ, diverſa in membra meantis,
> Interceptus aquis. Lib. iii. v. 638.
>
> No ſingle wound the gaping rupture ſeems,
> Where trickling crimſon wells in ſlender ſtreams;
> But, from an op'ning horrible and wide,
> A thouſand veſſels pour the burſting tide:
> At once the winding channel's courſe was broke,
> Where wand'ring life her mazy journey took;
> At once the currents all forgot their way,
> And loſt their purple in the azure ſea. Rowe.

Such was the death of Lucan before he had completed his 27th year.—His wife, Polla Argentaria, is ſaid to have tranſcribed and corrected the three firſt books of the Pharſalia after his death. It is much to be regretted (Mr Hayley obſerves) that we poſſeſs not the poem which he wrote on the merits of this amiable and accompliſhed woman; but her name is immortalized by two ſurviving poets of that age. The veneration which ſhe paid to the memory of her huſband is recorded by Martial; and more poetically deſcribed in that pleaſing and elegant little production of Statius, *Genethliacon Lucani*, a poem ſaid to have been written at the requeſt of Argentaria. The author, after invoking the poetical deities to attend the ceremony, touches with great delicacy and ſpirit on the compoſitions of Lucan's childhood, which are loſt, and the Pharſalia, the production of his early youth: he then pays a ſhort compliment to the beauty and talents of Argentaria; laments the cruel fate which deprived her ſo immaturely of domeſtic happineſs; and concludes with an addreſs to the ſhade of Lucan, which, with Mr Hayley's tranſlation, we ſhall ſubjoin in a Note, as it ſeems to furniſh a ſtrong preſumption of Lucan's innocence in regard to one of the accuſations mentioned above (A). "Had he been really guilty of baſely endangering the life of his mother (ſays Mr Hayley), it is not probable that his wife would have honoured his memory with ſuch enthuſiaſtic veneration; or that Statius, in verſes deſigned to do him honour, would have alluded to *the mother* of Nero. If his character as a man has been injured by the hiſtorian (continues Mr Hayley), his poetical reputation has been treated not leſs injuriouſly by the critics. Quintilian, by a frivolous diſtinction, diſputes his title to be claſſed among the poets; and Scaliger ſays, with a brutality of language diſgraceful only to himſelf, that he ſeems rather to *bark* than to *ſing*. But theſe inſults may appear amply compenſated, when we remember, that in the moſt poliſhed nations of modern Europe the moſt elevated and poetic ſpirits have been his warmeſt admirers; that in France he was idolized by Corneille, and in England tranſlated by Rowe.—The ſevereſt cenſures on Lucan have proceeded from thoſe who

Terras deſpicis, et ſepulchra rides:
Seu pacis meritum nemus recluſæ
Felix Elyſiis tenes in oris,
Quo Pharſalica turba congregatur;
Et te nobile carmen inſonantem
Pompeii comitantur et Catones:
Tu magna ſacer et ſuperbus umbra
Neſcis Tartaron, et procul nocentum
Audis verbera, pallidumque viſa
Matris lampade reſpicis Neronem.
Adſis lucidus; et vocante Polla
Unam, quæſo, diem deos ſilentum
Exores; ſolet hoc patere limen
Ad nuptas redeuntibus maritis.
Hæc te non thiaſis procax doloſis
Falſi numinis induit figuras;
Ipſum ſed colit, et frequentat ipſum
Imis altius inſitum medullis;
Ac ſolatia vana ſubminiſtrat
Vultus, qui ſimili notatus auro
Stratis prænitet, excubatque ſomno
Securæ. Procul hinc abite mortes;
Hæc vitæ genitalis eſt origo;
Cedat luctus atrox, geniſque manent
Jam dulces lacrymæ, dolorque feſtus
Quicquid fleverat ante nunc adoret.

But you, O! whether to the ſkies
On Fame's triumphant car you riſe,
(Where mightier ſouls new life aſſume)
And mock the confines of the tomb;
Or whether in Elyſium bleſt
You grace the groves of ſacred reſt,
Where the Pharſalian heroes dwell;
And, as you ſtrike your epic ſhell,
The Pompeys and the Catos throng
To catch the animating ſong;
Of Tartarus the dread controul
Binds not your high and hallow'd ſoul;
Diſtant you hear that wailing coaſt,
And ſee the guilty Nero's ghoſt
Grow pale with anguiſh and affright,
His mother flaſhing on his ſight.
Be preſent to your Polla's vows,
While to your honour'd name ſhe bows!
One day let your intreaties gain
From thoſe who rule the ſhadowy train!
Their gates have op'd to bleſs a wife,
And given a huſband back to life.
In you the tender fair invites
No fancied god with frantic rites:
You are the object of her prayers,
You in her inmoſt heart ſhe bears:
And, ſtampt on mimic gold, your head
Adorns the faithful mourner's bed,
And ſooths her eyes before they cloſe,
The guardian of her chaſte repoſe.
Away with all funereal ſtate!
From hence his nobler life we date:
Let mourning change the pang ſevere
To fond devotion's grateful tear!
And feſtal grief, its anguiſh o'er,
What it lamented, now adore!

have unfairly compared his language to that of Virgil: but how unjuſt and abſurd is ſuch a compariſon! it is comparing an uneven block of porphyry, taken rough from the quarry, to the moſt beautiful ſuperficies of poliſhed marble. How differently ſhould we think of Virgil as a poet, if we poſſeſſed only the verſes which he wrote at that period of life when Lucan compoſed his Pharſalia! In the diſpoſition of his ſubject, in the propriety and elegance of diction, he is undoubtedly far inferior to Virgil: but if we attend to the bold originality of his deſign, and to the vigour of his ſentiments; if we conſider the Pharſalia as the rapid and uncorrected ſketch of a young poet, executed in an age when the ſpirit of his countrymen was broken, and their taſte in literature corrupted; it may juſtly be eſteemed as one of the moſt noble and moſt wonderful productions of the human mind."—Lucan wrote ſeveral poems; but we have none remaining beſide his *Pharſalia*, of which an excellent Engliſh verſion has been given by Mr Nicholas Rowe.

LUCANUS, the Stag-beetle, in zoology; a genus of inſects of the order coleoptera: The antennæ end in a club or knob, which is compreſſed or flattened on one ſide, and divided into ſhort laminæ reſembling the teeth of a comb; the jaws are porrected or advanced before the head, and are dentated. There are 20 ſpecies. The largeſt, as well as the moſt ſingular, is the cervus; which is eaſy to be known by two large moveable maxillæ, reſembling in form the horns of a ſtag, which project from its head, and have in a ſpecial manner acquired it the appellation of Stag-Beetle. Thoſe maxillæ, broad and flat, equal to one third of the inſect's length, have in the middle, towards their inner part, a ſmall branch, and at their extremity are forked. Beſides this, they have ſeveral ſmall teeth throughout their whole length. The head that bears theſe maxillæ is very irregular, very broad and ſhort. The thorax is ſomething narrower than the head and body, and margined round. The elytra are very plain, without either ſtreaks or lines. The whole animal is of a deep brown colour. It is commonly found upon the oak, but is ſcarce in the neighbourhood of London, and though the largeſt of coleopterous inſects to be met with in this part of the world, it is much ſmaller than thoſe of the ſame ſpecies that are found in woody countries. This creature is ſtrong and vigorous, and its horns, with which it pinches ſeverely, are carefully to be avoided.—The jaws are ſometimes as red as coral, which gives this inſect a very beautiful appearance; the female is diſtinguiſhed by the ſhortneſs of the jaws, which are not half ſo long as thoſe of the male.—Theſe inſects feed on the liquor that oozes from oaks, which they ſuck with their trunk or tongue. The females depoſit their eggs in the trunks of decayed trees, ſuch as the oak and the aſh. The larvæ or grubs lodge under the bark and in the hollow of old trees, which they eat into and reduce into fine powder, and there transform themſelves into chryſalids. They are common in Kent and Suſſex, and are ſometimes met with in other parts of England. The porrected jaws are particularly uſeful to theſe animals, in ſtripping off the bark from trees, and affixing themſelves thereby to the tree, while they ſuck with their trunk the juice that oozes from it.

Plate CCLXXV.

LUCAR de Barameda (St), a handſome and conſiderable town of Spain, with a very good harbour, well defended, in Andaluſia. It was once the greateſt port in Spain, before the galleons unloaded their treaſure at Cadiz. It is ſeated at the mouth of the river Quadalquiver. W. Long. 6. 5. N. Lat. 36. 40.

Lucar *de Guadiana* (St), a ſtrong town of Spain, in Andaluſia, on the confines of Algarve; ſeated on the river Guadiana, with a little harbour. W. Long. 5. 59. N. Lat. 37. 32.

Lucar *la Major* (St), a ſmall town of Spain, in Andaluſia, with the title of a duchy. It is ſeated on the river Guadiana, in W. Long. 6. 32. N. Lat. 37. 21.

LUCARIA, a feaſt celebrated at Rome on the 18th of July, in memory of the flight of the Romans into a great wood, where they found an aſylum, and ſaved themſelves from deſtruction. This wood, in which they found protection, was ſituated between Tyber and the *Via Salaria*. The enemies from whom the Romans fled were the Gauls.—On this feſtival, Plutarch tells us, it was cuſtomary to pay the actors, and ſuch as contributed to the public amuſement, with the money ariſing from the ſelling of wood. This money was called *lucar*. It is obvious, from what has been obſerved, that *lucar* and *lucaria* are derived from *lucus*, a grove.

LUCAS (Jacobs), an eminent artiſt, more generally known by the name of *Lucas van* Leyden, or *Hugenſe*, was born at Leyden in 1494. He received his firſt inſtructions in the art of painting from his father Hugues Jacobs; but completed his ſtudies in the ſchool of Cornelius Engelbrecht. He gained much money by his profeſſion; and being of a generous turn of mind, he ſpent it freely, dreſſed well, and lived in a ſuperior ſtyle. It is ſaid, that, a few years before his death, he made a tour into Zealand and Brabant; and during his journey, a painter of Fluſhing, envious of his great abilities, gave him poiſon at an entertainment; which, though very ſlow, was too fatal in its effect, and put an end to his life, after ſix years languiſhing under its cruel influence. Others, denying the ſtory of the poiſon, attribute his death to his inceſſant induſtry. The ſuperiority of this artiſt's genius manifeſted itſelf in his infancy: for his works, even from the age of nine, were ſo excellent, as to excite the admiration of all contemporary artiſts; and when he was about 15, he painted a St Hubert, which gained him great applauſe. His tone of colouring (Mr Pilkington obſerves) is good, his attitudes (making a reaſonable allowance for the ſtiff German taſte) are well-choſen, his figures have a conſiderable expreſſion in their faces, and his pictures are very highly finiſhed. He endeavoured to proportion the ſtrength of his colouring to the different degrees of diſtance in which his objects were placed: for in that early time, the true principles of perſpective were but little known, and the practice of it was much leſs obſerved. In the town-hall at Leyden, the moſt capital picture of Lucas, the ſubject of which is the Laſt Judgement, is preſerved with great care; the magiſtrates having refuſed very large ſums which have been offered for it.

This artiſt painted not only in oil, but alſo in diſtemper and upon glaſs. Nor was he leſs eminent for his engraving than for his painting. He carried on a familiar and friendly correſpondence with Albert

Durer, who was his cotemporary; and, it is ſaid, that as regularly as Albert Durer publiſhed one print, Lucas publiſhed another, without the leaſt jealouſy on either ſide, or wiſh to depreciate each other's merit. And when Albert came into Holland upon his travels, he was received by Lucas in a moſt cordial and affectionate manner. His ſtyle of engraving, however, according to Mr Strutt, differed conſiderably from that of Albert Durer, "and ſeems evidently to have been founded upon the works of Iſrael van Mechlen. His prints are very neat and clear, but without any powerful effect. The ſtrokes are as fine and delicate upon the objects in the front, as upon thoſe in the diſtances; and this want of variety, joined with the feebleneſs of the maſſes of ſhadow, give his engravings, with all their neatneſs, an unfiniſhed appearance, much unlike the firm ſubſtantial effect which we find in the works of Albert Durer. He was attentive to the minutiæ of his art. Every thing is carefully made out in his prints, and no part of them is neglected. He gave great character and expreſſion to the heads of his figures; but, on examination of his works, we find the ſame heads too often repeated. The hands and feet are rather mannered than correct; and when he attempted to draw the naked figure, he ſucceeded but very indifferently. He affected to make the folds of his draperies long and flowing; but his female figures are frequently ſo exceſſively loaded with girdles, bandages, and other ornamental trappings, that much of the elegance of the deſign is loſt. He engraved on wood, as well as on copper; but his works on the former are by no means numerous. They are, however, very ſpirited; tho' not equal, upon the whole, to thoſe of his friend Albert. The prints of this maſter are pretty numerous, but very ſeldom met with complete; eſpecially fine impreſſions of them. For though they are, generally ſpeaking, executed with the graver only, yet, from the delicacy of the execution, they ſoon ſuffered in the printing. Of his engravings the few following may be mentioned as among the principal. 1. *Mahomet ſleeping, with a prieſt murdered by his ſide, and another figure ſtealing his ſword*, a middling-ſized upright plate, dated 1508, ſaid to be one of his moſt early productions. 2. An *ecce homo*, a large plate, lengthwiſe, dated 1510. 3. *The crucifixion on Mount Calvary*, the ſame. 4. *The wiſe mens offering*, the ſame, dated 1513. 5. *Return of the prodigal ſon*, a middling-ſized plate, lengthwiſe, dated 1518. 6. A large print lengthwiſe called *the dance of Magdalen*, dated 1519. 7. His own *portrait*, a ſmall upright plate, dated 1525. 8. *David playing before Saul*, a middling-ſized upright plate, dated   This is a very fine print; the expreſſion of Saul's countenance, in particular, is admirable. 9. A print known by the name of *Uleſpiegle*, which is the ſcarceſt of all the works of this maſter. It is in the collection of the king of France; and ſaid by Marolles, and other maſters, to be unique. But Baſan informs us, that M. Mariette had alſo an impreſſion of this plate; and it has been ſince found in one or two other collections. It repreſents a travelling bag-piper with his family; himſelf playing as he goes along, and carrying two children in a baſket at his back; his wife trudging by his ſide, ſupporting with one hand an infant on her ſhoulder, and with the other leading an aſs loaded with two baſkets, having two children in each; and another child going before, with a little dog, completes the ſingular groupe. This rare print is dated 1520, and is known to have been ſold for 16 louis-d'ors.—It is nearly 7½ inches high by 4¾ broad; and has been twice copied. One of the copies is the reverſe way: but the other is the ſame way with the original; and though not ſo well executed, might without a compariſon be miſtaken for it.

Lucas (Richard), D. D. a learned Engliſh divine, was born in 1648, and ſtudied at Oxford: after which he entered into holy orders, and was for ſome time maſter of the free ſchool at Abergavenny. Being eſteemed an excellent preacher, he became vicar of St Stephen's, Coleman ſtreet, in London, and lecturer of St Olave's in Southwark. He was doctor of divinity; and in 1696 was inſtalled prebendary of Weſtminſter. His ſight began to fail him in his youth; and he totally loſt it in his middle age. He was greatly eſteemed for his piety and learning; and publiſhed ſeveral works, particularly, 1. Practical Chriſtianity. 2. An inquiry after happineſs. 3. Several ſermons. 4. A Latin tranſlation of the whole duty of man. He died in 1715.

LUCCA, a ſmall republic of Italy on the coaſt of the Mediterranean, between the territory of Genoa on the weſt, Modena on the north, and Tuſcany on the eaſt. According to Keyſler, it is only about 30 miles in circumference, but is exceeding fertile and populous. It contains, beſides the city of Lucca, 150 villages. The number of inhabitants are computed at 120,000. The government is lodged in a gofalonier, whoſe power is much the ſame with that of the doges of Venice and Genoa. He is aſſiſted by nine counſellors: but the power of all the ten continues only for two months; during which time they live in the ſtate-palace, and at the public expence. They are choſen out of the great council, which conſiſts of 240 nobles; but even this council is changed by a new election every two years. The revenues of the republic are about 400,000 ſcudi or crowns; out of which they maintain 500 men by way of regular force, and 70 Swiſs as a guard to their acting magiſtrates. The city of Lucca is ſituated in a plain, terminating in moſt delightful eminences, adorned with villas, ſummer-houſes, corn-fields, and plantations of every kind; ſo that nothing either for uſe or pleaſure is here wanting. The city, which is about three Italian miles in circumference, has regular well-lined fortifications; and its ſtreets, though irregular, are wide, well paved, and full of handſome houſes. The number of its inhabitants are computed to be above 40,000; and they carry on large manufactures, eſpecially of ſilk-ſtuffs. Lucca has a biſhop, who enjoys ſeveral extraordinary privileges; and its cathedral is Gothic. The city ſtands in E. Long. 11. 27. N. Lat. 43. 52.

LUCENTI, Lucentia, or *Lucentum*, a town of the Hither Spain, now Alicant, a ſea-port of Valencia. W. Long. 32′, Lat. 38° 37′.

LUCERES, in Roman antiquity, the third in order of the three tribes into which Romulus divided the people, including all foreigners; ſo called from the *lucus* or grove, where Romulus opened an aſylum.

LUCERIA (anc. geog.), a town of Apulia in Italy; which in Strabo's time ſtill exhibited marks of

Diomed's

Diomed's ſovereignty in thoſe parts. Ptolemy has *Nuceria;* whether from miſtake, or the cuſtom of his time, uncertain. Now *Nocera de Pagani,* in the kingdom of Naples. E. Long. 15. 0. N. Lat. 40. 40.

LUCERIUS, in mythology, a name given to Jupiter, as *Luceria* was given to Juno, as the deities which gave light to the world.

LUCERNE, one of the 13 cantons of Swiſſerland. It holds the third place among the 13; and is the head of the Catholic cantons. Though leſs than Zuric, and conſequently much leſs than Berne, it is, however, far more extenſive than any of the reſt, being 15 or 16 leagues long, and eight broad. The population is eſtimated at 100,000. Even the mountainous part is not barren, but abundant in wood and paſture, furniſhing cattle, hides, cheeſe, and butter, for exportation. All the north part is fertile in grain, fruit, and hay; ſupplying ſufficient for the conſumption of the inhabitants: but as the mountaineers of the little cantons come to their market for corn, the people of Lucerne purchaſe this commodity from other parts of Swiſſerland, but eſpecially from Alſace and Suabia. Their manufactures are very inconſiderable; conſiſting only in a little ſilk and cotton thread.—The government is oligarchical. The councils are choſen from among 500 citizens only. The great council of 64 members is the nominal ſovereign; but in fact the power reſides in the ſenate, or little council of 36, having for their chiefs the two Avoyers.—The whole canton profeſſes the Roman Catholic religion. The pope's nuncio, with the title of legate *a latere,* uſually reſides at Lucerne.—They threw off the Auſtrian yoke in 1352, and by entering into a perpetual alliance with the three ancient cantons, they gave ſuch weight to the confederacy, as to enable it in 1386 to reſiſt all the efforts of the enemy at the bloody battle of Sempach.

The *town of Lucerne* is ſituated at the extremity of a moſt beautiful lake of the ſame name, where the river Reuſs iſſues from it. The buildings are ancient, and the ſtreets narrow; nor is Lucerne populous in proportion to its extent, the inhabitants being only between 3 and 4000. Since this is the great paſſage to Italy by Mount St Gothard, and the merchandize which paſſes the Alps on mules, and is to be tranſported by the rivers Reuſs, Aar, and Rhine, is all depoſited here, it might have a flouriſhing trade if arts and manufactures were attended to. The Reuſs ſeparates the town into two unequal parts, which are connected by three bridges; one wide for carriages; and two narrow covered ones for foot paſſengers: beſides theſe, there is a fourth over an arm of the lake, to paſs to the cathedral. Three of theſe bridges have old bad paintings of the Dance of Death, and the Hiſtory of the Bible, and of Swiſſerland. They make a commodious dry walk for the inhabitants.—Of religious edifices, the principal are the cathedral, or collegiate church of St Leger; the convent of Cordeliers; the college of the Jeſuits; the convent of Capuchins; and two convents of nuns. Of the ſecular buildings, the hotel de Ville is the principal. The arſenal is well furniſhed. The water tower is remarkable only for its poſition and antiquity: it is ſaid to have been a pharos or lighthouſe.—What greatly attracts moſt the notice of ſtrangers is, a plan in relief of part of the cantons of Lucerne, Zug, and Berne, and the whole of Schweitz, Uri, and Underwald, executed by General Pfiffer on a large ſcale. He has completed about 60 ſquare leagues; the plan is 12 feet long, and nine and a half broad: every mountain is accurately meaſured; and every object diſtinctly placed.

The *Lake of Lucerne* exhibits greater variety and more pictureſque ſcenery than any other of the Swiſs lakes. It is ſeven leagues long in a right line, and three wide about Kuſſnacht; but the ſhape is very irregular. The whole ſouth ſide is bordered by high mountains; but the north exhibits hills of no great height. The narrow gulph that extends towards the weſt, is bordered on the north and north-weſt by mount Pilat, which is a ſingle mountain riſing boldly more than 6000 feet above the lake; and on the ſouth by mount Burgenberg. Stanz-Stadt, belonging to the canton of Underwald, is on this ſide; and hereabouts the lake is deepeſt. Kuſſnacht is on the point of the other gulph, which extends towards the eaſt, and is wider than the former. All the country to the weſt of theſe gulphs, and part of it to the north of the latter, belongs to the canton of Lucerne; but that which is to the ſouth and north-eaſt is dependant on the canton of Zug. All the mountains on the left ſhore of the lake belong to the canton of Underwald; thoſe on the right, partly to the canton of Uri, partly to that of Schweitz, partly to the little republic of Gerſaw, but principally to the canton of Lucerne.

LUCERNE, in botany. See MEDICAGO.—For the culture of this plant, ſee AGRICULTURE, n° 183.

LUCIA (St), one of the Caribbee Iſlands in the Weſt Indies, about 22 miles long, and 11 broad, the middle of it lying in N. Lat. 39. 14. W. Long. 27. 0. It was firſt ſettled by the French in 1650; but was reduced by the Engliſh in 1664, who evacuated it in 1666. The French immediately re-ſettled the iſland, but were again driven away by the Caribbs. As ſoon as the ſavages were gone, the former inhabitants returned, but only for a ſhort time; for being afraid of falling a prey to the firſt privateer that ſhould viſit their coaſts, they removed either to other French ſettlements that were ſtronger, or which they might expect to be better defended. There was then no regular culture or colony at St Lucia; it was only frequented by the inhabitants of Martinico, who came thither to cut wood, and to build canoes, and who had conſiderable docks on the iſland. In 1718 it was again ſettled by the French; but four years after, it was given by the court of London to the duke of Montague, who was ſent to take poſſeſſion of it. This occaſioned ſome diſturbance between the two courts; which was ſettled, however, by an agreement made in 1731, that, till the reſpective claims ſhould be finally adjuſted, the iſland ſhould be evacuated by both nations, but that both ſhould wood and water there. This precarious agreement furniſhed an opportunity for private intereſt to exert itſelf. The Engliſh no longer moleſted the French in their habitations; but employed them as their aſſiſtants in carrying on with richer colonies a ſmuggling trade, which the ſubjects of both governments thought equally advantageous to them. This trade has been more or leſs conſiderable till the treaty of 1763, when the pro-

property of St Lucia was ſecured to the crown of France. After that time the colony flouriſhed conſiderably. In the beginning of the year 1772, the number of white people amounted to 2018 ſouls, men, women, and children; that of the blacks to 663 free-men, and 12,795 ſlaves. The cattle conſiſted of 928 mules or horſes, 2070 head of horned cattle, and 3184 ſheep or goats. There were 38 ſugar plantations, which occupied 978 pieces of land; 5,395,889 coffee-trees; 1,321,600 cocoa plants; and 367 plots of cotton. There were 706 dwelling places. The annual revenue at that time was about 175,000l. which, according to the Abbé Raynal, muſt have increaſed one-eighth yearly for ſome time. It was taken by the Britiſh fleet under admirals Byron and Barrington, in the year 1778; but was reſtored to France at the peace of 1783.

The ſoil of St Lucia is tolerably good, even at the ſea ſide; and is much better the farther one advances into the country. The whole of it is capable of cultivation, except ſome high and craggy mountains which bear evident marks of old volcanoes. In one deep valley there are ſtill eight or ten ponds, the water of which boils up in a dreadful manner, and retains ſome of its heat at the diſtance of 6000 toiſes from its reſervoirs. The air in the inland parts, like that of all other uninhabited countries, is foul and unwholeſome; but grows leſs noxious as the woods are cleared and the ground laid open. On ſome parts of the ſea-coaſt, the air is ſtill more unhealthy, on account of ſome ſmall rivers which ſpring from the foot of the mountains, and have not ſufficient ſlope to waſh down the ſands with which the influx of the ocean ſtops up their mouths, by which means they ſpread themſelves into unwholeſome marſhes on the neighbouring grounds.

Lucia (St), a high and mountainous iſland of Africa, and one of thoſe of Cape Verde, is about nine leagues long, and lies in the latitude of 16° 18′ N. according to the Engliſh geographers; but according to all others, it is a degree farther to the northward. On the eaſt-ſouth-eaſt ſide is a harbour, with a bottom and ſhore of white ſand; but its beſt road is oppoſite to St Vincent's to the ſouth-weſt, where there are at leaſt 20 fathoms of water. On the weſt ſide there is no water: it abounds with goats, ſea and land fowl, tortoiſes, &c. but whether it hath any inhabitants is not certainly known.

LUCIAN, a celebrated Greek author in the firſt century, was born at Samoſata, of obſcure parents, in the reign of the emperor Trajan. He ſtudied law, and practiſed ſome time as an advocate; but growing weary of the wrangling oratory of the bar, he commenced rhetorician. He lived to the time of Marcus Aurelius, who made him regiſter of Alexandria in Egypt; and, according to Suidas, he was at laſt worried by dogs. Lucian was one of the fineſt wits in all antiquity. His Dialogues, and other works, are written in Greek. In theſe he has joined the uſeful to the agreeable, inſtruction to ſatire, and erudition to elegance; and we every where meet with that fine and delicate raillery which characteriſes the Attic taſte.—Thoſe who cenſure him as an impious ſcoffer at religion, have reaſon on their ſide, if religion conſiſted in the theology of the Pagan poets, or in the extravagant opinions of philoſophers; for he perpetually throws ſuch ridicule on the gods and philoſophers, with their vices, as inſpires hatred and contempt for them; but it cannot be ſaid that he writes any where againſt an over-ruling providence.

LUCIANISTS, or **Lucanists**, a religious ſect, ſo called from Lucianus, or Lucanus, a heretic of the ſecond century, being a diſciple of Marcion, whoſe errors he followed, adding ſome new ones to them. Epiphanius ſays he abandoned Marcion; teaching that people ought not to marry, for fear of enriching the Creator: and yet other authors mention that he held this error in common with Marcion and other Gnoſtics. He denied the immortality of the ſoul; aſſerting it to be material.

There was another ſect of Lucianiſts, who appeared ſome time after the Arians. They taught, that the Father had been a Father always, and that he had the name even before he begot the Son; as having in him the power or faculty of generation: and in this manner they accounted for the eternity of the Son.

LUCID intervals, the fits of lunatics or maniacs, wherein the phrenzy leaves them in poſſeſſion of their reaſon.

LUCIFER, according to the poets, was the ſon of Jupiter and Aurora: in aſtronomy, Lucifer is the bright planet Venus, which either goes before the ſun in the morning, and is our morning ſtar; or in the evening follows the ſun, and then is called *Heſperus* or the evening ſtar.

LUCIFERA, in mythology, a ſurname given to Diana, under which title ſhe was invoked by the Greeks in childbed. She was repreſented as covered with a large veil, interſperſed with ſtars, bearing a creſcent on her head, and holding in her hand a lighted flambeau.

LUCIFERIANS, a religious ſect, who adhered to the ſchiſm of Lucifer, biſhop of Cagliari, in the fourth century, who was baniſhed by the emperor Conſtantius for having defended the Nicene doctrine concerning the three perſons in the godhead.—St Auguſtine ſeems to intimate, that they believed the ſoul, which they conſidered as of a carnal nature, to be tranſmitted to the children from their fathers. Theodoret ſays, that Lucifer was the author of a new error. The Luciferians increaſed mightily in Gaul, Spain, Egypt, &c. The occaſion of the ſchiſm was, that Lucifer would not allow any acts he had done to be aboliſhed. There were but two Luciferian biſhops, but a great number of prieſts and deacons. The Luciferians bore a peculiar averſion to the Arians.

LUCILIUS (Caius), a Roman knight, and a Latin poet, was born at Sueſſa in Italy, about 140 B. C. He ſerved under Scipio-Africanus in the war with the Numantines; and was in great favour with that celebrated general, and with Lælius. He wrote 30 books of ſatires, in which he laſhed ſeveral perſons of quality very ſharply. Some learned men aſcribe the invention of ſatire to him; but M. Dacier has maintained, with great probability, that Lucilius only gave a better turn to that kind of poetry, and wrote it with more wit and humour than his predeceſſors Ennius and Pacuvius had done. His fragments have been carefully collected by Francis Douza at Leyden in 1599, with notes. But they require ſtill to be better illuſtrated by ſome learned critic.

LUCINA, a goddeſs among the Romans, who preſided over women in labour. Some take her to be Diana, others Juno. She is called *Lucina*, becauſe ſhe brought children to the light; from the Latin word *lux*, "light."

LUCIUS, in ichthyology. See Esox.

LUCONIA. See Manila.

LUCOPHEREA, in ichthyology. See Perca.

LUCRETIA, the famous Roman matron, wife of Collatinus, and the cauſe of the revolution in Rome from a monarchy to a republic: this lady being raviſhed by Sextus, the eldeſt ſon of Tarquin king of Rome, ſtabbed herſelf, 509 B.C. See the article Chastity. The bloody poinard, with her dead body expoſed to the ſenate, was the ſignal of Roman liberty; the expulſion of the Tarquins, and abolition of the regal dignity, was inſtantly reſolved on, and carried into execution. See Rome.

LUCRETIUS, or Titus Lucretius Caius, one of the moſt celebrated of the Latin poets, was born of an ancient and noble Roman family, and ſtudied at Athens, where he became one of Epicurus's ſect. He acquired great reputation by his learning and eloquence; but in the flower of his age fell into a frenzy, occaſioned by a philtre given him by his wife, who was diſtractedly fond of him. Lucretius, during the intervals of his madneſs, put Epicurus's doctrines into verſe, and compoſed his ſix books *De rerum natura*, which are ſtill extant. It is ſaid that he killed himſelf in a fit of madneſs, in the 54th year before the Chriſtian æra, when 51 years old. The moſt correct edition of Lucretius is that of Simon de Coline. The cardinal de Polignac has refuted Lucretius's arguments in his excellent Latin poem intitled *Anti-Lucretius*. His poem *De rerum natura* has been tranſlated into Engliſh by Mr Creech.

LUCRINUS lacus (anc. geog.), a lake of Campania, between Baiæ and Puteoli, famous for its oyſters (Horace, Martial, Juvenal); *Lucrinenſes* (Cicero), the people dwelling on it. Now a perfect bay ſince the earthquake in 1538.

LUCULLUS (Lucius Lucinius), a Roman general, celebrated for his eloquence, his victories, and his riches. In his youth he made a figure at the bar; and being afterwards made quæſtor in Aſia, and prætor in Africa, governed thoſe provinces with great moderation and juſtice. Scarce was he known as a military man, when he twice beat the fleet of Amilcar, and gained two great victories over him. His happy genius was greatly improved by ſtudy; for he employed his leiſure in reading the beſt authors on military affairs. Being made conſul with Aurelius Cotta, during the third war with Mithridates king of Pontus, he was ſent againſt this prince: and this expedition was attended with a ſeries of victories, which did him leſs honour than an act of generoſity towards his colleague; who, willing to take advantage of his abſence to ſignalize himſelf by ſome great exploit, haſtened to fight Mithridates; but was defeated and ſhut up in Calcedonia; where he muſt have periſhed, if Lucullus, ſacrificing his reſentment to the pleaſure of ſaving a Roman citizen, had not flown to his aſſiſtance, and diſengaged him. All Pontus then ſubmitted to Lucullus; who being continued in his government of Aſia, entered the territories of Tigranes, the moſt powerful king in Aſia. That prince marched with a formidable army againſt Lucullus: who defeated him with a handful of men, and killed great numbers of his forces; took Tigranocertes, the capital of his kingdom; and was ready to put an end to the war, when the intrigues of a tribune got him depoſed, and Pompey nominated in his room. Lucullus having brought home prodigious riches, now gave himſelf up to exceſſive luxury; and his table was ſerved with a profuſion till that time unknown. He brought from the Eaſt a great number of books, which he formed into a library, and gave admittance to all men of learning, who frequented it in great numbers. Toward the end of his life, he fell into a kind of madneſs; and Lucullus, his brother, was appointed his guardian. He is ſaid to have been the firſt who brought cherries into Europe, having brought the grafts from the kingdom of Pontus.

LUCUS, in general, denotes a wood or grove ſacred to a deity; ſo called *à lucendo*, becauſe a great number of lights were uſually burning in honour of the god (Iſidorus); a practice common with idolaters, as we learn from Scripture: hence Homer's αγλαον αλσος.

LUD, a Britiſh king mentioned in our old chronicles, and ſaid to have reigned about the year of the world 3878. He is reported to have enlarged and walled about *Troynovant*, or New Troy, where he kept his court, and made it his capital. The name of *London* is hence derived from *Lud's town*; and *Ludgate*, from his being buried near it: but this is only one among many other derivations of the name of London; which are at leaſt equally probable. See London.

LUDI, a term uſed for ſhows and public repreſentations made by the Romans, for the entertainment of the people. See Games.

For an account of the particular games of Greece and Rome, as the Iſthmian, Nemæan, Olympic, &c. ſee Isthmian, &c.

LUDIUS, a celebrated painter, lived in the reign of Auguſtus Cæſar, and excelled in grand compoſitions. He was the firſt who painted the fronts of houſes in the ſtreets of Rome; which he beautified with great variety of landſcapes, and many other different ſubjects.

LUDLOW (Edmund), ſon of Sir Henry Ludlow was born at Maidenhead, and educated in Trinity college, Oxford. His father oppoſing the king's intereſt, Mr Ludlow joined with the ſame party, and was preſent at the battle of Edgehill as a volunteer under the earl of Eſſex. Upon the death of his father, he was choſen knight of the ſhire for Wilts, and obtained the command of a regiment of horſe for the defence of that county. He was one of King Cha. I.'s judges: after whoſe death he was ſent by the parliament into Ireland, in quality of lieutenant-general of the horſe; which employment he diſcharged with diligence and ſucceſs till the death of the lord-deputy Ireton, when he acted for ſome time as general, though without that title; Cromwell, who knew him to be ſincerely in the intereſt of the commonwealth, always finding out ſome pretext to hinder the conferring of that character upon him. The laſt ſtroke had been given

llow.

Ludolph || Luff.

given by Ludlow to the Iriſh rebellion, if the uſurpation of Cromwell had not prevented it. Under his power he never acted; and though Cromwell uſed his utmoſt efforts, he remained inflexible. After Cromwell's death, he endeavoured to reſtore the commonwealth; but Charles II. being recalled, he thought proper to conceal himſelf, and eſcaped into Switzerland, where he ſettled. After the revolution, he came over into England, in order to be employed in Ireland againſt King James: but appearing publicly in London, it gave great offence; and an addreſs was preſented by Sir Edward Seymour to King William III. for a proclamation in order to apprehend Colonel Ludlow, attainted for the murder of King Charles I. Upon this he returned to Switzerland, where he died. During his retirement in Switzerland he wrote his Memoirs.

Ludlow, a town of Shropſhire in England, ſituated at the conflux of the Teme and Corve, 18 miles from Shrewſbury, and 138 from London. The preſident of the council of the marches, eſtabliſhed by Henry VIII. generally kept his courts in it, by which the town was much benefited, theſe courts not having been aboliſhed till the 1ſt of William and Mary. Its neighbourhood to Wales makes it a great thoroughfare, and engages many of the Welch to ſend their children of both ſexes to it for education. It was incorporated by Edward IV. and among other privileges has that of trying and executing criminals within itſelf. It is one of the neateſt towns in England, with walls and ſeven gates. It is divided into four wards; and is governed by 2 bailiffs, 12 aldermen, 25 common-councilmen, a recorder, a town-clerk, ſteward, chamberlain, coroner, &c. From the caſtle on the top of the hill on which the town ſtands is a moſt delightful proſpect. In an apartment of the outer gatehouſe Samuel Butler is ſaid to have written the firſt part of Hudibras. Of this caſtle, which was beſieged and taken by King Stephen, ſome of the offices are fallen down, and great part of it turned into a bowling-green; but part of the royal apartments and the ſword of ſtate are ſtill left. The walls were at firſt a mile in compaſs, and there was a lawn before it for near two miles, of which much is now incloſed. The battlements are very high and thick, and adorned with towers. It has a neat chapel, where are the coats of arms of abundance of Welch gentry, and over the ſtable-doors are the arms of Queen Elizabeth, the earls of Pembroke, &c. This caſtle was a palace of the prince of Wales, in right of his principality. The river Teme has a good bridge over it, ſeveral wears acroſs it, and turns a great many mills. Here is a large parochial church, which was formerly collegiate; in the choir whereof is an inſcription relating to Prince Arthur, elder brother to King Henry VIII. who died here, and whoſe bowels were here depoſited, though it is ſaid his heart was taken up ſome time ago in a leaden box. In this choir is a cloſet, commonly called *God's Houſe*, where the prieſts uſed to keep their conſecrated utenſils; and in the market-place is a conduit, with a long ſtone croſs on it, and a niche wherein is the image of St Laurence, to whom the church was dedicated. On the north ſide of the town there was a rich priory, whereof there are few ruins to be ſeen except thoſe of its church. Here are an alms-houſe for 30 poor people, and two charity-ſchools where 50 boys and 30 girls are both taught and clothed. It has a market on Monday, and three leſſer ones on Wedneſday, Friday, and Saturday. Its fairs are on the Tueſday Eaſter, Whit-Wedneſday, Auguſt 21. Sept. 28. and Dec. 8. Proviſions are very cheap here; and at the annual horſe-races there is the beſt of company. The country round is exceedingly pleaſant, fruitful, and populous, eſpecially that part called the *Corveſdale*, being the vale on the banks of the river Corve. Ludlow ſends two members to parliament.

LUDOLPH (Job), a very learned writer of the 17th century, was born at Erfurt in Thuringia. He travelled much, and was maſter of 25 languages; viſited libraries, ſearched after natural curioſities and antiquities every where, and converſed with learned men of all nations. He publiſhed A Hiſtory of Ethiopia, and other curious books.

Ludolph (Henry William), nephew of Job abovementioned, was born at Erfurt in 1655. He came over to England as ſecretary to M. Lenthe, envoy from the court of Copenhagen to that of London; and being recommended to Prince George of Denmark, was received as his ſecretary. He enjoyed this office for ſome years, until he was incapacitated by a violent diſorder; when he was diſcharged with a handſome penſion: after he recovered, he travelled into Muſcovy, where he was well received by the czar, and where his knowledge made the Muſcovite prieſts ſuppoſe him to be a conjuror. On his return to London in 1694, he was cut for the ſtone; and as ſoon as his health would permit, in acknowledgment of the civilities he had received in Muſcovy, he wrote a grammar of their language, that the natives might learn their own tongue in a regular method. He then travelled into the Eaſt, to inform himſelf of the ſtate of the Chriſtian church in the Levant; the deplorable condition of which induced him, after his return, with the aid of the biſhop of Worceſter, to print an edition of the New Teſtament in the vulgar Greek, to preſent to the Greek church. In 1709, when ſuch numbers of Palatines came over to England, Mr Ludolph was appointed by Queen Anne one of the commiſſioners to manage the charities raiſed for them; and he died early the following year. His collected works were publiſhed in 1712.

LUDWIDGIA, in botany: A genus of the monogynia order, belonging to the tetrandria claſs of plants; and in the natural method ranking under the 17th order, *Calycanthemæ*. The corolla is tetrapetalous; the calyx quadripartite, ſuperior; the capſule tetragonal, quadrilocular, inferior, and polyſpermous.

LUES, among phyſicians, is in general uſed for a diſeaſe of any kind; but in a more particular ſenſe is reſtrained to contagious and peſtilential diſeaſes: thus the *lues Gallica*, or *venerea*, ſignifies the venereal diſeaſe. See Medicine-*Index*.

LUFF, the order from the pilot to the ſteerſman to put the helm towards the *lee*-ſide of the ſhip, in order to make the ſhip ſail nearer the direction of the wind. Hence, luff round, or luff a-lee, is the exceſs of this movement, by which it is intended to throw the ſhip's head up in the wind, in order to tack her, &c. A ſhip is accordingly ſaid to ſpring her luff when ſhe yields to the effort of the helm, by ſailing nearer to the line of the wind than ſhe had done before. See alſo *Hauling the Wind.*

Luff-Tackle, a name given by ſailors to any large tackle that is not deſtined for a particular place, but may be variouſly employed as occaſion requires. It is generally ſomewhat larger than the jigger tackle, although ſmaller than thoſe which ſerve to hoiſt the heavier materials into and out of the veſſel, which latter are the main and fore-tackles, the ſtay and quarter-tackles, &c.

LUG-sail, a ſquare-ſail, hoiſted occaſionally on the maſt of a boat or ſmall veſſel upon a yard which hangs nearly at right angles with the maſt. Theſe are more particularly uſed in the barca longas, navigated by the Spaniards in the Mediterranean.

LUGDUNUM (anc. geog.), the capital of the Seguſiani in Gallia Celtica, ſituated at the conflux of the Arar and Rhodanus, on an eminence, as the Celtic term *dune* ſignifies; built by Manutius Plancus under Auguſtus, while commanding in that part of Gaul; and whither he led a colony. Now *Lyons*, capital of the Lyonois.

Lugdunum Batavorum (anc. geog), a town of the Batavi in Gallia Belgica. Now *Leyden* in Holland.

Lugdunum Converarum (anc. geog.), a town of Gaul in Aquitain, at the foot of the Pyrenees. Now *S. Bertrand*, in Gaſcony.

LUGEUS lacus (anc. geog.), a lake of Japydia, the weſtmoſt diſtrict of Illyricum, to the ſouth of the Save, and near the head of the Arſia. Now commonly called the *Zirichnitz Lake*, from a ſmall adjoining town. It is locked on every ſide with mountains; from which ſcanty currents run down; the leſs in quantity their waters, becauſe drank up by the earth; till at length they are ſwallowed up in rocky furrows, ſo formed as to reſemble artificial. In theſe the water being ſo redundant as to refuſe receiving any more, they regurgitate, and return the water with extraordinary celerity; which thus ſpreading itſelf, forms a lake, in moſt places 18 cubits high. Theſe waters afterwards retire with no leſs celerity than they came on, not only through the furrows, but paſs through the whole of the bottom, as through a ſieve; which when perceived by the inhabitants, they directly ſtop up the larger apertures, and thus take large quantities of fiſh: when the lake is dry, they cut down their harveſt on the ſpot where they ſowed, and ſow again before the inundation comes on: and graſs ſhoots ſo quick on it, that it may be cut down in three weeks time (Lazius, Wernherus).

LUGGERSHALL, a borough of Wiltſhire, 12 miles north of Saliſbury, and 75 north by weſt of London. It is an ancient borough by preſcription, though but a ſmall hamlet, near the foreſt of Chute, in a delightful country; and was the reſidence of ſeveral kings. It had formerly a caſtle. It is governed by a bailiff choſen yearly at the lord of the manor's court-leet. On the neighbouring downs there uſed to be horſe-races. It has a fair on the 25th of July, and ſends two members to parliament.

LUKE (St), the evangeliſt, and the diſciple of the apoſtles, was originally of Antioch in Syria, and by profeſſion a phyſician. He particularly attached himſelf to St Paul, and was his faithful companion in his travels and labours. He went with him to Troas in Macedonia about the year 51. He wrote his Goſpel in Achaia about the year 53; and, ten years after, the Acts of the Apoſtles, which contains a hiſtory of 30 years. Of all the inſpired writers of the New Teſtament, his works are written in the moſt elegant Greek. It is believed that St Luke died at Rome, or in Achaia.

Goſpel of St Luke, a canonical book of the New Teſtament. Some think that it was properly St Paul's Goſpel; and that, when the apoſtle ſpeaks of *his* Goſpel, he means what is called *St Luke's*. Irenæus ſays, that St Luke digeſted into writing what St Paul preached to the Gentiles; and Gregory Nazianzen tells us, that St Luke wrote with the aſſiſtance of St Paul.

St Luke the Evangeliſt's Day, a feſtival in the Chriſtian church, obſerved on the 18th of October.

LULA, a town of Swediſh Lapland; ſeated at the mouth of the river Lula, on the weſt ſide of the gulph of Bothnia, 42 miles ſouth-weſt of Tornea. E. Long. 21. 0. N. Lat. 64. 30.

Lula Lapmark, a province of Swediſh Lapland; bounded by that of Tornea on the north, by the Bothnic Gulph on the eaſt, by Pithia Lapmark on the ſouth, and Norway on the weſt.

LULLI (John Baptiſt), the moſt celebrated and moſt excellent muſician that has appeared in France ſince the revival of learning, was born at Florence. He was taken to France when very young by a perſon of quality; and he carried the art of playing on the violin to the higheſt perfection. Louis XIV. made him ſuperintendant of muſic. Some time after Perinna having introduced operas into France, and quarrelling with his company, he reſigned his privilege to Lulli. Operas were then carried to the utmoſt perfection by this celebrated muſician, and were attended with continual applauſe. Lulli every year, after this time, gave a piece of his own compoſition, till his death, which happened in 1687.

LULLY (Raymond), a famous writer, ſurnamed the *Enlightened Doctor*, was born in the iſland of Majorca in 1225. He applied himſelf with indefatigable labour to the ſtudy of the Arabian philoſophy, to chemiſtry, phyſic, and divinity; and acquired great reputation by his works. He at length went to preach the goſpel in Africa; and was ſtoned to death in Mauritania, at the age of 80 He is honoured as a martyr at Majorca, whither his body was carried. He wrote many treatiſes on all the ſciences, in which he ſhows much ſtudy and ſubtilty, but little judgment or ſolidity. A complete edition of his works has been printed at Mentz.—He ought not to be confounded with Raymond Lully of Terraca, ſurnamed *Neophyta*, who from being a Jew turned Dominican friar. This laſt Lully maintained ſeveral opinions that were condemned by Pope Gregory XI.

LUMBAGO, a fixed pain in the ſmall of the back. See Medicine-*Index*.

LUMBARIS, a name given to the arteries and veins which ſpread over the loins.

LUMBRICAL, a name given to four muſcles of the fingers and to as many of the toes.

LUMBRICUS, the Worm, in zoology; a genus of inſects belonging to the order of vermes inteſtina. The body is cylindrical, annulated, with an elevated belt near the middle, and a vent-hole on its ſide. There are two ſpecies of this animal.

1. Lumbricus terreſtris, the earth or dew worm, Mr Barbut obſerves, differs extremely in colour and external appearance in the different periods of its growth, which has occaſioned people little acquainted with the variations of this kind of animals to make four or five different ſpecies of them: The general colour is a duſky red.—They live under ground, never quitting the earth but after heavy rains or at the approach of ſtorms, and in the ſeaſon of their amours. The method to force them out is, either to water the ground with infuſions of bitter plants, or to trample on it. The bare motion on the ſurface of the ſoil drives them up, in fear of being ſurpriſed by their formidable enemy the mole. The winding progreſſion of the worm is facilitated by the inequalities of its body, armed with ſmall, ſtiff, ſharp-pointed briſtles: when it means to inſinuate itſelf into the earth, there oozes from its body a clammy liquor, by means of which it ſlides down. It never damages the roots of vegetables. Its food is a ſmall portion of earth, which it has the faculty of digeſting: The ſuperfluity is ejected by way of excrement, under a vermicular appearance. Earth-worms are hermaphrodites, and have the parts of generation placed near the neck: their copulation is performed on the ground; nothing being more uſual than to ſee it full of holes, which holes are thought to be made by thoſe kind of worms coming to the ſurface in queſt of females. During their coition they would ſooner ſuffer themſelves to be cruſhed than parted.

Plate LXXIV

2. The marinus, marine worm, or lug, is of a pale red colour, and the body is compoſed of a number of annular joints; the ſkin is ſcabrous, and all the rings or joints are covered with little prominences, which render it extremely rough to the touch. It is an inhabitant of the mud about the ſea ſhores, and ſerves for food to many kinds of fiſh: ſurpriſing large ones are to be met with about the Bognor rocks in Suſſex. The fiſhermen bait their hooks and nets with it.

For the effects of theſe animals in the human body, and the method of expelling them, ſee MEDICINE-*Index*.

LUMELLO, a village in Italy, which gives name to the Lumellin, a ſmall diſtrict in the duchy of Milan, lying along the river Po, and of which Mortaria and Valencia are the principal places. It was ceded to the duke of Savoy in 1707, and confirmed by the treaty of Utrecht in 1713. E. Long. 8. 42. N. Lat. 45. 5.

LUMINOUS, an epithet applied to any thing that ſhines or emits light.

LUMINOUS Emanations, have been obſerved from human bodies, as alſo from thoſe of brutes. The light ariſing from currying a horſe, or from rubbing a cat's back, are known to moſt Inſtances of a like kind have been known on combing a woman's head. Bartholin gives us an account, which he intitles *mulier ſplendens*, of a lady in Italy whoſe body would ſhine whenever ſlightly touched with a piece of linen. Theſe effluvia of animal bodies have many properties in common with thoſe produced from glaſs; ſuch as their being lucid, their ſnapping, and their not being excited without ſome degree of friction; and are undoubtedly electrical, as a cat's back has been found ſtrongly electrical when ſtroaked. See ELECTRICITY, and LIGHT.

LUMINOUSNESS OF THE SEA. See LIGHT, and SEA.

LUMINOUSNESS of Putreſcent Subſtances. See LIGHT.

LUMP-FISH. See CYCLOPTERUS.

LUNA (anc. geog.), a foreſt of Germany, at no great diſtance from the Hercynia; below which were the Boemi: it was therefore in Moravia, near the ſprings of the Marus, now March, which runs into the Danube over againſt Carnutum.

LUNA, or *Lunna*, a town of Gallia Celtica. Now *Clugny* in Burgundy.

LUNA, a town and port of Liguria, at the mouth of the Macra. The town was but ſmall, but the port large and beautiful, according to Strabo. Now extinct, and its ruins called *Luna Diſtrutta*. It was famous for its quarries of white marble, thence called *Lunenſe*; and for its cheeſe, remarkable rather for its ſize than goodneſs, each being a thouſand weight.

LUNA, in aſtronomy, the moon. See ASTRONOMY, *paſſim*.

LUNA, in the jargon of the alchemiſts, ſignifies *ſilver*; ſo called from the ſuppoſed influence of the moon thereupon.

LUNA Cornea, in chemiſtry, is the combination of marine acid with ſilver. See CHEMISTRY-*Index*.

LUNACY, a ſpecies of madneſs. See LUNATIC, and MEDICINE-*Index*.

LUNACY, in law. See IDIOCY, and LUNATIC.

LUNÆ MONS (anc. geog.), a promontory of Luſitania. Now *Rock of Liſbon*. W. Long. 10. N. Lat. 38. 50.—Another *Lunæ Mons* of Ethiopia, from which the Nile was ſuppoſed to take its riſe.

LUNÆ Portus, a very extenſive port, or more truly a bay, of Liguria, between Portus Veneris and Portus Ericis, 20 miles in compaſs. Now *il Golfo della Spezia*, on the eaſt coaſt of the territory of Genoa.

LUNAR, ſomething relating to the MOON.

LUNAR Month. See MONTH.

LUNAR Year, conſiſts of 354 days, or 12 ſynodical months. See YEAR.

LUNAR Dial. See DIALLING.

LUNARE OS, in anatomy, is the ſecond bone in the firſt row of the carpus. It has its name from the Latin, *luna* "the moon," becauſe one of its ſides is in form of a creſcent.

LUNARIA, SATTIN-FLOWER, or *Moonwort*, in botany: A genus of the ſiliculoſa order, belonging to the tetradynamia claſs of plants; and in the natural method ranking under the 39th order, *Siliquoſæ*. The ſilicula is entire, elliptical, compreſſed-plane, and pedicellated; with the valves equal to the partition, parallel and plane; the leaves of the calyx are alternately fitted at the baſe. This plant is famous in ſome parts of the kingdom for its medicinal virtues, though it has not the fortune to be received in the ſhops. The people in the northern countries dry the whole plant in an oven, and give as much as will lie on a ſhilling for a doſe twice a-day in hemorrhages of all kinds, particularly in the too abundant flowing of the menſes, and with great ſucceſs. The Welch, among whom it is not uncommon, Dr Needham informs us, make an ointment of it, which they uſe externally, and pretend it cures dyſenteries.

LUNARIUM (anc. geog.), a promontory of the Hither Spain, between Blanda and Bætulo. Commonly called *el Cabo de Palafugel*, in Catalonia, on the Mediterranean; or *Cabo de Toſa*, on the ſame coaſt, and in Catalonia, 15 miles from the former, to the weſt.

LUNATIC, a perſon affected with that ſpecies of madneſs termed *lunacy*. The word is indeed properly applied to one that hath lucid intervals; ſometimes enjoying his ſenſes, and ſometimes not; and that frequently ſuppoſed to depend on the influence of the moon.

Lunatic, in law. Under the general term of *non compos mentis* (which Sir Edward Coke ſays is the moſt legal name) are comprized not only lunatics, but perſons under frenzies, or who loſe their intellects by diſeaſe; thoſe that *grow* deaf, dumb, and blind, not being *born* ſo; or ſuch, in ſhort, as are judged by the court of chancery incapable of conducting their own affairs. To theſe alſo, as well as idiots, the king is guardian, but to a very different purpoſe. For the law always imagines, that theſe accidental misfortunes may be removed; and therefore only conſtitutes the crown a truſtee for the unfortunate perſons, to protect their property, and to account to them for all profits received, if they recover, or after their deceaſe to their repreſentatives. And therefore it is declared by the ſtatute 17 Edw. II. c. 10. that the king ſhall provide for the cuſtody and ſuſtentation of lunatics, and preſerve their lands, and the profits of them, for their uſe when they come to their right mind; and the king ſhall take nothing to his own uſe: and if the parties die in ſuch eſtate, the reſidue ſhall be diſtributed for their ſouls by the advice of the ordinary, and of courſe (by the ſubſequent amendments of the law of adminiſtrations) ſhall now go to their executors or adminiſtrators.

On the firſt attack of lunacy, or other occaſional inſanity, when there may be hopes of a ſpeedy reſtitution of reaſon, it is uſual to confine the unhappy objects in private cuſtody under the direction of their neareſt friends and relations: and the legiſlature, to prevent all abuſes incident to ſuch private cuſtody, hath thought proper to interpoſe its authority, by 14. Geo. III. c. 49. for regulating private mad-houſes. But when the diſorder is grown permanent, and the circumſtances of the party will bear ſuch additional expence, it is thought proper to apply to the royal authority to warrant a laſting confinement.

The method of proving a perſon *non compos* is very ſimilar to that of proving him an idiot. The lord chancellor, to whom, by ſpecial authority from the king, the cuſtody of idiots and lunatics is intruſted, upon petition or information, grants a commiſſion in nature of the writ *de idiota inquirendo*, to inquire into the party's ſtate of mind; and if he be found *non compos*, he uſually commits the care of his perſon, with a ſuitable allowance for his maintenance, to ſome friend, who is then called his committee. However, to prevent ſiniſter practices, the next heir is ſeldom permitted to be of this committee of the perſon; becauſe it is his intereſt that the party ſhould die. But, it hath been ſaid, there lies not the ſame objection againſt his next of kin, provided he be not his heir; for it is his intereſt to preſerve the lunatic's life, in order to increaſe the perſonal eſtate by ſavings, which he or his family may hereafter be entitled to enjoy. The heir is generally made the manager or committee of the eſtate, it being clearly his intereſt by good management to keep it in condition: accountable, however, to the court of chancery, and to the *non compos* himſelf, if he recovers; or otherwiſe, to his adminiſtrators. See Idiocy.

LUNATION, the period or ſpace of time between one new moon and another; alſo called *ſynodical month*. See Cycle and Epact.

LUNDEN, or Lund, a conſiderable town of Sweden, in Gothland; and capital of the territory of Schonen, with an archbiſhop's ſee and an univerſity. It was ceded to the Swedes by the Danes in 1658. E. Long. 13. 25. N. Lat. 55. 40.

LUNDY island, ſituated 50 miles in the ſea, off the N. W. coaſt of Devonſhire, is 5 miles long and 2 broad, but ſo encompaſſed with inacceſſible rocks, that it has but one entrance to it, ſo narrow that two men can ſcarce go abreaſt. It is reckoned in the hundred of Branton. It had once both a fort and a chapel. The ſouth part of it is indifferent good ſoil, but the north part of it is barren, and has a high pyramidical rock called the Conſtable. Here are horſes, kine, hogs, and goats, with great ſtore of ſheep and rabbits; but the chief commodity is fowl, with which it abounds much, their eggs being very thick on the ground at their ſeaſon of breeding. No venomous creature will live in this iſland. In the reign of King Henry VIII. one William Moriſco, who had conſpired to murder him at Woodſtock, fled to this iſland, which he fortified, turned pirate, and did much damage to this coaſt, but was taken by ſurprize at length, with 16 of his accomplices, and put to death.

LUNE, Lunula, in *Geometry*, a plane in form of a creſcent or half-moon, terminated by the circumference of two circles, that interſect each other within.

LUNENBURG, or Luneburg *Zell*, a principality of Germany, bounded to the ſouth by that of Calenberg, the dioceſe of Hildeſheim, and the duchy of Brunſwic; to the north, by the duchy of Lauenburg and the Elbe, by the laſt of which it is ſeparated from the territory of the imperial city of Hamburg; to the eaſt, by the duchy of Brunſwic, the Alte Mark, and the duchy of Mecklenburg; and to the weſt, by the duchies of Bremen and Verden, the county of Hoya, and the principality of Calenberg. The ſoil, except along the Elbe, Aller, and Jetz, is either ſand, heath, or moors. In the more fruitful parts of it are produced wheat, rye, barley, oats, peaſe, buck wheat, flax, hemp, hops, pulſe, oak, beech, firs, pines, birch, and alder, together with black cattle and horſe. The heaths abound with bees and honey, and a ſmall kind of ſheep whoſe wool is long and courſe. Lunenburg is well furniſhed with ſalt ſprings and limeſtone, and the foreſt of Gorde with veniſon. The rivers Elbe, Ilmenau, and Aller, are navigable; and conſequently very advantageous to the country, independent of the fiſh which they yield. The general diets of this principality are convened by the ſovereign twice a year, and held at Zell. They conſiſt of the deputies of the nobility and the towns of Lunenburg, Uelzen, and Zell, who have the nomination of the members of the high colleges, and other officers, jointly with the ſove-

Lunenburg

reign. There are near 200 Lutheran churches in the country, under two general and 15 ſubordinate ſuperintendants, ſeveral grammar-ſchools, two Calviniſt churches at Zell, and an academy of exerciſes at Lunenburg. The manufactures are chiefly linen cloth, cottons, ribbons, ſtockings, hats, ſtarch, bleached wax, refined ſugar, gold and ſilver wires, all kinds of wooden wares, barges, boats, and ſhips. The exports of theſe to Hamburg, Lubec, and Altena, are conſiderable. The neighbourhood of theſe cities, with the facility of conveying goods and merchandize to them and other places, either by land or water, is very advantageous to this country, and contributes greatly to its ſubſiſtence. On account of this principality, the king of Great Britain has a ſeat and voice both in the college of the princes of the empire and of the circle of Lower Saxony. Its quota in the Matricula is 20 horſes and 120 foot, or 720 florins in lieu of them. The revenues of the principality ariſe chiefly from the demeſnes, tolls on the Elbe, contributions, duties on cattle, beer, wine, brandy, and other commodities, which all together muſt be very conſiderable, ſome bailiwics alone yielding upwards of 20,000 rixdollars.

LUNENBURG, the capital of the principality of the ſame name, is a pretty large town of Germany, on the river Elmen, or the Ilmenau, which is navigable from the town to the Elbe, at the diſtance of 13 miles. It is 27 miles from Hamburgh, 43 from Zell, 65 from Brunſwic, 76 from Bremen, 68 from Hanover; and ſtands in E. Long. 10. 40. N. Lat. 53. 28. Its inhabitants are reckoned at between 8000 and 9000. Formerly this town was one of the Hanſe, and an imperial city. Some derive its name from *Lina*, the ancient name of the Ilmenau; others from *Luna*, the moon, an image of which is ſaid to have been worſhipped by the inhabitants in the times of Paganiſm. Here were anciently ſeveral convents, viz. one of Minims, another of Premonſtratenſians, another of Benedictines, and a fourth of Minorites. Out of the revenues of the Benedictine monaſtery was founded an academy for the martial exerciſes, where young gentlemen of the principality of Lunenburg are maintained gratis, and taught French, fencing, riding, and dancing; but foreigners are educated at a certain fixed price. A Latin ſchool was alſo founded, conſiſting of four claſſes, and well endowed out of theſe revenues. The ſuperintendency and management of theſe, and the eſtates appropriated to their maintenance, belongs to the landſchaft director, and the aufreiter, who are both choſen from among the Luneburg nobility. The firſt came in place of the Popiſh abbot, and as ſuch is head of the ſtates of the principality, and preſident of the provincial college. He has the title of *excellency;* and in public inſtruments ſtyles himſelf, *by the grace of God landſchaft director*, and *lord of the manſion of St Michael in Luneburg.* The chief public edifices are three pariſh-churches, the ducal palace, three hoſpitals, the town-houſe, the ſalt-magazine, the anatomical theatre, the academy; the conventual church of St Michael, in which lie interred the ancient dukes; and in which is the famous table eight feet long, and four wide, plated over with chaſed gold, with a rim embelliſhed with precious ſtones, of an immenſe value, which was taken from the Saracens by the emperor Otho, and preſented to this church; but in 1698, a gang of thieves ſtripped it of 200 rubies and emeralds, together with a large diamond, and moſt of the gold, ſo that at preſent but a ſmall part of it remains. Here are ſome very rich ſalt-ſprings. Formerly, when there was a greater demand for the ſalt, upwards of 120,000 tons have been annually boiled here, and ſold off: but ſince the commencement of the preſent century, the ſalt trade hath declined greatly. A fifth of the ſalt made here belongs to the king, but is farmed out. It is ſaid to excel all the other ſalt made in Germany. This town is well fortified; and has a garriſon, which is lodged in barracks. In the neighbourhood is a good lime-ſtone quarry; and along the Ilmenau are ware-houſes, in which are lodged goods brought from all parts of Germany, to be forwarded by the Elmenau to Hamburg, or by the Aſche to Lubec, from whence other goods are brought back the ſame way. The town itſelf drives a conſiderable traffic in wax, honey, wool, flax, linen, ſalt, lime, and beer.

Lunenſe || Lungs.

LUNENSE MARMOR, in the natural hiſtory of the ancients, the name of that ſpecies of white marble now known among us by the name of the *Carrara-marble*, and diſtinguiſhed from the ſtatuary kind by its greater hardneſs and leſs ſplendour. It was ever greatly eſteemed in building and ornamental works, and is ſo ſtill. It is of a very cloſe and fine texture, of a very pure white, and much more tranſparent than any other of the white marbles. It has always been found in great quantities in Italy, and is ſo to this day. See LUNA.

LUNETTE, in fortification, an enveloped counter-guard, or elevation of earth, made beyond the ſecond ditch, oppoſite to the places of arms; differing from the ravelins only in their ſituation. *Lunettes* are uſually made in ditches full of water, and ſerve to the ſame purpoſe as fauſſebrays, to diſpute the paſſage of the ditch. See FORTIFICATION.

LUNETTE, in the manege, is a half horſe-ſhoe, or ſuch a ſhoe as wants the ſpunge, *i. e.* that part of the branch which runs towards the quarters of the foot.

LUNETTE is alſo the name of two ſmall pieces of felt, made round and hollow, to clap upon the eyes of a vicious horſe that is apt to bite, and ſtrike with his fore feet, or that will not ſuffer his rider to mount him.

LUNGS, in anatomy, a part of the human body, ſerving for reſpiration. See ANATOMY, n° 117.

In the *Journal de Médicine* for June 1789 is a deſcription of an

Inſtrument for Inflating the LUNGS, invented by M. Gorcy phyſician to the military hoſpital at Neufbriſack, which appears to be exteremly well adapted to the purpoſe, whilſt it may be uſed with the greateſt eaſe and facility.

This inſtrument, which the inventor ſtyles *apodopic*, that is, "reſtorer of reſpiration," conſiſts of a double pair of bellows, BCLM, fig. 1, the two different parts of which have no communication with each other. In the lower ſide B M, is an aperture A for a valve conſtructed on the principles of thoſe of Mr Nairne's air-pump. It conſiſts of a rim of copper, cloſed at one end by a plate of the ſame metal, in which plate are ſeven ſmall holes placed at equal diſtances. This plate

Plate CCLXXV.

is

is covered with a piece of ſilk coated with elaſtic gum, in which are ſix tranſverſe inciſions of two or three lines in length. Each inciſion is ſo made as to be ſituated between two of the holes, and at an equal diſtance from each: *ſee* D, fig. 2. The ſilk muſt be made very ſecure, by a thread paſſing ſeveral times round the rim. It is obvious, that a ſtream of air applied to that ſide of the plate which is oppoſite the ſilk, will paſs through the holes, and, lifting up the ſilk, eſcape through the inciſions. On the contrary, a ſtream of air applied to the other ſide will preſs the ſilk upon the plate, and thus cloſe the holes, ſo that it will be impoſſible for it to paſs through them. This valve opens internally, ſo as to admit the air from without. At B is another valve, on the ſame conſtruction, but opening in a contrary direction, thus permitting the air to eſcape out of the lower part into the tube E F, but preventing its entrance. At C is another valve, opening internally to admit the air from the tube E F; and at D there is a fourth, opening externally, to diſcharge the air from the upper part.

The flexible tube E F, ſcrewed on at the end C B, being introduced into one of the noſtrils, whilſt the mouth and the other noſtril are cloſed by an aſſiſtant, if we ſeparate the two handles L M, which were cloſe together at the introduction of the tube, it is evident, that the air in the lungs will ruſh into the upper part through the valve C, whilſt the external air will fill the lower part through the valve A: the two handles being again brought into contact, the atmoſpheric air will be forced into the lungs through the valve B, and at the ſame time the air in the upper part will be diſcharged at the valve D. Thus by the alternate play of the double bellows, the lungs will be alternately filled and emptied as in reſpiration. In uſing the inſtrument care ſhould be taken not to be too violent; as the more perfectly the natural motion of reſpiration is imitated the better.

To prevent any ſubſtances from without injuring the valves A, D, fig. 1, the rim is made with a ſcrew, B, fig. 3, in order to receive a cap A A, fig. 3, full of ſmall holes. This ſcrew has alſo another uſe. If dephlogiſticated air be preferred, a bladder filled with it, fig. 4, may, by means of the ſcrew A, be faſtened to the valve A, fig. 1; and, to prevent waſte, as this air may ſerve ſeveral times, a flexible tube may be ſcrewed on the valve D, fig. 1. communicating with the bladder by means of the opening *d*, fig. 4: thus it may be employed as often as the operator thinks proper.

There is a handle K to the partition in the middle, in order that, if it be at any time neceſſary to uſe either of the diviſions alone, the other may be confined from acting. *c*, *b*, fig. 5, repreſent the two valves to be applied at the end of the inſtrument C, B, fig. 1; and fig. 6. is a ſection of the end C B, ſhowing the valves in their proper places.

It is proper to add, that the capacity of the inſtrument ſhould be proportioned to the quantity of air received into the lungs in inſpiration, which Dr Goodwyn has aſcertained to be twelve cubical inches or ſomewhat more. Each diviſion of the inſtrument, therefore, ſhouldbe capable of containing that quantity.

Lung-Wort, in botany. See PULMONARIA.

LUNISOLAR YEAR, in chronology, the ſpace of 532 common years; found by multiplying the cycle of the ſun by that of the moon.

LUNULA. See LUNE.

LUPERCALIA, feaſts inſtituted in ancient Rome, in honour of the god Pan.—The word comes from *Lupercal*, the name of a place under the Palatine mountain, where the ſacrifices were performed.

The Lupercalia were celebrated on the 15th of the kalends of March, that is, on the 15th of February, or, as Ovid obſerves, on the third day after the ides. They are ſuppoſed to have been eſtabliſhed by Evander.

On the morning of this feaſt, the Luperci, or prieſts of Pan, ran naked through the ſtreets of Rome, ſtriking the married women they met on the hands and belly with a thong or ſtrap of goat's leather, which was held an omen promiſing them fecundity and happy deliveries. See LUPERCI.

This feaſt was aboliſhed in the time of Auguſtus; but afterwards reſtored, and continued to the time of the emperor Anaſtaſius.—Baronius ſays it was aboliſhed by the pope in 496.

LUPERCI, a name given to the prieſts of the god Pan. See LUPERCALIA.

The *luperci* were the moſt ancient order of prieſts in Rome; they were divided into two colleges or companies, the one called *Fabii* and the other *Quintilii*. To theſe Cæſar added a third, which he called *Julii*.

LUPINUS, LUPINE, in botany: A genus of the decandria order, belonging to the diadelphia claſs of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The calyx is bilabiated; there are five oblong and five roundiſh antheræ; the legumen is coriaceous. There are ſeven ſpecies, ſix of them hardy herbaceous flowery annuals, and one perennial, riſing with upright ſtalks from one to three or four feet high, ornamented with digitate or fingered leaves, and terminated by long whorled ſpikes of papilionaceous flowers, white, blue, yellow, and roſe-coloured. They are all eaſily raiſed from ſeed; and ſucceed in any open borders, where they make a fine variety.

The ſeeds of the white lupine, which have a leguminous taſte accompanied with a diſagreeable bitter one, are ſaid to be anthelmintic, both internally taken, and applied externally. Caſpar Hoffman cautions againſt their external uſe, and tells us (from one of the Arabian writers) that they have ſometimes occaſioned death. Simon Pauli alſo ſays, that he ſaw a boy of eight or ten years of age, after taking a dram of theſe ſeeds in powder, ſeized with exquiſite pains in the abdomen, a difficulty of reſpiration, and almoſt total loſs of voice; and that he was relieved from theſe complaints by a glyſter of milk and ſugar, which brought away a vaſt quantity of worms. But Mr Geoffroy obſerves, very juſtly, that either theſe ſymptoms were owing to the worms, and not to the medicine; or that theſe ſeeds, if they have any noxious quality, loſe it with their bitterneſs in boiling; ſince they were commonly uſed among the Greeks as food, and recommended by Galen as very wholeſome.

LUPULUS, in botany. See HUMULUS.

LUPUS, in zoology. See CANIS.

Lupus-Marinus. See ANARRHICHAS.

Lupus, in aſtronomy. See there, n° 406.

LURCHER, a kind of hunting-dog much like a mongrel gre-hound, with pricked ears, a ſhagged coat, and generally of a yellowiſh white colour: they are very ſwift runners, ſo that if they get between the burrows and the conies they ſeldom miſs; and this is their common practice in hunting: yet they uſe other ſubtilties, as the tumbler does, ſome of them bringing in their game, and thoſe are the beſt. It is alſo obſervable, that a lurcher will run down a hare at ſtretch.

LURE, in falconry, a device of leather, in the ſhape of two wings, ſtuck with feathers, and baited with a piece of fleſh, to call back a hawk when at conſiderable diſtance.

LURGAN, a poſt and fair town in the county of Armagh and province of Ulſter in Ireland, 67 miles from Dublin. It is a flouriſhing town, agreeably ſituated in the midſt of a much improved country; and the inhabitants are extenſively engaged in the linen manufacture. It ſtands on a gentle eminence, about two miles from Lough Neagh, of which it commands a moſt beautiful and extenſive proſpect. The fairs are three in the year. N. Lat. 54. 35. W. Long. 6. 31.

Lurgan-green, a poſt and fair town of Ireland, in the county of Louth and province of Leinſter, 37 miles from Dublin; a mile beyond which is a handſome ſeat of the earl of Charlemont. It has three fairs in the year.

LURIDÆ, the name of the 28th order in Linnæus's fragments of a natural method. See Botany, p. 462.

LUSATIA, a marquiſate of Germany, in Upper Saxony; bounded to the eaſt by Sileſia, to the weſt by Miſnia, to the ſouth by Bohemia, and to the north by the marquiſate of Brandenburgh. Till towards the middle of the 15th century, the Upper Luſatia was called the *Mark,* i. e. *the marquiſite or the land of Budiſzin and Gorlitz;* and the Lower only *Luſatia,* which, it is ſaid, in the Sclavonic, ſignifies "a woody or marſhy country." The air of the Upper Luſatia, which is hilly or mountainous, is better than that of the Lower, a great part of which is mooriſh and boggy. Both abound in wood, eſpecially the Lower, and turf for fuel. The heathy and mountainous tracts are generally barren; but the lower champaign and marſh lands are tolerably fertile, producing paſture, wheat, rye, oats, barley, buck-wheat, peaſe, lentils, beans, and millet; together with flax, hops, tobacco, ſome white and red wine, and what is called *manna.* Of ſeveral of theſe articles, however, conſiderable quantities are imported. In this country are found alſo quarries of ſtone, medicinal ſprings, baſtard diamonds, agates, and jaſpers, earths and clays for tobacco-pipes and all ſorts of earthen ware, alum, good iron, ſtone, vitriolic and copper water; nor is it deſtitute of cattle, fiſh, and veniſon. The rivers Spree, the Schwarze or Black Elſter, and the Pulznitz, have their ſources in the Luſatias, which are alſo watered by the Neiſſe and Queis. The ancient inhabitants of this country were the Saxons, who were ſucceeded by the Vandals, and theſe by the Sober-Wends, a Sclavonian people. The preſent inhabitants, the deſcendants of the Wends, have an odd dreſs; and the language is ſo inarticulate and guttural, that it hath been ſaid, it might be pronounced without lips, teeth, or tongue: but the towns are almoſt wholly peopled by Germans.

In the Upper Luſatia are ſix towns which appear at the land-diets, 16 ſmaller country-towns, and four market towns. In the Lower are four diet-towns, 13 country-towns, and two market ones. Both marquiſates were formerly ſubject either to the kings of Bohemia, the archdukes of Auſtria, or electors of Brandenburgh; but, in 1636, both were abſolutely ceded to the elector of Saxony, in lieu of the 72 tons of gold which he expended in aſſiſting the emperor Ferdinand II. againſt the Bohemians.

Chriſtianity was firſt planted in Luſatia in the ſeventh century; but it was ſeveral centuries after that before Popery was fully eſtabliſhed. In the 11th century many cloiſters were erected in the country; but at the reformation ſuch numbers embraced Lutheraniſm, that it became the predominant religion, and ſtill continues, though there are ſtill ſeveral Roman Catholic foundations, churches, market-towns, and villages. The enthuſiaſtic ſect of Hernhuters poſſeſſes a great influence and eſteem here. There are conſiderable manufactures of woollen and linen ſtuffs in the Luſatias, eſpecially the Upper. At Budiſſen, and in the adjacent country, prodigious quantities of ſtockings, ſpatterdaſhes, caps, and gloves are made. The linen manufactures alſo flouriſh here, chiefly in the Upper Luſatia, where all ſorts of linen are made, printed, and dyed. Excluſive of theſe, there are conſiderable manufactures of hats, leather, paper, gunpowder, iron, glaſs, bleached wax, &c. Though the demand and exportation of theſe commodities, particularly linens and woollens, is not ſo great as formerly, yet it is ſtill conſiderable, and more than overbalances their importations in wool, yarn, ſilk, wines, ſpices, corn, freſh and baked fruits, garden ſtuff, and hops. Diſputes of many years ſtanding have ſubſiſted between the country-artificers and linen-manufacturers on the one ſide, and the diet-towns on the other; the latter unjuſtly ſeeking to exclude the former from any ſhare in the linen trade. The natives of this country are ſaid to have quick natural parts, but to be ſordidly penurious. We are told they obſerve the Saxon laws much better than they did the Bohemian. Learning hath been much eſteemed and encouraged in both marquiſates ſince the reformation. The ſchools in the ſix diet-towns of Upper Luſatia, particularly at Gorlitz, Budiſſen, and Zittau, greatly diſtinguiſh themſelves, having handſome ſtipends. In Lower Luſatia alſo are ſome good ſchools, with ſtipends for the maintenance of ſtudents. Printing is ſaid to be much followed, and brought to great perfection in this country.

In Upper Luſatia, the ſtates conſiſt, 1ſt, of thoſe called *ſtate-lords;* 2dly, of the prelates; 3dly, of the gentry and commonalty, under which are comprehended the counts, barons, nobles, and burgeſſes, poſſeſſors of fees and fief-eſtates; and, 4thly, of the repreſentatives of the ſix principal towns. Without the conſent of theſe ſtates no taxes can be impoſed, nor any thing of importance, that regards the public, tranſacted. The diets are ordinary or extraordinary. The ordinary meet once in three years, and the extraordinary when ſummoned by the ſovereign upon particular emergencies. As to eccleſiaſtical matters, the dean of

Budiſſen and his conſiſtory exerciſe all manner of epiſcopal juriſdiction; and, among the Proteſtants, the juriſdiction belongs either to the ſuperior, the upper-office, or the patrons. The revenues ariſing to the ſuperior or ſovereign, from Upper Luſatia, conſiſt partly of the ſubſidies granted by the ſtates, among which, at preſent, are reckoned capitation and eſtate-money; and partly of the beer-tax, exciſe, tolls, &c. —Upper Luſatia is divided into two great circles, viz. thoſe of Budiſſen and Gorlitz, which are again divided into leſſer circles.

The land-ſtates of Lower Luſatia conſiſt, like thoſe of the Upper, of prelates, lords, and knights, and the repreſentatives of the ſtate towns, which are Luckau, Gubben-Lubbin, and Kalau. Two land diets are yearly held at Lubben, called *voluntary-diets;* but when the ſuperior cauſes the ſtates to be ſummoned together at his diſcretion, and propoſitions to be laid before them, by commiſſaries deputed for that purpoſe, ſuch convention is called a *great land-diet.* The marquiſate is divided into five circles, each of which holds a circle-aſſembly in its circle-town. The chief officers appointed either by the ſuperior or the ſtates, are, the preſident of the upper-office, the land-captain, and the land-judge. The principal tribunals are, the land-court, and the upper-office, to which lie appeals from the inferior judicatories. There are alſo officers for the ſeveral circles. Spiritual matters belong here to a conſiſtory, erected in 1668. The ordinary taxes are paid into the cheſt of the circle; and from thence conſigned to the general cheſt, of which the upper tax-receiver is ſuperintendant. By him an annual account of the receipts is made out, which is examined and paſſed by the deputies of the ſtates.

LUSITANIA (anc. geog.), one of the diviſions of Spain, extending to the north of the Tagus, quite to the ſea of Cantabria, at leaſt to the Promontorium Celticum. But Auguſtus, by a new regulation, made the Anas its boundary to the ſouth, the Durius to the north; and thus conſtituting only a part of the modern Portugal. *Luſitani* the people, (Diodorus, Stephanus).

LUSTRAL, an epithet given by the ancients to the water uſed in their ceremonies to ſprinkle and purify the people. From them the Romaniſts have borrowed the holy water uſed in their churches.

Lustral Day, (Dies Luſtricus), that whereon the luſtrations were performed for a child, and its name given; which was uſually the ninth day from the birth of a boy, and the eighth from that of a girl. Tho' others performed the ceremony on the laſt day of that week wherein the child was born, and others on the fifth day from its birth.

Over this feaſt-day the goddeſs Nundina was ſuppoſed to preſide; the midwifes, nurſes, and domeſtics, handed the child backwards and forwards, around a fire burning on the altars of the gods, after which they ſprinkled it with water; hence this feaſt had the name of *amphidromia.* The old women mixed ſaliva and duſt with the water. The whole ended with a ſumptuous entertainment. The parents received gifts from their friends on this occaſion. If the child was a male, their door was decked with an olive garland; if a female, with wool, denoting the work about which women were to be employed.

LUSTRATION, in antiquity, ſacrifices or ceremonies by which the ancients purified their cities, fields, armies, or people, defiled by any crime or impurity. Some of theſe luſtrations were public, others private. There were three ſpecies or manners of performing luſtration, *viz.* by fire and ſulphur, by water, and by air; which laſt was done by fanning and agitating the air round the thing to be purified. Some of theſe luſtrations were neceſſary, *i. e.* could not be diſpenſed with; as luſtrations of houſes in time of a plague, or upon the death of any perſon: others again were done out of choice, and at pleaſure. The public luſtrations at Rome were celebrated every fifth year; in which they led a victim thrice round the place to be purified, and in the mean time burnt a great quantity of perfumes. Their country luſtrations, which they called *ambarvalia,* were celebrated before they began to reap their corn: in thoſe of the armies, which they called *armiluſtria,* ſome choſen ſoldiers, crowned with laurel, led the victims, which were a cow, a ſheep, and a bull, thrice round the army ranged in battle-array in the field of Mars, to which deity the victims were afterwards ſacrificed, after pouring out many imprecations upon the enemies of the Romans. The luſtrations of their flocks were performed in this manner: the ſhepherd ſprinkled them with pure water, and thrice ſurrounded his ſheepfold with a compoſition of ſavin, laurel, and brimſtone ſet on fire; and afterwards ſacrificed to the goddeſs Pales an offering of milk boiled, wine, a cake, and millet. As for private houſes, they were luſtrated with water, a fumigation of laurel, juniper, olive-tree, ſavin, and ſuch like; and the victim commonly was a pig. Luſtrations made for particular perſons were commonly called *expiations,* and the victims *piacula.* There was alſo a kind of luſtration uſed for infants, by which they were purified, girls the third, and boys the ninth, day after their birth; which ceremony was performed with pure water and ſpittle. See the article Ambarvalia.—In their luſtratory ſacrifices, the Athenians ſacrificed two men, one for the men of their city, and the other for the women. Divers of theſe expiations were auſtere: ſome faſted; others abſtained from all ſenſual pleaſures; and ſome, as the prieſts of Cybele, caſtrated themſelves. The poſtures of the penitents were different according to the different ſacrifices. The prieſts changed their habits according to the ceremony to be performed; white, purple, and black, were the moſt uſual colours. They caſt into the river, or at leaſt out of the city, the animals or other things that had ſerved for a luſtration or ſacrifice of atonement; and thought themſelves threatened with ſome great misfortune when by chance they trod upon them. Part of theſe ceremonies were aboliſhed by the emperor Conſtantine, and his ſucceſſors: the reſt ſubſiſted till the Gothic kings were maſters of Rome; under whom they expired, excepting what the popes thought proper to adopt and bring into the church.

For the luſtration, or rather expiation, of the ancient Jews, ſee Expiation.

LUSTRE, the gloſs or brightneſs appearing on any thing, particularly on manufactures of ſilk, wool, or ſtuff. It is likewiſe uſed to denote the compoſition or manner of giving that gloſs.

The luſtre of ſilks is given them by waſhing in ſoap, then clear water, and dipping them in alum water cold. To give ſtuffs a beautiful luſtre: For every eight pounds of ſtuff allow a quarter of a pound of linſeed; boil it half an hour, and then ſtrain it through a cloth, and let it ſtand till it is turned almoſt to a jelly: afterwards put an ounce and a half of gum to diſſolve 24 hours; then mix the liquor, and put the cloth into this mixture, take it out, dry it in the ſhade, and preſs it. If once doing is not ſufficient, repeat the operation. Curriers give a luſtre to black leather firſt with juice of barberries, then with gum-arabic, ale, vinegar, and Flanders-glue, boiled together. For coloured leather, they uſe the white of an egg beaten in water. Moroccoes have their luſtre from juice of barberries, and lemon or orange. For hats, the luſtre is frequently given with common water; ſometimes a little black dye is added: the ſame luſtre ſerves for furs, except that for very black furs they ſometimes prepare a luſtre of galls, copperas, Roman alum, ox's marrow, and other ingredients.

Lustre, an appellation given to a branched candleſtick, when made of glaſs. See Branch and Jesse.

LUSTRINGS. A company was incorporated for making, dreſſing, and luſtrating alamodes and luſtrings in England, who were to have the ſole benefit thereof, by ſtat. 4 and 5 William and Mary. And no foreign ſilks known by the name of *luſtrings* or alamodes are to be imported but at the port of London, &c. Stat. 9. and 10. W. III. c. 43. See Silk.

LUSTRUM, in Roman antiquity, a general muſter and review of all the citizens and their goods, which was performed by the cenſors every fifth year, who afterwards made a ſolemn luſtration. See the article Lustration.

This cuſtom was firſt inſtituted by Servius Tullius, about 180 years after the foundation of Rome. In courſe of time the luſtra were not celebrated ſo often; for we find the fifth luſtrum celebrated at Rome only in the 574th year of that city.

LUTE, or Luting, among chemiſts, a mixed, tenacious, ductile ſubſtance, which grows ſolid by drying, and, being applied to the juncture of veſſels, ſtops them up ſo as to prevent the air from getting either in or out. See Chemistry-*Index*.

Lute, is alſo a muſical inſtrument with ſtrings.—The lute conſiſts of four parts, *viz.* the table, the body or belly, which has nine or ten ſides; the neck, which has nine or ten ſtops or diviſions, marked with ſtrings; and the head or croſs, where the ſcrew for raiſing and lowering the ſtrings to a proper pitch of tone are fixed. In the middle of the table there is a roſe or paſſage for the ſound; there is alſo a bridge that the ſtrings are faſtened to, and a piece of ivory between the head and the neck to which the other extremities of the ſtrings are fitted. In playing, the ſtrings are ſtruck with the right hand, and with the left the ſtops are preſſed. The lutes of Bologna are eſteemed the beſt on account of the wood, which is ſaid to have an uncommon diſpoſition for producing a ſweet ſound.

LUTETIA parisiorum, (anc. geog.), a town of the Pariſii, in Gallia Celtica, ſituated in an iſland in the Sequana or Seine. It received its name, as ſome ſuppoſe, from the quantity of clay, *lutum*, which is in its neighbourhood. J. Cæſar fortified and embelliſhed it, from which circumſtance ſome authors call it *Julii Civitas*. Julian the apoſtate reſided there for ſome time. It is now *Paris*, the capital of France; ſo called from its name *Paryis* in the lower age.

LUTHER (Martin), the celebrated author of the Reformation, was a native of Eiſleben in Saxony, and born in 1483. Though his parents were poor, he received a learned education; during the progreſs of which, he gave many indications of uncommon vigour and acuteneſs of genius. As his mind was naturally ſuſceptible of ſerious impreſſions, and tinctured with ſomewhat of that religious melancholy which delights in the ſolitude and devotion of a monaſtic life, he retired into a convent of Auguſtinian friars; where he acquired great reputation, not only for piety, but for love of knowledge and unwearied application to ſtudy. The cauſe of this retirement is ſaid to have been, that he was once ſtruck by lightning, and his companion killed by his ſide by the ſame flaſh. He had been taught the ſcholaſtic philoſophy which was in vogue in thoſe days, and made conſiderable progreſs in it: but happening to find a copy of the bible which lay neglected in the library of his monaſtery, he applied himſelf to the ſtudy of it with ſuch eagerneſs and aſſiduity, as quite aſtoniſhed the monks; and increaſed his reputation for ſanctity ſo much, that he was choſen profeſſor firſt of philoſophy, and afterwards of theology, at Wittemberg on the Elbe, where Frederic elector of Saxony had founded an univerſity.

While Luther continued to enjoy the higheſt reputation for ſanctity and learning, Tetzel, a Dominican friar, came to Wittemberg in order to publiſh indulgences. Luther beheld his ſucceſs with great concern; and having firſt inveighed againſt indulgences from the pulpit, he afterwards publiſhed 95 theſes, containing his ſentiments on that ſubject. Theſe he propoſed, not as points fully eſtabliſhed, but as ſubjects of inquiry and diſputation. He appointed a day on which the learned were invited to impugn them either in perſon or by writing; and to the whole he ſubjoined ſolemn proteſtations of his high reſpect for the apoſtolic ſee, and of his implicit ſubmiſſion to its authority. No opponent appeared at the time prefixed; the theſes ſpread over Germany with aſtoniſhing rapidity, and were read with the greateſt eagerneſs.

Though Luther met with no oppoſition for ſome little time after he began to publiſh his new doctrines, it was not long before many zealous champions aroſe to defend thoſe opinions with which the wealth and power of the clergy were ſo ſtrictly connected. Their cauſe, however, was by no means promoted by theſe endeavours; the people began to call in queſtion even the authority of the canon law and of the pope himſelf.—The court of Rome at firſt deſpiſed theſe new doctrines and diſputes; but at laſt the attention of the pope being raiſed by the great ſucceſs of the reformer, and the complaints of his adverſaries, Luther was ſummoned, in the month of July 1518, to appear at Rome, within 60 days, before the auditor of the chamber. One of Luther's adverſaries, named Prierias, who had written againſt him, was appointed to examine his doctrines, and to decide concerning them. The pope wrote at the ſame time to the elector of Saxony, beſeeching him not to protect a man whoſe heretical and profane tenets were ſo ſhocking to pious ears; and enjoined the provincial of the Auguſtinians to check by his authority the raſhneſs of an arrogant monk, which brought diſgrace upon their order, and gave offence and diſturbance to the whole church.

From theſe letters, and the appointment of his open enemy Prierias to be his judge, Luther eaſily ſaw what ſentence he might expect at Rome; and therefore diſcovered the utmoſt ſolicitude to have his cauſe tried in Germany, and before a leſs ſuſpected tribunal. He wrote a ſubmiſſive letter to the pope, in which he promiſed an unreſerved obedience to his will, for as yet he entertained no doubt of the divine original of the pope's authority; and by the interceſſion of the other profeſſors, Cajetan the pope's legate in Germany was appointed to hear and determine the cauſe. Luther appeared before him without heſitation: but Cajetan thought it below his dignity to diſpute the point with a perſon ſo much his inferior in rank; and therefore required him, by virtue of the apoſtolic powers with which he was clothed, to retract the errors which he had uttered with regard to indulgences and the nature of faith, and to abſtain for the future from the publication of new and dangerous opinions; and at the laſt forbad him to appear in his preſence, unleſs he propoſed to comply with what had been required of him.

This haughty and violent manner of proceeding, together with ſome other circumſtances, gave Luther's friends ſuch ſtrong reaſons to ſuſpect that even the imperial ſafe-conduct would not be able to protect him from the legate's power and reſentment, that they prevailed on him ſecretly to withdraw from Augſburg, where he had attended the legate, and to return to his own country. But before his departure, according to a form of which there had been ſome examples, he prepared a ſolemn appeal from the pope, ill-informed at that time concerning his cauſe, to the pope, when he ſhould receive more full intimation with reſpect to it.—Cajetan, enraged at Luther's abrupt retreat, and at the publication of his appeal, wrote to the elector of Saxony, complaining of both; and requiring him, as he regarded the peace of the church, or the authority of its head, either to ſend that ſeditious monk a priſoner to Rome, or to baniſh him out of his territories. Frederic had hitherto, from political motives, protected Luther, as thinking he might be of uſe in checking the enormous power of the ſee of Rome; and though all Germany reſounded with his fame, the elector had never yet admitted him into his preſence. But upon this demand made by the cardinal, it became neceſſary to throw off ſomewhat of his former reſerve. He had been at great expence and beſtowed much attention on founding a new univerſity, an object of conſiderable importance to every German prince; and foreſeeing how fatal a blow the removal of Luther would be to its reputation, he not only declined complying with either of the pope's requeſts, but openly diſcovered great concern for Luther's ſafety.

The ſituation of our reformer, in the mean time, became daily more and more alarming. He knew very well what were the motives which induced the elector to afford him protection, and that he could by no means depend on a continuance of his friendſhip. If he ſhould be obliged to quit Saxony, he had no other aſylum, and muſt ſtand expoſed to whatever puniſhment the rage or bigotry of his enemies could inflict; and ſo ready were his adverſaries to condemn him, that he had been declared a heretic at Rome before the expiration of the 60 days allowed him in the citation for making his appearance. Notwithſtanding all this, however, he diſcovered no ſymptoms of timidity or remiſſneſs; but continued to vindicate his own conduct and opinions, and to inveigh againſt thoſe of his adverſaries with more vehemence than ever. Being convinced, therefore, that the pope would ſoon proceed to the moſt violent meaſures againſt him, he appealed to a general council, which he affirmed to be the repreſentative of the Catholic church, and ſuperior in power to the pope, who being a fallible man, might err, as St Peter, the moſt perfect of his predeceſſors, had done.

The court of Rome were equally aſſiduous in the mean time to cruſh the author of theſe new doctrines which gave them ſo much uneaſineſs. A bull was iſſued by the pope, of a date prior to Luther's appeal, in which he magnified the virtues of indulgences, and ſubjected to the heavieſt eccleſiaſtical cenſures all who preſumed to teach a contrary doctrine. Such a clear deciſion of the ſovereign pontiff againſt him might have been very fatal to Luther's cauſe, had not the death of the emperor Maximilian, which happened on January 17. 1519, contributed to give matters a different turn. Both the principles and intereſt of Maximilian had prompted him to ſupport the authority of the ſee of Rome: but, in conſequence of his death, the vicariate of that part of Germany which is governed by the Saxon laws devolved to the elector of Saxony; and, under the ſhelter of his friendly adminiſtration, Luther himſelf enjoyed tranquillity, and his opinions took ſuch root in different places, that they could never afterwards be eradicated. At the ſame time, as the election of an emperor was a point more intereſting to the pope (Leo X.) than a theological controverſy which he did not underſtand, and of which he could not foreſee the conſequences, he was ſo extremely ſolicitous not to irritate a prince of ſuch conſiderable influence in the electoral college as Frederic, that he diſcovered a great unwillingneſs to pronounce the ſentence of excommunication againſt Luther, which his adverſaries continually demanded with the moſt clamorous importunity.

From the reaſon juſt now given, and Leo's natural averſion to ſevere meaſures, a ſuſpenſion of proceeding againſt Luther took place for 18 months, though perpetual negociations were carried on during this interval in order to bring the matter to an amicable iſſue. The manner in which theſe were conducted having given our reformer many opportunities of obſerving the corruption of the court of Rome, its obſtinacy in adhering to eſtabliſhed errors, and its indifference about truth, however clearly propoſed or ſtrongly proved, he began, in 1520, to utter ſome doubts with regard to the divine orignial of the papal authority, which he publicly diſputed with Eccius, one of his moſt learned and formidable antagoniſts. The diſpute was indeciſive, both parties claiming the victory; but it muſt have been very mortifying to the partizans of the Romiſh church to hear ſuch an eſſential point of their doctrine publicly attacked.

The Papal authority being once ſuſpected, Luther proceeded to puſh on his inquiries and attacks from one doctrine to another, till at laſt he began to ſhake the firmeſt foundations on which the wealth and power of the church were eſtabliſhed. Leo then began to perceive that there were no hopes of reclaiming ſuch an incorrigible heretic; and therefore prepared to denounce the ſentence of excommunication againſt him. The college of cardinals was often aſſembled, in order to prepare the ſentence with due deliberation; and the ableſt canoniſts were conſulted how it might be expreſſed with unexceptionable formality. At laſt it was iſſued on the 15th of June 1520. Forty-one propoſitions, extracted out of Luther's works, were therein condemned as heretical, ſcandalous, and offenſive to pious ears; all perſons were forbidden to read his writings, upon pain of excommunication; ſuch as had any of them in their cuſtody were commanded to commit them to the flames; he himſelf, if he did not, within 60 days, publicly recant his errors, and burn his books, was pronounced an obſtinate heretic, excommunicated, and delivered to Satan for the deſtruction of the fleſh; and all ſecular princes were required, under pain of incurring the ſame cenſure, to ſeize his perſon, that he might be puniſhed as his crimes deſerved.

Luther was not in the leaſt diſconcerted by this ſentence, which he had for ſome time expected. He renewed his appeal to his general council; declared the pope to be that antichriſt, or man of ſin, whoſe appearance is foretold in the New Teſtament; declaimed againſt his tyranny with greater vehemence than ever; and at laſt, by way of retaliation, having aſſembled all the profeſſors and ſtudents in the univerſity of Wittemberg, with great pomp, and in the preſence of a vaſt multitude of ſpectators, he caſt the volumes of the canon law, together with the bull of excommunication, into the flames. The manner in which this action was juſtified, gave ſtill more offence than the action itſelf. Having collected from the canon law ſome of the moſt extravagant propoſitions with regard to the plenitude and omnipotence of the pope's power, as well as the ſubordination of all ſecular juriſdiction to his authority, he publiſhed theſe with a commentary, pointing out the impiety of ſuch tenets, and their evident tendency to ſubvert all civil government.

On the acceſſion of Charles V. to the empire, Luther found himſelf in a very dangerous ſituation. Charles, in order to ſecure the pope's friendſhip, had determined to treat him with great ſeverity. His eagerneſs to gain this point, rendered him not averſe to gratify the papal legates in Germany, who inſiſted, that, without any delay or formal deliberation, the diet then ſitting at Worms ought to condemn a man whom the pope had already excommunicated as an incorrigible heretic. Such an abrupt manner of proceeding, however, being deemed unprecedented and unjuſt by the members of the diet, they made a point of Luther's appearing in perſon, and declaring whether he adhered or not to thoſe opinions which had drawn upon him the cenſures of the church. Not only the emperor, but all the princes through whoſe territories he had to paſs, granted him a ſafe conduct; and Charles wrote to him at the ſame time, requiring his immediate attendance on the diet, and renewing his promiſes of protection from any injury or violence. Luther did not heſitate one moment about yielding obedience; and ſet out for Worms, attended by the herald who had brought the emperor's letter and ſafe-conduct. While on his journey, many of his friends, whom the fate of Huſs, under ſimilar circumſtances, and notwithſtanding the ſame ſecurity of an imperial ſafe-conduct, filled with ſolicitude, adviſed and intreated him not to ruſh wantonly into the midſt of danger. But Luther, ſuperior to ſuch terrors, ſilenced them with this reply, "I am lawfully called (ſaid he) to appear in that city; and thither will I go in the name of the Lord, though as many devils as there are tiles on the houſes were there combined againſt me."

The reception which he met with at Worms, was ſuch as might have been reckoned a full reward of all his labours, if vanity and the love of applauſe had been the principles by which he was influenced. Greater crowds aſſembled to behold him than had appeared at the emperor's public entry; his apartments were daily filled with princes and perſonages of the higheſt rank; and he was treated with an homage more ſincere, as well as more flattering, than any which preeminence in birth or condition can command. At his appearance before the diet, he behaved with great decency, and with equal firmneſs. He readily acknowledged an exceſs of acrimony and vehemence in his controverſial writings; but refuſed to retract his opinions unleſs he were convinced of their falſehood, or to conſent to their being tried by any other rule than the word of God. When neither threats nor intreaties could prevail on him to depart from this reſolution, ſome of the eccleſiaſtics propoſed to imitate the example of the council of Conſtance, and, by puniſhing the author of this peſtilent hereſy, who was now in their power, to deliver the church at once from ſuch an evil. But the members of the diet refuſing to expoſe the German integrity to freſh reproach by a ſecond violation of public faith, and Charles being no leſs unwilling to bring a ſtain upon the beginning of his adminiſtration by ſuch an ignominious action, Luther was permitted to depart in ſafety. A few days after he left the city, a ſevere edict was publiſhed in the emperor's name, and by authority of the diet, depriving him, as an obſtinate and excommunicated criminal, of all the privileges which he enjoyed as a ſubject of the empire, forbidding any prince to harbour or protect him, and requiring all to ſeize his perſon as ſoon as the term ſpecified in his protection ſhould be expired.

But this rigorous decree had no conſiderable effect; the execution of it being prevented partly by the multiplicity of occupations which the commotions in Spain, together with the wars in Italy and the Low Countries, created to the emperor; and partly by a prudent precaution employed by the elector of Saxony, Luther's faithful patron. As Luther, on his return from Worms, was paſſing near Altenſtrain in Thuringia, a number of horſemen in maſks ruſhed ſuddenly out of a wood, where the elector had appointed them to lie in wait for him, and, ſurrounding his company, carried him, after diſmiſſing all his attendants, to Wortburg, a ſtrong caſtle not far diſtant. There the elector ordered him to be ſupplied with every thing neceſſary or agreeable; but the place of his retreat was carefully concealed, until the fury of the preſent ſtorm againſt him began to abate, upon a change in the political ſyſtem of Europe. In this ſolitude, where he remained nine months, and which he frequently called his *Patmos*, after the name of that iſland to which the apoſtle John was baniſhed, he exerted his uſual vigour and induſtry in defence of his doctrines, or in confutation of his adverſaries, publiſhing ſeveral treatiſes, which revived the ſpirit of his followers, aſtoniſhed to a great degree and diſheartened at the ſudden diſappearance of their leader.

Luther, weary at length of his retirement, appeared publicly again at Wittemberg, upon the 6th of March 1522. He appeared indeed without the elector's leave; but immediately wrote him a letter, to prevent his taking it ill. The edict of Charles V. as ſevere as it was, had given little or no check to Luther's doctrine: for the emperor was no ſooner gone into Flanders, than his edict was neglected and deſpiſed, and the doctrine ſeemed to ſpread even faſter than before. Caroloſtadius, in Luther's abſence, had puſhed things on faſter than his leader; and had attempted to aboliſh the uſe of maſs, to remove images out of the churches, to ſet aſide auricular confeſſion, invocation of ſaints, the abſtaining from meats; had allowed the monks to leave their monaſteries, to neglect their vows, and to marry; in ſhort, had quite changed the doctrine and diſcipline of the church at Wittemberg: all which, though not againſt Luther's ſentiments, was yet blamed by him, as being raſhly and unſeaſonably done. Lutheraniſm was ſtill confined to Germany: it was not got to France; and Henry VIII. of England made the moſt rigorous acts to hinder it from invading his realm. Nay, he did ſomething more: to ſhow his zeal for religion and the holy ſee, and perhaps his ſkill in theological learning, he wrote a treatiſe *Of the ſeven ſacraments*, againſt Luther's book *Of the captivity of Babylon*; which he preſented to Leo X. in October 1521. The pope received it very favourably; and was ſo well pleaſed with the king of England, that he complimented him with the title of *Defender of the faith*. Luther, however, paid no regard to his kingſhip; but anſwered him with great ſharpneſs, treating both his perſon and performance in the moſt contemptuous manner. Henry complained of Luther's rude uſage of him to the princes of Saxony; and Fiſher, biſhop of Rocheſter, replied to his anſwer, in behalf of Henry's treatiſe: but neither the King's complaint, nor the biſhop's reply, was attended with any viſible effects.

Luther, though he had put a ſtop to the violent proceedings of Caroloſtadius, now made open war with the pope and biſhops; and, that he might make the people deſpiſe their authority as much as poſſible, he wrote one book againſt the pope's bull, and another againſt the order falſely called the *order of biſhops*. The ſame year, 1522, he wrote a letter, dated July the 29th, to the aſſembly of the ſtates of Bohemia; in which he aſſured them that he was labouring to eſtabliſh their doctrine in Germany, and exhorted them not to return to the communion of the church of Rome; and he publiſhed alſo, this year, a tranſlation of the New Teſtament in the German tongue, which was afterwards corrected by himſelf and Melancthon. This tranſlation having been printed ſeveral times, and being in every body's hands, Ferdinand archduke of Auſtria, the emperor's brother, made a very ſevere edict, to hinder the farther publication of it; and forbad all the ſubjects of his imperial majeſty to have any copies of it, or of Luther's other books. Some other princes followed his example; and Luther was ſo angry at it, that he wrote a treatiſe, *Of the ſecular power*, in which he accuſes them of tyranny and impiety. The diet of the empire was held at Nurenburg, at the end of the year; to which Hadrian VI. ſent his brief, dated November the 25th: for Leo X. died upon the 2d of December 1521, and Hadrian had been elected pope upon the 9th of January following. In his brief, among other things, he obſerves to the diet, how he had heard, with grief, that Martin Luther, after the ſentence of Leo X. which was ordered to be executed by the edict of Worms, continued to teach the ſame errors, and daily to publiſh books full of hereſies: that it appeared ſtrange to him, that ſo large and ſo religious a nation could be ſeduced by a wretched apoſtate friar: that nothing, however, could be more pernicious to Chriſtendom: and that therefore he exhorts them to uſe their utmoſt endeavours to make Luther, and the authors of theſe tumults, return to their duty; or, if they refuſe and continue obſtinate, to proceed againſt them according to the laws of the empire, and the ſeverity of the laſt edict.

The reſolution of this diet was publiſhed in the form of an edict, upon the 6th of March 1523; but it had no effect in checking the Lutherans, who ſtill went on in the ſame triumphant manner. This year Luther wrote a great many pieces: among the reſt, one upon the dignity and office of the ſupreme magiſtrate; which Frederic elector of Saxony is ſaid to have been highly pleaſed with. He ſent, about the ſame time, a writing in the German language to the Waldenſes, or Pickards, in Bohemia and Moravia, who had applied to him "about worſhipping the body of Chriſt in the euchariſt." He wrote alſo another book, which he dedicated to the ſenate and people of Prague, "about the inſtitution of miniſters of the church." He drew up a form of ſaying maſs. He wrote a piece, entitled, *An example of popiſh doctrine and divinity*; which Dupins calls *a ſatire againſt nuns and thoſe who profeſs a monaſtic life*. He wrote alſo againſt the vows of virginity, in his preface to his commentary on 1 Cor. viii. And his exhortations here were, it ſeems, followed with effects: for ſoon after, nine nuns, among whom was Catharine de Bore, eloped from the nunnery at Nimptſchen, and were brought, by the aſſiſtance of Leonard Coppen, a burgeſs of Torgau, to Wittemberg. Whatever offence this proceeding might give to the Papiſts, it was highly extolled by Luther; who, in a book written in the German language, compares the deliverance of theſe nuns from the ſlavery of a monaſtic life, to that of the ſouls which Jeſus Chriſt has delivered by his death. This year Luther had occaſion to canonize two of his followers, who, as Melchior Adam relates, were burnt at Bruſſels in the beginning of July, and were the firſt who ſuffered martyrdom for his doctrine. He wrote alſo a conſolatory epiſtle to three noble ladies at Miſnia, who were baniſhed from the duke of Saxony's court at Friburg, for reading his books.

In the beginning of the year 1524, Clement VII.

ſent a legate into Germany to the diet, which was to be held at Nurenburg. Hadrian VI. died in October 1523, and was ſucceeded by Clement upon the 19th of November. A little before his death he canonized Benno, who was biſhop of Meiſſen in the time of Gregory VII. and one of the moſt zealous defenders of the holy ſee Luther, imagining that this was done directly to oppoſe him, drew up a piece with this title, *Againſt the New Idol and Old Devil ſet up at Meiſſen;* in which he treats the memory of Gregory with great freedom, and does not ſpare even Hadrian. Clement VII.'s legate repreſented to the diet of Nurenburg the neceſſity of enforcing the execution of the edict of Worms, which had been ſtrangely neglected by the princes of the empire: but, notwithſtanding the legate's ſolicitations, which were very preſſing, the decrees of that diet were thought ſo ineffectual, that they were condemned at Rome, and rejected by the emperor. It was in this year that the diſpute between Luther and Eraſmus, about free-will, began Eraſmus had been much courted by the Papiſts to write againſt Luther; but he was all along of opinion, that writing would not be found an effectual way to end the differences and eſtabliſh the peace of the church. However, tired out at length with the importunities of the pope and the Catholic princes, and deſirous at the ſame time to clear himſelf from the ſuſpicion of favouring a cauſe which he would not ſeem to favour, he reſolved to write againſt Luther, though, as he tells Melancthon, it was with ſome reluctance, and choſe free-will for the ſubject. His book was intitled, *A Diatriba, or Conference about Free-will;* and was written with much moderation, and without perſonal reflections. He tells Luther in the preface, "That he ought not to take his diſſenting from him in opinion ill, becauſe he had allowed himſelf the liberty of differing from the judgment of popes, councils, univerſities, and doctors of the church." Luther was ſome time before he anſwered Eraſmus's book; but at laſt publiſhed a treatiſe *De Servo Arbitrio*, or *Of the Servitude of Man's Will;* and though Melancthon had promiſed Eraſmus, that Luther ſhould anſwer him with civility and moderation, yet Luther had ſo little regard to Melancthon's promiſe, that he never wrote any thing ſharper. He accuſed Eraſmus of being careleſs about religion, and little ſolicitous what became of it, provided the world continued in peace; and that his notions were rather philoſophical than Chriſtian Eraſmus immediately replied to Luther, in a piece called *Hyperaſpiſtes;* in the firſt part of which he anſwers his arguments, and in the ſecond his perſonal reflections.

In October 1524, Luther flung off the monaſtic habit; which, though not premeditated and deſigned, was yet a very proper preparative to a ſtep he took the year after; we mean, his marriage with Catharine de Bore. Catharine de Bore was a gentleman's daughter, who had been a nun, and was taken, as we have obſerved, out of the nunnery of Nimptſchen, in the year 1523. Luther had a deſign, as Melchior Adam relates, to marry her to Glacius, a miniſter of Ortamunden: but ſhe did not like Glacius; and ſo Luther married her himſelf upon the 13th of June 1525. This conduct of his was blamed not only by the Catholics, but, as Melancthon ſays, by thoſe of his own party. He was even for ſome time aſhamed of it himſelf; and owns, that his marriage had made him ſo deſpicable, that he hoped his humiliation would rejoice the angels, and vex the devils. Melancthon found him ſo afflicted with what he had done, that he wrote ſome letters of conſolation to him. It was not ſo much the marriage, as the circumſtances of the time, and the precipitation with which it was done, that occaſioned the cenſures paſſed upon Luther. He married all of a ſudden, and at a time when Germany was groaning under the miſeries of a war which was ſaid at leaſt to be owing to Lutheraniſm. Then, again, it was thought an indecent thing in a man of 42 years of age, who was then, as he pretended, reſtoring the Goſpel, and reforming mankind, to involve himſelf in marriage with a woman of 26, either through incontinence, or any account whatever. But Luther, as ſoon as he had recovered himſelf a little from this abaſhment, aſſumed his former air of intrepidity, and boldly ſupported what he had done with reaſons. "I took a wife (ſays he), in obedience to my father's commands; and haſtened the conſummation, in order to prevent impediments, and ſtop the tongues of ſlanderers." It appears from his own confeſſion, that this reformer was very fond of Mrs de Bore, and uſed to call her *his Catharine;* which made profane people think and ſay wicked things of him: "And therefore (ſays he) I married of a ſudden, not only that I might not be obliged to hear the clamours which I knew would be raiſed againſt me, but to ſtop the mouths of thoſe who reproached me with Catharine de Bore." Luther alſo gives us to underſtand, that he did it partly as concurring with his grand ſcheme of oppoſing the Catholics.

Luther, notwithſtanding, was not himſelf altogether ſatisfied with theſe reaſons. He did not think the ſtep he had taken could be ſufficiently juſtified upon the principles of human prudence; and therefore we find him, in other places, endeavouring to account for it from a ſupernatural impulſe. But whether there was any thing divine in it or not, Luther found himſelf extremely happy in his new ſtate, and eſpecially after his wife had brought him a ſon. "My rib Kate (ſays he in the joy of his heart) deſires her compliments to you, and thanks you for the favour of your kind letter. She is very well, through God's mercy. She is obedient and complying with me in all things; and more agreeable, I thank God, than I could have expected; ſo that I would not change my poverty for the wealth of Crœſus." He was heard to ſay (Seckendorf tells us), that he would not exchange his wife for the kingdom of France, nor for the riches of the Venetians; and that for three reaſons: firſt, Becauſe ſhe had been given him by God, at the time when he implored the aſſiſtance of the Holy Ghoſt in finding a good wife; ſecondly, Becauſe, though ſhe was not without faults, yet ſhe had fewer than other women; and, thirdly, Becauſe ſhe religiouſly obſerved the conjugal fidelity ſhe owed him. There went at firſt a report, that Catharine de Bore was brought to bed ſoon after her marriage with Luther; but Eraſmus, who had wrote that news to his friends, acknowledged the falſity of it a little after.

His marriage, however, did not retard his activity and diligence in the work of reformation. He reviſed the Augſburg confeſſion of faith, and apology for the Pro-

Proteſtants, when the Proteſtant religion was firſt eſtabliſhed on a firm baſis. See PROTESTANTS and REFORMATION.

After this, Luther had little elſe to do than to ſit down and contemplate the mighty work he had finiſhed: for that a ſingle monk ſhould be able to give the church ſo rude a ſhock, that there needed but ſuch another entirely to overthrow it, may very well ſeem a mighty work. He did indeed little elſe: for the remainder of his life was ſpent in exhorting princes, ſtates, and univerſities, to confirm the reformation which had been brought about through him; and publiſhing from time to time ſuch writings as might encourage, direct, and aid, them in doing it. The emperor threatened temporal puniſhment with armies, and the pope eternal with bulls and anathemas; but Luther cared for none of their threats. His friend and coadjutor Melancthon was not ſo indifferent; for Melancthon had a great deal of ſoftneſs, moderation, and diffidence in his make, which made him very uneaſy, and even ſorrowful, in the preſent diſorders. Hence we find many of Luther's letters written on purpoſe to ſupport and comfort him under theſe ſeveral diſtreſſes and anxieties.

In the year 1533, Luther wrote a conſolatory epiſtle to the citizens of Oſchatz, who had ſuffered ſome hardſhips for adhering to the Augſburg confeſſion of faith; in which, among other things, he ſays: "The devil is the hoſt, and the world is his inn; ſo that wherever you come, you ſhall be ſure to find this ugly hoſt." He had alſo about this time a terrible controverſy with George duke of Saxony, who had ſuch an averſion to Luther's doctrine, that he obliged his ſubjects to take an oath that they would never embrace it. However, 60 or 70 citizens of Leipſic were found to have deviated a little from the Catholic way in ſome point or other, and they were known previouſly to have conſulted Luther about it; upon which George complained to the elector John, that Luther had not only abuſed his perſon, but alſo preached up rebellion among his ſubjects. The elector ordered Luther to be acquainted with this; and to be told at the ſame time, that if he did not clear himſelf of the charge, he could not poſſibly eſcape puniſhment. But Luther eaſily refuted the accuſation, by proving, that he had been ſo far from ſtirring up his ſubjects againſt him, on the ſcore of religion, that, on the contrary, he had exhorted them rather to undergo the greateſt hardſhips, and even ſuffer themſelves to be baniſhed.

In the year 1534, the Bible tranſlated by him into German was firſt printed, as the old privilege, dated at Bibliopolis, under the elector's hand, ſhows; and it was publiſhed the year after. He alſo publiſhed this year a book againſt maſſes and the conſecration of prieſts, in which he relates a conference he had with the devil upon thoſe points; for it is remarkable in Luther's whole hiſtory, that he never had any conflicts of any kind within, but the devil was always his antagoniſt. In February 1537, an aſſembly was held at Smalkald about matters of religion, to which Luther and Melancthon were called. At this meeting Luther was ſeized with ſo grievous an illneſs, that there were no hopes of his recovery. He was afflicted with the ſtone, and had a ſtoppage of urine for 11 days. In this terrible condition he would needs undertake to travel, notwithſtanding all that his friends could ſay or do to prevent him: his reſolution, however, was attended with a good effect; for the night after his departure he began to be better. As he was carried along, he made his will, in which he bequeathed his deteſtation of Popery to his friends and brethren; agreeably to what he often uſed to ſay: *Peſtis eram vivus, moriens ero mors tua, papa;* that is, "I was the plague of Popery in my life, and ſhall continue to be ſo in my death."

This year the Pope and the court of Rome, finding it impoſſible to deal with the Proteſtants by force, began to have recourſe to ſtratagem. They affected therefore to think, that though Luther had indeed carried things on with a high hand and to a violent extreme, yet what he had pleaded in defence of theſe meaſures was not entirely without foundation. They talked with a ſeeming ſhow of moderation; and Pius III. who ſucceeded Clement VII. propoſed a reformation firſt among themſelves, and even went ſo far as to fix a place for a council to meet at for that purpoſe. But Luther treated this farce as it deſerved to be treated; unmaſked and detected it immediately; and, to ridicule it the more ſtrongly, cauſed a picture to be drawn, in which was repreſented the pope ſeated on high upon a throne, ſome cardinals about him with foxes tails on, and ſeeming to evacuate upwards and downwards (*ſurſum deorſum repurgare*, as Melchior Adam expreſſes it). This was fixed over-againſt the title-page, to let the readers ſee at once the ſcope and deſign of the book; which was, to expoſe that cunning and artifice with which thoſe ſubtle politicians affected to cleanſe and purify themſelves from their errors and ſuperſtitions. Luther publiſhed about the ſame time A Confutation of the pretended Grant of Conſtantine to Sylveſter Biſhop of Rome; and alſo ſome letters of John Huſs, written from his priſon at Conſtance to the Bohemians.

In this manner was Luther employed till his death, which happened in the year 1546. That year, accompanied by Melancthon, he paid a viſit to his own country, which he had not ſeen for many years, and returned again in ſafety. But ſoon after he was called thither again by the earls of Manſfeldt, to compoſe ſome differences which had ariſen about their boundaries. Luther had not been uſed to ſuch matters; but becauſe he was born at Iſleben, a town in the territory of Mansfeldt, he was willing to do his country what ſervice he could, even in this way. Preaching his laſt ſermon therefore at Wittemberg, upon the 17th of January, he ſet off on the 23d; and at Hall in Saxony lodged with Juſtus Jonas, with whom he ſtaid three days, becauſe the waters were out. Upon the 28th, he paſſed over the river with his three ſons and Dr Jonas; and being in ſome danger, he ſaid to the Doctor, "Do not you think it would rejoice the devil exceedingly, if I and you, and my three ſons, ſhould be drowned?" When he entered the territories of the earls of Mansfeldt, he was received by 100 horſemen or more, and conducted in a very honourable manner; but was at the ſame time ſo very ill, that it was feared he would die. He ſaid, that theſe fits of ſickneſs often came upon him when he had any great buſineſs to undertake: of this, however, he did not recover; but died upon the 18th of February, in the 63d year of his age. A little before he expired, he admoniſhed thoſe that were about him to pray to God for the propagation of the Goſpel; "becauſe (ſaid he) the council of Trent, which had ſat once or twice, and the pope, would deviſe ſtrange things againſt it." Soon after, his body was put into a leaden coffin, and carried with funeral pomp to the church at Iſleben, when Dr Jonas preached a ſermon upon the occaſion. The earls of Mansfeldt deſired that his body ſhould be interred in their territories; but the elector of Saxony inſiſted upon his being brought back to Wittemberg; which was accordingly done: and there he was buried with the greateſt pomp that perhaps ever happened to any private man. Princes, earls, nobles, and ſtudents without number, attended the proceſſion; and Melancthon made his funeral oration.

A thouſand lies were invented by the Papiſts about Luther's death. Some ſaid that he died ſuddenly; others, that he killed himſelf; others, that the devil ſtrangled him; others, that his corpſe ſtunk ſo abominably, that they were forced to leave it in the way, as it was carried to be interred. Nay, lies were invented about his death, even while he was yet alive. Luther, however, to give the moſt effectual refutation of this account of his death, put forth an advertiſement of his being alive; and, to be even with the Papiſts for the malice they had ſhown in this lie, wrote a book at the ſame time to prove, that "the papacy was founded by the devil."

Luther's works were collected after his death, and printed at Wittemberg in 7 vols folio. Catharine de Bore ſurvived her huſband a few years; and continued the firſt year of her widowhood at Wittemberg, though Luther had adviſed her to ſeek another place of reſidence. She went from thence in the year 1547, when the town was ſurrendered to the emperor Charles V. Before her departure, ſhe had received a preſent of 50 crowns from Chriſtian III. king of Denmark; and the elector of Saxony, and the counts of Mansfeldt, gave her good tokens of their liberality. With theſe additions, to what Luther had left her, ſhe had wherewithal to maintain herſelf and her family handſomely. She returned to Wittemberg, when the town was reſtored to the elector; where ſhe lived in a very devout and pious manner, till the plague obliged her to leave it again in the year 1552. She ſold what ſhe had at Wittemberg; and retired to Torgau, with a reſolution to end her life there. An unfortunate miſchance befel her in her journey thither, which proved fatal to her. The horſes growing unruly, and attempting to run away, ſhe leaped out of the vehicle ſhe was conveyed in; and, by leaping, got a fall, of which ſhe died about a quarter of a year after, at Torgau, upon the 20th of December 1552. She was buried there in the great church, where her tomb and epitaph are ſtill to be ſeen; and the univerſity of Wittemberg, which was then at Torgau becauſe the plague raged at Wittemberg, made a public programma concerning the funeral pomp.

LUTHERANISM, the ſentiments of Martin Luther with regard to religion. See Luther.

Lutheraniſm has undergone ſome alterations ſince the time of its founder.—Luther rejected the epiſtle of St James, as inconſiſtent with the doctrine of St Paul, in relation to juſtification; he alſo ſet aſide the Apocalypſe: both which are now received as canonical in the Lutheran church.

Luther reduced the number of ſacraments to two, *viz.* baptiſm, and the euchariſt: but he believed the impanation, or conſubſtantiation, that is, that the matter of the bread and wine remain with the body and blood of Chriſt; and it is in this article that the main difference between the Lutheran and Engliſh churches conſiſts.

Luther maintained the maſs to be no ſacrifice; exploded the adoration of the hoſt, auricular confeſſion, meritorious works, indulgences, purgatory, the worſhip of images, &c. which had been introduced in the corrupt times of the Romiſh church. He alſo oppoſed the doctrine of free-will, maintained predeſtination, and aſſerted our juſtification to be ſolely by the imputation of the merits and ſatisfaction of Chriſt. He alſo oppoſed the faſtings in the Romiſh church, monaſtical vows, the celibate of the clergy, &c.

LUTHERANS, the Chriſtians who follow the opinions of Martin Luther, one of the principal reformers of the church in the 16th century. See Luther.

The Lutherans, of all Proteſtants, are thoſe who differ leaſt from the Romiſh church; as they affirm, that the body and blood of Chriſt are materially preſent in the ſacrament of the Lord's ſupper, though in an incomprehenſible manner; and likewiſe repreſent ſome religious rites and inſtitutions, as the uſe of images in churches, the diſtinguiſhing veſtments of the clergy, the private confeſſion of ſins, the uſe of wafers in the adminiſtration of the Lord's ſupper, the form of exorciſm in the celebration of baptiſm, and other ceremonies of the like nature, as tolerable, and ſome of them as uſeful. The Lutherans maintain, with regard to the divine decrees, that they reſpect the ſalvation or miſery of men, in conſequence of a previous knowledge of their ſentiments and characters, and not as free and unconditional, and as founded on the mere will of God. Towards the cloſe of the laſt century, the Lutherans began to entertain a greater liberality of ſentiment than they had before adopted; though in many places they perſevered longer in ſevere and deſpotic principles than other Proteſtant churches. Their public teachers now enjoy an unbounded liberty of diſſenting from the deciſions of thoſe ſymbols or creeds which were once deemed almoſt infallible rules of faith and practice, and of declaring their diſſent in the manner they judge the moſt expedient. Moſheim attributes this change in their ſentiments to the maxim which they generally adopted, that Chriſtians were accountable to God alone for their religious opinions; and that no individual could be juſtly puniſhed by the magiſtrate for his erroneous opinions, while he conducted himſelf like a virtuous and obedient ſubject, and made no attempts to diſturb the peace and order of civil ſociety.

LUTHERN, in architecture, a kind of window over the cornice, in the roof of a building; ſtanding perpendicularly over the naked of a wall, and ſerving to illuminate the upper ſtory.

Lutherns are of various forms; as ſquare, ſemicircular, round, called *bull's eyes*, *flat arches*, &c.

LUTRA, in zoology. See Muſtela.

LUTTI (Beneditto), an eminent painter, born at

Florence in 1666. He was the diſciple of Antonio Dominico Gabiani, and his merit was judged equal to that of his maſter: he painted few beſide eaſel pieces; and his works were much valued and ſought for in England, France, and Germany. The emperor knighted him; and the elector of Mentz, together with his patent of knighthood, ſent him a croſs ſet with diamonds. Lutti was never ſatisfied in finiſhing his pictures; yet though he often retouched them, they never appeared laboured. He died in 1724.

LUTZEN, a town of Upper Saxony in Germany; famous for a battle fought here in 1632, when Guſtavus Adolphus king of Sweden was killed. It is ſituated on the river Elſter, in E. Long. 12. 37. N. Lat. 51. 20.

LUXATION, is when any bone is moved out of its place or articulation, ſo as to impede or deſtroy its proper office or motion. See SURGERY.

LUXEMBURG, a city of the Auſtrian Netherlands, and capital of a duchy of the ſame name. It is ſeated partly on a hill, and partly on a plain; but is very ſtrong both by art and nature. It is but indifferently built, though there are ſome good ſtone houſes in it. There is nothing very remarkable among the ſtructures but the Jeſuits church; which is a handſome edifice, after the modern taſte. It was taken by Louis XIV. in 1684; who ſo augmented the fortifications, that it is now one of the ſtrongeſt towns in Europe. It was ceded to Spain by the treaty of Ryſwick; but the French took it again in 1701, and gave it up to the houſe of Auſtria by the treaty of Utrecht. It is 25 miles ſouth-weſt of Treves, and 100 weſt of Mentz. E. Long. 6. 10. N. Lat. 49. 52.

LUXEMBURG (the duchy of), is one of the 17 provinces of the Netherlands. It is bounded on the eaſt by the archbiſhoprick of Treves; on the ſouth, by Lorrain; on the weſt, partly by Champagne, and partly by the biſhoprick of Liege, which likewiſe, with part of Limburg, bound it on the north. It lies in the foreſt of Ardenne, which is one of the moſt famous in Europe. In ſome places it is covered with mountains and woods, and in general it is fertile in corn and wine; and here are a great number of iron-mines. The principal rivers are, the Moſelle, the Sour, the Ourte, and the Semoy. It belongs partly to the houſe of Auſtria, and partly to the French; and Thionville is the capital of the French part.

LUXEMBURG (François Henry de Montmorenci), duke of, and marſhal of France, a renowned general in the ſervice of Louis XIV. was born in 1628. He was with the prince of Conde at the battle of Rocroy, in 1643; and in 1668 diſtinguiſhed himſelf at the conqueſt of Franche Compté. In 1672, he commanded in chief the French army in Holland; when he defeated the enemy near Woerden and Bodegrave, and was univerſally admired for the fine retreat he made in 1673. He became marſhal of France in 1675; gained the battle of Flerus in 1690, that of Steenkirk in 1692, and that of Nerwind in 1693. He died at Verſailles in 1695.

LUXURIANS FLOS, "a luxuriant or double flower;" a flower, ſome of whoſe parts are increaſed in number, to the diminution or entire excluſion of others.

The parts that are augmented or multiplied in luxuriant flowers, are the flower-cup and petals, which Linnæus conſiders as the teguments or covers of the flower; the parts that are diminiſhed, or entirely excluded, are the ſtamina or chives, which the ſame author denominates the male organs of generation.

Luxuriance in flowers is capable of the three following varieties.

1. A flower is ſaid to be MULTIPLIED *(flos multiplicatus)*, when the increaſe of the petals is not ſuch as to exclude all the ſtamina: in this ſenſe, flowers are peoperly ſaid to be double, triple, or quadruple, according to the number of multiplications of the petals.

2. A flower is ſaid to be FULL, *(flos plenus)*, when, by the multiplication of the petals, all the ſtamina are excluded. Such are moſt of the double flowers that engage the attention of floriſts.

3. A flower is ſaid to be PROLIFIC *(flos prolifer)*, which produces flowers, and ſometimes leaves, from its centre.

For a particular deſcription of each of theſe kinds of luxuriance in flowers, ſee the articles *MULTIPLICATUS Flos*, *PLENUS Flos*, and *PROLIFER Flos*.

Many natural orders of plants do not in any circumſtances produce luxuriant flowers. Of this kind are the maſqued-flowers of Tournefort, excepting calve's-ſnout; the rough-leaved, umbelliferous, ſtarry plants, and ſuch as flower at the joints, of Ray: ſome umbelliferous flowers, however, are *prolific*.

The pea-bloom, or butterfly-ſhaped flowers, are rarely rendered double; ſome inſtances, however, of luxuriance, are obſerved in a ſpecies of ladies-finger, coronilla, and broom.

All luxuriant flowers are vegetable monſters. Such as are perfectly full, by which we mean the greateſt degree of luxuriance, cannot be propagated by ſeeds; becauſe theſe, for want of impregnation, can never ripen. Full flowers therefore are very properly denominated by Linnæus *eunuchs*. This higheſt degree of luxuriance is very common in carnation, lychnis, anemone, ſtock, Indian creſs, roſe, marſh marigold, ranunculus, violet, pœony, and narciſſus.

Flowers which do not exclude all the ſtamina, perfect their ſeeds. Of this kind are poppy, fennel-flower, campanula, and ſome others.

Some flowers, as thoſe of the water-lily, fig-marigold, and cactus, have many rows or ſeries of petals, without the number of ſtamina being in the leaſt diminiſhed. Such flowers are by no means to be reckoned luxuriant, in the ſlighteſt degree.

Luxuriance in flowers is generally owing to exceſs of nouriſhment.

LUXURY; voluptuouſneſs, or an extravagant indulgence in diet, dreſs, and equipage.

Luxury, among the Romans, prevailed to ſuch a degree, that ſeveral laws were made to ſuppreſs, or at leaſt limit it. The extravagance of the table began about the time of the battle of Actium, and continued in great exceſs till the reign of Galba. Peacocks, cranes of Malta, nightingales, veniſon, wild and tame fowl, were conſidered as delicacies. A profuſion of proviſions was the reigning taſte. Whole wild boars were often ſerved up, and ſometimes they were filled with various ſmall animals, and birds of different kinds: this diſh they called the *Trojan horſe*, in alluſion to the wooden horſe filled with ſoldiers.

Fowls and game of all ſorts were ſerved up in whole pyramids, piled up in diſhes as broad as moderate tables. Lucullus had a particular name for each apartment; and in whatever room he ordered his ſervants to prepare the entertainment, they knew by the direction the expence to which they were to go. When he ſupped in the Apollo, the expence was fixed at 50,000 *drachmæ*, that is L. 1250. M. Antony provided eight boars for 12 gueſts. Vitellius had a large ſilver platter, ſaid to have coſt a million of *ſeſterces*, called *Minerva's buckler*. In this he blended together the livers of gilt-heads, the brains of pheaſants and peacocks, the tongues of phenicopters, and the milts of lampreys. Caligula ſerved up to his gueſts pearls of great value diſſolved in vinegar; the ſame was done alſo by Clodius the ſon of Æſop the tragedian. Apicius laid aſide 90,000,000 of *ſeſterces*, beſides a mighty revenue, for no other purpoſe but to be ſacrificed to luxury: finding himſelf involved in debt, he looked over his accounts, and though he had the ſum of 10,000,000 of *ſeſterces* ſtill left, he poiſoned himſelf for fear of being ſtarved to death.

The Roman laws to reſtrain luxury were *Lex Orchia*, *Fannia*, *Didia*, *Licinia*, *Cornelia*, and many others: But all theſe were too little; for as riches increaſed amongſt them, ſo did ſenſuality.

What were the ideas of luxury entertained in England about two centuries ago, may be gathered from the following paſſage of Holinſhed; who, in a diſcourſe prefixed to his Hiſtory, ſpeaking of the increaſe of luxury, ſays, "Neither do I ſpeak this in reproach of any man, God is my judge; but to ſhow, that I do rejoice rather to ſee how God has bleſſed us with his good gifts, and to behold how that in a time wherein all things are grown to the moſt exceſſive prices, we yet do find means to obtain and atchieve ſuch furniture as heretofore was impoſſible. There are old men yet dwelling in the village where I remain, which have noted three things to be marvellouſly altered in England within their ſound remembrance. One is the multitude of chimneys lately erected; whereas in their young days there were not above two or three, if ſo many, in moſt uplandiſh towns of the realm (the religious houſes, and manor places of their lords, always excepted, and peradventure ſome great perſonages), but each made his fire againſt a reredoſs [ſkreen] in the hall where he dreſſed his meat and dined.—The ſecond is the great amendment of lodging; for, ſaid they, our fathers and we ourſelves have lain full oft upon ſtraw pallets covered only with a ſheet, under coverlits made of a dogſwaine or horharriots (to uſe their own terms), and a good log under their head inſtead of a bolſter.—If it were ſo that the father or good man of the houſe had a mattraſs, or flock bed and ſheets, a ſack of chaff to reſt his head upon, he thought himſelf to be as well lodged as the lord of the town. So well were they contented, that pillows (ſaid they) were thought meet only for women in childbed; as for ſervants, if they had any ſheet above them, it was well; for ſeldom had they any under their bodies to keep them from pricking ſtraws, that ran oft through the canvas and their hardened hides.—The third thing they tell of, is the exchange of treene [wooden] platters into pewter, and wooden ſpoons into ſilver or tin; for ſo common were all ſorts of treene veſſels in old times, that a man ſhould hardly find four pieces pewter (of which one was peradventure a ſalt) in a good farmer's houſe. Again, in times paſt, men were contented to dwell in houſes builded of ſallow, willow, &c. ſo that the uſe of oak was in a manner dedicated wholly unto churches, religious houſes, princes palaces, navigation, &c. But now willow, &c. are rejected, and nothing but oak any where regarded; and yet ſee the change, for when our houſes were builded of willow, then had we oaken men; but now that our houſes are come to be made of oak, our men are not only become willow, but a great many altogether of ſtraw, which is a ſore alteration. In theſe, the courage of the owner was a ſufficient defence to keep the houſe in ſafety; but now the aſſurance of the timber muſt defend the men from robbing. Now have we many chimneys, and yet our tenderlins complain of rheums, catarrhs, and poſes; then had we none but reredoſes, and our heads did never ach. For as the ſmoke in thoſe days were ſuppoſed to be a ſufficient hardening for the timber of the houſe; ſo it was reputed a far better medicine to keep the goodman and his family from the quacks or poſe; wherewith, as then, very few were acquainted. Again, our pewterers in time paſt employed the uſe of pewter only upon diſhes and pots, and a few other trifles for ſervice; whereas now they are grown into ſuch exquiſite cunning, that they can in a manner imitate by infuſion any form or faſhion, of cup, diſh, ſalt, bowl, or goblet, which is made by the goldſmiths craft, though they be ever ſo curious and very artificially forged. In ſome places beyond the ſea, a garniſh of good flat Engliſh pewter (I ſay flat, becauſe diſhes and platters in my time began to be made deep, and like baſons, and are indeed more convenient both for ſauce and keeping the meat warm) is eſteemed ſo precious as the like number of veſſels that are made of fine ſilver."

Particular inſtances of luxury in *eating*, however, might be adduced from an earlier period, ſurpaſſing even the extravagance of the Romans. Thus, in the 10th year of the reign of Edward IV. 1470, George Nevill, brother to the earl of Warwick, at his inſtalment into the archiepiſcopal ſee of York, entertained moſt of the nobility and principal clergy, when his bill of fare was 300 quarters of wheat, 350 tuns of ale, 104 tuns of wine, a pipe of ſpiced wine, 80 fat oxen, ſix wild bulls, 1004 wethers, 300 hogs, 300 calves, 3000 geeſe, 3000 capons, 300 pigs, 100 peacocks, 200 cranes, 200 kids, 2000 chickens, 4000 pigeons, 4000 rabbits, 204 bitterns, 4000 ducks, 200 pheaſants, 500 partridges, 2000 woodcocks, 400 plovers, 100 curlews, 100 quails, 1000 egrets, 200 rees, 400 bucks, does, and roebucks, 1506 hot veniſon paſties, 4000 cold ditto, 1000 diſhes of jelly parted, 4000 diſhes of jelly plain, 4000 cold cuſtards, 2000 hot cuſtards, 300 pikes, 300 breams, eight ſeals, four porpuſſes, 400 tarts. At this feaſt the earl of Warwick was ſteward, the earl of Bedford treaſurer, and lord Haſtings comptroller, with many more noble officers; 1000 ſervitors, 62 cooks, 515 menial apparitors in the kitchen.—But ſuch was the fortune of the man, that after his extreme prodigality he died in the moſt abject but unpitied poverty, *vinctus jacuit in ſumma inopia.*

And as to *dreſs*, luxury in that article ſeems to have attained a great height long before Holinſhed's time: For in the reign of Edward III. we find no fewer than ſeven ſumptuary laws paſſed in one ſeſſion of parliament to reſtrain it. It was enacted, that men ſervants of lords, as alſo of tradeſmen and artiſans, ſhall be content with one meal of fiſh or fleſh every day; and the other meals, daily, ſhall be of milk, cheeſe, butter, and the like. Neither ſhall they uſe any ornaments of gold, ſilk, or embroidery; nor their wives and daughters any veils above the price of twelvepence. Artiſans and yeomen ſhall not wear cloth above 40s. the whole piece (the fineſt then being about L. 6 per piece), nor the ornaments before named. Nor the women any veils of ſilk, but only thoſe of thread made in England. Gentlemen under the degree of knights, not having L. 100 yearly in land, ſhall not wear any cloth above 4½ marks the whole piece. Neither ſhall they or their females uſe cloth of gold, ſilver, or embroidery, &c. But eſquires having L. 200 *per annum* or upwards of rent, may wear cloths of five marks the whole piece or cloth; and they and their females may alſo wear ſtuff of ſilk, ſilver, ribbons, girdles, or furs. Merchants, citizens, burghers, and artificers of tradeſmen, as well of London as elſewhere, who have goods and chattels of the clear value of L. 500, and their females, may wear as is allowed to gentlemen and eſquires of L. 100 *per annum*. And merchants, citizens, and burgeſſes, worth above L. 1000 in goods and chattels, may (and their females) wear the ſame as gentlemen of L. 200 *per annum*. Knights of 200 marks yearly may wear cloth of ſix marks the cloth, but no higher; but no cloth of gold, nor furred with ermine: but all knights and ladies having above 400 marks yearly, up to L. 1000 *per annum*, may wear as they pleaſe, ermine excepted; and they may wear ornaments of pearl and precious ſtones for their heads only. Clerks having degrees in cathedrals, colleges, &c. may wear as knights and eſquires of the ſame income. Plowmen, carters, ſhepherds, and ſuch like, not having 40s. value in goods or chattels, ſhall wear no ſort of cloth but blanket and ruſſet lawn of 12d. and ſhall wear girdles and belts; and they ſhall only eat and drink ſuitable to their ſtations. And whoſoever uſes other apparel than is preſcribed by the above laws ſhall forfeit the ſame.

Concerning the general utility of luxury to a ſtate, there is much controverſy among the political writers. Baron Monteſquieu lays it down, that luxury is neceſſary in monarchies, as in France; but ruinous to democracies, as in Holland. With regard therefore to Britain, whoſe government is compounded of both ſpecies, it is held to be a dubious queſtion, how far private luxury is a public evil; and, as ſuch, cogniſable by public laws. And indeed our legiſlators have ſeveral times changed their ſentiments as to this point; for formerly there were a number of penal laws exiſting to reſtrain exceſs in apparel, chiefly made in the reigns of Edward III. IV. and Henry VIII. a ſpecimen of which we have inſerted above. But all of them it appeared expedient to repeal at an after period. In fact, although luxury will of neceſſity increaſe according to the influx of wealth, it may not be for the general benefit of commerce to impoſe, as in the above cited laws, an abſolute prohibition of every degree of it: yet, for the good of the public, it may be neceſſary that ſuch as go beyond proper bounds in eating, drinking, and wearing what by no means is ſuitable to their ſtation, ſhould be taxed accordingly, could it be done without including thoſe who have a better title to ſuch indulgence. This is certainly, however, a point which ſhould be maturely weighed before executed; and, in mercantile countries at leaſt, ſuch reſtraints may be found prejudicial, moſt likely impracticable, eſpecially where true liberty is eſtabliſhed. Sir William Temple obſerves, ſpeaking of the trade and riches, and at the ſame time of the *frugality* of the Hollanders, "That ſome of our maxims are not ſo *certain* as *current* in politics: as that encouragement of exceſs and luxury, if employed in the conſumption of *native* commodities, is of advantage to trade. It may be ſo to that which impoveriſhes, but not to that which enriches a country. It is indeed leſs prejudicial, if it lies in *native* than in *foreign* wares; but the humour of *luxury* and expence cannot ſtop at certain bounds; what begins in *native* will proceed in *foreign* commodities; and though the example ariſe among idle perſons, yet the imitation will run into all degrees, even of thoſe men by whoſe induſtry the nation ſubſiſts. And beſides, the more of *our own* we ſpend, the leſs we ſhall have to ſend abroad; and ſo it will come to paſs, that while we drive a vaſt trade, yet, by buying much more than we *ſell*, we ſhall come to be poor at laſt."

LYBIA, or LIBYA, a name anciently given to all that part of Africa lying between the border of Egypt and the river Triton; and comprehending *Cyrenaica*, *Marmarica*, and the Regio *Syrtica*. See theſe articles.

LYCÆUM, Λυκειον, in antiquity, the name of a celebrated ſchool or academy at Athens, where Ariſtotle explained his philoſophy. The place was compoſed of porticoes, and trees planted in the quincunx form, where the philoſophers diſputed walking. Hence *philoſophy of the Lycæum* is uſed to ſignify the philoſophy of Ariſtotle, or the Peripatetic philoſophy. Suidas obſerves, that the Lycæum took its name from its having been originally a temple of Apollo Lycæus; or rather a portico or gallery built by Lycæus ſon of Apollo: but others mention it to have been built by Piſiſtratus or Pericles.

LYCÆUS (anc. geog.), a mountain of Arcadia, ſacred to Jupiter; whence *Jupiter Lycæus* (Pliny). Sacred alſo to Pan (Virgil): and hence *Lycæa*, the rites performed to Pan on this mountain; which Evander carrying with him to Latium, were called *Lupercalia* (Virgil).

LYCAON (fab. hiſt.), the firſt king of Arcadia, ſon of Pelaſgus and Melibœa. He built a town called Lycoſura, on the top of mount Lycæus, in honour of Jupiter. He had many wives, by whom he had a daughter called Calliſto, and 50 ſons. He was ſucceeded on the throne by Nyctimus, the eldeſt of his ſons. He lived about 1820 years before the Chriſtian æra.—Another king of Arcadia celebrated for his cruelties. He was changed into a wolf by Jupiter, becauſe he offered human victims on the altar of the god Pan. Some attribute this metamorphoſis to another cauſe. The ſins of mankind, as they relate, were become ſo enormous, that Jupiter viſited the earth to puniſh wickedneſs and impiety. He came to Arcadia, where he was announced as a god, and the people began to pay proper adoration to his divinity. Lycaon, however, who uſed to ſacrifice all ſtrangers to his wanton cruelty, laughed at the pious prayers of his ſubjects; and to try the divinity of the god, he ſerved up human fleſh on his table. This impiety ſo irritated Jupiter, that he immediately deſtroyed the houſe of Lycaon, and changed him into a wolf.

LYCAONIA, (anc. geog.), a ſmall country of the Hither Aſia, contained between Pamphylia to the ſouth, Cappadocia to the north, Piſidia and Phrygia to the weſt, and Armenia Minor to the eaſt. *Lycaones*, the people. This country, though ſituated very near mount Taurus, and part of it on it, yet the Romans reckoned it into Aſia intra Taurum. *Arcadia*, anciently called *Lycaonia*, (Stephanus.)—Alſo an iſland in the Tiber, joined to Rome by a bridge, and to the land by another, namely, the Ceſtius and Fabricius.

LYCHNIS, CAMPION, in botany, including alſo the *Bachelor's-button*, *Catch-fly*, &c: A genus of the pentagynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 22d order, *Caryophyllæ*. The calyx is monophyllous, oblong, and ſmooth; there are five unguiculated petals; with the ſegments of the limb almoſt bifid; the capſule quinquelocular.

Species, &c. 1. The Chalcedonica, or Chalcedonian ſcarlet lychnis, hath a fibrated perennial root; upright, ſtraight, hairy, annual ſtalks, riſing three or four feet high; garniſhed with long, ſpear-pointed, cloſe-fitting leaves, by pairs oppoſite; and the ſtalk crowned by a large, compact, flat bunch of beautiful ſcarlet or flame-coloured flowers, appearing in June and July. Of this there are varieties, with ſingle ſcarlet flowers, with large double ſcarlet flowers of exceeding beauty and elegance, with pale-red flowers, and with white flowers. Of theſe varieties, the double ſcarlet lychnis is ſuperior to all for ſize and elegance: the flowers being large, very double, and collected into a very large bunch, exhibit a charming appearance; the ſingle ſcarlet kind is alſo very pretty; and the others effect an agreeable variety with the ſcarlet kinds. 2. The diœcia, or diœcious lychnis, commonly called *bachelors-button*, hath fibrated perennial roots; upright ſtalks, branching very diffuſe and irregular, two or three feet high; having oval, acute-pointed, rough leaves, by pairs oppoſite; and all the branches terminated by cluſters of diœcious flowers of different colours and properties in the varieties; flowering in April and May. The varieties, are the common ſingle red-flowered bachelors button, double red, double white, and ſingle white-flowered. The double varieties are exceedingly ornamental in their bloom; the flowers large, very double, and continue long in blow; the ſingle red ſort grows wild by ditch ſides and other moiſt places in many parts of England; from which the doubles were accidentally obtained by culture in gardens. The flowers are often diœcious, *i. e.* male and female on diſtinct plants. 3. The viſcaria, or viſcous German lychnis, commonly called *catch-fly*, hath fibry perennial roots; crowned by a tuft of long graſſy leaves cloſe to the ground; many erect, ſtraight, ſingle ſtalks, riſing a foot and a half or two feet high, exſuding from their upper part a viſcous or clammy matter; garniſhed with long narrow leaves, by pairs oppoſite; and terminated by many reddiſh purple flowers, in cluſters one above another, forming a ſort of long looſe ſpike; all the flowers with entire petals; flowering in May. Of this alſo there are varieties with ſingle red flowers, with double red flowers, and with white flowers. The double variety is conſiderably the moſt eligible for general culture, and is propagated in plenty by parting the roots. All the varieties of this ſpecies emitting a glutinous liquid matter from their ſtalks, flies happening to light thereon ſometimes ſtick and entangle themſelves, whence the plant obtains the name Catch-fly. 4. The flos-cuculi, cuckoo-flower lychnis, commonly called *ragged-robin*, hath fibry perennial roots; upright, branchleſs, channelled ſtalks, riſing near two feet high; garniſhed with long, narrow, ſpear-ſhaped leaves, in pairs oppoſite; and terminated by branchy foot-ſtalks, ſuſtaining many purple, deeply quadrifid flowers; appearing in May. The flowers having each petal deeply quadrifid in a torn or ragged-like manner, the plant obtained the cant name of Ragged-robin. There are varieties with ſingle flowers and double flowers. The double ſort is a large, very multiple, fair flower: it is an improved variety of the ſingle, which grows wild in moſt of our moiſt meadows, and is rarely cultivated; but the double, being very ornamental, merits culture in every garden. All the four ſpecies and reſpective varieties are very hardy; all fibrous-rooted, the roots perennial; but are annual in ſtalks, which riſe in ſpring, flower in ſummer, ſucceeded in the ſingles by plenty of ſeed in autumn, by which all the ſingle varieties may be raiſed in abundance, but the doubles only by dividing the roots, and ſome by cuttings of the flower-ſtalks.

LYCIA, a country of Aſia Minor, bounded by the Mediterranean on the ſouth, Caria on the weſt, Pamphylia on the eaſt, and Phrygia on the north. It was anciently called *Milyas*, and *Tremile*, from the Milyæ, or Solymi, a people of Crete, who came to ſettle there. The country received the name of *Lycia* from Lycus the ſon of Pandion, who eſtabliſhed himſelf there. The inhabitants have been greatly commended by all the ancients for their ſobriety and juſtice. They were conquered by Crœſus king of Lydia, and afterwards by Cyrus. Though they were ſubject to the power of Perſia, yet they were governed by their own kings, and only paid a yearly tribute to the Perſian monarch. They became part of the Macedonian empire when Alexander came into the eaſt, and afterwards were ceded to the houſe of the Seleucidæ. The country was reduced into a Roman province by the emperor Claudius.

LYCIUM, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 28th order, *Luridæ*. The corolla is tubular, having its throat cloſed up with the beard of the filaments; the berry is bilocular. There are eight ſpecies, natives of various countries.

LYCODONTES, in natural hiſtory, the petrified teeth of the lupus-piſcis, or wolf-fiſh, frequently found foſſile. They are of different ſhapes; but the moſt common kind riſe into a ſemiorbicular form, and are hollow within, ſomewhat reſembling an acorn-cup; this hollow is found ſometimes empty, and ſometimes filled with the ſtratum in which it is immerſed. Many of them have an outer-circle, of a different colour from the reſt.

LYCOMEDES, (fab. hiſt.), a king of Scyros an iſland in the Ægean ſea. He was ſon of Apollo and Parthenope. He was ſecretly entruſted with the care of young Achilles, whom his mother Tethis had diſguiſed in woman's cloaths, to remove him from the Trojan war, where ſhe knew he muſt unavoidably periſh. Lycomedes has rendered himſelf famous for his treachery to Theſeus, who had implored his protection when driven from his throne of Athens by the uſurper Mneſtheus. Lycomedes, as it is reported, either envious of the fame of his illuſtrious gueſts, or bribed by the emiſſaries of Mneſtheus, led Theſeus to an elevated place, on pretence to ſhow him the extent of his dominions, and perfidiouſly threw him down a precipice, where he was killed.

LYCOPERDON, in botany: A genus of the natural order of fungi, belonging to the cryptogamia claſs of plants. The fungus is roundiſh, and full of farinaceous ſeeds. There are 10 ſpecies, of which the following are the moſt remarkable.

1. The tuber, truffles, or ſubterraneous puff-balls, is a native of woods both in Scotland and England. It is a ſubterraneous fungus, growing generally in cluſters three or four inches under ground, without any viſible root. The figure of it is nearly ſpherical, the ſize that of a potato; the exterior coat at firſt white, afterwards black, and ſtudded with pyramidical or polyhedrous tubercles; the internal ſubſtance ſolid and callous, of a dirty-white or pale-brown colour, grain'd like a nutmeg with ſerpentine lines; in which, according to Micheli, are imbedded minute oval capſules, containing each from two to four round warted ſeeds. The truffles of Great Britain ſeldom exceed three or four ounces in weight; but in Italy, and ſome other parts of the continent, they are ſaid to have been found of the enormous ſize of eight and even 14 pounds. They are received at our tables, either freſh and roaſted like potatoes, or dried and ſliced into ragouts. They have a volatile and ſomewhat urinous ſmell, and are reputed to be aphrodiſiacal. Dogs are with much pains taught to hunt for them by the ſcent, and to ſcratch up the ground under which they lie.

2. The boviſta, or common puff-ball, is frequent in meadows and paſtures in the autumn. It varies exceedingly in ſize, figure, ſuperficies, and colour. In general, it conſiſts of a ſack or bag, having a root at its baſe, and the bag compoſed of three membranes, an epidermis, a tough white ſkin, and an interior coat which adheres cloſely to the central pith. The pith in the young plants is of a yellowiſh colour, at firſt firm and ſolid, but ſoon changes into a cellular ſpongy ſubſtance, full of a dark dull-green powder, which diſcharges itſelf through an aperture at the top of the fungus, which aperture is formed of lacerated ſegments, in ſome varieties reflexed. The powder is believed to be the ſeeds, which through a microſcope appear of a ſpherical form, and to be annexed to elaſtic hairs. See *Haller's Hiſt. Helvet. n.* 2172.

Among the numerous varieties of this fungus, the glabrum is moſt remarkable. It is a ſmooth ſeſſile kind, of a nearly ſpherical form, puckered or contracted at the root. This ſometimes grows to an enormous ſize. It has been found in England as big as a man's head; and at Carraria, near Padua in Italy, ſpecimens have been gathered, weighing 25 pounds, and meaſuring two yards in circumference: but its more ordinary ſize is that of a walnut or an apple.

The varieties of this ſpecies have no limits, being frequently found to run into one another; the ſcaly, warty, and echinated coats turning ſmooth as the plants grow old, and the neck of the fungus having no determinate length. The natural colour of the puff-ball is either white, grey, or aſh-coloured: but is ſometimes found yellowiſh, tawny, and browniſh. The internal ſpongy part of it, bound on to wounds, is eſteemed good to ſtop bleedings. Preſſed and dried in an oven, the puff-ball becomes a kind of tinder, the ſmoke of which is ſaid to intoxicate bees. See *Gent. Mag.* July 1766. The Italians fry the great variety, and indeed any of the others when young, and eat them with ſalt and oil, according to the relation of Marſigli.

LYCOPERSICON. See Solanum.

LYCOPODIUM, or club-moss; a genus of the natural order of muſci, belonging to the cryptogamia claſs of plants. The antheræ are bivalved and ſeſſile; there are no calyptra. There are 24 ſpecies; of which the following are the moſt remarkable.

1. The *clavatum*, or common club-moſs, is common in dry and mountainous places, and in fir foreſts. The ſtalk is proſtrate, branched, and creeping, from a foot to two or three yards long; the radicles woody. The leaves are numerous, narrow, lanceolated, acute, often incurved at the extremity, terminated with a long white hair, and every where ſurround the ſtalk. The peduncles are erect, firm, and naked (except being thinly ſet with lanceolate ſcales), and ariſe from the ends of the branches. They are generally two or three inches long, and terminated with two cylindrical yellowiſh ſpikes, imbricated with oval-acute ſcales, finely lacerated on the edges, and ending with a hair. In the *ala* or boſom of the ſcale is a kidney-ſhaped capſule, which burſts with elaſticity when ripe, and throws out a light yellow powder, which, blown into the flame of a candle, flaſhes with a ſmall exploſion. The Swedes make mats of this moſs to rub their ſhoes upon. In Ruſſia, and ſome other countries, the powder of the capſules is uſed in medicine to heal galls in children, chops in the ſkin, and other ſores. It is alſo uſed to powder over officinal pills, and to make artificial lightning at theatres. The Poles make a decoction of the plant, and, dipping a linen cloth into it, apply it to the heads of perſons afflicted with the diſeaſe called the *plica polonica*, which is ſaid to be cured by this kind of fomentation.

2. The *ſelago*, or fir club-moſs, is common in the Highland mountains of Scotland, and in the Hebrides. The ſtalk at the baſe is ſingle and reclining; but a little higher is divided into upright dichotomous branches, from two to ſix inches high, ſurrounded with eight longitudinal oblique ſeries of lanceolate, ſmooth, rigid, imbricated leaves. Near the ſummits of the branches, in the *alæ* of the leaves, are placed ſingle kidney-ſhaped capſules, conſiſting of two valves, which open horizontally like the ſhells of an oyſter,

and caſt out a fine yellow powder. Theſe capſules Linnæus ſuppoſes to be *antheræ*, or male parts of fructification. In the *alæ* alſo of many of the leaves, near the tops of the branches, are often found what the ſame great author calls *female flowers*, but which the ingenious Haller eſteems to be only gems or buds of a future plant. They conſiſt, firſt, of four ſtiff, lanceolate, incurved, minute leaves, one of the outermoſt longer and larger than the reſt. Theſe are ſuppoſed to correſpond to the *calyx* in regular flowers. Again, at the bottom of this *calyx* are five ſmall pellucid ſubſtances reſembling leaves, viſible only by a microſcope, which are ſuppoſed analogous to piſtils. Theſe, in time, grow up into three large broad leaves, two of the five united together like the hoof of an ox; with a third narrower one annexed at the baſe, and two other minute ones oppoſite to the other three. Theſe five leaves are joined at the baſe; and in autumn, falling from the *calyx*, vegetate, and produce a new plant. See a diſſertation *De ſeminibus muſcorum, Amœnit. Academ.* II. p. 261. In the iſland of Raaſay, near Sky, in Roſsſhire, and ſome other places, the inhabitants make uſe of this plant inſtead of alum, to fix the colours in dyeing. The Highlanders alſo ſometimes take an infuſion of it as an emetic and cathartic: but it operates violently; and, unleſs taken in a ſmall doſe, brings on giddineſs and convulſions. Linnæus informs us, that the Swedes uſe a decoction of it to deſtroy lice on ſwine and other animals.

LYCOPOLIS, or LYCON, (anc. geog.) ſo called from the worſhip of wolves. *Lycopolitæ*, the people; *Lycopolites*, the diſtrict. There were two towns of this name, one in the Delta, or Lower Egypt, near the Mediterranean; the other in the Thebais, or Higher Egypt, in the northern part, to the weſt of the Nile

LYCOPHRON, a famous Greek poet and grammarian, born at Colchis in Eubœa, flouriſhed about 304 B. C. and, according to Ovid, was killed by an arrow. He wrote 20 tragedies; but all his works are loſt, except a poem intitled *Caſſandra*, which contains a long train of predictions, which he ſuppoſes to have been made by Caſſandra, Priam's daughter. This poem is extremely obſcure. The beſt edition of it is that of Dr Potter, printed at Oxford in 1697, folio.

LYCOPSIS, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 41ſt order, *Aſperifoliæ*. The corolla has an incurvated tube.

LYCOPUS, in botany: A genus of the monogynia order, belonging to the diandria claſs of plants; and in the natural method ranking under the 42d order, *Verticillatæ*. The corolla is quadrifid, with one of the ſegments emarginated; the ſtamina ſtanding aſunder, with four retuſe ſeeds.

LYCURGIA, a feſtival obſerved by the Spartans, in memory of their lawgiver Lycurgus, whom they honoured with a temple and anniverſary ſacrifice.

LYMPHÆA, were artificial caves or grottos amongſt the Romans, furniſhed with a great many tubes, canals, and various hydraulic apparatus, thro' which the water guſhed out upon the ſpectators unexpectedly whilſt they were admiring the beautiful arrangement of the ſhell-work in the grotto.

LYCURGUS, the celebrated legiſlator of the Spartans, was the ſon of Eunomes king of Sparta. ——He travelled to Greece, to the iſle of Crete, to Egypt, and even to the Indies, to converſe with the ſages and learned men of thoſe countries, and to learn their manners, their cuſtoms, and their laws. After the death of his brother Polydectes, who was king of Sparta, his widow offered the crown to Lycurgus, promiſing that ſhe would make herſelf miſcarry of the child of which ſhe was pregnant, provided he would marry her; but Lycurgus nobly refuſed theſe advantageous offers, and afterwards contented himſelf with being tutor to his nephew Charillus, and reſtored to him the government when he came of age; but notwithſtanding this regular and generous conduct, he was accuſed of a deſign to uſurp the crown. This calumny obliged him to retire to the iſland of Crete, where he applied himſelf to the ſtudy of the laws and cuſtoms of nations. At his return to Lacedemon, he reformed the government: and, to prevent the diſorders occaſioned by luxury and the love of riches, he prohibited the uſe of gold and ſilver; placed all the citizens in a ſtate of equality; and introduced the ſtricteſt temperance, the moſt exact diſcipline, and thoſe admirable laws which (a few excepted) have been celebrated by all hiſtorians. It is ſaid, that, to engage the Lacedemonians to obſerve them inviolably, he made them promiſe with an oath not to change any part of them till his return; and that he afterwards went to the iſland of Crete, where he killed himſelf, after having ordered that his aſhes ſhould be thrown into the ſea, for fear leſt if his body ſhould be carried to Sparta the Lacedemonians would think themſelves abſolved from their oath. He flouriſhed about 870 B. C.

LYDD, a town of Kent in England, two miles and a half ſouth-weſt of Romney, of which town and port it is a member, and 71 miles from London. It is a populous town, with a market on Thurſday, and fair on July 24th. It is incorporated by the name of a bailiff, elected July 22d, jurats, and commonalty. In the beach near Stone-end, is a heap of ſtones, fancied to be the tomb of Criſpin and Criſpianus. And near the ſea is a place called *Holmſtone*, conſiſting of beach and pebble-ſtones, which abounds nevertheleſs with holm trees. Here is a charity ſchool.

LYDGATE (John), called the *Monk of Bury*; not, as Cibber conjectures, becauſe he was a native of that place, for he was born about the year 1380, in the village of Lydgate; but becauſe he was a monk of the Benedictine convent at St Edmund's-Bury. After ſtudying ſome time in our Engliſh univerſities, he travelled to France and Italy; and, having acquired a competent knowledge of the languages of thoſe countries, he returned to London, where he opened a ſchool, in which he inſtructed the ſons of the nobility in polite literature. At what time he retired to the convent of St Edmund's-Bury, does not appear; but he was certainly there in 1415. He was living in 1446, aged about 66; but in what year he died, is not known. Lydgate, according to Pits, was an elegant poet, a perſuaſive rhetorician, an expert mathematician, an acute philoſopher, and a tolerable divine. He was a voluminous writer; and, conſidering the age in which he lived, an excellent poet. His language is leſs obſolete, and his verſification much more harmonious, than the language and verſification of Chaucer, who wrote about half a century before him. He wrote, 1. Hiſtory of the Theban war, printed at the end of Chaucer's works, 1561, 1602, 1687. 2. Poemation of good counſel; at the end of Chaucer's works. 3. The life of Hector; London 1594, fol. printed by Groſs, dedicated to Henry V. 3. Life of the Bleſſed Virgin; printed by Caxton. 4. The proverbs of Lydgate upon the fall of princes; printed by Wink. Word. Lond. . . . . 4to. 5. Diſpute of the horſe, the ſheep, and the gooſe; printed in Caxton's Collect. 4to. 6. The temple of braſs; among the works of Chaucer. 7. London lickpenny; *vide* Stowe's hiſtory, &c. &c. Beſides an incredible number of other poems and tranſlations preſerved in various libraries, and of which the reader will find a catalogue in biſhop Tanner.

LYDIA (anc. geog.), a celebrated kingdom of Aſia Minor.—All the ancient writers tell us, that Lydia was firſt called *Mæonia* or *Meonia*, from Meon king of Phrygia and Lydia; and that it was known under no other deuomination till the reign of Atys, when it began to be called *Lydia* from his ſon Lydus. Bochart finding in his learned collection of Phœnician words the verb *luz*, ſignifying "to wind," and obſerving that the country we are ſpeaking of is watered by the Mæander ſo famous for its windings, concludes that it was thence named *Lydia*, or *Ludia*. As to the ancient name of Mæonia, he takes it to be a Greek tranſlation of the Phœnician word *lud;* wherein he agrees in ſome meaſure with Stephanus, who derives the name of Mæonia from Mæon the ancient name of the Mæander. Some take the word *mæonia* to be a tranſlation of a Hebrew word ſignifying "metal," becauſe that country, ſay they, was in former times enriched above any other with mines. Though Lydia and Mæonia are by moſt authors indifferently uſed for one and the ſame country, yet they are ſometimes diſtinguiſhed; that part where mount Tmolus ſtood, watered by the Pactolus, being properly called *Mæonia;* and the other, lying on the coaſt, *Lydia*. This diſtinction is uſed by Homer, Callimachus, Dionyſius, and other ancient writers. In after ages, when the Ionians, who had planted a colony on the coaſt of the Egean Sea, began to make ſome figure, that part was called *Ionia*, and the name of *Lydia* given to the ancient Mæonia.—Lydia, according to Pliny, Ptolemy, and other ancient geographers, was bounded by the Myſia Major on the north, by Caria on the ſouth, by Phrygia Major on the eaſt, and Ionia on the weſt, lying between the 37th and 39 degrees of north latitude. What the ancients ſtyle the kingdom of *Lydia* was not confined within theſe narrow boundaries, but extended from Halys to the Egean ſea. Pliny's deſcription includes Æolia, lying between the Hermus and the Caicus.

As to the origin of the Lydians, Joſephus, and after him all the eccleſiaſtic writers, derive them from Lud Shem's fourth ſon; but this opinion has no other foundation than the ſimilitude of names. Some of the ancients will have the Lydians to be a mixed colony of Phrygians, Myſians, and Carians. Others finding ſome conformity in religion and religious ceremonies between the Egyptians and Tuſcans who were a Lydian colony, conclude them, without any farther evidence, to be originally Egyptians. All we know for certain is, that the Lydians were a very ancient nation, as is manifeſt from their very fables; for Atys, Tantalus, Pelops, Niobe, and Arachne, are all ſaid to have been the children of Lydus. And Zanthus in his *Lydiaca*, quoted by Stephanus, informs us, that the ancient city of Aſcalon, one of the five ſatrapies of the Philiſtines, mentioned in the books of Joſhua and the Judges, was built by one Aſcalus a Lydian, whom Achiamus king of Lydia had appointed to command a body of troops which he ſent, we know not on what occaſion, into Syria. The Heraclidæ, or kings of Lydia, deſcended from Hercules, began to reign before the Trojan war; and had been preceded by a long ſeries of ſovereigns ſprung from Atys, and hence ſtyled *Atyadæ:* a ſtrong proof of the antiquity of that kingdom.

The Lydians began very early to be ruled by kings whoſe government ſeems to have been truly deſpotic and the crown hereditary. We read of three diſtinct races of kings reigning over Lydia, viz. the Atyadæ, the Heraclidæ, and the Mermnadæ.

The *Atyadæ* were ſo called from Atys the ſon of Cotys and grandſon of Manes the firſt Lydian king. But the hiſtory of this family is obſcure and fabulous.

The Atyadæ were ſucceeded by the *Heraclidæ*, or the deſcendants of Hercules. For Hercules being, by the direction of the oracle, ſold as a ſlave to Omphale a queen of Lydia to expiate the murder of Iphitus, had, during his captivity, by one of her ſlaves, a ſon named *Cleolaus*, whoſe grandſon Argon was the firſt of the Heraclidæ that aſcended the throne of Lydia. This race is ſaid to have reigned 505 years, the father ſucceeding the ſon for 22 generations. They began to reign about the time of the Trojan war. The laſt of the family was the unhappy Candaules, who loſt both his life and kingdom by his imprudence. An event of which we have the following account by Herodotus. Candaules had a wife whom he paſſionately loved, and believed the moſt beautiful of her ſex. He extolled her charms to Gyges his favourite, whom he uſed to entruſt with his moſt important affairs; and the more to convince him of her beauty, reſolved to ſhow her to him quite naked: he accordingly placed him in the porch of her chamber where the queen uſed to undreſs when ſhe went to bed, ordering him to retire after he ſhould have ſeen her, and take all poſſible care not to be obſerved. But notwithſtanding all the caution he could uſe, ſhe plainly diſcovered him going out; and though ſhe did not doubt but it was her huſband's contrivance, yet ſhe paſſed that night in a ſeeming tranquillity, ſuppreſſing her reſentment till next morning, while ſhe ſent for Gyges, and reſolutely told him that he muſt either by his death atone for the criminal action he had been guilty of, or put to death Candaules the contriver of it, and receive both her and the kingdom of Lydia for his reward. Gyges at firſt earneſtly begged of her that ſhe would not drive him to the neceſſity of ſuch a choice. But finding that he could not prevail with her, and that he muſt either kill his maſter or die himſelf, he choſe the former part of the alternative. Being led by the queen to the ſame place where her huſband had poſted him the night before, he ſtabbed the king while he was aſleep, married the queen, and took poſſeſſion of the kingdom, in which he was confirmed by the anſwer of the Delphic oracle. The Lydians having taken up arms to revenge the death of their prince, an agreement was made between them and the followers of Gyges, that if the oracle ſhould declare him to be lawful king of Lydia he ſhould be permitted to reign; if not, he ſhould reſign the crown to the Heraclidæ. The anſwer of the oracle proving favourable to Gyges, he was univerſally acknowledged for lawful king of Lydia. Candaules is ſaid to have purchaſed a picture painted by Bularchas, repreſenting a battle of the Magnetes, for its weight in gold; a circumſtance which ſhows how early the art of painting began to be in requeſt, for Candaules was cotemporary with Romulus.

Gyges having thus poſſeſſed himſelf of the kingdom of Lydia, ſent many rich and valuable preſents to the oracle of Delphos, among others, ſix cups of gold weighing 30 talents, and greatly eſteemed for the workmanſhip. He made war on Miletus and Smyrna, took the city of Colophon, and ſubdued the whole country of Troas. In his reign, and by his permiſſion, the city of Abydus was built by the Mileſians. Plutarch and other writers relate his acceſſion to the crown of Lydia in a quite different manner, and tell us, without making any mention of the queen, that Gyges rebelled againſt Candaules and ſlew him in an engagement. In Gyges began the third race called *Mermnadæ;* who were alſo, properly ſpeaking, Heraclidæ, being deſcended from a ſon of Hercules by Omphale. Gyges reigned 38 years, and was ſucceeded by his ſon Ardyes.

This prince carried on the war againſt the Mileſians which his father had begun, and poſſeſſed himſelf of Priene, in thoſe days a ſtrong city. In his reign the Cimerians invaded and over-run all Aſia Minor; but what battles were fought between the Lydians and theſe invaders, and with what ſucceſs, we find no where mentioned. Herodotus only informs us, that in the time of Ardyes they poſſeſſed themſelves of Sardis, the metropolis of Lydia, but could never reduce the caſtle. Ardyes reigned 49 years, and was ſucceeded by his ſon Sadyattes, who reigned 12 years, and warred moſt part of his reign with the Mileſians.

After him came his ſon Alyattes, who for the ſpace of five years continued the war which his father had begun againſt the Mileſians, ravaging their country, and about harveſt time carrying away all their corn yearly, in order to oblige them, for want of proviſions, to ſurrender their city, which he knew he could not reduce any other way, the Mileſians being at that time maſters of the ſea. In the 12th year of this war the Lydians having ſet fire to the corn in the fields, the flames were carried by a violent wind, which happened to blow at that time, to the temple of Minerva at Aſſeſus, and burnt it down to the ground. Not long after, Alyattes falling ſick, ſent to conſult the oracle at Delphos; which refuſed to return any anſwer till ſuch time as the king ſhould rebuild the temple of Minerva at Aſſeſus. Alyattes, thus warned, diſpatched ambaſſadors to Miletus, enjoining them to conclude a truce with the Mileſians till the temple ſhould be rebuilt. On the arrival of the ambaſſadors, Thraſybulus, then king of Miletus, commanded all the corn that was at that time in the city to be brought into the market-place, ordering the citizens to banquet in public, and revel as if the city were plentifully ſtored with all manner of proviſions. This ſtratagem Thraſybulus practiſed, to the end that the ambaſſadors ſeeing ſuch quantities of corn, and the people every where diverting themſelves, might acquaint their maſter with their affluence, and divert him from purſuing the war. As Thraſybulus had deſigned, ſo it happened; for Alyattes, who believed the Mileſians greatly diſtreſſed for proviſions, receiving a different account from his ambaſſadors, changed the truce into a laſting peace, and ever afterwards lived in amity and friendſhip with Thraſybulus and the Mileſians. He was ſucceeded, after a reign of 57 years, by his ſon Crœſus, whoſe uninterrupted proſperity, in the firſt years of his reign, far eclipſed the glory of all his predeceſſors. He was the firſt that made war on the Epheſians, whoſe city he beſieged and took notwithſtanding their conſecrating it to Diana, and faſtening the walls by a rope to her temple, which was ſeven ſtadia diſtant from the city. After the reduction of Epheſus, he attacked, under various pretences, the Ionians and Æolians, obliging them, and all the other Greek ſtates of Aſia, to pay him a yearly tribute. Having met with ſuch extraordinary ſucceſs by land, the Lydian prince determined to render his power equally conſpicuous by ſea. For this purpoſe he thought ſeriouſly of equipping a fleet; with which he purpoſed to invade and conquer the Grecian iſlands directly fronting his dominions. But this deſign, which, conſidering the ſlow progreſs in maritime power among the nations moſt diligent to attain it, would probably have failed of ſucceſs, was prevented by the advice of a philoſophical traveller conveyed in ſuch a lively turn of wit, as eaſily changed the reſolution of the king. Bias of Priené in Ionia, ſome ſay Pittacus of Mitylene in the iſle of Leſbos, while he travelled after the Grecian cuſtom, from curioſity and a love of knowledge, was preſented to Crœſus at the Lydian court; and being aſked by that prince what news from Greece; he anſwered with a republican freedom, that the iſlanders had collected powerful ſquadrons of cavalry with an intention of invading Lydia. “ May the gods grant (ſaid Crœſus), that the Greeks, who are unacquainted with horſemanſhip, ſhould attack the diſciplined valour of the Lydian cavalry; there would ſoon be an end to the conteſt.” “ In the ſame manner (replied Bias), as if the Lydians, who are totally unexperienced in naval affairs, ſhould invade the Grecians by ſea.” Struck by the acuteneſs of this unexpected obſervation, Crœſus deſiſted from his intended expedition againſt the iſlands, and inſtead of employing new means for extending his conqueſts, determined peaceably to enjoy the laurels which he had won, and to diſplay the grandeur which he had attained. But his happineſs was ſoon after allayed by the death of his favourite ſon Atys, who was unfortunately killed at the chace of a wild boar. For this loſs he continued diſconſolate for two years and in a ſtate of inaction, till the conqueſts of Cyrus, and growing power of the Perſians, rouſed up his martial ſpirit, and diverted his mind to other thoughts. He apprehended that the ſucceſs which attended Cyrus in all his undertakings, might at laſt prove dangerous to himſelf, and therefore reſolved to put a ſtop, if poſſible, to his progreſs. In taking this reſolution, which might probably be attended with the moſt important conſequences, he was deſirous to learn the will of heaven concerning the iſſue of the war. The principal oracles which he conſulted were thoſe of Branchis in Ionia, of Hammon in Libya, and of Delphi in Greece. Among theſe reſpected ſhrines, the oracle of Delphi maintained its aſcendant, as the moſt faithful interpreter of fate. Crœſus was fully perſuaded of its veracity; and deſirous generouſly to compenſate for the trouble which he had already given, and ſtill meant to give, the prieſts of Apollo, he ſacrificed 3000 oxen to the god, and adorned his ſhrine with dedications equally valuable for the workmanſhip and for the materials; precious veſſels of ſilver, ewers of iron beautifully inlaid and enamelled; various ornaments of pure gold, particularly a golden lion weighing ten talents, and a female figure three cubits or near five feet high. In return for theſe magnificent preſents, the oracle, in ambiguous language, flattered Crœſus with obtaining an eaſy victory over his enemies, and with enjoying a long life and a proſperous reign. The god at the ſame time enjoined him to contract an alliance with the moſt powerful of the Grecian ſtates.

Elevated with theſe favourable predictions of Apollo, Crœſus prepared to yield a ready obedience to the only condition required on his part for the accompliſhment of his aſpiring purpoſe. Not deeming himſelf ſufficiently acquainted with the affairs of Greece, to know what particular republic was meant by the oracle, he made particular inquiry of thoſe beſt informed concerning the ſtate of Europe; and diſcovered, that among all the members of the Grecian confederacy, the Athenians and Lacedemonians were juſtly intitled to the pre-eminence. In order to learn which of theſe communities deſerved the epithet of *moſt powerful*, it was neceſſary to ſend ambaſſadors into Greece. The Lydians diſpatched with this important commiſſion, ſoon diſcovered that the Athenians, after having been long haraſſed by internal diſſenſions, were actually governed by the tyrant Piſiſtratus. The Spartans, on the other hand, though anciently the worſt regulated of all the Grecian communities, had enjoyed domeſtic peace and foreign proſperity ever ſince they had adopted the wiſe inſtitutions of Lycurgus. After that memorable period, they had repeatedly conquered the warlike Argives, triumphed over the hardy Arcadians; and notwithſtanding the heroic exploits of Ariſtomenes, ſubdued and enſlaved their unfortunate rivals of Meſſene. To the Lydian ambaſſadors, therefore, the Spartan republic appeared to be pointed out by the oracle as the community whoſe alliance they were enjoined to ſolicit. Having repaired accordingly to Sparta, they were introduced not only to the kings and ſenate, but, as the importance of the negociation required, to the general aſſembly of the Lacedemonians, to whom they, in few words, declared the object of their commiſſion: "We are ſent, O Lacedemonians! by Crœſus, king of the Lydians and of many other nations, who being commanded by the oracle of Apollo to ſeek the friendſhip of the moſt powerful people of Greece, now ſummons you, who juſtly merit that epithet, to become his faithful allies, in obedience to the will of the god whoſe authority you acknowledge." The Lacedemonians, pleaſed with the alliance of a warlike king, and ſtill more with the fame of their valour, readily accepted the propoſal. To the ſtrict connection of an offenſive and defenſive league, they joined the more reſpected ties of ſacred hoſpitality. A few years before this tranſaction, they had ſent to purchaſe gold at Sardis for making a ſtatue of Apollo. Crœſus had on that occaſion gratuitouſly ſupplied their want. Remembering this generoſity, they gave the Lydian ambaſſadors at their departure, as a preſent for their maſter, a veſſel of braſs containing 300 amphoras (above 12 hogſheads), and beautifully carved on the outſide with various forms of animals.

Crœſus, having thus happily accompliſhed the deſign recommended by the oracle, was eager to ſet out upon his intended expedition. He had formerly entered into alliance with Amaſis king of Egypt, and Labynetus king of Babylon. He had now obtained the friendſhip of the moſt warlike nation of Europe. The newly-raiſed power of Cyrus and the Perſians ſeemed incapable of reſiſting ſuch a formidable confederacy.

Elevated with theſe flattering ideas of his own invincible greatneſs, Crœſus waited not to attack the Perſian dominions until he had collected the ſtrength of his allies. The ſanguine impetuoſity of his temper, unexperienced in adverſity, unfortunately precipitated him into meaſures no leſs ruinous than daring. Attended only by the arms of Lydia, and a numerous band of mercenaries, whom his immenſe wealth enabled him at any time to call into his ſervice, he marched towards the river Halys; and having croſſed with much difficulty that deep and broad ſtream, entered the province of Cappadocia, which formed the weſtern frontier of the Median dominions. That unfortunate country ſoon experienced all the calamities of invaſion. The Pterian plain, the moſt beautiful and the moſt fertile diſtrict of Cappadocia, was laid waſte; the ports of the Euxine, as well as ſeveral inland cities, were plundered; and the inoffenſive inhabitants were either put to the ſword or dragged into captivity. Encouraged by the unreſiſting ſoftneſs of the natives of thoſe parts, Crœſus was eager to puſh forwards; and if Cyrus did not previouſly meet him in the field, he had determined to proceed in triumph to the mountains of Perſia. Againſt this dangerous reſolution he was in vain exhorted by a Lydian named Sandanis; who, when aſked his opinion of the war, declared it with that freedom which the princes of the Eaſt have in every age permitted, amidſt all the pride and caprices of deſpotic power, to men diſtinguiſhed by the gifts of nature or education. "You are preparing, O king, to march againſt a people who lead a laborious and a miſerable life; whoſe daily ſubſiſtence is often denied them, and is always ſcanty and precarious; who drink only water, and who are clothed with the ſkins of wild beaſts. What can the Lydians gain by the conqueſt of Perſia; they who enjoy all the advantages of which the Perſians are deſtitute? For my part, I deem it a bleſſing of the gods, that they have not excited the warlike poverty of theſe miſerable barbarians to invade and plunder the luxurious wealth of Lydia." The moderation of this advice was rejected by the fatal preſumption of Crœſus; who confounding the dictates of experienced wiſdom with the mean ſuggeſtions of puſillanimity, diſmiſſed the counſellor with contempt.

Meanwhile, the approach of Cyrus, who was not of a temper to permit his dominions to be ravaged with impunity, afforded the Lydian king an opportunity of bringing the war to a more ſpeedy iſſue than by his intended expedition into Perſia. The army of Cyrus gradually augmented on his march; the tributary princes cheerfully contributing with their united ſtrength towards the aſſiſtance of a maſter whoſe valour and generoſity they admired, and who now took arms to protect the ſafety of his ſubjects, as well as to ſupport the grandeur of his throne. Such was the rapidity of his movement, eſpecially after being informed of the deſtructive ravages of the enemy in Cappadocia, that he arrived from the ſhores of the Caſpian to thoſe of the Euxine Sea before the army of Crœſus had provided the neceſſaries for their journey. That prince, when appriſed of the neighbourhood of the Perſians, encamped on the Pterian plain; Cyrus likewiſe encamped at no great diſtance: frequent ſkirmiſhes happened between the light troops; and at length a general engagement was fought with equal fury and perſeverance, and only terminated by the darkneſs of night. The loſs on both ſides hindered a renewal of the battle. The numbers, as well as the courage of the Perſians, much exceeded the expectation of Crœſus. As they diſcovered not any intention to haraſs his retreat, he determined to move back towards Sardis, to ſpend the winter in the amuſements of his palace; and after ſummoning his numerous allies to his ſtandard, to take the field early in the ſpring with ſuch increaſe of force as ſeemed ſufficient to overpower the Perſians.

But this deſign was defeated by the careful vigilance of Cyrus. That experienced leader allowed the enemy to retire without moleſtation; carefully informing himſelf of every ſtep which they took, and of every meaſure which they ſeemed determined to purſue. Patiently watching the opportunity of a juſt revenge, he waited until Crœſus had re-entered his capital, and had diſbanded the foreign mercenaries, who compoſed the moſt numerous diviſion of his army. It then ſeemed the proper time for Cyrus to put his Perſians in motion; and ſuch was his celerity, that he brought the firſt news of his own arrival in the plain of Sardis. Crœſus, whoſe firmneſs might well have been ſhaken by the imminence of this unforeſeen danger, was not wanting on the preſent occaſion to the duties which he owed to his ſame and the luſtre of the Lydian throne. Though his mercenaries were diſbanded, his own ſubjects, who ſerved him from attachment, who had been long accuſtomed to victory, and who were animated with a high ſenſe of national honour, burned with a deſire of enjoying an opportunity to check the daring inſolence of the invaders. Crœſus indulged and encouraged this generous ardour. The Lydians in that age fought on horſeback, armed with long ſpears; the ſtrength of the Perſians conſiſted in infantry. They were ſo little accuſtomed to the uſe of horſes, that camels were almoſt the only animals which they employed as beaſts of burden. This circumſtance ſuggeſted to a Mede, by name Harpagus, a ſtratagem, which being communicated to Cyrus, was immediately adopted with approbation by that prince. Harpagus, having obſerved that horſes had a ſtrong averſion to the ſhape and ſmell of camels, adviſed the Perſian army to be drawn up in the following order: All the camels which had been employed to carry baggage and proviſions were collected into one body, arranged in a long line fronting the Lydian cavalry. The foot ſoldiers of the Perſians were poſted immediately behind the line, and placed at a due diſtance. The Median horſe (for a few ſquadrons of theſe followed the ſtandard of Cyrus) formed the rear of the army. As the troops on both ſides approached to join battle, the Lydian cavalry, terrified at the unuſual appearance of the camels, mounted with men in arms, were thrown into diſorder, and turning their heads, endeavoured to eſcape from the field. Crœſus, who perceived the confuſion, was ready to deſpair of his fortune; but the Lydians, abandoning their horſes, prepared with uncommon bravery to attack the enemy on foot. Their courage deſerved a better fate; but unaccuſtomed as they were to this mode of fighting, they were received and repelled by the experienced valour of the Perſian infantry, and obliged to take refuge within the fortified ſtrength of Sardis, where they imagined themſelves ſecure. The walls of that city bid defiance to the rude art of attack, as then practiſed by the moſt warlike nations. If the Perſian army ſhould inveſt it, the Lydians were provided with proviſions for ſeveral years; and there was reaſon to expect, that in a few months, and even weeks, they would receive ſuch aſſiſtance from Egypt, Babylonia, and Greece (to which countries they had already ſent ambaſſadors), as would oblige the Perſians to raiſe the ſiege.

The Lydian miniſters diſpatched into Greece met with great ſympathy from the Spartans. That people were particularly obſervant of the faith of treaties; and while they puniſhed their enemies with unexampled ſeverity, they behaved with generous compaſſion towards thoſe whom they had once accepted for allies. They immediately reſolved therefore to ſend him a ſpeedy and effectual relief; and for this purpoſe aſſembled their troops, made ready their veſſels, and prepared every thing neceſſary for the expedition.

The valour of the Spartans might perhaps have upheld the ſinking empire of Lydia; but before their armament could ſet ſail, Crœſus was no longer a ſovereign. Notwithſtanding the ſtrength of Sardis, that city had been taken by ſtorm on the 20th day of the ſiege; the walls having been ſcaled in a quarter which, appearing altogether inacceſſible, was too careleſsly guarded. This was effected by the enterpriſe of Hyreades a Mede, who accidentally obſerved a centinel deſcend part of the rock in order to recover his helmet. Hyreades was a native of the mountainous province of Mardia, and being accuſtomed to clamber over the dangerous precipices of his native country, reſolved to try his activity in paſſing the rock upon which he had diſcovered the Lydian. The deſign was more eaſily accompliſhed than he had reaſon to expect: emulation and ſucceſs encouraged the braveſt of the Perſians to follow his example; theſe were ſupported by greater numbers of their countrymen; the garriſon of Sardis was ſurpriſed; the citadel ſtormed;

the rich capital of Lower Aſia ſubjected to the vengeful rapacity of an indignant victor. Thus ended the ancient kingdom of Lydia, which continued ſubject to the Perſians till they alſo were conquered by the Macedonians.—For the fate of the Lydian monarch, ſee the article CROESUS.

LYDIAT (Thomas), a learned Engliſh divine, born in 1572, and educated at Oxford. About the year 1609, he became acquainted with Dr James Uſher, afterwards archbiſhop of Armagh, who carried him to Ireland. He was at Dublin college for about two years, after which he returned to England; and the rectory of Alkrington becoming vacant, he was preſented to it: but at length, being engaged for the debts of a near relation, which for the preſent he was unable to pay, having before ſpent his patrimony in printing ſeveral books, he was ſent to priſon; and was confined at Oxford, in the King's-bench, and elſewhere, till Sir William Boſwell, a generous patron of learned men, Dr Robert Pink, warden of New-college, biſhop Uſher, and Dr Laud, diſcharged the debt. In the civil wars, he ſuffered much in his rectory of Alkrington from the parliament-party; was four times pillaged to the value of at leaſt 70 l.; and was forced for a quarter of a year together to borrow a ſhirt to ſhift himſelf. He died in 1646. He wrote ſome pieces in Engliſh, and many works in Latin, on chronology and natural hiſtory.

LYDIUS LAPIS, in the natural hiſtory of the ancients; the name of the ſtone uſed by way of touchſtone for the trial of gold and ſilver, and called by ſome *Heraclius lapis;* both of which names were alſo applied by the ancients to the load-ſtone; and hence has ariſen no ſmall miſunderſtanding of their works. Pliny has obſerved, that both the load-ſtone and touch-ſtone were at times called *Lydius* and *Heraclius lapis.*

The true *lapis Lydius*, or the touchſtone, was anciently found only in the river Tmolus; but was afterwards found in many other places, and is now very common in many of the German rivers. The ancients give us very remarkable and circumſtantial accounts of the uſes they made of it; and it is plain they were able to diſcern the alloys of gold by means of it with very great exactneſs. We at preſent uſe ſeveral different ſtones under this name, and for the ſame purpoſe. In Italy, a green marble called *verdello*, is moſt frequently uſed; and with us, very frequently ſmall pieces of the *baſaltes*, the ſame with that vaſt piece of black marble called the *Giant's Cauſeway* in Ireland. See BASALTES; *GIANT's Cauſeway;* ICELAND, n° 5; STAFFA; and VOLCANO.

LYGEUM, in botany: a genus of the monogynia order, belonging to the triandria claſs of plants; and in the natural method ranking under the fourth order, *Gramina.* The ſpatha or ſheath is monophyllous; there are a pair of corollæ upon the ſame germen; the nut is bilocular.

LYGII, LIGII, *Lugii*, or *Logiones* (anc. geog.), a people of Germany, to the weſt of the Viſtula, where it forms a bend like a creſcent; *Ligii*, (Dio); *Lugii*, (Strabo); *Logiones*, (Zoſimus). Their name *Lugii* is conjectured to be derived from their mutually cloſe confederacy or league. The Viſtula was their boundary to the north, eaſt, and ſouth, with mount Aſciburgius to the weſt. Now the whole of that country lies in Poland, on this ſide the Viſtula.

LYING-IN-WOMEN. See MIDWIFERY.

LYING-To, or *Lying-By*, the ſituation of a ſhip, when ſhe is retarded in her courſe, by arranging the ſails in ſuch a manner as to counteract each other with nearly an equal effort, and render the ſhip almoſt immoveable, with reſpect to her progreſſive motion, or head-way. A ſhip is uſually brought-to by the main and fore-top ſails, one of which is laid aback, whilſt the other is full; ſo that the latter puſhes the ſhip forward, whilſt the former reſiſts this impulſe by forcing her aſtern. This is particularly practiſed in a general engagement, when the hoſtile fleets are drawn up in two lines of battle oppoſite each other. It is alſo uſed to wait for ſome other ſhip, either approaching or expected; or to avoid purſuing a dangerous courſe, eſpecially in dark or foggy weather, &c.

LYME-REGIS a ſea-port town of Dorſetſhire in England, 148 miles from London. It lies near the ſea, on the very borders of Devonſhire, in a cavity between two rocky hills, which makes it difficult of acceſs. It is about five furlongs long, and contains about 200 houſes. As it lies on the declivity of a hill, the houſes make a good ſhow, one above another; and ſome of them are built of freeſtone, and covered with blue ſlate. The corporation conſiſts of a mayor (who is juſtice of peace during his mayoralty and the year after, and in the third year both juſtice and coroner), a recorder, 15 capital burgeſſes, and a town-clerk. This place had formerly a very flouriſhing trade to France, Spain, the Straits, Newfoundland, and the Weſt Indies; during which, the cuſtoms amounted ſome years to 16,000l. But it ſtands on ſuch a high ſteep rock, that the merchants are obliged to load and unload their goods at a place a quarter of a mile off, called the *Cobb*, originally built in the reign of Edward III. which coſts a great ſum to maintain, but forms ſuch a harbour as perhaps is not to be equalled in the world, the ſhips being ſheltered by a high thick ſtone wall, raiſed in the main ſea a good way from the ſhore, broad enough for carriages and warehouſes, and the cuſtom-houſe officers have one upon it. The cellars of the low part of the town, near the ſea, are however often overflowed by the ſpring-tides 10 or 12 feet. There are guns planted for defence both of the Cobb and the town, the ſhore here being very proper for batteries. The cuſtom-houſe ſtands on pillars, with the corn-market under it. There is an alms-houſe in church-ſtreet, alſo Preſbyterian and Anabaptiſt meeting-houſes. The town-hall is near Broad-ſtreet. The church ſtands at the eaſt end of the town on a riſing ground. The market here is Friday, and there are two fairs in the year. We read, that, in 774, the Saxon King Kinwulf gave land hereabouts to the church of Sherborn, for the boiling of ſalt there to ſupply its neceſſities. At this place the duke of Monmouth landed in 1685. A few years ago above 2000l. worth of gold and ſilver coin of Char. I. and II. were diſcovered by ſome labourers.

LYMINGTON, a borough-town of Hampſhire in England, 97 miles ſouth-weſt of London. It ſtands about a mile from the channel, running between the main land and the iſle of Wight; and has a harbour for

for veſſels of conſiderable burden. The tide flows near a mile above the town. It has a market on Saturdays, and two fairs in the year; and ſends two members to parliament.

LYMPH, a fine colourleſs fluid, ſeparated in the body from the maſs of blood, and contained in peculiar veſſels called *lymphatics*. See ANATOMY.

LYMPHATI, was a name given by the Romans to ſuch as were ſeized with madneſs. It is ſuppoſed to be uſed for *Nymphati*, becauſe the ancients imagined that every perſon who had the misfortune to ſee a nymph was inſtantly ſtruck with phrenzy. *Lymphati* may indeed ſignify "madmen," as derived from *lympha*, "water," over which element the nymphs were thought to preſide: But it appears moſt likely, that diſtracted people were called *lymphati*, from the circumſtance of madmen's being affected with the *hydrophobia* or dread of water after the bite of a mad dog; for this peculiarity, in caſes of canine madneſs, was not unknown to the Romans.

LYNCEUS, in fabulous hiſtory, one of the 50 ſons of Ægeus, married Hypermneſtra, one of the 50 daughters of Danaus. See HYPERMNESTRA.

LYNCEUS, in fabulous hiſtory, one of the Argonauts, who went with Jaſon in the expedition to obtain the golden fleece. He was of great uſe to the Argonauts, by enabling them to avoid the ſand-banks and rocks they found in their way. The poets ſay, that Lynceus had ſo piercing a ſight, that it could not only penetrate to the bottom of the ſea, but even to hell. Some mythologiſts ſuppoſe, that this fable is taken from Lynceus's ſkill in obſerving the ſtars, and diſcovering the mines of gold and ſilver concealed in the earth.

LYNCURIUM, a ſtone thought to be the ſame with the tourmalin. The name is derived from λυγξ, "lynx," and ουρον, "urine."

LYNCURIUS LAPIS, a ſtone capable of producing muſhrooms.

In the Ephemerides of the Curious we find mention made of a ſtone, ſo called by Dr John George Wolckamerus, who ſaw one in Italy, which never ceaſes to produce in a few days muſhrooms of an excellent flavour by the moſt ſimple and eaſy proceſs imaginable. "It is (ſays he) of the bigneſs of an ox's head, rough and uneven on its ſurface, and on which alſo are perceived ſome clefts and crevices. It is black in ſome parts, and in others of a lighter and greyiſh colour. Internally it is porous, and nearly of the nature of the pumice-ſtone, but much heavier; and it contains a ſmall piece of flint, which is ſo incorporated with it as to appear to have been formed at the ſame time the ſtone itſelf received its form. This gives room to judge, that thoſe ſtones have been produced by a fat and viſcid juice, which has the property of indurating whatever matter it filtrates into. The ſtone here ſpoken of, when it has been lightly covered with earth, and ſprinkled with warm water, produces muſhrooms of an exquiſite flavour, which are uſually round, ſometimes oval, and whoſe borders, by their inflexions and different curvities, repreſent in ſome meaſure human ears. The principal colour of theſe muſhrooms is ſometimes yellowiſh, and ſometimes of a bright purple; but they are always diſſeminated with different ſpots, of a deep orange colour, or red brown; and when theſe ſpots are recent, and ſtill in full bloom, they produce a very agreeable effect to the ſight. But what appears admirable is, that the part of the ſtalk which remains adhering to the ſtone, when the muſhroom has been ſeparated from it, grows gradually hard, and petrifies in time, ſo that it ſeems that this fungites reſtores to the ſtone the nutritive juice it received from it, and that it thus contributes to its increaſe." John Baptiſt Porta pretends, that this ſtone is found in ſeveral parts of Italy; and that it is not only to be met with at Naples, taken out of mount Veſuvius, but alſo on mount Pantherico, in the principality of Arellino; on mount Garganus, in Apulia; and on the ſummit of ſome other very high mountains. He adds, that the muſhrooms which grow on thoſe ſorts of ſtones, and are uſually called *fungi lyncurii*, have the property of diſſolving and breaking the ſtone of the kidneys and bladder; and that, for this purpoſe, nothing more is required than to dry them in the ſhade, and being reduced to powder, to make the patient, faſting, take a ſufficient quantity of this powder in a glaſs of white-wine, which will ſo cleanſe the excretory ducts of the urine, that no ſtones will ever after be collected in them. As to the form of thoſe muſhrooms, their root is ſtony, uneven, divided according to its longitudinal direction, and compoſed of fibres as fine as hairs, interwoven one with another. Their form, on firſt ſhooting out, reſembles a ſmall bladder, ſcarce then larger than the bud of a vine; and if in this ſtate they are ſqueezed between the fingers, an aqueous ſubacid liquor iſſues out. When they are at their full growth, their pedicle is of a finger's length, larger at top than at bottom, and becomes inſenſibly ſlenderer in proportion as it is nearer the earth. Theſe muſhrooms are alſo formed in an umbella, and variegated with an infinity of little ſpecks ſituated very near one another. They are ſmooth and even on the upper part, but underneath leafy like the common muſhrooms. Their taſte is likewiſe very agreeable, and the ſick are not debarred eating of them when they have been dreſſed in a proper manner. Curioſity having prompted ſome naturaliſts and phyſicians to ſubmit theſe ſtones to a chemical analyſis, in order to be more competent judges of the uſes they might be put to in medicine, there firſt came forth, by diſtillation, an inſipid water, and afterwards a ſpirituous liquor. The retort having been heated to a certain point, there aroſe an oil, which had nearly the ſmell and taſte of that of guaiacum; and a very acrid ſalt was extracted from the aſhes.

LYNN-REGIS, a town of Norfolk, in England, diſtant 98 miles from London. It is a handſome, large, well-built place, and ſends two members to parliament. It was a borough by preſcription in 1298. King John, on account of its adherence to him againſt the barons, made it a free borough, with large privileges. He appointed it a provoſt, and gave it a large ſilver cup of 73 ounces doubly gilt and enamelled, and a large ſilver ſword that is carried before the mayor; though this laſt, according to ſome, is Henry VIII.'s ſword, which he gave to the town when it came into his hands by exchange with the biſhop of Norwich; after which it was called King's Lynn, whereas before it was Biſhop's Lynn. Henry III. made it a mayor-town, for its ſerving him againſt the barons.

It has had 15 royal charters; and is governed by a mayor, high-ſteward, under-ſteward, recorder, 12 aldermen, and 18 common-council men. It has two churches, beſides St Nicholas, a chapel of eaſe to St Margaret's, a preſbyterian and a quakers meeting-houſe, with a bridewell or workhouſe, and ſeveral alms-houſes, and a free-ſchool. In September 1741 the ſpires of its two churches were both blown down by a ſtorm of wind; and that of St Margaret's, which was 193 feet in height, having beat in the body of the church, it has been ſince rebuilt, towards which king George II. gave L.1000, and the late earl of Orford, then Sir Robert Walpole, L.500. This church was formerly an abbey, and afterwards one of the largeſt pariſh-churches in England. The town-houſe, called Trinity-hall, is a noble old fabric; and ſo is the Exchange, which is of free-ſtone, with two orders of columns. St Nicholas's chapel is very ancient, and reckoned one of the faireſt and largeſt of the kind in England. It has a bell-tower of free-ſtone, and an eight-ſquare ſpire over it, both which together are 170 feet from the ground. There is a library in it that was erected by ſubſcription; and there is another at St Margaret's. Here have been formerly ſeveral monaſteries; but the only fabric remaining that belongs to any religious order is the Grey-friars ſteeple, a noted ſea-mark. The ſituation of this town, near the fall of the Ouſe into the ſea, after having received ſeveral other rivers, of which ſome are navigable, gives it an opportunity of extending its trade into eight different counties; by which many conſiderable cities and towns, viz. Peterborough, Ely, Stamford, Bedford, St Ives, Huntingdon, St Neot's, Northampton, Cambridge, St Edmundſbury, and the north part of Bucks, as well as the inland parts of Norfolk and Suffolk, are ſupplied with heavy goods, not only from our own produce, as coals and ſalt from Newcaſtle, but alſo of merchandize imported from abroad, eſpecially wine; of which two articles, viz. coals and wine, this is the greateſt port for importation of any place on all the eaſtern coaſt of England; and thoſe wherein the Lynn merchants deal more largely than any town in England, except London, Briſtol, and Newcaſtle. In return for this, Lynn receives back all the corn which the counties juſt mentioned produce, for exportation; and therefore ſends more of it abroad than any port except Hull. The foreign trade of the merchants here is very conſiderable, eſpecially to Holland, Norway, and the Baltic, and alſo to Spain and Portugal; and formerly they drove a good trade to France, till it was turned off, by treaties on one hand, and by prohibitions, high duties, &c. on the other, to Spain and Portugal. The harbour is ſafe when ſhips are in it, but difficult to enter by reaſon of the many flats and ſhoals in the paſſage; which, however, are well buoyed, and good pilots are always ready. The town conſiſts of about 2400 houſes; and appears to have been very ſtrong, by the ruins of the works demoliſhed in the civil wars. St Ann's platform at the north end mounts 12 great guns, and commands all the ſhips paſſing near the harbour; and towards the land, beſides the wall, there is a ditch. Four rivulets run through the town; and the tide of the Ouſe, which is about as broad here as the Thames at London-bridge, riſes 20 feet perpendicular. In the great market-place a ſtatue was erected in 1686 to the honour of king James II. There is another ſpacious market-place, adorned with a ſtatue of king William III. and a fine croſs with a dome and gallery round it ſupported by 16 pillars. The market-houſe is of free-ſtone, ſupported by 16 columns; and is 70 feet high, erected on four ſteps, neatly adorned with ſtatues, &c. Every firſt Monday in the month, the mayor, aldermen, preachers, &c. meet to hear and determine all controverſies amicably, for preventing law-ſuits. This was firſt eſtabliſhed in 1588, and is called *The Feaſt of Reconciliation*. The markets are on Tueſdays and Saturdays; and it has two fairs: one of which, beginning Feb. 14. laſts for a fortnight, and is called Lynn-mart; the other is a cheeſe-fair on Oct. 6. The adherence of this town to king John and to Henry VIII. as above mentioned, are not the only inſtances of its loyalty to its ſovereigns; for, in the late civil wars, it held out for king Charles I. and ſuſtained a formal ſiege of above 18,000 men of the parliament-army, for above three weeks; but, for want of relief, was obliged to ſurrender, and ſubmit to the terms of paying 10s. a-head for every inhabitant, and a month's pay to the ſoldiers, to ſave the town from plunder. There are more gentry, and conſequently more gaiety, in this town than in Yarmouth or even Norwich; there being ſuch plenty of eatables and drinkables, that Spelman ſays Ceres and Bacchus ſeem to have eſtabliſhed their magazines at this place; the eaſt ſide abounding with corn, ſheep, rabbits, hares, &c. the weſt ſide with cheeſe, butter, black-cattle, ſwans, and the wild-fowl common to marſhes, beſides the abundance of ſea and river fiſh; ſo that he thinks there is no place in Great Britain, if in Europe, has ſuch a variety in ſo ſmall a compaſs of ground. At a ſmall diſtance from the town ſtands a mount called the Lady's or Red Mount, where was once a chapel dedicated to the Virgin Mary, which was a reſting-place for pilgrims on their way towards her convent at Walſingham. The king's ſtaith-yard, or quay, where the greateſt part of the imported wines is landed and put into large vaults, is a handſome ſquare, with brick buildings, in the centre whereof is a ſtatue of king James I. People paſs hence into the fen-country, and over the famous waſhes into Lincolnſhire in boats, which are often loſt, by venturing out at an improper ſeaſon and without guides.

LYNX, in zoology. See Felis.

LYON *King of Arms*. See King; and Law, n° clviii. 16.

This office is of great antiquity and reſpect in Scotland; and although the preciſe time of its inſtitution is unknown, yet it muſt have been as early as the introduction of armorial figures as hereditary marks of gentility and diſtinction into this country, which was in the 12th century. His regalia are, a crown of gold; with a crimſon velvet-cap, a gold taſſel, and an ermine lining; a velvet-robe reaching to his feet, with the arms of the kingdom embroidered thereon before and behind in the proper tinctures; a triple row of gold chain round his neck, with an oval gold medal pendent thereto, on one ſide of which is the royal bearing, and on the other St Andrew with his croſs enamelled in proper colours, and a baton of gold enamelled green, powdered with the badges of the kingdom. The Lord Lyon's rank is ſuperior to that of any other king of arms, as he holds his office immediately from the ſovereign by commiſſion under the great ſeal; whereas the kings of arms in England are deputies to the Earl Marſhal, and act under his authority. Formerly Scotland was divided into two provinces, the one on the north and the other on the ſouth ſide of Forth; and theſe provinces were under the management of two deputies appointed by the Lord Lyon to ſuperintend the execution of all the buſineſs of his office. Before the revolution, the Lord Lyon, at his admiſſion into office, was moſt ſolemnly crowned by the ſovereign or his commiſſioner, in preſence of the nobility, the officers of ſtate, and other great men, after a ſuitable ſermon preached in the royal chapel; and his crown was of the ſame form with the imperial crown of the kingdom. On ſolemn occaſions he wears the regalia above deſcribed; at all other times, he wears the oval gold medal or badge on his breaſt, ſuſpended by a broad green ribbon. He has the abſolute diſpoſal of all the offices in his own court, and of the heralds and purſuivants places. The meſſengers at arms throughout Scotland are alſo created by him, and are amenable to his juriſdiction. And the powers veſted in him by his commiſſion are the ſame with thoſe of the ſovereign in all matters relative to the marks of gentility.

LYONET (Peter), an ingenious naturaliſt, and member of ſeveral learned ſocieties, was born at Mæſtricht, and was deſcended from a very ancient and reſpectable family of Lorrain. He had ſcarcely attained his ſeventh year before he diſplayed an uncommon ſtrength and agility in all bodily exerciſes; but he was not leſs diligent in the improvement of his mind. Being placed at the Latin ſchool, he learned chronology, and exerciſed himſelf in Latin, Greek, and French poetry, as alſo in Hebrew, logic, and the Carteſian Phyſics. He was particularly fond of the ſtudy of languages, whereof he underſtood no leſs than nine, living and dead. Having entered the univerſity of Leyden, he ſtudied the Newtonian philoſophy, geometry, algebra, &c.; but his father (who was a clergyman), deſiring he ſhould attach himſelf to divinity, he reluctantly abandoned the former ſtudies, as his paſſion for them was not eaſily to be overcome. He at the ſame time applied himſelf to anatomy, and alſo to muſic and drawing. He began afterwards to practiſe ſculpture: and performed ſeveral pieces in wood, ſome of which are preſerved, and have been greatly admired by the artiſts. After this, he betook himſelf to drawing portraits of his friends from life; wherein, after three or four months practice, he became a great proficient. Having attained the degree of candidate in divinity, he reſolved to ſtudy law, to which he applied himſelf with ſo much zeal, that he was promoted at the end of the firſt year. Arrived at the Hague, he undertook the ſtudy of decyphering; and became ſecretary of the cyphers, tranſlator of the Latin and French languages, and patent-maſter, to their High Mightineſſes. Meanwhile, having taken a ſtrong liking to the ſtudy of inſects, he undertook an hiſtorical deſcription of ſuch as are found about the Hague, and to that end collected materials for ſeveral volumes; and having invented a method of drawing adapted thereto, he enriched this work with a great number of plates, univerſally admired by all the connoiſſeurs who had ſeen them. In the year 1742 was printed at the Hague a French tranſlation of a German work, the 'Theology of Inſects,' by Mr Leſſer. Love of truth engaged Mr Lyonet to defer the publication of his above-mentioned deſcription, and to make ſome obſervations on that work, to which he has added two moſt beautiful plates, engraved from his deſigns. This performance cauſed his merit to be univerſally known and admired. The celebrated M. de Reaumur had the above tranſlation reprinted at Paris, not ſo much on account of the work itſelf as of Mr Lyonet's obſervations; and beſtowed on it, as did alſo many other authors, the higheſt encomiums. He afterwards executed drawings of the freſh-water polypus for Mr Trembley's beautiful work, 1744. The ingenious Wandelaar had engraved the firſt five plates; when Mr Lyonet, who had never witneſſed this operation, concerned at the difficulties he experienced in getting the remaining eight finiſhed in the ſuperior ſtyle he required, reſolved to perform the taſk himſelf. He accordingly took a leſſon of one hour of Mr Wandelaar, engraved three or four ſmall plates, and immediately began upon the work itſelf, which he performed in ſuch a manner as drew on him the higheſt degree of praiſe, both from Mr Trembley and from many other artiſts, particularly the celebrated Van Gool; who declared that the performance aſtoniſhed not only the amateurs, but alſo the moſt experienced artiſts. In 1748 he was choſen member of the Royal Society of London. In 1749 he began (by mere chance) his amazing collection of horns and ſhells, which, according to the univerſal teſtimony of all travellers and amateurs who have viſited it, is at preſent the moſt beautiful, and certainly one of the moſt valuable, in Europe. In 1753 he became member of the newly-eſtabliſhed Dutch Society of Sciences at Haerlem; and in 1757, after the celebrated M. le Cat, profeſſor in anatomy and ſurgery, and member of almoſt all the principal ſocieties in Europe, had ſeen Mr Lyonet's incomparable *Traité Anatomique de la Chenille qui ronge le Bois de Saule*, with the drawings belonging to it (which work was afterwards publiſhed), he was elected member of the Royal Academy of Sciences of Rome, whereof M. le Cat was perpetual ſecretary. After the publication of this treatiſe, he became, in 1760, member of the Royal Academy of Sciences of Berlin; in 1761, of the Imperial Academy of Naturaliſts; and, in 1762, of the Imperial Academy of Sciences at St Peterſburg. In order to enable ſuch as might be deſirous of following him in his intricate and moſt aſtoniſhing diſcoveries reſpecting the ſtructure of this animal, Mr Lyonet publiſhed, in the 'Tranſactions of the Dutch Society of Sciences at Haerlem,' a deſcription and a plate (as he alſo afterwards did in French at the beginning of his *Traité Anatomique*) of the inſtrument and tools he had invented for the purpoſe of diſſection, and likewiſe of the method he uſed to aſcertain the degree of ſtrength of his magnifying glaſſes. Notwithſtanding all this labour, which was conſiderably increaſed by the extenſive correſpondence which he for many years carried on with ſeveral learned and reſpectable perſonages, he ſtill found means to ſet apart a large proportion of his time (as he himſelf mentions it in his preface) for the immediate ſervice of his country; but was not fortunate enough (as appears by his writings) to get any other recompenſe for his exertions than ſorrow and diſappointment.—During the laſt fifteeen or twenty years of his life, Mr Lyonet added to the valuable treaſure he had already collected of natural curioſities, a moſt ſuperb cabinet of paintings, conſiſting of more than 560 performances; among which are many of the moſt eminent works of the firſt Dutch maſters. He did this with a view to procure himſelf ſome amuſement during the latter part of his life, when old age and infirmities muſt weaken his powers, and ſet bounds to his activity. He had always indeed accuſtomed himſelf to employment, inſomuch that he has written ſome pieces of Dutch poetry; and this diſpoſition remained with him till within a fortnight of his death, when he was attacked with an inflammation in his breaſt, which, though apparently cured, was, in the end, the cauſe of his diſſolution. He died at the Hague in January 1789, aged 83 years, leaving behind him a moſt eſtimable character.

LYONOIS, a large province of France; bounded on the north by Burgundy; on the eaſt, by Dauphiny, Breſſe, and the principality of Dombs; on the ſouth, by Vivareis and Velay; and on the weſt, by Auvergne and a ſmall part of Bourbonnois. It comprehends Lower Lyonnois, Beaujolois, and Forez; and it produces corn, wine, fruits, and more eſpecially excellent cheſnuts. The principal rivers are the Soane, the Rhone, and the Loire. Lyons is the capital town.

LYONS, a large, rich, handſome, ancient, and famous town of France, being the moſt conſiderable in the kingdom, next to Paris, with an archbiſhop's ſee, an academy of ſciences and belles lettres, and an academy of arts and ſciences ſettled here in 1736. It is ſeated in the centre of Europe, on the confluence of the rivers Rhone and Soan: on the ſide of it are two high mountains; and the mountain of St Sebaſtian ſerves as a bulwark againſt the north winds, which often blow here with great violence. It contains about 150,000 inhabitants; and the houſes, in general, are high and well built. It has ſix gates, and as many ſuburbs. The town-houſe, the arſenal, the amphitheatre built by the ancient Romans, the hoſpital, and the numerous palaces, are worthy of a traveller's attention. The cathedral is a ſuperb ſtructure, and the canons that compoſe the chapter are all perſons of diſtinction. It is a place of very great trade, which is extended not only through France, but to Italy, Swiſſerland, and Spain; and there are four celebrated fairs every year, which are frequented by great numbers of people. It derives vaſt advantages from the rivers it ſtands upon; and is ſituated in E. Long. 4. 55. N. Lat. 45. 46.

LYRA, in ichthyology. See CALLYONIMUS.

LYRA, in aſtronomy, a conſtellation in the northern hemiſphere. The number of its ſtars, in Ptolemy's catalogue, is ten; in Tycho's eleven; in Hevelius's ſeventeen; and in the Britannic catalogue twenty-one.

LYRE, a muſical inſtrument of the ſtringed kind, much uſed by the ancients.

Concerning the number of ſtrings with which this inſtrument was furniſhed, there is great controverſy. Some aſſert it to be only three; and that the ſounds of the two remote were acute, and that of the intermediate one a mean between thoſe two extremes: that Mercury, the inventor, reſembled thoſe three chords to as many ſeaſons of the year, which were all that the Greeks reckoned, namely, Summer, Winter, and Spring: aſſigning the acute to the firſt, the grave to the ſecond, and the mean to the third.

Others aſſert that the lyre had four ſtrings; that the interval between the firſt and the fourth was an octave; that the ſecond was a fourth from the firſt, and the fourth the ſame diſtance from the third, and that from the ſecond to the third was a tone.

Another claſs of writers contend that the lyre of Mercury had ſeven ſtrings. Nicomachus, a follower of Pythagoras, and the chief of them, gives the following account of the matter: "The lyre made of the ſhell was invented by Mercury; and the knowledge of it, as it was conſtructed by him of ſeven ſtrings, was tranſmitted to Orpheus: Orpheus taught the uſe of it to Thamyris and Linus; the latter of whom taught it to Hercules, who communicated it to Amphion the Theban, who built the ſeven gates of Thebes to the ſeven ſtrings of the lyre." The ſame author proceeds to relate, "That Orpheus was afterwards killed by the Thracian women; and that they are reported to have caſt his lyre into the ſea, which was afterwards thrown up at Antiſſa, a city of Leſbos: that certain fiſhers finding it, they brought it to Terpander, who carried it to Egypt, exquiſitely improved, and, ſhowing it to the Egyptian prieſts, aſſumed to himſelf the honour of its invention."

This difference among authors ſeems to have ariſen from their confounding together the Egyptian and the Grecian Mercuries.—The invention of the primitive lyre with three ſtrings was due to the firſt Egyptian HERMES, as mentioned under that article.—The lyre attributed to the Grecian Mercury is deſcribed by almoſt all the poets to be an inſtrument of ſeven ſtrings†. Vincenzio Galilei has collected the various opinions of the ſeveral Greek writers who have mentioned the invention of the chelys or teſtudo; and the late Mr Spence has done the ſame in a very circumſtantial but ludicrous manner. "Horace talks of Mercury as a wonderful muſician, and repreſents him with a lyre. There is a ridiculous old legend relating to this invention, which informs us, that Mercury, after ſtealing ſome bulls from Apollo, retired to a ſecret grotto, which he uſed to frequent, at the foot of a mountain in Arcadia. Juſt as he was going in, he found a tortoiſe feeding at the entrance of his cave: he killed the poor creature, and, perhaps, eat the fleſh of it. As he was diverting himſelf with the ſhell, he was mightily pleaſed with the noiſe it gave from its concave figure. He had poſſibly been cunning enough to find out, that a thong pulled ſtrait and faſtened at each end, when ſtruck by the finger, made a ſort of muſical ſound. However that was, he went immediately to work, and cut ſeveral thongs out of the hides he had lately ſtolen, and faſtened them as tight as he could to the ſhell of this tortoiſe; and, in playing with them, made a new kind of muſic with them to divert himſelf in his retreat."

---

† See Mercury.

retreat." This, conſidered only as an account of the firſt invention of the lyre, is not altogether ſo unnatural.

The moſt ancient repreſentations of this inſtrument agree very well with the account of its invention: the lyre, in particular on the old celeſtial globes, was repreſented as made of one entire ſhell of a tortoiſe; and that Amphion in the celebrated group of the Dirce or Toro, in the Farneſe palace at Rome, which is of Greek ſculpture, and very high antiquity, is figured in the ſame manner.

There have, however, been many other claimants to the ſeven-ſtringed lyre. For though Mercury invented this inſtrument in the manner already related, it is ſaid he afterwards gave it to Apollo, who was the firſt that played upon it with method, and made it the conſtant companion of poetry. According to Homer's account of this tranſaction, in his hymn to Mercury, it was given by that god to Apollo, as a peace-offering and indemnification for the oxen which he had ſtolen from him:

> To Phœbus Maia's ſon preſents the lyre,
> A gift intended to appeaſe his ire.
> The god receives it gladly, and eſſays
> The novel inſtrument a thouſand ways;
> With dext'rous ſkill the plectrum wields; and ſings,
> With voice accordant to the trembling ſtrings,
> Such ſtrains as gods and men approv'd, from whence
> The ſweet alliance ſprung of ſound and ſenſe.

Diodorus informs us, that Apollo ſoon repenting of the cruelty with which he had treated Marſyas in conſequence of their muſical conteſt, broke the ſtrings of the lyre, and by that means put a ſtop for a time to any further progreſs in the practice of that new inſtrument. "The muſes (adds he) afterwards added to this inſtrument the ſtring called *meſe;* Linus, that of *lichanos;* and Orpheus and Thamyras, thoſe ſtrings which are named *hypate* and *parhypate* (A).

Again, many ancient and reſpectable authors tell us, that, before the time of Terpander, the Grecian lyre had only four ſtrings; and, if we may believe Suidas, it remained in this ſtate 856 years, from the time of Amphion, till Terpander added to it three new ſtrings, which extended the muſical ſcale to a heptachord, or ſeventh, and ſupplied the player with two conjoint tetrachords. It was about 150 years after this period, that Pythagoras is ſaid to have added an eighth ſtring to the lyre, in order to complete the octave, which conſiſted of two disjoint tetrachords.

Boethius gives a different hiſtory of the ſcale, and tells us, that the ſyſtem did not long remain in ſuch narrow limits as a tetrachord. Choræbus, the ſon of Athis, or Atys, king of Lydia, added a fifth ſtring; Hyagnis, a ſixth; Terpander, a ſeventh; and, at length, Lychaon of Samos, an eighth. But all theſe accounts are irreconcileable with Homer's hymn to Mercury, where the chelys, or teſtudo, the invention of which he aſcribes to that god, is ſaid to have had ſeven ſtrings. There are many claimants among the muſicians of ancient Greece to the ſtrings that were afterwards added to theſe, by which the ſcale, in the time of Ariſtoxenus, was extended to two octaves. Athenæus, more than once, ſpeaks of the nine-ſtringed inſtrument; and Ion of Chios, a tragic and lyric poet and philoſopher, who firſt recited his pieces in the 82d olympiad, 452 B.C. mentions, in ſome verſes quoted by Euclid, the ten-ſtringed lyre; a proof that the third conjoint tetrachord was added to the ſcale in his time, which was about 50 years after Pythagoras is ſuppoſed to have conſtructed the octachord.

The different claimants among the Greeks to the ſame muſical diſcoveries, only prove, that muſic was cultivated in different countries; and that the inhabitants of each country invented and improved their own inſtruments, ſome of which happening to reſemble thoſe of other parts of Greece, rendered it difficult for hiſtorians to avoid attributing the ſame invention to different perſons. Thus the ſingle flute was given to Minerva and to Marſyas; the ſyrinx or fiſtula, to Pan and to Cybele; and the lyre or chithara, to Mercury, Apollo, Amphion, Linus, and Orpheus. Indeed, the mere addition of a ſtring or two to an inſtrument without a neck, was ſo obvious and eaſy, that it is ſcarce poſſible not to conceive many people to have done it at the ſame time.

With reſpect to the form of the ancient lyre, as little agreement is to be found among authors as about the number of ſtrings. The beſt evidences concerning it are the repreſentations of that inſtrument in the hands of ancient ſtatues, bas-reliefs, &c. See Plate CCLXXV. where,

Fig. 1. is a repreſentation of the teſtudo, or lyre of Amphion, in front, as it appears on the baſe of the celebrated Toro Farneſe at Rome. This admirable work, conſiſting of four figures bigger than the life, beſides the toro, or bull, was found in Caracalla's baths, where the Farneſe Hercules was likewiſe diſcovered: and, except

---

(A) It has been already related, that the lyre invented by the Egyptian Mercury had but three ſtrings; and by putting theſe two circumſtances together, Dr Burney obſerves, we may perhaps acquire ſome knowledge of the progreſs of muſic, or, at leaſt, of the extenſion of its ſcale, in the higheſt antiquity.

Meſe, in the Greek muſic, is the fourth ſound of the ſecond tetrachord of the great ſyſtem, and firſt tetrachord invented by the ancients, anſwering to our A, on the fifth line in the baſe. If this ſound then was added to the former three, it proves two important points: firſt, that the moſt ancient tetrachord was that from E in the baſe to A; and that the three original ſtrings in the Mercurian and Apollonian lyre were tuned E, F, G, which the Greeks called *Hypate Meſon*, *Parhypate Meſon*, *Meſon Diatonos*. The addition therefore of *Meſe* to theſe, completed the firſt and moſt ancient tetrachord, E, F, G, A.

The ſtring *lichanos*, then, being added to theſe, and anſwering to our D on the third line in the baſe, extended the compaſs downwards, and gave the ancient lyre a regular ſeries of five ſounds in the Dorian mode, the moſt ancient of all the Greek modes; and the two ſtrings called *Hypate* and *Parhypate*, correſponding with our B and C in the baſe, completed the heptachord, or ſeven ſounds, B, C, D, E, F, G, A, a compaſs that received no addition till after the time of Pindar, who calls the inſtrument then in uſe the *ſeven-tongued lyre.*

cept the Laocoon, is the only piece of Greek ſculpture mentioned by Pliny that is now remaining. The two projections near the bottom ſeem to have been faſtenings for the ſtrings, and to have anſwered the purpoſe of tail-pieces in modern inſtruments.

2. The lyre held by Terpſichore, in the picture of that muſe dug out of Herculaneum.

3. The Abyſſinian teſtudo, or lyre in uſe at preſent in the province of Tigre, from a drawing of Mr Bruce, communicated to Dr Burney. "This inſtrument (ſays he) has ſometimes five, ſometimes ſix, but moſt frequently ſeven ſtrings, made of the thongs of raw ſheep or goat ſkins, cut extremely fine, and twiſted; they rot ſoon, are very ſubject to break in dry weather, and have ſcarce any ſound in wet. From the idea, however, of this inſtrument being to accompany and ſuſtain a voice, one would think that it was better mounted formerly.

"The Abyſſinians have a tradition, that the ſiſtrum, lyre, and tambourine, were brought from Egypt into Ethiopia, by Thot, in the very firſt ages of the world. The flute, kettle-drum, and trumpet, they ſay, were brought from Paleſtine, with Menelek, the ſon of their queen of Saba by Solomon, who was their firſt Jewiſh king.

"The lyre in Amharic is called *beg*, 'the ſheep;' in Ethiopic, it is called *meſinko;* the verb *ſinko* ſignifies to ſtrike ſtrings with the fingers: no plectrum is ever uſed in Abyſſinia; ſo that meſinko, being literally interpreted, will ſignify the 'ſtringed inſtrument played upon with the fingers.'

"The ſides which conſtitute the frame of the lyre were anciently compoſed of the horns of an animal of the goat kind called *agazan*, about the ſize of a ſmall cow, and common in the province of Tigre. I have ſeen ſeveral of theſe inſtruments very elegantly made of ſuch horns, which nature ſeems to have ſhaped on purpoſe. Some of the horns of an African ſpecies of this animal may be ſeen in M. Buffon's hiſtory of the king of France's cabinet. They are bent, and leſs regular than the Abyſſinian; but after fire-arms became common in the province of Tigre, and the woods were cut down, this animal being more ſcarce, the lyre has been made of a light red wood; however, it is always cut into a ſpiral twiſted form, in imitation of the ancient materials of which the lyre was compoſed. The drawing I ſend you was one of theſe inſtruments made of wood.

"The kingdom of Tigre, which is the largeſt and moſt populous province of Abyſſinia, and was during many ages the ſeat of the court, was the firſt which received letters and civil and religious government; it extended once to the Red Sea: various reaſons and revolutions have obliged the inhabitants to reſign their ſea-coaſt to different barbarous nations, Pagan and Mahometan: while they were in poſſeſſion of it, they ſay that the Red Sea furniſhed them with tortoiſe-ſhells, of which they made the bellies of their lyres, as the Egyptians did formerly, according to Apollodorus and Lucian; but having now loſt that reſource, they have adopted, in its place, a particular ſpecies of gourd, or pumpkin, very hard and thin in the bark, ſtill imitating with the knife the ſquares, compartments, and figure of the ſhell of the tortoiſe.

"The lyre is generally from three feet to three feet ſix inches high; that is, from a line drawn thro' the point of the horns, to the lower part of the baſe of the ſounding board. It is exceedingly light, and eaſy of carriage, as an inſtrument ſhould naturally be in ſo rugged and mountainous a country.

"When we conſider the parts which compoſe this lyre, we cannot deny it the earlieſt antiquity. Man in his firſt ſtate was a hunter and a fiſher, and the oldeſt inſtrument was that which partakes moſt of that ſtate. The lyre, compoſed of two principal pieces, owes the one to the horns of an animal, the other to the ſhell of a fiſh.

"It is probable, that the lyre continued with the Ethiopians in this rude ſtate as long as they confined themſelves to their rainy, ſteep, and rugged mountains: and afterwards, when many of them deſcended along the Nile in Egypt, its portability would recommend it in the extreme heats and wearineſs of their way. Upon their arrival in Egypt, they took up their habitation in caves, in the ſides of mountains, which are inhabited to this day. Even in theſe circumſtances, an inſtrument larger than the lyre muſt have been inconvenient and liable to accidents in thoſe caverns; but when theſe people increaſed in numbers and courage, they ventured down into the plain, and built Thebes. Being now at their eaſe, and in a fine climate, all nature ſmiling around them, muſic and other arts were cultivated and refined, and the imperfect lyre was extended into an inſtrument of double its compaſs and volume. The ſize of the harp could be now no longer an objection; the Nile carried the inhabitants every where eaſily, and without effort; and we may naturally ſuppoſe in the fine evenings of that country, that the Nile was the favourite ſcene upon which this inſtrument was practiſed; at leaſt the ſphinx and lotus upon its head, ſeem to hint that it was ſomeway connected with the overflowings of that river." See HARP.

4. An Etruſcan lyre, with ſeven ſtrings, in the collection of Etruſcan, Greek, and Roman antiquities, publiſhed from the cabinet of the Hon. Sir William Hamilton, Vol. I. Naples 1766. Pl. cix. With reſpect to this inſtrument, it is worthy of obſervation, that though the vaſe upon which it is repreſented is of ſuch indiſputable and remote antiquity, the tail-piece, bridge, belly, and ſound-holes, have a very modern appearance, and manifeſt a knowledge in the conſtruction of muſical inſtruments among the Etruſcans ſuperior to that of the Greeks and Romans in much later times. The lower part of the inſtrument has much the appearance of an old baſs-viol, and it is not difficult to diſcover in it more than the embryo of the whole violin family. The ſtrings lie round, as if intended to be played on with a bow; and even the croſs lines on the tail-piece are ſuch as we frequently ſee on the tail-pieces of old viols.

5. The Tripodian lyre of Pythagoras the Zacynthian, from a bas-relief in the Maffei palace at Rome repreſenting the whole choir of the muſes. Athenæus gives the following account of this extraordinary inſtrument, *lib.* xiv. *cap.* 15. *p.* 637. "Many ancient inſtruments are recorded (ſays Artemon), of which we have ſo little knowledge, that we can hardly be certain of their exiſtence; ſuch as the tripod of Pythagoras the Zacynthian, which, on account of its difficulty, continued in uſe but a ſhort time. It reſembled in form the Delphic tripod, whence it had its name. The legs were equidiſtant, and fixed

upon a moveable baſe that was turned by the foot of the player; the ſtrings were placed between the legs of the ſtool; the vaſe at the top ſerved for the purpoſe of a ſound-board, and the ſtrings of the three ſides of the inſtrument were tuned to three different modes, the Doric, Lydian, and Phrygian. The performer ſat on a chair made on purpoſe; ſtriking the ſtrings with the fingers of the left hand, and uſing the plectrum with the right, at the ſame time turning the inſtrument with his foot to whichever of the three modes he pleaſed: ſo that by great practice he was enabled to change the modes with ſuch velocity, that thoſe who did not ſee him would imagine they heard three different performers playing in three different modes. After the death of this admirable muſician, no other inſtrument of the ſame kind was ever conſtructed."

6. A lyre in the famous ancient picture dug out of Herculaneum, upon which Chiron is teaching the young Achilles to play. See Chiron.

LYRIC-POETRY, was ſuch as the ancients ſung to the lyre or harp.—It was originally employed in celebrating the praiſes of gods and heroes, and its characteriſtic was ſweetneſs. Who was the author of it is not known. It was much cultivated by the Greeks; and Horace was the firſt who attempted it in the Latin language. Anacreon, Alcæus, Steſichorus, Sappho, and Horace, were the moſt celebrated lyric poets of antiquity.

LYRODI, among the ancients, a kind of muſicians who played on the lyre and ſung at the ſame time. This appellation was alſo given to ſuch as made it their employment to ſing lyric poems compoſed by others.

LYS, or Lis. See Lis.

Lys, the name of a meaſure uſed by the Chineſe in eſtimating diſtances. Two hundred lys make 60 geographical miles, which are equal to one degree.

LYSANDER, a famous Spartan general. See Sparta.

LYSANDRIA, a Samian feſtival, celebrated with games and ſacrifices in honour of the Lacedemonian general Lyſander. It was anciently called *herea;* but this name the Samians aboliſhed by a public decree.

LYSIARCH, an ancient magiſtrate, who ſuperintended the ſacred games, and preſided in matters of religion in the province of Lycia. He was created in a council conſiſting of deputies from all the provincial cities, in number 23. The lyſiarchs were both heads of the council and pontiffs of the province.

LYSIAS, an ancient Grecian orator, was born at Syracuſe in the 80th olympiad. At 15, he went to Thurion, a colony of the Athenians; and when grown up, aſſiſted in the adminiſtration of the government there many years. When about 47 years of age, he returned to Athens; whence, being afterwards baniſhed by the 30 tyrants, he went to Megara. Upon his return, Thraſybulus would have had him employed again in ſtate matters; but this not taking place, he ſpent the remainder of his life as a private man. He was very familiar with Socrates, and other illuſtrious philoſophers. He profeſſed to teach the art of ſpeaking; not that he pleaded at the bar himſelf, but he ſupplied others with ſpeeches. "Fuit Lyſias in cauſis forenſibus non verſatus" (ſays Cicero), "ſed egregie ſubtilis ſcriptor atque elegans," &c. Quintilian calls him, "ſubtilis atque elegans, et quo nihil, ſi Oratorio ſatis ſit docere, quæras perfectius. Nihil enim eſt inane, nihil arceſſitum; puro tamen fonti, quam magno flumini, proprior." Plutarch and Photius relate, that 425 orations were formerly exhibited under the name of Lyſias; of which 34 only are now extant. The beſt edition of them is by Dr John Taylor at London, 1739, 4to; Cambridge, 1740, 8vo.

LYSIMACHIA, LOOSESTRIFE, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 20th order, *Rotaceæ.* The corolla is rotaceous; the capſule globular, beaked, and ten-valved. There are ten ſpecies, but only four are commonly cultivated in gardens. Theſe are hardy, herbaceous perennials and biennials, riſing with erect ſtalks from 18 inches to two or three feet high; garniſhed with narrow entire leaves; and terminated by ſpikes and cluſters of monopetalous, rotated, five-parted ſpreading flowers of white and yellow colours.—They are eaſily propagated by ſeeds, and will thrive in any ſoil or ſituation.

LYSIPPUS, a celebrated Greek ſtatuary, was born at Sicyone, and at firſt followed the buſineſs of a lockſmith, which he quitted in order to practiſe painting: But he afterwards applied himſelf entirely to ſculpture; in which he acquired an immortal reputation, and made a great number of ſtatues that were the admiration of the people of Athens and Rome. His grand ſtatue of the ſun repreſented in a car drawn by four horſes, was worſhipped at Rhodes; he made ſeveral ſtatues of Alexander and his favourites, which were brought to Rome by Metellus after he had reduced the Macedonian empire; and the ſtatue of a man wiping and anointing himſelf after bathing, being particularly excellent, was placed by Agrippa before his baths in that city. He lived in the time of Alexander the Great, about 334 B. C.; and left three ſons, who were all famous ſtatuaries.

LYTHRUM, PURPLE LOOSESTRIFE, in botany: A genus of the monogynia order, belonging to the decandria claſs of plants; and in the natural method ranking under the 17th order, *Calycanthemæ.* The calyx is cleft in 12 parts; and there are ſix petals inſerted into it; the capſule is bilocular and polyſpermous. There are 10 ſpecies, of which the moſt remarkable are, 1. The ſalicaria, or common purple looſeſtrife, with oblong leaves, is a native of Britain, and grows naturally by the ſides of ditches and rivers. It hath a perennial root, from which come forth ſeveral upright angular ſtalks, riſing from three to four feet high, garniſhed with oblong leaves placed ſometimes by pairs; but ſometimes there are three leaves at each joint ſtanding round the ſtalk. The flowers are purple, and produced in a long ſpike at the top of the ſtalk; ſo make a fine appearance. 2. The hyſpanum, or Spaniſh looſeſtrife, with an hyſſop leaf, grows naturally in Spain and Portugal. It hath a perennial root. The ſtalks are ſlender, not more than nine or ten inches long, ſpreading out on every ſide. The lower part of the ſtalks is garniſhed with oblong oval leaves placed oppoſite. The flowers come out ſingly from the ſide of the ſtalks at each joint; they are larger than thoſe of the common ſort, and make a fine appearance in the month of July when they are in beauty. The firſt kind is propagated by parting the roots in autumn, but requires a moiſt ſoil;—the ſecond is propagated by ſeeds brought from thoſe countries where it is native.

LYTTELTON (Edward), lord Lyttelton, keeper of the great ſeal in the reign of Charles I. was eminent for his probity and his moderation at the commencement of that monarch's diſputes with his ſubjects. Without forfeiting his fidelity to the king, he preſerved the eſteem of the parliament till 1644, when he was made colonel of a regiment in the king's army at York. He died in 1645. Beſides ſeveral of his ſpeeches which have been printed, he wrote reports in the common pleas and exchequer printed at London in 1683, in folio; ſeveral arguments and diſcourſes, &c.

LYTTELTON (George lord) eldeſt ſon of Sir Thomas Lyttelton, bart. deſcended from the great judge Lyttelton, was born in 1700, at ſeven months; and the midwife ſuppoſing him to be dead, threw him careleſsly into the cradle; where, had not ſome ſigns of life been taken notice of by one of the attendants, he might never have recovered. He received the elements of his education at Eaton-ſchool, where he ſhowed an early inclination to poetry. His paſtorals and ſome other light pieces were originally written in that ſeminary of learning; from whence he was removed to the univerſity of Oxford, where he purſued his claſſical ſtudies with uncommon avidity, and ſketched the plan of his Perſian Letters, a work which afterwards procured him great reputation, not only from the elegance of the language in which they were compoſed, but from the excellent obſervations they contained on the manners of mankind.

In the year 1728, he ſet out on the tour of Europe; and, on his arrival at Paris, accidentally became acquainted with the honourable Mr Poyntz, then our miniſter at the court of Verſailles; who was ſo ſtruck with the extraordinary capacity of our young traveller, that he invited him to his houſe, and employed him in many political negociations, which he executed with great judgment and fidelity.

Mr Lyttelton's conduct, while on his travels, was a leſſon of inſtruction to the reſt of his countrymen. Inſtead of lounging away his hours at the coffee-houſes frequented by the Engliſh, and adopting the faſhionable follies and vices of France and Italy, his time was paſſed alternately in his library and in the ſociety of men of rank and literature. In this early part of his life, he wrote a poetical epiſtle to Dr Ayſcough, and another to Mr Pope, which ſhow ſingular taſte and correctneſs.

After continuing a conſiderable time at Paris with Mr Poyntz, who, to uſe his own words, behaved like a ſecond father to him, he proceeded to Lyons and Geneva; and from thence to Turin, where he was honoured with great marks of friendſhip by his Sardinian majeſty. He then viſited Milan, Venice, Genoa, and Rome, where he applied himſelf cloſely to the ſtudy of the fine arts; and was, even in that celebrated metropolis, allowed a perfect judge of painting, ſculpture, and architecture.

During his continuance abroad, he conſtantly correſponded with Sir Thomas, his father. Several of his letters are yet remaining, and place his filial affection in a very diſtinguiſhed light. He ſoon after returned to his native country, and was elected repreſentative for the borough of Okehampton in Devonſhire; and behaved ſo much to the ſatisfaction of his conſtituents, that they ſeveral times re-elected him for the ſame place without putting him to the leaſt expence.

About this period, he received great marks of friendſhip from Frederic prince of Wales, father of his preſent majeſty; and was, in the year 1737, appointed principal ſecretary to his royal highneſs, and continued in the ſtricteſt intimacy with him till the time of his death. His attention to public buſineſs did not, however, prevent him from exerciſing his poetical talent. A moſt amiable young lady, Miſs Forteſcue, inſpired him with a paſſion, which produced a number of little pieces, remarkable for their tenderneſs and elegance; and he had a happy facility of ſtriking out an extempore compliment, which obtained him no ſmall ſhare of reputation. One evening being in company with lord Cobham and ſeveral of the nobility at Stowe, his lordſhip mentioned his deſign of putting up a buſt of lady Suffolk in his beautiful gardens; and, turning to Mr Lyttelton, ſaid, "George, you muſt furniſh me with a motto for it." "I will, my lord," anſwered Mr Lyttelton; and directly produced the following couplet:

Her wit and beauty for a court were made,
But truth and goodneſs fit her for a ſhade.

When Mr Pitt, the late earl of Chatham, loſt his commiſſion in the guards, in conſequence of his ſpirited behaviour in parliament, Mr Lyttelton was in waiting at Leiceſter-houſe, and, on hearing the circumſtance, immediately wrote theſe lines:

Long had thy virtue mark'd thee out for fame,
Far, far ſuperior to a cornet's name;
This generous Walpole ſaw, and griev'd to find
So mean a poſt diſgrace that noble mind;
The ſervile ſtandard from thy free-born hand
He took, and bade thee lead the patriot-band.

In the year 1742, he married Lucy, the daughter of Hugh Forteſcue, Eſq; of Filleigh in the county of Devon, the lady abovementioned, whoſe exemplary conduct, and uniform practice of religion and virtue, eſtabliſhed his conjugal happineſs upon the moſt ſolid baſis.

In 1744, he was appointed one of the lords commiſſioners of the treaſury; and, during his continuance in that ſtation, conſtantly exerted his influence in rewarding merit and ability. He was the friend and patron of the late Henry Fielding, James Thomſon author of the Seaſons, Mr Mallet, Dr Young, Mr Hammond, Mr Weſt, Mr Pope, and Voltaire. On the death of Thomſon, who left his affairs in a very embarraſſed condition, Mr Lyttelton took that poet's ſiſter under his protection. He reviſed the tragedy of Coriolanus, which that writer had not put the laſt hand

hand to; and brought it out at the theatre-royal, Covent-garden, with a prologue of his own writing, in which he ſo affectingly lamented the loſs of that delightful bard, that not only Mr Quin, who ſpoke the lines, but almoſt the whole audience, ſpontaneouſly burſt into tears.

In the beginning of the year 1746, his felicity was interrupted by the loſs of his wife, who died in the 29th year of her age; leaving him one ſon, Thomas, the late lord Lyttelton; and a daughter, Lucy, who ſome time ſince married lord viſcount Valentia. The remains of his amiable lady were depoſited at Over-Arley in Worceſterſhire; and an elegant monument was erected to her memory in the church of Hagley, which contains the following inſcription written by her huſband:

> Made to engage all hearts, and charm all eyes:
> Tho' meek, magnanimous; tho' witty, wiſe;
> Polite, as all her life in courts had been;
> Yet good, as ſhe the world had never ſeen:
> The noble fire of an exalted mind,
> With gentleſt female tenderneſs combin'd.
> Her ſpeech was the melodious voice of love,
> Her ſong the warbling of the vernal grove;
> Her eloquence was ſweeter than her ſong,
> Soft as her heart, and as her reaſon ſtrong.
> Her form each beauty of her mind expreſs'd,
> Her mind was virtue by the graces dreſs'd.

Beſides theſe beautiful lines, Mr Lyttelton wrote a monody on the death of his lady, which will be remembered while conjugal affection and a taſte for poetry exiſt in this country.

His maſterly obſervations on the converſion and apoſtleſhip of St Paul, were written at the deſire of Gilbert Weſt, Eſq; in conſequence of Mr Lyttelton's aſſerting, that, beſide all the proofs of the Chriſtian religion, which might be drawn from the prophecies of the Old Teſtament, from the neceſſary connection it has with the whole ſyſtem of the Jewiſh religion, from the miracles of Chriſt, and from the evidence given of his reſurrection by all the other apoſtles, he thought the converſion of St Paul alone, duly conſidered, was of itſelf a demonſtration ſufficient to prove Chriſtianity to be a divine revelation. Mr Weſt was ſtruck with the thought; and aſſured his friend, that ſo compendious a proof would be of great uſe to convince thoſe unbelievers that will not attend to a longer ſeries of arguments; and time has ſhown he was not out in his conjecture, as the tract is eſteemed one of the beſt defences of Chriſtianity which has hitherto been publiſhed.

In 1754, he reſigned his office of lord of the treaſury, and was made cofferer to his majeſty's houſehold, and ſworn of the privy-council: previous to which, he married, a ſecond time, Elizabeth, daughter of field-marſhal Sir Robert Rich, whoſe indiſcreet conduct gave him great uneaſineſs, and from whom he was ſeparated by mutual conſent, a few years after his marriage.

After being appointed chancellor and under-treaſurer of the court of exchequer, he was, by letters-patent dated the 19th of November 1757, 31 Geo. II. created a peer of Great Britain, by the ſtyle and title of *Lord Lyttelton, baron of Frankley, in the county of Worceſter*. His ſpeeches on the Scotch and mutiny bills in the year 1747, on the Jew bill in 1753, and on the privilege of parliament in 1763, ſhowed ſound judgment, powerful eloquence, and inflexible integrity. During the laſt ten years he lived chiefly in retirement, in the continual exerciſe of all the virtues which can ennoble private life. His laſt work was Dialogues of the Dead, in which the morality of Cambray and the ſpirit of Fontenelle are happily united.

He was ſuddenly ſeized with an inflammation of the bowels, in the middle of July 1773, at his ſeat at Hagley; which terminated in his death, on the 22d of that month. His laſt moments were attended with unimpaired underſtanding, unaffected greatneſs of mind, calm reſignation, and humble but confident hopes in the mercy of God. As he had lived univerſally eſteemed, he died lamented by all parties. A complete collection of his works has been publiſhed ſince his deceaſe, by his nephew George Aſycough, Eſq.

M.

M, a liquid conſonant, and the twelfth letter in the alphabet.

It has one unvaried ſound, and is pronouuced by ſtriking the upper lip againſt the lower; in which the pronunciation of this letter agrees with that of *b*; the only difference between the two conſiſting in a little motion made in the noſe in pronouncing *m*, and not in *b*: whence it happens that thoſe who have taken cold, for *m* ordinarily pronounce *b*; the noſe in that caſe being diſabled from making the neceſſary motion.

All conſonants are formed with the aid of vowels; in *em* the vowel precedes, in *be* it follows; and *m* is never mute.

Quintilian obſerves, that the *m* ſometimes ends Latin words, but never Greek ones; the Greeks always changing it in that caſe into *n*, for the ſake of the better ſound.

M is alſo a numeral letter, and among the ancients was uſed for a thouſand; according to the verſe,

M caput eſt numeri, quem ſcimus mille teneri.

When a daſh is added to the top of it, as $\overline{\text{M}}$; it ſignifies a thouſand times a thouſand.

M, as an abbreviature, ſtands for Manlius, Marcus, Martius, and Mucius: M. A. ſignifies *magiſter artium*, or maſter of arts; MS. manuſcript, and MSS. manuſcripts.

M, in aſtronomical tables, and other things of that kind, is uſed for *meridional* or ſouthern; and ſometimes for *meridian* or mid-day.

M, in medicinal preſcription, is frequently uſed to ſignify a maniple or handful: and it is ſometimes alſo put at the end of a recipe, for *miſce* "mingle;" or for *mixtura* "a mixture." Thus, *m. f. julapium*, ſignifies "mix and make a julep."

M, in law, the brand or ſtigma of a perſon convicted of manſlaughter, and admitted to the benefit of his clergy. It is to be burnt on the brawn of his left thumb.

MAAT (John). See BLANKOF.

MABA, in botany: A genus of the triandria order, belonging to the diœcia claſs of plants. The perianthium of the male is trifid; that of the female is as in the male; the fruit is a plum two-celled ſuperior.

MABILLON (John), a very learned writer of France in the 17th century, was born at Perre-monte, on the frontiers of Champagne, in 1632. He was educated in the univerſity of Rheims, and afterwards entered into the abbey of the Benedictines of St Remy. In the year 1663, he was appointed keeper of the treaſures and monuments of France at St Dennis: but having unfortunately broke a looking-glaſs there, which was pretended to have belonged to Virgil, he deſired leave of his ſuperiors to quit an employment which frequently obliged him to tell things he did not believe. Next year he went to Paris; and was very ſerviceable to Father d'Acheri, who was deſirous of having ſome young monk who could aſſiſt him in compiling his *Spicilegium*. This made him known. Soon after, the congregation of St Maur having formed a deſign of publiſhing new editions of the fathers, reviſed from the MSS. in the libraries of the Benedictines, Mabillon was charged with the edition of St Bernard, which he prepared with extraordinary diligence. After that, he publiſhed many other works, which are evidences of his vaſt capacity and induſtry. In 1682, he was employed by Mr Colbert in examining ſome ancient titles relating to the royal family. The year following he ſent him into Germany, to ſearch the archives and libraries of the ancient abbeys, for what was moſt curious and proper to illuſtrate the hiſtory of the church in general, and that of France in particular. He has publiſhed an account of this journey. In 1685, he undertook another journey into Italy, by order of the king of France; and returned the year following with a very noble collection. He placed in the king's library above 3000 volumes of rare books, printed and in MSS. and compoſed two volumes of the pieces which he had diſcovered in that country. He was highly eſteemed for his virtues as well as his learning.

MACACO, or MACAUCO. See LEMUR.

MACAO, a town of China, in the province of Canton, ſeated in an iſland at the mouth of the river Tae. The Portugueſe have been in poſſeſſion of the harbour for 150 years. Formerly they had a great trade here; but now they have only a fort with a ſmall garriſon. The houſes are built after the European manner; and there is a Chineſe mandarin, as well as a Portugueſe governor, to take care of the town and the neighbouring country. E. Long. 112. 13. N. Lat. 22. 12.

MACAO, in ornithology. See PSITTACUS.

MACARIANS, in eccleſiaſtical hiſtory, the followers of Macarius, an Egyptian monk, who was diſtinguiſhed towards the cloſe of the fourth century for his ſanctity and virtue. In his writings there are ſome ſuperſtitious tenets, and alſo certain opinions that ſeem tainted with Origeniſm. The name has been alſo applied to thoſe who adopted the ſentiments of Macarius a native of Ireland, who, about the cloſe of the ninth century, propagated in France the error afterwards maintained by Averrhoes, that one individual intelligence or ſoul performed the ſpiritual and rational functions in all the human race.

MACARONI. See FOLENGIO, and the next article.

MACARONIC, or MACARONIAN, a kind of burleſque poetry, conſiſting of a jumble of words of different languages, with words of the vulgar tongue Latonized, and Latin words modernized. *Maccaroni* among the Italians, as has been obſerved by Cælius Rhodiginus, ſignifies *a coarſe clowniſh man*; and becauſe this kind of poetry is patched out of ſeveral languages, and full of extravagant words, &c. the Italians, among whom it had its riſe, gave it the name of *maccaronian*, or *maccaronic* poetry. Others chooſe to derive it *à macaronibus*, from *macaroons*, a kind of confection made of meal not boulted, ſweet-almonds, ſugar, and the white of eggs, accounted a great dainty among the country-people in Italy; which, from their being compoſed of various ingredients, occaſioned this kind of poetry, which conſiſts of Latin, Italian, Spaniſh, French, Engliſh, &c. to be called by their name.

Example.—A bold fellow in the *macaronic* ſtyle, ſays,

Enfilavi omnes ſcadrones & regimandos, &c.

Another example:

Archelos piſtoliferos furiamque manantum,
Et grandem eſmeutam quæ inopinum facta ruelle eſt:
Toxinumque alto troublantem corda clochero, &c.

Theoph. Folengius, a Benedictine monk of Mantua, was the firſt who invented, or at leaſt cultivated, this kind of verſe. See FOLENGIO.

The beſt pieces of this kind are, the *Baldus* of Folengio, and *Macaronis Forza* by Stefonio a Jeſuit, among the Italians; and the *Reatus veritabilis ſuper terribili eſmeuta paiſanarum de Ruellis*, among the French. The famous Rabelais firſt transferred the *macaronic* ſtyle out of the Italian verſe into French proſe: and on the model thereof formed ſome of the beſt things in his *Pantagruel*. We have little in Engliſh in the *macaronian* way; nothing ſcarce, but ſome little looſe pieces collected in Camden's remains. But the Germans and Netherlanders have had their *macaronic* poets; witneſs the *Certamen Catholicum cum Calviniſtis*, of one Martinius Hamconius Friſius, which contains about 1200 verſes, all the words whereof begin with the letter *C*.

MACARSKA, a town of Dalmatia, and capital of Primogria, with a pretty good harbour, and a biſhop's ſee, ſeated on the gulph of Venice. E. Lon. 17. 57. N. Lat 43. 42.

MACASSAR, a conſiderable kingdom of the iſland of Celebes, in the Eaſt-Indies. The climate is very hot; and would be intolerable, were it not for the rains which fall when the ſun is directly over their heads. The ſoil is extremely fertile, and there are ripe fruits at all times of the year. There are great numbers of monkies, who are devoured by monſtrous ſerpents; ſome of which are ſo large, that they will ſwallow one of theſe animals entire. The Macaſſars are large, robuſt, courageous, and greatly addicted to war. They profeſs the Mahometan religion.

Macassar, a large, ſtrong, and handſome town of the iſland of Celebes, and capital of the kingdom of the iſland of Celebes, where the king reſides. The houſes are all built of wood, and ſupported by thick poſts; and they have ladders to go up into them, which they draw up as ſoon as they have entered. The roofs are covered with very large leaves, which prevent the rain from entering. It is ſeated near the mouth of a large river, which runs through the kingdom from north to ſouth. E. Long. 117. 55. S. Lat. 5. 0.

Macassar Poiſon, in natural hiſtory, called *ippo* in the Macaſſar and Malayan tongue, is the gum of a certain tree, ſhining, brittle, black, and every way like ſtone-pitch, growing in the iſland Celebes, in the South Seas; with which all the natives arm themſelves in travel, having a long hollow trunk of a hard red wood like braſil, accurately bored, and at one end is fixed a large lance-blade of iron. Then they make a ſmall arrow, very ſtraight, and ſomewhat bigger than a large wheaten ſtraw: at one end they fix it into a round piece of white, light, ſoft, wood, like cork, about the length of the little finger, juſt fit for the bore of the trunk, to paſs clear by the force of one's breath, and to fill it ſo exactly, that the air may not paſs by, but againſt it, in order to carry it with the greater force. At the other end they fix in it either a ſmall fiſh-tooth for that purpoſe, or make a blade of wood of the bigneſs of the point of a lancet, about three-quarters of an inch long, and making a little notch in the end of the arrow, they ſtrike it firm therein, which they anoint with poiſon. The poiſonous gum, when gathered, is put into hollow bamboos or canes, ſtopped up very cloſe, and thus brought to Macaſſar. When they fit it for uſe, they take a piece of ſmooth turtle-ſhell, and a ſtick cut flat and ſmooth at the end: then they take green galangal root, grate it, and with the addition of a little fair water, preſs the juice into a clean china diſh: then with a knife ſcraping a little of the poiſon upon the ſhell, dip the end of the ſtick in the forementioned liquor, and with this diſſolve the poiſon to the conſiſtence of a ſyrup: when this is done, they anoint the fiſh-tooth or wooden blade with the ſame ſtick, and lay it in the ſun, ſo that it may be baked hard. The pointed arrows thus prepared, are put in hollow bamboos, cloſe ſhut, and in this ſtate they retain their virtue for a month.

MACCABÆUS (Judas). See Judas.

MACCABEES, two apocryphal books of ſcripture, containing the hiſtory of Judas and his brothers, and their wars againſt the Syrian kings in defence of their religion and liberties, ſo called from Judas Mattathias, ſurnamed *Maccabeus*, as ſome ſay from the word מכבי, formed of the initials of מי כמכה כאלם יהוה, q. d. *Who is like unto thee, O Lord, among the Gods*; which was the motto of his ſtandard; whence thoſe who fought under his ſtandard were called *Maccabees*, and the name was generally applied to all who ſuffered in the cauſe of the true religion, under the Egyptian or Syrian kings. The firſt book of the Maccabees is an excellent hiſtory, and comes neareſt to the ſtyle and manner of the ſacred hiſtorians of any extant. It was written originally in the Chaldee language, of the Jeruſalem dialect, and was extant in this language in the time of Jerom. From the Chaldee it was tranſlated into Greek, from the Greek into Latin. It is ſuppoſed to have been written by John Hyrcanus the ſon of Simon, who was prince and high prieſt of the Jews near 30 years, and began his government at the time where this hiſtory ends. It contains the hiſtory of 40 years, from the reign of Antiochus Epiphanes to the death of Simon the high prieſt; that is, from the year of the world 3829 to the year 3869; 131 years before Chriſt. The ſecond book of the Maccabees begins with two epiſtles ſent from the Jews of Jeruſalem to the Jews of Egypt and Alexandria; to exhort them to obſerve the feaſt of the dedication of the new altar erected by Judas on his purifying the temple. The firſt was written in the 169th year of the era of the Seleucidæ, *i. e.* before Chriſt 144; and the ſecond in the 188th year of the ſame era, or 125 before Chriſt; and both appear to be ſpurious. After theſe epiſtles follows the preface of the author to his hiſtory, which is an abridgement of a larger work, compoſed by one Jaſon, a Jew of Cyrene, who wrote in Greek the hiſtory of Judas Maccabeus and his brethren, and the wars againſt Antiochus Epiphanes, and Eupator his ſon. This ſecond book does not by any means equal the accuracy and excellency of the firſt. It contains a hiſtory of about 15 years, from the execution of Heliodorus's commiſſion, who was ſent by Seleucus to fetch away the treaſures of the temple, to the victory obtained by Judas Maccabeus over Nicanor; that is, from the year of the world 3828, to the year 3843, 147 years before Chriſt.

There are in the Polyglot bibles, both of Paris and London, Syriac verſions of both theſe books; but they, as well as the Engliſh verſions which we have among the apocryphal writers in our Bibles, are derived from the Greek. There is alſo a third book of the Maccabees, containing the hiſtory of the perſecution of Ptolemy Philopator againſt the Jews in Egypt, and their ſufferings under it; and ſeems to have been written by ſome Alexandrian Jew in the Greek language, not long after the time of Siracides. It is in moſt of the ancient manuſcript copies of the Greek Septuagint, particularly in the Alexandrian and Vatican, but was never inſerted into the vulgar Latin verſion of the Bible, nor conſequently into any of our Engliſh copies. Moreover, Joſephus's hiſtory of the martyrs that ſuffered under Antiochus Epiphanes, is found in ſome manuſcript Greek Bibles, under the name of the fourth book of the *Maccabees*.

Macbeth, Macbride.

MACBETH, a Scots nobleman in the 11th century, nearly allied to Duncan king of Scotland.—Not contented with curbing the king's authority, he carried his peſtilent ambition ſo far as to put him to death; and, chaſing Malcolm Kenmure his ſon and heir into England, uſurped the crown. Siward earl of Northumberland, whoſe daughter Duncan had married, undertook, by the order of Edward the Confeſſor, the protection of the fugitive prince.—He marched with an army into Scotland; defeated and killed Macbeth; and reſtored Malcolm to the throne of his anceſtors. Shakeſpeare has made this tranſaction the ſubject of one of his beſt tragedies.

MACBRIDE (Dr David), an eminent phyſician and philoſopher, was deſcended from an ancient family in the county of Galloway in Scotland. His grandfather, a clergyman, had ſettled in Ireland about the end of the laſt century, as miniſter to a Preſbyterian congregation at Belfaſt; and his father, who followed the ſame line, was ſettled at Ballymony in the county of Antrim, where he married, and where our author was born in April 1726. After a proper ſchool-education, and having paſſed ſome time under the tuition of an eminent ſurgeon in his native place, he was ſent to the univerſity of Glaſgow. Having there completed the uſual courſe of academical ſtudies, he came to Edinburgh for the further proſecution of medical ſcience. After a ſhort ſtay here, a war then prevailing between France and Britain, he was induced to go on board the navy in the ſtation of a ſurgeon's mate. In the ſervice of his country he continued for ſeveral years; and after diſcharging for ſome time the duties of an aſſiſtant, he was raiſed to the rank of ſurgeon. In this ſituation, he firſt turned his thoughts towards the diſcovery of a remedy for the ſea-ſcurvy. It was not, however, at this period, that either chance or reaſoning ſuggeſted to him the employment of an article which has ſince been attended with the moſt beneficial conſequences. Here he had an opportunity only of obſerving the ſymptoms, of ſtudying the nature, and of lamenting the conſequences, of the diſeaſe.

The termination of the war by the peace of Aix-la-Chapelle put a period to Dr Macbride's employment as a naval ſurgeon. He had now probably obtained much medical knowledge in the ſchool of experience; but he was ſenſible that he had ſtill much to acquire in that of ſcience. An ardent keenneſs to mingle in active life had led him from the ſchools of medicine at an earlier period than could have been wiſhed; and an earneſt deſire to found his future practice in the beſt eſtabliſhed principles led him back to them, when a judgment, matured by years, and informed from the obſervation of facts, rendered him capable of hearing teachers with greater advantage. He returned therefore to Edinburgh, and again entered on the career of academical purſuits, under the tuition of Dr Monro, and thoſe other teachers, whoſe abilities raiſed the fame of the medical ſchool at this place. But not ſatisfied with the inſtructions to be had from any one ſet of profeſſors, the celebrity of the medical teachers in London led him alſo to viſit that capital. There he particularly became the pupil of thoſe diſtinguiſhed lecturers, Dr Hunter and Dr Smellie. And while from the former he laboured to acquire an accurate chirurgical knowledge, from the latter he endeavoured to obtain the true principles of midwifery conſidered as a ſcience. At the ſame time, he was no leſs induſtrious in improving himſelf in the ſucceſsful practice of both arts by attention at hoſpitals.

Macbride.

Thus prepared for the exerciſe of his profeſſion, about the end of the year 1749 he fixed his reſidence in Dublin in the charactor of ſurgeon and accoucheur. If amiable manners, and extenſive knowledge of his profeſſion, could alone have been ſufficient introductions to practice, he might in a ſhort time have looked for a competent ſhare of buſineſs in that capital; but while he had to combat that objection which very generally ariſes from youth, his progreſs was alſo not a little retarded by an uncommon degree of modeſty. Hence for ſeveral years he remained almoſt in a ſtate of obſcurity, and was employed by but few people either of rank or fortune. But, if it is to be regretted that for many years his time was not ſo fully employed in the lucrative part of his profeſſion as was due to his merit, it ought ſtill to be remembered, that this eſſentially promoted the cauſe of ſcience: for by this means his genius and induſtry were directed to medical reſearches; and were productive of diſcoveries which will with honour tranſmit his name to lateſt poſterity. Theſe, though ſome of them might have been ſucceſsfully turned to his own emolument, were freely communicated to the world in different publications; and he did not ſhow greater ingenuity in making diſcoveries, than liberality of ſentiment in publiſhing them for the advantage of others.—His firſt publication, intitled, "Experimental Eſſays on Medical and Philoſophical Subjects," made its appearance in the year 1764.—Theſe eſſays are five in number: 1. On the fermentation of alimentary mixture and the digeſtion of the food. 2. On the nature and properties of fixed air. 3. On the different kinds of antiſeptics. 4. Of the diſſolvent power of quicklime. 5. Of the ſea-ſcurvy. The merit of all theſe is ſufficiently known and acknowledged: but the laſt of them is unqueſtionably the moſt important; the method therein propoſed of both the prevention and cure of that dreadful diſeaſe the ſcurvy, having been confirmed by repeated and undeniable obſervation.

Having thus equally diſtinguiſhed himſelf as an ingenious philoſopher and able practitioner, the world were not now ſlow in beſtowing upon him the tribute of applauſe to which he was intitled. His name was enrolled with honour in the liſts of many learned ſocieties; and the univerſity where his ſtudies had firſt been commenced, were proud to confer upon him the degree of Doctor of Medicine.

The reputation, however, of being a diſtinguiſhed author, was to him but a ſecondary object; and his talents were not confined to the advancement of medicine alone. Having ſucceſsfully diſcovered a conſiderable improvement in the art of tanning, with that ſpirited generoſity which is ever the concomitant of real worth, he ſpeedily and freely communicated it to the public, by publiſhing, firſt, "An Account of a New Method of Tanning;" and afterwards, "Inſtructions for carrying on the New Method of Tanning." As a mark of approbation for this liberal conduct, as well as a teſtimony of reſpect for his ingenuity, prize-medals were conferred upon him by the Societies of Arts both in London and Dublin. But his laſt and

moſt

Macbride, moſt extenſive publication was more immediately in the line of his own profeſſion: It is intitled, "A Methodical Introduction to the Theory and Practice of Medicine." In that valuable work he has given a conciſe and connected view of the principles and practice of the healing art, as beſt eſtabliſhed by ſound reaſon, and confirmed by accurate obſervation. Moſt, if not all of theſe publications, not only went through various editions, but were tranſlated into different languages.

After the merit of Dr Macbride came to be properly known, the public ſeemed to ſhow a deſire of making compenſation for having ſo long overlooked it. His employment increaſed ſo rapidly, that he had more buſineſs than he could tranſact either with eaſe or ſafety. This having kept him in perpetual agitation both of body and mind, at laſt induced an almoſt total incapacity of ſleeping. From this circumſtance his health could not fail to be impaired. In this ſituation, after accidental expoſure to cold, he was attacked with a fever, which put an end to his life on the 13th of December 1778, in the 53d year of his age.

Thoſe who were his moſt intimate acquaintance were inclined to believe that his death was not a little haſtened by domeſtic calamities. During his reſidence in Dublin he was twice married, and was as often ſubjected to that inexpreſſible diſtreſs which muſt reſult from a final ſeparation in this world from the moſt intimate and loving friends. By both of his wives he had ſeveral children; but none of them ſurvived their father. And on theſe calamitous events, although he was able to conceal his feelings from the world, yet they gave a ſevere ſhock to his conſtitution. After his death, ſeveral of the playful trinkets of his infants, with the ſignature of *dulces exuviæ*, were found in his repoſitories among papers on medical and other important ſubjects: an incontrovertible proof, that in him at leaſt, the great mind of the philoſopher was conjoined with the feeling heart of the affectionate father. But if his abilities were remarkable as a philoſopher and phyſician, if his conduct was exemplary as an huſband and parent, his manners were no leſs amiable as a companion and friend. His polite and benevolent conduct, joined to his taſte for the fine arts, conciliated the affections and eſteem of all who knew him. His death was univerſally and ſincerely lamented in the city of Dublin.

MACCLESFIELD, a town of Cheſhire in England, 171 miles from London, is ſeated on the edge of a foreſt of the ſame name, upon a high bank near the river Bollin; and is a large, handſome town, with a fine church and a very high ſteeple. It was erected into a borough by King Edward III. is governed by a mayor, and enjoys great privileges and juriſdictions by virtue of the court and the liberties of the foreſt. In its church are two braſs plates, on one of which there is a promiſe of 26,000 years and 26 days pardon for ſaying five Pater-Noſters and five Aves. Its chief manufacture is mohair buttons. The market is on Mondays; the fairs are June 11 and 30, and Nov. 2. In Macclesfield foreſt are many pits dug for the ſake of the turf; in which it is common to ſee fir-trees buried, which are dug up for various uſes, but chiefly for ſplinters that ſerve the poor for candles. W. Long. 2. 10. N. Lat. 53. 15.

Mace, Macedon.

MACE, an ancient weapon, formerly much uſed by the cavalry of all nations. It was commonly made of iron; its figure much reſembles a chocolate-mill; many ſpecimens may be ſeen in the Tower. It was with one of theſe that Walworth mayor of London knocked the rebel Wat Tyler from off his horſe in Smithfield for approaching the young king Richard II. in an inſolent manner; and as he fell, he diſpatched him with his dagger. The mace in modern times changed its form; and being no longer a war inſtrument, is made of copper or ſilver gilt, ornamented with a crown, globe, and croſs, and is now the chief inſignia of authority throughout Great Britain. Similar to the ancient maces, were thoſe ſtaves at the end of which iron or leaden balls armed with ſpikes were ſuſpended by chains: they were till lately carried by the pioneers of the trained-bands or city militia.

MACE, in the materia medica, the ſecond coat or covering of the kernel of the nutmeg, is a thin and membranaceous ſubſtance, of an oleaginous nature, and a yellowiſh colour; being met with in flakes of an inch or more in length, which are divided into a multitude of ramifications. It is of an extremely fragrant, aromatic, and agreeable flavour; and of a pleaſant, but acrid oleaginous taſte.

Mace is carminative, ſtomachic, and aſtringent; and poſſeſſes all the virtues of nutmeg, but has leſs aſtringency.—The oils of mace and nutmeg, whether prepared by diſtillation or expreſſion, are ſo much of the ſame nature, that they may be indiſcriminately uſed for one another on all occaſions. They give eaſe in cholics, and often in nephritic caſes, taken internally from one drop to five or ſix of the diſtilled oil, or an equal quantity of the expreſſed; and externally, they are of uſe to rub paralytic limbs: they alſo aſſiſt digeſtion; and will often ſtop vomitings and hiccoughs, only by being rubbed on the region of the ſtomach. The nurſes have a cuſtom of applying oil of mace by expreſſion to childrens navels to eaſe their gripes, and that often with ſucceſs; and we are aſſured, by authors of credit, that when rubbed on the temples, it promotes ſleep.

MACEDON, or MACEDONIA, a moſt celebrated kingdom of antiquity, was bounded on the eaſt by the Ægean ſea; on the ſouth by Theſſaly and Epirus; on the weſt by the Ionian ſea or Adriatic; on the north, at firſt by the river Strymon and the Scardian mountains, but afterwards by the river Neſſus or Neſtus. In a direct line the whole country extended only 150 miles in length; but the windings of the coaſt lengthened it out to three times that extent; in which almoſt every convenient ſituation was occupied by a Grecian ſea-port. The country was naturally divided by the Thermaic and Strymonic gulphs, into the provinces of Pieria, Chalcis, and Pangæus. The middle region, which took its name from a city of Euboea from whence it was originally peopled, was very fertile and pleaſant; the inland country, being diverſified by lakes, rivers, and arms of the ſea, was extremely convenient for inland navigation, while the towns of Amphipolis, Potidæa, Acanthus, and many others, afforded marts for the commerce of the republics of Greece, as well as of Thrace and Macedon. On one ſide of this diſtrict were the mountains of Pangæus, and on the other the plains of Pieria. The Pangæan moun-

1 Situation, &c. of the country.

mountains, which extended 90 miles towards the eaſt and the river Neſſus, though proper neither for corn nor paſture, produced plenty of timber for ſhip-building; while the ſouthern branches of the mountain contained rich veins of gold and ſilver; but theſe, though wrought ſucceſſively by the Thaſians and the Athenians, were only brought to perfection by Philip of Macedon, who extracted from them gold and ſilver to the value of 200,000l. Sterling annually. Pieria extended 50 miles along the Thermaic gulph, to the confines of Theſſaly and mount Pindus. The inland part of the country was beautifully diverſified with ſhady hills and fountains; and ſo admirably calculated for ſolitary walks and retirement, that the ancients looked upon it to be the favourite haunt of the muſes, and accordingly beſtowed upon them the title of *Pierides*.

2
Different names.

3
Kingdom founded by Caranus.

In the moſt early times this country was called *Æmathia*, from *Æmathius* one of its princes. The name of *Macedon* is ſaid to have been derived from *Macedo* a deſcendant of Deucalion; though others ſuppoſe it to have been only a corruption of *Mygdonia* a diſtrict of the country. In thoſe remote ages of antiquity, Macedon, like moſt other countries of Europe, was divided into a great number of petty principalities, of which ſcarce even the names are known at this time. All authors agree, however, that *Caranus* was the firſt who eſtabliſhed any permanent ſovereignty in Macedon. He was an Argive, a deſcendant of Hercules, and about 800 years B. C. conducted a ſmall colony of his countrymen into the inland diſtrict of Macedon at that time diſtinguiſhed by the name of *Æmathia* as already mentioned. This territory was about 300 miles in circumference. On the ſouth it was ſeparated from the ſea by a number of Greek republics, of which the moſt conſiderable were thoſe of Olynthus and Amphipolis; and on the north, eaſt, and weſt, was ſurrounded by the barbarous kingdoms of Thrace, Pœonia, and Illyricum. According to the traditions of thoſe times, Caranus, having conſulted the oracle on the ſucceſs of his intended expedition, was commanded to be directed by the goats in the eſtabliſhment of his empire. For ſome time he proceeded at random, without knowing what to make of the oracle's anſwer; but happening to enter the ſmall kingdom of *Æmathia*, at that time governed by King Midas, he obſerved a herd of goats running towards *Edeſſa* the capital. Recollecting then the anſwer of the oracle, he attacked and took the city by ſurpriſe, ſoon after making himſelf maſter of the whole kingdom. In memory of this remarkable event he called the city *Ægea*, and the people *Ægiates*, from the goats who conducted him, and made uſe of the figure of a goat in his ſtandard. From this fable alſo we ſee why the figure of a goat is ſo frequently ſeen on the coins of Philip and his ſucceſſors.

4
Policy of this prince.

The little colony of Argives led into Æmathia by Caranus would ſoon have been overwhelmed by the barbarous nations who ſurrounded it, had not this prince and his ſubjects taken care to ingratiate themſelves with their neighbours, rather than to attempt to ſubdue them by force of arms. They inſtructed them in the Grecian religion and government, and in the knowledge of many uſeful arts; adopting themſelves, in ſome degree, the language and manners of the barbarians; imparting to them in return ſome part of the Grecian civilization and polite behaviour. Thus they gradually aſſociated with the fierce and warlike tribes in their neighbourhood; and this prudent conduct, being followed by ſucceeding generations, may be looked upon as one of the cauſes of the Macedonian greatneſs.

5
Perdiccas I. a celebrated monarch.

6
Invaſion by the Illyrians.

Caranus, dying after a reign of three years, left the kingdom to his ſon Cœnus; who having conſiderably enlarged his dominions, was ſucceeded by Thurymas, and he by Perdiccas I. This laſt prince is by Thucydides and Herodotus accounted the founder of the Macedonian monarchy; though his hiſtory is ſo obſcured by fable, that nothing certain can now be known concerning it. In proceſs of time, however, the good underſtanding which had ſubſiſted between the Macedonians and their barbarous neighbours began to ſuffer an interruption; and in 691 B. C. the kingdom was for the firſt time invaded by the Illyrians. At firſt they did conſiderable damage by their ravages; but the Macedonian monarch, Argæus, having decoyed them into an ambuſh, cut off great numbers, and obliged the remainder to leave the kingdom. In the reign of his ſucceſſors, however, they returned, and occaſionally proved very troubleſome enemies till the reigns of Philip and Alexander.

7
Interference of the Perſians and Macedonians.

In the mean time the kingdom of Macedon began to be affected by thoſe great events which took place in other parts of the world. Cyrus having overthrown the Babylonian empire, and conquered all the weſtern part of Aſia, eſtabliſhed a mighty monarchy, which threatened all the eaſtern parts of Europe with ſubjection. The Greeks, however, having now emerged from their barbariſm, and acquired great knowledge in the art of war, were able to reſiſt effectually this very formidable power; but the kingdom of Macedon, obſcure and unconnected, was obliged to yield, and though not formally made a province of the Perſian empire, was nevertheleſs accounted in ſome ſort as under the vaſſalage and protection of the Perſians. Alcetas, who aſcended the Macedonian throne about the time that the Perſian monarchy was founded, had the dexterity to preſerve his dominions from the encroachments of the Greeks on the one hand, and of the Perſians on the other; but in the reign of his ſucceſſor Amyntas a formal demand was made of ſubmiſſion to the great King Darius, by ſending him a preſent of earth and water. Seven ambaſſadors were ſent on this errand by Megabizus, one of the officers of Darius. They were ſumptuouſly entertained by Amyntas; but having attempted to take ſome indecent liberties with the Macedonian women, Alexander the king's ſon cauſed them all to be murdered. This raſh action had almoſt proved the ruin of the kingdom; but Alexander found means to pacify Bubaris the general ſent againſt him by Megabizus, by ſhowing him his ſiſter Gygæa, a very beautiful woman, with whom the Perſian fell in love at firſt ſight, and afterwards married her.

8
Advantages accruing to Macedon from this interference.

From this time the Macedonians were accounted the faithful allies of the Perſians; and, through the intereſt of his ſon-in-law, Amyntas obtained the country in the neighbourhood of mount Hæmus and Olympus, at the ſame time that the city of Alabanda in Phrygia was given to Amyntas the nephew of Alexander. The Macedonians diſtinguiſhed themſelves in the time of of the Perſian invaſion of Greece, by furniſhing their allies with 200,000 recruits; though ſome cities, particularly Potidæa, Olynthus, and Pallene, adhered to the Grecian intereſt. The two laſt were taken and raſed, and the inhabitants maſſacred by the Perſians; but Potidæa eſcaped by reaſon of the ſea breaking into the Perſian camp, where it did great damage. Alexander, however, afterwards thought proper to court the favour of the Greeks by giving them intelligence of the time when Mardonius deſigned to attack them. The remaining tranſactions of this reign are entirely unknown, farther than that he enlarged his dominions to the river Neſſus on the eaſt and the Axius on the weſt.

9 Reign of Perdiccas II.

Alexander I. was ſucceeded by his ſon Perdiccas II. who, according to Dr Gillies, "inherited his father's abilities, though not his integrity." But from his duplicity above mentioned both to Greeks and Perſians, it does not appear that he had much to boaſt of as to the latter quality. In the Peloponneſian war he eſpouſed the cauſe of the Spartans againſt the Athenians, from whom he was in danger by reaſon of their numerous ſettlements on the Macedonian coaſt, and their great power by ſea. For ſome time, however, he amuſed the Athenians with a ſhow of friendſhip; but at laſt, under pretence of enabling Olynthus and ſome other cities to recover their liberties, he aſſiſted in deſtroying the influence of the Athenians in thoſe places, in hopes of eſtabliſhing that of the Macedonians in its ſtead. But this deſign failed of ſucceſs; the Olynthian confederacy was broken, and the members of it became ſubject to Sparta, until at laſt, by the misfortunes of that republic, they became ſufficiently powerful not only to reſiſt the encroachments of the Macedonians, but to make conſiderable conqueſts in their country.

10 Of Archelaus I.

Perdiccas II. was ſucceeded about 416 B. C. by Archelaus I. He enlarged his dominions by the conqueſt of Pydna, and other places in Pieria, though his ambition ſeems rather to have been to improve his dominions than greatly to extend them. He facilitated the communication between the principal towns of Macedon, by cutting ſtraight roads through moſt part of the country: he built walls and fortreſſes in ſuch places as afforded a favourable ſituation; encouraged agriculture and the arts, particularly thoſe ſubſervient to war; formed magazines of arms; raiſed and diſciplined a conſiderable body of cavalry; and in a word, ſays Dr Gillies, added more to the ſolid grandeur of Macedon than had been done by all his predeceſſors put together. Nor was he regardleſs of the arts of peace. His palace was adorned by the works of Grecian painters. Euripides was long entertained at his court; Socrates was earneſtly ſolicited to live there, after the example of this philoſophic poet, formed by his precepts and cheriſhed by his friendſhip: men of merit and genius in the various walks of literature and ſcience were invited to reſide in Macedon, and treated with diſtinguiſhed regard by a monarch duly attentive to promote his own glory and the happineſs of his ſubjects."

11 The kingdom becomes a prey to civil diſſenſions.

This great monarch died after a reign of ſix years, a ſpace by far too ſhort to accompliſh the magnificent projects he had formed. After his death the kingdom fell under the power of uſurpers or weak and wicked monarchs. A number of competitors conſtantly appeared for the throne; and theſe by turns called in to their aſſiſtance the Thracians, Illyrians, Theſſalians; the Olynthian confederacy, Athens, Sparta, and Thebes. Bardyllis, an active and daring chief, who, from being head of a gang of robbers, had become ſovereign of the Illyrians, entered Macedon at the head of a numerous army, depoſed Amyntas II. the father of Philip, and ſet up in his place one Argæus, who conſented to become tributary to the Illyrians. Another candidate for the throne, named *Pauſanias*, was ſupported by the Thracians; but, by the aſſiſtance of the Theſſalians and Olynthians, Amyntas was enabled to reſume the government. After his reſtoration, however, the Olynthians refuſed to deliver up ſeveral places of importance belonging to Macedon which Amyntas had either entruſted to their care, or which they had taken from his antagoniſt.

12 War with the Olynthians.

Amyntas complained to Sparta; and that republic, which had already formed ſchemes of very extenſive ambition, ſo readily complied with the requeſt, that it was generally ſuppoſed to have proceeded from Spartan emiſſaries ſent into Macedonia. They pretended indeed to heſitate a little, and to take time to deliberate on the army which ought to be raiſed for the purpoſe; but Cleigenes, the principal ambaſſador, repreſented the urgency of the caſe in ſuch a manner, that the troops which happened at that time to be ready were ordered to take the field without delay. Two thouſand Spartans, under the command of Eudamidas, were ordered into Macedon, while a powerful reinforcement under the command of Phœbidas, brother to the general, was ordered to follow him as ſoon as poſſible. By accident, Phœbidas and his auxiliaries were detained till the ſeaſon for action was paſſed; but Eudamidas with his ſmall army performed very eſſential ſervice. The appearance of a Spartan army at once encouraged the ſubjects and allies of the Olynthians to revolt; and the city of Potidæa, a place of great importance in the iſthmus of Pallene, ſurrendered ſoon after his arrival in the country. Being too much elated with his ſucceſs, however, Eudamidas approached ſo near the city of Olynthus, that he was unexpectedly attacked, defeated, and killed in a ſally of the citizens. He was ſucceeded by Teleutias the brother of Ageſilaus, who had under his command a body of 10,000 men, and was farther aſſiſted by Amyntas king of Macedon and Derdas his brother, the governor or ſovereign of the moſt weſterly province of Macedon, which abounded in cavalry. By theſe formiable enemies the Olynthians were defeated in a number of battles, obliged to ſhut themſelves up in their city, and prevented from cultivating their territory; on which Teleutias advanced with his whole forces to inveſt the city itſelf. His exceſſive eagerneſs to deſtroy his enemies proved his ruin. A body of Olynthian horſe had the boldneſs to paſs the river Amnias in ſight of the allied army, though ſo much ſuperior in number. Teleutias ordered his targeteers to attack them, the Olynthians, having retreated acroſs the river, were cloſely purſued by the Lacedemonians, great part of whom alſo paſſed the river; but the Olynthians ſuddenly turning upon them, killed upwards of 100, with Tlemonidas their leader. Teleutias, exaſperated at this diſaſter, ordered the remainder of the targeteers and cavalry to purſue; while he himſelf advanced at the head of the heavy armed foot with ſuch celerity that they began to fall into diſorder. The Olynthians allowed them to proceed, and the Lacedæmonians very imprudently advanced juſt under the towers and battlements of the city. The townſmen then mounted the walls, and diſcharged upon them a ſhower of darts, arrows, and other miſſile weapons, while the flower of the Olynthian troops, who had been purpoſely poſted behind the gates, ſallied forth and attacked them with great violence. Teleutias attempting to rally his men, was ſlain in the firſt onſet; the Spartans who attended him were defeated, and the whole army at laſt diſperſed with great ſlaughter, and obliged to ſhelter themſelves in the towns of Acanthus, Apollonia, Spartolus, and Potidæa.

13
The Olynthians obliged to ſubmit.

14
Pella made the capital of Macedon.

The Spartans, undiſmayed by this terrible diſaſter, next ſent their King Ageſipolis with a powerful reinforcement into Macedon. His preſence greatly raiſed the ſpirits of the Lacedæmonian allies, and his rapid ſucceſs ſeemed to promiſe a ſpeedy termination to the war, when he himſelf died of a calenture. He was ſucceeded in the throne by his brother Cleombrotus, and in the command of the army by Polybiades an experienced general, who likewiſe brought along with him a powerful reinforcement. Olynthus was now completely blocked up by land, while a ſquadron of Lacedæmonian galleys blocked up the neighbouring harbour of Myceberna. The Olynthians, however, held out for nine or ten months, but at laſt were obliged to ſubmit on very humiliating conditions. They formally renounced all claim to the dominion of Chalcis; they ceded the Macedonian cities to their ancient governor; and in conſequence of this Amyntas left the city of Ægæa or Edeſſa, where till now he had held his royal reſidence, and fixed it at Pella, a city of great ſtrength and beauty, ſituated on an eminence, which together with a plain of conſiderable extent was defended by impaſſable moraſſes, and by the rivers Axius and Lydias. It was diſtant about 15 miles from the Ægean ſea, with which it communicated by means of the abovementioned rivers. It was originally founded by the Greeks, who had lately conquered and peopled it; but in conſequence of the misfortunes of Olynthus, it now became the capital of Macedon, and continued ever after to be ſo.

15
Pauſanias uſurps the throne.

16
Ptolemy aſpires to the throne.

17
The Macedonians defeated, and their king killed by the Illyrians.

Amyntas, thus fully eſtabliſhed in his dominions, continued to enjoy tranquillity during the remaining part of his life. The reign of his ſon Alexander was ſhort, and diſturbed by invaſions of the Illyrians; from whom he was obliged to purchaſe a peace. He left behind him two brothers, Perdiccas and Philip, both very young; ſo that Pauſanias again found means to uſurp the throne, being ſupported not only by the Thracians, but a conſiderable number of Greek mercenaries, as well as a powerful party in Macedon itſelf. In this critical juncture, however, Iphicrates the Athenian happening to be on an expedition to Amphipolis, was addreſſed by Eurydice the widow of Amyntas, ſo warmly in behalf of her two ſons, whom ſhe preſented to him, that he intereſted himſelf in their behalf, and got Perdiccas the eldeſt eſtabliſhed on the throne. He was induced alſo to this piece of generoſity by the kindneſs which Eurydice and her huſband had formerly ſhown to himſelf, and he likewiſe ſaw the advantages which muſt enſue to his country from a connection with Macedon. During the minority of the young prince, however, his brother Ptolemy, who was his guardian, openly aſpired to the throne; but he was depoſed by the Theban general Pelopidas, who reinſtated Perdiccas in his dominions; and in order to ſecure, in the moſt effectual manner, the dependence of Macedon upon Thebes, carried along with him thirty Macedonian youths as hoſtages; and among them Philip, the younger brother of the king. Perdiccas now, elated by the protection of ſuch powerful allies, forgot Iphicrates and the Athenians, and even diſputed with them the right to the city of Amphipolis, which had been decreed to them by the general council of Greece, but which his oppoſition rendered impoſſible for them to recover. In conſequence of the truſt he put in theſe new allies, alſo, it is probable that he refuſed to Bardyllis the Illyrian the tribute which the Macedonians had been obliged to pay him; which occaſioned a war with that nation. In this conteſt the Macedonians were defeated with the loſs of 4000 men, Perdiccas himſelf being taken priſoner, and dying ſoon after of his wounds.

The kingdom was now left in the moſt deplorable ſtate. Amyntas, the proper heir to the throne, was an infant; the Thebans, in whom Perdiccas had placed ſo much confidence, were deprived of the ſovereignty of Greece; the Athenians, juſtly provoked at the ungrateful behaviour of the late monarch, ſhowed an hoſtile diſpoſition; the Illyrians ravaged the weſt, and the Pæonians the north quarter of the kingdom; the Thracians ſtill ſupported the cauſe of Pauſanias, and propoſed to ſend him into Macedon at the head of a numerous army; while Argæus, the former rival of Amyntas, renewed his pretenſions to the throne, and by flattering the Athenians with the hopes of recovering Amphipolis, eaſily induced them to ſupport his claims; and in conſequence of this they fitted out a fleet, having on board 3000 heavy armed ſoldiers, which they ſent to the coaſt of Macedon.

18
Philip arrives in Macedon.

Philip, the late king's brother, no ſooner heard of his defeat and death, than he ſet out privately from Thebes; and on his arrival in Macedon found matters in the ſituation we have juſt now deſcribed. Fired with an inſatiable ambition, it is very probable that from the very firſt moment he had reſolved to ſeize the kingdom for himſelf; yet it was neceſſary at firſt to pretend that he aſſumed the throne only to preſerve it for his nephew. Philip, as has already been mentioned, was carried off as an hoſtage by Pelopidas, but for a long time paſt had remained in ſuch obſcurity, that hiſtorians diſagree as to his place of reſidence; ſome placing him in Thebes, and others in Macedon. It is certain, however, that from the age of 15 he had been very much in the family of Epaminondas, from whoſe leſſons he could not but derive the greateſt emolument. It is probable alſo that he attended this celebrated general in many of his expeditions; and it is certain, that, with an attendance ſuitable to his rank, he viſited moſt of the principal republics, and ſhowed an attention to their inſtitutions, both civil and military, far ſuperior to his years. Having eaſy acceſs to whomſoever he pleaſed, he cultivated the friendſhip of the firſt people in Greece. Even in Athens, where

where no good-will ſubſiſted with Macedon, the philoſophers Plato, Iſocrates, and Ariſtotle, cultivated his acquaintance: and the connection he formed with the principal leaders of that republic in the early period of his life, no doubt contributed greatly to the accompliſhment of the deſigns in which he afterwards proved ſo ſucceſsful.

19
Retrieves the affairs of the kingdom.

His appearance in Macedon inſtantly changed the face of affairs: the Macedonian army, though defeated, was not entirely deſtroyed; and the remainder of them ſecured themſelves in the fortreſſes which had been built by Archelaus. There were alſo conſiderable garriſons in the fortreſſes, and walled towns ſcattered over the kingdom; and the Illyrians, who had made war only for the ſake of plunder, ſoon returned home to enjoy the fruits of their victory. His other enemies, the Thracians and Pæonians, were much leſs formidable than the Illyrians, being ſtill in a very rude and uncivilized ſtate, incapable of uniting under one head in ſuch a manner as to bring any formidable army into the field. While the Illyrians therefore gave up the campaign through mere caprice and unſteadineſs, Philip himſelf applied to the Pæonians, and by fair promiſes and flattery prevailed upon them to deſiſt. The king of Thrace, by means of a ſum of money, was eaſily prevailed upon to abandon the cauſe of Pauſanias; ſo that Philip, freed from theſe barbarians, was now left at liberty to oppoſe the Athenians, who ſupported Argæus, and threatened a very formidable invaſion.

The appearance of the Athenian fleet before Methone, with that of Argæus at the head of a numerous army in Pieria, filled the whole country with conſternation; and Philip, who was by no means deficient in talents neceſſary to recommend himſelf to the good graces of the people, took the opportunity of getting Amyntas ſet aſide, and himſelf declared king; for which indeed the danger of the times afforded a very plauſible pretext.

20.
Takes upon him the ſovereignty.

Argæus, in the mean time, advanced with his Athenian allies towards Edeſſa, or Ægæ, the ancient capital of the Macedonian empire, where he hoped to have been amicably received; but finding the gates ſhut againſt him, he returned back to Methone.

21
Defeats and kills Argæus an uſurper.

Philip haraſſed him in his retreat, cutting off great numbers of his men, and afterwards defeated him in a general engagement; in which Argæus himſelf, with the flower of his army, was cut in pieces, and all the reſt taken priſoners.

This firſt inſtance of ſucceſs contributed greatly to raiſe the ſpirits of Philip's party; and he himſelf took care to improve it in the beſt manner poſſible.

22
Philip's politic treatment of the priſoners.

Having taken a great number of priſoners, both Macedonians and Athenians, he determined, by his treatment of them, to ingratiate himſelf with both parties. The former were called into his preſence, and, after a gentle reprimand, admitted to ſwear allegiance to him; after which they were diſtributed through the army: the Athenians were entertained at his table, diſmiſſed without ranſom, and their baggage reſtored. The priſoners were juſt allowed time to return to their native city and to ſpread abroad the news of Philip's generoſity, when they were followed by ambaſſadors from Macedon with propoſals for peace.

23
Renounces his right to Amphipolis.

As he knew that the loſs of Amphipolis had greatly irritated them, he now thought proper to renounce his juriſdiction over that city; and it was accordingly declared free and independent, and ſubject only to the government of its own free and equitable laws. This artful conduct, together with his kind treatment of the priſoners, ſo wrought upon the minds of the Athenians, that they conſented to the renewal of a treaty which had formerly ſubſiſted between them and his father Amyntas. Thus he found means to remove all jealouſy of his ambition or the ſchemes he might afterwards undertake to their prejudice; and not only this, but to induce them to engage in a ruinous war with their allies, which occupied their attention until Philip had an opportunity of getting his matters ſo well eſtabliſhed that it was impoſſible to overthrow them.

24
Reduces the power of the nobility.

The new king being thus left at liberty to regulate his domeſtic concerns, began to circumſcribe the power of his chiefs and nobles; who, eſpecially in the more remote provinces, paid very little regard to the authority of the kings of Macedon; ſometimes, even in times of public calamity, throwing off their allegiance altogether, and aſſuming an independent government over conſiderable tracts of country.

25
Chooſes a number of illuſtrious young men for his companions.

To counteract the ambition of theſe chiefs, Philip choſe a body of the braveſt Macedonian youths, whom he entertained at his own table, and honoured with many teſtimonies of his friendſhip, giving them the title of his *companions*, and allowing them conſtantly to attend him in war and hunting. Their intimacy with the ſovereign, which was conſidered as an indication of their merit, obliged them to ſuperior diligence in all the ſevere duties of military diſcipline; and the young nobility, eager to participate ſuch high honours, vied with each other in their endeavours to gain admiſſion into this diſtinguiſhed order; ſo that while on the one hand they ſerved as hoſtages, on the other they formed an uſeful ſeminary for future generals, by whom both Philip and Alexander were afterwards greatly aſſiſted in their conqueſts.

26
Whether he inſtituted the phalanx.

Diodorus Siculus, and all the Roman writers who have treated of the hiſtory of Greece, aſſert that Philip, in the firſt year of his reign, inſtituted the Macedonian phalanx; a body of 6000 men armed with ſhort ſwords fitted either for cutting or ſtabbing, having alſo ſtrong bucklers four feet long and two and an half broad, and pikes 14 feet long; uſually marching 16 men deep. But this opinion is controverted by others. Dr Gillies ſuppoſes that the opinion had ariſen from the Romans meeting with the phalanx in its moſt complete form in Macedon; and as they became acquainted with Greece and Macedon pretty nearly at the ſame time, it was natural for them to ſuppoſe that it had been invented among the Macedonians. The phalanx, he ſays, is nothing different from the armour and arrangement which had always prevailed among the Greeks, and which Philip adopted in their moſt perfect form; "nor is there reaſon (ſays he) to think that a prince, who knew the danger of changing what the experience of ages had approved, made any alteration in the weapons or tactics of that people. The improvement in the countermarch, to which Philip gave the appearance of advancing inſtead of retreating, mentioned by Ælian in his Tactics, c. xxviii. was borrowed, as this author tells us, from the Lacedæmonians. If Philip increaſed the phalanx, uſually leſs numerous, to 6000 men, this was far from an improvement; and the later kings of Macedon,

Macedon, who ſwelled it to 16,000, only rendered that order of battle more unwieldy and inconvenient." Inſtead of this, Philip, according to our author, employed himſelf in procuring arms, horſes, and other neceſſary materials for war; and in introducing a more ſevere and exact military diſcipline than had formerly been known in Macedon.

27
Overcomes the Pæonians and Illyrians.

While the king thus took the beſt methods to render himſelf ſecure at home and formidable abroad, the Pæonians again began to make incurſions into the kingdom. The death of Agis their king, however, who was a man of great military ſkill, deprived them almoſt of every power of reſiſtance when they were attacked. Philip, of conſequence, over-ran their country with little oppoſition, and reduced them to the ſtate of tributaries to Macedon. No ſooner was this accompliſhed, than he undertook a winter's campaign againſt the Illyrians, who had long been the natural enemies of Macedon. They had now extended their territory to the eaſt; by which means the Macedonians were excluded from the harbours on the coaſt of the Adriatic. This was a grievance to Philip, who ſeems early to have meditated the raiſing of a naval power; neither could he hope to be in ſafety, ſhould the kingdom be left open to the incurſions of a barbarous enemy: for which reaſons he determined at once to humble thoſe enemies in ſuch a manner that they ſhould no longer be in a ſituation to give him any diſturbance. After an ineffectual negociation, he was met by Bardyllis at the head of a conſiderable body of infantry, but with only 400 horſe. They made a gallant reſiſtance for ſome time; but being unable to cope with ſuch a ſkilful general as Philip, they were defeated with the loſs of 7000 men, among whom was their leader Bardyllis, who fell at the age of 90.

28
They are forced to become tributary.

By this diſaſter the Illyrians were ſo much diſheartened, that they ſent ambaſſadors to Philip, humbly begging for peace on any terms. The conqueror granted them the ſame conditions which had been impoſed upon the Pæonians, viz. the becoming tributary, and yielding up to him a conſiderable part of their country. That part of it which lay to the eaſtward of a lake named Lychnidus he annexed to Macedon; and probably built a town and ſettled a colony there; the country being fertile, and the lake abounding with many kinds of fiſh highly eſteemed by the ancients. This town and lake were about 50 miles diſtant from the Ionian ſea; and ſuch was the aſcendency which the arms and policy of Philip acquired over his neighbours, that the inhabitants of all the intermediate diſtrict ſoon adopted the language and manners of their conquerors; and their territory, hitherto unconnected with any foreign power, ſunk into ſuch abſolute dependence upon Macedon, that many ancient geographers ſuppoſed it to be a province of that country.

29
His great deſigns.

Philip had no ſooner reduced the Illyrians, than he began to put in execution greater deſigns than any he had yet attempted. The rich coaſts to the ſouthward of Macedon, inhabited chiefly by Greeks, preſented a ſtrong temptation to his ambition and avarice. The confederacy of Olynthus, after having thrown off the yoke of Sparta, was become more powerful than ever, and could ſend into the field an army of 10,000 heavy armed troops, beſides a number of cavalry in proportion. Moſt of the towns in Chalcidice were become its allies or ſubjects; ſo that this populous and wealthy province, together with Pangæus on the right and Pieria on the left, of both which the cities were either independent or ſubject to the Athenians, formed a barrier not only ſufficient to guard againſt any incurſions of the Macedonians, but which was even formidable to them. But though Philip was ſenſible enough of the importance of thoſe places, he conſidered the conqueſt of Amphipolis as more neceſſary at the preſent time. By the poſſeſſion of this place Macedon would be connected with the ſea, and would be ſecured in many commercial advantages, which could not but contribute greatly to the proſperity of the kingdom at large; a road was likewiſe opened to the woods and mines of Pangæus, the former of which were ſo neceſſary to the raiſing of a naval power, and the latter for the eſtabliſhment of a proper military force. This city had indeed been declared independent by Philip himſelf in the beginning of his reign; but this was only to prevent a rupture with the Athenians, who ſtill aſſerted their right to it as an ancient colony; though, by reaſon of the perfidy of Charidemus, a native of Eubœa, they had hitherto failed in their attempts to recover it. The Amphipolitans, however, having once enjoyed the ſweets of liberty, prepared to maintain themſelves in their independence. In the mean time the hoſtile deſigns of Philip, which all his precaution had not been able to conceal, alarmed the inhabitants to ſuch a degree, that they thought proper to put themſelves under the protection of the Olynthians. By them they were readily received into the confederacy; and, truſting to the ſtrength of their new allies, behaved in ſuch an inſolent manner to Philip, that he was not long of finding a ſpecious pretext for hoſtility; at which the Olynthians, greatly alarmed, ſent ambaſſadors to Athens, requeſting their aſſiſtance againſt ſuch a powerful enemy. Philip, however, juſtly alarmed at ſuch a formidable conſpiracy, ſent agents to Athens, with ſuch expedition that they arrived there before any thing could be concluded with the Olynthian deputies. Having gained over the popular leaders and orators, he deceived and flattered the magiſtrates and ſenate in ſuch an artful manner, that a negociation was inſtantly ſet on foot, by which Philip engaged to conquer Amphipolis for the Athenians, upon condition that they ſurrendered to him the ſtrong fortreſs of Pydna, a place which he repreſented as of much leſs importance to them; promiſing alſo to confer upon them many other advantages, which, however, he did not ſpecify at that time. Thus the Athenians, deceived by the perfidy of their own magiſtrates, elated with the hopes of recovering Amphipolis, and outwitted by the ſuperior policy of Philip, rejected with diſdain the proffers of the Olynthians.

30
Plans the conqueſt of Amphipolis.

31
Engages to conquer it for the Athenians.

The ambaſſadors of Olynthus returned home highly diſguſted with the reception they had met with; but had ſcarce time to communicate the news to their countrymen, when the ambaſſadors of Philip arrived at Olynthus. He pretended to condole with them on the affront they had received at Athens; but teſtified his ſurpriſe that they ſhould court the aſſiſtance of that diſtant and haughty republic, when they could avail themſelves of the powerful kingdom of Macedon, which wiſhed

wiſhed for nothing more than to enter into equal and laſting engagements with their confederacy. As a proof of his moderation and ſincerity, he offered to put them in poſſeſſion of Anthemus, an important town in the neighbourhood, of which the Macedonians had long claimed the juriſdiction, making many other fair promiſes; and among the reſt, that he would reduce for them the cities of Pydna and Potidæa, which he choſe rather to ſee in dependence on Olynthus than Athens. Thus he prevailed upon the Olynthians not only to abandon Amphipolis, but to aſſiſt him with all their power in the execution of his deſigns.

Philip now loſt no time in executing his purpoſes on Amphipolis; and preſſed the city ſo cloſely, that the people were glad to apply to the Athenians for relief. Accordingly they diſpatched two of their moſt eminent citizens, Hierax and Stratocles, to repreſent the danger of an alliance betwixt Philip and the Olynthians, and to profeſs their ſorrow for having ſo deeply offended the parent ſtate. This repreſentation had ſuch an effect, that though the Athenians were then deeply engaged in the ſocial war, they would probably have paid ſome attention to the Amphipolitans, had not Philip taken care to ſend them a letter with freſh aſſurances of friendſhip, acknowledging their right to Amphipolis, and which he hoped ſhortly to put into their hands in terms of his recent agreement. By theſe ſpecious pretences the Athenians were perſuaded to pay as little regard to the deputies of the Amphipolitans as they had already done to thoſe of the Olynthians; ſo that the city, unable to defend itſelf alone againſt ſo powerful an enemy, ſurrendered at laſt at diſcretion in the year 357 B. C.

32
Amphipolis ſurrenders.

Philip ſtill proceeded in the ſame cautious and politic manner in which he had begun. Though the obſtinate defence of the Amphipolitans might have furniſhed a pretence for ſeverity, he contented himſelf with baniſhing a few of the popular leaders from whom he had moſt cauſe to dread oppoſition, treating the reſt of the inhabitants with all manner of clemency; but took care to add Amphipolis to his own dominions, from which he was determined that it never ſhould be ſeparated, notwithſtanding the promiſes he had made to the Athenians. Finding that it was not his intereſt at this time to fall out with the Olynthians, he cultivated the friendſhip of that republic with great aſſiduity; took the cities of Pydna and Potidæa, which he readily yielded to the Olynthians, though they had given him but litle aſſiſtance in the reduction of theſe places. Potidæa had been garriſoned by the Athenians; and them the artful king ſent back without ranſom, lamenting the neceſſity of his affairs which obliged him, contrary to his inclination, to oppoſe their republic. Though this was rather too groſs, the Athenians at preſent were ſo much engaged with the ſocial war, that they had not leiſure to attend to the affairs of other nations. Philip made the beſt uſe of his time, and next projected the conqueſt of the gold mines of Thrace. That rich and fertile country was now held by one Cotys, a prince of ſuch weak intellectual faculties, that the ſuperſtition of the Greeks, into which he was newly initiated, had almoſt entirely ſubverted his reaſon; and he wandered about in queſt of the goddeſs Minerva, with whom he fancied himſelf in love. The invaſion of the Macedonians, however, awaked him from his reverie; and Cotys, finding himſelf deſtitute of other means of oppoſition, attempted to ſtop the progreſs of the enemy by a letter. To this Philip paid no regard: the Thracians were inſtantly expelled from their poſſeſſions at Crenidæ, where there were very valuable gold mines. Theſe had formerly been worked by colonies from Thaſos and Athens; but the coloniſts had long ſince been expelled by the barbarous Thracians, who knew not how to make uſe of the treaſure they were in poſſeſſion of. Philip took the trouble to deſcend into the mines himſelf, in order to inſpect the works; and having cauſed them to be repaired, planted a Macedonian colony at Crenidæ, beſtowed upon it the name of Philippi, and drew annually from the gold mines to the value of near 1000 talents, or 200,000 l. ſterling; an immenſe ſum in thoſe days. The coins ſtruck here were likewiſe called Philippi.

33
Makes himſelf maſter of the gold mines of Thrace.

34
Settles the affairs of Theſſaly greatly to his advantage.

Philip having obtained this valuable acquiſition, next took upon him to ſettle the affairs of Theſſaly, where every thing was in confuſion. This country had been formerly oppreſſed by Alexander tyrant of Pheræ; after whoſe death three others appeared, *viz.* Tiſiphornus, Pitholaus, and Lycophron, the brothers-in-law of Alexander, who had likewiſe murdered him. By the united efforts of the Theſſalians and Macedonians, however, theſe uſurpers were eaſily overthrown, and effectually prevented from making any diſturbances for the future; and the Theſſalians, out of a miſtaken gratitude, ſurrendered to Philip all the revenues ariſing from their fairs and towns of commerce, as well as all the conveniencies of their harbours and ſhipping; a conceſſion which Philip took care to ſecure in the moſt effectual manner.

35
Marries Olympias.

Having now not only eſtabliſhed his ſovereignty in the moſt effectual manner, but rendered himſelf very powerful and formidable to his neighbours, Philip determined to enjoy ſome repoſe from his fatigues. Having formed an alliance with Arybbas king of Epirus, he, in the year 357 B. C. married Olympias the ſiſter of that prince; a match thought the more eligible, as the kings of Epirus were ſuppoſed to be deſcended from Achilles. The nuptials were ſolemnized at Pella with great pomp, and ſeveral months were ſpent in ſhows and diverſions; during which Philip ſhowed ſuch an extreme proneneſs to vice of every kind, as diſgraced him in the eyes of his neighbours, and moſt probably laid the foundation of his future domeſtic unhappineſs. So much was this behaviour of the Macedonian monarch taken notice of by the neighbouring ſtates, that the Pæonians and Illyrians threw off the yoke, engaging in their ſchemes the king of Thrace; and notwithſtanding the inſane ſtate of that prince, their deſigns were now carried on with more judgment than was uſual with barbarians. Philip, however, notwithſtanding his diſſipation, got warning of his danger in ſufficient time to prevent the bad conſequences which might have enſued had the confederates got time to bring their matters to a proper bearing. Early in the ſpring 356 he took the field with the flower of the Macedonian troops. Having marched in perſon againſt the Pæonians and Thracians, he diſpatched Parmenio his beſt general into Illyria. Both enterpriſes proved ſucceſsful; and while Philip returned victorious from Thrace, he received an account of the

36
A general combination of the neighbouring princes formed againſt him.

37
Defeats his enemies.

victory gained by Parmenio; a ſecond meſſenger informed him of a victory gained by his chariot at the Olympic games; and a third, that Olympias had been delivered of a ſon at Pella.

38 Birth of Alexander the Great.

This was the celebrated Alexander, to whom the diviners propheſied the higheſt proſperity and glory, as being born in ſuch auſpicious circumſtances.

39 Ariſtotle appointed his preceptor.

A ſhort time after the birth of Alexander, Philip wrote a letter to the philoſopher Ariſtotle, whom he choſe for preceptor to his young ſon. The letter was written with great brevity, containing only the following words: "Know that a ſon is born to us. We thank the gods not ſo much for their gift, as for beſtowing it at a time when Ariſtotle lives. We aſſure ourſelves that you will form him a prince worthy of his father, and worthy of Macedon."

40 Extent of the Macedonian territories.

He next ſet about the farther enlargement of his territories, which were already very conſiderable. Pæonia was now one of his provinces; on the eaſt his dominions extended to the ſea of Thaſos, and on the weſt to the lake Lychnidus. The Theſſalians were in effect ſubject to his juriſdiction, and the poſſeſſion of Amphipolis had ſecured him many commercial advantages; he had a numerous and well-diſciplined army, with plentiful reſources for ſupporting ſuch an armament, and carrying through the other ſchemes ſuggeſted by his ambition; though his deep and impenetrable policy rendered him more truly formidable than all theſe put together.

41 Projects the conqueſt of Olynthus and of all Greece.

His firſt ſcheme was the reduction of Olynthus, the moſt populous and fertile country on the borders of Macedon; after which his ambition prompted him to acquire the ſovereignty of all Greece. To accompliſh the former, he had hitherto courted the friendſhip of the Olynthians by every poſſible method; and without letting ſlip any opportunity to accompliſh the latter, he deprived the Athenians gradually of ſeveral of their ſettlements in Thrace and Macedon. In theſe depredations, however, he took care always to give ſuch appearance of juſtice to his actions, that his antagoniſts, who had ſtudied the matter leſs deeply, could not find a plauſible pretext for engaging in war againſt him, even when he had openly committed hoſtilities againſt them. Philip eaſily perceived that the affairs of the Greeks were coming to a criſis, and he determined to wait the event of their mutual diſſentions.

42 Account of the Phocian war.

That event did not diſappoint his hopes. The Phocians had violated the religion of thoſe days in a moſt extraordinary manner; they had even ploughed up the lands conſecrated to Apollo: and however they might pretend to excuſe themſelves by examples, the Amphictyons fulminated a decree againſt the Phocians, commanding the ſacred lands to be laid waſte, and impoſing an heavy fine upon the community.

By this decree all Greece was again involved in the war called *Phocian*, from the name of the city about which it commenced. Philip at the beginning of the troubles was engaged in Thrace, where a civil war had taken place among the ſons of Cotys; and wherever Philip interfered, he was ſure to make matters turn out to his own advantage. His incroachments at length became ſo enormous, that Kerſobletes, the moſt powerful of the contending princes, agreed to cede the Thracian Cherſoneſus to the Athenians; who immediately ſent Chares at the head of a powerful armament to take poſſeſſion of it. In this expedition the town of Seſtos was taken by ſtorm, and the inhabitants cruelly treated by Chares, while Philip employed himſelf in the ſiege of Methone in Pieria.

43 Philip loſes an eye at the ſiege of Methone.

This city he likewiſe reduced; but the king loſt an eye at the ſiege in the following extraordinary manner, if we may give credit to ſome ancient hiſtorians. A celebrated archer, named Aſter, had it ſeems offered his ſervices to Philip, being repreſented as ſuch an excellent markſman, that he could hit the ſwifteſt bird on the wing. Philip replied, that he would be of excellent uſe if they were to make war with ſtarlings. Aſter, diſguſted with this reception, went over to the enemy, and with an arrow wounded the king in the eye. When the weapon was extracted, it was found to have on it the following inſcription: "For the right eye of Philip." The king ordered the arrow to be ſhot back again, with another inſcription, importing that he would cauſe Aſter to be hanged when the town was taken. A report was raiſed after Philip's death, that he had loſt his eye by prying too narrowly into the amours of Olympias and Jupiter Ammon; which the vanity of his ſucceſſor prompted him to cheriſh, as his flatterers had probably been the inventors of it.

All this time the Phocian war raged with the greateſt fury, and involved in it all the ſtates of Greece.

44 Is engaged in a war with Onomarchus the Phocian general,

Lycophron, one of the Theſſalian tyrants, whom Philip had formerly deprived of his authority, had again found means to re-eſtabliſh his authority; and his countrymen having taken part with the Phocians, Lycophron called in Onomarchus the Phocian general to protect him againſt the power of Philip, by whom he was ſenſible that he would ſoon be attacked. The king accordingly marched into Theſſaly with a conſiderable army, defeated Phyallus the brother of Onomarchus, whom the latter had ſent into the country with a detachment of 7000 men.

45 Who defeats him;

After this he beſieged and took the city of Pegaſæ, driving the enemy towards the frontiers of Phocis. Onomarchus then advanced with the whole army; and Philip, though inferior in numbers, did not decline the engagement. The Phocians at firſt gave ground, on which the Macedonians purſued, but in good order; but coming near a precipice, on the top of which Onomarchus had poſted a detachment of ſoldiers, the latter rolled down ſtones and fragments of the rock in ſuch a manner as did dreadful execution, and threw them into the utmoſt diſorder. Philip, however, rallied his troops with great preſence of mind, and prevented the Phocians from gaining any farther advantage than they had already done; ſaying, as he drew off his men, that they did not retreat through fear, but like rams, in order to ſtrike with the greater vigour. Nor was he long before he made good his aſſertion; for having recruited his army with the greateſt expedition, he returned into Theſſaly at the head of 20,000 foot and 500 horſe, where he was met by Onomarchus.

46 But is at laſt defeated and killed.

The Macedonians at this time were ſuperior in number to their enemies; and Philip moreover took care to remind them, that their quarrel was that of heaven, and that their enemies had been guilty of ſacrilege, by profaning the temple of Delphi. That they might be ſtill more animated in the cauſe, he put crowns of laurel on their heads. Thus fired by enthuſiaſm, and having beſides the advantage of numbers, the Phocians were altogether unable to withſtand them. They threw away their arms and fled towards the ſea, where they expected to have been relieved by Chares, who, with the Athenian fleet, was nigh the ſhore: but in this they were diſappointed, for he made no attempt to ſave them. Upwards of 6000 periſhed in the field of battle or in the purſuit, and 3000 were taken priſoners. The body of Onomarchus being found among the ſlain, was by order of Philip hung up on a gibbet as a mark of infamy, on account of his having polluted the temple; the bodies of the reſt were thrown into the ſea, as being all partakers of the ſame crime. The fate of the priſoners is not known, by reaſon of an ambiguity in a ſentence of Diodorus Siculus, which may imply that they were drowned, though it does not expreſsly ſay ſo.

47 Philip purſues his ambitious ſchemes.

After this victory, Philip ſet about the ſettlement of Theſſaly, waiting only for an opportunity to put in execution his favourite ſcheme of invading Greece. In the mean time, he rejoiced to ſee the ſtates weakening each other by their mutual diſſenſions; of which he never failed to take advantage as far as poſſible. He now, however, began to throw off the maſk with regard to the Olynthians, whom he had long deceived with fair promiſes. Having detached Kerſobletes from the intereſt of the Athenians, he eſtabliſhed him in the ſovereignty of Thrace; not out of any good will, but with a view to deſtroy him whenever a proper opportunity offered. Were he once poſſeſſed of the dominions of that prince, the way to Byzantium was open to him; the poſſeſſion of which muſt have been a great temptation to Philip, who well knew how to value the importance of its ſituation both with reſpect to commerce and war: and in order to pave the way to this important conqueſt, he attacked the fortreſs of Heræum, a ſmall and in itſelf unimportant place, though, by reaſon of its neighbourhood to Byzantium, the acquiſition was valuable to Philip.

48 Is oppoſed by the Athenians.

The Athenians, however, at laſt began to perceive the deſigns of Philip, and determined to counteract them. For this purpoſe they entered into an alliance with Olynthus; and having warned Kerſobletes of his danger, they ordered a powerful fleet to the defence of the Heræum. But theſe vigorous meaſures were ſoon counteracted by the report of Philip's death, which had been occaſioned by his wound at Methone, and a diſtemper ariſing from the fatigues he had afterwards undergone. The inconſtant Athenians too eaſily gave credit to this report; and, as if all danger had been over with his death, diſcontinued their preparations, and directed their whole attention to the ſacred war.

49 Continuation of the Phocian war.

—This conteſt, inſtead of being ended by the death of Onomarchus, now raged with double fury. Phyallus, abovementioned, the only ſurviving brother of Onomarchus, undertook the cauſe of the Phocians; and his affairs becoming every day more and more deſperate, he undertook the moſt unaccountable method of retrieving them which could be imagined; having converted into ready money the moſt precious materials belonging to the temple at Delphi, and with this treaſure doubled the pay of his ſoldiers. By this new piece of ſacrilege, he indeed brought many adventurers to his ſtandard, though he cut off all hopes of mercy for himſelf or his party ſhould he be defeated. Having the aſſiſtance of 1000 Lacedemonians, 2000 Achæans, and 5000 Athenian foot, with 400 cavalry, he was ſtill enabled to make a very formidable appearance; and the Phocians took the field with great proſpect of ſucceſs.

50 Philip engages in the quarrel.

Philip now thought it time to throw off the maſk entirely, for which the proceedings of the Athenians, particularly their league with Olynthus, furniſhed him with a plauſible pretext; and the revenging ſuch horrid ſacrilege as had been committed at Delphi ſeemed to give him a title to march at the head of an army into Greece. The ſuperſtition of the Greeks, however, had not yet blinded them to ſuch a degree, but they could eaſily perceive that Philip's piety was a mere pretence, and that his real deſign was to invade and conquer the whole country. The Athenians no ſooner heard of the march of the Macedonian army, than they diſpatched, with all expedition, a ſtrong guard to ſecure the paſs of Thermopylæ; ſo that Philip was obliged to return greatly chagrined and diſappointed.

51 Is prevented from entering Greece.

Their next ſtep was to call an aſſembly, to deliberate upon the meaſures proper to be taken in order to reſtrain the ambition of the Macedonian monarch; and this aſſembly is rendered memorable by the firſt appearance of Demoſthenes as an orator againſt Philip. Athens for ſome time had been in a very alarming ſituation. They were deeply involved in the ſacred war; their northern poſſeſſions were continually inſulted and plundered by Philip; while a number of his mercenary partiſans drew off the public attention to ſuch a degree, that, inſtead of taking meaſures to counteract that ambitious prince, they amuſed themſelves with ſpeculations about the deſigns of the Perſian monarch, who was preparing for war againſt the Cyprians, Egyptians, and Phænicians.

52 Extreme indolence and careleſsneſs of the Athenians.

Iſocrates the celebrated orator, and Phocion the ſtateſman, joined the multitude in their preſent opinion, though not from any mercenary motives, but purely from a ſenſe of the unſteady conduct of the Athenians; who, they were aſſured, could not contend with a prince of the vigour and activity of Philip; and therefore exhorted them by all means to cultivate the friendſhip of Philip, whom they could not oppoſe with any probability of ſucceſs.

53 Advice of Iſocrates the orator to them.

Iſocrates, indeed, greatly wiſhed for an expedition into Aſia, and looked upon Philip to be the only general capable of conducting it, though at preſent the Greeks had no pretence for making war upon the Perſians, but that of revenging former injuries: and on this ſubject he addreſſed a diſcourſe to Philip himſelf; and it is even ſaid, that Iſocrates, by the power of his rhetoric, prevailed upon Philip and the Athenians to lay aſide their animoſities for a ſhort time, and conſent to undertake this expedition in conjunction.

54 He and Phocion are oppoſed by Demoſthenes.

If this coalition, however, did really take place, it was of very ſhort duration. The views of Phocion and Iſocrates were violently oppoſed by Demoſthenes. Though ſenſible of the corruption and degeneracy of his countrymen, he hoped to be able to rouſe them from their lethargy by dint of his eloquence; a talent he had been at great pains to cultivate, and in which he is ſaid to have excelled all men that ever exiſted.

55 Subſtance of his firſt diſcourſes.

In his firſt addreſſes to the people, this celebrated orator exhorted them to awake from their indolence, and to aſſume the direction of their own affairs. They had been too long governed, he ſaid, by the incapacity of a few ambitious men, to the great diſadvantage as well as diſgrace of the community. In the firſt place, an orator who had placed himſelf at the head of a faction of no more than 300 or 400, availed himſelf and his followers of the careleſsneſs and negligence of the people to rule them at pleaſure. From a conſideration of their preſent weakneſs and corruption, as well as of the deſigns and commotions of the neighbouring powers, he adviſed them to abandon all romantic and diſtant ſchemes of ambition; and inſtead of carrying their arms into remote countries, to prepare for repelling the attacks which might be made upon their own dominions. He inſiſted alſo upon a better regulation of their finances, a more equal diſtribution of the public burthens, in proportion to the abilities of thoſe upon whom they were laid, and upon the retrenching many ſuperfluous expences. Having pointed out in a ſtrong light the vigorous conduct of Philip; and ſhown by what means he had attained to ſuch a reſpectable footing in the world, he next laid down a proper plan for their military operations. He told them, that they were not yet prepared to meet Philip in the field; they muſt begin with protecting Olynthus and the Cherſoneſus, for which it would be neceſſary to raiſe a body of 2000 light armed troops, with a due proportion of cavalry, which ought to be tranſported under a proper convoy to the iſlands of Lemnos, Thaſos, and Sciathos, in the neighbourhood of Macedon. In theſe they would enjoy all kinds of neceſſaries in abundance, and might avail themſelves of every favourable incident, to appear at the firſt ſummons of their allies; and either to repel the incurſions of the Macedonians, or haraſs their territories. While this was going on, more vigorous preparations might be made for war at home; and it was propoſed, that only the fourth part of the Athenian citizens ſhould enliſt, and no more ſupplies were wanted at preſent but 90 talents. But notwithſtanding the moderation of theſe propoſals, and the urgent neceſſities of the ſtate, it was impoſſible to prevail upon the indolent and careleſs Athenians to provide for their own ſafety. They appear, indeed, at this time, to have been deſperately ſunk in effeminacy and diſſipation; which diſpoſition Philip took care to encourage to the utmoſt of his power. There was an aſſembly in the city called the *Sixty*, from their conſiſting originally of that number, who met expreſsly for the purpoſes of extinguiſhing all care about public affairs, and to intoxicate themſelves with every kind of pleaſure they had in their power. With this aſſembly Philip was ſo well pleaſed, that he ſent them money to ſupport their extravagancies; and ſo effectually did they anſwer his purpoſes, that all the eloquence of Demoſthenes could not counteract the ſpeeches of orators much his inferiors when backed by Macedonian gold.

Philip himſelf, as we have already hinted, was exceſſively debauched in his private character, and the moſt ſhameful ſtories are related of him by the ancient writers, particularly by Demoſthenes. Theopompus too, an author who flouriſhed in the time of Alexander, and was rewarded and honoured by that monarch, alſo ſpeaks of him in ſuch terms as we cannot with decency relate: but theſe accounts, coming from the avowed enemies of the king, are ſcarcely to be credited; and perhaps *policy*, as well as inclination, might contribute ſomewhat to this ſcandalous behaviour, that he might thereby recommend himſelf to the libertines of Athens, and prevent even many of the more thinking part of the people from ſuſpecting his deſigns. But in whatever exceſſes he might at times indulge himſelf, he never loſt ſight of his main object, the ſubjugation of the Greek ſtates. On pretence of being in want of money to defray the expence of his buildings, he borrowed money at a very high price throughout the whole country; and this he found an eaſy matter to do, as the diſſipation of the Delphic treaſures had rendered caſh very plentiful in Greece. Thus he attached his creditors firmly to his own intereſt; and on pretence of paying debts, was enabled without moleſtation to beſtow a number of penſions and gratuities upon the Athenian orators, who by their treacherous harangues contributed greatly to the ruin of their country; at leaſt as far as it could be ruined by ſubjection to a prince who would have obliged them to remain at peace, and apply themſelves to uſeful arts. Theſe he himſelf encouraged in a very eminent degree. The greateſt part of his time was employed at Pella, which city he adorned in the moſt magnificent manner with temples, theatres, and porticoes. He invited, by liberal rewards, the moſt ingenious artiſts in Greece; and as many of theſe met with very little encouragement in their own country, great numbers flocked to him from all quarters. In the government of his people, alſo, Philip behaved with the utmoſt impartiality; liſtening with condeſcenſion to the complaints of the meaneſt of his ſubjects, and keeping up a conſtant correſpondence with thoſe whom he thought worthy of his acquaintance; from which, it is not eaſy to imagine how he could be ſo guilty of the vices we have already mentioned from ſome ancient hiſtorians.

The fate of Olynthus was now ſoon determined. This city, which held the balance of power betwixt Athens and Macedon, was taken and plundered, and the inhabitants ſold for ſlaves; but the chief hope of Philip was in putting an end to the Phocian war. For this purpoſe he affected a neutrality, that he might thereby become the arbiter of Greece. His hopes were well founded; for the Thebans, who were at the head of the league againſt the Phocians, ſolicited him on the one ſide, and the ſtates confederate with the Phocians did the like on the other. He anſwered neither, yet held both in dependence. In his heart he favoured the Thebans, or rather placed his hopes of favouring his own cauſe in that ſtate; for he well knew, that the Athenians, Spartans, and other ſtates allied with Phocis, would never allow him to paſs Thermopylæ, and lead an army into their territories. So much reſpect, however, did he ſhow to the ambaſſadors from theſe ſtates, particularly Cteſiphon and Phrynon, who came from Athens, that they believed him to be in their intereſt, and reported as much to their maſters. The Athenians, who were now diſſolved in eaſe and luxury, received this news with great ſatisfaction; and named immediately ten plenipotentiaries to go and treat of a full and laſting peace with Philip. Among theſe plenipotentiaries were Demoſthenes and Æſchines, the moſt celebrated orators in Athens. Philip gave directions that theſe ambaſſadors ſhould be treated with the utmoſt civility; naming, at the ſame time, three of

56
Over-reaches the Athenians, and at laſt concludes a peace.

his miniſters to confer with them, viz. Antipater, Parmenio, and Eurylochus. Demoſthenes being obliged to return to Athens, recommended it to his colleagues not to carry on their negociations with Philip's deputies; but to proceed with all diligence to court, there to confer with the king himſelf. The ambaſſadors, however, were ſo far from following his inſtructions, that they ſuffered themſelves to be put off for three months by the arts of Philip and his miniſters.

In the mean time, the king took from the Athenians ſuch places in Thrace as might beſt cover his frontiers; giving their plenipotentiaries, in their ſtead, abundance of fair promiſes, and the ſtrongeſt aſſurances that his good-will ſhould be as beneficial to them as ever their colonies had been. At laſt a peace was concluded; but then the ratification of it was deferred till Philip had poſſeſſed himſelf of Pheræa in Theſſaly, and ſaw himſelf at the head of a numerous army: then he ratified the treaty; and diſmiſſed the plenipotentiaries with aſſurances, that he would be ready at all times to give the Athenians proofs of his friendſhip. On their return to Athens, when this matter came to be debated before the people, Demoſthenes plainly told them, that, in his opinion, the promiſes of Philip ought not to be relied on, becauſe they appeared to be of little ſignificance in themſelves, and came from a prince of ſo much art, and ſo little fidelity, that they could derive no authority from their maker. Æſchines, on the other hand, gave it as his ſentiment, that the king of Macedon's aſſurances ought to give them full ſatisfaction. He ſaid, that for his part, he was not politician enough to ſee any thing of diſguiſe or diſſimulation in the king's conduct; that there was great danger in diſtruſting princes; and that the ſureſt method of putting men upon deceit was to ſhow that we ſuſpected them of it. The reſt of the plenipotentiaries concurred with Æſchines; and the people, deſirous of quiet, and addicted to pleaſure, eaſily gave credit to all that was ſaid, and decreed that the peace ſhould be kept. All this was the eaſier brought about, becauſe Phocion, the worthieſt man in the republic, did not oppoſe Philip; which was owing to his having a juſt ſenſe of the ſtate his country was in. He conceived, that the Athenians of thoſe times were nothing like their anceſtors; and therefore, as he expreſſed himſelf on another occaſion, he was deſirous, ſince they would not be at the head of Greece themſelves, that they would at leaſt be upon good terms with that power which would be ſo.

57 Paſſes Thermopylæ, and ends the Phocian war.

Philip, who knew how to uſe as well as to procure opportunity, while the Athenians were in this good humour, paſſed Thermopylæ, without their knowing whether he would fall on Phocis or Thebes; but he quickly undeceived them, by commanding his ſoldiers to put on crowns of laurel, declaring them thereby the troops of Apollo, and himſelf the lieutenant-general of that god. He then entered Phocis with an air of triumph; which ſo terrified the Phocians, whom he had cauſed to be proclaimed ſacrilegious perſons, that they immediately diſmiſſed all thoughts of defence, and without more ado ſubmitted to his mercy. Thus the Phocian war, which had ſo long employed all Greece, was ended without a ſtroke; and the judgement on the Phocians remitted to the Amphictyons, or grand council of Greece. By their decree the walls of three Phocian cities were demoliſhed, the people were forbid to inhabit in any but villages, to pay a yearly tribute of 60 talents, and never to make uſe either of houſes or arms till they had repaid to the temple of Apollo the money they had ſacrilegiouſly carried from thence. Their arms were taken from them, broken to pieces, and burnt; their double voice in the council was taken from them, and given to the Macedonians. Other orders were made for ſettling the affairs both of religion and ſtate throughout Greece: all of which were executed by Philip with great exactneſs and moderation, he paying the moſt profound reſpect to the council; and, when he had performed its commands, retiring peaceably with his army back to Macedon, which gained him great reputation.

58 Is again oppoſed by the Athenians.

At Athens alone, the juſtice and piety of Philip was not underſtood. The people began to ſee, though a little too late, that they had been abuſed and deceived by thoſe who had negociated the late peace. They ſaw, that, through their acceptance of it, the Phocians were deſtroyed; that Philip was become maſter of Thermopylæ, and might enter Greece when he pleaſed; that, in abandoning their allies, they had abandoned themſelves; and that, in all probability, they might ſoon feel the weight of his power, whom they had ſo fooliſhly truſted: they therefore began to take new and hoſtile meaſures; they ordered that the women ſhould retire out of the villages into the city, their walls be repaired, and their forts new ſtrengthened. They ſeemed inclined to queſtion Philip's election into the council of the Amphictyons, becauſe it had been done without their conſent; and even to proceed to an open war. In all likelihood they had carried things to extravagancy, if Demoſthenes had not interpoſed. He told them, that though he was not for making the peace, he was however for keeping it; and that he ſaw no manner of occaſion for their entering into ſo unequal a conteſt as would needs enſue, if they took up arms, not only againſt Philip, but againſt all the ſtates concurring with him in the late tranſactions. This ſeems to have cooled the rage of the Athenians; and to have brought them to think of *ruining* Philip by degrees, as by degrees they had *raiſed* him.

59 Purſues his conqueſts in Thrace.

The fame of his atchievements without the bounds of Macedon having diſpoſed the ſubjects of Philip to hope every thing from his conduct, and the ſeveral ſtates of Greece to deſire above all things his friendſhip; that prudent monarch laid hold of this favourable ſituation to fix his dominion on ſuch a ſtable foundation as that a reverſe of fortune ſhould not immediately deſtroy it. To this end, while he carried on his negociations through Greece, he likewiſe kept his army in exerciſe, by taking ſeveral places in Thrace, which terribly incommoded the Athenians. Diopithes, who had the government of the Athenian colonies in thoſe parts, perceiving well what end Philip had in view, did not ſtay for inſtructions from home; but having raiſed with much expedition a conſiderable body of troops, taking advantage of the king's being abſent with his army, entered the adjacent territories of Philip, and waſted them with fire and ſword.

60 His dominions invaded by Diopithes.

The king, who, on account of the operations of the cam-

campaign in the Cherſoneſe, was not at leiſure to repel Diopithes by force, nor indeed could divide his army without imminent hazard, choſe, like an able general, rather to abandon his provinces to inſults, which might be afterwards revenged, than, by following the dictates of an ill-timed paſſion, to hazard the loſs of his veteran army, whereon lay all his hopes. He contented himſelf, therefore, with complaining to the Athenians of Diopithes's conduct, who in a time of peace had entered his dominions, and committed ſuch devaſtations as could ſcarce have been juſtified in a time of war. His partiſans ſupported this application with all their eloquence. They told the Athenians, that unleſs they recalled Diopithes, and brought him to a trial for this infringement of the peace, they ought not to hope either for the friendſhip of Philip or of any other prince or ſtate; neither could they juſtly complain, if, prompted by ſuch a precedent, others ſhould break faith with them, and fall without the leaſt notice upon their dominions.

61
Who is defended by Demoſthenes.

Demoſthenes defended Diopithes; and undertook to ſhow that he deſerved the praiſe and not the cenſure of the Athenians. Thoſe of the other party began then to charge him with crimes of a different nature; they alleged, that he oppreſſed the ſubjects and maltreated the allies of Athens. Demoſthenes replied, that of theſe things there were as yet no proofs; that when ſuch ſhould appear, a ſingle galley might be ſent to bring over Diopithes to abide their judgment, but that Philip would not come if they ſent a fleet; whence he inferred, that they ought to be cautious, and to weigh well the merits of this cauſe before they took any reſolution. He ſaid, that it was true Philip had not as yet attacked Attica, or pretended to make a deſcent on their territories in Greece, or to force his way into their ports; when it came to that, he was of opinion they would be hardly able to defend themſelves; wherefore he thought ſuch men were to be eſteemed as ſought to protect their frontiers, in order to keep Philip as long as might be at a diſtance: whereupon he moved, that, inſtead of diſowning what Diopithes had done, or directing him to diſmiſs his army, they ſhould ſend him over recruits, and ſhow the king of Macedon they knew how to protect their territories, and to maintain the dignity of their ſtate, as well as their anceſtors. Theſe arguments had ſuch an effect, that a decree was made conformable to his motion.

While affairs ſtood thus, the Illyrians recovering courage, and ſeeing Philip at ſuch a diſtance, haraſſed the frontiers of Macedon, and threatened a formidable invaſion: but Philip, by quick marches, arrived on the borders of Illyrium; and ſtruck this barbarous people with ſuch a panic, that they were glad to compound for their former depredations at the price he was pleaſed to ſet. Moſt of the Greek cities in Thrace now ſought the friendſhip of the king, and entered into a league with him for their mutual defence. As it cannot be ſuppoſed, that each of theſe free cities had a power equal to that of Philip, we may therefore look upon him as their protector.

62
Philip's ſchemes defeated.

About this time Philip's negociations in Peloponneſus began to come to light; the Argives and Meſſenians, growing weary of that tyrannical authority which the Spartans exerciſed over them, applied to Thebes for aſſiſtance; and the Thebans, out of their natural averſion to Sparta, ſought to open a paſſage for Philip into Peloponneſus, that, in conjunction with them, he might humble the Lacedemonians. Philip readily accepted the offer; and reſolved to procure a decree from the Amphictyons, directing the Lacedemonians to leave Argos and Meſſene free; which if they complied not with, he, as the lieutenant of the Amphictyons, might, with great appearance of juſtice, march with a body of troops to enforce their order. When Sparta had intelligence of this, ſhe immediately applied to Athens, earneſtly intreating aſſiſtance, as in the common cauſe of Greece. The Argives and Meſſenians, on the other hand, laboured aſſiduouſly to gain the Athenians to their ſide; alleging that, if they were friends to liberty, they ought to aſſiſt thoſe whoſe only aim was to be free. Demoſthenes, at this juncture, outwreſtled Philip, if we may borrow that king's expreſſion: for, by a vehement harangue, he not only determined his own citizens to become the avowed enemies of the king, but alſo made the Argives and Meſſenians not over fond of him for an ally; which when Philip perceived, he laid aſide all thoughts of this enterpriſe for the preſent, and began to practiſe in Eubœa.

This country, now called *Negropont*, is ſeparated from Greece by the Euripus, a ſtrait ſo narrow, that Eubœa might eaſily be united to the continent. This ſituation made Philip call it *the fetters of Greece*, which he therefore ſought to have in his own hands. There had been for ſome years great diſturbances in that country; under colour of which, Philip ſent forces thither, and demoliſhed Porthmos, the ſtrongeſt city in thoſe parts, leaving the country under the government of three lords, whom Demoſthenes roundly calls *tyrants* eſtabliſhed by Philip. Shortly after, the Macedonians took Oreus, which was left under the government of five magiſtrates, ſtyled alſo *tyrants* at Athens. Thither Plutarch of Eretria, one of the moſt eminent perſons in Eubœa, went to repreſent the diſtreſſes of his country, and to implore the Athenians to ſet it free. This ſuit Demoſthenes recommended warmly to the people; who ſent thither their famous leader Phocion, ſupported by formidable votes, but a very ſlender army: yet ſo well did he manage the affairs of the commonwealth and her allies, that Philip quickly found he muſt for a time abandon that project; which, however, he did not till he had formed another no leſs beneficial to himſelf, or leſs dangerous to Athens. It was, the proſecution of his conqueſts in Thrace, which he thought of puſhing much farther than he had hitherto done, or could be reaſonably ſuſpected to have any intention of doing.

Extraordinary preparations were made by the Macedonian monarch for this campaign. His ſon Alexander was left regent of the kingdom; and he himſelf with 30,000 men laid ſiege to Perinthus, one of the ſtrongeſt cities in the country. At preſent, however, all his arts of cajoling and pretending friendſhip were inſufficient to deceive the Athenians. They gave the command of their army and fleet to Phocion; a general of great abilities, and with whom Philip would have found it very hard to contend. On the other hand, the king of Perſia began to turn jealous of the growing power of the Macedonian monarch. The Perſian kings had been accuſtomed to regard thoſe of Macedon as their faithful allies; but the good fortune

of

of Philip, the continual clamour of the Athenians againſt him, and his dethroning at pleaſure the petty princes of Thrace, made him now regarded in another light. When therefore he led his troops againſt Perinthus, *the Great King*, as he was ſtyled by the Greeks, ſent his letters mandatory to the governors of the maritime provinces, directing them to ſupply the place with all things in their power; in conſequence of which they filled it with troops, granted ſubſidies in ready money, and ſent beſides great convoys of proviſion and ammunition. The Byzantines alſo, ſuppoſing their own turn would be next, exerted their utmoſt endeavours for the preſervation of Perinthus; ſending thither the flower of their youth, with all other neceſſaries for an obſtinate defence. The conſequence of all this was, that Philip found himſelf obliged to raiſe the ſiege with great loſs.

63
How he at laſt gained his point.

That the reputation of the Macedonian arms might not ſink by this diſgrace, Philip made war on the Scythians and Triballi, both of whom he defeated; and then formed a deſign of invading Attica, though he had no fleet to tranſport his troops, and knew very well that the Theſſalians were not to be depended upon if he attempted to march through the Piſæ, and that the Thebans would even then be ready to oppoſe his march. To obviate all theſe difficulties, he had recourſe to Athens itſelf; where, by means of his partiſans, he procured his old friend Æſchines to be ſent their deputy to the Amphictyons. This ſeemed a ſmall matter, and yet was the hinge on which his whole project turned. By that time Æſchines had taken his ſeat, a queſtion was ſtirred in the council, whether the Locrians of Amphiſia had not been guilty of ſacrilege in ploughing the fields of Cyrrha in the neighbourhood of the temple of Delphi. The aſſembly being divided in their opinions, Æſchines propoſed to take a view; which was accordingly decreed. But when the Amphictyons came in order to ſee how things ſtood, the Locrians, either jealous of their property, or ſpurred thereto by the ſuggeſtions of ſome who ſaw farther than themſelves, fell upon thoſe venerable perſons ſo rudely, that they were compelled to ſecure themſelves by flight. The Amphictyons decreed, that an army ſhould be raiſed, under the command of one of their own number, to chaſtiſe the delinquents; but as this army was to be compoſed of troops ſent from all parts of Greece, the appearance at the rendezvous was ſo inconſiderable, that the Amphictyons ſent to command them durſt undertake nothing. The whole matter being reported to the council, Æſchines, in a long and eloquent harangue, ſhowed how much the welfare and even the ſafety of Greece depended on the deference paid to their decrees; and after inveighing againſt the want of public ſpirit in ſuch as had not ſent their quotas at the time appointed by the council, he moved that they ſhould elect Philip for their general, and pray him to execute their decree. The deputies from the other ſtates, conceiving that by this expedient their reſpective conſtituents would be free from any farther trouble or expence, came into it at once; whereupon a decree was immediately drawn up, purporting that ambaſſadors ſhould be ſent to Philip of Macedon, in the name of Apollo and the Amphictyons, once more to require his aſſiſtance, and to notify to him, that the ſtates of Greece had unanimouſly choſen him their general, with full power to act as he thought fit againſt ſuch as had oppoſed the authority of the Amphictyons.

64
Is choſen general by the Amphictyons.

Thus of a ſudden Philip acquired all that he ſought; and having an army ready in expectation of this event, he immediately marched to execute the commands of the Amphictyons in appearance, but in reality to accompliſh his own deſigns. For having paſſed into Greece with his army, inſtead of attacking the Locrians, he ſeized immediately upon Elatea a great city of Phocis upon the river Cephiſus.

65
Is oppoſed by the Athenians and Thebans.

The Athenians in the mean time were in the utmoſt confuſion on the news of Philip's march. However, by the advice of Demoſthenes, they invited the Thebans to join them againſt the common enemy of Greece. Philip endeavoured as much as poſſible to prevent this confederacy from taking place; but all his efforts proved ineffectual. The Athenians raiſed an army, which marched immediately to Eleuſis, where they were joined by the Thebans. The confederates made the beſt appearance that had ever been ſeen in Greece, and the troops were exceedingly good; but unfortunately the generals were men of no conduct or ſkill in the military art.

66
Whom he defeats at Cheronæa.

An engagement enſued at Cheronæa; wherein Alexander commanded one wing of the Macedonian army, and his father Philip the other. The confederate army was divided according to the different nations of which it conſiſted; the Athenians having the right and the Bœotians the left. In the beginning of the battle the confederates had the better; whereupon Stratocles an Athenian commander cried out, "Come on, brother ſoldiers, let us drive them back to Macedon:" which being overheard by the king, he ſaid very coolly to one of his officers, "Theſe Athenians do not know how to conquer." Upon this he directed the files of the phalanx to be ſtraitened; and drawing his men up very cloſe, retired to a neighbouring eminence: from whence, when the Athenians were eager in their purſuit, he ruſhed down with impetuoſity, broke, and routed them with prodigious ſlaughter. The orator Demoſthenes behaved very unbecomingly in this engagement; for he deſerted his poſt, and was one of the firſt that fled: nay, we are told, that a ſtake catching hold of his robe, he, not doubting but it was an enemy, cried out, "Alas! ſpare my life."

67
Is appointed general againſt the Perſians.

This victory determined the fate of Greece; and from this time we muſt reckon Philip ſupreme lord of all the Grecian ſtates. The firſt uſe he made of his power was to convoke a general aſſembly, wherein he was recogniſed generaliſſimo, and with full power appointed their leader againſt the Perſians. Having, by virtue of his authority, ſettled a general peace among them, and appointed the quota that each of the ſtates ſhould furniſh for the war, he diſmiſſed them; and returning to Macedon, began to make great preparations for this new expedition. His pretence for making war on the Perſians at this time was the aſſiſtance given by the Perſians to the city of Perinthus, as already mentioned. In the mean time, however, the king, by reaſon of the diſſenſions which reigned in his family, was made quite miſerable. He quarrelled with his wife Olympias to ſuch a degree, that he divorced her, and married another woman named *Cleopatra*. This produced a quarrel between him and his ſon Alexander;

lexander; which alſo came to ſuch an height, that Alexander retired into Epirus with his mother. Some time afterwards, however, he was recalled, and a reconciliation took place in appearance; but in the mean time a conſpiracy was formed againſt the king's life, the circumſtances and cauſes of which are very much unknown. Certain it is, however, that it took effect, as the king was exhibiting certain ſhows in honour of his daughter's marriage with the king of Epirus. Philip, having given a public audience to the ambaſſadors of Greece, went next day in ſtate to the theatre. All the ſeats were early taken up; and the ſhows began with a ſplendid proceſſion, wherein the images of the 12 ſuperior deities of Greece were carried, as alſo the image of Philip, habited in like manner, as if he now made the 13th, at which the people ſhouted aloud. Then came the king alone, in a white robe, crowned, with his guards at a conſiderable diſtance, that the Greeks might ſee he placed his ſafety only in his confidence of the loyalty of his ſubjects. Pauſanias, the aſſaſſin, however, had fixed himſelf cloſe by the door of the theatre; and obſerving that all things fell out as he had foreſeen they would, took his opportunity when the king drew near him, and plunging his ſword in his left ſide, laid him dead at his feet. He then fled as faſt as he was able towards the place where his horſes were; and would have eſcaped, had not the twig of a vine catched his ſhoe and thrown him down. This gave time to thoſe who purſued him to come up with him; but inſtead of ſecuring him, in order to extort a diſcovery of his accomplices, they put an end to his life.

68.
Is murdered.

69
His character.

With regard to the character of this monarch, it appears certain, that he was one of the moſt eminent perſons that ever ſat on a throne. Had he lived for ſome time longer, he would in all probability have ſubdued the Perſians; which was in truth leſs difficult than what he had already done. "Had that event taken place (ſays Dr Gillies), the undertakings of his long and ſucceſsful reign would have been ennobled and illuminated by the ſplendor of extenſive foreign conqueſt. Philip would have reached the height of ſuch renown as is obtained by the habits of activity, vigilance, and fortitude, in the purſuit of unbounded greatneſs; and in the opinion of poſterity, would perhaps have ſurpaſſed the glory of all kings and conquerors who either preceded or followed him. Yet, even on this ſuppoſition, there is not any man of ſenſe and probity, who, if he allows himſelf time for ſerious reflection, would purchaſe the imagined grandeur and proſperity of the king of Macedon at the price of his artifices and his crimes; and to a philoſopher, who conſidered either the means by which he had obtained his triumphs or the probable conſequences of his dominion over Greece and Aſia, the buſy ambition of this mighty conqueror would appear but a deceitful ſcene of ſplendid miſery."

70
Extravagant joy of the Athenians.

No ſooner did the news of Philip's death reach Athens, than, as if all danger had been paſt, the inhabitants ſhowed the moſt extravagant ſigns of joy. Demoſthenes and his party put on chaplets of flowers, and behaved as if they had gained a great victory. Phocion reproved them for this madneſs; bidding them remember, that "the army which had beaten them at Cheronæa was leſſened but by one." This reproof, however, had very little effect. The people heard with pleaſure all the harſh things which the orators could ſay of the young Alexander king of Macedon, whom they repreſented as a giddy wrong-headed boy, ready to graſp all things in his imagination, and able to perform nothing. The affairs of Macedon indeed were in a very diſtracted ſtate on the acceſſion of Alexander: for all the neighbouring nations had the ſame notion of the young king with the Athenians; and being irritated by the uſurpations of Philip, immediately revolted; and the ſtates of Greece entered into a confederacy againſt him. The Perſians had been contriving to transfer the war into Macedon; but as ſoon as the news of Philip's death reached them, they behaved as if all danger had been over. At the ſame time Attalus, one of the Macedonian commanders, aſpired to the crown, and ſought to draw off the ſoldiers from their allegiance.

In the councils held on this occaſion, Alexander's beſt friends adviſed him rather to make uſe of diſſimulation than force, and to cajole thoſe whom they thought he could not ſubdue. Theſe advices, however, were ill-ſuited to the temper of their monarch. He thought that vigorous meaſures only were proper, and therefore immediately led his army into Theſſaly. Here he harangued the princes ſo effectually, that he thoroughly gained them over to his intereſt, and was by them declared general of Greece; upon which he returned to Macedon, where he cauſed Attalus to be ſeized and put to death.

71.
Alexander declared general of Greece.

In the ſpring of the next year (335 B. C.) Alexander reſolved to ſubdue the Triballians and Illyrians, who inhabited the countries now called *Bulgaria* and *Sclavonia*, and had been very formidable enemies to the Macedonian power. In this expedition he diſcovered, though then but 20 years of age, a ſurpriſing degree of military knowledge. Having advanced to the paſſes of Mount Hæmus, he found that the barbarians had poſted themſelves in the moſt advantageous manner. On the tops of the cliffs, and at the head of every paſſage, they had placed their carriages and waggons in ſuch a manner as to form a kind of parapet with their ſhafts inwards, that when the Macedonians ſhould have half aſcended the rock, they might be able to puſh theſe heavy carriages down upon them. They reckoned the more upon this contrivance, becauſe of the cloſe order of the phalanx, which, they imagined, would be terribly expoſed by the ſoldiers wanting room to ſtir, and thereby avoid the falling waggons. But Alexander, having directed his heavy-armed troops to march, gave orders, that, where the way would permit, they ſhould open to the right and left, and ſuffer the carriages to go through; but that, in the narrow paſſes, they ſhould throw themſelves on their faces with their ſhields behind them, that the carts might run over them. This had the deſired effect; and the Macedonians reached the enemies works without the loſs of a man. The diſpute was then quickly decided; the barbarians were driven from their poſts with great ſlaughter, and left behind them a conſiderable booty for the conquerors.

72
Defeats the Triballi.

The next exploits of Alexander were againſt the Getæ, the Tanlantii, and ſome other nations inhabiting the country on the other ſide of the Danube. Them he alſo overcame; ſhowing in all his actions

73 The Thebans revolt on the news of his death.

the moſt perfect ſkill in military affairs, joined with the greateſt valour. In the mean time, however, all Greece was in commotion by a report which had been confidently ſpread abroad, that the king was dead in Illyria. The Thebans, on this news, ſeized Amyntas and Timolaus, two eminent officers in the Macedonian garriſon which held their citadel, and dragged them to the market-place, where they were put to death without either form or proceſs, or any crime alleged againſt them. Alexander, however, did not ſuffer them to remain long in their miſtake. He marched with ſuch expedition, that in ſeven days he reached Pallene in Theſſaly; and in ſix days more he entered Bœotia, before the Thebans had any intelligence of his paſſing the ſtraits of Thermopylæ. Even then they would not believe that the king was alive; but inſiſted that the Macedonian army was commanded by Antipater, or by one Alexander the ſon of Æropus. The reſt of the Greeks, however, were not ſo hard of belief; and therefore ſent no aſſiſtance to the Thebans, who were thus obliged to bear the conſequences of their own folly and obſtinacy. The city was taken by ſtorm, and the inhabitants were for ſome hours maſſacred without diſtinction of age or ſex; after which the houſes were demoliſhed, all except that of Pindar the famous poet, which was ſpared out of reſpect to the merit of its owner, and becauſe he had celebrated Alexander I. king of Macedon. The lands, excepting thoſe deſtined to religious uſes, were ſhared among the ſoldiers, and all the priſoners ſold for ſlaves; by which 440 talents were brought into the king's treaſury.

74 Thebes taken and deſtroyed.

By this ſeverity the reſt of the Grecian ſtates were ſo thoroughly humbled, that they thought no more of making any reſiſtance, and Alexander had nothing further to hinder him from his favourite project of invading Aſia. Very little preparation was neceſſary for the Macedonian monarch, who went out as to an aſſured conqueſt, and reckoned upon being ſupplied only by the ſpoils of his enemies. Hiſtorians are not agreed as to the number of his army: Arrian ſays, that there were 30,000 foot and 5000 horſe. Diodorus Siculus tells us, that there were 13,000 Macedonian foot, 7000 of the confederate ſtates, and 5000 mercenaries. Theſe were under the command of Parmenio. Of the Odriſians, Triballians, and Illyrians, there were 5000; and of the Agrians, who were armed only with darts, 1000. As for the horſe, he tells us there were 18,000 commanded by Philotas, and as many Theſſalians under the command of Callas: out of the confederate ſtates of Greece, were 600 commanded by Eurygius; and 900 Thracians and Peonians, who led the van under Caſſander. Plutarch tells us, that, according to a low computation, he had 30,000 foot and 5000 horſe; and, according to the largeſt reckoning, he had 34,000 foot and 4000 horſe. As to his funds for the payment of the army, Ariſtobulus ſays it was but 70 talents; and Oneſicritus, who was alſo in this expedition, not only takes away the 70 talents, but affirms that the king was 200 in debt. As for proviſions, there was juſt ſufficient for a month and no more; and to prevent diſturbances, Antipater was left in Macedon with 12,000 foot and 1500 horſe.

75 Number of the army with which he invaded Aſia.

76 Sets out on his expedition.

The army having aſſembled at Amphipolis, he marched from thence to the mouths of the river Strymon; then croſſing mount Pangæus, he took the road to Abdera. Croſſing the river Ebrus, he proceeded through the country of Pætis, and in 20 days reached Seſtos; thence he came to Eleus, where he ſacrificed on the tomb of Proteſilaus, becauſe he was the firſt among the Greeks who at the ſiege of Troy ſet foot on the Aſiatic ſhore. He did this, that his landing might be more propitious than that of the hero to whom he ſacrificed, who was ſlain ſoon after. The greateſt part of the army, under the command of Parmenio, embarked at Seſtos, on board a fleet of 160 galleys of three benches of oars, beſides ſmall craft. Alexander himſelf ſailed from Eleus; and when he was in the middle of the Helleſpont, offered a bull to Neptune and the Nereids, pouring forth at the ſame time a libation from a golden cup. When he drew near the ſhore, he lanched a javelin, which ſtuck in the earth: then, in complete armour, he leaped upon the ſtrand; and having erected altars to Jupiter, Minerva, and Hercules, he proceeded to Ilium. Here again he ſacrificed to Minerva; and taking down ſome arms which had hung in the temple of that goddeſs ſince the time of the Trojan war, conſecrated his own in their ſtead. He ſacrificed alſo to the ghoſt of Priam, to avert his wrath on account of the deſcent which he himſelf claimed from Achilles.

In the mean time the Perſians had aſſembled a great army in Phrygia; among whom was one Memnon a Rhodian, the beſt officer in the ſervice of Darius. Alexander, as ſoon as he had performed all the ceremonies which he judged neceſſary, marched directly towards the enemy. Memnon gave it as his opinion, that they ſhould burn and deſtroy all the country round, that they might deprive the Greeks of the means of ſubſiſting, and then tranſport a part of their army into Macedon. But the Perſians, depending on their cavalry, rejected this ſalutary advice; and poſted themſelves along the river Granicus, in order to wait the arrival of Alexander. In the engagement which happened on the banks of that river, the Perſians were defeated†, and Alexander became maſter of all the neigbouring country; which he immediately began to take care of, as if it had been part of his hereditary dominions. The city of Sardis was immediately delivered up; and here Alexander built a temple to Jupiter Olympius. After this, he reſtored the Epheſians to their liberty; ordered the tribute which they formerly paid to the Perſians to be applied towards the rebuilding of the magnificent temple of Diana; and having ſettled the affairs of the city, marched againſt Miletus. This place was defended by Memnon with a conſiderable body of troops who had fled thither after the battle of Granicus, and therefore made a vigorous reſiſtance. The fortune of Alexander, however, prevailed; and the city was ſoon reduced, though Memnon with part of the troops eſcaped to Halicarnaſſus. After this, the king diſmiſſed his fleet; for which various reaſons have been aſſigned; though it is probable, that the chief one was to ſhow his army that their only reſource now was in ſubverting the Perſian empire.

77 Conſequences of his firſt victory.

Almoſt all the cities between Miletus and Halicarnaſſus ſubmitted as ſoon as they heard that the former was taken; but Halicarnaſſus, where Memnon commanded with a very numerous garriſon, made an obſtinate defence. Nothing, however, was able to reſiſt the

---

† See *Granicus*.

the Macedonian army. Memnon was at laſt obliged to abandon the place; upon which Alexander took and raſed the city of Tralles in Phrygia; received the ſubmiſſion of ſeveral princes tributary to the Perſians; and having deſtroyed the Marmarians, a people of Lycia who had fallen upon the rear of his army, put an end to the campaign; after which he ſent home all the new-married men; in obedience, it would ſeem, to a precept of the Moſaic law, and which endeared him more to his ſoldiers than any other action of his life.

As ſoon as the ſeaſon would permit, Alexander quitted the province of Phaſelus; and having ſent part of his army through the mountainous country to Perga, by a ſhort but difficult road, took his route by a certain promontory, where the way is altogether impaſſable, except when the north winds blow. At the time of the king's march the ſouth wind had held for a long time; but of a ſudden it changed, and blew from the north ſo violently, that, as he and his followers declared, they obtained a ſafe and eaſy paſſage through the Divine aſſiſtance. By many this march is held to be miraculous, and compared to that of the children of Iſrael through the Red Sea; while, on the other hand, it is the opinion of others, that there was nothing at all extraordinary in it. He continued his march towards Gordium, a city of Phrygia; the enemy having abandoned the ſtrong paſs of Telmiſſus, through which it was neceſſary for him to march. When he arrived at Gordium, and found himſelf under a neceſſity of ſtaying ſome time there till the ſeveral corps of his army could be united, he expreſſed a ſtrong deſire of ſeeing Gordius's chariot, and the famous knot in the harneſs, of which ſuch ſtrange ſtories had been publiſhed to the world. The cord in which this knot was tied, was made of the inner rind of the cornel-tree; and no eye could perceive where it had begun or ended. Alexander, when he could find no poſſible way of untying it, and yet was unwilling to leave it tied leſt it ſhould cauſe ſome fears in the breaſts of his ſoldiers, is ſaid by ſome authors to have cut the cords with his ſword, ſaying, "It matters not how it is undone." But Ariſtobulus aſſure us, that the king wreſted a wooden pin out of the beam of the waggon, which, being driven in acroſs the beam, held it up; and ſo took the yoke from under it. Be this as it will, however, Arrian informs us, that a great tempeſt of thunder, lightning, and rain, happening the ſucceeding night, it was held declarative of the true ſolution of this knot, and that Alexander ſhould become lord of Aſia.

78
Unties the Gordian knot.

The king having left Gordium, marched towards Cilicia; where he was attended with his uſual good fortune, the Perſians abandoning all the ſtrong paſſes as he advanced. As ſoon as he entered the province, he received advice that Arſames, whom Darius had made governor of Tarſus, was about to abandon it, and that the inhabitants were very apprehenſive that he intended to plunder them before he withdrew. To prevent this, the king marched inceſſantly, and arrived juſt in time to ſave the city. But his ſaving it had well nigh coſt him his life: for, either through the exceſſive fatigue of marching, as ſome ſay, or, according to others, by his plunging when very hot into the river Cydnus, which, as it runs through thick ſhades, has its waters exceſſively cold, he fell into ſuch a diſtemper as threatened his immediate diſſolution. His army loſt their ſpirits immediately; the generals knew not what to do; and his phyſicians were ſo much affrighted, that the terror of his death hindered them from uſing the neceſſary methods for preſerving his life. Philip the Acarnanian alone preſerved temper enough to examine the nature of the king's diſeaſe; the worſt ſymptom of which was a continual waking, and which he took off by means of a potion, and in a ſhort time the king recovered his uſual health.

79
His ſickneſs and recovery.

Soon after Alexander's recovery, he received the agreeable news that Ptolemy and Aſander had defeated the Perſian generals, and made great conqueſts on the Helleſpont; a little after that, he met the Perſian army at Iſſus, commanded by Darius himſelf. A bloody engagement enſued, in which the Perſians were defeated with great ſlaughter, as related under the article Issus. The conſequences of this victory were very advantageous to the Macedonians. Many governors of provinces and petty princes ſubmitted themſelves to the conqueror; and ſuch as did ſo were treated, not as a newly-conquered people, but as his old hereditary ſubjects; being neither burthened with ſoldiers nor oppreſſed with tribute. Among the number of thoſe places which, within a ſhort ſpace after the battle of Iſſus, ſent deputies to ſubmit to the conqueror, was the city of Tyre. The king, whoſe name was Azelmicus, was abſent in the Perſian fleet; but his ſon was among the deputies, and was very favourably received by Alexander. The king probably intended to confer particular honours on the city of Tyre; for he acquainted the inhabitants that he would come and ſacrifice to the Tyrian Hercules, the patron of their city, to whom they had erected a moſt magnificent temple. But theſe people, like moſt other trading nations, were too ſuſpicious to think of admitting ſuch an enterpriſing prince with his troops within their walls They ſent therefore their deputies again to him, to inform him, that they were ready to do whatever he ſhould command them; but, as to his coming and ſacrificing in their city, they could not conſent to that, but were poſitively determined not to admit a ſingle Macedonian within their gates. Alexander immediately diſmiſſed their deputies in great diſpleaſure. He then aſſembled a council of war, wherein he inſiſted ſtrongly on the diſaffected ſtate of Greece, (for moſt of the Grecian ſtates had ſent ambaſſadors to Darius, to enter into a league with him againſt the Macedonians), the power of the Perſians by ſea, and the folly of carrying on the war in diſtant provinces, while Tyre was left unreduced behind them: he alſo remarked, that if once this city was ſubdued, the ſovereignty of the ſea would be transferred to them, becauſe it would fix their poſſeſſion of the coaſts; and as the Perſian fleet was compoſed chiefly of tributary ſquadrons, thoſe tributaries would fight the battles, not of their late but of their preſent maſters. For theſe reaſons the ſiege of Tyre was reſolved on. The town was not taken, however, without great difficulty; which provoked Alexander to ſuch a degree, that he treated the inhabitants with the greateſt cruelty. See Tyre.

80
Tyre taken and deſtroyed.

After the reduction of Tyre, Alexander, though the ſeaſon was already far advanced, reſolved to make an an expedition into Syria; and in his way thither propoſed to chaſtiſe the Jews, who had highly offended him during the ſiege of Tyre: for when he ſent to them to demand proviſions for his ſoldiers, they anſwered, That they were the ſubjects of Darius, and bound by oath not to ſupply his enemies. The king, however, was pacified by their ſubmiſſion; and not only pardoned them, but conferred many privileges upon them, as related under the article Jews.

81 Egypt ſubmits. From Jeruſalem Alexander marched directly to Gaza, the only place in that part of the world which ſtill held out for Darius. This was a very large and ſtrong city, ſituated on an high hill, about five miles from the ſea-ſhore. One *Batis*, or *Betis*, an eunuch, had the government of the place; and had made every preparation neceſſary for ſuſtaining a long and obſtinate ſiege. The governor defended the place with great valour, and ſeveral times repulſed his enemies: but at laſt it was taken by ſtorm, and all the garriſon ſlain to a man; and this ſecured to Alexander an entrance into Egypt, which having before been very impatient of the Perſian yoke, admitted the Macedonians peaceably.

82 Alexander viſits the temple of Jupiter Ammon. Here the king laid the foundations of the city of Alexandria, which for many years after continued to be the capital of the country. While he remained here, he alſo formed the extraordinary deſign of viſiting the temple of Jupiter Ammon. As to the motives by which he was induced to take this extraordinary journey, authors are not agreed; but certain it is, that he hazarded himſelf and his troops in the higheſt degree; there being two dangers in this march, which, with the example of Cambyſes, who loſt the greateſt part of his army in it, might have terrified any body but Alexander. The firſt was the want of water, which, in the ſandy deſarts ſurrounding the temple, is no where to be found; the other, the uncertainty of the road from the fluctuation of the ſands; which changing their ſituation every moment, leave the traveller neither a road to walk in nor mark to march by. Theſe difficulties, however, Alexander got over; though not without a miraculous interpoſition, as is pretended by all his hiſtorians.

Alexander having conſulted the oracle, and received a favourable anſwer, returned to purſue his conqueſts. Having ſettled the government of Egypt, he appointed the general rendezvous of his forces at Tyre. Here he met with ambaſſadors from Athens, requeſting him to pardon ſuch of their countrymen as he found ſerving the enemy. The king, being deſirous to oblige ſuch a famous ſtate, granted their requeſt; and ſent alſo a fleet to the coaſt of Greece, to prevent the effects of ſome commotions which had lately happened in Peloponneſus. He then directed his march to Thapſacus; and having paſſed the Euphrates and Tigris, met with Darius near Arbela, where the Perſians were again overthrown with prodigious ſlaughter†, and Alexander in effect became maſter of the Perſian empire.

† See *Arbela*.

83 Reduces Babylon, Suſa, and Perſepolis. After this important victory, Alexander marched directly to Babylon, which was immediately delivered up; the inhabitants being greatly diſaffected to the Perſian intereſt. After 30 days ſtay in this country, the king marched to Suſa, which had already ſurrendered to Philoxenus; and here he received the treaſures of the Perſian monarch, amounting, according to the moſt generally received account, to 50,000 talents. Having received alſo at this time a ſupply of 6000 foot and 500 horſe from Macedon, he ſet about reducing the nations of Media, among whom Darius was retired. He firſt reduced the Uxians: and having forced a paſſage to Perſepolis the capital of the empire, he like a barbarian deſtroyed the ſtately palace there, a pile of building not to be equalled in any part of the world; after having given up the city to be plundered by his ſoldiers. In the palace he found 120,000 talents, which he appropriated to his own uſe, and cauſed immediately to be carried away upon mules and camels; for he had ſuch an extreme averſion to the inhabitants of Perſepolis, that he determined to leave nothing valuable in the city.

84 He purſues Darius. During the time that Alexander remained at Perſepolis, he received intelligence that Darius remained at Ecbatana the capital of Media; upon which he purſued him with the greateſt expedition, marching at the rate of near 40 miles a-day. In 15 days he reached Ecbatana, where he was informed that Darius had retired from thence five days before, with an intent to paſs into the remoteſt provinces of his empire. This put ſome ſtop to the rapid progreſs of the Macedonian army; and the king perceiving that there was no neceſſity for hurrying himſelf and his ſoldiers in ſuch a manner, began to give the orders requiſite in the preſent ſituation of his affairs. The Theſſalian horſe, who had deſerved exceedingly well of him in all his battles, he diſmiſſed according to his agreement; gave them their whole pay, and ordered 2000 talents over and above to be diſtributed among them. He then declared that he would force no man: but if any were willing to ſerve him longer for pay, he deſired they would enter their names in a book, which a great many of them did; the reſt ſold their horſes, and prepared for their departure. The king appointed Epocillus to conduct them to the ſea, and aſſigned him a body of horſe as an eſcort: he likewiſe ſent Menetes with them, to take care of their embarkation, and that they were ſafely landed in Eubœa without any expence to themſelves.

On receiving freſh information concerning the ſtate of Darius's affairs, the king ſet out again in purſuit of him, advancing as far as Rhages, a city one day's journey from the Caſpian ſtraits: there he underſtood that Darius had paſſed thoſe ſtraits ſome time before; which information leaving him again without hopes, he halted for five days. Oxidates, a Perſian whom Darius had left priſoner at Suſa, was made governor of Media, while the king departed on an expedition into Parthia. The Caſpian ſtraits he paſſed immediately without oppoſition; and then gave directions to his officers to collect a quantity of proviſions ſufficient to ſerve his army on a long march through a waſted country. But before his officers could accompliſh thoſe commands, the king received intelligence that Darius had been murdered by Beſſus, one of his own ſubjects, and governor of Bactria, as is related at length under the article Persia. 85 Who is murdered.

86 Alexander reduces Hyrcania. As ſoon as Alexander had collected his forces together, and ſettled the government of Parthia, he entered Hyrcania; and having, according to his uſual cuſtom, committed the greateſt part of his army to the care of Craterus, he, at the head of a choice body of troops, paſſed through certain craggy roads,

and before the arrival of Craterus, who took an open and eaſy path, ſtruck the whole provinces with ſuch terror, that all the principal places were immediately put into his hands, and ſoon after the province of Aria alſo ſubmitted, and the king continued Satibarzanes the governor in his employment.—The reduction of this province finiſhed the conqueſt of Perſia; but the ambition of Alexander to become maſter of every nation of which he had the leaſt intelligence, induced him to enter the country of the *Mardi*, merely becauſe its rocks and barrenneſs had hitherto hindered any body from conquering, or indeed from attempting to conquer it. This conqueſt, however, he eaſily accompliſhed, and obliged the whole nation to ſubmit to his pleaſure. But in the mean time diſturbances began to ariſe in Alexander's new empire, and among his troops, which all his activity could not thoroughly ſuppreſs. He had ſcarcely left the province of Aria, when he received intelligence, that the traitor Beſſus had cauſed himſelf to be proclaimed king of Aſia by the name of *Artaxerxes;* and that Satibarzanes had joined him, after having maſſacred all the Macedonians who had been left in the province. Alexander appointed one *Arſames* governor in the room of Satibarzanes; and marched thence with his army againſt the *Zarangæ*, who under the command of Barzaentes, one of thoſe who had conſpired againſt Darius, had taken up arms, and threatened to make an obſtinate defence. But their numbers daily falling off, Barzaentes being afraid they would purchaſe their own ſafety at the expence of his, privately withdrew from his camp, and, croſſing the river Indus, ſought ſhelter among the nations beyond it. But they, either dreading the power of Alexander, or deteſting the treachery of this Perſian towards his former maſter, ſeized and delivered him up to Alexander, who cauſed him immediately to be put to death.

87
The Macedonians give themſelves up to luxury.

88
Alexander conforms to the Perſian cuſtoms.

The immenſe treaſure which the Macedonians had acquired in the conqueſt of Perſia began now to corrupt them. The king himſelf was of a moſt generous diſpoſition, and liberally beſtowed his gifts on thoſe around him; but they made a bad uſe of his bounty, and fooliſhly indulged in thoſe vices by which the former poſſeſſors of that wealth had loſt it. The king did all in his power to diſcourage the lazy and inactive pride which now began to ſhow itſelf among his officers; but neither his diſcourſes nor his example had any conſiderable effect. The manners of his courtiers from bad became worſe, in ſpite of all he could ſay or do to prevent it; and at laſt they proceeded to cenſure his conduct, and to expreſs themſelves with ſome bitterneſs on the ſubject of his long continuance of the war, and his leading them conſtantly from one labour to another. This came to ſuch an height, that the king was at laſt obliged to uſe ſome ſeverity in order to keep his army within the limits of their duty. From this time forward, however, Alexander himſelf began to alter his conduct; and by giving a little into the cuſtoms of the Orientals, endeavoured to ſecure that obedience from his new ſubjects which he found ſo difficult to be preſerved among his old ones. He likewiſe endeavoured, by various methods, to blend the cuſtoms of the Aſiatics and the Greeks. The form of his civil government reſembled that of the ancient Perſian kings: in the military affairs, however, he preſerved the Macedonian diſcipline; but then he made choice of 30,000 boys out of the provinces, whom he cauſed to be inſtructed in the Greek language, and directed to be brought up in ſuch a manner as that from time to time he might with them fill up the phalanx. The Macedonians ſaw with great concern theſe extraordinary meaſures, which ſuited very ill with their groſs underſtandings; for they thought, after all the victories they had gained, to be abſolute lords of Aſia, and to poſſeſs not only the riches of its inhabitants, but to rule the inhabitants themſelves; whereas they now ſaw, that Alexander meant no ſuch thing; but that, on the contrary, he conferred governments, offices at court, and all other marks of confidence and favour, indiſcriminately both on Greeks and Perſians. From this time alſo the king ſeems to have given inſtances of a cruelty he had never ſhown before. Philotas his moſt intimate friend was ſeized, tortured, and put to death for a conſpiracy of which it could never be proved that he was guilty; and ſoon after Parmenio and ſome others were executed without any crime at all real or alleged. Theſe things very much diſturbed the army. Some of them wrote home to Macedonia of the king's ſuſpicions of his friends, and his diſpoſition to hunt out enemies at the very extremities of the world. Alexander having intercepted ſome of theſe letters, and procured the beſt information he could concerning their authors, picked out theſe diſſatiſfied people, and having diſpoſed them into one corps, gave it the title of the *turbulent battalion;* hoping by this means to prevent the ſpirit of diſaffection from pervading the whole army.

As a farther precaution againſt any future conſpiracy, Alexander thought fit to appoint Hephæſtion and Clytus generals of the auxiliary horſe; being apprehenſive, that if this authority was lodged in the hands of a ſingle perſon, it might prompt him to dangerous undertakings, and at the ſame time furniſh him with the means of carrying them into execution. To keep his forces in action, he ſuddenly marched into the country of the Euergetæ, i. e. *Benefactors;* and found them full of that kind and hoſpitable diſpoſition for which that name had been beſtowed on their anceſtors: he therefore treated them with great reſpect; and at his departure added ſome lands to their dominions, which lay contiguous, and which for that reaſon they had requeſted of him.

89
Satibarzanes defeated and killed.

Turning then to the eaſt, he entered Arachoſia, the inhabitants of which ſubmitted without giving him any trouble. While he paſſed the winter in theſe parts, the king received advice, that the Arians, whom he had ſo lately ſubdued, were again up in arms, Satibarzanes being returned into that country with two thouſand horſe aſſigned him by Beſſus. Alexander inſtantly diſpatched Artabazus the Perſian, with Erigyus and Caranus, two of his commanders, with a conſiſiderable body of horſe and foot: he likewiſe ordered Phrataphernes, to whom he had given the government of Parthia, to accompany them. A general engagement enſued, wherein the Arians behaved very well, as long as their commander Satibarzanes lived; but he engaging Erigyus, the Macedonian ſtruck him firſt into the throat, and then, drawing forth his ſpear again, through the mouth; ſo that he immediately expired, and with him the courage of his ſoldiers, who inſtantly began to fly; whereupon Alexander's commanders made an eaſy conqueſt of the reſt of the country, and ſettled it effectually under his obedience.

The king, notwithſtanding the inclemency of the ſeaſon, advanced into the country of Paropamiſus, ſo called from the mountain Paropamiſus, which the ſoldiers of Alexander called *Caucaſus*. Having croſſed the country in 16 days, he came at length to an opening leading into Media; which finding of a ſufficient breadth, he directed a city to be built there, which he called *Alexandria*, as alſo ſeveral other towns about a day's journey diſtant from thence: and in theſe places he left 7000 perſons, part of them ſuch as had hitherto followed his camp, and part of the mercenary ſoldiers, who, weary of continual fatigue, were content to dwell there. Having thus ſettled things in this province, ſacrificed ſolemnly to the gods, and appointed Proexes the Perſian preſident thereof, with a ſmall body of troops under the command of Niloxenus to aſſiſt him, he reſumed his former deſign of penetrating into Bactria.

90
Beſſus reduced and put to death.

Beſſus, who had aſſumed the title of *Artaxerxes*, when he was aſſured that Alexander was marching towards him, immediately began to waſte all the country between Paropamiſus and the river Oxus; which river he paſſed with his forces, and then burnt all the veſſels he had made uſe of for tranſporting them, retiring to Nautaca, a city of Sogdia; fully perſuaded, that, by the precautions he had taken, Alexander would be compelled to give over his purſuit. This conduct of his, however, diſheartened his troops, and gave the lie to all his pretenſions; for he had affected to cenſure Darius's conduct, and had charged him with cowardice, in not defending the rivers Euphrates and Tigris, whereas he now quitted the banks of the moſt defenſible river perhaps in the whole world. As to his hopes, tho' it cannot be ſaid they were ill founded, yet they proved abſolutely vain; for Alexander, continuing his march, notwithſtanding all the hardſhips his ſoldiers ſuſtained, reduced all Bactria under his obedience, particularly the capital Bactria and the ſtrong caſtle Aornus: in the latter he placed a garriſon under the command of Archelaus; but the government of the province he committed to Artabazus. He then continued his march to the river Oxus: on the banks of which when he arrived, he found it three quarters of a mile over, its depth more than proportionable to its breadth, its bottom ſandy, its ſtream ſo rapid as to render it almoſt unnavigable, and neither boat nor tree in its neighbourhood; ſo that the ableſt commanders in the Macedonian army were of opinion that they ſhould be obliged to march back. The king, however, having firſt ſent away, under a proper eſcort, all his infirm and worn-out ſoldiers, that they might be conducted ſafe to the ſea-ports, and from thence to Greece, deviſed a method of paſſing this river without either boat or bridge, by cauſing the hides which covered the ſoldiers tents and carriages to be ſtuffed with ſtraw, and then tied together, and thrown into the river. Having croſſed the Oxus, he marched directly towards the camp of Beſſus, where when he arrived, he found it abandoned; but received at the ſame time letters from Spitamenes and Dataphernes, who were the chief commanders under Beſſus, ſignifying, that, if he would ſend a ſmall party to receive Beſſus, they would deliver him into his hands; which they did accordingly, and the traitor was put to death in the manner related in the hiſtory of PERSIA.

A ſupply of horſes being now arrived, the Macedonian cavalry were remounted. Alexander continued his march to Maracanda the capital of Sogdia, from whence he advanced to the river Iaxartes. Here he performed great exploits againſt the Scythians; from whom, however, tho' he overcame them, his army ſuffered much; and the revolted Sogdians being headed by Spitamenes, gave him a great deal of trouble. Here he married Roxana the daughter of Oxyartes, a prince of the country whom he had ſubdued. But during theſe expeditions, the king greatly diſguſted his army by the murder of his friend Clytus in a drunken quarrel at a banquet, and by his extravagant vanity in claiming divine honours.

91
Alexander marries Roxana.

92
Paſſes the Indus

At laſt he arrived at the river Indus, where Hephæſtion and Perdiccas had already provided a bridge of boats for the paſſage of the army. The king refreſhed his troops for 30 days in the countries on the other ſide of the river, which were thoſe of his friend and ally Taxiles, who gave him 30 elephants, and joined his army now with 700 Indian horſe, to which, when they were to enter upon action, he afterwards added 5000 foot. The true reaſon of this ſeems to have been his enmity to Porus, a famous Indian prince, whoſe territories lay on the other ſide of the river Hydaſpes. During this receſs, the king ſacrificed with great ſolemnity; receiving alſo ambaſſadors from Ambiſurus, a very potent prince, and from Doxareas, who was likewiſe a king in thoſe parts, with tenders of their duty, and conſiderable preſents. Theſe ceremonies over, Alexander appointed Philip governor of Taxila, and put a Macedonian garriſon into the place, becauſe he intended to erect an hoſpital there for the cure of his ſick and wounded ſoldiers. He then ordered the veſſels, of which his bridge had been compoſed when he paſſed the Indus, to be taken to pieces, that they might be brought to the Hydaſpes, where he was informed that Porus with a great army lay encamped to hinder his paſſage. When he approached the banks of this river with his army and the auxiliaries under the command of Taxiles, he found that the people he had to do with were not ſo eaſily to be ſubdued as the Perſians and other Aſiatics. The Indians were not only a very tall and robuſt, but alſo a very hardy and well-diſciplined people; and their king Porus was a prince of high ſpirit, invincible courage, and great conduct.

It was about the ſummer ſolſtice when Alexander reached the Hydaſpes, and conſequently its waters were broader, deeper, and more rapid, than at any other time; for in India the rivers ſwell as the ſun's increaſing heat melts the ſnow, and ſubſide again as winter approaches. Alexander therefore had every difficulty to ſtruggle with. Porus had made his diſpoſitions ſo judiciouſly, that Alexander found it impoſſible to practiſe upon him as he had done upon others, and to paſs the river in his view: wherefore he was conſtrained to divide his army into ſmall parties, and to practiſe other arts, in order to get the better of ſo vigilant a prince. To this end he cauſed a great quantity of corn and other proviſions to be brought into his camp; giving out, that he intended to remain where he was till the river fell, and by becoming fordable ſhould give him an opportunity of forcing a paſſage: this did not, however, hinder Porus from keeping up very ſtrict diſcipline in his camp; which when Alexander perceived, he frequently made ſuch motions as ſeemed to indicate a change of his reſolution, and that he had ſtill thoughts of paſſing the river. The main thing the Macedonians ſtood in fear of were the elephants; for the bank being pretty ſteep on the other ſide, and it being the nature of horſes to ſtart at the firſt appearance of thoſe animals, it was foreſeen that the army would be diſordered, and incapable of ſuſtaining the charge of Porus's troops.

93
And the Hydaſpes with difficulty.

At length Alexander paſſed the river by the following contrivance. There was, at the diſtance of 150 ſtadia from his camp, a rocky promontory projecting into the river, thick covered with wood; and over-againſt this promontory there lay a pretty large uninhabited iſland almoſt overgrown with trees. The king therefore conceived within himſelf a project of conveying a body of troops from this promontory into that iſland; and upon this ſcheme he built his hopes of ſurpriſing Porus, vigilant as he was. To this end he kept him and his army conſtantly alarmed for many nights together, till he perceived that Porus apprehended it was only done to haraſs his troops, and therefore no longer drew out of his camp, but truſted to his ordinary guards: then Alexander reſolved to put his deſign in execution. A conſiderable body of horſe, the Macedonian phalanx, with ſome corps of light-armed foot, he left in his camp under the command of Craterus, as alſo the auxiliary Indians; giving theſe orders to be obſerved in his abſence, that if Porus marched againſt him with part of his army and left another part with the elephants behind in his camp, Craterus and his forces ſhould remain where they were; but if it ſo happened that Porus withdrew his elephants, then Craterus was to paſs the river, becauſe his cavalry might then do it ſafely. Alexander having marched half the way, or about nine of our miles, ordered the mercenary troops under the command of Attalus and other generals, to remain there; and directed them, that as ſoon as he knew he was engaged with the Indians on the other ſide, they ſhould paſs in veſſels provided for that purpoſe, in order to aſſiſt him. Then marching a long way about, that the enemy might not perceive his deſign of reaching the rock, he advanced as diligently as he could towards that poſt. It happened very fortunately for him, that a great ſtorm of thunder, lightning, and hail, roſe in the night, whereby his march was perfectly concealed, his veſſels of 30 oars put together, and his tents ſtuffed and ſtitched, ſo that they paſſed from the rock into the iſland, without being perceived, a little before break of day; the ſtorm ceaſing juſt as he and his ſoldiers were ready for their paſſage. When they had traverſed the iſland, they boldly ſet forward to gain the oppoſite ſhore in ſight of Porus's out-guards, who inſtantly poſted away to give their maſter an account of the attempt. Alexander landed firſt himſelf, and was followed as expeditiouſly as poſſible by his forces, whom he took care to draw up as faſt as they arrived. When they began their march again, they found that their good fortune was not ſo great as at firſt they eſteemed it; for it appeared now, that they had not reached the continent at all, but were in truth in another iſland much larger than the former. They croſſed it as faſt as they could, and found that it was divided from the *terra firma* by a narrow channel, which, however, was ſo ſwelled by the late heavy rain, that the poor ſoldiers were obliged to wade up to the breaſt. When they were on the other ſide, the king drew them up again carefully, ordering the foot to march ſlowly, they being in number about 6000, while himſelf with 5000 horſe advanced before. As ſoon as Porus received intelligence that Alexander was actually paſſing the river, he ſent his ſon with 2000 horſe, and 120 armed chariots, to oppoſe him. But they came too late: Alexander was already got on ſhore, and even on his march.

94
The ſon of Porus defeated and killed.

When the Macedonian ſcouts perceived them advance, they informed the king, who ſent a detachment to attack them, remaining ſtill at the head of his cavalry in expectation of Porus. But when he found that this party was unſupported, he inſtantly attacked with all his horſe, and defeated them with the ſlaughter of many, and the loſs of all their armed chariots, the ſon of Porus being ſlain in the fight. The remainder of the horſe returning to the camp with this diſaſtrous account, Porus was in ſome confuſion: however, he took very quickly the beſt and wiſeſt reſolutions his circumſtances would allow; which were, to leave a part of his army, with ſome of his elephants, to oppoſe Craterus, who was now about to paſs the river alſo; and, with the reſt, to march againſt Alexander and his forces, who were already paſſed. This reſolution once taken, he marched immediately out of his camp, at the head of 4000 horſe, 30,000 foot, 300 chariots, and 200 elephants. He advanced as expeditiouſly as he could, till he came into a plain which was firm and ſandy, where his chariots and elephants might act to advantage: there he halted, that he might put his army in order, knowing well that he need not go in queſt of his enemy. Alexander ſoon came up with his horſe, but he did not charge Porus; on the contrary, he halted, and put his troops in order, that they might be able to defend themſelves in caſe they were attacked. When he had waited ſome time, his foot arrived; whom he immediately ſurrounded with his horſe, that, after ſo fatiguing a march, they might have time to cool and breathe themſelves, before they were led to engage. Porus permitted all this, becauſe it was not his intereſt to fight, and becauſe he depended chiefly upon his order of battle, the elephants covering his foot, ſo that the Macedonians could not charge them.

95
Porus himſelf defeated.

When Alexander had diſpoſed his foot in proper order, he placed his horſe on the wings: and, obſerving that he was much ſuperior in them to the enemy, and that the cavalry of Porus were eaſy to be charged, he reſolved to let the foot have as little ſhare as poſſible in the battle. To this end, having given the neceſſary directions to Cœnus who commanded them, he went himſelf to the right, and with great fury fell upon the left wing of Porus. The diſpute, tho' ſhort, was very bloody: the cavalry of Porus, tho' they fought gallantly, were quickly broken; and the foot being by this means uncovered, the Macedonians charged them. But the Indian horſe rallying, came up to their relief, yet were again defeated. By this time the archers had wounded

wounded many of the elephants, and killed moſt of their riders, ſo that they did not prove leſs troubleſome and dangerous to their own ſide than to the Macedonians; whence a great confuſion enſued: and Cœnus, taking this opportunity, fell in with the troops under his command, and entirely defeated the Indian army. Porus himſelf behaved with the greateſt intrepidity, and with the moſt excellent conduct: he gave his orders, and directed every thing, as long as his troops retained their form; and, when they were broken, he retired from party to party as they made ſtands, and continued fighting till every corps of Indians was put to the rout. In the mean time Craterus had paſſed with the reſt of the Macedonian army; and theſe, falling upon the flying Indians, increaſed the ſlaughter of the day exceſſively, inſomuch that 20,000 foot and 3000 horſe were killed, all the chariots were hacked to pieces, and the elephants not killed were taken: two of Porus's ſons fell here, as alſo moſt of his officers of all ranks.

96
He ſubmits to Alexander.

As for Porus, Alexander gave ſtrict directions that no injury might be done to his perſon: he even ſent Taxiles to perſuade him to ſurrender himſelf, and to aſſure him that he ſhould be treated with all the kindneſs and reſpect imaginable; but Porus, diſdaining this advice from the mouth of an old enemy, threw a javelin at him, and had killed him but for the quick turn of his horſe. Meroe the Indian, who was alſo in the ſervice of Alexander, ſucceeded better: he had been the old acquaintance of Porus; and therefore when he intreated that prince to ſpare his perſon, and to ſubmit himſelf to fortune and a generous victor, Porus followed his advice; and we may truly ſay, that the condition of this Indian king ſuffered nothing by the loſs of the battle. Alexander immediately gave him his liberty, reſtored him ſhortly after to his kingdom, to which he annexed provinces almoſt equal to it in value. Neither was Alexander a loſer by his munificence; for Porus remained his true friend and conſtant ally.

To perpetuate the memory of this victory, Alexander ordered two cities to be erected; one on the field of battle, which he named *Nicæa;* the other on this ſide the river, which he called *Bucephala*, in honour of his horſe Bucephalus, who died here, as Arrian ſays, of mere old age, being on the verge of 30. All the ſoldiers, who fell in battle, he buried with great honours; offered ſolemn ſacrifices to the gods, and exhibited pompous ſhows on the banks of the Hydaſpes, where he had forced his paſſage. He then entered the territories of the Glauſæ, in which were 37 good cities, and a multitude of populous villages. All theſe were delivered up to him without fighting; and as ſoon as he received them, he preſented them to Porus; and having reconciled him to Taxiles, he ſent the latter home to his own dominions. About this time ambaſſadors arrived from ſome Indian princes with their ſubmiſſions; and Alexander having conquered the dominions of another Porus, which lay on the Hydraotes a branch of the Indus, added them to thoſe of Porus his ally.

In the middle of all this ſucceſs, however, news arrived, that the Cathei, the Oxydracæ, and the Malli, the moſt warlike nations of India, were confederated againſt the Macedonians, and had drawn together a great army. The king immediately marched to give them battle; and in a few days reached a city called *Sangala*, ſeated on the top of an hill, and having a fine lake behind it. Before this city the confederate Indians lay encamped, having three circular lines of carriages locked together, and their tents pitched in the centre. Notwithſtanding the apparent difficulty of forcing theſe intrenchments, Alexander reſolved immediately to attack them. The Indians made a noble defence; but at laſt the firſt line of their carriages was broken, and the Macedonians entered. The ſecond was ſtronger by far; yet Alexander attacked that too, and after a deſperate reſiſtance forced it. The Indians, without truſting to the third, retired into the city; which Alexander would have inveſted: but the foot he had with him not being ſufficient for that purpoſe, he cauſed his works to be carried on both ſides as far as the lake; and, on the other ſide of that, ordered ſeveral brigades of horſe to take poſt; ordering alſo battering engines to be brought up, and in ſome places employing miners. The ſecond night, he received intelligence that the beſieged, knowing the lake to be fordable, intended to make their eſcape through it. Upon this the king ordered all the carriages which had been taken in forcing their camp to be placed up and down the roads, in hopes of hindering their flight; giving directions to Ptolemy, who commanded the horſe on the other ſide of the lake, to be extremely vigilant, and to cauſe all his trumpets to ſound, that the forces might repair to that poſt where the Indians made their greateſt effort. Theſe precautions had all the effect that could be deſired: for of the few Indians who got through the lake, and paſſed the Macedonian horſe, the greater part were killed on the roads; but the greateſt part of their army was conſtrained to retire again through the water into the city. Two days after, the place was taken by ſtorm. Seventeen thouſand Indians were killed; 70,000 taken priſoners; with 300 chariots, and 500 horſe. The Macedonians are ſaid to have loſt only 100 men in this ſiege; but they had 1200 wounded, and among theſe ſeveral perſons of great diſtinction.

97
Sangala taken,

The city was no ſooner taken, than Alexander diſpatched Eumenes his ſecretary, with a party of horſe, to acquaint the inhabitants of the cities adjacent with what had befallen the Sangalans; promiſing alſo, that they ſhould be kindly treated if they would ſubmit. But they were ſo much affrighted at what had happened to their neighbours, that, abandoning all their cities, they fled into the mountains; chooſing rather to expoſe themſelves to wild beaſts, than to theſe invaders, who had treated their countrymen ſo cruelly. When the king was informed of this, he ſent detachments of horſe and foot to ſcour the roads; and theſe, finding aged, infirm, and wounded people, to the number of about 500, put them to the ſword without mercy. Perceiving that it was impoſſible to perſuade the inhabitants to return, he cauſed the city of Sangala to be raſed, and gave the territories to the few Indians who had ſubmitted to him.

98
And raſed.

Alexander, ſtill unſated with conqueſt, now prepared to paſs the Hyphaſis. The chief reaſon which induced him to think of this expedition was, the information he had received of the ſtate of the countries beyond that river. He was told that they were in themſelves rich and fruitful; that their inhabitants were not only a very martial people, but very civilized; that they were governed by the nobility, who were themſelves ſubject to the laws; and that as they lived in happineſs and freedom, it was likely they would fight obſtinately in defence of thoſe bleſſings. He was farther told, that among theſe nations there were the largeſt, ſtrongeſt, and moſt uſeful elephants bred and tamed; and was therefore fired with an earneſt deſire to reduce ſuch a bold and brave people under his rule, and of attaining to the poſſeſſion of the many valuable things that were ſaid to be amongſt them. As exorbitant, however, as his perſonal ambition was, he found it impoſſible to infuſe any part of it into the minds of his ſoldiers; who were ſo far from wiſhing to triumph over new and remote countries, that they were highly deſirous of leaving thoſe that they had already conquered. When therefore they were informed of the king's intentions, they privately conſulted together in the camp about the ſituation of their own affairs. At this conſultation, the graveſt and beſt of the ſoldiers lamented that they were made uſe of by their king, not as lions, who fall fiercely upon thoſe who have injured them; but as maſtiffs, who fly upon and tear thoſe who are pointed out to them as enemies. The reſt were not ſo modeſt; but expreſſed themſelves roundly againſt the king's humour for leading them from battle to battle, from ſiege to ſiege, and from river to river; proteſting that they would follow him no further, nor laviſh away their lives any longer, to purchaſe fame for him.

99 **Alexander's troops refuſe to proceed further.**

Alexander was a man of too much penetration not to be early in perceiving that his troops were very uneaſy. He therefore harangued them from his tribunal; but though his eloquence was great, and the love his army had for him was yet very ſtrong, they did not relent. For ſome time the ſoldiers remained ſullen and ſilent; and at laſt turned their eyes on Cœnus, an old and experienced general, whom Alexander loved, and in whom the army put great confidence.—He had the generoſity to undertake their cauſe; and told Alexander frankly, "that men endured toil in hopes of repoſe; that the Macedonians were already much reduced in their numbers; that of thoſe who remained, the greater part were invalids; and that they expected, in conſideration of their former ſervices, that he would now lead them back to their native country: an act which, of all others, would moſt contribute to his own great deſigns; ſince it would encourage the youth of Macedon, and even of all Greece, to follow him in whatever new expedition he pleaſed to undertake." The king was far from being pleaſed with this ſpeech of Cœnus, and much leſs with the diſpoſition of his army, which continued in a deep ſilence. He therefore diſmiſſed the aſſembly: but next day he called another, wherein he told the ſoldiers plainly, that he would not be driven from his purpoſe; that he would proceed in his conqueſts with ſuch as ſhould follow him voluntarily: as for the reſt, he would not detain them, but would leave them at liberty to go home to Macedon, where they might publiſh, "that they had left their king in the midſt of his enemies." Even this expedient had no ſucceſs; his army was ſo thoroughly tired with long marches and deſperate battles, that they were determined to go no further, either for fair ſpeeches or foul. Upon this Alexander retired to his tent, where he refuſed to ſee his friends, and put on the ſame gloomy temper that reigned among his troops. For three days things remained in this ſituation. At laſt the king ſuddenly appeared; and, as if he had been fully determined to purſue his firſt deſign, he gave orders for ſacrificing for the good ſucceſs of his new undertaking. Ariſtander the augur reported, that the omens were altogether inauſpicious; upon which the king ſaid, that ſince his proceeding farther was neither pleaſing to the gods nor grateful to his army, he would return. When this was rumoured among the army, they aſſembled in great numbers about the royal tent, ſaluting the king with loud acclamations, wiſhing him ſucceſs in all his future deſigns; giving him at the ſame time hearty thanks, for that "he who was invincible had ſuffered himſelf to be overcome by their prayers."

100 **He conſents to return.**

A ſtop being thus put to the conqueſts of Alexander, he determined to make the Hyphaſis the boundary of his dominions; and having erected twelve altars of an extraordinary magnitude, he ſacrificed on them: after which he exhibited ſhows in the Grecian manner; and, having added all the conquered country in theſe parts to the dominions of Porus, he began to return. Having arrived at the Hydaſpes, he made the neceſſary preparations for ſailing down the Indus into the ocean. For this purpoſe, he ordered vaſt quantities of timber to be felled in the neighbourhood of the Hydaſpes, through which he was to ſail into the Indus; he cauſed the veſſels with which he had paſſed other rivers to be brought thither, and aſſembled a vaſt number of artificers capable of repairing and equipping his fleet; which, when finiſhed, conſiſted of 80 veſſels of three banks of oars, and 2000 leſſer ſhips and tranſports. Thoſe who were to manage this fleet were collected out from the Phœnicians, Cyprians, Carians, and Egyptians following his army, and who were reckoned perfectly well ſkilled in the naval art. When all things were ready, the army embarked about break of day; the king, in the mean time, ſacrificing to the gods according to the ceremonies uſed in his own country, and likewiſe according to thoſe of the country where he now was. Then he himſelf went on board; and cauſing the ſignal to be given by ſound of trumpet, the fleet ſet ſail. Craterus and Hephæſtion had marched ſome days before with another diviſion of the army; and in three days the fleet reached that part of the river which was oppoſite to their camps. Here he had information, that the Oxydracæ and Malli were raiſing forces to oppoſe him: upon which he immediately determined to reduce them; for, during this voyage, he made it a rule to compel the inhabitants on both ſides of the river to yield him obedience. But before he arrived on the coaſts of the people above mentioned, he himſelf ſuſtained no ſmall danger; for, coming to the confluence of the Aceſines with the Hydaſpes, from whence both rivers roll together into the Indus, the eddies, whirlpools, and rapid currents, ruſhing with tremendous noiſe from the reſpective channels of thoſe rivers into the great one formed by them both, at once terrified thoſe who navigated his veſſels, and actually

101 **Sails down the Indus.**

tually deſtroyed many of the long veſſels, with all who were aboard of them; the king himſelf being in ſome danger, and Nearchus the admiral not a little at a loſs. As ſoon as this danger was over, Alexander went on ſhore; and having ordered his elephants with ſome troops of horſe and archers to be carried acroſs, and put under the command of Craterus, he then divided his army on the left-hand bank into three bodies; the firſt commanded by himſelf, the ſecond by Hyphæſtion, and the third by Ptolemy. Hyphæſtion had orders to move ſilently through the heart of the country, five days march before the king; that if, on Alexander's approach, any of the barbarians ſhould attempt to ſhelter themſelves by retiring into the country, they might fall into the hands of Hephæſtion. Ptolemy Lagus was ordered to march three days journey behind the king, that if any eſcaped his army, they might fall into Ptolemy's hands; and the fleet had orders to ſtop at the confluence of this river with the Hydraotes till ſuch time as theſe ſeveral corps ſhould arrive.

102
His expedition againſt the Malli.

Alexander himſelf, at the head of a body of horſe and light armed foot, marched through a deſart country againſt the Malli; and, ſcarce affording any reſt to his ſoldiers, arrived in three days at a city into which the barbarians had put their wives and children, with a good garriſon for their defence. The country people, having no notion that Alexander would march through ſuch a deſert and barren region, were all unarmed, and in the utmoſt confuſion. Many of them therefore were ſlain in the field; the reſt fled into the city, and ſhut the gates. But this only protracted their fate for a ſhort time; for the king, having ordered the city to be inveſted by his cavalry, took it, as well as the caſtle, by ſtorm, and put all he found there to the ſword. He ſent at the ſame time Perdiccas with a conſiderable detachment, to inveſt another city of the Malli at a conſiderable diſtance; but when he came there, he found it abandoned. However, he purſued the inhabitants who had but lately left it, and killed great numbers of them on the road. After this the king took ſeveral other cities, but not without conſiderable reſiſtance; for the Indians ſometimes choſe to burn themſeves in their houſes rather than ſurrender. At laſt he marched to their capital city; and finding that abandoned, he proceeded to the river Hydraotes, where he found 50,000 men encamped on the oppoſite bank, in order to diſpute his paſſage. He did not heſitate, however, to enter the river with a conſiderable party of horſe: and ſo much were the Indians terrified at his preſence, that their whole army retired before him. In a ſhort time they returned and attacked him, being aſhamed to fly before ſuch an inconſiderable number; but in the mean time the reſt of the Macedonian forces came up, and the Indians were obliged to retire to a city which lay behind them, and which Alexander inveſted that very night. The next day he ſtormed the city, with ſuch violence, that the inhabitants were compelled to abandon it, and to retire to the caſtle, where they prepared for an obſtinate defence. The king inſtantly gave orders for ſcaling the walls, and the ſoldiers prepared to execute theſe orders as faſt as they could; but the king being impatient caught hold of a ladder and mounted it firſt himſelf, being followed by Leonatus, Peuceſtas, and Abreas, the latter a man of great valour, and who on that account had double pay allowed him. The king having gained the top of the battlements, cleared them quickly of the defendants, killing ſome of them with his ſword, and puſhing others over the walls: but after this was done, he was in more danger than ever; for the Indians galled him with their arrows from the adjacent towers, though they durſt not come near enough to engage him. His own battalion of targeteers mounting in haſte to ſecond him, broke the ladders; which, as ſoon as Alexander perceived, he threw himſelf down into the caſtle, as did alſo Peuceſtas, Leonatus, and Abreas. As ſoon as the king was on the ground, the Indian general ruſhed forward to attack him; but Alexander inſtantly diſpatched him, as well as ſeveral others who followed him. Upon this the reſt retired, and contented themſelves with throwing darts and ſtones at him at a diſtance. Abreas was ſtruck into the head with an arrow, and died on the ſpot; and, ſhortly after, another pierced through the king's breaſtplate into his body. As long as he had ſpirits, he defended himſelf valiantly; but, through a vaſt effuſion of blood, loſing his ſenſes, he fell upon his ſhield. Peuceſtas then covered him with the ſacred ſhield of Pallas on one ſide, as did Leonatus with his own ſhield on the other, though they themſelves were dreadfully wounded. In the mean time, however, the ſoldiers on the outſide, eager to ſave their king, ſupplied their want of ladders by driving large iron pins into the walls. By the help of theſe many of them aſcended, and came to the aſſiſtance of Alexander and his companions. The Indians were now ſlaughtered without mercy; but Alexander continued for ſome time in a very dangerous way: however, he at laſt recovered his ſtrength, and ſhowed himſelf again to his army, which filled them with the greateſt joy.

103
His deſperate valour and danger.

104
Is with difficulty ſaved by his men.

The Malli, being now convinced that nothing but ſubmiſſion could ſave the remainder of them, ſent deputies to Alexander, offering the dominion of their country; as did alſo the Oxydracæ: and the king having ſettled every thing in theſe countries agreeable to his mind, proceeded on his voyage down the river Indus. In this voyage he received the ſubmiſſion of ſome other Indian princes; and perceiving, that, at the point of the iſland Pattala, the river divided itſelf into two vaſt branches, he ordered an haven and convenient docks to be made there for his ſhips; and when he had careened his fleet, he ſailed down the right-hand branch towards the ocean. In his paſſage he ſuſtained great difficulties by reaſon of his want of pilots, and at the mouth of the river very narrowly miſſed being caſt away: yet all this did not hinder him from purſuing his firſt deſign, though it does not appear that he had any other motive thereto than the vain deſire of boaſting that he had entered the ocean beyond the Indus: for, having conſecrated certain bulls to Neptune, and thrown them into the ſea, performed certain libations of golden cups, and thrown the cups alſo into the ſea, he came back again; having only ſurveyed two little iſlands, one at the mouth of the Indus, and one a little farther in the ocean.

105
He proceeds in his voyage down the Indus.

On the king's return to Pattala, he reſolved to ſail down the other branch of the Indus, that he might ſee whether it was more ſafe and commodious for his fleet than that which he had already tried; and for this he had very good reaſons. He had reſolved to ſend Nearchus with his fleet by ſea, through the Perſian gulf up the river Tygris, to meet him and his army in Meſopotamia; but as the poſſibility of this voyage depended on the ceaſing of the Eteſian winds, there was a neceſſity of laying up the fleet till the ſeaſon ſhould prove favourable. Alexander, therefore, ſailing through this branch of the Indus, ſought on the ſea-coaſt for bays and creeks, where his fleet might anchor in ſafety; he cauſed alſo pits to be ſunk, which might be filled with freſh water for the uſe of his people; and took all imaginable precautions for preſerving them in eaſe and ſafety till the ſeaſon would allow them to continue their voyage. In this he ſucceeded to his wiſh; for he found this branch of the river Indus, at its mouth, ſpread over the plain country and forming a kind of lake, wherein a fleet might ride with ſafety. He therefore appointed Leonatus, and a part of his army, to carry on ſuch works as were neceſſary; cauſing them to be relieved by freſh troops as often as there was occaſion: then having given his laſt inſtructions to Nearchus, he departed with the reſt of the army, in order to march back to Babylon.

106 Sets out for Babylon.

Before the king's departure, many of his friends adviſed him againſt the route which he intended to take. They told him, that nothing could be more raſh or dangerous than this reſolution. They acquainted him, that the country through which he was to travel was a wild uncultivated deſart; that Semiramis, when ſhe led her ſoldiers this way out of India, brought home but 20 of them; and that Cyrus, attempting to do the ſame, returned with only ſeven. But all this was ſo far from deterring Alexander, that it more than ever determined him to purſue no other road. As ſoon, therefore, as he had put things in order, he marched at the head of a ſufficient body of troops to reduce the Oritæ, who had never vouchſafed either to make their ſubmiſſion or to court his friendſhip. Their territories lay on the other ſide of a river called *Arabis*, which Alexander croſſed ſo ſpeedily, that they had no intelligence of his march; whereupon moſt of them quitted their country, and fled into the deſarts. Their capital he found ſo well ſituated, that he reſolved to take it out of their hands, and to cauſe a new and noble city to be founded there, the care of which he committed to Hephæſtion. Then he received the deputies of the Oritæ and Gedroſi; and having aſſured them, that if the people returned to their villages, they ſhould be kindly treated, and having appointed Apollophenes preſident of the Oritæ, and left a conſiderable body of troops under Leonatus to ſecure their obedience, he began his march through Gedroſia. In this march his troops ſuffered incredible hardſhips. The road was very uncertain and troubleſome, on account of its lying thro' deep and looſe ſands, riſing in many places into hillocks, which forced the ſoldiers to climb, at the ſame time that it ſunk under their feet; there were no towns, villages, nor places of refreſhment, to be met with; ſo that, after exceſſive marches, they were forced to encamp among theſe dry ſands. As to proviſions, they hardly met with any during their whole march. The ſoldiers were therefore obliged to kill their beaſts of carriage: and ſuch as were ſent to bring ſome corn from the ſea-ſide, were ſo grievouſly diſtreſſed, that, though it was ſealed with the king's ſignet, they cut open the bags, chooſing rather to die a violent death for diſobedience than periſh by hunger. When the king, however, was informed of this, he freely pardoned the offenders; he was alſo forced to accept the excuſes that were daily made for the loſs of mules, horſes, &c. which were in truth eaten by the ſoldiers, and their carriages broken in pieces to avoid further trouble. As for water, their want of it was a great misfortune; and yet their finding it in plenty was ſometimes a greater: for, as by the firſt they periſhed with thirſt, ſo by the latter they were burſt, thrown into dropſies, and rendered incapable of travel. Frequently they met with no water for the whole day together: ſometimes they were diſappointed of it at night; in which caſe, if they were able, they marched on; ſo that it was common with them to travel 30, 40, 50, or even 60 miles without encamping. Numbers through theſe hardſhips were obliged to lag in the rear; and of theſe many were left behind, and periſhed; for indeed ſcarce any ever joined the army again. Their miſeries, however, they ſuſtained with incredible patience, being encouraged by the example of their king; who, on this occaſion, ſuffered greater hardſhips than the meaneſt ſoldier in his army. At laſt they arrived at the capital of Gedroſia, where they refreſhed themſelves, and ſtaid ſome time: after which, they marched into Caramania; which being a very plentiful country, they there made themſelves ample amends for the hardſhips and fatigues they had ſuſtained. Here they were joined firſt by Craterus with the troops under his command, and a number of elephants; then came Staſanor preſident of the Arians, and Phariſmanes the ſon of Phrataphernes governor of Parthia. They brought with them camels, horſes, and other beaſts of burden, in vaſt numbers; having foreſeen, that the king's march thro' Gedroſia would be attended with the loſs of the greateſt part, if not of all the cavalry and beaſts belonging to his army.

107 His dangerous march through Gedroſia.

108 He arrives in Caramania.

109 Redreſſes the grievances of his people.

During Alexander's ſtay in Caramania, he redreſſed the injuries of his people, who had been grievouſly oppreſſed by their governors during his abſence. Here alſo he was joined by his admiral Nearchus, who brought him an account that all under his command were in perfect ſafety, and in excellent condition; with which the king was mightily pleaſed, and, after having beſtowed on him ſingular marks of his favour, ſent him back to the navy. Alexander next ſet out for Perſia, where great diſorders had been committed during his abſence. Theſe alſo he redreſſed, and cauſed the governor to be crucified; appointing in his room Peuceſtas, who ſaved his life when he fought ſingly againſt a whole garriſon as above related. The new governor was no ſooner inveſted with his dignity, than he laid aſide the Macedonian garb, and put on that of the Medes; being the only one of Alexander's captains, who, by complying with the manners of the people he governed, gained their affection.

While Alexander viſited the different parts of Perſia, he took a view, among the reſt, of the ruins of Perſepolis, where he is ſaid to have expreſſed great ſorrow for the deſtruction he had formerly occaſioned. From Perſepolis he marched to Suſa, where he gave an

an extraordinary looſe to pleaſure; reſolving to make himſelf and his followers ſome amends for the difficulties they had hitherto undergone; purpoſing at the ſame time ſo effectually to unite his new conquered with his hereditary ſubjects, that the jealouſies and fears, which had hitherto tormented both, ſhould no
110 Marries other two wives.
longer ſubſiſt. With this view he married two wives of the blood royal of Perſia; viz. Barſine, or Statira, the daughter of Darius, and Paryſatis the daughter of Ochus. Drypetis, another daughter of Darius, he gave to Hephæſtion; Amaſtrine, the daughter of Oxyartes the brother of Darius, married Craterus; and to the reſt of his friends, to the number of 80, he gave other women of the greateſt quality. All theſe marriages were celebrated at once, Alexander himſelf beſtowing fortunes upon them; he directed likewiſe to take account of the number of his officers and ſoldiers who had married Aſiatic wives; and tho' they appeared to be 10,000, yet he gratified each of them according
111 Pays the debts of his army.
to his rank. He next reſolved to pay the debts of his army, and thereupon iſſued an edict directing every man to regiſter his name and the ſum he owed; with which the ſoldiers complying ſlowly, from an apprehenſion that there was ſome deſign againſt them, Alexander ordered tables heaped with money to be ſet in all quarters of the camp, and cauſed every man's debts to be paid on his bare word, without even making any entry of his name; though the whole ſum came to 20,000 talents. On ſuch as had diſtinguiſhed themſelves in an extraordinary manner, he beſtowed crowns of gold. Peuceſtas had the firſt; Leonatus the ſecond; Nearchus the third; Oneſicritus the fourth; Hephæſtion the fifth; and the reſt of his guards had each of them one. After this he made other diſpoſitions for conciliating, as he ſuppoſed, the differences among all his ſubjects. He reviewed the 30,000 youths, whom at his departure for India he had ordered to be taught Greek and the Macedonian diſcipline; expreſſing high ſatisfaction at the fine appearance they made, which rendered them worthy of the appellation he beſtowed on them, viz. that of *Epigoni*, i. e. ſucceſſors. He promoted alſo, without any diſtinction of nation, all thoſe who had ſerved him faithfully and valiantly in the Indian war. When all theſe regulations were made, he gave the command of his heavy armed troops to Hephæſtion, and ordered him to march directly to the banks of the Tigris, while in the mean time a fleet was equipped for carrying the king and the troops he retained with him down to the ocean.

Thus ended the exploits of Alexander; the greateſt conqueror that ever the world ſaw, at leaſt with reſpect to the rapidity of his conqueſts. In 12 years time he had brought under his ſubjection Egypt, Libya, Aſia Minor, Syria, Phœnicia, Paleſtine, Babylonia, Perſia, with part of India and Tartary. Still, however, he meditated greater things. He had now got a great taſte in maritime affairs; and is ſaid to have meditated a voyage to the coaſts of Arabia and Ethiopia, and thence round the whole continent of Africa to the Straits of Gibraltar. But of this there is no great certainty; though that he intended to ſubdue the Carthaginians and Italians, is more than probable. All theſe deſigns, however, were fruſtrated by his death, which happened at Babylon in 323 B. C. He is ſaid to have received ſeveral warnings of his approaching fate, and to have been adviſed to avoid that city; which advice he either deſpiſed or could not
112 He dies at Babylon.
follow. He died of a fever after eight days illneſs, without naming any ſucceſſor; having only given his ring to Perdiccas, and left the kingdom, as he ſaid, *to the moſt worthy.*

113 His character.
The character of this great prince has been variouſly repreſented; but moſt hiſtorians ſeem to have looked upon him rather as an illuſtrious madman than one upon whom the epithet of *Great* could be properly beſtowed. From a careful obſervation of his conduct, however, it muſt appear, that he poſſeſſed not only a capacity to plan, but likewiſe to execute, the greateſt enterpriſes that ever entered into the mind of any of the human race. From whatever cauſe the notion originated, it is plain that he imagined himſelf a divine perſon, and born to ſubdue the whole world: and extravagant and impracticable as this ſcheme may appear at preſent, it cannot at all be looked upon in the ſame light in the time of Alexander. The Greeks were in his time the moſt powerful people in the world in reſpect to their ſkill in the military art, and the Perſians were the moſt powerful with reſpect to wealth and numbers. The only other powerful people in the world were the Carthaginians, Gauls, and Italian nations. From a long ſeries of wars which the Carthaginians carried on in Sicily, it appeared that they were by no means capable of contending with the Greeks even when they had an immenſe ſuperiority of numbers; much leſs then could they have ſuſtained an attack from the whole power of Greece and Aſia united. The Gauls and Italians were indeed very brave, and of a martial diſpoſition; but they were barbarous, and could not have reſiſted armies well diſciplined and under the command of ſuch a ſkilful leader as Alexander. Even long after his time, it appeared that the Romans themſelves could not have reſiſted the Greeks; ſince Regulus, after having defeated the Cathaginians and reduced them to the utmoſt diſtreſs, was totally unable to reſiſt a Carthaginian army commanded by a Greek general, and guided by Greek diſcipline.

Thus it appears, that the ſcheme of Alexander cannot by any means be accounted that of a madman, or of one who projects great things without judgment or means to execute them. If we conſider from his actions the end which moſt probably he had in view, could his ſcheme have been accompliſhed, we ſhall find it not only the greateſt but the *beſt* that can poſſibly be imagined. He did not conquer to deſtroy, enſlave, or oppreſs; but to civilize, and unite the whole world as one nation. No ſooner was a province conquered than he took care of it as if it had been part of his paternal inheritance. He allowed not his ſoldiers to oppreſs and plunder the Perſians, which they were very much inclined to do; on the contrary, by giving into the oriental cuſtoms himſelf, he ſtrove to extinguiſh that inveterate hatred which had ſo long ſubſiſted between the two nations. In the Scythian countries which he ſubdued, he purſued the ſame excellent plan. His courage and military ſkill, in which he never was excelled, were diſplayed, not with a view to rapine or deſultory conqueſt, but to civilize and induce the barbarous inhabitants to employ themſelves in a more pro-

per

per way of life. "Amidſt the hardſhips of a military life (ſays Dr Gillies), obſtinate ſieges, bloody battles, and dear bought victories, he ſtill reſpected the rights of mankind, and practiſed the mild virtues of humanity. The conquered nations enjoyed their ancient laws and privileges; the rigours of deſpotiſm ſoftened; arts and induſtry encouraged; and the proudeſt Macedonian governors compelled, by the authority and example of Alexander, to obſerve the rules of juſtice towards their meaneſt ſubjects. To bridle the fierce inhabitants of the Scythian plains, he founded cities and eſtabliſhed colonies on the banks of the Iaxartes and Oxus; and thoſe deſtructive campaigns uſually aſcribed to his reſtleſs activity and blind ambition, appeared to the diſcernment of this extraordinary man not only eſſential to the ſecurity of the conqueſts which he had already made, but neceſſary for the more remote and ſplendid expeditions which he ſtill purpoſed to undertake, and which he performed with ſingular boldneſs and unexampled ſucceſs."—In another place the ſame author gives his character in the following words.

"He was of a low ſtature, and ſomewhat deformed; but the activity and elevation of his mind animated and ennobled his frame. By a life of continual labour, and by an early and habitual practice of the gymnaſtic exerciſes, he had hardened his body againſt the impreſſions of cold and heat, hunger and thirſt, and prepared his robuſt conſtitution for bearing ſuch exertions of ſtrength and activity, as have appeared incredible to the undiſciplined ſoftneſs of modern times. In generoſity and in proweſs, he rivalled the greateſt heroes of antiquity; and in the race of glory, having finally outſtripped all competitors, became ambitious to ſurpaſs himſelf. His ſuperior ſkill in war gave uninterrupted ſucceſs to his arms; and his natural humanity, enlightened by the philoſophy of Greece, taught him to improve his conqueſts to the beſt intereſts of mankind. In his extenſive dominions, he built or founded not leſs than 70 cities; the ſituation of which being choſen with conſummate wiſdom, tended to facilitate communication, to promote commerce, and to diffuſe civility through the greateſt nations of the earth. It may be ſuſpected, indeed, that he miſtook the extent of human power, when in the courſe of one reign he undertook to change the face of the world; and that he miſcalculated the ſtubbornneſs of ignorance and the force of habit, when he attempted to enlighten barbariſm, to ſoften ſervitude, and to tranſplant the improvements of Greece into an African and Aſiatic ſoil, where they have never been known to flouriſh. Yet let not the deſigns of Alexander be too haſtily accuſed of extravagance. Whoever ſeriouſly conſiders what he actually performed before his 33d year, will be cautious of determining what he might have accompliſhed had he reached the ordinary term of human life. His reſources were peculiar to himſelf; and ſuch views as well as actions became him as would have become none beſides. In the language of a philoſophical hiſtorian, 'he ſeems to have been given to the world by a peculiar diſpenſation of Providence, being a man like to none other of the human kind.'

"From the part which his father Philip and himſelf acted in the affairs of Greece, his hiſtory has been tranſmitted through the impure channels of exaggerated flattery or malignant envy. The innumerable fictions, which diſgrace the works of his biographers, are contradicted by the moſt authentic accounts of his reign, and inconſiſtent with thoſe public tranſactions which concurring auhorities confirm. In the preſent work it ſeemed unneceſſary to expatiate on ſuch topics, ſince it is leſs the buſineſs of hiſtory to repeat or even to expoſe errors than to ſelect and impreſs uſeful truths. An author, ambitious of attaining that purpoſe, can ſeldom indulge the language of general panegyric. He will acknowledge, that Alexander's actions were not always blameleſs; but, after the moſt careful examination, he will affirm, that his faults were few in number, and reſulted from his ſituation rather than from his character.

"From the firſt years of his reign he experienced the crimes of diſaffection and treachery, which multiplied and became more dangerous with the extent of his dominions and the difficulty to govern them. Several of his lieutenants early aſpired at independence; others formed conſpiracies againſt the life of their maſter. The firſt criminals were treated with a lenity becoming the generous ſpirit of Alexander: But when Philotas, the ſon of Parmenio, and even Parmenio himſelf, afforded reaſon to ſuſpect their fidelity; when the Macedonian youths, who, according to the inſtitution of Philip, guarded the royal pavilion, prepared to murder their ſovereign, he found it neceſſary to depart from his lenient ſyſtem, and to hold with a firmer hand the reins of government. Elated by unexampled proſperity, and the ſubmiſſive reverence of vanquiſhed nations, his loftineſs diſguſted the pride of his European troops, particularly the Macedonian nobles, who had been accuſtomed to regard themſelves rather as his companions than ſubjects. The pretenſions which ſound policy taught him to form and to maintain, of being treated with thoſe external honours ever claimed by the monarchs of the Eaſt, highly offended the religious prejudices of the Greeks, who deemed it impious to proſtrate the body or bend the knee to any mortal ſovereign. Yet had he remitted formalities conſecrated by the practice of ages, he muſt inſenſibly have loſt the reſpect of his Aſiatic ſubjects. With a view to reconcile the diſcordant principles of the victors and vanquiſhed, he affected an immediate deſcent from Jupiter Ammon, a claim liberally admitted by the avarice or fears of the Libyan prieſts; and which, he had reaſon to expect, could not be very obſtinately denied by the credulity of the Greeks and Macedonians, who univerſally acknowledged that Philip, his reputed father, was remotely deſcended from the Grecian Jupiter. But the ſucceſs of this deſign, which might have intitled him, as ſon of Jupiter, to the ſame obeiſance from the Greeks which the barbarians readily paid him as monarch of the Eaſt, was counteracted, at firſt by the ſecret diſpleaſure, and afterwards by the open indignation, of ſeveral of his generals and courtiers. Nor did the conduct of Alexander tend to extricate him from this difficulty. With his friends he maintained that equal intercourſe of viſits and entertainments which characteriſed the Macedonian manners; indulged the liberal flow of unguarded converſation; and often exceeded that intemperance in wine which diſgraced his age and country."

We ſhall conclude this character of Alexander with obſerving, that he had in view, and undoubtedly muſt have accompliſhed, the ſovereignty of the ocean as well as of the land. The violent reſiſtance made by the Tyrians had ſhown him the ſtrength of a commercial nation; and it was undoubtedly with a view to enrich his dominions by commerce, that he equipped the fleet on the Indus, and wiſhed to keep up a communication with India by land as well as by ſea. "It was chiefly with a view to the latter of theſe objects (ſays Dr Robertſon), that he examined the navigation of the Indus with ſo much attention. With the ſame view, on his return to Suſa, he in perſon ſurveyed the courſe of the Euphrates and Tigris, and gave directions to remove the cataracts or dams with which the ancient monarchs of Perſia, induced by a peculiar precept of their religion, which enjoined them to guard with the utmoſt care againſt defiling any of the elements, had conſtructed near the mouths of theſe rivers, in order to ſhut out their ſubjects from any acceſs to the ocean. By opening the navigation in this manner, he propoſed, that the valuable commodities of India ſhould be conveyed from the Perſian Gulf into the interior parts of his Aſiatic dominions, while by the Arabian Gulf they ſhould be carried to Alexandria, and diſtributed to the reſt of the world.

"Grand and extenſive as theſe ſchemes were, the precautions employed, and the arrangements made for carrying them into execution, were ſo various and ſo proper, that Alexander had good reaſon to entertain ſanguine hopes of their proving ſucceſsful. At the time when the mutinous ſpirit of his ſoldiers obliged him to relinquiſh his operations in India, he was not 30 years of age complete. At this enterpriſing period of life, a prince of a ſpirit ſo active, perſevering, and indefatigable, muſt have ſoon found means to reſume a favourite meaſure on which he had been long intent. If he had invaded India a ſecond time, he would not, as formerly, have been obliged to force his way through hoſtile and unexplored regions, oppoſed at every ſtep by nations and tribes of barbarians whoſe names had never reached Greece. All Aſia, from the ſhores of the Ionian ſea to the banks of the Hyphaſis, would then have been ſubject to his dominion; and through that immenſe ſtretch of country he had eſtabliſhed ſuch a chain of cities or fortified ſtations, that his armies might have continued their march with ſafety, and have found a regular ſucceſſion of magazines provided for their ſubſiſtence. Nor would it have been difficult for him to bring into the field forces ſufficient to have atchieved the conqueſt of a country ſo populous and extenſive as India. Having armed and diſciplined his ſubjects in the Eaſt like Europeans, they would have been ambitious to imitate and to equal their inſtructors; and Alexander might have drawn recruits, not from his ſcanty domains in Macedonia and Greece, but from the vaſt regions of Aſia, which in every age has covered the earth, and aſtoniſhed mankind with its numerous armies. When at the head of ſuch a formidable power he had reached the confines of India, he might have entered it under circumſtances very different from thoſe in his firſt expedition. He had ſecured a firm footing there, partly by means of the garriſons which he left in the three cities which he had built and fortified, and partly by his alliance with Taxiles and Porus. Theſe two Indian princes, won by Alexander's humanity and beneficence, which, as they were virtues ſeldom diſplayed in the ancient mode of carrying on war, excited of courſe an higher degree of admiration and gratitude, had continued ſteady in their attachment to the Macedonians. Reinforced by their troops, and guided by their information as well as by the experience which he had acquired in his former campaigns, Alexander muſt have made rapid progreſs in a country where every invader from his time to the preſent age has proved ſucceſsful.

"But this and all his other ſplendid ſchemes were terminated at once by his untimely death. In conſequence of that, however, events took place which illuſtrate and confirm the juſtneſs of the preceding ſpeculations and conjectures by evidence the moſt ſtriking and ſatisfactory. When that great empire, which the ſuperior genius of Alexander had kept united and in ſubjection, no longer felt his ſuperintending control, it broke into pieces, and its various provinces were ſeized by his principal officers, and parcelled out among them. From ambition, emulation, and perſonal animoſity, they ſoon turned their arms againſt one another; and as ſeveral of the leaders were equally eminent for political abilities and for military ſkill, the conteſt was maintained long, and carried on with frequent viciſſitudes of fortune. Amidſt the various convulſions and revolutions which theſe occaſioned, it was found that the meaſures of Alexander for the preſervation of his conqueſts had been concerted with ſuch ſagacity, that upon the final reſtoration of tranquillity, the Macedonian dominion continued to be eſtabliſhed in every part of Aſia, and not one province had ſhaken off the yoke. Even India, the moſt remote of Alexander's conqueſts, quietly ſubmitted to Pytho the ſon of Agenor, and afterwards to Seleucus, who ſucceſſively obtained dominion over that part of Aſia. Porus and Taxiles, notwithſtanding the death of their benefactor, neither declined ſubmiſſion to the authority of the Macedonians nor made any attempt to recover independence."

114
Cauſes of the diſſolution of his empire.

With the death of Alexander fell alſo the glory of the Macedonians; who very ſoon relapſed into a ſituation as bad, or worſe, than that in which they had been before the reign of Philip. This was occaſioned principally by his not having diſtinctly named a ſucceſſor, and having no child of his own come to the years of diſcretion to whom the kingdom might ſeem naturally to belong. The ambition and jealouſy of his mother Olympias, his queen Roxana, and eſpecially of the great commanders of his army, not only prevented a ſucceſſor from being ever named, but occaſioned the death of every perſon, whether male or female, who was in the leaſt related to Alexander. To have a juſt notion of the origin of theſe diſturbances, it is neceſſary in the firſt place to underſtand the ſituation of the Macedonian affairs at the time of Alexander's death.

When Alexander ſet out for Aſia, he left Antipater, as we formerly obſerved, in Macedon, to prevent any diſturbances that might ariſe either there or in Greece. The Greeks, even during the lifetime of Alexander, bore the ſuperiority which he exerciſed over them with great impatience; and, though nothing could be more gentle

gentle than the government of Antipater, yet he was exceedingly hated, becauſe he obliged them to be quiet. One of the laſt actions of Alexander's life ſet all Greece in a flame. He had, by an edict, directed all the cities of Greece to recal their exiles; which edict, when it was publiſhed at the Olympic games, created much confuſion. Many of the cities were afraid, that, when the exiles returned, they would change the government; moſt of them doubted their own ſafety if the edict took place; and all of them held this peremptory decree to be a total abolition of their liberty. No ſooner therefore did the news of Alexander's death arrive than they prepared for war.

115
Aridæus appointed king.

116
A party formed by Meleager, and another by Perdiccas.

In Aſia the ſtate of things was not much better; not indeed through any inclination of the conquered countries to revolt, but through the diſſenſions among the commanders.—In the general council which was called ſoon after the death of Alexander, after much confuſion and altercation, it was at laſt agreed, or rather commanded by the ſoldiers, that Aridæus the brother of Alexander, who had always accompanied the king, and had been wont to ſacrifice with him, ſhould aſſume the ſovereignty.—This Aridæus was a man of very ſlender parts and judgment, not naturally, but by the wicked practices of Olympias, who had given him poiſonous draughts in his infancy, leſt he ſhould ſtand in the way of her ſon Alexander or any of his family; and for this, or ſome other reaſon, Perdiccas, Ptolemy, and moſt of the horſe-officers, reſented his promotion to ſuch a degree, that they quitted the aſſembly, and even the city. However, Meleager, at the head of the phalanx, vigorouſly ſupported their firſt reſolution, and threatened loudly to ſhed the blood of thoſe who affected to rule over their equals, and to aſſume a kingdom which no way belonged to them. Aridæus was accordingly arrayed in royal robes, had the arms of Alexander put upon him, and was ſaluted by the name of *Philip*, to render him more popular. Thus were two parties formed, at the head of whom were Meleager and Perdiccas; both of them pretending vaſt concern for the public good, yet, at bottom, deſiring nothing more than their own advantage. Perdiccas was a man of high birth, had had a ſupreme command in the army, was much in favour with Alexander, and one in whom the nobility had put great confidence. Meleager was become formidable by having the phalanx on his ſide, and having the nominal king entirely in his power: for Aridæus, or Philip, was obliged to comply with whatever he thought proper; and publicly declared, that whatever he did was by the advice of Meleager; ſo that he made his miniſter accountable for his own ſchemes, and no way endangered himſelf. The Macedonians alſo, beſides their regard for the deceaſed king, ſoon began to entertain a perſonal love for Philip on account of his moderation.

It is remarkable, however, that notwithſtanding all the favours which Alexander had conferred upon his officers, and the fidelity with which they had ſerved him during his life, only two of them were attached to the intereſts of his family after his death. Theſe were Antipater and Eumenes the Cardian, whom he had appointed his ſecretary. Antipater, as we have already ſeen, was embroiled with the Greeks, and could not aſſiſt the royal family who were in Aſia; and Eumenes had not as yet ſufficient intereſt to form a party in their favour. In a ſhort time, however, Perdiccas prevailed againſt Meleager, and got him murdered; by which means the ſupreme power for a time fell into his hands. His firſt ſtep, in conſequence of this power, was to diſtribute the provinces of the empire among the commanders in the following manner, in order to prevent competitors, and to ſatisfy the ambition of the principal commanders of the army. Aridæus, and the ſon of Roxana, born after the death of his father, were to enjoy the regal authority. Antipater had the government of the European provinces. Craterus had the title of *protector*. Perdiccas was general of the houſehold troops in the room of Hephæſtion. Ptolemy the ſon of Lagus had Egypt, Libya, and that part of Arabia which borders upon Egypt. Cleomenes, a man of infamous character, whom Alexander had made receiver-general in Egypt, was made Ptolemy's deputy. Leomedon had Syria; Philotas, Cilicia; Pithon, Media; Eumenes, Cappadocia, Paphlagonia, and all the country bordering on the Euxine Sea, as far as Trapezus; but theſe were not yet conquered, ſo that he was a governor without a province. Antigonus had Pamphylia, Lycia, and Phrygia Major; Caſſander, Caria; Menander, Lydia; Leonatus, Phrygia on the Helleſpont.

117
Meleager murdered, and the empire divided.

118
Alexander's body neglected, and his will ſet aſide.

In the mean time, not only Alexander's will, but Alexander himſelf, was ſo much neglected, that his body was allowed to remain ſeven days before any notice was taken of it, or any orders given for its being enbalmed. The only will he left was a ſhort memorandum of ſix things he would have done.—1. The building of a fleet of 1000 ſtout galleys, to be made uſe of againſt the Carthaginians and other nations who ſhould oppoſe the reduction of the ſea-coaſts of Africa and Spain, with all the adjacent iſlands as far as Sicily. 2. A large and regular highway was to be made along the coaſt of Africa, as far as Ceuta and Tangier. 3. Six temples of extraordinary magnificence were to be erected at the expence of 1500 talents each. 4. Caſtles, arſenals, havens, and yards for building ſhips, to be ſettled in proper places throughout his empire. 5. Several new cities were to be built in Europe and Aſia; thoſe in Aſia to be inhabited by colonies from Europe, and thoſe in Europe to be filled with Aſiatics; that, by blending their people and their manners, that hereditary antipathy might be eradicated which had hitherto ſubſiſted between the inhabitants of the different continents. 6. Laſtly, he had projected the building of a pyramid, equal in bulk and beauty to the biggeſt in Egypt, in honour of his father Philip. All theſe deſigns, under pretence of their being expenſive, were referred to a council of Macedonians, to be held nobody knew when or where.

The government, being now in the hands of Perdiccas and Roxana, grew quickly very cruel and diſtaſteful. Alexander was ſcarce dead when the queen ſent for Statira and Drypetis, the two daughters of Darius, one of whom had been married to Alexander and the other to Hephæſtion; but as ſoon as they arrived at Babylon, cauſed them both to be murdered, that no ſon of Alexander by any other woman, or of Hephæſtion, might give any trouble to her or her ſon Alexander.

119
The daughters of Darius put to death by Roxana.

Alexander. Syſigambis, the mother of Darius, no ſooner heard that Alexander the Great was dead, than ſhe laid violent hands on herſelf, being apprehenſive of the calamities which were about to enſue.

120 The Greeks revolt, but are ſubdued

War was firſt declared in Greece againſt Antipater in the year 321 B. C. Through the treachery of the Theſſalians, that general was defeated, with the army he had under his own command. Leonatus was therefore ſent from Aſia, with a very conſiderable army, to his aſſiſtance; but both were overthrown with great loſs by the confederates, and Leonatus himſelf was killed. In a ſhort time, however, Craterus arrived in Greece with a great army, the command of which he reſigned to Antipater. The army of the confederates amounted to 25,000 foot and 3000 horſe; but Antipater commanded no fewer than 40,000 foot, 3000 archers, and 5000 horſe. In ſuch an unequal conteſt, therefore, the Greeks were defeated, and forced to ſue for peace; which they did not obtain but on condition of their receiving Macedonian garriſons into ſeveral of their cities. At Athens alſo the democratic government was abrogated; and ſuch a dreadful puniſhment did this ſeem to the Athenians, that 22,000 of them left their country, and retired into Macedon.

121 Diſturbances in Aſia and Thrace.

While theſe things were doing in Greece, diſturbances began alſo to ariſe in Aſia and in Thrace. The Greek mercenaries, who were diſperſed through the inland provinces of Aſia, deſpairing of ever being allowed to return home by fair means, determined to attempt it by force. For this purpoſe, they aſſembled to the number of 20,000 foot and 3000 horſe; but were all cut off to a man by the Macedonians. In Thrace, Lyſimachus was attacked by one Seuthes, a prince of that country who claimed the dominions of his anceſtors, and had raiſed an army of 20,000 foot and 8000 horſe. But though the Macedonian commander was forced to engage this army with no more than 4000 foot and 2000 horſe, yet he kept the field of battle, and could not be driven out of the country.

122 Ambition and cruelty of Perdiccas.

Perdiccas, in the mean time, by pretending friendſhip to the royal family, had gained over Eumenes entirely to his intereſt; and at laſt put him in poſſeſſion of the province of Cappadocia by the defeat of Ariarathes king of that country, whom he afterwards cruelly cauſed to be crucified. His ambition, however, now began to lead him into difficulties. At the firſt diviſion of the provinces, Perdiccas, to ſtrengthen his own authority, had propoſed to marry Nicæa the daughter of Antipater; and ſo well was this propoſal reliſhed, that her brethren Jollas and Archias conducted her to him, in order to be preſent at the celebration of the nuptials. But Perdiccas now had other things in view. He had been ſolicited by Olympias to marry her daughter Cleopatra, the widow of Alexander king of Epirus, and who then reſided at Sardis in Lydia. Eumenes promoted this match to the utmoſt of his power, becauſe he thought it would be for the intereſt of the royal family; and his perſuaſions had ſuch an effect on Perdiccas, that he was ſent to Sardis to compliment Cleopatra, and to carry preſents to her in name of her new lover. In the abſence of Eumenes, however, Alcetas, the brother of Perdiccas, perſuaded him to marry Nicæa; but, in order to gratify his ambition, he reſolved to divorce her immediately after marriage, and marry Cleopatra. By this laſt marriage, he hoped to have a pretence for altering the government of Macedon; and, as a neceſſary meaſure preparative to theſe, he entered into contrivances for deſtroying Antigonus. Unfortanately for himſelf, however, he ruined all his ſchemes by his own jealouſy and precipitate cruelty. Cynane, the daughter of Philip by his ſecond wife, had brought her daughter named *Adda*, and who was afterwards named *Eurydice*, to court, in hopes that king Aridæus might marry her. Againſt Cynane, Perdiccas, on ſome political motives, conceived ſuch a grudge, that he cauſed her to be murdered. This raiſed a commotion in the army; which frightened Perdiccas to ſuch a degree, that he now promoted the match between Aridæus and Eurydice; to prevent which, he had murdered the mother of the young princeſs. But, in the mean time, Antigonus, knowing the deſigns of Perdiccas againſt himſelf, fled with his ſon Demetrius to Greece, there to take ſhelter under the protection of Antipater and Craterus, whom he informed of the ambition and cruelty of the regent.

123 A combination againſt him.

A civil war was now kindled. Antipater, Craterus, Neoptolemus, and Antigonus, were combined againſt Perdiccas; and it was the misfortune of the empire in general, that Eumenes, the moſt able general, as well as the moſt virtuous of all the commanders, was on the ſide of Perdiccas, becauſe he believed him to be in the intereſt of Alexander's family. Ptolemy, in the mean time, remained in quiet poſſeſſion of Egypt; but without the leaſt intention of owning any perſon for his ſuperior: however, he alſo acceded to the league formed againſt Perdiccas; and thus the only perſon in the whole empire who conſulted the intereſt of the royal family was Eumenes.

124 Alexander buried in Egypt.

It was now thought proper to bury the body of Alexander, which had been kept for two years, during all which time preparations had been making for it. Aridæus, to whoſe care it was committed, ſet out from Babylon for Damaſcus, in order to carry the king's body to Egypt. This was ſore againſt the will of Perdiccas; for it ſeems there was a ſuperſtitious report, that wherever the body of Alexander was laid, that country ſhould flouriſh moſt. Perdiccas, therefore, out of regard to his native ſoil, would have it conveyed to the royal ſepulchres in Macedon; but Aridæus, pleading the late king's expreſs direction, was determined to carry it into Egypt, from thence to be conveyed to the temple of Jupiter Ammon.—The funeral was accordingly conducted with all imaginable magnificence. Ptolemy came to meet the body as far as Syria: but, inſtead of burying it in the temple of Jupiter Ammon, erected a ſtately temple for it in the city of Alexandria; and, by the reſpect he ſhowed for his dead maſter, induced many of the Macedonian veterans to join him, and who were afterwards of the greateſt ſervice to him.

125 Perdiccas killed by his own men.

No ſooner was the funeral over, than both the parties above mentioned fell to blows. Perdiccas marched againſt Ptolemy; but was ſlain by his own men, who, after the death of their general, ſubmitted to his antagoniſt; and thus Eumenes was left alone to contend againſt all the other generals who had ſerved under Alexander. In this conteſt, however, he would by no means have been overmatched, had his ſoldiers been attached to him; but as they had been accuſtomed to ſerve under thoſe very generals againſt whom they were now to fight, they were on all occaſions ready to betray and deſert Eumenes. However, he defeated and killed Neoptolemus and Craterus, but then found himſelf obliged to contend with Antipater and Antigonus. Antipater was now appointed protector of the kings, with ſovereign power; and Eumenes was declared a public enemy. A new diviſion of Alexander's empire took place. Egypt, Libya, and the parts adjacent, were given to Ptolemy becauſe they could not be taken from him. Syria was confirmed to Leomedon. Philoxenus had Cilicia. Meſopotamia and Arbelitis were given to Amphimachus. Babylon was beſtowed on Seleucus. Suſiana fell to Antigenes, who commanded the Macedonian *Argyraſpidæ* or *Silver Shields*, becauſe he was the firſt who oppoſed Perdiccas. Peuceſtas held Perſia. Tlepolemus had Caramania. Pithon had Media as far as the Caſpian ſtraits. Staſander had Aria and Drangia. Philip, Parthia. Staſonor, Bactria and Sogdia. Sybirtius, Aracopa. Oxyartes, the father of Roxana, Parapomiſis. Another Pithon had the country between this province and India. Porus and Taxiles held what Alexander had given them, becauſe they would not part with any of their dominions. Cappadocia was aſſigned to Nicanor. Phrygia Major, Lycaonia, Pamphylia, and Lycia, were given to Antigonus. Caria to Caſſander, Lydia to Clytus, Phrygia the Leſs to Aridæus. Caſſander was appointed general of the horſe; while the command of the houſehold troops was given to Antigonus, with orders to proſecute the war againſt Eumenes.—Antipater having thus ſettled every thing as well as he could, returned to Macedon with the two kings, to the great joy of his countrymen, having left his ſon Caſſander to be a check upon Antigonus in Aſia.

126
A new diviſion of the empire

Matters now ſeemed to wear a better aſpect than they had yet done; and, had Eumenes believed that his enemies really conſulted the intereſt of Alexander's family, there is not the leaſt doubt that the war would have been immediately terminated. He ſaw, however, that the deſign of Antigonus was only to ſet up for himſelf, and therefore he refuſed to ſubmit. From this time, therefore, the Macedonian empire ceaſed in Aſia; and an account of the tranſactions of this part of the world fall to be recorded under the article SYRIA. The Macedonian affairs are now entirely confined to the kingdom of Macedon itſelf, and to Greece.

127
Total deſtruction of Alexander's family.

Antipater had not long been returned to Macedon, when he died; and the laſt action of his life completed the ruin of Alexander's family. Out of a view to the public good, he had appointed Polyſperchon, the eldeſt of Alexander's captains at hand, to be *protector* and *governor* of Macedon. This failed not to diſguſt his ſon Caſſander; who thought he had a natural right to theſe offices, and of courſe kindled a new civil war in Macedon. This was indeed highly promoted by his firſt actions as a governor. He began with attempting to remove all the governors appointed in Greece by Antipater, and to reſtore democracy wherever it had been aboliſhed. The immediate conſequence of this was, that the people refuſed to obey their magiſtrates; the governors refuſed to reſign their places, and applied for aſſiſtance to Caſſander. Polyſperchon alſo had the imprudence to recal Olympias from Epirus, and allow her a ſhare in the adminiſtration; which Antipater, and even Alexander himſelf, had always refuſed her. The conſequence of all this was, that Caſſander invaded Greece, where he prevailed againſt Polyſperchon: Olympias returned to Macedon, where ſhe cruelly murdered Aridæus and his wife Eurydice; ſhe herſelf was put to death by Caſſander, who afterwards cauſed Roxana and her ſon to be murdered, and Polyſperchon being driven into Etolia, firſt raiſed to the crown Hercules the ſon of Alexander by the daughter of Darius, and then by the inſtigation of Caſſander murdered him, by which means the line of Alexander the Great became totally extinct.

128
Various revolutions in the government.

Caſſander having thus deſtroyed all the royal family, aſſumed the regal title, as he had for 16 years before had all the power. He enjoyed the title of *king of Macedon* only three years; after which he died, about 298 B. C. By Theſſalonica, the daughter of Philip king of Macedon, he left three ſons, Philip, Antipater, and Alexander. Philip ſucceeded him, but ſoon after died of a conſumption. A conteſt immediately began between the two brothers, Antipater and Alexander. Antipater ſeized the kingdom; and to ſecure himſelf in it, murdered his mother Theſſalonica, if not with his own hand, at leaſt the execrable fact was committed in his preſence. Alexander invited Pyrrhus king of Epirus, and Demetrius the ſon of Antigonus, to aſſiſt him and revenge the death of his mother. But Pyrrhus being bought off, and a peace concluded between the brothers, Alexander, being afraid of having too many protectors, formed a ſcheme of getting Demetrius aſſaſſinated. Inſtead of this, however, both he and Antipater were put to death; and Demetrius became king of Macedon four years after the death of Caſſander.

In 287 B. C. Demetrius was driven out by Pyrrhus, who was again driven out by Lyſimachus two years after, who was ſoon after killed by Seleucus Nicator; and Seleucus, in his turn, was murdered by Ptolemy Ceranus, who became king of Macedon about 280 B. C. The new king was in a ſhort time cut off, with his whole army, by the Gauls; and Antigonus Gonatus, the ſon of Demetrius Poliorcetes, became king of Macedon in 278 B. C. He proved ſucceſsful againſt the Gauls, but was driven out by Pyrrhus king of Epirus; who, however, ſoon diſobliged his ſubjects to ſuch a degree, that Antigonus recovered a great part of his kingdom. But in a little time, Pyrrhus being killed at the ſiege of Argos in Greece, Antigonus was reſtored to the whole of Macedon; but ſcarcely was he ſeated on the throne, when he was driven from it by Alexander the ſon of Pyrrhus. This new invader was, in his turn, expelled by Demetrius the ſon of Antigonus; who, though at that time but a boy, had almoſt made himſelf maſter of Epirus. In this enterpriſe, however, he was diſappointed; but by his means Antigonus was reſtored to his kingdom, which he governed for many years in peace. By a ſtratagem he made himſelf maſter of the city of Corinth, and from that time began to form ſchemes for the thorough conqueſt of Greece. The method he took to accompliſh this was, to ſupport the petty tyrants of Greece againſt the free ſtates: which indeed weakened the power of the latter; but involved the whole country in ſo many calamities, that theſe tranſactions could not redound much to the reputation either of his arms or his honour. About 243 B. C. he died, leaving the kingdom to his ſon, Demetrius II.

129 War with the Romans.

Neither Demetrius, nor his ſucceſſor Antigonus Doſon, performed any thing remarkable. In 221 B. C. the kingdom fell to Philip, the laſt but one of the Macedonian monarchs. To him Hannibal applied for aſſiſtance after the battle of Cannæ, which he refuſed; and the ſame imprudence which made him refuſe this aſſiſtance prompted him to embroil himſelf with the Romans; and at laſt to conclude a treaty with them, by which he in effect became their ſubject, being tied up from making peace or war but according to their pleaſure. In 179 B. C. he was ſucceeded by his eldeſt ſon Perſes, under whom the war with the Romans was renewed. Even yet the Macedonians were terrible in war; and their phalanx, when properly conducted, ſeems to have been abſolutely invincible by any method of making war known at that time. It conſiſted of 16,000 men, of whom 1000 marched abreaſt, and thus was 16 men deep, each of whom carried a kind of pike 23 feet long. The ſoldiers ſtood ſo cloſe, that the pikes of the fifth rank reached their points beyond the front of the battle. The hindermoſt ranks leaned their pikes on the ſhoulders of thoſe who went before them, and, locking them faſt, preſſed briſkly againſt them when they made the charge; ſo that the firſt five ranks had the impetus of the whole phalanx, which was the reaſon why the ſhock was generally irreſiſtible. The Romans had never encountered ſuch a terrible enemy; and in the firſt battle, which happened 171 B. C. they were defeated with the loſs of 2200 men, while the Macedonians loſt no more than 60. The generals of Perſes now preſſed him to ſtorm the enemy's camp; but he being naturally of a cowardly diſpoſition refuſed to comply, and thus the beſt opportunity he ever had was loſt. Still, however, the Romans gained little or no advantage, till the year 168 B. C. when Paulus Æmilius, a moſt experienced commander, was ſent into Macedon. Perſes now put all upon the iſſue of a general engagement; and Æmilius, with all his courage and military experience, would have been defeated, had the Macedonians been commanded by a general of the ſmalleſt courage or conduct. The light armed Macedonians charged with ſuch vigour, that after the battle, ſome of their bodies were found within two furlongs of the Roman camp. When the phalanx came to charge, the points of their ſpears ſtriking into the Roman ſhields, kept the heavy armed troops from making any motion; while, on the other hand, Perſes's light-armed men did terrible execution. On this occaſion, it is ſaid, that Æmilius tore his clothes, and gave up all hopes. However, perceiving that as the phalanx gained ground it loſt its order in ſeveral places, he cauſed his own light-armed troops to charge in thoſe places, whereby the Macedonians were ſoon put into confuſion. If Perſes with his horſe had on the firſt appearance of this charged the Romans briſkly, his infantry would have been able to recover themſelves; but inſtead of this, he betook himſelf to flight, and the infantry at laſt did the ſame, but not till 20,000 of them had loſt their lives.

This battle decided the fate of Macedonia, which immediately ſubmitted to the conqueror. The cowardly king took refuge in the iſland of Samothrace; but was at laſt obliged to ſurrender to the Roman conſul, by whom he was carried to Rome, led in triumph, and afterwards moſt barbarouſly uſed. Some pretenders to the throne appeared afterwards; but being unable to defend themſelves againſt the Romans, the country was reduced to a Roman province in 148 B. C. To them it continued ſubject till the year 1357, when it was reduced by the Turkiſh ſultan Bajazet, and hath remained in the hands of the Turks ever ſince.

130 Macedonia becomes a Roman province.

MACEDONIANS, in eccleſiaſtical hiſtory, the followers of Macedonius, biſhop of Conſtantinople, who, through the influence of the Eunomians, was depoſed by the council of Conſtantinople in 360, and ſent into exile. He conſidered the Holy Ghoſt as a divine energy diffuſed throughout the univerſe, and not as a perſon diſtinct from the Father and the Son. The ſect of Macedonians was cruſhed before it had arrived at its full maturity, by the council aſſembled by Theodoſius in 381, at Conſtantinople. See SEMIARIANS.

MACEDONIUS. See MACEDONIANS.

MACER (EMILIUS), an ancient Latin poet, was born at Verona, and flouriſhed under Auguſtus Cæſar. Euſebius relates, that he died a few years after Virgil. Ovid ſpeaks of a poem of his, on the nature and quality of birds, ſerpents, and herbs; which he ſays Macer being then very old had often read to him:

> *Sæpe ſuas volucres legit mibi grandior ævo,*
> *Quæque nocet ſerpens, quæ juvat herba, Macer.*
> *De Ponto, lib.* iv. *eleg.* 10.

There is extant a poem upon the nature and power of herbs under Macer's name; but it is ſpurious. He alſo wrote a ſupplement to Homer, as Quintus Calaber did afterwards in Greek:

> *Tu canis æterno quicquid reſtabat Homero:*
> *Ne careant ſumma Troica bella manu.*
> *De Ponto, lib.* ii. *eleg.* 10.

MACERATION, is an infuſion of, or ſoaking ingredients in water or any other fluid, in order either to ſoften them or draw out their virtues.

MACERATA, a handſome and populous town of Italy, in the territory of the church, and in the Marche of Ancona, with a biſhop's ſee, and an univerſity. It is ſeated near the mountain Chiento, in E. Long. 13. 37. N. Lat. 43. 15.

MACHAON, a celebrated phyſician among the ancients, ſon of Æſculapius and brother to Podalirus. He went to the Trojan war with the inhabitants of Trica, Ithome, and Œchalia. According to ſome, he was king of Meſſenia. He was phyſician to the Greeks, and healed the wounds which they received during the Trojan war. Some ſuppoſe he was killed before Troy by Eurypylus the ſon of Telephus. He received divine honours after death, and had a temple in Meſſenia.

MACHÆRUS (anc. geog.), a citadel on the other ſide Jordan, near the mountains of Moab, not far from and to the north of the *Lacus Aſphaltites.* It was the ſouth boundary of the Peræa: ſituated on a mountain encompaſſed round with deep and broad valleys; built by Alexander king of the Jews, deſtroyed by Gabinius in the war with Ariſtobulus, and rebuilt by Herod with a cognominal town round it. Here John the Baptiſt was beheaded (Joſephus).

MACHIAN, one of the Molucca iſlands, in the Eaſt Indian Ocean, about 20 miles in circumference, and the moſt fertile of them all. It likewiſe produces the beſt cloves; and is in poſſeſſion of the Dutch, who have three ſtrong forts built on it.

MACHIAVEL (Nicholas), a famous political writer of the 16th century, was born of a diſtinguiſhed family at Florence. He wrote in his native language with great elegance and politeneſs, though he underſtood very little of the Latin tongue; but he was in the ſervice of Marcellus Virgilius, a learned man, who pointed out to him many of the beautiful paſſages in the ancients, which Machiavel had the art of placing properly in his works. He compoſed a comedy upon the ancient Greek model; in which he turned into ridicule many of the Florentine ladies, and which was ſo well received, that Pope Leo X. cauſed it to be acted at Rome. Machiavel was ſecretary, and afterwards hiſtoriographer, to the republic of Florence. The houſe of Medicis procured him this laſt office, together with a handſome ſalary, in order to pacify his reſentment for having ſuffered the torture upon ſuſpicion of being an accomplice in the conſpiracy of the Soderini againſt that houſe, when Machiavel bore his ſufferings without making any confeſſion. The great encomiums he beſtowed upon Brutus and Caſſius, both in his converſations and writings, made him ſtrongly ſuſpected of being concerned in another conſpiracy againſt cardinal Julian de Medicis, who was afterwards pope under the name of *Clement VII.* However, they carried on no proceedings againſt him; but from that time he turned every thing into ridicule, and gave himſelf up to irreligion. He died in 1530, of a remedy which he had taken by way of prevention.—Of all his writings, that which has made the moſt noiſe, and has drawn upon him the moſt enemies, is a political treatiſe entitled the *Prince;* which has been tranſlated into ſeveral languages, and wrote againſt by many authors. The world is not agreed as to the motives of this work; ſome thinking, he meant to recommend tyrannical maxims; others, that he only delineated them to excite abhorrence. Machiavel alſo wrote, Reflections on Titus Livius, which are extremely curious; The Hiſtory of Florence, from the year 1205 to 1494; and a quarto volume of Poems and other pieces. Mr Harrington conſiders him as a ſuperior genius, and as the moſt excellent writer on politics and government that ever appeared.

MACHINE, (*Machina*), in the general, ſignifies any thing that ſerves to augment or to regulate moving powers: Or it is any body deſtined to produce motion, ſo as to ſave either time or force. The word comes from the Greek μαχανη, "machine, invention, art:" And hence, in ſtrictneſs, a machine is ſomething that conſiſts more in art and invention, than in the ſtrength and ſolidity of the materials; for which reaſon it is that the inventors of machines are called *ingenieurs* or *engineers.*

Machines are either ſimple or compound. The ſimple ones are the ſeven mechanical powers, viz. lever, ballance, pully, axis and wheel, wedge, ſcrew, and inclined plane. See Mechanics.

From theſe the compound ones are formed by various combinations, and ſerve for different purpoſes. See Mechanics and Hydrostatics; alſo the articles Agriculture, Cannon, Centrifugal, Fire, Steam, Furnace, Burroughs, Ramsden, &c. &c.

Machines uſed in war amongſt the Greeks, were principally theſe: 1. Κλιμακες, or ſcaling ladders; 2. The battering ram; 3. The *helepolis;* 4. The χελωνη or tortoiſe, called by the Romans *teſtudo;* 5. The χωμα or *agger*, which was faced with ſtone, and raiſed higher than the wall; 6. Upon the χωμα were built πυργοι or towers of wood; 7. Γερραι, or oſier hurdles; 8. *Catapultæ*, or καταπελται, from which they threw arrows with amazing force; and, 9. The λιθοϐολοι, πετροϐολοι, or αφετηρια, from which ſtones were caſt with great velocity.

The principal warlike machines made uſe of by the Romans were, the ram, the *lupus* or wolf, the *teſtudo* or tortoiſe, the *baliſta*, the *catapulta*, and the *ſcorpion.*

MACHINERY, in epic and dramatic poetry, is when the poet introduces the uſe of machines; or brings ſome ſupernatural being upon the ſtage, in order to ſolve ſome difficulty or to perform ſome exploit out of the reach of human power.

The ancient dramatic poets never made uſe of machines, unleſs where there was an abſolute neceſſity for ſo doing: whence the precept of Horace;

> *Nec Deus interſit, niſi dignus vindice nodus*
> *Inciderit.*

It is quite otherwiſe with epic poets, who introduce machines in every part of their poems; ſo that nothing is done without the intervention of the gods. In Milton's Paradiſe Loſt, by far the greater part of the actors are ſupernatural perſonages: Homer and Virgil do nothing without them; and, in Voltaire's Henriade, the poet has made excellent uſe of St Louis.

As to the manner in which theſe machines ſhould act, it is ſometimes inviſibly, by ſimple inſpirations and ſuggeſtions; ſometimes by actually appearing under ſome human form; and, laſtly, by means of dreams and oracles, which partake of the other two. However, all theſe ſhould be managed in ſuch a manner as to keep within the bounds of probability.

MACHUL, an inſtrument of muſic among the Hebrews. Kircher apprehends that the name was given to two kinds of inſtruments, one of the ſtringed and the other of the pulſatile kind. That of the former ſort had ſix chords: though there is great reaſon to doubt whether an inſtrument requiring the aid of the hair-bow, and ſo much reſembling the violin, be ſo ancient. The ſecond kind was of a circular form, made of metal, and either hung round with little bells, or furniſhed with iron rings ſuſpended on a rod or bar that paſſed acroſs the circle. Kircher ſuppoſes that it was moved to and fro by a handle fixed to it, and thus emitted a melancholy kind of murmur.

Plate CCLXXIX

MACHYNLETH, a town of Montgomeryſhire in North Wales, 198 miles from London, and 32 from Montgomery. It is an ancient town; and has a market on Mondays, and fairs on May 16, June 26, July 9, September 18, and November 25, for ſheep, horned cattle, and horſes. It is ſeated on the river Douay, over which there is a large ſtone bridge, which leads into Merionethſhire. It was here that Owen Glyndwr exerciſed the firſt acts of his royalty in 1402.

Here he accepted the crown of Wales, and aſſembled a parliament; and the houſe wherein they met is now ſtanding, divided into tenements.

MACKENZIE, (Sir George), an able lawyer, a polite ſcholar, and a celebrated wit, was born at Dundee in the county of Angus in Scotland in 1636, and ſtudied at the univerſities of Aberdeen and St Andrew's; after which he applied himſelf to the civil law, travelled into France, and proſecuted his ſtudy in that faculty for about three years. At his return to his native country, he became an advocate in the city of Edinburgh; and ſoon gained the character of an eminet pleader. He did not, however, ſuffer his abilities to be confined entirely to that province. He had a good taſte for polite literature; and he gave the public, from time to time, inconteſtable proofs of an uncommon proficiency therein. He had practiſed but a few years, when he was promoted to the office of a judge in the criminal court; and, in 1674, was made king's advocate, and one of the lords of the privy council in Scotland. He was alſo knighted by his majeſty, In theſe ſtations he met with a great deal of trouble, on account of the rebellions which happened in his time; and his office of advocate requiring him to act with ſeverity, he did not eſcape being cenſured, as if in the deaths of ſome particular perſons who were executed he had ſtretched the laws too far. But there does not ſeem to have been any juſt foundation for this clamour againſt him; and it is generally agreed, that he acquitted himſelf like an able and upright magiſtrate. Upon the abrogation of the penal laws by king James II. our advocate, though he had always been remarkable for his loyalty, and even cenſured for his zeal againſt traitors and fanatics, thought himſelf obliged to reſign his poſt; being convinced, that he could not diſcharge the duties of it in that point with a good conſcience. But he was ſoon after reſtored, and held his offices till the revolution; an event which, it ſeems, he could not bring himſelf to approve. He had hoped that the prince of Orange would have returned to his own country when matters were adjuſted between the king and his ſubjects; and upon its proving otherwiſe, he quitted all his employments in Scotland, and retired into England, reſolving to ſpend the remainder of his days in the univerſity of Oxford. He arrived there in September 1689, and proſecuted his ſtudies in the Bodleian library, being admitted a ſtudent there by a grace paſſed in the congregation, June 2. 1690. In the ſpring following, he went to London; where he fell into a diſorder, of which he died in May 1691. His corpſe was conveyed by land to Scotland, and interred there with great pomp and ſolemnity. "The politeneſs of his learning, and the ſprightlineſs of his wit, were (ſays the reverend Mr Granger) conſpicuous in all his pleadings, and ſhone in his ordinary converſation." Mr Dryden acknowledges, that he was unacquainted with what he calls the *beautiful turn of words and thoughts in poetry*, till they were explained and exemplified to him in a converſation with that noble wit of Scotland Sir George Mackenzie.—He wrote ſeveral pieces of hiſtory and antiquities; Inſtitutions of the laws of Scotland; Eſſays upon various ſubjects, &c. His works were printed together at Edinburgh in 1716, in 2 vols folio.

MACKEREL, in ichthyology. See SCOMBER.

MACKEY (John,) an Engliſhman, employed by the government as a ſpy upon James II. after the revolution, was author of Memoirs of James's court at St Germaine, and of the court of England in the reigns of William III. and queen Anne; in which are many curious anecdotes not to be met with in any other work. He died in 1726.

MACLAURIN (Colin), a moſt eminent mathematician and philoſopher, was the ſon of a clergyman, and born at Kilmoddan in Scotland in 1698. He was ſent to the univerſity of Glaſgow in 1709; where he continued five years, and applied himſelf to ſtudy in a moſt intenſe manner. His great genius for mathematical learning diſcovered itſelf ſo early as at twelve years of age; when, having accidentally met with an Euclid in a friend's chamber, he became in a few days maſter of the firſt ſix books without any aſſiſtance: and it is certain, that in his 16th year he had invented many of the propoſitions which were afterwards publiſhed under the title of *Geometria organica.* In his 15th year he took the degree of maſter of arts; on which occaſion he compoſed and publicly defended a theſis On the power of Gravity, with great applauſe. After this he quitted the univerſity, and retired to a country-ſeat of his uncle, who had the care of his education; for his parents had been dead ſome time. Here he ſpent two or three years in purſuing his favourite ſtudies; but, in 1717, he offered himſelf a candidate for the profeſſorſhip of mathematics in the Mariſchal college of Aberdeen, and obtained it after a ten days trial with a very able competitor. In 1719, he went to London, where he became acquainted with Dr Hoadly then biſhop of Bangor, Dr Clarke, Sir Iſaac Newton, and other eminent men; at which time alſo he was admitted a member of the Royal Society: and in another journey in 1721, he contracted an intimacy with Martin Folkes, Eſq. the preſident of it, which laſted to his death.

In 1722, lord Polwarth, plenipotentiary of the king of Great-Britain at the congreſs of Cambray, engaged him to go as a tutor and companion to his eldeſt ſon, who was then to ſet out on his travels. After a ſhort ſtay at Paris, and viſiting other towns in France, they fixed in Lorrain; where Maclaurin wrote his piece On the Percuſſion of Bodies, which gained the prize of the royal academy of ſciences for the year 1724. But his pupil dying ſoon after at Montpelier, he returned immediately to his profeſſion at Aberdeen. He was hardly ſettled here, when he received an invitation to Edinburgh; the curators of that univerſity being deſirous that he ſhould ſupply the place of Mr James Gregory, whoſe great age and infirmities had rendered him incapable of teaching. He had ſome difficulties to encounter, ariſing from competitors, who had good intereſt with the patrons of the univerſity, and alſo from the want of an additional fund for the new profeſſor; which however at length were all ſurmounted, principally by the means of Sir Iſaac Newton. In Nov. 1725, he was introduced into the univerſity; as was at the ſame time his learned colleague and intimate friend, Dr Alexander Monro, profeſſor of anatomy. After this, the mathematical claſſes ſoon became very numerous, there being generally upwards of 100 young gentlemen attending his lectures every year; who being of different ſtandings and proficiency, he was obliged to divide them into four or five claſſes, in each of which he employed a full hour every day, from the firſt of November to the firſt of June.

He lived a bachelor to the year 1733: but being not leſs formed for ſociety than for contemplation, he then married Anne, the daughter of Mr Walter Stewart ſolicitor-general to his late majeſty for Scotland. By this lady he had ſeven children, of whom two ſons and three daughters, together with his wife, ſurvived him. In 1734, Berkeley, biſhop of Cloyne, publiſhed a piece called "The Analyſt;" in which he took occaſion, from ſome diſputes that had ariſen concerning the grounds of the fluxionary method, to explode the method itſelf, and alſo to charge mathematicians in general with infidelity in religion. Maclaurin thought himſelf included in this charge, and began an anſwer to Berkeley's book: but, as he proceeded, ſo many diſcoveries, ſo many new theories and problems occurred to him, that inſtead of a vindicatory pamphlet, his work came out, A complete ſyſtem of Fluxions, with their application to the moſt conſiderable problems in geometry and natural philoſophy. This work was publiſhed at Edinburgh in 1742, 2 vols 4to; and as it coſt him infinite pains, ſo it is the moſt conſiderable of all his works, and will do him immortal honour. In the mean time, he was continually obliging the public with ſome performance or obſervation of his own; many of which were publiſhed in the fifth and ſixth volumes of the "Medical Eſſays" at Edinburgh. Some of them were likewiſe publiſhed in the Philoſophical Tranſactions; as the following: 1. Of the conſtruction and meaſure of curves, N° 356. 2. A new method of deſcribing all kinds of curves, N° 359. 3. A letter to Martin Folkes, Eſq; on equations with impoſſible roots, May 1726, N° 394. 4. Continuation of the ſame, March 1729, N° 408. 5. December the 21ſt, 1732, on the deſcription of curves; with an account of farther improvements, and a paper dated at Nancy, Nov. 27, 1722, N° 439. 6. An account of the treatiſe of fluxions, Jan. 27, 1742, N° 467. 7. The ſame continued, March 10, 1742, N° 469. 8. A rule for finding the meridional parts of a ſpheroid with the ſame exactneſs as of a ſphere, Auguſt 1741, N° 461. 9. Of the baſis of the cells wherein the bees depoſite their honey; Nov. 3. 1734. N° 471.

In the midſt of theſe ſtudies, he was always ready to lend his aſſiſtance in contriving and promoting any ſcheme which might contribute to the ſervice of his country. When the earl of Morton ſet out in 1739 for Orkney and Shetland, to viſit his eſtates there, he deſired Mr Maclaurin to aſſiſt him in ſettling the geography of thoſe countries, which is very erroneous in all our maps; to examine their natural hiſtory, to ſurvey the coaſts, and to take the meaſure of a degree of the meridian. Maclaurin's family affairs, and other connections, would not permit him to do this: he drew, however, a memorial of what he thought neceſſary to be obſerved, furniſhed the proper inſtruments, and recommended Mr Short, the famous optician, as a fit operator for the management of them. He had ſtill another ſcheme for the improvement of geography and navigation, of a more extenſive nature; which was the opening a paſſage from Greenland to the South Sea by the north pole. That ſuch a paſſage might be found, he was ſo fully perſuaded, that he has been heard to ſay, if his ſituation could admit of ſuch adventures, he would undertake the voyage, even at his own charge. But when ſchemes for finding it were laid before the parliament in 1744, and himſelf conſulted by ſeveral perſons of high rank concerning them, before he could finiſh the memorials he propoſed to ſend, the premium was limited to the diſcovery of a North-weſt paſſage: and he uſed to regret, that the word Weſt was inſerted, becauſe he thought that paſſage, if at all to be found, muſt lie not far from the pole.

In 1745, having been very active in fortifying the city of Edinburgh againſt the rebel army, he was obliged to fly from thence to the north of England; where he was invited by Herring, then archbiſhop of York, to reſide with him during his ſtay in this country. In this expedition, however, being expoſed to cold and hardſhips, and naturally of a weak and tender conſtitution, he laid the foundation of an illneſs which put an end to his life, in June 1746, at the age of 48.

Mr Maclaurin was a very good as well as a very great man, and worthy of love as well as admiration. His peculiar merit as a philoſopher was, that all his ſtudies were accommodated to general utility; and we find, in many places of his works, an application even of the moſt abſtruſe theories, to the perfecting of mechanical arts. He had reſolved, for the ſame purpoſe, to compoſe a courſe of practical mathematics, and to reſcue ſeveral uſeful branches of the ſcience from the bad treatment they often met with in leſs ſkilful hands. But all this his death prevented; unleſs we ſhould reckon, as a part of his intended work, the tranſlation of Dr David Gregory's "Practical Geometry," which he reviſed, and publiſhed with additions, 1745. In his lifetime, however, he had frequent opportunities of ſerving his friends and his country by his great ſkill. Whatever difficulty occurred concerning the conſtructing or perfecting of machines, the working of mines, the improving of manufactures, the conveying of water, or the execution of any other public work, he was at hand to reſolve it. He was likewiſe employed to terminate ſome diſputes of conſequence that had ariſen at Glaſgow concerning the gauging of veſſels; and for that purpoſe preſented to the commiſſioners of exciſe two elaborate memorials, with their demonſtrations, containing rules by which the officers now act. He made alſo calculations relating to the proviſion, now eſtabliſhed by law, for the children and widows of the Scots clergy, and of the profeſſors in the univerſities, intitling them to certain annuities and ſums, upon the voluntary annual payment of a certain ſum by the incumbent. In contriving and adjuſting this wiſe and uſeful ſcheme, he beſtowed a great deal of labour, and contributed not a little towards bringing it to perfection. It may be ſaid of ſuch a man, that "he lived to ſome purpoſe;" which can hardly be ſaid of thoſe, how uncommon ſoever their abilities and attainments, who ſpend their whole time in abſtract ſpeculations, and produce nothing to the real uſe and ſervice of their fellow creatures.

Of his works, we have mentioned his *Geometria Organica*, in which he treats of the deſcription of curve lines by continued motion. We need not repeat what has been ſaid concerning his piece which gained the prize of the royal academy of ſciences in 1724. In 1740, the academy adjudged him a prize, which did him ſtill more honour, for ſolving the motion of the tides from the theory of gravity; a queſtion which had been given out the former year, without receiving any ſolution. He had only ten days to draw this paper up in, and could not find leiſure to tranſcribe a fair copy; ſo that the Paris edition of it is incorrect. He afterwards reviſed the whole, and inſerted it in his Treatiſe of Fluxions; as he did alſo the ſubſtance of the former piece. Theſe, with the Treatiſe of Fluxions, and the pieces printed in the Philoſophical Tranſactions, of which we have given a liſt, are all the writings which our author lived to publiſh. Since his death, two volumes more have appeared; his Algebra, and his Account of Sir Iſaac Newton's Philoſophical Diſcoveries. His Algebra, though not finiſhed by himſelf, is yet allowed to be excellent in its kind; containing, in no large volume, a complete elementary treatiſe of that ſcience, as far as it has hitherto been carried. His Account of Sir Iſaac Newton's Philoſophy was occaſioned in the following manner: Sir Iſaac dying in the beginning of 1728, his nephew, Mr Conduitt, propoſed to publiſh an account of his life, and deſired Mr Maclaurin's aſſiſtance. The latter, out of gratitude to his great benefactor, cheerfully undertook, and ſoon finiſhed, the hiſtory of the progreſs which philoſophy had made before Sir Iſaac's time, and this was the firſt draught of the work in hand; which not going forward, on account of Mr Conduitt's death, was returned to Mr Maclaurin.—To this he afterwards made great additions, and left it in the ſtate in which it now appears. His main deſign ſeems to have been, to explain only thoſe parts of Sir Iſaac's philoſophy which have been, and ſtill are, controverted: and this is ſuppoſed to be the reaſon why his grand diſcoveries concerning light and colours are but tranſiently and generally touched upon. For it is known, that ever ſince the experiments, on which his doctrine of light and colours is founded, have been repeated with due care, this doctrine has not been conteſted; whereas his accounting for the celeſtial motions, and the other great appearances of nature, from gravity, is miſunderſtood, and even ridiculed by ſome to this day.

MACQUER (Philippe), advocate of the parliament of Paris, where he was born in 1720, being deſcended from a reſpectable family. A weakneſs in his lungs having prevented him from engaging in the laborious exerciſes of pleading, he dedicated himſelf to literary purſuits. His works are, 1. *L'Abregé Chronologique de l'Hiſtoire Eccleſiaſtique*, 3 vols. 8vo, written in the manner of the Preſident Henault's Hiſtory of France, but not poſſeſſed of equal ſpirit and elegance. 2. *Les Annales Romaines*, 1756, 8vo; another chronological abridgement, and much better ſupported than the former. Into this work the author has introduced every thing moſt worthy of notice which has been written by Saint Evremond, Abbé Saint-Real, Preſident Monteſquieu, Abbé Mably, &c. concerning the Romans; and, if we except a difference of ſtyle, which is eaſily diſcernible, it is, in other reſpects, a very judicious compilation. 3. *Abregé Chronologique de l'Hiſtoire d'Eſpagne & de Portugal*, 1759, 1765, in two vols. 8vo. This book, in point of accuracy, is worthy of the Preſident Henault, by whom it was begun; but it diſplays no diſcrimination of character nor depth of reſearch. The author received aſſiſtance from M. Lacombe, whoſe talents for chronological abridgement are well known. The republic of letters ſuſtained a loſs by the death of M. Macquer, which happened on the 27th of January 1770, at the age of 50. As to his character, he was induſtrious, agreeable, modeſt, and ſincere, and an enemy to all fooliſh vanity and affectation. He had a cold imagination, but a correct taſte. He had an eager thirſt for knowledge of every kind, and he had neglected no uſeful branch of ſtudy. He had a ſhare in the Dictionary of Arts and Profeſſions, in 2 vols 8vo, and in the Tranſlation of the Syphilis of Fracaſtor publiſhed by Lacombe.

MACQUER (Pierre Joſeph), brother to the former, was born at Paris the 9th of October 1718, and died there February 16th 1784. He was a member of the academy of ſciences, and late profeſſor of pharmacy; and was engaged in the *Journal des Savans*, for the articles of medicine and chemiſtry. With the latter ſcience he was intimately acquainted. He had a ſhare in the *Pharmacopœia Pariſienſis*, publiſhed in 1758, in 4to. His other works are, 1. *Elemens de Chimie theorique;* Paris, 1749, 1753, 12mo; which have been tranſlated into Engliſh and German.—2. *Elemens de Chimie pratique*, 1751, 2 vols. 12mo. Theſe two works were re-publiſhed together, in 1756, in 3 vols 12mo. 3. *Plan d'un cours de Chimie experimentale & raiſonée*, 1757, 12mo; in the compoſition of which he was aſſociated with M. Beaumé. 4. *Formulæ Medicamentorum Magiſtralium*, 1763. 5. *L'Art de la Teinture en Soie*, 1763—6. *Dictionnaire de Chemie, contenant la théorie & la pratique de cet art*, 1766, 2 vols 8vo; which has been tranſlated into German, with notes; and into Engliſh, with notes, by Mr Keir. Macquer has, by his labours and writings, greatly contributed to render uſeful an art which formerly tended only to ruin the health of the patient by foreign remedies, or to reduce the profeſſors of it to beggary, while they proſecuted the idle dreams of converting every thing into gold.

MACRIN (Salmon), one of the beſt Latin poets of the 16th century, was born at Loudon. His true name was *John Salmon*; but he took that of *Macrin*, from his being frequently ſo called in ridicule by Francis I. on account of his extraordinary leanneſs. He was preceptor to Claudius of Savoy, count of Tende; and to Honorius the count's brother; and wrote ſeveral pieces of poetry in lyric verſe, which were ſo admired, that he was called *the Horace of his time*. He died of old age, at Loudon, in 1555.—*Charles* MACRIN, his ſon, was not inferior to him as a poet, and ſurpaſſed him in his knowledge of the Greek tongue. He was preceptor to Catharine of Navarre, the ſiſter of Henry the Great; and periſhed in the maſſacre on St Bartholomew's day in 1572.

MACROBII, a people of Ethiopia, celebrated for their juſtice, and the innocence of their manners: alſo a people in the iſland Meröe. The Hyperboreans were alſo called Macrobii: They generally lived to their 120th year; and from their longevity they obtained their name (μακρος βιος, *long life*.)

MACROBIUS (Ambroſius Aurelius Theodoſius), an ancient Latin writer, who flouriſhed towards the latter part of the fourth century.—Of what country he was, is not clear: Eraſmus, in his Ciceronianus, ſeems to think he was a Greek; and he himſelf tells us, in the preface to his Saturnalia, that he was not a Roman, but laboured under the inconveniences of writing in a language which was not natural to him. Of what religion he was, Chriſtian or Pagan, is uncertain. Barthius ranks him among the Chriſtians; but Spanheim and Fabricius ſuppoſe him to have been a heathen. This, however, is certain, that he was a man of conſular dignity, and one of the chamberlains or maſters of the wardrobe to Theodoſius; as appears from a reſcript directed to Florentius, concerning thoſe who were to obtain that office. He wrote a Commentary upon Cicero's *Somnium Scipionis*, and ſeven books of *Saturnalia*, which treat of various ſubjects, and are an agreeable mixture of criticiſm and antiquity. He was not an original writer, but made great uſe of other people's works, borrowing not only their materials, but even their language, and for this he has been ſatirically rallied by ſome modern authors, though rather unfairly, conſidering the expreſs declaration and apology which he makes on this head, at the very entrance of his work. "Don't blame me," ſays he, "if what I have collected from multifarious reading, I ſhall frequently expreſs in the very words of the authors from whom I have taken it: for my view in this preſent work is, not to give proofs of my eloquence, but to collect and digeſt into ſome regularity and order ſuch things as I thought might be uſeful to be known. I ſhall therefore here imitate the bees, who ſuck the beſt juices from all ſorts of flowers, and afterwards work them up into various forms and orders, with ſome mixture of their own proper ſpirit." The *Somnium Scipionis* and *Saturnalia* have been often printed; to which has been added, in the later editions, a piece intituled, *De Differentiis & Societatibus Græci Latinique Verbi.*

MACROCEPHALUS, (compounded of μακρος "great," and κεφαλη "head," denotes a perſon with a head larger or longer than the common ſize. Macrocephali, or Long-heads, is a name given to a certain people, who, according to the accounts of authors, were famous for the unſeemly length of their heads: yet cuſtom ſo far habituated them to it, that inſtead of looking on it as a deformity, they eſteemed it a beauty, and, as ſoon as the child was born, moulded and faſhioned its head in their hands to as great a length as poſſible, and afterwards uſed all ſuch rollers and bandages as might ſeem moſt likely to determine its growing long. The greater part of the iſlanders in the Archipelago, ſome of the people of Aſia, and even ſome of thoſe of Europe, ſtill preſs their childrens heads out lengthwiſe. We may obſerve alſo, that the Epirots, many people of America, &c. are all born with ſome ſingularity in the conformation of their heads; either a flatneſs on the top, two extraordinary protuberances behind, or one on each ſide; ſingularities which we can only regard as an effect of an ancient and ſtrange mode, which at length is become hereditary in the nation. According to the report of many travellers, the operation of compreſſing the head of a child lengthwiſe, while it is yet ſoft, is with a view inſenſibly to enlarge the interval between the two eyes, ſo that the viſual rays turning more to the right and left, the ſight would embrace a much larger portion of the horizon; the advantage of which they are well acquainted with, either in the conſtant exerciſe of hunting, or on a thouſand other occaſions. Ever ſince the 16th century, the miſſionaries eſtabliſhed in the countries inhabited by the ſavages of America, have endeavoured to deſtroy this cuſtom; and we find in the ſeſſions of the third council of Lima, held in 1585, a canon which expreſsly prohibits it. But if it has been repreſſed one way, the free negroes and Maroons, although Africans, have adopted it, ſince they have been eſtabliſhed among the Caribs, ſolely with the view of diſtinguiſhing their children, which are born free, from thoſe who are born in ſlavery. The Omaquas, a people of South America, according to P. Veigh, preſs the heads of their children ſo violently between two planks that they become quite ſharp at the top, and flat before and behind. They ſay they do this to give their heads a greater reſemblance to the moon.

MACROCERCI, a name given to that claſs of animalcules which have tails longer than their bodies.

MACROCOLUM, or Macrocollum (formed of μακρος "large," and κολλαω "I join,") among the Romans, the largeſt kind of paper then in uſe. It meaſured ſixteen inches, and frequently two feet.

MACROCOSM, a word denoting the great world or univerſe. It is compounded of the Greek words μακρος "great," and κοσμος "world."

MACROOMP, or Macroom, a town of Ireland, in the barony of Muſkerry, county of Cork, and province of Munſter, 142 miles from Dublin; it is ſituated amongſt hills, in a dry gravelly limeſtone ſoil.—This place is ſaid to take its name from an old crooked oak, ſo called in Iriſh, which formerly grew here. The caſtle was firſt built in King John's time, ſoon after the Engliſh conqueſt, (according to Sir Richard Cox) by the Carews, but others attribute it to the Daltons. It was repaired and beautified by Teague Macarty, who died in the year 1565, and was father to the celebrated Sir Cormac Mac Teague mentioned by Cambden and other writers as an active perſon in Queen Elizabeth's time. The late Earls of Glancarty altered this caſtle into a more modern ſtructure, it being burnt down in the wars of 1641. Oppoſite to the bridge, is the pariſh-church, dedicated to St Colman of Cloyne. Here is a barrack for a foot company, a market-houſe, and handſome Roman Catholic chapel. A conſiderable number of perſons have been employed in this town in combing wool and ſpinning yarn, and ſome ſalt-works have been erected here. At half a mile's diſtance is a ſpa, that riſes on the very brink of a bog; its waters are a mild chalybeate, and are accounted ſerviceable in hypochondriacal caſes, and in cutaneous eruptions. The fairs are four in the year.

MACROPYRENIUM, in natural hiſtory, a genus of foſſils conſiſting of cruſtated ſeptariæ, with a long nucleus ſtanding out at each end of the maſs.

MACROTELOSTYLA, in natural hiſtory, the name of a genus of cryſtals, which are compoſed of two pyramids joined to the end of a column; both the pyramids, as alſo the column, being hexangular, and

and the whole body conſequently compoſed of 18 planes.

MACTATIO, in the Roman ſacrifices, ſignifies the act of killing the victim. This was performed either by the prieſt himſelf, or ſome of his inferior officers, whom we meet with under the names of *popæ*, *agones*, *cultrarii*, and *victimarii*; but, before the beaſt was killed, the prieſt, turning himſelf to the eaſt, drew a crooked line with his knife, from the forehead to the tail. Among the Greeks, this ceremony was performed moſt commonly by the prieſt, or, in his abſence, by the moſt honourable perſon preſent. If the ſacrifice was offered to the celeſtial gods, the victim's throat was bent up towards heaven; if to the infernal, or to heroes, it was killed with its throat towards the ground. The manner of killing the animal was by a ſtroke on the head, and, after it was fallen, thruſting a knife into its throat. Much notice was taken, and good or ill ſucceſs predicted, from the ſtruggles of the beaſt, or its quiet ſubmiſſion to the blow, from the flowing of the blood, and the length of time it happened to live after the fall, &c.

MACULÆ, in aſtronomy, dark ſpots appearing on the luminous ſurfaces of the ſun and moon, and even ſome of the planets. See ASTRONOMY, n° 30. and n° 58 *et ſeq.* and n° 98. and n° 121 *et ſeq.*

MAD-APPLE. See SOLANUM.

MADAGASCAR, the largeſt of the African iſlands, is ſituated between 43° and 51° of E. Long. and between 12° and 26° of S. Lat.; extending in length near 1000 miles from north-north-eaſt to ſouth-ſouth-weſt, and about 300 in breadth where broadeſt. It was diſcovered in 1506 by Laurence Almeyda; but the Perſians and the Arabians were acquainted with it from time immemorial under the name of *Serandib.* Alphonzo Albukerque ordered Ruy Pereira dy Conthinto to viſit the interior parts, and that general intruſted Triſtan d'Acunha with the ſurvey. The Portugueſe called it the iſland of *St Laurence*; the French, who viſited it in the reign of Henry IV. named it *Iſle Dauphine ;* its proper name is *Madegaſſe.* It is now, however, by common conſent, called *Madagaſcar.*

This large iſland, according to many learned geographers, is the Cerné of Pliny, and the Menuthiaſde of Ptolemy. It is every where watered by large rivers, ſtreams, and rivulets, which have their ſource at the foot of that long chain of mountains which runs thro' the whole extent of the iſland from eaſt to weſt. The two higheſt promontories are called *Vivagora* and *Botiſtmene.*

Theſe mountains (according to the Abbe Rochon*) incloſe within their boſoms a variety of precious minerals and uſeful foſſils. The traveller (who for the firſt time rambles over ſavage and mountainous countries, interſected with valleys and with hills, where nature left to herſelf brings forth the moſt ſingular and the moſt varied productions) is involuntarily ſurpriſed and terrified at the ſight of precipices, the ſummits of which are crowned with monſtrous trees, that ſeem coeval with the world. His aſtoniſhment is redoubled at the noiſe of thoſe grand caſcades, the approach to which is generally inacceſſible. But to thoſe views ſo ſublimely picturesque, rural ſcenes ſoon ſucceed ; little hills, gentle riſing grounds, and plains, the vegetation of which is never repreſſed by the intemperance or the viciſſitude of the ſeaſons. The eye contemplates with pleaſure thoſe vaſt ſavannas which nouriſh numberleſs herds of bullocks and of ſheep. You behold a flouriſhing agriculture, produced almoſt ſolely by the fertiliſing womb of nature. The fortunate inhabitants of Madagaſcar do not bedew the earth with their ſweat ; they ſcarce ſtir the ground with a rake, and even that ſlight preparation is ſufficient. They ſcrape little holes at a ſmall diſtance from each other, into which they ſcatter a few grains of rice, and cover them with their feet ; and ſo great in the fertility of the ſoil, that the lands ſown in this careleſs manner produce an hundred fold.

The foreſts preſent a prodigious variety of the moſt uſeful and the moſt beautiful trees ; ebony, wood for dying, bamboos of an enormous thickneſs, and palm trees of every kind. The timber employed in ſhip-building is no leſs common than thoſe kinds ſo much prized by the cabinet-maker. We are told by the French governor Flacourt, in his hiſtory of this iſland †, that in the year 1650 he ſent to France 52,000 weight of aloes of an excellent quality. All of theſe various trees and ſhrubs are ſurrounded by an infinite number of paraſitical plants : muſhrooms of an infinite diverſity of kinds and colours are to be met with every where in the woods; and the inhabitants know well how to diſtinguiſh thoſe which are prejudicial to the health. They collect large quantities of uſeful gums and reſins ; and out of the milky ſap of a tree, denominated by them *ſinguiore*, the inhabitants, by means of coagulation, make that ſingular ſubſtance known to naturaliſts by the name of *gum elaſtic.* (See CAOUTCHOUC and JATROPHA.)

Beſides the aromatic and medicinal herbs which abound in the foreſts, the iſland produces flax and hemp of a length and ſtrength which ſurpaſs any in Europe. Sugar canes, wax, honey of different kinds, tobacco, indigo, white pepper, gum-lac, ambergris, ſilk, and cotton, would long ſince have been objects of commerce which Madagaſcar would have yielded in profuſion, if the Europeans, in viſiting the iſland, had furniſhed the inhabitants with the neceſſary information for preparing and improving theſe ſeveral productions.

The ſugar-canes (as we are informed by another traveller||) are much larger and finer than any in the weſt Indies ; being as thick as a man's wriſt, and ſo full of juice, that a foot of them will weigh two pounds. When the natives travel, they carry a ſugar-cane along with them, which will ſupport them for two or three days. Here are alſo plenty of tamarinds ; and ſuch quantities of limes and oranges, that very large caſks may be filled with their juices at a trifling expence, as they may be purchaſed for iron-pots, muſkets, powder, ball, &c. During the ſhort time that Admiral Watſon's ſquadron ſtaid here in 1754, Mr Ives preſerved about half a hogſhead full of thoſe juices, which proved afterwards of the greateſt ſervice to the ſhips crews. It muſt be obſerved, however, that no good water is to be had at St Auguſtine in the ſouth-weſt part of the iſland, where ſhips uſually touch, unleſs boats are ſent for it four or five miles up the river ; and inſtead of filling their caſks at low water (as is the caſe in moſt other rivers), they muſt begin to fill at

* *Voyage à Madagaſcar*, &c. Par. 1791.

† *Hiſt. de la Grand Iſle de Madag.* Paris 1660.

|| *Ives's Voyage to India, p.* 14.

about a quarter's flood: The reaſon aſſigned for this is, that the river has a communication with the ſea at other places beſides this of St Auguſtine's bay; and it has been found by experience, that the ſea-water brought into the river by the flood-tide is not diſcharged till a quarter's flood of the next tide in St Auguſtine's bay; and for three miles up the river, the water is always very brackiſh, if not quite ſalt.

The abundance and variety of proviſions of every kind, which a fine climate and fertile ſoil can produce, are on no part of the globe, according to M. Rochon, ſuperior to thoſe of Madagaſcar: game, wild-fowl, poultry, fiſh, cattle, and fruits, are alike plentiful. The oxen, Mr Ives alſo informs us, are large and fat, and have each a protuberance of fat between the ſhoulders, weighing about 20 pounds. Their fleſh is greatly eſteemed by all the European nations trading to India, and ſhips are ſent to Madagaſcar on purpoſe to kill and ſalt them on the iſland. The protuberance of fat above mentioned is particularly eſtemed after it has lain ſome time in ſalt; but our author ſays, that he could not join in the encomiums either on this piece or the beef in general; as the herbage on which the creatures feed gives their fleſh a particular taſte, which to him was diſagreeable. The ſheep differ little from the goats; being equally hairy, only that their heads are ſomewhat larger: their necks reſemble that of a calf, and their tails weigh at leaſt ten pounds. Vaſt quantities of locuſts riſe here from the low lands in thick clouds, extending ſometimes to an incredible length and breadth. The natives eat theſe inſects, and even prefer them to their fineſt fiſh. Their method of dreſſing them is to ſtrip off their legs and wings, and fry them in oil.

The inhabitants (termed *Melagaches* or *Madecaſſes*), M. Rochon informs us, are in perſon above the middle ſize of Europeans. The colour of the ſkin is different in different tribes: among ſome it is of a deep black, among others tawney; ſome of the natives are of a copper colour, but the complexion of by far the greateſt number is olive. All thoſe who are black have woolly hair like the negroes of the coaſt of Africa: thoſe, on the other hand, who reſemble Indians and Mulattoes, have hair equally ſtraight with that of the Europeans; the noſe is not broad and flat; the forehead is large and open; in ſhort, all the features are regular and agreeable. Their phyſiognomy diſplays the appearance of frankneſs and of ſatisfaction: they are deſirous only of learning ſuch things as may adminiſter to their neceſſities; that ſpecies of knowledge which demands reflection is indifferent to them; ſober, agile, active, they ſpend the greateſt part of their time either in ſleep or in amuſement. In fine, according to the Abbé, the natives of Madagaſcar, like ſavages in general, poſſeſſes a character equally devoid of vice and of virtue; the gratifications of the preſent moment ſolely occupy his reflections; he poſſeſſes no kind of foreſight whatever; and he cannot conceive the idea that there are men in the world who trouble themſelves about the evils of futurity.

The population of the iſland has been eſtimated at four millions; but this calculation is thought exaggerated by our author, and indeed it appears incredible to us. Every tribe or ſociety inhabits its own canton, and is governed by its own cuſtoms. Each of theſe acknowledges a chief; this chief is ſometimes elective, but more uſually hereditary. The lands are not divided and portioned out, but belong to thoſe who are at the trouble of cultivating them. Theſe iſlanders make uſe of neither locks nor keys; the principal part of their food conſiſts in rice, fiſh, and fleſh; their rice is moiſtened with a ſoup which is ſeaſoned with pimento, ginger, ſaffron, and aromatic herbs. They diſplay wonderful cunning in catching a variety of birds, many of which are unknown in Europe: they have the pheaſant, the partridge, the quail, the pintado, the wild duck, teal of five or ſix different kinds, the blue hen, the black paroquet, and the turtle-dove, in great plenty; and alſo a bat of a monſtrous ſize, which is much prized on account of its exquiſite flavour. Theſe laſt are ſo hideous in their appearance, that they at firſt terrify the European ſailors; but after they have vanquiſhed their repugnance to them, they prize their fleſh infinitely before that of the pullets of their own country. The Melagaches alſo catch an immenſe quantity of ſea-fiſh; ſuch as the dorado, the ſole, the herring, the mackarel, the turtle, &c. with oyſters, crabs, &c. The rivers afford excellent eels, and mullets of an exquiſite flavour.

The inhabitants near St Auguſtine's bay, Mr Ives informs us, ſpeak as much broken Engliſh as enables them to exchange their proviſions for Europeon articles. Theſe, on the part of the Melagaches, are cattle, poultry, milk, fruit, rice, ſalt, porcelain, potatoes, yams, fiſh, lances, and ſhells. From the Europeans they receive muſkets, powder, bullets, flints, *clouties*, (including handkerchiefs, and linen of all kinds), beads, iron pots, &c.—Silver, which they call *Manila*, is in great eſteem with them, and is made by them into bracelets for their wives.

That part of the iſland at which the Engliſh ſquadron touched, is the dominions of the king of *Baba*, who, by the account of Mr Ives, ſeemed greatly to affect to be an Engliſhman. They had no ſooner touched at the iſland, than they were waited on by one called *Robin Hood*, and another perſon, both of whom bore the office of *purſers*. Along with theſe were *Philibey* the general; John Anderſon and Frederic Martin, captains. Nor did the king himſelf and his family diſdain to pay them a viſit; who, in like manner, were diſtinguiſhed by Engliſh names; the king's eldeſt ſon being called the prince of Wales, and the court not being without a duke of Cumberland, a prince Auguſtus, princeſſes, &c. as in England. All theſe grandees came on board naked, excepting only a ſlight covering about their loins and on their ſhoulders, made of a kind of graſs growing on the iſland; which they had adorned with ſmall glaſs beads by way of border or fringe. Their hair reſembled that of the Indians in being long and black, rather than the woolly heads of the African negroes. “The wives of the Melagaches (according to our author) take great pains with their huſbands hair; ſometimes putting it in large and regular curls; at other times braiding it in great order, and making it ſhine with a particular oil, which the iſland produces. The men always carry in their hands a wooden lance headed with iron, which is commonly made very neat; and they are ſuch excellent markſmen, that they will ſtrike with it a very ſmall object at 30 or 40 yards diſtance. They have alſo commonly a muſket, which they get from Europeans in exchange for cattle, and are always ſure to keep in excellent order. I am ſorry to ſay (continues Mr Ives) that the Engliſh are frequently guilty of great impoſitions in this kind of traffic, by diſpoſing of cheap and ill-tempered barrels among the poor inhabitants, who ſometimes loſe their lives by the burſting of theſe pieces. Such iniquitous practices as theſe muſt in the end prove injurious to the nation; and has indeed already made the name of more than one half of theſe traders truly infamous among the deluded but hitherto friendly Madagaſcarians.

“They are a civil and good-natured people, but eaſily provoked, and apt to ſhow their reſentment on the leaſt provocation, eſpecially when they think themſelves injured or ſlighted. Another characteriſtic of them is, the very high notions of dignity they entertain of their king; which is carried to ſuch a height, that they are never more ſenſibly hurt than when they imagine he is treated with incivility or diſreſpect. This mighty monarch reſides in a town built with mud, about 12 miles up the country from St Auguſtine's Bay. On the eaſt ſide of the bay, as you enter, there reſided one Prince William, a relation and tributary to the king; but who in moſt caſes acted as an independent prince, and always uſed his utmoſt endeavours with the officers to cauſe them buy their proviſions from him, and not from the king or his ſubjects. In this prince's territories, not far from the ſea, are the remains of a fort built by Avery the Pirate.

“All the women of Madagaſcar, excepting the very pooreſt ſort, wear a covering over their breaſts and ſhoulders, ornamented with glaſs beads, and none go without a cloth about their loins. They commonly walk with a long ſlender rod or ſtick. The men are allowed to marry as many women as they can ſupport.

“During our ſtay at this iſland (ſays Mr Ives), I obſerved, with great concern, ſeveral miſerable objects in the laſt ſtage of the venereal diſeaſe. They had not been able to find any cure; and as far as I could learn, their doctors are totally ignorant of medicine. The only method they uſe for curing all diſtempers, as well external as internal, is the wearing on the arm or neck a particular charm or amulet; or beſmearing the part affected with earth moiſtened with the juice of ſome plant or tree, and made up into a ſoft paſte.

“I took ſome pains to learn their religious tenets; and find that they worſhip one Univerſal Father; whom, when they ſpeak in Engliſh, they call *God;* and in whom they conceive all kinds of perfection to reſide. The ſun they look upon as a glorious body; and, I believe, as a ſpiritual being, but created and dependent. They frequently look up to it with wonder, if not with praiſe and adoration. They make their ſupplications to the *One* Almighty, and offer ſacrifices to him in their diſtreſſes. I had the curioſity to attend a ſacrifice, at the hut of John Anderſon, whoſe father had for a long time been afflicted with ſickneſs. About ſun-ſet an ox was brought into the yard; and the ſon, who officiated as prieſt, ſlew it. An altar was reared nigh, and the poſt of it was ſprinkled with the blood of the victim. The head, after its being ſevered from the body, was placed, with the horns on, at the foot of the altar: the caul was burned on the fire, and moſt of the pluck and entrails boiled in a pot. The ſick man, who was brought to the door, and placed on the ground ſo as to face the ſacrifice, prayed often, and ſeemingly with great fervency. His eyes were fixed attentively towards the heavens, and his hands held up in a ſupplicating poſture. The ceremony ended with the ſon's cutting up the ox into ſmall pieces; the greateſt part of which he diſtributed among the poor ſlaves belonging to his father and himſelf; reſerving, however, ſome of the beſt pieces for his own uſe. Upon the whole, I ſaw ſo many circumſtances in this Madagaſcarian ſacrifice, ſo exactly reſembling thoſe deſcribed in the Old Teſtament as offered up by the Jews, that I could not turn my thoughts back to the original, without being ſenſibly ſtruck by the exactneſs of the copy.”

When the ſquadron firſt arrived at Madagaſcar, the king of Baba, a man of about 60 years of age, was ill of the gout. Having demanded of admiral Watſon ſome preſents, the latter complimented him, among other things, with ſome brandy. The monarch then aſked him if he had any doctor with him, and if he was a great doctor, and a king's doctor? To all which being anſwered in the affirmative, he deſired him to bring ſome *mahomets* (medicines) for his ſick knee. With this requiſition Mr Ives deſigned to comply; but having waited until ſome officers ſhould be ready to accompany him, his majeſty, in the mean time, took ſuch a doſe of brandy as quickly ſent the gout into his head, and occaſioned his death. Mr Ives obſerves, that it happened very luckily for him that the monarch's deceaſe happened without his having taken any of the medicines intended for him, as it would have been impoſſible to avoid the imputation of having poiſoned him, which would certainly have been reſented by his loyal ſubjects.

The king's death occaſioned great confuſion; the grandees being deſirous that it ſhould be concealed for ſome time. This, however, was found impoſſible; on which they ſet off for the *Mud Town* about 11 o'clock the ſame evening. All the inhabitants of the village followed their example; leaving only the dogs, who ſet up the moſt hideous howling. Captain Frederic Martin coming to take leave of the Engliſh, begged with great earneſtneſs for a freſh ſupply of gun-powder; whiſpering that the king was dead, and that they ſhould in all probability go to war about making another. They had been formerly told, that one who had the title of *duke* of Baba would certainly ſucceed to the throne; but they afterwards learned, that Philibey the general having eſpouſed the cauſe of *Rephani* the late king's ſon, and taken him under his tutelage and protection, this youth, who was only about 16 years of age, ſucceeded his father as king of Baba.

The following is a deſcription of the ſouthern diviſion of the iſland, from the Abbé Rochon.

“That part of Madagaſcar in which fort Dauphin is ſituated is very populous. Almoſt all the villages are placed on eminences, and ſurrounded with two rows of ſtrong palliſadoes, ſomewhat in the manner of ſuch of our fences as are compoſed of hurdles and turf. Within, is a parapet of ſolid earth about four feet in height;

height; large pointed bamboos placed at the diſtance of five feet from each other, and ſunk in a pit, form a kind of loop-holes, which contribute towards the defence of theſe villages, ſome of which are beſides fortified with a ditch ten feet in breadth and ſix in depth. The dwelling of the chief is called a *donac.* When the chiefs go abroad, they are always provided with a muſket and a ſtick armed with iron, and adorned at the extremity with a little tuft of cow's hair. They wear a bonnet of red wool. It is chiefly by the colour of their bonnet that they are diſtinguiſhed from their ſubjects. Their authority is extremely limited: however, in the province of *Carcanoſſi,* the lands by cuſtom belong to their chiefs, who diſtribute them among their ſubjects for the purpoſes of cultivation; they exact a trifling quit-rent in return, which in their language is called *faenſa.*—The people of Carcanoſſi are not altogether ignorant of the art of writing; they even poſſeſs ſome hiſtorical works in the Madagaſcar tongue: but their learned men, whom they term *Ombiaſſes,* make uſe of the Arabic characters alone. They have treatiſes on medicine, geomancy, and judicial aſtrology; the moſt renowned live in the province of *Matatane:* it is in that diſtrict that magic ſtill remains in all its glory; the Matanes are actually dreaded by the other Madecaſſees on account of their excellence in this deluſive art. The Ombiaſſes have public ſchools in which they teach geomancy and aſtrology. The natives have undoubtedly learned the art of writing from the Arabians, who made a conqueſt of this iſland about 300 years ſince.

"The people of the province of *Anoſſi,* near fort Dauphin, are lively, gay, ſenſible, and grateful; they are paſſionately fond of women; are never melancholy in their company; and their principal occupation is to pleaſe the ſex: indeed, whenever they meet their wives, they begin to ſing and dance. The women, from being happy, are always in good humour. Their lively and cheerful character is extremely pleaſing to the Europeans. I have often been preſent at their aſſemblies, where affairs of importance have been agitated; I have obſerved their dances, their ſports, and their amuſements, and I have found them free from thoſe exceſſes which are but too common among poliſhed nations. Indeed I was too young at this time for my obſervations to be of much weight: but if my experience be inſufficient to inſpire confidence, I beg the reader will rather conſider the nature of things, than the relations given by men without principles or intelligence, who fancy that they have a right to tyrannize over the inhabitants of every country which they can ſubdue. If the people of Madagaſcar have ſometimes availed themſelves of treachery, they have been forced to it by the tyranny of the Europeans. The weak have no other arms againſt the ſtrong. Could they defend themſelves by any other means from our artillery and bayonets? They are uninformed and helpleſs; and we avail ourſelves of their weakneſs, in order to make them ſubmit to our covetouſneſs and caprice. They receive the moſt cruel and oppreſſive treatment, in return for the hoſpitality which they generouſly beſtow on us; and we call them traitors and cowards, when we force them to break the yoke with which we have been pleaſed to load them."

In the ſecond volume of Count Benyowſky's Memoirs and Travels we have the following account of the religion, government, &c. of the people of this iſland.

"The Madagaſcar nation believe in a Supreme Being, whom they call *Zanhare,* which denotes creator of all things. They honour and revere this Being; but have dedicated no temple to him, and much leſs have they ſubſtituted idols. They make ſacrifices, by killing oxen and ſheep, and they addreſs all theſe libations to God. It has been aſſerted, that this nation likewiſe makes offerings to the devil: but in this there is a deception; for the piece of the ſacrificed beaſt which is uſually thrown into the fire is not intended in honour of the devil, as is uſually pretended. This cuſtom is very ancient, and no one can tell the true reaſon of it. With regard to the immortality of the ſoul, the Madagaſcar people are perſuaded, that, after their death, their ſpirit will return again to the region in which the Zanhare dwells; but they by no means admit that the ſpirit of man, after his death, can ſuffer any evil. As to the diſtinction of evil or good, they are perſuaded that the good and upright man ſhall be recompenſed; in this life, by a good ſtate of health, the conſtancy of his friends, the increaſe of his fortunes, the obedience of his children, and the happineſs of beholding the proſperity of his family: and they believe that the wicked man's fate ſhall be the contrary to this. The Madagaſcar people, upon this conviction, when they make oaths, add benedictions in favour of thoſe who keep them, and curſes againſt thoſe who break them. In this manner it is that they appeal to the judgment of Zanhare, in making agreements; and it has never been known, or heard of, that a native of Madagaſcar has broken his oath, provided it was made in the uſual manner, which they ſay was preſcribed by their forefathers.

"As to their kings and form of government, &c. The Madagaſcar people have always acknowledged the line of Ramini, as that to which the rights of Ampanſacabe or ſovereign belongs. They have conſidered this line as extinct ſince the death of Dian Ramini Larizon, which happened 66 years ago, and whoſe body was buried upon a mountain, out of which the river Manangourou ſprings; but having acknowledged the heir of this line on the female ſide, they re-eſtabliſhed this title in the year 1776. The right of the Ampanſacabe conſiſts in nominating the Rohandrians to aſſiſt in the cabars, at which all thoſe who are cited are bound to appear, and the judgment of the Ampanſacabe in his cabar is deciſive. Another prerogative of the Ampanſacabe is, that each Rohandrian is obliged to leave him by will a certain proportion of his property, which the ſucceſſors uſually purchaſe by a ſlight tribute or fine. Thirdly, the Ampanſacabe has a right to exact from each Rohandrian one tenth of the produce of his land, and a number of horned cattle and ſlaves, in proportion to the riches of the country poſſeſſed by each Rohandrian.—The ſecond order is compoſed of the Rohandrians, or princes. Since the loſs of the Ampanſacabe, three of theſe Rohandrians have aſſumed the title of *kings,* namely the Rohandrian of the province of Mahavelou, named *Hiavi;* of the province of Voemar, named *Lambouin;* and a third at Bombetoki, named *Cimanounpou.* The third order conſiſts of the Voadziri, or lords of a diſtrict, compoſed

compoſed of ſeveral villages. The fourth order conſiſts of the Lohavohits, or chiefs of villages. The fifth order, Odzatzi, who are freemen, and compoſe the attendants or followers of the Rohandrians, Voadziri, or Lohavohits. The ſixth order conſiſts of Ombiaſſes, or learned men; and this order forms the warriors, workmen, phyſicians, and diviners: theſe laſt poſſeſs no charge. The ſeventh order conſiſts of Ampurias or ſlaves.

"Having made inquiries from Bombetoki paſſing to the northward, and as far as Itapere, the reſult proved that there are 38 Rohandrians actually reigning, and 287 Voadziri. With reſpect to the Lohavohits, Ondzatzi, and Ombiaſſes, it was not poſſible to obtain any accurate determination of their number. Theſe orders preſerve a regular gradation, reſpecting which it would be very difficult to give a detailed account. They live in the manner we read of concerning the ancient patriarchs. Every father of a family is prieſt and judge in his own houſe, though he depends upon the Lohavohits, who ſuperintends his conduct. This laſt is anſwerable to his Voadziri, and the Voadziri to the Rohandrian.

"The Madagaſcar people having no communication with the main land of Æthiopia, have not altered their primitive laws; and the language throughout the whole extent of the iſland is the ſame. It would be a raſh attempt to determine the origin of this nation; it is certain that it conſiſts of three diſtinct races, who have for ages paſt formed intermixtures which vary to infinity. The firſt race is that of Zafe Ibrahim, or deſcendants of Abraham; but they have no veſtige of Judaiſm, except circumciſion, and ſome names, ſuch as Iſaac, Reuben, Jacob, &c. This race is of a brown colour.—The ſecond race is that of Zaferamini: with reſpect to this, ſome books which are ſtill extant among the Ombiaſſes, affirm, that it is not more than ſix centuries ſince their arrival at Madagaſcar.—With reſpect to the third race of Zafe Canambou, it is of Arabian extraction, and arrived much more lately than the others from the coaſts of Æthiopia: hence it poſſeſſes neither power nor credit, and fills only the charges of writers, hiſtorians, poets, &c.

"In regard to arts and trades, the Madagaſcar nation are contented with ſuch as are neceſſary to make their moveables, tools, utenſils, and arms for defence; to conſtruct their dwellings, and the boats which are neceſſary for their navigation; and laſtly, to fabricate cloths and ſtuffs for their cloathing. They are deſirous only of poſſeſſing the neceſſary ſupplies of immediate utility and convenience. The principal and moſt reſpected buſineſs, is the manufacture of iron and ſteel. The artiſts in this way call themſelves *ampaneſa vihe*. They are very expert in fuſing the ore, and forging utenſils, ſuch as hatchets, hammers, anvils, knives, ſpades, ſagayes, razors, pincers, or tweezers for pulling out the hair, &c. The ſecond claſs conſiſts of the goldſmiths (*ompaneſa vola mena*): they caſt gold in ingots, and make up bracelets, buckles, ear-rings, drops, rings, &c. The third are called *ompavillanga*, and are potters. The fourth are the *ompanevatta*, or turners in wood, who make boxes called *vatta*, plates, wooden and horn ſpoons, bive-hives, coffins, &c. The fifth, *ompan cacaſou*, or carpenters. They are very expert in this buſineſs, and make uſe of the rule, the plane, the compaſſes, &c. The ſixth are the *ompaniavi*, or rope-makers. They make their ropes of different kinds of bark of trees, and likewiſe of hemp. The ſeventh, *ampan lamba*, or weavers. This buſineſs is performed by women only, and it would be reckoned diſgraceful in a man to exerciſe it. The *ombiaſſes* are the literary men and phyſicians, who give advice only. The *herauvitz* are comedians and dancers.

"The Madagaſcar people always live in ſociety; that is to ſay, in towns and villages. The towns are ſurrounded by a ditch and palliſades (as already mentioned), at the extremities of which a guard from 12 to 20 armed men is kept. The houſes of private people conſiſt of a convenient cottage, ſurrounded by ſeveral ſmall ones: the maſter of the houſe dwells in the largeſt, and his women or ſlaves lodge in the ſmaller. Theſe houſes are built of wood, covered with leaves of the palm-tree or ſtraw.

"The houſes of the great men of the country are very ſpacious; each houſe is compoſed of two walls and four apartments: round about the principal houſe other ſmaller habitations are built for the accommodation of the women, and the whole family of the chief; but the ſlaves cannot paſs the night within them. Moſt of the houſes inhabited by the Rohandrians are built with taſte and admirable ſymmetry."

The French attempted to conquer and take poſſeſſion of the whole iſland, by order, and for the uſe of, their Moſt Chriſtian Majeſties, Louis XIII. and XIV. and they maintained a footing on it from the year 1642 to 1657. During this period, by the moſt cruel treachery, they taught the native princes the barbarous traffic in ſlaves, by villanouſly ſelling to the Dutch governor of Mauritius a number of innocent people, who had been aſſiſting them in forming a ſettlement at Fort Dauphin.

The Abbé Rochon tells us, that the inſalubrity of the air in Madagaſcar determined his countrymen in 1664 to quit that immenſe iſland, in order to eſtabliſh themſelves at ſo inconſiderable a place as the Iſle of Bourbon, which is ſcarcely perceptible in a map of the globe: but it is apparent, from the account of the ſtate of the French affairs on the iſland of Madagaſcar in 1661, when Flacourt's narrative was publiſhed, that their ill treatment of the natives had raiſed ſuch a general and formidable oppoſition to their reſidence in the country, that the French were obliged to abandon their poſſeſſions for other reaſons than the unhealthy qualities of the climate. We have not room here for a detail of all the oppreſſive meaſures of the French, which the Abbé himſelf candidly cenſures in the ſtrongeſt terms; but ſhall extract the following narrative, both becauſe it is intereſting in itſelf, and exhibits the cauſes and the means of their expulſion.

La Caſe, one of the French officers employed by the governor of Fort Dauphin againſt the natives, was ſo ſucceſsful in all his enterpriſes, that they called him *Deaan Pous*, the name of a chief who had formerly conquered the whole iſland. The French governor, jealous of his renown, treated him harſhly, and refuſed to allow him the rank or honours due to his valour. The ſovereign of the province of Amboulle, called *Deaan Raſcitat*, taking advantage of his diſcontent, prevailed on him to become his general. Five Frenchmen followed him. Deaan Nong, the daughter of Raſcitat, captivated by the perſon and heroiſm of La Caſe, offered him her hand with the conſent of her father. The chief, grown old, infirm, and arrived at the laſt ſtage of exiſtence, had the ſatisfaction of ſecuring the happineſs of his ſubjects, by appointing his ſon-in-law abſolute maſter of the rich province of Amboulle. La Caſe, in marrying Deaan Nong, refuſed to take the titles and honours attached to the ſovereign power: he would accept of no other character, than that of the firſt ſubject of his wife, who was declared ſovereign at the death of her father. Secure in the affection of this princeſs, who was not only poſſeſſed of perſonal charms, but of courage and great qualities, he was beloved and reſpected by her family, and by all the people of Amboulle, who reverenced him as a father; and yet, how much ſoever he wiſhed it, he was unable to contribute to the proſperity of his countrymen at Fort Dauphin, whom he knew to be in the utmoſt diſtreſs. The governor, regarding him as a traitor, had ſet a price on his head, and on the heads of the five Frenchmen who had followed him. The neighbouring chiefs, irritated at this treatment of a man whom they ſo much venerated, unanimouſly refuſed to ſupply the fort with proviſions. This occaſioned a famine in the place, which, with a contagious fever and other maladies, reduced the French garriſon to 80 men.

The eſtabliſhment at Fort Dauphin, on the point of being totally deſtroyed, was preſerved for a ſhort time from ruin by the arrival of a veſſel from France, commanded by Kercadio an officer of Brittany, who, with the aſſiſtance of a young advocate who had been kidnapped on board the veſſel, prevailed on the envious and implacable governor Chamargou, to make peace with La Caſe and his ſovereign ſpouſe Deaan Nong. This peace, however, laſted but for a ſhort time; the French, reſtleſs and inſolent to the neighbouring nations, again drew on them the vengeance of the natives. Even the few friends whom they had been able to acquire by means of La Caſe, were rendered hoſtile to them by the tyrannic zeal of the miſſionaries; who, not contented with being tolerated and allowed to make converts, inſiſted on Deaan Manang ſovereign of Mandrarey, a powerful, courageous, and intelligent chief, well-diſpoſed to the French, to divorce all his wives but one. This prince, not convinced of the neceſſity of ſuch a meaſure, aſſured them that he was unable to change his habits and way of living, which were thoſe of his forefathers. "You would allow me (ſays he) to have one wife; but if the poſſeſſion of one woman is a bleſſing, why ſhould a numerous ſeraglio be an evil, while peace and concord reign among thoſe of whom it is compoſed? Do you ſee among us any indications of jealouſy or hatred? No, all our women are good; all try to make me happy; and I am more their ſlave than their maſter." This ſpeech had no effect on father Stephen, ſuperior of the Madagaſcar miſſion. He peremptorily ordered him inſtantly to repudiate all his wives except one; and threatened, in preſence of the women, to have them taken from him by the French ſoldiers if he heſitated in complying with his commands. It is eaſy to imagine, ſays M. Rochon, with what indignation this language muſt have been heard in the *donac* or palace of this prince. The females aſſailed the miſſionary on all ſides; loaded him with execrations and blows; and, in their fury, would doubtleſs have afforded him no more quarter than the Thracian women did Orpheus, if Deaan Manang, notwithſtanding his own agitation, had not made uſe of all his authority to ſave him.

In order to free himſelf from the perſecution of this prieſt, he removed with his family 70 or 80 miles up into the country; but he was ſoon followed by Father Stephen and another miſſionary, with their attendants. The chief, Manang, ſtill received them civilly; but he intreated them no longer to inſiſt on the converſion of him and his people, as it was impoſſible to oblige them to quit the cuſtoms and manners of their anceſtors. The only reply which Father Stephen made to this intreaty, was by tearing off the *oli*, and the amulets and charms which the chief wore as ſacred badges of his own religion; and, throwing them into the fire, he declared war againſt him and his nation. This violence inſtantly coſt him and his followers their lives: they were all maſſacred by order of Manang, who vowed the deſtruction of all the French in the iſland; in which intention he proceeded in a manner that has been related by an eye-witneſs, who was afterwards provincial commiſſary of artillery, in a narrative publiſhed at Lyons in 1722, intitled *Voyage de Madagaſcar*. "Our yoke (ſays the Abbé Rochon) was become odious and inſupportable. Hiſtorians, for the honour of civilized nations, ſhould bury in oblivion the afflicting narratives of the atrocities execriſed on theſe people, whom we are pleaſed to call barbarous, treacherous, and deceitful, becauſe they have revolted againſt European adventurers, whoſe leaſt crime is that of violating the ſacred rites of hoſpitality."

It was about the year 1672 that the French were totally driven from the iſland of Madagaſcar; and no conſiderable attempts were made to form freſh eſtabliſhments there till within theſe few years, by M. de Modave, and by Count Benyowſki; neither of which was attended with ſucceſs, for reaſons given by the Abbé, but which we have not room to detail.

MADDER. See Rubia.

M. Macquer obſerves, that the Hollanders are obliged to the refugees from Flanders for the knowledge of manufacturing the root of madder; and that they generally cultivate it in freſh lands which have not been ploughed. The commodity, when manufactured, is diſtinguiſhed into different kinds, as grape madder, bunch-madder, &c. The grape-madder is the heart of the root; the other, beſides the heart, conſiſts alſo of the bark and ſmall fibres proceeding from the principal root. For that kind called *grape-madder*, the fineſt roots are picked out, the bark ſeparated at the mill, and the inſide root kept moiſt in caſks for three or four years, which makes it more fit for dyeing than otherwiſe it would be. Unleſs madder be kept cloſe in this manner, it is apt to ſpoil, and loſes its bright colour in a great meaſure. It is yellow at firſt, but grows red and darker with age. It ſhould be choſen of a fine ſaffron colour, in very hard lumps, and of a ſtrong though not diſagreeable ſmell.

The madder uſed for dyeing cottons in the Eaſt Indies, is in ſome reſpects different from that of Europe.

rope. On the coaſt of Coromandel it has the name of *chat*, and grows wild on the coaſt of Malabar. The cultivated kind is imported from Vaour and Tuccorin, but the moſt eſteemed is the Perſian chat called alſo *dumas*. Another plant, called *raye de chaye*, or colour-root, is alſo gathered on the coaſt of Coromandel; but this, though ſuppoſed to be a ſpecies of madder, is a kind of *galium flore albo*, which, however, gives a tolerable good colour to cotton. Another ſpecies of madder, called *chive-boya*, and *chine-hazala*, is cultivated at Kunder in the neighbourhood of Smyrna, and ſome other countries of Turkey in Aſia. It is more eſteemed than the beſt Zealand madder imported into theſe parts by the Dutch; and experiments have ſhown that it is ſuperior to any other kind as a dyeing ingredient. The modern Greeks call this kind of madder *lizari*, and the Arabs *fonoy*. The fine colour of theſe madders, however, are by our author attributed to their being dried in the air, and not in ſtoves. Another kind of madder is produced in Canada, where it is called *tyſſa-voyana*; its qualities are nearly the ſame with the European kind.

The root of madder impregnates water with a dull red colour, and ſpirit of wine with a deep bright red. This root, when eat by animals along with their food, tinges their urine, and their moſt ſolid bones, of a deep red. Wool previouſly boiled in a ſolution of alum and tartar, receives from a hot decoction of madder and tartar a very durable but not a very beautiful red colour. Mr Margraaf (Berlin Mem. 1771), ſhows how a very durable lake of a fine red colour, fit for the purpoſes of painting, may be obtained from madder. This proceſs is as follows: Take two ounces of the pureſt Roman alum, and diſſolve it in three French quarts of diſtilled water that has boiled, and in a clean glazed pot. Set the pot on the fire; and when the water begins to boil, withdraw it, and add two ounces of the beſt Dutch madder. Boil the mixture once or twice; then remove it from the fire, and filter it through a double filter of paper not coloured. Let the liquor thus filtrated ſtand a night to ſettle, and pour off the clear liquor into the glazed pot previouſly well cleaned. Make the liquor hot, and add to it gradually a clear ſolution of ſalt of tartar in water, till all the madder is precipitated. Filtrate the mixture; and upon the red precipitate which remains upon the filter pour boiling diſtilled water, till the water no longer acquires a ſaline taſte. The red lake is then to be gently dried. No other water, neither rain nor river water, produces ſo good a colour as that which has been diſtilled, and the quantity required of this is conſiderable. The colour of the above precipitate is deep; but if two parts of madder be uſed to one part of alum, the colour will be ſtill deeper: one part of madder and four parts of alum produces a beautiful roſe colour.

MADEIRAS, a cluſter of iſlands ſituated in the Atlantic ocean in W. Long. 16°, and between 32° and 33° N. Lat.—The largeſt of them, called *Madeira*, from which the reſt take their name, is about 55 Engliſh miles long, and 10 miles broad; and was firſt diſcovered on the 2d of July, in the year 1419, by Joao Gonzales Zarco, there being no hiſtorical foundation for the fabulous report of its diſcovery by one Machin an Engliſhman. It is divided into two capitanias, named *Funchal* and *Maxico*, from the towns of thoſe names. The former contains two judicatures, viz. Funchal and Calhetta; the latter being a town with the title of a county, belonging to the family of Caſtello Melhor. The ſecond capitania likewiſe comprehends two judicatures, viz. Maxico (read Maſhico) and San Vicente.

Funchal is the only cidade or city in this iſland, which has alſo ſeven villas or towns; of which there are four, Calhetta, Camara de Lobos, Ribeira Braba, and Ponta de Sol in the capitania of Funchal, which is divided into 26 pariſhes. The other three are in the capitania of Maxico, which conſiſts of 17 pariſhes; theſe towns are called *Maxico*, *San Vicente*, and *Santa Cruz*.

The governor is at the head of all the civil and military departments of this iſland, of Porto-Santo, the Salvages, and the Ilhas Deſartas; which laſt only contain the temporary huts of ſome fiſhermen, who reſort thither in purſuit of their buſineſs.

The law-department is under the corregidor, who is appointed by the king of Portugal, commonly ſent from Liſbon, and holds his place during the king's pleaſure. All cauſes come to him from inferior courts by appeal. Each judicature has a ſenate; and a *Juiz* or judge, whom they chooſe, preſides over them. At Funchal he is called *Juiz da Fora*; and in the abſence, or after the death of the corregidor, acts as his deputy. The foreign merchants elect their own judges, called the *Providor*, who is at the ſame time collector of the king's cuſtoms and revenues, which amount in all to about 12,000 l. Sterling. Far the greateſt part of this ſum is applied towards the ſalaries of civil and military officers, the pay of troops, and the maintenance of public buildings. This revenue ariſes, firſt from the tenth of all the produce of this iſland belonging to the king, by virtue of his office as grand maſter of the order of Chriſt; ſecondly, from ten per cent. duties laid on all imports, proviſions excepted; and laſtly, from the eleven per cent. charged on all exports.

The iſland has but one company of regular ſoldiers of 100 men: the reſt of the military force is a militia conſiſting of 3000 men, divided into companies, each commanded by a captain, who has one lieutenant under him and one enſign. There is no pay given to either the private men or the officers of this militia; and yet their places are much ſought after, on account of the rank which they communicate. Theſe troops are embodied once a-year, and exerciſed once a-month. All the military are commanded by the *Serjeante Mór*. The governor has two *Capitanos de Sal* about him, who do duty as aides-de-camp.

The ſecular prieſts on the iſland are about 1200, many of whom are employed as private tutors. Since the expulſion of the Jeſuits, no regular public ſchool is to be found here; unleſs we except a ſeminary, where a prieſt, appointed for that purpoſe, inſtructs and educates ten ſtudents at the king's expence. Theſe wear a red cloak over the uſual black gowns worn by ordinary ſtudents. All thoſe who intend to go into orders, are obliged to qualify themſelves by ſtudying in the univerſity of Coimbra, lately re-eſtabliſhed in Portugal. There is alſo a dean and chapter at Madeira, with a biſhop at their head, whoſe income is conſiderably greater than the governor's; it conſiſts of 110 pipes of wine, and of 40 muys of wheat, each containing 24 buſhels; which amounts in common years to 3000 l. Sterling. Here are likewiſe 60 or 70 Franciſcan friars, in four monaſteries, one of which is at Funchal. About 300 nuns live on the iſland, in four convents, of the order of Merci, Sta, Clara, Incarnacao, and Bom Jeſus. Thoſe of the laſt mentioned inſtitution may marry whenever they chooſe, and leave their monaſtry.

In the year 1768, the inhabitants living in the 43 pariſhes of Madeira, amounted to 63,913, of whom there were 31,341 males and 32,572 females. But in that year 5243 perſons died, and no more than 2198 children were born; ſo that the number of the dead exceeded that of the born by 3045. It is highly probable that ſome epidemical diſtemper carried off ſo diſproportionate a number in that year, as the iſland would ſhortly be entirely depopulated if the mortality were always equal to this. Another circumſtance concurs to ſtrengthen this ſuppoſition, namely, the excellence of the climate. The weather is in general mild and temperate: in ſummer, the heat is very moderate on the higher parts of the iſland, whither the better ſort of people retire for that ſeaſon; and in the winter the ſnow remains there for ſeveral days, whilſt it is never known to continue above a day or two in the lower parts.

The common people of this iſland are of a tawney colour, and well ſhaped; though they have large feet, owing perhaps to the efforts they are obliged to make in climbing the craggy paths of this mountainous country. Their faces are oblong, their eyes dark; their black hair naturally falls in ringlets, and begins to criſp in ſome individuals, which may perhaps be owing to intermarriages with negroes; in general, they are hard-featured, but not diſagreeable. Their women are too frequently ill-favoured, and want the florid complexion, which, when united to a pleaſing aſſemblage of regular features, gives our northern fair ones the ſuperiority over all their ſex. They are ſmall, have prominent cheek-bones, large feet, an ungraceful gait, and the colour of the darkeſt brunette. The juſt proportion of the body, the fine form of their hands, and their large, lively eyes, ſeem in ſome meaſure to compenſate for thoſe defects. The labouring men, in ſummer, wear linen trowſers, a coarſe ſhirt, a large hat, and boots; ſome have a ſhort jacket made of cloth, and a long cloak, which they ſometimes carry over their arm. The women wear a petticoat, and a ſhort corſelet or jacket, cloſely fitting their ſhapes, which is a ſimple, and often not an inelegant dreſs. They have alſo a ſhort, but wide cloak; and thoſe that are unmarried tie their hair on the crown of their head, on which they wear no covering.

The country people are exceeding ſober and frugal; their diet in general conſiſting of bread and onions, or other roots, and little animal-food. However, they avoid eating tripe, or any offals, becauſe it is proverbially ſaid of a very poor man, "He is reduced to eat tripe." Their common drink is water, or an infuſion of the remaining rind or ſkin of the grape (after it has paſſed through the wine-preſs), which when fermented acquires ſome tartneſs and acidity, but cannot be kept very long. The wine for which the iſland is ſo famous, and which their own hands prepare, ſeldom if ever regales them.

Their principal occupation is the planting and raiſing of vines; but as that branch of agriculture requires little attendance during the greateſt part of the year, they naturally incline to idleneſs. The warmth of the climate, which renders great proviſion againſt the inclemencies of weather unneceſſary, and the eaſe with which the cravings of appetite are ſatisfied, muſt tend to indolence, wherever the regulations of the legiſlature do not counteract it, by endeavouring, with the proſpect of increaſing happineſs, to infuſe the ſpirit of induſtry. It ſeems the Portugueſe government does not purſue the proper methods againſt this dangerous lethargy of the ſtate. They have lately ordered the plantation of olive trees here, on ſuch ſpots as are too dry and barren to bear vines; but they have not thought of giving temporary aſſiſtance to the labourers, and have offered no premium by which theſe might be induced to conquer their reluctance to innovations and averſion to labour.

The vineyards are held only on an annual tenure, and the farmer reaps but four-tenths of the produce, ſince four other tenths are paid in kind to the owner of the land, one tenth to the king, and one to the clergy. Such ſmall profits, joined to the thought of toiling merely for the advantage of others, if improvements were attempted, entirely preclude the hopes of a future increaſe. Oppreſſed as they are, they have however preſerved a high degree of cheerfulneſs and contentment; their labours are commonly alleviated with ſongs, and in the evening they aſſemble from different cottages to dance to the drowſy muſic of a guittar.

The inhabitants of the towns are more ill-favoured than the country-people, and often pale and lean. The men wear French clothes, commonly black, which do not ſeem to fit them, and have been in faſhion in the polite world about half a century ago. Their ladies are delicate, and have agreeable features: but the characteriſtic jealouſy of the men ſtill locks them up, and deprives them of a happineſs which the country-women, amidſt all their diſtreſſes, enjoy. Many of the better people are a ſort of *petite nobleſſe*, which we would call *gentry*, whoſe genealogical pride makes them unſociable and ignorant, and cauſes a ridiculous affectation of gravity. The landed property is in the hands of a few ancient families, who live at Funchal, and in the various towns on the iſland.

Madeira conſiſts of one large mountain, whoſe branches riſe every-where from the ſea towards the centre of the iſland, converging to the ſummit, in the midſt of which is a depreſſion or excavation, called the *Val* by the inhabitants, always covered with a freſh and delicate herbage. The ſtones on the iſland ſeem to have been in the fire, are full of holes, and of a blackiſh colour; in ſhort, the greater part of them are lava. A few of them are of the kind which the Derbyſhire miners call *dunſtone*. The ſoil of the whole iſland is a tarras mixed with ſome particles of clay, lime, and ſand, and has much the ſame appearance as ſome earths on the iſle of Aſcenſion. From this circumſtance, and from the excavation of the ſummit of the mountain, it is probable, that in ſome remote period a volcano has produced the lava and the ochreous particles, and that the Val was formerly its crater.

Many brooks and ſmall rivulets deſcend from the ſummits in deep chaſms or glens, which ſeparate the various parts of the iſland. The beds of the brooks are in ſome places covered with ſtones of all ſizes, carried down from the higher parts by the violence of winter-rains or floods of melted ſnow. The water is conducted by wears and channels in the vineyards, where each proprietor has the uſe of it for a certain time; ſome being allowed to keep a conſtant ſupply of it, ſome to uſe it thrice, others twice, and others only once a-week. As the heat of the climate renders this ſupply of water to the vineyards abſolutely neceſſary, it is not without great expence that a new vineyard can be planted; for the maintenance of which, the owners muſt purchaſe water at a high price, from thoſe who are conſtantly ſupplied, and are thus enabled to ſpare ſome of it.

Wherever a level piece of ground can be contrived in the higher hills, the natives make plantations of eddoes encloſed by a kind of dike to cauſe a ſtagnation, as that plant ſucceeds beſt in ſwampy ground. Its leaves ſerve as food for hogs, and the country-people uſe the roots for their own nouriſhment.

The ſweet potatoe is planted for the ſame purpoſe, and makes a principal article of diet; together with cheſnuts, which grow in extenſive woods, on the higher parts of the iſland, where the vine will not thrive. Wheat and barley are likewiſe ſown, eſpecially in ſpots where the vines are decaying through age, or where they are newly planted. But the crops do not produce above three months proviſions; and the inhabitants are therefore obliged to have recourſe to other food, beſides importing conſiderable quantities of corn from North America in exchange for wine. The want of manure, and the inactivity of the people, are in ſome meaſure the cauſes of this diſadvantage; but ſuppoſing huſbandry to be carried to its perfection here, they could not raiſe corn ſufficient for their conſumption. They make their threſhing-floors of a circular form, in a corner of a field, which is cleared and beaten ſolid for the purpoſe. The ſheaves are laid round about it; and a ſquare board, ſtuck full of ſharp flints below, is dragged over them by a pair of oxen, the driver getting on it to increaſe its weight. This machine cuts the ſtraw as if it had been chopped, and frees the grain from the huſk, from which it is afterwards ſeparated.

The great produce of Madeira is the wine, from which it has acquired fame and ſupport. Where the ſoil, expoſure, and ſupply of water, will admit of it, the vine is cultivated. One or more walks, about a yard or two wide, interſect each vineyard, and are included by ſtone-walls two feet high. Along theſe walks, which are arched over with laths about ſeven feet high, they erect wooden pillars at regular diſtances, to ſupport a lattice-work of bamboos, which ſlopes down from both ſides of the walk, till it is only a foot and a half or two feet high, in which elevation it extends over the whole vineyard. The vines are in this manner ſupported from the ground, and the people have room to root out the weeds which ſpring up between them. In the ſeaſon of the vintage, they creep under this lattice-work, cut off the grapes, and lay them into baſkets: ſome bunches of theſe grapes weigh ſix pounds and upwards. This method of keeping the ground clean and moiſt, and ripening the grapes in the ſhade, contributes to give the Madeira wines that excellent flavour and body for which they are remarkable. The owners of vineyards are however obliged to allot a certain ſpot of ground for the growth of bamboos; for the lattice work cannot be made without them; and it is ſaid ſome vineyards lie quite neglected for want of this uſeful reed.

The wines are not all of equal goodneſs, and conſequently of different prices. The beſt, made of a vine imported from Candia by order of the Infante of Portugal, Don Henry, is called *Madeira Malmſey*, a pipe of which cannot be bought on the ſpot for leſs than 40 or 42 l. Sterling. It is an exceeding rich ſweet wine, and is only made in a ſmall quantity. The next ſort is a dry wine, ſuch as is exported for the London market, at 30 or 31 l. Sterling the pipe. Inferior ſorts for the Eaſt India, Weſt India, and North American markets, ſell at 28, 25, and 20 l. Sterling. About 30,000 pipes, upon a mean, are made every year, each containing 110 gallons. About 13,000 pipes of the better ſorts are exported; and all the reſt is made into brandy for the Brazils, converted into vinegar, or conſumed at home.

The incloſures of the vineyards conſiſt of walls, and hedges of prickly pear, pomegranates, myrtles, brambles, and wild roſes. The gardens produce peaches, apricots, quinces, apples, pears, walnuts, cheſnuts, and many other European fruits; together with now and then ſome tropical plants, ſuch as bananas, goavas, and pine-apples.

All the common domeſtic animals of Europe are likewiſe found at Madeira; and their mutton and beef, though ſmall, is very well taſted. Their horſes are ſmall, but ſure-footed; and with great agility climb the difficult paths, which are the only means of communication in the country. They have no wheel-carriages of any kind; but in the town they uſe a ſort of drays or ſledges, formed of two pieces of plank joined by croſs pieces, which make an acute angle before; theſe are drawn by oxen, and are uſed to tranſport caſks of wine, and other heavy goods, to and from the warehouſes.

The animals of the feathered tribe, which live wild here, are more numerous than the wild quadrupeds; there being only the common grey rabbit here, as a repreſentative of the laſt-mentioned claſs. Tame birds, ſuch as turkies, geeſe, ducks, and hens, are very rare, which is perhaps owing to the ſcarcity of corn.

There are no ſnakes whatſoever in Madeira; but all the houſes, vineyards, and gardens, ſwarm with lizards. The friars of one of the convents complained to Mr Forſter, that theſe vermin deſtroyed the fruit in their garden; they had therefore placed a braſs-kettle in the ground to catch them, as they are conſtantly running about in queſt of food. In this manner they daily caught hundreds, which could not get out on account of the ſmooth ſides of the kettle, but were forced to periſh.

The ſhores of Madeira, and of the neighbouring Salvages and Deſertas, are not without fiſh; but as they are not in plenty enough for the rigid obſervance of Lent, pickled herrings are brought from Gottenburg in Engliſh bottoms, and ſalted cod from New York and other American ports, to ſupply the deficiency.

MADIAN, (anc. geog.) a town of Arabia Petræa, near the Arnan; ſo called from one of the ſons of Abraham by Ketura, in ruins in Jerome's time. Jerome mentions another MADIAN, or MIDIAN, beyond Arabia, in the deſart, to the ſouth of the Red Sea: and hence *Madianæi*, and *Madianitæi*, the people; and *Madianæa Regio*, the country.

MADNESS, a moſt dreadful kind of delirium, without fever. See (the *Index* ſubjoined to) MEDICINE.

MADOX (Dr Iſaac), an ingenious and worthy prelate, born of obſcure parents about the year 1696, who placed him apprentice to a paſtry-cook; but not reliſhing this employment, and having an inclination to learning, he was put to ſchool by ſome friends, and completed his ſtudies at Aberdeen. He entered into orders; and having the good fortune to be made chaplain to Dr Bradford biſhop of Chicheſter, he married his niece, a very ſenſible and worthy lady. From this time his preferment may be dated; he was made king's chaplain, clerk of the cloſet to queen Caroline, and about the year 1736 biſhop of St Aſaph; from whence, in 1743, he was tranſlated to Worceſter. He was an excellent preacher, and a great promoter of public charities; particularly the Worceſter infirmary, and the hoſpital for inoculating the ſmall-pox at London: his ſermon in favour of this latter inſtitution, preached in 1752, was much admired, and contributed greatly to extend the practice of inoculation. He publiſhed ſome other ſingle ſermons, and a Defence of the Doctrine and Diſcipline of the Church of England, in anſwer to Mr Neale's Hiſtory of the Puritans.—Dr Madox died in 1759.

MADRAS. See *St George*.

MADRE DE POPA, a town and convent of South America, in Terra Firma, ſeated on the river Grande. It is almoſt as much reſorted to by pilgrims of America as Loretto is in Europe; and the image of the Virgin Mary is ſaid to have done many miracles in favour of the ſea-faring people. W. Lon. 76. 0. N. Lat. 11. 0.

MADREPORA, in natural hiſtory, the name of a genus of ſubmarine ſubſtances; the characters of which are, That they are almoſt of a ſtony hardneſs, reſembling the corals, and are uſually divided into branches, and pervious by many holes or cavities, which are frequently of a ſtellar figure.

In the Linnæan ſyſtem, this is a genus of lithophyta: The animal that inhabits it is the Meduſa; it comprehends 39 ſpecies. According to Donati, the madrepora is like the coral as to its hardneſs, which is equal to bone or marble; the colour is white when poliſhed; its ſurface is lightly wrinkled, and the wrinkles run lengthwiſe of the branches; in the centre there is a ſort of cylinder, which is often pierced thro' its whole length by two or three holes. From this cylinder are detached about 17 laminæ, which run to the circumference in ſtraight lines; and are tranſverſely interſected by other laminæ, forming many irregular cavities; the cellules, which are compoſed of theſe laminæ ranged into a circle, are the habitations of little polypes, which are extremely tender animals, generally tranſparent, and variegated with beautiful colours. M. de Peyſſonel obſerves, that thoſe writers who only conſidered the figures of ſubmarine ſubſtances, denominated that claſs of them, which ſeemed pierced with holes, *pora*; and thoſe, the holes of which were large, they called *madrepora*. He defines them to be all thoſe marine bodies which are of a ſtony ſubſtance, without either bark or cruſt, and which have but one apparent opening at each extremity, furniſhed with rays that proceed from the centre to the circumference. He obſerves that the body of the animal of the madrepora, whoſe fleſh is ſo ſoft that it divides upon the gentleſt touch, fills the centre; the head is placed in the middle, and ſurrounded by ſeveral feet or claws, which fill the intervals of the partitions obſerved in this ſubſtance, and are at pleaſure brought to its head, and are furniſhed with yellow papillæ. He diſcovered that its head or centre was lifted up occaſionally above the ſurface, and often contracted and dilated itſelf like the pupil of the eye: he ſaw all its claws moved, as well as its head or centre. When the animals of the madrepora are deſtroyed, its extremities become white. In the madrepora, he ſays, the animal occupies the extremity; and the ſubſtance is of a ſtony but more looſe texture than the coral. This is formed, like other ſubſtances of the ſame nature, of a liquor which the animal diſcharges; and he farther adds, that there are ſome ſpecies of the polype of the madrepora which are produced ſingly, and others in cluſters.

MADRID, a town of New Caſtile in Spain, and capital of the whole kingdom, though it never had the title of a *city*, is ſituated in W. Long. 3. 5. N. Lat. 40. 26. It ſtands in the centre of a large plain, ſurrounded with mountains, and in the very heart of Spain, on the banks of the little river Manzanares, which is always very low and ſhallow, except when it is ſwelled by the melting of the ſnow on the mountains. The city is in general well laid out; the ſtreets are very handſome; and the houſes are fair and lofty, but built of brick, with lattice-windows, excepting thoſe of the rich, who have glaſs in their windows; only, during the ſummer-heats, they uſe gauze, or ſome ſuch thin ſtuff, inſtead of it, to let in the freſh air. There are two ſtately bridges here over the Manzanares, a great many magnificent churches, convents, hoſpitals, and palaces. The royal palace, which ſtands on the weſt ſide of the town, on an eminence, is ſpacious and magnificent, conſiſting of three courts, and commanding a fine proſpect. At the eaſt end of the town is the prado, or pardo; which is a delightful plain, planted with regular rows of poplar trees, and watered with a great many fountains; where the nobility and gentry take the air on horſeback, or in their coaches, and the common people on foot, or divert themſelves with a variety of ſports and exerciſes. Almoſt all the ſtreets of Madrid are ſtraight, wide, clean, and well paved. The largeſt and moſt frequented are the ſtreet of Alcala, that of Atocha, that of Toledo, and the *Calle grande* or great ſtreet. Madrid has alſo ſeveral ſquares, which in general are not very regular. The principal are thoſe of San Joachim, Sol, Laſganitas, San Domingo, La Cevado, and the Plaza Mayor. The latter eſpecially deſerves notice for its ſpaciouſneſs and regularity, and the elegant and lofty houſes it contains. It is fifteen hundred and thirty-ſix feet in circuit.

cuit. The houſes, of which there are 136, are of five ſtories, ornamented with balconies; the firſt of which, ſupported by pillars, form a piazza round the ſquare, where the inhabitants may walk under cover. In the middle of the ſquare a market is kept.—The ſtreets and ſquares of Madrid, except the Plaza Mayor which has been juſt deſcribed, are ornamented with fountains in a very ill taſte. Thoſe moſt to be diſtinguiſhed in this particular are the fountain of the ſmall irregular ſquare called *Plaza di Antonio Martin*, and that of the ſquare named *Puerta del Sol*. The others are not more magnificent though leſs ridiculous. The water of all theſe fountains is excellent; and the air of Madrid, though the weather be variable and uncertain, is extremely pure. It was this purity of the air and excellent quality of the water which induced Philip II. and his ſucceſſors to fix their reſidence in this city. It is alſo well ſupplied with proviſions of all kinds at reaſonable rates; and the court, with the reſort and reſidence of the quality, and the high colleges and offices that are kept here, occaſion a briſk trade and circulation of money.

The ſacred edifices in this city have nothing remarkable in their architecture: thoſe of St Paſqual, St Iſabella, and the Carmelites, contain highly valuable collections of pictures which may be ſeen with admiration even after the paintings of the Eſcurial and the new palace. The church of St Iſidro, which heretofore belonged to the Jeſuits, has a portal which has eſcaped the contagion of the age in which it was built. There is another church much more modern, which on account of its maſs has a venerable appearance, but which true taſte may juſtly diſavow: it is that of St Saleſas, or the viſitation, founded by Ferdinand VI. and the queen Barbara his wife.—The convent of St Francis has already been ſome years building *, and there are hopes that it will become one of the fineſt productions of architecture in the capital.—Beſides a variety of charitable foundations, there are here three confraternities, the revenues of which are appropriated to the ſuccour of the wretched; and an inſtitution ſimilar to the *Mont de Pieté* in Paris, the principal object of which is to advance money to the neceſſitous.

The city of Madrid contains 15 gates, 18 pariſhes, 35 convents of monks, and 31 of nuns; 39 colleges, hoſpitals, or houſes of charity; 7398 dwelling-houſes, and about 140,000 inhabitants. The Lombard traveller, Father Caimo, tells us, that 50,000 ſheep and 12,000 oxen are annually conſumed there; to which his editor has added a ludicrous eſtimate of the onions and leeks devoured there, which he ſays amount to 970000000000000000000000000000045. But this writer (M. Bourgoanne obſerves) would not at preſent have any reaſon to complain of the diſagreeable ſmells of the ſtreets, nor would he find all the perfumes of Arabia neceſſary to defend himſelf from them. By the vigilance of the modern police, for which (M. Bourgoanne informs us) it is indebted to the count D'Aranda, it is rendered one of the cleaneſt cities in Europe.

There are four academies in Madrid: The firſt is the Spaniſh academy founded in 1714, in imitation of the French academy, and conſiſting of 24 members, including the preſident. Its device is a crucible on burning coals, with the motto *limpia, fixa, y da eſplendor;* "it purifies, fixes, and gives luſtre." Its firſt object was the compilation of a dictionary of the Spaniſh language, which was publiſhed in ſix volumes folio, and of which a new edition, with great additions, has been lately put to the preſs. The ſame academy is alſo employed on a ſuperb edition of Don Quixotte, adorned with elegant engravings far ſuperior to the laſt, and collated with all the former editions. The ſecond is the academy of hiſtory; which owes its origin to a ſociety of individuals, the object of whoſe meetings was to preſerve and illuſtrate the hiſtorical monuments of the kingdom of Spain. Their labours met the approbation of Philip V. who in 1738 confirmed their ſtatutes by a royal cedula. This academy conſiſts of 24 members, including the preſident, ſecretary, and cenſor. Its device is a river at its ſource; and the motto, *In patriam populumque fluit.* The other two academies are the academy of the fine arts, painting, ſculpture, and architecture; and the academy of medicine. The latter is held in no great eſteem.

The environs of Madrid contain ſeveral royal ſeats; among which are El Buen Retiro, Caſa del Campo, Florida, Le Pardo, Sarſuela, and St Ildefonſo; but the moſt magnificent not only in this country but perhaps in the whole world is the Eſcurial, which takes its name from a ſmall village, near which it ſtands, about 22 miles north-weſt from Madrid; and of which a deſcription is given under the article ESCURIAL. Another royal palace, greatly admired particularly for it delicious gardens and ſurpriſing water-works, is Aranjuez, which is ſituated on the Tagus; about 30 miles ſouth of Madrid. See ARANJUEZ.

MADRIGAL, a ſhort amorous poem, compoſed of a number of free and unequal verſes, neither confined to the regularity of a ſonnet, nor to the point of an epigram; but only conſiſting of ſome tender and delicate thought, expreſſed with a beautiful, noble, and elegant ſimplicity.

Menage derives the word from *mandra*, which, in Latin and Greek, ſignifies "a ſheep-fold;" imagining it to have been originally a kind of paſtoral or ſhepherd's ſong; whence the Italians formed their *madrigale*, and we *madrigal*. Others rather chooſe to derive it from the word *madrugar*, which in the Spaniſh language ſignifies "to riſe in the morning;" the *madrigales* being formerly ſung early in the morning by thoſe who had a mind to ſerenade their miſtreſſes.

MADURA, a province of Aſia, in the peninſula on this ſide the Ganges; bounded on the eaſt by Tanjour and Marava, on the ſouth-eaſt by the ſea, on the weſt by the Balagate mountains, which ſeparate it from Malabar, and on the north by Viſapour and Carnate. The inhabitants are Gentoos, and of a thieviſh diſpoſition. The commodities are rice, elephants teeth, and cotton-cloth; of which laſt a great deal is made here, and very fine. The Dutch have a pearl-fiſhery, which brings them in a large ſum annually.

MÆANDER (anc. geog.), a celebrated river of Aſia Minor, riſing near Celænæ. It flows through Caria and Ionia into the Ægean ſea between Miletus and Priene, after it has been increaſed by the waters of the Marſyas, Lycus, Eudon, Lethæus, &c. It is

---

* *Bourgoanne's Travels in Spain*, 1789.

celebrated among the poets for its windings, which amount to not leſs than 600, and from which all obliquities have received the name of *mæanders*. It forms in its courſe, according to the obſervation of ſome travellers, the Greek letters ε ζ ξ ς & ω; and from its windings Dædalus is ſaid to have had the firſt idea of his famous labyrinth.

MÆATÆ, anciently a people of Britain, near Severus's wall, inhabiting the diſtrict now called *Lauderdale*, in Scotland.

MÆCENAS (Caius Cilnius), the great friend and counſellor of Auguſtus Cæſar, was himſelf a very polite ſcholar, but is chiefly memorable for having been the patron and protector of men of letters. He was deſcended from a moſt ancient and illuſtrious origin, even from the kings of Hetruria, as Horace often tells us; but his immediate forefathers were only of the equeſtrian order. He is ſuppoſed to have been born at Rome, becauſe his family lived there; but in what year, antiquity does not tell us. It ſays as little about his education; but we know it muſt have been of the moſt liberal kind, and perfectly agreeable to the dignity and ſplendor of his birth, ſince he excelled in every thing that related to arms, politics, and letters. How Mæcenas ſpent his younger years is alſo unknown to us, any farther than by effects; there being no mention made of him by any writer before the death of Julius Cæſar, which happened in the year of Rome 709. Then Octavius Cæſar, who was afterwards called *Auguſtus*, went to Rome, to take poſſeſſion of his uncle's inheritance; and then Mæcenas became firſt publicly known, though he appears to have been Auguſtus's intimate friend, and as it ſhould ſeem guardian, from his childhood. From that time he accompanied him through all his fortunes, and was his counſellor and adviſer upon all occaſions; ſo that Pedo Albinovanus juſtly called him *Cæſaris dextram*, "Cæſar's right-hand."

In A. R. 710, the year that Cicero was killed and Ovid born, Mæcenas diſtinguiſhed himſelf by his courage and military ſkill at the battle of Modena, where the conſuls Hirtius and Panſa were ſlain in fighting againſt Antony; as he did afterwards at Philippi. After this laſt battle began the memorable friendſhip between Mæcenas and Horace. Horace, as Suetonius relates, was a tribune in the army of Brutus and Caſſius, and upon the defeat of thoſe generals made a priſoner of war. Mæcenas, finding him an accompliſhed man, became immediately his friend and protector; and afterwards recommended him to Auguſtus, who reſtored to him his eſtate with no ſmall additions. In the mean time, though Mæcenas behaved himſelf well as a ſoldier in theſe and other battles, yet his principal province was that of a miniſter and counſellor. He was the adviſer, the manager, the negociator, in every thing that related to civil affairs. When the league was made at Brunduſium between Antony and Auguſtus, Mæcenas was ſent to act on the part of Auguſtus. This we learn from Horace in his journey to Brunduſium:

> *Huc venturus erat Mæcenas optimus, atque*
> *Cocceius, miſſi magnis de rebus uterque*
> *Legati, averſos ſoliti componere amicos.* Sat. v. l. 1.

And afterwards, when this league was near breaking, through the ſuſpicions of each party, Mæcenas was ſent to Antony to ratify it anew.

In the year 717, when Auguſtus and Agrippa went to Sicily to fight Sextus Pompeius by ſea, Mæcenas went with them; but ſoon after returned, to appeaſe ſome commotions which were riſing at Rome: for though he uſually attended Auguſtus in all his military expeditions, yet, whenever there was any thing to be done at Rome either with the ſenate or people, he was always diſpatched thither for that purpoſe.

Upon the total defeat of Antony at Actium, Mæcenas returned to Rome, to take the government into his hands, till Auguſtus could ſettle ſome neceſſary affairs in Greece and Aſia. Agrippa ſoon followed Mæcenas; and when Auguſtus arrived, he placed theſe two great men and faithful adherents, the one over his civil the other over his military concerns. While Auguſtus was extinguiſhing the remains of the civil war in Aſia and Egypt, young Lepidus, the ſon of the triumvir, was forming a ſcheme to aſſaſſinate him at his return to Rome. This conſpiracy was diſcovered at once, by the extraordinary vigilance of Mæcenas; who, as Velleius Paterculus ſays, "obſerving the raſh councils of the headſtrong youth with the ſame tranquillity and calmneſs as if nothing at all had been doing, inſtantly put him to death, without the leaſt noiſe and tumult; and by that means extinguiſhed another civil war in its very beginning."

The civil wars being now at an end, Auguſtus returned to Rome; and from this time Mæcenas indulged himſelf at vacant hours in literary amuſements, and the converſation of men of letters. In the year 734 Virgil died, and left Auguſtus and Mæcenas heirs to what he had. Mæcenas was exceſſively fond of this poet, who, of all the wits of the Auguſtan age, ſtood higheſt in his eſteem; and if the Georgics and the Æneid be owing to the good taſte and encouragement of this patron, as there is ſome reaſon to think, poſterity cannot commemorate him with too much gratitude. Horace may be ranked next to Virgil in Mæcenas's good graces: we have already mentioned how and at what time their friendſhip commenced. Propertius alſo acknowledges Mæcenas for his favourer and protector, lib. ii. eleg. 7. Nor muſt Varius be forgot, though we have nothing of his remaining; ſince we find him highly praiſed by both Virgil and Horace. He was a writer of tragedies; and Quintilian thinks he may be compared with any of the ancients. In a word, Mæcenas's houſe was a place of refuge and welcome to all the learned of his time; not only to Virgil, Horace, Propertius, and Varius, but to Fundarius, whom Horace extols as an admirable writer of comedies; to Fuſcus Ariſtius, a noble grammarian, and Horace's intimate friend; to Plotius Tucea, who aſſiſted Varius in correcting the Æneid after the death of Virgil; to Valgius, a poet and very learned man, who, as Pliny tells us, dedicated a book to Auguſtus, *De uſu Herbarum;* to Aſinius Pollio, an excellent tragic writer; and to ſeveral others, whom it would be tedious to mention. All theſe dedicated their works, or ſome part of them at leaſt, to Mæcenas, and celebrated his praiſes in them over and over: and we may obſerve farther, what Plutarch tells us, that even Auguſtus himſelf inſcribed his Commentaries to him and to Agrippa.

Mæcenas continued in Auguſtus's favour to the end of his life, but not uninterruptedly. Auguſtus had an intrigue with Mæcenas's wife: and though the miniſter bore this liberty of his maſter very patiently, yet there was a coldneſs on the part of Auguſtus, which, however, ſoon went off. Mæcenas died in the year 745; but at what age we cannot preciſely determine, though we know he muſt have been old. He muſt have been older than Auguſtus, becauſe he was a kind of tutor to him in his youth: and then find him often called *an old man* by Pædo Albinovanus, a cotemporary poet, whoſe elegy upon his dead patron is ſtill extant. He made Auguſtus his heir; and recommended his friend Horace to him in thoſe memorable laſt words, "*Horatii Flacci, ut mei, memor eſto*, &c." Horace, however, did not probably ſurvive him long, as there is no elegy of his upon Mæcenas extant, nor any account of one having ever been written, which there certainly would have been had Horace ſurvived him any time. Nay, Father Sanadon, the French editor of Horace, will have it, that the poet died before his patron; and that theſe laſt words were found only in Mæcenas's will, which had not been altered.

Mæcenas is ſaid never to have enjoyed a good ſtate of health in any part of his life: and many ſingularities are related of his bodily conſtitution. Thus Pliny tells us, that he was always in a fever; and that, for three years before his death, he had not a moment's ſleep. Though he was ceertainly an extraordinary man, and poſſeſſed many admirable virtues and qualities, yet it is agreed on all hands, that he was very luxurious and effeminate. "Mæcenas (ſays Velleius Paterculus) was of the equeſtrian order, but ſprung from a moſt illuſtrious origin. He was a man, who, when buſineſs required, was able to undergo any fatigue and watching; who conſulted properly upon all occaſions, and knew as well how to execute what he had conſulted; yet a man who in ſeaſons of leiſure was luxurious, ſoft, and effeminate, almoſt beyond a woman. He was no leſs dear to Cæſar than Agrippa, but diſtinguiſhed by him with fewer honours; for he always continued of the equeſtrian rank, in which he was born: not that he could not have been advanced upon the leaſt intimation, but he never ſolicited it."

But let moraliſts and politicians determine of Mæcenas as they pleaſe, the men of letters are under high obligations to celebrate his praiſes and revere his memory: for he countenanced, protected, and ſupported, as far as they wanted his ſupport, all the wits and learned men of his time; and that too, out of a pure and diſintereſted love of letters, when he had no little views of policy to ſerve by their means: whence it is no wonder, that all the protectors and patrons of learning, ever ſince, have uſually been called *Mæcenas's*.

MAELSTROM, a very dangerous whirlpool on the coaſt of Norway, in the 68th degree of latitude, in the province of Nordland, and the diſtrict of Lofoden, and near the iſland of Moſkoe, from whence it alſo takes the name of *Moſkoe-ſtrom*. Its violence and roarings exceed that of a cataract, being heard to a great diſtance, and without any intermiſſion, except a quarter every ſixth hour, that is, at the turn of high and low water, when its impetuoſity ſeems at a ſtand, which ſhort interval is the only time the fiſhermen can venture in: but this motion ſoon returns, and, however calm the ſea may be, gradually increaſes with ſuch a draught and vortex as abſorb whatever comes within their ſphere of action, and keep it under water for ſome hours, when the fragments, ſhivered by the rocks, appear again. This circumſtance, among others, makes ſtrongly againſt Kircher and others, who imagine that there is here an abyſs penetrating the globe, and iſſuing in ſome very remote parts, which Kircher is ſo particular as to aſſign, for he names the gulph of Bothnia. But after the moſt exact reſearches which the circumſtances will admit, this is but a conjecture without foundation; for this and three other vortices among the Ferroe iſlands, but ſmaller, have no other cauſe, than the colliſion of waves riſing and falling, at the flux and reflux, againſt a ridge of rocks and ſhelves, which confine the water ſo that it precipitates itſelf like a cataract; and thus the higher the flood riſes, the deeper muſt the fall be; and the natural reſult of this is a whirlpool or vortex, the prodigious ſuction whereof is ſufficiently known by leſſer experiments. But what has been thus abſorbed, remains no longer at the bottom than the ebb laſts; for the ſuction then ceaſes, and the flood removes all attraction, and permits whatever had been ſunk to make its appearance again. Of the ſituation of this amazing Moſkoeſtrom we have the following account from Mr Jonas Ramus, "The mountain of Helſeggen, in Lofoden, lies a league from the iſland Ver, and betwixt theſe two runs that large and dreadful ſtream called *Moſkoeſtrom*, from the iſland Moſkoe, which is in the middle of it, together with ſeveral circumjacent iſles, as Ambaaren, half a quarter of a league northward, Iſleſen, Hoeholm, Kieldholm, Suarven, and Buckholm. Moſkoe lies about half a quarter of a mile ſouth of the iſland of Ver, and betwixt them theſe ſmall iſlands, Otterholm, Flimen, Sandfleſen, Stockholm. Betwixt Lofoden and Moſkoe, the depth of the water is between 36 and 40 fathoms; but on the other ſide, towards Ver, the depth decreaſes ſo as not to afford a convenient paſſage for a veſſel, without the riſk of ſplitting on the rocks, which happens even in the calmeſt weather: when it is flood, the ſtream runs up the country between Lofoden and Moſkoe with a boiſterous rapidity; but the roar of its impetuous ebb to the ſea is ſcarce equalled by the loudeſt and moſt dreadful cataracts; the noiſe being heard ſeveral leagues off, and the vortices or pits are of ſuch an extent and depth, that if a ſhip comes within its attraction, it is inevitably abſorbed and carried down to the bottom, and there beat to pieces againſt the rocks; and when the water relaxes, the fragments thereof are thrown up again. But theſe intervals of tranquillity are only at the turn of the ebb and flood, and calm weather: and laſt but a quarter of an hour, its violence gradually returning. When the ſtream is moſt boiſterous, and its fury heightened by a ſtorm, it is dangerons to come within a Norway mile of it; boats, ſhips, and yachts having been carried away, by not guarding againſt it before they were within its reach. It likewiſe happens frequently, that whales come too near the ſtream, and are overpowered by its violence; and then it is impoſſible to deſcribe their howlings and bellowings in their fruitleſs ſtruggles to diſengage themſelves. A bear once attempting to ſwim from Lofoden to Moſkoe, with a deſign of preying upon the ſheep at paſture in the iſland, afforded the like ſpectacle to the people; the ſtream caught him, and bore him down, whilſt he roared terribly, ſo as to be heard on ſhore. Large ſtocks of firs and pine trees, after being abſorbed by the current, riſe again, broken and torn to ſuch a degree as if briſtles grew on them. This plainly ſhows the bottom to conſiſt of craggy rocks, among which they are whirled to and fro. This ſtream is regulated by the flux and reflux of the ſea; it being conſtantly high and low water every ſix hours. In the year 1645, early in the morning of Sexageſima Sunday, it raged with ſuch noiſe and impetuoſity, that on the iſland of Moſkoe, the very ſtones of the houſes fell to the ground."

MÆMACTERIA, ſacrifices offered to Jupiter at Athens in the winter month Mæmacterion. The god ſurnamed Mæmactes was intreated to ſend mild and temperate weather, as he preſided over the ſeaſons, and was the god of the air.

MÆMACTERION was the fourth month of the Athenian year, containing twenty-nine days, and anſwering to the latter part of our September, and the beginning of October. It received its name from the feſtival *Memacteria*, which was obſerved about this time. This month was called by the Bœotians *Alalcomenius*.

MÆNA, in ichthyology. See SPARUS.

MÆNALUS (anc. geog.) a mountain of Arcadia ſacred to the god Pan, and greatly frequented by ſhepherds. It received its name from Mænalus a ſon of Lycaon. It was covered with pine trees, whoſe echo and ſhade have have been greatly celebrated by all the ancient poets.

MÆONIA, or MOEONIA, a country of Aſia Minor, and forming part of Lydia; namely the neighbourhood of mount Tmolus, and the country watered by the Pactolus. The reſt on the ſea-coaſt was called Lydia. See LYDIA.

MÆONIDÆ, a name given to the Muſes, becauſe Homer, their greateſt and worthieſt favourite, was ſuppoſed to be a native of Mæonia.

MÆONIDES, a ſurname of Homer, becauſe, according to the opinion of ſome writers, he was born in Mæonia, or becauſe his father's name was Mæon.

MÆOTIS PALUS or LACUS, *Mæotica Palus*, or *Mæoticus Lacus*, (anc. geog.), a large lake or part of the ſea between Europe and Aſia, at the north of the Euxine, to which it communicates by the Cimerian Boſphorus. It was worſhipped as a deity by the Maſſagetæ. It extends about 390 miles from ſouth-weſt to north-eaſt, and is about 600 miles in circumference. Still called *Palus Mæotis*, reaching from Crim Tartary to the mouth of the Don.

MÆSTLIN (Michael), in Latin *Mæſtlinus*, a celebrated aſtronomer of Germany, was born in the duchy of Wittemberg; but ſpent his youth in Italy, where he made a ſpeech in favour of Copernicus's ſyſtem, which brought Galilæo over from Ariſtotle and Ptolemy, to whom he had been hitherto entirely devoted. He afterwards returned to Germany, and became profeſſor of mathematics at Tubingen; where, among his other ſcholars, he taught the great Kepler, who has praiſed ſeveral of his ingenious inventions, in his *Aſtronomia Optica*. Though Tycho Brahe did not aſſent to Mæſtlin's opinion, yet he allowed him to be an extraordinary perſon deeply ſkilled in the ſcience of aſtronomy. Mæſtlin publiſhed many mathematical and aſtronomical works; and died in 1590.

MÆSTRICHT, an ancient large, and ſtrong town of the Netherlands, ceded to the Dutch by the treaty of Munſter. The town-houſe and the other public buildings are handſome, and the place is about four miles in circumference, and ſtrongly fortified. It is governed jointly by the Dutch and the biſhop of Liege; however, it has a Dutch garriſon. The inhabitants are noted for making excellent fire-arms, and ſome ſay that in the arſenal there are arms ſufficient for a whole army. Both Papiſts and Proteſtants are allowed the free exerciſe of their religion, and the magiſtrates are compoſed of both. It is ſeated on the river Maeſe, which ſeparates it from Wyck, and with which it communicates by a handſome bridge. Mæſtricht revolted from the Spaniards in 1570, but was reduced in 1579. Louis XIV. became maſter of it in 1673; but it was reſtored to the ſtates by the treaty of Nimeguen in 1678. E. Long. 5. 50. N. Lat. 51. 5.

MAFFÆUS (Vegio), a Latin poet, born in Lombardy in 1407, was greatly admired in his time. He wrote epigrams, and a humorous ſupplement to Virgil, which he called *The thirteenth book of the Æneid*: this was as humorouſly tranſlated into Engliſh a few years ſince by Mr Ellis. Maffæus wrote alſo ſome proſe works. He was chancellor of Rome towards the end of the pontificate of Martin V.; and died in 1458.

MAFFEI (Scipio), a celebrated Italian poet, born of an illuſtrious and ancient family at Verona, in 1675. After having finiſhed his ſtudies, he took arms, and diſtinguiſhed himſelf by his valour at the battle of Donawert; but he more particularly diſtinguiſhed himſelf by his love of learning, which made him undertake ſeveral voyages into France, England, and Germany. He converſed with the learned in all thoſe countries, and obtained their friendſhip and eſteem. He was a member of the academy of the Arcadia at Rome, an honorary foreign member of that of Inſcriptions at Paris; and died in 1755. He wrote many works in verſe and proſe, which are eſteemed; the moſt known of which are, 1. The tragedy of Merope, of which there are two French tranſlations in proſe. 2. Ceremony, a comedy. 3. A tranſlation, into Italian verſe, of the firſt book of Homer's Iliad. 4. Many other pieces of poetry, in a collection intitled *Rhyme and Proſe*, quarto. His principal works in proſe, are, 1. *Verona illuſtrata*. 2. *Iſtoria diplomatica*. 3. *Scienza cavallereſca*; an excellent work, in which he attacks duelling. 4. An edition of *Theatro Italiano*. 5. An edition of Caſſiodorus on the Epiſtles, Acts of the Apoſtles, and Apocalypſe. 6. *Galliæ antiquitates quædam ſelectæ atque in plures epiſtolas diſtributæ*; and ſeveral other works.

MAGADA, in mythology, a title under which Venus was known and worſhipped in Lower Saxony; where this goddeſs had a famous temple, which was treated with reſpect even by the Huns and Vandals when they ravaged the country. It is ſaid to have been deſtroyed by Charlemagne.

MAGADOXO, the capital town of a kingdom of the ſame name, in Africa, and on the coaſt of Ajan. It is ſeated near the mouth of a river of the ſame name, defended by a citadel, and has a good harbour. The inhabitants are Mahometans. E. Long. 45. 15. N. Lat. 3. 0.

MAGAS, Magadis, (from μαγαδιζειν "to ſing or play in uniſon or octave,") the name of a muſical inſtrument in uſe among the ancients.

There were two kinds of *magades*, the one a ſtring inſtrument, formed of 20 chords arranged in pairs, and tuned to uniſon or octave, ſo that they yielded ten ſounds; the invention whereof is aſcribed by ſome to Sappho; by others, to the Lydians; and by ſome, to Timotheus of Miletus. The other was a kind of flute, which at the ſame time yielded very high and very low notes. The former kind was at leaſt much improved by Timotheus of Miletus, who is ſaid to have been impeached of a crime, becauſe by increaſing the number of chords he ſpoiled and diſcredited the ancient muſic.

MAGAZINE, a place in which ſtores are kept, of arms, ammunition, proviſions, &c. Every fortified town ought to be furniſhed with a large magazine, which ſhould contain ſtores of all kinds, ſufficient to enable the garriſon and inhabitants to hold out a long ſiege; and in which ſmiths, carpenters, wheel-wrights, &c. may be employed in making every thing belonging to the artillery; as carriages, waggons, &c.

Powder Magazine, is that place where the powder is kept in very large quantities. Authors differ greatly both with regard to the ſituation and conſtruction; but all agree, that they ought to be arched and bomb-proof. In fortifications, they are frequently placed in the rampart; but of late they have been built in different parts of the town. The firſt powder-magazines were made with Gothic arches: but M. Vauban finding them too weak, conſtructed them in a ſemicircular form; whoſe dimenſions are 60 feet long within, 25 broad; the foundations are eight or nine feet thick, and eight feet high from the foundation to the ſpring of the arch; the floor is two feet from the ground, which keeps it from dampneſs.

One of our engineers of great experience ſome time ſince had obſerved, that after the centres of ſemicircular arches are ſtruck, they ſettle at the crown and riſe up at the hanches, even with a ſtraight horizontal extrados, and ſtill much more ſo in powder-magazines, whoſe outſide at top is formed like the roof of a houſe, by two inclined planes joining in an angle over the top of the arch, to give a proper deſcent to the rain; which effects are exactly what might be expected agreeable to the true theory of arches. Now, as this ſhrinking of the arches muſt be attended with very ill conſequences, by breaking the texture of the cement after it has been in ſome degree dried, and alſo by opening the joints of the vouſſoirs at one end, ſo a remedy is provided for this inconvenience with regard to bridges, by the *arch of equilibration* in Mr Hutton's book on bridges; but as the ill effect is much greater in powder-magazines, the ſame ingenious gentleman propoſed to find an arch of equilibration for them alſo, and to conſtruct it when the ſpan is 20 feet, the pitch or height 10 (which are the ſame dimenſions as the ſemicircle), the inclined exterior walls at top forming an angle of 113 degrees, and the height of their angular point above the top of the arch equal to ſeven feet. This very curious queſtion was anſwered in 1775 by the reverend Mr Wildbore, to be found in Mr Hutton's *Miſcellanea Mathematica*.

Artillery Magazine. In a ſiege, the magazine is made about 25 or 30 yards behind the battery, towards the parallels, and at leaſt three feet underground, to hold the powder, loaded ſhells, port fires, &c. Its ſides and roof muſt be well ſecured with boards to prevent the earth from falling in: a door is made to it, and a double trench or paſſage is ſunk from the magazine to the battery, one to go in and the other to come out at, to prevent confuſion. Sometimes traverſes are made in the paſſages to prevent ricochet ſhot from plunging into them.

Magazine, on ſhip-board, a cloſe room or ſtorehouſe, built in the fore or after part of the hold, to contain the gunpowder uſed in battle. This apartment is ſtrongly ſecured againſt fire, and no perſon is allowed to enter it with a lamp or candle: it is therefore lighted, as occaſion requires, by means of the candles or lamps in the *light-room* contiguous to it.

Magazine *Air-Gun*. See Air-*Gun*.

Magazines *(Literary)*; a well known ſpecies of periodical publications, of which the firſt that appeared was *The Gentleman's*, ſet on foot by the inventor Mr Edward Cave in the year 1731: (ſee the article Cave). This, as Dr Kippis obſerves*, "may be conſidered as ſomething of an epocha in the literary hiſtory of this country. The periodical performances before that time were almoſt wholly confined to political tranſactions, and to foreign and domeſtic occurrences; but the monthly magazines have opened a way for every kind of inquiry and information. The intelligence and diſcuſſion contained in them are very extenſive and various; and they have been the means of diffuſing a general habit of reading through the nation, which in a certain degree hath enlarged the public underſtanding. Many young authors, who have afterwards riſen to conſiderable eminence in the literary world, have here made their firſt attempts in compoſition. Here too are preſerved a multitude of curious and uſeful hints, obſervations, and facts, which otherwiſe might have never appeared; or if they had appeared in a more evaneſcent form, would have incurred the danger of being loſt. If it were not an invidious taſk, the hiſtory of them would be no incurious or unentertaining ſubject. The magazines that unite utility with entertainment, are undoubtedly preferable to thoſe *(if there have been any ſuch)* which have only a view to idle and frivolous amuſement. It may be obſerved, that two of them, *The Gentleman's* and *The London*, which laſt was begun the year after the former, have amidſt their numerous rivals preſerved their reputation to the preſent day. They have both of them, in general, joined inſtruction with pleaſure; and this likewiſe hath been the caſe with ſome others of a later origin."—The original London Magazine, it is believed, has been diſcontinued for ſome years paſt.—The next oldeſt publication of this kind is that intitled *The Scots Magazine*; which was commenced at Edinburgh a few years poſterior to the appearance of the *Gentleman's* at London; which, like it, has ſurvived many rivals; and which ſtill ſubſiſts, deſervedly eſteemed for the chaſteneſs of its plan and the accuracy of its information.

MAGDALEN (Mary.) See Mary.

Religious of St Magdalen, a denomination given to divers communities of nuns, conſiſting generally of pe-

---

* *Biog. Brit.* vol. iii. art. Cave.

nitent courtezans; ſometimes alſo called *Magdalanettes.* Such are thoſe at Metz, eſtabliſhed in 1452; thoſe at Paris, in 1492; thoſe at Naples, firſt eſtabliſhed in 1324, and endowed by Queen Sancha, to ſerve as a retreat for public courtezans, who ſhould betake themſelves to repentance; and thoſe of Rouen and Bourdeaux, which had their original among thoſe of Paris in 1618. In each of theſe monaſteries there are three kinds of perſons and congregations; the firſt conſiſt of thoſe who are admitted to make vows, and theſe bear the name of *St Magdalen;* the congregation of St Martha is the ſecond, and is compoſed of thoſe whom it is not judged proper to admit to vows; finally, the congregation of St Lazarus is compoſed of ſuch as are detained there by force.

The religious of St Magdalen at Rome were eſtabliſhed by Pope Leo X. Clement VIII. ſettled a revenue on them; and farther appointed, that the effects of all public proſtitutes, dying inteſtate, ſhould fall to them; and that the teſtaments of the reſt ſhould be invalid unleſs they bequeathed a portion of their effects, which was to be at leaſt a fifth part, to them.

Magdalen-Hoſpital. See London, n° 115.

MAGDALENA, one of the Marqueſas iſlands, about five leagues in circuit, and ſuppoſed to be in S. Lat. 10. 25. W. Long. 138. 50. It was only ſeen at nine leagues diſtance by thoſe who diſcovered it.

MAGDALENE's Cave, a cave of Germany, and in Carinthia, 10 miles eaſt of Gortz. It appears like a chaſm in a rock, and at the entrance torches are lighted to conduct travellers. It is divided into ſeveral apartments, or halls, with a vaſt number of pillars formed by nature, which give it a beautiful appearance; they being as white as ſnow, and almoſt tranſparent. The bottom is of the ſame ſubſtance, inſomuch that a perſon may fancy himſelf to be walking among the ruins of an enchanted caſtle, ſurrounded with magnificent pillars, ſome entire and others broken.

MAGDEBURG, a duchy of Germany, in the circle of Lower Saxony; bounded on the north by the duchy of Mecklenburgh, on the ſouth and ſouthweſt by the principality of Anhalt and Halberſtadt, on the eaſt by Upper Saxony with part of Brandenburg, and on the weſt by the duchy of Wolfenbuttle. The Saale circle, and that of Luxkenwalde, are ſeparated from the reſt, and ſurrounded on all ſides by a part of Upper Saxony. This country is, for the moſt part, level; but ſandy, marſhy, or overgrown with woods. There are ſalt ſprings in it ſo rich, that they are ſufficient to ſupply all Germany with that commodity. The Holz circle is the moſt fruitful part of it. In the Saale circle, where wood is ſcarce, there is pit-coal: and at Rothenburg is a copper-mine worked. The duchy is well watered, for the Elbe paſſes through it; and the Saale, Havel, Aller, Ohre, and Elſter, either riſe in, or waſh ſome part of it in their courſe. The whole duchy, excluſive of that part of the county of Mansfeldt which is connected with it, is ſaid to contain 29 cities, ſix towns, about 430 villages, and 330,000 inhabitants. The ſtates of the country conſiſt of the clergy, the nobility, and deputies of the cities. Before it became ſubject to the electoral houſe of Brandenburg, frequent diets were held in it; but at preſent no diets are held, nor have the ſtates the direction of the finances as formerly. Before the Reformation, it was an archbiſhopric, ſubject in ſpirituals to the pope alone, and its prelate was primate of all Germany; but embracing the Reformation, it choſe itſelf adminiſtrators, till the treaty of Munſter in 1648, when it was given, together with the biſhopric of Halberſtadt, to the elector of Brandenburg, as an equivalent for the Hither Pomerania, granted by that treaty to the king of Sweden. Lutheraniſm is the predominant religion here; but Calviniſts, Jews, and Roman-catholics, are tolerated. Of the laſt there are five convents, who never embraced the Reformation. All the Lutheran pariſhes, amounting to 314, are ſubject to 16 inſpectors, under one general ſuperintendant; only the clergy of the old town of Magdeburg are under the direction of their ſenior. The Jews have a ſynagogue at Halle. The manufactures of the duchy are cloth, ſtuffs, ſtockings, linen, oil-ſkins, leather, and parchment; of which, and grain of all ſorts, large quantities are exported. The arms of it are, Party per pale, ruby, and pearl. The king of Pruſſia, as duke of Magdeburg, ſits and votes between the elector of Bavaria, as duke of Bavaria, and the elector palatine, as palſgrave of Lautern. Of the ſtates of the circle of Lower Saxony he is the firſt. His matricular aſſeſſment for the duchy is 43 horſe and 196 foot, or 1300 florins monthly; and to the chamber of Witzlar 343 florins and 40 kruitzers. For the civil government of the duchy there is a council of regency, with a war and demeſne chamber; and for the eccleſiaſtical, a conſiſtory, and general ſuperintendant. The revenues of the duchy, ariſing from the ſalt-works, demeſnes, and taxes, ſome of which are very heavy and oppreſſive, are ſaid to amount to 800,000 rixdollars annually. With reſpect to ſalt, every houſekeeper in the Pruſſian dominions is obliged to buy a certain quantity for himſelf and wife; and alſo for every child and ſervant, horſe, cow, calf, and ſheep, that he poſſeſſes. The principal places are Magdeburg, Halle, and Glauche.

Magdeburg, a city of Germany, in a duchy of the ſame name, of which it is not only the capital, but that of all Lower Saxony, and formerly even of all Germany. It ſtands on the Elbe, in E. Long. 12. 9. N. Lat. 52. 16. It is a city of great trade, ſtrongly fortified, and very ancient. Its name ſignifies the *maiden city*; which, ſome imagine, took its riſe from the temple of Venus, which is ſaid to have ſtood here anciently, and to have been deſtroyed by Charlemagne. The founder of the city is ſuppoſed to have been Otho I. or his empreſs Editha, daughter to Edmund the Saxon king of England. The ſame emperor founded a Benedictine convent here, which he afterwards converted into an archbiſhopric, of which the archbiſhop was a count-palatine, and had very great privileges, particularly that of wearing the archiepiſcopal pallium, and having the croſs borne before him, beſides many others. The firſt tournament in Germany is ſaid to have been appointed near this city, by the emperor Henry the Fowler; but theſe paſtimes were afterwards aboliſhed, becauſe they occaſioned ſuch envy and animoſity among the nobility, that ſeveral of them killed one another upon the ſpot. The ſituation of the city is very convenient and pleaſant, upon the banks of the Elbe, amidſt ſpacious fruitful plains, and on the road betwixt High and Low Germany. It has been a great ſufferer by fires and ſieges; but by none ſo much as that in 1631, when the emperor's general, count Tilly, took it by ſtorm, plundered and ſet it on fire, by which it was entirely reduced to aſhes, except the cathedral, the convent of our Lady, and a few cottages belonging to fiſhermen; of 40,000 burghers, not above 400 eſcaping. The ſoldiers ſpared neither age nor ſex; but ripped up women with child, murdered ſucking infants in ſight of their parents, and raviſhed young women in the ſtreets; to prevent which violation, many of them flung themſelves into the Elbe, and others into the fire. The city is now populous, large, and well built, particularly the broad ſtreet and cathedral-ſquare. The principal buildings are the king's palace, the governor's houſe, the armoury, guild-hall, and cathedral. The laſt is a ſuperb ſtructure in the antique taſte, dedicated to St Maurice, which has a fine organ, the maſter-pipe of which is ſo big, that a man can ſcarce claſp it with both arms; it alſo contains the tombs of the emperor Otho and the empreſs Editha; a fine marble ſtatue of St Maurice, a porphyry font, an altar in the choir of one ſtone of divers colours, curiouſly wrought, and many other curioſities. They ſhow here a bedſtead and table which belonged to Martin Luther, when he was an Auguſtine friar in a cloyſter of this city before the Reformation. Among the relicts, they pretend to have the baſon in which Pilate waſhed his hands after his condemnation of our Saviour; the lantern which Judas made uſe of when he apprehended him; and the ladder on which the cock crowed after St Peter denied him. The chapter conſiſts of a provoſt, 16 major and ſeven minor canons; beſides which, there are four other Lutheran collegiate foundations, and a Lutheran convent dedicated to our Lady, in which is a ſchool or ſeminary. Here is alſo a gymnaſium, with an academy, in which young gentlemen are inſtructed in the art of war. The canons of the chapter, which, except the change of religion, is upon the ſame footing as before the Reformation, muſt make proof of their nobility. The prebends and dignities are all in the gift of the elector; and the revenue of the provoſt is computed at 12,000 crowns a-year. Here is a great trade, and a variety of manufactures. The chief are thoſe of woollen cloths and ſtuffs, ſilks, cottons, linen, ſtockings, hats, gloves, tobacco and ſnuff. The city was formerly one of the Hanſe and Imperial towns. Editha, conſort to Otho I. on whom it was conferred as a dowry, among many other privileges and advantages, procured it the grant of a yearly fair. The bargravate of this city was anciently an office of great power; having the civil and criminal juriſdiction, the office of hereditary cup-bearer being annexed to it; and was long held as a fief of the archbiſhopric, but afterwards became an imperial fief, which was again conferred on the archbiſhopric by the elector of Saxony, upon certain conditions.

MAGDOLUM, or MAGDALUM (anc. geog.), a town of the Lower Egypt, twelve miles to the ſouth of Peluſium (Herodotus, Antonine), which doubtleſs is the Migdol or Magdol of Jeremiah.—Another MAGDALUM, or MIGDOL, denoting literally "a tower or place of ſtrength," near the Red Sea, (Moſes); far to the ſouth of the former.

MAGELLAN (Ferdinand), a celebrated Portugueſe mariner in the 16th century. He being diſſatiſfied with the king of Portugal, went into the ſervice of the emperor Charles V. and failed from Seville with five veſſels in 1519, when he diſcovered and paſſed the ſtrait to which he gave his own name, and ſailed through the South Sea to the Ladrone Iſlands, when, according to ſome authors, he was poiſoned in 1520; though others ſay that he was killed in a mutiny of his people in the iſland of Mutan, on account of his ſeverity. His voyage round the world was written by one on board, and has been frequently printed in Engliſh. His ſuddenly converting to the Chriſtian religion people whoſe language was unknown to him, as his was to them, is an abſurdity that diſcredits this work.

Straits of MAGELLAN, a narrow paſſage between the iſland of Terra del Fuego and the ſouthern extremity of the continent of America. This paſſage was firſt diſcovered by Ferdinand Magellan, who ſailed through it into the South Sea, and from thence to the Eaſt Indies. Other navigators have paſſed the ſame way; but as theſe ſtraits are exceedingly difficult, and ſubject to ſtorms, it has been common to ſail by Cape Horn, rather than through the Straits of Magellan. See *Straits Le MAIRE*, and *TERRA del Fuego*.

MAGELLANIC-CLOUDS, whitiſh appearances like clouds, ſeen in the heavens towards the ſouth pole, and having the ſame apparent motion as the ſtars. They are three in number, two of them near each other. The largeſt lies far from the ſouth pole; but the other two are not many degrees more remote from it than the neareſt conſpicuous ſtar, that is, about 11 degrees. Mr Boyl conjectures, that if theſe clouds were ſeen through a good teleſcope, they would appear to be multitudes of ſmall ſtars, like the milky-way.

MAGGI (Jerome), in Latin *Magius*, one of the moſt learned men of the 16th century, was born at Anghiari in Tuſcany. He applied himſelf to all the ſciences, and even to the art of war; and diſtinguiſhed himſelf ſo much in this laſt ſtudy, that the Venetians ſent him into the iſland of Cyprus in quality of judge of the admiralty. When the Turks beſieged Famaguſta, he performed all the ſervices that could be expected from the moſt excellent engineer: he invented mines and machines for throwing fire, by means of which he deſtroyed all the works of the beſiegers, and in an inſtant overthrew what had coſt the Turks infinite labour. But they had their revenge; for, taking the city in 1571, they plundered his library, carried him loaded with chains to Conſtantinople, and treated him in the moſt inhuman and barbarous manner. He nevertheleſs comforted himſelf from the example of Æſop, Menippus, Epictetus, and other learned men; and, after paſſing the whole day in the meaneſt drudgery, he ſpent the night in writing. He compoſed, by the help of his memory alone, treatiſes filled with quotations, which he dedicated to the Imperial and French ambaſſadors. Theſe miniſters, moved by compaſſion for this learned man, reſolved to purchaſe

Maggot.

Maggot, Magi.

him: but while they were treating for his ranſom, Maggi found means to make his eſcape, and to get to the Imperial ambaſſador's houſe; when the Grand Vizir being enraged at his flight, and remembering the great miſchief he had done the Turks during the ſiege of Famaguſta, ſent to have him ſiezed, and cauſed him to be ſtrangled in priſon in 1572. His principal works are, 1. A treatiſe on the bells of the ancients. 2. On the deſtruction of the world by fire. 3. Commentaries on Æmilius Probus's lives of illuſtrious men. 4. Commentaries on the inſtitutes. Theſe works are written in elegant Latin. He alſo wrote a treatiſe on fortification in Italian; and a book on the ſituation of ancient Tuſcany.

He ought not to be confounded with his brother *Bartholomew Maggi*, a phyſician at Bologna, who wrote a treatiſe of gun-ſhot wounds; nor with *Vincent Maggi*, a native of Breſſe, and a celebrated profeſſor of humanity at Ferrare in Padua, who was the author of ſeveral works.

MAGGOT, the common name of the fly-worm bred in fleſh, from the egg of the great blue fleſh-fly. Notwithſtanding the diſtaſte for this animal, its figure and ſtructure of parts are greatly worth attending to; and may ſerve as a general hiſtory of the claſs of worms produced from the eggs of flies.

This animal is white and fleſhy: its body is compoſed of a number of rings, like the bodies of caterpillars and other ſimilar inſects; and is capable, at the pleaſure of the animal, of aſſuming different figures; being at times more or leſs extended in length, and conſequently more or leſs thick.

Notwithſtanding that this animal has no legs, it is able to move itſelf very ſwiftly; and in its firſt attempt to move its body, is extended to its greateſt length, and aſſumes ſomething of the figure of a pointed cone. The pointed part of the cone is the head of the animal, and is not ſeparated from the next ring by any deeper furrow than the reſt of the rings are from one another. In ſome ſtates of the animal, one may ſee two ſhort horns thruſt out from the head; but more generally two ſcaly hooks are obſervable: theſe are, however, ſometimes hid, and have each of them a caſe or ſheath; into which the animal can retract them at pleaſure. Theſe hooks are bent into an arch, the concavity of which is towards the plane on which the creature is placed; and they are thickeſt at their inſertion in the head, and thence diminiſh gradually, till they terminate in a fine ſharp point.

Theſe two hooks are placed in a parallel direction, and can never come together, and therefore cannot ſerve in the place of teeth for grinding the food; but merely to pull and ſever it in pieces, that it may be of a proper ſize for the mouth of the creature. Beſides theſe hooks the maggot has a kind of dart, which is about a third part of their length, and is placed at an equal diſtance between them. This alſo is brown and ſcaly like them; it is quite ſtraight, and terminates in a fine point. The hooks have as it were two ſcaly thorns at their points; and this dart ſeems intended, by reiterated ſtrokes, to divide and break the pieces of fleſh theſe have ſeparated from the reſt into ſmaller parts. Immediately below the apertures for the egreſs of the hooks, is placed the mouth of the animal; the creature does not ſhow this little opening unleſs preſſed: but if the preſſure is properly managed, it will ſufficiently open it, and there may be diſcovered within it a ſmall protuberance, which may very naturally be ſuppoſed either the tongue or the ſucker of the animal. The hooks in theſe creatures not only ſupply the place of teeth, but alſo of legs; ſince it is by faſtening theſe hooks into the ſubſtance it is placed on, and then drawing up its body to it, that it pulls itſelf along.

The back of this creature lowers itſelf by degrees as it approaches the extremity of the belly; and near the place where the back begins to lower itſelf, are placed the creature's two principal organs of reſpiration. One may perceive there two ſmall roundiſh brown ſpots: they are very eaſily diſtinguiſhable by the naked eye, becauſe the reſt of the body of the creature is white; but if we take in the aſſiſtance of glaſſes, each of theſe ſpots appears to be a brown circular eminence raiſed a little above the reſt of the body. On each of theſe ſpots one may alſo diſcover three oblong oval cavities, ſomething of the ſhape of button-holes; theſe are ſituated in a parallel direction to one another, and their length nearly in a perpendicular direction to that of the body of the animal. Theſe apertures are ſo many ſtigmata or air-holes; openings deſtined to admit the air neceſſary to the life of the animal. It has ſix of theſe ſtigmata, three in each ſide of its body.

The great tranſparency of the body of this animal gives us an opportunity alſo to diſtinguiſh that it has on each ſide a large white veſſel running the whole length of the body. It is eaſy to follow the courſe of theſe veſſels through their whole length, but they are moſt diſtinct of all towards its hinder part; and they are always ſeen to terminate each in the brown ſpot above mentioned: this leaves us no room to doubt that they are the two principal tracheæ.

The ramifications of the two great tracheæ are very beautifully ſeen in this creature, eſpecially on its belly: and it is remarkable, that no veſſel analogous to the great artery in the caterpillar claſs can be diſcovered in theſe; though, if there were any ſuch, their great tranſparence muſt needs make them very eaſily diſtinguiſhable; nor could its dilatations and contractions, if ſo conſiderable as in that claſs of animals, be leſs ſo. See Eruca.

Malpighi imagined, that this artery in the caterpillar claſs was a ſeries of hearts; in its place, however, there may be ſeen in theſe animals a true heart. It is eaſy to obſerve in theſe creatures, about the fourth ring of their body, a ſmall fleſhy part, which has alternate contractions and dilatations; and is not only diſcoverable in the body by means of its tranſparence, but on making a proper ſection of them in the ſecond, third, and fourth, will be thrown out of the body of the creature, and continue its beats for ſome time afterwards.

MAGI, or Magians, an ancient religious ſect in Perſia, and other eaſtern countries, who maintained that there were two principles, one the cauſe of all good, the other the cauſe of all evil: and, abominating the adoration of images, they worſhipped God only by fire; which they looked upon as the brighteſt and moſt glorious ſymbol of Oromaſdes, or the good God; as darkneſs is the trueſt ſymbol of Arimanius, or the evil god. This religion was reformed by Zoroaſter, who main-

maintained that there was one ſupreme independent Being; and under him two principles or angels, one the angel of goodneſs and light, and the other of evil and darkneſs: that there is a perpetual ſtruggle between them, which ſhall laſt to the end of the world; that then the angel of darkneſs and his diſciples ſhall go into a world of their own, where they ſhall be puniſhed in everlaſting darkneſs; and the angel of light and his diſciples ſhall alſo go into a world of their own, where they ſhall be rewarded in everlaſting light.

The prieſts of the magi were the moſt ſkilful mathematicians and philoſophers of the ages in which they lived, inſomuch that a learned man and a magian became equivalent terms. The vulgar looked on their knowledge as ſupernatural; and hence thoſe who practiſed wicked and miſchievous arts, taking upon themſelves the name of *magians*, drew on it that ill ſignification which the word magician now bears among us.

This ſect ſtill ſubſiſts in Perſia under the denomination of *gaurs*, where they watch the ſacred fire with the greateſt care, and never ſuffer it to be extinguiſhed.

MAGIC, Magia, Μαγεια, in its ancient ſenſe, the ſcience or diſcipline and doctrine of the magi, or wiſe men of Perſia. See Magi.

The origin of magic and the magi is aſcribed to Zoroaſter. Salmaſius derives the very name from Zoroaſter, who, he ſays, was ſurnamed *Mog*, whence Magus. Others, inſtead of making him the author of the Perſian philoſophy, make him only the reſtorer and improver thereof; alleging, that many of the Perſian rites in uſe among the magi were borrowed from the Zabii among the Chaldeans, who agreed in many things with the magi of the Perſians; whence ſome make the name *magus* common both to the Chaldeans and Perſians. Thus Plutarch mentions, that Zoroaſter inſtituted magi among the Chaldeans, in imitation whereof the Perſians had theirs too.

Magic, in a more modern ſenſe, is a ſcience which teaches to perform wonderful and ſurpriſing effects.

The word *magic* originally carried with it a very innocent, nay, laudable meaning; being uſed purely to ſignify the ſtudy of wiſdom, and the more ſublime parts of knowledge; but in regard the ancient magi engaged themſelves in aſtrology, divination, ſorcery, &c. the term *magic* in time became odious, and was only uſed to ſignify an unlawful and diabolical kind of ſcience, depending on the aſſiſtance of the devil and departed ſouls.

If any wonder how ſo vain and deceitful a ſcience ſhould gain ſo much credit and authority over mens minds, Pliny gives the reaſon of it. It is, ſays he, becauſe it has poſſeſſed itſelf of three ſciences of the moſt eſteem among men; taking from each all that is great and marvellous in it. Nobody doubts but it had its firſt origin in medicine; and that it inſinuated itſelf into the minds of the people, under pretence of affording extraordinary remedies. To theſe fine promiſes it added every thing in religion that is pompous and ſplendid, and that appears calculated to blind and captivate mankind. Laſtly, it mingled judicial aſtrology with the reſt; perſuading people, curious of futurity, that it ſaw every thing to come in the heavens.

Agrippa divides magic into three kinds; natural, celeſtial, and ceremonial or ſuperſtitious.

Natural Magic is no more than the application of natural active cauſes to paſſive ſubjects; by means whereof many ſurpriſing, but yet natural, effects are produced.

In this way many of our experiments in natural philoſophy, eſpecially thoſe of electricity, optics, and magnetiſm, have a kind of magical appearance, and among the ignorant and credulous might eaſily paſs for miracles. Such, without doubt, have been ſome of thoſe miracles wrought by ancient magicians, whoſe knowledge of the various powers of nature, there is reaſon to believe, was much greater than modern vanity will ſometimes allow †.

Baptiſta Porta has a treatiſe of natural magic, or of ſecrets for performing very extraordinary things by natural cauſes. The natural magic of the Chaldeans was nothing but the knowledge of the powers of ſimples and minerals. The magic which they called *theurgia*, conſiſted wholly in the knowledge of the ceremonies to be obſerved in the worſhip of the gods, in order to be acceptable. By virtue of theſe ceremonies they believed they could converſe with ſpiritual beings, and cure diſeaſes.

Celeſtial Magic, borders nearly on judiciary aſtrology: it attributes to ſpirits a kind of rule or dominion over the planets, and to planets a dominion over men; and on thoſe principles builds a ridiculous kind of ſyſtem. See Astrology.

Superſtitious or *Goetic Magic*, conſiſts in the invocation of devils. Its effects are uſually evil and wicked, though very ſtrange, and ſeemingly ſurpaſſing the powers of nature; ſuppoſed to be produced by virtue of ſome compact, either tacit or expreſs, with evil ſpirits: but the truth is, theſe have not all the power that is uſually imagined, nor do they produce thoſe effects ordinarily aſcribed to them.

This ſpecies of magic, there is every reaſon to believe, had its origin in Egypt, the native country of paganiſm. The firſt magicians mentioned in hiſtory were Egyptians; and that people ſo famed for early wiſdom believed not only in the exiſtence of dæmons, the great agents in magic (ſee Dæmon), but alſo that different orders of thoſe ſpirits preſided over the elements of earth, air, fire, and water, as well as over the perſons and affairs of men. Hence they aſcribed every diſeaſe with which they were afflicted to the immediate agency of ſome evil dæmon. When any perſon was ſeized with a fever, for inſtance, they did not think it neceſſary to ſearch for any natural cauſe of the diſeaſe; it was immediately attributed to ſome dæmon which had taken poſſeſſion of the body of the patient, and which could not be ejected but by charms and incantations.

Theſe ſuperſtitious notions, which had ſpread from Egypt over all the eaſt, the Jews imbibed during their captivity in Babylon. Hence we find them in the writings of the New Teſtament attributing almoſt every diſeaſe to which they were incident to the immediate agency of devils (ſee Possession). Many of the ſame impious ſuperſtitions were brought from Egypt and Chaldea by Pythagoras, and tranſmitted by him and his followers to the Platoniſts in Greece. This

---

† See Stillingfleet's *Origines Sacræ*, book ii. c. 2.

is apparent from the writers of the life of Pythagoras. Jamblicus, ſpeaking of the followers of that philoſopher, ſays expreſsly, that they cured certain diſeaſes by incantations; and Porphyry adds, that they cured diſeaſes both of the mind and of the body by ſongs and incantations. This was exactly the practice of the Egyptian prieſts, who were all ſuppoſed to keep up a conſtant intercourſe with dæmons, and to have the power of controuling them by magical charms and ſacred ſongs. Agreeably to this practice of his maſters, we are told that Pythagoras directed certain diſeaſes of the mind, doubtleſs thoſe which he attributed to the agency of dæmons, to be cured partly by *incantations*, partly by *magical hymns*, and partly by *muſic*.—και τας ψυχας δε νοσουντας παρεμυθειτο τους μεν επωδαις και μαγειαις τους δε μουσικη.

That there are different orders of created ſpirits,—whether called dæmons or angels,—whoſe powers intellectual and active greatly ſurpaſs the powers of man, reaſon makes probable, and revelation certain. Now it was the univerſal belief of the ancient nations, ſays the learned Moſheim †, and eſpecially of the orientals, that certain ſounds and words, for the moſt part barbarous, were highly grateful, and that others were equally diſagreeable, to theſe ſpirits. Hence, when they wiſhed to render a dæmon propitious, and to employ him on any particular office, the magicians compoſed their ſacred ſongs of the words which were believed to be agreeable to him; and when it was their intention to drive him from themſelves or others, they ſung in a ſtrain which they fancied a dæmon could not hear but with horror. From the ſame perſuaſion aroſe the cuſtom of ſuſpending from the neck of a ſick perſon, whoſe diſeaſe was ſuppoſed to be inflicted by a dæmon, an amulet, ſometimes made of gold and ſometimes of parchment, on which was written one or more of thoſe words which dæmons could not bear either to hear or to ſee: and in a didactic poem on the healing art ſtill extant, we are taught by *Serenus Sammonicus*, that the word ABRACADABRA is an infallible remedy for a ſemitertian fever or ague; and to baniſh grief of heart, *Marcellinus* thinks nothing more effectual than the word καριαγκων. In more modern times, as we are informed by Agrippa, the words uſed by thoſe in compact with the devil, to invoke him, and to ſucceed in what they undertake, are, *Dies*, *mies*, *jeſquet*, *benedoefet*, *douvima*, *enitemaus*. There are an hundred other formulas of words compoſed at pleaſure, or gathered from ſeveral different languages, or patched from the Hebrew, or formed in imitation of it. And among the primitive Chriſtians there was a ſuperſtitious cuſtom, of which we ſuſpect ſome remains may yet be found among the illiterate vulgar in different countries, of faſtening to the neck of a ſick perſon, or to the bed on which he lay, ſome text from the New Teſtament, and eſpecially the firſt two or three verſes of the goſpel of St John, as a charm undoubtedly efficacious to baniſh the diſeaſe.

That magicians who could thus cure the ſick, were likewiſe believed to have the power of inflicting diſeaſes, and of working miracles, by means of their ſubſervient dæmons, need not be doubted. Ancient writers of good credit are full of the wonders which they performed. We ſhall mention a few of thoſe which are beſt atteſted, and inquire whether they might not have been effected by other means than the interpoſition of dæmons.

The firſt magicians of whom we read are thoſe who in Egypt oppoſed Moſes. And we are told, that, when Aaron caſt down his rod, and it became a ſerpent, they alſo did the like with their inchantments; "for they caſt down every man his rod, and they became ſerpents." This was a phenomenon which, it muſt be confeſſed, had a very miraculous appearance; and yet there ſeems to have been nothing in it which might not have been effected by ſlight of hand. The Egyptians, and perhaps the inhabitants of every country where ſerpents abound, have the art of depriving them of their power to do miſchief, ſo that they may be handled without danger. It was eaſy for the magicians, who were favoured by the court, to pretend that they changed their roads into ſerpents, by dexterouſly ſubſtituting one of thoſe animals in place of the rod. In like manner they might pretend to change water into blood, and to produce frogs; for if Moſes gave in theſe inſtances, as we know he did in others, any previous information of the nature of the miracles which were to be wrought, the magicians might eaſily provide themſelves in a quantity of blood and number of frogs ſufficient to anſwer their purpoſe of deceiving the people. Beyond this, however, their power could not go. It ſtopped where that of all workers in legerdemain muſt have ſtopt—at the failure of proper materials to work with. Egypt abounds with ſerpents; blood could be eaſily procured; and without difficulty they might have frogs from the river: But when Moſes produced lice from the duſt of the ground, the magicians, who had it not in their power to collect a ſufficient quantity of theſe animals, were compelled to own this to be an effect of divine agency.

The appearance of Samuel to Saul at Endor is the next miracle, ſeemingly performed by the power of magic, which we ſhall conſider. It was a common pretence of magicians, that they could raiſe up ghoſts from below, or make dead perſons appear unto them to declare future events; and the manner of their incantation is thus deſcribed by Horace:

> —— Pallor utraſque
> Fecerat horrendas aſpectu. Scalpere terram
> Unguibus, et pullam divellere mordicus agnam
> Cœperunt: cruor in foſſam confuſus, ut inde
> Manes elicerent, animas reſponſa daturas.
>
> "With yellings dire they fill'd the place,
> And hideous pale was either's face.
> Soon with their nails they ſcrap'd the ground,
> And fill'd a magic trench profound
> With a black lamb's thick-ſtreaming gore,
> Whoſe members with their teeth they tore;
> That they might charm the ſprights to tell
> Some curious anecdotes from hell."
>
> FRANCIS.

Whether the witch of Endor made uſe of ſuch infernal charms as theſe, the ſacred hiſtorian has not informed us; but Saul addreſſed her, as if he believed that by ſome form of incantation ſhe could recal from the ſtate of departed ſpirits the ſoul of the prophet who had been for ſome time dead. In the ſubſequent apparition, however, which was produced,

† See his edition of *Cudworth's Intellectual Syſtem*.

ſome have thought there was nothing more than a trick, by which a cunning woman impoſed upon Saul's credulity, making him believe that ſome confident of her own was the ghoſt of Samuel. But had that been the caſe, ſhe would undoubtedly have made the pretended Samuel's anſwer as pleaſing to the king as poſſible, both to ſave her own life, which appears from the context to have been in danger, and likewiſe to have procured the larger reward. She would never have told her ſovereign, ſhe durſt not have told him, that he himſelf ſhould be ſhortly ſlain, and his ſons with him; and that the hoſt of Iſrael ſhould be delivered into the hands of the Philiſtines. For this reaſon many critics, both Jewiſh and Chriſtian, have ſuppoſed that the apparition was really a dæmon or evil angel, by whoſe aſſiſtance the woman was accuſtomed to work wonders, and to foretel future events. But it is ſurely very incredible, that one of the apoſtate ſpirits of hell ſhould have upbraided Saul for applying to a *ſorcereſs*, or ſhould have accoſted him in ſuch words as theſe: "Why haſt thou diſquieted *me*, to bring me up? Wherefore doſt thou aſk of *me*, ſeeing the *Lord* is departed from thee, and is become thine enemy? For the *Lord* hath rent the kingdom out of thine hand, and given it to thy neighbour, even to David. Becauſe thou obeyedſt not the voice of the *Lord*, therefore the *Lord* hath done this thing to thee this day." It is to be obſerved farther, that what was here denounced againſt Saul was really prophetic, and that the event anſwered to the prophecy in every particular. Now, though we do not deny that there are created ſpirits of penetration vaſtly ſuperior to that of the moſt enlarged human underſtanding; yet we dare maintain, that no finite intelligence could by its own mere capacity have ever found out the preciſe time of the two armies engaging, the ſucceſs of the Philiſtines, the conſequences of the victory, and the very names of the perſons that were to fall in battle. Saul and his ſons were indeed men of tried bravery, and therefore likely to expoſe themſelves to the greateſt danger; but after the menaces which he received from the apparition, he would have been impelled, one ſhould think, by common prudence, either to chicane with the enemy, or to retire from the field without expoſing himſelf, his ſons, and the whole army, to certain and inevitable deſtruction; and his acting differently, with the conſequences of his conduct, were events which no limited underſtanding could either foreſee or certainly foretel. If to theſe circumſtances we add the ſuddenneſs of Samuel's appearance, with the effect which it had upon the ſorcereſs herſelf, we ſhall find reaſon to believe, that the apparition was that of no evil dæmon. There is not, we believe, upon record, another inſtance of any perſon's pretending to raiſe a ghoſt from below, without previouſly uſing ſome magical rites or ſome form of incantation. As nothing of that kind is mentioned in the caſe before us, it is probable that Samuel appeared before he was called. It is likewiſe evident from the narrative, that the apparition was not what the woman expected; for we are told, that "when ſhe ſaw Samuel, ſhe cried out for fear." And when the king exhorted her not to be afraid, and aſked what ſhe ſaw, "the woman ſaid, I ſee gods *(elohim)* aſcending out of the earth." Now, had ſhe been accuſtomed to do ſuch feats, and known that what ſhe ſaw was only her ſubſervient dæmon, it is not conceivable that ſhe could have been ſo frightened, or have miſtaken her familiar for *elohim* in any ſenſe in which that word can be taken. We are therefore ſtrongly inclined to adopt the opinion of thoſe who hold that it was Samuel himſelf who appeared and propheſied, not called up by the wretched woman or her demons, but, to her utter confuſion, and the diſgrace of her art, ſent by God to rebuke Saul's madneſs in a moſt affecting and mortifying way, and to deter all others from ever applying to magicians or dæmons for aſſiſtance when refuſed comfort from heaven. For though this hypotheſis may to a ſuperficial thinker ſeem to tranſgreſs the rule of Horace—*Nec deus interſit*, &c.—which is as applicable to the interpretation of ſcripture, as to the introduction of ſupernatural agency in human compoſitions; yet he who has ſtudied the theocratical conſtitution of Iſrael, the nature of the office which was there termed regal, and by what means the adminiſtration was in emergencies conducted, will have a different opinion, and at once perceive the *dignus vindice nodus*.

The ſudden and wonderful deſtruction of the army of Brennus the Gaul, has likewiſe been attributed to magic, or, what in this inquiry amounts to the ſame thing, to the interpoſition of evil ſpirits, whom the prieſts of Apollo invoked as gods. Thoſe barbarians had made an inroad into Greece, and inveſted the temple of Apollo at Delphi, with a view to plunder it of the ſacred treaſure. Their numbers and courage overpowered all oppoſition; and they were juſt upon the point of making themſelves maſters of the place, when, Juſtin informs us, that, to encourage the beſieged, the prieſts and propheteſs "adveniſſe deum *clamant;* eumque ſe vidiſſe deſilientem in templum per culminis aperta faſtigia. Dum omnes opem dei ſuppliciter implorant, juvenem ſupra humanum modum inſignis pulchritudinis, comiteſque ei duas armatas virgines, ex propinquis duabus Dianæ Minervæque ædibus occurriſſe, nec oculis tantum hæc ſe perſpexiſſe; audiſſe etiam ſtridorem arcus, ac ſtrepitum armorum: proinde ne cunctarentur, diis anteſignanis, hoſtem cædere, et victoriæ deorum ſocios ſe adjungere," ſummis obſecrationibus monebant. Quibus vocibus incenſi, omnes certatim in prælium proſiliunt. Præſentiam Dei et ipſi ſtatim ſenſere: nam et terræ motu portio montis abrupta Gallorum ſtravit exercitum, et confertiſſimi cunei non ſine vulneribus hoſtium diſſipati ruebant. Inſecuta deinde tempeſtas eſt, quæ grandine et frigore ſaucios ex vulneribus abſumpſit (A)."

This was unqueſtionably an extraordinary event; and

"(A) Called aloud that the god had arrived: That they had ſeen him leap into the temple through the aperture in the roof: That whilſt they were all humbly imploring his help, a youth of more than human beauty, accompanied by two virgins in armour, had run to their aſſiſtance from the neighbouring temples of Diana and

and it muſt be aſcribed either to the immediate interpoſition of the Supreme Being, to natural means, or to the agency of dæmons: there is no other alternative. But it is altogether incredible that the Supreme Being ſhould have miraculouſly interpoſed to defend the temple of a pagan divinity. It is very difficult to ſuppoſe that an earthquake, produced in the ordinary courſe of nature, ſhould have been foretold by the prieſts, or that it could have happened ſo opportunely for the preſervation of their treaſure from the hands of fierce babarians. Nothing, therefore, it has been ſaid, remains, but either to allow the earthquake to have been produced by evil ſpirits, or to deny the truth of the hiſtorian's relation. But the cataſtrophe of Brennus's army is recorded in the ſame manner by ſo many ancient writers of good credit, that we cannot call in queſtion their veracity: and therefore, being unwilling to admit the agency of dæmons into this affair, it will be incumbent on us to ſhow by what human contrivance it might have been effected; for its arrival at ſo critical a juncture will not eaſily ſuffer us to ſuppoſe it a mere *natural* event.

“ The inclination of a Pagan prieſt (ſays Biſhop Warburton †) to aſſiſt his god in extremity, will hardly be queſtioned; and the inclination of thoſe at *Delphi* was not ill ſeconded by their public management and addreſs. On the firſt rumour of Brennus's march againſt them, they iſſued orders, as from the oracle, to all the region round, forbidding the country people to ſecrete or bear away their wine and proviſions. The effects of this order ſucceeded to their expectations. The half-ſtarved barbarians finding, on their arrival in *Phocis*, ſo great a plenty of all things, made ſhort marches, diſperſed themſelves over the country, and revelled in the abundance that was provided for them. This reſpite gave time to the friends and allies of the god to come to his aſſiſtance. Their advantages of ſituation likewiſe ſupported the meaſures which they had taken for a vigorous defence. The town and temple of Delphi were ſeated on a bare and cavernous rock, defended on all ſides with precipices inſtead of walls. A large receſs within aſſumed the form of a theatre; ſo that the ſhouts of ſoldiers, and the ſounds of military inſtruments, re-echoing from rock to rock, and from cavern to cavern, increaſed the clamour to an immenſe degree; which, as the hiſtorian obſerves, could not but have great effects on ignorant and barbarous minds. The playing off theſe panic terrors was not indeed of itſelf ſufficient to repulſe and diſſipate a hoſt of fierce and hungry invaders, but it enabled the defenders to keep them at bay till a more ſolid entertainment was provided for them, in the *exploſion* and fall of that portion of the rock at the foot of which the greater part of the army lay encamped.

“ Among the caverns in the ſacred rock, there was one which, from an intoxicating quality diſcovered in the ſteam which iſſued from it, was rendered very famous by being fitted to the recipient of the prieſteſs of Apollo (A). Now, if we only ſuppoſe this, or any other of the vapours emitted from the numerous fiſſures, to be endowed with that unctuous, or otherwiſe inflammatory quality, which modern experience ſhows to be common in mines and ſubterraneous places, we can eaſily conceive how the prieſts of the temple might, without the agency of dæmons, be able to work the wonders which hiſtory ſpeaks of as effected in this tranſaction. For the throwing down a lighted torch or two into a chaſm whence ſuch a vapour iſſued, would ſet the whole into a flame; which, by ſuddenly rarifying and dilating the air, would, liked fired gun-powder, blow up all before it. That the prieſts, the guardians of the rock, could be long ignorant of ſuch a quality, or that they would divulge it when diſcovered, cannot be ſuppoſed. Strabo relates, that one *Onomarchus*, with his companions, as they were attempting by night to dig their way through to rob the holy treaſury, were frightened from their work by the violent ſhaking of the rock; and he adds, that the ſame phenomenon had defeated many other attempts of the like nature. Now, whether the tapers which *Onomarchus* and his companions were obliged to uſe while they were at work, inflamed the vapour, or whether the prieſts of Apollo heard them at it, and ſet fire to a countermine, it is certain a quality of this kind would always ſtand them in ſtead. Such then (preſumes the learned prelate) was the expedient (B) they employed to diſlodge this neſt of hornets, which had ſettled at the foot of their ſacred rock; for the ſtorm of thunder, lightning, and hail, which followed, was the natural effect of the violent concuſſions given to the air by the exploſion of the mine.”

Two inſtances more of the power of ancient magic we ſhall juſt mention, not becauſe there is any thing

† *Julian*.

---

and Minerva; and that they had not only beheld theſe things with their eyes, but had alſo heard the whizzing of his bow and the clangor of his arms. They therefore earneſtly exhorted the beſieged not to neglect the heavenly ſignal, but to ſally out upon their enemies, and partake with the divinities of the glory of the victory.” With theſe words the ſoldiers being animated, eagerly ruſhed to battle: and were themſelves quickly ſenſible of the preſence of the god; for part of the rock being torn away by an earthquake, rolled down upon the Gauls; whoſe thickeſt battalions being thus thrown into confuſion, fled, expoſed to the weapons of their enemies. Soon afterwards a tempeſt aroſe, which by cold and the fall of hailſtones cut off the wounded.

(A) “ In hoc rupis anfractu, media ferme montis altitudine, planities exigua eſt, atque in ea profundum terræ foramen, quod in oraculo patet, ex quo frigidus ſpiritus, vi quadam velut vento in ſublime expulſus, mentes vatum in vecordiam vertit, impletaſque deo reſponſa conſulentibus dare cogit.” JUST. lib. 24. c. 10.

(B) The learned author, by arguments too tedious to be here enumerated, confirms the reaſoning which we have borrowed from him; and likewiſe ſhows from hiſtory, that the prieſts, before they came to extremities with the ſacred rock, had entered into treaty with thoſe barbarians, and paid them a large tribute to decamp and quit the country. This adds greatly to the probability of his account of the exploſion; for nothing but the abſolute impoſſibility of getting quit of their beſiegers by any other means, could have induced the prieſts to hazard an experiment ſo big with danger to themſelves as well as to their enemies.

thing particular or important in the facts, but becauſe ſome credit ſeems to have been given to the narration by the diſcerning Cudworth. Philoſtratus, in his life of Apollonius Tyanæus, informs us, that a *laughing Dæmoniac* at Athens was cured by that magician, who ejected the evil ſpirit by threats and menaces; and the biographer adds, that the dæmon, at his departure, is ſaid to have overturned a ſtatue which ſtood before the porch where the cure was performed. The other inſtance is of the ſame magician freeing the city of Epheſus from the *plague* by ſtoning to death an old ragged beggar whom Apollonius called the *plague*, and who appeared to be a *dæmon* by his changing himſelf into the form of a *ſhagged dog*.

That ſuch tales as theſe ſhould have been thought worthy of the ſlighteſt notice by the incomparable author of the Intellectual Syſtem, is indeed a wonderful phænomenon in the hiſtory of human nature. The whole ſtory of Apollonius Tyanæus, as is now well known, is nothing better than a collection of the moſt extravagant fables ‡: but were the narrative ſuch as that credit could be given to the facts here related, there appears no neceſſity in either caſe for calling in the agency of evil ſpirits by the power of magic.—The Athenians of that age were a ſuperſtitious people. Apollonius was a ſhrewd impoſtor, long practiſed in the art of deceiving the multitude. For ſuch a man it was eaſy to perſuade a friend and confidant to act the part of the *laughing dæmoniac*; and without much difficulty the ſtatue might be ſo undermined as inevitably to tumble upon a violent concuſſion being given to the ground at the time of the departure of the pretended dæmon. If ſo, this feat of magic dwindles down into a very trifling trick performed by means both ſimple and natural. The other caſe of the poor man at Epheſus, who was ſtoned to death, is exactly ſimilar to that of thoſe innocent women in our own country, whom the vulgar in the laſt century were inſtigated to burn for the ſuppoſed crime of witchcraft. We have no reaſon to ſuppoſe that an Epheſian mob was leſs inflammable or credulous than a Britiſh mob, or that Apollonius played his part with leſs ſkill than a Chriſtian dæmonologiſt: and as the ſpirits of our witches, who were ſacrificed to folly and fanaticiſm, were often ſuppoſed to migrate from their dead bodies into the bodies of *hares* or *cats* accidentally paſſing by, ſo might this impoſtor at Epheſus perſuade his cruel and credulous inſtruments, that the ſpirit of their victim had taken poſſeſſion of the body of the *ſhagged dog*.

Still it may be ſaid, that in *magic* and *divination* events have been produced out of the ordinary courſe of nature; and as we cannot ſuppoſe the Supreme Being to have countenanced ſuch abominable practices by the interpoſition of his power, we muſt neceſſarily attribute thoſe effects to the agency of dæmons, or evil ſpirits. Thus, when Æneas conſulted the Sybil, the agency of the inſpiring god changed her whole appearance:

————"Poſcere fata
Tempus," ait: "Deus, ecce, Deus." Cui talia fanti
Ante fores, ſubito non vultus, non color unus,
Non comptæ manſêre comæ: ſed pectus anhelum,
Et rabie fera corda tument; majorque videri,
Nec mortale ſonans: afflata eſt numine quando
Jam propiore Dei.————

————"Aloud ſhe cries,
"This is the time, inquire your deſtinies.
He comes, behold, a god!" Thus while ſhe ſaid,
And ſhivering at the ſacred entry ſtaid,
Her colour chang'd, her face was not the ſame,
And hollow groans from her deep ſpirit came:
Her hair ſtood up; convulſive rage poſſeſs'd
Her trembling limbs, and heav'd her lab'ring breaſt;
Greater than human kind ſhe ſeem'd to look,
And with an accent more than mortal ſpoke.
Her ſtaring eyes with ſparkling fury roll,
When all the God came ruſhing on her ſoul."

DRYDEN.

In anſwer to this, it is to be obſerved, that the temple of Apollo at Cumæ was an immenſe excavation in a ſolid rock. The rock was probably of the ſame kind with that on which the temple of Delphi was built, full of fiſſures, out of which exhaled perpetually a poiſonous kind of vapour. Over one of theſe fiſſures was the tripod placed, from which the prieſteſs gave the oracle. Now we learn from St Chryſoſtom, that the prieſteſs was a woman: "Quæ in tripodes ſedens expanſa malignum ſpiritum per interna immiſſum, et per genitales partes ſubeuntem excipiens, furore repleretur, ipſaque reſolutis crinibus baccharetur, ex ore ſpumam emittens, et ſic furoris verba loquebatur." By comparing this account with that quoted above from Juſtin, which is confirmed both by Pauſanias and by Strabo, it is evident, that what Chryſoſtom calls *malignum ſpiritum* was a particular kind of vapour blown forcibly through the fiſſure of the rock. But if there be a vapour of ſuch a quality as, if received *per partes genitales*, would make a woman furious, there is ſurely no neceſſity for calling into this ſcene at Cumæ the agency of a dæmon or evil ſpirit. Beſides, it is to be remembered, that in all myſtical and magical rites, ſuch as this was, both the prieſts and the perſons conſulting them prepared themſelves by particular kinds of food, and ſometimes, as there is reaſon to believe, by human ſacrifices ‡, for the approach of the god or dæmon whoſe aid they invoked. On the preſent occaſion, we know from the poet himſelf, that a cake was uſed which was compoſed of poppy-ſeed and honey; and Plutarch ſpeaks of a ſhrub called *leucophyllus*, uſed in the celebration of the myſteries of Hecate, which drives men into a kind of frenzy, and makes them confeſs all the wickedneſs which they had done or intended. This being the caſe, the illuſions of fancy occaſioned by poppy will ſufficiently account for the change of the ſybil's appearance, even though the inhaled vapour ſhould not have poſſeſſed that efficacy which Chryſoſtom and Juſtin attribute to it. Even ſome ſorts of our ordinary food occaſion ſtrange dreams, for which onions in particular are remarkable. Exceſſive drunkenneſs, as is well known, produces a diſorder named by the bacchanalians of this country *the blue devils*, which conſiſts of an immenſe ſucceſſion of ſpectres, accompanied with extreme horror to the perſon who ſees them. From theſe facts, which cannot be denied, there muſt ariſe a ſuſpicion, that by uſing very unnatural food, ſuch as human blood, the vileſt of inſects,

ſerpents, and medicated cakes, by ſhutting themſelves up in ſolitudes and caves, and by deviſing every method to excite horrid and dreadful ideas or images in the fancy, the ancient magicians might by natural means produce every phenomenon which they attributed to their gods or dæmons. Add to this, that in ancient times magic was ſtudied as a ſcience. Now, as we cannot ſuppoſe that every one who ſtudied it intended abſolutely nothing, or that all who believed in it were *wholly* deceived; what can we infer, but that the ſcience conſiſted in the knowledge of thoſe drugs which produced the phantoms in the imagination, and of the method of preparing and properly employing them for that purpoſe? The celebrated Friar Bacon indeed, as far back as the 13th century, wrote a book *de Nullitate Magiæ:* but though we ſhould allow that this book proved to demonſtration, that in his time no ſuch thing as magic exiſted, it never could prove that the caſe had always been ſo. At that time almoſt all the ſciences were loſt; and why not magic as well as others? It is likewiſe an undoubted fact, that magic at all times prevailed among the Aſiatics and Africans more than among the Europeans. The reaſon doubtleſs was, that the former had the requiſites for the art in much greater perfection than we. Human ſacrifices were frequent among them; they had the moſt poiſonous ſerpents, and the greateſt variety of vegetable poiſons, together with that powerful narcotic opium; all which were of eſſential uſe in myſtical and magic rites. They had, beſides, a burning ſun, frightful deſarts and ſolitudes; which, together with extreme faſting, were all called into their aſſiſtance, and were ſufficient to produce, by natural means, the moſt wonderful phenomena which have ever been attributed to magical incantations. Even in our own days, we have the teſtimony of two travellers, whom we cannot ſuſpect to be either liars or enthuſiaſts, that both the Indians and Africans perform feats for which neither they nor the moſt enlightened Europeans can account. The one is Mr Groſe, who viſited the Eaſt Indies about the year 1762; and the other is Mr Bruce, who informs us, that the inhabitants of the weſtern coaſt of Africa pretend to hold a communication with the devil, and verify their aſſertions in ſuch a manner that neither he nor other travellers know what to make of it: but it does not from this follow, that Mr Bruce believed that communication to be real. We have all ſeen one of the moſt illiterate men that ever aſſumed the title of *Doctor*, perform feats very ſurpriſing, and ſuch as even a philoſopher would have been puzzled to account for, if he had not been previouſly let into the ſecret; and yet no man ſuppoſes that *Katterfelto* holds any communication with the devil, although he has ſometimes pretended it among people whoſe minds he ſuppoſed unenlightened.

Still it may be objected, that we have a vaſt number of hiſtories of witches, who in the laſt century confeſſed, that they were preſent with the devil at certain meetings; that they were carried through the air, and ſaw many ſtrange feats performed, too numerous and too ridiculous to be here mentioned. The beſt anſwer to this objection ſeems to be that given by Dr Ferrier in his eſſay on Popular Illuſions *. "The ſolemn meeting of witches (ſays he) are ſuppoſed to be put beyond all doubt by the numerous confeſſions of criminals, who have deſcribed their ceremonies, named the times and places of their meetings with the perſons preſent, and who have agreed in their relations, though ſeparately delivered. But I would obſerve, firſt, that the circumſtances told of thoſe feſtivals are in themſelves ridiculous and incredible; for they are repreſented as gloomy and horrible, and yet with a mixture of childiſh and extravagant fancies, more likely to diſguſt and alienate than conciliate the minds of their gueſts. They have every appearance of uneaſy dreams. Sometimes the devil and his ſubjects *ſay maſs*; ſometimes he *preaches* to them; more commonly he was ſeen in the form of a *black goat*, ſurrounded by imps in a thouſand frightful ſhapes; but none of theſe forms are *new*, they all reſemble known quadrupeds or reptiles. Secondly, I obſerve, that there is direct proof furniſhed even by demonologiſts, that *all* thoſe ſuppoſed journeys and entertainments were nothing more than dreams. Perſons accuſed of witchcraft have been repeatedly watched about the time they had fixed for their meeting: they have been ſeen to anoint themſelves with ſoporific compoſitions; after which they fell into profound ſleep; and on awaking ſeveral hours afterwards, they have related their journey through the air, with their amuſement at the feſtival, and have named the perſons whom they ſaw there." This is exactly conformable to the practice of the ancient magicians and diviners, and ſeems to be the true way of accounting, as well for many of the phenomena of magic, as for that extravagant and ſhameful ſuperſtition which prevailed ſo much during part of the laſt century, and by which ſuch numbers of innocent men and women were cruelly put to death (c). We may indeed be aſſured, that the devil has it not in his power to reverſe in a ſingle inſtance the laws of nature without a divine permiſſion; and we can conceive but one occaſion (ſee POSSESSION) on which ſuch permiſſion could be given conſiſtently with the wiſdom and the goodneſs of God. All the tales, therefore, of diabolical agency in magic and witchcraft muſt undoubtedly be falſe; for a power which the devil is not himſelf at liberty to exert, he cannot communicate to a human creature. Were the caſe otherwiſe; were thoſe powers, "which (according to Johnſon) only the controul of Omnipotence reſtrains from laying creation waſte, ſubſervient to the invocations of wicked mortals; were thoſe ſpirits,—

——of which the leaſt could wield
The elements, and arm him with the force
Of all their regions,"——permitted to work miracles, and either to inflict or to remove diſeaſes at the deſire of their capricious votaries, how comfortleſs and wretched would be the life of men! But the matter has been long ago determined by the failure of Pharaoh's magicians; who, though by legerdemain they imitated ſome of the miracles of Moſes, could not form the vileſt inſect, or ſtand before the diſeaſe which he inflicted upon them as well as upon others.

The

Magic Square.

The revival of learning, and the ſucceſs with which the laws of nature have been inveſtigated, have long ago baniſhed this ſpecies of magic from all the enlightened nations of Europe. Among ourſelves, none but perſons groſsly illiterate pay the leaſt regard to magical charms; nor are they any where abroad more prevalent than among the inhabitants of Lapland and Iceland. Theſe people, indeed, place an abſolute confidence in the effects of certain idle words and actions; and ignorant ſailors from other parts of the world are deceived by their aſſertions and their ceremonies. The famous *magical drum* of the Laplanders is ſtill in conſtant uſe in that nation; and Scheffer, in his Hiſtory of Lapland, has given an account of its ſtructure.

This inſtrument is made of beech, pine, or fir, ſplit in the middle, and hollowed on the flat ſide where the drum is to be made. The hollow is of an oval figure; and is covered with a ſkin clean dreſſed, and painted with figures of various kinds, ſuch as ſtars, ſuns and moons, animals and plants, and even countries, lakes and rivers; and of later days, ſince the preaching of Chriſtianity among them, the acts and ſufferings of our Saviour and his apoſtles are often added among the reſt. All theſe figures are ſeparated by lines into three regions or cluſters.

There is, beſides theſe parts of the drum, an index and a hammer. The index is a bundle of braſs or iron rings, the biggeſt of which has a hole in its middle, and the ſmaller ones are hung to it. The hammer or drumſtick is made of the horn of a rein-deer; and with this they beat the drum ſo as to make theſe rings move, they being laid on the top for that purpoſe. In the motion of theſe rings about the pictures figured on the drum, they fancy to themſelves ſome prediction in regard to the things they inquire about.

What they principally inquire into by this inſtrument, are three things. 1. What ſacrifices will prove moſt acceptable to their gods. 2. What ſucceſs they ſhall have in their ſeveral occupations, as hunting, fiſhing, curing of diſeaſes, and the like; and, 3. What is doing in places remote from them. On theſe ſeveral occaſions they uſe ſeveral peculiar ceremonies, and place themſelves in various odd poſtures as they beat the drum; which influences the rings to the one or the other ſide, and to come nearer to the one or the other ſet of figures. And when they have done this, they have a method of calculating a diſcovery, which they keep as a great ſecret, but which ſeems merely the buſineſs of the imagination in the diviner or magician.

Magic Square, a ſquare figure, formed of a ſeries of numbers in mathematical proportion; ſo diſpoſed in parallel and equal ranks, as that the ſums of each row, taken either perpendicularly, horizontally, or diagonally, are equal.

Let the ſeveral numbers which compoſe any ſquare number (for inſtance, 1, 2, 3, 4, 5, &c. to 25 incluſive, the ſquare number) be diſpoſed, in their natural order, after each other in a ſquare figure of 25 cells, each in its cell; if now you change the order of theſe numbers, and diſpoſe them in the cells in ſuch manner, as that the five numbers which fill an horizontal rank of cells, being added together, ſhall make the ſame ſum with the five numbers in any other rank of cells, whether horizontal or vertical, and even the ſame number with the five in each of the two diagonal ranks: this diſpoſition of numbers is called a *magic ſquare*, in oppoſition to the former diſpoſition, which is called a *natural ſquare*. See the figures following:

Magic Square.

15	6	4	23	17
24	18	12	10	1
7	5	21	19	13

One would imagine that theſe magic ſquares had that name given them in regard this property of all their ranks, which, taken any way, make always the ſame ſum, appeared extremely ſurpriſing, eſpecially in certain ignorant ages, when mathematics paſſed for magic; but there is a great deal of reaſon to ſuſpect, that theſe ſquares merited their name ſtill farther, by the ſuperſtitious operations they were employed in, as the conſtruction of taliſmans, &c. for, according to the childiſh philoſophy of thoſe days, which attributed virtues to numbers, what virtues might not be expected from numbers ſo wonderful?

However, what was at firſt the vain practice of makers of taliſmans and conjurers, has ſince become the ſubject of a ſerious reſearch among mathematicians; not that they imagine it will lead them to any thing of ſolid uſe or advantage. Magic ſquares favour too much of their original to be of much uſe; but only as it is a kind of play, where the difficulty makes the merit, and it may chance to produce ſome new views of numbers, which mathematicians will not loſe the occaſion of.

Eman. Moſchopulus, a Greek author of no great antiquity, is the firſt that appears to have ſpoken of magic ſquares: and by the age wherein he lived, there is reaſon to imagine he did not look on them merely as a mathematician. However, he has left us ſome rules for their conſtruction. In the treatiſe of Cor. Agrippa, ſo much accuſed of magic, we find the ſquares of ſeven numbers, *viz.* from three to nine incluſive, diſpoſed magically; and it muſt not be ſuppoſed that thoſe ſeven numbers were preferred to all the other without ſome very good reaſon: in effect, it is becauſe their ſquares, according to the ſyſtem of Agrippa and his followers, are planetary. The ſquare of 3, for inſtance, belongs to Saturn; that of 4 to Jupiter; that of 5 to Mars; that of 6 to the Sun; that of 7 to Venus; that of 8 to Mercury; and that of 9 to the Moon. M. Bachet applied himſelf to the ſtudy of magic ſquares, on the hint he had taken from the planetary ſquares of Agrippa, as being unacquainted with the work of Moſchopulus, which is only in manuſcript in the French king's library; and, without the aſſiſtance of any author, he found out a new method for thoſe ſquares whoſe root is uneven, for inſtance 25, 49, &c. but he could not make any thing of thoſe whoſe root is even.

After him came M. Frenicle, who took the ſame ſubject in hand. A certain great algebraiſt was of opinion, that whereas the 16 numbers which compoſe the ſquare might be diſpoſed 20922789888000 different ways in a natural ſquare (as from the rules of combination

bination it is certain they may), they could not be diſpoſed in a magic ſquare above 16 different ways; but M. Frenicle ſhowed, that they might be thus diſpoſed 878 different ways: whence it appears how much his method exceeds the former, which only yielded the 55th part of magic ſquares of that of M. Frenicle.

To this inquiry he thought fit to add a difficulty that had not yet been conſidered: the magic ſquare of 7, for inſtance, being conſtructed, and its 49 cells filled, if the two horizontal ranks of cells, and, at the ſame time, the two vertical ones, the moſt remote from the middle, be retrenched; that is, if the whole border or circumference of the ſquare be taken away, there will remain a ſquare whoſe root will be 5, and which will only conſiſt of 25 cells. Now it is not at all ſurpriſing that the ſquare ſhould be no longer magical, becauſe the ranks of the large ones were not intended to make the ſame ſum, excepting when taken entire with all the ſeven numbers that fill their ſeven cells; ſo that being mutilated each of two cells, and having loſt two of their numbers, it may be well expected, that their remainders will not any longer make the ſame ſum. But M. Frenicle would not be ſatisfied, unleſs when the circumference or border of the magic ſquare was taken away, and even any circumference at pleaſure, or, in fine, ſeveral circumferences at once, the remaining ſquare was ſtill magical: which laſt condition, no doubt, made theſe ſquares vaſtly more magical than ever.

Again, he inverted that condition, and required that any circumference taken at pleaſure, or even ſeveral circumferences, ſhould be inſeparable from the ſquare; that is, that it ſhould ceaſe to be magical when they were removed, and yet continue magical after the removal of any of the reſt. M. Frenicle, however, gives no general demonſtration of his methods, and frequently ſeems to have no other guide but chance. It is true, his book was not publiſhed by himſelf, nor did it appear till after his death, *viz.* in 1693.

In 1703, M. Poignard, canon of Bruſſels, publiſhed a treatiſe of ſublime magic ſquares. Before him there had been no magic ſquares made but for ſerieſes of natural numbers that formed a ſquare; but M. Poignard made two very conſiderable improvements. 1. Inſtead of taking all the numbers that fill a ſquare, for inſtance the 36 ſucceſſive numbers, which would fill all the cells of a natural ſquare, whoſe ſide is 6, he only takes as many ſucceſſive numbers as there are units in the ſide of the ſquare, which, in this caſe, are ſix; and theſe ſix numbers alone he diſpoſes in ſuch manner in the 36 cells that none of them are repeated twice in the ſame rank, whether it be horizontal, vertical, or diagonal; whence it follows, that all the ranks, taken all the ways poſſible, muſt always make the ſame ſum, which M. Poignard calls repeated progreſſion. 2. Inſtead of being confined to take theſe numbers according to the ſeries and ſucceſſion of the natural numbers, that is, in an arithmetical progreſſion, he takes them likewiſe in a geometrical progreſſion, and even in an harmonical progreſſion. But with theſe two laſt progreſſions the magic muſt neceſſarily be different to what it was: in the ſquares filled with numbers in geometrical progreſſion, it conſiſts in this, that the products of all the ranks are equal; and in the harmonical progreſſion, the numbers of all the ranks continually follow that progreſſion. he makes ſquares of each of theſe three progreſſions repeated.

This book of M. Poignard gave occaſion to M. de la Hire to turn his thoughts the ſame way, which he did with ſuch ſucceſs, that he ſeems to have well nigh completed the theory of magic ſquares. He firſt conſiders uneven ſquares: all his predeceſſors on the ſubject having found the conſtruction of even ones by much the moſt difficult; for which reaſon M. de la Hire reſerves thoſe for the laſt. This exceſs of difficulty may ariſe partly from hence, that the numbers are taken in arithmetical progreſſion. Now in that progreſſion, if the number of terms be uneven, that in the middle has ſome properties, which may be of ſervice; for inſtance, being multiplied by the number of terms in the progreſſion, the product is equal to the ſum of all the terms.

M. de la Hire propoſes a general method for uneven ſquares, which has ſome ſimilitude with the theory of compound motions, ſo uſeful and fertile in mechanics. As that conſiſts in decompounding motions, and reſolving them into others more ſimple; ſo does M. de la Hire's method conſiſt in reſolving the ſquare that is to be conſtructed into two ſimple and primitive ſquares. It muſt be owned, however, it is not quite ſo eaſy to conceive thoſe two ſimple and primitive ſquares in the compound or perfect ſquare, as in an oblique motion to imagine a parallel and perpendicular one.

Suppoſe a ſquare of cells, whoſe root is uneven, for inſtance 7; and that its 49 cells are to be filled magically with numbers, for inſtance the firſt 7. M. de la Hire, on the one ſide, takes the firſt 7 numbers, beginning with unity, and ending with the root 7; and on the other 7, and all its multiples to 49, excluſively; and as theſe only make ſix numbers, he adds 0, which makes this an arithmetical progreſſion of 7 terms as well as the other; 0. 7. 14. 21 28. 35. 42. This done, with the firſt progreſſion repeated, he fills the ſquare of the root 7 magically; In order to this, he writes in the firſt ſeven cells of the firſt horizontal rank the ſeven numbers propoſed in what order he pleaſes, for that is abſolutely indifferent; and it is proper to obſerve here, that thoſe ſeven numbers may be ranged in 5040 different manners in the ſame rank. The order in which they are placed in the firſt horizontal rank, be it what it will, is that which determines their order in all the reſt. For the ſecond horizontal rank, he places in its firſt cell, either the third, the fourth, the fifth, or the ſixth number, from the firſt number of the firſt rank; and after that writes the ſix others in order as they follow. For the third horizontal rank, he obſerves the ſame method with regard to the ſecond that he obſerved in the ſecond with regard to the firſt, and ſo of the reſt. For inſtance, ſuppoſe the firſt horizontal rank filled with the ſeven numbers in their natural order, 1, 2, 3, 4, 5, 6, 7; the ſecond horizontal rank may either commence with 3, with 4, with 5, or with 6: but in this inſtance it commences with 3; the third rank therefore muſt com-

1	2	3	4	5	6	7
3	4	5	6	7	1	2
5	6	7	1	2	3	4
7	1	2	3	4	5	6
2	3	4	5	6	7	1
4	5	6	7	1	2	3
6	7	1	2	3	4	5

mence with 5, the fourth with 7, the fifth with 2, the ſixth with 4, and the ſeventh with 6. The commencement of the ranks which follow the firſt being thus determined, the other numbers, as we have already obſerved, muſt be written down in the order wherein they ſtand in the firſt, going on to 5, 6, and 7, and returning to 1, 2, &c. till every number in the firſt rank be found in every rank underneath, according to the order arbitrarily pitched upon at firſt. By this means it is evident, that no number whatever can be repeated twice in the ſame rank; and by conſequence, that the ſeven numbers 1, 2, 3, 4, 5, 6, 7, being in each rank, muſt of neceſſity make the ſame ſum.

It appears, from this example, that the arrangement of the numbers in the firſt rank being choſen at pleaſure, the other ranks may be continued in four different manners: and ſince the firſt rank may have 5040 different arrangements, there are no leſs than 20160 different manners of conſtructing the magic ſquare of ſeven numbers repeated.

1	2	3	4	5	6	7
2	3	4	5	6	7	1
3	4	5	6	7	1	2
4	5	6	7	1	2	3
5	6	7	1	2	3	4
6	7	1	2	3	4	5
7	1	2	3	4	5	6

1	2	3	4	5	6	7
7	1	2	3	4	5	6
6	7	1	2	3	4	5
5	6	7	1	2	3	4
4	5	6	7	1	2	3
3	4	5	6	7	1	2
2	3	4	5	6	7	1

The order of the numbers in the firſt rank being determined; if in beginning with the ſecond rank, the ſecond number 2, or the laſt number 7, ſhould be pitched upon, in one of thoſe caſes and repeated; and in the other caſe, the other diagonal would be falſe unleſs the number repeated ſeven times ſhould happen to be 4; for four times ſeven is equal to the ſum of 1, 2, 3, 4, 5, 6, 7: and in general, in every ſquare conſiſting of an unequal number of terms, in arithmetical progreſſion, one of the diagonals would be falſe according to thoſe two conſtructions, unleſs the term always repeated in that diagonal were the middle term of the progreſſion. It is not, however, at all neceſſary to take the terms in an arithmetical progreſſion; for, according to this method, one may conſtruct a magic ſquare of any numbers at pleaſure, whether they be according to any certain progreſſion or not. If they be in an arithmetical progreſſion, it will be proper, out of the general method, to except thoſe two conſtructions which produce a continual repetition of the ſame term in one of the two diagonals, and only to take in the caſe wherein that repetition would prevent the diagonal from being juſt; which caſe being abſolutely diſregarded when we computed that the ſquare of 7 might have 20,160 different conſtructions, it is evident that by taking that caſe in it muſt have vaſtly more.

To begin the ſecond rank with any other number beſides the ſecond and the laſt, muſt not, however, be looked on as an univerſal rule: it holds good for the ſquare of 7; but if the ſquare of 9, for inſtance, were to be conſtructed, and the fourth figure of the firſt horizontal rank were pitched on for the firſt of the ſecond, the conſequence would be, that the fifth and eighth horizontal ranks would likewiſe commence with the ſame number, which would therefore be repeated three times in the ſame vertical rank, and occaſion other repetitions in all the reſt. The general rule, therefore, muſt be conceived thus: Let the number in the firſt rank pitched on, for the commencement of the ſecond, have ſuch an exponent of its quota; that is, let the order of its place be ſuch, as that if an unit be taken from it, the remainder will not be any juſt quota part of the root of the ſquare; that is, cannot divide it equally. If, for example, in the ſquare of 7, the third number of the firſt horizontal rank be pitched on for the firſt of the ſecond, ſuch conſtruction will be juſt; becauſe the exponent of the place of that number, viz. 3, ſubtracting 1, that is, 2 cannot divide 7. Thus alſo might the fourth number of the ſame firſt rank be choſen, becauſe 4—1, viz. 3, cannot divide 7; and, for the ſame reaſon, the fifth or fixth number might be taken: but in the ſquare of 9, the fourth number of the firſt rank muſt not be taken, becauſe 4—1, viz. 3, does divide 9. The reaſon of this rule will appear very evidently, by conſidering in what manner the returns of the ſame numbers do or do not happen, taking them always in the ſame manner in any given ſeries. And hence it follows, that the fewer diviſions the root of any ſquare to be conſtructed has, the more different manners of conſtructing it there are; and that the prime numbers, i. e. thoſe which have no diviſions, as 5, 7, 11, 13, &c. are thoſe whoſe ſquares will admit of the moſt variations in proportion to their quantities.

The ſquares conſtructed according to this method have ſome particular properties not required in the problem; for the numbers that compoſe any rank parallel to one of the two diagonals, are ranged in the ſame order with the numbers that compoſe the diagonal to which they are parallel. And as any rank parallel to a diagonal muſt neceſſarily be ſhorter, and have fewer cells than the diagonal itſelf, by adding to it the correſpondent parallel, which has the number of cells by which the other falls ſhort of the diagonal, the numbers of thoſe two parallels, placed as it were end to end, ſtill follow the ſame order with thoſe of the diagonal: beſides that their ſums are likewiſe equal; ſo that they are magical on another account. Inſtead of the ſquares, which we have hitherto formed by horizontal ranks, one might alſo form them by vertical ones; the caſe is the ſame in both.

First Primitive.

1	2	3	4	5	6	7
3	4	5	6	7	1	2
5	6	7	1	2	3	4
7	1	2	3	4	5	6
2	3	4	5	6	7	1
4	5	6	7	1	2	3
6	7	1	2	3	4	5

All we have hitherto ſaid regards only the firſt primitive ſquare, whoſe numbers, in the propoſed example, were 1, 2, 3, 4, 5, 6, 7; here ſtill remains the

Second Primitive.

0	7	14	21	28	35	42
21	28	35	42	0	7	14
42	0	7	14	21	28	35
14	21	28	35	42	0	7
35	42	0	7	14	21	28
7	14	21	28	35	42	0
28	35	42	0	7	14	21

ſecond primitive, whoſe numbers are 0, 7, 14, 21, 28, 35, 42. M. de la Hire proceeds in the ſame manner here as in the former; and this may likewiſe be conſtructed in 20,160 different manners, as containing the ſame number of terms with the firſt. Its conſtruction being made, and of conſequence all its ranks making the ſame ſum, it is evident, that if we bring the two into one, by adding together the numbers of the two correſponding cells of the two ſquares, that is, the two numbers of the firſt of each, the two numbers of the ſecond, of the third, &c. and diſpoſe them in the 49 correſponding cells of a third ſquare, it will likewiſe be magical in regard to its rank, formed by the addition of equal ſums to equal ſums, which muſt of neceſſity be equal among themſelves. All that remains in doubt is, whether or no, by the addition of the correſponding cells of the two firſt ſquares, all the cells of the third will be filled in ſuch manner, as that each not only contains one of the numbers of the progreſſion from 1 to 49, but alſo that this number be different from any of the reſt, which is the end and deſign of the whole operation.

As to this it muſt be obſerved, that if in the conſtruction of the ſecond primitive ſquare care has been taken, in the commencement of the ſecond horizontal rank, to obſerve an order with regard to the firſt different from what was obſerved in the conſtruction of the firſt ſquare; for inſtance, if the ſecond rank of the firſt ſquare began with the third term of the firſt rank, and the ſecond rank of the ſecond ſquare commence with the fourth of the firſt rank, as in the example it actually does; each number of the firſt ſquare may be combined once, and only once, by addition with all the numbers of the ſecond. And as the numbers of the firſt are here 1, 2, 3, 4, 5, 6, 7, and thoſe of the ſecond, 0, 7, 14, 21, 28, 35, 42, by combining them in this manner we have all the numbers in the progreſſion from 1 to 49, without having any of them repeated; which is the perfect magic ſquare propoſed.

Perfect Square.

1	9	17	25	33	41	49
24	32	40	48	7	8	16
47	6	14	15	23	31	39
21	22	41	38	46	5	13
37	47	4	12	20	28	29
11	19	27	35	36	46	3
34	42	43	2	10	18	26

The neceſſity of conſtructing the two primitive ſquares in a different manner does not at all hinder but that each of the 20,160 conſtructions of the one may be combined with all the 20,160 conſtructions of the other: of conſequence, therefore, 20,160 multiplied by itſelf, which makes 406,425,600, is the number of different conſtructions that may be made of the perfect ſquare, which here conſiſts of the 49 numbers of the natural progreſſion. But as we have already obſerved, that a primitive ſquare of ſeven numbers repeated may have above 20,160 ſeveral conſtructions, the number 406,425,600 muſt come vaſtly ſhort of expreſſing all the poſſible conſtructions of a perfect magic ſquare of the 49 firſt numbers.

As to the even ſquares, he conſtructs them like the uneven ones, by two primitive ſquares; but the conſtruction of primitives is different in general, and may be ſo a great number of ways: and thoſe general differences admit of a great number of particular variations, which give as many different conſtructions of the ſame even ſquare. It ſcarce ſeems poſſible to determine exactly, either how many general differences there may be between the conſtruction of the primitive ſquares of an even ſquare and an uneven one, nor how many particular variations each general difference may admit of; and, of conſequence, we are ſtill far from being able to determine the number of different conſtructions of all thoſe that may be made by the primitive ſquares.

The ingenious Dr Franklin ſeems to have carried this curious ſpeculation farther than any of his predeceſſors in the ſame way. He has conſtructed not only a magic ſquare of ſquares, but likewiſe a magic circle of circles, of which we ſhall give ſome account for the amuſement of our readers. The magic ſquare of ſquares is formed by dividing the great ſquare, as in Plate 294. fig. 1. The great ſquare is divided into 256 ſmall ſquares, in which all the numbers from 1 to 256 are placed in 16 columns, which may be taken either horizontally or vertically. The properties are as follow:

1. The ſum of the 16 numbers in each column, vertical and horizontal, is 2056.

2. Every half column, vertical and horizontal, makes 1028, or half of 2056.

3. Half a diagonal aſcending added to half a diagonal deſcending, makes 2056; taking theſe half diagonals from the ends of any ſide of the ſquare to the middle thereof; and ſo reckoning them either upward or downward, or ſidewiſe from left to right hand, or from right to left.

4. The ſame, with all the parallels to the half diagonals, as many as can be drawn in the great ſquare: for any two of them being directed upward and downward, from the place where they begin to that where they end, their ſums will make 2056. The ſame downward and upward in like manner: or all the ſame if taken ſideways to the middle, and back to the ſame ſide again. N. B. One ſet of theſe half diagonals and their parallels is drawn in the ſame ſquare upward and downward. Another ſuch ſet may be drawn from any of the other three ſides.

5. The four corner numbers in the great ſquare, added to the four central numbers therein, make 1028; equal to the half ſum of any vertical or horizontal column which contains 16 numbers; and equal to half a diagonal or its parallel.

6. If a ſquare hole (equal in breadth to four of the little ſquares) be cut in a paper, through which any of the 16 little ſquares in the great ſquare may be ſeen, and the paper be laid on the great ſquare, the ſum of all the 16 numbers, ſeen through the hole, is equal to the ſum of the 16 numbers in any horizontal or vertical column, viz. to 2056.

The magic circle of circles (fig. 2.) is compoſed of a ſeries of numbers from 12 to 75 incluſive, divided into eight concentric circular ſpaces, and ranged in eight radii of numbers, with the number 12 in the centre; which number, like the centre, is common to all theſe circular ſpaces, and to all the radii.

The

Magic Square.

The numbers are ſo placed, that the ſum of all thoſe in either of the concentric circular ſpaces above mentioned, together with the central number 12, make 360; equal to the number of degrees in a circle.

The numbers in each radius alſo, together with the central number 12, make juſt 360.

The numbers in half of any of the above circular ſpaces, taken either above or below the double horizontal line, with half the central number 12, make 180; equal to the number of degrees in a ſemicircle.

If any four adjoining numbers be taken, as if in a ſquare, in the radial diviſions of theſe circular ſpaces, the ſum of theſe, with half the central number, make 180.

There are, moreover, included, four ſets of other circular ſpaces, bounded by circles which are eccentric with reſpect to the common centre; each of theſe ſets containing five ſpaces. The centres of the circles which bound them are at A, B, C, and D. The ſet whoſe centre is at A is bounded by dotted lines; the ſet whoſe centre is at C is bounded by lines of ſhort unconnected ſtrokes; and the ſet round D is bounded by lines of unconnected longer ſtrokes, to diſtinguiſh them from one another. In drawing this figure by hand, the ſet of concentric circles ſhould be drawn with black ink, and the four different ſets of eccentric circles with four kinds of ink of different colours; as blue, red, yellow, and green, for diſtinguiſhing them readily from one another. Theſe ſets of eccentric circular ſpaces interſect thoſe of the concentric, and each other; and yet the numbers contained in each of the eccentric ſpaces, taken all around through any of the 20 which are eccentric, make the ſame ſum as thoſe in the concentric, namely 360, when the central number 12 is added. Their halves alſo, taken above or below the double horizontal line, with half the central number, make 180.

Obſerve, that there is not one of the numbers but what belongs at leaſt to two of the circular ſpaces, ſome to three, ſome to four, ſome to five; and yet they are all ſo placed as never to break the required number 360 in any of the 28 circular ſpaces within the primitive circle.

To bring theſe matters in view, all the numbers as above mentioned are taken out, and placed in ſeparate columns as they ſtand around both the concentric and eccentric circular ſpaces, always beginning with the outermoſt and ending with the innermoſt of each ſet, and alſo the numbers as they ſtand in the eight radii, from the circumference to the centre; the common central number 12 being placed the loweſt in each column.

1. In the eight concentric circular ſpaces.

360	360	360	360	360

6. In the five eccentric circular ſpaces whoſe centre is at D.

62	24	71	17	69
15	64	22	66	20
23	65	21	67	12
70	18	68	27	61
49	37	51	28	58
32	54	34	52	43
40	55	33	53	35
57	31	48	38	50
12	12	12	12	12
360	360	360	360	360

If, now, we take any four numbers, as in a ſquare form, either from N° 1. N° 2. (as we ſuppoſe from N° 1.) as in the margin, and add half the central number 12 to them,

14 72
25 63
6

the

the ſum will be 180; equal to half the numbers in any circular ſpace taken above or below the double horizontal line, and equal to the number of degrees in a ſemicircle. Thus, 14, 72, 25, 63, and 6, make 180.

Magic Lantern. See Dioptrics, art. x, p. 37.

MAGICIAN, one who practices magic, or hath the power of doing wonderful feats by the agency of ſpirits.

Among the eaſtern nations it ſeems to have been formerly common for the princes to have magicians about their court to confer with upon extraordinary occaſions. And concerning theſe there hath been much diſputation: ſome ſuppoſing that their power was only feigned, and that they were no other than impoſtors who impoſed on the credulity of their ſovereigns; while others have thought that they really had ſome unknown connection or correſpondence with evil ſpirits, and could by their means accompliſh what otherwiſe would have been impoſſible for men. See the article Magic.

MAGINDANAO, or Mindanao. See Mindanao.

MAGISTERY, in chemiſtry, a name given to almoſt all precipitates. Thus, *magiſtery* and *precipitate* are ſynonymous: but chemiſts chiefly uſe *precipitates* as a general term, and apply that of *magiſtery* to ſome particular precipitates only which are uſed in medicine and in the arts. Such are, the magiſteries of biſmuth, coal, crabs-eyes, ſulphur, &c.

Magistery *of Biſmuth.* See Chemistry, n° 766.

MAGISTRATE, any public officer to whom the executive power of the law is committed either wholly or in part.

MAGLIABECHI (Antony), a perſon of great learning, and remarkable for an amazing memory, was born at Florence in 1633. His father died when he was only ſeven years old. His mother had him taught grammar and drawing, and then put him apprentice to one of the beſt goldſmiths in Florence. When he was about 16 years old, his paſſion for learning began to ſhow itſelf; and he laid out all his money in buying books. Becoming acquainted with Michael Ermini, librarian to the cardinal de Medicis, he ſoon perfected himſelf by his aſſiſtance in the Latin tongue, and in a little time became maſter of the Hebrew. His name ſoon became famous among the learned. A prodigious memory was his diſtinguiſhing talent; and he retained not only the ſenſe of what he had read, but frequently all the words, and the very manner of ſpelling. It is ſaid that a gentleman, to make trial of the force of his memory, lent him a manuſcript he was going to print. Some time after it was returned, the gentleman, coming to him with a melancholy countenance, pretended it was loſt, and requeſted Magliabechi to recollect what he remembered of it; upon which he wrote the whole, without miſſing a word. He generally ſhut himſelf up the whole day, and opened his doors in the evening to the men of letters who came to converſe with him. His attention was ſo abſorbed by his ſtudies, that he often forgot the moſt urgent wants of nature. Coſmo III. grand duke of Florence, made him his librarian; but he ſtill continued negligent in his dreſs, and ſimple in his manners. An old cloak ſerved him for a morning-gown in the day and for bed-cloaths at night. The duke, however, provided for him a commodious apartment in his palace, which he was with difficulty perſuaded to take poſſeſſion of; but which he quitted four months after, and returned to his houſe. He was remarkable for his extraordinary modeſty, his ſincerity, and his beneficence, which his friends often experienced in their wants. He was a patron of men of learning; and had the higheſt pleaſure in aſſiſting them with his advice and information, and in furniſhing them with books and manuſcripts. He had the utmoſt averſion at any thing that looked like conſtraint; and therefore the grand duke always diſpenſed with his perſonal attendance, and ſent him his orders in writing. Though he lived a moſt ſedentary life, he reached the 81ſt year of his age; and died in the midſt of the public applauſe, after enjoying, during the latter part of his life, ſuch affluence as few have ever procured by their learning. By his will, he left a very fine library to the public, with a fund for its ſupport.

MAGLOIRE (St), a native of Wales in Great Britain, and couſin-german to St Sampſon and St Mallo. He embraced a monaſtic life, and went into France, where he was made abbot of Dol, and after that a provincial biſhop in Brittany. He afterwards founded a monaſtery in the iſland of Jerſey, where he died on the 14th of October 575, about the age of 80. His remains were tranſported to the ſuburbs of St Jacques, and depoſited in a monaſtery of Benedictines, which was ceded to the fathers of the oratory in 1628. It is now the ſeminary of St Magloire, celebrated on account of the learned men whom it has produced. This ſaint cultivated poetry with conſiderable ſucceſs: the hymn which is ſung at the feaſt of All Saints was compoſed by him; *Cœlo quos eadem gloria conſecrat*, &c.

MAGNA assisa eligenda, is a writ anciently directed to the ſheriff for ſummoning four lawful knights before the juſtices of aſſize, in order to chooſe 12 knights of the neighbourhood, &c. to paſs upon the great aſſize between ſuch a perſon plaintiff and ſuch a one defendant.

Magna Charta. See Charta.

MAGNANIMITY, denotes greatneſs of mind, particularly in circumſtances of trial and adverſity.—Mr Stretch ‡ well obſerves of it, that it is the good ſenſe of pride, and the nobleſt way of acquiring applauſe. It renders the ſoul ſuperior to the trouble, diſorder, and emotion which the appearance of great danger might excite; and it is by this quality that heroes maintain their tranquillity, and preſerve the free uſe of their reaſon in the moſt ſurpriſing and dreadful accidents. It admires the ſame quality in its enemy; and fame, glory, conqueſts, deſire of opportunities to pardon and oblige their oppoſers, are what glow in the minds of the brave. Magnanimity and courage are inſeparable.

1. The inhabitants of Privernum being ſubdued and taken priſoners after a revolt, one of them being aſked by a Roman ſenator, who was for putting them all to death, what puniſhment he and his fellow captives deſerved? anſwered with great intrepidity, "We deſerve that puniſhment which is due to men who are jealous of their liberty, and think themſelves worthy of it." Plautinus perceiving that his anſwer exaſperated ſome of the ſenators, endeavoured to prevent the

‡ *Beauties of Hiſtory*, under the word.

the ill effects of it, by putting a milder queſtion to the priſoner: "How would you behave (ſays he) if Rome ſhould pardon you?" "Our conduct (replied the generous captive) depends upon yours. If the peace you grant be an honourable one, you may depend on a conſtant fidelity on our parts: if the terms of it be hard and diſhonourable, lay no ſtreſs on our adherence to you." Some of the judges conſtrued theſe words as menaces; but the wiſer part finding in them a great deal of magnanimity, cried out, that a nation whoſe only deſire was liberty, and their only fear that of loſing it, was worthy to become Roman. Accordingly, a decree paſſed in favour of the priſoners, and Privernum was declared a municipium. Thus the bold ſincerity of one man ſaved his country, and gained it the privilege of being incorporated into the Roman ſtate.

2. Subrius Flavius, the Roman tribune, being impeached for having conſpired againſt the life of the emperor Nero, not only owned the charge, but gloried in it. Upon the emperor's aſking him what provocation he had given him to plot his death? "Becauſe I abhorred thee (ſaid Flavius), though there was not in the whole army one more zealouſly attached to thee than I, ſo long as thou didſt merit affection; but I began to hate thee when thou becameſt the murderer of thy mother, the murderer of thy brother and wife, a charioteer, a comedian, an incendiary, and a tyrant." Tacitus tells us, that the whole conſpiracy afforded nothing which proved ſo bitter and pungent to Nero as this reproach. He ordered Flavius to be immediately put to death, which he ſuffered with amazing intrepidity. When the executioner deſired him to ſtretch out his neck valiantly, "I wiſh (replied he) thou mayeſt ſtrike as valiantly."

3. When the Scythian ambaſſadors waited on Alexander the Great, they gazed attentively upon him for a long time without ſpeaking a word, being very probably ſurpriſed, as they formed a judgment of men from their air and ſtature, to find that his did not anſwer the high idea they entertained of him from his fame. At laſt, the oldeſt of the ambaſſadors (according to Q. Curtius) addreſſed him thus: "Had the gods given thee a body proportionable to thy ambition, the whole univerſe would have been too little for thee. With one hand thou wouldſt touch the eaſt, and with the other the weſt; and, not ſatisfied with this, thou wouldſt follow the ſun, and know where he hides himſelf. But what have we to do with thee? we never ſet foot in thy country. May not thoſe who inhabit woods be allowed to live, without knowing who thou art, and whence thou comeſt? We will neither command over, nor ſubmit to, any man. And that thou mayeſt be ſenſible what kind of people the Scythians are, know, that we received from heaven as a rich preſent, a yoke of oxen, a ploughſhare, a dart, a javelin, and a cup. Theſe we make uſe of, both with our friends and againſt our enemies. To our friends we give corn, which we procure by the labour of our oxen; with them we offer wine to the gods in our cup; and with regard to our enemies, we combat them at a diſtance with our arrows, and near at hand with our javelins. But thou, who boaſteſt thy coming to extirpate robbers, thou thyſelf art the greateſt robber upon earth. Thou haſt plundered all nations thou overcameſt: thou haſt poſſeſſed thyſelf of Lydia, invaded Syria, Perſia, and Bactriana; thou art forming a deſign to march as far as India; and now thou comeſt hither to ſeize upon our herds of cattle. The great poſſeſſions thou haſt, only make thee covet more eagerly what thou haſt not. If thou art a god, thou oughteſt to do good to mortals, and not deprive them of their poſſeſſions. If thou art a mere man, reflect always on what thou art. They whom thou ſhalt not moleſt will be thy true friends, the ſtrongeſt friendſhips being contracted between equals; and they are eſteemed equals who have not tried their ſtrength againſt each other: but do not imagine that thoſe whom thou conquereſt can love thee."

Rapin's Hiſt. an. 1199

4. Richard I. king of England, having inveſted the caſtle of Chalus, was ſhot in the ſhoulder with an arrow; an unſkilful ſurgeon endeavouring to extract the weapon, mangled the fleſh in ſuch a manner, that a gangrene enſued. The caſtle being taken, and perceiving he ſhould not live, he ordered Bertram de Gourdon, who had ſhot the arrow, to be brought into his preſence. Bertram being come, "What harm (ſaid the king) did ever I do thee, that thou ſhouldſt kill me?" The other replied with great magnanimity and courage, "You killed with your own hand my father and two of my brothers, and you likewiſe deſigned to have killed me. You may now ſatiate your revenge. I ſhould cheerfully ſuffer all the torments that can be inflicted, were I ſure of having delivered the world of a tyrant who filled it with blood and carnage." This bold and ſpirited anſwer ſtruck Richard with remorſe. He ordered the priſoner to be preſented with one hundred ſhillings, and ſet at liberty; but Maccardec, one of the king's friends, like a true ruffian, ordered him to be flayed alive.

5. The following modern inſtance is extracted from a late French work intitled, *Ecole hiſtorique & morale du ſoldat*, &c. A mine, underneath one of the outworks of a citadel, was intruſted to the charge of a ſerjeant and a few ſoldiers of the Piedmonteſe guards. Several companies of the enemy's troops had made themſelves maſters of this work; and the loſs of the place would probably ſoon have followed had they maintained their poſt in it. The mine was charged, and a ſingle ſpark would blow them all into the air. The ſerjeant, with the greateſt coolneſs, ordered the ſoldiers to retire, deſiring them to requeſt the king to take care of his wife and children; ſtruck fire, ſet a match to the train, and ſacrificed himſelf for his country.

MAGNESA, or Magnesia, (anc. geog.) a town or a diſtrict of Theſſaly, at the foot of mount Pelius, called by Philip, the ſon of Demetrius, one of the three keys of Greece, (Pauſanias.)

MAGNESIA, or Magnesia alba, in mineralogy and chemiſtry, a kind of earth only diſcovered ſince the beginning of this century. It firſt began to be known at Rome by the name of the *Count de Palma's powder*, which a canon there offered as a general remedy for all diſorders. It was by many conſidered as a calcareous earth; but F. Hoffman ſhowed it to be eſſentially diſtinct. The ſame was afterwards done by

Dr Black of Edinburgh and M. Margraaf of Berlin, though unknown to each other at the time. When pure, it is extremely white, looſe, and light; the ſpecific gravity about 2.330. It is one of the moſt infuſible ſubſtances in nature; neither melting, nor even hardening nor contracting, in the focus of the moſt powerful burning-glaſs. An experiment was made on ſome of this earth in the ſummer of 1782 by M. Magellan, with Mr Parker's burning-glaſs; the effects of which are more powerful than thoſe of any other, though its diameter is only 32 inches. The event ſeemed at firſt to be unfavourable to the concluſion above mentioned; for a cubic inch of magneſia, a quarter of an inch each ſide, being put into its focus, was hardened, and reduced to leſs than a third part of its bulk each way, viz. from .25 of an inch to .08. On applying a ſimilar cube of magneſia, however, from Mr Henry's manufacture at Mancheſter, it neither became harder nor ſenſibly diminiſhed in ſize. Bergman informs us, that magneſia, unleſs precipitated by the volatile alkali, or that by the neat alkaliſed tartar, always contains ſome ſiliceous or calcareous earth. Almoſt the ſame thing happens when it is ſeparated by calcination from the remaining lixiviations of the nitrous and marine acids; in which caſe, by ſuch a violent fire, it adheres together, and even ſhows a tendency to vitrify.

Notwithſtanding this extreme refractorineſs of magneſia by itſelf, it melts eaſily with borax, though ſcarce affected by alkalies or the calces of lead; when mixed with other earths it produces hard maſſes of various kinds; when mixed with calcareous, argillaceous, or ſiliceous earths, it melts in the fire; and if four times its weight of green glaſs be added to it, the maſs forms a kind of porcelain ſo hard as to ſtrike fire with ſteel. But neither an equal part of the above earths, nor of ponderous earth, glaſs of lead, vegetable alkali, nor vitriolated tartar, added ſeparately to magneſia, will melt in the fire: however, when mixed with common argillaceous earth, it melts into a hard maſs. Magneſia differs from calcareous earth in having a much ſmaller attraction for fixed air. In this reſpect it is inferior even to fixed alkaline ſalts; ſo that it will not render any of theſe cauſtic, though it will do ſo to the volatile alkali. It alſo parts very readily with its own fixed air by mere heat; and it was by making experiments on this ſubſtance that Dr Black made his firſt diſcoveries concerning fixed air. In its calcined ſtate, however, it does not ſhow any of the cauſticity of lime, but may be ſafely taken internally; and is even preferred by ſome to that which contains fixed air. In this ſtate it is much leſs ſoluble than when combined with fixed air, and does not effervеſce with any acid. When mixed with water, a very ſmall degree of heat is excited, and in about 7962 times its weight of water it totally diſſolves. It diſſolves alſo very readily in aerial acid; by which means it is frequently united with freſh water. For the ſame reaſon, when we mix a ſolution of perfectly mild alkali, either fixed or volatile, with a ſolution of magneſia, no precipitation follows; becauſe the great quantity of fixed air extricated by the union of the acid and alkali, inſtantly diſſolves the precipitate as faſt as it is formed. But if we put this mixture over the fire, it will grow thick, and coagulate as ſoon as it is heated to a certain degree; becauſe the magneſia is unable to retain, in any conſiderable heat, as much fixed air as is neceſſary for its ſolution.

On putting magneſia into water, and afterwards drying it, it is found to retain $\frac{18}{100}$ of its weight of aqueous fluid; but when fully ſaturated with aerial acid, it will abſorb and retain $\frac{66}{100}$ of the ſame. When fully ſaturated with aerial acid, it is more ſoluble in cold than in hot water; becauſe the heat of the latter diſſipates part of the fixed air, as was obſerved concerning the alkaline ſalts.

Magneſia, when combined with different acids, forms ſalts exceedingly different from thoſe produced by calcareous earth under ſimilar circumſtances; and of which an account is given under the article CHEMISTRY. It is uſually prepared either from the bittern of ſea-ſalt, or from the ſalt prepared from that liquid under the name of Epſom ſalt. The magneſia prepared directly from the bittern, however, is by no means equal in purity to that produced from the finer kinds of Epſom ſalt. Hence, in order to have pure magneſia, Bergman gives the following directions: "Let Epſom ſalt, in well-formed cryſtals, be diſſolved in diſtilled water; and from this the magneſia is to be precipitated by mild volatile alkali. Some of this earth that remains ſuſpended in the ſolution, by means of aerial acid, may be eaſily precipitated by a ſimple ebullition. An hundred pounds of this magneſia, when rightly prepared, contains near 25 parts of fixed air, 30 of water, and 45 of pure earth. Its ſpecific gravity is then 2.155. This method of preparation may anſwer very well for having a very pure magneſia; but when it is required to have it very light and ſpongy, which, by thoſe who uſe it, is looked upon to be the only criterion of its goodneſs, we muſt uſe the following method:

Take any quantity of Epſom ſalt, diſſolve it in boiling water, and filter the ſolution. Diſſolve alſo half the quantity of good pearl-aſh, and filter this ſolution. Both of theſe ſolutions ought to be ſomewhat diluted; and it will be proper to uſe twice the quantity of water which would fairly diſſolve the ſalts. Mix the two ſolutions when nearly cold, and ſtir them very well together. Let the mixture ſtand for ſome hours until the precipitate has fallen to the bottom in form of a coarſe gritty powder. Put the whole then into a clean copper kettle, under which a moderate fire is made. Stir the matter inceſſantly with a large wooden ſpatula, to prevent the powder from ſticking to the bottom. As the mixture heats, the powder begins to loſe its ſandy appearance, and to increaſe greatly in quantity; ſo that, though at firſt the mixture was quite thin, with only a ſmall portion of ſandy matter amongſt it, before it has attained the boiling heat it will be ſo thick that it can ſcarce be ſtirred. When the grittineſs is quite gone, the matter muſt be put upon a filtering cloth, and warm water poured upon it till it runs inſipid. The magneſia is then to be put upon chalk ſtones, which will abſorb the greateſt part of the moiſture; and it may at laſt be fully dried in a ſtove.

Magneſia alba is a good abſorbent; and undoubtedly to be preferred to crab's-eyes, on account of its purgative quality when united with an acid, which the other has not. It has been eſteemed hurtful in bilious habits where there is a diſpoſition in the ſtomach contrary to acidity. This, however, according to Mr Henry, is doubtful: and where putrid bile is to be corrected, he thinks good purpoſes may be anſwered by taking magneſia with an acid in a ſtate of effervеſcence; as the fixed air, thus extricated, will correct the putridity of the contents of the inteſtines, while they are at the ſame time evacuated downwards. He is alſo of opinion, that in cutaneous diſeaſes it may enter the circulation in form of a neutral ſalt, and, by acting as a diaphoretic and diuretic, prove an excellent alterative.

For ſome medical purpoſes, magneſia is uſed in a calcined ſtate; in which caſe it is deprived of its fixed air, and then it proves nearly as aperient as a double quantity of magneſia in its uncalcined ſtate. Mr Henry is of opinion, that it may be uſeful in diſtenſions of the bowels ariſing from flatus; that it may be ſucceſsfully employed as a cathartic with patients labouring under the ſtone, who are uſing the lixivium ſaponaceum; and that, joined with warm aromatics, it may be of ſervice in correcting the great flatulency which ſo much afflicts people of a gouty diſpoſition. From ſeveral experiments made by the ſame author, it alſo appears that magneſia has a conſiderable antiſeptic power. The like virtue he aſcribes to all kinds of teſtaceous powders: whence he concludes, that medicines of this kind are by no means improper in fevers of a putreſcent type; that where bile is ſuſpected to be the cauſe of any putrid diſeaſe, thoſe antiſeptics ſhould be preſcribed which particularly impede its corruption; that, as calcined magneſia is a more powerful antiſeptic than moſt other abſorbents, it merits a preference to theſe; and that where an acid cacochymy prevails, magneſia or other abſorbents, taken immediately before or after meal-time, may, by increaſing the putrefactive fermentation of animal-food, be of very great ſervice. He hath alſo found, that magneſia hath a power of promoting the ſolution of reſinous gums in water; and thus we have an elegant and eaſy method of preparing aqueous tinctures from theſe ſubſtances. Such tinctures, however, are calculated only for extemporaneous preſcription, as moſt of them depoſit a ſediment when they have been kept a week or two.

Black MAGNESIA. See MANGANESE.

MAGNESIA (anc. geog.), a maritime diſtrict of Theſſaly, lying between the ſouth part of the Sinus Thermaicus and the Pegaſæus to the ſonth, and to the eaſt of the Pelaſgiotis. *Magnetes*, the people. *Magneſius* and *Magneſſus*, the epithet; (Horace).

MAGNESIA, a town of Aſia Minor on the Mæander, about 15 miles from Epheſus. Themiſtocles died there: it was one of the three towns given him by Artaxerxes, with theſe words, "to furniſh his table with bread." It is alſo celebrated for a battle which was fought there, 190 years before the Chriſtian æra, between the Romans and Antiochus king of Syria. The forces of Antiochus amounted to 70,000 men according to Appian, or 70,000 foot and 12,000 horſe according to Livy, which has been exaggerated by Florus to 300,000 men; the Roman army conſiſted of about 28 or 30,000 men, 2000 of which were employed in guarding the camp. The Syrians loſt 50,000 foot and 4000 horſe; and the Romans only 300 killed, with 25 horſe. It was founded by a colony from Magneſia in Theſſaly; and was commonly called *Magneſia ad Mæandrum*, to diſtinguiſh it from another, called *Magneſia ad Sipylum* in Lydia at the foot of mount Sipylus.

MAGNESIA ad Sipylum, anciently *Tantalis*, the reſidence of Tantalus, and capital of Mæonia, where now ſtands the lake Sale. A town of Lydia, at the foot of mount Sipylus, to the eaſt of the Hermus; adjudged free under the Romans. It was deſtroyed by an earthquake in the reign of Tiberius.

MAGNET (*Magnes*), the LOADSTONE: a ſort of ferruginous ſtone, in weight and colour reſembling iron ore, though ſomewhat harder and more heavy; endowed with various extraordinary properties, attractive, directive, inclinatory, &c. See MAGNETISM.

The magnet is alſo called *Lapis Heraclæus*, from Heraclea, a city of Magneſia, a port of the ancient Lydia, where it is ſaid to have been firſt found, and from which it is uſually ſuppoſed to have taken its name. Though others derive the word from a ſhepherd named *Magnes*, who firſt diſcovered it with the iron of his crook on mount Ida. It is alſo called *Lapis Nauticus*, by reaſon of its uſe in navigation; and *ſiderites*, from its attracting iron, which the Greeks call σιδηρος.

The magnet is uſually found in iron mines, and ſometimes in very large pieces half magnet half iron. Its colour is different according to the different countries it is brought from. Norman obſerves, that the beſt are thoſe brought from China and Bengal, which are of an irony or ſanguine colour; thoſe of Arabia are reddiſh; thoſe of Macedonia blackiſh; and thoſe of Hungary, Germany, England, &c. the colour of unwrought iron. Neither its figure nor bulk is determinate, it is found of all forms and ſizes.

The ancients reckoned five kinds of magnets, different in colour and virtue; the Ethiopic, Magneſian, Bœotic, Alexandrian, and Natolian. They alſo took it to be male and female: but the chief uſe they made of it was in medicine; eſpecially for the cure of burns and defluxions on the eyes.—The moderns, more happy, employ it to conduct them in their voyages. See NAVIGATION.

The moſt diſtinguiſhing properties of the magnet are, That it attracts iron, and that it points to the poles of the world; and in other circumſtances alſo dips or inclines to a point beneath the horizon, directly under the pole; and that it communicates theſe properties, by touch, to iron. On which foundation are built the mariner's needles, both horizontal and inclinatory.

Attractive Power of the MAGNET was known to the ancients; and is mentioned even by Plato and Euripides, who call it the *Herculean ſtone*, becauſe it commands iron, which ſubdues every thing elſe: but the knowledge of its directive power, whereby it diſpoſes its poles along the meridian of every place, and occaſions needles, pieces of iron, &c. touched with it, to point nearly north and ſouth, is of a much later date; though the exact time of its diſcovery, and the diſcoverer himſelf, are yet in the dark. The firſt tidings we hear of it is in 1260, when Marco Polo the Venetian is ſaid by ſome to have introduced the mariner's compaſs; tho' not as an invention of his own, but as derived from the Chineſe, who are ſaid to have had the uſe of it long before; though ſome imagine that the Chineſe rather borrowed it from the Europeans.

Flavio de Gioia, a Neapolitan, who lived in the 13th century, is the perſon uſually ſuppoſed to have the beſt title to the diſcovery: and yet Sir G. Wheeler mentions, that he had ſeen a book of aſtronomy much older, which ſuppoſed the uſe of the needle; though not as applied to the uſes of navigation, but of aſtronomy. And in Guyot de Provins, an old French poet, who wrote about the year 1180, there is an expreſs mention made of the loadſtone and the compaſs; and their uſe in navigation obliquely hinted at.

The Variation of the MAGNET, or its declination from the pole, was firſt diſcovered by Seb. Cabot, a Venetian, in 1500; and the variation of that variation, by Mr Gellibrand, an Engliſhman, about the year 1625. See VARIATION.

Laſtly, the dip or inclination of the needle, when at liberty to play vertically, to a point beneath the horizon, was firſt diſcovered by another of our countrymen, Mr R. Norman, about the year 1576. See the article *Dipping-*NEEDLE.

MAGNETICAL NEEDLE. See *Magnetical* NEEDLE.

MAGNETISM;

THE power by which the loadſtone is influenced, manifeſting itſelf by certain attractive and directive virtues, and which may be underſtood from the following phenomena afterwards mentioned, which are common to all magnetical bodies.

CHAP. I. *Phenomena and Laws of Magnetiſm.*

§ 1. *Phenomena of the Magnet.*

1. A magnet, whether natural or artificial, attracts iron, and all ſubſtances which contain it in its metallic ſtate. A pure calx of iron is but little attracted; but if the calx be heated ſtrongly in conjunction with charcoal duſt, it will then be attracted, though it has not regained its metallic ſplendour, and is quite deſtitute of malleability. The ſemimetal called *nickel*, and perhaps ſome others, are attracted by the magnet, though freed from iron as much as poſſible. From ſome accounts it has been ſuſpected that braſs was in a ſmall degree affected by the magnet, and even that all very minute bodies are ſomewhat under its influence; but this ſeems not yet to be ſufficiently aſcertained.

2. If a magnet be ſuſpended by a thread, nicely placed on a pivot, or ſet to float in a baſon of water, it will turn one and conſtantly the ſame ſide nearly towards the north pole of the earth, the other of courſe turning towards the ſouth. Hence theſe parts of the magnet have been called its poles, taking the deſignations of north and ſouth from thoſe parts of the world towards which they turn. This property is called the *polarity* of the magnet; and when it is in the act of turning itſelf into this poſition, it is ſaid to *traverſe*. A plane drawn perpendicular to the horizon through both poles of a magnet, after it has turned itſelf, is called the *magnetic meridian;* and the angle it makes with the meridian of the place is called the *declination* of the magnet or of the magnetic needle.

3. When either the north or the ſouth poles of two magnets are placed near to each other, they repel; but a north and a ſouth pole attract each other.

4. A magnet placed in ſuch a manner as to be entirely at liberty, inclines one of its poles to the horizon, and of courſe elevates the other above it. This property is called the *inclination* or *dipping* of the magnet; and is moſt conſpicuous in artificial magnets or needles, which may be accurately balanced before the magnetic virtue is imparted to them.

5. By proper management any magnet may be made to communicate its virtue to a piece of ſteel or iron, which virtue it will retain for a longer or ſhorter time according to circumſtances.

§ 2. *Of the different Subſtances attracted by the Magnet.*

It has already been ſaid, that iron is the only ſubſtance which the magnet particularly attracts, and that too when in its metallic ſtate. Nevertheleſs this metal is ſo univerſally diffuſed, that there are few ſubſtances which do not contain a ſufficient quantity of it to be in ſome degree affected by the magnet. Iron itſelf is attracted with different degrees of force according to the ſtate in which it is with regard to malleability.—Even the pureſt calx or ſolution that can be made, is ſaid to be in ſome degree affected by the magnet; but of all ſubſtances ſoft iron is attracted with the greateſt force when clean and of an uniform texture. Hardened ſteel is attracted with much leſs force than iron; but the ſcales ſeparated from red-hot iron, the fuſed globules from flint and ſteel, or the finery cinder, are attracted as much as iron itſelf. The black calx of iron is attracted but very weakly; and the red calx or ruſt ſo little, that it is generally ſaid to be quite inſenſible to the magnetic attraction; though this is not found to be ſtrictly true, even when the calx is prepared by fire, and purified in the moſt careful manner. Sometimes the ſcales and calx are capable of acquiring a polarity, though weakly. Ores of iron are attracted with greater or leſs force according to the ſtate of the metal in them, and according to the quantity of it they contain; though the attraction is always manifeſt even when they contain ſuch a ſmall quantity as ſcarcely to deſerve the name of ores. They are generally much more attracted after calcination than before; becauſe this operation communicates to them a portion of phlogiſton by which they approach to a metallic ſtate. Ores of lead, tin, and copper, are likewiſe attracted, as well as native cinnabar, on account of the quantity of iron they contain; and it is remarkable, that though pure lead in its metallic ſtate is not in the leaſt attracted, its calx is ſo in ſome degree. The calx of tin is alſo attracted, though in a ſtill ſmaller degree than that of lead. Zinc, biſmuth, and cobalt, but eſpecially the ores of theſe ſemimetals, are attracted; but not antimony, unleſs it be firſt expoſed to a gentle heat; and arſenic is not attracted at all. One kind of biſmuth is ſaid to be abſolutely repelled by the magnet. Almoſt all other minerals are attracted, at leaſt after having been expoſed to the ac-

Subſtances attracted by the Magnet.

tion of fire. Calcareous earth is attracted leſs than any other kind, and the ſiliceous earth the moſt frequently. Sand, eſpecially the black kind, is generally attracted; and amber as well as other combuſtible ſubſtances have the ſame property, after being burned. Almoſt every part of animal and vegetable bodies is affected by the magnet after being burned; but unburned animal or vegetable ſubſtances are very ſeldom if ever perceptibly attracted. It is alſo remarkable, that even ſoot, or the duſt which falls upon any thing left expoſed to the atmoſphere, are ſenſibly attracted. Colourleſs precious ſtones, as the diamond and cryſtals, are not attracted; neither the amethyſt, topaz, chalcedony, or ſuch as are deprived of their colour by fire; but all others, as the ruby, chryſolite, and tourmalin, are attracted. The emerald, and particularly the garnet, are not only attracted, but frequently acquire an evident polarity. The opal is attracted but weakly.

The attraction of ſo many different ſubſtances ſhows the univerſal diffuſion of iron throughout almoſt all terreſtrial ſubſtances; for to this we are with the greateſt probability to aſcribe the attraction of ſo many ſubſtances by the magnet. How ſmall a quantity of iron indeed will give a ſubſtance this property, is evident from the following experiment related by Mr Cavallo. "Having choſen a piece of Turky-ſtone which weighed above an ounce, I examined it by a very ſenſible magnet needle, but did not find that it was affected in the leaſt. A piece of ſteel was then weighed with a pair of ſcales, which would turn with the 20th part of a grain, and one end of it drawn over the ſtone in various directions. After this operation the ſteel was again weighed, and found to have loſt no perceptible part of its weight; yet the Turky-ſtone, which had acquired only this very ſmall quantity of ſteel, now affected the magnetic needle very ſenſibly." In making his obſervations on this experiment, he propoſes the magnet as a teſt of iron in different ſubſtances, being capable of detecting a ſmaller quantity than any method that chemiſtry can yet afford.

Our author has been at conſiderable pains to inveſtigate the magnetic properties of braſs and other metals; having made many experiments upon the ſubject, of which the following are the reſults: 1. Hammered braſs is much more generally attracted by the magnet than other kinds; and ſuch as is not influenced in this manner, acquires the property by being hammered. 2. A piece of braſs rendered magnetic by hammering, loſes the property on being made red hot ſo as to become ſoftened; by a ſecond hammering it becomes again magnetic; and thus may be made to loſe its property and recover it alternately. 3. Suſpecting that the magnetic property might be occaſioned by a ſmall quantity of iron abraded from the hammer, the pieces of braſs were beat between two pieces of card-paper; notwithſtanding which precaution, it acquired the magnetic property as before. 4 Sometimes an evident degree of magnetiſm was communicated by two or three ſtrokes, and with the card-paper not above 30 ſtrokes were given to make the braſs ſenſibly magnetic. 5. A piece of braſs was hardened by beating it between two large flints, uſing one for the hammer and the other for the anvil; but ſtill it acquired a magnetic property, tho' leſs than with the iron hammer, which might be explained by the roughneſs of the flints, and their not coming into contact ſufficiently with the metal. Neither of the flints was found to have acquired the ſmalleſt degree of magnetic power either before or after the experiment. 6. By melting the braſs in a crucible, it was found to have entirely loſt its magnetiſm. 7. A piece of braſs deprived of its magnetic property by fire, regained it after a few ſtrokes of the hammer, though laid between two pieces of copper. 8. Moſt of the pieces of braſs tried by our author became magnetic by hammering; but ſome, though rendered equally hard with the reſt, did not affect the needle in the leaſt; but theſe could not originally be diſtinguiſhed from ſuch as are capable of becoming magnetic. 9. As, notwithſtanding the precautions made uſe of in the above experiments to prevent the iron of the hammer from being in any manner of way communicated to the braſs, an objection might ariſe, that ſome quantity of the calx might be diffuſed through the metal, and acquire phlogiſton by hammering, he tried the following experiment, which ſeemed deciſive. A piece of braſs which would acquire no magnetiſm by hammering, was put upon an anvil with a conſiderable quantity of crocus martis, which had no effect upon the needle. It was then hammered for a long time, turning it frequently, ſo that the crocus was beat into the ſubſtance of the braſs, and gave it a red colour; nevertheleſs, it affected the needle in this ſtate no more than before. 10. A hole of about an eighth part of an inch in length, and little more than one 50th of an inch in diameter, was drilled in a piece of braſs which could not be rendered magnetic by hammering; after which the hole was filled with crocus martis, and hammered as before, but ſtill it ſhowed no ſigns of magnetiſm (A). 11. On making this piece of braſs, containing the crocus, red hot, it then affected the needle, but only in that place where the crocus was. 12. On repeating this experiment with black calx of iron inſtead of crocus martis, the braſs was weakly attracted in that place where the calx was, and this attraction was neither augmented nor diminiſhed by calcination. 13. On mixing a ſmall quantity of iron with four times its weight of braſs which could not be made magnetic by hammering, the whole was rendered powerfully magnetic; but on again mixing this compound with 50 times its weight of the ſame braſs, the attraction became ſo weak as to be ſcarcely perceptible; and was neither augmented by hammering nor diminiſhed by ſoftening. 14. On repeating moſt of his experiments, by letting the pieces of braſs float upon quickſilver in the manner hereafter deſcribed, he found that very few of them were not affected; and even the indifference of any of them did not ſeem to be

Subſtances attracted by the Magnet.

(A) Theſe two experiments ſeem inconſiſtent with our author's aſſertion, that calces of iron are *always* affected in ſome degree by the magnet.

Subſtances attracted by the Magnet.

be very well aſcertained; though theſe did not acquire any additional magnetiſm by hammering.

From all theſe experiments Mr Cavallo draws the following concluſions. 1. Moſt braſs becomes magnetic by hammering, and loſes that property by annealing or ſoftening in the fire; or at leaſt its magnetiſm is ſo far weakened by it, as afterwards to be only diſcovered when floating on quickſilver. 2. The acquired magnetiſm is not owing to particles of ſron naturally or artificially mixed with the braſs. 3. The pieces of braſs which have that property retain it without any diminution after a great number of repeated trials; but he found no method of giving magnetiſm to braſs which had it not naturally. 4. A large piece of braſs has generally a ſtronger magnetic power than a ſmall one; and the flat ſurface draws the needle more powerfully than the edge or corner. 5. If only one end of a piece of braſs be hammered, then that end alone will diſturb the magnetic needle. 6. The magnetic power which braſs acquires by hammering has a certain limit, beyond which it cannot be increaſed by farther hammering. This limit is different in different pieces of braſs, according to their thickneſs or quality. 7. In the courſe of his experiments, the following circumſtance was twice obſerved: A piece of braſs which had the property of becoming magnetic by hammering, and of loſing that property by annealing, loſt its magnetic power entirely by being left in the fire till partially melted, but recovered it again on being fully ſo. 8. A long continuance in a ſtrong fire, which alters the texture of the metal, making it what ſome workmen call *rotten*, generally deſtroys the magnetic property alſo; whence this property ſeems to be owing to ſome particular configuration of its parts. 9. When braſs is uſed in magnetical inſtruments, it ought either to be left entirely ſoft, or choſen of ſuch a ſort as will not become magnetic by hammering. 10. There are few ſubſtances in nature, which, when floated upon quickſilver, are not affected in ſome degree by the magnet.

Our author next proceeded to try the magnetic power of other metals, particularly the component parts of braſs, &c. copper, and zinc. With the former the reſult was doubtful; and though pieces of hammered copper would ſometimes attract the needle, yet the attraction was always exceedingly weak. Zinc had no effect, either in its natural ſtate or hammered as much as it could bear without breaking. A mixture of it with tin had no effect. The ſame was obſerved of a piece of a broken reflector of a teleſcope made of tin and copper; a mixture of tin, zinc, and copper; a piece of ſilver whether ſoft or hammered; a piece of pure gold whether ſoft or hammered; a mixture of gold and ſilver, both hard and ſoft; and another mixture of much ſilver, a little copper, and a ſtill leſs quantity of gold.

The magnetic property of nickel has been mentioned by ſeveral authors; but Mr Cavallo ſays he has found ſome pieces which did not affect the needle in the leaſt. "It is probable (ſays he) that theſe pieces were not pure nickel, and perhaps ſome cobalt was contained in them; but I ſee no reaſon why the nickel, when alloyed with a little cobalt, ſhould ſhow no attraction towards the magnet, if that property did really and eſſentially belong to it." Our author, laſtly, made ſeveral experiments upon platina; the magnetic properties of which were found to be very ſimilar to thoſe of braſs; the native grains becoming magnetic by hammering, and loſing that property by heat; but the precipitate from aqua-regia, fuſed in a violent fire, or rather concreted together by this means, ſhowed no ſign of attraction whatever.

Attraction towards Iron.

§ 3. *Of the Attraction of the Magnet towards Iron in its various States of Exiſtence.*

I. The firſt experiment which naturally occurs on this ſubject is, Whether mere heat can make any change in the magnetic properties of iron without deſtroying its texture or diminiſhing the power of the magnet to which it is applied. Kircher ſays, that he tried this experiment, and found that a piece of iron heated to ſuch a degree as to be ſcarcely diſcernible from a burning coal, was in that ſtate as powerfully attracted as if it had been cold. Mr Cavallo found the effect directly the reverſe; for, having heated a piece of ſteel red hot, and in that ſtate preſented it to the magnet, ſo as to touch it repeatedly in various places, not the leaſt ſign of attraction could be perceived. In this experiment, the redneſs of the iron could plainly be perceived in day-light; and our author acknowledges, that iron, tho' its redneſs be perceptible in the dark, will ſtill be attracted by the magnet. The reſult was the ſame on repeating the experiment a number of times over; but the attraction became as ſtrong as ever a little after the redneſs ceaſed in the dark. The attraction ſeemed to begin ſooner in ſteel than in iron. Our author does not pretend to ſay, that by heating iron to a red, or even to a white heat, the attraction of the magnet for it is abſolutely annihilated; but it certainly was ſo far diminiſhed that it did not affect the magnetic needle.

II. It was now tried what would be the effect of decompoſing iron; and with this view an earthen veſſel, containing about two ounces of iron-filings, was placed near the ſouth end of the needle of the compaſs, by which the latter was drawn a little out of its direction. On adding ſome water, and then vitriolic acid, the attraction ſeemed to be increaſed, and the needle came nearer the veſſel. This ſuperior attraction continued till the efferveſcence began to ceaſe; and at laſt it was found to be inferior to what it had been originally. To obviate ſome objections which might ariſe from the motion of the iron-filings, the experiment was repeated with ſteel-wire twiſted in various directions, ſo as to preſent a large ſurface to the acid; and being placed at a proper diſtance from the needle, it attracted it out of its direction from 281° to 280°. After adding the diluted vitriolic acid, a ſtrong efferveſcence enſued, and the needle was moved to 279° 47′; five minutes after that it ſtood at 279° 35′; and in five minutes more at 279° 30′; ſeeming even to come ſomewhat nearer in a little time after: but as it then appeared to have gained its maximum of attraction, the pot was removed, and the needle went back to its original ſtation of 281°.

On repeating this experiment with different acids, it was found that the vitriolic increaſed the attraction more than either the nitrous or marine. With the former of theſe the maximum of attraction was ſooner gained

Degrees, &c. of Attraction.

gained and ſooner loſt than with the reſt; and with marine acid the attraction was weakeſt of all; which, however, our author imputes to his not being able to raiſe a ſufficient effervefcence with this acid.

III. The degree of magnetic attraction depends upon the ſtrength of the magnet itſelf, the weight and ſhape of the iron preſented to it, the magnetic or unmagnetic ſtate of the body, and the diſtance between them. A piece of clean and ſoft iron is more powerfully attracted than any other ferruginous ſubſtance of the ſame ſize and ſhape. Steel is attracted leſs powerfully. The attraction is ſtrongeſt at the poles, diminiſhing according to the diſtance from them, and entirely ceaſing at the equator or middle point betwixt the poles. It is ſtrongeſt near the ſurface of the magnet, diminiſhing as we recede from it; but the proportion in which this diminution takes place has not been exactly determined. M. Muſchenbroeck made the following experiments in order to determine this point.

1. A cylindrical magnet, two inches long, and weighing 16 drams, was ſuſpended by an accurate balance above a cylinder of iron exactly of the ſame ſhape and dimenſions, and the degree of attraction betwixt the two meaſured by weights put into the oppoſite ſcale; the magnet being ſucceſſively placed at different diſtances from the iron. The reſults were as follow:

Diſtance in inches.	Attraction in grains.
6	3
5	3½
4	4½
3	6
2	9
1	18
0	57

2. A ſpherical magnet of the ſame diameter with the cylindrical one, but of greater ſtrength, was affixed to one of the ſcales of the balance, and the cylindrical magnet uſed in the former experiment placed upon the table with its ſouth pole upwards, facing the north pole of the ſpherical magnet; when the attractions were found as follow:

Diſtance in inches.	Attraction in grains.
6	21
5	27
4	34
3	44
2	64
1	100
0	260

3. Changing the cylindrical magnet for the iron cylinder abovementioned, the reſult was as follows:

Diſtance in inches.	Attraction in grains.
6	7
5	9½
4	15
3	25
2	45
1	92
0	340

IV. Uſing a globe of iron of the ſame diameter with the magnet inſtead of the cylinder, the reſults were:

Diſtance in inches	Attraction in grains.
8	1
7	2
6	3¼
5	6
4	9
3	16
2	30
1	64
0	290

In the experiments with the cylinder, it was found that the magnet attracted a ſhorter cylinder with leſs force, but in the ſame proportion.—From the others, it appears, that one magnet attracts another with leſs force than a piece of iron, but that the attraction begins from a greater diſtance; whence it muſt follow a different law of decreaſe.

IV. The attraction between the magnet and a piece of iron is ſubject to variation from the mere ſhape of the latter, there being a limit in the weight and ſhape of the iron, in which it will attract it more forcibly than any other; but this can only be determined by actual experiment.

V. It has already been obſerved, that magnetic attraction takes place only between the oppoſite poles of two magnets: however, it frequently happens, that though the north pole of one magnet be preſented to the north pole of another, that they ſhow neither attraction nor repulſion; but that when placed very near each other, they will attract. This is explained by our author in the following manner: "When a piece of iron, or any other ſubſtance that contains iron, is brought within a certain diſtance of a magnet, it becomes itſelf a magnet, having the poles, the attractive power, and, in ſhort, every property of a real magnet. That part of it which is neareſt to the magnet acquires a contrary polarity; but it often happens that one of the magnets, being more powerful than the other, will change the pole of that other magnet in the ſame manner as it gives magnetiſm to any other piece of iron which is expoſed to its influence; and then an attraction will take place between two poles apparently of the ſame names; though, in fact, it is an attraction between poles of different names, becauſe one of them has actually been changed. Thus, ſuppoſe that a powerful magnet has been placed with its north pole very near the north pole of a weak magnet, it will be found, that, inſtead of repelling, they will attract each other, becauſe that part of the weak magnet which before was a north pole, has been changed into a ſouth pole by the action of the ſtrong magnet."

VI. Neither the attraction nor the repulſion of magnetiſm is ſenſibly affected by the interpoſition of bodies of any ſort, excepting iron or ferruginous ſubſtances in general. Thus ſuppoſe, that, when a magnet is placed at an inch diſtance from a piece of iron, an ounce, or any determinate weight, is required to move it; the ſame will be required, though a plate of metal, Degrees, &c. of Attraction.

metal, glaſs, or any other ſubſtance excepting iron be interpoſed. Neither the abſence nor preſence of air has any effect upon it.

VII. By heat, the power of a magnet is weakened; and when it arrives at that degree called a white heat, it is entirely deſtroyed. On the other hand, the attraction is increaſed conſiderably by adding more and more weight to the magnet: for thus it will be found that the magnet will keep ſuſpended this day a little more weight than it did the day before; which additional weight being added to it on the following day, or ſome day after, it will be able to ſuſpend a weight ſtill greater, and ſo on as far as a certain limit. On the other hand, by an improper ſituation, or by diminiſhing the quantity of iron appended to it, the power will decreaſe very conſiderably.

VIII. The magnetic attraction is communicable to any given piece of ſteel only in a certain degree; and therefore if a magnet is ſtrong enough to give the maximum of attraction to the piece, it cannot be afterwards rendered more powerful by applying another magnet, however ſtrong. Thus, indeed, the ſteel may be made ſtronger for a few minutes; but this overplus of attraction begins to go off as ſoon as the ſtrong magnet is withdrawn; and the power, continuing gradually to diminiſh, ſettles in a ſhort time at that degree which is its limit ever after.

IX. Some have aſſerted, that in the northern parts of the world, the north pole of the magnet is ſtronger than the ſouth pole, and that in the ſouthern parts the contrary takes place; others are of a quite contrary opinion, affirming, that in the northern regions the ſouth pole is ſtronger than the north one: but neither of theſe opinions have yet been ſufficiently confirmed by experience.

X. If a piece of iron be held to one of the poles of a magnet, the attractive power of the other pole will thus be augmented: Hence we may underſtand why a magnet will lift a greater weight from a piece of iron than from wood or any other ſubſtance, viz. that the iron appended to the magnet becomes itſelf a magnet while it remains in that ſituation; and thus, having two poles, the iron which is placed near the one increaſes the attractive power of the other which adheres to the magnet, and enables it to ſuſtain a greater weight than it would otherwiſe do.

XI. Soft iron acquires the magnetic power by being appended to a magnet; but it laſts only while the iron remains in that ſituation, vaniſhing as ſoon as the magnet and iron are ſeparated from each other. With hard iron, but eſpecially ſteel, the caſe is quite different; and the harder the iron or ſteel is, the more permanent is the magnetiſm which it acquires; though in proportion to this ſame hardneſs it is difficult to impregnate it with the virtue.

XII. The ſmalleſt natural magnets generally poſſeſs the greateſt proportion of attractive power; ſo that there have frequently been ſeen magnets not weighing more than 20 or 30 grains, which would take up 40 or 50 times their own weight; but the greateſt proportion of attractive power, perhaps ever known, belonged to the magnet worn by Sir Iſaac Newton in his ring. It weighed only three grains, and was able to take up 746 grains, or nearly 250 times its own weight; and Mr Cavallo has ſeen one which could not weigh more than ſix or ſeven grains, and yet was capable of lifting 300. A ſemicircular ſteel magnet made by Mr Canton, weighing one ounce and 13 penny-weights, took up 90 ounces; but magnets of above two pounds ſeldom lift more than five or ſix times their own weight, or indeed ſeldom ſo much. It frequently happens, that a piece cut off from a large natural magnet will lift more than the ſtone itſelf did when whole; which is to be attributed to the heterogeneous nature of the ſtone itſelf; for if part of it be impure, it is plain that this can do nothing elſe than obſtruct the virtue of the remainder, which conſequently muſt act more powerfully when the obſtruction is removed.

13. As the two magnetic poles taken together are capable of lifting a much greater weight than a ſingle one, and as they are generally ſituated in oppoſite parts of its ſurface, it has been cuſtomary to adapt two broad pieces of ſoft iron to them, letting the pieces project on one ſide of the magnet; becauſe, in that caſe, the pieces themſelves being rendered magnetic, another piece of iron could be conveniently adapted to their projections ſo as to let both poles act in concert. Theſe pieces of iron are generally held faſt upon the magnet by means of a braſs or ſilver box; in which caſe the magnet is ſaid to be *armed*, and the pieces of iron are called its *armature*. For the ſame purpoſe, and to avoid the armature, artificial magnets have been commonly made in the ſhape of a horſe-ſhoe, having their poles in the two extremities. This is by far the beſt ſhape for magnets; and the horſe-ſhoe ones are always more powerful than ſtraight magnetic bars.

§ 4. *Of the Polarity of the Magnet.*

Polarity of the Magnet.

Though, properly ſpeaking, no magnet can have more than two poles, viz. a north and a ſouth one, yet it frequently happens that both the natural and artificial kind are divided as it were into ſeveral magnets; each of which having likewiſe a north and ſouth pole, the whole appears to have a number of poles, ſome of one denomination and ſome of the other.—This plurality of poles ariſes ſometimes from the ſhape, but more commonly from the heterogeneous nature, of the magnet itſelf: and with reſpect to thoſe which have more than two poles, the following laws have been obſerved: 1. That the parts adjacent to one pole are endowed with a contrary polarity. 2. That the poles of one denomination are not always equal in number, but that they never differ by more than one: thus if the magnet has four ſouth poles, it will either have three, four, or five north poles. Good and properly ſhaped magnets, however, have only two poles directly oppoſite to one another; though in truth it is always one half, or at leaſt a great part of the magnet, that poſſeſs one kind of polarity, the other having the contrary kind; the two points, which we call the *poles*, being only thoſe where the attractive virtue is ſtrongeſt. Thoſe two points, in good magnets, are joined by a line paſſing through the centre, which line is called the *axis* of the magnet; and a circle whoſe plane is perpendicular to the axis encompaſſing the middle of the magnet is called its *equator;* and to complete the ſuppoſed ſimilarity between the terraqueous globe and magnetical bodies, the latter have frequently

quently been formed of a ſpherical ſhape, with the poles and equator marked upon their ſurface ; in which caſe they have got the name of *terrellas* or ſmall earths. On breaking a magnet into two or three parts, each one becomes a perfect magnet, though they have not always an equal number of poles of the ſame denomination. The poles of the broken pieces generally anſwer to thoſe of the whole magnet which were neareſt them, though this does not always hold good.

A magnet with two poles will very readily place itſelf in the magnetic meridian, if ſuſpended by a fine thread, or otherwiſe left at liberty to turn ; but when there are more than two poles, it may happen that their oppoſite tendencies will counteract each other in ſuch a manner that the magnet cannot traverſe ; though it will ſtill attract and repel as though it had only two. Thus, ſuppoſe that an oblong magnet has a north polarity at both ends and a ſouth polarity in the middle ; if the north poles are both equally ſtrong, then it is, plain, that neither of them can point towards that quarter in preference to the other ; but if a magnet of this kind be broken in the middle, the two parts will traverſe very readily. It very ſeldom happens, however, that both poles are equally ſtrong ; in which caſe one of them will always get the better of the other, and the magnet will traverſe notwithſtanding its having more than two poles. The polarity of the magnet is its moſt valuable property, as upon it depends the conſtruction of the magnetic needle or mariner's compaſs ſo uſeful in navigation ; for an account of which, ſee the article Compass, and Needle.

For the variation of the needle, or its declination from the true north and ſouth direction, ſee the article Variation.

An account of the inclination or dipping of the magnetic needle is given under the article *Dipping Needle*.

The directive, or polar power of a magnet, extends farther than its attractive power : thus if a magnet, freely ſuſpended, be placed in the neighbourhood of another, it will be found that they can affect each other's direction when their attraction towards iron or towards each other cannot be perceived. This may be eaſily tried by placing one of them in a ſcale of a balance and the other at a diſtance below it.

Chap. II. *Theory of Magnetiſm.*

The phenomena of magnetiſm, like thoſe of electricity, depend on a cauſe ſo little ſubject to the inveſtigation of our ſenſes, that any regular and well ſupported theory can as yet ſcarcely be expected. The ſubject indeed is ſtill more difficult than that of electricity ; for in the latter the fluid is often made viſible and otherwiſe perceptible by our ſenſes ; but no experiment could ever render the cauſe of magnetiſm perceptible otherwiſe than by its effects. The idea of its being occaſioned by a fluid entering in at one pole and paſſing out at another, took its riſe, and became pretty general, from the following experiment : Having put a ſmall artificial magnet among ſome iron-filings laid upon a piece of paper, give the table a few gentle knocks with your hand, ſo as to ſhake the filings a little, and they will diſpoſe of themſelves as repreſented in fig. 1. where A B and C D repreſent the two poles of the magnet, and the dotted lines the diſpoſition of the filings. But Mr Cavallo obſerves, that this experiment cannot be any proof of the fluid's circulation ; " becauſe if the fluid, of whatever nature it may be, did really circulate from one pole to the other, and had any action on the filings, theſe would be all driven towards that pole to which the fluid directed its courſe. The true cauſe of the diſpoſition of the filings is their becoming actually magnetic, and their two extremities being poſſeſſed of contrary polarities. Now, when there are many particles of iron near the magnet, thoſe which touch its ſurface are rendered magnetic ; conſequently they attract other particles, and theſe being alſo rendered magnetic, attract others, and ſo on, forming ſtrings of ſmall magnets, which gradually increaſe in power as they recede from the magnet. As each of theſe particles has two magnetic poles, by a little conſideration it will appear, that the fartheſt ends of theſe ſtrings or lines which proceed from the parts adjacent to one of the poles of the magnet, for inſtance the north, are likewiſe poſſeſſed of the north polarity ; and the fartheſt extremities of thoſe which proceed from the parts adjacent to the ſouth pole of the magnet, are poſſeſſed of the ſouth polarity : hence, when they come ſufficiently near, they attract the extremities of the former ſtrings, and conſequently form the curves delineated on the figure. The ſhaking of the table in this experiment ſerves to ſtir the filings, by making them jump up a little way, and thus place themſelves in the proper ſituation ; otherwiſe the action of the magnet will not have power ſufficient to diſpoſe properly thoſe particles which ſtand at a conſiderable diſtance."

Plate CCLXXVI fig. 1.

The late diſcoveries in electricity have naturally ſuggeſted another theory, viz. that the magnetic phenomena may be occaſioned by a fluid analogous to the electric, or perhaps by the very ſame : and with a view to inveſtigate this theory, the phenomena of magnetiſm and electricity have been accurately compared with each other, and the analogy between them carefully marked. This analogy is found to conſiſt principally in the following particulars :

1. Electricity is of two kinds, poſitive and negative, each of which repels its own kind, and attracts the oppoſite. In magnetics, the north and ſouth poles do the ſame ; each being repulſive of its own kind of magnetiſm, and attracting the oppoſite.

2. In electricity, whenever a body in its natural ſtate is brought near an electrified one, it becomes itſelf electrified, and poſſeſſed of the contrary electricity ; after which an attraction takes place. In like manner, when a piece of iron or ſteel is brought within the influence of a magnet, it becomes itſelf poſſeſſed of a magnetiſm contrary to that which the magnet poſſeſſes, and is of courſe attracted.

3. One ſort of electricity cannot be produced without the other, neither is it poſſible to produce one kind of magnetiſm without the other alſo.

4. The electric power may be retained by certain ſubſtances, as amber, glaſs, &c. but eaſily pervades other ſubſtances, which are therefore called *conductors*. Magnetiſm has a ſimilar conductor in ſoft iron ; for by means of it the virtue may be extended farther

than can be done without it; at the ſame time that the iron itſelf loſes all magnetic power the moment it is ſeparated from the magnet. Hardened iron, caſt-iron, and ſteel, perform a part analogous to that of electrics; for the virtue does not eaſily pervade them, but is retained, and may be communicated by them to other unmagnetic pieces, in like manner as the electric virtue may be communicated to bodies by means of an excited electric. With regard to other ſubſtances, they ſeem not to be properly conductors of magnetiſm, becauſe the fluid pervades them as though nothing were preſent, and they cannot tranſmit the virtue farther than it would go without them. With ſoft iron it is otherwiſe. Thus, if to one of the poles of a magnet we append a piece of iron of conſiderable length, the end fartheſt from the magnet will likewiſe attract iron with much more force than the magnet could do at that diſtance without it, while at the ſame time this attractive power is plainly that of the magnet itſelf, and not any way inherent in the iron, as it vaniſhes the moment we ſeparate them. If a piece of hard ſteel of an equal length with the iron be appended to the magnet by one of its ends, we will find that the diſtant end will not manifeſt any attraction, and it will be a conſiderable time before the magnetic virtue can diffuſe itſelf for any diſtance along it; but when the ſeparation is made, the ſteel will be found to be magnetic, and will preſerve its virtue for a long time.

5. The electric virtue exerts itſelf moſt powerfully on points, which are found to carry it off or receive it in vaſt quantities. In like manner a magnet will hold a piece of iron more powerfully by a corner, or blunt point, than by a flat ſurface. On ſharp points indeed the magnet has but little hold by reaſon of the deficiency of ſurface.

6. From ſome experiments related under the article Electricity, it appears poſſible to ſuperinduce the negative and poſitive electricities upon one another; and in magnetics it is poſſible to do the ſame. Thus, if we place a wire of ſome length upon a pivot, ſo that it can turn very eaſily, by touching both ends of it upon the poles of a magnet it will acquire a polarity; one end being repelled by one pole and attracted by the other. If now we give the north end, for inſtance, a very ſlight touch with the north pole of the magnet, we will find that it has a ſmall degree of ſouth magnetiſm ſuperinduced upon it, ſo that on approaching the ſouth pole of the magnet it will be repelled; but by approaching the magnet nearer, or holding the wire for a little from flying away, the ſouth magnetiſm of the wire will be entirely deſtroyed, and the north magnetiſm appear as before. This experiment is not very eaſily made; its ſucceſs depends on having the firſt magnetiſm as ſtrong and the ſecond as weak as poſſible.

Theſe are the moſt remarkable particulars in which magnetiſm and electricity are found to agree; but the differences between them are no leſs remarkable than thoſe particulars. The magnetic power affects none of our ſenſes, and moſt perceptibly at leaſt attracts only iron; while electricity attracts and repels bodies of every kind indiſcriminately. The electric virtue reſides on the ſurface, but that of the magnet pervades the whole ſubſtance. A magnet loſes nothing of its power by communicating its virtue to other bodies, but electricity always does: and, laſtly, the magnetic virtue is permanent; whereas that of electricity, without the greateſt care, is exceedingly periſhable, and capable of being diſſipated.

Notwithſtanding theſe diſagreements, however, the analogies betwixt magnetiſm and electricity are ſo great, that the hypotheſis of a magnetic as well as of an electric fluid has now gained general credit; and upon this hypotheſis Profeſſor Æpinus has attempted to ſolve the phenomena of magnetiſm in the following manner:

1. This fluid is ſufficiently ſubtile to penetrate the ſubſtance of all terreſtrial bodies, and like the electric fluid is ſuppoſed to be repulſive of itſelf.

2. There is a mutual attraction between the magnetic fluid and iron, but an indifference betwixt it and all other bodies.

3. There is a great reſemblance betwixt ferruginous bodies and electrics, as the magnetic fluid paſſes with difficulty through the former.

4. Iron and all ferruginous ſubſtances contain a quantity of magnetic fluid equably diſperſed through their ſubſtance when thoſe bodies are not magnetic. In this ſtate they ſhow neither attraction nor repulſion, becauſe the repulſion between the particles of magnetic fluid is balanced by the attraction between the matter of thoſe bodies and the fluid; in which caſe theſe bodies are ſaid to be in a natural ſtate: but when in a ferruginous body the quantity of magnetic fluid is driven to one, then the body becomes magnetic; one extremity of it being now overcharged with magnetic fluid and the other undercharged. Bodies thus conſtituted, viz. rendered magnetic, exert a repulſion between their overcharged extremities in virtue of the repulſion between the particles of that exceſs of magnetic fluid, which is more than overbalanced by the attraction of their matter. There is an attraction exerted between the overcharged extremity of one magnetic body and the undercharged extremity of the other, on account of the attraction between that fluid and the matter of the body: but to explain the repulſion which takes place betwixt their undercharged extremities, we muſt either imagine that iron when deprived of the magnetic fluid is repulſive of itſelf, or that the undercharged extremities appear to repel each other only becauſe either of them attracts the oppoſite overcharged extremities.

A ferruginous body, therefore, according to this hypotheſis, is rendered magnetic by having the equable diffuſion of magnetic fluid through its ſubſtance diſturbed, ſo as to have an overplus of it in one or more parts and a deficiency in others, its magnetiſm remaining as long as its impermeability prevents the reſtoration of the balance between the overcharged and undercharged parts. A piece of iron is rendered magnetic by the vicinity of a magnet; becauſe when the overcharged part or pole of the magnet is preſented to it, the overplus of the magnetic fluid in that pole repels the fluid away from the neareſt extremity of the iron; which therefore becomes undercharged, or poſſeſſed of the contrary polarity, to the moſt remote part of the iron, which conſequently becomes overcharged, or poſſeſſed of the ſame polarity as the preſented pole of the magnet. When the piece of iron is rendered magnetic by preſenting it to the undercharged extremity or pole of the magnet, then the part of the iron which is neareſt to it becomes overcharged, &c. becauſe that part of the magnet, being deprived of its magnetic fluid, attracts the magnetic fluid of the iron to that extremity of the iron which lies neareſt to itſelf.

Hence, in order to give magnetiſm to a piece of ſteel, the ſtrength of the magnet employed muſt be ſuch as to overcome the reſiſtance which the ſubſtance of the ſteel makes againſt the free paſſage of the magnetic fluid: hence a piece of ſoft ſteel is rendered magnetic more eaſily than a hard one, and a ſtrong magnet will render magnetic ſuch bodies as a weak one cannot affect. When two magnets of equal power have their oppoſite poles preſented to each other, they mutually preſerve and ſtrengthen the powers of each other; but when poles of the ſame denomination are forced together, if the powers are equal, they mutually weaken each other; or if unequal, the weaker will have its poles altered, or perhaps its attractive power entirely deſtroyed in a ſhort time.

Before we make any remarks upon this hypothesis, it will be neceſſary to take notice of another, which Mr Cavallo conſiders as ſo well eſtabliſhed, "that there can hardly be a philoſopher ſceptical enough to doubt of its truth." This is, that the earth itſelf is a magnet; which poſition, he ſays, is proved almoſt to a demonſtration in the following manner.

1. Almoſt all the phenomena which may be exhibited with a common magnet may alſo be exhibited with the earth, as far as it can be tried. And,

2. Vaſt maſſes of iron or ferruginous matter actually magnetic are dug out of the earth almoſt in every part of it.

In ſupport of the above poſition, he adduces the phenomena of the compaſs, dipping-needle, and the magnetiſm (to be afterwards explained) which ſoft iron receives when properly ſituated. All theſe may be imitated by a common magnet or terrella. An objection, however, occurs, that the moſt remarkable phenomenon of all, viz. the attraction of iron, is wanting. No experiment has yet ſhown that this metal is attracted more powerfully near the poles than at the equator itſelf; yet this ought very notably to be the caſe in ſuch a large magnetic body. Our author indeed is of opinion, that if the experiment were tried with ſufficient accuracy, the weight of the iron would be augmented by proceeding a conſiderable way either ſouthward or northward. But beſides that this hypotheſis is as yet entirely unſupported by experiment, the difference he even ſuppoſes is quite trifling and inſignificant. The dipping of the needle may indeed ſhow that in this hemiſphere there is a ſuperiority of attraction between one end of the needle and the earth: but it remains to be proved whether this ſuperiority reſides in the needle or in the earth itſelf. The following conſideration indeed ſeems evidently to ſhow that the power, whatever it is, reſides in the needle itſelf; namely, that at the equator, the needle ought to remain in an eaſt and weſt direction, if ſo placed; becauſe of the equal attraction of the north and ſouth poles. Were the needle carried to the pole itſelf, we can only ſuppoſe that it would point perpendicularly downwards; in every other caſe, the attraction will not be perpendicular, but oblique: and ſuppoſing us to recede from the point of perpendicular attraction only a few miles, the obliquity would become ſo great, that no attraction or repulſion towards that point would be diſtinguiſhable from an horizontal direction. The inclination of the needle therefore ſhows, that it is not actuated by the influence of a diſtant point in the earth; but by ſome power in the atmoſphere immediately acting upon the needle, and directing its courſe either to the earth, or from it, in a certain poſition.

Thoſe who maintain the magnetiſm of the earth, have been conſiderably embarraſſed with ſome of the natural phenomena. The variation of the compaſs firſt ſhowed that the needle was not influenced by thoſe points on which the earth turns round in its diurnal courſe: but this was eaſily ſolved by another hypotheſis, viz. that the earth had two magnetical poles by which the needle is influenced, and two others round which it turns on its axis. This hypotheſis was likewiſe embarraſſed by the continual ſhifting of the variation either to the eaſtward or weſtward. Hence another ſuppoſition was made by Dr Halley; namely, that there is a large magnet incloſed within the body of the earth, which not being fixed to the external part, moved with reſpect to it, and of conſequence occaſioned the variation. This was likewiſe overthrown, by obſerving that the variation of the compaſs was irregular, and differed ſo much in different parts of the world, that it could not be owing to any regular cauſe diffuſed over the whole. Four magnetic poles were then ſuppoſed to lie within the earth, and to be moveable with reſpect to each other; and that therefore the variation, whoſe theory would now be very intricate, ought to be derived from all their actions conjointly: but, notwithſtanding all this complication of poles, it might ſtill be objected, that ſome kind of regularity, not obſerved in the variation of the magnetic compaſs, ought to have taken place. So that as yet there is no theory which ſeems to explain the variation with any kind of certainty.

The different hypotheſes on this ſubject are more fully conſidered under the article VARIATION: here we ſhall only obſerve, that with reſpect to the magnetiſm of the earth, the particulars already related ſeem to decide againſt its exiſtence. The moſt unequivocal proof we have of the exiſtence of magnetiſm is the attraction of iron; and this capital mark is deficient, or at leaſt has never be enproved, in the earth. The poles of all the magnets, we know, are fixed and invariable; nor are we obliged to have recourſe to magnets within magnets, or other uncouth ſuppoſitions, to account for their phenomena: if the earth is a magnet, therefore, the magnetiſm it poſſeſſes muſt be of a kind ſo different from the property uſually diſtinguiſhed by that name, that we can in no reſpect determine them to be the ſame.

Mr Cavallo is of opinion that "the magnetiſm of the earth ariſes from the magnetiſm of all the magnetic ſubſtances contained in it, and intermixed with other bodies; that the magnetic poles of the earth may be conſidered as the centres of the polarities of all the particular aggregates of the magnetic ſubſtances; and that thoſe principal poles muſt change place relatively to the ſurface of the earth, according as the particular aggregates of magnetic ſubſtances within the earth are in ſome manner or other altered, ſo as to have their power diminiſhed, increaſed, approached, or removed from the principal poles." But this ſeems not by any means ſufficient to account for the phenomena. The magnetic needle is indeed affected by iron at a diſtance, but that diſtance is by no means conſiderable. A magnet or needle in a houſe in one ſtreet will not be affected by a ſmith's ſhop or iron warehouſe in another; and there is an undoubted certainty that the magnetic needle is affected on ſome parts of the ſea where no magnetic bodies can be preſent unleſs at a great diſtance on land, or below the unfathomable depths of the ocean. Beſides, let us imagine as many of theſe bodies as we pleaſe within the ſurface of the earth, they muſt be ſuppoſed, in order to account for the phenomena of the needle, to have their poles lying all nearly the ſame way; which can by no means be proved to be the caſe: not to mention that the attraction of iron would in ſome places be very perceptible, which has never yet been experienced in any part of the world.

Laſtly, the hypotheſis of the magnetiſm of the earth ſeems to be entirely overthrown by the following curious method of giving magnetiſm inſtantaneouſly to an iron-bar. Take a bar of ſoft iron two or three feet long, and between an half and two inches thick; which deſcription is very well anſwered by ſome kitchen pokers. Place it in the magnetical line, *i. e.* the poſture aſſumed by the dipping needle; or if a needle of this kind is not at hand, place it ſtraight up in any degree of north or ſouth latitude beyond 40°, or horizontally if nearer to the equator. Preſent then a magnetic needle to various parts of the bar; and it will be found, that in this country the lower half of the bar will repel the north end of the needle, and the upper half attract it. In ſouth latitudes the caſe will be reverſed; for the lower end will attract the north pole of the needle, and the upper end repel it. If the bar be not very ſhort, its extremities will alſo attract ſmall bits of iron, as filings, &c. On turning it upſide down, the end which repelled the north pole of the needle before will now attract it; the reaſon of which is, that in the northern hemiſphere the end which is neareſt the earth always becomes a north pole, and in the ſouthern hemiſphere a ſouth one. Now it is plain, that conſidering the diſtance of both poles of the earth from the iron-rod, any kind of poſture in which we can place it muſt make a difference ſo trifling, that we cannot ſuppoſe the one to influence it more than the other. The whole phenomenon ſhows that there is in the atmoſphere a current of fluid either going into the earth, or coming out from it, which influences iron when held in the direction in which itſelf moves. That it does not influence the metal when lying horizontally, may be owing to its want of ſufficient breadth to render the effect perceptible. The earth therefore is not a magnet, but is ſurrounded by a fluid whoſe motion is productive of magnetiſm in iron; and moſt probably, though it produces this as it were accidentally, will be found to anſwer much more important purpoſes in the economy of nature. The next queſtion then is with regard to the fluid itſelf: and this, from many articles in this work, will appear to be the ſame with that of electricity. Under the article AURORA *Borealis*, EARTHQUAKE, ELECTRICITY, &c. it is ſhown, that the ſolar light, abſorbed by the equatorial regions of the earth, becomes ſubject to new laws of motion, acting in ſhort as if it were another fluid, in which ſtate we call it *electricity*, or the *electric fluid*. In this ſtate it paſſes through the ſubſtance of the earth from the equator towards the polar regions, getting out again in the vicinity of the poles, aſcending into the high atmoſpherical regions, and then returning to the equatorial parts from whence it came. On this ſuppoſition, which appears to be greatly confirmed by various natural phenomena, it is eaſy to ſee, why in the northern and ſouthern parts the direction of the currents iſſuing from the earth ſhould always become more and more perpendicular to the earth as we approach the poles, and on the contrary why their direction muſt be horizontal or nearly ſo in the equatorial parts. The diſcovery of this general cauſe therefore ſeems to be the neareſt approach we can as yet make to the knowledge of the origin of magnetical phenomena. In what manner *iron* more than other metals is influenced by this fluid, or why the direction of a current of electric matter either to or from the earth, ſhould cauſe ſuch ſtrong attractions as magnetical bodies are ſometimes endowed with, we have as yet no data for underſtanding.

Æpinus's theory of an accumulation of the electric fluid in one pole, and a deficiency of it in the other, ſeems not to be tenible in any reſpect. It is impoſſible to ſhow why the mere turning of a bar upſide down ſhould accumulate the fluid, unleſs it was a gravitating one in the end next the earth; and though we ſhould even make this extravagant ſuppoſition, it will be as difficult to account for the very ſame fluid being repelled by the earth in the ſouthern hemiſphere: for if we account the north magnetiſm an accumulation, we muſt count the ſouth one a deficiency; or if the ſouth magnetiſm is an accumulation, the oppoſite one muſt be a deficiency; and whichever ſuppoſition we adhere to, the difficulties are equally great and unſurmountable.

Chap. III. *Practice of Magnetiſm.*

THIS conſiſts in communicating the magnetic virtue from one body to another; making artificial magnets, compaſſes, dipping-needles, &c.; and inveſtigating the various phenomena reſulting from bodies placed in different ſituations.

§ 1. *To communicate Magnetiſm by the Loadſtone.*

Magnetiſm is communicated merely by preſenting a piece of iron or ſteel to one of the poles of a magnet or loadſtone, even without touching it; though a ſtrong and permanent power cannot be given without contact, or even ſtroaking the one upon the other for a number of times. In this operation, that part of the ferruginous body which touches the pole of the magnet acquires the contrary magnetiſm; that is, if it touches the north pole, it will turn towards the ſouth, *et vice verſa*. The power acquired is ſtrongeſt when ſoft iron is applied, weaker with hardened iron, and weakeſt of all with hard ſteel: but the permanency of it follows juſt the reverſe of this rule; for ſteel or hardened iron will preſerve its virtue for many years, but ſoft iron loſes it the moment we withdraw the magnet. When we deſire a ſtrong and permanent virtue, therefore, it is beſt to uſe the hardeſt ſteel, and to impregnate it by means of one or more powerful magnets; taking care that the north pole of the magnet which gives the virtue be applied to that end of the ſteel which is to be made the ſouth pole. The ſame method may be employed in rendering a weak magnet more powerful than before, or in reſtoring the virtue to one which has loſt it.

The operation of communicating magnetiſm to pieces of ſteel or iron, is called *touching* them; and as this is of the utmoſt utility in navigation, for the purpoſe of giving polarity to needles, very conſiderable pains have been beſtowed upon the ſubject, in order to diſcover the methods of giving them the magnetic virtue in the moſt effectual and permanent manner.—When only one magnetic bar is to be made uſe of, one of its poles muſt be applied as repreſented fig. 2. where C D repreſents the needle or ſteel bar to be impregnated. The magnet A B is then to be drawn all along the ſurface of it, till it reaches the extremity D. The magnet being then removed, muſt be applied to the extremity C, and drawn over the needle as before. Thus the needle muſt be rubbed ſeveral times; by which means it will acquire a conſiderable degree of magnetiſm. In this method, that other extremity of the needle which the magnet touched laſt acquires the contrary magnetiſm; that is, if B be the north pole of the magnet, C will be the north pole, and D the ſouth of the needle. This method, however, is never found to be equally effectual with that in which two magnets, or both poles of one magnet, are made uſe of.

Plate CCLXXVI.

To communicate magnetiſm by means of two magnetic bars, place the bar or needle A B, fig. 3. upon a table; then ſet the two magnetic bars C D, E F, ſtraight upright upon it at a little diſtance, equal on both ſides from the middle of the bar A B, and in ſuch a manner that the ſouth pole D of one of the bars may be neareſt to that end of the bar A B which is to become the north pole, &c. Theſe two bars muſt then be ſlid gradually towards one extremity of the bar, keeping them conſtantly at the ſame diſtance from each other; and when one of them, for inſtance CD, is arrived at A, then they muſt be ſlid the contrary way, till E F arrives at B; and thus the bar A B muſt be rubbed a greater or ſmaller number of times, till it will be found by trial to have acquired a conſiderable power. When the magnetic bars are powerful, and the bar A B of very good ſteel, and not very large, a dozen of ſtrokes are fully ſufficient; but when the bars are to be removed from the bar A B, care muſt be taken to bring them to the ſame ſituation where they were firſt placed; viz. at a little and equal diſtance from the middle of the bar A B, from whence they may be lifted up.

If it be required to communicate the greateſt magnetic power poſſible, we may proceed in the following manner: 1. The magnetic bars may be joined at top, as in fig. 4. interpoſing a piece of wood, or any other ſubſtance excepting iron; for thus the oppoſite poles being contiguous in the upper part, ſtrengthen each other, and of conſequence the lower ones are alſo ſtrengthened. 2. The bar to be rendered magnetic may be placed between the bars of ſoft iron, as ſhown in the ſame figure. 3. The magnetic bars may be inclined the contrary way, as recommended by Mr Æpinus, making an angle of about 15 degrees with the bar A B. See fig. 5. In the ſame manner may a bar be rendered magnetic by an armed or horſe-ſhoe magnet. In any of the methods hitherto mentioned, however, the bar to be rendered magnetic muſt be ſtroked on every ſide; and to let the magnetic centre fall juſt in its middle, care muſt be taken to ſtroke one half of the bar juſt as much as the other. Whenever a ſteel bar, or, in general, any piece of ferruginous matter, is rendered magnetic by the application of two bars, or by the two poles of one magnet, the operation is called the *double touch*, but the ſingle touch when only one bar is applied.

Artificial magnets of a ſemicircular form, or ſhaped like a horſe-ſhoe, have the magnetiſm communicated to them in the ſame manner with thoſe which are ſtraight, only the magnetic bars uſed for this purpoſe muſt follow the curvature of the bar to be impregnated. Thus, ſuppoſe it is required to impregnate the crooked piece of ſteel A B C, fig. 6. lay it flat on a table, and to its extremities apply the magnets D F, E G, joining their extremities F G with the conductor or piece of ſoft iron F G. Apply then the magnetic bars H I to the middle of the piece A B C, and ſtroke it with them from end to end, following the direction of the bent ſteel, ſo that on one ſide of it the magnetic bars may ſtand as repreſented by the dotted lines L K. When the piece of ſteel has been thus rubbed a ſufficient number of times on one ſide, it is then to be turned, and rubbed in like manner on the other, until it has acquired a ſufficient degree of magnetiſm.

From conſidering that ſoft iron, or ſoft ſteel, acquires magnetiſm very eaſily, though it loſes it with equal facility, Mr Cavallo was induced to ſuppoſe, that if magnetiſm were to be communicated to a piece of hard ſteel while ſoftened by heat, and the metal were then to be hardened by pouring cold water upon it while in the act of receiving the magnetiſm, it was poſſible the virtue might be firſt communicated to them in a very high degree, and then be fixed by means of the hardening of the ſteel. To determine this matter, ſix magnetic bars were placed in an oblong earthen veſſel, in ſuch a manner that the north poles of three of them might be oppoſite to the ſouth poles of the three others, forming two parcels of bars lying in the ſame direction, and about three inches aſunder, which was nearly the length of the ſteel-bar intended to be rendered magnetic. The bar was made quite red hot, and in that ſtate was placed between the magnetic bars. Cold water was then immediately poured upon it; by which it was hardened to ſuch a degree that the file could not touch it; but though it had thus received a conſiderable degree of magnetiſm, the power was not ſuperior to what might have been communicated in the ordinary way. On repeating the experiment with ſteel-bars of different ſizes, it was found that ſhort bars receive a proportionably greater degree of power than long ones, and that becauſe the latter cannot be ſufficiently penetrated by the magnetic power when the magnets are placed at their ends; and if a number of magnets be placed along the ſides, in order to communicate a greater degree of virtue, it frequently happens that the bar acquires a number of poles. Our author is nevertheleſs of opinion, that this method is of conſiderable uſe: though by it we cannot communicate

communicate any extraordinary degree of magnetiſm, it is yet very uſeful in conſtructing large artificial magnets. For thus they will acquire a conſiderable degree of power, without any additional trouble to the workman, and may then be fully impregnated in the uſual way, which cannot be done without a great deal of labour when the operation is begun upon bars which have no virtue at all.

§ 2. *To communicate the Magnetic Virtue without any Magnet either natural or artificial.*

This may be done with a ſoft iron-bar in the manner already related, viz. by turning it in a poſition perpendicular to the ſurface of the earth, or any other excepting a line directly perpendicular to the dipping-needle. The magnetiſm thus acquired, however, is always weak, and is inſtantaneouſly loſt; while a ſteel-bar will not receive any perceptible degree of magnetiſm by this method. But if an iron-bar be made red hot, and left to cool in the magnetic line, or if it be repeatedly ſtruck with a hammer while in that line, it will acquire a ſmall degree of permanent magnetiſm; though this alſo will ſoon vaniſh by leaving the bar in an improper poſition, or by inverting and ſtriking it again. The magnetiſm laſts longer in proportion to the hardneſs of the iron: but a longer time will be required to give it the degree of virtue it is capable of receiving by this method. If an iron bar is left for a long time in the direction of the magnetic line, or even in a perpendicular poſture, it will ſometimes acquire a great degree of power. Mr Boyle makes mention of an iron-bar, ten feet long, which had acquired ſo much virtue by ſtanding in this poſture, that it exceeded a loadſtone of three pounds and an half weight, and would turn the needle at eight or ten feet diſtance. Even tongs, pokers, and other kitchen utenſils, by being often heated, and ſet to cool again in an erect poſture, are frequently obſerved to gain a magnetic virtue. Sometimes iron-bars, which were not capable of receiving permanent magnetiſm on account of their ſoftneſs, have, merely by expoſure to the atmoſphere for a great length of time, acquired a conſiderable degree of power; at the ſame time it has been remarked, that theſe bars became much harder by this expoſure; the cauſe of which has not yet been diſcovered.

Iron or ſteel acquires a very perceptible degree of magnetiſm by drilling, hammering, or other methods by which they are put into violent action. The cauſe of this magnetiſm Mr Cavallo looks for in the earth itſelf, the changeable nature of the metal by heat or cold, and the vibratory motion into which it's parts are accidentally put. "For the ſame reaſons (ſays he) it ſeems that magnetiſm, in certain caſes, is produced by electricity; the particulars obſerved concerning which are the following:—When the bar or needle is laid horizontally in the magnetic meridian, whichever way the ſhock of an electric jar or battery enters, the end of the needle which lies towards the north acquires the north polarity, viz. the power of turning towards the north when freely ſuſpended, the other end acquiring the ſouth polarity. If the bar before it receives the ſhock has ſome polarity, and is placed with its poles contrary to the uſual direction, then its original polarity is always diminiſhed, and ſometimes reverſed. When the needle is ſtruck ſtanding perpendicularly in this hemiſphere, the lower end becomes the north pole, even when it had ſome magnetiſm before, and receives the ſhock while ſtanding with its ſouth pole downwards. When all other circumſtances are alike, the degree of magnetiſm received ſeems to be the ſame, whether the needles are ſtruck while ſtanding horizontally in the magnetic meridian or perpendicular to the horizon. When a needle is placed in the magnetic equator, a ſhock through its length very ſeldom renders it magnetic; but if the ſhock be paſſed through its width, it acquires the virtue, the extremity which lay towards the weſt generally becoming the north pole. If a needle or bar ſtrongly magnetic, or a natural magnet, be ſtruck by the electric ſhock, its power is thereby diminiſhed. When the ſhock is too ſtrong, ſo that the needle is thereby rendered conſiderably hot, it acquires either no magnetiſm at all, or a very ſmall degree of it. Hence a ſtroke of lightning often renders pieces of iron or ſteel magnetic, as well as thoſe bodies which naturally contain iron, as ſome bricks, &c."

There are various methods of communicating a permanent magnetiſm to ferruginous bodies, by means of a bar rendered magnetic by the earth; of which the moſt ſimple is that deſcribed by Mr Marcel, whoſe experiments were made in the year 1726. Being employed in making ſome obſervations on the magnetic power which he found in great pieces of iron, he took a large vice weighing 90 pounds, in which he fixed a ſmall anvil weighing 12 pounds. The ſteel to which he wiſhed to give the magnetic virtue was laid upon the anvil in a north and ſouth poſition, which happened to be the diagonal of the ſquare ſurface of the latter. He then took a piece of iron an inch ſquare, and 33 inches long, weighing about eight pounds, having one end rounded and brightly poliſhed, the other being tapered. Holding then the ſteel faſt upon the anvil with one hand, he took the iron-bar in the other; and holding it perpendicularly, he rubbed the ſteel hard with the rounded part towards him from north to ſouth, always carrying the bar far enough round about to begin again at the north. Having thus given 10 or 12 ſtrokes, the ſteel was turned upſide down, and rubbed as much on the other ſide. Proceeding in this manner till it had been rubbed 400 times, the ſteel was as ſtrongly magnetic as if it had been touched by a powerful loadſtone. The place where he began to rub was always the north pole. In theſe experiments it ſometimes happened that the virtue was imparted by a few ſtrokes; nay, by a ſingle one, a ſmall needle was made to receive a very conſiderable power. Thus he imparted to two compaſs needles ſuch a degree of magnetic power, that one took up $\frac{3}{4}$ths and another a whole ounce of iron; and though theſe needles were anointed with linſeed oil to keep them from ruſting, and a hard coat was thus formed upon them, they nevertheleſs retained their virtue. Thus alſo a knife was made ſo ſtrongly magnetical, that it would take up an ounce and three quarters of iron. Four ſmall pieces of ſteel, each an inch long and $\frac{1}{12}$th of an inch broad, as thin as the ſpring of a watch, were thus impregnated with the magnetic virtue, and then joined into a ſmall artificial magnet; which at its firſt formation took up eight times its own

own weight of iron; and after being ſix years kept in the moſt careleſs manner, was found to have rather gained than loſt any thing of its virtue. In the courſe of his experiments, Mr Marcel found, that the end at which he began to rub was always the north pole, whatever poſition the ſteel was laid in. On rubbing a piece of ſteel from one end to the middle, and then from the other end to the middle, it acquired two north poles, one at each end, the middle being a ſouth pole. Beginning to rub from the middle towards each end, he found a north pole in the middle and a ſouth pole at each extremity.

Plate CCLXXVI

Magnetiſm may be communicated to a ſmall piece of ſoft ſteel in the following manner. Take two iron bars of about an inch ſquare, and upwards of three feet in length, keep them in the magnetical line, or in a pependicular poſture, as repreſented fig. 7. Let the piece of ſteel CB be either faſtened to the edge of a table or held by an aſſiſtant; and placing the lower extremity of the bar AB, and the upper extremity of the bar CD, on oppoſite ſides, and in the middle of the ſteel, ſtroke the latter from the middle towards its extremities, moving both bars at the ſame time. When both are arrived at the extremities of the ſteel, remove them from it, and apply them again to the middle. Do ſo for 40 or 50 times, and the ſteel will be found to have a conſiderable degree of magnetic power. Care, however, muſt be taken, in removing the bars, not to draw them along the ſurface of the ſteel, or the experiment will not ſucceed, becauſe the magnetiſm is deſtroyed by the contrary ſtrokes.

The late Dr Godwin Knight poſſeſſed a ſurpriſing ſkill in magnetiſm, being able to communicate an extraordinary degree of attractive or repulſive virtue, and to alter or reverſe the poles at pleaſure; but as he refuſed to diſcover his methods upon any terms whatever (even, as he ſaid, though he ſhould receive in return as many guineas as he could carry), theſe curious and valuable ſecrets have died with him. In the 69th volume of the Philoſophical Tranſactions, however, Mr Benjamin Wilſon hath given a proceſs which at leaſt diſcovers one of the leading principles of Dr Knight's art, and may perhaps be a means of diſcovering the whole to thoſe who ſhall be leſs reſerved. The doctor's proceſs, according to Mr Wilſon, was as follows. Having provided himſelf with a great quantity of clean iron-filings, he put them into a large tub that was more than one third filled with clean water; he then, with great labour, worked the tub to and fro for many hours together, that the friction between the grains of iron by this treatment might break off ſuch ſmaller parts as would remain ſuſpended in the water for a time. The obtaining of theſe very ſmall particles in ſufficient quantity ſeemed to him to be one of the principal deſiderata in the experiment. The water being by this treatment rendered very muddy, he poured the ſame into a clean iron veſſel, leaving the filings behind; and when the water had ſtood long enough to become clear, he poured it out carefully, without diſturbing ſuch of the ſediment as ſtill remained, which now appeared reduced almoſt to impalpable powder. This powder was afterwards removed into another veſſel in order to dry it; but as he had not obtained a proper quantity thereof by this one ſtep, he was obliged to repeat the proceſs many times. Having at laſt procured enough of this very fine powder, the next thing was to a make paſte of it, and that with ſome vehicle which would contain a conſiderable quantity of the phlogiſtic principle: for this purpoſe, he had recourſe to linſeed oil in preference to all other fluids. With theſe two ingredients only he made a ſtiff paſte, and took particular care to knead it well before he moulded it into convenient ſhapes. Sometimes, while the paſte continued in its ſoft ſtate he would put the impreſſion of a ſeal upon the ſeveral pieces; one of which is in the Britiſh Muſæum. This paſte was then put upon wood, and ſometimes on tiles, in order to bake or dry it before a moderate fire, at about the diſtance of a foot or thereabouts. He found that a moderate fire was moſt proper, becauſe a greater degree of heat made the compoſition frequently crack in many places. The time required for the baking or drying of this paſte was generally about five or ſix hours before it attained a ſufficient degree of hardneſs. When that was done, and the ſeveral baked pieces were become cold, he gave them their magnetic virtue in any direction he pleaſed, by placing them between the extreme ends of his large magazine of artificial magnets for a few ſeconds or more as he ſaw occaſion. By this method the virtue they acquired was ſuch, that, when any of thoſe pieces were held between two of his beſt ten-guinea bars, with its poles purpoſely inverted, it immediately of itſelf turned about to recover its natural direction, which the force of thoſe very powerful bars was not ſufficient to counteract.

In the 66th volume of the Philoſophical Tranſactions we have the following account, from Dr Fothergill, of Dr Knight's method of imitating natural magnets, but which is by Mr Cavallo ſuppoſed to be owing to ſome miſtake or miſinformation. "I do not know (ſays he), that ever the doctor (Dr Knight) left behind him any deſcription of a compoſition he had made to form artificial loadſtones. I have ſeen in his poſſeſſion, and many other of his friends have likewiſe ſeen, ſuch a compoſition; which retained the magnetic virtue in a manner much more fixed than either any real loadſtone or any magnetic bar however well tempered. In the natural ones he could change the poles in an inſtant, ſo likewiſe in the hardeſt bars; but in the compoſition the poles were immoveable. He had ſeveral ſmall pieces of this compoſition which had ſtrong magnetic powers. The largeſt was about half an inch in breadth, very little longer than broad, and near a quarter of an inch thick. It was not armed, but the ends were powerfully magnetic; nor could the poles be altered, tho' it was placed between two of his largeſt bars, and they were very ſtrongly impregnated. The maſs was not very heavy, and had much the appearance of a piece of black lead, though not quite ſo ſhining. I believe he never divulged this compoſition; but I think he once told me, the baſis of it was filings of iron reduced by long continued attrition to a perfectly impalpable ſtate, and then incorporated with ſome pliant matter to give it due conſiſtence."

From theſe accounts it appears that the baſis of Dr Knight's artificial loadſtones was the black powder to which iron filings are reduced by water, and which is known among the apothecaries by the name of *Martial Æthiops*: whence Mr Cavallo gives the following receipt for imitating the natural magnets.—"Take ſome martial æthiops, or, which is more eaſily caſily procured, reduce into very fine powder the ſcales of iron which fall from red-hot iron when hammered, and are found abundantly in ſmiths ſhops. Mix this powder with drying linſeed oil, ſo as to form it into a very ſtiff paſte, and ſhape it in a mould ſo as to give it any form you require; whether of a terrella, a human head, or any other. This done, put it into a warm place for ſome weeks, and it will dry ſo as to become very hard; then render it magnetic by the application of powerful magnets, and it will acquire a conſiderable power."

As to the method of making artificial magnets of ſteel, none has ſucceeded in it better than Mr Canton, whoſe proceſs is as follows.

Plate CCLXXVI.

Procure a dozen of bars; ſix of ſoft ſteel, each three inches long, one quarter of an inch broad, and one twentieth of an inch thick; with two pieces of iron, each half the length of one of the bars, but of the ſame breadth and thickneſs; alſo ſix pieces of hard ſteel, each five inches and a half long, half an inch broad, and three-twentieths of an inch thick; with two pieces of iron of half the length, but the whole breadth and thickneſs of one of the hard bars; and let all the bars be marked with a line quite round them at one end. Then take an iron poker and tongs (fig. 8.), or two bars of iron, the larger they are and the longer they have been uſed, the better; and fixing the poker upright between the knees, hold to it, near the top, one of the ſoft bars, having its marked end downwards, by a piece of ſewing ſilk, which muſt be pulled tight by the left hand, that the bar may not ſlide: then graſping the tongs with the right hand, a little below the middle, and holding them nearly in a vertical poſition, let the bar be ſtroked by the lower end from the bottom to the top, about ten times on each ſide, which will give it a magnetic power ſufficient to lift a ſmall key at the marked end: which end, if the bar was ſuſpended on a point, would turn towards the north, and is therefore called the *north pole*; and the unmarked end is, for the ſame reaſon, called the *ſouth pole*. Four of the ſoft bars being impregnated after this manner, lay the two (fig. 9.) parallel to each other, at the diſtance of one fourth of an inch, between the two pieces of iron belonging to them, a north and a ſouth pole againſt each piece of iron: then take two of the four bars already made magnetical, and place them together ſo as to make a double bar in thickneſs, the north pole of one even with the ſouth pole of the other: and the remaining two being put to theſe, one on each ſide, ſo as to have two north and two ſouth poles together; ſeparate the north from the ſouth poles at one end by a large pin, and place them perpendicularly with that end downward on the middle of one of the parallel bars, the two north poles towards its ſouth and the two ſouth poles towards its north end: ſlide them backward and forward three or four times the whole length of the bar, and removing them from the middle of this, place them on the middle of the other bar as before directed, and go over that in the ſame manner; then turn both the bars the other ſide upwards, and repeat the former operation: this being done, take the two from between the pieces of iron; and, placing the two outermoſt of the touching bars in the room, let the other two be the outermoſt of the four to touch theſe with; and this proceſs being repeated till each pair of bars have been touched three or four times over, which will give them a conſiderable magnetic power, put the half-dozen together after the manner of the four (fig. 10.), and touch them with two pair of the hard bars placed between their irons, at the diſtance of about half an inch from each other: then lay the ſoft bars aſide; and with the four hard ones let the other two be impregnated (fig. 11.), holding the touching bars apart at the lower end near two tenths of an inch; to which diſtance let them be ſeparated after they are ſet on the parallel bar, and brought together again before they are taken off: this being obſerved, proceed according to the method deſcribed above, till each pair have been touched two or three times over. But as this vertical way of touching a bar will not give it quite ſo much of the magnetic virtue as it will receive, let each pair be now touched once or twice over in their parallel poſition between the irons (fig. 12.), with two of the bars held horizontally, or nearly ſo, by drawing at the ſame time the north pole of one from the middle over the ſouth end, and the ſouth of the other from the middle over the north end of a parallel bar; then bringing them to the middle again, without touching the parallel bar, give three or four of theſe horizontal ſtrokes to each ſide. The horizontal touch, after the vertical, will make the bars as ſtrong as they poſſibly can be made, as appears by their not receiving any additional ſtrength, when the vertical touch is given by a great number of bars, and the horizontal by thoſe of a ſuperior magnetic power. This whole proceſs may be gone through in about half an hour; and each of the large bars, if well hardened, may be made to lift 28 Troy ounces, and ſometimes more. And when theſe bars are thus impregnated, they will give to an hard bar of the ſame ſize its full virtue in leſs than two minutes; and therefore will anſwer all the purpoſes of magnetiſm in navigation and experimental philoſophy much better than the loadſtone, which is known not to have a ſufficient power to impregnate hard bars. The half dozen being put into a caſe (fig. 13.) in ſuch a manner as that two poles of the ſame denomination may not be together, and their irons with them as one bar, they will retain the virtues they have received; but if their power ſhould, by making experiments, be ever ſo far impaired, it may be reſtored without any foreign aſſiſtance in a few minutes. And if, out of curioſity, a much larger ſet of bars ſhould be required, theſe will communicate to them a ſufficient power to proceed with; and they may, in a ſhort time, by the ſame method, be brought to their full ſtrength.

To expedite the proceſs of making magnets, the bars ſhould be fixed in a groove, or between braſs pins, to prevent them from ſliding; or they may be kept ſteady by means of a weight and ruler, as in fig. 11.

§ 3. *Apparatus for making Experiments in Magnetiſm, with an Account of various Experiments tending to illuſtrate and prove the Laws already laid down.*

The apparatus neceſſary in magnetics is but ſmall; conſiſting only of a few magnets or magnetic bars, a magnetic horizontal needle or compaſs, and a dipping needle. For thoſe who do not intend to be very accurate, a common artificial horſe-ſhoe magnet and a few ſewing needles may be ſufficient; but where greater accuracy is required, it will then be neceſſary to

have

have a good ſet of magnetic bars, commonly ſix; a few ſmall magnetic needles, a larger needle in a box with a graduated circle, and a dipping needle; to which may be added ſome pieces of ſteel-wire, a few bars of ſoft iron, &c.

The magnetic bars ought to be made of the beſt ſteel, and tempered quite hard. There is not, however, any method known as yet by which we can diſtinguiſh the kind of ſteel which is beſt for magnetical purpoſes. It will be proper, therefore, previous to the conſtruction of the bars, to try the quality of the metal in the following manner: Take a piece of it about three inches long and a quarter of an inch thick, no matter whether round or ſquare; make it red-hot, and in that condition plunge it into cold water, which hardens it ſo that a file will not touch it. Apply then two powerful magnetic bars; holding the north pole of one to one extremity of the ſteel, and the ſouth-pole of the other magnet to the other extremity of the ſteel. Having kept them in this poſition for about a minute, ſeparate them from the ſteel, and then try whether it will keep ſuſpended a key or other piece of iron which may be at hand. By treating in this manner pieces of different ſteel, it will eaſily be perceived which is capable of lifting the greateſt weight, and conſequently the moſt proper for the conſtruction of the bars.

Having determined the quality of the material, the next thing to be conſidered is the ſhape of the bars; for unleſs the length and breadth of them bear a certain proportion to each other, they will not be capable of receiving their utmoſt power. The beſt ſhape, according to Mr Cavallo, is when the length is ten times the breadth and 20 times the thickneſs. The uſual dimenſions are five inches in length, half an inch in breadth, and a quarter of an inch in thickneſs. Cylindrical bars are leſs convenient.—It is not abſolutely neceſſary to poliſh theſe bars; though it will be better to do ſo, they being in this ſtate much leſs liable to ruſt. One extremity is generally marked with a line all round, to diſtinguiſh one pole from another; and it is the north pole which is uſually marked in this manner. When kept together, the magnetic bars muſt be placed alternately with the marked end of one contiguous to the unmarked end of the other. Two pieces of ſoft iron called *ſupports* always belong to each ſet of bars. Each of theſe is equal in ſize to the half of one of the bars; ſo that when placed contiguous to one another in one direction, they may equal one of the bars. Theſe are uſeful when other bodies are to be rendered magnetic. For the conſtruction of the *Compass* and *Dipping-Needle*, ſee theſe articles.

Experiments with the above deſcribed Apparatus.

1. *To determine whether any ſubſtance is attracted ly the magnet or not.*—If the ſubſtance to be examined contains iron, the attraction will evidently ſhow itſelf on bringing near it one of the magnetic bars. The quantity of attraction will always be known by the force requiſite to ſeparate them, and its proportion is eſtimated by the degree of that force. Thus if two ounces are required to ſeparate a magnet from any ſubſtance, the degree of attraction is reckoned double to that which requires only one ounce to ſeparate them. If the attraction be ſo ſmall that it cannot be perceived in this way, it muſt be put to ſwim upon water in an earthen or wooden veſſel, by means of a piece of wood or cork. In this way the attraction will be much more eaſily manifeſted by the body coming towards the magnet when approached to it. It will ſometimes be neceſſary to bring the magnet within one-tenth part of an inch of the body to be attracted; and as the latter advances, care muſt be taken to withdraw the magnet; for if they be ſuffered to ſtrike againſt each other, the body, if hard, will generally recede; and it will likewiſe be proper to preſent the magnet to the body when the latter is at reſt.

By letting the ſubſtances to be attracted ſwim upon quickſilver, a ſtill ſmaller degree of attraction can be perceived. In uſing this fluid, the following particulars muſt be attended to. 1. The aperture of the veſſel in which the quickſilver is kept muſt be at leaſt ſix inches in diameter. The reaſon of this is, that, as the ſurface of the quickſilver deſcends near the ſides of the veſſel, the curvature of ſurface formed by that deſcent is proportionably greater in the narrow veſſels than larger ones. If the veſſel is only three or four inches in diameter, the body to be attracted will perpetually run from one ſide to another: a common ſoup-plate, however, will be found a very convenient veſſel for this purpoſe. 2. It will be neceſſary to have the quickſilver very pure; and as it is very difficult to preſerve it in that ſtate, it muſt be frequently paſſed through a piece of writing paper rolled up conically, and having a ſmall aperture of about $\frac{1}{40}$th of an inch diameter in the lower part. 3. The neighbouring air muſt not be diſturbed, that the body may be kept without motion; and, while in this ſtate, one of the poles of the magnet is to be preſented to it in the ſame manner as when the experiment is tried with water. It was in this manner that Mr Cavallo made his experiments on the magnetiſm of braſs and other metals, of which we have already given an account.

If it be ſuſpected that the given body have ſome magnetiſm already, the very ſame proceſs is required; only obſerving to preſent a piece of ſoft and clean iron to the body when ſwimming upon water or quickſilver. A piece of iron about half an ounce weight, and an inch in length, will be very proper for this purpoſe.

2. *To find the poles of a magnetic body.*—Preſent the various parts of the body ſucceſſively to one of the poles of a magnetic needle, and it will ſoon be diſcovered which parts of the given body are poſſeſſed of a contrary polarity by the needle's ſtanding perpendicularly towards them. One of the poles being thus diſcovered, turn the oppoſite pole of the magnetic needle towards the body, and it will ſoon find out its other pole. When the magnetiſm of the body to be examined is very weak, there will be danger of reverſing the polarity by bringing the needle too near; and as the diſtance at which this effect will take place cannot be determined, it will always be proper to keep it ſo far diſtant that it can only ſenſibly affect the needle. Where there are only two poles, they may be found out merely by ſprinkling ſome iron-filings upon the body; for theſe will ſtand erect upon the polar points. They may be diſtinguiſhed by ſetting the body to float in water, or tying it to a thread and letting it hang

freely, ſo that one may turn towards the north and the other towards the ſouth. This method, however, will not ſucceed when there are more than two poles, nor even very well in that caſe, unleſs they lie in parts directly oppoſite to one another.

3. *Effects of the magnet on ſoft iron.*—Having placed a magnetic needle upon a table, bring a bar of ſoft iron about eight inches long and a quarter of an inch thick, ſo near that it may draw one end of the needle a little out of the way. In this ſituation approach gradually the north pole of a magnet to the other extremity of the bar, and the north end of the needle will recede from the bar more and more in proportion as the magnet is brought nearer the bar. If the experiment be repeated with the other pole of the magnet, the north end of the needle will then be attracted by the bar. The reaſon of this is, that when we bring the north pole of the magnet towards one end of the bar, the latter acquires a ſouth polarity, and the other one of courſe a north polarity. Hence the needle is repelled, becauſe magnetic poles of the ſame kind repel one another; but when the ſouth pole is brought near the end of the bar, that end which it approaches receives the north polarity, and the other of courſe the ſouth; whence the needle, inſtead of being repelled, is now attracted. By approaching a ſmall magnetic needle to different parts of the bar, it will be found that one half of it poſſeſſes one kind of polarity, and the other the contrary kind; the magnetic centre, however, or the limit betwixt the two polarities, is not always in the middle of the bar, but is generally nearer that end which is preſented to the magnet. The difference increaſes as the bar is lengthened; and when the latter exceeds a certain length, it acquires ſeveral poles. This depends on the ſtrength of the magnet; and when it happens, the firſt magnetic centre comes very near to the end of the bar which ſtands next the magnet, and ſucceſſive centres are formed betwixt every two poles. Thus, ſuppoſing the north pole of a magnet to be brought to the end of ſuch a bar, the end it touches becomes a ſouth pole; a few inches farther a north polarity takes place, after that a ſouth polarity, and ſo on. The poles become weaker and weaker as they recede from the end which the magnet touches; ſo that if the bar be of conſiderable length, they totally vaniſh long before they come to the other end. Hence, by applying a magnet to one end of a long bar, we will not thereby give any magnetiſm to the other; and this will happen when a magnet capable of lifting two pounds of iron is applied to a bar of about an inch ſquare and five feet long.

4. *The action of magnetiſm ſhown by the repulſion of two pieces of wire.*—Tie two pieces of ſoft wire each to a ſeparate thread, and having ſuſpended them cloſe by each other, bring one of the poles of a magnet under them, and they will immediately repel; the divergency becoming greater as the magnet is brought nearer within a certain limit, and will decreaſe as the magnet is removed. If ſteel-wires or common ſewing needles be uſed, the repulſion will continue for a conſiderable time after the magnet is removed; and this divergency will even be greater after the removal of the magnet, as its attraction tends to draw them nearer each other; and, if brought too near, no repulſion will be ſhown by them. The experiment may be agreeably diverſified by uſing four or more needles, and preſenting a north pole to one pair and a ſouth pole to another, &c.

Plate CCLXXVI

5. *In what circumſtances a magnet can lift the greateſt weight.*—By means of a crooked wire we may ſhow that the power of a magnet varies according to circumſtances. Thus, let a piece of wire about a quarter of an inch in diameter, and four or five inches long, be bent in the manner repreſented by ACB, fig. 14. with a ſharp corner at C. Tie it faſt to a croſs bar, or let it be held by an aſſiſtant with the corner downwards. Then apply either pole of the magnet DE to one of its extremities; and if in this ſituation a ſmall piece of iron, as H, be put to the corner C, it will remain ſuſpended. On applying the contrary pole of another magnet to the other extremity of the wire, the piece of iron will immediately fall off; but if a pole of the ſame kind be applied, it will not only be ſtill kept ſuſpended, but be more ſtrongly attracted than before.

In the caſe juſt mentioned, the firſt magnet is aſſiſted by the action of the ſecond; but in order to ſtrengthen a magnet in this manner, it does not appear neceſſary to uſe a magnet at all. Thus, having found by trial how much a magnetic bar can lift, procure an oblong piece of iron about four inches long, and ſomewhat heavier than the bar can bear. Apply one end of this to the pole of the bar, holding it with your hand till you place under the other end a larger piece of iron. It will then be found that the magnet will ſupport the piece of iron which it could not do before. The lower piece of iron is to be placed between an half and three quarters of an inch below the under part of the oblong piece which hangs at the magnet. The ſame effect will be produced by the oppoſite pole of another magnet; but a pole of the ſame denomination would weaken the attraction.

6. *The generation of poles, and of magnetic centres in the parts of a broken magnet.*—Take a magnetic bar about ſix or eight inches long and a quarter of an inch diameter, whoſe magnetic centre will be in the middle, or near it. Break off about one third part by a ſmart ſtroke of an hammer, and it will be found that the broken part, though in the magnet it had but one polarity, will now have acquired a north and ſouth pole, with a magnetic centre, as if it were a diſtinct magnet. The experiment may be diverſified as follows: Having made a ſteel bar about ſix inches long and a quarter of an inch thick quite hard, break it into two unequal parts. Join theſe, and preſs them hard together, giving it the magnetic virtue at the ſame time by means of two powerful magnets: while the parts remain in this poſition, ſo that the bar looks as if it had not been broke, it will have only two poles; but as ſoon as they are ſeparated, each part will be found to become a diſtinct magnet, having a north and ſouth pole proper to itſelf.

7. *To remove the magnetic centre in a magnet.*—This may be done in various ways; as, by ſtriking a magnetic bar repeatedly, heating it, hard rubbing, &c.; but in all theſe methods the magnetiſm of the bar is diminiſhed at the ſame time that the centre is removed; ſo that they ought not to be continued beyond what is neceſſary to produce a ſenſible removal of the magnetic centre.

8. *The diſadvantages of uſing magnets of unequal power, and of ſteel not properly hardened.*—Having communicated the magnetic virtue to a ſteel-bar by means of a magnet of any given power, then rub it with a weaker magnet, and it will be found, that the power of the bar, inſtead of being augmented, will now be diminiſhed; being no ſtronger than if it had been rubbed only with the weak magnet. The impropriety of uſing ſoft ſteel in making artificial magnets may be underſtood from the following example: Take two wires about 14 inches long, and one eighth of an inch in thickneſs; let one be of very hard ſteel, the other of ſoft ſteel or iron, though not of the ſofteſt ſort: then, by means of magnetic bars, give the virtue to thoſe wires, treating them both in the ſame manner, and it will be generally found that the hard wire will have only two poles, but the other a greater number.

9. *To weaken or deſtroy the magnetiſm of a wire by bending.*—Having communicated the magnetic virtue to an iron or ſoft ſteel wire of about four or five inches long and one-twentieth of an inch in diameter, roll it round a ſtick ſo as to make four or five revolutions. When taken off the ſtick it will be found to have its virtue quite deſtroyed, or at leaſt very much weakened by the bending. This effect cannot be produced but when the texture of the wire is ſtrained by the bending; for if it be of ſuch an elaſtic nature as to recover its ſtraightneſs after being once rolled round the ſtick, little change is made on the magnetic power. When only the middle of the wire is bent, little or no change takes place in the magnetic power. If a piece of magnetic wire be cleft, or ſplit lengthwiſe, the parts will ſometimes have the ſame poles, and ſometimes the contrary; but when one part is much thinner than the other, the ſlender part will generally have its poles reverſed.

10. *To improve natural magnets.*—This may be done by the ſame methods which are uſed to communicate the virtue to ſteel-bars or to iron-ores: but the natural magnets being generally very ſhort, we can ſeldom do more than place them between two ſtrong magnetic bars: However, when they are of ſufficient length, they muſt be rubbed with other bars beſides thoſe between which they are put; uſing the ſame precautions as in making artificial magnets. When ſubjected to this operation, it will always be proper to remove the armature from them.

11. *To arm natural or artificial magnets.*—The firſt ſtep towards this operation is to find out the poles of the magnet, after which it is to be properly ſhaped: that of a parallelopipedon is the beſt: in which caſe care muſt be taken to let the poles fall about the middle of two oppoſite ſurfaces; and in this direction the magnet ought to have the greateſt length poſſible; for a natural magnet is weakened much more by having a part cut off from its length than its breadth. This being done, provide two plates of ſoft iron, equal in breadth to thoſe ſurfaces where the poles ſtand, and projecting a little on one ſide of the ſtone, as ſhown by fig. 15. The projections marked DD muſt be much narrower than the breadth of the plates; from a quarter to half an inch being ſufficient for the larger magnets, and about one tenth of an inch for ſmall ones, for the purpoſe of applying to them the ſurface of the iron F. The thickneſs of the plates CD CD muſt be proportioned to the ſtrength of the magnet A B; and this proportion cannot eaſily be determined without an actual experiment. The beſt method, therefore, is to make them ſomewhat thick at firſt, and then keep filing them down as long as the power of the magnet increaſes; after which the filing is to be diſcontinued. The armature may be kept on either by tying or by a box; which laſt is the preferable method. The armature of ſpherical magnets muſt be adapted to their ſhape, and each large enough to cover a quarter of it. In like manner may artificial magnets be armed, and thus a compound magnet may be produced much more powerful than any ſingle one. Thus Dr Knight conſtructed two very powerful artificial magnets, or magazines of magnetic bars, which are now in the repoſitory of the Royal Society. Each of theſe conſiſts of 240 bars diſpoſed in four lengths, ſo as to form a parallelopipedon, each length containing 60 bars. They are all kept together by iron braces, and the whole ſuſpended on pivots, with a wooden pedeſtal or carriage, by which they may be eaſily placed in any required poſition. If the artificial magnets be made in the ſhape of a horſe-ſhoe or a ſemicircle, they have no occaſion for armature, it being ſufficient to join them either by rivetting or by means of a box; and indeed even when ſtraight bars are uſed, a compound magnet may be made without armature; but then as the poles cannot act in the ſame plain, it is neceſſary to have two magazines in order to give magnetiſm the more conveniently to other bodies. The power of a magnet is rather augmented by being armed, for the ſame reaſon that it is increaſed by a piece of iron affixed to it. E is a braſs ring, by which it may be ſuſpended with the iron adhering to it, which is the beſt method for preſerving its virtue.

12. *Magnetiſm requires ſome time to penetrate through iron.* Having placed a bulky piece of iron, ſuppoſe one weighing 40 or 50 pounds, ſo near a magnetic needle as to draw it a little out of its direction, apply one of the poles of a ſtrong magnet to the other extremity of the iron, and you will find that it requires ſome ſeconds before the needle can be affected by it. The interval is greater or leſs according to the ſize of the iron and the ſtrength of the magnet.

CHAP. IV. *Entertaining Experiments.*

Conſtruction of the MAGNETIC PERSPECTIVE-GLASS.] Provide an ivory tube, about two inches and a half long, and of the form expreſſed in fig. 16. The ſides of this tube muſt be thin enough to admit a conſiderable quantity of light. It is to open at one end with a ſcrew; at that end there muſt be placed an eye-glaſs of about two inches focus, and at the other end any glaſs you pleaſe. Have a ſmall magnetic needle, like that placed on a compaſs. It muſt be ſtrongly touched, and ſo placed at the bottom of the tube that it may turn freely round. It is to be fixed on the centre of a ſmall ivory circle C, of the thickneſs of a counter, which is placed on the object-glaſs D, and painted black on the ſide next it. This circle muſt be kept faſt by a circular rim of paſteboard, that the needle may not riſe off its pivot, after the ſame manner as in the compaſs. This tube will thus become a compaſs, ſufficiently tranſparent to

Plate CCLXXVI

ſhow the motions of the needle. The eye-glaſs ſerves more clearly to diſtinguiſh the direction of the needle ; and the glaſs at the other end, merely to give the tube the appearance of a common perſpective. It will appear from the laws of magnetiſm already laid down, that the needle in this tube, when placed over, and at a ſmall diſtance from, a magnet, or any machine in which it is contained, will neceſſarily place itſelf in a poſition directed by that magnet, and conſequently ſhow where the north and ſouth pole of it is placed ; the north end of the needle conſtantly pointing to the ſouth end of the magnet. This effect will take place, though the magnet be incloſed in a caſe of wood, or even metal, as the magnetic effluvia penetrates all bodies. You muſt obſerve, however, that the attracting magnet muſt not be very far diſtant from the needle, eſpecially if it be ſmall, as in that caſe its influence extends but to a ſhort diſtance. This tube may be differently conſtructed, by placing the needle in a perpendicular direction, on a ſmall axis of iron, on which it muſt turn quite freely, between two ſmall plates of braſs placed on each ſide the tube : the two ends of the needle ſhould be in exact equilibrium. The north and ſouth ends of this needle will, in like manner, be attracted by the ſouth and north ends of the magnetic bar. The former conſtruction, however, appears preferable, as it is more eaſily excited, and the ſituation of the needle much more eaſily diſtinguiſhed.

Exp. I. *The magnetic paradox.*

Plate CCLXXVII

Having placed a ſmall piece of iron wire not above a tenth part of an inch long upon a table AB, fig. 17. Hold the magnetic bar EF about four or five inches above the table, with either of its poles pointing to the table, and ſo that the perpendicular let fall from the pole may touch the table at G, two or three inches from the wire ; which diſtances, however, are ſubject to variations ariſing from the power of the magnet.—When the magnet is held in a proper poſition with reſpect to the iron, the latter will elevate one of its ends, as is ſhown at CD, forming an angle with the table, which is larger the nearer the wire comes to the point G, where it ſtands quite upright. Knock the table gently, and the wire CD will gradually proceed towards G, every knock making it jump up and advance a little way. This will naturally be attributed to the attraction of the magnet ; which not being ſufficiently ſtrong to draw the wire directly towards it, is juſt able to bring it gradually towards G when the motion of the table lifts it up. But if, inſtead of holding the magnet over the table, it be placed below it at HI, the wire will now make an obtuſe angle towards G ; as is ſhown at KL, and, on knocking the table, will recede from the magnet as if repelled, though in truth it is as much attracted as before.

The cauſe of this ſeeming repulſion will be underſtood from fig. 18. where the wire is repreſented by KL and the magnet by H. The former being rendered magnetic by the proximity of the magnet H, is inclined to it according to the laws already laid down; but, by reaſon of its weight, and being ſupported only at one end, it inclines leſs than it would do if it were freely ſuſpended by its centre. Let MN be a line paſſing through the centre of the wire ; then, by the motion of the table, the wire being lifted up, the end K will be at liberty to deſcend farther in the direction in which it is attracted by the magnet than it was before. It will then take the poſition repreſented by *r* Q, its centre remaining nearly in the ſame perpendicular MN. We ſay nearly, becauſe the action of the magnet will undoubtedly move the whole wire ſomewhat nearer to itſelf; and the motion of the centre will be a diagonal compounded of the forces of gravity and of the magnet. The latter, however, being much ſmaller, will, by conſpiring with the action of gravity, draw down the neareſt end of the wire *r* ſo far, that a perpendicular line PO let fall from the extremity of it will touch the table in a point farther diſtant from the magnet than K. In this perpendicular the wire will depend very nearly, and then reſume its proper ſituation, parallel, or nearly ſo, to KL ; when a ſecond knock will remove it a little farther off, for the reaſon already aſſigned. The former part of the experiment may be eaſily explained upon the ſame principles. The whole may be diverſified by uſing iron-filings inſtead of the wire. In this caſe, when the magnet is held over the table, they will be gradually collected about the point G, and diſperſed from it while the magnet is held under.

2. *The communicative crown.*

Take a crown-piece, and bore a hole in the ſide of it ; in which place a piece of wire, or a large needle, well poliſhed, and ſtrongly touched with a magnet. Then cloſe the hole with a ſmall piece of pewter, that it may not be perceived. Now the needle in the magnetic perſpective before deſcribed, when it is brought near to this piece of money, will fix itſelf in a direction correſpondent to the wire or needle in that piece. Deſire any perſon to lend you a crown-piece, which you dexterouſly change for one that you have prepared as above. Then give the latter piece to another perſon, and leave him at liberty either to put it privately in a ſnuff-box, or not ; he is then to place the box on a table, and you are to tell him, by means of your glaſs, if the crown is or is not in the box. Then bringing your perſpective cloſe to the box, you will know, by the motion of the needle, whether it be there or not ; for as the needle in the perſpective will always keep to the north of itſelf, if you do not perceive it has any motion, you conclude the crown is not in the box. It may happen, however, that the wire in the crown may be placed to the north, in which caſe you will be deceived. Therefore, to be ſure of ſucceſs, when you find the needle in the perſpective remain ſtationary, you may make ſome pretence to deſire the perſon to move the box into another poſition, by which you will certainly know if the crown-piece be there or not.—You muſt remember, that the needle in the perſpective muſt here be very ſenſible, as the wire in the crown cannot poſſibly have any great attractive force.

3. *The magnetic table.*

Under the top of a common table place a magnet that turns on a pivot ; and fix a board under it, that nothing may appear. There may alſo be a drawer under the table, which you pull out to ſhow that there is nothing concealed. At one end of the table there muſt

Entertaining Experiments.

muſt be a pin that communicates with the magnet, and by which it may be placed in different poſitions: this pin muſt be ſo placed as not to be viſible to the ſpectators. Strew ſome ſteel-filings or very ſmall nails over that part of the table where the magnet is. Then aſk any one to lend you a knife, or a key, which will then attract part of the nails or filings. Then placing your hand in a careleſs manner on the pin at the end of the table, you alter the poſition of the magnet; and giving the key to any perſon, you deſire him to make the experiment, which he will then not be able to perform. You then give the key to another perſon; at the ſame time placing the magnet, by means of the pin, in the firſt poſition, when that perſon will immediately perform the experiment.

4. *The myſterious watch.*

You deſire any perſon to lend you his watch, and aſk him if he thinks it will or will not go when it is laid on the table. If he ſay it will, you place it over the end of the magnet, and it will preſently ſtop (A). You then mark with chalk, or a pencil, the preciſe point where you placed the watch; and moving the poſition of the magnet, as in the laſt experiment, you give the watch to another perſon, and deſire him to make the experiment; in which he not ſucceeding, you give it to a third perſon, at the ſame time replacing the magnet, and he will immediately perform the experiment

5. *The magnetic dial.*

Provide a circle of wood or ivory, of about five or ſix inches diameter, as fig. 19. which muſt turn quite free on the ſtand B (fig. 20.) in the circular border A: on the circle muſt be placed the dial of paſteboard C (fig. 19.) whoſe circumference is to be divided into 12 equal parts, in which muſt be inſcribed the numbers from 1 to 12, as on a common dial. There muſt be a ſmall groove in the circular frame D, to receive the paſteboard circle: and obſerve, that the dial muſt be made to turn ſo free, that it may go round without moving the circular border in which it is placed. Between the paſte-board circle and the bottom of the frame, place a ſmall artificial magnet E (fig. 21.), that has a hole in its middle, or a ſmall protuberance. On the outſide of the frame place a ſmall pin P, which ſerves to ſhow where the magnetic needle I, that is placed on a pivot at the centre of the dial, is to ſtop. This needle muſt turn quite free on its pivot, and its two ſides ſhould be in exact equilibrium. Then provide a ſmall bag, that has five or ſix diviſions, like a lady's work-bag, but ſmaller. In one of theſe diviſions put ſmall ſquare pieces of paſteboard, on which are wrote the numbers from 1 to 12, and if you pleaſe you may put ſeveral of each number. In each of the other diviſions you muſt put 12 or more like pieces; obſerving, that all the pieces in each diviſion muſt be marked with the ſame number. Now the needle being placed upon its pivot, and turned quickly about, it will neceſſarily ſtop at that point where the north end of the magnetic bar is placed, and which you previouſly know by the ſituation of the ſmall pin in the circular border. You therefore preſent to any perſon that diviſion of the bag which contains the ſeveral pieces on which is wrote the number oppoſite to the north end of the bar, and tell him to draw any one of them he pleaſes. Then placing the needle on the pivot, you turn it quickly about, and it will neceſſarily ſtop, as we have already ſaid, at that particular number.

Entertaining Experiments.

Another experiment may be made with the ſame dial, by deſiring two perſons to draw each of them one number out of two different diviſions of the bag; and if their numbers, when added together, exceed 12, the needle or index will ſtop at the number they exceed it; but if they do not amount to 12, the index will ſtop at the ſum of thoſe two numbers. In order to perform this experiment, you muſt place the pin againſt the number 5, if the two numbers to be drawn from the bag be 10 and 7; or againſt 9 if they be 7 and 2.—If this experiment be made immediately after the former, as it eaſily may, by dexterouſly moving the pin, it will appear the more extraordinary.

6. *The dexterous painter.*

Provide two ſmall boxes, as M and N (fig. 22), four inches wide, and four inches and a half long. Let the box M be half an inch deep, and N two-thirds of an inch. They muſt both open with hinges, and ſhut with a claſp. Have four ſmall pieces of light wood, (fig. 23, 24, 25, 26.) of the ſame ſize with the inſide of the box M (fig. 22.), and about one third of an inch thick. In each of theſe let there be a groove, as AB, EF, CD, GH; theſe grooves muſt be in the middle, and parallel to two of the ſides. In each of theſe grooves place a ſtrong artificial magnet, as fig. 27. The poles of theſe magnets muſt be properly diſpoſed with regard to the figures that are to be painted on the boards; as is expreſſed in the plate. Cover the bars with paper, to prevent their being ſeen; but take care, in paſting it on, not to wet the bars, as they will thereby ruſt, which will conſiderably impair their virtue. When you have painted ſuch ſubjects as you chooſe, you may cover them with a very thin clear glaſs. At the centre of the box N, place a pivot (fig. 28.), on which a ſmall circle of paſteboard OPQR (fig. 29.) is to turn quite free; under which is to be a touched needle S. Divide this circle into four parts, which are to be diſpoſed with regard to the poles of the needle, as is expreſſed in the figure. In theſe four diviſions you are to paint the like ſubjects as are on the four boards, but reduced to a ſmaller compaſs. Cover the inſide of the top of this box with a paper M, (ſee fig. 22.) in which muſt be an opening D, at about half an inch from the centre of the box, that you may perceive, ſucceſſively, the four ſmall pictures on the paſteboard circle juſt mentioned. This opening is to ſerve as the cloth on which the little painter is ſuppoſed to draw one of the pictures. You may cover the top of the box, if you pleaſe, with a thin glaſs. Then give the firſt box to any perſon, and tell him to place any one of the four pictures in it privately, and, when he has cloſed it, to give it you. You then place the other box over it; when the moveable circle, with the needle, will turn till it comes in the ſame poſition with the bar in the

---

(A) To perform this experiment, you muſt uſe a ſtrong magnetic bar; and the balance of the watch muſt not be of braſs, but ſteel.

Entertaining Experiments.

firſt box. It will then appear that the little dexterous painter has already copied the picture that is incloſed in the firſt box.

7. *The cylindric oracle.*

Provide a hollow cylinder of about ſix inches high and three wide, as AB, fig. 30. Its cover CD muſt be made to fix on any way. On one ſide of this box or cylinder let there be a groove, nearly of the ſame length with that ſide; in which place a ſmall ſteel bar (fig. 31.) that is ſtrongly impregnated, with the north pole next the bottom of the cylinder. On the upper ſide of the cover deſcribe a circle; and divide it into ten equal parts, in which are to be wrote the numbers from 1 to 10, as is expreſſed in fig. 32. Place a pivot at the centre of this circle, and have ready a magnetic needle. You are then to provide a bag, in which there are ſeveral diviſions, like that deſcribed in exper. 5. In each of theſe diviſions put a number of papers, on which the ſame or ſimilar queſtions are wrote. In the cylinder put ſeveral different anſwers to each queſtion, and ſeal them up in the manner of ſmall letters. On each of theſe letters or anſwers is to be wrote one of the numbers of the dial or circle at the top of the box. You are ſuppoſed to know the number of the anſwers to each queſtion. You then offer one of the diviſions of the bag, obſerving which diviſion it is, to any perſon, and deſire him to draw one of the papers. Next put the top on the cylinder, with that number which is wrote on the anſwer directly over the bar. Then placing the needle on the pivot, you turn it briſkly about, and it will naturally ſtop at the number over the bar. You then deſire the perſon who drew the queſtion to obſerve the number at which the needle ſtands, and to ſearch in the box for a paper with the ſame number, which he will find to contain the anſwer.—You may repeat the experiment by offering another diviſion of the bag to the ſame or another perſon; and placing the number that correſponds to the anſwer over the magnetic bar, proceed as before.

It is eaſy to conceive of ſeveral anſwers to the ſame queſtion. For example, ſuppoſe the queſtion to be, Is it proper to marry?

Anſwer 1. While you are young, not yet; when you are old, not at all.

2. Marry in haſte, and repent at leiſure.

3. Yes, if you can get a good fortune; for ſomething has ſome favour, but nothing has no flavour.

4. No, if you are apt to be out of humour with yourſelf; for then you will have two perſons to quarrel with.

5. Yes, if you are ſure to get a good huſband (wife); for that is the greateſt bleſſing of life. But take care you are ſure.

6. No, if the perſon you would marry is an angel; unleſs you will be content to live with the devil.

8. *The enchanted ewer.*

Fix a common ewer, as A, (fig. 33.) of about 12 inches high, upon a ſquare ſtand BC; in one ſide of which there muſt be a drawer D, of about four inches ſquare and half an inch deep. In the ewer place a hollow tin cone, inverted, as AB, fig. 34. of about four inches and a half diameter at top, and two inches at bottom; and at the bottom of the ewer there muſt likewiſe be a hole of two inches diameter.

Upon the ſtand, at about an inch diſtance from the bottom of the ewer, and directly under the hole, place a ſmall convex mirror H, of ſuch convexity that a perſon's viſage, when viewed in it, at about 15 inches diſtance, may not appear above two inches and a half long.

Upon the ſtand likewiſe, at the point I, place a pivot of half an inch high, on which muſt be fixed a touched needle RQ, incloſed in a circle of very thin paſteboard OS, fig. 35. of five inches diameter. Divide this paſteboard into four parts, in each of which draw a ſmall circle: and in three of theſe circles paint a head as x, y, z, the dreſs of each of which is to be different, one, for example, having a turban, another a hat, and the other a woman's cap. Let that part which contains the face in each picture be cut out, and let the fourth circle be entirely cut out; as it is expreſſed in the figure. You muſt obſerve, that the poles of the needle are to be diſpoſed in the ſame manner as in the plate.

You are next to provide four ſmall frames of wood or paſteboard, n° 1, 2, 3, 4, each of the ſame ſize with the inſide of the drawer. On theſe frames muſt be painted the ſame figures as on the circular paſteboard; with this difference, that there muſt be no part of them cut out. Behind each of theſe pictures place a magnetic bar, in the ſame direction as is expreſſed in the plate; and cover them over with paper, that they may not be viſible. Matters being thus prepared, you firſt place in the drawer the frame n° 4. on which there is nothing painted. You then pour a ſmall quantity of water into the ewer, and deſire the company to look into it, aſking them if they ſee their own figures as they are. Then you take out the frame n °4. and give the three others to any one, deſiring him to chooſe in which of thoſe dreſſes he would appear. Then put the frame with the dreſs he has choſe in the drawer; and a moment after, the perſon looking into the ewer will ſee his own face ſurrounded with the dreſs of that picture. For, the paſteboard circle (divided, as above deſcribed, into four parts, in three of which are painted the ſame figures as on three of the boards, and the fourth left blank) containing a magnetic needle, and the four boards having each a concealed magnet; therefore, when one of them is put in the drawer under the ewer, the circle will correſpond to the poſition of that magnet, and conſequently the perſon looking into the top of the ewer will ſee his own face ſurrounded with the head-dreſs of the figure in the drawer.—This experiment, well performed, is highly agreeable. As the paſteboard circle can contain only three heads, you may have ſeveral ſuch circles, but you muſt then have ſeveral other frames: and the ewer muſt be made to take off from the ſtand.

9. *The box of metals.*

Provide a wooden box, about 13 inches long and ſeven wide, as ABCD (fig. 36.). The cover of this box ſhould be as thin as poſſible. Have ſix ſmall boxes or tables, about an inch deep, all of the ſame ſize and form, as EFGHIK, that they may indiſcriminately go into ſimilar holes made in the bottom of the large box. In each of theſe tablets is to be placed a ſmall magnetic ball, and their poles are to be diſpoſed as expreſſed in the figure. Cover each of theſe tablets with a thin plate of one of the ſix following metals, viz. gold, ſilver, copper, iron, pewter, and lead. You muſt alſo have a magnetic perſpective, at the end of which is to be two circles, one divided into ſix equal parts, and the other into four, as in fig. 37. from the centre of which there muſt be drawn an index N, whoſe point is to be placed to the north. Therefore, when you are on the ſide CD of the box, and hold your perſpective over any one of the tablets that are placed on the holes E, F, G, ſo that the index drawn on the circle is perpendicular to the ſide AB, the needle in the perſpective will have its ſouth pole directed to the latter that denotes the metal contained in that tablet. When you hold the perſpective over one of the boxes placed in the holes H, I, K, ſo that the index drawn on the circle is perpendicular to the ſide CD, the ſouth pole of the needle will in like manner expreſs the name of the metal incloſed. If the under ſide of any one of the tablets be turned upwards, the needle will be ſlower in its motion, on account of the greater diſtance of the bar. The gold and ſilver will ſtill have the ſame direction; but the four other metals will be expreſſed by the letters on the interior circle. If any one of the metals be taken away, the needle will not then take any of the above directions, but naturally point to the north; and its motion will be much ſlower. You therefore give the box to any one, and leave him at liberty to diſpoſe all the tablets in what manner and with what ſide upward he pleaſe, and even to take any one of them away. Then, by the aid of your perſpective, you tell him immediately the name of the metal on each tablet, and of that he has taken away.

Plate CCLXXVIII

This box of metals will, on compariſon, be found far to exceed that which has been publicly exhibited: for that, being compoſed of ſix tablets, of which two only differ in form, admits but of ſix different diſpoſitions, whereas in this the tablets may be placed 720 different ways. In the other, you muſt alſo know the particular ſide of the box, which in this is not at all neceſſary. Nay, you may here diſtinguiſh each metal, though the box be completely covered with paper; for the effect of the needle will be always the ſame. The experiments with this box are therefore much more extraordinary, and its conſtruction at the ſame time more ſimple.

10. *The magnetic planetarium.*

CONSTRUCT a round box, ILMN, (fig. 38,) of eight or nine inches diameter, and half an inch deep. On its bottom fix a circle of paſteboard, on which draw the central circle A, and the ſeven circumjacent circles B, C, D, E, F, G, H. Divide the central circle into ſeven equal parts by the lines AB, AC, AD, AE, AF, AG, and AH, which muſt paſs through the centres of the other circles, and divide each of them into two equal parts. Then divide the circumference of each of thoſe circles into 14 equal parts, as in the figure. You are likewiſe to have another paſteboard of the ſame figure, and divided in the ſame manner, which muſt turn freely in the box by means of an axis placed on a pivot; one end of which is to be fixed in the centre of the circle A. (See fig. 39.) On each of the ſeven ſmaller circles at the bottom of the box, place a magnetic bar, two inches long, in the ſame direction with the diameters of thoſe circles, and their poles in the ſituations expreſſed in the figure. There muſt be an index O (fig. 39.), like that of the hour-hand of a dial, which is to be fixed on the axis of the central circle, and by which the paſteboard circle in the box may be turned about. There muſt be alſo a needle P, which muſt turn freely on the axis, without moving the circular paſteboard.—In each of the ſeven diviſions of the central circle write a different queſtion; and in another circle, divided into 12 parts, you may write the names of the 12 months. In each of the ſeven circles write two anſwers to each queſtion, obſerving that there muſt be but ſeven words in each anſwer; in the following manner. In the firſt diviſion of the circle G fig. 37. which is oppoſite to the firſt queſtion, write the firſt word of the firſt anſwer. In the ſecond diviſion of the next circle, write the ſecond word; and ſo on to the laſt word, which will be in the ſeventh diviſion of the ſeventh circle. In the eighth diviſion of the firſt circle, write the firſt word of the ſecond anſwer; in the ninth diviſion of the ſecond circle, write the ſecond word of the ſame anſwer; and ſo on to the 14th diviſion of the ſeventh circle, which muſt contain the laſt word of that anſwer. The ſame muſt be done for all the ſeven queſtions; and to each of them muſt be aſſigned two anſwers, the words of which are to be diſperſed through the ſeven circles. At the centre of each of theſe circles place a pivot; and have two magnetic needles, the pointed end of one of which muſt be north, and the other ſouth, QR, (fig. 39.) Now, the index of the central circle being directed to any one of the queſtions, if you place one of the two magnetic needles on each of the ſeven leſſer circles, they will fix themſelves according to the direction of the bars on the correſpondent circles at the bottom of the box, and conſequently point to the ſeven words that compoſe the anſwer. If you place one of the other needles on each circle, it will point to the words that are diametrically oppoſite to thoſe of the firſt anſwer, the north pole being in the place of the ſouth pole of the other.—You therefore preſent this planetarium to any perſon, and deſire him to chooſe one of the queſtions there wrote; and you then ſet the index of the central circle to that queſtion, and putting one of the needles on each of the ſeven circles, you turn it about; and when they all ſettle, they will point to the ſeven words that compoſe the anſwer. The two anſwers may be one favourable and the other unfavourable; and the different needles will ſerve to diverſify the anſwers when you repeat the experiment.

There may be alſo a moveable needle to place againſt the names of the months; and when the party hax fixed upon a queſtion, you place that needle againſt the month in which he was born, which will give the buſineſs an air of more myſtery. On the centre of the large circle may be the figure of the ſun; and on each of the ſeven ſmaller circles one of the characters of the five planets, together with the earth and moon. This

Entertaining Experiments.

experiment, well executed, is one of the moſt entertaining that magnetiſm has produced.

11. *The ſagacious ſwan.*

Plate CCLXXVIII. Fig. 40.

Provide a box XY, 18 inches long, 9 wide, and 2 deep, the top of which is to ſlide on and off at the end Y. Toward the end X, deſcribe a circle of ſix inches diameter, round which are to be fixed ſix ſmall vaſes of wood or ivory, of one inch and a half high; and to each of them there muſt be a cover. At the end Y place an egg B, of ivory or other matter, of about three inches and a half high, with a cover that ſhuts by a hinge, and faſtens with a ſpring. It muſt be fixed on the ſtand C; through which, as well as the bottom of the egg, and the part of the box directly underneath, there muſt paſs a hole of one-third of an inch in diameter. In this cavity place an ivory cylinder F, that can move freely, and riſes or falls by means of the ſpring R. You muſt have a thin copper baſon A, of ſix inches diameter, which is to be placed on the centre of the circle at X, and conſequently in the middle of the ſix vaſes. Let a proper workman conſtruct the movement expreſſed by fig. 41. which is compoſed of a quadrant G, that has 16 teeth, and is moveable about an axis in the ſtand H, that has an elbow, by which it is ſcrewed to the bottom of the box at L. To the quadrant there muſt be joined the ſtraight piece K. The horizontal wheel M has 24 teeth; and is ſupported by the piece S, which is ſcrewed to the end of the box next Y. On the axis of this wheel place a braſs rod OP, five inches long; and at the part Q place a large bar or horſe-ſhoe, of a ſemicircular form, and about two inches and a half diameter, ſtrongly impregnated. The ſteel rod V, takes at one end the teeth of the quadrant G, by the pinion F, and at the other end the wheel M, by the perpendicular wheel N, of 30 teeth; the two ends of this rod are ſupported by the two ſtands that hold the other pieces. Under the piece K, that joins to the quadrant, muſt be placed the ſpring R, by which it is raiſed, and puſhes up the cylinder that goes through the ſtand C into the egg. You muſt alſo have ſix ſmall etwees or caſes, as Y, Y, Y, Y, Y, Y. They muſt be of the ſame circumference with the cylinder in the ſtand, and round at their extremities: their length muſt be different, that, when they are placed in the egg, and the lower end enters the hole in which is the cylinder, they may thruſt it down more or leſs, when the top of the egg, againſt which they preſs, is faſtened down; and thereby lower the bar that is fixed to the end of the quadrant, and conſequently, by means of the pinion Z and wheels NM turn the horſe-ſhoe that is placed upon the axis of the laſt wheel. The exact length of theſe etwees can be determined by trials only; which trials, however, may be made with round pieces of wood. In each of theſe etwees place a different queſtion, wrote on a ſlip of paper and rolled up, and in each of the vaſes put the anſwer to one of the queſtions; as you will know, by trials, where the magnetic bar or horſe-ſhoe will ſtop. Laſtly, provide a ſmall figure of a ſwan, or what other you pleaſe, made of cork or enamel, in which you muſt fix a touched needle, of the largeſt ſize of thoſe commonly uſed in ſewing.

Being thus prepared, you offer a perſon the ſix etwees, and deſire him to chooſe any one of them himſelf, and conceal the others, or give them to different perſons. He is then to open his etwee, read the queſtion it contains to himſelf, and return the etwee to you, after replacing the queſtion. You then put the etwee in the egg, and placing the ſwan upon the water in the baſon, you tell the company ſhe will preſently diſcover in which of the vaſes the anſwer is contained. The ſame experiment may be repeated with all the etwees.

Entertaining Experiments.

12. *The multifarious verſe.*

The eight words that compoſe this Latin verſe,

Tot ſunt tibi dotes, quot cœli ſidera, virgo (A),

being privately placed in any one of the different combinations of which they are ſuſceptible, and which are 40320 in number, to tell the order in which they are placed.

Fig. 42.

Provide a box that ſhuts with hinges, and is eight inches long, three wide, and half an inch deep. Have eight pieces of wood about one third of an inch thick, two inches long, and one and a half wide, which will therefore, when placed cloſe together, exactly fill the box. In each of theſe pieces or tablets place a magnetic bar, with their poles as is expreſſed in the figure. The bars being covered over, write on each of the tablets, in the order they then ſtand, one of the words of the foregoing Latin verſe. On a very thin board of the ſame dimenſions with the box, draw the eight circles, A, B, C, D, E, F, G, H, (fig. 43.) whoſe centres ſhould be exactly over thoſe of the eight tablets in the box when the board is placed upon it. Divide each of thoſe circles into eight parts, as in the figure; and in each of thoſe diviſions write one of the words of the Latin verſe, and in the preciſe order expreſſed in the plate; ſo that, when the board is placed over the box, the eight touched needles placed at the centre of the circles may be regulated by the poles of the bars in the box, and conſequently the word that the needle points to in the circle be the ſame with that inſcribed on the tablet. Cover the board with a glaſs, to prevent the needles from riſing off their pivots, as is done in the ſea-compaſs. Over the board place four plates of glaſs, I, L, M, N, fig. 44. which will give the machine the figure of a truncated pyramid, of eight inches high. Cover it with a glaſs, or rather a board, in which are placed two lenſes, O O, of eight inches focus, and diſtant from each other about half an inch. Line the four plates of glaſs that compoſe the ſides with very thin paper, that will admit the light, and at the ſame time prevent the company from ſeeing the circles on the board.

Theſe preparations being made, you give the box to any one; and tell him to place the tablets on which the words are wrote, privately, in what poſition he thinks proper, then to cloſe the box, and, if he pleaſe, to wrap it up in paper, ſeal it, and give it you. Then placing the board with the pyramid upon it, you immediately tell him the order in which the tablets are placed, by reading the words to which the needles on the circles point.

MAG-

(A) *i. e.* Thy virtues, virgin, are as numerous as the ſtars of heaven.

Animal Magnetiſm

Animal MAGNETISM, a ſympathy lately ſuppoſed by ſome perſons to exiſt between the magnet and the human body ; by means of which the former became capable of curing many diſeaſes in an unknown way, ſomething reſembling the performances of the old magicians.

The fanciful ſyſtem, to call it by no worſe name, of animal magnetiſm, appears to have originated, in 1774, from a German philoſopher named *Father Hehl*, who greatly recommended the uſe of the magnet in medicine. M. Meſmer, a phyſician of the ſame country, by adopting the principles of Hehl, became the direct founder of the ſyſtem ; but, afterwards deviating from the tenets of his inſtructor, he loſt his patronage, as well as that of Dr Ingenhouſz, which he had formerly enjoyed. Meſmer had already diſtinguiſhed himſelf by "A diſſertation on the influence of the Stars upon the human body," which he publicly defended in a theſis before the univerſity of Vienna ; but he was ſo unable to ſtand before the oppoſition of Hehl and Ingenhouſz, that his ſyſtem fell almoſt inſtantly into diſrepute. Meſmer appealed to the academy of ſciences at Berlin ; but they rejected his principles as deſtitute of foundation, and unworthy of the ſmalleſt attention. He then made a tour through Germany, publiſhing every where the great cures he performed by means of his animal magnetiſm, while his enemies every where purſued him with detections of the falſehood of his aſſertions.

Meſmer, ſtill undaunted by ſo many defeats, returned to Vienna ; but meeting there with no better ſucceſs than before, he retired to Paris in the beginning of the year 1778. Here he met with a very different reception. He was firſt patroniſed by the author of the *Dictionnaire des Merveilles de la Nature* ; in which work a great number of his cures were publiſhed, Meſmer himſelf receiving likewiſe an ample teſtimony of his candour and *ſolid reaſoning*. Our phyſician ſoon collected ſome patients ; and in the month of April 1778 retired with them to Creteil, from whence he in a ſhort time returned with them perfectly cured. His ſucceſs was now as great as his diſappointment had been before. Patients increaſed ſo rapidly that the Doctor was ſoon obliged to take in pupils to aſſiſt him in his operations. Theſe pupils ſucceeded equally well as Meſmer himſelf ; and ſo well did they take care of their own emolument, that one of them, named M. Deſlon, realized upwards of L. 100,000 Sterling. In 1779 Meſmer publiſhed a memoir on the ſubject of Animal Magnetiſm, promiſing afterwards a complete work upon the ſame, which ſhould make as great a revolution in philoſophy as it had already done in medicine.

The new ſyſtem now gained ground daily ; and ſoon became ſo faſhionable, that the jealouſy of the faculty was thoroughly awakened, and an application concerning it was made to government. In conſequence of this a committee was appointed to inquire into the matter, conſiſting partly of phyſicians and partly of members of the royal academy of ſciences, with Dr Benjamin Franklin at their head. This was a thunderſtroke to the ſupporters of the new doctrine.—— Meſmer himſelf refuſed to have any communication with the committee ; but his moſt celebrated pupil Deſlon was leſs ſcrupulous, and explained the principles of his art in the following manner :

Animal Magnetiſm

1. Animal magnetiſm is an univerſal fluid, conſtituting an abſolute plenum in nature, and the medium of all mutual influence between the celeſtial bodies and betwixt the earth and animal bodies.

2. It is the moſt ſubtile fluid in nature ; capable of a flux and reflux, and of receiving, propagating, and continuing all kinds of motion.

3. The animal body is ſubjected to the influences of this fluid by means of the nerves, which are immediately affected by it.

4. The human body has poles and other properties analogous to the magnet.

5. The action and virtue of animal magnetiſm may be communicated from one body to another, whether animate or inanimate.

6. It operates at a great diſtance without the intervention of any body.

7. It is increaſed and reflected by mirrors ; communicated, propagated, and increaſed by ſound ; and may be accumulated, concentrated, and tranſported.

8. Notwithſtanding the univerſality of this fluid, all animal bodies are not equally affected by it ; on the other hand, there are ſome, though but few in number, the preſence of which deſtroys all the effects of animal magnetiſm.

9. By means of this fluid nervous diſorders are cured immediately, and others mediately ; and its virtues, in ſhort, extend to the univerſal cure and preſervation of mankind.

From this extraordinary theory, Meſmer, or M. Deſlon, had fabricated a paper, in which he ſtated that there was in nature but one diſeaſe and one cure, and that this cure was animal magnetiſm : and laſtly, M. Deſlon engaged, 1. To prove to the commiſſioners, that ſuch a thing as animal magnetiſm exiſted ; 2. To prove the utility of it in the cure of diſeaſes ; after which he was to communicate to them all that he knew upon the ſubject. The commiſſioners accordingly attended in the room where the patients underwent the magnetical operations. The apparatus conſiſted of a circular platform made of oak, and raiſed about a foot and an half from the ground ; which platform was called the *baquet*. At the top of it were a number of holes, in which were iron rods with moveable joints for the purpoſe of applying them to any part of the body. The patients were placed in a circle round, each touching an iron rod, which he could apply to any part of the body at pleaſure ; they were joined to one another by a cord paſſing round their bodies, the deſign being to increaſe the effect by communication. In the corner of the room was a piano forte, on which ſome airs were played, occaſionally accompanied with a ſong. Each of the patients held in his hand an iron rod ten or twelve feet long ; the intention of which, as Deſlon told the commiſſioners, was to concentrate the magnetiſm in its point, and thus to render its effects more ſenſible. Sound is another conductor of this magnetiſm ; and in order to communicate the magnetiſm to the piano forte, nothing more is neceſſary than to bring the iron rod near it. Some magnetiſm is alſo furniſhed by the perſon who plays it ; and this magnetiſm is tranſmitted

ted to the patients by the ſounds. The internal part of the platform was ſaid to be ſo contrived as to concentrate the magnetiſm, and was the reſervoir whence the virtue diffuſed itſelf among the patients. Its ſtructure, however, is not mentioned; but the committee ſatisfied themſelves, by means of a needle and electrometer, that neither common magnetiſm nor electricity was concerned.

Beſides the different ways of receiving the magnetiſm already mentioned, viz. by the iron, cord, and piano forte, the patients alſo had it directly from the Doctor's finger, and a rod which he held in his hand, and which he carried about the face, head, or ſuch parts of the patient as were diſeaſed; obſerving always the direction of what he called the poles. The principal application of magnetiſm, however, was by preſſure of the hands or fingers on the hypochondria or lower regions of the ſtomach.

The effects of theſe operations upon Deſlon's patients were very different. Some felt nothing, neither had the magnetiſm any effect whatever upon them. Some ſpit, coughed, ſweat, and felt, or pretended to feel, extraordinary heats in different parts of the body. Many women, but very few men, had convulſions, which Deſlon called their criſis, &c.—The commiſſioners at laſt found that they could come to no ſatisfactory concluſion while they attended in this public way, and therefore determined to try the experiments themſelves privately. As the fluid itſelf, however, was totally imperceptible by any of the ſenſes, they could only aſcertain themſelves of its exiſtence by ultimately curing diſeaſes, or by its obſervable effects upon the human body. Being well aſſured, however, that though many diſeaſes were cured, it would not amount to any proof of the exiſtence of animal magnetiſm, they determined to obſerve its effects on the animal œconomy. For this purpoſe they made the following experiments:

1. They tried it upon themſelves, and felt nothing.

2. Seven of Deſlon's patients were magnetiſed at Dr Franklin's houſe, four of whom felt nothing; three felt, or affected to feel ſomething.

3. Several perſons in a higher ſphere of life were magnetiſed, and felt nothing.

4. The commiſſioners, now determined to diſcover what ſhare imagination had in this buſineſs, blindfolded ſeveral of the common people, and made them ſometimes think that they were magnetiſed, at other times they magnetiſed them without letting them know that they did ſo: the conſequence was, that when they ſuppoſed themſelves magnetiſed, the patients likewiſe thought they felt ſomething, and *vice verſa*.

5. A magnetiſed tree was ſaid to produce convulſions; a young man, blindfolded, fell into convulſions when he imagined himſelf near the tree, though he was really at a conſiderable diſtance from it. Deſlon accounted for this on the principle of all trees being magnetic: but in this caſe, every one, ſuſceptible of magnetiſm, would be ſeized with convulſions when he approached a tree. The ſame influence of imagination was obſerved in a woman accuſtomed to have convulſions when magnetiſed. They came on when nothing was done to her, on being told, when blindfolded, that ſhe was magnetiſed.

Other inſtances are given, from which it was evident, either that the patients were impoſtors, or in ſuch a moſt wretched ſtate of debility both of mind and body, that the moſt trifling effects of the former had the moſt powerful effects on the latter. The commiſſioners therefore entirely diſapproved of the whole. The touch, imitation, and imagination, they concluded, were the great cauſes of the effects produced by Mr Deſlon's operations; and by means of theſe they ſuppoſed that convulſions, which in themſelves are a very violent diſorder, might be ſpread much farther than could be wiſhed, even through a whole city. It was obſerved that the operator ſometimes preſſed ſtrongly, and for a length of time, upon different parts of the body, particularly the hypochondria and pit of the ſtomach; and it is well known that a ſtrong preſſure on theſe parts will produce diſagreeable ſenſations in thoſe who enjoy perfect health.

It is needleſs to add more upon this ſubject, than that Meſmer complained of the report of the commiſſioners, petitioned parliament, was by them commanded to diſcover the myſteries of his doctrine; and that it is now exploded by every man of ſenſe.—The concluſion of the academicians concerning it was, that it is not entirely uſeleſs even to philoſophy; as it is one *fact* more to be conſigned to the hiſtory of the errors and illuſions of the human mind, and a ſignal inſtance of the power of imagination.

MAGNIEZ (Nicolas), a learned and laborious eccleſiaſtic, who died in the year 1749 at an advanced age. He is known by his excellent Latin dictionary, intitled *Novitius*, printed at Paris 1721, 2 vols 4to. Notwithſtanding the great utility of this dictionary to maſters, and the merited eſteem in which it is held, it has never undergone another edition; for in that which bears the date of 1733, there is no circumſtance of difference except the frontiſpiece. In this dictionary, beſides the words to be met with in the claſſics, we find all thoſe which occur in the Bible, the breviary, and the eccleſiaſtical authors, the terms of art, the names of great men, heathen gods, biſhops, councils, hereſies, &c.; in ſhort, more than 6000 words which are not to be found in the common dictionaries.

MAGNIFYING, the making of objects appear larger than they would otherwiſe do; whence convex lenſes, which have the power of doing this, are called *magnifying glaſſes*. See OPTICS.

MAGNITUDE, whatever is made up of parts locally extended, or that has ſeveral dimenſions; as a line, ſurface, ſolid, &c.

MAGNOLIA, the LAUREL-LEAVED TULIP-TREE, in botany: A genus of the polyginia order, belonging to the polyandria claſs of plants; and in the natural method ranking under the 52d order, *Coadnatæ*. The calyx is triphyllous; there are nine petals; the capſules bivalved and imbricated; the ſeeds pendulous, and in the form of a berry.

Species. 1. The glauca, or ſmall magnolia, is a native of Virginia, Carolina, and other parts of North America. In moiſt places it riſes from ſeven or eight to 15 or 16 feet high, with a ſlender ſtem. The wood is white and ſpongy, the bark ſmooth and of a greeniſh white colour; the branches garniſhed with thick ſmooth leaves, like thoſe of the bay; but of an oval ſhape, ſmooth on their edges, and white underneath. The flowers are produced at the extremities of the branches, are white, compoſed of ſix concave petals, and have an agreeable ſcent. After the flowers are paſt, the fruit increaſes in ſize till it becomes as large as a walnut with its cover; but of a conical ſhape, having many cells round the outſide, in each of which is a flat ſeed about the ſize of a ſmall kidney-bean. When ripe, the fruit is of a brown colour, the ſeeds are diſcharged from their cells, and hang by a ſlender thread. 2. The grandiflora, or great magnolia, is a native of Florida and South Carolina. It riſes to the height of 80 feet or more, with a ſtraight trunk upwards of two feet diameter, having a regular head. The leaves reſemble thoſe of the laurel, but are larger, and continue green throughout the year. The flowers are produced at the ends of the branches, and are of a purpliſh white colour. 3. The tripetala, or umbrella-tree, is a native of Carolina. It riſes, with a ſlender trunk, to the height of 16 or 20 feet; the wood is ſoft and ſpongy; the leaves remarkably large, and produced in horizontal circles, ſomewhat reſembling an umbrella, from whence the inhabitants of thoſe countries have given it this name. The flowers are compoſed of ten or eleven white petals, that hang down without any order. The leaves drop off at the beginning of winter. 4. The acuminata, with oval, ſpear-ſhaped, pointed leaves, is a native of the inland parts of North America. The leaves are near eight inches long, and five broad; ending in a point. The flowers come out early in the ſpring, and are compoſed of 12 white petals; the wood is of a fine grain, and an orange colour.

Culture, &c. All theſe ſpecies are propagated by ſeeds, which muſt be procured from the places where they grow naturally. They ſhould be put up in ſand, and ſent over as ſoon as poſſible; for if they are kept long out of the ground, they rarely grow.—The glauca generally grows in a poor ſwampy ſoil, or on wet meadows. The Engliſh and Swedes in Pennſylvania and New Jerſey call it *beaver-tree*, becauſe the root of it is the dainty of beavers, which are caught by its means. It drops its leaves early in autumn, though ſome of the young trees keep them all the winter. This tree is ſeldom found to the north of Pennſylvania, where it begins to flower about the end of May. The ſcent of its bloſſoms is exquiſite: for by it you can diſcover, within three quarters of an Engliſh mile, whether theſe little trees ſtand in the neighbourhood, provided the wind be not againſt it; for the whole air is filled with this ſweet and pleaſant odour. It is beyond deſcription agreeable to travel in the woods about that time, eſpecially towards night. They retain their flowers for three weeks, and even longer, according to the quality of the ſoil on which the trees ſtand; and during the whole time of their being in bloſſom, they ſpread their odoriferous exhalations. The berries likewiſe look very fine when they are ripe; for they have a rich red colour, and hang in bunches on ſlender ſtalks. The cough and other pectoral diſeaſes are cured by putting the berries into rum or brandy, of which a draught every morning may be taken: the virtues of this remedy were univerſally extolled, and even praiſed, for their ſalutary effects in conſumptions. The bark being put into brandy, or boiled in any other liquor, is ſaid not only to eaſe pectoral diſeaſes, but likewiſe to be of ſome ſervice againſt all internal pains and heat; and it was thought that a decoction of it could ſtop the dyſentery. Perſons who had caught cold boiled the branches of the beaver-tree in water, and drank it to their great relief. *Kalm.*

MAGNUS (John), archbiſhop of Upſal, was born at Lincopping in 1488. Being made apoſtolical nuncio, he uſed his utmoſt endeavours to prevent Guſtavus Vaſa from becoming king of Sweden, and the introduction of Lutheraniſm into his dominions; and ſpared no means to attain theſe ends. He died at Rome in 1545. He wrote a hiſtory of Sweden, and a hiſtory of the archbiſhops and biſhops of Upſal.

Magnus (Olaus), archbiſhop of Upſal in Sweden, ſucceeded his brother John Magnus in 1544. He appeared with great credit at the council of Trent in 1546, and ſuffered much afterward for the Catholic religion. We have of his writing, A Hiſtory of the Manners, Cuſtoms, and Wars of the Northern Nations of Europe.

MAGNUS campus, (anc. geog.), a tract lying towards Scythopolis, or Bethſan in Gallilee, beyond which it extends into Samaria; Joſephus placing the common boundary between theſe two diſtricts, in the Campus Magnus. Called alſo *Eſdrelon*, (Judith); 30 miles long, and 18 broad; having Samaria with mount Ephraim to the ſouth, the lake Geneſareth to the eaſt, mount Carmel to the weſt, and Lebanon to the north.

Magnus *Portus*, (anc. geog.), a port of the Belgæ, in Britain, on the Channel. Now thought to be Portſmouth, in Hampſhire.—Another *Portus Magnus* of Bætica in Spain; a port to the eaſt of Abdera.

MAGO, the name of ſeveral Carthaginian generals. See Carthage.

Mago, (anc. geog.) a citadel and town of the Balearis Minor, or Minorca. Now Maon, or Mahon. E. long. 4° 6′. lat. 39° 5′.

MAGONTIACUM, Moguntiacum, or *Mogontiacus*, truncated afterwards by the poets to Mogontia, Maguntia, and Moguntia: a town of Gallia Belgica. Now *Mentz*, capital of the electorate of that name; ſituated at the confluence of the Rhine and Maine. E. long. 8°, lat. 50°.

MAGOPHONIA (formed from μαγος, "magus," and φονος, "ſlaughter"), the name of a feaſt among the ancient Perſians, held in memory of the expulſion of the Magians. The Magus Smerdis having uſurped the throne of Perſia, upon the death of Cambyſes, 521 years before Jeſus Chriſt, ſeven of the principal lords of the court conſpired to drive him out of it.—Their deſign was executed with good ſucceſs: Smerdis and his brother, another Magus, called Patizithes, were killed. Upon which the people alſo roſe, and put all the Magi to the ſword, inſomuch that there would not one have eſcaped, had not night come upon them. Darius, ſon of Hyſtaſpes, was then elected king; and, in memory of this maſſacre of the Magi, a feaſt was inſtituted, ſays Herodotus, called *Magophonia.* See Magi.

MAGPY, in ornithology. See Corvus.

MAHIE, the name given by the inhabitants of Otaheite, or George's iſland, to their bread-fruit when made into a kind of ſour paſte, which, in conſequence of having undergone a fermentation, will keep a conſiderable time, and ſupply them with food when no ripe fruit is to be had. When therefore they ſee a great ſhew of new fruit on the trees, they ſtrip them all at once of their former crop, of which they make mahie. This *ſuccedaneum* for ripe bread-fruit is thus made. They gather the fruit before it be perfectly ripe, and laying it in heaps cover it cloſely with leaves. In this ſtate it ferments, and becomes diſagreeably ſweet; the core is then taken out entire, and the reſt of the fruit thrown into a hole in their houſes, dug on purpoſe, and neatly lined in the bottom and ſides with graſs. The whole is then covered with leaves, and heavy ſtones are laid upon them. In this ſtate it undergoes a ſecond fermentation, and becomes ſour; after which it will ſuffer no change for many months. It is taken out of this hole as it is wanted for uſe, and being made into balls, it is wrapped up in leaves and baked, and thus dreſſed it will keep for five or ſix weeks. It is eaten, both cold and hot, and the natives of thoſe countries ſeldom make a meal without it; but to captain Cook and his company the taſte was as diſagreeable as that of a pickled olive generally is the firſt time it is eaten.

MAHO. See Hibiscus.

MAHOGANY. See Swietenia.

MAHOMET, or Mohammed, ſtyled the *Impoſtor*, was born in the reign of Anuſhirwan the Juſt, emperor of Perſia, about the end of the 6th century of the Chriſtian æra. He came into the world under ſome diſadvantages. His father Abd'allah was a younger ſon of Abd'almotalleb; and dying very young, and in his father's lifetime, left his widow and infant-ſon in very mean circumſtances, his whole ſubſtance conſiſting but of five camels and one Ethiopian ſhe-ſlave. Abd'almotalleb was therefore obliged to take care of his grandchild Mahomet; which he not only did during his life, but at his death enjoined his eldeſt ſon Abu Taleb, who was brother to Abd'allah by the ſame mother, to provide for him for the future: which he very affectionately did, and inſtructed him in the buſineſs of a merchant, which he followed; and to that end he took him into Syria when he was but 13. He afterwards recommended him to Khadijah, a noble and rich widow, for her factor; in whoſe ſervice he behaved himſelf ſo well, that by making him her huſband ſhe ſoon raiſed him to an equality with the richeſt in Mecca.

After he began by this advantageous match to live at his eaſe, it was, that he formed the ſcheme of eſtabliſhing a new religion, or, as he expreſſed it, of replanting the only true and ancient one profeſſed by Adam, Noah, Abraham, Moſes, Jeſus, and all the prophets, by deſtroying the groſs idolatry into which the generality of his countrymen had fallen, and weeding out the corruptions and ſuperſtitions which the latter Jews and Chriſtians had, as he thought, introduced into their religion, and reducing it to its original purity, which conſiſted chiefly in the worſhip of one only God.

Before he made any attempt abroad, he rightly judged that it was neceſſary for him to begin with the converſion of his own houſehold. Having therefore retired with his family, as he had done ſeveral times before, to a cave in mount Hara, he there opened the ſecret of his miſſion to his wife Khadijah; and acquainted her, that the angel Gabriel had juſt before appeared to him, and told him that he was appointed the apoſtle of God: he alſo repeated to her a paſſage which he pretended had been revealed to him by the miniſtry of the angel, with thoſe other circumſtances of this firſt appearance, which are related by the Mahometan writers. Khadijah received the news with great joy; ſwearing by him in whoſe hands her ſoul was, that ſhe truſted he would be the prophet of his nation; and immediately communicated what ſhe had heard to her couſin Warakah Ebn Nawfal, who, being a Chriſtian, could write in the Hebrew character, and was tolerably well verſed in the ſcriptures; and he as readily came into her opinion, aſſuring her that the ſame angel who had formerly appeared unto Moſes was now ſent to Mahomet. The firſt overture the prophet made was in the month of Ramadan, in the 40th year of his age, which is therefore uſually called the year of his miſſion.

Encouraged by ſo good a beginning, he reſolved to proceed, and try for ſome time what he could do by private perſuaſion, not daring to hazard the whole affair by expoſing it too ſuddenly to the public. He ſoon made proſelytes of thoſe under his own roof, viz. his wife Khadijah, his ſervant Zeid Ebn Haretha, to whom he gave his freedom on that occaſion, (which afterwards became a rule to his followers), and his couſin and pupil Ali, the ſon of Abu Taleb, though then very young: but this laſt, making no account of the other two, uſed to ſtyle himſelf the *firſt of believers*. The next perſon Mahomet applied to was Abd'allah Ebn Abi Kohafa, ſurnamed *Abu Becr*, a man of great authority among the Koreiſh, and one whoſe intereſt he well knew would be of great ſervice to him; as it ſoon appeared: for Abu Becr, being gained over, prevailed alſo on Othman Ebn Affan, Abd'alraham Ebn Awf, Saad Ebn Abbi Wakkas, al Zobeir Ebn al Awam, and Telha Ebn Obeid'allah, all principal men of Mecca, to follow his example. Theſe men were the ſix chief companions, who, with a few more, were converted in the ſpace of three years: at the end of which, Mahomet having, as he hoped, a ſufficient intereſt to ſupport him, made his miſſion no longer a ſecret, but gave out that God had commanded him to admoniſh his near relations; and in order to do it with more convenience and proſpect of ſucceſs, he directed Ali to prepare an entertainment, and invite the ſons and deſcendants of Abd'almotaleb, intending then to open his mind to them. This was done, and about 40 of them came; but Abu Laheb, one of his uncles, making the company break up before Mahomet had an opportunity of ſpeaking, obliged him to give them a ſecond invitation the next day; and when they were come, he made them the following ſpeech: "I know no man in all Arabia who can offer his kindred a more excellent thing than I now do you: I offer you happineſs both in this life, and in that which is to come; God Almighty hath commanded me to call you unto him: Who, therefore, among you will be aſſiſtant to me herein, and become my brother and my vicegerent?" All of them heſitating, and declining the matter, Ali at length roſe up, and declared that he would be his aſſiſtant; and vehemently threatened thoſe who ſhould oppoſe him. Mahomet upon this embraced Ali with great demonſtrations of affection, and deſired all who were preſent to hearken to and obey him as his deputy; at which the company broke out into a great laughter, telling Abu Taleb that he muſt now pay obedience to his ſon.

This repulſe, however, was ſo far from diſcouraging Mahomet, that he began to preach in public to the people; who heard him with ſome patience till he came to upbraid them with the idolatry, obſtinacy, and perverſeneſs of themſelves and their fathers: which ſo highly provoked them, that they declared themſelves his enemies; and would ſoon have procured his ruin, had he not been protected by Abu Taleb. The chief of the Koreiſh warmly ſolicited this perſon to deſert his nephew, making frequent remonſtrances againſt the innovations he was attempting; which proving ineffectual, they at length threatened him with an open rupture, if he did no prevail on Mahomet to deſiſt. At this Abu Taleb was ſo far moved, that he earneſtly diſſuaded his nephew from purſuing the affair any farther, repreſenting the great danger he and his friends muſt otherwiſe run. But Mahomet was not to be intimidated; telling his uncle plainly, *that if they ſet the ſun againſt him on his right hand, and the moon on his left, he would not leave his enterprize*: and Abu Taleb, ſeeing him ſo firmly reſolved to proceed, uſed no further arguments, but promiſed to ſtand by him againſt all his enemies.

The Koreiſh, finding they could prevail neither by fair words or menaces, tried what they could do by force and ill-treatment; uſing Mahomet's followers ſo very injuriouſly, that it was not ſafe for them to continue at Mecca any longer: whereupon Mahomet gave leave to ſuch of them as had not friends to protect them to ſeek for refuge elſewhere. And accordingly in the fifth year of the prophet's miſſion, 16 of them, four of whom were women, fled into Ethiopia; and among them Othman Ebn Affan and his wife Rakiah, Mahomet's daughter. This was the firſt flight; but afterwards ſeveral others followed them, retiring one after another, to the number of 83 men and 18 women, beſides children. Theſe refugees were kindly received by the Najaſhi, or king of Ethiopia; who refuſed to deliver them up to thoſe whom the Koreiſh ſent to demand them, and, as the Arab writer unanimouſly atteſt, even profeſſed the Mahometan religion.

In the ſixth year of his miſſion, Mahomet had the pleaſure of ſeeing his party ſtrengthened by the converſion of his uncle Hamza, a man of great valour and merit; and of Omar Ebn al K[illegible]tab, a perſon highly eſteemed, and once a violent oppoſer of the prophet. As perſecution generally advances rather than obſtructs the ſpreading of a religion, Iſlamiſm made ſo great a progreſs among the Arab tribes, that the Koreiſh, to ſuppreſs it effectually if poſſible, in the ſeventh year of Mahomet's miſſion, made a ſolemn league or covenant againſt the Haſhemites and the family of Abd'almotaleb, engaging themſelves to contract no marriages with any of them, and to have no communication with them; and, to give it the greater ſanction, reduced it into writing, and laid it up in the Caaba. Upon this the tribe became divided into two factions; and the family of Haſhem all repaired to Abu Taleb, as their head; except only Abd'al Uzza, ſurnamed *Abu Laheb*, who, out of inveterate hatred to his nephew and his doctrine, went over to the oppoſite party, whoſe chief was Abu Soſian Ebn Harb, of the family of Ommeya.

The families continued thus at variance for three years; but in the tenth year of his miſſion, Mahomet told his uncle Abu Taleb, that God had manifeſtly ſhowed his diſapprobation of the league which the Koreiſh had made againſt them, by ſending a worm to eat out every word of the inſtrument except the name of *God*. Of this accident Mahomet had probably ſome private notice: for Abu Taleb went immediately to the Koreiſh, and acquainted them with it; offering, if it proved falſe, to deliver his nephew up to them; but in caſe it were true, he inſiſted that they ought to lay aſide their animoſity, and annul the league they had made againſt the Haſhemites. To this they acquieſced; and going to inſpect the writing, to their great aſtoniſhment found it to be as Abu Taleb had ſaid; and the league was thereupon declared void.

In the ſame year Abu Taleb died, at the age of above fourſcore; and it is the general opinion that he died an infidel: though others ſay, that when he was at the point of death he embraced Mahometaniſm; and produce ſome paſſages out of his poetical compoſitions to confirm their aſſertion. About a month, or, as ſome write, three days after the death of this great benefactor and patron, Mahomet had the additional mortification to loſe his wife Khadijah, who had ſo generouſly made his fortune. For which reaſon this year is called the *year of mourning*.

On the death of theſe two perſons, the Koreiſh began to be more troubleſome than ever to their prophet, and eſpecially ſome who had formerly been his intimate friends; inſomuch that he found himſelf obliged to ſeek for ſhelter elſewhere, and firſt pitched upon Tayef, about 60 miles eaſt from Mecca, for the place of his retreat. Thither therefore he went, accompanied by his ſervant Zied, and applied himſelf to two of the chief of the tribe of Thakif who were the inhabitants of that place; but they received him very coldly. However, he ſtaid there a month; and ſome of the more conſiderate and better ſort of men treated him with a little reſpect: but the ſlaves and inferior people at length roſe againſt him; and bringing him to the wall of the city, obliged him to depart and return to Mecca, where he put himſelf under the protection of Al Motaam Ebn Adi.

This repulſe greatly diſcouraged his followers. However, Mahomet was not wanting to himſelf; but boldly continued to preach to the public aſſemblies at the pilgrimage, and gained ſeveral proſelytes; and among them ſix of the inhabitants of Yathreb of the Jewiſh tribe of Khazraj; who, on their return home, failed not to ſpeak much in commendation of their new religion, and exhorted their fellow-citizens to embrace the ſame.

In the 12th year of his miſſion it was that Mahomet gave out that he had made his night-journey from Mecca to Jeruſalem, and thence to heaven, ſo much ſpoken of by all that write of him. Dr Prideaux thinks he invented it, either to anſwer the expectations

of

of thoſe who demanded ſome miracle as a proof of his miſſion; or elſe, by pretending to have converſed with God, to eſtabliſh the authority of whatever he ſhould think fit to leave behind by way of oral tradition, and make his ſayings to ſerve the ſame purpoſe as the oral law of the Jews. But it does not appear that Mahomet himſelf ever expected ſo great a regard ſhould be paid to his ſayings, as his followers have ſince done; and ſeeing he all along diſclaimed any power of performing miracles, it ſeems rather to have been a fetch of policy to raiſe his reputation, by pretending to have actually converſed with God in heaven, as Moſes had heretofore done in the mount, and to have received ſeveral inſtitutions immediately from him, whereas before he contented himſelf with perſuading them that he had all by the miniſtry of Gabriel.

However, this ſtory ſeemed ſo abſurd and incredible, that ſeveral of his followers left him upon it; and had probably ruined the whole deſign, had not Abu Becr vouched for his veracity, and declared, that, if Mahomet affirmed it to be true, he verily believed the whole. Which happy incident not only retrieved the prophet's credit, but increaſed it to ſuch a degree, that he was ſecure of being able to make his diſciples ſwallow whatever he pleaſed to impoſe on them for the future. And this fiction, notwithſtanding its extravagance, was one of the moſt artful contrivances Mahomet ever put in practice, and what chiefly contributed to the raiſing of his reputation to that great height to which it afterwards arrived.

In this year, called by the Mahometans the *accepted year*, 12 men of Yathreb or Medina, of whom 10 were of the tribe of Khazraj, and the other two of that of Aws, came to Mecca, and took an oath of fidelity to Mahomet at al Akaba, a hill on the north of that city. This oath was called the *womens oath;* not that any women were preſent at this time, but becauſe a man was not thereby obliged to take up arms in defence of Mahomet or his religion; it being the ſame oath that was afterwards exacted of the women, the form of which we have in the Koran, and is to this effect: *viz.* That they ſhould renounce all idolatry; and they ſhould not ſteal, nor commit fornication, nor kill their children (as the Pagan Arabs uſed to do when they apprehended they ſhould not be able to maintain them), nor forge calumnies; and that they ſhould obey the prophet in all things that were reaſonable. When they had ſolemnly engaged to all this, Mahomet ſent one of his diſciples, named *Maſab Ebn Omair*, home with them, to inſtruct them more fully in the grounds and ceremonies of his new religion.

Maſab being arrived at Medina, by the aſſiſtance of thoſe who had been formerly converted, gained ſeveral proſelytes, particularly Oſaid Ebn Hodeira, a chief man of the city, and Saad Ebn Moadh, prince of the tribe of Aws; Mahometaniſm ſpreading ſo faſt, that there was ſcarce a houſe wherein there were not ſome who had embraced it.

The next year, being the 13th of Mahomet's miſſion, Maſab returned to Mecca, accompanied by 73 men and two women of Medina who had profeſſed Iſlamiſm, beſides ſome others who were as yet unbelievers. On their arrival, they immediately ſent to Mahomet, and offered him their aſſiſtance, of which he was now in great need; for his adverſaries were by this time grown ſo powerful in Mecca, that he could not ſtay there much longer without imminent danger. Wherefore he accepted their propoſal, and met them one night, by appointment, at al Akaba above mentioned, attended by his uncle al Abbas; who, though he was not then a believer, wiſhed his nephew well, and made a ſpeech to thoſe of Medina; wherein he told them, that as Mahomet was obliged to quit his native city, and ſeek an aſylum elſewhere, and they had offered him their protection, they would do well not to deceive him; that if they were not firmly reſolved to defend, and not betray him, they had better declare their minds, and let him provide for his ſafety in ſome other manner. Upon their proteſting their ſincerity, Mahomet ſwore to be faithful to them, on condition that they ſhould protect him againſt all inſults as heartily as they would their own wives and families. They then aſked him what recompence they were to expect if they ſhould happen to be killed in his quarrel; he anſwered, Paradiſe. Whereupon they pledged their faith to him, and ſo returned home; after Mahomet had choſen 12 out of their number, who were to have the ſame authority among them as the 12 apoſtles of Chriſt had among his diſciples.

Hitherto Mahomet had propagated his religion by fair means; ſo that the whole ſucceſs of his enterpriſe, before his flight to Medina, muſt be attributed to perſuaſion only, and not to compulſion. For before this ſecond oath of fealty or inauguration at al Akaba, he had no permiſſion to uſe any force at all; and in ſeveral places of the Koran, which he pretended were revealed during his ſtay at Mecca, he declares his buſineſs was only to preach and admoniſh; that he had no authority to compel any perſon to embrace his religion; and that, whether people believe or not, was none of his concern, but belonged ſolely unto God. And he was ſo far from allowing his followers to uſe force, that he exhorted them to bear patiently thoſe injuries which were offered them on account of their faith; and, when perſecuted himſelf, choſe rather to quit the place of his birth and retire to Medina, than to make any reſiſtance. But this great paſſiveneſs and moderation ſeem entirely owing to his want of power, and the great ſuperiority of his oppoſers for the firſt 12 years of his miſſion; for no ſooner was he enabled, by the aſſiſtance of thoſe of Medina, to make head againſt his enemies, than he gave out, that God had allowed him and his followers to defend themſelves againſt the infidels; and at length, as his forces increaſed, he pretended to have the divine leave even to attack them; and to deſtroy idolatry, and ſet up the true faith by the ſword; finding, by experience, that his deſigns would otherwiſe proceed very ſlowly, if they were not utterly overthrown; and knowing, on the other hand, that innovators, when they depend ſolely on their own ſtrength, and can compel, ſeldom run any riſk; from whence, ſays Machiavel, it follows, that all the armed prophets have ſucceeded, and the unarmed ones have failed. Moſes, Cyrus, Theſeus, and Romulus, would not have been able to eſtabliſh the obſervance of their inſtitutions for any length of time, had they not been armed. The firſt paſſage of the Koran which gave Mahomet the permiſſion of defending himſelf by arms, is ſaid to have been that in the 22d chapter; after which a great number to the ſame purpoſe were revealed.

That Mahomet had a right to take up arms for his own defence againſt his unjuſt perſecutors, may perhaps be allowed; but whether he ought afterwards to have made uſe of that means for the eſtabliſhing of his religion, it is not ſo eaſy to determine. How far the ſecular power may or ought to interpoſe in affairs of this nature, mankind are not agreed. The method of converting by the ſword gives no very favourable idea of the faith which is ſo propagated, and is diſallowed by every body in thoſe of another religion, though the ſame perſons are willing to admit of it for the advancement of their own; ſuppoſing that, though a falſe religion ought not to be eſtabliſhed by authority, yet a true one may; and accordingly force is almoſt as conſtantly employed in theſe caſes by thoſe who have the power in their hands, as it is conſtantly complained of by thoſe who ſuffer the violence. It is certainly one of the moſt convincing proofs that Mahometaniſm was no other than a human invention, that it owed its progreſs and eſtabliſhment almoſt entirely to the ſword; and it is one of the ſtrongeſt demonſtrations of the divine original of Chriſtianity, that it prevailed againſt all the force and powers of the world by the mere dint of its own truth, after having ſtood the aſſaults of all manner of perſecutions, as well as other oppoſitions, for 300 years together, and at length made the Roman emperors themſelves ſubmit thereto; after which time, indeed, this proof ſeems to fail, Chriſtianity being then eſtabliſhed, and Paganiſm aboliſhed, by public authority, which has had great influence in the propagation of the one and deſtruction of the other ever ſince. But to return.

Mahomet, having provided for the ſecurity of his companions as well as his own, by the league offenſive and defenſive which he had now concluded with thoſe of Medina, directed them to repair thither, which they accordingly did; but himſelf with Abu Becr and Ali ſtaid behind, having not yet received the divine permiſſion, as he pretended, to leave Mecca. The Koreiſh fearing the conſequence of this new alliance, began to think it abſolutely neceſſary to prevent Mahomet's eſcape to Medina; and having held a council thereon, after ſeveral milder expedients had been rejected, they came to a reſolution that he ſhould be killed; and agreed that a man ſhould be choſen out of every tribe for the execution of this deſign; and that each man ſhould have a blow at him with his ſword, that the guilt of his blood might fall equally on all the tribes, to whoſe united power the Haſhemites were much inferior, and therefore durſt not attempt to revenge their kinſman's death.

This conſpiracy was ſcarce formed, when, by ſome means or other, it came to Mahomet's knowledge; and he gave out that it was revealed to him by the angel Gabriel, who had now ordered him to retire to Medina. Whereupon, to amuſe his enemies, he directed Ali to lie down in his place, and wrap himſelf up in his green cloak, which he did; and Mahomet eſcaped miraculouſly, as they pretend, to Abu Becr's houſe, unperceived by the conſpirators, who had already aſſembled at the prophet's door. They, in the mean time, looking through the crevice, and ſeeing Ali, whom they took to be Mahomet himſelf, aſleep, continued watching there till morning, when Ali aroſe, and they found themſelves deceived.

From Abu Becr's houſe Mahomet and he went to a cave in mount Thur, to the ſouth-eaſt of Mecca, accompanied only by Amer Ebn Foheirah, Abu Becr's ſervant, and Abd'allah Ebn Oreitah, an idolater whom they had hired for a guide. In this cave they lay hid three days, to avoid the ſearch of their enemies; which they very narrowly eſcaped, and not without the aſſiſtance of more miracles than one: for ſome ſay that the Koreiſh were ſtruck with blindneſs, ſo that they could not find the cave; others, that after Mahomet and his companions were got in, two pigeons laid their eggs at the entrance, and a ſpider covered the mouth of the cave with her web, which made them look no farther. Abu Becr, ſeeing the prophet in ſuch imminent danger, became very ſorrowful; whereupon Mahomet comforted him with theſe words, recorded in the Koran, *Be not grieved, for God is with us.* Their enemies being retired, they left the cave, and ſet out for Medina, by a by-road; and having fortunately, or, as the Mahometans tell us, miraculouſly eſcaped ſome who were ſent to purſue them, arrived ſafely at that city; whither Ali followed them in three days, after he had ſettled ſome affairs at Mecca.

The firſt thing Mahomet did after his arrival at Medina, was to build a temple for his religious worſhip, and a houſe for himſelf, which he did on a parcel of ground which had before ſerved to put camels in, or, as others tell us, for a burying-ground, and belonged to Sahal and Soheil the ſons of Amru, who were orphans. This action Dr Prideaux exclaims againſt, repreſenting it as a flagrant inſtance of injuſtice; for that, ſays he, he violently diſpoſſeſſed theſe poor orphans, the ſons of an inferior artificer (whom the author he quotes calls a *carpenter*), of this ground, and ſo founded the firſt fabric of his worſhip with the like wickedneſs as he did his religion. But, to ſay nothing of the improbability that Mahomet ſhould act in ſo impolitic a manner at his firſt coming, the Mahometan writers ſet this affair in a quite different light: one tells us that he treated with the lads about the price of the ground, but they deſired he would accept it as a preſent: however, as hiſtorians of good credit aſſure us, he actually bought it; and the money was paid by Abu Becr. Beſides, had Mahomet accepted it as a preſent, the orphans were in circumſtances ſufficient to have afforded it: for they were of a very good family, of the tribe of Najjer, one of the moſt illuſtrious among the Arabs; and not the ſons of a carpenter, as Dr Prideaux's author writes, who took the word *Najjer*, which ſignifies "a carpenter," for an appellative, whereas it is a proper name.

Mahomet, being ſecurely ſettled at Medina, and able not only to defend himſelf againſt the inſults of his enemies, but to attack them, began to ſend out ſmall parties to make repriſals on the Koreiſh; the firſt party conſiſting of no more than nine men, who intercepted and plundered a caravan belonging to that tribe, and in the action took two priſoners. But what eſtabliſhed his affairs very much, and was the foundation on which he built all his ſucceeding greatneſs, was the gaining of the battle of Bedr, which was fought in the ſecond year of the Hegira, and is ſo famous in the Mahometan hiſtory. Some reckon no leſs than 27 expeditions wherein Mahomet was perſonally preſent, in nine of which he gave battle, beſides ſeveral other expeditions in which he was not preſent. His forces he maintained partly by the contributions of his followers for this purpoſe, which he called by the name of *zacat* or *alms*, and the paying of which he very artfully made one main article of his religion; and partly by ordering a fifth part of the plunder to be brought into the public treaſury for that purpoſe, in which matter he likewiſe pretended to act by the divine direction.

In a few years, by the ſucceſs of his arms (notwithſtanding he ſometimes came off by the worſt) he conſiderably raiſed his credit and power. In the ſixth year of the Hegira he ſet out with 1400 men to viſit the temple of Mecca, not with any intent of committing hoſtilities, but in a peaceable manner. However, when he came to al Hodeibiya, which is ſituated partly within and partly without the ſacred territory, the Koreiſh ſent to let him know that they would not permit him to enter Mecca, unleſs he forced his way; whereupon he called his troops about him, and they all took a ſolemn oath of fealty or homage to him, and he reſolved to attack the city; but thoſe of Mecca ſending Arwa Ebn Maſud, prince of the tribe of Thakif, as their ambaſſador, to deſire peace, a truce was concluded between them for ten years, by which any perſon was allowed to enter into league either with Mahomet, or with the Koreiſh, as he thought fit.

It may not be improper, in order to ſhow the inconceivable veneration and reſpect the Mahometans by this time had for their prophet, to mention the account which the above-mentioned ambaſſador gave the Koreiſh, at his return, of their behaviour. He ſaid he had been at the courts both of the Roman emperor and of the king of Perſia, and never ſaw any prince ſo highly reſpected by his ſubjects as Mahomet was by his companions: for, whenever he made the ablution, in order to ſay his prayers, they ran and catched the water that he had uſed; and, whenever he ſpit, they immediately licked it up, and gathered every hair that fell from him with great ſuperſtition.

In the ſeventh year of the Hegira, Mahomet began to think of propagating his religion beyond the bounds of Arabia; and ſent meſſengers to the neighbouring princes, with letters to invite them to Mahometiſm. Nor was this project without ſome ſucceſs. Khoſru Parviz, then king of Perſia, received his letter with great diſdain, and tore it in a paſſion, ſending away the meſſenger very abruptly; which when Mahomet heard, he ſaid *God ſhall tear his kingdom.* And ſoon after a meſſenger came to Mahomet from Badhan king of Yaman, who was a dependent on the Perſians, to acquaint him that he had received orders to ſend him to Khoſru. Mahomet put off his anſwer till the next morning, and then told the meſſenger it had been revealed to him that night that Khoſru was ſlain by his ſon Shiruyeh; adding, that he was well aſſured his new religion and empire ſhould riſe to as great a height as that of Khoſru; and therefore bid him adviſe his maſter to embrace Mahometiſm. The meſſenger being returned, Badhan in a few days received a letter from Shiruyeh, informing him of his father's death, and ordering him to give the prophet no further diſturbance. Whereupon Badhan and the Perſians with him turned Mahometans.

The emperor Heraclius, as the Arabian hiſtorians aſſure us, received Mahomet's letter with great reſpect, laying it on his pillow, and diſmiſſed the bearer honourably. And ſome pretend that he would have profeſſed this new faith, had he not been afraid of loſing his crown.

Mahomet wrote to the ſame effect to the king of Ethiopia, though he had been converted before, according to the Arab writers; and to Mokawkas, governor of Egypt, who gave the meſſenger a very favourable reception, and ſent ſeveral valuable preſents to Mahomet, and among the reſt two girls, one of which, named Mary, became a great favourite with him. He alſo ſent letters of the like purport to ſeveral Arab princes: particularly one to al Hareth Ebn Abi Shamer king of Ghaſſean, who returning for anſwer that he would go to Mahomet himſelf, the prophet ſaid, *May his kingdom periſh:* another to Hawdha Ebn Ali, king of Yamama, who was a Chriſtian, and, having ſome time before profeſſed Iſlamiſm, had lately returned to his former faith; this prince ſent back a very rough anſwer, upon which Mahomet curſing him, he died ſoon after: and a third to al Mondar Ebn Sawa, king of Bahrein, who embraced Mahometiſm, and all the Arabs of that country followed his example.

The eighth year of the Hegira was a very fortunate year to Mahomet. In the beginning of it, Khaled Ebn al Walid and Amru Ebn al As, both excellent ſoldiers, the firſt of whom afterwards conquered Syria and other countries, and the latter Egypt, became proſelytes to Mahometiſm. And ſoon after the prophet ſent 3000 men againſt the Grecian forces, to revenge the death of one of his ambaſſadors, who, being ſent to the governor of Boſra on the ſame errand as thoſe who went to the abovementioned princes, were ſlain by an Arab, of the tribe of Ghaſſan, at Muta, a town in the territory of Balka in Syria, about three days journey eaſtward from Jeruſalem, near which town they encountered. The Grecians being vaſtly ſuperior in number (for, including the auxiliary Arabs, they had an army of 100,000 men), the Mahometans were repulſed in the firſt attack, and loſt ſucceſſively three of their generals, viz. Zeid Ebn Haretha Mahomet's freedman, Jaafar the ſon of Abu Taleb, and Abdallah Ebn Rawaha: but Khaleb Ebn al Walid ſucceeding to the command, overthrew the Greeks with a great ſlaughter, and brought away abundance of rich ſpoil; on occaſion of which action Mahomet gave him the title of *Seif min ſoyuf Allah,* "one of the ſwords of God."

In this year alſo Mahomet took the city of Mecca, the inhabitants whereof had broken the truce concluded on two years before. For the tribe of Becr, who were confederates with the Koreiſh, attacking thoſe of Khozaah, who were allies of Mahomet, killed ſeveral of them, being ſupported in the action by a party of the Koreiſh themſelves. The conſequence of this violation was ſoon apprehended; and Abu Soſian himſelf made a journey to Medina on purpoſe to heal the breach and renew the truce: but in vain; for Mahomet, glad of this opportunity, refuſed to ſee him: whereupon he applied to Abu Beer and Ali; but they giving him no anſwer, he was obliged to return to Mecca as he came.

Mahomet immediately gave orders for preparations to be made, that he might ſurpriſe the Meccans while they were unprovided to receive him: in a little time he began his march thither; and by that time he came near the city, his forces were encreaſed to 10,000 men. Thoſe of Mecca, being not in a condition to defend themſelves againſt ſo formidable an army, ſurrendered at diſcretion; and Abu Soſian ſaved his life by turning Mahometan. About 28 of the idolaters were killed by a party under the command of Khaled; but this happened contrary to Mahomet's orders, who, when he entered the town, pardoned all the Koreiſh on their ſubmiſſion, except only ſix men and four women, who were more obnoxious than ordinary (ſome of them having apoſtatiſed), and were ſolemnly proſcribed by the prophet himſelf; but of theſe no more than three men and one woman were put to death, the reſt obtaining pardon on their embracing Mahometiſm, and one of the women making her eſcape.

The remainder of this year Mahomet employed in deſtroying the idols in and round Mecca, ſending ſeveral of his generals on expeditions for that purpoſe, and to invite the Arabs to Iſlamiſm: wherein it is no wonder if they now met with ſucceſs.

The next year, being the ninth of the Hegira, the Mahometans call *the year of embaſſies:* for the Arabs had been hitherto expecting the iſſue of the war between Mahomet and the Koreiſh: but, ſo ſoon as that tribe, the principal of the whole nation, and the genuine deſcendants of Iſhmael, whoſe prerogatives none offered to diſpute, had ſubmitted, they were ſatisfied that it was not in their power to oppoſe Mahomet; and therefore began to come in to him in great numbers, and to ſend embaſſies to make their ſubmiſſions to him, both to Mecca, while he ſtaid there, and alſo to Medina, whither he returned this year. Among the reſt, five kings of the tribe of Hamyar profeſſed Mahometiſm, and ſent ambaſſadors to notify the ſame.

In the 10th year, Ali was ſent into Yaman to propagate the Mahometan faith there; and, as it is ſaid, converted the whole tribe of Hamdan in one day. Their example was quickly followed by all the inhabitants of that province, except only thoſe of Najran, who, being Chriſtians, choſe rather to pay tribute.

Thus was Mahometiſm eſtabliſhed, and idolatry rooted out, even in Mahomet's lifetime (for he died the next year), throughout all Arabia, except only Yamama, where Moſeilama, who ſet up alſo for a prophet as Mahomet's competitor, had a great party, and was not reduced till the kalifat of Abu Beer: and the Arabs being then united in one faith, and under one prince, found themſelves in a condition of making thoſe conqueſts which extended the Mahometan faith over ſo great a part of the world.

MAHOMET, the name of ſeveral emperors of the Turks; of whom the moſt celebrated is,

MAHOMET II. ſurnamed *the Great,* their ſeventh ſultan. See TURKEY.

He was born at Adrianople the 24th of March 1430; and is to be remembered chiefly by us for taking Conſtantinople in 1453, and thereby driving many learned Greeks into the Weſt, which was a great cauſe of the reſtoration of learning in Europe, as the Greek literature was then introduced here. He was one of the greateſt men upon record, with regard to the qualities neceſſary to a conqueror: for he conquered two empires, twelve kingdoms, and two hundred conſiderable cities. He was very ambitious of the title of Great, and the Turks gave it him; even the Chriſtians have not diſputed it with him; for he was the firſt of the Ottoman emperors whom the Weſtern nations dignified with the title of Grand Seignior or Great Turk, which poſterity has preſerved to his deſcendants. Italy had ſuffered greater calamities, but ſhe had never felt a terror equal to that which this ſultan's victories imprinted. The inhabitants ſeemed already condemned to wear the turban: it is certain, that pope Sixtus IV. repreſented to himſelf Rome as already involved in the dreadful fate of Conſtantinople; and thought of nothing but eſcaping into Provence, and once more transferring the holy ſee to Avignon. Accordingly, the news of Mahomet's death, which happened the 3d of May 1481, was received at Rome with the greateſt joy that ever was beheld there. Sixtus cauſed all the churches to be thrown open, made the tradeſpeople leave off their work, ordered a feaſt of three days, with public prayers and proceſſions, commanded a diſcharge of the whole artillery of the caſtle of St Angelo all that time, and put a ſtop to his journey to Avignon.

He appears to be the firſt ſultan who was a lover of arts and ſciences; and even cultivated polite letters. He often read the Hiſtory of Auguſtus, and the other Cæſars; and he peruſed thoſe of Alexander, Conſtantine, and Theodoſius, with more than ordinary pleaſure, becauſe theſe had reigned in the ſame country with himſelf. He was fond of painting, muſic, and ſculpture; and he applied himſelf to the ſtudy of agriculture. He was much addicted to aſtrology; and uſed to encourage his troops by giving out, that the motion and influence of the heavenly bodies promiſed him the empire of the world. Contrary to the genius of his country, he delighted ſo much in the knowledge of foreign languages, that he not only ſpoke the Arabian, to which the Turkiſh laws, and the religion of their legiſlator Mahomet, are appropriated, but alſo the Perſian, the Greek, and the French, that is, the corrupted Italian. Landin, a knight of Rhodes, collected ſeveral letters which this ſultan wrote in the Syriac, Greek, and Turkiſh languages, and tranſlated them into Latin. Where the originals are, nobody knows; but the tranſlation has been publiſhed ſeveral times; as at Lyons 1520, in 4to; at Baſil 1554, 12mo; in a collection publiſhed by Oporinus, at Marpurg 1604, in 8vo; and at Leipſic 1690, in 12mo. Melchior Junius, profeſſor of eloquence at Straſburg, publiſhed at Montbeliard, 1595, a collection of letters, in which there are three written by Mahomet II. to Scanderbeg. One cannot diſcover the leaſt air of Turkiſh ferocity in theſe letters: they are written in as civil terms, and as obliging a manner, as the moſt polite prince in Chriſtendom could have written.

MAHOMETANISM, or MAHOMETISM, the ſyſtem of religion broached by Mahomet, and ſtill adhered to by his followers. See MAHOMET, and ALCORAN.

Mahometaniſm is profeſſed by the Turks, Perſians, and ſeveral nations among the Africans, and many among the Eaſt-Indians.

The Mahometans divide their religion into two general parts, faith and practice: of which the firſt is divided into ſix diſtinct branches; Belief in God, in his angels, in his ſcriptures, in his prophets, in the reſurrection and final judgment, and in God's abſolute decrees. The points relating to practice are, Prayer, with waſhings, &c. alms, faſting, pilgrimage to Mecca, and circumciſion.

I. Of the Mahometan *Faith.*] 1. That both Mahomet, and thoſe among his followers who are reckoned orthodox, had and continue to have juſt and true notions of God and his attributes, appears ſo plain from the Koran itſelf, and all the Mahometan divines, that it would be loſs of time to refute thoſe who ſuppoſe the God of Mahomet to be different from the true God, and only a fictitious deity or idol of his own creation.

2. The exiſtence of angels, and their purity, are abſolutely required to be believed in the Koran; and he is reckoned an infidel who denies there are ſuch beings, or hates any of them, or aſſerts any diſtinction of ſexes among them. They believe them to have pure and ſubtile bodies, created of fire; that they neither eat nor drink, nor propagate their ſpecies; that they have various forms and offices, ſome adoring God in different poſtures, others ſinging praiſes to him, or interceding for mankind. They hold, that ſome of them are employed in writing down the actions of men; others in carrying the throne of God, and other ſervices.

The four angels, whom they look on as more eminently in God's favour, and often mention on account of the offices aſſigned them, are, Gabriel, to whom they give ſeveral titles, particularly thoſe of the *holy ſpirit*, and the *angel of revelations*, ſuppoſing him to be honoured by God with a greater confidence than any other, and to be employed in writing down the divine decrees; Michael, the friend and protector of the Jews; Azrael, the *angel of death*, who ſeparates mens ſouls from their bodies; and Iraſil, whoſe office it will be to ſound the trumpet at the reſurrection. The Mahometans alſo believe, that two guardian angels attend on every man, to obſerve and write down his actions, being changed every day, and therefore called *al Moakkibat*, or "the angels who continually ſucceed one another."

The devil, whom Mahomet names *Eblis*, from his *deſpair*, was once one of thoſe angels who are neareſt to God's preſence, called *Azazil;* and fell, according to the doctrine of the Koran, for refuſing to pay homage to Adam at the command of God.

Beſides angels and devils, the Mahometans are taught by the Koran to believe an intermediate order of creatures, which they call *jin* or *genii*, created alſo of fire, but of a groſſer fabric than angels, ſince they eat and drink, and propagate their ſpecies, and are ſubject to death. Some of theſe are ſuppoſed to be good and others bad, and capable of future ſalvation or damnation, as men are; whence Mahomet pretended to be ſent for the converſion of genii as well as men.

3. As to the ſcriptures, the Mahometans are taught by the Koran, that God, in divers ages of the world, gave revelations of his will in writing to ſeveral prophets, the whole and every one of which it is abſolutely neceſſary for a good Moſlem to believe. The number of theſe ſacred books were, according to them, 104. Of which 10 were given to Adam, 50 to Seth, 30 to Edris or Enoch, 10 to Abraham; and the other four, being the Pentateuch, the Pſalms, the Goſpel, and the Koran, were ſucceſſively delivered to Moſes, David, Jeſus, and Mahomet; which laſt being the ſeal of the prophets, thoſe revelations are now cloſed, and no more are to be expected. All theſe divine books, except the four laſt, they agree to be now entirely loſt, and their contents unknown; though the Sabians have ſeveral books which they attribute to ſome of the antediluvian prophets. And of thoſe four, the Pentateuch, Pſalms, and Goſpel, they ſay, have undergone ſo many alterations and corruptions, that, though there may poſſibly be ſome part of the true word of God therein, yet no credit is to be given to the preſent copies in the hands of the Jews and Chriſtians. The Mahometans have alſo a goſpel in Arabic, attributed to St Barnabas; wherein the hiſtory of Jeſus Chriſt is related in a manner very different from what we find in the true goſpels, and correſpondent to thoſe traditions which Mahomet has followed in his Koran. Of this goſpel the Moriſcoes in Africa have a tranſlation in Spaniſh; and there is, in the library of prince Eugene of Savoy, a manuſcript of ſome antiquity, containing an Italian tranſlation of the ſame goſpel; made, it is to be ſuppoſed, for the uſe of renegades. This book appears to be no original forgery of the Mahometans; though they have, no doubt, interpolated and altered it ſince, the better to ſerve their purpoſe; and in particular, inſtead of the *Paraclete*, or *Comforter*, they have in this apocryphal goſpel inſerted the word *Periclyte*, that is, the "famous," or "illuſtrious;" by which they pretend their prophet was foretold by name, that being the ſignification of *Mohammed* in Arabic: and this they ſay to juſtify that paſſage of the Koran, where Jeſus Chriſt is formally aſſerted to have foretold his coming, under his other name of *Ahmed*, which is derived from the ſame root as *Mohammed*, and of the ſame import. From theſe, or ſome other forgeries of the ſame ſtamp, it is that the Mahometans quote ſeveral paſſages, of which there are not the leaſt footſteps in the New Teſtament.

4. The number of the prophets, which have been from time to time ſent by God into the world, amounts to no leſs than 224,000, according to one Mahometan tradition; or to 124,000, according to another: among whom 313 were apoſtles, ſent with ſpecial commiſſions to reclaim mankind from infidelity and ſuperſtition; and ſix of them brought new laws or diſpenſations, which ſucceſſively abrogated the preceding: theſe were Adam, Noah, Abraham, Moſes, Jeſus, and Mahomet. All the prophets in general, the Mahometans believe to have been free from great

Mahometaniſm.

ſins and errors of conſequence, and profeſſors of one and the ſame religion, that is, Iſlam, notwithſtanding the different laws and inſtitutions which they obſerved. They allow of degrees among them, and hold ſome of them to be more excellent and honourable than others. The firſt place they give to the revealers and eſtabliſhers of new diſpenſations, and the next to the apoſtles.

In this great number of prophets, they not only reckon divers patriarchs and perſons named in ſcripture, but not recorded to have been prophets (wherein the Jewiſh and Chriſtian writers have ſometimes led the way), as Adam, Seth, Lot, Iſhmael, Nun, Joſhua, &c. and introduce ſome of them under different names, as *Enoch*, *Heber*, and *Jethro*, who are called, in the Koran, *Edris*, *Hud*, and *Shoaib;* but ſeveral others whoſe very names do not appear in ſcripture (though they endeavour to find ſome perſons there to fix them on), as Saleh, Khedr, Dhu'lkefl, &c.

5. The belief of a general reſurrection and a future judgment.

When a corpſe is laid in the grave, they ſay he is received by an angel, who gives him notice of the coming of the two examiners; who are two black livid angels, of a terrible appearance, named *Monker* and *Nakir*. Theſe order the dead perſon to ſit upright; and examine him concerning his faith, as to the unity of God, and the miſſion of Mahomet: if he anſwer rightly, they ſuffer the body to reſt in peace, and it is refreſhed by the air of paradiſe; but, if not, they beat him on the temples with iron maces, till he roars out for anguiſh ſo loud, that he is heard by all from eaſt to weſt, except men and genii. They then preſs the earth on the corpſe, which is gnawed and ſtung till the reſurrection by 99 dragons, with ſeven heads each; or, as others ſay, their ſins will become venomous beaſts, the grievous ones ſtinging like dragons, the ſmaller like ſcorpions, and the other like ſerpents: circumſtances which ſome underſtand in a figurative ſenſe.

As to the ſoul, they hold, that, when it is ſeparated from the body by the angel of death, who performs his office with eaſe and gentleneſs towards the good, and with violence towards the wicked, it enters into that which they call *al berzakh*, or *the interval* between death and the reſurrection. If the departed perſon was a believer, they ſay two angels meet it, who convey it to heaven, that its place there may be aſſigned, according to its merit and degree. For they diſtinguiſh the ſouls of the faithful into three claſſes: the firſt of prophets, whoſe ſouls are admitted into paradiſe immediately; the ſecond of martyrs, whoſe ſpirits, according to a tradition of Mahomet, reſt in the crops of green birds, which eat of the fruits and drink of the rivers of paradiſe; and the third of other believers, concerning the ſtate of whoſe ſouls before the reſurrection there are various opinions.

Though ſome among the Mahometans have thought that the reſurrection will be merely ſpiritual, and no more than the returning of the ſoul to the place whence it firſt came (an opinion defended by Ebn Sina, and called by ſome the *opinion of the philoſophers*); and others, who allow man to conſiſt of body only, that it will be merely corporeal; the received opinion is, that both body and ſoul will be raiſed: and their doctors argue ſtrenuouſly for the poſſibility of the reſurrection of the body, and diſpute with great ſubtilty concerning the manner of it. But Mahomet has taken care to preſerve one part of the body, whatever becomes of the reſt, to ſerve for a baſis of the future edifice, or rather a leaven for the maſs which is to be joined to it. For he taught, that a man's body was entirely conſumed by the earth, except only the bone called *al ajb*, which we name the *os coccygis*, or rump-bone; and that, as it was the firſt formed in the human body, it will alſo remain uncorrupted till the laſt day, as a ſeed from whence the whole is to be renewed; and this, he ſaid, would be effected by a forty years rain, which God ſhould ſend, and which would cover the earth to the height of 12 cubits, and cauſe the bodies to ſprout forth like plants. Herein, alſo, is Mahomet beholden to the Jews; who ſay the ſame things of the bone Luz, excepting that what he attributes to a great rain, will be effected, according to them, by a dew, impregnating the duſt of the earth.

Mahometaniſm.

The time of the reſurrection the Mahometans allow to be a perfect ſecret to all but God alone; the angel Gabriel himſelf acknowledging his ignorance in this point, when Mahomet aſked him about it. However, they ſay, the approach of that day may be known from certain ſigns which are to precede it. Theſe ſigns they diſtinguiſh into two ſorts, the leſſer and the greater.

The leſſer ſigns are, 1. The decay of faith among men. 2. The advancing of the meaneſt perſons to eminent dignity. 3. That a maid-ſervant ſhall become the mother of her miſtreſs (or maſter); by which is meant, either that towards the end of the world men ſhall be much given to ſenſuality, or that the Mahometans ſhall then take many captives. 4. Tumults and ſeditions. 5. A war with the Turks. 6. Great diſtreſs in the world, ſo that a man, when he paſſes by another's grave, ſhall ſay, Would to God I were in his place. 7. That the provinces of Irac and Syria ſhall refuſe to pay their tribute. And, 8. That the buildings of Median ſhall reach to Ahab, or Yahab.

The greater ſigns are, 1. The ſun's riſing in the weſt; which ſome have imagined it originally did. 2. The appearance of the beaſt, which ſhall riſe out of the earth, in the temple of Mecca, or on mount Safa, or in the territory of Tayef, or ſome other place. This beaſt, they ſay, is to be 60 cubits high; though others, not ſatisfied with ſo ſmall a ſize, will have her reach to the clouds and to heaven, when her head only is out; and that ſhe will appear for three days, but ſhow only a third part of her body. They deſcribe this monſter, as to her form, to be a compound of various ſpecies; having the head of a bull, the eyes of a hog, the ears of an elephant, the horns of a ſtag, the neck of an oſtrich, the breaſt of a lion, the colour of a tiger, the back of a cat, the tail of a ram, the legs of a camel, and the voice of an aſs. Some ſay this beaſt is to appear three times in ſeveral places, and that ſhe will bring with her the rod of Moſes and the ſeal of Solomon; and, being ſo ſwift that none can overtake or eſcape her, will with the firſt ſtrike all the believers on the face, and mark them with the word *mumen*, *i. e.* believer; and with the latter will mark the unbelievers on the face likewiſe, with the word *Cafer*, *i. e.* infidel, that every perſon may be known for what he really is. They add, that the ſame beaſt is to demonſtrate the vanity of all religions except Iſlam, and to ſpeak Arabic. All this ſtuff ſeems to be the reſult of a confuſed idea of the beaſt in the Revelations. 3. War with the Greeks, and the taking Conſtantinople by 70,000 of the poſterity of Iſaac, who ſhall not win that city by force of arms, but the walls ſhall fall down while they cry out, *There is no God but God, God is moſt great!* As they are dividing the ſpoil, news will come to them of the appearance of Antichriſt; whereupon they ſhall leave all, and return back. 4. The coming of Antichriſt, whom the Mahometans call *Maſih al Dajjal, i. e.* the falſe or lying Chriſt, and ſimply *al Dajjal*. He is to be one-eyed, and marked on the forehead with the letters C. F. R. ſignifying *Cafer*, or infidel. They ſay that the Jews give him the name of *Meſſiah Ben David;* and pretend he is to come in the laſt days, and to be lord both of land and ſea, and that he will reſtore the kingdom to them. 5. The deſcent of Jeſus on earth. They pretend that he is to deſcend near the white tower to the eaſt of Damaſcus, when the people are returned from the taking of Conſtantinople: that he is to embrace the Mahometan religion, marry a wife, get children, kill Antichriſt; and at length die after 40 years, or, according to others, 24 years continuance on earth. Under him, they ſay, there will be great ſecurity and plenty in the world, all hatred and malice being laid aſide; when lions and camels, bears and ſheep, ſhall live in peace, and a child ſhall play with ſerpents unhurt. 6. War with the Jews; of whom the Mahometans are to make a prodigious ſlaughter, the very trees and ſtones diſcovering ſuch of them as hide themſelves, except only the tree called *gharkad*, which is the tree of the Jews. 7. The eruption of Gog and Magog, or, as they are called in the eaſt, *Yajuj* and *Majuj;* of whom many things are related in the Koran and the traditions of Mahomet. Theſe barbarians, they tell us, having paſſed the lake of Tiberias, which the vanguard of their vaſt army will drink dry, will come to Jeruſalem, and there greatly diſtreſs Jeſus and his companions; till, at his requeſt, God will deſtroy them, and fill the earth with their carcaſes, which, after ſome time, God will ſend birds to carry away, at the prayers of Jeſus and his followers. Their bows, arrows, and quivers, the Moſlems will burn for ſeven years together; and at laſt, God will ſend a rain to cleanſe the earth and to make it fertile. 8. A ſmoke which ſhall fill the whole earth. 9. An eclipſe of the moon. Mahomet is reported to have ſaid, that there would be three eclipſes before the laſt hour; one to be ſeen in the eaſt, another in the weſt, and the third in Arabia. 10. The returning of the Arabs to the worſhip of Allat and al Uzza, and the reſt of their ancient idols, after the deceaſe of every one in whoſe heart there was faith equal to a grain of muſtard-ſeed; none but the very worſt of men being left alive. For God, they ſay, will ſend a cold odoriferous wind, blowing from Syria Damaſcena, which ſhall ſweep away the ſouls of all the faithful, and the Koran itſelf, ſo that men will remain in the groſſeſt ignorance for 100 years. 11. The diſcovery of a vaſt heap of gold and ſilver by the retreating of the Euphrates, which will be the deſtruction of many. 12. The demolition of the Caaba, or temple of Mecca, by the Ethiopians. 13. The ſpeaking of beaſts and inanimate things. 14. The breaking out of fire in the province of Hejaz; or, according to others, in Yaman. 15. The appearance of a man of the deſcendants of Kahtan, who ſhall drive men before him with his ſtaff. 16. The coming of the Mohdi, or director; concerning whom Mahomet propheſied, that the world ſhould not have an end till one of his own family ſhould govern the Arabians, whoſe name ſhould be the ſame with his own name, and whoſe father's name ſhould alſo be the ſame with his father's name; and who ſhould fill the earth with righteouſneſs. This perſon the Shiites believe to be now alive, and concealed in ſome ſecret place till the time of his manifeſtation; for they ſuppoſe him no other than the laſt of the 12 Imams, named *Mahomet Abu'lkaſem*, as their prophet was; and the ſon of Haſſan al Aſkeri, the 11th of that ſucceſſion. He was born at Serman-rai, in the 255th year of the Hegira. From this tradition, it is to be preſumed, an opinion pretty current among the Chriſtians took its riſe, that the Mahometans are in expectation of their prophet's return. 17. A wind which ſhall ſweep away the ſouls of all who have but a grain of faith in their hearts, as has been mentioned under the tenth ſign.

Theſe are the greater ſigns, which, according to their doctrine, are to precede the reſurrection, but ſtill leave the hour of it uncertain: for the immediate ſign of its being come will be the firſt blaſt of the trumpet, which they believe will be ſounded three times. The firſt they call the *blaſt of conſternation;* at the hearing of which all creatures in heaven and earth ſhall be ſtruck with terror, except thoſe whom God ſhall pleaſe to exempt from it. The effects attributed to this firſt ſound of the trumpet are very wonderful: for they ſay, the earth will be ſhaken, and not only all buildings, but the very mountains levelled; that the heavens ſhall melt, the ſun be darkened, the ſtars fall, on the death of the angels, who, as ſome imagine, hold them ſuſpended between heaven and earth; and the ſea ſhall be troubled and dried up, or, according to others, turned into flames, the ſun, moon, and ſtars being thrown into it: the Koran, to expreſs the greatneſs of the terror of that day, adds, that women who give ſuck ſhall abandon the care of their infants, and even the ſhe camels which have gone 10 months with young (a moſt valuable part of the ſubſtance of that nation) ſhall be utterly neglected. A farther effect of this blaſt will be that concourſe of beaſts mentioned in the Koran, though ſome doubt whether it be to precede the reſurrection or not. They who ſuppoſe it will precede, think that all kinds of animals, forgetting their reſpective natural fierceneſs and timidity, will run together into one place, being terrified by the ſound of the trumpet and the ſudden ſhock of nature.

The Mahometans believe that this firſt blaſt will be followed by a ſecond, which they call the *blaſt of exinanition;* by which all creatures both in heaven and earth ſhall die or be annihilated, except thoſe which God ſhall pleaſe to exempt from the common fate; and this, they ſay, ſhall happen in the twinkling of an eye, nay in an inſtant; nothing ſurviving except God alone, with paradiſe and hell, and the inhabitants of thoſe two places, and the throne of glory. The laſt who ſhall die will be the angel of death.

Forty years after this will be heard the *blaſt of reſurrection*, when the trumpet ſhall be ſounded the third time by Iſraſil, who, together with Gabriel and Michael, will be previouſly reſtored to life, and, ſtanding on the rock of the temple of Jeruſalem, ſhall, at God's command, call together all the dry and rotten bones, and other diſperſed parts of the bodies, and the very hairs to judgment. This angel, having, by the divine order, ſet the trumpet to his mouth, and called together all the ſouls from all parts, will throw them into his trumpet, from whence, on his giving the laſt ſound, at the command of God, they will fly forth like bees, and fill the whole ſpace between heaven and earth, and then repair to their reſpective bodies, which the opening earth will ſuffer to ariſe; and the firſt who ſhall ſo ariſe, according to a tradition of Mahomet, will be himſelf. For this birth the earth will be prepared by the rain above-mentioned, which is to fall continually for 40 years, and will reſemble the ſeed of a man, and be ſupplied from the water under the throne of God, which is called *living water*; by the efficacy and virtue of which the dead bodies ſhall ſpring forth from their graves, as they did in their mother's womb, or as corn ſprouts forth by common rain, till they become perfect; after which breath will be breathed into them, and they will ſleep in their ſepulchres till they are raiſed to life at the laſt trump.

When thoſe who have riſen ſhall have waited the limited time, the Mahometans believe God will at length appear to judge them; Mahomet undertaking the office of interceſſor, after it ſhall have been declined by Adam, Noah, Abraham, and Jeſus, who ſhall beg deliverance only for their own ſouls. They ſay, that on this ſolemn occaſion God will come in the clouds ſurrounded by angels, and will produce the books wherein the actions of every perſon are recorded by their guardian angels, and will command the prophets to bear witneſs againſt thoſe to whom they have been reſpectively ſent. Then every one will be examined concerning all his words and actions uttered and done by him in this life; not as if God needed any information in theſe reſpects, but to oblige the perſon to make public confeſſion and acknowledgement of God's juſtice. The particulars of which they ſhall give an account, as Mahomet himſelf enumerated them, are, of their time, how they ſpent it; of their wealth, by what means they acquired it, and how they employed it; of their bodies, wherein they exerciſed them; of their knowledge and learning, what uſe they made of them. To the queſtions we have mentioned each perſon ſhall anſwer, and make his defence in the beſt manner he can, endeavouring to excuſe himſelf by caſting the blame of his evil deeds on others; ſo that a diſpute ſhall ariſe even between the ſoul and the body, to which of them their guilt ought to be imputed: the ſoul ſaying, *O Lord, my body I received from thee; for thou createdſt me without a hand to lay hold with, a foot to walk with, an eye to ſee with, or an underſtanding to apprehend with, till I came and entered into this body; therefore puniſh it eternally, but deliver me.* The body, on the other ſide, will make this apology: *O Lord, thou createdſt me like a ſtock of wood, having neither hand that I could lay hold with, nor foot that I could walk with, till this ſoul, like a ray of light, entered into me, and my tongue began to ſpeak, my eye to ſee, and my foot to walk; therefore puniſh it eternally, but deliver me.* But God will propound to them the following parable of the blind man and the lame man, which, as well as the preceding diſpute, was borrowed by the Mahometans from the Jews. A certain king, having a pleaſant garden, in which were ripe fruits, ſet two perſons to keep it, one of whom was blind, and the other lame; the former not being able to ſee the fruit, nor the latter to gather it: the lame man, however, ſeeing the fruit, perſuaded the blind man to take him upon his ſhoulders, and by that means he eaſily gathered the fruit; which they divided between them. The lord of the garden coming ſome time after, and inquiring after his fruit, each began to excuſe himſelf: the blind man ſaid he had no eyes to ſee with; and the lame man, that he had no feet to approach the trees. But the king, ordering the lame man to be ſet on the blind, paſſed ſentence on and puniſhed them both. And in the ſame manner will God deal with the body and the ſoul. As theſe apologies will not avail on that day, ſo it will be in vain for any one to deny his evil actions; ſince men and angels, and his own members, nay, the very earth itſelf, will be ready to bear witneſs againſt him.

At this examination, they alſo believe, that each perſon will have the book wherein all the actions of his life are written delivered to him: which books the righteous will receive into their right hand, and read with great pleaſure and ſatisfaction; but the ungodly will be obliged to take them, againſt their wills, in their left, which will be bound behind their backs, their right hand being tied up to their necks.

To ſhow the exact juſtice which will be obſerved on this great day of trial, the next thing they deſcribe is the balance, wherein all things ſhall be weighed. They ſay it will be held by Gabriel; and that it is of ſo vaſt a ſize, that its two ſcales, one of which hangs over paradiſe, and the other over hell, are capacious enough to contain both heaven and hell. Though ſome are willing to underſtand what is ſaid in the Koran concerning this balance allegorically, and only as a figurative repreſentation of God's equity; yet the more ancient and orthodox opinion is, that they are to be taken literally; and ſince words and actions, being mere accidents, are not capable of being themſelves weighed, they ſay that the books wherein they are written will be thrown into the ſcales, and according as thoſe wherein the good or evil actions are recorded ſhall preponderate, ſentence will be given: thoſe whoſe balances laden with good works ſhall be heavy, will be ſaved; but thoſe whoſe balances are light, will be condemned. Nor will any one have cauſe to complain that God ſuffers any good action to paſs unrewarded, becauſe the wicked for the good they do have their reward in this life, and therefore can expect no favour in the next.

This examination being paſt, and every one's works weighed in a juſt balance, that mutual retaliation will follow, according to which every creature will take vengeance one of another, or have ſatisfaction made them for the injuries which they have ſuffered. And, ſince there will then be no other way of returning like for like, the manner of giving this ſatisfaction will be by taking away a proportional part of the good works of him who offered the injury, and adding it to thoſe of him who ſuffered it. Which being done, if the angels (by whoſe miniſtry this is to be performed) ſay, *Lord, we have given to every one his due, and there remaineth of this perſon's good works ſo much as equalleth the weight of an ant,* God will, of his mercy, cauſe it to be doubled unto him, that he may be admitted into paradiſe; but if, on the contrary, his good works be exhauſted, and there remain evil works only, and there be any who have not yet received ſatisfaction from him, God will order that an equal weight of their ſins be added unto his, that he may be puniſhed for them in their ſtead, and he will be ſent to hell laden with both. This will be the method of God's dealing with mankind. As to brutes, after they ſhall have likewiſe taken vengeance of one another, he will command them to be changed into duſt; wicked men being reſerved to more grievous puniſhment, ſo that they ſhall cry out, on hearing this ſentence paſſed on the brutes, *Would to* God *that we were duſt alſo.* As to the genii, many Mahometans are of opinion, that ſuch of them as are true believers, will undergo the ſame fate as the irrational animals, and have no other reward than the favour of being converted into duſt; and for this they quote the authority of their prophet.

The trials being over, and the aſſembly diſſolved, the Mahometans hold, that thoſe who are to be admitted into paradiſe will take the right-hand way, and thoſe who are deſtined to hell-fire will take the left; but both of them muſt firſt paſs the bridge called in Arabic *al Sirat*, which they ſay is laid over the midſt of hell, and deſcribe to be finer than a hair, and ſharper than the edge of a ſword; ſo that it ſeems very difficult to conceive how any one ſhall be able to ſtand upon it: for which reaſon, moſt of the ſect of the Motazalites reject it as a fable; though the orthodox think it a ſufficient proof of the truth of this article, that it was ſeriouſly affirmed by him who never aſſerted a falſehood, meaning their prophet: who, to add to the difficulty of the paſſage, has likewiſe declared, that this bridge is beſet on each ſide with briars and hooked thorns: which will however be no impediment to the good; for they ſhall paſs with wonderful eaſe and ſwiftneſs, like lightning, or the wind, Mahomet and his Moſlems leading the way; whereas the wicked, what with the ſlipperineſs and extreme narrowneſs of the path, the intangling of the thorns, and the extinction of the light which directed the former to paradiſe, will ſoon miſs their footing, and fall down headlong into hell, which is gaping beneath them.

As to the puniſhment of the wicked, the Mahometans are taught, that hell is divided into ſeven ſtories or apartments, one below another, deſigned for the reception of as many diſtinct claſſes of the damned. The firſt, which they call *Jehennam*, they ſay, will be the receptacle of thoſe who acknowledged one-God, that is, the wicked Mahometans; who, after having there been puniſhed according to their demerits, will at length be releaſed. The ſecond, named *Ladha*, they aſſign to the Jews; the third, named *al Hotama*, to the Chriſtians; the fourth, named *al Sair* to the Sabians; the fifth, named *Sakar*, to the Magians; the ſixth, named *al Jahim*, to the idolaters; and the ſeventh, which is the loweſt and worſt of all, and is called *al Hawyat*, to the hypocrites, or thoſe who outwardly profeſſed ſome religion, but in their hearts were of none. Over each of theſe apartments they believe there will be ſet a guard of angels, 19 in number; to whom the damned will confeſs the juſt judgment of God, and beg them to intercede with him for ſome alleviation of their pain, or that they may be delivered by being annihilated.

Mahomet has, in his Koran and traditions, been very exact in deſcribing the various torments of hell, which, according to him, the wicked will ſuffer both from intenſe heat and exceſſive cold. We ſhall, however, enter into no detail of them here; but only obſerve, that the degrees of theſe pains will alſo vary in proportion to the crimes of the ſufferer, and the apartment he is condemned to; and that he who is puniſhed the moſt lightly of all will be ſhod with ſhoes of fire, the fervour of which will cauſe his ſkull to boil like a cauldron. The condition of theſe unhappy wretches, as the ſame prophet teaches, cannot be properly called either *life* or *death;* and their miſery will be greatly increaſed by their deſpair of being ever delivered from that place, ſince, according to that frequent expreſſion in the Koran, *they muſt remain therein for ever.* It muſt be remarked, however, that the infidels alone will be liable to eternity of damnation; for the Moſlems, or thoſe who have embraced the true religion, and have been guilty of heinous ſins, will be delivered thence after they ſhall have expiated their crimes by their ſufferings. The time which theſe believers ſhall be detained there, according to a tradition handed down from their prophet, will not be leſs than 900 years, nor more than 7000. And, as to the manner of their delivery, they ſay that they ſhall be diſtinguiſhed by the marks of proſtration on thoſe parts of their bodies with which they uſed to touch the ground in prayer, and over which the fire will therefore have no power; and that, being known by this characteriſtic, they will be releaſed by the mercy of God, at the interceſſion of Mahomet and the bleſſed: whereupon thoſe who ſhall have been dead, will be reſtored to life, as has been ſaid; and thoſe whoſe bodies ſhall have contracted any ſootineſs or filth from the flames and ſmoke of hell, will be immerſed in one of the rivers of paradiſe, called the *river of life*, which will waſh them whiter than pearls.

The righteous, as the Mahometans are taught to believe, having ſurmounted the difficulties, and paſſed the ſharp bridge abovementioned, before they enter paradiſe, will be refreſhed by drinking at the *pond* of their prophet, who deſcribes it to be an exact ſquare of a month's journey in compaſs; its water, which is ſupplied by two pipes from al Cawthar, one of the rivers of paradiſe, being whiter than milk or ſilver, and more odoriferous than muſk, with as many cups ſet around it as there are ſtars in the firmament; of which water whoever drinks will thirſt no more for ever. This is the firſt taſte which the bleſſed will have of their future and now near-approaching felicity.

Though paradiſe be ſo very frequently mentioned in the Koran, yet it is a diſpute among the Mahometans whether it be already created, or to be created hereafter; the Motazalites and ſome other ſectaries aſſerting, that there is not at preſent any ſuch place in nature, and that the paradiſe which the righteous will inhabit in the next life will be different from that from which Adam was expelled. However, the orthodox profeſs the contrary, maintaining that it was created even before the world, and deſcribe it, from their prophet's traditions, in the following manner.

They ſay it is ſituated above the ſeven heavens (or in the ſeventh heaven), and next under the throne of God; and, to expreſs the amenity of the place, tell us, that the earth of it is of the fineſt wheat-flour, or of the pureſt muſk, or, as others will have it, of ſaffron: that its ſtones are pearls and jacinths, the walls of its buildings enriched with gold and ſilver, and that the trunks of all its trees are of gold: among which the moſt remarkable is the tree called *Tuba*, or the tree of happineſs. Concerning this tree, they fable, that it ſtands in the palace of Mahomet, though a branch of it will reach to the houſe of every true believer; that it will be laden with pomegranates, grapes, dates, and other fruit, of ſurpriſing bigneſs, and of taſtes unknown to mortals. So that, if a man deſire to eat of any particular kind of fruit, it will immediately be preſented him; or, if he chooſe fleſh, birds ready dreſſed will be ſet before him, according to his wiſh. They add, that the boughs of this tree will ſpontaneouſly bend down to the hand of the perſon who would gather of its fruits, and that it will ſupply the bleſſed not only with food, but alſo with ſilken garments, and beaſts to ride on ready ſaddled and bridled, and adorned with rich trappings, which will burſt forth from its fruits; and that this tree is ſo large, that a perſon, mounted on the fleeteſt horſe, would not be able to gallop from one end of its ſhade to the other in 100 years.

As plenty of water is one of the greateſt additions to the pleaſantneſs of any place, the Koran often ſpeaks of the rivers of paradiſe as a principal ornament thereof: ſome of theſe rivers, they ſay, flow with water, ſome with milk, ſome with wine, and others with honey; all taking their riſe from the root of the tree Tuba.

But all theſe glories will be eclipſed by the reſplendent and raviſhing girls of paradiſe, called, from their large black eyes, *Hur al oyun*, the enjoyment of whoſe company will be a principal felicity of the faithful. Theſe, they ſay, are created, not of clay, as mortal women are, but of pure muſk; being, as their prophet often affirms in his Koran, free from all natural impurities, defects, and inconveniences incident to the ſex, of the ſtricteſt modeſty, and ſecluded from public view in pavilions of hollow pearls, ſo large, that as ſome traditions have it, one of them will be no leſs than four paraſangs (or, as others ſay, 60 miles) long, and as many broad.

The name which the Mahometans uſually give to this happy manſion, is *al Jannat*, or "the garden;" and ſometimes they call it, with an addition, *Jannat al Ferdaws*, "the garden of paradiſe;" *Jannat Aden*, "the garden of Eden," (though they generally interpret the word *Eden*, not according to its acceptation in Hebrew, but according to its meaning in their own tongue, wherein it ſignifies "a ſettled or perpetual habitation;") *Jannat al Mawa*, "the garden of abode;" *Jannat al Naim*, "the garden of pleaſure;" and the like: by which ſeveral appellations ſome underſtand ſo many different gardens, or at leaſt places of different degrees of felicity (for they reckon no leſs than 100 ſuch in all), the very meaneſt whereof will afford its inhabitants ſo many pleaſures and delights, that one would conclude they muſt even ſink under them, had not Mahomet declared, that, in order to qualify the bleſſed for a full enjoyment of them, God will give to every one the abilities of 100 men.

6. God's abſolute decree and predeſtination both of good and evil. The orthodox doctrine is, that whatever hath or ſhall come to paſs in this world, whether it be good, or whether it be bad, proceedeth entirely from the divine will, and is irrevocably fixed and recorded from all eternity in the preſerved table: God having ſecretly predetermined not only the adverſe and proſperous fortune of every perſon in this world, in the moſt minute particulars, but alſo his faith or infidelity, his obedience or diſobedience, and conſequently his everlaſting happineſs or miſery after death; which fate or predeſtination it is not poſſible by any foreſight or wiſdom to avoid.

Of this doctrine Mahomet makes great uſe in his Koran for the advancement of his deſigns; encouraging his followers to fight without fear, and even deſperately, for the propagation of their faith, by repreſenting to them, that all their caution could not avert their inevitable deſtiny, or prolong their lives for a moment; and deterring them from diſobeying or rejecting him as an impoſtor, by ſetting before them the danger they might thereby incur of being, by the juſt judgment of God, abandoned to ſeduction, hardneſs of heart, and a reprobate mind, as a puniſhment for their obſtinacy.

II. *Religious practice.* 1. The firſt point is *prayer*, under which are alſo comprehended thoſe legal waſhings or purifications which are neceſſary preparations thereto.

Of theſe purifications there are two degrees, one called *ghoſl*, being a total immerſion or bathing of the body in water; and the other called *wodu* (by the Perſians, *abdeſt*), which is the waſhing of their faces, hands, and feet, after a certain manner. The firſt is required in ſome extraordinary caſes only, as after having lain with a woman, or being polluted by emiſſion of ſeed, or by approaching a dead body; women alſo being obliged to it after their courſes or childbirth. The latter is the ordinary ablution in common caſes, and before prayer, and muſt neceſſarily be uſed by every perſon before he can enter upon that duty. It is performed with certain formal ceremonies, which have been deſcribed by ſome writers, but much eaſier apprehended by ſeeing them done, than by the beſt deſcription.

That his followers might be more punctual in this duty, Mahomet is ſaid to have declared, that *the practice of religion is founded on cleanlineſs*, which is the *one half of the faith*, and the *key of prayer*, without which it will not be heard by God. That theſe expreſſions may be the better underſtood, al Ghazali reckons four degrees of purification; of which the firſt is the cleanſing of the body from all pollution, filth, and excrements; the ſecond, the cleanſing of the members of

Mahometaniſm.

the body from all wickedneſs and unjuſt actions; the third, the cleanſing the heart from all blameable inclinations and odious vices; and the fourth, the purging a man's ſecret thoughts from all affections which may divert their attendance on God; adding, that the body is but as the outward ſhell, in reſpect to the heart, which is as the kernel.

Circumciſion, though it be not ſo much as once mentioned in the Koran, is yet held by the Mahometans to be an ancient divine inſtitution, confirmed by the religion of Iſlam, and, though not ſo abſolutely neceſſary but that it may be diſpenſed with in ſome caſes, yet highly proper and expedient. The Arabs uſed this rite for many ages before Mahomet, having probably learned it from Iſhmael, though not only his deſcendants, but the Hamyarites and other tribes practiſed the ſame. The Iſhmaelites, we are told, uſed to circumciſe their children, not on the eighth day, as is the cuſtom of the Jews, but when about 12 or 13 years old, at which age their father underwent that operation; and the Mahometans imitate them ſo far as not to circumciſe children before they may be able at leaſt diſtinctly to pronounce that profeſſion of their faith, *There is no* God *but* God, Mahomet *is the apoſtle of* God; but pitch on what age they pleaſe for the purpoſe, between 6 and 16, or thereabouts.

Prayer was by Mahomet thought ſo neceſſary a duty, that he uſed to call it *the pillar of religion*, and *the key of paradiſe*; and when the Thakifites, who dwelt at Tayef, ſending, in the ninth year of the Hegira, to make their ſubmiſſion to the prophet, after the keeping of their favourite idol had been denied them, begged at leaſt, that they might be diſpenſed with as to their ſaying of their appointed prayers, he anſwered, *That there could be no good in that religion wherein was no prayer.*

That ſo important a duty, therefore, might not be neglected, Mahomet obliged his followers to pray five times every 24 hours, at certain ſtated times; viz. 1. In the morning before ſun-riſe: 2. When noon is paſt, and the ſun begins to decline from the meridian: 3. In the afternoon, before ſun-ſet: 4. In the evening, after ſun-ſet, and before day be ſhut in; and, 5. After the day is ſhut in, and before the firſt watch of the night. For this inſtitution he pretended to have received the divine command from the throne of God himſelf, when he took his night-journey to heaven; and the obſerving of the ſtated times of prayer is frequently inſiſted on in the Koran, though they be not particularly preſcribed therein. Accordingly, at the aforeſaid times, of which public notice is given by the Muedhdhins, or Criers, from the ſteeples of their moſques (for they uſe no bells), every conſcientious Moſlem prepares himſelf for prayer, which he performs either in the moſque or any other place, provided it be clean, after a preſcribed form, and with a certain number of praiſes or ejaculations (which the more ſcrupulous count by a ſtring of beads), and uſing certain poſtures of worſhip; all which have been particularly ſet down and deſcribed, though with ſome few miſtakes, by other writers, and ought not to be abridged, unleſs in ſome ſpecial caſes, as on a journey, on preparing for battle, &c.

For the regular performance of the duty of prayer among the Mahometans, beſides the particulars above mentioned, it is alſo requiſite that they turn their faces, while they pray, towards the temple of Mecca; the quarter where the ſame is ſituated, being, for that reaſon, pointed out within their moſques by a nich, which they call *al Mehrab*; and without, by the ſituation of the doors opening into the galleries of the ſteeples: there are alſo tables calculated for the ready finding out their Keblah, or part towards which they ought to pray, in places where they have no other direction.

2. *Alms* are of two ſorts, *legal* and *voluntary*. The *legal alms* are of indiſpenſable obligation, being commanded by the law, which directs and determines both the portion which is to be given, and of what things it ought to be given; but the *voluntary alms* are left to every one's liberty, to give more or leſs, as he ſhall ſee fit. The former kind of alms ſome think to be properly called *zacat*, and the latter *ſadekat*; though this name be alſo frequently given to the legal alms. They are called *zacat*, either becauſe they *increaſe* a man's ſtore by drawing down a bleſſing thereon, and produce in his ſoul the virtue of liberality; or becauſe they *purify* the remaining part of one's ſubſtance from pollution, and the ſoul from the filth of avarice; and *ſadakat*, becauſe they are a proof of a man's ſincerity in the worſhip of God. Some writers have called the legal alms *tithes*; but improperly, ſince in ſome caſes they fall ſhort, and in others exceed that proportion.

3. *Faſting* is a duty of ſo great moment, that Mahomet uſed to ſay it was *the gate of religion*, and that the *odour of the mouth of him who faſteth is more grateful to* God *than that of muſk*; and al Ghazali reckons faſting *one fourth part of the faith*. According to the Mahometan divines, there are three degrees of faſting: 1. The reſtraining the belly and other parts of the body from ſatiſfying their luſts: 2. The reſtraining the ears, eyes, tongue, hands, feet, and other members, from ſin; and, 3. The faſting of the heart from worldly cares, and reſtraining the thought from every thing beſides God.

The Mahometans are obliged, by the expreſs command of the Koran, to faſt the whole month of Ramadan, from the time the new moon firſt appears, till the appearance of the next new moon; during which time they muſt abſtain from eating, drinking, and women, from day-break till night or ſun-ſet. And this injunction they obſerve ſo ſtrictly, that, while they faſt, they ſuffer nothing to enter their mouths, or other parts of their body, eſteeming the faſt broken and null, if they ſmell perfumes, take a clyſter or injection, bathe, or even purpoſely ſwallow their ſpittle; ſome being ſo cautious, that they will not open their mouths to ſpeak leſt they ſhould breathe the air too freely: the faſt is alſo deemed void, if a man kiſs or touch a woman, or if he vomit deſignedly. But after ſun-ſet they are allowed to refreſh themſelves, and to eat and drink, and enjoy the company of their wives till day-break; though the more rigid begin the faſt again at midnight. This faſt is extremely rigorous and mortifying when the month of Ramadan happens to fall in ſummer (for the Arabian year being lunar, each month runs through all the different ſeaſons in the courſe of 33 years), the length and heat of the days making the obſervance of it much more difficult and uneaſy than in winter.

The reaſon given why the month of Ramadan was pitched on for this purpoſe is, that on that month the Koran was ſent down from heaven. Some pretend, that Abraham, Moſes, and Jeſus, received their reſpective revelations in the ſame month.

4. The pilgrimage to Mecca is ſo neceſſary a point of practice, that, according to a tradition of Mahomet, he who dies without performing it may as well die a Jew or a Chriſtian; and the ſame is expreſsly commanded in the Koran.

The temple of Mecca ſtands in the midſt of the city, and is honoured with the title of *Maſjad al elharam*, i. e. *the ſacred or inviolable temple.* What is principally reverenced in this place, and gives ſanctity to the whole, is a ſquare ſtone building, called the CAABA; (ſee that article).

To this temple every Mahometan, who has health and means ſufficient, ought, once at leaſt in his life, to go on pilgrimage; nor are women excuſed from the performance of this duty. The pilgrims meet at different places near Mecca, according to the different parts from whence they come, during the months of Shawal and Dhu'lkaada; being obliged to be there by the beginning of Dhu'lhajja; which month, as its name imports, is peculiarly ſet apart for the celebration of this ſolemnity.

At the place above mentioned the pilgrims properly commence ſuch; when the men put on the Ibram or ſacred habit, which conſiſts only of two woollen wrappers, one wrapped about their middle to cover their privities, and the other thrown over their ſhoulders, having their heads bare, and a kind of ſlippers which cover neither the heel nor the inſtep, and ſo enter the ſacred territory in their way to Mecca. While they have this habit on, they muſt neither hunt nor fowl, (though they are allowed to fiſh); which precept is ſo punctually obſerved, that they will not kill even a louſe or flea if they find them on their bodies: there are ſome noxious animals, however, which they have permiſſion to kill during the pilgrimage, as kites, ravens, ſcorpions, mice, and dogs given to bite. During the pilgrimage, it behoves a man to have a conſtant guard over his words and actions; to avoid all quarrelling or ill-language, all converſe with women, and all obſcene diſcourſe; and to apply his whole attention to the good work he is engaged in.

The pilgrims, being arrived at Mecca, immediately viſit the temple; and then enter on the performance of the preſcribed ceremonies, which conſiſt chiefly in going in proceſſion round the Caaba, in running between the mounts Safa and Merwa, in making the ſtation on mount Arafat, and ſlaying the victims, and ſhaving their heads in the valley of Mina.

In compaſſing the Caaba, which they do ſeven times, beginning at the corner where the black ſtone is fixed, they uſe a ſhort quick pace, the three firſt times they go round it, and a grave ordinary pace the four laſt; which, it is ſaid, was ordered by Mahomet, that his followers might ſhow themſelves ſtrong and active to cut off the hopes of the infidels, who gave out that the immoderate heats of Medina had rendered them weak. But the aforeſaid quick pace they are not obliged to uſe every time they perform this piece of devotion, but only at ſome particular times. So often as they paſs by the black ſtone, they either kiſs it, or touch it with their hand and kiſs that.

The running between Safa and Merwa is alſo performed ſeven times, partly with a ſlow pace and partly running: for they walk gravely till they come to a place between two pillars; and there they run, and afterwards walk again; ſometimes looking back, and ſometimes ſtopping, like one who had loſt ſomething, to repreſent Hagar ſeeking water for her ſon; for the ceremony is ſaid to be as ancient as her time.

On the ninth of Dhu'lhajja, after morning-prayer, the pilgrims leave the valley of Mina, whither they come the day before; and proceed in a tumultuous and ruſhing manner to mount Arafat, where they ſtay to perform their devotions till ſun-ſet: then they go to Mozdalifa, an oratory between Arafat and Mina; and there ſpend the night in prayer and reading the Koran. The next morning by day break they viſit *al Maſher al Karam*, or "the ſacred monument;" and, departing thence before ſun-riſe, haſte by Batn Mohaſſer to the valley of Mina, where they throw ſeven ſtones at three marks or pillars, in imitation of Abraham, who, meeting the devil in that place, and being by him diſturbed in his devotions, or tempted to diſobedience when he was going to ſacrifice his ſon, was commanded by God to drive him away by throwing ſtones at him; though others pretend this rite to be as old as Adam, who alſo put the devil to flight in the ſame place, and by the ſame means.

This ceremony being over, on the ſame day, the tenth of Dhu'lhajja, the pilgrims ſlay their victims in the ſaid valley of Mina; of which they and their friends eat part, and the reſt is given to the poor. Theſe victims muſt be either ſheep, goats, kine, or camels; males, if of either of the two former kinds; and females if of either of the latter; and of a fit age. The ſacrifices being over, they ſhave their heads and cut their nails, burying them in the ſame place; after which the pilgrimage is looked on as completed: though they again viſit the Caaba, to take their leave of that ſacred building.

The rapid ſucceſs which attended the propagation of this new religion was owing to cauſes that are plain and evident, and muſt remove, or rather prevent, our ſurprize, when they are attentively conſidered. The terror of Mahomet's arms, and the repeated victories which were gained by him and his ſucceſſors, were, no doubt, the irreſiſtible arguments that perſuaded ſuch multitudes to embrace his religion and ſubmit to his dominion. Beſides, his law was artfully and marvellouſly adapted to the corrupt nature of man; and, in a more particular manner, to the manners and opinions of the eaſtern nations, and the vices to which they were naturally addicted: for the articles of faith which it propoſed were few in number, and extremely ſimple; and the duties it required were neither many nor difficult, nor ſuch as were incompatible with the empire of appetites and paſſions. It is to be obſerved farther, that the groſs ignorance, under which the Arabians, Syrians, Perſians, and the greateſt part of the eaſtern nations, laboured at this time, rendered many an eaſy prey to the artifice and eloquence of this bold adventurer. To theſe cauſes of the progreſs of Mahometiſm, we may add the bitter diſſenſions and cruel animoſities that reigned among the Chriſtian ſects, particularly the Greeks, Neſtorians, Eutychians, and Monophyſites; diſſenſions that filled a great part of the Eaſt with carnage, aſſaſſinations, and ſuch deteſtable enormities, as rendered the very name of Chriſtianity odious to many. We might add here, that the Monophyſites and Neſtorians, full of reſentment againſt the Greeks, from whom they had ſuffered the bittereſt and moſt injurious treatment, aſſiſted the Arabians in the conqueſt of ſeveral provinces, into which, of conſequence, the religion of Mahomet was afterwards introduced. Other cauſes of the ſudden progreſs of that religion will naturally occur to ſuch as conſider attentively its ſpirit and genius, and the ſtate of the world at this time.

MAHOMETANS, thoſe who believe in the religion and divine miſſion of Mahomet. See MAHOMET, MAHOMETANISM, and ALCORAN.

MAHRATTA. See MARHATTA.

MAHWAH, or MAWEE, in botany; an Eaſt-Indian tree, ſo called by the natives of Bahar and the neighbouring countries, but of which the Shanſcrit name is *Madhuca* or *Madhudruma*. According to Lieut. C. Hamilton, by whom a very particular account of this tree is given in the *Aſiatic Reſearches* ‡, it is of the claſs of the polyandria-monogynia of Linnæus, but of a genus not deſcribed by him. The calyx is monophyllous, quadrifid, half divided, and imbricated in its divided part; the two oppoſite and outer parts covering partially the two oppoſite and inner. The corolla is monopetalous, having an inflated tube for its lower part, of near an inch long, thick, fleſhy, and of a cream colour: from this ariſe nine ſmall leaves, as it were, like petals from a calyx, that are imbricated and twiſted, one over the other, from right to left, claſping the lower part of the ſtyle in a point; by which they ſeem to ſerve, in ſome reſpect, like a forceps, to detach the whole corolla at the ſeaſon of its dropping. There are no filaments; but the antheræ, which are in number moſt commonly twenty-ſix, long, ſcabrous, and ſpear-headed, are inſerted in rows, on the inſide and upper part of the tube of the corolla. The ſtyle is long, round, and tapering, and projects about an inch beyond the corolla; it is ſucceeded by a drupe, with a thick pericarpium, bilocular, containing two ſeeds or kernels covered with a dark brown ſkin: there are often, however, three of theſe, in three ſeparate diviſions. The flowers riſe in bunches, from the extremities of the ſmaller branches; and have each a pedicle of about an inch and a half long: theſe are moſtly turned downwards, whence the corollas more eaſily drop off.

The tree, when full grown, is about the ſize of a common Mango tree, with a buſhy head and oval leaves a little pointed; its roots ſpreading horizontally, are ſunk but little in the earth: the trunk, which is often of a conſiderable thickneſs, riſes ſeldom to any great height, without giving off branches; it is, however, not uncommon to ſee it ſhoot up clear to the length of eight or ten feet: the wood itſelf is moderately hard, fine grained, and of a reddiſh colour. By inciſion the tree affords a reſinous gum from the bark.

The flowers are of a nature very extraordinary, "differing eſſentially (ſays Mr Hamilton) from thoſe of any other plant with which I am acquainted, as they have not, in any reſpect, the uſual appearance of ſuch, but rather reſemble *berries*; and I, like many others, had long conceived them to be the fruit of the Mahwah." The tree drops its leaves in the month of February, and early in March theſe flowers begin to come out in cluſters of thirty, forty, or fifty, from the extremity of every ſmall branch; and, from this period till the latter end of April, as the flowers come to maturity (for they never open or expand), they continue falling off, with their antheræ, in the mornings, a little after ſun-riſe; when they are gathered; and afterwards dried by an expoſure of a few days in the ſun: when thus prepared, they very much reſemble a dried grape, both in taſte and flavour. Immediately after the flowers drop off, freſh ſhoots are made for the new leaves, which ſoon make their appearance, coming preſently to their full growth.

The fruit (*properly* ſo called) is of two ſorts in ſhape; the one reſembling a ſmall walnut, the other ſomewhat larger and pointed: it is ripe towards the middle of May; and continues dripping from the tree till the whole fall, which is generally about the beginning or towards the middle of June. The outer covering, or *pericarpium*, which is of a ſoft texture, commonly burſts in the fall, ſo that the ſeeds are very eaſily ſqueezed out of it: the ſeeds are ſomewhat of the ſhape but longer than an olive. Theſe ſeeds are replete with a thick oil, of the conſiſtence of butter or *ghee*, which is obtained by expreſſion.

From this deſcription it may eaſily be conceived, that the Mahwah tree and its productions are of ſingular and general uſe, eſpecially in thoſe dry and barren countries, which, from the nature of their ſituation, are not ſo well calculated for producing in plenty or perfection the other neceſſaries of life.

The corolla or flowers, after being dried as before deſcribed, are eaten by the natives raw or dreſſed with their *curries*; and, when even ſimply boiled with rice, they afford a ſtrengthening and wholeſome nouriſhment. They are indeed, our author tells us, often applied to a leſs laudable purpoſe; for being fermented, they yield by diſtillation a ſtrong ſpirit, which the people here ſell ſo very cheap, that for one *pice* (about a half-penny) may be purchaſed no leſs than a *cutchaſeer* (above a pint Engliſh) with which any man may get completely drunk. Theſe flowers make an article of trade; being exported from this country to Patna and elſewhere in no inconſiderable quantities.

The oil yielded by the fruit, as before mentioned, reſembles ghee ſo much, that, being cheaper, the natives often mix it with that commodity. They uſe it the ſame as ghee in their victuals, and in the compoſition of ſome ſorts of ſweetmeats; and burn it in their lamps. It is alſo regarded as a ſalutary remedy, applied exteriorly to wounds and all cutaneous eruptions. It is at firſt of the conſiſtence of common oil, but ſoon coagulates: after being kept for ſome time, it acquires a bitteriſh taſte and rancid ſmell, which renders it ſomewhat leſs agreeable as an article of food: but this is an inconvenience which, by the oil being properly clarified and prepared at firſt, might be perhaps avoided. This oil is alſo exported both in its adulterated and original ſtate to Patna and other parts of the low country.

The author does not know any purpoſe to which

---

‡ Vol. I. art. xiv.

Mahwah.

the gum has ever been applied: but if found upon trial to be of uſe, he informs us that it might be collected in large quantities; and that the beſt ſeaſon for this would be in the months of March and April, about the time the flowers come out, when the tree ſeems to be moſt replete with it: ſuch an operation, indeed, would probably diminiſh its produce in the fruit and flower; but where it was ſufficiently cultivated, the loſs in thoſe could be but little felt.

The wood, from what has been already ſaid of it, cannot be expected to be often had in beams of any conſiderable length, ſo as to make it ſo very uſeful in building as it would otherwiſe be from its not being liable to be eat by the white ants: Mr Keir, however, told our author, that when he was at Chowſee (a village upon the Caramnaſſa near Buxar), he had beams of it which were to the beſt of his remembrance above 20 feet long: but in many other reſpects it is a moſt uſeful wood; and as it is tough, and of a ſtrong texture, it might perhaps be employed to advantage in ſhip-building; in which caſe, if properly cultivated in many grounds that ſeem well adapted for it and fit for little elſe, it might thus in time become a valuable article in that branch at Calcutta, whither it could eaſily be tranſported during the rainy ſeaſon from almoſt any part of theſe countries, by ſeveral rivers that are then ſufficiently full to float it down.

The tree, it is ſaid, though it does not refuſe a rich ſoil, will grow in the moſt barren ground, even amongſt ſtones and gravel, where there is the leaſt appearance of a ſoil; and it ſeems to deſtroy all the ſmaller trees and bruſhwood about it. It does not require much moiſture, ſeeming to produce nearly as well in the drieſt as in moſt favourable years, and in every ſituation; and is therefore admirably fitted for the convenience of the inhabitants of theſe hilly countries, which are peculiarly ſubject to long and ſevere droughts during the hot months.

“ Yet, notwithſtanding its utility, and the immenſe quantity of ground that ſeems ſo well adapted to the growth of it, both here and in the neighbouring provinces of Catak, Pacheet, Rotas, &c. (greateſt part of which, indeed, ſeems fit for no other uſeful production) I have myſelf never obſerved (ſays our author), nor can I find any of my acquaintance who ever have remarked, one ſingle tree in its infant ſtate. We can ſee, every where, full grown trees in great abundance; but, never meeting with any young plants, both I and all whom I have ſpoken to on the ſubject, are at ſome loſs to conceive how they ſhould have come here: neither can the country people themſelves, of whom I have inquired, give any rational account of this; although it appears pretty evident that numbers of them muſt have been cultivated ſome time or other, every village having many of them growing about it. This is a circumſtance which ſufficiently marks the true character of the lower order of natives in their moſt ſupine indolence and ſloth; owing chiefly, perhaps, to the ignorance and ſtupid rapacity of their Rajahs, Zemindars, and other landholders, and their total inattention to the welfare of thoſe dejected wretches from whom they derive their conſequence and power. Of their baſe indifference to the intereſts of thoſe whom they thus affect to hold beneath their regard, many ſtriking inſtances occurred to me in the courſe of my inquiries upon this very ſubject; and it was not long ago that, aſking ſome queſtions concerning the mahwah of a Zemindar in this neighbourhood, he anſwered, that ‘ it was the food of the poor people, and how ſhould he know any thing about it!’

Mahwah.

“ It was this ſtrange neglect of the culture of it, and a knowledge of its uſefulneſs (continues our author), which firſt led me to enquire into the nature of this tree, from which the bulk of the people hereabouts already draw ſuch great benefit, in order to know whether they might not increaſe it without any great trouble to themſelves; and whether thereby the revenue might not alſo be increaſed, and a certain proviſion be made againſt famines, from which the natives often ſuffer ſeverely in theſe higher diſtricts.

“ To effect this, it would be neceſſary to give the Ryots every poſſible encouragement to raiſe the tree from the ſeeds; but as the torpid apathy of theſe people, whether natural or acquired, will ever prevent their being moved to any exertion by a proſpect, however alluring, of diſtant advantage, I apprehend the only way of bringing this about would be making the planting and raiſing of a certain number of mahwahs (in proportion to the value of the tenure) an article in their kabooleats or agreements.

“ The tree, as has been already obſerved, will grow almoſt any where: it ought to be ſown about the beginning of the rains, either in beds (to be afterwards tranſplanted) or at about thirty or forty feet diſtance, in the ground deſigned for it. It is ſaid that in ſeven years the trees will give flowers and fruit; in ten, they will yield about half of their common produce; and that in twenty years they come to their full growth; after which, if my information be good, they will laſt near one hundred years. This account, I acknowledge, muſt neceſſarily be very vague and uncertain, as I never have met with a ſingle perſon who appeared to have had either opportunity or inclination to obſerve its progreſs. Such, however, is what the country people ſay of it.

“ I am told that a good tree will eaſily give four puckha maunds (about three hundred weight avoirdupois) of dried flowers, which will ſell here for about two rupees; and of ſeeds it will afford about two maunds; and this, of oil, will yield 26 ſeers puckha weight (near 60 lb.) which, in a year like this, when oil is cheap, will ſell at this place for two rupees more. It is to be obſerved, however, that every tree will not give ſo much, neither are the flowers and oil ſo clear in any part of the hills as at Chitra; but, allowing only a half of this or leſs, to be the product of each tree (though it might be rendered ſtill much greater by the very leaſt care and induſtry in the cultivation of it), within the ſpace of 20 years a ſubſiſtence might be raiſed to the inhabitants, and a conſiderable revenue to the proprietors of the lands throughout an immenſe tract of country; the greateſt part of which, in its preſent ſtate, is little better than a barren waſte, and cannot pay one ſingle anna to the Zemindar or the government. That ſuch an advantage might be derived from it, may be proved by the moſt moderate calculation: for ſuppoſing the trees to be ſown at 40 feet diſtance from each other, on each begah (about the third of an acre) might ſtand eight trees; and ſuppoſing the product of each tree to be only half a rupee, there would be four rupees of annual value on a begah of ground; half of which going to the proprietor, it would thus give a far better rent than the generality of the beſt grounds in theſe parts; and the labourer would have a produce, without any other trouble than that of ſowing the ſeed, and fencing the ground whilſt the trees were young; and that of annually gathering the flowers and preparing the oil when they arrive at their proper ſize; and they would probably begin to give a produce within leſs than 10 years after the ſowing.

"As this tree will yield nearly its uſual quantity of flowers and fruit in ſeaſons when, for want of rain, every other crop fails; if thus cultivated, it would afford the inhabitants a ſure and certain reſource, under the moſt dreadful, and what has hitherto been to them the moſt deſtructive, of all calamities, famine. It is well known, that the rice and other ſorts of grain which form the chief part of their ſuſtenance, require a conſiderable degree of moiſture to bring them to perfection; an unuſually dry ſeaſon deſtroys the harveſt in thoſe articles, and reduces the Ryots in general to the utmoſt miſery; a predicament into which they could hardly fall, even in the ſevereſt dearth of grain, whilſt they had plenty of the flowers and fruit of the mahwah to depend upon."

MAIA, (fab. hiſt.), the daughter of Atlas and Pleione. She was the mother of Mercury by Jupiter. She was one of the Pleiades, the moſt luminous of the ſeven ſiſters; (ſee PLEIADES). Alſo, a ſurname of Cybele.

MAIDEN, an inſtrument for beheading criminals.

Of the uſe and form of this inſtrument Mr Pennant gives the following account. "It ſeems to have been confined to the limits of the foreſt of Hardwick, or the 18 towns and hamlets within its precincts. The time when this cuſtom took place is unknown; whether Earl Warren, lord of this foreſt, might have eſtabliſhed it among the ſanguinary laws then in uſe againſt the invaders of the hunting rights; or whether it might not take place after the woollen manufactures at Halifax began to gain ſtrength, is uncertain. The laſt is very probable; for the wild country around the town was inhabited by a lawleſs ſet, whoſe depredations on the cloth-tenters might ſoon ſtifle the efforts of infant induſtry. For the protection of trade, and for the greater terror of offenders by ſpeedy execution, this cuſtom ſeems to have been eſtabliſhed, ſo as at laſt to receive the force of law, which was, 'That if a felon be taken within the liberty of the foreſt of Hardwick, with goods ſtolen out, or within the ſaid precincts, either hand-habend, back-berand, or confeſſion'd, to the value of thirteen-pence halfpenny, he ſhall, after three market-days or meeting-days within the town of Halifax, next after ſuch his apprehenſion, and being condemned, be taken to the gibbet, and there have his head cut from its body.'

"The offender had always a fair trial; for as ſoon as he was taken, he was brought to the lord's bailiff at Halifax: he was then expoſed on the three markets (which here were held thrice in a week), placed in a ſtocks, with the goods ſtolen on his back, or, if the theft was of the cattle kind, they were placed by him; and this was done both to ſtrike terror into others, and to produce new informations againſt him. The bailiff then ſummoned four freeholders of each town within the foreſt to form a jury. The felon and proſecutors were brought face to face; the goods, the cow or horſe, or whatſoever was ſtolen, produced. If he was found guilty, he was remanded to priſon, had a week's time allowed for preparation, and then was conveyed to this ſpot, where his head was ſtruck off by this machine. I ſhould have premiſed, that if the criminal, either after apprehenſion, or in the way to execution, could eſcape out of the limits of the foreſt (part being cloſe to the town), the bailiff had no farther power over him; but if he ſhould be caught within the precincts at any time after, he was immediately executed on his former ſentence.

"This privilege was very freely uſed during the reign of Elizabeth: the records before that time were loſt. Twenty-five ſuffered in her reign, and at leaſt twelve from 1623 to 1650; after which I believe the privilege was no more exerted.

"This machine of death is now deſtroyed; but I ſaw one of the ſame kind in a room under the parliament-houſe at Edinburgh, where it was introduced by the regent Morton, who took a model of it as he paſſed through Halifax, and at length ſuffered by it himſelf. It is in form of a painter's eaſel, and about ten feet high: at four feet from the bottom is a croſs bar, on which the felon lays his head, which is kept down by another placed above. In the inner edges of the frame are grooves; in theſe is placed a ſharp ax, with a vaſt weight of lead, ſupported at the very ſummit with a peg; to that peg is faſtened a cord, which the executioner cutting, the ax falls, and does the affair effectually, without ſuffering the unhappy criminal to undergo a repetition of ſtrokes, as has been the caſe in the common method. I muſt add, that if the ſufferer is condemned for ſtealing a horſe or a cow, the ſtring is tied to the beaſt, which, on being whipped, pulls out the peg, and becomes the executioner."

MAIDEN is alſo the name of a machine firſt uſed in Yorkſhire, and ſince introduced into other places, for waſhing of linen; conſiſting of a tub 19 inches high, and 27 in diameter at the top, in which the linen is put, with hot water and ſoap, to which is adapted a cover, fitting it very cloſely, and faſtened to the tub by two wedges; through a hole in the middle of the cover paſſes an upright piece of wood, kept at a proper height by a peg above, and furniſhed with two handles, by which it is turned backward and forward: to the lower end of this upright piece is faſtened a round piece of wood, in which are fixed ſeveral pieces, like cogs of a wheel. The operation of this machine is to make the linen paſs and repaſs quick through the water.

MAIDEN-Rents, in our old writers, a noble paid by the tenants of ſome manors on their marriage. This was ſaid to be given to the lord for his omitting the cuſtom of marcheta, whereby he was to have the firſt night's lodging with his tenant's wife; but it ſeems more probably to have been a fine for a licence to marry a daughter.

MAIDENHEAD, a town of Berks, 26 miles from London, with a ſtone bridge over the Thames.

It is governed by a high-ſteward, a mayor, a ſteward, and 10 aldermen, out of which laſt two bridgemaſters are choſen every year. Here is a gaol both for debtors and felons. The town ſtands partly in the pariſh of Bray and partly in that of Cookham; and here is a chapel peculiar to the corporation, the miniſter whereof is choſen by the inhabitants, and not obliged to attend the biſhop's viſitation. Here are ſeveral alms-houſes and charities. This town, now ſo conſiderable, did not begin to flouriſh till, by the building of its bridge, travellers were brought this way, who before uſed a ferry at that called *Babham's End*, two miles north of it. The barge pier-bridge is maintained by the corporation, for which they are allowed the tolls both over and under it. The bridge-pier divides Berks from Bucks. There is a great trade here in malt, meal, and timber, which they carry in their barges to London. As this is the great thoroughfare from thence to Bath, Briſtol, and other ſouth-weſt parts of England, the adjacent wood or thicket has been noted for many robberies. The market here is on Wedneſdays; there are three fairs; and here are frequent horſe-races.

MAIDSTONE, a town of Kent, in England, 36 miles from London, ſeated on the river Medway, a branch of which runs through it. It is a corporation, and ſends two members to parliament. Its chief trade, beſides linen-thread, which it makes to great perfection, is in hops; of which there are great plenty of plantations about the town, as well as orchards of cherries. The tide flows quite up to the town, and brings up barges, &c. of 50 or 60 tons. It has a fine ſtone bridge. One of the public gaols for the county is kept in this town; and the cuſtody of weights and meaſures, renewed by the ſtandard of King Henry VII. was committed to it by parliament, as being in the centre of Kent: for which reaſon the knights of the ſhire are always elected, and the courts of juſtice always held here, and generally the aſſizes. The archbiſhop of Canterbury is conſtant parſon of this pariſh, which is his peculiar, and ſerved by his curate. Here are four charity ſchools, in which are above 100 boys and girls, who are viſited once a week and catechiſed by the miniſter. This is ſuch a plentiful country, and the lands hereabouts are ſo rich, that London is ſupplied with more commodities from hence than from any market-town in England; particularly with the large bullocks that come from the Weald of Kent, which begins but ſix miles off; with timber, wheat, and great quantities of hops, apples, and cherries; with a ſort of paving-ſtone, eight or ten inches ſquare, that is exceeding durable; and with the fine white ſand for glaſs-houſes and ſtationers. There are ſo many gentlemens ſeats within 10 miles, that it is rare to find a town of ſo much trade and buſineſs ſo full of gentry and good company. The market here, which is the beſt in the county, is on Thurſday; it has another on the ſecond Tueſday of every month, granted them by George II. in 1751; and fairs on February 13th, May 12th, June 20th (called *Garlic fair)*, and October 17th. Here was a college or hoſpital, erected by Archbiſhop Boniface; and a chantry, by Archbiſhop Thomas Arundel, which is now the free ſchool.

MAIENNE, a conſiderable, handſome, and populous town in France, with the title of a duchy; ſeated on a river of the ſame name, in W. Long. 0. 35. N. Lat. 48. 18.

MAIGNAN (Emanuel), a religious minim, and one of the greateſt philoſophers of his age, was born of an ancient and noble family at Thoulouſe in 1601. Like the famous Paſcal, he became a complete mathematician without the aſſiſtance of a teacher; and filled the profeſſor's chair at Rome in 1636, where, at the expence of Cardinal Spada, he publiſhed his book *De Perſpectiva Horaria*. He returned to Thoulouſe in 1650, and was created provincial: the king, who in 1660 entertained himſelf with the machines and curioſities in his cell, made him offers by Cardinal Mazarine, to draw him to Paris; but he humbly deſired to ſpend the remainder of his days in a cloyſter. He publiſhed a courſe of philoſophy, 4 vols 8vo, at Thoulouſe; to the ſecond edition of which he added two treatiſes, one againſt the vortices of Deſcartes, and the other on the ſpeaking trumpet invented by Sir Samuel Morland. He is ſaid to have ſtudied even in his ſleep, his very dreams being employed in theorems, the demonſtrations of which would awaken him with joy. He died in 1676.

MAJESTY, a title given to kings, which frequently ſerves as a term of diſtinction. The word ſeems compoſed of the two Latin words, *major* "greater," and *ſtatus* "ſtate." The emperor is called *Sacred Majeſty*, *Imperial Majeſty*, and *Cæſarean Majeſty:* The king of Hungary is ſtyled *His Apoſtolic Majeſty*. The king of Spain is termed *His moſt Catholic Majeſty;* and the king of Portugal, *His moſt Faithful Majeſty*. The king of France uſed to be called *His moſt Chriſtian Majeſty;* and when he treated with the emperor, the word *Sacred* was added: He is now plain *King of the French*.—With reſpect to other kings, the name of the kingdom is added; as *His Britannic Majeſty*, *His Poliſh Majeſty*, &c. Formerly princes were more ſparing in giving titles, and more modeſt in claiming them: before the reign of Charles V. the king of Spain had only the title of *Highneſs;* and before that of Hen. VIII. the kings of England were only addreſſed under the titles of *Grace* and *Highneſs*.

Under the Roman republic, the title *Majeſty (majeſtas)* belonged to the whole body of the people, and to the principal magiſtrates; ſo that to diminiſh or wound the majeſty of the commonwealth, was to be wanting in reſpect to the ſtate or to its miniſters. But the power afterwards paſſing into the hands of a ſingle perſon, the appellation of *Majeſty* was transferred to the emperor and the imperial family. Pliny compliments Trajan on his being contented with the title of *Greatneſs;* and ſpeaks vary invidiouſly of thoſe who affected that of *Majeſty*. And yet this laſt ſeems to be the moſt modeſt and juſt title that can be attributed to ſovereigns, ſince it ſignifies no more than the royalty or ſovereign power.

MAII INDUCTIO, an ancient cuſtom for the prieſt and people of country-villages to go in proceſſion to ſome adjoining wood on a May-day morning; and return in a kind of triumph, with a May-pole, boughs, flowers, garlands, and other tokens of the ſpring. This May-game, or rejoicing at the coming of the ſpring, was for a long time obſerved, and ſtill is in ſome parts of England; but there was thought to be ſo much heathen vanity in it, that it was condemned and prohibited within the dioceſe of Lincoln by the good old biſhop Groſthead.

MAIL *(maille)*, a term primarily applied to the maſhes or holes in net-work.

Coat of MAIL. See COAT. It is called alſo a *habergeon*. Anciently they alſo wore ſhirts of mail under the waiſtcoat, to ſerve as a defence againſt ſwords and poniards. We alſo read of gloves of mail.

MAIL, or *Mall*, alſo ſignifies a round ring of iron; whence the play of pall-mall, from *palla* "a ball," and *maille* "the round ring through which it is to paſs."

MAIL, or *Maille*, in our old writers, a ſmall kind of money. Silver half-pence were likewiſe termed *mailles*, 9 Hen. V. By indenture in the mint, a pound weight of old ſterling ſilver was to be coined into 360 ſterlings or pennies, or 720 *mails* or halfpennies, or 1440 farthings. Hence the word *mail* was derived, which is now vulgarly uſed in Scotland to ſignify an annual rent.

MAIL, or *Maill*, on ſhip-board, a ſquare machine compoſed of a number of rings interwoven net-wiſe, and uſed for rubbing off the looſe hemp which remains on lines or white cordage after it is made.

MAIL is likewiſe uſed for the leather bag wherein letters are carried by the poſt.

MAIL-Coaches. See COACH.

Action of MAILS *and Duties*, in Scots law. See LAW, p. 699, § 7. and p. 712, § 20.

MAIL (*Black*). See *BLACK-Mail*.

MAILLA (Joſeph-Anne-Marie de Moyriac de), a learned Jeſuit, was born in the caſtle of Maillac in the Bugey, and appointed a miſſionary to China, whither he went in 1703. At the age of 28 he had acquired ſo great ſkill in the characters, arts, ſciences, mythology, and ancient books of the Chineſe, as to aſtoniſh even the learned. He was greatly beloved and eſteemed by the emperor Kam-Hi, who died in 1722. He, together with other miſſionaries, was employed by that prince to draw a chart of China and Chineſe Tartary, which was engraved in France in the year 1732. He drew likewiſe particular charts of ſome of the provinces of this vaſt empire; with which the emperor was ſo pleaſed, that he ſettled the author at his court. The great annals of China were alſo tranſlated into French by Father Mailla, and his manuſcript was tranſmitted to France in 1737. This work was publiſhed in 12 volumes quarto, under the inſpection of M. Groſier, and is the firſt complete hiſtory of that extenſive empire. The ſtyle, which was full of hyperbole and bombaſt, has been reviſed by the editor, and the ſpeeches which extended to too great a length, and had too much ſameneſs in them, have been omitted. Father Mailla, after having reſided 45 years in China, died at Pekin on the 28th of June 1748, in the 79th year of his age. Kieu-Lung the reigning emperor paid the expences of his funeral. He was a man of a lively and gentle character, capable of the moſt perſevering labour and the moſt unremitting activity.

MAILLET (Benoit de), deſcended from a noble family in Lorrain, was born in 1659, and appointed, at the age of 33, conſul general for Egypt. He fulfilled this office for 16 years with great ability, ſupported the king's authority againſt the janizaries, and greatly extended the trade of France into that part of Africa. As a recompence for his ſervices, the king beſtowed upon him the conſulſhip of Leghorn, which is the firſt and moſt conſiderable conſulſhip in his gift. Being at laſt appointed in 1715 to viſit the ſea-ports in the Levant and on the coaſt of Barbary, he was ſo ſucceſsful in the execution of his commiſſion, that he obtained permiſſion to retire with a conſiderable penſion. He ſettled at Marſeilles; where he died in 1738, in the 79th year of his age. He was a man of a lively imagination, and gentle manners; in ſociety he was very amiable, and he poſſeſſed the ſtricteſt probity. He was fond of praiſe, and very anxious about the reputation of genius. During the whole of his life he paid particular attention to the ſtudy of natural hiſtory; and his principal object was to become acquainted with the origin of our globe. On this important ſubject he left ſome curious obſervations, which have been publiſhed in octavo under the title of *Telliamed*, which is the name *de Maillet* written backwards. The editor Abbé Maſcrier has given to this work the form of dialogue. An Indian philoſopher is introduced as explaining to a French miſſionary his opinion concerning the nature of the globe, and the origin of mankind: and, which is very incredible, he ſuppoſes it to have come out of the waters, and makes an abode uninhabitable by man the birthplace of the human race. His great object is to prove, that all the ſtrata of which this globe is compoſed, even to the tops of the higheſt mountains, have come from the boſom of the waters; that they are the work of the ſea, which continually retires to allow them gradually to appear. Telliamed dedicated his book to the illuſtrious Cyrano de Bergerac author of the imaginary "Travels to the ſun and moon." In the humorous epiſtle which is addreſſed to him, the Indian philoſopher informs us that theſe dialogues are nothing but a collection of dreams and fancies. He cannot be accuſed of having broken his word; but he may well be reproached with not having written them in the ſame ſtyle with his letter to Cyrano, and with not having diſplayed equal livelineſs and humour. A ſubject the moſt extravagant is handled in the graveſt manner, and his ridiculous opinion is delivered with all the ſerious air of a philoſopher. Of the ſix dialogues which compoſe the work, the four firſt contain many curious obſervations truly philoſophical and important: in the other two we find nothing but conjectures, fancies, and fables, ſometimes amuſing, but always abſurd. To Maillet we are indebted alſo for "A Deſcription of Egypt," collected from his memoirs by the editor of Telliamed, 1743, 4to, or in 2 vols 12mo.

MAIM, MAIHEM, or *Mayhem*, in law, a wound by which a perſon loſes the uſe of a member that might have been a defence to him; as when a bone is broken, a foot, hand, or other member cut off, or an eye put out; though the cutting off an ear or noſe, or breaking the hinder-teeth, was formerly held to be no maim. A maim by caſtration was anciently puniſhed with death, and other maims with loſs of member for member; but afterwards they were only puniſhed by fine and impriſonment. It is now enacted by the ſtatute 22 & 23 Car. II. that if any perſon, from malice aforethought, ſhall diſable any limb or member of any of the king's ſubjects with an intent to diſfigure him, the offender, with his aiders and abettors, ſhall be guilty of ſelony without benefit of clergy; though no ſuch attainder ſhall corrupt the blood, or occaſion forfeiture of lands, &c.

MAIMBOURG (Louis), born at Nanci in 1610, became a Jeſuit in 1626; and acquired reputation as a teacher, but yet more by the many hiſtories which he publiſhed. The Janſeniſts criticiſed his hiſtory of Arianiſm, and that of the *Iconoclaſtes;* and his hiſtory of Calviniſm, publiſhed in 1681, ſtirred up a violent paper-war againſt him, the operations whereof he left entirely to his enemies, without giving himſelf any trouble offenſively or defenſively. He was degraded by the general of the Jeſuits, on account of his having declared too boldly in favour of the Gallican church againſt the Ultramountains. He retired into the abbey of St Victor, where he died in 1686.

He ought not to be confounded with *Theodore Maimbourg* his couſin; who embraced Calviniſm, afterwards returned to the Romiſh church, returned back to the reformed religion, embraced Socinianiſm, and died at London about the year 1693, after having publiſhed ſome works.

MAIMONIDES (Moſes), or MOSES THE SON OF MAIMON, a celebrated rabbi, called by the Jews *the eagle of the doctors*, was born of an illuſtrious family at Cordova in Spain, in 1131. He is commonly named *Moſes Ægyptius*, becauſe he ſettled in Egypt, where he ſpent his whole life in quality of phyſician to the ſultan. Here he opened a ſchool, which was ſoon filled with pupils from all parts; from Alexandria and Damaſcus eſpecially, whoſe proficiency under him ſpread his fame all over the world. He was no leſs eminent in philoſophy, mathematics, and divinity, than in medicine. Caſaubon affirms it may be truly ſaid of him, as Pliny of old ſaid of Diodorus Siculus, that "he was the firſt of his tribe who ceaſed to be a trifler." It would be tedious to enumerate all the works of Maimonides; ſome were written originally in Arabic, but are now extant only in Hebrew tranſlations. "Thoſe (ſays Collier), who deſire to learn the doctrine and the canon law contained in the Talmud, may read Maimonides's compendium of it in good Hebrew, in his book intitled *Iad;* wherein they will find great part of the fables and impertinencies in the Talmud entirely diſcarded. But the *More Nevochim* is the moſt valued of all his works; deſigned to explain the obſcure words, phraſes, metaphors, &c. in ſcripture, which, when literally interpreted, have either no meaning or appear abſurd.

MAIN, an epithet uſually applied by ſailors to whatever is principal, as oppoſed to whatever is inferior or ſecondary. Thus the main land is uſed in contradiſtinction to an iſland or peninſula; and the main-maſt, the main-wale, the main-keel, and the main-hatchway, are in like manner diſtinguiſhed from the fore and mizen maſts, the channel-wales, the falſe keel, and the fore and after hatchways, &c.

MAINOUR, MANOUR, or *Meinour* (from the French *manier*, i. e. *manu tractare*), in a legal ſenſe denotes the thing that a thief taketh away or ſtealeth: As to be taken with the mainour (*Pl. Cor.* fol. 179.), is to be taken with the thing ſtolen about him: And again (fol. 194.) it was preſented, that a thief was delivered to the ſheriff or viſcount, together with the mainour: And again (fol. 186.), if a man be indicted, that he feloniouſly ſtole the goods of another, where, in truth, they are his own goods, and the goods he brought into the court as the mainour; and if it be demanded of him, what he ſaith to the goods, and he diſclaim them; though he be acquitted of the felony, he ſhall loſe the goods: And again (fol. 149.), if the defendant were taken with the manour, and the manour be carried to the court, they, in ancient times, would arraign him upon the manour, without any appeal or indictment. Cowel. See Blackſt Comment. Vol. III. 71. Vol. IV. 303.

MAINPRIZE. See *Falſe Imprisonment*.

The writ of mainprize, *manucaptio*, is a writ directed to the ſheriff (either generally, when any man is impriſoned for a bailable offence, and bail hath been refuſed; or ſpecially, when the offence or cauſe of commitment is not properly bailable below), commanding him to take ſureties for the priſoner's appearance, uſually called *mainpernors*, and to ſet him at large. Mainpernors differ from bail, in that a man's bail may impriſon, or ſurrender him up before the ſtipulated day of appearance; mainpernors can do neither, but are barely ſureties for his appearance at the day: bail are only ſureties that the parties be anſwerable for the ſpecial matter for which they ſtipulate, mainpernors are bound to produce him to anſwer all charges whatever. See *Habeas Corpus*.

MAINTENANCE, in law, bears a near relation to BARRETRY; being an officious intermeddling in a ſuit that no way belongs to one, by maintaining or aſſiſting either party with money or otherwiſe, to proſecute or defend it: a practice that was greatly encouraged by the firſt introduction of uſes. This is an offence againſt public juſtice, as it keeps alive ſtrength and contention, and prevents the remedial proceſs of the law into an engine of oppreſſion. And therefore, by the Roman law, it was a ſpecies of the *crimen falſi*, to enter into any confederacy, or do any act to ſupport another's law-ſuit, by money, witneſſes, or patronage. A man may, however, maintain the ſuit of his near kinſman, ſervant, or poor neighbour, out of charity and compaſſion, with impunity. Otherwiſe the puniſhment by common law is fine and impriſonment; and by the ſtatute 32 Hen. VIII. c. 9. a forfeiture of 10 l.

MAINTENON (Madame de), a French lady of extraordinary fortune, deſcended from an ancient family, and whoſe proper name was *Frances Daubigne*, was born in 1635. Her parents by miſfortunes being ill able to ſupport her, ſhe fell to the care of her mother's relations; to eſcape which ſtate of dependence, ſhe was induced to marry that famous old buffoon the Abbé Scarron, who ſubſiſted himſelf only on a penſion allowed him by the court for his wit and parts. She lived with him many years, which Voltaire makes no ſcruple to call the happieſt years of her life; but when he died in 1660, ſhe found herſelf as indigent as ſhe was before her marriage. Her friends indeed endeavoured to get her huſband's penſion continued to her, and preſented ſo many petitions to the king about it, all beginning with "The widow Scarron moſt humbly prays your majeſty's, &c." that he was quite weary of them, and has been heard to exclaim, "Muſt I always be peſtered with the widow Scarron?" At laſt, however, through the recommendation of Madame de Monteſpan, he ſettled a much larger penſion on her, with a genteel apology for making her wait ſo long; and afterward made choice of her to take care of the education of the young duke of Maine, his ſon by Madame de Monteſpan. The letters ſhe wrote on this occaſion charmed the king, and were the origin of her advancement; her perſonal merit effected all the reſt. He bought her the lands of Maintenon, the only eſtate ſhe ever had; and finding her pleaſed with the acquiſition, called her publicly *Madam de Maintenon;* which was of great ſervice to her in her good fortune, by releaſing her from the ridicule attending that of Scarron. Her elevation was to her only a retreat; the king came to her apartment every day after dinner, before and after ſupper, and continued there till midnight: here he did buſineſs with his miniſters, while Madam de Maintenon, employed in reading or needlework, never ſhowed any deſire to talk of ſtate-affairs, and carefully avoided all appearance of cabal or intrigue; ſhe did not even make uſe of her power to dignify her own relations. About the latter end of the year 1685, Louis XIV. married her, he being then in his 48th and ſhe in her 50th year; and that piety with which ſhe inſpired the king to make her a wife inſtead of a miſtreſs, became by degrees a ſettled diſpoſition of mind She prevailed on Louis to found a religious community at St Cyr, for the education of 300 young ladies of quality; and here ſhe frequently retired from that melancholy of which ſhe complains ſo pathetically in one of her letters, and which few ladies will ſuppoſe ſhe ſhould be liable to in ſuch an elevated ſituation. But, as M. Voltaire ſays, if any thing could ſhow the vanity of ambition, it would certainly be this letter. Madam de Maintenon could have no other uneaſineſs than the uniformity of her manner of living with a great king; and this made her once ſay to the Count Daubigné her brother, "I can hold it no longer; I wiſh I was dead." The anſwer he made to her was, "You have then a promiſe to marry the Almighty!" Louis, however, died before her in 1715; when ſhe retired wholly to St Cyr, and ſpent the reſt of her days in acts of devotion; and what is moſt ſurpriſing is, that her huſband left no certain proviſion for her, recommending her only to the duke of Orleans. She would accept no more than a penſion of 80,000 livres, which was punctually paid her till ſhe died in 1719. A collection of her letters has been publiſhed, and tranſlated into Engliſh; from which familiar intercourſes her character will be better known than from deſcription.

MAJOR, in the art of war, the name of ſeveral officers of very different ranks and functions.

Major-general. See General.

Major of a Regiment of Foot, the next officer to the lieutenant-colonel, generally promoted from the eldeſt captain: he is to take care that the regiment be well exerciſed, to ſee it march in good order, and to rally it in caſe of being broke in action: he is the only officer among the infantry that is allowed to be on horſeback in time of action, that he may the more readily execute the colonel's orders.

Major of a Regiment of Horſe, as well as foot, ought to be a man of honour, integrity, underſtanding, courage, activity, experience, and addreſs: he ſhould be maſter of arithmetic, and keep a detail of the regiment in every particular: he ſhould be ſkilled in horſemanſhip, and ever attentive to his buſineſs: one of his principal functions is, to keep an exact roſter of the officers for duty: he ſhould have a perfect knowledge in all the military evolutions, as he is obliged by his poſt to inſtruct others, &c.

Town-Major, the third officer in order in a garriſon, and next to the deputy-governor. He ſhould underſtand fortification, and has a particular charge of the guards, rounds, patroles, and centinels.

Brigade-Major, is a particular officer appointed for that purpoſe only in camp: he goes every day to head-quarters to receive orders from the adjutant-general: there they write exactly whatever is dictated to them: from thence they go and give the orders, at the place appointed for that purpoſe, to the different majors or adjutants of the regiments which compoſe that brigade, and regulate with them the number of officers and men which each are to furniſh for the duty of the army; taking care to keep an exact roſter, that one may not give more than another; and that each march in their tour: in ſhort, the major of brigade is charged with the particular detail in his own brigade, in much the ſame way as the adjutant-general is charged with the general detail of the duty of the army. He ſends every morning to the adjutant-general an exact return, by battalion and company, of the men of his brigade miſſing at the retreat, or a report expreſſing that none are abſent: he alſo mentions the officers abſent with or without leave.

As all orders paſs through the hands of the majors of brigade, they have infinite occaſions of making known their talents and exactneſs.

Major of Artillery, is alſo the next officer to the lieutenant-colonel. His poſt is very laborious, as the whole detail of the corps particularly reſts with him; and for this reaſon all the non-commiſſioned officers are ſubordinate to him, as his title of *ſerjeant-major* imports: in this quality they muſt render him an exact account of every thing which comes to their knowledge, either regarding the duty or wants of the artillery and ſoldiers. He ſhould poſſeſs a perfect knowledge of the power of artillery, together with all its evolutions. In the field he goes daily to receive orders from the brigade-major, and communicates them with the parole to his ſuperiors, and then dictates them to the adjutant. He ſhould be a very good mathematician, and be well acquainted with every thing belonging to the train of artillery, &c.

Major of Engineers, commonly with us called *Sub-directors*, ſhould be very well ſkilled in military architecture, fortification, gunnery, and mining. He ſhould know how to fortify in the field, to attack and defend all ſorts of poſts, and to conduct the works in a ſiege, &c. See Engineer.

Aid-Major, is on ſundry occaſions appointed to act as major, who has a pre-eminence above others of the ſame denomination. Our horſe and foot-guards have their guidons, or ſecond and third majors.

Serjeant-Major, is a non-commiſſioned officer, of great merit and capacity, ſubordinate to the adjutant as he is to the major. See Serjeant.

Drum-Major, is not only the firſt drummer in the regiment

regiment, but has the ſame authority over his drummers as the corporal has over his ſquad. He inſtructs them in their different beats; is daily at orders with the ſerjeants, to know the number of drummers for duty. He marches at their head when they beat in a body. In the day of battle, or at exerciſe, he muſt be very attentive to the orders given him, that he may regulate his beats according to the movements ordered.

Fife-Major, is he that plays the beſt on that inſtrument, and has the ſame authority over the fifers as the drum-major has over the drummers. He teaches them their duty, and appoints them for guards, &c.

Major, in law, a perſon who is of age to manage his own affairs. By the civil law a man is not a major till the age of 25 years; in England, he is a major at 21, as in Normandy at 20.

Major, in logic, is underſtood of the firſt propoſition of a regular ſyllogiſm, It is called *major*, becauſe it has a more extenſive ſenſe than the minor propoſition, as containing the principal term. See Logic.

Major and *Minor*, in muſic, are applied to concords which differ from each other by a ſemi-tone. See Concord.

Major-tone is the difference between the fifth and fourth; and major ſemi-tone the difference between the major fourth and the third. The major tone ſurpaſſes the minor by a comma.

Major-Domo, an Italian term, frequently uſed to ſignify a ſteward or maſter of the houſhold. The title of *major domo* was formerly given in the courts of princes to three different kinds of officers. 1. To him who took care of what related to the prince's table, or eating; otherwiſe called *eleater*, *præfectus menſæ*, *architriclinus*, *dapifer*, and *princeps coquorum*.—2. Major-domo was alſo applied to the ſteward of the houſhold.—3. The title of major-domo was alſo given to the chief miniſter, or him to whom the prince deputed the adminiſtration of his affairs, foreign and domeſtic, relating to war as well as peace. Inſtances of major-domos in the two firſt ſenſes are frequent in the Engliſh, French, and Norman affairs.

MAJOR (John), a ſcholaſtic divine and hiſtorian, was born at Haddington, in the province of Eaſt Lothian in Scotland. It appears from ſome paſſages in his writings, that he reſided a while both at Oxford and Cambridge. He went to Paris in 1493, and ſtudied in the college of St Barbe, under the famous John Boulac. Thence he removed to that of Montacute, where he began to ſtudy divinity under the celebrated Standouk. In the year 1498, he was entered of the college of Navarre. In 1505, he was created doctor in divinity; returned to Scotland in 1519, and taught theology during ſeveral years in the univerſity of St Andrew's. But at length, being diſguſted with the quarrels of his countrymen, he went back to Paris, and reſumed his lectures in the college of Montacute, where he had ſeveral pupils, who afterwards became men of great eminence. About the year 1530, he returned once more to Scotland, and was choſen profeſſor of theology at St Andrew's, of which he afterwards became provoſt; and there died in 1547, aged 78. His logical treatiſes form one immenſe folio; his commentary on Ariſtotle's phyſics makes another; and his theological works amount to ſeveral volumes of the ſame ſize. Theſe maſſes of crude and uſeleſs diſquiſition were the admiration of his cotemporaries. A work, leſs prized in his own age, was to make him known to poſterity. His book *De Geſtis Scotorum*, was firſt publiſhed at Paris by Badius Aſcenſius, in the year 1521. He rejects in it ſome of the fictions of former hiſtorians; and would have had greater merit if he had rejected more. He intermingles the hiſtory of England with that of Scotland; and has incurred the cenſure of ſome partial writers, for giving an authority to the authors of the former nation, which he refuſes to thoſe of his own. Bede, Caxton, and Froiſſard, were exceedingly uſeful to him. What does the greateſt honour to this author is, the freedom with which he has cenſured the rapacity and indolence of eccleſiaſtics, and the ſtrain of ridicule with which he treats the pope's ſupremacy. The ſtyle in which he wrote does not deſerve commendation. Biſhop Spottiſwood calls it *Sorbonnic* and *barbarous*.

MAJORCA, an iſland of the Mediterranean, lying between Yvica on the weſt and Minorca on the eaſt. Theſe three iſlands were anciently called *Baleares*, ſuppoſed to be from the ſkill of their inhabitants in ſlinging, for which they were very remarkable. Originally they belonged to the Carthaginians; but during the wars of that people with the Romans, they ſeem to have regained their liberty. In 122 B. C. they were ſubdued by Metellus the Roman conſul, who treated the inhabitants with ſuch cruelty, that out of 30,000 he ſcarce left 1000 alive. He then built two cities on Majorca; one called *Palma*, now *Majorca*, to the eaſt; the other to the weſt, named *Pollentia*, now no longer in being. The iſland continued ſubject to the Romans, and to the nations who over-ran the weſtern part of the empire, for many ages. At laſt it was ſubdued by the Moors about the year 800. By them the iſland was put in a much better condition than it ever was before or ſince. The Moors being very induſtrious, and alſo populous, ſurrounded the whole coaſt with fortifications, that is, with a kind of towers and lines between them; cultivated every ſpot in the iſland that was not either rock or ſand; and had no fewer than 15 great towns, whereas now there are not above three. Neither was it at all difficult for the Mooriſh monarch to bring into the field an army much ſuperior in number to the inhabitants that are now upon it, taking in all ranks, ſexes, and ages. In 1229, the iſland was ſubdued by the king of Arragon, who eſtabliſhed in it a new kingdom, feudatory to that of Arragon, which was again deſtroyed in 1341 by the ſame monarchs; and ever ſince, the iſland hath been ſubject to Spain, and hath entirely loſt its importance. It is about 60 miles long, and 45 broad. The air is clear and temperate, and, by its ſituation, the heat in ſummer is ſo qualified by the breezes, that it is by far the moſt pleaſant of all the iſlands in the Mediterranean. There are ſome mountains; but the country is generally flat, and of ſuch an excellent ſoil, that it produces great quantities of corn as good in its kind as any in Europe. Oil, wine, and ſalt, are very plentiful, as alſo black cattle and ſheep; but deer, rabbits, and wild-fowl, abound ſo much, that they alone are ſufficient for the ſubſiſtence of the inhabitants. There are no rivers, but a great many ſprings and wells, as well as ſeveral good harbours. The inhabitants are robuſt, active, and good ſeamen.

MAJORCA, a handſome, large, rich, and ſtrong town, in the iſland of the ſame name, with a biſhop's ſee. It contains about 6000 houſes, and 22 churches, beſides the cathedral. The ſquares, the cathedral, and the royal palace, are magnificent ſtructures. A captain-general reſides there, who commands the whole iſland; and there is a garriſon againſt the incurſion of the Moors. It was taken by the Engliſh in 1706; but was retaken in 1715, ſince which time it has been in the hands of the Spaniards. It is ſeated on the ſouth-weſt part of the iſland, where there is a good harbour, 70 miles north-eaſt of Yvica, 120 ſouth-eaſt of Barcelona, 140 eaſt of Valencia, and 300 from Madrid. E. Long. 2. 55. N. Lat. 39. 36.

MAIRAN (Jean-Jacques d'Ortous de), deſcended from a noble family at Beſiers, was born in that city in 1678, and died at Paris of a defluxion of the lungs on the 20th of February 1771, at the age of 93. He was one of the moſt illuſtrious members of the academy of ſciences and of the French academy. Being early connected with the former ſociety, he, in the year 1741, ſucceeded Fontenelle in the office of ſecretary. This ſtation he filled with the moſt diſtinguiſhed ſucceſs till the year 1744; and, like his predeceſſor, poſſeſſed the faculty of placing the moſt abſtract ſubjects in the cleareſt light; a talent which is very rare, but which appears conſpicuous in all his works. The chief of them are, 1. *Diſſertation ſur la Glace*, the laſt edition of which was printed in 1749, 12mo. This excellent little tract has been tranſlated into German and Italian. 2. *Diſſertation ſur la cauſe de la lumiere des Phoſphores*, 1717, 12mo. 3. *Traité hiſtorique & phyſique de l'Aurore Boréale*, firſt publiſhed in 12mo 1733, and afterwards much enlarged and printed in 4to in 1754. The ſyſtem embraced by the author is liable to be controverted; but the book diſplays great taſte and erudition. 4. *Lettre au Pere Parennin, contenant diverſes queſtions ſur la Chine*, 12mo. This is a very curious work, and is full of that philoſophical ſpirit which characteriſes the author's other publications. 5. A great number of papers in the memoirs of the academy of ſciences (ſince 1719), of which he publiſhed ſome volumes. 6. Several Diſſertations on particular ſubjects, which form only ſmall pamphlets. 7. The *Eloges* of the Academicians of the Academy of Sciences, who died in 1741, 1742, 1743, in 12mo. 1747. Without imitating Fontenelle, the author attained almoſt equal excellence by his talent of diſcriminating characters, appreciating their worth, and giving them their due ſhare of praiſe, without at the ſame time concealing their defects.

Mairan's reputation extended itſelf into foreign countries. He was a member of the imperial academy at Peterſburgh, of the royal academy of London, of the inſtitution at Bologne, of the royal ſocieties of Edinburgh and Upſal, &c. The gentleneſs and ſweetneſs of his manners made him be conſidered as a perfect model of the ſocial virtues. He poſſeſſed that amiable politeneſs, that agreeable gaiety, and that ſteady firmneſs, which never fail to procure love and eſteem. But we muſt add, ſays M. Saverien, that every thing had a reference to himſelf; ſelf-love and a regard to his own reputation were the motives of all his actions. He was deeply affected with cenſure or applauſe, and yet he had many friends. Uniting much gentleneſs of diſpoſition to an ingenious and agreeable expreſſion of countenance, he poſſeſſed the art of inſinuating himſelf into the good graces of others, ſo as to have the way to elevation and ſucceſs. He was honoured with protection and particular marks of regard by the duke of Orleans the regent, who bequeathed to him his watch in his will. The prince of Conti loaded him with favours: and the chancellor Dagueſſeau, obſerving in him great originality and ingenuity of thought, appointed him preſident of the *Journal des Savans*; a ſtation which he filled very much to the ſatisfaction of the public and of the learned. The private and ſelfiſh views imputed to him by M. Saverien never made him deficient in what was due to the ſtricteſt probity. An expreſſion of his is remembered, which could have proceeded only from ſentiment; "An honeſt man (ſaid he) is one whoſe blood is refreſhed with the recital of a good action." He was ready at repartee. One day he happened to be in company with a gentleman of the gown, and to differ with him in opinion upon ſome point which had no more connection with juriſprudence than with geometry. "Sir (ſaid the magiſtrate, who ſuppoſed that a learned man was a perfect idiot out of his own ſphere), we are not now talking of Euclid or Archimedes"—"No, nor of Cujas nor Barthole!" replied the academician.

MAIRE (Streights le), a paſſage to Cape Horn, ſituated between Terra del Fuego and Staten iſland; which, being diſcovered by Le Maire, obtained his name. It is now, however, leſs made uſe of than formerly, ſhips going round Staten Iſland as well as Terra del Fuego.

MAISTRE (Louis-Iſaac le), better known by the name of *Sacy*, was born at Paris in 1613. His genius very early diſcovered itſelf. After an excellent courſe of ſtudy under the direction of the abbot of ſaint Cyran, he was raiſed to the prieſthood in 1648, and ſoon after was choſen, on account of his virtues, to be director of the religious of Port Royal des Champs. As this monaſtery bore the reputation of Janſeniſm, their enemies were furniſhed with a pretence for perſecuting them. In 1661 the director was obliged to conceal himſelf; and in 1666 he was committed to the Baſtile. During his confinement he compoſed the book *Figures de la Bible*; in which, according to the Moliniſts, alluſions are made to the ſufferings endured by the Janſeniſts. If we may believe a Jeſuit writer, the gentlemen of Port Royal and thoſe who oppoſed their errors are repreſented in the 92d figure, the former by David, the latter by Saul. Rehoboam in the 116th figure, Jezebel in the 130th, Ahaſuerus in the 148th and 150th, and Darius in the 160th, in the opinion of this author, repreſent Louis XIV. The writer of theſe anecdotes, of which we do not anſwer for the authenticity, adds, that when Sacy wiſhed to reproach his perſecutors, he always did it by means of the holy fathers. If this is the key to thoſe enigmatical portraits and alluſions, which it is pretended are to be found in that book, certain we are it was not diſcovered by the ſpirit of charity. Beſides, it is not certain that Sacy was the author of that book; for it is much more probable that it was compoſed by Nicolas Fontaine his fellow priſoner.

To Sacy's confinement the public are indebted for a French tranſlation of the Bible. This work was finiſhed in 1668, the evening before the feaſt of All Saints; on which day he recovered his liberty, after an impriſonment of two years and a half. He was preſented to the king and the miniſter; and all the favour he aſked from them was, that they would ſend ſeveral times a year to examine the ſtate of the priſoners in the Baſtile. Le Maiſtre continued at Paris till 1675, when he retired to Port-Royal, which he was obliged to leave in 1679. He went to ſettle at Pompone, where he died January 4th 1684, at the age of 71. From him we have 1. *La Traduction de la Bible*, with explanations of the ſpiritual and literal meaning taken from the fathers, the greater part of which was done by du Foſſé, Huré, and Tourneux. This is the beſt French tranſlation which has yet appeared, and the moſt eſteemed edition is that of Paris in 32 volumes 8vo, 1682 and following years. The author tranſlated the New Teſtament three times, becauſe the firſt time the ſtyle of it appeared too much laboured and too refined, and the ſecond too ſimple. A counterfeit of the edition in 32 vols 8vo, was publiſhed at Bruſſels in 40 vols 12mo. The beſt editions of this verſion have been publiſhed at Bruſſels, 1700, in 3 vols 4to; at Amſterdam, under the name of *Paris*, 1711, 8 vols in 12mo; at Paris 1713, in 2 vols 4to; and in 1715, with notes and a concordance, 4 vols folio. 2. *Une Traduction des Pſeaumes ſelon l'Hebreu & la Vulgate*, in 12mo. 3. *Une Verſion des Homelies de St Chryſoſtome ſur St Matthieu*, in 3 vols 8vo. 4. *La Traduction de l'Imitation de Jeſus Chriſt (ſous le nom de Beuil, prieur de Saint-Val)*, Paris 1663, 8vo. 5. *Celle de Phedre*, 12mo. *(ſous le nom de Saint-Aubin)*. 6. *De trois Comédies de Térence*, in 12mo. 7. *Des Lettres de Bongars (ſous le nom de Brianville)*. 8. *Du Pöeme de St Proſper ſur les ingrates*, in 12mo. *en verſe & en proſe*. 9. *Les Enluminures de l'Almanach des Jéſuites*, 1654, 12mo. reprinted in 1733. In 1653 there appeared a print repreſenting the overthrow of Janſeniſm anathematiſed by the two powers, and the confuſion of the diſciples of the biſhop of Ypres, who are going to ſeek refuge with the Calviniſts. The monks of Port-Royal were greatly provoked at this print, and Sacy thought that he would lower its reputation by means of his *Enluminures*, which Racine has ridiculed in one of his letters. It is indeed very ſtrange that men of taſte and piety ſhould write ſatires to the injury of one another. 10. *Heures de Port-Royal*, in 12mo. 11. *Lettres de Piété*, Paris 1690, 2 vols 8vo.

MAITLAND (Sir Richard), a Scottiſh poet and eminent public character, who flouriſhed during the greateſt part of the 16th century. The ancient name of the family was *Mautalant*; and the firſt who diſtinguiſhed the houſe was an old Sir Richard, famous for his valour, who lived ſome time ſubſequent to the middle of the 13th century. He was then baron or laird of Thirlſtane in Haddingtonſhire. In 1346 the family muſt have been eminent; for in that year John Maitland of Thirlſtane married Agnes daughter of Patrick earl of March. On the 28th January 1432, William Maitland of Thirlſtane obtained from Archibald duke of Touraine and earl of Douglas a grant of the lands of Blyth and others.—William, the father of our poet, and who (while his father John Maitland of Thirlſtane was yet alive) firſt had the title of Lethington, married Martha daughter of George Lord Seaton, and was killed at Flodden in 1513.

Sir Richard was born in 1496; was educated at St Andrew's; and went to France to ſtudy the laws. Upon his return, ſays Mackenzie, he became a favourite of James V. and in the books of ſederunt is marked an extraordinary lord of ſeſſion in 1553. By a letter of James VI. it appears that Sir Richard had ſerved his grandſir, goodſir, goodam, his mother, and himſelf, faithfully in many public offices. He unhappily became blind before 1561, or his 65th year: but notwithſtanding, he was made a ſenator of the college of juſtice, by the title of Lord Lethington, 12th Nov. 1561; and on the 20th Dec. 1562, one of the counſel and lord-privy ſeal; which laſt office he held till 1567, when he reſigned it in favour of John his ſecond ſon. Sir Richard continued a lord of ſeſſion during all the troubleſome times of the regents in the minority of James VI. till 1584, when he reſigned; and died 20th March 1586. By Mary his wife, daughter of Thomas Cranſton of Corſly, he had ſeven children, of whom three were ſons: 1. William, the famous ſecretary; 2. Sir John, afterward Lord Thirlſtane and chancellor; and, 3. Thomas, who is the prolocutor with Buchannan in his treatiſe *De Jure Regni*.—Sir Richard is never mentioned by writers but with reſpect as a man of great talents and virtue. Knox indeed blames him for taking a ſum of money, to ſuffer Cardinal Beaton to eſcape when impriſoned at Seaton. But Knox (Mr Pinkerton obſerves) was too vehement, and often blamed without cauſe.—One poem of Sir Richard's was publiſhed in the Evergreen; but no more of his works appeared till they were inſerted in the Collection in 2 vols publiſhed ſome years ago by Mr Pinkerton. Beſides poems, he wrote a MS. (formerly, as Dr Mackenzie ſhows, in the earl of Winton's library), the title of which was, "The Chronicle and Hiſtorie of the Houſe and Surname of Seaton, unto the moneth of November, in the yeir of God An Thuſand Five Hundereth Fifty Aught yeirs. Collectit, writ, and ſet furth, be Sir Richard de Maitland of Leithingtoun, knicht, doughter-ſone of the ſaid hous." Mackenzie gives an account of it.—Mr Forbes, in the preface to his Deciſions, tells us there is ſtill a MS. of the deciſions from 15th December 1550 till 30th July 1565 by our author, folio, in the advocates library.

Maitland (John), Lord Thirlſtane, chancellor of Scotland, was the ſecond ſon of Sir Richard. He was born in the year 1537, educated in Scotland, and was afterwards ſent to France to ſtudy the law. On his return to his native country, he commenced advocate; in which profeſſion his abilities became eminently conſpicuous. In 1567, his father reſigned the privy-ſeal in his favour. This office he kept till 1570; when, for his loyalty to the queen, he loſt the ſeal, and it was given to George Buchanan. He was made a ſenator of the college of juſtice, or lord of ſeſſion, in 1581; ſecretary of ſtate in 1584; and lord high chancellor in 1586. The chancellor's power and influence created him many enemies among the Scottiſh nobility, who made ſeveral attempts to deſtroy him, but without ſucceſs. In 1589, he attended the king on his voyage to Norway, where his bride, the princeſs of Denmark, was detained by contrary wind. The marriage was immediately conſummated; and they returned with the queen to Copenhagen, where they ſpent the enſuing winter. During their reſidence in Denmark, the chancellor became intimately acquainted with the celebrated Tycho-Brahe. In 1590 he was created Lord Maitland of Thirlſtane —Towards the end of the year 1592, the chancellor incurred the queen's diſpleaſure, for refuſing to relinquiſh his lordſhip of Muſſelburgh, which ſhe claimed as being a part of Dunfermline. He abſented himſelf for ſome time from court; but was at length reſtored to favour, and died of a lingering illneſs in the year 1595, much regretted by the king. He bears a high character both for talents and integrity among all hiſtorians. Melville, who writes the *Memoirs*, Mr Pinkerton obſerves, was his perſonal enemy, ſo muſt not receive much credit in his cenſures of him. Beſide his Scottiſh poetry in the *Maitland Collection*, he wrote ſeveral Latin epigrams, &c. to be found in the *Deliciæ Poetarum Scotorum*, vol. ii. The chancellor's only ſon, John Lord Thirlſtane, was firſt made viſcount and then earl of Lauderdale, by James VI. 1624. The earl's ſon was John, the only duke of Lauderdale, and born 1616 at Lethington.

MAITTAIRE (Michael), an eminently learned writer, was born in 1668. Dr South, canon of Chriſt-Church, made him a ſtudent of that houſe, where he took the degree of M. A. March 23. 1696. From 1695 till 1699 he was ſecond maſter of Weſtminſter ſchool; which was afterwards indebted to him for *Græcæ Linguæ Dialecti, in uſum Scholæ Weſtmonaſterienſis*, 1706, 8vo; and for "The Engliſh Grammar, applied to, and exemplified in, the Engliſh Tongue, 1712," 8vo. In 1711, he publiſhed "Remarks on Mr Whiſton's Account of the Convocation's proceedings with relation to himſelf, in a Letter to the right reverend Father in God George Lord Biſhop of Bath and Wells," 8vo.; alſo "An Eſſay againſt Arianiſm, and ſome other Hereſies; or a Reply to Mr William Whiſton's Hiſtorical Preface and Appendix to his Primitive Chriſtianity revived," 8vo. In 1709 he gave the firſt ſpecimen of his great ſkill in typographical antiquities, by publiſhing *Stephanorum Hiſtoria, vitas ipſorum ac libros complectens*, 8vo; which was followed in 1717 by *Hiſtoria Typographorum aliquot Pariſienſium, vitas et libras complectens*, 8vo. In 1719, *Annales Typographici ab artis inventæ origine ad annum* MD, 4to. The ſecond volume, divided into two parts, and continued to the year 1536, was publiſhed at the Hague in 1702; introduced by a letter of John Toland, under the title of *Conjectura veriſimilis de prima Typographiæ Inventione*. The third volume, from the ſame preſs, in two parts, continued to 1557, and (by an Appendix) to 1664, in 1725. In 1733 was publiſhed at Amſterdam what is uſually conſidered as the fourth volume, under the title of *Annales Typographici ab artis inventæ origine, ad annum* MDCLXIV, *opera Mich. Maittaire, A. M. Editio nova, auctior et emendatior, tomi primi pars poſterior* (A). In 1741 the work was cloſed at London, by *Annalium Typographicorum Tomus quintus et ultimus, indicem in tomos quatuor præeuntes complectens*; divided, like the two preceding volumes, into two parts. In the intermediate years, Mr Maittaire was diligently employed on various works of value. In 1713 he publiſhed by ſubſcription *Opera et Fragmenta Veterum Poëtarum*, 1713, two volumes in folio: the title of ſome copies is dated 1721. In 1714, he was the editor of a Greek Teſtament, in 2 vols. The Latin writers, which he publiſhed ſeparately, moſt of them with good indexes, came out in the following order: In 1713, *Chriſtus Patiens; Juſtin; Lucretius; Phædrus; Salluſt; Terence*. In 1715, *Catullus; Tibullus; Propertius; Cornelius Nepos; Florus; Horace; Juvenal; Ovid*, 3 vols; *Virgil*. In 1711, *Cæſar's Commentaries; Martial; Quintus Curtius*. In 1718 and 1725, *Velleius Paterculus*. In 1719, *Lucan*. In 1720, *Bonefonii Carmina*. In 1711 he publiſhed, *Batrachomyomachia Græce ad veterum exemplarium fidem recuſa: Gloſſa Græca; variantibus lectionibus, verſionibus Latinis, commentariis et indicibus illuſtrata*, 8vo. In 1722, *Miſcellanea Græcorum aliquot Scriptorum Carmina, cum verſione Latina et Notis*, 4to. In 1724 he compiled, at the requeſt of Dr John Freind (at whoſe expence it was printed), an Index to the works of *Aretæus*, to accompany the ſplendid folio edition of that author in 1723. In 1725 he publiſhed an excellent edition of *Anacreon* in 4to, of which no more than 100 copies were printed, and the few errata in each copy corrected by his own hand. A ſecond edition of the like number was printed in 1741, with ſix copies on fine writing paper. In 1726 he publiſhed *Petri Petiti Medici Pariſienſis in tres priores Aretæi Cappadocis Libros Commentarii, nunc primum editi*, 4to. This learned commentary was found among the papers of Grævius. From 1728 to 1733 he was employed in publiſhing *Marmorum Arundelianorum, Seldenianorum, aliorumque Academiæ Oxonienſi donatorum, una cum Commentariis et Indice, editio ſecunda*, folio; to which an Appendix was printed in 1733. *Epiſtola D. Mich. Maittaire ad D. P. Des Maizeaux, in qua Indicis in Annales Typographicos methodus explicatur*, &c. is printed in "The Preſent State of the Republic of Letters," Auguſt 733, p. 142. The life of Robert Stephens in Latin, reviſed and corrected by the author, with a new and complete liſt of his works, is prefixed to the improved edition of R. Stephens's Theſaurus, 4 vols in folio, in 1734. In 1736 appeared *Antiquæ Inſcriptiones duæ*, folio; being a commentary on two large copper tables diſcovered near Heraclea, in the Bay of Tarentum. In 1738 were printed at the Hague *Græcæ Linguæ Dialecti in Scholæ Regiæ Weſtmonaſterienſis uſum recogniti opera Mich. Maittaire*. In 1739 he addreſſed to the empreſs of Ruſſia a ſmall Latin poem, under the title of *Carmen Epinicium Auguſtiſſimæ Ruſſorum Imperatrici ſacrum*. His name not having been printed in the title-page, it

---

(A) The aukwardneſs of this title has induced many collectors to diſpoſe of their firſt volume, as thinking it ſuperſeded by the ſecond edition: but this is by no means the caſe; the volume of 1719 being equally neceſſary to complete the ſet as that of 1733, which is a reviſion of all the former volumes. The whole work, when properly bound, conſiſts, *ad libitum*, either of five volumes or of nine.

it is not ſo generally known that he was editor of Plutarch's *Apophthegmata*, 1741, 4to. The laſt publication of Mr Maittaire was a volume of poems in 4to, 1742, under the title of *Senilia, ſive Poetica aliquot in argumentis varii generis tentamina.* Mr Maittaire died in 1747, aged 79. His valuable library, which had been 50 years collecting, was ſold by auction by Meſſrs Cock and Langford, at the cloſe of the ſame year, and the beginning of the following, taking up in all 44 nights. Mr Maittaire, it may be added, was patroniſed by the firſt earl of Oxford, both before and after that gentleman's elevation to the peerage, and continued a favourite with his ſon the ſecond earl. He was alſo Latin tutor to Mr Stanhope, the earl of Cheſterfield's favourite ſon.

MAIZE, or *Indian Corn*. See Zea.

MAKI. See Lemur.

MALABAR, the name given to a great part of the weſt coaſt of the peninſula, on this ſide of the Ganges, from the kingdom of Baglala to Cape Comorin, or only from the north extremity of the kingdom of Canara as far as Cape Comorin. It is bounded by the mountains of Balligate on the eaſt; by Decan on the north; and on the weſt and ſouth is waſhed by the Indian ſea.

MALACA (anc. geog.), ſurnamed *Fœderatorum* by Pliny; a maritime town of Bætica: A Carthaginian colony according to Strabo; ſo called from *Malâch*, ſignifying "ſalt;" a place noted for pickled or ſalted meat. Now *Malaga*, a port town of Granada in Spain. W. Long. 4. 45. N. Lat. 36. 40.

MALACCA, the moſt ſoutherly part of the great peninſula beyond the Ganges, is about 600 miles in length, and contains a kingdom of the ſame name. It is bounded by the kingdom of Siam on the north; by the bay of Siam and the Indian ocean on the eaſt; and by the ſtraits of Malacca, which ſeparate it from the iſland of Sumatra, on the ſouth-weſt. This country is more to the ſouth than any other in the Eaſt Indies; and comprehends the towns and kingdoms of Patan, Pahan, Igohor, Pera, Queda, Borkelon, Ligor; and to the north the town and kingdom of Tanaſſery, where the Portugueſe formerly carried on a great trade. This laſt either does or did belong to the king of Siam. The people of Malacca are in general ſubject to the Dutch, who poſſeſs all the ſtrong places on the coaſt, and compel them to trade on their own terms, excluding all other nations of Europe from having any commerce with the natives.

The Malays are governed by feudal laws. A chief, who has the title of *king* or *ſultan*, iſſues his commands to his great vaſſals, who have other vaſſals in ſubjection to them in a ſimilar manner. A ſmall part of the nation live independent, under the title of *oranicai* or *noble*, and ſell their ſervices to thoſe who pay them beſt; while the body of the nation is compoſed of ſlaves, and live in perpetual ſervitude.

The generality of theſe people are reſtleſs, fond of navigation, war, plunder, emigrations, colonies, deſperate enterpriſes, adventures, and gallantry. They talk inceſſantly of their honour and their bravery; whilſt they are univerſally conſidered by thoſe with whom they have intercourſe, as the moſt treacherous, ferocious people on earth. This ferocity, which the Malays qualify under the name of *courage*, is ſo well known to the European companies who have ſettlements in the Indies, that they have univerſally agreed in prohibiting the captains of their ſhips who may put into the Malay iſlands, from taking on board any ſeamen from that nation, except in the greateſt diſtreſs, and then on no account to exceed two or three. It is not in the leaſt uncommon for an handful of theſe horrid ſavages ſuddenly to embark, attack a veſſel by ſurpriſe, maſſacre the people, and make themſelves maſter of her. Malay batteaux, with 24 or 30 men, have been known to board European ſhips of 30 or 40 guns, in order to take poſſeſſion of them, and murder with their poignards great part of the crew. Thoſe who are not ſlaves go always armed: they would think themſelves diſgraced if they went abroad without their poignards, which they call *crit*. As their lives are a perpetual round of agitation and tumult, they cannot endure the long flowing garments in uſe among the other Aſiatics. Their habits are exactly adapted to their ſhapes, and loaded with a multitude of buttons, which faſten them cloſe to their bodies.

The country poſſeſſed by the Malays is in general very fertile. It abounds with odoriferous woods, ſuch as the aloes, the ſandal, and the Caſſia. The ground is covered with flowers of the greateſt fragrance, of which there is a perpetual ſucceſſion throughout the year. There are abundance of mines of the moſt precious metals, ſaid to be richer even than thoſe of Brazil or Peru, and in ſome places are mines of diamonds. The ſea alſo abounds with excellent fiſh, together with ambergris, pearls, and thoſe delicate bird-neſts ſo much in requeſt in China, formed in the rocks with the ſpawn of fiſhes and the foam of the ſea, by a ſpecies of ſmall-ſized ſwallow peculiar to thoſe ſeas. Theſe are of ſuch an exquiſite flavour, that the Chineſe for a long time purchaſed them for their weight in gold, and ſtill buy them at an exceſſive price. See *Birds-Neſt*.

Notwithſtanding all this plenty, however, the Malays are miſerable. The culture of the lands, abandoned to ſlaves, is fallen into contempt. Theſe wretched labourers, dragged inceſſantly from their ruſtic employments by their reſtleſs maſters, who delight in war and maritime enterpriſes, have never time or reſolution to give the neceſſary attention to the labouring of their grounds; of conſequence the lands for the moſt part are uncultivated, and produce no kind of grain for the ſubſiſtence of the inhabitants. The ſago tree indeed ſupplies in part the defect of grain. It is a ſpecies of the palm-tree, which grows naturally in the woods to the height of about 20 or 30 feet; its circumference being ſometimes from five to ſix. Its ligneous bark is about an inch in thickneſs, and covers a multitude of long fibres, which being interwoven one with another envelope a maſs of a gummy kind of meal. As ſoon as this tree is ripe, a whitiſh duſt, which tranſpires through the pores of the leaves, and adheres to their extremities, indicates that the trees are in a ſtate of maturity. The Malays then cut them down near the root, divide them into ſeveral ſections, which they ſplit into quarters: they then ſcoop out the maſs of mealy ſubſtance, which is enveloped by and adheres to the fibres; they dilute it in pure water, and then paſs it through a ſtraining bag of fine cloth, in order to ſeparate it from the fibres. When this paſte has loſt part of its moiſture by evaporation, the Malays throw it into a kind of earthen veſſel of different ſhapes, where they allow it to dry and harden. Their paſte is wholeſome nouriſhing food, and preſerves for many years.

MALACCA, the capital of the country of the ſame name, is ſituated in a flat country cloſe to the ſea. The walls and fortifications are founded on a ſolid rock, and are carried up to a great height; the lower part of them is waſhed by the ſea at every tide, and on the land-ſide is a wide canal or ditch, cut from the ſea to the river, which makes it an iſland. In 1641 it was taken from the Portugueſe by the Dutch, ſince which time it has continued in their poſſeſſion. In this city there are a great many broad ſtreets; but they are very badly paved. The houſes are tolerably well built, and ſome of them have gardens behind or on one ſide. The inhabitants conſiſt of a few Dutch, many Malayans, Moors, Chineſe, and other Indians, who are kept in awe by a fortreſs, which is ſeparated from the city by a river, and by good walls and baſtions, as well as by ſtrong gates, and a draw-bridge that is on the eaſtern ſide. The city is well ſituated for trade and navigation. E. Long. 102. 2. N. Lat. 2. 12.

MALACHI, or the prophecy of MALACHI, a canonical book of the Old Teſtament, and the laſt of the 12 leſſer prophets. Malachi propheſied about 300 years before Chriſt, reproving the Jews for their wickedneſs after their return from Babylon, charging them with rebellion, ſacrilege, adultery, profaneneſs, and infidelity; and condemning the prieſts for being ſcandalouſly careleſs in their miniſtry: at the ſame time not forgetting to encourage the pious few, who, in that corrupt age, maintained their integrity. This prophet diſtinctly points at the Meſſiah, who was ſuddenly to come to his temple, and to be introduced by Elijah the prophet, that is, by John the Baptiſt, who came in the ſpirit and power of Elias, or Elijah.

MALACIA, in medicine, is a languiſhing diſorder incident to pregnant women, in which they long ſometimes for one kind of food and ſometimes for another, and eat it with extraordinary greedineſs.

MALACOPTERYGEOUS, among ichthyologiſts, an appellation given to ſuch fiſhes as have the rays of their fins bony, but not pointed or ſharp at the extremities like thoſe of ancanthopterygeous fiſhes.

MALACOSTOMOUS FISHES, thoſe deſtitute of teeth in the jaws, called in Engliſh *leather-mouthed*, as the tench, carp, bream, &c.

MALAGA, an ancient, rich, and ſtrong town of Spain, in the kingdom of Grenada, with two caſtles, a biſhop's ſee, and a good harbour, which renders it a place of conſiderable commerce. The advantage of this commerce, according to M. Bourgoanne, is entirely in favour of Spain, but almoſt without any to its navigation; of 842 veſſels which arrived at this port in 1782, from almoſt every commercial nation, ſcarcely 100 were Spaniſh, even reckoning the ſhips of war which anchored there. The Engliſh, who are in poſſeſſion of the greateſt part of the trade, carry thither woollens and great quantities of ſmall ware; the Dutch carry ſpice, cutlery ware, laces, ribbons, thread, &c. Theſe nations, thoſe of the north, and Italy, export to the amount of two millions and a half of piaſtres in wines, fruits, ſumach, pickled anchovies, oil, &c. and all they carry thither amounts only to about a million and a half. The balance would be ſtill more advantageous for Malaga if the ſilk and wool of the kingdom of Grenada were exported from this port; but theſe are employed in the country where they are produced. The ſtreets of Malaga are narrow, but there are ſome good ſquares; and the cathedral church is a ſuperb building, ſaid to be as large as St Paul's. The only other building of note is the biſhop's palace; which is a large edifice, but looks inſignificant from its being ſituated near the other. Its prelate enjoys a revenue of L. 16,000 Sterling. Malaga is ſeated on the Mediterranean ſea, at the foot of a craggy mountain. E. Long. 4. 56. N. Lat. 6. 51.

MALAGRIDA (Gabriel), an Italian Jeſuit, was choſen by the general of the order to conduct miſſions into Portugal. To great eaſe and fluency of ſpeech, for which he was indebted to enthuſiaſm, he added the moſt ardent zeal for the intereſt of the ſociety to which he belonged. He ſoon became the faſhionable director; and every one, ſmall or great, placed himſelf under his conduct. He was reſpected as a ſaint, and conſulted as an oracle. When a conſpiracy was formed by the duke d'Aveiro againſt the king of Portugal, it is aſſerted by the enemies of the ſociety, that three Jeſuits, among whom was Malagrida, were conſulted concerning the meaſure. They add (what is very improbable), that it was decided by theſe caſuiſts, that it was only a venial crime to kill a king who perſecuted the ſaints. At that time the king of Portugal, ſpurred on by a miniſter who had no favour for the Jeſuits, openly declared himſelf againſt them, and ſoon after baniſhed them from his kingdom. Only three of them were apprehended, Malagrida, Alexander, and Mathos, who were accuſed of having approved his murder. But either the trial could not be proceeded in without the conſent of the pope, which was not granted, or no proof could be got ſufficient to condemn Malagrida; and therefore the king was obliged to deliver him to the inquiſition, as being ſuſpected of having formerly advanced ſome raſh propoſitions which bordered on hereſy. Two publications which he acknowledged, and which give the fulleſt indications of complete inſanity, were the foundation of theſe ſuſpicions. The one was written in Latin, and intitled *Tractatus de vita et imperio Antichriſti*; the other in Portugueſe, under the title of the "Life of St Anne, compoſed with the aſſiſtance of the bleſſed Virgin Mary and her moſt holy Son." They are full of extravagance and abſurdity.—This enthuſiaſt pretended to have the gift of miracles. He confeſſed before the judges of the Inquiſition, that God himſelf had declared him his ambaſſador, apoſtle, and prophet; that he was united to God by a perpetual union; and that the Virgin Mary, with the conſent of Jeſus Chriſt and of the whole Trinity, had declared him to be her ſon. In ſhort, he confeſſed, as is pretended, that he felt in the priſon, at the age of 72, ſome emotions very uncommon at that period of life, which at firſt gave him great uneaſineſs, but that it had been revealed to him by God that theſe emotions were only the natural effect of an involuntary agitation, wherein there was the ſame merit as in prayer. It was for ſuch extravagancies that this unfortunate wretch was condemned by the Inquiſition: but his death was haſtened by a viſion which he eagerly revealed. Upon occaſion of the death of the marquis de Tancourt, commander in chief of the province of Eſtremadura, mournful and continued diſcharges were made in honour of him by the caſtle of Liſbon, and by all the forts on the banks of the Tagus. Theſe being heard by Malagrida in his dungeon, he inſtantly ſuppoſed, from their extraordinary nature, and from their happening during the night, that the king was dead. The next day he demanded an audience from the members of the Inquiſition: which being granted, he told them that he had been ordered by God to ſhow the miniſter of the holy office that he was not a hypocrite, as was pretended; for the king's death had been revealed to him, and he had ſeen in a viſion the torments to which his majeſty was condemned for having perſecuted the religious of his order. This was ſufficient to accelerate his puniſhment: he was burnt on the 21ſt of September 1761; not as the accomplice of a parricide, but as a falſe prophet, for which he deſerved to be confined in bedlam rather than tied to the ſtake. The acts of impiety whereof he was accuſed were nothing more than extravagancies proceeding from a miſtaken devotion and an overheated brain.

MALDEN, a town of Eſſex, 37 miles from London, ſituated on an eminence at the conflux of the Chelmer and Pant or Blackwater, where they enter the ſea. It was the firſt Roman colony in Britain, and the ſeat of ſome of the old Britiſh kings. It was beſieged, plundered, and burnt by queen Boadicea; but the Romans repaired it. It was again ruined by the Danes, but rebuilt by the Saxons. It is a populous corporation, governed by two bailiffs, ſix aldermen, 18 headboroughs or capital burgeſſes, a ſteward, recorder, and above 400 commonalty and burgeſſes, who have all a vote for its members of parliament. It has a convenient haven on an arm of the ſea for veſſels of 400 tons; and drives a good trade in coal, iron, corn, and deals. It formerly had three, now only two, pariſh-churches. Here is a large library for the uſe of the miniſter and the clergy of the neighbouring pariſhes, who generally reſide here on account of the unwholeſomeneſs of the air where their churches are. Here is a grammar-ſchool, a ſmall-church, ſchool, and a workhouſe where the poor weave ſack-cloth. The cuſtom of Borough Engliſh is kept up here. It has a market on Saturdays, and a fair on the 18th of September. A little beyond it begins Blackwater bay, famous for the Walfleet oyſters. The channel called Malden-water is navigable to the town. King Edward the elder (of the Saxon race) reſided here whilſt he built Witham and Hertford caſtles. On the weſt ſide of the town are the remains of a camp.

MALALEUCA, the Cayputi tree: A genus of the polyandria order, belonging to the polyadelphia claſs of plants. There is but one ſpecies, viz. the leucodendrum, a native of the Eaſt Indies and South-Sea iſlands. Mr Forſter relates that leucodendra were found in the iſland of New Caledonia: they were black at the root; but had a bark perfectly white and looſe, with long narrow leaves like our willows. The leaves are extremely fragrant and aromatic; and Rumphius tells us, that from them the natives of the Moluccas make the oil called *cayputi*. This oil is commended as a nervous medicine, and as being uſeful in ſome cardialgies. The doſe is four or five drops in ſome convenient liquor.

MALDIVIA islands, a cluſter of ſmall iſlands in the Indian ocean, 500 miles ſouth-weſt of the continent of the iſland of Ceylon. They are about 1000 in number, and are very ſmall; extending from the ſecond degree of ſouth latitude to the ſeventh degree north latitude. They are generally black low lands, ſurrounded by rocks and ſands. The natives are of the ſame complexion with the Arabians, profeſs the Mahometan religion, and are ſubject to one ſovereign. The channels between the iſlands are very narrow, and ſome of them are fordable. They produce neither rice, corn, nor herbage; but the natives live upon cocoa-nuts, and other fruits, roots, and fiſh. They have little or nothing to barter with, unleſs the ſhells called *cowrys*, or *blackmore's teeth*, with which they abound; and theſe ſerve inſtead of ſmall coin in many parts of India.

MALDONAT (John), a Spaniſh Jeſuit born in 1534, was accuſed of hereſy, and of procuring a fraudulent will in ſeducing the preſident de St Andre at Paris to bequeath his eſtate to the Jeſuits. Peter Gondi acquitted him of the firſt charge, and the parliament of Paris of the other. He retired after theſe troubles to Bourges, but went to Rome by order of pope Gregory XIII. to take care of the publication of the Septuagint; and there, finiſhing his commentary on the goſpels in 1582, he died in the beginning of the following year. He wrote, beſides, Commentaries on Jeremiah, Baruch, Ezekiel, and Daniel; a treatiſe on the ſacraments, on grace, on original ſin; and ſeveral other pieces printed at Paris in 1677, in folio. His ſtyle is clear, lively, and eaſy. He does not ſervilely follow the ſcholaſtic divines; but is pretty free, and ſometimes ſingular, in his ſentiments.

MALE, among zoologiſts, that ſex of animals which has the parts of generation ſituated externally. See Sex and Generation.

The term *male* has alſo, from ſome ſimilitude to that ſex in animals, been applied to ſeveral inanimate things; thus we ſay, a male flower, a male ſcrew, &c. See Mas *Planta*, Masculus *Flos*, and Screw; alſo Female and Flos.

MALEBRANCHE (Nicholas), an eminent French metaphyſician, the ſon of Nicholas Malebranche, ſecretary to the French king, was born in 1638, and admitted into the congregation of the oratory in 1660. He at firſt applied himſelf to the ſtudy of languages and hiſtory: but afterwards meeting with Des Cartes's *Treatiſe of Man*, he gave himſelf up entirely to the ſtudy of philoſophy. In 1699, he was admitted an honorary member of the Royal Academy of Sciences at Paris. Notwithſtanding he was of a delicate conſtitution, he enjoyed a pretty good ſtate of health till his death, which happened in 1715, at the age of 77. Father Malebranche read little, but thought a great deal. He deſpiſed that kind of philoſophy which conſiſts only in knowing the opinions of other men, ſince a perſon may know the hiſtory of other mens thoughts without thinking himſelf. He could never read ten verſes together without diſguſt. He meditated with his windows ſhut, in order to keep out the light, which he found to be a diſturbance to him. His converſation turned upon the ſame ſubjects as his books; but was mixed with ſo much modeſty and deference to the judgment of others, that it was extremely and univerſally deſired. His books are famous; particularly his *Recherche de la Verite*, i. e. "Search after truth:" his deſign in which is, to point to us the errors in which we are daily led by our ſenſes, imagination, and paſſions; and to preſcribe a method for diſcovering the truth, which he does, by ſtarting the notion of ſeeing all things in God. And hence he is led to think and ſpeak merely of human knowledge, either as it lies in written books, or in the book of nature, compared with that light which diſplays itſelf from the ideal world; and by attending to which, with pure and defecate minds, he ſuppoſes knowledge to be moſt eaſily had. The fineneſs of this author's ſentiments, together with his fine manner of expreſſing them, made every body admire his genius and abilities; but he has generally paſſed for a viſionary philoſopher. Mr Locke, in his examination of Malebranche's opinion of ſeeing all things in God, ſtyles him "an acute and ingenious author;" and tells us, that there are "a great many very fine thoughts, judicious reaſonings, and uncommon reflections, in his *Recherche*." But Mr Locke, in that piece, endeavours to refute the chief principles of his ſyſtem. He wrote many other pieces beſides that we have mentioned, all tending ſome way or other to confirm his main ſyſtem, eſtabliſhed in the *Recherche*, and to clear it from the objections which were brought againſt it, or from the conſequence which were deduced from it: and if he has not attained what he aimed at in theſe ſeveral productions, he has certainly ſhown great abilities and a vaſt force of genius.

MALHERBE (Francis de), the beſt French poet of his time, was born at Caen about the year 1556, of a noble and ancient family. He quitted Normandy at 17 years of age; and went into Provence, where he attached himſelf to the family of Henry Angouleme, the natural ſon of king Henry II. and was in the ſervice of that prince till he was killed by Altoviti in 1586. At length cardinal de Perron, being informed of his merit and abilities, introduced him to Hen. IV. who took him into his ſervice. After that monarch's death, queen Mary de Medicis ſettled a penſion of 500 crowns upon our poet, who died at Paris in 1628. The beſt and moſt complete edition of his poetical works is that of 1666, with Menage's remarks. Malherbe ſo far excelled all the French poets who preceded him, that Boileau conſiders him as the father of French poetry: but he compoſed with great difficulty, and put his mind on the rack in correcting what he wrote. He was a man of a ſingular humour, blunt in his behaviour, and without religion. When the poor uſed to promiſe him, that they would pray to God for him, he anſwered them, that "he did not believe they could have any great intereſt in heaven, ſince they were left in ſuch a bad condition upon earth; and that he ſhould be better pleaſed if the duke de Luyne, or ſome other favourite, had made him the ſame promiſe." He would often ſay that "the religion of gentlemen was that of their prince." During his laſt ſickneſs he had much ado to reſolve to confeſs to a prieſt; for which he gave this facetious reaſon, that "he never uſed to confeſs but at Eaſter." And ſome few moments before his death, when he had been in a lethargy two hours, he awaked on a ſudden to reprove his landlady, who waited on him, for uſing a word that was not good French; ſaying to his confeſſor, who reprimanded him for it, that "he could not help it, and he would defend the purity of the French language to the laſt moment of his life."

MALICE, in ethics and law, is a formed deſign of doing miſchief to another; it differs from hatred. In murder, it is malice makes the crime; and if a man, having a malicious intent to kill another, in the execution of his malice kills a perſon not intended, the malice ſhall be connected to his perſon, and he ſhall be adjudged a murderer. The word *ex malitia præcogitata* are neceſſary to an indictment of murder, &c. And this *malitia præcogitata*, or *malice prepenſe*, may be either expreſs or implied in law. Expreſs malice is, when one, with a ſedate, deliberate mind, and formed deſign, kills another; which formed deſign is evidenced by external circumſtances diſcovering that intention; as lying in wait, antecedent menaces, former grudges, and concerted ſchemes to do him ſome bodily harm. Beſides, where no malice is expreſſed, the law will imply it; as where a man wilfully poiſons another, in ſuch a deliberate act the law preſumes malice, though no particular enmity can be proved. And if a man kills another ſuddenly, without any, or without a conſiderable provocation, the law implies malice; for no perſon, unleſs of an abandoned heart, would be guilty of ſuch an act upon a ſlight or no apparent cauſe.

MALIGNANT, among phyſicians, a term applied to diſeaſes of a very dangerous nature, and generally infectious; ſuch are the dyſentery, hoſpital-fever, &c. in their worſt ſtages.

Malignity among phyſicians ſignifies much the ſame with contagion. See CONTAGION.

MALL, SEA-MALL, or *Sea-mew*, in ornithology. See LARUS.

MALLARD, in ornithology. See ANAS.

MALLEABLE, a property of metals whereby they are capable of being extended under the hammer.

MALLENDERS, in farriery. See there § xxxiv.

MALLEOLI, in the ancient art of war, were bundles of combuſtible materials, ſet on fire to give light in the night, or to annoy the enemy; when they were employed for the latter purpoſe they were ſhot out of a bow, or fixed to a javelin, and thus thrown into the enemies engines, ſhips, &c. in order to burn them. Pitch was always a principal ingredient in the compoſition. The malleoli had alſo the name of *pyroboli*.

MALLET or MALLOCH, (David) an Engliſh poet, but a Scotſman by birth, was born in that country about 1700. By the penury of his parents, he was compelled to be janitor of the high ſchool at Edinburgh; but he ſurmounted the diſadvantages of his birth and fortune; for when the Duke of Montroſe applied to the college of Edinburgh for a tutor to educate his ſons, Malloch was recommended. When his pupils went abroad, they were entruſted to his care; and having conducted them through their travels, he returned with them to London. Here, reſiding in their family, he naturally gained admiſſion to perſons of high rank and character, and began to give ſpecimens of his poetical talents. In 1733, he publiſhed a poem on Verbal Criticiſm, on purpoſe to make his court to Pope. In 1740, he wrote a Life of Lord Bacon, which was then prefixed to an edition of his works; but with ſo much more knowledge of hiſtory than of ſcience, that, when he afterwards undertook the Life of Marlborough, ſome were apprehenſive leſt he ſhould forget that Marlborough was a general, as he had forgotten that Bacon was a philoſopher. The old ducheſs of Marlborough aſſigned in her will this taſk to Glover and Mallet, with a reward of 1000 l. and a prohibition to inſert any verſes. Glover is ſuppoſed to have rejected the legacy with diſdain, ſo that the work devolved upon Mallet; who had alſo a penſion from the late duke of Marlborough to promote his induſtry, and who was continually talking of the diſcoveries he made, but left not when he died any hiſtorical labours behind him. When the prince of Wales was driven from the palace, and kept a ſeparate court by way of oppoſition, to increaſe his popularity by patronizing literature, he made Mallet his under-ſecretary, with a ſalary of 200l. a year.—Thomſon likewiſe had a penſion; and they were aſſociated in the compoſition of the Maſque of Alfred, which in its original ſtate was played at Cliefden in 1740. It was afterwards almoſt wholly changed by Mallet, and brought upon the ſtage of Drury Lane in 1751, but with no great ſucceſs. He had before publiſhed two tragedies; Eurydice, acted at Drury Lane in 1731; and Muſtapha, acted at the ſame theatre in 1739. It was dedicated to the prince his maſter, and was well received, but never was revived. His next work was Amyntor and Theodora (1747), a long ſtory in blank verſe; in which there is copiouſneſs and elegance of language, vigour of ſentiment, and imagery well adapted to take poſſeſſion of the fancy. In 1753, his maſque of Britannia was acted at Drury Lane, and his tragedy of Elvira in 1763; in which year he was appointed keeper of the book of entries for ſhips in the port of London. In the beginning of the laſt war, when the nation was exaſperated by ill ſucceſs, he was employed to turn the public vengeance upon Byng, and wrote a letter of accuſation under the character of a Plain Man. The paper was with great induſtry circulated and diſperſed; and he for his ſeaſonable intervention had a conſiderable penſion beſtowed upon him, which he retained to his death. Towards the end of his life he went with his wife to France; but after a while, finding his health declining, he returned alone to England, and died in April 1765. He was twice married, and by his firſt wife had ſeveral children. One daughter, who married an Italian of rank named Cileſia, wrote a tragedy called Almida, which was acted at Drury Lane. His ſecond wife was the daughter of a nobleman's ſteward, who had a conſiderable fortune, which ſhe took care to retain in her own hands. His ſtature was diminutive, but he was regularly formed; his appearance, till he grew corpulent, was agreeable, and he ſuffered it to want no recommendation that dreſs could give it. His converſation was elegant and eaſy.

Mallet (Edme) was born at Melun in 1713, and enjoyed a curacy in the neighbourhood of his native place till 1751, when he went to Paris to be profeſſor of theology in the college of Navarre, of which he was admitted a doctor. Boyer, the late biſhop of Mirepoix, was at firſt much prejudiced againſt him; but being afterwards undeceived, he conferred upon him the ſee of Verdun as a reward for his doctrine and morals. Janſeniſm had been imputed to him by his enemies with this prelate; and the Gazette which went by the name of *Eccleſiaſtical*, accuſed him of impiety. Either of theſe imputations was equally undeſerved by the Abbé Mallet: as a Chriſtian, he was grieved at the diſputes of the French Church; and, as a philoſopher, he was aſtoniſhed that the government had not, from the very beginning of thoſe diſſenſions impoſed ſilence on both parties. He died at Paris in 1755, at the age of 42. The principal of his works are, 1. *Principes pour la lecture des Poëtes*, 1745, 12mo. 2 vols. 2. *Eſſai ſur l'Etude des Belles-Lettres*, 1747, 12mo. 3. *Eſſai ſur les bienſeances oratoires*, 1753, 12mo. 4. *Principes pour la lecture des Orateurs*, 1753, 12mo, 3 vols. 5. *Hiſtoire des Guerres civiles de France ſous les regnes de Francois II. Charles IX. Henri III. & Henry IV.* tranſlated from the Italian of d'Avila.—In Mallet's works on the Poets, Orators, and the Belles Lettres, his object is no more than to explain with accuracy and preciſion the rules of the great maſters, and to ſupport them by examples from authors ancient and modern. The ſtyle of his different writings, to which his mind bore a great reſemblance, was neat, eaſy, and unaffected. But what muſt render his memory eſtimable, was his attachment to his friends, his candour, moderation, gentleneſs, and modeſty. He was employed to write the theological and belles-lettres articles in the *Encyclopédie*; and whatever he wrote in that dictionary was in general well compoſed. Abbé Mallet was preparing two important works when the world was deprived of him by death. The firſt was *Une Hiſtoire generale de nos Guerres depuis le commencement de la Monarchie*; the ſecond, *Une Hiſtoire du Concile de Trente*, which he intended to ſet in oppoſition to that of Father Paul tranſlated by Father le Courayer.

MALLET, a large kind of hammer made of wood; much uſed by artificers who work with a chiſſel, as ſculptors, maſons, and ſtone-cutters, whoſe mallet is ordinarily round; and by carpenters, joiners, &c. who uſe it ſquare. There are ſeveral ſorts of mallets uſed for different purpoſes on ſhip-board. The calking mallet is chiefly employed to drive the oakum into the ſeams of a ſhip, where the edges of the planks are joined to each other in the ſides, deck, or bottom. The head of this mallet is long and cylindrical, being hooped with iron to prevent it from ſplitting in the exerciſe of calking. There is alſo the ſerving mallet, uſed in ſerving the rigging, by binding the ſpun-yarn more firmly about it than could poſſibly be done by hand, which is performed in the following manner: the ſpun-yarn being previouſly rolled up in a large ball or clue, two or three turns of it are paſſed about the rope, and about the body of the mallet, which for this purpoſe is furniſhed with a round channel in its ſurface, that conforms to the convexity of the rope intended to be ſerved. The turns of the ſpun-yarn being ſtrained round the mallet, ſo as to confine it firmly to the rope, which is extended above the deck, one man paſſes the ball continually about the rope, whilſt the other, at the ſame time, winds on the ſpun-yarn by means of the mallet, whoſe handle acting as a lever ſtrains every turn about the rope as firm as poſſible.

MALLEVILLE (Claud de), a French poet, born at Paris, was one of the firſt members of the French academy, and gained a prize from Voiture and other ingenious men. He became ſecretary to M. de Baſſompierre, to whom he performed important ſervices while he was in priſon; and with the rewards he received for them he purchaſed the place of ſecretary to the king. He was likewiſe ſecretary to the French academy, and died in 1647. He wrote ſonnets, ſtanzas, elegies, epigrams, ſongs, madrigals, and a paraphraſe on ſome of the Pſalms. His ſonnets are moſt eſteemed.

MALLICOLLO, one of the new Hebrides iſlands in the ſouth-ſea, and the moſt conſiderable of them all next to *Eſpiritu Santo*. It is 18 leagues long from ſouth-eaſt to north-weſt; its greateſt breadth, which is at the ſouth-eaſt end, is eight leagues; the north-weſt end is two-thirds its breadth, and narrower in the middle one-third. This contraction is occaſioned by a wide and deep bay on the ſouth-weſt ſide. It appears to be very fertile, and well inhabited; the land on the ſea coaſt is rather low, and lies with a greater ſlope from the hills which are in the middle of the iſland; lat. 16 deg. 28. min. ſouth; 167 deg. 56 min. eaſt. On inquiring of the natives the name of this iſland, they were anſwered that it was Mallicollo, which has a near reſemblance to Manicollo, the name which Quiros received for it 160 years before. He did not indeed viſit the iſland, but had his intelligence from the natives.

The ſouth coaſt, which was moſt attentively examined by captain Cook, is luxuriantly clothed with wood and other vegetables, from the ſea-ſhore to the very ſummits of the hills. To the north-weſt, the country is leſs woody, but more agreeably interſected by lawns, ſome of which appeared to be cultivated. The vegetable productions of this country ſeemed to be in great variety; cocoa nuts, bread-fruit, bananas, ſugar-canes, yams, eddoes, and turmeric: but captain Cook thought the fruits here not ſo good as at the Society and Friendly Iſles. Hogs, and common poultry, are their domeſtic animals; and as the frequent ſqueaking of pigs was heard in the woods, it was concluded that the former are in conſiderable numbers here. A brace of Taheitian puppies was given them, with a view to ſtock the country with that ſpecies of animal: theſe they received with ſtrong ſigns of ſatisfaction. The woods appeared to be inhabited by many ſpecies of birds. Here was caught a ſhark, which meaſured nine feet in length, on which the ſhip's company feaſted with great reliſh: this ſhark, when cut open, was found to have the bony point of an arrow ſticking in its head, having been ſhot quite through the ſkull. The wound was healed ſo perfectly, that not the ſmalleſt veſtige of it appeared on the outſide: a piece of the wood ſtill remained ſticking to the bony point, as well as a few fibres with which it had been tied on; but both the wood and the fibres were ſo rotted, as to crumble into duſt at the touch. Two large reddiſh fiſh of the ſea-bream kind were likewiſe caught, on which moſt of the officers and ſome of the petty officers dined the next day. The night following every one who had eaten of them was ſeized with violent pains in the head and bones, attended with a ſcorching heat all over the ſkin, and numbneſs in the joints; even ſuch hogs and dogs as had partaken of theſe fiſh gave ſtrong ſymptoms of being poiſoned: one hog, who had eaten of the garbage, ſwelled to a great ſize, and died at night: ſeveral dogs were affected in the ſame manner; they groaned moſt piteouſly, had violent reachings, and could hardly drag their limbs along. Theſe fiſh were ſuppoſed to have been of the ſame ſort with thoſe which Quiros mentions to have produced ſimilar effects on board his ſhip, and which he calls *pargos*, which is the Spaniſh name for the ſea-bream. Perhaps theſe fiſh are not always poiſonous; but, like many ſpecies in the Weſt and Eaſt Indies, may acquire that quality by feeding on poiſonous vegetables: which concluſion is ſupported by the circumſtance of the inteſtines having been found to be more poiſonous than the reſt. The effects of this poiſon on the officers continued for near a fortnight, during which time their pains returned every night, their teeth were looſe, and their gums and palate excoriated.

The natives of Mallicollo are deſcribed as the moſt ugly, ill-proportioned people imaginable, and in every reſpect different from the other iſlanders in the South-Sea: they are of a very dark colour, and diminutive ſize; with long heads, flat faces, and monkey countenances; their hair, in general, black or brown, ſhort and curly, but not quite ſo ſoft and woolly as that of a negro. Their beards are very ſtrong, criſp, and buſhy, and generally black and ſhort. But what ſerves greatly to increaſe their natural deformity is a cuſtom which they have of wearing a belt, or cord, round their waiſt: this rope is as thick as a man's finger; and is tied ſo tight round their belly, that it would be fatal to a perſon unaccuſtomed from infancy to ſuch an unnatural ligature; for it cuts ſuch a deep notch acroſs the navel, that the belly ſeems in a manner divided, one part being above and the other below the rope. The men go quite naked, except a piece of cloth or leaf uſed as a wrapper. Moſt other nations invent ſome kind of covering from motives of ſhame; but here a roll of cloth, continually faſtened to the belt, rather diſplays than conceals, and is the oppoſite of modeſty. Beſides having the flat broad noſe and projecting cheek-bones of a negro, and a very ſhort forehead, many increaſed their natural uglineſs by painting their faces and breaſts with a black colour. Some few had a ſmall cap on the head made of matted-work. They wear bracelets of white and black ſhells, which preſs the upper arm ſo cloſely, that they ſeem to have been put on when the wearer was very young: this tends, as well as the belt, to reduce the Mallicolleſe to that ſlender ſhape which characteriſes them. The depreſſion of their foreheads is ſuppoſed to be artificial, as the heads of infants may be ſqueezed into any kind of form.

The firſt natives that were ſeen carried clubs in their hands, and waded into the water, carrying green boughs, the univerſal ſign of peace. In a day's time they ventured to come within a few yards of the ſhip's boat, which was ſent out; when they dipped their hands into the ſea, and gathering ſome water in their palms, poured it on their heads. The officers in the boat, in compliance with their example, did the ſame, with which the Indians appeared to be much pleaſed. They repeated the word *tomarr*, or *tomarro*, continually; which ſeemed to be an expreſſion among them equivalent to *tayo* among the Society-Iſlands. The greater part were now armed with bows and arrows, and a few with ſpears. At length they ventured near the ſhip, and received a few preſents of Taheitian cloth, which they eagerly accepted, and handed up their arrows in exchange, ſome of which were pointed with wood and ſome with bone, and daubed with a black gummy ſtuff which was ſuppoſed to be poiſoned; but its effects were tried on a dog, without producing any dangerous ſymptoms. They continued about the ſhip, talking with great vociferation, but at the ſame time in ſuch a good-humoured manner as was very entertaining. On looking ſtedfaſtly at one of them, he began to chatter with great fluency, and "grinned horribly a ghaſtly ſmile." Some continued about the ſhip till midnight; finding, however, at length, that they were but little noticed, for the captain wanted to get rid of them, they returned on ſhore, where the ſound of ſinging and beating their drums was heard all night. Mr Forſter ſuppoſes there may be 50,000 inhabitants on this extenſive iſland, which contains more than 600 ſquare miles. "We ought (ſays he) to figure to ourſelves this country as one extenſive foreſt; they have only begun to clear and plant a few inſulated ſpots, which are loſt in it like ſmall iſlands in the Pacific Ocean." Perhaps, if we could ever penetrate through the darkneſs which involves the hiſtory of this nation, we might find that they have arrived in the South-Sea much later than the natives of the Friendly and Society Iſlands: ſo much at leaſt is certain, that the latter appear to be a race totally diſtinct from the former; their form, their language, and their manners, ſtrongly mark this difference. The natives, on ſome parts of New-Guinea and Papua, ſeem to correſpond, in many particulars, with what has been obſerved of the Mallicolleſe. They differ likewiſe very widely from the light-coloured inhabitants of the South-Sea, by keeping their bodies entirely free of punctures. Whatever theſe people ſaw, they coveted; but they never repined at a refuſal. The looking-glaſſes which were given them were highly eſteemed, and they took great pleaſure in viewing themſelves; ſo that theſe ugly people ſeemed to have more conceit than the beautiful nation at O-Taheitee and the Society Iſlands. Early the next morning the natives came off to the ſhip in their canoes, and four or five of them went on board without any arms. They ſoon became familiar, and, with the greateſt eaſe, climbed up the ſhrouds to the maſt-head; when they came down, the captain took them into his cabbin, and gave them medals, ribbons, nails, and pieces of red baize. They appeared the moſt intelligent of any nation that had been ſeen in the South-Sea: they readily underſtood the meaning conveyed by ſigns and geſtures; and in a few minutes taught the gentlemen of the ſhip ſeveral words in their language, which appeared to be wholly diſtinct from that general language of which ſo many dialects are ſpoken at the Society-Iſlands, the Marqueſas, Friendly-Iſles, Eaſter-Iſland, and New-Zeeland. Their language was not difficult to pronounce, but contained more conſonants than any of them. Mr Forſter, and ſome of the gentlemen from the ſhip, went on ſhore, and converſed with the natives, who with great good-will ſat down on the ſtump of a tree to teach them their language. They were ſurpriſed at the readineſs of their gueſts to remember, and ſeemed to ſpend ſome time in pondering how it was poſſible to preſerve the ſound by ſuch means as pencils and paper. They were not only aſſiduous in teaching; but had curioſity enough to learn the language of the ſtrangers, which they pronounced with ſuch accuracy as led their inſtructors to admire their extenſive faculties and quick apprehenſion. Obſerving their organs of ſpeech to be ſo flexible, they tried the moſt difficult ſounds in the European languages, and had recourſe to the compound Ruſſian *ſhtch*, all of which they pronounced at the firſt hearing without the leaſt difficulty. They preſently learned the Engliſh numerals, which they repeated rapidly on their fingers; ſo that what they wanted in perſonal beauty was amply compenſated to them in acuteneſs of underſtanding. They expreſs their admiration by hiſſing like a gooſe.

Their muſic is not remarkable either for harmony or variety, but ſeemed to be of a more lively turn than that at the Friendly-iſlands. Their behaviour to their viſitants was, in general, harmleſs, but cautious: they gave them no invitation to ſtay among them; for they ſeemed not to reliſh the proximity of ſuch powerful people, being probably accuſtomed to acts of violence and outrage from their neighbours. "In ſome of their countenances (ſays Mr Forſter), we thought we could trace a miſchievous, ill-natured diſpoſition; but we might miſtake jealouſy for hatred."

Very few women were ſeen, but thoſe few were no leſs ugly than the men: they were of ſmall ſtature, and their heads, faces, and ſhoulders, were painted red. Thoſe who were grown up, and probably married, had ſhort pieces of a kind of cloth, or rather matting, round their waiſts, reaching nearly to their knees; the reſt had only a ſtring round the middle, with a wiſp of ſtraw; and the younger ones, from infancy to the age of 10 years, went ſtark naked, like the boys of the ſame age. The women were not obſerved to have any finery in their ears or round their necks and arms, it being faſhionable in this iſland for the men only to adorn themſelves; and wherever this cuſtom prevails, the other ſex is commonly oppreſſed, deſpiſed, and in a ſtate of ſervility. Here the women were ſeen with bundles on their backs, which contained their children; the men ſeemed to have no kind of regard for them. None of them came off to the ſhip, and they generally kept at a diſtance when any party landed from the boat. They perforate the cartilage of the noſe between the noſtrils; and thruſt therein a piece of white ſtone about an inch and a half long, which is bent like the curvature of a bow. The houſes here are, like thoſe of the other iſles, rather low, and covered with a palmthatch. Some were incloſed or walled round with boards, and the entrance to theſe was by a ſquare hole at one end.

Their weapons are bows and arrows, and a club about two feet and a half in length, made of the cauſuarina wood, commonly knobbed at one end, and well poliſhed. This weapon they hang on their right ſhoulder, from a thick rope made of a kind of graſs. It appeared to be preſerved for cloſe engagements, after having emptied the quiver. On the left wriſt they wear a circular wooden plate, neatly covered, and joined with ſtraw, about five inches in diameter, upon which they break the violence of the recoiling bow-ſtring, and preſerve their arm unhurt. Their arrows are made of a ſort of reed; and are ſometimes armed with a long ſharp point made of the red-wood, and ſometimes with a very hard point made of bone: and theſe points are all covered with a ſubſtance which was ſuppoſed to be poiſoned. Indeed the people themſelves confirmed theſe ſuppoſitions, by making ſigns to the gentlemen of the ſhip not to touch the point, and giving them to underſtand that if they were pricked by them they would die: they are very careful of them themſelves, and keep them always wrapt up in a quiver. Some of theſe arrows are armed with two or three points each, with ſmall prickles on the edge to prevent the arrow from being drawn out of the wound. Repeated and effectual trials of the virulence of this poiſon were made upon dogs, but they gave no ſigns of being hurt by it.

Their food ſeems to be principally vegetables, ſince they apply themſelves to huſbandry. As hogs and fowls are bred here, the natives, doubtleſs, feaſt ſometimes on pork and poultry; and as they have canoes, it may be ſuppoſed that they draw a part of their ſubſiſtence from the ocean. The greateſt number of canoes that were ſeen along-ſide the ſhip at one time did not exceed 10, or, according to Mr Forſter, 14, and no more than four or five people in each: they were ſmall, of indifferent workmanſhip, and without ornament; but provided with an outrigger.

After ſome ſlight indications of a hoſtile intention on the part of the natives, which they had ſhown in their canoes whilſt about the ſhip, captain Cook, with a party of marines in two boats, landed in the face of 400 or 500 Indians who were aſſembled on the ſhore. Tho' they were all armed with bows and arrows, clubs and ſpears, they made not the leaſt oppoſition; on the contrary, ſeeing the captain advance alone, unarmed, with only a green branch in his hand, one of them, who ſeemed to be a chief, giving his bow and arrows to another, met him in the water, bearing alſo a green branch. When they met, the branches were exchanged; and the chief led the captain by the hand up to the crowd, to whom he immediately diſtributed preſents: in the mean time the marines were landed, and drawn up upon the beach. The captain then made ſigns that he wanted wood, and they by ſigns gave him permiſſion to cut down the trees. A ſmall pig was preſently brought, and preſented to the captain, who in return gave the bearer a piece of cloth. It was expected from this inſtance, that an exchange of proviſions for various articles of merchandiſe would take place: but theſe expectations proved fallacious; no more pigs were procured, and only about half a dozen cocoa-nuts, and a ſmall quantity of freſh water. As theſe iſlanders were poſſeſſed of hogs as well as fowls, their backwardneſs to part with either might be owing to the little eſtimation in which they held ſuch articles as were tendered in barter; for they ſet no value on any nails, or any other kind of iron-tools, and held all the gew-gaws of finery equally cheap. They would now and then exchange an arrow for a piece of cloth, but very ſeldom would part with a bow. After ſending on board what wood had been cut, the party all embarked, and the natives diſperſed. When the ſhip was about to leave this iſland, captain Cook gives the following relation: "When the natives ſaw us under ſail, they came off in canoes, making exchanges with more confidence than before, and giving ſuch extraordinary proofs of their honeſty as ſurpriſed us. As the ſhip at firſt had freſh way thro' the water, ſeveral of the canoes dropped aſtern after they had received goods, and before they had time to deliver theirs in return: inſtead of taking advantage of this, as our friends at the Society-iſlands would have done, they uſed their utmoſt efforts to get up with us, and deliver what they had already been paid for. One man in particular followed us a conſiderable time, and did not reach us till it was calm, and the thing was forgotten. As ſoon as he came along-ſide, he held up the article, which ſeveral on board were ready to buy: but he refuſed to part with it till he ſaw the perſon to whom he had before ſold it; and to him he gave it. The perſon not knowing the man again, offered him ſomething in return, which he refuſed; and ſhowing him what had been given before, at length made him ſenſible of the nice ſenſe of honour which had actuated this Indian."

MALLOW, a manor, and alſo a borough town in the county of Cork, and province of Munſter in Ireland, above 118 miles from Dublin. It was incorporated by charter in 1688, and ſends two members to parliament. It is pleaſantly ſituated on the north bank of the Blackwater, over which there is an excellent ſtone-bridge. Here is alſo a good church, a market houſe, and barracks for a troop of horſe. Not far diſtant is a fine ſpring of a moderately tepid water, which burſts out of the bottom of a fine limeſtone rock, and approaches the neareſt in all its qualities to the hot-well waters of Briſtol of any that has been yet diſcovered in this kingdom, which brings a reſort of good company there frequently in the ſummer months, and has cauſed it to be called the *Iriſh Bath*. Mallow is a poſt town, and has five fairs.

Indian-Mallow. See Sida.

MALMSBURY, a town of Wiltſhire, in England, 95 miles from London. It ſtands on a hill, with ſix bridges over the river Avon at the bottom; with which, and a brook that runs into it, it is in a manner encompaſſed. It formerly had walls and a caſtle, which were pulled down to enlarge the abbey, which was the biggeſt in Wiltſhire, and its abbots ſat in parliament. The Saxon King Athelſtan granted the town large immunities, and was buried under the high altar of the church, and his monument ſtill remains in the nave of it. The memory of Aldhelm, its firſt abbot, who was the king's great favourite, and whom he got to be canonized after his death, is ſtill kept up by a meadow near this town, called Aldhelm's Mead. By charter of King William III. the corporation conſiſts of an alderman, who is choſen yearly, 12 capital burgeſſes, and 4 aſſiſtants, land-holders and commoners. Here is an alms-houſe for 4 men and 4 women, and near the bridge an hoſpital for lepers, where it is ſuppoſed there was formerly a nunnery. This town drives a conſiderable trade in the woollen manufactory; has a market on Saturday, and three fairs. It has ſent members to parliament ever ſince the 26th of Edward I.

William of MALMSBURY. See WILLIAM.

MALO (St) a ſea-port town of France, in the province of Brittany, ſituated in the latitude of 48 degrees 38 minutes north, and 1 degree 57 minutes to the weſt. The town ſtands upon a rock called the iſland of St Aaron, ſurrounded by the ſea at high water, which is now joined to the continent, by means of a ſort of cauſey or dike, near a mile long, called the Sillon, which has been often damaged by ſtorms, and was almoſt quite ruined in the year 1730. At the end of this cauſey next the town is a caſtle, flanked with large towers, a good ditch, and a large baſtion. The city nearly covers the whole ſurface of the iſland, and is of an oblong form, ſurrounded with a ſtrong rampart, on which there is a number of cannon.— There is always in it a good garriſon. The cathedral-church is dedicated to St Vincent, and ſtands in the ſquare of the ſame name, as do alſo the town-houſe and the epiſcopal palace. There are ſome other ſquares in the place, but leſs remarkable; and as to the ſtreets, except two or three, they are all very narrow. There being no ſprings of freſh water in St Malo, the inhabitants are at great pains to convey the rain which falls on the roofs of their houſes into ciſterns; and of this they have enough for all family-uſes. There is only one pariſh-church in the town, though it contains between 9000 and 10,000 inhabitants; but there are ſeveral convents of monks and nuns, and a general hoſpital. The two entrances into the harbour are defended by ſeveral forts, ſuch as that of the Conchal; of the great and the little bay; the forts of Iſle-Rebours, Sezembre, Roteneuf; the caſtle of Latte, and Fort-Royal. Theſe are ſeveral little iſles near the harbour, the moſt conſiderable whereof is that of St Sezembre, which is near a quarter of a league in circumference, and ſerve as ſo many outworks to the fortifications of the city, and are uſeful as bulwarks, by breaking the violence of the waves, which otherwiſe would beat with great force againſt the walls of the city. At the end of the cauſey next the continent ſtands the ſuburb of St Servant, large and well built. Here the merchants have their houſes and ſtore-houſes. Here is the dock-yard; and a ſecure harbour is formed by the river Rance, where ſhips of great burden can ride at anchor very near the houſes. The harbour is one of the beſt in the kingdom, and moſt frequented by merchant-ſhips; but it is of very difficult and dangerous acceſs on account of the rocks which lie round it. The town of St Malo is exceedingly well ſituated for trade; and accordingly, in this reſpect, it has ſucceeded beyond moſt towns in France. It maintains a trade with England, Holland, and Spain.— The commerce of Spain is of all the moſt conſiderable, and moſt profitable to the inhabitants of St Malo, the ſhips of the Malouins being frequently employed as regiſter ſhips by the Spaniards, to carry out the rich cargoes to Peru and Mexico, and bring home treaſure and plate from America. The inhabitants of St Malo carry on alſo a conſiderable trade in dry and ſalted cod to Newfoundland. They ſend to this fiſhery a good many veſſels from 100 to 300 tons burden, with ſalt for the fiſh, and proviſions for ſubſiſting the crews. They carry their fiſh to Italy, Spain, and ſome to Bourdeaux and Bayonne, and bring home the returns in fruits, ſoap, oil, &c. which are diſpoſed of to great advantage at Nantz. St Malo is the capital of the biſhopric of that name, which is of conſiderable extent; and the ſoil about it produces moſt kinds of grain and fruits in great abundance. The moſt remarkable towns in the diſtrict and dioceſe of St Malo, are St Servand, Cancalle, Chateauneuf, Dinan, Tintiniac, Combourg, Montfort, Breal, Guer, Ploermel, Joſſelin, &c.

MALO, MACLOU, or *Mahout*, (Saint), the ſon of a gentleman in Great Britain, and couſin to St Magloire, was educated in a monaſtery in Ireland, and afterwards choſen biſhop of Gui-Caſtel, a dignity which his humility prevented him from accepting. The people wiſhing to compel him, he went into Brittany, and put himſelf under the direction of a holy anchoret called Aaron, in the neighbourhood of Aleth. Some time after, about the year 541, he was choſen biſhop of that city, and there cultivated piety and religion with great ſucceſs. He afterwards retired to a ſolitude near Xaintes, where he died November 15. 565. From him the city of St Malo derives its name; his body having been carried thither, after the reduction of Aleth to a ſmall village called *Guidalet* or *Guichalet*, and the transference of the epiſcopal ſee to St Malo.

MALOUIN (Paul-Jaques), born at Caen in 1701, was profeſſor of medicine in the royal college of Paris, phyſician in ordinary to the queen, and a member of the Royal Society of London, and of the Academy of Sciences of Paris. Theſe ſtations were a proper reward for his very extenſive information in medicine and chemiſtry; and his amiable and ſteady character procured him many friends and protectors. He was very unlike ſome modern phyſicians, who put little truſt in medicine; and was greatly diſpleaſed to hear any ill ſpoken of his profeſſion. He obſerved one day to a young man who took this liberty, that all great men had reſpected medicine: *Ah!* ſaid the young fellow, *you muſt at leaſt except from the liſt one Moliere. But then,* inſtantly replied the doctor, *you ſee he is dead.* He is ſaid to have believed the certainty of his art as firmly as a mathematician does that of geometry. Having preſcribed a great many medicines for a celebrated man of letters, who followed his directions exactly, and was cured, Malouin eagerly embraced him, ſaying, *You deſerve to be ſick.* As he valued the rules of medicine ſtill more on his own account than on that of others, he obſerved, eſpecially in the latter part of his life, a very auſtere regimen. He ſtrictly practiſed the preſervative part of medicine, which is much more certain in its effects than the reſtorative. To this regimen Malouin was indebted, for what many philoſophers have deſired in vain, a healthy old age and an eaſy death. He was a ſtranger to the infirmities of age; and died at Paris of an apoplexy, the 3d of January 1778, in the 77th year of his age. By his will he left a legacy to the faculty of medicine, upon condition of their holding a public meeting every year for the purpoſe of giving the public an account of his labours and diſcoveries. Malouin was economical, but at the ſame time very diſintereſted. After two years of very lucrative practice, he left Paris and went to Verſailles, where he ſaw very few patients, obſerving that he had *retired to the court*. His principal works are, 1. *Traite de Chimie*, 1734, 12mo. 2. *Chimie medicinale*, 2 vols 12mo, 1755; a book full of curious obſervations, and written in a chaſte and well adapted ſtyle. He had the character of a laborious chemiſt; and he was a well informed and even a diſtinguiſhed one for the age in which he lived: but his knowledge of chemiſtry, it muſt be confeſſed, was very imperfect, compared with the ſtate of the ſcience in the preſent age, in which it has aſſumed a new face, that probably will not be the laſt. 3. Some of the Arts in the Collection publiſhed by the academy of ſciences on the arts and profeſſions. A circumſtance which happened at a meeting of the academy does as much honour to his heart, as any of his works do to his underſtanding. A new treatiſe on the art of baking, wherein ſome of Malouin's ideas were combated, was read by M. Parmentier before his fellows, among whom was the old doctor. The young academician, who knew how eaſily ſelf-love is hurt, was afraid to meet his looks: but no ſooner was the reading finiſhed, than Malouin went up to him, and embracing him, "Receive my reſpects (ſaid he), you have ſeen farther into the ſubject than I did." 4. He was likewiſe the author of the chemical articles in the *Encyclopédie*.

Of the ſame family was *Charles Malouin*, who graduated as a doctor of medicine in the univerſity of Caen, and died in 1718 in the flower of his age. He publiſhed a Treatiſe on Solids and Fluids, Paris 1718, 12mo.

MALPAS, a town of Cheſhire, 166 miles from London. It ſtands on a high hill, not far from the river Dee, on the borders of Shropſhire; has a grammar-ſchool, and an hoſpital, and had formerly a caſtle. It is called in Latin *Mala Platea*, i. e. "Ill Street," and was, for the ſame reaſon, by the Normans, called *Mal Pas*; but its three ſtreets, of which it chiefly conſiſts, are now well paved; and here is a benefice rich enough to ſupport two rectors, who officiate alternately in its ſtately church. It has a good market on Mondays, and three fairs in the year.

MALPIGHI (Marcellus), an eminent Italian phyſician and anatomiſt in the 17th century. He ſtudied under Maſſari and Mariano. The duke of Tuſcany invited him to Piſa, to be profeſſor of phyſic there. In this city he contracted an intimate acquaintance with Borelli, to whom he aſcribed all the diſcoveries he had made. He went back to Bologna, the air of Piſa not agreeing with him. Cardinal Antonio Pignatelli, who had known him while he was legate at Bologna, being choſen pope in 1691, under the name of *Innocent XII.* immediately ſent for him to Rome, and appointed him his phyſician. But this did not hinder him from purſuing his ſtudies, and perfecting his works, which have immortalized his memory. He died in 1694; and his works, with his life written by himſelf prefixed, were firſt collected and printed at London, in folio, in 1667.

MALPIGHIA, Barbadoes cherry. a genus of the trigynia order, belonging to the decandria claſs of plants; and in the natural method ranking under the 23d order, *Trihilatæ*. The calyx is pentaphyllous, with melliferous pores on the outſide at the baſe. There are five petals, roundiſh, and unguiculated: the berry unilocular, and triſpermous. There are eight or ten ſpecies, all of them ſhrubby evergreens of the warm parts of America, riſing with branchy ſtems from 8 or 10 to 15 or 20 feet high, ornamented with oval and lanceolate entire leaves, and large pentapetalous flowers, ſucceeded by red, cherry-ſhaped, eatable berries, of an acid and palatable flavour; and which, in the Weſt Indies, where they grow naturally, are uſed inſtead of cherries. Three of the ſpecies are reared in our gardens, and make a fine variety in the ſtove. They retain their leaves all the year round; and begin to flower about the end of autumn, continuing in conſtant ſucceſſion till the ſpring; after which they frequently produce and ripen their fruit, which commonly equals the ſize of a ſmall cherry. The flowers are of a pale-red or purple colour. Theſe plants are propagated by ſeed, which muſt be ſown in ſpring, in pots of rich earth: then plunge them in a hot-bed; and when the plants are three or four inches high, prick them in ſeparate ſmall pots, give water, and plunge them in the bark-bed of the ſtove; where after they have remained a year or two, they may be placed in any part of it. They may even be placed in the open air during a month or two of the hotteſt weather in ſummer; but muſt be carefully ſupplied with water during the whole year.

MALPLAQUET, a village of the Netherlands, in Hainault, famous for a moſt bloody battle fought here on the 11th of September 1709, between the French under old marſhal Villars, and the allies commanded by prince Eugene and the duke of Marlborough. The French army amounted to 120,000 men; and were poſted behind the woods of La Marte and Taniers, in the neighbourhood of Malplaquet. They had fortified their ſituation in ſuch a manner with lines, hedges, and trees laid acroſs, that they ſeemed to be quite inacceſſible. In this ſituation they expected certain victory; and even the common ſoldiers were ſo eager to engage, that they flung away the bread which had been juſt given them, though they had taken no ſuſtenance for a whole day before. The allied army began the attack early in the morning, being favoured by a thick fog. The chief fury of their impreſſion was made upon the left of the enemy; and with ſuch ſucceſs, that, notwithſtanding their lines and barricadoes, the French were in leſs than an hour driven from their entrenchments. But on the enemy's right the combat was ſuſtained with much greater obſtinacy. The Dutch, who carried on the attack, drove them from their firſt line; but were repulſed from the ſecond with great ſlaughter. The prince of Orange, who headed that attack, perſiſted in his efforts with incredible perſeverance and intrepidity, though two horſes had been killed under him, and the greater part of his officers ſlain and diſabled. At laſt, however, the French were obliged to yield up the field of battle; but not till after having ſold a dear-bought victory. Villars being dangerouſly wounded, they made an excellent retreat under the conduct of Bouflers, and took poſt near Gueſnoy and Valenciennes. The conquerors took poſſeſſion of the field of battle, on which above 20,000 of their beſt troops lay dead. The loſs of the French, it is ſaid, did not exceed 8000; and marſhal Villars confidently aſſerted, that, if he had not been diſabled, he would have gained an undoubted victory.

MALT denotes barley cured, or prepared to fit it for making a potable liquor, under a denomination of *beer* or *ale*. See BREWING.

Malt-Liquors have different names as well as different virtues, properties, and uſes, both from the different manners of preparing the malt; whence they are diſtinguiſhed into *pale* and *brown;* and from the different manners of preparing or brewing the liquors themſelves; whence they are divided into *beer* and *ale*, *ſtrong* and *ſmall*, *new* and *old*.

Malt drinks are either pale or brown, as the malt is more or leſs dried on the kiln; that which is the ſlendereſt dried tinging the liquor leaſt in brewing, and therefore being called *pale;* whereas that higher dried, and as it were roaſted, makes it of a higher colour. A mixture of both theſe makes an amber colour; whence ſeveral of theſe liquors take their name.

Now, it is certain, the pale malt has moſt of the natural grain in it, and is therefore the moſt nouriſhing; but, for the ſame reaſon, it requires a ſtronger conſtitution to digeſt it. Thoſe who drink much of it, are uſually fat and ſleek in their bloom, but are often cut off by ſudden fevers; or, if they avoid this, they fall early into a diſtempered old age.

The brown malt makes a drink much leſs viſcid, and fitter to paſs the ſeveral ſtrainers of the body; but, if very ſtrong, it may lead on to the ſame inconveniences with the pale: though a ſingle debauch wears off much more eaſily in the brown.

Dr Quincy obſerves, that the beſt pale malt liquors are thoſe brewed with hard waters, as thoſe of ſprings and wells, becauſe the mineral particles, wherewith theſe waters are impregnated, help to prevent the coheſions of thoſe drawn from the grain, and enable them to paſs the proper ſecretions the better; as the viſcid particles of the grain do likewiſe defend theſe from doing the miſchief they might otherwiſe occaſion. But ſofter waters ſeem beſt ſuited to draw out the ſubſtance of high-dried malts, which retain many fiery particles in their contexture, and are therefore beſt loſt in a ſmooth vehicle.

For the differences in the preparation of malt liquors, they chiefly conſiſt in the uſe of hops, as in beer; or in the more ſparing uſe of them, as in ale.

The difference made by hops is beſt diſcovered from the nature and quality of the hops themſelves: theſe are known to be a ſubtle grateful bitter; in their compoſition, therefore, with this liquor, they add ſomewhat of an alkaline nature, *i. e.* particles that are ſublime, active, and rigid. By which means, the ropy viſcid parts of the malt are more divided and ſubtilized: and are therefore not only rendered more eaſy of digeſtion and ſecretion in the body, but alſo, while in the liquor, they prevent it from running into ſuch coheſions as would make it ropy, vapid, and ſour.

For want of this, in unhopped drinks, that clammy ſweetneſs, which they retain after working, ſoon turns them acid and unfit for uſe; which happens ſooner or latter in proportion to the ſtrength they receive from the malt, and the comminution that has undergone by fermentation.

It is a common opinion, that ale is more diuretic than beer; that is, liquor leſs hopped more than that with a greater quantity of hops in it: which may hold in ſome conſtitutions; becauſe ale being more ſmooth, ſoftening, and relaxing, where urine is to be promoted by enlarging the paſſage, as in thin, dry conſtitutions, this is the moſt likely to effect it. But, where the promoting of urine is to be done by attenuating and breaking the juices, and rendering them more fluid, it is certainly beſt anſwered by thoſe drinks which are well hopped.

As to the diſpute, whether or no hops tend to breed the ſtone; it is too long to enter upon here. Quincy is of opinion, there is but little reaſon for the affirmative ſide of the queſtion; and in the general, makes no ſcruple to ſay, that, for one conſtitution damaged by beer, there are numbers ſpoiled by ale. This laſt manifeſtly fouls the glands, ſtuffs the veſſels with ſlime and viſcidity, makes the body unwieldy and corpulent, and paves the way for cachexies, jaundice, aſthmas, and at laſt incurable dropſies. The urinary paſſages, alſo, which it is ſuppoſed to clear, will, in time, be filled by it with ſlough and matter of as ill conſequence as gravel.

The different ſtrengths of malt liquors alſo make their effects different. The ſtronger they are, the more viſcid parts they carry into the blood; and though the ſpirituous parts make theſe imperceptible at firſt; yet when thoſe are evaporated, which will be in a few hours, the other will be ſenſibly felt by pains in the head, nauſeouſneſs at the ſtomach, and laſſitude or liſtleſſneſs to motion. This thoſe are the moſt ſenſible of who have experienced the extremes of drinking theſe liquors and wines; for a debauch of wine they find much ſooner worn off, and they are much more lively and briſk afterwards, than after fuddling malt liquors, whoſe viſcid remains will be long before they be ſhaken off.

Malt liquors therefore are, in general, the more wholeſome for being ſmall; *i. e.* of ſuch a ſtrength as is liable to carry a ſmall degree of warmth into the ſtomach, but not ſo great as to prevent their being proper diluters of the neceſſary food. Indeed, in robuſt people, or thoſe who labour hard, the viſcidities of the drink may be broken into convenient nouriſhment; but in perſons of another habit and way of living, they ſerve rather to promote obſtructions and ill humours.

The age of malt liquors is the laſt thing by which they are rendered more or leſs wholeſome. Age ſeems to do nearly the ſame thing as hops; for thoſe liquors which are longeſt kept are certainly the leaſt viſcid; age breaking the viſcid parts, and by degrees rendering them ſmaller, and fitter for ſecretion.

But this is always determined according to their ſtrength; in proportion to which, they will ſooner or later come to their full perfection as well as decay; for, when ale or beer is kept till its particles are broken and comminuted as far as they are capable, then it is that they are beſt; and, beyond this, they will be continually on the decay, till the finer ſpirits are entirely eſcaped, and the remainder becomes vapid and ſour.

Malt-Diſtillery. This is an extenſive article of trade, and by which very large fortunes are made. The art is to convert fermented malt liquors into a clear inflammable ſpirit, which may be either ſold for uſe in the common ſtate of a proof ſtrength, that is, the ſame ſtrength with French brandy; or is rectified into that purer ſpirit uſually ſold under the name of *ſpirit of wine;* or made into compound cordial waters, by being diſtilled again from herbs and other ingredients. See Brewing and Wash.

To brew with malt in the moſt advantageous manner, it is neceſſary, 1. That the ſubject be well prepared; 2. That the water be ſuitable and duly applied; and, 3. That ſome certain additions be uſed, or alterations made, according to the ſeaſon of the year, and the intention of the operator: and by a proper regulation in theſe reſpects, all the fermentable parts of the ſubject will thus be brought into the tincture, and become fit for fermentation.

The due preparation of the ſubject conſiſts in its being juſtly malted and well ground. When the grain is not ſufficiently malted, it is apt to prove hard, ſo that the water can have but very little power to diſſolve its ſubſtance; and if it be too much malted, a part of the fermentable matter is loſt in that operation. The harder and more flinty the malt is, the finer it ought to be ground; and in all caſes, when intended for diſtillation, it is adviſable to reduce it to a kind of finer or coarſer meal. When the malt is thus ground, it is found by experience that great part of the time, trouble, and expence of the brewing is ſaved by it, and yet as large a quantity of ſpirit will be produced; for thus the whole ſubſtance of the malt may remain mixed among the tincture, and be fermented and diſtilled among it. This is a particular that very well deſerves the attention of the malt diſtiller as that trade is at preſent carried on; for the diſpatch of the buſineſs, and the quantity of ſpirit procured, is more attended to than the purity or perfection of it.

The ſecret of this matter depends upon the thoroughly mixing or briſkly agitating and throwing the meal about, firſt in cold and then in hot water; and repeating this agitation after the fermentation is over, when the thick turbid waſh being immediately committed to the ſtill already hot and dewy with working, there is no danger of burning, unleſs by accident, even without the farther trouble of ſtirring, which in this caſe is found needleſs, though the quantity be ever ſo large, provided that requiſite care and cleanlineſs be uſed; and thus the buſineſs of brewing and fermenting may very commodiouſly be performed together, and reduced to one ſingle operation. Whatever water is made choice of, it muſt ſtand in a hot ſtate upon the prepared malt, eſpecially if a clear tincture be deſired; but a known and very great inconvenience attends its being applied too hot, or too near to a ſtate of boiling, or even ſcalding with regard to the hand. To ſave time in this caſe, and to prevent the malt running into lumps and clods, the beſt way is to put a certain meaſured quantity of cold water to the malt firſt; the malt is then to be ſtirred very well with this, ſo as to form a ſort of thin uniform paſte or pudding; after which the remaining quantity of water required may be added in a ſtate of boiling, without the leaſt danger of making what, in the diſtillers language, is called a *pudden*.

In this manner the due and neceſſary degree of heat in the water, for the extracting all the virtues of the malt, may be hit upon very expeditiouſly, and with a great deal of exactneſs, as the heat of boiling water is a fixed ſtandard which may be let down to any degree by a proportionate mixture of cold water, due allowances being made for the ſeaſon of the year, and for the temperature of the air.

This little obvious improvement, added to the method juſt above hinted for the reducing brewing and fermentation to one operation, will render it practicable to very conſiderable advantage, and the ſpirit improved in quality as well as quantity.

A much more profitable method than that uſually practiſed for the fermenting malt for diſtillation, in order to get its ſpirit, is the following: take ten pounds of malt reduced to a fine meal, and three pounds of common wheat-meal: add to theſe two gallons of cold water, and ſtir them well together; then add five gallons of water, boiling hot, and ſtir altogether again. Let the whole ſtand two hours, and then ſtir it again; and when grown cold, add to it two ounces of ſolid yeaſt, and ſet it by looſely covered in a warmiſh place to ferment.

This is the Dutch method of preparing what they call the *waſh for malt ſpirit*, whereby they ſave much trouble and procure a large quantity of ſpirit: thus commodiouſly reducing the two buſineſſes of brewing and fermenting to one ſingle operation. In England the method is to draw and maſh for ſpirit as they ordinarily do for beer, only inſtead of boiling the wort, they pump it into large coolers, and afterwards run it into their fermenting backs, to be there fermented with yeaſt. Thus they beſtow twice as much labour as is neceſſary, and loſe a large quantity of their ſpirit by leaving the groſs bottoms out of the ſtill for fear of burning.

All ſimple ſpirits may be conſidered in the three different ſtates of low wines, proof ſpirit, and alcohol, the intermediate degrees of ſtrength being of leſs general uſe; and they are to be judged of only according as they approach to or recede from theſe. Low wines at a medium contain a ſixth part of pure inflammable ſpirit, five times as much water as ſpirit neceſſarily ariſing in the operation with a boiling heat. Proof goods contain about one half of the ſame totally inflammable ſpirit; and alcohol entirely conſiſts of it.

Malt low-wines, prepared in the common way, are exceeding nauſeous; they have, however, a natural vinoſity or pungent agreeable acidity, which would render the ſpirit agreeable to the palate were it not for the large quantity of the groſs oil of the malt that abounds in it. When this oil is detained in ſome meaſure

meaſure from mixing itſelf among the low wines, by the ſtretching a coarſe flannel over the neck of the ſtill or at the orifice of the worm, the ſpirit becomes much purer in all reſpects; it is leſs fulſome to the taſte, leſs offenſive to the ſmell, and leſs milky to the eye. When theſe low wines, in the rectification into proof-ſpirits, are diſtilled gently, they leave a conſiderable quantity of this groſs fetid oil behind them in the ſtill along with the phlegm; but if the fire be made fierce, this oil is again raiſed and brought over with the ſpirit; and being now broken ſomewhat more fine, it impregnates it in a more nauſeous manner than at firſt. This is the common fault both of the malt diſtiller and of the rectifier; the latter, inſtead of ſeparating the ſpirit from this naſty oil, which is the principal intent of his proceſs, attends only to the leaving the phlegm in ſuch quantity behind, that the ſpirit may be of a due ſtrength as proof or marketable goods, and brings over the oil in a worſe ſtate than before. To this inattention to the proper buſineſs of the proceſs, it is owing, that the ſpirit, after its ſeveral rectifications, as they are miſcalled, is often found more ſtinking than when delivered out of the hands of the malt diſtiller. All this may be prevented by the taking more time in the ſubſequent diſtillations, and keeping the fire low and regular; the ſudden ſtirring of the fire, and the haſty way of throwing on the freſh fuel, being the general occaſion of throwing up the oil by ſpurts, where the fire in general, during the proceſs, has not been ſo large as to do that miſchief.

The uſe of a balneum mariæ, inſtead of the common ſtill, would effectually prevent all this miſchief, and give a purer ſpirit in one rectification than can otherwiſe be procured in ten, or indeed according to the common methods at all.

Malt low wine, when brought to the ſtandard of proof ſpirit, loſes its milky colour, and is perfectly clear and bright, no more oil being contained in it than is perfectly diſſolved by the alcohol, and rendered miſcible with that proportion of phlegm, which is about one half the liquor: its taſte alſo is cleaner, tho' not more pleaſant; there being leſs of the thick oil to hang on the tongue than its own form; which is not the caſe in the low wines, where the oil being undiſſolved, adheres to the mouth in its own form, and does not paſs lightly over it.

When proof-ſpirit of malt is diſtilled over again, in order to be rectified into alcohol, or, as we uſually call it, ſpirits of wine, if the fire be raiſed at the time when the faints begin to fall off, a very conſiderable quantity of oil will be raiſed by it, and will run in the viſible form of oil from the noſe of the worm. This is not peculiar to malt ſpirit; but the French brandy ſhows the ſame phenomenon, and that in ſo great a degree, that half an ounce of this oil may be obtained from a ſingle piece of brandy.

Malt ſpirit, more than any other kind, requires to be brought into the form of alcohol, before it can be uſed internally, eſpecially as it is now commonly made up in the proof ſtate, with as much of this nauſeous and viſcous oil as will give it a good crown of bubbles. For this reaſon it ought to be reduced to an alcohol, or totally inflammable ſpirit, before it is admitted into any of the medicinal compoſitions. If it be uſed without this previous caution, the odious taſte of the malt oil will be diſtinguiſhed among all the other flavours of the ingredients.

Malt ſpirit, when it has once been reduced to the true form of an alcohol, is afterwards more fit for all the curious internal uſes than even French brandy; it being after this purification a more uniform, hungry, taſteleſs, and impregnable ſpirit, than any other ſpirits which we eſteem ſo much finer.

A pure ſpirit being thus procured, ſhould be kept carefully in veſſels of glaſs or ſtone, well ſtopped, to prevent the evaporation of any of its volatile part. If preſerved in caſks, it is apt to impregnate itſelf very ſtrongly with the wood. The quantity of pure alcohol obtainable from a certain quantity of malt, differs according to the goodneſs of the ſubject, the manner of the operation, the ſeaſon of the year, and the ſkilfulneſs of the workmen; according to which variations, a quarter of malt will afford from eight or nine to thirteen or fourteen gallons of alcohol. This ſhould encourage the malt diſtiller to be careful and diligent in his buſineſs, as ſo very large a part of his profit depends wholly on the well conducting his proceſſes.

After every operation in this buſineſs, there remains a quantity of faints, which in their own coarſe ſtate ought never to be admitted into the pure ſpirit; theſe are to be ſaved together, and large quantities of them at once wrought into alcohol. It is eaſy to reduce theſe to ſuch a ſtate that they will ſerve for lamp-ſpirits. Their diſagreeable flavour being corrected by the adding of aromatics during the diſtillations, the reducing them into a perfect and pure alcohol is practicable, but not without ſuch difficulties as render it ſcarce worth the trader's while. One way of doing it is by diſtilling them from water into water, and that with a very ſlow fire. By this means a pure alcohol may be made out of the fouleſt faints.

The malt diſtiller always gives his ſpirit a ſingle rectification *per ſe*, in order to purify it a little, and make it up proof; but in this ſtate it is not to be reckoned fit for internal uſes, but ſerves to be diſtilled into geneva and other ordinary compound ſtrong waters for the vulgar.

The Dutch, who carry on a great trade with malt ſpirit, never give it any farther rectification than this; and it is on this account, that the malt ſpirit of England is in general ſo much more in eſteem. The Dutch method is only to diſtil the waſh into low wines, and then to full proof ſpirit; they then directly make it into geneva, or elſe ſend it as it is to Germany, Guinea, and the Eaſt-Indies, for the Dutch have little notion of our rectification. Their ſpirit is by this means rendered very foul and coarſe, and is rendered yet more nauſeous by the immoderate uſe they make of rye-meal. Malt ſpirit, in its unrectified ſtate, is uſually found to have the common bubble proof, as the malt diſtiller knows that it will not be marketable without it.

The whole matter requiſite to this is, that it have a conſiderable portion of the groſs oil of the malt well broke and mixed along with it; this gives the rectifier a great deal of trouble if he will have the ſpirit fine; but in the general run of the buſineſs, the rectifier does not take out this oil, but breaks it finer, and mixes it faſter in by alkaline ſalts, and diſguiſes its taſte by the addition of certain flavouring ingredients. The ſpirit loſes in theſe proceſſes the vinoſity it had when it came out of the hands of the malt diſtiller, and is in all reſpects worſe, except in the diſguiſe of a mixed flavour.

The alkaline ſalts uſed by the rectifier deſtroying the natural vinoſity of the ſpirit, it is neceſſary to add an extraneous acid in order to give it a new one. The acid they generally uſe is the ſpiritus nitri dulcis; and the common way of uſing it is the mixing it to the taſte with the rectified ſpirit: this gives our malt ſpirit, when well rectified, a flavour ſomewhat like that of French brandy, but this ſoon flies off; and the better method is to add a proper quantity of Glauber's ſtrong ſpirit of nitre to the ſpirit in the ſtill. The liquor in this caſe comes over impregnated with it, and the acid being more intimately mixed, the flavour is retained.

Malt-Bruiſer, or *Bruiſing-mill*. It has been found by repeated experiments, that bruiſing malt is a more advantageous method than the old one of grinding and flouring. By bruiſing, there is not only leſs waſte, but the malt is alſo better fitted for giving out all its virtues. It has lately, therefore, become a practice to ſqueeze malt between rollers, by means of a proper apparatus, of which various conſtructions have been invented. As the beſt contrivance of this ſort is ſaid to be the bruiſing-mill of Mr Winlaw, we have given a figure of it on Plate CCLXXXII. where AAAA is the frame; B, the large cylinder or roller; C, the ſmall one; D, the hopper; E, the ſhoe; F, the frame that ſupports the hopper; G, a fly-wheel; H, the windlas. To uſe this engine, it is directed to ſcrew the large roller up to the ſmall one, and not to feed two faſt from the ſhoe, which is regulated by pins that have ſtrings fixed to them. It is evident, that when two ſmooth ſurfaces are oppoſed to each other at a diſtance which can be regulated at pleaſure, neither grain nor any other ſimilar ſubſtance can paſs between them without being bruiſed. This being the principle on which the bruiſing-mill acts, the meally ſubſtance, which is the eſſential part of malt, is entirely removed from the ſkin or huſk which contains it, and all the virtues of the malt are with eaſe extracted by the water in a manner ſuperior to what is affected when the grain is only cut by grinding. The operation is at the ſame time ſo expeditiouſly performed, that two men can with eaſe bruiſe a buſhel of malt in a minute. —By the ſame engine may alſo be bruiſed oats and beans for horſes. A great part of the corn given theſe animals, it is well known, is ſwallowed whole, and often paſſes through them in the ſame ſtate; in which caſe, they cannot receive any nouriſhment from the grains that are unbroken: but when bruiſed in this engine, it eaſes maſtication; and every grain being prepared for nutrition, a much leſs quantity will of courſe be found to be ſufficient. For bruiſing beans, the two regulating ſcrews muſt be unſcrewed a little; and the fly-wheel requires to be then ſet in motion with the hand, on account that the rollers are then a little ſpace apart, and will not turn each other before the beans come between them.

Malt-Tax, is the ſum of 750,000l. raiſed every year by parliament ſince 1697, by a duty of 6d. on the buſhel of malt, and a proportionable ſum on certain liquors, ſuch as cyder and perry, which might otherwiſe prevent the conſumption of malt. This is under the management of the commiſſioners of the exciſe; and is indeed itſelf no other than the annual exciſe. In 1760, an additional perpetual exciſe of 3d. per buſhel was laid upon malt; and in 1763, a proportial exciſe was laid upon cyder and perry, but new-modelled in 1766. See Excise.

MALTA, a celebrated iſland of the Mediterranean, ſituated between the 15th and 16th degrees of eaſt longitude, and between the 35th and 36th degrees of north latitude. It is about 19 or 20 leagues in length, nine or ten in breadth, and 60 in circumference. Anciently it was called *Melita*; and is ſuppoſed by Cluverius, from its ſituation and other particulars, to be the Hiperia mentioned by Homer, whence the Pheaces were afterwards driven by the Phenicians, and retired into Scheria and the iſland of Corfu; which is the more probable, as the ancient poet places the mountain Melita in that iſland. He has likewiſe brought ſome probable arguments to prove, that Melita or Malta is the ancient *Ogygia*; in which the famed nymph *Calypſo*, daughter of the Ocean and Thetis, received the ſhipwrecked Ulyſſes, and detained him ſeven years.

1
Ancient hiſtory of the iſland.

The moſt ancient poſſeſſors of Malta, of whom we have any certain account, were the Carthaginians; from whom it was taken by the Romans: and yet during the whole time that it continued under the power of theſe polite nations, it was almoſt entirely barren. The ſoil was partly ſandy and partly rocky, having ſcarcely any depth of earth; and withal ſo ſtony, that it was hardly capable of producing corn or any other grain except cummin, and ſome ſeeds of a ſimilar nature. Its chief products were figs, melons, honey, cotton, and ſome few other fruits and commodities which the inhabitants exchanged for corn; and in this barren ſtate it ſeems to have continued till it came into the poſſeſſion of the Maltese knights. It laboured alſo under great ſcarcity of water and fuel: upon all which accounts it was till that time but thinly inhabited, there being only about 30 or 40 boroughs or other villages ſcattered about, and no city except the capital, called alſo *Malta*, and the town and fort of St Angelo, which defended the harbour: ſo that the whole number of its inhabitants did not exceed 12,000, including women and children; the greateſt part of whom were very indigent.

According to an ancient tradition, Malta was firſt poſſeſſed by an African prince named *Battus*, an enemy to queen Dido; from whom it was taken by the Carthaginians, as may be juſtly inferred from ſeveral Punic inſcriptions to be ſeen on ſtone-pillars and other monuments yet ſtanding. From the Carthaginians it paſſed to the Romans, who made themſelves maſters of it at the ſame time that they ſubdued the iſland of Sicily. Theſe were driven out by the Arabs in the year 828; who were driven out of it in their turn by Roger the Norman, earl of Sicily, who took poſſeſſion of it in 1190: from which time it continued under the dominion of the Sicilian princes till the time of Char. V. when it fell under his power, along with Naples and Sicily. To cover the iſland of Sicily from the Turks, Charles gave the iſland to the *knights of Rhodes*, ſince that time called *knights of Malta*.

2
Malta given to the knights of Rhodes.

The origin and hiſtory of theſe knights is given under

der the article *Knights of Malta* and *Rhodes*. Here it is ſufficient to obſerve, that in 1530, the knights of Rhodes having been expelled from that iſland by Soliman the Turkiſh ſultan, and deſtitute of an habitation, accepted, tho' not without ſome reluctance on account of its barrenneſs, the offer made them by Charles V. of the iſland of Malta. The grand maſter having cauſed his two large carracks, the galleys of the order, and a good number of other tranſport-ſhips laden with great quantities of arms, ammunition, and troops, to be got ready, he and his knights embarked in the former, with all the effects, records, and treaſure belonging to the order, and the reſt in the latter. In their paſſage they ſuffered very much by a violent ſtorm; in which one of their galleys ſplit upon a rock, and one of the carracks was run aground by the violence of the waves, after having broke her three anchors. She ſtuck ſo faſt, that they expected every moment to ſee her ſplit in pieces; when providentially a contrary wind diſengaged her without damage. This event was counted as a lucky omen, and on the 26th of October that year all the company were ſafely landed.

At the firſt landing of the Malteſe knights, they found themſelves obliged to lodge in a very poor town or borough at the foot of the hill on which ſtands the caſtle of St Angelo, and where their only habitations were fiſhermens huts. The grand-maſter, with the principal knights, took poſſeſſion of the caſtle, where the accommodations were ſomewhat better: tho' theſe too were very mean, and out of repair. Three days after, he took poſſeſſion of the city, which was formerly called *Malta*, but ſince that time hath taken the name of the *Notable City;* and after that, of the whole iſland of Malta, and the neighbouring one of Goſa.

3 They attempt the conqueſt of Modon without ſucceſs.

The firſt care of the knights, after having ſettled their authority through the two iſlands, was to provide ſome better accommodation for the preſent, and to chooſe a proper place where to fix their habitation. But as the iſland had no other defence than the old caſtle of St Angelo, and was ſo much expoſed on all ſides, that it would have required greater ſums than their exhauſted treaſury could ſpare to put it in a proper ſtate of defence; the grand-maſter was obliged to content himſelf with ſurrounding the borough abovementioned, wherein he had ordered new buildings to be reared for the preſent habitation of his knights, with a ſtout wall, to prevent its being ſurpriſed by the Turkiſh and Barbary corſairs. His deſign indeed, at this time, was not to have fixed the abode of the knights in the bare and defenceleſs iſland of Malta, but to ſtay in it only till he had got a ſufficient force to attempt the conqueſt of *Modon*, a town of the Morea, and which was not only a populous and opulent place, but lay very convenient for making an attempt on the iſland of Rhodes, their ancient habitation, and to which they were naturally attached. This, however, did not hinder his taking all proper meaſures for ſecuring Malta as well as Goſa, and laying out a proper plan for ſecuring them from attacks, in caſe the deſign on Modon ſhould fail.

In the mean time, as ſuperſtition was then univerſally prevalent, the grand-maſter, among other precious relics which they had brought from Rhodes, cauſed the arm of St Catharine to be carried in proceſſion to the cathedral. Whilſt they were on their march, one of the centinels gave them notice, that a large Turkiſh merchantman was wrecked on their coaſt. The grand-maſter immediately diſpatched ſome of his knights and ſoldiers thither; who finding Iſaac the patron of the ſhip, a native of Modon, and one Maurithiſala Nocher, an excellent engineer, they were retained in the ſervice of the order, and the latter was immediately employed in fortifying the iſland.

The knights were hardly ſettled in Malta, when the emperor, and other European potentates, endeavoured to engage them in a war with the inhabitants of Barbary, as the city of Tripoli, then held by Charles, was in great danger of falling into the hands of the infidels. The attempt on Modon, however, was firſt made; but it proved unſucceſsful through the baſe avarice of the Malteſe forces: for they having been admitted into the city, during the night began to murder and plunder the inhabitants, without waiting for the arrival of the galleys which were coming to their aſſiſtance. The conſequence was, that the inhabitants armed, and a deſperate battle began; in which the Malteſe, notwithſtanding the utmoſt efforts, were obliged to retire, but not till they had loaded themſelves with plunder, and carried away 800 women captive.

4 Join the emperor againſt the Turks.

The grand-maſter, looking upon this diſappointment as a ſign that Providence had ordained Malta to be the reſidence of the knights, did not renew his attempts upon Modon; but, in 1532, joined with the emperor againſt the Turks, and ſent a great number of his galleys to join the confederate fleet under the celebrated Andrew Doria. In conſequence of this aid, the undertaking proved ſucceſsful; and in all probability the conqueſt of Modon would have been accompliſhed, had not the ſoldiery, diſcouraged by the bad ſucceſs of the laſt attempt, openly refuſed to proceed, and obliged the emperor to proceed to Coron, another town belonging to the Turks. Through the valour of the Malteſe knights, this place was ſoon obliged to capitulate; and in a ſecond expedition in 1533, the knights again diſtinguiſhed themſelves in a moſt eminent manner. They were quickly recalled, however, by the grand-maſter to the defence of the iſland, which was now threatened with an invaſion by Barbaroſſa the celebrated Turkiſh corſair, who ſcoured thoſe ſeas at the head of above fourſcore galleys. This invaſion, however, did not take place; and in 1534 the grand-maſter Villiers de L'Iſle Adam died, and was ſucceeded by Perino de Ponte, a native of the town of Aſt in Italy.

The new grand-maſter, who received intelligence of his election at St Euphemia in Calabria, very ſoon after received another expreſs, giving an account of the wars which in that time reigned in Tunis, and the danger that Tripoli as well as Malta was in from Barbaroſſa, who was by this time become maſter both of Algiers and Tunis; upon which he made all the haſte he could to his new government. His firſt care was to ſend a ſtrong reinforcement to Italy; after which, he diſpatched an embaſſy to the emperor, intreating him to equip a powerful fleet againſt Barbaroſſa, without which it would be impoſſible for Tripoli to hold out much longer.

5 Africa invaded by Charles.

6 Deſperate valour of the Malteſe knights.

By this embaſſy from De Ponte, and another to the ſame purpoſe from Muley Haſſan, the depoſed king of Tunis, Charles was eaſily prevailed on to carry his arms into Africa; in which he was aſſiſted by a great number of the braveſt knights, together with 18 brigantines of different ſizes, four of the beſt Malteſe galleys, and their veſſel called the *great carrack*, of itſelf almoſt equivalent to a ſquadron. In this expedition the knights diſtinguiſhed themſelves in a moſt eminent manner. At the ſiege of Goletta, one of the knights, named *Converſa*, an excellent engineer, by means of a *barcalonga*, got almoſt cloſe to the great tower, which he furiouſly battered with large cannon, while the great carrack, which was behind all the reſt of the veſſels, and by reaſon of its height could fire over them, did prodigious execution. A breach was ſoon made; and hardly was it wide enough to be ſcaled, when the Malteſe knights jumped out of the galleys into their long-boats, and thence into the ſea, with their ſwords in their hands, and waded through the water above their girdles, it being too ſhallow for boats to approach the ſhore. The ſtandard-bearer of the order was the firſt that jumped into the water, and led the reſt to the attack; they claiming every where the poſt of honour. They marched with the greateſt reſolution through the moſt terrible firing and ſhowers of all kinds of miſſile weapons; and, having gained the ſhore, quickly aſcended the breach, on the top of which they planted their great ſtandard. A great number loſt their lives, and ſcarce one came off unwounded; but the emperor did them the juſtice to own, that the taking the place was chiefly owing to the valour of the Malteſe knights.

7 Privileges conferred upon them by the emperor.

The city of Tunis was ſoon taken after the fortreſs of Goletta; on the ſurrender of which, the emperor, deſigning to return into Europe, took his laſt dinner on board the great carrack; where he was magnificently entertained, and beſtowed on the ſurviving knights the greateſt encomiums, and marks of his eſteem and gratitude to the owner. Theſe he accompanied with conſiderable preſents and with two new grants. By the firſt, they were allowed to import corn and other proviſions from Sicily, without paying duty; and by the ſecond, the emperor engaged, that none of the order ſhould enjoy any of the eſtates or revenues, due to Malteſe knights, throughout all his dominions, unleſs they were lawfully authorized by the grand-maſter and his council; or till the originals had been examined and regiſtered by himſelf, or ſuch miniſters as he ſhould appoint for that purpoſe. The fleet then ſet ſail for Malta; where, on their arrival, they received the news of the grand-maſter's death, who was ſucceeded by Didier de Tolon de St Jalle, a native of Provence, and then grand prior of Tholouſe, where he reſided at the time of his election.

8 The Turks make an unſucceſsful attempt on Tripoli.

The preſent grand-maſter was a man of great conduct and bravery, which he had formerly ſhown at the ſiege of Rhodes; and the ſituation of affairs at this time required a perſon of experience. The Turkiſh corſairs, quite tired out with the dreadful havoc made among them by Botigella, grand prior of Piſa, who ſeldom quitted the ſea, and never ſailed out without ſinking ſome of them, or making conſiderable prizes, had agreed to enter into a ſtrong confederacy, either to ſurpriſe the city of Tripoli where his retreat was, or, if that failed, to lay ſiege to it by ſea and land; in either of which attempts, they were ſure of all the aſſiſtance of Barbaroſſa and Hayradin, then lord of Tagiora. This laſt had undertaken the command and conduct of the whole enterpriſe; but the governor being informed of the deſign, prepared to give him a warm reception. Hayradin came thither with his whole force in the dead of the night, and began to ſcale the walls in thoſe places where he reckoned them to be moſt defenceleſs. They no ſooner appeared at the foot of them, than the garriſon, which had been kept up in arms, poured down ſuch ſtreams of wildfire, boiling oil, melted lead, &c. and threw ſuch volleys of ſtones, while the great and ſmall guns ſo annoyed thoſe that ſtood fartheſt off, that great numbers of them were deſtroyed. They perſiſted in the attack, however, with great fury and vigour, till Hayradin, who was foremoſt in one of the ſcalades, was knocked down by a muſket-ſhot from the top of his ladder. He fell into the ditch, and was taken up almoſt dead; upon which his troops inſtantly diſperſed themſelves, and abandoned the enterpriſe. The governor of Tripoli, however, judging that this would not be the laſt viſit of the kind which in all probability he would receive, immediately diſpatched an expreſs to Malta, with propoſals for fortifying the city, and demoliſhing a ſtrong tower on that coaſt named *Alcaid*, which was held by a Turkiſh corſair. His advice being approved of, the commander Botigella, now general of the galleys, was immediately diſpatched with a ſufficient force; who, having landed his men at Tripoli, immediately marched, with them and a body of Arab mercenaries towards Alcaid; and without ſtaying to open the trenches, or any other covering than his gabions, levelled his artillery againſt it. Hayradin being informed of this, came with his Turks to its defence; but was intercepted by a ſtrong detachment of Malteſe knights at the head of the hired Arabs, and repulſed with loſs; ſo that all he could do was to convey about 50 or 60 Turks into the place, and to annoy the Chriſtians with ſome ſlight ſkirmiſhes. Botigella, perceiving that his cannon did not make ſuch quick diſpatch as he wiſhed, ſent ſome of his galleys; under the ſhelter of which he quickly ſprung a mine, which brought down part of the wall, and buried moſt of the corſairs under it; upon which the reſt, ſeeing the Malteſe knights mount the breach ſword-in-hand, immediately threw down their arms. The tower was then razed to the ground; after which Botigella marched to a town called *Adabus*, whence he drove Hayradin, who had intrenched himſelf in it, and gave the plunder to the Arabs. In his return he attacked and took a large Turkiſh galley, the cargo of which was valued at 160,000 crowns, and had on board 200 perſons; ſo that he landed in triumph, and was received with the loud acclamations of the whole order, who came to meet him on his arrival. Soon after the grand-maſter fell ſick and died, and was ſucceeded by John de Homedes.

The Malteſe ſtill continued to behave with their uſual valour againſt the Turks; but, through the negligence of Charles V. almoſt all the places held by the Chriſtians on the African coaſt were reduced by the infidels, and the valour exerted by the Malteſe ſerved only to deſtroy great numbers of them. At laſt the emperor's affairs in Africa were totally ruined by

9
The emperor ſaved by the valour of the Malteſe knights.

his unſucceſsful expedition againſt ALGIERS, an account of which was given under that article, nº 12—18. Here indeed it is thought that the emperor himſelf could not have eſcaped, had not the Malteſe knights repulſed the Turks, who had attacked even the imperial quarters. They purſued them even to the gates of the city, and were in hopes of entering it with them; but the governor having cauſed the gates to be ſhut before the Turks had all got in, the knights were diſappointed. When the Spaniſh troops reimbarked, the Malteſe were alſo of great ſervice in repulſing the enemy; and indeed behaved on both occaſions with ſo much valour and intrepidity, that the reſt of the allies could not ſufficiently admire them. The misfortune, however, was, that the loſs they ſuffered, both of men and ſhips, eſpecially by ſome of their beſt commanders, more than counterbalanced the glory they had gained. The emperor, before they parted, gave them the moſt ample teſtimony of his ſatisfaction and gratitude, as far as words and encomiums could go; after which, the Malteſe commander ſet ſail, with the ſmall remains of his knights, in three ſhattered veſſels, and arrived ſafely at the port of Malta about the end of November 1548.

While the Malteſe were employed in this unfortunate expedition, the iſland was ſo terribly annoyed by the Turkiſh and other corſairs, that the port was in ſome meaſure blocked up by them; whilſt the coaſts, both here and at Goſa, lay expoſed to frequent inſults and depredations, and often to the loſs of their inhabitants. This obliged the Malteſe admiral Simeoni to refit his galleys with all poſſible expedition, and again put to ſea in queſt of theſe enemies. In this enterpriſe he ſucceeded ſo well, that he ſent home a great number of the corſair captains in chains. Being obliged to put in at the port of Tripoli, the governor informed him, that he had juſt received an expreſs from the king of Tunis, acquainting him that Barbaroſſa was making the moſt preſſing complaints to the Porte againſt the Malteſe knights, whilſt his lieutenant Morat Haga was making great preparations at Tachora for the ſiege of Tripoli, which he doubted not would be followed by that of Tunis; the king having become odious to the Turks and Moors on account of his alliance with the emperor; after whoſe late diſaſter a great number of towns in that kingdom had revolted from him, and a much greater number of his ſubjects had put themſelves under the protection of the Algerine monarch, who was expected ſhortly from Conſtantinople at the head of a powerful fleet.

10
The Turks take Tripoli, and reſolve to expel the knights from Malta.

On the receipt of theſe unwelcome news, an embaſſy was ſent to the emperor, in order to perſuade him to cauſe the fortifications of Tripoli be repaired; but without ſucceſs. All that could be obtained was fair words and promiſes; the conſequence of which was, that the Malteſe made moſt violent and almoſt incredible exertions againſt their enemies, till at laſt Soliman reſolved to expel the knights from Malta, as he had before done from Rhodes. To this he was chiefly inſtigated by Dragut, an old experienced corſair, who had obtained the command of his fleet after the death of Barbaroſſa. The ſiege was accordingly commenced in 1551; but, by a ſtratagem, the Turkiſh commander was induced to depart. However, he reduced the caſtle of Goſa and the city of Tripoli. Nothing happened of great conſequence from that time till the year 1564, when freſh complaints being made to Soliman, he propoſed, in a grand council, where moſt of his officers attended, to extirpate the knights altogether. This deſign was ſtrenuouſly opppoſed by Hali, one of Dragut's moſt experienced captains, who offered the moſt ſolid reaſons againſt it; but being overruled by the reſt, an expedition againſt Malta was reſolved upon. One of the ſultan's firſt cares was to ſend ſome ſpies, in the diſguiſe of fiſhermen, to take a full view of the iſland, who found means to bring him an exact plan of it, with all its fortifications, havens, ſtrength, the number of its inhabitants, &c. whilſt he was haſtening his armaments againſt it. By this time, as the Malteſe had very little reaſon to doubt that the Turkiſh armaments were deſigned againſt their iſland, the viceroy of Sicily, Don Garcia, was ordered by his maſter to take it in his way to the caſtle of Goletta, in order to conſult with the grand-maſter about the neceſſary means for oppoſing ſuch a formidable power. The grand-maſter acquainted him, that, in caſe of an attack upon Malta, he ſhould want both men and corn: upon which the viceroy engaged to ſupply him with both on his return to Sicily; in pledge of which he left one of his ſons with him, who was afterwards admitted into the order. He was no ſooner departed, than the grand-maſter ſummoned all the knights of the order, diſperſed through ſeveral parts of Europe, to repair to him. Thoſe that were in Italy raiſed a body of 2000 foot, to which the viceroy of Sicily added two companies of Spaniſh forces. All the galleys of the order were employed in tranſporting theſe troops, together with all manner of proviſions and ammunition, into the iſland; and the knights that were in it, in diſtributing, diſciplining, and exerciſing their new levies, as well as the Malteſe militia, againſt the ſiege. Thus the grand-maſter ſaw himſelf ſtrengthened by the arrival of 600 knights, all of whom brought with them retinues of ſtout good ſervants, fit to aſſiſt in the defence of the iſland; whilſt thoſe, who by reaſon of age, ſickneſs, or other impediments, could not to repair to him, ſold their moſt valuable effects in order to aſſiſt him with their purſes. The pope, on his part, contented himſelf with ſending a ſupply of 10,000 crowns; and the king of Spain ordered his viceroy Don Garcia to raiſe an army of 20,000 men, to be ready to ſail thither as ſoon as called for. The grand-maſter employed the remainder of his time in viſiting all the forts, magazines, arſenals, &c. and aſſigning to each tongue their ſeveral poſts, and making all neceſſary preparations, till the Ottoman fleet appeared in ſight on the 18th of May 1565. It conſiſted of 159 large galleys and galleons, carrying on board 30,000 forces, janizaries and ſpahis, beſides the ſlaves at the oar, accompanied by a conſiderable number of other veſſels, laden with artillery, ammunition, and other neceſſaries for a ſiege. The whole armament was commanded by Muſtapha Baſha, an old experienced officer, aged about 85 years, and an old favourite and confident of the ſultan; of an haughty cruel temper, who made it a merit to violate his word, and to uſe all manner of violence againſt the Chriſtians, eſpecially againſt the Malteſe. This formidable army landed at ſome diſtance from Il Borgo, and ſoon afterwards ſpread themſelves over the country; ſetting fire to the villages,

11
The ſiege commenced.

villages, putting the peaſants to the ſword, and carrying off ſuch of the cattle as, notwithſtanding the orders of the grand-maſter, had not been ſecured within the forts and towns.

While the Turks were thus employed, La Valette (the grand maſter) ſent out De Copier, marſhal of the order, with 200 horſe and 600 foot, to watch their motions. De Copier, an officer of great experience, executed his commiſſion with ſo much prudence and vigour, that, by falling unexpectedly on detached parties, he cut off 1500 Turks, with the loſs only of 80 men.

The Turkiſh general held a council of war as ſoon as all his troops were landed, to aſſiſt him in reſolving where he ſhould begin his attack. Piali, the Turkiſh admiral, agreeably to what he underſtood to have been the ſultan's inſtructions, was of opinion that they ought not to enter upon action till Dragut ſhould arrive. But Muſtapha having received information of the king of Spain's preparations, thought ſomething ought to be done inſtantly for the ſafety of the fleet; which lay at preſent in a creek, where it was expoſed to the violence of the eaſt wind, and might be attacked with great advantage by the Spaniards. On this account he was of opinion, that they ſhould immediately lay ſiege to a fort called *St Elmo*, which ſtood on a neck of land near Il Borgo, having the principal harbour on one ſide of it, and on the other another harbour large enough to contain the whole fleet in ſafety. This propoſal was approved by a majority of the council, and Muſtapha proceeded without delay to carry it into execution.

12 Deſperate defence of fort St Elmo.

La Valette did not expect that a place which was neither ſtrong nor large enough to admit a numerous garriſon, could be defended long againſt ſo great a force as was employed to reduce it; but he thought it neceſſary that the ſiege of this fort ſhould be prolonged as much as poſſible, in order to give the viceroy of Sicily time to come to his relief. With this view, he reſolved to throw himſelf into St Elmo, with a ſelect body of troops; and he was preparing to ſet out, when the whole body of knights remonſtrated with ſuch earneſt importunity againſt his leaving the town, that he at laſt conſented to ſuffer the reinforcement, which he had prepared, to be conducted to the fort by a knight called *De Medran*, upon whoſe conduct and intrepidity he could rely with the moſt aſſured confidence.

Not long after De Medran's arrival in the fort, the garriſon made a vigorous ſally, in which they drove the enemy from their entrenchments, and put a number of them to the ſword. But the reſt ſoon recovered from their ſurpriſe; and having returned to the charge, they compelled the Chriſtians to retire. In this rencounter, the vigorous efforts of the Janiſaries were favoured by the wind, which blew the ſmoke of the guns upon the fort, and covered the beſieged with a thick cloud, through which it was impoſſible to diſcern the operations of the enemy. This incident the Turks had the preſence of mind to improve to very great advantage. They ſeized, unperceived, upon the counterſcarps; made a lodgment there with beams, woolſacks, and gabions; and raiſed a battery upon it with incredible expedition. After the ſmoke was diſperſed, the beſieged beheld what had been done with much aſtoniſhment; and they were the more diſquieted, as the fortification which the Turks had raiſed upon the counterſcarp overtopped a ravelin which lay near it, in which the beſieged could no longer appear with ſafety. They reſolved, however, to defend this ravelin as long as poſſible, whatever it ſhould coſt them.

In the mean time Dragut, and another noted Corſair named Uluchiali, arrived with 20 galleys; having, beſides ſlaves and ſeamen, 2500 troops on board. This reinforcement, and the preſence of Dragut, added freſh vigour to the operations of the ſiege. This gallant Corſair expoſed himſelf, on all occaſions, with the utmoſt intrepidity; ſpent whole days in the trenches; and as, beſides his other extraordinary talents, he was particularly ſkilful in the management of artillery, he cauſed ſome new batteries to be raiſed in more advantageous ſituations than had hitherto been made choice of; and kept up a continual fire both on the ravelin above mentioned and a cavalier that covered the fort, and was one of its principal defences.

This cavalier ſoon became the only defence which could prevent the beſiegers from coming up to the very foot of the wall. Some Turkiſh engineers having approached the ravelin at day-break, to obſerve the effects of their artillery, they perceived a gun-port ſo low, that one of them, when mounted on the ſhoulders of another, looked into it, and ſaw the Chriſtian ſoldiers lying on the ground aſleep. Of this they gave immediate information to the troops; who, advancing as quickly and ſilently as poſſible, and clapping ladders to the gun-hole, got up into the ravelin, and cut moſt of the Chriſtians to pieces.

Between this ravelin and the cavalier lay the ditch, over which the beſieged had thrown a temporary bridge of planks leading up to the cavalier. The Turks, perceiving this, leaped inſtantly upon the bridge, and attempted to make themſelves maſters of the cavalier, as they already were of the ravelin. But the garriſon was now alarmed; the braveſt of the knights haſtened from different quarters to the poſt of danger; and, after an obſtinate engagement, they compelled the Turks to retire into the ravelin. There, obſerving another way of reaching the cavalier by a path from the bottom of the ditch, they threw themſelves down without dread or heſitation; and having aſcended by this path to the other ſide, they renewed their attack with greater fury than ever. The combat laſted from ſun-riſe till noon, when the knights at laſt proved victorious. About 20 knights and 100 ſoldiers were killed; and near 3000 of the enemy.

As the ravelin was open on the ſide towards the fort, the beſieged pointed ſome cannon againſt it, and made great havock among the infidels. But Muſtapha, ſenſible of the value of the acquiſition he had made, poured in freſh ſoldiers without number, and the pioneers coming forward with wool-ſacks, planks, and gabions, put the troops at length in ſafety, and made a lodgment in the ravelin, of which the garriſon were never afterwards able to diſpoſſeſs them.

The grand-maſter's concern on account of this diſaſter was greatly augmented, by conſidering, that it could not have happened ſo ſoon without ſome negligence on the part of the garriſon. He ſent them, however, an immediate reinforcement; and both the ſiege and the defence were carried on with the ſame vigour as before.

But the ſituation of the beſieged was now become much more dangerous than formerly. The Turks applied with unremitting diligence to heighten the ravelin till it overtopped the wall of the fort; and after this the garriſon could no longer appear upon the parapet with ſafety. Many were killed by the enemy's artillery, ſeveral breaches were made in the wall, and the hearts of the braveſt knights began to fail within them.

13
The knights deſire permiſſion to leave the fort, but are refuſed.

They agreed therefore, though with much reluctance, to apply to the grand-maſter for liberty to quit the fort; and they made choice of the chevalier de Medran for their meſſenger. He repreſented that the fort was in reality no longer tenible; and that, to continue in it, though only for a few days, would infallibly occaſion the deſtruction of the garriſon.

Moſt of the knights in council thought that this requeſt of the garriſon ought to be immediately granted. But la Valette was of a contrary opinion.—This he repreſented to the chevalier de Medran; and ſent him back with inſtructions to remind the knights of the vows which they took, at their entrance into the order, of ſacrificing their lives for its defence. He likewiſe bad him aſſure them, in his name, that he would not fail to ſend them ſuch reinforcements as they ſhould ſtand in need of; and was determined, as ſoon as it ſhould be neceſſary, to come himſelf to their aſſiſtance, with a fixed unalterable pupoſe to lay down his life ſooner than deliver the fort into the hands of the infidels.

This anſwer had the deſired effect on ſeveral of the knights, and particularly on thoſe whoſe principles of honour and attachment to the order were confirmed by years. But the greater part of them were much diſſatisfied. They thought the grand-maſter's treatment of them harſh and cruel; and wrote him a letter, ſubſcribed by 53; in which, after repeating their former requeſt, they informed him, that if he did not, on the next night, ſend boats to carry them to the town, they were determined to ſally out into the Turkiſh camp, where they might fall honourably by the ſword, inſtead of ſuffering ſuch an ignominious death as they had reaſon to expect if the fort was taken by ſtorm.

To this letter la Valette replied, "That they were much miſtaken if they expected to ſatisfy their honour by throwing away their lives; ſince it was no leſs their duty to ſubmit to his authority, than to ſacrifice their lives in defence of the order: that the preſervation of the whole depended on their preſent obedience to his commands: that no aid was to be expected from Spain if the fort were given up. And that if he ſhould yield to their requeſt, and bring them to the town, the town itſelf would then be immediately inveſted; and they, as well as the reſt, ſoon afterwards reduced to a ſituation more deſperate than that from which they were ſo ſolicitous to eſcape, by deſerting an important poſt which they had undertaken to defend." Beſides this letter, he ſent three commiſſioners to examine the ſtate of the fortifications; intending by this meaſure either to gain time or to prevent the garriſon from ſinking into deſpair.

Theſe commiſſioners differed very widely in the accounts which they delivered at their return. Two of them thought it impoſſible to defend the fort much longer. But the third, named Conſtantine Caſtriot, a Greek prince, deſcended from the famous Albanian hero Scanderbeg, whether from ignorance or a conſciouſneſs of greater reſources in his native courage than the other two poſſeſſed, maintained that the garriſon was far from being reduced to the laſt extremity; and to give proof how firmly he was perſuaded of the truth of what he ſaid, he offered to enter the fort himſelf, and to undertake the defence of it with ſuch troops as ſhould be willing to accompany him.

The grand-maſter, ſtrongly impreſſed with a ſenſe of the neceſſity of protracting the ſiege, immediately accepted this offer, and beſtowed the higheſt encomiums on Caſtriot's zeal and reſolution. Nor did Caſtriot find any difficulty in perſuading a ſufficient number to attend him, who were no leſs zealous and reſolute than himſelf. The ſoldiers crowded to his ſtandard, and were emulous to have their names enrolled for that dangerous ſervice in which he had engaged.

When la Valette ſaw the ſpirit by which theſe men were animated, and had no longer any doubt of being able by their means to prolong the ſiege of the fort; he ſent a letter to the knights, acquainting them, that he was now willing to give them their diſcharge; and would immediately ſend another garriſon, into whoſe hands he deſired they ſhould be ready to deliver up the fort, and come themſelves to the town in the boats in which their ſucceſſors were to be tranſported.

The contents and ſtyle of this letter affected the knights in the moſt ſenſible manner, and rouſed within them that delicate ſenſe of honour by which the order had been ſo long and ſo eminently diſtinguiſhed.—They reſolved without heſitation to remain in the fort till every man ſhould periſh, rather than either deliver it to the new garriſon or abandon it to the enemy. And they went in a body to the governor, and intreated him to inform the grand-maſter of their repentance, and to join with them in praying that they might be ſuffered to wipe out the remembrance of their fault by their future conduct.

The grand-maſter ſuffered himſelf at laſt to be overcome; and henceforth the garriſon, diſmiſſing all thoughts of their own ſafety, were intent on nothing but how to prolong the defence.

14
Invention of burning hoops.

The grand-maſter ſent them every night freſh troops to ſupply the place of the killed and wounded; and kept them well furniſhed with proviſions, ammunition, and fire-works. Of theſe laſt he had invented a particular kind, which conſiſted of hoops of wood, covered with wool, and ſteeped in boiling oil and other inflammable liquors, mixed with nitre and gunpowder. To theſe machines they ſet fire, and threw them flaming in the midſt of the enemy when they were crowded together at an aſſault. It happened often that two or three of the Turks were hooked together and ſcorched to death; and the utmoſt confuſion was produced wherever they were thrown.

The beſieged ſtood much in need of this, and every other inſtrument of miſchief that could be deviſed, for

their

their defence. In ſpite of the moſt vigorous oppoſition, the Turks had caſt a bridge over the ditch, and begun to ſap and undermine the wall. From the 17th of June to the 14th of July, not a ſingle day paſſed without ſome rencounter; and Muſtapha had frequently attempted to ſcale the wall of the fort, but had been as often repulſed with the loſs of ſome of the braveſt of his troops.

Aſhamed at having been detained ſo long before a place of ſuch inconſiderable ſtrength, he reſolved to make one great deciſive effort; and to bring to the aſſault as many of his forces as the ſituation of the place would permit him to employ. He had already made ſeveral breaches; but in order to ſecure the ſucceſs of the aſſault which he now intended, he kept his batteries playing all the 15th without intermiſſion, till the wall on that ſide where he deſigned his attack was almoſt level with the rock. On the 16th, the fleet was drawn up before ſunriſe, as near the fort as the depth of the water would allow. Four thouſand muſketeers and archers were ſtationed in the trenches: and the reſt of the troops, upon a ſignal given, advanced to the breach. The garriſon was prepared to receive them; the breach was lined with ſeveral ranks of ſoldiers, having the knights interſperſed among them at certain diſtances. The Turks attempted often to break through this determined band, and to overpower them with their numbers; but their numbers ſerved only to augment the loſs which they ſuſtained. Every ſhot from the fort did execution. The artillery made dreadful havoc among them; and the burning hoops were employed with aſtoniſhing ſucceſs. The novelty of theſe machines, and the ſhrieks of thoſe who were caught in them, added greatly to the terror which they inſpired; and made it impoſſible for the Turkiſh officers to keep their men firm and ſteady in purſuing the advantages which, had they preſerved their ranks, their numbers muſt have infallibly acquired.

At length Muſtapha, after having continued the aſſault for more than ſix hours, without gaining a ſingle inch of ground on the beſieged, gave orders for ſounding a retreat. In this attack the garriſon loſt about 20 knights and 300 ſoldiers; but this loſs was immediately ſupplied by a reinforcement from the town; and Muſtapha was at laſt convinced, that, unleſs the communication between the fort and the town were cut off, it would be impoſſible to bring the ſiege of the former to a period, while any troops remained in the other parts of the iſland. By the advice of Dragut, he reſolved to extend his trenches and batteries on the ſide next the town, till they ſhould reach to that part of the ſea, or great harbour, where thoſe ſupplies were landed which the grand-maſter daily ſent to the garriſon. This undertaking he knew muſt be attended with the utmoſt difficulty, becauſe all the ſpace between his intrenchments, and the point to which it was neceſſary to extend them, lay expoſed to the artillery both of fort St Elmo and St Angelo. In viewing the ground, a Sangiac, in whom he put confidence, was killed by his ſide; and, which was ſtill a more irreparable loſs, Dragut received a mortal wound, of which he died in a few days. This did not, however, diſcourage Muſtapha from purſuing his deſign. By employing his troops and pioneers at the work day and night, without intermiſſion, he at length carried it into execution. Then having planted batteries along the ſhore, and filled his trenches with muſketeers, it was impoſſible for any boat to paſs from the town to the fort without the moſt imminent danger of either being ſunk or intercepted.

After this precaution, he reſumed with freſh vigour his attempts to take the fort by ſtorm. On the 21ſt he made four different aſſaults: all of which the garriſon withſtood; and, in repulſing ſo many thouſand brave and well-diſcipined troops, diſplayed a degree of proweſs and fortitude which almoſt exceeds belief, and is beyond the power of deſcription. But this heroic garriſon was now exceedingly reduced in number; and there was the ſtrongeſt reaſon to apprehend, that, in one aſſault more, they muſt inevitably be overpowered, unleſs a reinforcement were ſent them from the town. Of their deſperate ſituation they gave intelligence to the grand-maſter by one who ſwam acroſs the harbour in the night. The boats were inſtantly filled with knights and other ſoldiers, who generouſly reſolved to devote themſelves to certain deſtruction for the general ſafety, and the preſervation of the fort. They ſet off from the town with as much alacrity as if they had entertained the moſt ſanguine hopes of victory; but they found the Turks every where ſo much upon their guard, and the lines ſo ſtrongly defended, that, after ſeveral fruitleſs attempts to land, they were at laſt obliged to return, depreſſed with ſorrow for the fate of their brave companions.

The garriſon, now deſpairing of relief, gave themſelves up for loſt; but inſtead of either capitulating or attempting to eſcape, they prepared for death, and paſſed the night in prayer and in receiving the ſacrament; after which they embraced one another tenderly, and then repaired to their reſpective poſts; while ſuch of the wounded as had been diſabled from walking, were, at their own earneſt deſire, carried to the ſide of the breach, where they waited, without diſmay, for the approach of the Turkiſh army.

Early in the morning of the 23d of July, the Turks advanced to the aſſault with loud ſhouts, as to certain victory, which they believed ſo ſmall a handful of men as now remained in the fort would not dare to diſpute with them. In this expectation they were diſappointed. The garriſon being reſolved on death, and deſpiſing danger, were more than men; and exerted a degree of proweſs and valour that filled their enemies with amazement. The combat laſted upwards of four hours, till not only every knight but every ſoldier had fallen, except two or three who had ſaved themſelves by ſwimming. The Turkiſh colours were then planted on the ramparts; and the fleet entered the harbour, which the fort commanded, in a kind of triumph. When Muſtapha took a view of the fort, and examined its ſize and fortifications, he could not refrain from ſaying, "What will not the father coſt us (meaning the town), when the ſon, who is ſo ſmall, has coſt ſo many thouſands of our braveſt troops?" But this reflection, far from exciting his admiration of that heroic fortitude which he had found ſo difficult to overcome, ſerved only to inſpire him with a brutal fury. He ordered all ſuch of the garriſon as were found lying on the breach alive to be ript open, and their hearts

15
The fort taken, and the garriſon cut off.

16
Cruelty of Muſtapha.

hearts torn out: and, as an inſult on the knights and their religion, he cauſed their dead bodies to be ſearched for, and large gaſhes to be made in them, in the form of a croſs; after which he tied them on planks, and threw them into the ſea, to be carried by the wind and tide to the town or fort St Angelo.

17 And of the grand-maſter.

The grand-maſter was at firſt melted into tears at this ſhocking ſpectacle; but his grief was ſoon converted into indignation and revenge: and theſe paſſions betrayed him into an action unworthy of the exalted character which he bore. In order to teach the baſha, as he pretended, to make war with leſs barbarity, he cauſed all the Turks whom he had taken priſoners to be maſſacred; and then putting their heads into his largeſt cannon, he ſhot them into the Turkiſh camp.

In the ſiege which has been related, the order loſt about 1500 men, including 130 of the braveſt knights.

Muſtapha vainly imagined, that, being intimidated by the fate of their companions, they would be now inclined to liſten to terms of capitulation: and in this hope, he ſent an officer with a white flag to one of the gates, attended by a Chriſtian ſlave deſigned to ſerve for his interpreter. The Turk was not allowed to enter within the town; but the Chriſtian was admitted, and was led through ſeveral ranks of ſoldiers under arms by an officer, who, after ſhowing him all the fortifications of the place, deſired him to take particular notice of the depth and breadth of the ditch, and ſaid to him, “See there, the only ſpot we can afford your general; and there we hope ſoon to bury him and all his Janiſaries.”

This inſulting ſpeech being reported by the ſlave, excited in the fiery mind of the baſha the higheſt degree of wrath and indignation, and made him reſolve to exert himſelf to the utmoſt in the proſecution of the ſiege. His troops, though greatly diminiſhed, were ſtill ſufficient to inveſt at once both the town and the fort of St Michael. He kept a conſtant fire on both; but he intended firſt to apply to the reduction of the latter, which he propoſed to attack both by land and water, at the extremity of the peninſula on which it ſtands. In order to accompliſh this deſign, it was neceſſary he ſhould have ſome ſhipping introduced into the harbour for tranſporting his forces. But the mouth of the harbour having been rendered inacceſſible by a great iron chain and the cannon of St Angelo, his deſign muſt have been relinquiſhed, if Piali had not ſuggeſted an expedient againſt which the grand-maſter had not provided. This was, to make the Chriſtian ſlaves and the crews of the ſhips draw a number of boats, by the ſtrength of their arms, over the neck of land on which ſtood fort St Elmo. Of this propoſal, which Muſtapha immediately adopted, information was carried to the grand-maſter by a Turkiſh officer; who, being by birth a Greek, was touched ſuddenly with remorſe, and deſerted to the Chriſtians. In conſequence of this intelligence, La Valette ſet a great number of hands to work in framing a ſtacado along that part of the promontory where the Turks intended their attack; and at another part, where the depth of the water or the hardneſs of the bottom would not admit the ſtacado, he cauſed ſtrong intrenchments to be made upon the beach. Muſtapha, in the mean time, fired inceſſantly upon the fort, while the ſlaves and crews were employed in tranſporting the boats over land into the harbour. At length the baſha, judging that the number of boats which he had tranſported would be ſufficient, and that the breaches which his artillery had made were practicable, reſolved, without further delay, to make an attack both by ſea and land. He was the more confident of ſucceſs, as, ſince the taking of St Elmo, he had received a conſiderable reinforcement, by the arrival of Haſcem, ſon of Barbaroſſa, with 2500 ſelect ſoldiers, commonly called *the Bravoes of Algiers*. Haſcem, who poſſeſſed a conſiderable ſhare of his father's fire, and was ambitious to diſtinguiſh himſelf in the ſultan's ſervice, begged of Muſtapha to intruſt him with the aſſault of fort St Michael; and vaunted, with his natural arrogance, that he would ſoon make himſelf maſter of it ſword-in-hand. The baſha, whether from an opinion of his valour, or an intention to make him learn at his own expence the folly of his preſumption, readily complied with his requeſt; and, having added 6000 men to his Algerines, he promiſed to ſupport him with the reſt of his army.

Haſcem divided his forces with Candeliſſa, an old corſair, his lieutenant; to whom he committed the attack by ſea, whilſt he reſerved that on the land-ſide to himſelf.

18 The Turks repulſed with great ſlaughter.

Candeliſſa having put his troops on board the boats, ſet out with drums beating, and hautboys and other muſical inſtruments playing, preceded by a boat filled with Mahometan prieſts, ſome of whom were employed in offering prayers to heaven for his ſucceſs, or in ſinging hymns; while others had books in their hands, out of which they read imprecations againſt the Chriſtians. Candeliſſa attempted firſt to break down the ſtacado which had been formed to obſtruct his landing; but finding it much ſtronger than he expected, and that, while he was employed in demoliſhing it, his troops muſt ſuffer greatly from the enemy's fire, he thought it would be eaſier to make a deſcent on that part of the ſhore which the grand-maſter had ſtrengthened with entrenchments. At this important poſt, the Chriſtian troops were commanded by an ancient knight of the name of *Guimeran*. This experienced officer reſerved his fire till the Turks had advanced within a little diſtance of the ſhore, when, by a ſingle diſcharge, he killed about 400 men. This did not prevent the reſt from approaching. Candeliſſa puſhed forwards while the Chriſtians were loading their cannon, and landed at the head of his Algerines. But Guimeran having reſerved ſome cannon charged with grape-ſhot, did dreadful execution among them after they had landed, and many of them began to fly to their boats: which Candeliſſa obſerving, he commanded the boats to be put off to a little diſtance from the ſhore. His troops, perceiving then that they muſt either die or conquer, took courage from deſpair, and advanced boldly to the intrenchment, with ladders for ſcaling it in one hand and their ſabres in the other. The combatants on both ſides diſplayed the moſt intrepid valour. Great numbers fell, and the ditch was choaked with blood, and with the bodies of the dead and wounded. The Turks at laſt, after an engagement of five hours, reached the top of the entrenchment,

ment, and there planted their enſigns. The knights, ſtung with ſhame on account of their retreat, returned with redoubled ardour. But they would probably have been overpowered by the ſuperior number of the enemy, had not the grand-maſter ſent them a ſeaſonable reinforcement, under the admiral de Giou and the chevalier de Quiney; who fell upon the Algerines and Turks with a degree of fury that ſtruck terror into Candeliſſa himſelf, who was noted for his intrepidity. Having ordered the boats to be brought nearer the ſhore, he was among the firſt who fled. His bravoes fought deſperately for ſome time after he had left them; but were at length thrown down from the intrenchments, and compelled to fly to their boats with the utmoſt precipitation. The Chriſtians purſued them, and the batteries continued firing on them without intermiſſion. Many of the boats were ſunk; the water was covered with dead bodies, mangled limbs, ſhields, and helmets. Of the 4000 who had been ſent on this enterpriſe, ſcarcely 500 remained, and many of theſe were dangerouſly wounded.

Haſcem was not more fortunate in his aſſault by land than Candeliſſa was by ſea. After having been repulſed at one breach with great ſlaughter, he rallied his troops, and led them on to another, where he fought long and deſperately, till, moſt of the bravoes having fallen by his ſide, he was obliged, with much reluctance and ſorrow, to ſound a retreat.

19 Incredible valour of the Malteſe.

Muſtapha, not unmindful of his promiſe to ſupport him, no ſooner perceived him beginning to retire, than he ordered the Janiſaries, whom he kept under arms, to advance. The garriſon had maintained an engagement with Haſcem for five hours, in the middle of the day, and in the hotteſt ſeaſon of the year; yet, as if they had not been ſubject to the wants and weakneſſes of humanity, they advanced beyond the breach to meet the Janiſaries, and fought apparently with as much vigour and fortitude as before. By the power of ſuperior numbers, they were compelled to fall back within the breach. But there they made the moſt deſperate reſiſtance; and, being reinforced by De Giou and De Quiney, with the troops which had triumphed over Candeliſſa, they at laſt repulſed the Janiſaries with dreadful ſlaughter; after having loſt more than 40 knights, and 200 of the braveſt of the common men.

Muſtapha, enraged by this invincible obſtinacy which the Chriſtians diſplayed in their defence, and dreading that the Spaniſh ſuccours, which had been already delayed much longer than he expected, might ſoon arrive, reſolved now to employ his whole force at once; and while he himſelf proſecuted the ſiege of fort St Michael with one half of his troops, to employ the other, under Piali, againſt the town. More batteries were raiſed; the trenches were advanced ſtill nearer than before; bridges of ſail-yards and maſts were thrown over the ditches; mines, notwithſtanding the hard and rocky ſoil, were ſprung; aſſaults were repeated without number; and the two baſhas, emulous of one another, and each of them agitated with continual anxiety leſt victory ſhould declare firſt for his competitor, exhibited the moſt ſhining proofs of perſonal courage, and exhauſted all the art of war then known in the world. Yet, through the determined bravery of the knights, conducted by the grand-maſter with conſummate prudence and indefatigable vigilance, the Turks were baffled in every attempt, and repulſed with ſlaughter. Muſtapha flattered himſelf once with the moſt ſanguine hopes of ſucceſs on his part, from a machine invented by his principal engineer, in the form of a huge caſk bound ſtrongly with iron hoops, and filled with gunpowder, nails, chains, bullets, and ſuch other inſtruments of death. After ſetting fire to a train which was faſtened to this machine, it was thrown, by the force of an engine, upon a ravelin that was the principal defence of the fort. But the garriſon, undiſmayed, found means, before it caught fire, to caſt it out again into the midſt of the aſſailants. In a moment afterwards it burſt with dreadful fury, and filled the Turks with conſternation. The knights then ſallied out upon them ſword-in-hand; and, taking advantage of their confuſion, killed many of them, and put the reſt to flight.

20 A great number of Turks deſtroyed by a contrivance of their own.

Piali had, on ſome occaſions, ſtill more reaſon than Muſtapha to entertain the hopes of victory, although the town was much ſtronger than the fort and La Valette commanded there in perſon. By his batteries he had demoliſhed all the out-works of the place, and had made an immenſe breach in the wall. While his troops were engaged in a furious aſſault, that engroſſed the whole attention of the beſieged from morning till night, he employed a great number of pioneers in raiſing a cavalier or platform of earth and ſtones, cloſe by the breach, and ſo high as to overlook the parapet. Night, in the mean time, came on, and prevented him from carrying any further this great advantage; but he doubted not that next day he ſhould be able to make himſelf maſter of the place.

21 The grand-maſter prevents the knights from abandoning the town.

As ſoon as he had drawn off his forces, a council of the order was convened, and moſt of the knights were of opinion that the town was no longer tenible; that the fortifications which ſtill remained ſhould be blown up; and that the garriſon and inhabitants ſhould retire into the caſtle of St Angelo. But the grand-maſter received this propoſal with horror and indignation. "This would be in effect (ſaid he) to deliver the whole iſland into the hands of the infidels. Fort St Michael, which has been ſo gallantly defended, and which is preſerved by its communication with the town, would thus be ſoon reduced to the neceſſity of ſurrendering. There is no room in the caſtle of St Angelo for the inhabitants and troops; nor, if there were room, is there water in that fort for ſo great a number." It was then propoſed, that at leaſt the relics of the ſaints and the ornaments of the churches ſhould be carried into the caſtle; and the knights earneſtly intreated the grand-maſter to retire into it himſelf, aſſuring him that they would conduct the defence with the utmoſt vigour and vigilance. "No, my brethren (he replied), what you propoſe as to the ſacred things would ſerve only to intimidate the ſoldiers. We muſt conceal our apprehenſions. It is here we muſt either die or conquer. And is it poſſible that I, at the age of 71, can end my life ſo honourably as in fighting, together with my friends and brethren, againſt the implacable enemies of our holy faith? He then told them what he thought proper to be done, and proceeded inſtantly to put it into execution. Having called all the ſoldiers from fort St Angelo, except a few who were neceſſary for managing the artillery, he employed

them

them and the inhabitants all night in throwing up intrenchments within the breach; after which he ſent out ſome of the braveſt knights, with a ſelect body of troops, to make an attempt on the cavalier. Theſe men ſtole ſoftly along the foot of the wall till they arrived at the place appointed; when they ſet up a loud ſhout, and attacked the guards whom Piali had left there with ſo much fury, that the Turks, believing the whole garriſon had fallen upon them, abandoned their poſt, and fled precipitately to their camp.

The cavalier was immediately fortified, a battery of cannon planted on it, and a parapet raiſed on the ſide towards the enemy. And thus the breach was rendered impracticable; the town put in greater ſecurity than before; and a work, which had been deviſed for its deſtruction, converted into a bulwark for its defence.

The grand-maſter had now greater confidence than ever of being able to hold out till the Spaniards ſhould come to his relief. In conſequence of the aſſurances given by Philip and the Sicilian viceroy, he had, long before this time, entertained the hopes of their arrival; and had often earneſtly ſolicited the viceroy to haſten his departure from Meſſina. The conduct of this nobleman was long exceedingly myſterious. The patience of the knights was worn out by his delays; and they, and many others, ſuſpected that the real motive of his conduct was the dread of encountering with an admiral of ſo conſiderable reputation as Piali. But it afterwards appeared that the viceroy had acted agreeably to his inſtructions from the court of Spain. For although Philip was, for the reaſons above mentioned, ſincerely intereſted in the preſervation of the knights, and had amuſed them with the moſt flattering promiſes of aſſiſtance; yet he ſeems from the firſt to have reſolved not to expoſe himſelf to danger on that account, and to avoid if poſſible a general engagement.

22
Ungrateful and ungenerous conduct of the king of Spain.

A generous and grateful prince would have acted very differently towards an ally ſo deſerving of his ſupport; and if either generoſity or gratitude had been the leading principle of Philip's conduct, it is probable he would, on this occaſion, have regarded the knights as his own ſubjects; and have thought it no leſs incumbent on him to exert himſelf in their defence, than if they had acknowledged him as their ſovereign.

But Philip was affected by their danger only ſo far as it threatened the tranquillity of his own dominions. He had reſolved to interpoſe in their behalf, rather than to ſuffer them to be overpowered; but he appears to have been very little touched with their calamities, and to have intended to leave them to themſelves, as long as there was any proſpect of their being able to make reſiſtance; by doing which he conſidered, that he would not only preſerve his own ſtrength entire, but might afterwards engage with the Turks when they were exhauſted by the operations of the ſiege.

Philip adhered inflexibly to this plan, notwithſtanding the grand-maſter's repeated importunities, much longer than was conſiſtent with his own ſelfiſh views. For, without a degree of fortitude and proweſs on the part of the garriſon, and a degree of wiſdom, vigilance, and magnanimity on that of the grand-maſter, infinitely higher than there could be reaſon to expect, it muſt have been impoſſible for ſuch a handful of men to have withſtood, for ſo long a time, ſo great a force, and ſuch mighty efforts, as were employed to reduce them. Even the death of the grand-maſter alone, whoſe perſon was expoſed to perpetual danger, would have proved fatal to the knights, long before Philip ſent orders to his viceroy to give them any effectual ſupport; and in this caſe, as his own dominions or his fleet would have been immediately attacked, he would probably have had little reaſon to be ſatisfied with the timid ungenerous counſels which he purſued.

Whatever judgment may be formed on this head, the viceroy did not think himſelf at liberty to yield to the repeated applications of the grand-maſter, till the operations of the ſiege began to relax, and the Turkiſh forces were reduced from 45,000 to 15,000 or 16,000; of whom many were worn out with the fatigues which they had undergone, and others rendered unfit for action by a bloody-flux, which for ſeveral weeks had raged amongſt them.

In this ſituation of affairs, when it was probable that the knights would, without aſſiſtance, have compelled the Turks to raiſe the ſiege, the viceroy let the grand maſter know, that he had now received ſuch inſtructions from the king, as put it in his power to ſhow his attachment to the order: that he was not indeed permitted to attack the Turkiſh fleet; but that he would immediately bring him a ſtrong body of troops, whoſe commanders (as he himſelf muſt return to Sicily) were to be entirely ſubject to the grand-maſter's authority till the enemy ſhould be expelled.

23
The knights receive a reinforcement.

The viceroy, altho' ſtill ſuſpected of interpoſing unneceſſary delays, at length fulfilled his promiſe; and on the 7th of September landed 6000 men, under Don Alvaro de Sandé and Aſcanio della Corna, in that part of the iſland which lay at the greateſt diſtance from the Turks; after which, he immediately carried back the fleet to Sicily.

In the mean time, intelligence being brought to Muſtapha that the Spaniards were landed, and marching towards him, he was thrown into the moſt dreadful conſternation. Senſible that his ſoldiers were much diſheartened by their ill ſucceſs, he imagined that he was about to be attacked by a ſuperior army, conſiſting of the braveſt and beſt diſciplined troops in Spain. Without waiting for information of their number, he forthwith raiſed the ſiege, drew his garriſon out of St Elmo, and, leaving all his heavy cannon behind him, embarked his troops with as much precipitation as if the Spaniards with ſuperior forces had been in ſight. He had ſcarcely got on board when a deſerter arrived from the Spaniſh camp, and informed him, that with 15,000 or 16,000 men, he had fled before an army that did not exceed 6000, having no general at their head, and commanded by officers who were independent of one another. The baſha was overwhelmed with ſhame and vexation by this intelligence, and would have immediately diſembarked; but this, he knew, he durſt not attempt without conſulting Piali, Haſcem, and his other principal officers.

24
The Turks raiſe the ſiege in a panic.

While he was deliberating upon it, the grand-maſter improved to the beſt advantage the leiſure that was afforded him. He employed all the inhabitants, men, women, and children, as well as the ſoldiers, in filling up the enemy's trenches, and demoliſhing their works; and put a garriſon without delay into fort St Elmo; in which the Turks now beheld from their ſhips the ſtandard of St John erected, where that of Mahomet had lately ſtood.

This demonſtrated to Muſtapha how much new labour awaited him in caſe he ſhould return to the ſiege; but being enraged againſt himſelf on account of the precipitancy of his retreat, and diſquieted at the thoughts of the reception which he had reaſon to expect from Solyman, he wiſhed to atone for his imprudence, and to wipe off the reproach in which it had involved him, by victory or death. Piali, who, from his jealouſy of the baſha's credit with the ſultan, was not ſorry for the failure of his enterpriſe, repreſented in a council of war convened on this occaſion, That as the troops were much diſpirited and worn out, it would be expoſing them to certain deſtruction, either to lead them againſt the enemy, or to reſume the operations of the ſiege. But a majority of the council were of a different opinion; and it was reſolved to land the forces again without delay.

25 They return, but are defeated.

The Turkiſh ſoldiers complained bitterly of this unexpected reſolution, and obeyed the orders to diſembark with the greateſt reluctance. Their officers were obliged to employ threats with ſome and force with others. At length the number intended was put on ſhore, and Muſtapha ſet out at their head in ſearch of the enemy.

The grand-maſter had not neglected to give early notice of their march to the Spaniſh commanders, who had intrenched their little army on a ſteep hill, which the Turks would have found almoſt inacceſſible; and it was the opinion of ſome of the principal officers, that they ſhould avail themſelves of the advantage of their ſituation, and ſtand on their defence. But this propoſal was rejected with diſdain by the bold adventurous De Sande, and the greateſt part of the Spaniſh officers; and the troops were led out of their encampment, to meet the enemy in the open field. This conduct, more fortunate perhaps than prudent, contributed to increaſe the dejection of the Turkiſh ſoldiers, and to facilitate their defeat. Having been dragged againſt their inclination to the field of battle, and being attacked by the Spaniards with great fury, both in front and flank, they ſcarcely fought, but, being ſtruck with a ſudden panic, fled with the utmoſt precipitation.

Muſtapha, confounded and enraged by this puſillanimous behaviour of his troops, was hurried along by the violent tide of the fugitives. He fell twice from his horſe, and would have been taken priſoner if his officers had not reſcued him. The Spaniards purſued briſkly till they came to the ſea-ſhore. There Piali had his boats ready to receive the Turks, and a number of ſhallops filled with muſketeers drawn up to favour their eſcape. Without this precaution, they muſt all have periſhed; and, even notwithſtanding the protection which it afforded them, the number of their killed amounted to 2000 men, while the victors loſt only 13 or 14 at moſt.

Such, after four months continuance, was the concluſion of the ſiege of Malta, which will be for ever memorable on account of that extraordinary diſplay of the moſt generous and heroic valour by which the knights, ſo few in number, were enabled to baffle the moſt vigorous efforts which could be made to ſubdue them by the moſt powerful monarch in the world. The news of their deliverance gave univerſal joy to the Chriſtian powers; and the name of the grand-maſter excited every where the higheſt admiration and applauſe. Congratulations were ſent him from every quarter; and in many ſtates public rejoicings were celebrated on account of his ſucceſs.

With this ſiege is concluded every thing of importance in the hiſtory of Malta. The power of the Turks began about this time to be ſo much circumſcribed, that they ceaſed to be formidable to the Chriſtian nations, and the knights of Malta had no longer an opportunity of exerting their valour as formerly. They have remained ever ſince in quiet poſſeſſion of their iſland, of which the beſt deſcription we have met with is that given by Mr Brydone.

26 Deſcription of the iſland, &c.

"The approach of the iſland (ſays he) is very fine, although the ſhore is rather low and rocky. It is everywhere made inacceſſible to an enemy by an infinite number of fortifications. The rock, in many places, has been ſloped into the form of a glacis, with ſtrong parapets and intrenchments running behind it.—On getting aſhore we found ourſelves in a new world indeed.—The ſtreets (of Valetta) crowded with well-dreſſed people, who have all the appearance of health and affluence; and we were conducted by the Engliſh conſul to an inn, which had more the appearance of a palace.

"After dinner we went to viſit the principal villas of the iſland; particularly thoſe of the grand-maſter and the general of the galleys, which lie contiguous to one another. Theſe are nothing great or magnificent; but they are admirably contrived for a hot climate, where, of all things, ſhade is the moſt deſirable. The orange-groves are indeed very fine, and the fruit they bear ſuperior to any thing of the kind in Spain or Portugal.

"The aſpect of the country is far from being pleaſing: the whole iſland is a great rock of very white free-ſtone; and the ſoil that covers this rock is, in moſt places, not more than five or ſix inches deep; yet, what is ſingular, we found their crop in general was exceedingly abundant. They account for it from the copious dews that fall during the ſpring and ſummer months; and pretend likewiſe that there is a moiſture in the rock below the ſoil, that is of great advantage to the corn and cotton, keeping its roots perpetually moiſt and cool: without which ſingular quality, they ſay, they could have no crop at all, the heat of the ſun being ſo exceedingly violent.—The whole iſland produces corn only ſufficient to ſupply its inhabitants for five months or little more; but the crop they moſt depend upon is the cotton. They begin to ſow it about the middle of May, and continue till the middle of June; and the time of reaping is in the month of October and beginning of November.

"They pretend that the cotton produced from this plant, which is ſown and reaped in four months, is of a much ſuperior quality to that of the cotton-tree. I compared them; but I cannot ſay I found it ſo: this is indeed the fineſt; but that of the cotton-tree is by much the ſtrongeſt texture. The plant riſes to the height of a foot and an half; and is covered with a number of nuts or pods full of cotton: Theſe, when ripe, they are at great pains to cut off every morning before ſun-riſe; for the heat of the ſun immediately turns

turns the cotton yellow; which indeed we ſaw from thoſe pods they ſave for ſeed.

“ They manufacture their cotton into a great variety of ſtuffs. Their ſtockings are exceedingly fine. Some of them, they aſſured us, had been ſold for ten ſequins a-pair. Their coverlets and blankets are eſteemed all over Europe. Of theſe the principal manufactures are eſtabliſhed in the little iſland of Gozzo, where the people are ſaid to be more induſtrious than thoſe of Malta, as they are more excluded from the world, and have fewer inducements to idleneſs. Here the ſugar-cane is ſtill cultivated with ſucceſs, though not in any conſiderable quantity.

“ The Malteſe oranges certainly deſerve the character they have of being the fineſt in the world. The ſeaſon continues for upwards of ſeven months, from November till the middle of June; during which time thoſe beautiful trees are always covered with abundance of delicious fruit. Many of them are of the red kind, much ſuperior, in my opinion, to the others, which are rather too luſcious. They are produced, I am told, from the common orange-bud, ingrafted on the pomegranate ſtock. The juice of this fruit is as red as blood, and of a fine flavour. The greateſt part of their crop is ſent in preſents to the different courts of Europe, and to the relations of the chevaliers.

The induſtry of the Malteſe in cultivating their little iſland is inconceivable. There is not an inch of ground loſt in any part of it; and where there was not ſoil enough, they have brought over ſhips and boats loaded with it from Sicily, where there is plenty, and to ſpare. The whole iſland is full of incloſures of free-ſtone, which give the country a very uncouth and barren aſpect; and in ſummer reflects ſuch a light and heat, that it is exceedingly diſagreeable and offenſive to the eyes. The incloſures are very ſmall and irregular, according to the inclination of the ground. This, they ſay, they are obliged to obſerve, notwithſtanding the deformity it occaſions; otherwiſe the floods, to which they are ſubject, would ſoon carry off their ſoil.

“ The iſland is covered over with country-houſes and villages, beſides ſeven cities, for ſo they term them; but there are only two, the Valetta, and Citta Vecchia, that by any means deſerve that appellation. Every little village has a noble church, elegantly finiſhed, and adorned with ſtatues of marble, rich tapeſtry, and a large quantity of ſilver-plate.

“ The city of Valetta has certainly the happieſt ſituation that can be imagined. It ſtands upon a peninſula between two of the fineſt ports in the world, which are defended by almoſt impregnable fortifications. That on the ſouth ſide of the city is the largeſt. It runs about two miles into the heart of the iſland; and is ſo very deep, and ſurrounded by ſuch high grounds and fortifications, that they aſſured us the largeſt ſhips of war might ride here in the moſt ſtormy weather, almoſt without a cable.

“ This beautiful baſon is divided into five diſtinct harbours, all equally ſafe, and each capable of containing an immenſe number of ſhipping. The mouth of the harbour is ſcarcely a quarter of a mile broad, and is commanded on each ſide by batteries that would tear the ſtrongeſt ſhip to pieces before ſhe could enter. Beſides this, it is fronted by a quadruple battery, one above the other, the largeſt of which is a *fleur d'eau*, or on a level with the water. Theſe are mounted with about 80 of their heavieſt artillery: ſo that this harbour, I think, may really be conſidered as impregnable; and indeed the Turks have ever found it ſo, and I believe ever will.

“ The harbour on the north ſide of the city, although they only uſe it for fiſhing, and as a place of quarantine, would, in any other part of the world, be conſidered as ineſtimable. It is likewiſe defended by very ſtrong works; and in the centre of the baſon is an iſland on which they have built a caſtle and a lazaret.

“ The fortifications of Malta are indeed a moſt ſtupendous work. All the boaſted catacombs of Rome and Naples are a trifle to the immenſe excavations that have been made in this little iſland. The ditches, of a vaſt ſize, are all cut out of the ſolid rock. Theſe extend for a great many miles, and raiſe our aſtoniſhment to think that ſo ſmall a ſtate has ever been able to make them.

“ One ſide of the iſland is ſo completely fortified by nature, that there was nothing left for art. The rock is of a great height, and abſolutely perpendicular from the ſea for ſeveral miles. It is very ſingular, that on this ſide there are ſtill the veſtiges of ſeveral ancient roads, with the tracks of carriages worn deep in the rocks. Theſe roads are now terminated by the precipice, with the ſeas beneath; and ſhow, to a demonſtration, that this iſland has formerly been of a much larger ſize than it is at preſent; but the convulſion that occaſioned its diminution is probably much beyond the reach of any hiſtory or tradition. It has been often obſerved, notwithſtanding the very great diſtance of mount Ætna, that this iſland has generally been more or leſs affected by its eruptions; and they think it probable, that on ſome of theſe occaſions a great part of it may have been ſhaken into the ſea.

“ One half of mount Ætna is clearly diſcovered from Malta. They reckon the diſtance near 200 Italian miles. And the people of Malta affirm, that, in great eruptions of the mountain, their whole iſland is illuminated, and from the reflection in the water there appears a great track of fire all the way from Malta to Sicily. The thundering of the mountain is likewiſe diſtinctly heard.

“ We made an expedition through the iſland in coaches drawn by one mule each; the only kind of vehicle the iſland affords. The catacombs, not far from the ancient city of Melita, are a great work: they are ſaid to extend for 15 miles under-ground. Many people, they aſſure us, have been loſt in them by advancing too far; the prodigious number of branches making it next to impoſſible to find the way out again. The great ſource of water that ſupplies the city of Valetta takes its riſe near to this place; and there is an aqueduct, compoſed of ſome thouſand arches, that conveys it from thence to the city. The whole of this immenſe work was finiſhed at the private expence of one of the grand-maſters.

“ Not far from the old city there is a ſmall church dedicated to St Paul; and juſt by the church a miraculous ſtatue of the ſaint, with a viper on his hand; ſuppoſed to be placed on the very ſpot where the houſe ſtood in which he was received after his ſhipwreck on the iſland, and where he ſhook the viper off his hand into the fire without being hurt by it: at which time the Malteſe aſſure us, the ſaint curſed all the venomous animals of the iſland, and baniſhed them for ever. Whether this be the cauſe of it or not, the fact is certain that there are no venomous animals in Malta. They aſſured us, that vipers had been brought from Sicily, and died almoſt immediately on their arrival.

“ Adjoining to the church is the celebrated grotto in which the ſaint was impriſoned. It is looked upon with the utmoſt reverence and veneration; and if the ſtories they tell of it be true, it is well entitled to it all. It is exceedingly damp, and produces (I believe by a kind of petrifaction from the water) a whitiſh kind of ſtone, which, they aſſure us, when reduced to powder, is a ſovereign remedy in many diſeaſes, and ſaves the lives of thouſands every year. There is not a houſe in the iſland that is not provided with it: and they tell us there are many boxes of it ſent annually, not only to Sicily and Italy, but likewiſe to the Levant, and to the Eaſt Indies; and (what is conſidered as a daily ſtanding miracle) notwithſtanding this perpetual conſumption, it has never been exhauſted, nor even ſenſibly diminiſhed; the ſaint always taking care to ſupply them with a freſh quantity the day following. I taſted ſome of it, and believe it is a very harmleſs thing. It taſtes like exceeding bad magneſia, and, I believe, has pretty much the ſame effects. They give about a teaſpoonful of it to children in the ſmall-pox and in fevers. It produces a copious ſweat about an hour after, and, they ſay, never fails to be of ſervice. It is likewiſe eſteemed a certain remedy againſt the bite of all venomous animals. There is a very fine ſtatue of St Paul, in the middle of this grotto, to which they aſcribe great powers.

“ The grand-maſter of the knights of Malta is more abſolute, and poſſeſſes more power, than moſt ſovereign princes. His titles are, *ſerene highneſs* and *eminence*; and his houſehold-attendance and court are all very princely. As he has the diſpoſal of all lucrative offices, he makes of his councils what he pleaſes; beſides, in all the councils that compoſe the juriſdiction of this little nation, he himſelf preſides, and has two votes. He has the diſpoſal of 21 commanderies, and one priory, every five years; and as there is always a number of expectants, he is very much courted. He is choſen by a committee of 21; which committee is nominated by the ſeven nations, three out of each nation. The election muſt be over within three days of the death of the former grand-maſter; and, during theſe three days, there is ſcarce a ſoul that ſleeps at Malta: all is cabal and intrigue; and moſt of the knights are maſked, to prevent their particular attachments and connections from being known: the moment the election is over, every thing returns to its former channel.

“ The land-force of Malta is equal to the number of men in the iſland fit to bear arms. They have about 500 regulars belonging to the ſhips of war; and 150 compoſe the guard of the prince. The two iſlands of Malta and Gozzo contain about 150,000 inhabitants. The men are exceeding robuſt and hardy. I have ſeen them row for 10 or 12 hours without intermiſſion, and without even appearing to be fatigued. Their ſea-force conſiſts of 4 gallies, 3 galliots, 4 ſhips of 60 guns, and a frigate of 36, beſides a number of the quick-ſailing little veſſels called *ſcampavias* (literally *runaways*). Their ſhips, galleys, and fortifications, are not only well ſupplied with excellent artillery, but they have likewiſe invented a kind of ordnance of their own, unknown to all the world beſides. For we found, to our no ſmall amazement, that the rocks were not only cut into fortifications, but likewiſe into artillery, to defend theſe fortifications, being hollowed out, in many places, into the form of immenſe mortars. The charge is ſaid to be about a barrel of gunpowder, over which they place a large piece of wood, made exactly to fit the mouth of the chamber. On this they heap a great quantity of cannon-balls, ſhells, or other deadly materials; and when an enemy's ſhip approaches the harbour, they fire the whole into the air: and they pretend it produces a very great effect; making a ſhower for 200 or 300 yards round, that would ſink any veſſel.

“ Notwithſtanding the ſuppoſed bigotry of the Malteſe, the ſpirit of toleration is ſo ſtrong, that a moſque has been lately built for their ſworn enemies the Turks. Here the poor ſlaves are allowed to enjoy their religion in peace. It happened lately that ſome idle boys diſturbed them during their ſervice; they were immediately ſent to priſon, and ſeverely puniſhed. The police indeed is much better regulated than in the neighbouring countries, and aſſaſſinations and robberies are very uncommon; the laſt of which crimes the grand-maſter puniſhes with the utmoſt ſeverity. He is ſaid to be much more relaxed with regard to the firſt.

“ Perhaps Malta is the only country in the world where duelling is permitted by law. As their whole eſtabliſhment is originally founded on the wild and romantic principles of chivalry, they have ever found it too inconſiſtent with thoſe principles to aboliſh duelling; but they have laid it under ſuch reſtrictions as greatly to leſſen its danger. Theſe are curious enough. The duelliſts are obliged to decide their quarrel in one particular ſtreet of the city; and if they preſume to fight any where elſe, they are liable to the rigour of the law. But, what is not leſs ſingular, but much more in their favour, they are obliged, under the moſt ſevere penalties, to put up their ſwords when ordered to do ſo by a *woman*, a *prieſt*, or a *knight*. Under theſe limitations, in the midſt of a great city, one would imagine it almoſt impoſſible that a duel could ever end in blood; however, this is not the caſe: a croſs is always painted oppoſite to the ſpot where a knight has been killed, in commemoration of his fall. We counted about 20 of theſe croſſes.

“ About three months ago (Mr Brydone's letter is dated June 7. 1770), two knights had a diſpute at a billiard-table. One of them, after giving a great deal of abuſive language, added a blow; but, to the aſtoniſhment of all Malta (in whoſe annals there is not a ſimilar inſtance), after ſo great a provocation, he abſolutely refuſed to fight his antagoniſt. The challenge was repeated, and he had time to reflect on the conſequences; but ſtill he refuſed to enter the liſts. He was condemned to make the *amende honorable* in the great church of St John for 45 days ſucceſſively; then to be confined in a dungeon, without light, for five years; after which, he is to remain a priſoner in the caſtle for life.

life. The unfortunate young man who received this blow is likewiſe in diſgrace, as he has not had an opportunity of wiping it out in the blood of his adverſary.

"The horſe-races of Malta are of a very uncommon kind. They are performed without either ſaddle, bridle, whip, or ſpur; and yet the horſes are ſaid to run full ſpeed, and to afford a great deal of diverſion. They are accuſtomed to the ground for ſome weeks before; and although it is entirely over rock and pavement, there are very ſeldom any accidents. They have races of aſſes and mules performed in the ſame manner four times every year. The rider is only furniſhed with a machine like a ſhoemaker's awl, to prick on his courſer if he is lazy.

"As Malta is an epitome of all Europe, and an aſſemblage of the younger brothers, who are commonly the beſt, of its firſt families, it is probably one of the beſt academies for politeneſs in this part of the globe; beſides, where every one is entitled by law as well as cuſtom to demand ſatisfaction for the leaſt breach of it, people are under a neceſſity of being very exact and circumſpect, both with regard to their words and actions."

Knights of MALTA, otherwiſe called *Hoſpitalers of St John of Jeruſalem*, a religious military order, whoſe reſidence is in the iſland of Malta, ſituated in the Mediterranean ſea, upon the coaſt of Africa. The Knights of Malta, ſo famous for defending Chriſtendom, had their riſe as follows:

Some time before the journey of Godfrey of Bouillon into the Holy Land, ſome Neapolitan merchants, who traded in the Levant, obtained leave of the caliph of Egypt to build an houſe for thoſe of their nation who came thither on pilgrimage, upon paying an annual tribute. Afterwards they built two churches, and received the pilgrims with great zeal and charity. This example being followed by others, they founded a church in honour of St John, and an hoſpital for the ſick; whence they took the name of *Hoſpitalers*. A little after Godfrey of Bouillon had taken Jeruſalem, in 1099, they began to be diſtinguiſhed by black habits and a croſs with eight points; and, beſides the ordinary vows, they made another, which was to defend the pilgrims againſt the inſults of the infidels. This foundation was completed in 1104, in the reign of Baldwin; and ſo their order became military, into which many perſons of quality entered, and changed the name of *hoſpitalers* into that of *knights*.

When Jeruſalem was taken, and the Chriſtians loſt their power in the Eaſt, the knights retired to Acre or Ptolemais, which they defended valiantly in 1290. Then they followed the king of Cyprus, who gave them Limiſſon in his dominions, where they ſtaid till 1310. That ſame year they took Rhodes, under the grand-maſter Foulques de Villaret, a Frenchman; and next year defended it againſt an army of Saracens: ſince which the grand-maſters have uſed theſe four letters, F. E. R. T. i. e. *Fortitudo ejus Rhodum tenuit*; and the order was from thence called *knights of Rhodes*.

In 1522, Soliman having taken Rhodes, the knights retired into Candia, and thence into Sicily. In 1530, Charles V. gave them the iſland of Malta, to cover his kingdom of Sicily from the Turks. In 1566, Soliman beſieged Malta; but it was gallantly defended by the grand-maſter John de Valette Pariſot, and the Turks obliged to quit the iſland with great loſs.

The knights conſiſted of eight different languages or nations, of which the Engliſh were formerly the ſixth; but at preſent they are but ſeven, the Engliſh having withdrawn themſelves. The firſt is that of Provence, whoſe chief is grand commendator of religion: the ſecond, of Auvergne; whoſe chief is mareſchal of the order: the third, of France, whoſe chief is grand-hoſpitaler: the fourth, of Italy; and their chief, admiral: the fifth, of Arragon; and their chief, grand-conſervator: the ſixth, of Germany; and their chief, grand-bailiff of the order: the ſeventh, of Caſtile; and their chief, grand-chancellor. The chief of the Engliſh was grand-commander of the cavalry.

None are admitted into this order but ſuch as are of noble birth both by father and mother's ſide for four generations, excepting the natural ſons of kings and princes. The knights are of two ſorts; thoſe who have a right to be candidates for the dignity of grand-maſter, called *grand-croſſes*; and thoſe who are only *knights-aſſiſtants*, who are taken from good families. They never marry; yet have continued from 1090 to the preſent time.

The order conſiſts of three eſtates; the knights, chaplains, and ſervants at arms. There are alſo prieſts who officiate in the churches; friar-ſervants, who aſſiſt at the offices; and *donnes*, or *demi-croſſes*; but theſe are not reckoned as conſtituent parts of the body. This diviſion was made in 1130, by the grand-maſter Raimond du Puy.

The government of the order is mixed, being partly monarchical, and partly ariſtocratical. The grand-maſter is ſovereign, coins money, pardons criminals, and gives the places of grand-priors, bailiffs, knights, &c. The ordinary council is compoſed of the grand-maſter and the grand-croſſes. Every language has ſeveral grand priories, and every priory a certain number of commanderies.

The knights are received into this order, either by undergoing the trials preſcribed by the ſtatutes, or by diſpenſation. The diſpenſations are obtained either by the pope's brief, or by a general chapter of the order, and are granted in caſe of ſome defect as to the nobility of their pedigree, eſpecially on the mother's ſide. The knights are received, either as of age, under minority, or pages to the grand-maſter. They muſt be 16 years old complete before they are received: they enter into the noviciate at 17, and are profeſſed at 18. They ſometimes admit infants of one year old; but the expence is about 4000 livres. The grand-maſter has 16 pages who ſerve him, from 12 to 16 years of age. The knights wear on the left-ſide of their cloak or waiſtcoat a croſs of white waxed cloth, with eight points, which is their true badge; that of gold being only for ornament. When they go to war againſt the Turks, they wear a red caſſock, with a great white croſs before and behind, without points, which are the arms of the religion. The ordinary habit of the grand-maſter is a ſort of caſſock of tabby-cloth, tied about with a girdle, at which hangs a great purſe, to denote the charitable inſtitution of the order. Over this he wears a velvet gown; and on the left ſide a white croſs with eight points. His yearly revenue is 10,000 ducats. He acknowledges the kings of Spain, and

both

both the Sicilies, as his protectors; and is obliged, by his agreement with the emperor Charles V. to ſuppreſs pirates.

MALTON, a town of the north-riding of Yorkſhire in England, ſeated on the river Derwent, over which there is a good ſtone-bridge. It is compoſed of two towns, the New and the Old; and is well inhabited, accommodated with good inns, and ſends two members to parliament. W. Long. 0. 30. N. Lat. 54. 8.

MALVA, the MALLOW: A genus of the polyandria order, belonging to the monadelphia claſs of plants; and in the natural method ranking under the 37th order, *Columniferæ*. The calyx is double; the exterior one triphyllous; the arilli numerous and monoſpermous. There are 24 ſpecies; conſiſting of herbaceous perennials, biennials, and annuals, for medical, economical, and ornamental uſes; riſing with erect ſtalks from about half a yard to 10 or 12 feet high, garniſhed with large, roundiſh, lobated leaves, and quinquepetalous flowers. They are all eaſily and plentifully raiſed from ſeed.

The leaves of the common mallow are reckoned the firſt of the four emollient herbs: they were formerly in ſome eſteem as food, for looſening the belly; at preſent, decoctions of them are ſometimes employed in dyſenteries, heat, and ſharpneſs of urine; and, in general, for obtunding acrimonious humours: their principal uſe is in emollient glyſters, cataplaſms, and fomentations. The leaves enter the officinal decoction for glyſters, and a conſerve is prepared from the flowers.

Several ſpecies of malva, macerated like hemp, afford a thread ſuperior to hemp for ſpinning, and which is ſaid to make more beautiful cloths and ſtuffs than even flax. Theſe ſpecies are the criſpa, Peruviana, and Mauriſiana. From the former, which affords ſtronger and longer fibres, cords and twine have alſo been made. From the malvæ, likewiſe, a new ſort of paper has been fabricated by M. de l'Iſle. On this invention, Meſſ. Lavoiſier, Sage, and Berthollet, in name of the *Academie de Sciences*, obſerve, That "it is not probable the paper made by M. de l'Iſle will be ſubſtituted for that made from rags, either for the purpoſe of printing or writing. Yet paper from the mallows may be uſed for theſe purpoſes, if we can judge from a volume printed on it preſented to the academy. The great utility of M. de l'Iſle's invention is for furniture, which conſumes a great quantity of rags; and his papers have a natural hue, much more ſolid than can be given by colouring matter, and this hue may ſerve as a ground for other drawings. M. de l'Iſle ſhould, we think, be encouraged to purſue his experiments, which, we have reaſon to expect, may be in the end very uſeful: by his zeal, activity, and knowledge, he will probably contribute to render the art of making paper more perfect; in this art he is much engaged; and his attempts, which he has ſhown to the academy, merit its praiſes."

MALVERN, GREAT and LITTLE, (with the *Chace* and the *Hills*); two towns of Worceſterſhire, in which were formerly two abbeys, about three miles aſunder. Since the diſſolution nothing remains of the abbey of *Great Malvern* but the gateway of the abbey and church, now parochial. Part of it was a religious cell for hermits before the Conqueſt; and the greateſt part, with the tower, built in the reign of William the Conqueror. Its outward appearance is very ſtriking. It is 171 feet in length, 63 in breadth, and 63 in height. In it are ten ſtalls; and it is ſuppoſed to have been rebuilt in the year 1171. The nave only remains in part, the ſide aiſles being in ruins. The windows have been beautifully enriched with painted glaſs, and in it are remains of ſome very ancient monuments. *Little Malvern* ſtands in a cavity of the hills, which are great lofty mountains, riſing like ſtairs, one higher than another, for about ſeven miles, and divide this county from Herefordſhire. There is a ditch here very much admired. On the hills are two medicinal ſprings, called *holy wells*, one good for the eyes, and the other for cancers. Henry VII. his queen, and his two ſons prince Arthur and prince Henry, were ſo delighted with this place, that they beautified the church and windows, part of which remain, though mutilated. In the lofty ſouth windows of the church are the hiſtorical paſſages of the Old Teſtament; and in the north windows the pictures of the holy family, the nativity and circumciſion of our Saviour, the adoration of the ſhepherds and the kings, his preſentation in the temple, his baptiſm, faſting, and temptation, his miracles, his laſt ſupper with his diſciples, his prayer in the garden, his paſſion, death, and burial, his deſcent into hell, his reſurrection and aſcenſion, and the coming of the Holy Ghoſt. The hiſtory of our Saviour's paſſion is painted differently in the eaſt window of the choir, at the expence of Henry VII. whoſe figure is therefore often repreſented, as is that of his queen. In the weſt window is a noble piece of the day of judgment, not inferior to the paintings of Michael Angelo. *Malvern Chace* contains 7115 acres in Worceſterſhire (beſides 241 acres called the Prior's Land), 619 in Herefordſhire, and 103 in Glouceſterſhire. *Malvern Hills* run from north to ſouth, the higheſt point 1313 feet above the ſurface of the Severn at Hanley, and appear to be of lime-ſtone and quartz. On the ſummit of theſe hills is a camp with a treble ditch, imagined to be Roman, and is ſituated on the Herefordſhire ſide of the hills.

MALVEZZI (Virgilio marquis de), an Italian gentleman, born at Bologna, acquired great reputation by his learning and writings. He was well verſed in polite literature, muſic, law, phyſic, and the mathematics. He ſerved alſo in a diſtinguiſhed poſt in the army of Philip IV. king of Spain, and was employed by him in ſome important negociations. He died at Bologna in the year 1654, leaving ſeveral works in Spaniſh and Italian. Among the latter are his Diſcourſes on the Firſt Book of Tacitus: this work has been tranſlated into Engliſh.

MALUS, in botany. See PYRUS.

MAMALUKES, the name of a dynaſty that reigned in EGYPT. See that article, n° 98.

MAMBRUN (Peter), an ingenious and learned French Jeſuit, born in the dioceſe of Clermont, in the year 1581. He was one of the moſt perfect imitators of Virgil in Latin poetry, and his poems are of the ſame ſpecies: Thus he wrote *Eclogues; Georgics*, or four books on the culture of the ſoul and the underſtanding; together with a heroic poem intitled *Conſtantine, or Idolatry overthrown*. He ſhowed alſo great critical abilities in a Latin *Peripatetical diſſertation on epic poetry.* He died in 1661.

MAMERTINI, a mercenary band of ſoldiers which paſſed from Campania into Sicily at the requeſt of Agathocles. When they were in the ſervice of Agathocles, they claimed the privilege of voting at the election of magiſtrates at Syracuſe, and had recourſe to arms to ſupport their unlawful demands. The ſedition was appeaſed by the authority of ſome leading men, and the Campanians were ordered to leave Sicily. In their way to the coaſt they were received with great kindneſs by the people of Meſſana, and ſoon returned perfidy for hoſpitality. They conſpired againſt the inhabitants, murdered all the males in the city, married their wives and daughters, and rendered themſelves maſters of the place. After this violence they aſſumed the name of Mamertini, and called their city Mamertum, or Mamertium, from a provincial word which in their language ſignified *martial* or *warlike.* The Mamertines were afterwards defeated by Hiero, and totally diſabled to repair their ruined affairs.

MAMMÆ, in anatomy. See there, n° 112.

MAMMALIA, in natural hiſtory, the firſt claſs of animals in the Linnæan ſyſtem, divided into ſeven orders. See ZOOLOGY.

MAMMEA, *Mammee-Tree:* A genus of the monogynia order, belonging to the polyandria claſs of plants; and in the natural method ranking with thoſe of which the order is doubtful. The corolla is tetrapetalous; the calyx diphyllous; the berry very large and tetraſpermous. There are two ſpecies; both of them large evergreen trees of the hot parts of America and Aſia, and retained here in hot-houſes for variety; both of them adorned with large, oval, oblong, ſtiff leaves, and large quadripetalous flowers, ſucceeded by large round eatable fruit of a moſt exquiſitely rich flavour. They are propagated by ſeed, which is to be ſowed in ſmall pots of light earth, and plunged in the bark-bed, where they will ſoon come up; give gentle waterings, and about Auguſt tranſplant them into ſeparate pots a ſize larger, plunging them into the bark-bed, and giving ſhade and water till freſh-rooted. In this country they muſt never be taken out of the ſtove.

MAMMON, the god of riches, according to ſome authors; though others deny that the word ſtands for ſuch a deity, and underſtand by it only *riches* themſelves. Our Saviour ſays, We *cannot ſerve God and mammon;* that is, be religious and worldly-minded at the ſame time. Our poet Milton, by poetic licence, makes Mammon to be one of the fallen angels, and gives us his character in the following lines:

> Mammon, the leaſt erected ſpirit that fell
> From heav'n: for ev'n in heav'n his looks and thoughts
> Were always downward bent; admiring more
> The riches of heav'n's pavement, trodden gold,
> Than ought divine or holy elſe enjoy'd
> In beatific viſion: by him firſt
> Man alſo, and by his ſuggeſtion taught,
> Ranſack'd the centre, and with impious hands
> Rifled the bowels of their mother earth,
> For treaſures better hid. Soon had his crew
> Open'd into the hill a ſpacious wound,
> And digg'd out ribs of gold. Let none admire
> That riches grow in hell; that ſoil may beſt
> Deſerve the precious bane.

MAMMOTH, or MAMMUTH, the name of a huge animal now unknown, to which are ſaid to have belonged thoſe tuſks, bones, and ſkeletons of vaſt magnitude, which have been frequently found in different parts of Siberia, as well in the mountains as the valleys; likewiſe in Ruſſia, Germany, and North America. Many ſpecimens of them may be ſeen in the Imperial cabinet at Peterſburgh; in the Britiſh, Dr Hunter's, and the late Sir Aſhton Lever's muſeums, and in that of the Royal Society. A deſcription of the mammoth is given by Muller in the *Recueil des Voyages au Nord.* "This animal, he ſays, is four or five yards high, and about 30 feet long. His colour is greyiſh. His head is very long, and his front very broad. On each ſide, preciſely under the eyes, there are two horns, which he can move and croſs at pleaſure. In walking he has the power of extending and contracting his body to a great degree." Iſbrandes Ides gives a ſimilar account; but he is candid enough to acknowledge, that he never knew any perſon who had ſeen the mammoth alive. Mr Pennant, however, thinks it "more than probable, that it ſtill exiſts in ſome of thoſe remote parts of the vaſt new continent, impenetrated yet by Europeans. Providence (he adds) maintains and continues every created ſpecies; and we have as much aſſurance, that no race of animals will any more ceaſe while the earth remaineth, than *ſeed-time and harveſt, cold and heat, ſummer and winter, day and night.*" The Ohio Indians have a tradition handed down from their fathers reſpecting theſe animals, "That in ancient times a herd of them came to the Big-bone Licks, and began an univerſal deſtruction of the bears, deer, elks, buffaloes, and other animals which had been created for the uſe of the Indians: that the Great Man above, looking down and ſeeing this, was ſo enraged that he ſeized his lightning, deſcended to the earth, ſeated himſelf upon a neighbouring mountain on a rock, on which his ſeat and the print of his feet are ſtill to be ſeen, and hurled his bolts among them till the whole were ſlaughtered, except the big bull, who preſenting his forehead to the ſhafts, ſhook them off as they fell; but at length miſſing one, it wounded him in the ſide; whereon, ſpringing round, he bounded over the Ohio, the Wabaſh, the Illinois, and finally over the great lakes, where he is living at this day."

Several eminent naturaliſts, as Sir Hans Sloane, Gmelin, Daubenton, and Buffon, are of opinion that theſe prodigious bones and tuſks are really the bones and tuſks of elephants, and many modern philoſophers have held the mammoth to be as fabulous as the centaur. The great difference in ſize they endeavour to account for as ariſing from difference in age, ſex, and climate; and the cauſe of their being found in thoſe northern parts of the world where elephants are no longer natives, nor can even long exiſt, they preſume to have ariſen from hence; that, in the great revolutions which have happened in the earth, the elephants, to avoid deſtruction, have left their native country, and diſperſed themſelves wherever they could find ſafety. Their lot has been different. Some in a longer and others in a ſhorter time after their death, have been tranſported to great diſtances by ſome vaſt inundations. Thoſe, on the contrary, which ſurvived, and wandered far to the north, muſt neceſſarily have fallen victims to the rigour of the climate. Others, without reaching to ſo great a diſtance, might be drowned, or periſh with fatigue. In the year 1767, Dr Hunter, with the aſſiſtance of his brother Mr J. Hunter, had an opportunity of inveſtigating more particularly this part of natural hiſtory, and has evidently proved, that theſe foſſil bones and tuſks are not only larger than the generality of elephants, but that the tuſks are more twiſted, or have more of the ſpiral curve, than elephants teeth; and that the thigh and jaw bones differ in ſeveral reſpects from thoſe of the elephant: but what put the matter beyond all diſpute was the ſhape of the grinders, which clearly appeared to belong to a carnivorous animal, or at leaſt to an animal of the mixed kind; and to be totally different from thoſe of the elephant, which is well known not to be of the carnivorous, but graminivorous kind, both by the form of its grinders and by its never taſting animal food.—Some have ſuppoſed theſe foſſil bones to belong to the hippopotamus or river-horſe; but there are many reaſons againſt this ſuppoſition, as the hippopotamus is even much ſmaller than the elephant, and has ſuch remarkably ſhort legs, that his belly reaches within three or four inches of the ground.

North America ſeems to be the quarter where the remains in queſtion moſt abound. On the Ohio, and in many parts farther north, tuſks, grinders, and ſkeletons of unparalleled magnitude, which can admit of no compariſon with any animal at preſent known, are found in vaſt numbers, ſome lying on the ſurface of the earth, and ſome a little below it. A Mr Stanley, taken priſoner by the Indians near the mouth of the Taniſſee, relates, as Mr Jefferſon† informs us, that after being transferred through ſeveral tribes, from one to another, he was at length carried over the mountains weſt of the Miſſouri to a river which runs weſtwardly; that theſe bones abounded there; and that the natives deſcribed to him the animal to which they belonged as ſtill exiſting in the northern parts of their country; from which deſcription he judged it to be an elephant. Bones of the ſame kind have been lately found ſome feet below the ſurface of the earth, in ſalines opened on the North Holſton, a branch of the Taniſſee, about the latitude of 36½" N. Inſtances are mentioned of like animal remains found in the more ſouthern climates of both hemiſpheres: but Mr Jefferſon obſerves, "they are either ſo looſely mentioned, as to leave a doubt of the fact; ſo inaccurately deſcribed, as not to authoriſe the claſſing them with the great northern bones; or ſo rare, as to found a ſuſpicion that they have been carried thither as curioſities from more northern regions. So that, on the whole, there ſeem to be no certain veſtiges of the exiſtence of this animal farther ſouth than the ſalines laſt mentioned. It is remarkable (continues he) that the tuſks and ſkeletons have been aſcribed by the naturaliſts of Europe to the elephant, while the grinders have been given to the hippopotamus or river-horſe. Yet it is acknowledged, that the tuſks and ſkeletons are much larger than thoſe of the elephant, and the grinders many times greater than thoſe of the hippopotamus, and eſſentially different in form. Wherever theſe grinders are found, there alſo we find the tuſks and ſkeleton; but no ſkeleton of the hippopotamus nor grinders of the elephant. It will not be ſaid that the hippopotamus and elephant came always to the ſame ſpot, the former to depoſit his grinders, and the latter his tuſks and ſkeleton. For what became of the parts not depoſited there? We muſt agree, then, that theſe remains belong to each other; that they are of one and the ſame animal; that this was not a hippopotamus, becauſe the hippopotamus had no tuſks nor ſuch a frame, and becauſe the grinders differ in their ſize as well as in the number and form of their points. That it was not an elephant, I think aſcertained by proofs equally deciſive. I will not avail myſelf of the authority of the celebrated anatomiſt*, who, from an examination of the form and ſtructure of the tuſks, has declared they were eſſentially different from thoſe of the elephant; becauſe another anatomiſt†, equally celebrated, has declared, on a like examination, that they are preciſely the ſame. Between two ſuch authorities I will ſuppoſe this circumſtance equivocal. But, 1. The ſkeleton of the mammoth (for ſo the incognitum has been called) beſpeaks an animal of five or ſix times the cubic volume of the elephant, as M. de Buffon has admitted. 2. The grinders are five times as large, are ſquare, and the grinding ſurface ſtudded with four or five rows of blunt points: whereas thoſe of the elephant are broad and thin, and their grinding ſurface flat. 3. I have never heard an inſtance, and ſuppoſe there has been none, of the grinder of an elephant being found in America. 4. From the known temperature and conſtitution of the elephant, he could never have exiſted in thoſe regions where the remains of the mammoth have been found. The elephant is a native only of the torrid zone and its vicinities: if, with the aſſiſtance of warm apartments and warm clothing, he has been preſerved in life in the temperate climates of Europe, it has only been for a ſmall portion of what would have been his natural period, and no inſtance of his multiplication in them has ever been known. But no bones of the mammoth, as I have before obſerved, have been ever found further ſouth than the ſalines of the Holſton, and they have been found as far north as the Arctic circle. Thoſe, therefore, who are of opinion that the elephant and mammoth are the ſame, muſt believe, 1. That the elephant known to us can exiſt and multiply in the frozen zone; or, 2. That an internal fire may once have warmed thoſe regions, and ſince abandoned them, of which, however, the globe exhibits no unequivocal indications; or, 3. That the obliquity of the ecliptic, when theſe elephants lived, was ſo great as to include within the tropics all thoſe regions in which the bones are found; the tropics being, as is before obſerved, the natural limits of habitation for the elephant. But if it be admitted that this obliquity has really decreaſed, and we adopt the higheſt rate of decreaſe yet pretended, that is, of one minute in a century, to transfer the northern tropic to the Arctic circle, would carry the exiſtence of theſe ſuppoſed elephants 250,000 years back; a period far beyond our conception of the duration of animal bones left expoſed to the open air, as theſe are in many inſtances. Beſides, though theſe regions would then be ſuppoſed within the tropics, yet their winters would have been too ſevere for the ſenſibility of the elephant. They would have had, too, but one day and one night in

† *Notes on the State of Virginia*, p. 65.

* Hunter.

† D'Aubenton.

in the year; a circumſtance to which we have no reaſon to ſuppoſe the nature of the elephant fitted. However, it has been demonſtrated, that if a variation of obliquity in the ecliptic takes place at all, it is vibratory, and never exceeds the limits of nine degrees, which is not ſufficient to bring theſe bones within the tropics. One of theſe hypotheſes, or ſome other equally arbitrary and inadmiſſible to cautious philoſophy, muſt be adopted to ſupport the opinion that theſe are the bones of the elephant. For my own part, I find it eaſier to believe that an animal may have exiſted, reſembling the elephant in his tuſks and general anatomy, while his nature was in other reſpects extremely different. From the 30th degree of ſouth latitude to the 30th of north, are nearly the limits which nature has fixed for the exiſtence and multiplication of the elephant known to us. Proceeding thence northwardly to 36½ degrees, we enter thoſe aſſigned to the mammoth. The further we advance north, the more their veſtiges multiply as far as the earth has been explored in that direction; and it is as probable as otherwiſe, that this progreſſion continues to the pole itſelf, if land extends ſo far. The centre of the frozen zone then may be the acmé of their vigour, as that of the torrid is of the elephant. Thus nature ſeems to have drawn a belt of ſeparation between theſe two tremendous animals, whoſe breadth indeed is not preciſely known, though at preſent we may ſuppoſe it about 6½ degrees of latitude; to have aſſigned to the elephant the regions ſouth of theſe confines, and thoſe north to the mammoth, founding the conſtitution of the one in her extreme of heat, and that of the other in the extreme of cold. When the Creator has therefore ſeparated their nature as far as the extent of the ſcale of animal life allowed to this planet would permit, it ſeems perverſe to declare it the ſame, from a partial reſemblance of their tuſks and bones. But to whatever animal we aſcribe theſe remains, it is certain ſuch a one has exiſted in America, and that it was the largeſt of all terreſtrial beings of which any traces have ever appeared."

MAMRE, an Amorite, brother of Aner and Eſchol, and friend of Abraham (Gen. xiv. 13.). It was with theſe three perſons, together with his own and their domeſtics, that Abraham purſued and overcame the kings after their conqueſt of Sodom and Gomorrah. This Mamre, who dwelt near Hebron, communicated his name to great part of the country round about. Hence we read (ch. xiii. 18. xxiii. 17, &c.), that Abraham dwelt in Mamre and in the plain of Mamre. But it is obſerved, that what we tranſlate the *plain* ſhould be rendered the *oak*, of Mamre, becauſe the word *elon* ſignifies an *oak* or *tree of a long duration*. Sozomen tells us, that this tree was ſtill extant, and famous for pilgrimages and annual feaſts, even in Conſtantine's time; that it was about ſix miles diſtant from Hebron; that ſome of the cottages which Abraham built were ſtill ſtanding near it; and that there was a well likewiſe of his digging, whereunto both Jews, Chriſtians, and Heathens, did at certain ſeaſons reſort, either out of devotion or for trade, becauſe there was held a great mart. To theſe ſuperſtitions Conſtantine the Great put a ſtop.

1 General definition and character of man.

MAN, the head of the animal creation, is a being who feels, reflects, thinks, contrives, and acts; who has the power of changing his place upon the earth at pleaſure; who poſſeſſes the faculty of communicating his thoughts by means of ſpeech; and who has dominion over all other creatures on the face of the globe. Animated and enlightened by a ray from the Divinity, he ſurpaſſes in dignity every material being. He ſpends leſs of his time in ſolitude, than in ſociety and in obedience to thoſe laws which he himſelf has framed.

2 Varieties of man, according to Linnæus, (*Syſt. Nat.* edit. 13. Gmelin, p. 22.)

In the *Syſtema Naturæ*, MAN *(Homo)* is ranked as a diſtinct genus of the order *Primates* or "Chiefs," belonging to the *Mammalia* claſs of animals, or thoſe which nouriſh their young by means of lactiferous teats or paps. Of this genus he is the only ſpecies (A); and denominated *Sapiens*, as being endowed with wiſdom far ſuperior to, or rather in excluſion of, all other animals.—He *varies*, from climate, education, and habits; and the following varieties, excluſive of *wild men* (B), are enumerated by Linnæus.

α *Americans.* "Of copper-coloured complexion, choleric conſtitution, and remarkably erect."—Their hair is black, lank, and coarſe; their noſtrils are wide; their features harſh, and the chin is ſcantily ſupplied with beard. Are obſtinate in their tempers, free and ſatisfied with their condition; and are regulated in all their proceedings by traditional cuſtoms.—Paint their ſkin with red ſtreaks.

β *Europeans.* "Of fair complexion, ſanguine temperament, and brawny form."—The hair is flowing, and of various ſhades of brown; the eyes are moſtly blue. —They are of gentle manners, acute in judgment, of quick invention, and governed by fixed laws.—Dreſs in cloſe veſtments.

γ *Aſiatics.* "Of ſooty complexion, melancholic temperament, and rigid fibre."—The hair is ſtrong, black, and lank; the eyes are dark brown.—They are of grave, haughty, and covetous manners; and are governed by opinions.—Dreſs in looſe garments.

δ, *Africans.* "Of black complexion, phlegmatic tempe-

(A) In the early editions of Linnæus, the *Troglodytes* was added as another ſpecies; but is now more properly ranked under the genus *Simia*. See SIMIA.

(B) *HOMINES Feri*; deſcribed as walking on all-fours, as being dumb, and as covered with hair.—1. A youth found in Lithuania, in 1761, reſembling a bear. 2. A youth found in Heſſe, in 1544, reſembling a wolf. 3. A youth in Ireland reſembling a ſheep, (*Tulp. Obſ.* iv. 9.) 4. A youth in Bamberg reſembling an ox, (*Camerarius.*) 5. A wild youth found in 1724 in Hanover. 6. Wild boys found in 1719 in the Pyrenees. 7. A wild girl found in 1717 in Overyſel. 8. A wild girl found in 1731 in Champagne. 9. A wild lad found near Leyden, (*Boerhaave.*)—Theſe inſtances of wild men and their ſimilitudes, according to Mr Kerr †, are partly to be attributed to impoſture, and in part to exaggeration: Moſt probably (he thinks) idiots who had ſtrayed from their friends, and who reſembled the above animals only in imitating their voices.

† *Tranſlation of the Animal kingdom of Linnæus*, p. 44. note.

temperament, and relaxed fibre."—The hair is black and frizly; the ſkin ſoft and ſilky; the noſe flat; the lips are thick; and the female has a natural apron †, and long lax breaſts.—They are of crafty, indolent, and careleſs diſpoſitions, and governed in their actions by caprice.—Anoint the ſkin with greaſe.

† A doubtful circumſtance.

e, *Monſters*. Of theſe there are ſeveral varieties; the firſt and ſecond of which, in the following liſt, are occaſioned by peculiarity of climate, while the reſt are produced by artificial management. 1. *Alpini;* The inhabitants of the northern mountains: they are ſmall in ſtature, active and timid in their diſpoſitions. 2. *Patagonici:* The Patagonians of South America; of vaſt ſize, and indolent in their manners. 3. *Monorchides:* The Hottentots; having one teſticle extirpated. 4. *Imberbes:* Moſt of the American nations; who eradicate their beards and the hair from every part of the body except the ſcalp. 5. *Macrocephali:* The Chineſe; who have their heads artificially forced into a conical form. 6. *Plagiocephali:* The Canadian Indians; who have the fore part of their heads flattened, when young, by compreſſion.

3 Gmelin's arrangement, *(not. in loc. ubi ſupra.)*

The following arrangement of the varieties in the human ſpecies, is offered by Dr Gmelin as more convenient than that of Linnæus.

1. White, a: *(Hom. Albus.)* Formed by the rules of ſymmetrical elegance and beauty; or at leaſt what we conſider as ſuch.—This diviſion includes almoſt all the inhabitants of Europe; thoſe of Aſia on this ſide of the Oby, the Caſpian, Mount Imaus, and the Ganges; likewiſe the natives of the north of Africa, of Greenland, and the Eſquimaux.

b, Brown: *(Hom. Badius.)* Of a yellowiſh brown colour; has ſcanty hairs, flat features, and ſmall eyes.—This variety takes in the whole inhabitants of Aſia not included in the preceding diviſion.

c. Black: *(Hom. Niger.)* Of black complexion; has frizly hair, a flat noſe, and thick lips.—The whole inhabitants of Africa, excepting thoſe of its more northern parts.

d, Copper-coloured: *(Hom. Cupreus.)* The complexion of the ſkin reſembles the colour of copper not burniſhed.—The whole inhabitants of America, except the Greenlanders and Eſquimaux.

e, Tawny: *(Hom. Fuſcus.)* Chiefly of a dark blackiſh-brown colour; having a broad noſe, and harſh coarſe ſtraight hair—The inhabitants of the ſouthern iſlands, and of moſt of the Indian iſlands.

The following is Linnæus's deſcription of *Man*, as tranſlated by Mr Kerr.

4 Zoological deſcription of man.

"The Body, which ſeldom reaches ſix feet in height, is erect, and almoſt naked, having only ſome ſcattered diſtant hairs, except in ſome ſmall ſpots to be afterwards noticed, and when firſt born is entirely naked. The Head is ſhaped like an egg; the ſcalp being long, and covered with hair; the forehead broad; the top of the head flat; and the hind-head protuberant. The Face is naked, having the brow or forehead flattened and quadrangular; the temples are compreſſed, with peaked angles pointing upwards and backwards towards the hairy ſcalp. The eye-brows are prominent, and covered with hairs which, ſhedding outwards, cover each other like tiles; and between the inner extremities of the two eye-brows, there is a ſmooth, ſhallow furrow or depreſſion, in a line with the noſe. The upper eye-lid is moveable, but the lower one hardly moves, and both are planted at their edges with a row of ſtiff recurved hairs, named *eye-laſhes*. The eye-balls are round, having no ſuſpending muſcle as in thoſe of moſt quadrupeds; the pupil, or opening of the ſight, is circular; and the eye has no *membrana nictitans*. The upper parts of the cheeks are prominent, ſoftiſh, and coloured with a red bluſh; their outer parts flattened; the lower parts are hollowed, lax, and expanſile. The noſe is prominent, and compreſſed at the ſides; its extremity or point is higher than the reſt, and blunt; the noſtrils are oval, open downwards, with thickened edges, and are hairy on their inſides. The upper lip is almoſt perpendicular, and is furrowed on the middle, from the diviſion between the noſtrils to the edge of the lip; the under lip is erect, thicker and more prominent than that above; both have a ſmooth red protuberance, ſurrounding the mouth at their edges. The chin is prominent, blunt, and gibbous. In males, the face all round the mouth is covered with hair, called the *beard*, which firſt appears about puberty, in patches on the chin. The teeth in both jaws may be diſtinguiſhed into three orders; the *fore teeth* are erect, parallel, and wedge-like, of the kind named *inciſors*, or *cutting teeth;* they ſtand cloſe to each other, and are more equal and rounder than in other animals; the *tuſks*, called in man *eye-teeth* and *corner-teeth*, of which there is only one on each ſide of the fore-teeth in each jaw, are a little longer than the fore-teeth, but much leſs ſo than in other animals, and they are placed cloſe to the other teeth; the *grinders*, of which there are five on each ſide in both jaws, are blunt, and divided on their upper ſurface into pointed eminences; but theſe are not ſo remarkable as in other animals. The ears are placed on the ſides of the head, are of an oblong rounded figure, with a ſemilunar bend on their anterior edges; they lie flat to the head, are naked, arched at the margin on their upper and poſterior edges, and are thicker and ſoft at the under extremities.

"The Trunk of the body conſiſts of the neck, breaſt, back, and belly. The Neck is roundiſh, and ſhorter than the head; its vertebræ, or chine bones, are not, as in moſt animals, connected by a ſuſpenſory ligament; the nape is hollowed; the throat, immediately below the chin, is hollowed at its upper part, and protuberant in the middle a little lower down. The Breaſt is ſomewhat flattened both before and behind; on the fore-part there is a cavity or depreſſion where it joins with the neck; the arm-pits are hollow and hairy; the pit of the ſtomach is flat: On the breaſt are two diſtant, round, protuberant mammæ, or dugs, each having a cylindrical obtuſe wrinkly projecting nipple, which is ſurrounded by a darker coloured circle called the *areola*. The Back is flat, having protuberances on each ſide at the ſhoulder-blades, with a furrow or depreſſion between them. The Abdomen or belly is large and protuberant, with a hollow at the navel; the epigaſtric region, or ſituation of the ſtomach, is flat; the hypogaſtric regions, or ſides of the belly, are protuberant; the groins flattiſh and hollowed. The pubes is hairy; the pelvis, or baſin, is wider above, and grows narrower below. The male parts are external and looſe; the penis cylindrical; the ſcrotum roundiſh, lax, and wrinkled, being divided in the middle by a longitudinal ridge or ſmooth line, which extends along the whole perinæum: The female parts are compreſſed and protuberant, having labia, nymphæ, clytoris, and hymen; and, in adults, ſecreting the catamenia. There is no external tail.

“ The Limbs conſiſt of arms and hands inſtead of fore-legs; and of thighs, legs, and feet. The Arms are placed at a diſtance from each other; they are round, and about a foot in length from the joint of the ſhoulder to the elbow; the fore-arm, or cubit, contains two bones, and is obtuſely prominent; the *ulna*, which forms the principal thickneſs of the member, is round, and ſomewhat flattened on the inſide. The Hands are broad, flat, and rounded; convex on the outſide or back of the hand, and concave on the inſide or palm. Each hand has five fingers, one of which, named the *thumb*, is ſhorter and thicker than the reſt, and is placed at ſome diſtance from them; the others are near each other, and placed parallel, the outer or *little-finger* being the ſmalleſt; the ſecond, named *index* or *fore-finger*, and the fourth, called the *ring-finger*, are next in length and in ſize; and the third, or *middle-finger*, is the longeſt; the point of this laſt, when the arm and hand hang down, reaches to the middle of the thigh. The nails are rounded and oval, being flatly arched, or convex upwards, and each has a ſemilunar whitiſh mark at the root or lower extremity.

“ The lower limbs are placed cloſe together, having brawny muſcular haunches and ſwelling fleſhy hips; the knees are obtuſe, bend forwards, and have hollow hams behind. The Legs, which are nearly of the ſame length with the thighs, are of a muſcular make behind, where they ſwell out into what is called the *calf*; they are lean, and free of fleſh on the ſhins or fore-parts, and taper downwards to the ancle, which have hard hemiſpherical projections on each ſide, named the *ankle-bones* or *malleolæ*. The heel is thick, prominent, and gibbous, being longer and broader than in other animals, for giving a firm ſupport to the body; it joins immediately with the ſole of the foot. The Feet are oblong, convex above, and flattened on the ſoles, which have a tranſverſe hollow about the middle. Each foot has five toes, ſomewhat bent downwards, and gibbous or ſwelled underneath at their extremities; they are all placed cloſe together, the inner or great-toe being thicker and ſomewhat ſhorter than the reſt; the ſecond and third are nearly of equal length; and the fourth and fifth are ſhorter than the others, the laſt mentioned or little toe being the ſhorteſt and ſmalleſt. The toe nails reſemble thoſe on the fingers, which are already deſcribed.

“ Thus man differs from the other animals in his erect poſture and naked ſkin, having a hairy ſcalp, being furniſhed with hair on the eye-brows and eye-laſhes, and having, when arrived at puberty, the pubes, breaſt, arm-pits, and the chin of the males, covered with hair. His brain is larger than that of any other animal, even the moſt enormous; he is provided with an *uvula*, and has organs of ſpeech. His face is placed in the ſame parallel line with his body; he has a projecting compreſſed noſe, and a prominent chin. His feet in walking reſt on the heel. He has no tail; and, laſtly, the ſpecies is diſtinguiſhed from other animals by ſome peculiarities of the female conſtitution, which have been already mentioned.”

Noſce Teipſum, “ Know thyſelf,” is a precept worthy of the lawgiver of Athens: it has been called the firſt ſtep to wiſdom, and was formerly written on letters of gold in the temple of Diana. In the purſuit of this important branch of knowledge, MAN may be contemplated in the ſeven following reſpects:

1. PHYSIOLOGICALLY,—as a frail machine, chiefly compoſed of nerves and fibres interwoven with each other. His moſt perfect ſtate is during youth; and he is endowed with faculties more numerous, and in higher perfection, than thoſe of all other animals. “ Man, intended for exerciſing dominion over the whole animal creation, is ſent by Nature into the world naked, forlorn, and bewailing his lot; he is then unable to uſe his hands or feet, and is incapable of acquiring any kind of knowledge without inſtruction; he can neither ſpeak, nor walk, nor eat, nor perform any action whatever by natural inſtinct:” *Pliny*.—“ We may judge what kind of life is allotted to us by Nature, ſince it is ordained, as an omen, that we ſhould come weeping into the world:” *Seneca*.—“ It is humiliating to the pride of man, to conſider the pitiable origin of this moſt arrogant of all the animals:” *Pliny*.

5
Self-knowledge, or the ſtudy of man. (*Syſt. Nat.* Kerr.)

2. DIETETICALLY.—*Cura valetudinem*. Bodily health and tranquillity of mind are more to be deſired than all the riches, pomp, or glory, of a Crœſus, a Solomon, or an Alexander. Health is to be preſerved by moderation, it is deſtroyed by abſtinence, injured by variety of delicacies, weakened by unuſual things, and ſtrengthened by the uſe of proper and accuſtomed fare. Man, learned in the pernicious art of cookery, is fond of many diſhes, rendered palatable by the injurious effects of fire, and by the baneful addition of wine. “ Hunger is ſatisfied with a ſmall quantity of food, luxury demands overabundance. Imagination requires vaſt ſupplies; while nature is contented with a moderate quantity of ordinary food, and is burthened by ſuperfluity:” *Seneca*.—According as thou liveſt, ſo ſhall thy life be enjoyed.

3. PATHOLOGICALLY.—*Memento mori!* The life of man reſembles a bubble ready to burſt; his fate is ſuſpended by a hair, and is dependent on the uncertain lapſe of time. “ The earth contains nothing more frail than man:” *Homer*.—“ Nothing is weaker than human life: To what dangers, and to how many diſeaſes, is it not expoſed? Hence the whole period of a man's life is but a ſpan: Half of it is neceſſarily ſpent in a ſtate reſembling death; without including the years of infancy, wherein there is no judgment; or the period of old age, fertile in ſufferings, during which the ſenſes are blunted, the limbs become ſtiff, and the faculties of ſight and hearing, the powers of walking, and the teeth, the inſtruments of nouriſhment, fail before the reſt of the body:” *Pliny*.—“ Thus a conſiderable part of death is ſuffered during life; and death poſſeſſes all that belonged to the times which are paſt. Finally, nature will ſpeedily recal and deſtroy all the beings which thou ſeeſt, and all that thy imagination can ſuppoſe to exiſt hereafter; for death calls equally upon all, whether they be good or whether they be evil:” *Seneca*, ii. 59.

4. NATURALLY.—*Innocui vivite, Numen adeſt!* Man, the prince of animated beings, who is a miracle of na-

ture, and for whom all things on this earth were created, is a mimic animal, weeping, laughing, ſinging, ſpeaking; tractable, judicious, inquiſitive, and moſt wiſe; he is weak and naked, unprovided with natural weapons, expoſed to all the injuries of fortune, needful of aſſiſtance from others, of an anxious mind, ſolicitous of protection, continually complaining, changeable in temper, obſtinate in hope, and ſlow in the acquiſition of wiſdom. He deſpiſes the time which is paſt, abuſes that which is preſent, and ſets his affections on the uncertain future; thus continually neglecting winged time, which, though infinitely precious, can never be recalled: For thus the beſt and readieſt time, in every age, flies on with miſerable mortals; ſome it ſummons to attend their daily and burthenſome labours; ſome it confines to luxurious inaction, pampered even to ſuffocation with ſuperfluities; ſome it ſolicits in the ever reſtleſs paths of ambition; ſome it renders anxious for the acquiſition of wealth, and diſtreſſes by the poſſeſſion of the thing deſired; ſome it condemns to ſolitude, and others to have their doors continually crouded with viſitors; here one bewails the conduct of his children, there one grieves their loſs. Tears will ſooner fail us than their cauſes, which only oblivion can remove. "On every hand our evils overbalance our advantages; we are ſurrounded with dangers; we ruſh forwards into untried ſituations; we are enraged without having received provocation; like wild beaſts, we deſtroy thoſe we do not hate; we wiſh for favourable gales, which lead us only to deſtruction; the earth yawns wide, ready for our death:" *Seneca.*—"Other animals unite together againſt enemies of a kind different from their own, while man ſuffers moſt injuries from his own ſpecies:" *Pliny.*

5. POLITICALLY.—*Eſto antiqua virtute et fide!* Man, inſtead of following that which is right, is ſubjected to the guidance of manifeſt error; this envelopes all his faculties under the thick veil of cuſtom, as ſoon as he is born; according to its dictates he is fed, educated, brought up, and directed, in all things; and by its arbitrary rules his honeſty, fortitude, wiſdom, morality, and religion, are judged of; thus, governed by opinion, he lives conformably to cuſtom, inſtead of being guided by reaſon. Though ſent into the world a periſhable being, for all are evidently born to ſuffer, inſtead of endeavouring to ſecure thoſe things which are moſt advantageous and truly beneficial, he, infatuated by the ſmiles of fortune, anxiouſly collects her gaudy trifles for future enjoyment, and neglects her real benefits; he is driven to madneſs by envious ſnarlers; he perſecutes with hatred the truly religious for differing from himſelf in ſpeculative opinions; he excites numberleſs broils, not that he may do good, but for a purpoſe that even himſelf is ignorant of. He waſtes his precious and irrecoverable time in trifles; he thinks lightly of immortal and eternal concerns, while regulating the ſucceſſion of his poſterity; and perpetually entering on new projects, forgetful of his real condition, he builds palaces inſtead of preparing his grave; till at length, in the midſt of his ſchemes, death ſeizes him; and then, firſt opening his eyes, he perceives, O man! that all is deluſion. "Thus we live as if immortal, and firſt learn in death that we have to die:" *Seneca.*

6. MORALLY.—*Benefac et lætare!* Man is compoſed of an animated medullary ſubſtance, which prompts him to that which is right; and of a bodily frame liable to impreſſions, which inſtigates him to the enjoyment of pleaſure. In his natural ſtate he is fooliſh, wanton, an inconſiderate follower of example, ambitious, profuſe, diſſatiſfied, cunning, peeviſh, invidious, malicious, and covetous; by the influence of juſt morals he is transformed to be attentive, chaſte, conſiderate, modeſt, temperate, quiet, ſincere, mild, beneficent, grateful, and contented. "Sorrow, luxury, ambition, avarice, the deſire of life, and anxiety for the future, are common to all animals:" *Pliny.*

7. THEOLOGICALLY.—*Memento Creatoris tui!* Man, the ultimate purpoſe of creation, and maſterpiece of the works of Omnipotence, was placed on earth that he might contemplate its perfections; he was endowed with ſapient reaſon, and made capable of forming concluſions from the impreſſions of his ſenſes, that, from a conſideration of created objects, he might know their Creator as the Almighty, the Infinite, the Omniſcient, the Eternal God: That we may live morally under his governing care, it is requiſite that we have a thorough conviction of its exiſtence, and muſt have it ever in remembrance. Other revealed matters on this ſubject are left to be explained by the theologians.

"There are two things which lead to a knowledge of God; creation and revelation:" *Auguſtine.*—"God, therefore, may be found out by the light of nature, but is only to be known by the aſſiſtance of doctrine:" *Tertullian.*—"Man alone has the ineſtimable privilege of contemplating the perfections of God, who is the author both of nature and of revelation:" *Ibid.*—"Learn that God has both ordered you to exiſt, and that you ſhould ſtudy to act that part properly which is allotted for you in life:" *Perſ.* Sat. iii. 71.

The whole of this ENCYCLOPÆDIA may in ſome reſpect be accounted an analyſis of MAN; as comprehending his knowledge of God, of himſelf, and of natural and artificial objects. In the ſequel of this article we ſhall collect into one view the moſt important particulars relating to himſelf individually, conſidered as a phyſical being, and as forming a ſubject of natural hiſtory.

6
Natural hiſtory of Man.

Anatomiſts have employed much pains in the ſtudy of the material part of man, and of that organization which determines his place in the animal creation. From tracing and combining his different external parts; from obſerving that his body is in ſome places covered with hair; that he can walk upon his hands and his feet at the ſame time, in the manner of quadrupeds; that, like certain animals which hold their food in their paws, he has two clavicles; that the female brings forth her young alive, and that her breaſts are ſupplied with milk: from theſe circumſtances we might be led to aſſign man a place in the claſs of viviparous quadrupeds. But, in our opinion, ſuch an arrangement would be defective, arbitrary, and abſurd. Man is not a quadruped †: Of all the animals, he alone can ſupport himſelf, continually and without reſtraint, in an erect poſture (that is, with his head and body in a vertical line upon his legs). In this majeſtic and dignified attitude, he can change his place, ſurvey this earth which he inhabits, and turn his eyes towards the vault of heaven. By a noble and eaſy gait, he

† See *Comparative Anatomy*, Sect. i. ii.

preſerves an equilibrium in the ſeveral parts of his body, and tranſports himſelf from one place to another with different degrees of celerity (c). To man alone nature has denied a covering; but ſtill he is her maſterpiece, the laſt work which came from the hands of the Almighty Artiſt, the ſovereign and the chief of animals,

---

(c) M. Daubenton, after a careful examination of thoſe characters in the form of man by which he is diſtinguiſhed from other animals, has reduced them to two heads. The firſt is the ſtrength of the muſcles of the legs, by which the body is ſupported in a vertical poſition above them; the ſecond conſiſts in the articulation of the head with the neck by the middle of its baſe.

We ſtand upright, bend our body, and walk, without thinking on the power by which we are ſupported in theſe ſeveral poſitions. This power, ſays M. Daubenton, reſides chiefly in the muſcles, which conſtitute the principal part of the calf of the leg. Their exertion is felt, and their motion is viſible externally when we ſtand upright and bend our body backwards and forwards. This power is no leſs great when we walk even on an horizontal plane. In aſcending a height, the weight of the body is more ſenſibly felt than in deſcending. All theſe motions are natural to man. Other animals, on the contrary, when placed on their hind legs, are either incapable of performing them at all, or do it partially, with great difficulty, and for a very ſhort time. The *gibbon*, and the *jocko* or *ourang-outang*, are the animals moſt reſembling man in their conſtruction: they can ſtand upright with much leſs difficulty than other brutes; but the reſtraint they are under in this attitude plainly ſhows that it is not natural to them. The reaſon is, that the muſcles in the back part of the leg in the gibbon and the jocko are not, as in man, ſufficiently large to form a calf, and conſequently not ſufficiently ſtrong to ſupport the thighs and body in a vertical line, and to preſerve them in that poſture.

M. Daubenton has diſcovered, that the attitudes proper to man and to the animals are pointed out by the different manners in which the head is articulated with the neck. The two points, by which the oſſeous part of the head is connected with the firſt vertebra of the neck, and on which every movement of the head is made with the greateſt facility, are placed at the edge of the great foramen of the occipital bone, which in man is ſituated near the centre of the baſe of the cranium, affords a paſſage for the medullary ſubſtance into the vertebræ, and determines the place of the articulation of the head with the neck. The body and neck being, according to the natural attitude, in a vertical direction, the head muſt be placed in equilibrium upon the vertebræ as upon a pivot or point of ſupport. The face is on a vertical line, almoſt parallel to that of the body and neck. The jaws, which are very ſhort compared with thoſe of moſt other animals, extend very little farther forwards than the forehead.

No animal has, like man, its hind legs as long as the body, neck, and head, taken together, meaſuring from the top of the head to the os pubis.

In the frame of the human body the principal parts are nearly the ſame with thoſe of other animals; but in the connection and form of the bones, ſays M. Daubenton, there is as great a difference as in the attitudes proper to each. Were a man to aſſume the natural poſture of quadrupeds, and try to walk by the help of his hands and feet, he would find himſelf in a very unnatural ſituation; he could not move his feet and head but with the greateſt difficulty and pain; and let him make what exertions he pleaſed, he would find it impoſſible to attain a ſteady and continued pace. The principal obſtacles he would meet with would ariſe from the ſtructure of the pelvis, the hands, the feet, and the head.

The plane of the great occipital foramen, which in man is almoſt horizontal, puts the head in a kind of equilibrium upon the neck when we ſtand erect in our natural attitude: but when we are in the attitude of quadrupeds, it prevents us from raiſing our head ſo as to look forwards, becauſe the movement of the head is ſtopt by the protuberance of the occiput, which then approaches too near the vertebræ of the neck.

In moſt animals, the foramen magnum of the occipital bone is ſituated at the back part of the head; the jaws are very long; the occiput has no protuberance beyond the aperture, the plane of which is in a vertical direction, or inclined a little forwards or backwards; ſo that the head is pendant, and joined to the neck by its poſterior part. This poſition of the head enables quadrupeds, though their bodies are in a horizontal direction, to preſent their muzzle forwards, and to raiſe it ſo as to reach above them, or to touch the earth with the extremity of their jaws when they bring their neck and head down to their feet. In the attitude of quadrupeds, man could touch the earth only with the fore part or the top of the head.

To theſe differences of ſtructure, M. Daubenton adds, that when man is ſtanding, his heel reſts upon the earth as well as the other parts of his foot; when he walks it is the firſt part which touches the ground; man can ſtand on one foot: theſe are peculiarities in ſtructure and in the manner of moving which are not to be found in other animals. We may therefore conclude that man cannot be ranked in the claſs of quadrupeds. We may add, that in man the brain is much larger, and the jaws much ſhorter, than in any other animal. The brain, by its great extent, forms the protuberance of the occipital bone, the forehead, and all that part of the head which is above the ears. In animals, the brain is ſo ſmall, that moſt of them have no occiput, or the front is either wanting or little raiſed. In animals which have large foreheads, ſuch as the horſe, the ox, the elephant, &c. they are placed as low, and even lower, than the ears. Theſe animals likewiſe want the occiput, and the top of the head is of very ſmall extent. The jaws, which form the greateſt portion of the muzzle, are large in proportion to the ſmallneſs of the brain. The length of the muzzle varies in different animals: in ſolipede animals it is very long; it is ſhort in the ourang-outang; and in man it does not exiſt at all. No beard grows on the muzzle: this part is wanting in every animal.

mals, a world in miniature, the centre which connects the univerſe together. The form of his body, the organs whereof are conſtructed in ſuch a manner as to produce a much greater effect than thoſe of other animals, announces his power. Every thing demonſtrates the excellence of his nature, and the immenſe diſtance placed by the bounty of the Creator between man and beaſt. Man is a reaſonable being; brute animals are deprived of that noble faculty. The weakeſt and moſt ſtupid of the human race is able to manage the moſt ſagacious quadruped; he commands it, and makes it ſubſervient to his uſe. The operations of brutes are purely the effect of mechanical impulſe, and continue always the ſame; human works are varied without end, and infinitely diverſified in the manner of execution. The ſoul of man is free, independent, and immortal. He is fitted for the ſtudy of ſcience, and the cultivation of art; he has the excluſive privilege of examining every thing which has exiſtence, and of holding communication with his fellow-creatures by language, by particular motions of the body, and by marks and characters mutually agreed upon. Hence ariſes that phyſical pre-eminence which he enjoys over all animals; and hence that power which he poſſeſſes over the elements, and (ſo to ſpeak) over nature itſelf. Man, therefore, is unequalled in his kind; but the individuals thereof differ greatly from one another in figure, ſtature, colour, manners, and diſpoſitions. The globe which man inhabits is covered with the productions of his induſtry and the works of his hands: it is his labour, in ſhort, which gives a value to the whole terreſtrial maſs.

The hiſtory of man is an object of attention highly intereſting, whether we conſider him in the different periods of his life, or take a view of the varieties of the ſpecies, or examine the wonderful organization of his frame. We ſhall, therefore, attempt to give a ſhort ſketch of him in theſe different points of view; referring occaſionally to other parts of the work for more particular details.

7 Different periods of man's life.

8 His condition at birth;

“Nothing (ſays M. Buffon) exhibits ſuch a ſtriking picture of our weakneſs, as the condition of an infant immediately after birth. Incapable of employing its organs, it needs aſſiſtance of every kind. In the firſt moments of our exiſtence, we preſent an image of pain and miſery, and are more weak and helpleſs than the young of any other animal. At birth, the infant paſſes from one element to another: When it leaves the gentle warmth of the tranquil fluid by which it was completely ſurrounded in the womb of the mother, it becomes expoſed to the impreſſions of the air, and inſtantly feels the effects of that active element. The air acting upon the olfactory nerves, and upon the organs of reſpiration, produces a ſhock ſomething like ſneezing, by which the breaſt is expanded, and the air admitted into the lungs. In the mean time, the agitation of the diaphragm preſſes upon the viſcera of the abdomen, and the excrements are thus for the firſt time diſcharged from the inteſtines, and the urine from the bladder. The air dilates the veſicles of the lungs, and after being rarefied to a certain degree, is expelled by the ſpring of the dilated fibres reacting upon this rarefied fluid. The infant now reſpires; and articulates ſounds, or cries. [For the condition of the *fœtus in utero*, where it lives without reſpiration, ſee ANATOMY, n° 110; and for the nature and importance of reſpiration, ſee n° 118.]

9 and during the period of infancy.

Moſt animals are blind for ſome days after birth. Infants open their eyes to the light the moment they come into the world; but they are dull, fixed, and commonly blue. The new-born child cannot diſtinguiſh objects, becauſe he is incapable of fixing his eyes upon them. The organ of viſion is yet imperfect; the cornea is wrinkled; and perhaps the retina is too ſoft for receiving the images of external objects, and for communicating the ſenſation of diſtinct viſion. At the end of forty days, the infant begins to hear and to ſmile. About the ſame time it begins to look at bright objects, and frequently to turn its eyes towards the window, a candle, or any light. Now likewiſe it begins to weep; for its former cries and groans were not accompanied with tears. Smiles and tears are the effect of two internal ſenſations, both of which depend on the action of the mind. Thus they are peculiar to the human race, and ſerve to expreſs mental pain or pleaſure; while the cries, motions, and other marks of bodily pain and pleaſure, are common to man and moſt of the other animals. Conſidering the ſubject as metaphyſicians, we will find that pain and pleaſure are the univerſal power which ſets all our paſſions in motion.

The ſize of an infant born at the full time is commonly twenty-one inches; and that *fœtus*, which nine months before was an imperceptible bubble, now weighs ten or twelve pounds, and ſometimes more. The head is large in proportion to the body; and this diſproportion, which is ſtill greater in the firſt ſtage of the fœtus, continues during the period of infancy. The ſkin of a new-born child is of a reddiſh colour, becauſe it is ſo fine and tranſparent as to allow a ſlight tint of the colour of the blood to ſhine through. The form of the body and members is by no means perfect in a child ſoon after birth; all the parts appear to be ſwollen. At the end of three days, a kind of jaundice generally comes on, and at the ſame time milk is to be found in the breaſts of the infant, which may be ſqueezed out by the fingers. The ſwelling decreaſes as the child grows up.

The liquor contained in the amnios leaves a viſcid whitiſh matter upon the body of the child. In this country we have the precaution to waſh the new-born infant only with warm water; but it is the cuſtom with whole nations inhabiting the coldeſt climates, to plunge their infants into cold water as ſoon as they are born without their receiving the leaſt injury. It is even ſaid that the Laplanders leave their children in the ſnow till the cold has almoſt ſtopped their reſpiration, and then plunge them into a warm bath. Among theſe people, the children are alſo waſhed thrice a-day during the firſt year of their life. The inhabitants of northern countries are perſuaded that the cold bath tends to make men ſtronger and more robuſt, and on that account accuſtom their children to the uſe of it from their infancy. The truth is, that we are totally ignorant of the power of habit, or how far it can make our bodies capable of ſuffering, of acquiring, or of loſing.

The child is not allowed to ſuck as ſoon as it is born; but time is given for diſcharging the liquor and ſlime from the ſtomach, and the *meconium* or excrement, which is of a black colour, from the inteſtines. As theſe ſubſtances might ſour the milk, a little diluted wine mixed with ſugar is firſt given to the infant, and the breaſt is not preſented to it before ten or twelve hours have elapſed.

The young of quadrupeds can of themſelves find the way to the teat of the mother: it is not ſo with man. The mother, in order to ſuckle her child, muſt raiſe it to her breaſts; and, at this feeble period of life, the infant can expreſs its wants only by its cries.

10
Peculiar attention requiſite in rearing the young of mankind.

New-born children have need of frequent nouriſhment. During the day, the breaſt ought to be given them every two hours, and during the night as often as they awake. At firſt they ſleep almoſt continually; and they ſeem never to awake but when preſſed by hunger or pain. Sleep is uſeful and refreſhing to them; and it ſometimes becomes neceſſary to employ narcotic doſes, proportioned to the age and conſtitution of the child, for the purpoſe of procuring them repoſe. The common way of appeaſing the cries of children is by rocking them in the cradle; but this agitation muſt be very gentle, otherwiſe a great riſk is run of confuſing the infant's brain, and of producing a total derangement. It is neceſſary to their being in good health, that their ſleep be long and natural. It is poſſible, however, that they may ſleep too much, and thereby endanger their conſtitution. In that caſe, it would be proper to take them out of the cradle, and awaken them by a gentle motion, or by preſenting ſome bright object to their eyes. At this age we receive the firſt impreſſions from the ſenſes, which, without doubt, are more important during the reſt of life than is generally imagined. Great care ought to be taken to place the cradle in ſuch a manner that the child ſhall be directly oppoſite to the light: for the eyes are always directed towards that part of the room where the light is ſtrongeſt; and, if the cradle be placed ſideways, one of them, by turning towards the light, will acquire greater ſtrength than the other, and the child will ſquint. For the two firſt months, no other food ſhould be given to the child but the milk of the nurſe; and, when it is of a weak and delicate conſtitution, this nouriſhment alone ſhould be continued during the third or fourth month. A child, however robuſt and healthful, may be expoſed to great danger and inconvenience, if any other aliment is adminiſtered before the end of the firſt month. In Holland, Italy, Turkey, and the whole Levant, the food of children is limited to the milk of the nurſe for a whole year. The ſavages of Canada give their children ſuck for four, five, and ſometimes even ſeven years. In this country, as nurſes generally have not a ſufficient quantity of milk to ſatiſfy the appetite of their children, they commonly ſupply the want of it by panada, or other light preparations.

The teeth uſually begin to appear about the age of ſeven months. The cutting of theſe, although a natural operation, does not follow the common laws of nature, which acts continually on the human body without occaſioning the ſmalleſt pain or even producing any ſenſation. Here a violent and painful effort is made, accompanied with cries and tears. Children at firſt loſe their ſprightlineſs and gaiety; they become ſad, reſtleſs, and fretful. The gums are red, and ſwelled; but they afterwards become white, when the preſſure of the teeth is ſo great as to ſtop the circulation of the blood. Children apply their fingers to their mouth, that they may remove the irritation which they feel there. Some relief is given, by putting into their hands a bit of ivory or of coral, or of ſome other hard and ſmooth body, with which they rub the gums at the affected part. This preſſure, being oppoſed to that of the teeth, calms the pain for a moment, contributes to make the membrane of the gum thinner, and facilitates its rupture. Nature here acts in oppoſition to herſelf; and an inciſion of the gum muſt ſometimes take place, to allow a paſſage to the tooth. For the period of dentition, number of teeth, &c. ſee ANATOMY, n° 27.

When children are allowed to cry too long and too often, ruptures are ſometimes occaſioned by the efforts they make. Theſe may eaſily be cured by the ſpeedy application of bandages; but if this remedy has been too long delayed, the diſeaſe may continue through life. Children are very much ſubject to worms. Some of the bad effects occaſioned by theſe animals might be prevented by giving them a little wine now and then, for fermented liquors have a tendency to prevent their generation.

Though the body is very delicate in the ſtate of infancy, it is then leſs ſenſible of cold than at any other part of life. The internal heat appears to be greater: the pulſe in children is much quicker than in adults; from which we are certainly intitled to infer, that the internal heat is greater in the ſame proportion. For the ſame reaſon, it is evident that ſmall animals have more heat than large ones; for the beating of the heart and of the arteries is always quicker in proportion to the ſmallneſs of the animal. The ſtrokes of the heart in a ſparrow ſucceed one another ſo rapidly that they can ſcarcely be counted.

11
The great mortality to which children are ſubject.

Till three years of age, the life of a child is very precarious. In the two or three following years, it becomes more certain; and at ſix or ſeven years of age, a child has a better chance of living than at any other period of life. From the bills of mortality publiſhed at London, it appears, that of a certain number of children born at the ſame time, one half of them die the three firſt years: according to which, one half of the human race are cut off before they are three years of age. But the mortality among children is not nearly ſo great every where as in London. *M. Dupre de Saint-Maur*, from a great number of obſervations made in France, has ſhown that half of the children born at the ſame time are not extinct till ſeven or eight years have elapſed.

Among the cauſes which have occaſioned ſo great a mortality among children, and even among adults, the ſmall-pox may be ranked as the chief. But luckily the means of alleviating by inoculation the fatal effects of this terrible ſcourge are now univerſally known. See INOCULATION, and *MEDICINE-Index*.

12
Speech, when it commences.

Children begin learning to ſpeak about the age of twelve or fifteen months. In all languages, and among every people, the firſt ſyllables they utter are *ba*, *ba*, *ma*, *ma*, *pa*, *pa*, *taba*, *abada*: nor ought this to excite any ſurpriſe, when we conſider that theſe ſyllables are the ſounds moſt natural to man, becauſe they conſiſt of that vowel, and thoſe conſonants, the pronunciation of which require the ſmalleſt exertion in the organs of ſpeech. Some children at two years of age articulate diſtinctly, and repeat whatever is ſaid to them; but moſt children do not ſpeak till the age of two years and a half, or three years, and often later.

The life of man and of other animals is meaſured only from the moment of birth: they enjoy exiſtence, however, previous to that period, and begin to live in the ſtate of a fœtus. This ſtate is deſcribed and explained under the article ANATOMY, n° 110. The period of infancy, which extends from the moment of birth to about twelve years of age, has juſt now been conſidered.

13 Period of puberty and adoleſcence.

The period of infancy is followed by that of adoleſcence. This begins, together with puberty, at the age of twelve or fourteen, and commonly ends in girls at fifteen, and in boys at eighteen, but ſometimes not till twenty-one, twenty-three, and twenty-five years of age. According to its etymology (being derived from the Latin word *adoleſcentia*), it is completed when the body has attained its full height. Thus, puberty accompanies adoleſcence, and precedes youth. This is the ſpring of life; this is the ſeaſon of pleaſures, of loves, and of graces: but alas! this ſmiling ſeaſon is of ſhort duration. Hitherto nature ſeems to have had nothing in view but the preſervation and increaſe of her work: ſhe has made no proviſion for the infant except what is neceſſary to its life and growth. It has lived, or rather enjoyed a kind of vegetable exiſtence, which was ſhut up within itſelf, and which it was incapable of communicating. In this firſt ſtage of life, reaſon is ſtill aſleep: but the principles of life ſoon multiply, and man has not only what is neceſſary to his own exiſtence, but what enables him to give exiſtence to others. This redundancy of life, this ſource of health and vigour, can no longer be confined, but endeavours to diffuſe and expand itſelf.

14 Symptoms of puberty.

The age of puberty is announced by ſeveral marks. The firſt ſymptom is a kind of numbneſs and ſtiffneſs in the groins, accompanied with a new and peculiar ſenſation in thoſe parts which diſtinguiſh the ſexes. There, as well as in the arm-pits, ſmall protuberances of a whitiſh colour appear, which are the germs of a new production of a kind of hair, by which theſe parts are afterwards to be veiled. The voice, for a conſiderable time, is rough and unequal; after which it becomes fuller, ſtronger, and graver, than it was before. This change may eaſily be diſtinguiſhed in boys; but leſs ſo in girls, becauſe their voices are naturally ſharper. Theſe marks of puberty are common to both ſexes: but there are marks peculiar to each, ſuch as the diſcharge of the menſes, and the growth of the breaſts, in girls; the beard, and the emiſſion of ſemen, in boys; in ſhort, the feeling of venereal deſire, and the appetite which unites the ſexes. Among all races of mankind, the females arrive at puberty ſooner than the males; but the age of puberty is different in different nations, and ſeems partly to depend on the temperature of the climate and the quality of the food. In all the ſouthern countries of Europe, and in cities, the greateſt part of girls arrive at puberty about twelve, and boys about fourteen years of age. But in the northern parts, and in the country, girls ſcarcely arrive at puberty till they are fourteen or fifteen, and boys not till they are ſixteen or ſeventeen. In our climate, girls, for the greateſt part, have attained complete maturity at eighteen, and boys at twenty years of age.

At the age of adoleſcence, and of puberty, the body commonly attains its full height. About that time, young people ſhoot out ſeveral inches almoſt at once. But there is no part of the human body which increaſes more quickly and more perceptibly than the organs of generation in both ſexes. In males, this growth is nothing but an unfolding of the parts, an augmentation in ſize; but in females, it often occaſions a ſhrinking and contraction, which have received different names from thoſe who have treated of the ſigns of virginity. See VIRGINITY.

15 Effects of puberty.

Marriage is a ſtate ſuitable to man, wherein he muſt make uſe of thoſe new faculties which he has acquired by puberty. At this period of life, the deſire of producing a being like himſelf is ſtrongly felt. The external form and the correſpondence of the organs of ſex, occaſion without doubt that irreſiſtible attraction which unites the ſexes and perpetuates the race. By connecting pleaſure with the propagation of the ſpecies, nature has provided moſt effectually for the continuance of her work. *Increaſe and multiply*, is the expreſs command of the Creator, and one of the natural functions of life. We may add, that at the age of puberty a thouſand impreſſions act upon the nervous ſyſtem, and reduce man to ſuch a ſituation that he feels his exiſtence only in that voluptuous ſenſe, which then appears to become the ſeat of his ſoul, which engroſſes the whole ſenſibility of which he is ſuſceptible, and which at length proceeds to ſuch a height, that its attacks cannot long be ſupported without a general derangement of the whole machine. The continuance of ſuch a feeling may ſometimes indeed prove fatal to thoſe who indulge in exceſſive enjoyment; but it is equally dangerous to thoſe who obſtinately perſiſt in celibacy, eſpecially when ſtrongly ſolicited by nature. The ſemen, being too long confined in the ſeminal veſſels, may, by its ſtimulant property, occaſion diſeaſes in both ſexes, and excite irritations ſo violent as to reduce man to a level with the brutes, which, when acted upon by ſuch impreſſions, are perfectly furious and ungovernable. When this irritation proceeds to extremity, it produces what is called the *furor uterinus* in women. The oppoſite habit, however, is infinitely more common, eſpecially in the temperate, and above all in the frozen zones.

16 Its too frequent abuſe.

After all, exceſs is much more to be dreaded than continency. The number of diſſolute and intemperate men afford us plenty of examples. Some have loſt their memory, ſome have been deprived of ſight, ſome have become bald, and ſome have died through mere weakneſs. In ſuch a caſe, bleeding is well known to be fatal. Young men cannot be too often warned of the irreparable injury they may do to their health; and parents, to whoſe care they are entruſted, ought to employ all the means in their power to turn them from ſuch dangerous exceſſes.

17 Great importance of this ſeaſon of life.

But at the age of puberty, young men know not of how great importance it is to prolong this ſmiling ſeaſon of their days, whereon the happineſs or miſery of their future life ſo much depends. Then they look not forwards to futurity, nor reflect on what is paſt, nor enjoy preſent pleaſures with moderation. How many ceaſe to be men, or at leaſt to have the faculties of men, before the age of thirty? Nature muſt not be forced: like a true mother, her object is the ſober and diſcreet union of the ſexes. It is ſufficient to obey when ſhe commands, and to anſwer when ſhe calls. Neither muſt we forget here to mention and condemn an outrage committed againſt nature, the ſhameful practice of which endangers the loſs of health, and the total ruin of the conſtitution ; we mean that ſolitary libertiniſm (*maſturbatio*), by which a man or woman, deceiving nature as it were, endeavours to procure thoſe enjoyments which religion has forbidden except when connected with the happineſs of being a parent. Such then is the phyſical order which the Author of nature, the great preſerver of the ſpecies as well as of the individual, has appointed to induce man, by the attraction of pleaſure, to propagate and continue his race.

The procreation of children is the object of marriage ; but ſometimes this object fails to be accompliſhed. See IMPOTENCE and STERILITY.

18 Of procreation. According to the ordinary courſe of nature, women are not fit for conception till after the firſt appearance of the menſes. When theſe ſtop, which generally happens about forty or fifty years of age, they are barren ever after. Their breaſts then ſhrink and decay, and the voice becomes feebler. Some, however, have become mothers before they have experienced any menſtrual diſcharge ; and others have conceived at the age of ſixty, and ſometimes at a more advanced age. Such examples, though not unfrequent, muſt be conſidered as exceptions to the general rule ; but they are ſufficient to ſhow that the menſtrual diſcharge is not eſſential to generation. The age at which man acquires the faculty of procreating is not ſo diſtinctly marked. In order to the production of ſemen, the body muſt have attained a certain growth, which generally happens between twelve and eighteen years of age. At ſixty or ſeventy, when the body begins to be enervated by old age, the voice becomes weaker, the ſemen is ſecreted in ſmaller quantities, and it is often unprolific. There are inſtances, however, of old men who have procreated at the age of eighty or ninety. Boys have been found who had the faculty of generating at nine, ten, or eleven years of age ; and young girls who have become pregnant at the age of ſeven, eight, or nine. But ſuch facts, which are very rare, ought to be conſidered as extraordinary phænomena in the courſe of nature.

19 regnancy. Pregnancy is the time during which a woman carries in her womb the fruit of conception. It begins from the moment the prolific faculty has been reduced into act, and all the conditions requiſite in both ſexes have concurred to form the rudiments of a male or female fœtus ; and it ends with delivery. As ſoon as a woman is declared pregnant, ſays the author of the eſſay *Sur la maniere de perfectionner l'eſpece humaine*, ſhe ought to direct her attention wholly to herſelf, and make the wants of her offspring the ſtandard of her actions. She is now become the depoſitary of a new creature ſimilar to herſelf, and differing only in the proportion and ſucceſſive unfolding of its parts. She muſt be highly careful not to lace herſelf tight, to avoid exceſſive ſtretchings, and, in ſhort, to diſturb in no reſpect the natural ſtate of the womb. She muſt likewiſe beware of indulging certain paſſions, for we ſhall afterwards ſee what great changes are produced in the animal œconomy by ſtrong and violent paſſions.

An explanation, then, of what takes place during pregnancy, is nothing but a hiſtory of the formation of the fœtus ; of its expanſion ; of the extraordinary manner in which it lives, is nouriſhed, and grows in its mother's womb ; and of the way in which all theſe operations are performed with regard to both : for which ſee ANATOMY, n° 109, 110. It has been proved by many obſervations, that the fœtus changes its poſition in the womb, according to the different attitudes of the mother. It is commonly ſituated with its feet downwards, the breech reſting upon the heels, the head bent towards the knees, the hands bent towards the mouth, the feet turned inwards ; and in this poſition it ſwims like a kind of veſſel in the watery fluid contained in the membranes by which it is ſurrounded, without occaſioning any inconvenience to the mother, except what ariſes from its motions, ſometimes to the one ſide, and ſometimes to the other. At times, it even kicks with ſuch violence as to frighten the mother. But when once the head becomes ſufficiently large to deſtroy the equilibrium, it tumbles over and falls downwards ; the face is turned towards the *os ſacrum*, and the crown of the head towards the orifice of the *uterus*. This happens ſix weeks or two months before delivery. When the time of delivery arrives, the fœtus, finding itſelf too much confined in the womb, makes an effort to eſcape with its head firſt. At length, at the moment of delivery, it unites its own ſtrength with that of the mother, and opens the orifice of the *uterus* wide enough to allow a paſſage for itſelf. It happens ſometimes that the fœtus eſcapes from the *uterus* without burſting its covering, as is the caſe with animals. But, in general, the human fœtus pierces the membranes by its efforts ; and ſometimes a very thin part of them remains upon the head like a cap. The ancients conſidered this membranous covering as a ſign of good fortune ; and the ſame idea is ſtill prevalent among the vulgar. The liquor which eſcapes during delivery is called the *waters* of the mother. Theſe waters ſerve to guard the fœtus from external injuries, by eluding the violence of the blows which the mother may receive upon the belly ; and, in the ſame manner, they defend the womb from the ſhocks occaſioned by the motions of the fœtus. 20 Parturition. In ſhort, by rendering the paſſages ſoft and pliable, they facilitate the eſcape of the child in the time of delivery. (See MIDWIFERY.)—In the womb, the fœtus does not reſpire, as has been already mentioned ; conſequently what has been ſaid of the cries of children in the womb, muſt be conſidered as altogether fabulous.—Women have generally only one child at a birth. When they bear two, three, or more, the fœtuſes are ſeldom found under the ſame covering ; and their placentæ, though adhering, are almoſt always diſtinct. Twins are not uncommon, but there are ſeldom more. It is ſuppoſed, that among women with child, there is only one in 2500 who brings forth three children at a birth, one in 20,000 who brings forth four, and one in a million who brings forth five. When the number amounts to five, or even when there are but three or four, they are generally of a weakly conſtitution ; moſt of them die in the womb, or ſoon after delivery. See the article PROLIFIC.

At the age of puberty, or a few years after, the body attains its full ſtature. Some young men grow

21 Period of youth.

no taller after 15 or 16, and others continue to grow till the age of 20 or 23. At this period they are very ſlender: but by degrees the members ſwell and begin to aſſume their proper ſhape; and before the age of 30, the body in men has attained its greateſt perfection with regard to ſtrength, conſiſtence, and ſymmetry. Adoleſcence ends at the age of 20 or 25; and at this period youth (according to the diviſion which has been made of the years of man's life into different ages) begins. It continues till the age of 30 or 35.

22 Stature of man.

The common ſtature of men is about five feet and three, four, five, ſix, or ſeven inches; and of women about five feet and two, three, or four inches. Men below five feet are of a ſmall ſtature. The Laplanders do not exceed four feet and a half; and the natives of ſome other countries are ſtill ſmaller. Women attain their full height ſooner than men. Haller computes, that in the temperate climates of Europe, the medium ſtature of men is about five feet and five or ſix inches. It is obſerved by the ſame author, that in Switzerland the inhabitants of the plains are taller than thoſe of the mountains. It is difficult to aſcertain with preciſion the actual limits of the human ſtature. In ſurveying the inhabited earth, we find greater differences in the ſtatures of individuals than in thoſe of nations. In the ſame climate, among the ſame people, and ſometimes in the ſame family, there are men whoſe ſtature is either too tall or too diminutive. See the articles GIANT and DWARF.

23 State of manhood.

The body having acquired its full height during the period of adoleſcence, and its full dimenſions in youth, remains for ſome years in the ſame ſtate before it begins to decay. This is the period of manhood, which extends from the age of 30 or 35 to that of 40 or 45 years. During this ſtage, the powers of the body continue in full vigour, and the principal change which takes place in the human figure ariſes from the formation of fat in different parts. Exceſſive fatneſs disfigures the body, and becomes a very cumberſome and inconvenient load.

24 Nobleneſs of the human form and movements.

The body of a well-ſhaped man ought to be ſquare, the muſcles ought to be ſtrongly marked, the contour of the members boldly delineated, and the features of the face well defined. In women, all the parts are more rounded and ſofter, the features are more delicate, and the complexion brighter. To man belong ſtrength and majeſty; gracefulneſs and beauty are the portion of the other ſex. The ſtructure eſſential to each will be found in the deſcription of the human ſkeleton, under the article ANATOMY.

Every thing in both ſexes points them out as the ſovereigns of the earth; even the external appearance of man declares his ſuperiority to other living creatures. His body is erect; his attitude is that of command; his auguſt countenance, which is turned towards heaven, bears the impreſſions of his dignity. The image of his ſoul is painted in his face; the excellence of his nature pierces through the material organs, and gives a fire and animation to the features of his countenance. His majeſtic deportment, his firm and emboldened gait, announce the nobleneſs of his rank. He touches the earth only with his extremity: he views it only at a diſtance, and ſeems to deſpiſe it. It has been juſtly obſerved, that the countenance of man is the mirror of his mind. In the looks of no animal are the expreſſions of paſſion painted with ſuch energy and rapidity, and with ſuch gentle gradations and ſhades, as in thoſe of man. We know, that in certain emotions of the mind, the blood riſes to the face, and produces bluſhing; and that in others, the countenance turns pale. Theſe two ſymptoms, the appearance of which depends on the ſtructure and the tranſparency of the reticulum, eſpecially redneſs, conſtitute a peculiar beauty. In our climates, the natural colour of the face of a man in good health is white, with a lively red ſuffuſed upon the cheeks. Paleneſs of the countenance is always a ſuſpicious ſymptom. That colour which is ſhaded with black is a ſign of melancholy and of vitiated bile; and conſtant and univerſal redneſs is a proof that the blood is carried with too great impetuoſity to the brain. A livid colour is a morbid and dangerous ſymptom; and that which has a tint of yellow is a ſign of jaundice or repletion of bile. The colour of the ſkin is frequently altered by want of ſleep or of nouriſhment, or by looſeneſs and diarrhœa.

25 Diverſity of the countenance.

Notwithſtanding the general ſimilitude of countenance in nations and families, there is a wonderful diverſity of features. No one, however, is at a loſs to recollect the perſon to whom he intends to ſpeak, provided he has once fully ſeen him. One man has livelineſs and gaiety painted in his countenance, and announces before-hand, by the cheerfulneſs of his appearance, the character which he is to ſupport in ſociety. The tears which bedew the cheeks of another man would excite compaſſion in the moſt unfeeling heart. Thus the face of man is the rendezvous of the ſymptoms both of his moral and phyſical affections: tranquillity, anger, threatening, joy, ſmiles, laughter, malice, love, envy, jealouſy, pride, contempt, diſdain or indignation, irony, arrogance, tears, terror, aſtoniſhment, horror, fear, ſhame or humiliation, ſorrow and affliction, compaſſion, meditation, particular convulſions, ſleep, death, &c. &c. The difference of theſe characters appears to us of ſufficient importance to form a principal article in the natural hiſtory of man.

26 Analyſis of the features.

When the mind is at eaſe, all the features of the face are in a ſtate of profound tranquillity. Their proportion, harmony, and union, point out the ſerenity of the thoughts. But when the ſoul is agitated, the human face becomes a living canvas, whereon the paſſions are repreſented with equal delicacy and energy, where every emotion of the ſoul is expreſſed by ſome feature, and every action by ſome mark; the lively impreſſion of which anticipates the will, and reveals by pathetic ſigns our ſecret agitation, and thoſe intentions which we are anxious to conceal. It is particularly in the eyes that the ſoul is painted in the ſtrongeſt colours and with the moſt delicate ſhades.

The different colours of the eyes are, dark hazel, light hazel, green, blue, gray, and whitiſh-gray. The moſt common of theſe colours are hazel and blue, both of which are often found in the ſame eye. Eyes which are commonly called black, are only dark hazel; they appear black in conſequence of being contraſted with the white of the eye. Wherever there is a tint of blue, however ſlight, it becomes the prevailing colour, and outſhines the hazel, with which it is intermixed, to ſuch a degree, that the mixture cannot be perceived without a very narrow examination. The moſt beautiful eyes are thoſe which appear black or blue. In the former, there is more expreſſion and vivacity; in the latter, more ſweetneſs and perhaps delicacy.

Next to the eyes, the parts of the face by which the phyſiognomy is moſt ſtrongly marked, are the eye-brows. Being of a different nature from the other parts, their effect is increaſed by contraſt. They are like a ſhade in a picture, which gives relief to the other colours and forms.

The fore-head is one of the largeſt parts of the face, and contributes moſt to its beauty. Every body knows of how great importance the hair is in the phyſiognomy, and that baldneſs is a very great defect. When old age begins to make its approaches, the hair which firſt falls off is that which covers the crown of the head and the parts above the temples. We ſeldom ſee the hair of the lower part of the temples, or of the back of the head, completely fall off. Baldneſs is peculiar to men: women do not naturally loſe their hair, tho' it becomes white as well as that of the men at the approach of old age.

The noſe is the moſt prominent feature of the face. But as it has very little motion, and that only in the moſt violent paſſions, it contributes leſs to the expreſſion than to the beauty of the countenance. The noſe is ſeldom perpendicular to the middle of the face, but for the moſt part is turned to one ſide or the other. The cauſe of this irregularity, which, according to the painters, is perfectly conſiſtent with beauty, and of which even the want would be a deformity, appears to be frequent preſſure on one ſide of the cartilage of the child's noſe againſt the breaſt of the mother when it receives ſuck. At this early period of life, the cartilages and bones have acquired very little ſolidity, and are eaſily bent, as may be obſerved in the legs and thighs of ſome individuals, who have been injured by the bandages of the ſwaddling clothes.

27
The motions produced in them by the paſſions.

Next to the eyes, the mouth and lips have the greateſt motion and expreſſion. Theſe motions are under the influence of the paſſions. The mouth, which is ſet off by the vermilion of the lips and the enamel of the teeth, marks, by the various forms which it aſſumes, their different characters. The organ of the voice likewiſe gives animation to this feature, and communicates to it more life and expreſſion than is poſſeſſed by any of the reſt. The cheeks are uniform features, and have no motion or expreſſion excepting from that involuntary redneſs or paleneſs with which they are covered in different paſſions, ſuch as ſhame, anger, pride, and joy, on the one hand; and fear, terror, and ſorrow, on the other.

In different paſſions, the whole head aſſumes different poſitions, and is affected with different motions. It hangs forward during ſhame, humility, and ſorrow; it inclines to one ſide in languor and compaſſion; it is elevated in pride, erect and fixed in obſtinacy and ſelf-conceit: In aſtoniſhment it is thrown backwards; and it moves from ſide to ſide in contempt, ridicule, anger, and indignation.

In grief, joy, love, ſhame, and compaſſion, the eyes ſwell, and the tears flow. The effuſion of tears is always accompanied with an extenſion of the muſcles of the face, which opens the mouth.

In ſorrow, the corners of the mouth are depreſſed, the under-lip riſes, the eye-lids fall down, the pupil of the eye is raiſed and half concealed by the eye-lid. The other muſcles of the face are relaxed, ſo that the diſtance between the eyes and the mouth is greater than ordinary; and conſequently the countenance appears to be lengthened.

In fear, terror, conſternation, and horror, the forehead is wrinkled, the eye-brows are raiſed, the eye-lids are opened as wide as poſſible, the upper lid uncovers a part of the white above the pupil, which is depreſſed and partly concealed by the under lip. At the ſame time, the mouth opens wide, the lips recede from each other, and diſcover the teeth both above and below.

In contempt and deriſion, the upper lip is raiſed at one ſide and expoſes the teeth, while the other ſide of the lip moves a little and wears the appearance of a ſmile. The noſtril on the elevated ſide of the lip ſhrivels up, and the corner of the mouth falls down. The eye on the ſame ſide is almoſt ſhut, while the other is open as uſual; but the pupils of both are depreſſed, as when one looks down from a height.

In jealouſy, envy, and malice, the eye-brows fall down and are wrinkled; the eye-lids are elevated, and the pupils are depreſſed. The upper lip is elevated on both ſides, while the corners of the mouth are a little depreſſed, and the under lip riſes to join the middle of the upper.

In laughter, the corners of the mouth are drawn back and a little elevated; the upper parts of the cheeks riſe; the eyes are more or leſs cloſed; the upper lip riſes, and the under one falls down; the mouth opens; and in caſes of immoderate laughter, the ſkin of the noſe wrinkles. That gentler and more gracious kind of laughter which is called *ſmiling*, is ſeated wholly in the parts of the mouth. The under lip riſes; the angles of the mouth are drawn back; the cheeks are puffed up; the eye-lids approach one another; and a ſmall twinkling is obſerved in the eyes. It is very extraordinary, that laughter may be excited either by a moral cauſe without the immediate action of external objects, or by a particular irritation of the nerves without any feeling of joy. Thus an involuntary laugh is excited by a ſlight tickling of the lips, of the palm of the hand, of the ſole of the foot, of the arm-pits, and, in ſhort, below the middle of the ribs. We laugh when two diſſimilar ideas, the union of which was unexpected, are preſented to the mind at the ſame time, and when one or both of theſe ideas, or their union, includes ſome abſurdity which excites an emotion of diſdain mingled with joy. In general, ſtriking contraſts never fail to produce laughter.

A change is produced in the features of the countenance by weeping as well as by laughing. When we weep, the under lip is ſeparated from the teeth, the forehead is wrinkled, the eye-brows are depreſſed; the dimple, which gives a gracefulneſs to laughter, forſakes the cheek: the eyes are more compreſſed, and almoſt conſtantly bathed in tears, which in laughter flow more ſeldom and leſs copiouſly.

The arms, hands, and every part of the body, contribute to the expreſſion of the paſſions. In joy, for inſtance, all the members of the body are agitated with quick and various motions. In languor and ſorrow, the arms hang down, and the whole body remains fixed and immoveable. In admiration and ſurpriſe, this total ſuſpenſion of motion is likewiſe obſerved. In love, deſire, and hope, the head and eyes are raiſed to heaven, and ſeem to ſolicit the wiſhed-for good; the body leans forward as if to approach it; the arms are ſtretched out, and ſeem to ſeize before-hand the beloved object. On the contrary, in fear, hatred, and horror, the arms ſeem to puſh backward and repel the object of our averſion; we turn away our head and eyes as if to avoid the ſight of it; we recoil in order to ſhun it.

28 Vigour, &c. of the human body.

Although the human body is externally much more delicate than that of any other animal, yet it is very nervous, and perhaps ſtronger in proportion to its ſize than that of the ſtrongeſt animals. We are aſſured that the porters at Conſtantinople carry burdens of 900 pounds weight. A thouſand wonderful ſtories are related of the Hottentots and other ſavages concerning their agility in running. Civilized man knows not the full extent of his powers, nor how much he loſes by that effeminacy and inactivity by which they are weakened and deſtroyed. He is contented even to be ignorant of the ſtrength and vigour which his members are capable of acquiring by motion, and by being accuſtomed to ſevere exerciſes, as is obſerved in runners, tumblers, and rope-dancers. The concluſion is, therefore, founded on the moſt juſt and indiſputable induction and analogy.—The attitude of walking is leſs fatiguing to man than that in which he is placed when he is ſtopped in running. Every time he ſets his foot upon the ground, he paſſes over a more conſiderable ſpace; the body leans forwards, and the arms follow the ſame direction; the reſpiration increaſes, and breathing becomes difficult. Leaping begins with great inflexions of the members; the body is then much ſhortened, but immediately ſtretches itſelf out with a great effort. The motions which accompany leaping make it very fatiguing.

29 Reſtoration of its powers by ſleep

It is obſerved by M. Daubenton (*Nouvelle Encyclopédie*), that a ceſſation from exerciſe is not alone ſufficient to reſtore the powers of the body when they are exhauſted by fatigue. The ſprings, though not in action, are ſtill wound up while we are awake, even when every movement is ſuſpended. In ſleep nature finds that repoſe which is ſuited to her wants, and the different organs enjoy a ſalutary relaxation. This is that wonderful ſtate in which man, unconſcious of his own exiſtence, and ſunk in apparent death, repairs the loſs which his faculties has ſuſtained, and ſeems to aſſume a new exiſtence. In this ſtate of drowſineſs and repoſe, the ſenſes ceaſe to act, the functions of the ſoul are ſuſpended, and the body ſeems abandoned to itſelf. The external ſymptoms of ſleep, which alone are the object of our attention, are eaſily diſtinguiſhed. At the approach of ſleep, the eyes begin to wink, the eye-lids fall down, the head nods and hangs down: its fall aſtoniſhes the ſleeper; he ſtarts up, and makes an effort to drive away ſleep, but in vain; a new inclination, ſtronger than the former, deprives him of the power of raiſing his head; his chin reſts upon his breaſt, and in this poſition he enjoys a tranquil ſleep. See the article Sleep.

30 The period of decline.

Phyſiologiſts give the name of old age to that period of life which commences immediately after the age of manhood and ends at death; and they diſtinguiſh green old age from the age of decrepitude. But in our opinion, ſuch an extenſive ſignification of the word ought not to be admitted. We are not old men at the age of forty or forty-five; and though the body then gives ſigns of decay, it has not yet arrived at the period of old age. M. Daubenton obſerves, that it would be more proper to call it the *declining age*, becauſe nature then becomes retrograde, the fatneſs and good plight of the body diminiſhes, and certain parts of it do not perform their functions with equal vigour.

The age of decline extends from forty or forty-five to ſixty or ſixty-five years of age. At this time of life, the diminution of the fat is the cauſe of thoſe wrinkles which begin to appear in the face and ſome other parts of the body. The ſkin, not being ſupported by the ſame quantity of fat, and being incapable, from want of elaſticity, of contracting, ſinks down and forms folds. In the decline of life, a remarkable change takes place alſo in viſion. In the vigour of our days, the cryſtalline lens, being thicker and more diaphanous than the humours of the eye, enables us to read letters of a very ſmall character at the diſtance of eight or ten inches. But when the age of decline comes on, the quantity of the humours of the eye diminiſhes, they loſe their clearneſs, and the tranſparent cornea becomes leſs convex. To remedy this inconvenience, we place what we wiſh to read at a greater diſtance from the eye: but viſion is thereby very little improved, becauſe the image of the object becomes ſmaller and more obſcure. Another mark of the decline of life is a weakneſs of the ſtomach, and indigeſtion, in moſt people who do not take ſufficient exerciſe in proportion to the quantity and the quality of their food.

31 Old age.

At ſixty, ſixty-three, or ſixty-five years of age, the ſigns of decline become more and more viſible, and indicate *old age*. This period commonly extends to the age of ſeventy, ſometimes to ſeventy-five, but ſeldom to eighty. When the body is extenuated and bent by old age, man then becomes crazy. Crazineſs therefore is nothing but an *infirm old age*. The eyes and ſtomach then become weaker and weaker; leanneſs increaſes the number of the wrinkles; the beard and the hair become white; the ſtrength and the memory begin to fail.

After ſeventy, or at moſt eighty years of age, the life of man is nothing but labour and ſorrow: Such was the language of David near three thouſand years ago. Some men of ſtrong conſtitutions, and in good health, enjoy old age for a long time without decrepitude; but ſuch inſtances are not very common. The infirmities of decrepitude continually increaſe, and at length death concludes the whole. This fatal term is uncertain. The only concluſions which we can form concerning the duration of life, muſt be derived from obſervations made on a great number of men who were born at the ſame time, and who died at different ages. Theſe we ſhall mention in the ſequel.

The ſigns of decrepitude form a ſtriking picture of weakneſs, and announce the approaching diſſolution

32
Decrepitude, and death.

of the body. The memory totally fails; the nerves become hard and blunted; deafneſs and blindneſs take place; the ſenſes of ſmell, of touch, and of taſte, are deſtroyed; the appetite fails; the neceſſity of eating, and more frequently that of drinking, are alone felt; after the teeth fall out, maſtication is imperfectly performed, and digeſtion is very bad; the lips fall inwards; the edges of the jaws can no longer approach one another; the muſcles of the lower jaw become ſo weak, that they are unable to raiſe and ſupport it: the body ſinks down; the ſpine is bent outward; and the vertebræ grow together at the anterior part: the body becomes extremely lean; the ſtrength fails: the decrepid wretch is unable to ſupport himſelf; he is obliged to remain on a ſeat, or ſtretched in his bed: the bladder becomes paralytic; the inteſtines loſe their ſpring; the circulation of the blood becomes ſlower; the ſtrokes of the pulſe no longer amount to the number of eighty in a minute as in the vigour of life, but are reduced to twenty-four and ſometimes fewer: reſpiration is ſlower; the body loſes its heat; the circulation of the blood ceaſes; death follows; and the dream of life is no more.

33
Man naturally formed for long life.

Man, ſays Haller in his Phyſiology, has no right to complain of the ſhortneſs of life. Throughout the whole of living beings, there are few who unite in a greater degree all the internal cauſes which tend to prolong its different periods. The term of geſtation is very conſiderable; the rudiments of the teeth are very late in unfolding; his growth is ſlow, and is not completed before about twenty years have elapſed. —The age of puberty, alſo, is much later in man than in any other animal. In ſhort, the parts of his body being compoſed of a ſofter and more flexible ſubſtance, are not ſo ſoon hardened as thoſe of inferior animals. Man, therefore, ſeems to receive at his birth the ſeeds of a long life: if he reaches not the diſtant period which nature ſeemed to promiſe him, it muſt be owing to accidental cauſes foreign to himſelf. Inſtead of ſaying that he has finiſhed his life, we ought rather to ſay that he has not completed it.

The natural and total duration of life is in ſome meaſure proportioned to the period of growth. A tree or an animal which ſoon acquires its full ſize, decays much ſooner than another which continues to grow for a longer time. If it is true that the life of animals is eight times longer than the period of their growth, we might conclude that the boundaries of human life may be extended to a century and a half.

34
Duration of life.

It does not appear that the life of man becomes ſhorter in proportion to the length of time the world has exiſted. In the days of the Pſalmiſt, the ordinary limits of human life did not exceed ſeventy or eighty years. No king of Judah lived beyond that period. When the Romans, however, were numbered by Veſpaſian, there were found in the empire, in that age of effeminacy, ten men aged an hundred and twenty and upwards. Among the princes of modern times, the late Frederick the Great of Pruſſia lived to the age of 74. George II. of Britain lived to that of 77. Louis XIV. lived to the ſame age. Staniſlaus king of Poland and duke of Lorrain exceeded that age. Pope Clement XII. lived to the age of 80. George I. of Britain attained the age of 83. M. Bomare has collected divers inſtances of perſons who lived to the age of 110 and upwards, of which we ſhall in a note (D) ſpecify a few in ſupplement to thoſe already given under the article LONGEVITY.

Before

(D) William Lecomte, a ſhepherd, died ſuddenly in 1776, in the county of Caux in Normandy, at the age of 110. Cramers, phyſician to the emperor, ſaw at Temeſwar two brothers, the one aged 110 and the other 112, both of whom were fathers at that age. Saint Paul the hermit was 113 at his death. The Sieur Iſwan-Horwaths, knight of the order of St Louis, died at Sar-Albe in Lorrain in 1775, aged almoſt 111. He was a great hunter. He undertook a long journey a ſhort time before his death, and performed it on horſeback. Roſine Iwiwarouſka died at Minſk in Lithuania at the age of 113. Fockjel Johannes died at Oldeborn in Frieſland, aged 113 years and 16 days. Marſk Jonas died in the year 1775 at Vilejac in Hungary, aged 119. John Niethen of Bakler in Zeland lived to the age of 120. Eleonora Spicer died in 1773, at Accomack in Virginia, aged 121. John Argus was born in the village of Laſtua in Turkey, and died the 6th of March 1779, at the age of 123; having ſix ſons and three daughters, by whom he had poſterity to the fifth generation. They amounted to the number of 160 ſouls, and all lived in the ſame village. His father died at the age of 120. In December 1777, there lived in Devonſhire a farmer named *John Brookey*, who was 134 years of age, and had been fifteen times married. The Philoſophical Tranſactions mention an Engliſhman of the name of *Eccleſton*, who lived to the age of 143. Another Engliſhman of the name of *Effingham*, died in 1757 at the age of 144. Niels Jukens of Hamerſet in Denmark died in 1764, aged 146. Chriſtian Jacob Drakemberg died in 1770 at Archuſen, in the 146th year of his age. This old man of the north was born at Stavangar in Norway in 1624, and at the age of 130 married a widow of 60. In Norway ſome men have lived to the age of 150. John Rovin, who was born at Szatlova-Carantz-Betcher, in the bannat of Temeſwar, lived to the age of 172, and his wife to that of 164, having been married to him during the ſpace of 147 years. When Rovin died, their youngeſt ſon was 99 years of age. In the *Gazette de France*, Jan. 18. 1780, we are informed that there lived at that time at Cordova du Tucuman, in Spaniſh America, a negro woman called *Louiſa Trexo*, who, by the judicial teſtimony of ſeveral perſons 100 years old, and of a negro woman of 120, was aged between 174 and 175 years. Peter Zoten, a peaſant, and a countryman of John Rovin, died in 1724 at the age of 185. His youngeſt ſon was then 97 years of age. The hiſtory and whole length pictures of John Rovin, Henry Jenkins, and Peter Zorten, are to be ſeen in the library of S. A. R. prince Charles at Bruſſels. Hanovius, profeſſor at Dantzick, mentions in his nomenclature an old man who died at the age of 184; and another ſtill alive in Wallachia, whoſe age, according to this author, amounts to 186. *Dictionnaire d'Hiſt. Nat.* voce HOMME.

35
Remarkable inſtances of longevity.

36 Chief cauſes of longevity.

Before we proceed to aſſign the common cauſes of longevity, it is proper to inquire into the manner of life and the ſituation of thoſe by whom it has been enjoyed. We find, then, that thoſe who have lived to the greateſt age have been ſuch as did not attain their full growth till a very advanced period of life, and who have kept their appetites and paſſions under the moſt complete ſubjection. In a word, thoſe who have exceeded 100 years, have in general been robuſt, laborious, ſober, and careful to obſerve the ſtricteſt regimen. Enjoying a good conſtitution from nature, they have ſeldom or never been ſubject to diſeaſe. They have even enjoyed the greateſt health and vigour, and retained the uſe of their ſenſes to the laſt moment of their lives.

Among thoſe who have led a life of contemplation and ſtudy, many have reached a very advanced age. Longevity is frequent among the different orders of religious, who by their ſtatutes are confined to a moderate diet, and obliged to abſtain from wine and the uſe of meat. Some celebrated anchorets have lived to a great age while they fed upon nothing but the wild roots and fruits which they found in the deſert whither they had retired. The philoſopher Xenophilus, who lived to the age of 106, was of the Pythagorean ſect. It is well known, that thoſe philoſophers who held the tranſmigration of ſouls, denied themſelves the uſe of meat, becauſe they imagined that killing an animal would be to aſſaſſinate another ſelf. A country life has produced many ſound and vigorous old men. It is ſuppoſed that a happy old age is attained with greater difficulty in towns than in the country. Sir Hans Sloane, Duverney, and Fontenelle, however, are inſtances of men whoſe lives have been ſpent in cities, and yet extended to a very great length. It has been obſerved, that men deprived of reaſon live very long; and this Dr Haller imputes to their being exempted from thoſe inquietudes which he conſiders as the moſt deadly poiſon. Perſons poſſeſſing a ſufficiently good underſtanding, but deſtitute of ambition, have been found to enjoy very long life. Men who are devoid of pretenſions, who are free from thoſe cares which a deſire of ſhining by a diſplay of talents, or of acquiring dignity and power, neceſſarily brings in its train, who feel no regret for the paſt nor anxiety about the future, are ſtrangers to thoſe torments of the mind which waſte and conſume the body. To that tranquillity of ſoul, which is ſo excellent a prerogative of infancy, they add that of being long young by phyſical conſtitution on which the moral has a ſtriking and powerful influence.

Premature wiſdom, and early talents, are often fitter to excite aſtoniſhment than expectation. The rapid unfolding of the moral faculties, by ſhortening the period of youth, ſeems to diminiſh in proportion the total duration of life. We have known a young lady of ſeventeen, who could ſpeak very correctly ſeven languages: ſhe tranſlated and wrote Latin, Greek, Italian, Spaniſh, German, Engliſh, and French; but ſhe died at the age of eighteen. The young man by whom ſhe was aſked in marriage, having been informed that he could not obtain her hand till he had made himſelf worthy of her by the ſame degree of talents and information, died the ſame year, and at the ſame age. But in ſome families, the web of life, to uſe an expreſſion of Haller, ſeems to be better warped than in others: of this kind were the families of *Thomas Parr*, mentioned under LONGEVITY; and *John Argus*, mentioned in the foregoing note.

From the preceding obſervations, Dr Haller has attempted to deduce the cauſes why a few men are longer exempted than others from the common fate.

The circumſtances which oppoſe their influence are independent of our will; ſuch as the ravages of epidemic diſtempers, trouble, and anxiety of mind, which create diſeaſes in the body, or the torments of ambition. It is neceſſary to live in a ſalubrious climate, to enjoy a fortune ſufficiently eaſy to exclude thoſe uneaſy deſires which create a feeling of want and privation, to be deſcended from healthy parents, to avoid drinking wine in youth, to drink water, and to eat little meat and a great deal of vegetables. It is neceſſary alſo to be temperate in meals; moderate in pleaſures, ſtudy, and exerciſe; to be naturally inclined to cheerfulneſs; and to allot a due time to ſleep and repoſe.

37 Cauſes by which the natural tendency to long life is counteracted.

Long life is certainly very rare; but, as has been already obſerved, we muſt diſtinguiſh between what is natural to the conſtitution of man, and that which is the conſequence of his condition. By the former he is made to be long lived; but nature is arreſted in her courſe by local and accidental cauſes, which it is not in our power to avoid.

Let us take a retroſpective view of man's life from his infancy, and enumerate the chief of theſe different cauſes. Of a thouſand infants, an account of which Dr Haller has extracted from the London bills of mortality, twenty-three died almoſt as ſoon as they came into the world: teething carried of fifty, and convulſions two hundred and ſeventy-ſeven: eighty died of the ſmall pox, and ſeven of the meaſles. Among the adult females, eight at leaſt died in child-bed: conſumption and aſthma, diſeaſes more frequent in England than in France, carried off an hundred and ninety-one of the ſame ſex, and almoſt a fifth part of the full grown men. An hundred and fifty died of fevers. At a more advanced age, twelve died of apoplexy, and forty-one of dropſy, without mentioning thoſe to whom diſeaſes of little importance in themſelves became mortal. There only remained ſeventy-eight whoſe death could be aſcribed to old age; and of theſe twenty-ſeven lived to the age of eighty and upwards. Among the different diſeaſes of which we have juſt now ſeen the fatal effects, and which carry off more than nine-tenths of mankind, not one, it muſt be allowed, is natural to the conſtitution. The inhabitants of this iſland are in general but little ſubject to diſeaſes, excepting the ſmall-pox and the meaſles; and many of them enjoy uninterrupted health to old age.

What are the moſt prevalent diſeaſes in other countries, which prove equally fatal to the duration of human life? In northern climates, ſcurvy, the colic of the Laplanders, and diſeaſes of the lungs, moſt frequently occaſion death. In temperate climates, dropſy carries off a great many at the beginning of old age, which is the boundary of life in the greateſt part of both ſexes, when they have eſcaped the acute diſeaſes, ſuch as putrid fever, &c. Acute diſeaſes are moſt common in warm countries. In ſome places, the rays of of the ſun kill in a few hours thoſe who are expoſed to its burning heat. The air of Egypt and of Aſia Minor engenders the plague, by which one half of their inhabitants are carried off. Between the tropics men are ſubject to dyſenteries and violent fevers. The cold of the night, in warm climates, occaſions ſometimes violent diſeaſes, ſuch as palſy, quinſey, and a ſwelling of the head. Damp and marſhy places give riſe to fevers of a different kind, but alſo very dangerous. The life of ſailors has a great tendency to produce ſcurvy. How many profeſſions prove fatal to the health, and in moſt men haſten that period which nature would have brought on by ſlow degrees! Miners, ſtone-cutters, gilders, perſons employed in emptying privies, &c. are ſubject to diſeaſes of the lungs, and become paralytic. Other profeſſions of life bring on other accidents, of which it would carry us too far to give a particular account. What has heen ſaid is ſufficient to ſhow, that it is the dangers with which we are ſurrounded that ſhorten the period of human life.

By examining the liſt of thoſe who have attained a great age, it will be found that mankind are longer lived in northern than in ſouthern countries. It has been obſerved, that there are more old men in mountains and elevated ſituations than in plains and low countries. We repeat it, if the duration of life among the inhabitants of ſouthern climates be compared with the duration of life in northern nations, it will be allowed, that the latter enjoy both longer life and better health than the former. Their growth being retarded by the rigour of the climate, their decay muſt alſo be ſlower, becauſe of the proportion which exiſts between the growth of animals and the length of their lives. Among ten perſons who have lived to the age of an hundred, eight or nine will be found to have lived in the north.

38
More women than men attain to old age

It appears from the bills of mortality, that in the country more boys are born than girls: in cities, on the contrary, the number of females is commonly greateſt Obſervations made with great care prove, that in moſt countries there are fewer men alive than women, and that more males die, chiefly at the firſt and laſt periods of life. In Sweden, the whole number of females in 1763, was to that of males in the proportion of ten to nine. The number of old women who exceeded 80 years of age, was to that of old men of the ſame age in the proportion of 33 to 19: and there were more women than men who had attained the age of 86, in the proportion of almoſt two to one.

39
Villages more favourable than towns to longevity.

The late Dr Price made obſervations, after Dr Percival, on the difference of longevity, and the duration of human life, in towns, country-pariſhes, and villages; of which the following is the reſult. A greater number in proportion die in great towns than in ſmall ones, and a greater number in the latter than in villages. The cauſe of this difference, which is found to be very great, mnſt be, in the firſt place, the luxury and diſſipation which prevail in towns; and, ſecondly, the badneſs of the air. In the town of Mancheſter, according to obſervation, $\frac{1}{28}$ of the inhabitants die annually; whereas, in the neighbouring country, the number of deaths does not exceed $\frac{1}{40}$ of the whole inhabitants. It may be laid down as a general principle, that in great towns, the number of deaths annually is from 1 in 19 to 1 in 22 or 23; in middling towns, from 1 in 24 to 1 in 28; and in country pariſhes and villages ſeldom more than 1 in 40 or 50. In 1763, the number of inhabitants in Stockholm amounted to 72,979. The average number of deaths for the ſix years preceding had been 3802, which makes 1 in 19 annually; while throughout all Sweden, including the towns and the country, not more than 1 in 35 die annually. At Rome the inhabitants are numbered every year. In 1771 they were found to amount to 159,675: the average number of deaths for ten years was 7367; which makes 1 in 23$\frac{1}{2}$ annually. In London not leſs than 1 in 20$\frac{3}{4}$ of the inhabitants die every year.

40
Probabilities of the duration of life.

M. Daubenton has given in the *Encyclopédie Methodique*, a table of the probabilities of the duration of life, conſtructed from that which is to be found in the ſeventh volume of the *Supplemens a l'Hiſtoire Naturelle de M. de Buffon.*

The following is an abridgment of it:

Of 23,994 children born at the ſame time, there will probably die,

In one year - - -	7998
Remaining $\frac{2}{3}$ or 15996.	
In eight years - -	11997
Remaining $\frac{1}{2}$ or 11997.	
In 38 years - - -	15996
Remaining $\frac{1}{3}$ or 7998.	
In 50 years - -	17994
Remaining $\frac{1}{4}$ or 5998.	
In 61 years - -	19995
Remaining $\frac{1}{6}$ or 3999.	
In 70 years - - -	21595
Remaining $\frac{1}{10}$ or 2399.	
In 80 years - - -	22395
Remaining $\frac{1}{40}$ or 599.	
In 90 years - - -	23914
Remaining $\frac{1}{300}$ or 79.	
In 100 years - - -	23992
Remaining $\frac{1}{10000}$ or 2.	

41
Recapitulation of the different ſtages.

It thus appears, that a very ſmall number of men indeed paſs through all the periods of life, and arrive at the gaol marked out by nature. Innumerable cauſes accelerate our diſſolution. The life of man, we have obſerved, conſiſts in the activity and exerciſe of his organs, which grow up and acquire ſtrength during infancy, adoleſcence, and youth. No ſooner has the body attained its utmoſt perfection, than it begins to decline. Its decay is at firſt imperceptible; but in the progreſs of time the membranes become cartilaginous, the cartilages acquire the conſiſtence of bone; the bones become more ſolid, and all the fibres are hardened. Almoſt all the fat waſtes away; the ſkin becomes withered and ſcaly; wrinkles are gradually formed; the hair grows white; the teeth fall out; the face loſes its ſhape; the body is bent; and the colour and conſiſtence of the cryſtalline humour become more perceptible. The firſt traces of this decay begin to be perceived at the age of forty, and ſometimes ſooner; this is the *age of decline*. They increaſe by ſlow degrees till ſixty, which is the *period of old age*. They increaſe more rapidly till the age of ſeventy or ſeventy-five. At this period *crazineſs* begins, and continues always to increaſe. Next ſucceeds *decrepitude*;

when the memory is gone, the uſe of the ſenſes loſt, the ſtrength totally annihilated, the organs worn out, and the functions of the body almoſt deſtroyed. Little now remains to be loſt; and before the age of ninety or an hundred, death terminates at once decrepitude and life.

42 Gradual extinction of life.

The body then dies by little and little: its motion gradually diminiſhes; life is extinguiſhed by ſucceſſive gradations, and death is only the laſt term in the ſucceſſion. When the motion of the heart, which continues longeſt, ceaſes, man has then breathed his laſt; he has paſſed from the ſtate of life to the ſtate of death; and as at his birth a breath opened to him the career of life, ſo with a breath he finiſhes his courſe.

43 Natural cauſe of death.

This natural cauſe of death is common to all animals and even to vegetables. We may obſerve that the centre of an oak firſt periſhes and falls into duſt, becauſe theſe parts having become harder and more compact can receive no further nouriſhment. The cauſes of our diſſolution, therefore, are as neceſſary as death is inevitable; and it is no more in our power to retard this fatal term than to alter the eſtabliſhed laws of the univerſe. Hence the following maxim has been univerſally adopted, *Contra vim mortis, nullum medicamentum in hortis.* In whatever manner death happens, the time and circumſtances thereof are unknown. It is conſidered, however, as at all times terrible, and the very thoughts of it fill the mind with fear and trouble. It is notwithſtanding our duty frequently to direct our thoughts to that event, which muſt inevitably happen, and by a life of virtue and innocence to prepare againſt thoſe conſequences which we ſo much dread.

44 Operates more ſlowly upon women than upon men.

As in women the bones, the cartilages, the muſcles, and every other part of the body, are ſofter and leſs ſolid than thoſe of men, they muſt require more time in hardening to that degree which occaſions death.—Women of courſe ought to live longer than men. This reaſoning is confirmed by experience; for by conſulting the bills of mortality, it appears, that after women have paſſed a certain age they live much longer than men who have arrived at the ſame age.—In like manner, it is found by experience, that in women the age of youth is ſhorter and happier than in men, but that the period of old age is longer, and attended with more trouble. *Citius pubeſcunt, citius ſeneſcunt.*

45 Diſſolution of the body.

After death, the organization of the body begins to be diſſolved, and all the parts relax, corrupt, and ſeparate. This is produced by an inteſtine fermentation, which occaſions putrefaction, and reduces the body to volatile alkali, fetid oil, and earth.

THE other particulars that were propoſed to be noticed in this article are, The ſeveral ſenſes with which man is endowed; his conſtitution, and animal functions; and that variety of colour, form, and character, which he aſſumes in different quarters of the globe. But there is no occaſion to enlarge upon thoſe topics here, as they have been already explained in other parts of the work. For the two firſt, ſee ANATOMY, *paſſim*. The laſt has been partly diſcuſſed under the word COMPLEXION, and will be reſumed afterwards under the article VARIETIES *of the Human Species*. For what regards man, conſidered as a rational, ſocial, moral, and religious being, ſee METAPHYSICS, MORAL *Philoſophy*, RELIGION, and THEOLOGY; alſo SOCIETY, LAW, LANGUAGE, and LOGIC.

ISLE OF MAN, an iſland in the Iriſh ſea, lying about ſeven leagues north from Angleſey, about the ſame diſtance weſt from Lancaſhire, nearly the like diſtance ſouth-eaſt from Galloway, and nine leagues eaſt from Ireland. Its form is long and narrow, ſtretching from the north-eaſt of Ayre-point to the Calf of Man, which lies ſouth-weſt, at leaſt 30 Engliſh miles. Its breadth in ſome places is more than nine miles, in moſt places eight, and in ſome not above five, and contains about 160 ſquare miles.

The firſt author who mentions this iſland is Cæſar; for there can be as little doubt, that, by the *Mona*, of which he ſpeaks in his Commentaries, placing it in the midſt between Britain and Ireland, we are to underſtand Man; as that the *Mona* of Tacitus, which he acquaints us had a fordable ſtrait between it and the continent, can be applied only to Angleſey. Pliny has ſet down both iſlands; *Mone*, by which he intends Angleſey, and *Monabia*, which is Man. In Ptolemy we find *Monaæda*, or *Monaida*, that is, the farther or more remote Mōn. Oroſius ſtyles it *Menavia*; tells us, that it was not extremely fertile; and that this, as well as Ireland, was then poſſeſſed by the Scots. Beda, who diſtinguiſhes clearly two Menavian iſlands, names this the *northern Menavia*, beſtowing the epithet of *ſouthern* upon Angleſey. In ſome copies of Nennius, this iſle is denominated *Eubonia*; in others, *Menavia*; but both are explained to mean *Man*. Alured of Beverley alſo ſpeaks of it as one of the Menavian iſlands. The Britons, in their own language, called it *Manaw*, more properly *Main au*, *i. e.* "a little iſland," which ſeems to be latinized in the word *Menavia*. All which clearly proves, that this ſmall iſle was early inhabited, and as well known to the reſt of the world as either Britain or Ireland.

In the cloſe of the firſt century, the Druids, who were the prieſts, prophets, and philoſophers of the old Britons, were finally expelled by Julius Agricola from the ſouthern Mona; and we are told, that they then took ſhelter in the northern. This iſland they found well planted with firs; ſo that they had, in ſome meaſure, what they delighted in moſt, the ſhelter of trees; but, however, not the ſhelter of thoſe trees in which they moſt delighted, viz. the oaks: and therefore theſe they introduced. No hiſtories tell us this; but we learn it from more certain authority, great woods of fir having been diſcovered interred in the bowels of the earth, and here and there ſmall groves of oaks: but as theſe trees are never met with intermixed, ſo it is plain they never grew together; and as the former are by far the moſt numerous, we may preſume them the natural produce of the country, and that the latter were planted and preſerved by the Druids. They gave the people, with whom they lived, and over whom they ruled, a gentle government, wiſe laws, but withal a very ſuperſtitious religion. It is alſo very likely that they hindered them, as much as they could, from having any correſpondence with their neighbours; which is the reaſon that, though the iſland is mentioned by ſo many writers, not one of them, before Oroſius, ſays a word about the inhabitants. A little before his time, that is, in the beginning of the fifth century, the Scots had tranſported themſelves thither, it is ſaid, from Ireland. The tradition of the natives of Man (for they have a traditionary hiſtory) begins at this period. They ſtyle this firſt diſcoverer *Mannan Mac Lear;* and they ſay that he was a magician, who kept this country covered with miſts, ſo that the inhabitants of other places could never find it. But the ancient chronicles of Ireland inform us, that the true name of this adventurer was *Orbſenius*, the ſon of Alladius, a prince in their iſland; and that he was ſurnamed *Mannanan*, from his having firſt entered the iſland of Man, and *Mac Lir*, i. e. "the offspring of the ſea," from his great ſkill in navigation. He promoted commerce; and is ſaid to have given a good reception to St Patrick, by whom the natives were converted to Chriſtianity.

The princes who ruled after him ſeem to have been of the ſame line with the kings of Scotland, with which country they had a great intercourſe, aſſiſting its monarchs in their wars, and having the education of their princes confided to them in time of peace.

In the beginning of the ſeventh century, Edwin king of Northumberland invaded the Menavian iſlands, ravaged Man, and kept it for ſome time, when, Beda aſſures us, there were in it about 300 families; which was leſs than a third part of the people in Angleſey, though Man wants but a third of the ſize of that iſland.

The ſecond line of their princes they derive from Orri, who, they ſay, was the ſon of the king of Norway; and that there were 12 princes of this houſe who governed Man. The old conſtitution, ſettled by the Druids, while they ſwayed the ſceptre, was perfectly reſtored; the country was well cultivated and well peopled; their ſubjects were equally verſed in the exerciſe of arms and in the knowledge of the arts of peace: in a word, they had a conſiderable naval force, an extenſive commerce, and were a great nation, tho' inhabiting only a little iſle. Guttred the ſon of Orri built the caſtle of Ruſſyn, A. D. 960, which is a ſtrong place, a large palace, and has ſubſiſted now above 800 years. Macao was the ninth of theſe kings, and maintained an unſucceſsful ſtruggle againſt Edgar, who reduced all the little ſovereigns of the different parts of Britain to own him for their lord; and who, upon the ſubmiſſion of Macao, made him his high-admiral, by which title (*archipirata*, in the Latin of thoſe times) he ſubſcribes that monarch's charter to the abbey of Glaſtonbury.

After the death of Edward the Confeſſor, when Harold, who poſſeſſed the crown of England, had defeated the Norwegians at the battle of Stamford, there was amongſt the fugitives one Goddard Crownan, the ſon of Harold the Black, of Iceland, who took ſhelter in the iſle of Man. This iſle was then governed by another Goddard, who was a deſcendant from Macao, and he gave him a very kind and friendly reception. Goddard Crownan, during the ſhort ſtay he made in the iſland, perceived that his name-ſake was univerſally hated by his ſubjects; which inſpired him with hopes that he might expel the king, and become maſter of the iſland. This he at laſt accompliſhed, after having defeated and killed Fingal the ſon of Goddard, who had ſucceeded his father. Upon this he aſſigned the north part of the iſland to the natives, and gave the ſouth to his own people; becoming, in virtue of his conqueſt, the founder of their third race of princes. However he might acquire his kingdom, he governed it with ſpirit and prudence; made war with ſucceſs in Ireland; gained ſeveral victories over the Scots in the Iſles; and, making a tour through his new-obtained dominions, deceaſed in the iſland of Iſlay. He left behind him three ſons. A civil war breaking out between the two eldeſt, and both of them deceaſing in a few years, Magnus king of Norway coming with a powerful fleet, poſſeſſed himſelf of Man and the iſles, and held them as long as he lived; but, being ſlain in Ireland, the people invited home Olave, the youngeſt ſon of Goddard Crownan, who had fled to the court of England, and been very honourably treated by Henry the Second. There were in the whole nine princes of this race, who were all of them feudatories to the kings of England; and often reſorted to their court, were very kindly received, and had penſions beſtowed upon them. Henry III. in particular, charged Olavo, king of Man, with the defence of the coaſts of England and Ireland; and granted him annually for that ſervice 40 marks, 100 meaſures of wheat, and five pieces of wine. Upon the demiſe of Magnus, the laſt king of this iſle, without heirs male, Alexander III. king of Scots, who had conquered the other iſles, ſeized likewiſe upon this; which, as parcel of that kingdom, came into the hands of Edward I. who directed William Huntercumbe, guardian or warden of that iſle for him, to reſtore it to John Baliol, who had done homage to him for the kingdom of Scotland.

But it ſeems there was ſtill remaining a lady named *Auſtrica*, who claimed this ſovereignty, as couſin and neareſt of kin to the deceaſed Magnus. This claimant being able to obtain nothing from John Baliol, applied herſelf next to king Edward, as the ſuperior lord. He, upon this application, by his writ, which is yet extant, commanded both parties, in order to determine their right, to appear in the king's-bench. The progreſs of this ſuit does not appear; but we know farther, that this lady, by a deed of gift, conveyed her claim to Sir Simon de Montacute; and, after many diſputes, invaſions by the Scots, and other accidents, the title was examined in parliament, in the ſeventh of Edward III. and ſolemnly adjudged to Willlam de Montacute; to whom, by letters-patent, dated the ſame year, that monarch releaſed all claim whatſoever.

In the ſucceeding reign, William Montacute, earl of Saliſbury, ſold it to Sir William Scroop, afterwards earl of Wiltſhire; and, upon his loſing his head, it was granted by Henry IV. to Henry Percy, earl of Northumberland; who, being attainted, had, by the grace of that king, all his lands reſtored, except the iſle of Man, which the ſame monarch granted to Sir John Stanley, to be held by him of the kings his heirs and ſucceſſors, by homage, and a caſt of falcons to be preſented at every coronation. Thus it was poſſeſſed by this noble family, who were created earls of Derby, till the reign of queen Elizabeth; when, upon the demiſe of earl Ferdinand, who left three daughters, it was, as lord Coke tells us, adjudged to thoſe ladies, and from them purchaſed by William earl of Derby, the brother of Ferdinand, from whom it was claimed by deſcent, and adjudged to its preſent poſſeſſor, his grace the duke of Athol.

This iſland, from its ſituation directly in the mouth of the channel, is very beneficial to Britain, by leſſening the force of the tides, which would otherwiſe break with far greater violence than they do at preſent. It is frequently expoſed to very high winds; and at other times to miſts, which, however, are not at all unwholeſome. The ſoil towards the north is dry and ſandy, of conſequence unfertile, but not unimprovable; the mountains, which may include near two-thirds of the iſland, are bleak and barren; yet afford excellent peat, and contain ſeveral kinds of metals. They maintain alſo a kind of ſmall ſwine, called *purrs*, which are eſteemed excellent pork. In the valleys there is as good paſture, hay, and corn, as in any of the northern counties; and the ſouthern part of the iſland is as fine ſoil as can be wiſhed. They have marl and lime-ſtone ſufficient to render even their pooreſt lands fertile; excellent ſlate, rag-ſtone, black marble, and ſome other kinds for building. They have vegetables of all ſorts, and in the utmoſt perfection; potatoes in immenſe quantities; and, where proper pains have been taken, they have tolerable fruit. They have alſo hemp, flax, large crops of oats and barley, and ſome wheat. Hogs, ſheep, goats, black cattle, and horſes, they have in plenty; and, though ſmall in ſize, yet if the country was thoroughly and ſkilfully cultivated, they might improve the breed of all animals, as experience has ſhown. They have rabbits and hares very fat and fine; tame and wild fowl in great plenty; and in their high mountains they have one airy of eagles and two of excellent hawks. Their rivulets furniſh them with ſalmon, trout, eels, and other kinds of freſh-water fiſh; on their coaſts are caught cod, turbot, ling, halibut, all ſorts of ſhell-fiſh (oyſters only are ſcarce, but large and good), and herrings, of which they made anciently a great profit, though this fiſhery is of late much declined.

The inhabitants of Man, though far from being unmixed, were, perhaps, till within the courſe of the preſent century, more ſo than any other under the dominion of the crown of Great Britain; to which they are very proud of being ſubjects, though, like the inhabitants of Jerſey and Guernſey, they have a conſtitution of their own, and a peculiarity of manners naturally reſulting from a long enjoyment of it.—The Manks tongue is the only one ſpoken by the common people. It is the old Britiſh, mingled with Norſe, or the Norwegian language, and the modern language. The clergy preach and read the common prayer in it. In ancient times they were diſtinguiſhed by their ſtature, courage, and great ſkill in maritime affairs. They are at this day a briſk, lively, hardy, induſtrious, and well-meaning people. Their frugality defends them from want: and though there are few that abound, there are as few in diſtreſs; and thoſe that are, meet with a cheerful unconſtrained relief. On the other hand, they are choleric, loquacious, and, as the law till lately was cheap, and unincumbered with ſolicitors and attornies, not a little litigious. The revenue, in the earl of Derby's time, amounted to about 2500 l. a-year; from which, deducting his civil liſt, which was about 700l. the clear income amounted to 1800l. At the ſame time, the number of his ſubjects was computed at 20,000.—The ſovereign of Man, though he has long ago waved the title of *king*, was ſtill inveſted with regal rights and prerogatives; but the diſtinct juriſdiction of this little ſubordinate royalty, being found inconvenient for the purpoſes of public juſtice, and for the revenue (it affording a commodious aſylum for debtors, outlaws, and ſmugglers), authority was given to the treaſury, by ſtat. 12 Geo. I. c. 28. to purchaſe the intereſt of the then proprietors for the uſe of the crown: which purchaſe was at length completed in the year 1765, and confirmed by ſtat. 5. Geo. III. c. 26. and 39.; whereby the whole iſland and all its dependencies (except the landed property of the Athol family), their manorial rights and emoluments, and the patronage of the biſhopric and other eccleſiaſtical benefices, are unalienably veſted in the crown, and ſubjected to the regulation of the Britiſh exciſe and cuſtoms. The duke, however, is procuring an act of parliament to reviſe the former one.

The moſt general diviſion of this iſland is into north and ſouth; and it contains 17 pariſhes, of which five are market-towns, the reſt villages. Its diviſion with regard to its civil government, is into ſix ſheedings, every one having its proper coroner, who is in the nature of a ſheriff, is intruſted with the peace of his diſtrict, ſecures criminals, brings them to juſtice. &c. The lord chief-juſtice Coke ſays, "their laws were ſuch as ſcarce to be found any where elſe." In July 1786, a copper coinage for the uſe of the iſland was iſſued from the Tower of London.—There is a ridge of mountains runs almoſt the length of the iſle, from whence they have abundance of good water from the rivulets and ſprings; and Snafield, the higheſt, riſes about 580 yards. The air is ſharp and cold in winter, the froſts ſhort, and the ſnow, eſpecially near the ſea, lies not long on the ground. Here are quarries of good ſtone, rocks of lime-ſtone, and red free-ſtone, and good ſlate, with ſome mines of lead, copper, and iron. The trade of this iſland was very great before the year 1726; but the late lord Derby farming out his cuſtoms to foreigners, the inſolence of thoſe farmers drew on them the reſentment of the government of England, who, by an act of parliament, deprived the inhabitants of an open trade with this kingdom. This naturally introduced a clandeſtine commerce, which they carried on with England and Ireland with prodigious ſucceſs, and an immenſe quantity of foreign goods was run into both kingdoms, till the government in 1765 thought proper to put an entire ſtop to it, by purchaſing the iſland of the duke of Athol, as already mentioned, and permitting a free trade with England. On the little iſle of Peele, on the weſt ſide of Man, is a town of the ſame name, with a fortified caſtle. Before the ſouth promontory of Man, is a little iſland called the *Calf of Man:* it is about three miles in circuit, and ſeparated from Man by a channel about two furlongs broad. At one time of the year it abounds with puffins, and alſo with a ſpecies of ducks and drakes, by the Engliſh called *barnacles*, and by the Scots *clakes* and *Soland geeſe*.

The inhabitants of this iſle are of the church of England; and the biſhop is ſtyled *Biſhop of Sodor and Man.* This biſhoprick was firſt erected by Pope Gregory IV. and for its dioceſe had this iſle and all the Hebrides, or Weſtern iſlands of Scotland; but which were called *Sodoroc* by the Danes, who went to them by the north, from the Swediſh Sodor, Sail or Oar iſlands, from which the title of the biſhop of Sodor is ſuppoſed to originate. The biſhop's ſeat was at Ruſhin, or caſtletown, in the iſle of Man, and in Latin is entitled *Sodorenſis.* But when this iſland became dependent upon the kingdom of England, the Weſtern iſlands withdrew themſelves from the obedience of their biſhop, and had a biſhop of their own, whom they entitled alſo *Sodorenſis*, but commonly *Biſhop of the Iſles.* The patronage of the biſhopric was given, together with the iſland, to the Stanleys by king Edward IV. and came by an heir-female to the family of Athole; and, on a vacancy thereof, they nominated their deſigned biſhop to the king, who diſmiſſed him to the archbiſhop of York for conſecration.—By an act of parliament, the 33d of King Henry VIII. this biſhopric is declared in the province of York.

Man of war Bird. See Pelicanus.

MANAGE. See Manege.

MANASSEH (in Scripture hiſt.), the eldeſt ſon of Joſeph, and grandſon of the patriarch Jacob (Gen. xli. 50, 51.) was born in the year of the world 2290, before Jeſus Chriſt 1714.

The tribe deſcended from him came out of Egypt, in number 32,200 men, fit for battle, upwards of 20 years old, under the conduct of Gamaliel ſon of Pedahzur (Numb. ii. 20, 21.) This tribe was divided at their entrance into the land of Promiſe. One half had its portion beyond the river Jordan, and the other half on this ſide the river, The half tribe of Manaſſeh which ſettled beyond the river poſſeſſed the country of Baſhan, from the river Jabbok to mount Libanus, (Numb. xxii. 33, 34. &c.); and the other half tribe of Manaſſeh on this ſide Jordan, obtained for its inheritance the country between the tribe of Ephraim to the ſouth and the tribe of Iſſachar to the north, having the river Jordan to the eaſt and the Mediterranean ſea to the weſt, (Joſh. xvi. xvii.)

Manasseh, the 15th king of Judah, being the ſon and ſucceſſor of Hezekiah. His acts are recorded in 2 Kings xx. xxi. and 2 Chr. xxxiii.

MANATI, in zoology. See Trichecus.

MANCA, was a ſquare piece of gold coin, commonly valued at 30 pence; and *mancuſa* was as much as a mark of ſilver, having its name from *manu cuſa*, being coined with the hand: *(Leg. Canut.)* But the *manca* and *mancuſa* were not always of that value; for ſometimes the former was valued ax ſix ſhillings, and the latter, as uſed by the Engliſh Saxons, was equal in value to our half-crown. Manca *ſex ſolidis æſtimetur*, (Leg. H. 1. c. 69) Thorn in his chronicle, tells us, that mancuſa *eſt pondus duorum ſolidorum et ſex denariorum*; and with him agrees Du Cange, who ſays, that 20 *mancæ* make 50 ſhillings. *Manca* and *mancuſa* are promiſcuouſly uſed in the old books for the ſame money.

MANCHA, a territory of Spain in the province of New Caſtile, lying between the river Guadiana and Andaluſia. It is a mountainous country; and it was here that the famous Don Quixote was ſuppoſed to perform his exploits.

MANCHESTER, a town of Lancaſhire in England, ſituated in W. Long. 2. 42. N. Lat. 53. 27. Mr Whitaker conjectures, that the ſtation was firſt occupied by the Britons about 500 years B. C. but that it did not receive any thing like the form of a town till 450 years after, or 50 years B. C. when the Britons of Cheſhire made an irruption into the territories of their ſouthern neighbours, and of conſequence alarmed the Seſtuntii, or inhabitants of Lancaſhire, ſo much, that they began to build fortreſſes, in order to defend their country. Its Britiſh name was *Mancenion*, that is, "a place of tents:" it was changed, however, into *Mancunium* by the Romans, who conquered it under Agricola in the memorable year of the Chriſtian æra 79. It appears alſo to have been called *Mandueſuedum*, *Mandueſſedum*, *Manucium*, and *Mamceſtre;* from which laſt it ſeems moſt evident that the preſent name has been derived. It is diſtant from London 182 miles, and from Edinburgh 214; ſtanding near the conflux of the Irk and the Irwell, about three miles from the Merſey.

Mancheſter was accounted a large and populous town even 50 years ago; but ſince that time it is ſuppoſed to have increaſed in more than a triple proportion, both in reſpect to buildings and inhabitants. The houſes amount to a number not far ſhort of 12,000; and perhaps it may not be an overrate to reckon ſeven perſons to each, when it is conſidered, that, of the houſes occupied by working people of various deſcriptions, many have two, three, and ſometimes more, families in each. For though many hundred houſes have been built in the courſe of a few late years, yet are they conſtantly engaged as ſoon as poſſible; the avidity for building increaſing with every new acceſſion of inhabitants, and rents riſing to a degree ſcarcely known in other places. The progreſs of this οἰκομανια may be partly eſtimated by the price of building, land, and materials: a guinea per ſquare yard, chief rent, having been refuſed for ſome central plots; and bricks ſelling at 24s. per 1000, which about four years ſince were not more than half the price. Such, however, has been the happy concurrence of ingenuity and induſtry, and ſuch the aſtoniſhing improvements daily making in its numerous manufactures, together with the encouragement theſe afford to ſkilful artiſts in various branches, that ſtreets muſt extend in proportion: yet population appears to have increaſed more rapidly than buildings; hence competitions naturally ariſe, and hence a *temporary* advance of rents. The manufactures of this town and neighbourhood, from humble domeſtic beginnings about two centuries ago, have now, after progreſſive improvements, acquired ſuch celebrity, both in the ſcale of ornament and utility, as to ſpread in ten thouſand forms and colours, not only in theſe kingdoms, but over all Europe, and even into the diſtant continents; being at once moſt precious mines of well-earned private wealth, and important contributors to the neceſſary public treaſure of the ſtate. Its poſt-office alone may afford an evidence of its extenſive commerce. The population of the town may be further calculated from the great number of cotton factories within the boundaries of the town, wherein it is thought that 20,000 men, women, and children, are employed in the mere branches of preparing *warp* and *weft*. If to theſe be added the many hands applied to weaving, &c. &c. &c. beſide all the more general mechanics, as well as houſeholders, domeſtic ſervants, &c. Mancheſter may be ranked as the moſt populous market-town in Great Britain. The marriages in Mancheſter and Salford, from January 1791 to January 1792, were 1302, the chriſtenings 2960, and the burials 2286. Hence, ſhould it be computed that one in every 30 perſons died, the number of inhabitants would amount to 68,580, which is thought to be much under the ſum of an actual enumeration. The ſtreets are about 600, many of them ſpacious and airy, great part of the old buildings being removed, and the new ſtreets allowed a convenient breadth. The town is now lighted every night by 2000 lamps, and guarded by nearly 200 watchmen.

The college here was founded in 1422 by *Thomas Weſt* Lord Delaware; and conſiſted of a warden, eight fellows, four clerks, and ſix choriſters. About the ſame time the preſent collegiate church was built (timber only having been uſed for the former church); and John Huntington bachelor of laws was the firſt warden, named by the founder himſelf: he enjoyed the wardenſhip nearly 40 years; and a monument juſtly remains to his memory, he having been the firſt to propoſe and aſſiſt in the erection of the church. He died Nov. 11. 1458, and was interred in the middle of the choir. This church is a fine ſtructure of what is termed the Gothic ſyſtem, and is more enriched with ſculpture than ſuch churches uſually are. The tabernacle work over the ſtalls in the choir is very curious, as are the large arches added upon vaulting the choir. The organ, which coſt not leſs than L. 1000, is large and powerful. The laſt warden was Richard Murray, D. D. the 14th in ſucceſſion. The college was new-founded in 1636; and Richard Heyrick, B.D. named the firſt warden on that foundation. The preſent warden, Richard Aſheton, D. D. rector of Middleton, is the fifth in ſucceſſion from Richard Heyrick. The collegiate body now conſiſts of a warden, four fellows, two chaplains, two clerks (one of whom, by a very late regulation, is to be at leaſt bachelor of arts and in prieſt's orders), four choriſters, and four ſinging men.

Beſide the collegiate church, there are alſo the following. St Anne's, a handſome church, begun in 1709 and finiſhed in 1723: it is in the gift of the Biſhop of Cheſter. St Mary's, built by the clergy of the collegiate church, and conſecrated upwards of 30 years ago, is a neat and indeed an elegant edifice; as is St John's, which was built about 20 years ſince by the late Edward Byrom, Eſq. The next preſentation thereof is, by act of parliament, veſted in his heirs, afterwards devolving to the warden and fellows of the collegiate church. St Paul's church was erected upwards of 12 years ago; and is a handſome ſpacious building, chiefly brick; to which has been added, within the laſt two years, a lofty and ſubſtantial ſtone tower. St James's church has been finiſhed within the laſt ten years: it is a large well-lighted building of brick and ſtone, with a ſmall ſtone ſteeple. St Michael's is alſo of brick and ſtone, with a ſquare tower. It was built by the late Rev. Humphrey Owen (one of the chaplains of the collegiate church, and rector of St Mary's), in whoſe heirs the preſentation is veſted for a term of 60 years, and thenceforward in the warden and fellows of the college. To theſe may be added, St Thomas's, Ardwick Green; and Trinity church, Salford: for though the Irwell intervenes between Mancheſter and Salford, and each is governed by its reſpective conſtables; yet, being connected by three bridges, by mutual friendſhip, and by the common purſuit of univerſally uſeful manufactures and commerce, the two places are generally conſidered under the name of *Mancheſter*, as the borough of Southwark is not improperly deemed a part of the metropolis. In Salford there is likewiſe a Methodiſt chapel nearly finiſhed. A new church is alſo about to be built and dedicated to St Stephen. —In Mancheſter a new church is lately finiſhed, and called *St George's*; but divine ſervice has not yet been performed therein. St Peter's church, at the end of Moſley-ſtreet, was begun about three years ſince: when finiſhed, it will be a ſtrong and elegant ſtone ſtructure with a high ſpire; at preſent the body only is completed, and lighted, in a manner not very common, by ſix ſemicircular windows. The foundation of another church, to be called *St Clement's*, has alſo been laid, within the preſent year 1792, in Stephenſon's ſquare lately planned; and alſo one called the *New Jeruſalem Church*, nearly finiſhed. Beſide the 14 churches above enumerated, there are, a Catholic chapel, a large Methodiſt chapel, a chapel for the people called Quakers, and 5 chapels for diſſenters of other denominations.

Cheetham's Hoſpital, commonly called the College, becauſe it was originally the place of reſidence of the warden and fellows, is deſerving of particular notice. Humphrey Cheetham of Clayton near Mancheſter, Eſq; having been remarkably ſucceſsful in trade in the middle of the laſt century, bought the college, and liberally endowed it for the maintenance and education of 40 poor boys, admiſſible between the age of 6 and 10 years. By an improvement of the funds of the charity, the numbers of boys was increaſed to 60; and continued ſuch till the Eaſter meeting of the feoffees in 1780, when another augmentation took place, and the number has ſince been conſtantly 80. The townſhips, pointed out by the founder for objects of his charity, are the following, together with the reſpective numbers admitted from each: Mancheſter, original number 14, now 28; Salford 6, now 12; Droylſden 3, now 6; Crumpſall 2, now 4; Bolton-le-moors 10, now 20; Turton 5, now 10. So that 89 perſons are now annually provided for by this liberal benefactor; including for the hoſpital a governor, 1 man and 5 women ſervants; a ſchool-maſter; and, on the library eſtabliſhment, a librarian. (See an authentic letter in the *Gent. Mag.* for June 1792, p. 521.) The boys of this hoſpital are comfortably provided for till the age of 14, when they are further clothed, and with a premium placed apprentices to uſeful trades; and, in order to incite early habits of induſtry, to make them good ſervants, and at length good maſters, it has been ſuggeſted to furniſh ſome kind of eaſy employment for a ſmall part of their time not engaged at ſchool. The Library, which occupies an extenſive gallery of the ſame building, owes its foundation and increaſing importance to the ſame benevolent ſource. The annual value of the fund originally bequeathed for the purchaſe of books and for a librarian's ſalary was 116 l.; but, by recent improvements of the eſtate, the income is more than thrice that ſum. The books at this time amount to 10,000 volumes, of which a catalogue handſomely printed in 2 volumes 8vo has been publiſhed by the preſent librarian, the Rev. John Radcliffe, A. M. At ſtated hours, on all days, except Sundays and other holidays, the ſtudious may have free acceſs to read, *in the library*, any book it contains; and in order to render it comfortable during the cold ſeaſon of the year, ſeveral ſtoves are kept heated at the reading hours. This college and a large incloſed area are ſituated upon a high perpendicular rock, bounded by the Irk cloſe to its confluence with the Irwell; and is thought by Mr Whitaker to be included, as well as the collegiate church, within the boundaries of the ancient Roman prætorium; the whole of which ſite towards the Irwell, as on the ſide of the Irk, is conſiderably elevated above the water and the oppoſite land of Salford. The Free-ſchool, higher up on the ſame ſide the Irk, almoſt joining to the college, is ſupported by the rents of three mills; one of which is for grinding malt, another for corn, and the third is employed as a ſnuff-mill. Theſe rents are now encreaſed to 700 l. *per annum*, from which ſalaries are paid to three maſters and two aſſiſtants. The ſcholars educated here have certain exhibitions allowed at the univerſity; and ſuch of them as are entered at Brazen-noſe college Oxford have a chance of obtaining ſome valuable exhibitions ariſing from lands in Mancheſter bequeathed by Mr Hulme. The deſerved reputation of this ſchool is a powerful recommendation of its ſcholars entering at the univerſities. The Academy is a large and commodious building, raiſed by the ſubſcriptions of ſeveral reſpectable diſſenters, and placed under the care of able tutors. Here youth above 14 years of age are admitted and inſtructed in the various branches of liberal knowledge, preparatory to trade or the profeſſions. The Literary and Philoſophical Society of Mancheſter was inſtituted in the beginning of the year 1781, and is well known by its Memoirs, of which three volumes 8vo have been publiſhed; theſe have been tranſlated into the German language. A fourth volume is now in the preſs, and in all probability will be publiſhed in the ſpring of 1793. A ſociety was eſtabliſhed here in November 1789, under the name of the *Lancaſhire Humane Society*, for the encouragement of all who may attempt the recovery of perſons apparently drowned. The Infirmary, Diſpenſary, Lunatic Aſylum, and public Baths, are all ſituated on one large airy plot of land, in the moſt elevated and agreeable part of the town; a pleaſant graſs-plot and gravel-walk extending the whole length of the buildings; a canal intervening between them and the public ſtreet, next to which it is guarded by iron paliſades. The Lying-in hoſpital is ſituated in Salford, at the end of the old bridge. A new Work-houſe is nearly completed; and for ſuch a purpoſe a happier ſpot could not be found in any town than that whereon it is erected, being on an equal eminence with the college on the oppoſite ſide of the Irk, and promiſing the greateſt poſſible comforts to ſuch as may be neceſſitated to become its inhabitants. The Exchange was a ſtrong good building; but ſince the late act of parliament obtained for farther improvements of the town, it has been ſold and taken down, and its ſite formed into a convenient area, to the great advantage of the ſurrounding houſes. The Theatre is a neat building, wherein the boxes are placed in a ſemicircle oppoſite to the ſtage. The Gentlemens Concert-room is an elegant building, capacious enough to accommodate 1200 perſons. The concerts are ſupported by annual ſubſcriptions: but ſtrangers and military gentlemen have free admiſſion to the private concerts; as alſo to the public concerts, with a ſubſcriber's ticket. The new Aſſembly-rooms are large and commodious. A Circus is almoſt finiſhed. Here are two Market-places, the old and the new; which are well ſupplied with every-thing in ſeaſon, though at high rates. There are ſeveral charity-ſchools belonging to different churches and chapels, where children are furniſhed with clothes and taught to read. The Sunday-ſchools are numerous, and afford inſtruction to upwards of 5000 children.

Over the Irwell are three bridges, uniting the town with Salford: the old bridge is very high at the Mancheſter end, whence it ſlopes into Salford. The middle bridge, four feet wide, raiſed upon timber and flagged, is only for accommodation of foot-paſſengers, who from the Mancheſter ſide muſt deſcend to it by nearly forty ſteps. The lower bridge is a handſome ſtone building of two arches; this bridge affords a level road for two or three carriages abreaſt. It was undertaken and finiſhed by the private ſubſcription of a few gentlemen; and a ſmall toll is taken for all paſſing, which toll is now annually let by auction, and pays the proprietors remarkably well.—From Mancheſter there are likewiſe the ſame number of bridges over the Irk; only one, however, is adapted for the paſſage of carriages. The Irwell, having at a great expence been rendered navigable for veſſels of 20 or 30 tons burden, there is a conſtant communication between Liverpool, Mancheſter, and the intermediate places on the Irwell and Merſey, to the great advantage of the proprietors and the country at large. This navigation, and more eſpecially the duke of Bridgewater's canal, opening a paſſage from Mancheſter to the Merſey at 30 miles diſtance, have, together, greatly contributed to the preſent highly flouriſhing ſtate of the town. Advantages ſtill greater, becauſe more widely diffuſive, may reſult from the intended union of the Humber and the Merſey by means of canals. Indeed, every mile of canal would benefit many miles of land; and ſuch would be the reciprocity of intereſt, that it would undoubtedly extend and be felt far beyond the viſible meaſurement of the navigation.

We muſt not omit to notice the new penitentiary-houſe, called the *New Bailey*, for ſeparate confinement of various criminals. Over the entrance is a large ſeſſion-room, with adjoining rooms for the magiſtrates, council, jurors, &c. Beyond this, in the centre of a very large area incloſed by very high

walls,

walls, ſtands the Priſon, an extenſive building, forming a croſs three ſtories high; and the four wards of each ſtory may in an inſtant be ſeen by any perſon in its centre. This priſon is kept ſurpriſingly neat and healthy; and ſuch as can work at any trade, and are not confined for crimes of the greateſt magnitude, are employed in a variety of branches; ſo that one may be ſeen beating and cleanſing cotton, another carding it, another roving, and a fourth ſpinning. In the next place may be obſerved a man or a woman buſy at the loom; and in another, one or more engaged in cutting and raiſing the velvet pile. Hence induſtry is not ſuffered to ſlumber in the ſolitary cell, nor to quit it under the acquired impreſſions of that torpor which formerly accompanied the emancipated priſoner from his dungeon; rendering him, perhaps, totally unfit for the duties of honeſt ſociety, though well qualified, in all probability, to hord with gamblers, and be then, if not before, initiated into their pernicious myſteries.—At Kerſal-moor, three miles diſtant, horſe-races are annually permitted. The banks of the rivers and various brooks about the town afford excellent ſituations for the numerous dye-houſes employed for a multitude of fabrics. Among other things, the manufacture and finiſhing of hats is carried on to an extent of great importance.—The general market is here on Saturdays. Tueſday's market is chiefly for tranſacting buſineſs between the traders and manufacturers of the town and circumjacent country. The fairs are on Whit-Monday, October 1ſt, and November 17th.

Mancheſter is a manor with courts leet and baron. It ſends no members to parliament, but gives title to a duke. The annual fall of rain is here about 42 inches; though from January 1791 to January 1792 it was 44 inches. The ſun's greateſt heat 1791 was 76°, July 17.

MANCHINEEL See HIPPOMANE.

MANCIPATIO, was a term made uſe of in the Roman law, and may be thus explained; every father had ſuch a regal authority over his ſon, that before the ſon could be releaſed from his ſubjection and made free, he muſt be three times over ſold and bought, his natural father being the vender. The vendee was called *pater fiduciarius*. After this fictitious bargain, the *pater fiduciarius* ſold him again to the natural father, who could then, but not till then, *manumit* or make him free. The imaginary ſale was called *mancipatio*; and the act of giving liberty or ſetting him free after this was called *emancipatio*.

MANCIPATIO alſo ſignifies the ſelling or alienating of certain lands by the balance, or money paid by weight, and five witneſſes. This mode of alienation took place only amongſt Roman citizens, and that only in reſpect to certain eſtates ſituated in Italy, which were called *mancipia*.

MANCIPLE *(manceps)*, a clerk of the kitchen, or caterer. An officer in the inner temple was anciently ſo called, who is now the ſteward there; of whom Chaucer, the ancient Engliſh poet, ſome time a ſtudent of that houſe, thus writes:

> A manciple there was within the temple,
> Of which all caterers might take enſample

This officer ſtill remains in colleges in the univerſities.

MANCUNIUM (anc. geog.), a town of the Brigantes in Britain. Now *Mancheſter* in Lancaſhire. See MANCHESTER.

MANCUS (formed of *manu cuſus)*, in antiquity, an Anglo-Saxon gold coin, equal in value to $2\frac{1}{2}$ ſolidi, or 30 pence; and in weight to 55 Troy grains. The firſt account of this coin that occurs in the hiſtory of our country, is about the cloſe of the 8th century, in an embaſſy of Cenwulf king of Mercia to Leo III. requeſting the reſtoration of the juriſdiction of the ſee of Canterbury: this embaſſy was enforced by a preſent of 120 mancuſes. Ethelwolf alſo ſent yearly to Rome 300 mancuſes: and theſe coins are ſaid to have continued in ſome form or other till towards the concluſion of the Saxon government. The heriots of the nobility are chiefly eſtimated by this ſtandard in Canute's laws. It came originally from Italy, where it was called *ducat*: and is ſuppoſed to have been the ſame with the drachma or miliarenſis current in the Byzantine empire.

MANDAMUS, in law, a writ that iſſues out of the court of king's-bench, ſent to a corporation, commanding them to admit or reſtore a perſon to his office. This writ alſo lies where juſtices of the peace refuſe to admit a perſon to take the oaths in order to qualify himſelf for enjoying any poſt or office; or where a biſhop or archdeacon refuſes to grant a probate of a will, to admit an executor to prove it, or to ſwear a church-warden, &c.

MANDANES, an Indian prince and philoſopher, who for the renown of his wiſdom was invited by the ambaſſadors of Alexander the Great to the banquet of the ſon of Jupiter. A reward was promiſed him if he obeyed, but he was threatened with puniſhment in caſe of a refuſal. Unmoved by promiſes and threatenings, the philoſopher diſmiſſed them with obſerving, that though Alexander ruled over a great part of the univerſe, he was not the ſon of Jupiter; and that he gave himſelf no trouble about the preſents of a man who poſſeſſed not wherewithal to content himſelf. "I deſpiſe his threats (added he): if I live, India is ſufficient for my ſubſiſtence; and to me death has no terrors, for it will only be an exchange of old age and infirmity for the happineſs of a better life."

MANDARINS, a name given to the magiſtrates and governors of provinces in China, who are choſen out of the moſt learned men, and whoſe government is always at a great diſtance from the place of their birth. *Mandarin* is alſo a name given by the Chineſe to the learned language of the country; for beſides the language peculiar to every province, there is one common to all the learned in the empire, which is in China what Latin is in Europe; this is called the *mandarin tongue*, or the *language of the court*.

MANDATE, in law, a judicial commandment to do ſomething. See the article MANDAMUS.

MANDATE, in the canon law, a reſcript of the pope commanding an ordinary collator to put the perſon therein named in poſſeſſion of the firſt vacant benefice in his collation.

MANDATUM, was a fee or retainer given by the Romans to the *procuratores* and *advocati*. The *mandatum* was a neceſſary condition, without which they had not the liberty of pleading. Thus the legal eloquence of Rome, like that of our own country, could not be unlocked without a golden key.

MANDERSCHEIT, a town of Germany in the circle

circle of the Lower Rhine, and in the electorate of Triers, capital of a county of the ſame name, between the dioceſe of Triers and the duchy of Juliers. E. Long. 6. 32. N. Lat. 50. 20.

MANDEVILLE (Sir John), a phyſician, famous for his travels, was born at St Alban's, about the beginning of the 14th century. He had a liberal education, and applied himſelf to the ſtudy of phyſic; but being at length ſeized with an invincible deſire of ſeeing diſtant parts of the globe, he left England in 1332, and did not return till 34 years after. His friends, who had long ſuppoſed him dead, did not know him when he appeared. He had travelled through almoſt all the eaſt, and made himſelf maſter of a great variety of languages. He particularly viſited Scythia, Armenia the Greater and Leſs, Egypt, Arabia, Syria, Media, Meſopotamia, Perſia, Chaldea, Greece, Dalmatia, &c. His rambling diſpoſition did not ſuffer him to reſt; for he left his own country a ſecond time, and died at Liege in the Netherlands in 1372. He wrote An Itinerary, or an Account of his Travels, in Engliſh, French, and Latin.

MANDEVILLE (Bernard de), an eminent writer in the 18th century, was born in Holland, where he ſtudied phyſic, and took the degree of doctor in that faculty. He afterwards came over into England, and in 1714 publiſhed a poem, intitled, "The Grumbling Hive, or Knaves turned Honeſt;" upon which he afterwards wrote remarks, and publiſhed the whole at London, 1723, in 8vo, under the title of, "The Fable of the Bees, or private Vice made public Benefits; with an Eſſay on Charity and Charity-ſchools, and a Search into the Nature of Society." This book was preſented by the jury of Middleſex in July the ſame year, and ſeverely animadverted upon in "A Letter to the Right Honourable Lord C." printed in the London Journal of Saturday July 27, 1723. Our author publiſhed a Vindication. His book was attacked by ſeveral writers. He publiſhed other pieces, and died in 1724.

MANDRAGORA, in botany. See ATROPA.

MANDRAKE, in botany. See ATROPA and MUSA.

MANDREL, a kind of wooden pulley, making a member of the turner's lathe. Of theſe there are ſeveral kinds; as *Flat Mandrels*, which have three or more little pegs or points near the verge, and are uſed for turning flat boards on. *Pin Mandrels*, which have a long wooden ſhank to fit into a round hole made in the work to be turned. *Hollow Mandrels*, which are hollow of themſelves, and uſed for turning hollow work. *Screw Mandrels*, for turning ſcrews, &c.

MANE, the hair hanging down from a horſe's neck; which ſhould be long, thin, and fine; and if frizzled, ſo much the better.

MANEGE, or MANAGE, the exerciſe of riding the great horſe; or the ground ſet apart for that purpoſe; which is ſometimes covered, for continuing the exerciſe in bad weather; and ſometimes open, in order to give more liberty and freedom both to the horſeman and horſe. See HORSEMANSHIP.

The word is borrowed from the French *manage*, and that from the Italian *maneggio*; or, as ſome will have it, *a manu agendo*, "acting with the hand."

MANES, a poetical term, ſignifying the ſhades or ſouls of the deceaſed. The heathens uſed a variety of ceremonies and ſacrifices to appeaſe the manes of thoſe who were deprived of burial. See LEMURES and LEMURIA.

Dii Manes, were the ſame with *inferi*, or the infernal gods, who tormented men; and to theſe the heathens offered ſacrifices to aſſuage their indignation.

The heathen theology is a little obſcure with regard to theſe gods manes. Some hold, that they were the ſouls of the dead; others, that they were the genii of men; which laſt opinion ſuits beſt with the etymology of the word.

The heathens, it is pretty evident, uſed the word *manes* in ſeveral ſenſes; ſo that it ſometimes ſignified the ghoſts of the departed, and ſometimes the infernal or ſubterraneous deities, and in general all divinities that preſided over tombs.

The evocation of the manes of the dead ſeems to have been very frequent among the Theſſalians; but it was expreſsly prohibited by the Romans. See LARES.

MANES, the founder of the Manichæan ſyſtem. See MANICHEES.

MANETHO, an ancient Egyptian hiſtorian, who pretended to take all his accounts from the ſacred inſcriptions on the pillars of Hermes Triſmegiſtus. He was high prieſt of Heliopolis in the time of Ptolemy Philadelphus, at whoſe requeſt he wrote his hiſtory in Greek; beginning from their gods, and continuing it down to near the time of Darius Codomannus who was conquered by Alexander the Great. His hiſtory of Egypt is a celebrated work, that is often quoted by Joſephus and other ancient authors. Julius Africanus gave an abridgment of it in his Chronology. Manetho's work is however loſt; and there only remain ſome fragments extracted from Julius Africanus, which are to be found in Euſebius's Chronica.

MANFREDI (Euſtachio), a celebrated mathematician, born at Bologna in 1674, where he was elected mathematical profeſſor in 1698. He was made a member of ſeveral academies, and acquired great reputation by his Ephemerides, 4 vols. 4to, as well as by other works. He died in 1739.

MANFREDONIA, a port town of Naples, on the Gulph of Venice, which aroſe on the ruins of the ancient Sipontum; (ſee the article SIPONTUM). It received its name from its founder *Manfred*; who tranſplanted hither the few inhabitants that remained at Sipontum, and attracted other ſettlers to it by various privileges and exemptions. In order to found it under the moſt favourable auſpices, he called together all the famous profeſſors of aſtrology (a ſcience in which both he and his father placed great confidence), and cauſed them to calculate the happieſt hour and minute for laying the firſt ſtone. He himſelf drew the plans, traced the walls and ſtreets, ſuperintended the works, and by his preſence and largeſſes animated the workmen to finiſh them in a very ſhort ſpace of time. The port was ſecured from ſtorms by a pier, the ramparts were built of the moſt ſolid materials, and in the great tower was placed a bell of ſo conſiderable a volume as to be heard over all the plain of Capitanata, in order to alarm the country in caſe of an invaſion. Charles of Anjou afterwards removed the bell to Bari, and offered it at the ſhrine of St Nicholas, as a thankſgiving for the recovery of one of his children. In ſpite of all the precautions taken by Manfred to ſecure a brilliant deſtiny to his new city, neither his pains, nor the horoſcopes of his wizards, have been able to render it opulent or powerful. At preſent, Mr Swinburn informs us, it ſcarce muſters ſix thouſand inhabitants, though moſt of the corn exported from the province is ſhipped off here, and a direct trade carried on with Venice and Greece, for which reaſon there is a lazaretto eſtabliſhed; but from ſome late inſtances we may gather, that if the kingdom of Naples has for many years paſt remained free from the plague, it is more owing to good luck, and the very trifling communication with Turkey, than to the vigilance or incorruptibility of the officers of this port. In 1620, the Turks landed and pillaged Manfredonia. All ſorts of vegetables abound here, for flavour and ſucculency infinitely ſuperior to thoſe raiſed by continual waterings in the cineritious ſoil of Naples. Lettuce in particular is delicious, and fiſh plentiful and cheap.

MANGANESE, or Magnesia Nigra, a dark-coloured mineral employed in glaſs-works for purifying the glaſs, by taking away the colour it has already, or by ſuperadding a new colour to it. It is alſo uſed in the glazing of earthen ware, where it communicates a black colour. From its property of rendering glaſs colourleſs, it has ſometimes been called the ſoap of glaſs.

This ſubſtance, commonly called *black* or *glaſs-maker*'s manganeſe, is ſcarcely any other thing than the calx of a new ſemimetal, whoſe properties were for the firſt time inveſtigated by Mr Scheele in the Stockholm Memoirs for 1774: afterwards it was more fully inveſtigated by Dr Gahn, and lately by ſeveral other chemiſts. Its colour is of a duſky white; and the ſurface is uneven and irregular, owing to its imperfect fuſion. It is bright and ſhining when firſt broken, but tarniſhes by expoſure to air much ſooner than any other metallic ſubſtance. Its ſpecific gravity is 6,850: it equals, if it does not exceed, iron in hardneſs, as well as difficulty of fuſion. When reduced to powder, it becomes magnetical, though large pieces of it are not ſo. When expoſed to the air, it ſoon crumbles into a blackiſh brown powder, ſomewhat heavier than the regulus itſelf; and this effect is ſooner produced in a moiſt than a dry air.

The regulus is obtained by making the calx or ore of manganeſe into a ball with pitch, and putting it into a crucible with powdered charcoal one-tenth of an inch thick on the ſides and a quarter of an inch at the bottom. The empty ſpace is then to be filled with powdered charcoal, covering the crucible with another. Having luted the joints, the whole is to be expoſed to the ſtrongeſt heat of a forge for an hour or more. This regulus is ſoluble in all the acids, but moſt readily in the nitrous, the ſolution in which is generally of a browniſh colour, though that in the others is moſtly colourleſs. The brown colour in the nitrous ſolution ariſes from the mixture of a ſmall portion of iron, and there is always a black reſiduum reſembling plumbago left undiſſolved. Aerated alkalies throw down a white precipitate from theſe ſolutions, which by heat grows black, and is converted into the original calx of the metal.

Regulus of manganeſe melts readily with other metals, mercury alone excepted. Copper, united with a certain quantity of it, is extremely malleable; but ſcarce any traces of the red colour are to be ſeen on the ſurface when poliſhed, but the mixture ſometimes has a green effloreſcence by age. Its decompoſition by air is very remarkable. A piece of it newly made, when put into a dry bottle well corked, remained perfect for ſix months; but afterwards, when expoſed only for two days to the open air of a chamber, contracted a brown colour on the ſurface, and became ſo friable as to crumble into powder between the fingers, the internal parts only retaining an obſcure metallic ſplendour, which alſo diſappeared in a few hours.

This ſurpriſing facility of decompoſition might naturally lead us to ſuppoſe that no ſuch thing as native manganeſe could exiſt in the earth. In the *Journal de Phyſique* for January 1786, however, M. de Peyrouſe gives an account of a native regulus of manganeſe, the properties of which are as follow: 1. In appearance it very much reſembles the artificial regulus already mentioned. 2. It dirties the fingers by handling. 3. None of its particles are in the leaſt affected by the magnet. 4. It is compoſed of laminæ having a kind of divergence among themſelves. 5. Its metallic brilliancy is the ſame with that of the artificial regulus, and it has a partial malleability. 6. When repeatedly hammered, it exhibits a kind of exfoliation, forming itſelf into very thin leaves. 7. Its opacity and denſity are ſo completely ſimilar to the artificial regulus, that were it not for the matrix in which the latter is imbedded, it would be in a manner impoſſible to diſtinguiſh them.

This regulus is not found in large maſſes, or in any ſolid continuous body, but only in clots or lumps incloſed and intermixed with the powdery or calciform ore. Theſe lumps are ſomewhat flattened or compreſſed in their form like the artificial ones, though for the moſt part they are of a larger ſize. This powdery magneſian ore, in which the reguline lumps are imbedded, has an argentine hue, as if the materials had been ſubjected to ſome violent heat upon the ſpot.—This regulus was found among the iron mines of *Sem*, in the valley of *Viedorſos*, in the county of Foix, near the Pyrenean mountains.

Manganeſe is found in a calciform ſtate, of various colours. M. de Magellan obſerves, that the aerial acid is the only mineralizer of this ſemimetal in its dry ſtate; and that in proportion to the different degrees of phlogiſtication, a variety of colours is produced. When it contains as much phlogiſton as poſſible, without being reduced to a regulus, it always appears of a white colour, and contains about 40 *per cent.* of fixed air. In proportion to its dephlogiſtication and union with other ſubſtances, its colour is either blue, green, yellow, red, or black.

The black manganeſe ſeems to be the decayed particles of that which is indurated. The latter is met with either pure, or in form of balls ſeemingly compoſed of concentric fibres; ſometimes, but very rarely, it is met with of a white colour. Cronſtedt informs us, that he had a ſpecimen of this from an unknown place in Norway. He found that it differed from the common kind by giving a deep red colour to borax in the fire. By calcination it aſſumes a reddiſh brown colour.

Blue manganeſe, according to Mr Scheele, acquires its colour from the phlogiſton which it is enabled to retain by its union with fixed alkalies. Green ariſes from a mixture of the blue with the yellow calx of iron, and the yellow colour, from a prevalence of this calx; red from a ſlight dephlogiſtication of the calx; and black from a thorough dephlogiſtication of it.—The white kind, above mentioned, contains but a very ſmall proportion of iron. Rinman found it both in ſmall white cryſtals and in round maſſes in the cavities of quartz, and adhering to glanz-blende. The hardneſs rather leſs than limeſtone, the texture ſparry, and the ſubſtance ſcarcely magnetic even after roaſting: it affords a colourleſs ſolution with nitrous acid, from which mild alkalies throw down a white precipitate turning black with heat, as already mentioned, of the regulus itſelf. The white ore has alſo been found vegetating on the ſurface of ſome iron ores, particularly hæmatites. Mr Rinman alſo met with it in the form of calcareous ſpar of the colour of roſin, ſomewhat ſhining, and covered over in ſome places with a ſooty powder. It is found alſo in thin pieces, tranſparent at the edges, but not hard enough to ſtrike fire. This conſiſts of manganeſe bedded in zeolite. It melts *per ſe* with the heat of a blow-pipe into a whitiſh grey porous ſlag; and with the addition of calcined borax gives a garnet colour to glaſs. According to Kirwan, many of the white ſparry iron ores may be claſſed among thoſe of manganeſe, as they contain more of this ſemimetal than of iron.

Red manganeſe is ſaid to be found in Piedmont, but Cronſtedt ſays he never ſaw it. He was told by an ingenious workman, that this variety is free from iron, and gives rather a red than violet colour to glaſs. Mr Kirwan ſays, that this kind has leſs fixed air and more iron than the white kind. It is alſo joined with ponderous earth, calcareous earth, ponderous ſpar, and flint. It is found either looſe or ſemi-indurated, in a matrix of calcareous ſpar, on talcky ſchiſtus, or on hæmatites or other iron ores. It is found likewiſe in heavy hard maſſes of lamellar, radiated, or equable texture, or cryſtallized in pyramids, rhomboids, or ſhort brittle needles.

Manganeſe is alſo met with in a ſtate of union with iron. This is black, with a metallic ſplendour, and is the kind commonly employed in glaſs-houſes and potteries. There are ſeveral varieties of this ſtone in the mountains round Bath named Mendip-hills, of which the Briſtol potters conſume great quantities. The black ores of manganeſe differ but little from the brown ones. They are both found either cryſtallized as the red ores, or in ſolid maſſes, ſome of which have a metallic appearance; but others are dull, earthy, and mixed, or embodied in quartz, or in a looſe earthy form. Their ſpecific gravity is about 4.000. The black manganeſe is met with either ſolid and of a ſlaggy texture, ſteel-grained, radiated, or cryſtallized.

The Perigord ſtone belongs to this ſpecies of manganeſe. It is of a dark grey colour like the baſaltes, and may be ſcraped with a knife, but cannot be broken without difficulty. It is very compact, heavy, and as black, internally, as charcoal. It has a glittering appearance of a ſtriated kind, like the ore of antimony; and its particles are diſpoſed in the form of needles croſſing one another without any agglutination, inſomuch that ſome are looſe in a manner ſimilar to iron-filings when ſtuck to a loadſtone, and reſembling on the whole the ſcoria from a blackſmith's forge. By calcination this ſubſtance aſſumes a reddiſh brown colour, and becomes harder, but is not magnetic. It does not melt *per ſe*, but affords an amethyſt-coloured glaſs with borax. Nitrous acid has little effect upon it without ſugar. It ſeems to contain clay and ſome iron, and is of conſiderable ſpecific gravity. It is found in ſome parts of England as well as in Gaſcony and Dauphiny in France. The French potters and common enamellers ſometimes employ this ſubſtance in the glazing of their ware.

Black-wadd is likewiſe an ore of manganeſe. It is found in Derbyſhire, and is of a dark brown colour, partly in powder, and partly indurated and brittle. If half a pound of it be dried before the fire, and afterwards ſuffered to cool for an hour, and two ounces of linſeed oil afterwards added, mixing the whole looſely like barm with flour, little clots will be formed, and, in ſomething more than half an hour the whole will grow hot, and at laſt burſt into flame. The heat of the room in which this experiment was tried might be about 30° of Fahrenheit, and the heat to which it was expoſed in drying about 130. According to Wedgwood's Analyſis, this ore contains 43 parts of manganeſe, as much iron, 4½ of lead, and near 5 of micaceous earth.

Beſides the ores mentioned above, Mr Scheele informs us, that he has found manganeſe exiſting in pot-aſhes. Chemiſts, he tells us, have often obſerved, that alkaline ſalts, when calcined, aſſume a bluiſh or greeniſh colour. The cauſe of this has been ſaid to be a quantity of phlogiſton preſent in the alkali; but to this he objects, that ſuch a colour is not deſtroyed by fuſion with nitre. When fixed alkali is made to run over the crucible by too ſtrong a fire, the part that attaches itſelf to the outſide acquires a dark-green colour in conſequence of the aſhes uniting with it. If one part of alkali of tartar be mixed with one-fourth of fine ſifted aſhes and one-eighth of nitre, a dark-green maſs is obtained, which, by ſolution in water, affords a beautiful green ſolution, and, when filtered, turns red on the addition of a few drops of vitriolic acid. Some days afterwards a ſmall quantity of brown powder falls to the bottom, which diſcovers the ſame chemical properties as manganeſe. On diſſolving a quantity of ſifted aſhes in muriatic acid by digeſtion in a ſand-heat, the ſame ſmell of aqua-regia ariſes that is perceived on mixing manganeſe with ſpirit of ſalt. Adding ſome hours afterwards a certain quantity of vitriolic acid, in order to precipitate the greater part of the calcareous earth, the liquor had a yellow colour when filtered, and by means of fixed alkali let fall a yellow precipitate, which by calcination turned of a dark-grey, and ſhowed ſigns of containing manganeſe. Hence it appears that manganeſe really exiſts in the aſhes of vegetables, but not equally in all; for Mr Scheele obſerves, that wood-aſhes contain much more than thoſe of thyme (*thymus ſerpillum*).

Mr Scheele has laboured exceedingly to decompoſe this ſubſtance, and to diſcover its component parts. He candidly acknowledges, however, that he did not ſucceed in this inveſtigation according to his wiſh, and therefore cannot be certain that his concluſions are altogether juſt. The following experiments, however, he tells us, were made with the greateſt accuracy as well as expence of time and trouble.

Half an ounce of phlogiſticated manganeſe, purified from all foreign particles, was calcined upon an iron-plate till it grew black. It was then diſſolved in diluted vitriolic acid, with the addition of a little ſugar, in a ſand heat till the ſolution became limpid. On cooling, a fine ſhining powder precipitated, which proved to be ſelenite. Having ſeparated this by filtration, and then diluted the ſolution with ſix ounces of diſtilled water, precipitating it afterwards by vegetable alkali, the powder was edulcorated, and again expoſed to calcination (A). The manganeſe, when deprived of its phlogiſton, was again diſſolved by means of ſugar in diluted vitriolic acid; by which means as much ſelenite was obtained as before. The filtered ſolution was treated exactly in the ſame manner, and the operation repeated eleven times, yielding to appearance as much ſelenite as before. On weighing the reſults of all theſe calcinations, the manganeſe was found to be reduced to three drachms and five grains, and the quantity of ſelenite had increaſed to 49 grains; the whole ſeems therefore to be convertible into calcareous earth. On attempting to invert the experiment, and to produce manganeſe by combining phlogiſton with calcareous earth, he found it impoſſible to unite the two ſubſtances by any means he could deviſe.

This analyſis of manganeſe was undertaken at the deſire of Mr Bergman; who having informed him that Mr Sage ſuppoſes manganeſe to be nothing elſe than a mineraliſed mixture of cobalt and zinc, he afterwards made ſeveral experiments with a view to detect theſe ſubſtances, but in vain. "Manganeſe (ſays Mr Bergman) has been claſſed by all mineralogiſts among the ores of iron; but Mr Pott ſuppoſed the iron to be only accidentally mixed with it; and at laſt Mr Cronſtedt, in his Eſſay on Mineralogy, 1758, placed it among the earths. For my part, however, I muſt own that there are ſeveral circumſtances which make me think that it is a metallic ſubſtance. No pure earth colours glaſs, but all metallic calces have this property. Manganeſe, therefore, in this reſpect, ſhows a great reſemblance to the latter; which is further increaſed by its ſpecific gravity, and its ſtrong attraction for phlogiſton." Having then mentioned its precipitation by the Pruſſian alkali as an additional proof of its metallic nature, he proceeds thus: "But what kind of metal it is which manganeſe contains is not ſo eaſily aſcertained. The ſolution of cobalt does not loſe its colour on adding ſugar or any other phlogiſtic ſubſtance, and zinc does not impart any colour to acids. Theſe two ſubſtances conſequently differ from manganeſe, which does not indeed entirely agree with any other of the known metallic earths. I have, however, great reaſon to conjecture that it muſt be platina, the earth of which is not yet known; or a new metal, which at leaſt would agree with platina in the great difficulty with which it fuſes."

It has already been obſerved, that manganeſe is uſed in glaſs-works, and is capable both of deſtroying the colour of glaſs, and of giving a new colour to it, viz. that of violet. Mr Scheele deduces its operation from the properties related under the article CHEMISTRY, n° 1359 & ſeq. He enumerates its effects on glaſs-fluxes as follows: 1. A colourleſs glaſs-flux becomes conſtantly more or leſs red on addition of manganeſe, according to the quantity. 2. If the flux be a little alkaline, the colour will approach to violet. 3. Arſenic, gypſum, and calx of tin, deſtroy the red colour in theſe glaſſes, and thus render them clear. The action of arſenic is eaſily explained from CHEMISTRY, n° 919. where it is ſhown that manganeſe decompoſes arſenic by uniting with its phlogiſton, and that arſenic itſelf is compoſed of an acid of a peculiar nature united with phlogiſton. On mixing manganeſe, therefore, with glaſs in fuſion, the phlogiſton of the arſenic unites with the manganeſe, while the acid of arſenic unites with the alkali of the glaſs. This experiment ſucceeds in a covered crucible, though never when gypſum or calx of tin are made uſe of; but on adding powdered charcoal, an efferveſcence enſues, the red colour diſappears, and the glaſs becomes colourleſs. The phlogiſton of the charcoal is therefore the cauſe of the deſtruction of the colour, and the efferveſcence is a neceſſary conſequence of the emiſſion of the phlogiſton. 4. If glaſs coloured red by manganeſe be fuſed in a crucible with powdered charcoal, the colour diſappears during the efferveſcence without the addition of gypſum or calx of tin; but on keeping the glaſs a long time in fuſion upon charcoal, by means of the blow-pipe, the colour does not diſappear. Nay, if the colourleſs glaſs be kept in this ſtate for a ſhort time upon charcoal, it grows red again. 5. By adding a little ſulphur, the colour diſappears; and the ſame thing takes place on the addition of any metallic calx or any neutral ſalt containing the vitriolic acid. But here it muſt be obſerved, that all metals whoſe calces colour glaſs, while they deprive it of that which it has received from the manganeſe, will not fail to communicate their own peculiar colour to it. If to ſuch a colourleſs glaſs-globule, nitre, even in the ſmalleſt quantity, be added, it preſently grows red again; and the ſame thing happens if ſuch a colourleſs glaſs globule be kept in fuſion for a few minutes upon an iron plate; and thus the red colour may be made to appear and diſappear as often as we pleaſe.

From this explanation it appears how manganeſe purifies glaſs. When the colour of it depends on a quantity of coaly matter, it is improper to add more than is juſt ſufficient to ſaturate the phlogiſton. With regard to the green colour of common bottle-glaſs, Mr Scheele made the following experiment to determine whether it proceeded from iron or not. Having melted green glaſs by the blow-pipe upon a piece of the ſame ſubſtance, leſt in uſing a crucible he ſhould have been deceived by the iron it contained, he poured

---

(A) As in this proceſs a quantity of fixed air is always expelled from the alkali, it was neceſſary, in order to prevent any of the manganeſe from being diſſolved by it, to place the whole for ſome hours upon hot ſand, to expel the aerial fluid.

ed upon it a large quantity of muriatic acid; and having extracted a tincture, and poured into it a few drops of the ſolution of Pruſſian alkali, it aſſumed a bluiſh colour. Hence he concludes, that iron, nearly in its metallic form, is preſent in common green glaſs; for its calx always gives a yellowiſh colour to glaſs, and manganeſe added to a ſolution of iron in acids deſtroys the green colour, ſubſtituting a yellow one in its room; and in like manner, nitre added to green glaſs in fuſion takes away its colour. The ſame effect is produced by manganeſe if added in proper quantity; though, according to the experiments of Mr Scheele, ſomewhat of a yellowiſh colour ought to have been communicated by it; and he is of opinion that it was really ſo, though the quantity of iron was too ſmall to render it diſtinctly viſible. It is alſo remarkable, that the rays of light paſſing through glaſs of this kind, when nearly red hot, appear of a yellowiſh colour.

Mr Engeſtrom's experiments on this ſubject are ſomewhat different from thoſe of Mr Scheele. Having melted manganeſe and borax together upon a piece of charcoal, the glaſs at firſt aſſumed the common colour of manganeſe; but this was repeatedly deſtroyed, and made to appear without adding any thing. During the operation he took notice of the following phenomena: 1. When a ſmall quantity of manganeſe was taken, the colour was light, but with a larger it became nearly black; and whatever colour it aſſumed on the firſt fuſion was manifeſted alſo at the ſecond, when it was made to reappear. 2. Manganeſe, on being melted with borax, effervеſces violently; which ceaſes, however, as ſoon as the manganeſe is diſſolved. 3. To make the colour of the glaſs diſappear, it was neceſſary only to direct the blue flame of the candle upon the glaſs, and that equally and conſtantly, but not very violently. On blowing more faintly, and allowing the brown flame to touch the place, the colour returned. 4. About the time that the glaſs becomes colourleſs, a kind of ſection or partition is obſerved in it; and as ſoon as the colour diſappears, the blowing muſt be immediately diſcontinued, ſo that the brown flame ſhall not afterwards touch the glaſs. When it is taken out with the forceps, it appears perfectly colourleſs. 5. This deſtruction of the colour ſeems not to happen ſuddenly, but by degrees; for when the blowing was now and then diſcontinued before the true mark had appeared, the glaſs was generally lighter than before, though not quite colourleſs.

Though our author had been able to diſcharge the colour thus from glaſs, and to make it reappear, it ſeemed doubtful whether this could be done frequently; for having blown the blue flame violently againſt ſome glaſs, the colour of which he had already twice diſcharged and made to reappear, he found that it could not again be diſcharged even by conſtant blowing for an hour. In another experiment, having added a large quantity of manganeſe, he found that the glaſs retained its colour even in the utmoſt heat he could give it, though it always became colourleſs when warm, but regained its colour in the cold.

In both theſe experiments the violence of the flame had diſperſed and driven off ſome ſmall globules, which always remained colourleſs: the reaſon of this he thinks is, that manganeſe, or its colouring part, has a ſtrong attraction for a ſmall part only of borax; and that, by means of a violent heat, the ſuperfluous part may be ſeparated, and the reſt unite more cloſely with the earthy particles. The ſame thing happened likewiſe with the ſmall globules, which ſometimes remained after the maſs was taken away, fixed to the charcoal by the violence of the flame. "If this is really the caſe (ſays he), it would follow, that by repeating the experiment ſome of theſe particles would always ſeparate if a ſufficiently ſtrong flame was applied, and it would be impoſſible to expel the red colour afterwards. I dare not, however, advance this conjecture, though it is grounded on ſome experiments as a matter of certainty."

Cronſtedt obſerves, that manganeſe communicates a colour both to glaſſes and ſaline ſolutions. Borax, which has diſſolved it, becomes tranſparent, and aſſumes a reddiſh brown or hyacinthine colour; the microcoſmic ſalt becomes tranſparent, of a crimſon colour, and moulders in the air. In compoſitions for glaſs it becomes violet with the fixed alkali; but if a great quantity of manganeſe be added, the glaſs is in thick lumps and looks black; by ſcorification with lead the glaſs obtains a reddiſh brown colour. Manganeſe deflagrates with nitre; and the reſiduum, when thus deflagrated, communicates a deep-red colour to its lixivium. The calx, when reckoned to be light, weighs as much as an iron ore of the ſame texture. It ferments with vitreous compoſitions, and ſtill more when melted with the microcoſmic ſalt. The colours communicated by manganeſe to glaſſes are eaſily deſtroyed by the calx of tin or arſenic, and likewiſe vaniſh of themſelves in the air.

According to Dr Brunnich, manganeſe, when melted with nitre, aſſumes a green colour. Tin unites very readily with manganeſe; but zinc not without great difficulty, perhaps on account of its volatility and inflammable nature. White arſenic adheres to it, and, by means of the phlogiſton, reduces it to a metallic form. By ſimple calcination a blackiſh powder is produced; but if the ignition be continued for twelve days, it acquires a dark-green colour; producing alſo, ſometimes, one of a white or reddiſh colour. All theſe various calces, by means of a ſufficient degree of heat in a common crucible, run into a yellowiſh-red glaſs, which is pellucid, unleſs from too great thickneſs.

MANGE, in dogs. See *Diſeaſes of Dogs*.

MANGE, in farriery. See there, § xxiii.

MANGEART (Dom Thomas), a Benedictine of the congregation of St Vanne and St Hidulphe, whoſe knowledge was an ornament to his order. It gained him alſo the titles of antiquarian, librarian, and counſellor, to Charles duke of Lorrain. He was preparing a very conſiderable work when he died, A. D. 1763, before he had put his laſt hand to his book, which was publiſhed by Abbé Jacquin. This production appeared in 1763, in folio, with this title: *Introduction à la ſcience des Medailles, pour ſervir a la connoiſſance des Dieux, de la Religion, des Sciences, des Arts, et de tout ce qui appartient a l'Hiſtoire ancienne, avec les preuves tirées des Medailles.* The elementary treatiſes on the numiſmatic ſcience were not ſufficiently extenſive, and the particular diſſertations were by far too tedious and prolix. This learned Benedictine has collected into a ſingle volume all the principles contained in the former, and all the ideas of any conſequence which are to be found ſcattered through the latter. His work may ſerve as a ſupplement to Montfaucon's *Antiquity explained*. From Mangeart we likewiſe have a volume of ſermons; and a treatiſe on Purgatory, Nancy, 1739, 2 vols 12mo.

MANGEL-WURZEL. See Beta; and Agriculture, n° 52.

MANGER, is a raiſed trough under the rack in the ſtall, made for receiving the grain or corn that a horſe eats.

Manger, a ſmall apartment, extending athwart the lower-deck of a ſhip of war, immediately within the hauſe-holes, and fenced on the after-part by a partition, which ſeparates it from the other part of the deck behind it. This partition ſerves as a fence to interrupt the paſſage of the water, which occaſionally guſhes in at the hauſe-holes, or falls from the wet cable whilſt it is heaved in by the capſtern. The water, thus prevented from running aft, is immediately returned into the ſea by ſeveral ſmall channels, called *ſcuppers*, cut through the ſhip's ſide within the manger. The manger is therefore particularly uſeful in giving a contrary direction to the water that enters at the hauſe-holes, which would otherwiſe run aft in great ſtreams upon the lower-deck, and render it extremely wet and uncomfortable, particularly in tempeſtuous weather, to the men who meſs and ſleep in different parts thereof.

MANGENOT (Lewis), a canon of the temple at Paris, where he was born A. D. 1694, and died in 1768 at the age of 74. He was a ſocial poet, and an amiable man. But although lively and agreeable in his converſation, his character leaned ſomewhat towards cynical miſanthropy. Of this we may judge from the following verſes, written on a little parlour which he had erected in a garden dependent on his benefice:

Sans inquietude, ſans peine,
Je jouis dans ces lieux du deſtin le plus beau;
Les Dieux m'ont accordé l'Ame de Diogene,
Et mes foibles talens m'ont valu ſon tonneau.

His Poems were publiſhed at Amſterdam in 1776. This collection contains two eclogues full of nature, ſimplicity, and elegance; fables, ſome of which are well compoſed; tales, which are by far too licentious; moral reflections; ſentences; madrigals, &c. &c.

MANGET (John-James), an eminent phyſician, born at Geneva in 1652. The elector of Brandenburg made him his firſt phyſician in 1699; in which poſt he continued till his death, which happened at Geneva in 1742. He wrote many works; the moſt known of which are, 1. A collection of ſeveral Pharmacopœias, in folio. 2. *Bibliotheca pharmaceutico-medica*. 3. *Bibliotheca anatomica*. 4. *Bibliotheca chemica*. 5. *Bibliotheca chirurgica*. 6. A *bibliotheca* of all the authors who have written on medicine, in 4 vols folio. All theſe works are in Latin. Daniel le Clerc, the author of a Hiſtory of Phyſic, aſſiſted him in writing them.

MANGIFERA, the mango-tree, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking with thoſe of which the order is doubtful. The corolla is pentapetalous; the plum kidney-ſhaped. There is but one ſpecies, a native of many parts of the Eaſt Indies, whence it has been tranſplanted to Brazil and other warm parts of America. It grows to a large ſize; the wood is brittle, the bark rough when old; the leaves are ſeven or eight inches long, and more than two inches broad. The flowers are produced in looſe panicles at the ends of the branches, and are ſucceeded by large oblong kidney-ſhaped plums. This fruit, when fully ripe, is greatly eſteemed in the countries where it grows; but in Europe we have only the unripe fruit brought over in pickle. All attempts to propagate the plant have hitherto proved ineffectual; and Mr Miller is of opinion that the ſtones will not vegetate unleſs they are planted ſoon after they are ripe. He thinks therefore that the young plants ought to be brought over in boxes of earth; after which they may be kept in the tan-bed of the ſtove.

MANGOSTAN, or Mangosteen. See Garcinia.

MANGROVE. See Rhizophora.

MANHEIM, a town of Germany, in the Lower Palatinate, with a very ſtrong citadel, and a palace, where the elector Palatine often reſides. It is ſeated at the confluence of the rivers Neckar and Rhine, in E. Long. 8. 33. N. Lat. 49. 25.

MANHOOD, that ſtage of life which ſucceeds puberty or adoleſcence. See Man, n° 23.

MANIA, or Madness. See Medicine-*Index*.

MANICHEES, or Manicheans (*Manichæi*), a ſect of ancient heretics, who aſſerted two principles; ſo called from their author *Manes* or *Manichæus*, a Perſian by nation, and educated among the magi, being himſelf one of that number before he embraced Chriſtianity.

This hereſy had its firſt riſe about the year 277, and ſpread itſelf principally in Arabia, Egypt, and Africa. St Epiphanius, who treats of it at large, obſerves, that the true name of this hereſiarch was Cubricus; and that he changed it for *Manes*, which in the Perſian or Babyloniſh language ſignifies *veſſel*. A rich widow, whoſe ſervant he had been, dying without iſſue, left him ſtore of wealth; after which he aſſumed the title of the *apoſtle* or *envoy of Jeſus Chriſt*.

Manes was not contented with the quality of apoſtle of Jeſus Chriſt, but he alſo aſſumed that of the Paraclete, whom Chriſt had promiſed to ſend: which Auguſtin explains, by ſaying, that Manes endeavoured to perſuade men, that the Holy Ghoſt did perſonally dwell in him with full authority. He left ſeveral diſciples, and among others Addas, Thomas, and Hermas. Theſe he ſent in his lifetime into ſeveral provinces to preach his doctrine. Manes, having undertaken to cure the king of Perſia's ſon, and not ſucceeding, was put in priſon upon the young prince's death, whence he made his eſcape; but he was apprehended ſoon after, and flayed alive.

However, the oriental writers, cited by D'Herbelot and Hyde, tell us, that Manes, after having been protected in a ſingular manner by Hormizdas, who ſucceeded Sapor in the Perſian throne, but who was not able to defend him, at length, againſt the united hatred of the Chriſtians, the Magi, the Jews, and the Pagans, was ſhut up in a ſtrong caſtle, to ſerve him as a refuge againſt thoſe who perſecuted him on account of his doctrine. They add, that after the death of Hormizdas, Varanes I. his ſucceſſor, firſt protected Manes, but afterwards gave him up to the fury of the Magi, whoſe reſentment againſt him was due to his having adopted the Sadducean principles, as ſome ſay; while others attribute it to his having mingled the tenets of the Magi with the doctrines of Chriſtianity. However, it is certain that the Manicheans celebrated the day of their maſter's death. It has been a ſubject of much controverſy whether Manes was an impoſtor. The learned Dr Lardner has examined the arguments on both ſides; and though he does not chooſe to deny that he was an impoſtor, he does not diſcern evident proofs of it. He acknowledges, that he was an arrogant philoſopher and a great ſchemiſt; but whether he was an impoſtor, he cannot certainly ſay. He was much too fond of philoſophical notions, which he endeavoured to bring into religion, for which he is to be blamed: nevertheleſs, he obſerves, that every bold dogmatiſer is not an impoſtor.

The doctrine of Manes was a motley mixture of the tenets of Chriſtianity with the ancient philoſophy of the Perſians, in which he had been inſtructed during his youth. He combined theſe two ſyſtems, and applied and accommodated to Jeſus Chriſt the characters and actions which the Perſians attributed to the god Mithras.

He eſtabliſhed two principles, *viz.* a good and an evil one: the firſt, a moſt pure and ſubtile matter, which he called *light*, did nothing but good; and the ſecond a groſs and corrupt ſubſtance, which he called *darkneſs*, nothing but evil. This philoſophy is very ancient; and Plutarch treats of it at large in his Iſis and Oſiris.

Our ſouls, according to Manes, were made by the good principle, and our bodies by the evil one; thoſe two principles being, according to him, coeternal, and independent of each other. Each of theſe is ſubject to the dominion of a ſuperintendent being, whoſe exiſtence is from all eternity. The being who preſides over the *light* is called *God;* he that rules the land of *darkneſs* bears the title of *hyle* or *demon*. The ruler of the *light* is ſupremely happy, and in conſequence thereof benevolent and good: the prince of *darkneſs* is unhappy in himſelf, and deſirous of rendering others partakers of his miſery, and is evil and malignant. Theſe two beings have produced an immenſe multitude of creatures, reſembling themſelves, and diſtributed them through their reſpective provinces. After a conteſt between the ruler of *light* and the prince of *darkneſs*, in which the latter was defeated, this prince of *darkneſs* produced the firſt parents of the human race. The beings engendered from this original ſtock, conſiſt of a body formed out of the corrupt matter of the kingdom of darkneſs, and of two ſouls; one of which is ſenſitive and luſtful, and owes its exiſtence to the evil principle; the other rational and immortal, a particle of that divine light which had been carried away in the conteſt by the army of darkneſs, and immerſed into the maſs of malignant matter. The earth was created by God out of this corrupt maſs of matter, in order to be a dwelling for the human race, that their captive ſouls might by degrees be delivered from their corporeal priſons, and the celeſtial elements extended from the groſs ſubſtance in which they were involved. With this view God produced two beings from his own ſubſtance, *viz.* Chriſt and the Holy Ghoſt: for the Manicheans held a conſubſtantial Trinity. Chriſt, or the glorious intelligence, called by the Perſians *Mithras*, ſubſiſting in and by himſelf, and reſiding in the ſun, appeared in due time among the Jews, clothed with the ſhadowy form of a human body, to diſengage the rational ſoul from the corrupt body, and to conquer the violence of malignant matter. The Jews, incited by the prince of darkneſs, put him to an ignominious death, which he ſuffered not in reality, but only in appearance, and according to the opinion of men. When the purpoſes of Chriſt were accompliſhed, he returned to his throne in the ſun, appointing apoſtles to propagate his religion, and leaving his followers the promiſe of the Paraclete or Comforter, who is Manes the Perſian. Thoſe ſouls who believe Jeſus Chriſt to be the ſon of God, renounce the worſhip of the god of the Jews, who is the prince of darkneſs, and obey the laws delivered by Chriſt, and illuſtrated by Manes the comforter, are gradually purified from the contagion of matter; and their purification being completed, after having paſſed through two ſtates of trial, by water and fire, firſt in the moon and then in the ſun, their bodies return to the original maſs (for the Manicheans derided the reſurrection of bodies), and their ſouls aſcend to the regions of light. But the ſouls of thoſe who have neglected the ſalutary work of purification, paſs after death into the bodies of other animals or natures, where they remain till they have accompliſhed their probation. Some, however, more perverſe and obſtinate, are conſigned to a ſeverer courſe of trial, being delivered over for a time to the power of malignant aerial ſpirits, who torment them in various ways. After this, a fire ſhall break forth and conſume the frame of the world; and the prince and powers of darkneſs ſhall return to their primitive ſeats of anguiſh and miſery, in which they ſhall dwell for ever. Theſe manſions ſhall be ſurrounded by an invincible guard, to prevent their ever renewing a war in the regions of light.

Manes borrowed many things from the ancient Gnoſtics; on which account many authors conſider the Manicheans as a branch of the Gnoſtics.

In truth, the Manichean doctrine was a ſyſtem of philoſophy rather than of religion. They made uſe of amulets, in imitation of the Baſilidians; and are ſaid to have made profeſſion of aſtronomy and aſtrology. They denied that Jeſus Chriſt, who was only God, aſſumed a true human body, and maintained it was only imaginary: and therefore they denied his incarnation, death, &c. They pretended that the law of Moſes did not come from God, or the good principle, but from the evil one; and that for this reaſon it was abrogated. They rejected almoſt all the ſacred books in which Chriſtians look for the ſublime truths of their holy religion. They affirmed, that the Old Teſtament was not the work of God, but of the prince of darkneſs, who was ſubſtituted by the Jews in the place of the true God. They abſtained entirely from eating the fleſh of any animal; following herein the doctrine of the ancient Pythagoreans: they alſo condemned marriage. The reſt of their errors may be ſeen in St Epiphanius and St Auguſtin; which laſt, having been of their ſect, may be preſumed to have been thoroughly acquainted with them.

Tho' the Manichees profeſſed to receive the books of the New Teſtament, yet in effect they only took ſo much of them as ſuited with their own opinions.

They firſt formed to themſelves a certain idea or ſcheme of Chriſtianity; and to this adjuſted the writings of the apoſtles, pretending that whatever was inconſiſtent with this had been foiſted into the New Teſtament by later writers, who were half Jews. On the other hand, they made fables and apocryphal books paſs for apoſtolical writings; and even are ſuſpected to have forged ſeveral others, the better to maintain their errors. St Epiphanius gives a catalogue of ſeveral pieces publiſhed by Manes, and adds extracts out of ſome of them. Theſe are the Myſteries, Chapters, Goſpel, and Treaſury.

The rule of life and manners which Manes preſcribed to his followers was moſt extravagantly rigorous and ſevere. However, he divided his diſciples into two claſſes; one of which comprehended the perfect Chriſtians, under the name of the *elect*; and the other, the imperfect and feeble, under the title of *auditors* or *hearers*. The elect were obliged to a rigorous and entire abſtinence from fleſh, eggs, milk, fiſh, wine, all intoxicating drink, wedlock, and all amorous gratifications; and to live in a ſtate of the ſevereſt penury, nouriſhing their emaciated bodies with bread, herbs, pulſe, and melons, and depriving themſelves of all the comforts that ariſe from the moderate indulgence of natural paſſions, and alſo from a variety of innocent and agreeable purſuits. The auditors were allowed to poſſeſs houſes, lands, and wealth, to feed on fleſh, to enter into the bonds of conjugal tenderneſs; but this liberty was granted them with many limitations, and under the ſtricteſt conditions of moderation and temperance. The general aſſembly of the Manicheans was headed by a preſident, who repreſented Jeſus Chriſt. There were joined to him 12 rulers or maſters, who were deſigned to repreſent the 12 apoſtles, and theſe were followed by 72 biſhops, the images of the 72 diſciples of our Lord. Theſe biſhops had preſbyters or deacons under them, and all the members of theſe religious orders were choſen out of the claſs of the elect. Their worſhip was ſimple and plain; and conſiſted of prayers, reading the ſcriptures, and hearing public diſcourſes, at which both the auditors and elect were allowed to be preſent. They alſo obſerved the Chriſtian appointment of baptiſm and the euchariſt. They kept the Lord's day, obſerving it as a faſt; and they likewiſe kept Eaſter and Pentecoſt.

Towards the 4th century, the Manicheans concealed themſelves under various names, which they ſucceſſively adopted, and changed in proportion as they were diſcovered by them. Thus they aſſumed the names of Encratites, Apotactics, Saccophori, Hydroparaſtates, Solitaries, and ſeveral others, under which they lay concealed for a certain time, but could not however long eſcape the vigilance of their enemies. About the cloſe of the 6th century, this ſect gained a very conſiderable influence, particularly among the Perſians.

Toward the middle of the 12th century, the ſect of Manichees took a new face, on occaſion of one Conſtantine, an Armenian, and an adherer to it; who took upon him to ſuppreſs the reading of all other books beſides the Evangeliſts and the Epiſtles of St Paul, which he explained in ſuch a manner as to make them contain a new ſyſtem of Manicheiſm. He entirely diſcarded all the writings of his predeceſſors; rejecting the chimeras of the Valentinians, and their 30 æons; the fable of Manes, with regard to the origin of rain and other dreams; but ſtill retained the impurities of Baſilides. In this manner he reformed Manicheiſm, inſomuch that his followers made no ſcruple of anathematizing Scythian, Buddas, called alſo *Addas* and *Terebinth*, the contemporaries and diſciples, as ſome ſay, and, according to others, the predeceſſors and maſters of Manes, and even Manes himſelf, Conſtantine being now their great apoſtle. After he had ſeduced an infinite number of people, he was at laſt ſtoned by order of the emperor.

This ſect prevailed in Boſnia and the adjacent provinces about the cloſe of the 15th century; propagated their doctrines with confidence, and held their religious aſſemblies with impunity.

MANICORDON, or MANICHORD, a muſical inſtrument in form of a ſpinet; the ſtrings of which, like thoſe of the clarichord, are covered with little pieces of cloth, to deaden as well as to ſoften their ſound, whence it is alſo called the *dumb ſpinet*.

MANIFESTO; a public declaration made by a prince in writing, ſhowing his intentions to begin a war or other enterpriſe, with the motives that induce him to it, and the reaſons on which he founds his rights and pretenſions.

MANIHOT, or MANIOC. See JATROPHA.

MANILA, LUCONIA, or *Luzon*, the name of the largeſt of the Philippine iſlands in the Eaſt Indies, ſubject to Spain. It had the name of *Luzon* from a cuſtom that prevailed among the natives of beating or bruiſing their rice in wooden mortars, before they either boiled or baked it; luzon, in their language, ſignifying "a mortar."

As to ſituation, it is remarkably happy, lying between the eaſtern and weſtern continents, and having China on the north, at the diſtance of about 60 leagues; the iſlands of Japan on the north-eaſt, at the diſtance of about 250 leagues from the neareſt of them; the ocean on the eaſt; the other iſlands on the ſouth; and on the weſt Malacca, Patana, Siam, Cambodia, Cochin-China, and other provinces of India, the neareſt at the diſtance of 300 leagues.

The middle of this iſland is in the latitude 15° north; the eaſt point in 13° 38′, and the moſt northern point in 19°. The ſhape of it is ſaid to reſemble that of an arm bent; the whole length being about 160 Spaniſh leagues, the greateſt breadth between 30 and 40, and the circumference about 350. As to the longitude, the charts differ, ſome making the middle of the iſland to lie 113° eaſt from London, and others in 160°. The climate is hot and moiſt. One thing is held very extraordinary, that in ſtormy weather there is much lightning and rain, and that thunder is ſeldom heard till this is over. During the months of June, July, Auguſt, and part of September, the weſt and ſouth winds blow, which they call *vendavales*, bringing ſuch rains and ſtorms, that the fields are all overflowed, and they are forced to have little boats to go from one place to another. From October till the middle of December, the north wind prevails; and from that time till May, the eaſt and ſouth-eaſt; which winds are there called *breezes*. Thus there are two ſeaſons in thoſe ſeas, by the Portugueſe called *monzeens*; whence our word *monſoons*, that is, the breezes half the year, with a ſerene dry air; and the vendavales the other half, wet and ſtormy. It is further to be obſerved, that in this climate no vermin breed upon Europeans, though they wear dirty ſhirts, whereas it is otherwiſe with the Indians. The days here being always of an equal length, and the weather never cold, neither their clothes, nor the hour of dining, ſupping, doing buſineſs, ſtudying, or praying, are ever changed; nor is cloth worn, but only againſt the rain.

The air here being, as has been obſerved, very hot and moiſt, is not wholeſome; but is worſe for young men that come from Europe than for the old. As for the natives, without uſing many precautions, they live very commonly to fourſcore or 100. The ſoil is ſo rich, that rice grows even on the tops of the mountains without being watered; and this makes it ſo plentiful, that the Indians value gold ſo little as not to pick it up, though it lies almoſt every where under their feet.

Among the diſadvantages of the iſland, beſides frequent and terrible earthquakes, here are ſeveral burning mountains. The face of the iſland, however, is far from being disfigured by them, or by the conſequences of their exploſions.

The mountaineers, called *Tingiani*, have no particular place of abode, but always live under the ſhelter of trees, which ſerve them inſtead of houſes, and furniſh them with food; and when the fruit is eaten up, they remove where there is a freſh ſort.

Here are 40 different ſorts of palm-trees, the moſt excellent cocoas, wild cinnamon, wild nutmegs, and ſome ſay wild cloves alſo; ebony; ſandal-wood; the beſt caſſia, and in ſuch plenty, that they feed their hogs with its fruit; all kinds of cattle, and prodigious quantities of gold, amber, and ambergriſe.

There are ſeveral ſorts of people in this iſland beſides the Spaniards, as the Tagalians or Tagaleze, the Pintadoes or painted negroes, the Ilayas or Tinglianos, and the Negrellos. The Tagalians, who are thought to be Malayans by deſcent, are a modeſt, tractable, and well diſpoſed people. The Pintadoes, or painted negroes, are tall, ſtraight, ſtrong, active, and of an excellent diſpoſition. The Tinglianos, whom ſome ſuppoſe to be deſcended from the Japaneſe, are very brave, yet very courteous and humane. They live entirely on the gifts of nature; and never ſleep under any other ſhade than that of the trees or a cave. The Negrellos, who are held to be the Aborigines of the iſland, are barbarous and brutal to the laſt degree. When they kill a Spaniard, they make a cup of his ſkull and drink out of it.

This iſland is divided into ſeveral provinces, containing divers towns, the chief of which are Manila, Caceres, New-Segovia, Bondo, Paſſacao, Ibalon, Bulaw, Serſocon, or Bagatao, Lampon, Fernandina, Bolinao, Playahonda, Cavite, Mindora, Caleleya, and Balayan.

MANILA, the capital of an iſland of the ſame name in the Eaſt Indies, on the ſouth-eaſt ſide of the iſland, where a large river falls into the ſea, and forms a noble bay 30 leagues in compaſs, to which the Spaniards have given the name of *Bahia*, becauſe the river runs out of the great lake Bahi, which lies at the diſtance of ſix leagues behind it. In compaſs it is two miles, in length one third of a mile; the ſhape irregular, being narrow at both ends, and wide in the middle. On the ſouth it is waſhed by the ſea, and on the north and eaſt by the river; being alſo ſtrongly fortified with walls, baſtions, forts, and batteries.—Manila contains about 30,000 ſouls, who are a very motely race, diſtinguiſhed by ſeveral ſtrange names, and produced by the conjunction of Spaniards, Chineſe, Malabars, Blacks, and others inhabiting the city and iſlands depending on it. Without the walls are large ſuburbs, particularly that inhabited by the Chineſe merchants, called *Sangleys*. In proportion to the ſize of the place, the number of churches and religious houſes is very great. Only ſmall veſſels can come up to Manila; but three leagues ſouth of it is the town and port of Cavite, defended by the caſtle of St Philip, and capable of receiving the largeſt ſhips. Here ſtands the arſenal where the galleons are built, for which there are from 300 to 600 or 800 men conſtantly employed, who are relieved every month, and while upon duty are maintained at the king's expence. By an earthquake which happened here in 1645, a third part of the city of Manila was deſtroyed, and no leſs than 3000 people periſhed in the ruins.

In the war before laſt, Spain having entered into engagements with France, in conſequence of the family-compact of the houſe of Bourbon, it was found expedient by Britain to declare war alſo againſt Spain. Whereupon a force was ſent out from our Eaſt-India ſettlements, particularly Madras, for the conqueſt of the Philippine Iſlands, under General Draper and Admiral Corniſh: who, after a ſiege of 12 days, took Manila on the 6th of October 1762 by ſtorm; but, to ſave ſo fine a city from deſtruction, agreed to accept a ranſom, amounting to a million ſterling, a part of which, it is ſaid, was never paid. The Spaniſh viceroy reſides in this city, and lives like a ſovereign prince. The government is ſaid to be one of the beſt in the gift of the king of Spain. When the city was taken, as above, the archbiſhop, who is a kind of pope in this part of the world, was alſo viceroy. Five large ſhips, loaded with the riches of the Eaſt, as diamonds from Golconda, cinnamon from Ceylon, pepper from Sumatra and Java, cloves and nutmegs from the Moluccas and Banda iſlands, camphire from Borneo, benjamin and ivory from Cambodia, ſilks, tea, and china-ware from China, &c. ſail yearly from hence to Acapulco in Mexico, and return freighted with ſilver, making 400 per cent. profit.

The city of Manila is governed by two alcaides: the reſt of the cities and great towns have each an alcaide; and in every village there is a corregidore. Appeals from their ſentences are made to the royal court at Manila, in which there are four judges, and a fiſcal or attorney-general; each of theſe judges has a ſalary of 3300 pieces of eight per annum. The viceroy is preſident; and in that quality has an income of 4000 pieces of eight, but he has no vote; yet if the judges are equally divided, the preſident names a doctor of the civil law, who, in virtue of his appointment, has a deciſive voice. The attorney-general, in right of his office, is protector of the Chineſe, in conſideration of which he receives 600 pieces of eight every year. As for the Indians that are in ſubjection, they pay tribute in the following proportions: Young men from

18, and from thence, if they continue ſingle, to the age of 60, pay five rials of plate by way of capitation; as ſingle women likewiſe do from 24 to 50: married men pay ten rials. It is computed, that there are within the compaſs of this government 250,000 Indians, ſubject to his Catholic majeſty, of whom two-fifths hold immediately from the king, and the reſt from lords or proprietors, who pay two rials each for the maintenance of the forces, and the like ſum for the pariſh-prieſt. The royal revenue is computed at about half a million of pieces of eight, excluſive of caſualties. In regard to the military eſtabliſhment, the garriſon of Manila conſiſts of about 800 or 1000 men, and there are about 3000 more in the Philippines. The viceroy is by his office captain-general, with a ſalary of about 4000 pieces of eight.

MANILIUS (Marcus), a Latin poet, whoſe poem had the ill luck to lie buried in ſome German libraries, and was not heard of in the world until Poggius, about two centuries ago, publiſhed him from ſome old manuſcripts he found there. There is no account to be found of him but what can be drawn from his poem, which is called *Aſtronomicon;* and contains a ſyſtem of the ancient aſtronomy and aſtrology, together with the philoſophy of the Stoics. It conſiſts of five books; though there was a ſixth, which has not been recovered. From the ſtyle, and no mention of the author being found in ancient writers, it is probable he died young. It is collected, however, that he was a Roman of illuſtrious extraction, and lived under the reign of Auguſtus, whom he invokes, though not by name, yet by circumſtances and character that ſuit no other emperor. The beſt editions of Manilius are, that of Joſeph Scaliger in 1600, and that of Bently at London in 1738.

MANILLE, in commerce, a large braſs ring in the form of a bracelet, either plain or engraven, flat or round.

Manilles are the principal commodities which the Europeans carry to the coaſt of Africa, and exchange with the natives for ſlaves. Theſe people wear them as ornaments on the ſmall of the leg, and on the thick part of the arm above the elbow. The great men wear manilles of gold and ſilver; but theſe are made in the country by the natives themſelves.

MANIOC, or Manihot. See Jatropha.

MANIPULUS, Manipule, among the Romans, was a little body of infantry, which in the time of Romulus conſiſted of 100 men; and in the time of the conſuls, and firſt Cæſars, of 200.

The word properly ſignifies "a handful;" and, according to ſome authors, was firſt given to the handful of hay which they bore at the end of a pole, to diſtinguiſh themſelves by, before the cuſtom was introduced of bearing an eagle for their enſign; and hence alſo the phraſe, *a handful of men.* But Vegetius, Modeſtus, and Varro, gave other etymologies of the word: the laſt derives it from *manus,* a little body of men following the ſame ſtandard. According to the former, this corps was called *manipulus,* becauſe they fought hand in hand or all together: *Contubernium autem manipulus vocabatur ab eo, quod conjunctis manibus pariter dimicabant.*

Each manipule had two centurions, or captains, called *manipularii,* to command it; one whereof was lieutenant to the other. Each cohort was divided into three manipules, and each manipule into two centuries.

Aulus Gellius quotes an old author, one Cincius, who lived in the time of Hannibal (whoſe priſoner he was), and who, writing on the art of war, obſerves, that then each legion conſiſted of 60 centuries, of 30 manipules, and of ten cohorts. And again, Varro and Vegetius mention it as the leaſt diviſion in the army, only conſiſting of the tenth part of a century; and Spartian adds, that it contained no more than ten men. This ſhows that the manipulus was not always the ſame thing.

Manipulus is alſo an eccleſiaſtical ornament, worn by the prieſts, deacons, and ſubdeacons in the Romiſh church. It conſiſts of a little fillet in form of a ſtole, three or four inches broad, and made of the ſame ſtuff with the chaſuble; ſignifying and repreſenting an handkerchief which the prieſts in the primitive church wore on the arm to wipe off the tears they were continually ſhedding for the ſins of the people. There ſtill remains a mark of this uſage in a prayer rehearſed by thoſe who wear it; *Merear, Domine, portare manipulum fletus & doloris.*—The Greeks and Maronites wear two manipules, one on each arm.

Manipulus, among phyſicians, is uſed to ſignify a handful of herbs or leaves, or ſo much as a man can graſp in his hand at once; which quantity is frequently denoted by the abbreviature, M, or m.

MANIS, the Scaly Lizard, in zoology; a genus of quadrupeds belonging to the order of bruta, the characters of which are theſe: They have no foreteeth either in the upper or under jaw; the tongue is long and cylindrical; the ſnout is long and narrow; and the body is covered with hard ſcales. There are two ſpecies: 1. The pentadactyla, or ſhort-tailed manis, with five toes on each foot. The head is ſmaller than the neck; the eyes are very ſmall; the length of the body, including the tail, is from ſix to eight feet. The whole body is covered with hard ſcales, excepting the under-part of the head and neck, the breaſt, the belly, and the internal ſide of each leg. Betwixt the ſcales of this animal there are ſome hairs like the briſtles of a hog, browniſh at the points. The ſcales are of a reddiſh colour, very hard, convex above, and concave below. All the parts which want ſcales are naked. The ſcales are unconnected; and the animal can raiſe or lower them at pleaſure, like the quills of the porcupine. When irritated, he erects his ſcales, and rolls himſelf up like a hedge-hog. In this ſituation, neither the lion, tiger, nor any other animal can hurt him. It is ſaid to deſtroy the elephant by twiſting itſelf round his trunk, and compreſſing that tender organ with its hard ſcales. It feeds on lizards and inſects; turns up the ground with its noſe; walks with its claws bent under its feet; grows very fat; and is eſteemed delicate eating; makes no other noiſe than a kind of ſnorting. It is a mild inoffenſive creature, is ſlow of motion, and has no other method of eſcaping the purſuit of man, but by concealing himſelf in crannies of rocks, and in holes which they dig in the ground, and where they likewiſe bring forth their young. It is a native of the Eaſt Indies, and is very rare. Mr Pennant conjectures that it may be a native

Plate cclxxix.

of Guinea; the *quogeli* of the Negroes, which, Des Marchais ſays, grows to the length of eight feet, of which the tail is four. It lives in woods and marſhy places; feeds on ants, which it takes by laying its long tongue acroſs their paths, which is covered with a viſcous ſaliva, ſo that the inſects which attempt to paſs over it cannot extricate themſelves.

2. The tetradactyla, or long-tailed manis, with four toes on each foot. This ſpecies is very ſimilar to the former; only the tail of it is much longer in proportion to the body; and ſuch parts as want ſcales, inſtead of being naked, are covered with a ſoft hair. It inhabits Guinea, and is alſo found in the Eaſt Indies.

MANLEY (Mrs), the celebrated writer of the *Atalantis*, was the daughter of Sir Roger Manley, the reputed author of the firſt volume of the *Turkiſh Spy*. She loſt her parents very early; and after having been deluded into a falſe marriage by her guardian, who was her couſin, and afterwards deſerted her, ſhe was patronized by the ducheſs of Cleveland, miſtreſs of Charles II. But the ducheſs, being a woman of a very fickle temper, grew tired of Mrs Manley in ſix months time; and diſcharged her upon a pretence, whether groundleſs or not is uncertain, that ſhe intrigued with her ſon. After this ſhe wrote her firſt tragedy, called *Royal Miſchief*, which was acted with great applauſe in 1696; and her apartment being frequented by men of wit and gaiety, ſhe ſoon engaged in amours, and was taken into keeping. Her pen now grew as licentious as her conduct: for, in her retired hours, ſhe wrote four volumes, called *Memoirs of the New Atalantis*; in which ſhe was not only very free in her wanton tales of love-adventures, but ſatirized the characters of many diſtinguiſhed perſonages, eſpecially thoſe who had a principal concern in the Revolution. A proſecution was commenced againſt her for this work; but whether thoſe in power were aſhamed to bring a woman to trial for a few amorous trifles, or whether the laws could not reach her diſguiſed ſatire, ſhe was diſcharged; and a total change of the miniſtry enſuing, Mrs Manley lived in high reputation and gaiety, amuſing herſelf with the converſation of wits, and writing plays, poems, and letters. She died in 1724.

MANLIUS (Capitolinus), the renowned Roman conſul and general, who ſaved the capitol when it was attacked by the Gauls in the night: he was alarmed by the cries of geeſe, which were ever after held ſacred. But being afterwards accuſed of aſpiring at the ſovereignty, he was thrown from the Tarpeian rock. See Gaul and Rome.

Manlius (Torquatus), a celebrated conſul and Roman captain; had great wit, but a difficulty in expreſſing himſelf, which induced Manlius Imperioſus, his father, to keep him almoſt by force in the country. Pompey, tribune of the people, enraged at this inſtance of ſeverity, formed a deſign of accuſing Manlius the father before the judges; but Torquatus being informed of it, went to that tribune, and, with a poniard in his hand, made him ſwear that he would not proceed in that accuſation againſt him to whom he owed his life. At length Torquatus was made military tribune, and killed a ſoldier of the Gauls in ſingle combat, from whom he took a gold chain that he wore about his neck. From this action he obtained the name of *Torquatus*. He was conſul in the war againſt the Latins; when he ordered his own ſon to be beheaded, for fighting contrary to his orders, though he had gained the victory. He conquered the enemies of the republic, and was ſeveral times made conſul; but at laſt refuſed the conſulſhip, ſaying, That it was no more poſſible for him to bear with the vices of the people, than it was for the people to bear with his ſeverity.

MANNA, in the materia medica, the juice of certain trees of the aſh-kind*, either naturally concreted on the plants, or exſiccated and purified by art. There are ſeveral ſorts of manna in the ſhops. The larger pieces, called *flake manna*, are uſually preferred; though the ſmaller grains are equally good, provided they are white, or of a pale yellow colour; very light, of a ſweet, not unpleaſant taſte, and free from any viſible impurities. Some people injudiciouſly prefer the fat honey-like manna to the foregoing; this has either been expoſed to a moiſt air, or damaged by ſea or other water. This kind of manna is ſaid to be ſometimes counterfeited by a compoſition of ſugar and honey mixed with a little ſcammony; there is alſo a factitious manna, which is white and dry, ſaid to be compoſed of ſugar, manna, and ſome purgative ingredient, boiled to a proper conſiſtence. This may be diſtinguiſhed by its weight, ſolidity, untranſparent whiteneſs, and by its taſte, which is different from that of manna.

*See Manna-*Tree*, below.

Manna is a mild, agreeable laxative; and may be given with ſafety to children and pregnant women: nevertheleſs, in ſome particular conſtitutions, it acts very unkindly, producing flatulencies and diſtenſions of the viſcera: theſe inconveniencies may be prevented by the addition of any grateful warm aromatic. It operates ſo weakly, that it does not produce the full effect of a cathartic, unleſs taken in large doſes; and hence it is rarely given in this intention by itſelf. It may be commodiouſly diſſolved in the purging mineral waters, or joined to the cathartic ſalts, ſenna, rhubarb, or the like. Geoffroy recommends acuating it with a few grains of emetic tartar: by this management, he ſays, bilious ſerum will be plentifully evacuated, without any nauſea, gripes, or other inconvenience. It is remarkable, that the efficacy of this drug is greatly promoted (if the account of Valliſnieri is to be relied on) by a ſubſtance which is itſelf very ſlow of operation, *viz.* caſia. See Casia.

Manna, is alſo a Scripture-term, ſignifying a miraculous kind of food which fell from heaven for the ſupport of the Iſraelites in their paſſage through the wilderneſs, being in form of coriander-ſeeds, its colour like that of bdellium, and its taſte like honey.

The Scripture gives to manna the name of the *bread of heaven*, and the *food of angels*, Pſal. lxxviii. 25. whether it would inſinuate to us, that the angels ſent and prepared this food, or that angels themſelves, if they had need of any food, could not have any that was more agreeable than manna was. The author of the Book of Wiſdom ſays, xvi. 20. 21. that manna ſo accommodated itſelf to every one's taſte, that every one found it pleaſing to him; and that it included every thing that was agreeable to the palate and fit for good nouriſh-

nouriſhment; which expreſſion ſome have taken in the literal ſenſe, though others underſtand them figuratively.

The critics are divided about the original of the word *manna*. Some think that *man* is put inſtead of the Hebrew word *mah*, which ſignifies "What is this?" and that the Hebrews, then firſt ſeeing that new food which God had ſent them, cried to one another, מן הוא *man-hu*, inſtead of *mah-hu*, "What is this?" Others maintain, that the Hebrews very well knew before what manna was; and that, ſeeing it in great abundance about their camp, they ſaid one to another, *Man-hu*, "This is manna." Mr Saumaiſe and ſome other moderns are of this laſt opinion. They imagine, that the manna which God ſent the Iſraelites was nothing elſe but that fat and thick dew which ſtill falls in Arabia, which preſently condenſed, and ſerved for food to the people; that this is the ſame thing as the wild honey, mentioned Matt. iii. 4. wherewith John the Baptiſt was fed; and that the miracle of Moſes did not conſiſt in the production of any new ſubſtance, but in the exact and uniform manner in which the manna was diſpenſed by Providence for the maintenance of ſuch a great multitude.

On the contrary, the Hebrews and Orientals believe, that the fall of the manna was wholly miraculous. The Arabians call it the *ſugar-plums of the Almighty*; and the Jews are ſo jealous of this miracle, that they pronounce a curſe againſt all ſuch as preſume to deny the interpoſition of a miraculous power.

Our tranſlation, and ſome others, make Moſes fall into a plain contradiction in relating this ſtory of the manna, which they render thus: "And when the children of Iſrael ſaw it, they ſaid one to another, It is manna; for they wiſt not what it was." Exodus xvi. 15. Whereas the Septuagint, and ſeveral authors both ancient and modern, have tranſlated the text according to the original, "The Iſraelites ſeeing this, ſaid one to another, What is this? for they knew not what it was." For we muſt obſerve, that the word by which they aſked, *what this is?* was in their language *man*, which ſignifies likewiſe meat ready provided; and therefore it was always afterwards called *man* or *manna*.

Whether this manna had thoſe extraordinary qualities in it or no, which ſome imagine, it muſt be allowed to be truly miraculous, upon the following accounts. 1. That it fell but ſix days in the week. 2. That it fell in ſuch a prodigious quantity, as ſuſtained almoſt three millions of ſouls. 3. That there fell a double quantity every Friday, to ſerve them for the next day, which was their Sabbath. 4. That what was gathered on the firſt five days ſtunk and bred worms, if kept above one day: but that which was gathered on Friday kept ſweet for two days. And, laſtly, That it continued falling while the Iſraelites abode in the wilderneſs, but ceaſed as ſoon as they came out of it and had got corn to eat in the land of Canaan.

Manna-Tree, is a ſpecies of the aſh ‡, and a native of Calabria in Italy. The ſhoots of this tree are much ſhorter, and the joints cloſer together, than thoſe of the common aſh; the ſmall leaves are ſhorter, and deeper ſawed on their edges, and are of a lighter green. The flowers come out from the ſide of the branches, which are of a purple colour, and appear in the ſpring before the leaves come out. This tree is of humble growth, ſeldom riſing more than 15 or 16 feet high in this country.

A great quantity of fine manna is gathered at Carini in Sicily, oozing from a kind of aſh-tree with a bark ſimilar to that of the ebony, and a leaf ſomewhat like the acacia. M. de Non*, who gives an account of this manna, ſays, that it is produced from young trees about ſeven or eight years old when they are only about eight feet high. Inciſions are then made horizontally in the bark, and from theſe the manna flows. The inciſions are made from the earth to the top of the tree, and are repeated every two days from the end of July till the circulation is ſtopped in the courſe of the year, or till the manna becomes worſe in quality. It exſudes firſt as a white frothy liquor extremely light, pleaſant to the taſte, and of an agreeable flavour, which is coagulated by the heat of the ſun, and aſſumes an appearance ſomewhat reſembling ſtalactites. This is the beſt kind, and by the people of that country is called *lachrymatory* or *cane* manna. The inferior kind appears firſt in the form of a glutinous and higher coloured liquor, which is received on the leaves of the Indian fig, which are placed for that purpoſe at the foot of the tree. This alſo congeals by the heat of the ſun; though it is more heavy, purgative, and of much leſs value, than the former. It is called *fat* manna: In this part only reſides the faint and diſagreeable flavour obſervable in manna; for the cane manna is of an agreeable flavour, and of an excellent ſtomachic. It is got off from the bark of the tree by bending and ſhaking it. In rainy ſeaſons, they muſt gather the manna every day, which both leſſens the quantity and renders it of inferior quality. When the ſtem of the tree is entirely covered with inciſions, they cut it down cloſe to the ground; after which it puſhes out new tufts of wood, one or two ſtems of which are preſerved, and at a proper age produce manna as before. The tree itſelf is propagated by ſeed, and afterwards tranſplanting it. The wood is hard and heavy, of a bitter taſte, and recommended in the dropſy. It thrives only in hot climates, and requires to be expoſed to the north winds in order to make it productive; but M. de Non is of opinion, that it might be propagated, and would produce manna in Provence in France. The Sicilian manna is dearer and more eſteemed than that of Calabria, though the latter is more generally known and cultivated. The tree does not grow in any other part of the iſland excepting about Carini, where it is a native.

MANNER, in painting, a habitude that a man acquires in the three principal parts of painting, the management of colours, lights, and ſhadows; which is either good or bad according as the painter has practiſed more or leſs after the truth, with judgment and ſtudy. But the beſt painter is he who has no manner at all. The good or bad choice he makes is called *goute*.

MANNERS, the plural noun, has various ſignifications; as, the general way of life, the morals, or the habits, of any perſon or people; alſo ceremonious behaviour, or ſtudied civility. See the next article.

* *Travels in Sicily*.

Good-Manners.

Good-Manners, according to Swift, is the art of making thoſe people eaſy with whom we converſe.

Whoever makes the feweſt perſons uneaſy, is the beſt bred in the company.

As the beſt law is founded upon reaſon, ſo are the beſt manners. And as ſome lawyers have introduced unreaſonable things into common law; ſo likewiſe many teachers have introduced abſurd things into common good-manners.

One principal point of this art is to ſuit our behaviour to the three ſeveral degrees of men; our ſuperiors, our equals, and thoſe below us.

For inſtance, to preſs either of the two former to eat or drink is a breach of manners; but a tradeſman or a farmer muſt be thus treated, or elſe it will be difficult to perſuade them that they are welcome.

Pride, ill-nature, and want of ſenſe, are the three great ſources of ill-manners: without ſome one of theſe defects, no man will behave himſelf ill for want of experience; or of what, in the language of fools, is called *knowing the world.*

"I defy (proceeds our author) any one to aſſign an incident wherein reaſon will not direct us what we are to ſay or to do in company, if we are not miſled by pride or ill-nature. Therefore, I inſiſt that good ſenſe is the principal foundation of good manners; but becauſe the former is a gift which very few among mankind are poſſeſſed of, therefore all the civilized nations of the world have agreed upon fixing ſome rules for common behaviour, beſt ſuited to their general cuſtoms, or fancies, as a kind of artificial good-ſenſe to ſupply the defects of reaſon. Without which, the gentlemanly part of dunces would be perpetually at cuffs, as they ſeldom fail when they happen to be drunk, or engaged in ſquabbles about women or play. And, God be thanked, there hardly happeneth a duel in a year, which may not be imputed to one of thoſe three motives. Upon which account, I ſhould be exceedingly ſorry to find the legiſlature make any new laws againſt the practice of duelling; becauſe the methods are eaſy, and many, for a wiſe man to avoid a quarrel with honour, or engage in it with innocence. And I can diſcover no political evil, in ſuffering bullies, ſharpers, and rakes, to rid the world of each other by a method of their own, where the law hath not been able to find an expedient.

"As the common forms of good-manners were intended for regulating the conduct of thoſe who have weak underſtandings; ſo they have been corrupted by the perſons for whoſe uſe they were contrived. For theſe people have fallen into a needleſs and endleſs way of multiplying ceremonies, which have been extremely troubleſome to thoſe who practiſe them, and inſupportable to every body elſe; inſomuch that wiſe men are often more uneaſy at the over-civility of theſe refiners, than they could poſſibly be in the converſations of peaſants or mechanics.

"The impertinencies of this ceremonial behaviour are nowhere better ſeen than at thoſe tables where ladies preſide, who value themſelves upon account of their good-breeding; where a man muſt reckon upon paſſing an hour without doing any one thing he hath a mind to, unleſs he will be ſo hardy as to break through all the ſettled decorum of the family. She determines what he loveth beſt, and how much he ſhall eat; and if the maſter of the houſe happeneth to be of the ſame diſpoſition, he proceedeth in the ſame tyrannical manner to preſcribe in the drinking part: at the ſame time you are under the neceſſity of anſwering a thouſand apologies for your entertainment. And although a good deal of this humour is pretty well worn off among many people of the beſt faſhion, yet too much of it ſtill remaineth, eſpecially in the country; where an honeſt gentleman aſſured me, that having been kept four days againſt his will at a friend's houſe, with all the circumſtances of hiding his boots, locking up the ſtable, and other contrivances of the like nature, he could not remember, from the moment he came into the houſe to the moment he left it, any one thing wherein his inclination was not directly contradicted; as if the whole family had entered into a combination to torment him.

"But, beſides all this, it would be endleſs to recount the many fooliſh and ridiculous accidents I have obſerved among theſe unfortunate proſelytes to ceremony. I have ſeen a ducheſs fairly knocked down by the precipitancy of an officious coxcomb running to ſave her the trouble of opening a door. I remember, upon a birth-day at court, a great lady was rendered utterly diſconſolate, by a diſh of ſauce let fall by a page directly upon her head-dreſs and brocade, while ſhe gave a ſudden turn to her elbow upon ſome point of ceremony with the perſon who ſat next her. Monſieur Buys, the Dutch envoy, whoſe politics and manners were much of a ſize, brought a ſon with him about 13 years old to a great table at court. The boy and his father, whatever they put on their plates, they firſt offered round in order, to every perſon in the company; ſo that we could not get a minute's quiet during the whole dinner. At laſt their two plates happened to encounter, and with ſo much violence, that, being china, they broke in 20 pieces, and ſtained half the company with wet ſweatmeats and cream.

"There is a pedantry in manners as in all arts and ſciences, and ſometimes in trades. Pedantry is properly the over-rating any kind of knowledge we pretend to. And if that kind of knowledge be a trifle in itſelf, the pedantry is the greater. For which reaſon I look upon fiddlers, dancing-maſters, heralds, maſters of the ceremony, &c. to be greater pedants than Lipſius, or the elder Scaliger. With theſe kind of pedants, the court, while I knew it, was always plentifully ſtocked: I mean from the gentleman-uſher (at leaſt) incluſive, downward to the gentleman porter; who are, generally ſpeaking, the moſt inſignificant race of people that this iſland can afford, and with the ſmalleſt tincture of good-manners, which is the only trade they profeſs. For being wholly illiterate, converſing chiefly with each other, they reduce the whole ſyſtem of breeding within the forms and circles of their ſeveral offices: and as they are below the notice of miniſters, they live and die in court under all revolutions, with great obſequiouſneſs to thoſe who are in any degree of credit or favour, and with rudeneſs and inſolence to every body elſe. From whence I have long concluded, that good-manners are not a plant of the court-growth: for if they were, thoſe people who have underſtandings directly of a level for ſuch acquirements, and who have ſerved ſuch long apprenticeſhips to nothing elſe, would certainly have picked them up. For as to the great officers who attend the prince's perſon or councils, or preſide in his family, they are a tranſient body, who have no better a title to good-manners than their neighbours, nor will probably have recourſe to gentlemen-uſhers for inſtruction. So that I know little to be learned at court on this head, except in the material circumſtance of dreſs; wherein the authority of the maids of honour muſt indeed be allowed to be almoſt equal to that of a favourite actreſs.

“ I remember a paſſage my lord Bolinbroke told me: That going to receive prince Eugene of Savoy at his landing, in order to conduct him immediately to the queen, the prince ſaid he was much concerned that he could not ſee her majeſty that night: for Monſieur Hoffman (who was then by) had aſſured his highneſs, that he could not be admitted into her preſence with a tied-up periwig; that his equipage was not arrived; and that he had endeavoured in vain to borrow a long one among all his valets and pages. My lord turned the matter to a jeſt, and brought the prince to her majeſty: for which he was highly cenſured by the whole tribe of gentlemen-uſhers; among whom Monſieur Hoffman, an old dull reſident of the emperor's, had picked up this material point of ceremony; and which, I believe, was the beſt leſſon he had learned in 25 years reſidence.

“ I make a difference between *good-manners* and *good-breeding*; although, in order to vary my expreſſion, I am ſometimes forced to confound them. By the firſt, I only underſtand the art of remembering, and applying, certain ſettled forms of general behaviour. But *good-breeding* is of a much larger extent: for beſides an uncommon degree of literature ſufficient to qualify a gentleman for reading a play, or a political pamphlet, it taketh in a great compaſs of knowledge; no leſs than that of dancing, fighting, gaming, making the circle of Italy, riding the great horſe, and ſpeaking French; not to mention ſome other ſecondary or ſubaltern accompliſhments, which are more eaſily acquired. So that the difference between good-breeding and good-manners lieth in this, That the former cannot be attained to by the beſt underſtandings without ſtudy and labour; whereas a tolerable degree of reaſon will inſtruct us in every part of good-manners without other aſſiſtance.

“ I can think of nothing more uſeful upon this ſubject, than to point out ſome particulars wherein the very eſſentials of good-manners are concerned, the neglect or perverting of which doth very much diſturb the good commerce of the world, by introducing a traffic of a mutual uneaſineſs in moſt companies.

“ Firſt, a neceſſary part of good-manners is a punctual obſervance of time at our own dwellings, or thoſe of others, or at third places; whether upon matters of civility, buſineſs, or diverſion; which rule, though it be a plain dictate of common reaſon, yet the greateſt miniſter† I ever knew, was the greateſt treſpaſſer againſt it; by which all his buſineſs doubled upon him, and placed him in a continual arrear. Upon which I often uſed to rally him as deficient in point of good-manners. I have known more than one ambaſſador, and ſecretary of ſtate, with a very moderate portion of intellectuals, execute their office with great ſucceſs and applauſe, by the mere force of exactneſs and regularity. If you duly obſerve time for the ſervice of another, it doubles the obligation; if upon your own account, it would be manifeſt folly, as well as ingratitude, to neglect it; if both are concerned, to make your equal or inferior attend on you to his own diſadvantage, is pride and injuſtice.

“ Ignorance of forms cannot properly be ſtyled *ill-manners*: becauſe forms are ſubject to frequent changes; and conſequently, being not founded upon reaſon, are beneath a wiſe man's regard. Beſides, they vary in every country; and after a ſhort period of time vary frequently in the ſame: ſo that a man who travelleth, muſt needs be at firſt a ſtranger to them in every court through which he paſſeth; and perhaps, at his return, as much a ſtranger in his own; and, after all, they are eaſier to be remembered or forgotten than faces or names.

“ Indeed, among the many impertinencies that ſuperficial young men bring with them from abroad, this bigotry of forms is one of the principal, and more predominant than the reſt; who look upon them not only as if they were matters capable of admitting of choice, but even as points of importance; and therefore are zealous upon all occaſions to introduce and propagate the new forms and faſhions they have brought back with them: ſo that, uſually ſpeaking, the worſt-bred perſon in the company is a young traveller juſt arrived from abroad.”

MANNORY (Lewis), late advocate of the parliament of Paris, where he was born in 1696, and died in 1777. From him we have 18 vols 12mo of *Pleadings* and *Memoirs*. A great number of ſingular caſes occur in this collection: and the author has the talent of rendering them more ſtriking by the agreeable manner in which they are ſtated. He was Travenol's counſel in his proceſs againſt Voltaire, and was very ſatirical againſt that poet. The latter took revenge by deſcribing him as a mercenary babbler, who ſold his pen and his abuſe to the higheſt bidder.—Whatever may be the caſe, Mannory would certainly have been more eſteemed both as an advocate and as a writer, if he had paid more attention to his ſtyle, and had been leſs prolix; if he had thought more deeply, and been more ſparing of his pleaſantry in cauſes where nothing was required but knowledge and ſound reaſoning. He publiſhed alſo a tranſlation into French of Father Parée's funeral Oration on Louis XIV. and very judicious Obſervations on the Semiramis of Voltaire. In company Mannory was full of wit and ſpirit, but ſometimes a little too cutting and ſevere.

MANOEUVRE, in a military ſenſe, conſiſts ſolely in diſtributing equal motion to every part of a body of troops, to enable the whole to form, or change their poſition, in the moſt expeditious and beſt method, to anſwer the purpoſes required of a battalion, brigade, or line, of cavalry, artillery, or infantry. It has always been lamented, that men have been brought on ſervice without being informed of the uſes of the different manœuvres they have been practiſing; and, having no ideas of any thing but the uniformity of the parade, inſtantly fall into diſorder and confuſion when they loſe the ſtep, or ſee a deviation from the ſtraight lines they have been accuſtomed to at exerciſe. It is a pity to ſee ſo much attention given to ſhow, and ſo little to inſtruct the troops in what may be of uſe

† Harley earl of Oxford, lord high treaſurer to Queen Anne.

to them in real ſervice. No manœuvre ſhould be executed in preſence of the enemy, unleſs protected by ſome diviſion of the troops.

MANOMETER, or Manoscope, an inſtrument to ſhow or meaſure the alterations in the rarity or denſity of the air. The manometer differs from the barometer in this, That the latter only ſerves to meaſure the *weight* of the atmoſphere, or of the column of air over it; but the former, the denſity of the air in which it is found; which denſity depends not only on the weight of the atmoſphere, but alſo on the action of heat and cold, &c. Authors, however, generally confound the two together; and Mr Boyle himſelf gives us a very good manometer of his contrivance, under the name of a *ſtatical barometer*, conſiſting of a bubble of thin glaſs, about the ſize of an orange, which, being counterpoiſed when the air was in a mean ſtate of denſity, by means of a nice pair of ſcales, ſunk when the atmoſphere became lighter, and roſe as it grew heavier.

Another kind of manometers were made uſe of by colonel Roy, in his attempts to correct the errors of the barometer, and are deſcribed in the Philoſophical Tranſactions, Vol. LXVII. p. 689. "They were (ſays he) of various lengths, from four to upwards of eight feet: they conſiſted of ſtraight tubes, whoſe bores were commonly from $\frac{1}{15}$th to $\frac{1}{25}$th of an inch in diameter. The capacity of the tube was carefully meaſured, by making a column of quickſilver, about three or four inches in length, move along it from one end to the other. Theſe ſpaces were ſeverally marked, with a fine-edged file, on the tubes; and transferred from them to long ſlips of paſteboard, for the ſubſequent conſtruction of the ſcales reſpectively belonging to each. The bulb, attached to one end of the manometer at the glaſs-houſe, was of the form of a pear, whoſe point being occaſionally opened, dry or moiſt air could be readily admitted, and the bulb ſealed again, without any ſenſible alteration in its capacity.

"The air was confined by means of a column of quickſilver, long or ſhort, and with the bulb downward or upwards, according to the nature of the propoſed experiment. Here it muſt be obſerved, that, from the adheſion of the quickſilver to the tube, the inſtrument will not act truly, except it be in a vertical poſition; and even then it is neceſſary to give it a ſmall degree of motion, to bring the quickſilver into its true place; where it will remain in equilibrio, between the exterior preſſure of the atmoſphere on one ſide, and the interior elaſtic force of the confined air on the other.

"Pounded ice and water were uſed to fix a freezing point on the tube; and by means of ſalt and ice, the air was farther condenſed, generally four, and ſometimes five or ſix degrees below zero. The thermometer and manometer were then placed in a tin veſſel among water, which was brought into violent ebullition; where having remained a ſufficient time, and motion being given to the manometer, a boiling point was marked thereon. After this the fire was removed, and the gradual deſcents of the piece of quickſilver, correſponding to every 20 degrees of temperature in the thermometer, were ſucceſſively marked on a deal rod applied to the manometer. It is to be obſerved, that both inſtruments, while in the water, were in circumſtances perfectly ſimilar; that is to ſay, the ball and bulb were at the bottom of the veſſel.

"In order to be certain that no air had eſcaped by the ſide of the quickſilver during the operation, the manometer was frequently placed a ſecond time in melting ice. If the barometer had not altered between the beginning and end of the experiment, the quickſilver always became ſtationary at or near the firſt mark. If any ſudden change had taken place in the weight of the atmoſphere during that interval, the ſame was noted, and allowance made for it in afterwards proportioning the ſpaces.

"Long tubes, with bores truly cylindrical, or of any uniform figure, are ſcarcely ever met with. Such however as were uſed in theſe experiments, generally tapered in a pretty regular manner from one end to the other. When the bulb was downwards, and the tube narrowed that way, the column of quickſilver confining the air lengthened in the lower-half of the ſcale, and augmented the preſſure above the mean. In the upper half, the column being ſhortened, the preſſure was diminiſhed below the mean. In this caſe, the obſerved ſpaces both ways from the centre were diminiſhed in the inverſe ratio of the heights of the barometer at each ſpace, compared with its mean height. If the bore widened towards the bulb when downwards, the obſerved ſpaces, each way from the centre, were augmented in the ſame inverſe ratio; but in the experiments on air leſs denſe than the atmoſphere, the bulb being upwards, the ſame equation was applied with contrary ſigns: and if any extraordinary irregularity took place in the tube, the correſponding ſpaces were proportioned both ways from that point, whether high or low, that anſwered to the mean.

"The obſerved and equated manometrical ſpaces being thus laid down on the paſteboard containing the meaſures of the tube; the 212° of the thermometer, in exact proportion to the ſections of the bore, were conſtructed along-ſide of them: hence the coincidences with each other were eaſily ſeen; and the number of thermometrical degrees anſwering to each manometrical ſpace readily transferred into a table prepared for the purpoſe."

MANOR, Manerium, (*à manendo*, becauſe the uſual reſidence of the owner), ſeems to have been a diſtrict of ground held by lords or great perſonages; who kept in their own hands ſo much land as was neceſſary for the uſe of their families, which were called *terræ dominicales*, or *demeſne lands*; being occupied by the lord, or *dominus manerii*, and his ſervants. The other, or *tenemental* lands, they diſtributed among their tenants; which, from the different modes of tenure, were called and diſtinguiſhed by two different names.—Firſt, *book-land*, or charter-land, which was held by deed under certain rents and free ſervices, and in effect differed nothing from free ſocage lands: and from hence have ariſen moſt of the freehold tenants who hold of particular manors, and owe ſuit and ſervice to the ſame. The other ſpecies was called *folk-land*, which was held by no aſſurance in writing, but diſtributed among the common folk or people at the pleaſure of the lord, and reſumed at his diſcretion; being indeed land held in villenage. See Villenage.

Blackſt. Comment.

The reſidue of the manor, being uncultivated, was termed

termed the *lord's waſte*, and ſerved for public roads, and for common of paſture to the lord and his tenants. Manors were formerly called *baronies*, as they ſtill are *lordſhips*; and each lord or baron was empowered to hold a domeſtic court, called the *court-baron*, for redreſſing miſdemeſnors and nuſances within the manor, and for ſettling diſputes of property among the tenants. This court is an inſeparable ingredient of every manor; and if the number of ſuitors ſhould ſo fail, as not to leave ſufficient to make a jury or homage, that is, two tenants at the leaſt, the manor itſelf is loſt.

In the early times of our legal conſtitution, the king's greater barons, who had a large extent of territory held under the crown, granted out frequently ſmaller manors to inferior perſons to be held of themſelves; which do therefore now continue to be held under a ſuperior lord, who is called in ſuch caſes the *lord paramount* over all theſe manors; and his ſeignory is frequently termed an *honour*, not a *manor*; eſpecially if it hath belonged to an ancient feodal baron, or hath been at any time in the hands of the crown. In imitation whereof, theſe inferior lords began to carve out and grant to others ſtill more minute eſtates, to be held as of themſelves, and were ſo proceeding downwards *in infinitum*, till the ſuperior lords obſerved, that, by this method of ſubinfeudation, they loſt all their feodal profits of wardſhips, marriages, and eſcheats, which fell into the hands of theſe meſne or middle lords, who were the immediate ſuperiors of the *terre-tenant*, or him who occupied the land; and alſo that the meſne lords themſelves were ſo impoveriſhed thereby, that they were diſabled from performing their ſervices to their own ſuperiors. This occaſioned, firſt, that proviſion in the 32d chapter of *magna charta*, 9 Hen. III. (which is not to be found in the firſt chapter granted by that prince, nor in the great charter of King John), that no man ſhould either give or ſell his land without reſerving ſufficient to anſwer the demands of his lord; and, afterwards, the ſtatute of Weſtm. 3. or *quia emptores*, 18 Edw. I. c. 1. which directs, that, upon all ſales, or feoffments of land, the feoffee ſhall hold the ſame, not of his immediate feoffor, but of the chief lord of the fee, of whom ſuch feoffor himſelf held it. But theſe proviſions not extending to the king's own tenants *in capite*, the like law concerning them is declared by the ſtatutes of *prærogativa regis*, 17 Edw. II. c. 6. and of 34 Edw. III. c. 15. by which laſt all ſubinfeudations, previous to the reign of king Edward I. were confirmed; but all ſubſequent to that period were left open to the king's prerogative. And from hence it is clear, that all manors exiſting at this day, muſt have exiſted as early as kind Edward the Firſt: for it is eſſential to a manor, that there be tenants who hold of the lord; and, by the operation of theſe ſtatutes, no tenant *in capite* ſince the acceſſion of that prince, and no tenant of a common lord ſince the ſtatute of *quia emptores*, could create any new tenants to hold of himſelf. See Villenage.

MANS, an ancient, rich, and populous town of France, capital of the county of Maine, with a biſhop's ſee. Its wax and ſtuffs are famous. It is ſeated on a high hill near the river Sarr, in E. Long. 0. 10. N. Lat. 47. 58. It is an earldom beſtowed on William Murray, chief juſtice of England, with remainder to the family of Stormont in Scotland.

MANSE, Mansus, *Manſa*, or *Manſum*; in ancient law-books, denotes an *houſe*, or habitation, either with or without land. See House, and Mansion. The word is formed *a manendo*, "abiding;" as being the place of dwelling or reſidence

Capital Manse, (Manſum Capitale), denotes the *manor-houſe*, or lord's court. See Manor.

Mansus *Preſbyteri*, is a parſonage or vicarage houſe for the incumbent to reſide in. This was originally, and ſtill remains, an eſſential part of the endowment of a pariſh-church, together with the glebe and tythes. It is ſometimes called *Preſbyterium*. See Presbytery.

MANSFELD, a city of Germany, and capital of a county of the ſame name, in the circle of Upper Saxony. E. Long. 12. 55. N. Lat. 51. 35.

Mansfeld (Peter Erneſt, count of), was deſcended from one of the moſt illuſtrious families in Germany, and which has produced the greateſt number of diſtinguiſhed characters. In 1552, he was taken priſoner at Ivoy, where he commanded; and he was afterwards of great ſervice to the Catholics at the battle of Montcontour. In conſequence of his great talents, he was employed in affairs of the utmoſt delicacy and importance. Being made governor of Luxembourg, he maintained tranquillity in that province, while the reſt of the Low Countries was a prey to the horrors of civil war. In teſtimony of their gratitude, the States cauſed the following inſcription to be placed on the gate of the hotel de ville: *In Belgio omnia dum vaſtat civile bellum, Mansfeldus bello et pace fidus, hanc provinciam in fide continet ſervatque illæſam, cum ſummo populi conſenſu et hilari jucunditate.* He was afterward appointed to the command of the Low Countries; and died at Luxembourg, March 21. 1604, at the age of 87, with the title of *Prince of the Holy Empire.* His mauſoleum in bronze, which is to be ſeen in the chapel bearing his name, and adjoining to the Church of the Recollets at Luxembourg, is an admirable work. Four highly finiſhed weepers, with which this monument was ornamented, were carried off by Louis XIV. when he took this city in 1684. To a love of war, Mansfeld united a taſte for the ſciences; and he was a lover and encourager of the arts: he poſſeſſed a great and elevated mind; but, like many heroes ancient and modern, he was greedy of gain and laviſh of blood. Abbé Schannat has written the hiſtory of the count of Mansfeld in Latin; printed at Luxembourg, 1707. Charles prince of Mansfeld, his lawful ſon, ſignalized himſelf in the wars of Flanders and Hungary; and died without iſſue in 1595, after having beaten the Turks who attempted to relieve the city of Gran (Strigonia), which he was beſieging.

Mansfeld (Erneſt de), the illegitimate ſon of Peter Erneſt by a lady of Malines, was educated at Bruſſels, in the principles of the Roman Catholic religion, by his godfather Erneſt archduke of Auſtria. He was employed in the ſervice of the king of Spain in the Low Countries, and in that of the emperor in Hungary, together with his brother Charles count of Mansfeld. He was legitimated on account of his bravery by the emperor Rodolphus II.; but his father's poſts and poſſeſſions in the Spaniſh Netherlands having been refuſed him, contrary to promiſes which he had received, he, in 1610, joined the party of the Proteſtant princes. Being now become one of the moſt dangerous enemies of the houſe of Auſtria, who called him the *Attila of Chriſtianity*, he ſet himſelf, in 1618, at the head of the rebels in Bohemia, and got poſſeſſion of Pilſen in 1619. Though his troops were defeated in ſeveral battles, he was able to penetrate into the palatinate. He there took ſeveral places, ravaged Alſace, made himſelf maſter of Haguenau, and defeated the Bavarians. At length he was totally defeated by Walſtein, at the battle of Daſſou, which happened in the month of April 1626. He gave over his remaining troops to the Duke of Weimar, and intended to paſs into the Venetian States; but fell ſick in a village between Zara and Spalatro, and there expired, A. D. 1626, aged 46. The procurator Nani thus deſcribes him: "He was bold, intrepid in danger, and the moſt ſkilful negociator of the age in which he lived. He poſſeſſed a natural eloquence, and well knew how to inſinuate himſelf into the hearts of thoſe whom he wiſhed to gain. He was greedy of others wealth, and prodigal of his own.—He was full of vaſt projects and great hopes, and yet poſſeſſed neither lands nor money at his death." He did not wiſh to die in his bed; but dreſſed himſelf in his fineſt robes, put on his ſword, ſat up, leaning upon two domeſtics, and in this poſition, highly becoming a warrior, breathed his laſt. But of all the actions of this great captain and ſingular man, the following is without doubt the moſt extraordinary: Having got the moſt certain information that Cazel, in whom of all his officers he placed the greateſt confidence, had communicated his plans to the Auſtrian chief, he ſhowed neither paſſion nor reſentment at his treachery, but gave him 300 rix-dollars, and ſent him to count Buquoy, with a letter expreſſed in theſe words, "Cazel being attached to you and not to me, I ſend him to you, that you may have the benefit of his ſervices." The opinions of men were divided about this action, and it was as much cenſured as applauded. Be this as it may, Erneſt is deſervedly eſteemed one of the greateſt generals of his age. There never was a leader more patient, more indefatigable, more inured to toil and hardſhip, to watchings, to cold, and to hunger. He raiſed armies, and ravaged the enemy's territories with an incredible celerity. The Hollanders ſaid of him, that he was *bonus in auxilio, carus in pretio;* that is, that he rendered great ſervices to thoſe who employed him, but that he made them pay well for it.

Mansfeld (Henry-Francis, count of), was of the ſame houſe with the former, and ſignalized himſelf in the wars for the Spaniſh ſucceſſion. He died at Vienna on the 8th of June 1715, at the age of 74, after being a prince of the Holy Empire, a grandee of Spain, field-marſhal general of the emperor's armies, general of artillery, ambaſſador to France and Spain, preſident of the Aulic council, and great chamberlain to the emperor.

MANSFIELD, a town of Nottinghamſhire, in England, ſeated in the foreſt of Sherwood, 140 miles from London. It was anciently a royal demeſne. It has a market on Thurſdays, and two fairs. By an ancient cuſtom of this manor, the heirs were declared of age as ſoon as born. It is a well-built town, and drives a great trade in malt. Its market is well ſtocked with corn, cattle, &c. Here is a charity-ſchool for 36 boys.

MANSIO, a term often mentioned in itineraries, denoting *inns* on the public roads to lodge in, at the diſtance of eighteen miles from each other; (Lactantius). Alſo, in the lower ages, it came to denote "an encampment for one night," (Lampridius).

Mansio, or *Manſus*, was ſometimes alſo uſed in the ſame ſenſe with *hide;* that is, for as much land as one plough could till in a year. See Hide.

MANSION, Mansio, a dwelling-houſe, or habitation, eſpecially in the country. See Manse.

Mansion is more particularly uſed for the lord's chief dwelling-houſe within his fee; otherwiſe called the *capital meſſuage* or *manſe*, or chief manor-place. See Manor.

MANSLAUGHTER, the unlawful killing of another, without malice either expreſs or implied: Which may be either voluntarily, upon a ſudden heat; or involuntarily, but in the commiſſion of ſome unlawful act. Theſe were called, in the Gothic conſtitutions, *homicidia vulgaria; quæ aut caſu, aut etiam ſponte committuntur, ſed in ſubitaneo quodam iracundiæ calore et impetu.* And hence it follows, that in manſlaughter there can be no acceſſories before the fact; becauſe it muſt be done without premeditation.

1. As to the firſt, or voluntary branch: If upon a ſudden quarrel two perſons fight, and one of them kills the other, this is manſlaughter: and ſo it is, if they upon ſuch an occaſion go out and fight in a field; for this is one continued act of paſſion: and the law pays that regard to human frailty, as not to put a haſty and deliberate act upon the ſame footing with regard to guilt. So alſo if a man be greatly provoked, as by pulling his noſe, or other great indignity, and immediately kills the aggreſſor; though this is not excuſable *ſe defendendo*, ſince there is no abſolute neceſſity for doing it to preſerve himſelf; yet neither is it murder, for there is no previous malice; but it is manſlaughter. But in this, and in every other caſe of homicide upon provocation, if there be a ſufficient cooling-time for paſſion to ſubſide and reaſon to interpoſe, and the perſon ſo provoked afterwards kills the other, this is deliberate revenge, and not heat of blood; and accordingly amounts to murder. So if a man takes another in the act of adultery with his wife, and kills him directly upon the ſpot; though this was allowed by the law of Solon, as likewiſe by the Roman civil law (if the adulterer was found in the huſband's own houſe), and alſo among the ancient Goths; yet in England it is not abſolutely ranked in the claſs of juſtifiable homicide, as in caſe of a forcible rape, but it is manſlaughter. It is, however, the loweſt degree of it; and therefore in ſuch a caſe the court directed the burning in the hand to be gently inflicted, becauſe there could not be a greater provocation. Manſlaughter, therefore, on a ſudden provocation, differs from excuſable homicide *ſe defendendo* in this: That in one

caſe there is apparent neceſſity, for ſelf-preſervation, to kill the aggreſſor; in the other no neceſſity at all, being only a ſudden act of revenge.

2. The ſecond branch, or involuntary manſlaughter, differs alſo from homicide excuſable by miſadventure, in this: That miſadventure always happens in conſequence of a lawful act, but this ſpecies of manſlaughter in conſequence of an unlawful one. As if two perſons play at ſword and buckler, unleſs by the king's command, and one of them kills the other: this is manſlaughter, becauſe the original act was unlawful; but it is not murder, for the one had no intent to do the other any perſonal miſchief. So where a perſon does an act, lawful in itſelf, but in an unlawful manner, and without due caution and circumſpection; as when a workman flings down a ſtone or piece of timber into the ſtreet, and kills a man; this may be either miſadventure, manſlaughter, or murder according to the circumſtances under which the original act was done. If it were in a country village, where few paſſengers are, and he calls out to all people to have a care, it is miſadventure only: but if it were in London, or other populous towns, where people are continually paſſing, it is manſlaughter, though he gives loud warning; and murder, if he knows of their paſſing and gives no warning at all, for then it is malice againſt all mankind. And, in general, when an involuntary killing happens in conſequence of an unlawful act, it will be either murder or manſlaughter according to the nature of the act which occaſioned it. If it be in proſecution of a felonious intent, or in its conſequences naturally tending to bloodſhed, it will be murder; but if no more was intended than a mere civil treſpaſs, it will only amount to manſlaughter.

3. As to the puniſhment of this degree of homicide: The crime of manſlaughter amounts to felony, but within the benefit of clergy; and the offender ſhall be burnt in the hand, and forfeit all his goods and chattels.

But there is one ſpecies of manſlaughter, which is puniſhed as murder, the benefit of clergy being taken away from it by ſtatute; namely, the offence of mortally ſtabbing another, though done upon ſudden provocation. See STABBING.

MANSTEIN (Chriſtopher Herman of), was born at Peterſburgh, Sept. 1. 1711, and for a long time ſerved with great diſtinction as a colonel in the Ruſſian armies. In 1745 he went into the ſervice of the king of Pruſſia; was appointed major-general of infantry in 1754; and diſtinguiſhed himſelf on all occaſions by his bravery and his knowledge of the art of war. He was wounded at the battle of Kolin, and ſoon after killed near Leutmeritz. He was univerſally regretted by thoſe who knew him; and even the enemy ſhed tears upon the occaſion.—Thoſe leiſure moments which the laborious profeſſion of war allowed him to enjoy, Manſtein dedicated to ſtudy. He was acquainted with almoſt all the languages of Europe. From him we have Hiſtorical, Political, and Military Memoirs of (Ruſſia, Lyons, 1772), 2 vols, 8vo, with plans and charts. Theſe memoirs commence with the death of Catherine I. 1727, and end in 1744. He was an eyewitneſs, or had a very intimate knowlege, of all the events contained in them. A ſupplement is added, which goes back to the times of the ancient Czars, and in particular treats to a conſiderable length on Peter I. At the concluſion of the work, the author gives an idea of the military and naval force, of the trade, &c. of this extenſive empire. The facts contained in this little hiſtorical tract, are not more intereſting in themſelves than they are valuable on account of the candor of the hiſtorian, who witneſſed every event which he relates. Mr Hume having received the original French of theſe memoirs, cauſed them to be tranſlated into Engliſh, and publiſhed at London; ſoon after there appeared a German tranſlation of them, publiſhed at Hamburgh. A French edition was publiſhed by M. Huber at Leipſic in 1771; and there appeared a new and enlarged edition in 1782.

MANTA, in ichthyology; a flat fiſh mentioned by Ulloa and others, as exceedingly hurtful to the pearl-fiſhers, and which ſeems to be the ſame with that which Pliny has deſcribed under the name of *nubes* or *nebula*: *Ipſi ferunt* (Urinatores) *et nubem quandam craſſeſcere ſuper capita, planorum piſcium ſimilem, prementem eos, arcentemque a reciprocando et ob ſtilos præacutos lineis annexos habere ſeſe; quia in ſi perfoſſæ ita, non recedant caliginis et pavoris, ut arbitror, opere. Nubem enim ſive nebulam (cujus nomine id malum appellunt) inter animalia haud ullam reperit quiſquam.* (Plin. Hiſtor. Nat. lib. ix. cap. 46.) The account given of this *cloud* by thoſe divers is much the ſame with that which the divers in the American ſeas give of the manta, and the name of the cloud is perfectly applicable to it, as it really ſeems to be a cloud to thoſe who are in the water below it: the ſwimmers likewiſe carry long knives, or ſharp ſticks, for the purpoſe of diſperſing this animal. It is not improbable, that this fiſh has made its way into theſe ſeas from thoſe of the old world in the ſame manner as ſome others appear to have done. The ſtrength of this fiſh is ſo great, that it will not only ſtrangle a man whom it embraces or winds itſelf about, but it has even been ſeen to take the cable of an anchor and move it from the place where it had been caſt. It has been called *manta*, becauſe, when it lies ſtretched upon the ſea, as it frequently does, it ſeems like a fleece of wool floating upon the water.

MANTE, a conſiderable town of France, capital of the Mantois; ſeated on the river Seine, in E. Long. 1. 45. N. Lat. 48. 58.

MANTEGAR, or MAN-TIGER, as it is ſometimes written, in zoology, is the tufted ape, a ſpecies of ſimia. See SIMIA.

MANTEGNA (Andrew), was born in a village near Padua in 1451, and at firſt employed in keeping ſheep. It was obſerved, that inſtead of watching over his flock, he amuſed himſelf with drawing; and he was placed with a painter who, being delighted with his eaſe and taſte in work, and with his gentle and agreeable conduct in ſociety, adopted him for his ſon, and made him his heir. At the age of 17, Mantegna was employed to paint the altar of St Sophia in Padua, and the four evangeliſts. James Bellini, who admired his talents, gave him his daughter in marriage. Mantegna painted, for the duke of Mantua, the *Triumph of Cæſar*, which is the chef d'oeuvre of this painter, and has been engraved in claro-obſcuro, in nine plates. From reſpect to his extraordinary merit, the duke made him knight of his order. The invention of engraving prints with the graver is commonly aſcribed to Mantegna, who died at Mantua in 1517.

MANTELETS, in the art of war, a kind of moveable parapets, made of planks about three inches thick, nailed one over another, to the height of almoſt ſix feet, generally caſed with tin, and ſet upon little wheels, ſo that in a ſiege they may be driven before the pioneers, and ſerve as blinds to ſhelter them from the enemy's ſmall ſhot.

MANTICHORA, in natural hiſtory, a name given by the Roman authors to a fierce and terrible creature, which they deſcribe from the Greeks, who call it ſometimes alſo *mantichora*; but when they write more correctly, *martichora* and *martiora*. We have formed the name *man-tiger* on the ſound of the Roman name, tho' expreſſing a very different ſenſe; and our authors of the hiſtories of animals, figure to us under this name a terrible creature, partly from the accounts of Pliny exaggerated, and partly from their own imagination, with three rows of teeth, and with ſuch a ſhape as no animal ever poſſeſſed. See MANTEGAR.

The whole ſtory of this animal ſeems founded on the love of the wonderful; and very probably the *mantichora*, properly ſpeaking, was no other than ſome of the larger hyænas, which was at firſt ill-deſcribed, and afterwards more and more wonders were added to the ſtory, till all ſhadow of truth was loſt.

MANTINEA (anc. geog.), a town ſituated in the ſouth of Arcadia, on the confines of Laconia (Ptolemy); called afterwards *Antigonea*, in honour of king Antigonus. It is memorable for a battle fought in its neighbourhood between the Thebans and Spartans, in which fell the celebrated commander Epaminondas. See THEBES.

MANTIS, in zoology, a genus of inſects belongin to the order of hemiptera, the characters of which are theſe: The head is unſteady, or appears from its continual nodding motion to be ſlightly attached to the thorax: The mouth is armed with jaws, and furniſhed with filiform palpi: The antennæ are ſetaceous: The four wings are membranaceous, and wrapped round the body; the under ones folded: The anterior or firſt pair of feet are compreſſed, armed on the under ſide with teeth like a ſaw, and terminated by a ſingle nail or crotchet; the four hindermoſt are greſſorii, or formed rather for advancing ſlowly than for performing quick movements: The thorax is extended to a conſiderable length, narrow, and throughout of equal ſize. The name *montis*, given to this genus, denotes *ſoothſayer*; becauſe it has been imagined, that this inſect, by ſtretching out its fore feet, divined and pointed out thoſe things that were aſked of it. The inſect often reſts on its four hinder legs only, and holding the two fore ones raiſed up, joins them together, which has occaſioned its being called by the people of Languedoc, where it is very common, *pregadiou*, as if it prayed to God. The country folks moreover maintain, that this creature ſhows the way when aſked, becauſe it ſtretches thoſe ſame fore legs ſometimes to the right and ſometimes to the left: and indeed it is looked upon as an inſect almoſt ſacred, that muſt not be hurt. Its colour is all over of a browniſh green. The young ones have more of the green, the old more of the brown, caſt. It depoſits its eggs collected into a hemiſpherical parcel, flat on one ſide. There are in the parcel two rows of oblong eggs placed tranſverſely, and one row of ſhells placed longitudinally, in form of a roof, one over the other, which cover the joining of the two rows of eggs. The whole parcel is light, and as it were compoſed of very thin parchment.

Barbut's Inſects, p. 106.

There are 53 ſpecies of this genus. In plate CCLXXIX is repreſented the gongylodes, the ſhape of which is extraordinary, being narrow and long. The head is ſmall, flat, with two filiform ſhort antennæ. On the ſides of the head are ſituated two large poliſhed eyes. The thorax is ſubciliated, long, narrow, margined, with a longitudinal riſing in the middle, and a tranſverſe depreſſion at one-third of its length. The elytra, which cover two thirds of the inſect, are veined, reticulated, croſſed one over the other, and cover the wings, which are veined, and diaphanous. The hinder legs are very long, the middle ones ſhorter; and the foremoſt pair of thighs are terminated with ſpines, the reſt winged, as it were, with membranaceous lobes. The top of the head has the ſhape of an awl; is membranaceous, often ſplit in two at the extremity. It is an inhabitant of China.

The inſects belonging to this genus, in their moſt perfect ſtate, are generally of very beautiful green colours, which ſoon fade, and become the colour of dead leaves. Their elytra bearing ſo ſtrong a reſemblance to the leaves of ſome plants, have procured them the name of *walking leaves*.

MANTLE, or *MANTLE-Tree*, in architecture, the lower part of the chimney, or that piece of timber which is laid acroſs the jaumbs, and ſuſtains the compartments of the chimney-piece.

MANTLE, or *Mantling*, in heraldry, that appearance of folding of cloth, flouriſhing, or drapery, which in any atchievement is drawn about a coat of arms. See HERALDRY, p. 464. Sect. V.

MANTO, in poetic hiſtory, the daughter of Tireſias, and like her father ſtrongly inſpired with prophecy. She was in ſo great eſteem, that when the Argives pillaged Thebes, they thought they could not acquit their vow to Apollo, of conſecrating to him the moſt precious thing in their plunder, without offering him this young woman. She was therefore ſent to the temple of Delphi. But this did not engage her in any vow of continency; or, if it did, ſhe obſerved it very ill: for ſhe bore a ſon called *Amphilocus* to Alcmeon, who had been generaliſſimo of the army which took Thebes; and a daughter to the ſame, named *Tiſiphone*. Theſe children were the fruits of an amour carried on during the madneſs which had ſeized Alcmeon, after he had put his mother to death. Virgil tranſports her into Italy, not for the ſake of ſecuring her virginity, but to produce a ſon of her who built Mantua.

MANTUA, anciently a town of the Tranſpadana in Italy, ſituated on the Mincius, a river running from the Lacus Benacus. It is ſaid to have been founded about 300 years before Rome by Bianor or Ocnus, the ſon of Manto; and was the ancient capital of Etruria. When Cremona, which had followed the intereſt of Brutus, was given to the ſoldiers of Octavius, Mantua alſo, which was in the neighbourhood, ſhared the common calamity, and many of the inhabitants were tyrannically deprived of their poſſeſſions. Virgil, who was among them and a native of the town, applied for redreſs to Auguſtus, and obtained it by means of his poetical talents.

It is ſtill called Mantua, and is the capital of the duchy of that name. It is now a large place, having eight gates and about 16,000 inhabitants. The ſtreets are broad and ſtraight, and the houſes well built. It is very ſtrong by ſituation as well as by art; lying in the middle of a lake, or rather moraſs, formed by the river Minchio. There is no acceſs to the city but by two cauſeways which croſs this moraſs, and which are ſtrongly fortified: ſo that the city is looked upon to be one of the moſt conſiderable fortreſſes of Europe; and the allies in 1745, though their army was in the duchy, durſt not undertake the ſiege. It was greatly noted for its ſilk-manufactures, which are now much decayed. The air in the ſummer-time is very unwholeſome. The celebrated poet Virgil was born at a village near this city. E. Long. 10. 47. N. Lat. 45. 10.

Mantua, the duchy of, a country of Italy, lying along the river Po, which divides it into two parts. It is bounded on the north by the Veroneſe; on the ſouth by the duchies of Reggio, Modena, and Mirandola; on the eaſt by the Ferrareſe; and on the weſt by the Cremoneſe. It is about 50 miles in length, and 25 in breadth; is fruitful in corn, paſtures, flax, fruits, and excellent wine. Charles IV. the laſt duke of Mantua, being a vaſſal of the empire, took part with the French in the diſpute relating to the ſucceſſion of Spain; for which reaſon he was put under the ban of the empire, and died at Venice in 1708. He having no heirs, the emperor kept the Mantuan in his own hands, and the duke of Savoy had Montferrat, which were confirmed to them by ſubſequent treaties. After the death of the emperor in 1740, his eldeſt daughter, now empreſs-queen, kept poſſeſſion of the Mantuan; and the governor of the Milaneſe had the adminiſtration of affairs. The Mantuan comprehends the duchies of Mantua, Guaſtalla, and Sabioneta; the principalities of Caſtiglione, Solforino, and Boſolo; likewiſe the county of Novellara. The principal rivers are the Po, the Oglio, and the Minchio; and the principal town is Mantua.

MANTUAN (Baptiſt), a famous Italian poet, born at Mantua in 1448. He took his name from the town; not having a right to that of his father, as being a natural ſon. In his youth, he applied himſelf to Latin poetry, which he cultivated all his life; for it does not appear that he wrote any thing in Italian. He entered among the Carmelites, and became general of the order; though he quitted that dignity upon ſome diſguſt in 1515, and died the year following. The duke of Mantua, ſome years after, erected a marble ſtatue to his memory crowned with laurel, and placed it next to Virgil. His works were collected and publiſhed at Paris in three volumes folio in 1513, with the commentaries of St. Murrhon, S. Brant, and I. Badius.

MANUAL, a word ſignifying any thing performed by the hand.

Manual *(manualis)*, in law, ſignifies what is employed or uſed by the hand, and whereof a preſent profit may be made: as ſuch a thing in the manual occupation of one is where it is actually uſed or employed by him.

Manual is the name of a ſervice-book uſed in the church of Rome, containing the rites, directions to the prieſts, and prayers uſed in the adminiſtration of baptiſm and other ſacraments; the form of bleſſing holy water, and the whole ſervice uſed in proceſſions.

Manual Exerciſe, in the army, conſiſts in the obſervance of certain words of command appointed for this purpoſe. When a regiment is drawn up, or paraded for exerciſe, the men are placed three deep, either by companies, or divided into platoons, with the grenadiers on the right. When ſoldiers are drawn up for exerciſe, the ranks and files ſhould be exactly even; and each ſoldier ſhould be inſtructed to carry his arms well, to keep his firelock ſteady and even upon his ſhoulder, with the right hand hanging down, and the whole body without conſtraint. The diſtances between the files muſt be equal, and the ranks eight feet diſtant from each other. Every motion ſhould be performed with life, and the greateſt exactneſs obſerved in all firings, wheelings, and marching; and therefore a regiment ſhould never be under arms longer than two hours.

The following is an abſtract of the words of command at the manual exerciſe, with their explanations. 1. *Poiſe your firelock:* i. e. Seize the firelock with your right hand, and turn the lock outwards, keeping the firelock perpendicular; then bring up the firelock with a quick motion from the ſhoulder, and ſeize it with the left hand, juſt above the lock, ſo that the fingers may lie upon the ſtock, with the elbows down, and the thumb upon the ſtock; the firelock muſt not be held too far from the body, and the left-hand muſt be of an equal height with the eyes. 2. *Cock your firelock:* i. e. Turn the barrel oppoſite to your face, and place your thumb upon the cock, raiſing your elbow ſquare at this motion; then cock your firelock, by drawing your elbow down, placing your right-thumb on the breech-pin, and the fingers under the guard. 3. *Preſent:* i. e. Step back about ſix inches to the rear with the right-foot, bringing the left-toe to the front; at the ſame time the butt-end of the firelock muſt be brought to an equal height with the ſhoulder, placing the left-hand on the ſwell, and the fore-finger of the right-hand before the trigger, ſinking the muzzle a little. 4. *Fire:* i. e. Pull the trigger briſkly, and immediately after, bringing up the right-foot to the inſide of the left, come to the priming poſition, with the lock oppoſite to the right-breaſt, the muzzle to the height of the hat, keeping it firm and ſteady; and at the ſame time ſeize the cock with the fore-finger and thumb of the right hand, the back of the hand being turned up. 5. *Half-cock your firelock:* i. e. Half-bend the cock briſkly with a draw back of the right-elbow, bringing it cloſe to the butt of the fire-lock. 6. *Handle your cartridge:* i. e. Bring your right-hand with a ſhort round to your pouch, ſlapping it hard; ſeize the cartridge, and bring it with a quick motion to your mouth; bite the top well off, and bring the hand as low as the chin, with the elbow down. 7. *Prime:* i. e. Shake the powder into the pan, placing the three laſt fingers behind the rammer, with the elbow up. 8. *Shut your pans:* i. e. Shut your pans briſkly, drawing your right-arm at this motion towards your body, holding the cartridge faſt in your hand, as before; then turn the piece nimbly round to the loading poſition, with the lock to the front, and the muzzle to the height of the chin, bringing the right hand behind the muzzle, with both feet kept faſt in this motion. 9. *Charge with cartridge:* i. e. Turn up your hand, and put the cartridge into the muzzle, ſhaking the powder into the barrel; place your hand, cloſed, with a quick and ſtrong motion, upon the rammer. 10. *Draw your rammer:* i. e. Draw the rammer with a quick motion half out, ſeizing it at the muzzle back-handed; draw it quite out, turn it, and enter it into the muzzle. 11. *Ram down your charge:* i. e. Ram the cartridge well down in the barrel, inſtantly recovering and ſeizing the rammer back-handed at the centre, turning it, and entering it as far as the lower pipe, placing at the ſame time the edge of the hand on the butt end of the rammer, with fingers extended. 12. *Return your rammer:* i. e. Return the rammer, bringing up the piece with the left-hand to the ſhoulder, ſeizing it with the right-hand under the cock, keeping the left-hand faſt at the ſwell, turning the body ſquare to the front. 13. *Shoulder your firelock:* i. e. Quit the left-hand, and place it ſtrong upon the butt; quit the right hand, and throw it down the right-ſide. 14. *Reſt your firelock:* i. e. Seize the firelock with the right-hand, turning the lock outwards; raiſe the firelock from the ſhoulder, and place your left-hand with a quick motion above the lock, holding the piece right up and down in both hands before you, and your left-hand even with your eyes; ſtep briſkly back with your right-foot, placing it a hand's-breadth diſtance from your left-heel, and at the ſame time bring down your firelock as quick as poſſible to the reſt, ſinking it as far down before your left-hand as your right-hand will permit without conſtraint; your left hand being at the feather-ſpring, and your right, with fingers extended, held under the guard, taking care to draw in the muzzle well towards your body, and to dreſs in a line with the butt-end. 15. *Order your firelock:* i. e. Place your firelock nimbly with your left-hand againſt your right-ſhoulder; quit the firelock with the right-hand, ſinking it at the ſame time with your left; ſeize it at the muzzle, which muſt be of an equal height with your chin, and hold it cloſe againſt your right-ſide; lift up your right-foot, and place it by your left; at the ſame time throw back your left-hand by your left-ſide, and with your right bring down the butt-end ſtrong upon the ground, placing it even with the toe of your right-foot; the thumb of your right-hand lying along the barrel, and the muzzle kept at a little diſtance from your body. 16. *Ground your firelock:* i. e. Half-face to the right upon your heels, and at the ſame time turn the firelock, ſo that the lock may point to the rear, and the flat of the butt-end lie againſt the inſide of your foot; at the ſame time ſlipping the right-foot behind the butt of the firelock, the right-toe pointing to the right, and the left to the front: ſtep directly forward with your left-foot, about as far as the ſwell of the firelock, and lay it upon the ground, your left-hand hanging down by your left-leg, and your right kept faſt, with the butt-end againſt it; raiſe yourſelf up again nimbly, bringing back your left-foot to its former poſition, keeping your body faced to the right; face again to the left upon your heels, and come to your proper front, letting your hands hang down without motion. 17. *Take up your firelock:* i. e. Face to the right upon both heels; ſink your body down, and come to the poſition deſcribed in the ſecond motion of grounding; raiſe yourſelf and firelock, bringing it cloſe to your right ſide; come to your proper front, ſeizing your firelock at the muzzle, as in explanation 15. 18. *Reſt your firelock:* i. e. Bring your right-hand as far as the ſwell; raiſe the firelock high up in a perpendicular line from the ground with your right-hand, and ſeize it with your left above the ſpring, the cock being at the height of the waiſt-belt; ſtep back with your right-foot, placing it behind your left-heel, and come to the reſt. 19. *Shoulder your firelock:* i. e. Lift up your right-foot, and place it by your left; bring the firelock at the ſame time to your left-ſhoulder, and ſeize the butt-end with the left-hand, keeping it in the ſame poſition as above deſcribed; throw your right-hand briſkly back. 28. *Secure your firelock:* i. e. Bring the right-hand briſkly up, and place it under the cock, keeping the firelock ſteady in the ſame poſition; quit the butt with the left-hand, and ſeize the firelock with it at the ſwell, bringing the elbow cloſe down upon the lock; the right-hand being kept faſt in this motion, and the piece ſtill upright; quit the right-hand, and bring it down your right-ſide, bringing the firelock nimbly down to the ſecure; the left-hand in a line with the waiſt-belt. 21. *Shoulder your firelock:* i. e. Bring the firelock up to a perpendicular line, ſeizing it with the right-hand under the cock; quit the left-hand, and place it ſtrong upon the butt; quit the right hand, and bring it ſmartly down the right-ſide. 22. *Fix your bayonet:* i. e. Firſt and ſecond motions, as in the two firſt of the ſecure; quit the right-hand, and bring the firelock ſmartly down to the left-ſide with the left-hand, as far as it will admit without conſtraint, ſeizing the bayonet at the ſame time with the right-hand, and fixing it, placing that hand juſt below the braſs, with the piece kept cloſe to the hollow of the ſhoulder. 23. *Shoulder your firelock:* i. e. Quit the right-hand, and bring up the firelock with the left; ſeize it again under the cock with your right, as in the ſecond motion of the ſecure; quit the left-hand, and place it ſtrong upon the butt; quit the right-hand, and bring it down the right ſide. 24. *Preſent your arms;* i. e. as explained in three motions of the 14th word of command. 25. *To the right face:* i. e. Bring up the firelock with a quick motion high before you, till your left-hand comes even with your eyes, with the fingers of that hand extended along the ſtock, juſt above the feather-ſpring, the right-foot to be brought cloſe up to the left-heel in this motion; face to the right, taking care in facing to hold the firelock right up and down, and ſteady in your hands; ſtep back with your right-foot, and come down to your *preſent*, as in the foregoing explanation. 26. *To the right face;* i. e. as in the foregoing explanation, facing to the right. 27. *To the right-about face;* i. e. as in the 25th explanation, only coming to the right-about inſtead of to the right. 28. *To the left face:* i. e. Bring the right-foot briſkly to the hollow of your left, with the firelock in the ſame poſition as in the firſt motion of *facing to the right;* face to the left; come down to the *preſent*, as before. 29. *To the left face;* i. e. as in the foregoing explanation. 30. *To the left-about face;* i. e. as before, coming to the left-about inſtead of to the left. 31. *Shoulder your firelock;* i. e. as in the two motions of the 19th explanation. 32. *Charge your bayonet;* i. e. as in the firſt explanation: bring the ſwell of the firelock down ſtrong upon the palm of the hand, graſping the piece at the ſmall, behind the lock, and as high as the waiſt-belt; the firelock upon a level with the barrel upwards. 33. *Shoulder your firelock:* i. e. Bring up the firelock to the ſhoulder, place the left-hand upon the butt, bringing the feet ſquare to the front; quit the right-hand, and throw it down the right ſide. 34. *Advance your arms;* i. e. firſt and ſecond motions, as in the firſt explanation: bring the firelock down the right-ſide, with the right-hand as low as it will admit without conſtraint, ſlipping up the left-hand at the ſame time to the ſwell, the guard between the thumb and fore-finger of the right-hand, the three laſt fingers under the cock, with the barrel to the rear; quit the left-hand. 35. *Shoulder your firelock;* i. e. bring up the left-hand, and ſeize it at the ſwell; come ſmartly up to the poiſe; ſhoulder. 36. *Prime and load:* i. e. Come ſmartly to the *recover*, by ſpringing the firelock ſtraight up with the left-hand, turning the barrel inwards to the proper height of the recover: at the ſame time that the left-hand ſprings the firelock, the right-hand is raiſed briſkly from the right-ſide, and ſeizes the firelock acroſs the breaſt: as it riſes below the cock, the left-hand comes with a quick motion from the butt, and ſeizes the firelock ſtrong above the lock, the little finger of the left-hand at the ſpring of the lock, the left-hand at an equal height with the face, the butt cloſe to the body, but not preſſed, the firelock perpendicular oppoſite the left-ſide of the face: bring the firelock down with a briſk motion to the priming poſition, the left-hand holding the firelock, as in priming; the thumb of the right-hand placed againſt the face of the ſteel, the fingers clinched, and the elbow a little turned out, that the wriſt may be clear of the cock: open the pan, by throwing up the ſteel with a ſtrong motion of the right arm, turning the elbow in, and keeping the firelock ſteady in the left-hand; handle your cartridge, prime, ſhut your pan, caſt about, load, draw rammers, ram down the cartridge, return the rammers, ſhoulder. N. B. The motion of recover, and coming down to the priming poſition and opening pans, are to be done in the uſual time. The motions of handling cartridge to ſhutting the pans, are to be done as quick as poſſible: when the pans are ſhut, a ſmall pauſe is to be made, and then caſt about together; then the loading motions are to be done as quick as poſſible; but before the rammer is returned, another ſmall pauſe is to be made, counting 1, 2, between each motion, till the firelock is ſhouldered.—*Front rank, make ready:* i. e. Spring the firelock briſkly to the *recover*, keeping the left-foot faſt in this motion; as ſoon as the firelock is at the *recover*, without any ſtop, ſink the body briſkly without ſtooping forward, with a quick motion down upon the right-knee; the butt-end of the firelock at the ſame time falls upon the ground, the front part of the butt being in a line with the heel of the left-foot. As ſoon as the butt comes to the ground, the firelock is to be cocked, immediately ſeizing the cock and ſteel in the right-hand; the firelock to be held firm in the left-hand, about the middle of that part of the firelock between the lock and the ſwell of the ſtock; the point of the left-thumb to be cloſe to the ſwell, pointing upwards. As the body is ſinking, the right-knee is to be thrown as far back as the left-leg may be right up and down; the right foot to be thrown a little to the right; the body to be kept ſtraight; the head up, looking to the right along the rank, the ſame as if ſhouldered; the firelocks to be upright, and the butt about four inches to the right of the inſide of the left-foot. *Preſent:* i. e. Bring the firelock briſkly down to the *preſent*, by extending the left-arm to the full length with a ſtrong motion; at the ſame time ſpring up the butt by the cock with the right-hand, and raiſe the butt ſo high upon the right-ſhoulder, that you may not be obliged to ſtoop too much with the head; the right-cheek to be cloſe to the butt, and the left-eye ſhut, and look along the barrel with the right-eye from the breech-pin to the muzzle; keep the left-elbow down in an eaſy poſition, and ſtand as ſteady as poſſible; the thumb of the right-hand to remain in the poſition as deſcribed in the third explanation of the manual. *Fire:* i. e. Pull the trigger as directed in the manual; and as ſoon as the piece is fired, give yourſelf a ſtrong ſpring upon your left-leg, raiſing your body briſkly, and ſtraight up, keeping your left-foot faſt, and bringing the right-heel to the inſide of the left; at the ſame time the firelock is to be brought up to the priming-poſition, and half-cocked immediately: a ſhort pauſe is to be made; then handle cartridge, and go on with the loading motions deſcribed in the explanation of *prime and load.*—*Centre rank, make ready:* i. e. Spring the firelock briſkly to the recover; ſo ſoon as the left-hand ſeizes the firelock above the lock, the right-elbow is to be nimbly raiſed a little, placing the thumb of that hand upon the cock; the fingers open by the plate of the lock, and as quick as poſſible force the piece to the cock, by dropping the elbow, and forcing down the cock with the thumb, ſtepping at the ſame time a moderate pace to the right, keeping the left foot faſt; as the firelock is cocked, the thumb is to fall below the cock, the right-hand ſeizing the firelock cloſe under the cock firmly, the fore-finger not to be before the trigger; the piece to be held in this poſition perpendicular, oppoſite the left-ſide of the face, the butt cloſe to the left-breaſt, but not preſſed; the body to be ſtraight, and as full to the front as poſſible; the head kept up, looking to the right of the rank, that the body and the firelock may not ſtoop forward, nor lean much out of the rank. *Preſent:* i. e. Spring the firelock from the body to the arm's length with a quick motion, preſſing down the muzzle with the left-hand, and ſpring up the butt with the right-hand, as in the foregoing explanation of the *front-rank. Fire.* As in explanation 4, in the manual, with this difference, that the left-foot is to be brought up to the right, at the ſame time that the firelock is brought down to the priming poſition. The loading motions as in the explanations of priming and loading; and at the laſt motion of ſhouldering, to ſpring to the left again, and cover the file-leaders.—*Rear rank, make ready:* i. e. Recover the firelock, and cock as before directed for the centre-rank; as the firelock is recovered and cocked, ſtep briſkly ſtraight to the right, with the right-foot,

foot, a full pace; bring the left-heel about ſix inches before the right-foot; the body ſtraight, and as ſquare to the front as poſſible, as in the explanation of the *centre-rank*. *Preſent:* As in explanation *preſent*, before. *Fire:* As in explanation of the *centre rank;* and as the firelock is coming down to the priming poſition, the left is to be brought back to the right; and at the laſt motion of ſhouldering, to ſpring to the left again, and cover the file-leader.

There are ſome peculiar words of command at the manual exerciſe of the grenadiers, when apart from the battalion; and alſo for the cavalry and artillery.

MANUDUCTOR, a name given to an ancient officer in the church; who, from the middle of the choir, where he was placed, gave the ſignal for the choiriſters to ſing, and marked the meaſure, beat time, and regulated the muſic. The Greeks called him *meſuchoros*, becauſe ſeated in the middle of the choir: but in the Latin church he was called *manuductor;* from *manus* and *duco*, "I lead;" becauſe he led and guided the choir by the motions and geſture of the hand.

MANUFACTURE, a commodity produced from raw or natural materials, either by the work of the hand or by machinery.

MANUFACTURER, one who works up a natural product into an artificial commodity.

MANUMISSION, an act whereby a ſlave or villain is ſet at liberty, or let out of bondage. The word comes from the Latin *manus*, "hand;" and *mittere*, "to ſend;" *quia ſervus mittebatur extra manum ſeu poteſtatem domini ſui.* Some authors define manumiſſion an act by which a lord enfranchiſes his tenants, who till that time had been his vaſſals, and in a ſtate of ſlavery inconſiſtent with the ſanctity of the Chriſtian faith.

Among the Romans, the manumiſſion of ſlaves was performed three ſeveral ways. 1. When, with his maſter's conſent, a ſlave had his name entered in the cenſus or public regiſter of the citizens. 2. When the ſlave was led before the prætor, and that magiſtrate laid his wand called *vindicta* on his head. 3. When the maſter gave the ſlave his freedom by his teſtament. Servius Tullus is ſaid to have ſet on foot the firſt manner; and P. Valerius Publicola the ſecond. A particular account is given of the third in the Inſtitutes of Juſtinian. It was not neceſſary that the prætor ſhould be on his tribunal to perform the ceremony of manumiſſion: he did it any where indifferently, in his houſe, in the ſtreet, in going to bathe, &c. He laid the rod on the ſlave's head, pronouncing theſe words, *Dico eum liberum eſſe more Quiritum*, "I declare him a freeman, after the manner of the Romans." This done, he gave the rod to the lictor, who ſtruck the ſlave with it on the head, and afterwards with his hand on his face and back; and the notary or ſcribe entered the name of the new-freed man in the regiſter, with the reaſons of his manumiſſion. The ſlave had likewiſe his head ſhaved, and a cup given him by his maſter as a token of freedom. Tertullian adds, that he had then alſo a third name given him: if this were ſo, three names were not a token of nobility, but of freedom. The emperor Conſtantine ordered the manumiſſions at Rome to be performed in the churches.

Of manumiſſion there have alſo been various forms in England. In the time of the Conqueror, villains were manumitted, by the maſter's delivering them by the right hand to the viſcount, in full court, ſhowing them the door, giving them a lance and a ſword, and proclaiming them free. Others were manumitted by charter. There was alſo an implicit manumiſſion; as when the lord made an obligation for payment of money to the bondman at a certain day, or ſued him where he might enter without ſuit, and the like.

MANURE, any thing uſed for fattening and improving land. See AGRICULTURE, Part I. Sect. I. II. and III.

MANUSCRIPT, a book or paper *written with the hand;* by which it ſtands oppoſed to a *printed* book or paper. A manuſcript is uſually denoted by the two letters MS. and in the plural by MSS. What makes public libraries valuable is the number of ancient manuſcripts repoſited in them; ſee ALEXANDRIAN, CAMBRIDGE, CLERMONT, COTTONIAN, HARLEIAN, VATICAN, &c.

MANUTIUS (Aldus), the firſt of thoſe celebrated Venetian printers who were as illuſtrious for their learning as for uncommon ſkill in their profeſſion. He was born at Baſſano in Italy about the middle of the 15th century; and hence is ſometimes called *Baſſianus*, though generally better known by the name of *Aldus*. He was the firſt who printed Greek neatly and correctly; and acquired ſo much reputation by it, that whatever was finely printed was proverbially ſaid to have "come from the preſs of Aldus." We have a kind of Greek grammar of his; with Notes upon Homer, Horace, &c. He died at Venice, where he exerciſed his profeſſion, in 1516.

MANUTIUS (Paulus), ſon of the former, was brought up to his father's profeſſion. He was more learned than him; and he acquired, by continual reading of Tully, ſuch a purity in writing Latin, that even Scaliger allows a Roman could not exceed. Pope Pius IV. placed him at the head of the apoſtolical preſs, and gave him the charge of the Vatican library. His Epiſtles are infinitely laboured, and very correct; but, as may be ſaid of moſt of the Ciceronians, they contain ſcarcely any thing but mere words. This conſtant reading of Tully, however, together with his profound knowledge of antiquity, qualified him extremely well for an editor of Tully; whoſe works he accordingly publiſhed, with Commentaries on them, in 4 vols folio, at Venice in 1523. He died in 1574.

MANUTIUS (Aldus), the Younger, the ſon of Paulus, and the grandſon of Aldus, was eſteemed one of the greateſt geniuſes and moſt learned men of his time. Clement VIII. gave him the direction of the Vatican printing-houſe; but probably the profits of that place were very ſmall, ſince Manutius was obliged, for his ſubſiſtence, to accept of a profeſſor of rhetoric's chair, and to ſell the excellent library that was in his family, which his father, his uncle, and his great-uncle, had collected with extraordinary care, and which it is ſaid contained 80,000 volumes. He died at Rome in 1597, without any other recompenſe than the praiſes due to his merit. He wrote, 1. Commentaries on Cicero. 2. A treatiſe on orthography. 3. Three books of epiſtles; and other works in Latin and Italian, which are eſteemed.

MAON (anc. geog.), a town of the tribe of Judah, to the ſouth-eaſt, towards the Dead Sea. It gave name to the *wilderneſs of Maon*, 1 Sam. xxii.

MAP, a plain figure, repreſenting the ſurface of the earth, or a part thereof, according to the laws of perſpective. See GEOGRAPHY, n° 63—73.

MAPLE. See ACER.

MAPLE-Sugar. See SUGAR.

MAPLETOFT (Dr John), deſcended from a good family in Huntingdonſhire, was born in 1631. He was educated in Trinity-college, Cambridge, and qualified himſelf for the profeſſion of phyſic; and in 1675 was choſen profeſſor of that art at Greſham college. He tranſlated Dr Sydenham's *Obſervationes Medicæ circa morborum acutorum hiſtoriam et curationem* into the Latin, and Sydenham dedicated them to Mapletoft. He married in 1679, and ſoon after transferred his ſtudies from phyſic to divinity; took orders; obtained the vicarage of St Laurence Jewry, with the lectureſhip of St Chriſtopher's in London; and having been a benefactor to Sion college, was, in 1707, elected preſident. He continued to preach in his church of St Laurence Jewry till he was above 80 years of age; and in his decline printed a book intitled *The principles and duties of the Chriſtian religion*, &c. 8vo. 1710, a copy of which he ſent to every houſe in his pariſh. He was a polite ſcholar; and beſides ſome other pieces on moral and theological ſubjects, there are in the Appendix to Ward's Lives of the profeſſors of Greſham-college, three Latin lectures read there by him, on the origin of the art of medicine, and the hiſtory of its invention.

MAPPA, in the public games of the Roman circus, was a napkin hung out at the prætor's or other great magiſtrate's ſeat, as a ſignal for the race or other diverſions to begin. The mappa was received by the mapparius, or perſon who held it, from the conſul, prætor, or other great officer. Notice was anciently given by ſound of trumpet; but Nero is ſaid to have introduced the mappa, by throwing his napkin out of the window to ſatisfy the people, who grew noiſy at the delay of the ſports while he was at dinner.

MAPPARIUS, in Roman antiquity, the officer who gave the ſignal to the gladiators to begin fighting; which he did by throwing an handkerchief that he had received from the emperor or other magiſtrate.

MARACANDA (anc. geog.), capital of the Sogdiana. Now thought to be *Samarcand*, a city of Uſbec Tartary in Aſia, the country and royal reſidence of Tamerlane. See SAMARCAND.

MARACAYBO, a rich and conſiderable town of South America, and capital of the province of Venezuela, ſeated near a lake of the ſame name. It carries on a great trade in ſkins and chocolate, which is the beſt in America; and they have likewiſe very fine tobacco. It was taken by the French bucaneers in 1666 and 1678. W. Long. 70. 45. N. Lat. 10. 0.

MARACAYBO, a lake in South America, 200 miles long and 100 broad, which diſcharges itſelf by a river into the North Sea. It is well defended by ſtrong forts; which, however, did not hinder Sir Henry Morgan, a bucaneer, from entering it, and plundering ſeveral Spaniſh towns on the coaſt, after defeating a ſquadron ſent out againſt him.

MARAGNAN, a province of Brazil in South America, which comprehends a fertile populous iſland, 112 miles in circumference. The French ſettled here in 1612, and built a town; but they were ſoon driven from thence by the Portugueſe, who have poſſeſſed it ever ſince. The town is little, but ſtrong; and has a caſtle, a harbour, and a biſhop's ſee. The climate is very agreeable and wholeſome, and the ſoil produces plenty of all the neceſſaries of life. W. Long. 54. 35. S. Lat. 2. 0.

MARALDI (James Philip), a learned mathematician and aſtronomer, of the academy of ſciences at Paris, was born in 1665. He was the ſon of Francis Maraldi and Angela Catharine Caſini, the ſiſter of the famous aſtronomer of that name. His uncle made him go to France in 1687, where he acquired great reputation on account of his learning and obſervations. He made a catalogue of the fixed ſtars, which is more particular and exact than Bayer's; and has given a great number of curious and intereſting obſervations in the memoirs of the academy; in particular, thoſe on bees and petrifactions have been univerſally applauded. He died in 1729.

MARANA (John Paul), an ingenious writer of the 17th century, was of a diſtinguiſhed family, and born at Genoa; where he received an education ſuitable to his birth, and made a great progreſs in the ſtudy of polite literature and the ſciences. Having been engaged in the conſpiracy of Raphael della Terra, to deliver up Genoa to the duke of Savoy, he was in 1670, when 28 years of age, impriſoned in the tower of that city, and remained there four years. Being at length ſet at liberty, he was ordered to write the hiſtory of that conſpiracy; but, when finiſhed, it was ſeized and prevented from being publiſhed. When the republic of Genoa was at variance with the court of France, Marana, who had always an inclination for that court, was afraid of being impriſoned a ſecond time; and retired to Monaco, where he again wrote the hiſtory of the conſpiracy in Italian; and, in 1682, went to Lyons to get it printed. From Lyons he went to Paris, where his merit ſoon acquired him powerful protectors. He ſpent the reſt of his life in a happy and tranquil mediocrity, devoted to ſtudy and the ſociety of men of learning; and died in 1693. His hiſtory of the conſpiracy contains many curious and intereſting anecdotes, which are nowhere elſe to be found. He alſo wrote ſeveral other works; the moſt known of which is the Turkiſh Spy, in 6 vols 12mo, which was in 1742 augmented to ſeven. Of this ingenious work we have an excellent Engliſh tranſlation.

MARANO, a town of Italy, in the territory of Venice and province of Friuli, with a ſtrong citadel; ſeated in a marſh at the bottom of the Gulph of Venice, which renders it difficult of acceſs.

MARANS, a rich town of France, in the territory of Aunis and dioceſe of Rochelle, ſeated among ſalt marſhes, near the river Sevre, three miles from the ſea. It carries on a very great trade in corn; and is ſeated in W. Long. 0. 55. N. Lat. 46. 20.

MARANTA, INDIAN ARROW-ROOT: A genus of the monogynia order, belonging to the monandria claſs of plants; and in the natural method ranking under the eighth order, *Scitamineæ*. The corolla is ringent and quinquefid, with two ſegments alternately patent. There are three ſpecies, the arundinacea, galanga, and comoſa, all of them herbaceous perennial exotics of the Indies, kept here in hot-houſes for curioſity: they have thick, knotty, creeping roots, crowned with long, broad, arundinaceous leaves, ending in points, and upright ſtalks, half a yard high, terminated by bunches of monopetalous, ringent, five-parted flowers. They are propagated by parting the roots in ſpring, and planting them in pots of light rich earth, and then plunging them in the bark-bed. The root of the galanga is uſed by the Indians to extract the virus communicated by their poiſoned arrows; from whence it has derived its name of *arrow root.* The arundinacea, or ſtarch plant, riſes to two feet, has broad pointed leaves, ſmall white flowers, and one ſeed. It is cultivated in gardens and in proviſion-grounds in the Weſt Indies; and the ſtarch is obtained from it by the following proceſs deſcribed by Dr Wright. "The roots when a year old are dug up, well waſhed in water, and then beaten in large deep wooden mortars to a pulp. This is thrown into a large tub of clean water. The whole is then well ſtirred, and the fibrous part wrung out by the hands, and thrown away. The milky liquor being paſſed through a hair ſieve, or coarſe cloth, is ſuffered to ſettle, and the clear water is drained off. At the bottom of the veſſel is a white maſs, which is again mixed with clean water and drained: laſtly, the maſs is dried on ſheets in the ſun, and is pure ſtarch."—A decoction of the freſh roots (the Doctor informs us) makes an excellent ptiſan in acute diſeaſes.

MARASMUS, among phyſicians, denotes an atrophy or conſumption in its laſt and moſt deplorable ſtage.

MARATHON (anc. geog.), one of the demi or hamlets of Attica; about 10 miles to the north-eaſt of Athens, towards Bœotia, near the ſea. It ſtill retains its ancient name (Dr Chandler informs us); but is very inconſiderable, conſiſting only of a few houſes and gardens. The plain of Marathon, famous for Miltiades's victory over the Perſians, by which the liberties of Athens and other cities of Greece were ſaved, is long and narrow, but conſiſting chiefly of level ground, and therefore admitting the operations of cavalry, which formed the main ſtrength of the barbarian army, and with which the Greeks were very poorly provided. Here the Perſians, under the command of Datis, pitched their camp, by the advice of Hippias the baniſhed king of Athens, whoſe ſolicitations and intrigues had promoted the expedition, and whoſe perfect knowledge of the country, and intimate acquaintance with the affairs of Greece, rendered his opinion on all occaſions reſpectable. The Perſian army is ſaid to have conſiſted of 100,000 infantry, and 10,000 horſe.—Athens was in the utmoſt conſternation and diſmay. She had, upon the firſt appearance of the Perſian fleet, ſent to implore aſſiſtance from the other nations of Greece; but ſome had ſubmitted to Darius, and others trembled at the very name of the Medes or Perſians. The Lacedæmonians alone promiſed troops; but various obſtacles did not allow them immediately to form a junction with thoſe of Athens. This city therefore could only rely on its own ſtrength; and happily at this moment there appeared three men deſtined to give new energy to the ſtate. Theſe were Miltiades, Ariſtides, and Themiſtocles; whoſe example and harangues kindled the flame of the nobleſt heroiſm in the minds of the Athenians. Levies were immediately made. Each of the ten tribes furniſhed 1000 foot ſoldiers with a commander at their head. To complete this number it was neceſſary to enrol the ſlaves (A.) No ſooner were the troops aſſembled than they marched out of the city into the plain of Marathon, where the inhabitants of Platæa in Bœotia ſent them a reinforcement of 1000 infantry.

Scarcely were the two armies in ſight of each other, before Miltiades propoſed to attack the enemy. Ariſtides and ſeveral of the commanders warmly ſupported this meaſure: but the reſt, terrified at the exceſſive diſproportion of the armies, were deſirous of waiting for the ſuccours from Lacedæmon. Opinions being divided, they had recourſe to that of the polemarch, or chief of the militia, who was conſulted on ſuch occaſions, to put an end to the equality of ſuffrages. Miltiades addreſſed himſelf to him, with the ardour of a man deeply impreſſed with the importance of preſent circumſtances: "Athens (ſaid he to him) is on the point of experiencing the greateſt of viciſſitudes. Ready to become the firſt power of Greece, or the theatre of the tyranny and fury of Hippias, from you alone, Callimachus, ſhe now awaits her deſtiny. If we ſuffer the ardour of the troops to cool, they will ſhamefully bow beneath the Perſian yoke; but if we lead them on to battle, the gods and victory will favour us. A word from your mouth muſt now precipitate your country into ſlavery or preſerve her liberty." Callimachus gave his ſuffrage, and the battle was reſolved. To enſure ſucceſs, Ariſtides, and the other generals after his example, yielded to Miltiades the honour of the command which belonged to them in rotation: but, to ſecure them from every hazard, he preferred waiting for the day which of right placed him at the head of the army.

When that day arrived, Miltiades drew up his troops at the foot of a mountain, on a ſpot of ground ſcattered over with trees to impede the Perſian cavalry. The Platæans were placed on the left wing; Callimachus commanded the right; Ariſtides and Themiſtocles were in the centre of the battle, and Miltiades every where. An interval of nearly a mile ſeparated the Grecian army from that of the Perſians. At the firſt ſignal the Greeks advanced over this ſpace running. The Perſians, aſtoniſhed at a mode of attack ſo novel to both nations, for a moment remained motionleſs; but to the impetuous fury of the enemy they ſoon oppoſed a more ſedate and not leſs formidable fury. After an obſtinate conflict of ſome hours, victory began to declare herſelf in the two wings of the

---

(A) *Travels of Anacharſis*; authority, *Pauſan.* i. 79. But Dr Gillies ſeems to think that the armed ſlaves were not included in the 10,000; but amounted of themſelves to a greater number, and which formed the centre of the battle.

Marathon.

the Grecian army. The right diſperſed the enemy in the plain, while the left drove them back on a moraſs that had the appearance of a meadow, in which they ſtuck faſt and were loſt. Both theſe bodies of troops now flew to the ſuccour of Ariſtides and Themiſtocles, ready to give way before the flower of the Perſian troops placed by Datis in the centre of his battle. From this moment the rout became general. The Perſians, repulſed on all ſides, found their only aſylum in the fleet which had approached the ſhore. The conquerors purſued them with fire and ſword, and took, burnt, or ſunk the greater part of their veſſels: the reſt eſcaped by dint of rowing.

The Perſian army loſt about 6400 men; that of the Athenians 192. Miltiades was wounded; Hippias was left dead on the field, as were Steſileus and Callimachus, two of the Athenian generals. Scarcely was the battle over, when a ſoldier worn out with fatigue forms the project of carrying the firſt news of ſo ſignal a ſucceſs to the magiſtrates of Athens, and without quitting his arms, he runs, flies, arrives, announces the victory, and falls dead at their feet.

This battle was fought on the 6th of Boedromion, in the third year of the 72 Olympiad (or 29th September anno 490 B. C.). The next day 2000 Spartans arrived. In three days and nights they had marched 1200 ſtadia. Though informed of the defeat of the Perſians, they continued their march to Marathon, nor did they enviouſly ſhun to behold thoſe fields where a rival nation had ſignalized itſelf by ſo heroic an action: they there beheld the tents of the Perſians ſtill ſtanding, the plain ſtrewed over with dead, and covered with coſtly ſpoils: they there found Ariſtides, who with his tribe was guarding the priſoners and booty; and did not retire until they had beſtowed juſt applauſes on the victors.

The Athenians neglected nothing to eterniſe the memory of thoſe who fell in the battle. It had been uſual to inter the citizens who periſhed in war, at the public expence, in the Ceramicus without the city; but the death of theſe was deemed uncommonly meritorious. They were buried, and a barrow was made for them, where their bravery had been manifeſted. Their names were engraven on half columns erected on the plain of Marathon. Theſe monuments, not excepting thoſe of the generals Callimachus and Steſileus, were in a ſtyle of the greateſt ſimplicity. In the intervals between them were erected trophies bearing the arms of the Perſians. An artiſt of eminence had painted all the circumſtances of the battle in one of the moſt frequented porticoes of the city: Miltiades was there repreſented at the head of the generals, and in the act of exhorting the troops to fight for their country.

Pauſanias examined the field of battle about 600 years after this event. His account of it is as follows. "The barrow of the Athenians is in the plain, and on it are pillars containing the names of the dead under thoſe of the tribes to which they belonged; and there is another for the Platæenſians and ſlaves; and a diſtinct monument of Miltiades the commander, who ſurvived this exploit. There may be perceived nightly the neighing of horſes and the claſhing of arms. No perſon has derived any good from waiting on purpoſe to behold the ſpectres; but their anger does not fall on any one who happens to ſee them without deſign. The Marathonians worſhip thoſe who were ſlain in the battle, ſtyling them *heroes*.—A trophy alſo of white marble has been erected. The Athenians ſay the Medes were buried, religion requiring that the corpſe of a man be covered with earth; though I was not able to find any place of ſepulture; for there is no barrow or other ſign viſible, but they threw them promiſcuouſly into a pit.—Above the lake are the marble mangers of the horſes of Artaphernes, with marks of a tent on the rocks."

Many centuries have elapſed ſince the age of Pauſanias; but the principal barrow, it is likely that of the gallant Athenians, ſtill towers above the level of the plain. It is of light fine earth, and has a buſh or two growing on it. Dr Chandler informs us that he enjoyed a pleaſing and ſatisfactory view from the ſummit; and looked, but in vain, for the pillars on which the names were recorded, lamenting that ſuch memorials ſhould ever be removed. At a ſmall diſtance northward is a ſquare baſement of white marble, perhaps part of the trophy. A Greek church has ſtood near it; and ſome ſtones and rubbiſh, diſpoſed ſo as to form an open place of worſhip, remain.

Maratta, Maratti.

MARATTA. See MARHATTAS.

MARATTI (Carlo), a celebrated painter, was born at Camorano, near Ancona, in 1625. He came a poor boy to Rome, when only 11 years old; and at 12 recommended himſelf ſo effectually to Andrea Sacchi, by his drawings after Raphael in the Vatican, that he took him into his ſchool, where he continued 25 years till his maſter's death. His graceful and beautiful ideas occaſioned his being generally employed in painting madonas and female ſaints. No man ever performed in a better ſtyle, or with a greater elegance. From the fineſt ſtatues and pictures, he made himſelf maſter of the moſt perfect forms, and the moſt charming airs of heads, which he ſketched with equal eaſe and grace. He has produced a noble variety of draperies, more artfully managed, more richly ornamented, and with greater propriety than even the beſt of the moderns. He was inimitable in adorning the head, in the diſpoſal of the hair, and the elegance of his hands and feet, which are equal to thoſe of Raphael; and he particularly excelled in gracefulneſs. In his younger days he etched a few prints, as well of his own invention as after others, with equal ſpirit and correctneſs. It would be endleſs to recount the celebrated paintings done by this great man. Yet he executed nothing ſlightly, often changed his deſign, and almoſt always for the better, whence his pictures were long in hand. By the example of his maſter, he made ſeveral admirable portraits of popes, cardinals, and other people of diſtinction, from whom he received the higheſt teſtimonies of eſteem, as he likewiſe did from almoſt all the monarchs and princes of Europe. Innocent XI. appointed him keeper of the paintings in his chapel and the Vatican. Maratti erected two noble monuments for Raphael and Hannibal, at his own expence, in the Pantheon. How well he maintained the dignity of his profeſſion, appears by his anſwer to a Roman prince, who complaining of the exceſſive price of his pictures, he told him there was a vaſt debt due from the world to the famous artiſts his predeceſſors, and that he, as their rightful ſucceſſor, was come to claim thoſe arrears. His abilities in painting were accompanied with many virtues, and particularly with an extenſive charity. This great painter died at Rome in 1713, in the 88th year of his age.

MARAUDING, in a military ſenſe, means a party of ſoldiers, who, without any order, go into the neighbouring houſes and villages, when the army is either in camp or garriſon, to plunder and deſtroy, &c. Marauders are a diſgrace to the camp, to the military profeſſion, and deſerve no better quarter from their officers than they give to poor peaſants, &c.

MARAVEDI, a little Spaniſh copper coin, worth ſomewhat more than a French denier, or half a farthing Engliſh.

The Spaniards always count by maravedis, both in commerce and in their finances, though the coin itſelf is no longer current among them. Sixty-three maravedis are equivalent to a rial of ſilver; ſo that the piaſter, or piece of eight rials, contains 504; and the piſtole of four pieces of eight, 2016 maravedis.

This ſmallneſs of the coin produces vaſt numbers in the Spaniſh accounts and calculation; inſomuch that a ſtranger or correſpondent would think himſelf indebted ſeveral millions for a commodity that coſt but a few pounds.

In the laws of Spain, we meet with ſeveral kinds of maravedis; Alphonſine maravedis, white maravedis, maravedis of good money, maarvedis Combrenos, black maravedis, and old maravedis. When we find maravedis alone, and without any addition, it is to be underſtood of thoſe mentioned above. The reſt are different in value, fineneſs of metal, time, &c. Mariana aſſerts, that this coin is older than the Moors; that it came from the Goths; that it was anciently equal to a third part of the rial, and conſequently of 12 times the value of the preſent maravedi. Under Alphonſus XI. the maravedi was 17 times, under Henry II. ten times, under Henry III. five times, and under John II. two times and an half, the value of the preſent maravedi.

MARBELLA, a town of Andaluſia in Spain, ſituated at the mouth of the Rio Verde, 30 miles north-eaſt of Gibraltar, and 28 ſouth-weſt of Malaga. W. Long. 5. 25. N. Lat. 30. 25.

MARBLE, in natural hiſtory, a genus of foſſils; being bright and beautiful ſtones compoſed of ſmall ſeparate concretions, moderately hard, not giving fire with ſteel, fermenting with and ſoluble in acid menſtrua, and calcining in a ſlight fire.—The word comes from the French *marbre*, and that from the Latin *marmor*, of the Greek μαρμαιρειν to "ſhine or glitter."

The colours by which marbles are diſtinguiſhed are almoſt innumerable; but the moſt remarkable are, 1. The black marble of Flanders. 2. Plain yellow. 3. Yellow with ſome white veins. 4. Yellow with black dendrites. 5. Yellow with brown figures reſembling ruins. 6. Black and yellow. 7. Black and white. 8. Pale yellow, with ſpots of a blackiſh-grey colour. 9. Yellow, white, and red. 10. Pale yellow. 11. Olive colour, with deeper coloured croſs lines, and dendrites. 12. Browniſh red. 13. Fleſh-coloured and yellow. 14. Common red marble. 15. Crimſon, white, and grey. 16. Reddiſh-brown lumps, on a whitiſh ground. 17. Bluiſh grey. 18. Snowy-white.

The varieties of marble, numerous as they are, have been improperly augmented by virtuoſos, and ſome people who collect ſpecimens for the ſake of gain. The Italians are particularly curious in this way; and moſt of the names impoſed upon marbles are given by them. Every marble brought from an unknown place is called by them *antico*; when diſtinguiſhed by a number of bright colours, it is called *brocatello*, or *brocatellato*. When they want ſome of the originals to complete a whole ſet of marbles, they either ſubſtitute others which have the neareſt reſemblance to them; or, laſtly, they ſtain white marbles according to their own fancy, and impoſe them on the world as natural. The fineſt ſolid modern marbles are thoſe of Italy, Blankenburg, France, and Flanders. It has alſo been lately diſcovered, that very fine marble is contained in ſome of the Weſtern Iſlands of Scotland. Thoſe of Germany, Norway, and Sweden, are of an inferior kind, being mixed with a kind of ſcaly limeſtone; and even ſeveral of thoſe above mentioned are partly mixed with this ſubſtance, though in an inferior degree. Cronſtedt, however, mentions a new quarry of white marble in Sweden, which, from the ſpecimens he had ſeen, promiſed to be excellent.

The ſpecific gravity of marble is from 2700 to 2800; that of Carriera, a very fine Italian marble, is 2717.—Black marble owes its colour to a ſlight mixture of iron. Mr Bayen found ſome which contained 5 *per cent.* of the metal; notwithſtanding which, the lime prepared from it was white, but in time it acquired an ochry or reddiſh-yellow colour.

Marble, when chemically examined, appears to conſiſt of calcareous earth united with much fixed air; and is, like limeſtone or chalk, capable of being converted into a ſtrong quicklime.—Dr Black derives the origin of marbles, as well as limeſtone and marle, from the ſame ſource, *viz.* from the calcareous matter of ſhells and lithophyta. In one kind of limeſtone known by the name of *Portland-ſtone*, and conſiſting of round grains united together, it was ſuppoſed to be compoſed of the ſpawn of fiſh; but compariſons of other phenomena have explained it. It is plain that it has been produced from a calcareous ſand, which is found on the ſhore of ſome of the iſlands in the ſouthern climates. By the conſtant agitation the ſofter parts are worn off, and the harder parts remain in the form of particles that are highly poliſhed, and which are afterwards gradually made to concrete together by cauſes of which we have yet no knowledge.—There are indeed ſome few of the limeſtones and marbles in which we cannot diſcover any of the relics of the ſhells; but there are many ſigns of their having been in a diſſolved or liquified ſtate; ſo we cannot expect to ſee the remains of the form of the ſhells: but even in many of the marbles that have the greateſt appearance of a complete mixture, we ſtill find often the confuſed remains of the ſhells of which they have been originally compoſed. We ſhould ſtill find it difficult to conceive how ſuch maſſes ſhould have derived their origin from ſhells; but, conſidering the many collections that we have an opportunity of ſeeing in their ſteps towards this proceſs, and a little concreted together, ſo that by their going a ſtep farther they might form limeſtone and marbles, we ſhall ſoon ſee the poſſibility of their being all produced in the ſame manner. Thus vaſt quantities

tities of ſhells have been found in the province of Turin in France; and indeed there is no place where they have not been found. The lithophyta likewiſe ſeem to be a very fruitful ſource of this kind of earth. In the cold climates, where the moderate degree of heat is not ſo productive of animal-life, we have not ſuch an opportunity of obſerving this: but in the hot climates, the ſea, as well as the land, ſwarms with innumerable animals; and, at the bottom, with thoſe that produce the corals and madripores. We learn from the hiſtory of a ſhip that was ſunk in a ſtorm in the Gulf of Mexico, the vaſt growth there is of theſe bodies. About 30 years after, they attempted to dive into it to get out a quantity of ſilver; but they found great difficulty in getting it, from the ſhip being overgrown with coral. Sir Hans Sloan, in the Philoſophical Tranſactions, and in his hiſtory of Jamaica, obſerves, that the ſhip's timber, the iron, and money, were all concreted by the growth of the calcareous matter. So in a tract of many thouſands of years the quantity of it ſhould be very great; and as this is going on through a very great extent of the bottom of the ſea, it will produce very extenſive as well as maſſy collections of calcareous matter.

According to Sir William Hamilton †, many variegated marbles and precious ſtones are the produce of volcanoes.

Artificial MARBLES. The ſtucco, whereof they make ſtatues, buſts, baſſo-relievos, and other ornaments of architecture, ought to be marble pulverized, mixed in a certain proportion with plaſter; the whole well ſifted, worked up with water, and uſed like common plaſter. See STUCCO.

There is alſo a kind of artificial marble made of the flaky ſelenites, or a tranſparent ſtone reſembling plaſter; which becomes very hard, receives a tolerable poliſh, and may deceive a good eye. This kind of ſelenites reſembles Muſcovy talc.

There is another ſort of artificial marble formed by corroſive tinctures, which, penetrating into white marble to the depth of a line or more, imitate the various colours of other dearer marbles.

There is alſo a preparation of brimſtone in imitation of marble.

To do this, you muſt provide yourſelf with a flat and ſmooth piece of marble; on this make a border or wall, to encompaſs either a ſquare or oval table, which may be done either with wax or clay. Then having ſeveral ſorts of colours, as white lead, vermilion, lake, orpiment, maſticot, ſmalt, Pruſſian blue, &c. melt on a ſlow fire ſome brimſtone in ſeveral glazed pipkins; put one particular ſort of colour into each, and ſtir it well together; then having before oiled the marble all over within the wall, with one colour quickly drop ſpots upon it of larger and leſs ſize; after this, take another colour and do as before, and ſo on till the ſtone is covered with ſpots of all the colours you deſign to uſe. When this is done, you are next to conſider what colour the maſs or ground of your table is to be; if of a grey colour, then take fine ſifted aſhes, and mix it up with melted brimſtone; or if red, with Engliſh red ochre; if white, with white-lead; if black, with lamp or ivory black. Your brimſtone for the ground muſt be pretty hot, that the coloured drops on the ſtone may unite and incorporate with it. When the ground is poured even all over, you are next, if judged neceſſary, to put a thin wainſcot board upon it: this muſt be done whilſt the brimſtone is hot, making alſo the board hot, which ought to be thoroughly dry, in order to cauſe the brimſtone to ſtick the better to it. When the whole is cold, take it up, and poliſh it with a cloth and oil, and it will look very beautiful.

Elaſtic MARBLE, an extraordinary ſpecies of foſſil which has ſurpriſed all the naturaliſts who have ſeen it. There are ſeveral tables of it preſerved in the houſe of Prince Borgheſe at Rome, and ſhown to the curious. F. Jacquer, a celebrated mathematician, has given a deſcription in the Literary Gazette of Paris, but the naturaliſts cannot be contented with it. If permiſſion was given to make the requiſite experiments, this curious phenomenon might be better illuſtrated. There are five or ſix tables of that marble; their length is about two feet and a half, the breadth about ten inches, and the thickneſs a little leſs than three. They were dug up, as the Abbé Fortis was told, in the feod of Mondragone; the grain is of Carrareſe marble, or perhaps of the fineſt Greek. They ſeem to have ſuffered ſome attack of fire: though the firſt degree of pulverization obſervable in the angles, can, perhaps, ſcarcely be called that of imperfect calcination. They are very dry, do not yield to external impreſſion, reſound to the hammer, like other congenerous marble, and are perhaps ſuſceptible of a poliſh. Being ſet on end, they bend, oſcillating backward and forward; when laid horizontally, and raiſed at one end, they form a curve, beginning towards the middle; if placed on a table, and a piece of wood or any thing elſe is laid under them, they make a ſalient curve, and touch the table with both ends. Notwithſtanding this flexibility, they are liable to be broken if indiſcreetly handled; and therefore one table only, and that not the beſt, is ſhown to the curious. Formerly they were all together in the prince's apartment on the ground-floor.

Colouring of MARBLE. This is a nice art; and, in order to ſucceed in it, the pieces of marble on which the experiments are tried, muſt be well poliſhed, and free from the leaſt ſpot or vein. The harder the marble is, the better will it bear the heat neceſſary in the operation; therefore alabaſter and the common ſoft white marble are very improper for performing theſe operations upon.

Heat is always neceſſary for opening the pores of marble, ſo as to render it fit to receive the colours: but the marble muſt never be made red-hot; for then the texture of it is injured, and the colours are burnt, and loſe their beauty. Too ſmall a degree of heat is as bad as one too great; for, in this caſe, though the marble receives the colour, it will not be fixed in it, nor ſtrike deep enough. Some colours will ſtrike even cold; but they are never ſo well ſunk in as when a juſt degree of heat is uſed. The proper degree is that which, without making the marble red, will make the liquor boil upon its ſurface. The menſtruums uſed to ſtrike in the colours muſt be varied according to the nature of the colour to be uſed. A lixivium made with horſe's or dog's urine, with four parts of quick-

---

† *Phil. Tranſ.* vol. lviii. 12.

lime and one of pot-aſhes, is excellent for ſome colours; common ley of wood-aſhes is very good for others; for ſome, ſpirit of wine is beſt; and laſtly, for others, oily liquors, or common white-wine.

The colours which have been found to ſucceed beſt with the peculiar menſtruums, are theſe. Stone-blue diſſolved in ſix times the quantity of ſpirit of wine, or of the urinous lixivium, and that colour which the painters call *litmus*, diſſolved in common ley of wood-aſhes. An extract of ſaffron, and that colour made of buckthorn berries, and called by painters *ſap green*, both ſucceed well when diſſolved in urine and quicklime; and tolerably well when diſſolved in ſpirit of wine. Vermilion, and a very fine powder of cochineal, alſo ſucceed very well in the ſame liquors. Dragon's-blood ſucceeds in ſpirit of wine, as does alſo a tincture of logwood in the ſame ſpirit. Alkanet-root gives a fine colour; but the only menſtruum to be uſed for it is oil of turpentine; for neither ſpirit of wine, nor any lixivium, will do with it. There is another kind of *ſanguis draconis*, commonly called *dragon's-blood in tears*, which, mixed with urine, gives a very elegant colour.

Beſides theſe mixtures of colours and menſtruums, there are other colours which muſt be laid on dry and unmixed. Theſe are, dragon's-blood of the pureſt kind, for a red; gamboge for a yellow; green wax, for a green; common brimſtone, pitch, and turpentine, for a brown colour. The marble for theſe experiments muſt be made conſiderably hot, and then the colours are to be rubbed on dry in the lump. Some of theſe colours, when once given, remain immutable, others are eaſily changed or deſtroyed. Thus, the red colour given by dragon's-blood, or by a decoction of logwood, will be wholly taken away by oil of tartar, and the poliſh of the marble not hurt by it.

A fine gold colour is given in the following manner: Take crude ſal ammoniac, vitriol, and verdigriſe, of each equal quantities. White vitriol ſucceeds beſt; and all muſt be thoroughly mixed in fine powder.

The ſtaining of marble to all the degrees of red or yellow, by ſolutions of dragon's-blood or gamboge, may be done by reducing theſe gums to powder, and grinding them with the ſpirit of wine in a glaſs mortar. But, for ſmaller attempts, no method is ſo good as the mixing a little of either of thoſe powders with ſpirit of wine in a ſilver ſpoon, and holding it over burning charcoal. By this means a fine tincture will be extracted; and, with a pencil dipt in this, the fineſt traces may be made on the marble while cold; which, on the heating of it afterwards, either on ſand, or in a baker's oven, will all ſink very deep, and remain perfectly diſtinct on the ſtone. It is very eaſy to make the ground-colour of the marble red or yellow by this means, and leave white veins in it. This is to be done by covering the places where the whiteneſs is to remain with ſome white paint, or even with two or three doubles only of paper; either of which will prevent the colour from penetrating. All the degrees of red are to be given to marble by this gum alone; a ſlight tincture of it, without the aſſiſtance of heat to the marble, gives only a pale fleſh colour: but the ſtronger tinctures give it yet deeper; to this the aſſiſtance of heat adds greatly; and finally, the addition of a little pitch to the tincture, gives it a tendency to blackneſs, or any degree of deep red that may be deſired.

A blue colour may be given alſo to marble by diſſolving turnſol in lixivium, in lime and urine, or in the volatile ſpirit of urine; but this has always a tendency to purple, whether made by the one or the other of theſe ways. A better blue, and uſed in an eaſier manner, is furniſhed by the Canary turnſol, a ſubſtance well known among the dyers. This needs only to be diſſolved in water, and drawn on the place with a pencil: it penetrates very deeply into the marble; and the colour may be increaſed, by drawing the pencil wetted afreſh ſeveral times over the ſame lines. This colour is ſubject to ſpread and diffuſe itſelf irregularly: but it may be kept in regular bounds, by circumſcribing its lines with beds of wax, or any ſuch ſubſtance. It is alſo to be obſerved, that this colour ſhould always be laid on cold, and no heat given even afterwards to the marble: and one great advantage of this colour is, that it is therefore eaſily added to marbles already ſtained with other colours, is a very beautiful tinge, and laſts a long time.—See alſo CHEMISTRY, n° 753.

Arundel MARBLES, marble with a chronicle of the city of Athens, inſcribed on them (as was ſuppoſed) many years before our Saviour's birth; preſented to the univerſity of Oxford by Thomas earl of Arundel; whence the name. See *ARUNDELIAN Marbles*.

MARBLED, ſomething veined or clouded, reſembling marble. See MARBLING.

MARBLED China-ware, a name given by many to a ſpecies of porcelain or china-ware, which ſeems to be full of cemented flaws. It is called by the Chineſe, who are very fond of it, *tſou tchi*. It is generally plain white, ſometimes blue, and has exactly the appearance of a piece of China which had been firſt broken, and then had all the pieces cemented in their places again, and covered with the original varniſh. The manner of preparing it is eaſy, and might be imitated with us. Inſtead of the common varniſh of the China-ware, which is made of what they call *oil of ſtone* and *oil of fern* mixed together, they cover this with a ſimple thing made only of a ſort of coarſe agates, calcined to a white powder, and ſeparated from the groſſer parts by means of water, after long grinding in mortars. When the powder has been thus prepared, it is left moiſt, or in form of a ſort of cream, with the laſt water that is ſuffered to remain in it and this is uſed as the varniſh. Our cryſtal would ſerve full as well as thoſe coarſe agates, and the method of preparation is perfectly eaſy. The occaſion of the ſingular appearance of this ſort of porcelain is, that the varniſh never ſpreads evenly, but runs into ridges and veins. Theſe often run naturally into a ſort of moſaic-work, which can ſcarce be taken for the effect of chance. If the marbled China be deſired blue, they firſt give it a general coat of this colour, by dipping the veſſel into a blue varniſh; and when this is thoroughly dry, they add another coat of this agate-oil.

Playing MARBLES, are moſtly imported from Holland; where it is ſaid they are made by breaking the ſtone alabaſter, or other ſubſtance, into pieces or chips of a ſuitable ſize; theſe are put into an iron mill which turns by water: there are ſeveral partitions with raſps within, cut floatways, not with teeth, which turn conſtantly round with great ſwiftneſs; the friction againſt the raſps makes them round, and as they are formed, they fall out of different holes, into which ſize or chance throws them. They are brought from Nuremberg to Rotterdam, down the Rhine, and from thence diſperſed over Europe.

MARBLING, the method of preparing and colouring the marbled paper.

There are ſeveral kinds of marbled paper; but the principal difference of them lies in the forms in which the colours are laid on the ground: ſome being diſpoſed in whirls or circumvolutions; ſome in jagged lengths; and others only in ſpots of a roundiſh or oval figure. The general manner of managing each kind is, nevertheleſs, the ſame; being the dipping the paper in a ſolution of gum-tragacanth, or, as it is commonly called, *gum-dragon;* over which the colours, previouſly prepared with ox-gall and ſpirit of wine, are firſt ſpread.

The peculiar apparatus neceſſary for this purpoſe, is a trough for containing the gum-tragacanth and the colours; a comb for diſpoſing them in the figure uſually choſen; and a burniſhing ſtone for poliſhing the paper. The trough may be of any kind of wood; and muſt be ſomewhat larger than the ſheets of paper for marbling which it is to be employed: but the ſides of it need only riſe about two inches above the bottom; for by making it thus ſhallow, the leſs quantity of the ſolution of the gum will ſerve to fill it. The comb may be alſo of wood, and five inches in length; but ſhould have braſs teeth, which may be about two inches long, and placed at about a quarter of an inch diſtance from each other. The burniſhing ſtone may be of jaſper or agate; but as thoſe ſtones are very dear when of ſufficient largeneſs, marble or glaſs may be uſed, provided their ſurface be poliſhed to a greater degree of ſmoothneſs.

Theſe implements being prepared, the ſolution of gum-tragacanth muſt be made, by putting a ſufficient proportion of the gum, which ſhould be white and clear from all foulneſſes, into clean water, and letting it remain there a day or two, frequently breaking the lumps and ſtirring it till the whole ſhall appear diſſolved and equally mixed with the water. The conſiſtence of the ſolution ſhould be nearly that of ſtrong gum-water uſed in miniature-painting; and if it appear thicker, water muſt be added; or if thinner, more of the gum. When the ſolution is thus brought to a due ſtate, it muſt be paſſed through a linen cloth; and being then put into the trough, it will be ready to receive the colours.

The colours employed for red are carmine, lake, roſe-pink, and vermilion; but the two laſt are too hard and glaring, unleſs they be mixed with roſe-pink or lake, to bring them to a ſofter caſt; and with reſpect to the carmine and lake, they are too dear for common purpoſes: for yellow, Dutch pink and yellow ochre may be employed:—for blue, Pruſſian blue and verditer may be uſed:—for green, verdigriſe, a mixture of Dutch pink and Pruſſian blue, or verditer, in different proportions:—for orange, the orange-lake, or a mixture of vermilion, or red lead, with Dutch pink:—for purple, roſe-pink and Pruſſian blue.

Theſe ſeveral colours ſhould be ground with ſpirit of wine till they be of a proper fineneſs; and then, at the time of uſing them, a little fiſh-gall, or in default of it the gall of a beaſt, ſhould be added, by grinding them over again with it. The proper proportion of the gall muſt be found by trying them; for there muſt be juſt ſo much as will ſuffer the ſpots of colour, when ſprinkled on the ſolution of the gum-tragacanth, to join together, without intermixing or running into each other.

When every thing is thus prepared, the ſolution of the gum-tragacanth muſt be poured into the trough; and the colours, being in a ſeparate pot, with a pencil appropriated to each, muſt be ſprinkled on the ſurface of the ſolution, by ſhaking the pencil, charged with its proper colour, over it; and this muſt be done with the ſeveral kinds of colour deſired, till the ſurface be wholly covered.

When the marbling is propoſed to be in ſpots of a ſimple form, nothing more is neceſſary: but where the whirls or ſnail-ſhell figures are wanted, they muſt be made by means of a quill; which muſt be put among the ſpots to turn them about, till the effect be produced. The jagged lengths muſt be made by means of the comb above deſcribed, which muſt be paſſed through the colours from one end of the trough to the other, and will give them that appearance: but if they be deſired to be pointed both ways, the comb muſt be again paſſed through the trough in a contrary direction; or if ſome of the whirls or ſnail-ſhell figures be required to be added, they may be yet made by the means before directed.

The paper ſhould be previouſly prepared for receiving the colours, by dipping it over-night in water; and laying the ſheets on each other with a weight over them. The whole being thus ready, the paper muſt be held by two corners, and laid in the moſt gentle and even manner on the ſolution covered with the colours; and there ſoftly preſſed with the hand, that it may bear every-where on the ſolution. After which it muſt be raiſed and taken off with the ſame care, and then hung to dry acroſs a proper cord, ſubtended near at hand for that purpoſe: and in that ſtate it muſt continue till it be perfectly dry. It then remains only to give the paper a proper poliſh: in order to which, it is firſt rubbed with a little ſoap; and then muſt be thoroughly ſmoothed by the glaſs poliſhers, ſuch as are uſed for linen, and called the *calender glaſſes*. After which it ſhould be again rubbed by a burniſher of jaſper or agate; or, in default of them, of glaſs ground to the higheſt poliſh: for on the perfect poliſh of the paper depends in a great meaſure its beauty and value.

Gold or ſilver powders may be uſed, where deſired, along with the colour, ; and require only the ſame treatment as them, except that they muſt be firſt tempered with gum-water.

Marbling of books or paper is performed thus: Diſſolve four ounces of gum-arabic into two quarts of fair water; then provide ſeveral colours mixed with water in pots or ſhells; and, with pencils peculiar to each

each colour, ſprinkle them by way of intermixture upon the gum-water, which muſt be put into a trough or ſome broad-veſſel; then with a ſtick curl them, or draw them out in ſtreaks, to as much variety as may be done. Having done this, hold your book or books cloſe together, and only dip the edges in, on the top of the water and colours, very lightly; which done, take them off, and the plain impreſſion of the colours in mixture will be upon the leaves; doing as well the ends as the front of the book in the like manner.

Marbling a book on the covers is performed by forming clouds with aqua-fortis or ſpirit of vitriol mixed with ink, and afterwards glazing the covers. See the article Book-binding.

MARC-Antonio. See Raimondi.

MARCA (Peter de), one of the greateſt ornaments of the Galliean church, was born in Bearn, of an ancient family, in 1594. He firſt ſtudied the law, was made preſident of the parliament of Bearn, and, going to Paris in 1639, was made a counſellor of ſtate: the good opinion entertained of his knowledge was confirmed by his *Hiſtory of Bearn*. By the king's order he publiſhed a work, *De concordia ſacerdotii et imperii, ſive de libertatibus eccleſiæ Gallicæ*, in refutation of a book that appeared under the title of *Optatus Gallus*; and on this account, when on the death of his wife he was nominated biſhop of Conſerans, the court of Rome refuſed the bulls in his favour, until by another book he explained away all he had ſaid on behalf of the ſtate, to the limitation of the papal power. He obtained his confirmation, after ſeven years ſuſpenſe, in 1648; was tranſlated to the archbiſhopric of Toulouſe in 1652; and was made miniſter of ſtate in 1658. He died at Paris in 1662, a ſhort time after he had received the bulls as the archbiſhop of that metropolis. After his death appeared his *Poſthumous works*, with prefaces, notes, &c. by M. Baluze. In all he wrote, he ſhowed great abilities and learning, but is reproached for accommodating them to his views of intereſt and ambition.

MARCASITE, in mineralogy. This name has long been given indifferently to all ſorts of minerals; to ores, pyrites, and to ſemimetals. Lately, it ſeems to be confined to pyrites, and Wallerius propoſes to confine it to ſuch pyrites as are regularly formed. This ſeems to be better than to leave it a vague and indeterminate ſignification, on account of the ambiguity and obſcurity which mightthereby be introduced. See Pyrites.

MARCELLIANISM, the doctrines and opinions of the Marcellians, a ſect of ancient heretics, towards the cloſe of the ſecond century, ſo called from Marcellus of Ancyra, their leader, who was accuſed of reviving the errors of Sabellius. Some, however, are of opinion, that Marcellus was orthodox, and that they were his enemies the Arians, who fathered their errors upon him. St Epiphanius obſerves, that there was a great deal of diſpute with regard to the real tenets of Marcellus; but that, as to his followers, it is evident they did not own the three hypoſtaſes: for Marcellus conſidered the Son and Holy Ghoſt as two emanations from the divine nature, which, after performing their reſpective offices, were to return again into the ſubſtance of the Father; and this opinion is altogether incompatible with the belief of three diſtinct perſons in the Godhead.

MARCELLINUS (Ammianus.) See Ammianus.

MARCELLO (Benedict), a celebrated muſician, and deſcended from one of the moſt illuſtrious families in Venice. He lived in the beginning of the preſent century. We have of his compoſition, anthems, cantatas, and other works, which the connoiſſeurs rank as high as any of the numerous and excellent muſical compoſitions which the Italian ſchool has produced. "He is the Pindar of muſic, (ſays M. de la Borde). In boldneſs and regularity of deſign, he is the Michael Angelo of it. In analyſing his works, we diſcover a profound knowledge and great addreſs; but there is a difficulty attending the execution of them which is almoſt inſurmountable. It requires a voice poſſeſſed of great powers, and accuſtomed to the moſt extraordinary intervals." The chief of the family which ſtill exiſts was the ambaſſador of Venice to the Porte in 1770.

MARCELLUS (Marcus Claudius), a famous Roman general, who, after the firſt Punic war, had the management of an expedition againſt the Gauls. Here he obtained the *Spolia opima*, by killing with his own hand Viridomarus the king of the enemy. Such ſucceſs rendered him popular, and ſoon after he was entruſted to oppoſe Hannibal in Italy. He was the firſt Roman who obtained ſome advantage over this celebrated Carthaginian, and ſhowed his countrymen that Hannibal was not invincible. The troubles which were raiſed in Sicily by the Carthaginians at the death of Hieronymus, alarmed the Romans; and Marcellus, in his third conſulſhip, was ſent with a powerful force againſt Syracuſe. He attacked it by ſea and land; but his operations proved long ineffectual, and the invention and induſtry of Archimedes were able to baffle all the efforts, and to deſtroy all the great and ſtupendous machines and military engines of the Romans during three ſucceſſive years. The perſeverance of Marcellus at laſt obtained the victory. After this conqueſt, Marcellus was called upon by his country to oppoſe a ſecond time Hannibal. In this campaign he behaved with greater vigour than before; the greateſt part of the towns of the Samnites, which had revolted, were recovered by force of arms, and 3000 of the ſoldiers of Hannibal made priſoners. Some time after, in an engagement with the Carthaginian general, Marcellus had the diſadvantage: but on the morrow a more ſuceſsful ſkirmiſh vindicated his military character and the honour of the Roman ſoldiers. Marcellus, however, was not ſufficiently vigilant againſt the ſnares of his adverſary. He imprudently ſeparated himſelf from his camp, and was killed in an ambuſcade, in the 60th year of his age, in his 5th conſulſhip, A. U. C. 544. His body was honoured with a magnificent funeral by the conqueror, and his aſhes were conveyed in a ſilver urn to his ſon. Marcellus claims our commendation for his private as well as public virtues; and the humanity of a general will ever be remembered, who, at the ſurrender of Syracuſe, wept on the thought that many were going to be expoſed to the avarice and rapaciouſneſs of an incenſed ſoldiery, which the policy of Rome and the laws of war rendered inevitable.

MARCGRAVE, or Margrave, a kind of dignity

nity in Germany, anſwering to our marquis; (ſee MARQUIS.) The word is derived from the German *Marche*, or *Marcke*, which ſignifies "a frontier;" and *Graffe*, "count, governor;" *Marcgraves* being originally governors of cities lying on the frontiers of a country or ſtate.

MARCH, MARTIUS, the third month of the year, according to the common way of computing. See MONTH, and YEAR.

Among the Romans, March was the firſt month; and in ſome eccleſiaſtical computations, that order is ſtill preſerved; as particularly reckoning the number of years from the incarnation of our Saviour; that is, from the 25th of March.

It was Romulus who divided the year into months; to the firſt of which he gave the name of his ſuppoſed father *Mars*. Ovid, however, obſerves, that the people of Italy had the month of March before Romulus's time; but that they placed it very differently, ſome making it the third, ſome the fourth, ſome the fifth, and others the tenth month of the year.

In this month it was that the Romans ſacrificed to Anna Perenna; that they begun their comitia; that they adjudged their public farms and leaſes; that the miſtreſſes ſerved the ſlaves and ſervants at table, as the maſters did in the Saturnalia; and that the veſtals renewed the ſacred fire.

The month of March was always under the protection of Minerva, and always conſiſted of 31 days.—The ancients held it an unhappy month for marriage, as well as the month of May.

MARCH, in the military art, is the moving of a body of men from once place to another. Nothing is laid down particularly concerning the marches of the Jewiſh armies; only thus much we may collect, that they made uſe of trumpets, to the different ſounds of which they prepared themſelves by packing up their baggage, putting themſelves in readineſs, and attending at the ſtandards, to wait the ſignal for marching. We are told that the army of the Iſraelites marched in general no more than one league in a day and an half; but this appears to hold good only of their progreſs through difficult road: For Follard ſays they might, in an open country, march four leagues in a day or more. The Rabbins ſuppoſe that the Iſraelites marched in the ſame order they were placed in their camp. The Greeks, let the poſture of their affairs be what it would, never marched againſt their enemies till favourable omens encouraged the enterprize. An eclipſe of the moon, or any untoward accident, or the intervening of what they eſteemed an unlucky day, entirely prevented their march. But of all the Greeks the Lacedemonians were the moſt nice and ſcrupulous. The heavenly bodies directed all their motions; and it was an invariable maxim with them never to march before the full moon. The Greeks are particularly remarked by Homer for marching in good order and profound ſilence; whereas the Barbarian forces were all noiſe, clamour, and confuſion. It is needleſs to ſay any thing concerning the marches of the Roman armies, more than that they were performed with the greateſt order and diſpatch, inſomuch that their unexpected preſence frequently damped the ſpirits of their enemies. The Roman ſoldiers were enured to the military pace, that is, to walk 20 miles in five hours, though at the ſame time they carried burdens of ſixty pounds weight.

Of all the mechanical parts of war, in modern times, none is more eſſential than that of marching. It may be juſtly called the *key* which leads to all ſublime motions and manœuvres of an army; for they depend entirely on this point. A man can be attacked in four different ways; in the front, on both flanks, and in the rear: but he can defend himſelf, and annoy the enemy, only when placed with his face towards him. Hence it follows, that the general object of marching is reduced to three points only; to march forwards, and on both ſides, becauſe it is impoſſible to do it for any time backwards, and by that means face the enemy wherever he preſents himſelf.—The different ſteps to be made uſe of are three; ſlow, faſt, and oblique. The firſt is proper in advancing, when at a conſiderable diſtance from the enemy, and when the ground is unequal, that the line may not be broke, and a regular fire kept up without intermiſſion. The ſecond is chiefly neceſſary when you want to anticipate the enemy in occupying ſome poſt, in paſſing a defile, and, above all, in attacking an entrenchment, to avoid being a long while expoſed to the fire of the artillery and ſmall arms, &c. The third ſtep is of infinite conſequence, both in the infantry and cavalry; columns may be opened and formed into lines, and, *vice verſa*, lines into columns, by this kind of ſtep, in a leſſer ſpace, and conſequently in leſs time, than by any other method whatſoever. In coming out of a defile, you may inſtantly form the line without preſenting the flank to the enemy. The line may be formed, though ever ſo near to the enemy, with ſafety, becauſe you face him, and can with eaſe and ſafety protect and cover the motion of the troops, while they are coming out of the defiles, and forming. The ſame thing may be equally executed, when a column is to be formed in order to advance or retreat; which is a point of infinite conſequence, and ſhould be eſtabliſhed as an axiom.

The order of march of the troops muſt be ſo diſpoſed, that each ſhould arrive at their rendezvous, if poſſible, on the ſame day. The quarter-maſter-general, or his deputy, with an able engineer, ſhould ſufficiently reconnoitre the country, to obtain a perfect knowledge of it and the enemy, before he forms his routes.

Before a march, the army generally receives ſeveral days bread. The quarter-maſters, camp colour-men, and pioneers, parade according to orders, and march immediately after, commanded by the quarter-maſter-general or his deputy. They are to clear the roads, level the ways, make preparations for the march of the army, &c. The *general*, for inſtance, beats at 2, the *aſſembly* at 3, and the army to march in 20 minutes after. Upon beating the *general*, the village, and general officer's guards, quarter and rear-guards, join their reſpective corps; and the army pack up their baggage. Upon beating the *aſſembly*, the tents are to be ſtruck, and ſent with the baggage to the place appointed, &c.

The companies draw up in their ſeveral ſtreets, and the rolls are called. At the time appointed, the drummers are to beat a march, and fifers play at the head of the line, upon which the companies march out from their ſeveral ſtreets, form battalions as they advance to the head of the line, and then halt.

The ſeveral battalions will be formed into columns by the adjutant-general, and the order of march, &c. be given to the general officers who lead the columns.

The cavalry generally march by regiments or ſquadrons. The heavy artillery always keeps the great roads, in the centre of the columns, eſcorted by a ſtrong party of infantry and cavalry. The field-pieces march with the columns.

Each ſoldier generally marches with 36 rounds of powder and ball, and 2 good flints; one of which is to be fixed in the cock of his firelock. The routes muſt be formed ſo that no columns croſs one another on the march.

MARCHAND (John-Louis), a native of Lyons, who ſhares with the celebrated *d'Aquin* the glory of having carried the art of playing on the organ to the higheſt degree of perfection. When very young he went to Paris; and happening to be in the chapel of the college of Louis the Great, when they were waiting for the organiſt to begin divine ſervice, he offered himſelf in his place. His playing gave ſo great ſatisfaction, that the Jeſuits kept him in the college, and ſupplied him with every neceſſary to perfect his talents. Marchand continued to play the organ of their chapel; and though many advantageous places were offered to him, he always refuſed to accept them. This diſintereſted conduct was not ſolely owing to his gratitude; for he was of ſo whimſical and independent a diſpoſition of mind, that he was equally careleſs about reputation and glory. He died at Paris in 1732, at the age of 63. From him we have two books of Pieces for the Harpſichord, much eſteemed by the connoiſſeurs.

MARCHAND (Profeſſor), was from his youth brought up at Paris, in the profeſſion of a bookſeller, and in the knowledge of books. He kept a regular correſpondence with ſeveral learned men, among whom was Bernard the continuator of the *Nouvelles de la Republique des Lettres*, and furniſhed this writer with the literary anecdotes of France. Marchand, having embraced the Proteſtant religion, went to join Bernard in Holland. where he might be at liberty to profeſs his religious opinions. He continued the trade of bookſeller for ſome time; but afterwards quitted it, that he might dedicate himſelf wholly to the purſuits of literature. The hiſtory of France, together with a knowlege of books and authors, was always his favourite ſtudy. In the latter he was ſo eminently diſtinguiſhed, that he was conſulted from all parts of Europe. He was alſo one of the principal authors of the *Journal Literaire*, one of the beſt periodical works which have appeared in Holland; and he furniſhed excellent extracts for the other journals. This valuable and learned man died at an advanced age, the 14th of June 1756; and left the little fortune which he had, to a ſociety inſtituted at the Hague, for the education and inſtruction of a certain number of poor people. His library, which was excellently choſen for literary hiſtory, together with his manuſcripts, was left by his will to the univerſity of Leyden. From him we have, 1. *The Hiſtory of Printing*, a new edition of which has been promiſed by one of his friends. This work, which is full of notes and critical diſcuſſions, appeared in 1740 at the Hague, in 4to. There is ſuch a prodigious diſplay of erudition, and remarks and quotations are heaped together in ſuch confuſion, that when you get to the end of the chaos, you know not what concluſion to form concerning the points which have been diſcuſſed. Abbe Mercier, abbot of Saint-Leger de Soiſſons, gave, in 1775, 4to, a ſupplement to this hiſtory, which is equally curious and accurate. 2. An Hiſtorical Dictionary, or Memoirs Critical and Literary, printed at the Hague in 1758, in two ſmall volumes, folio. In this work we meet with hiſtorical ſingularities, literary anecdotes, and a diſcuſſion of points of bibliography; but too great minuteneſs prevails in it, the ſtyle is deficient in point of purity, and the author is too much carried away by the heat and eagerneſs of his character. More erudition could not well be collected; eſpecially upon ſubjects which, at leaſt to the generality of readers, are ſo unintereſting. 3. A new edition of Bayle's Dictionary, and Letters of the *Cymbalum mundi*, &c.

MARCHANTIA, in botany: A genus of the natural order of algæ, belonging to the cryptogamia claſs of plants. The male calyx is peltated, and covered below with monopetalous corollæ; the antheræ are multifid; the female calyx is ſeſſile, campanulated, and polyſpermous. There are eight ſpecies; of which the moſt remarkable are, 1. The polymorpha, or great ſtar-handed marchantia, is a native of Britain, growing on the banks of rivulets, on ſhady moiſt rocks, the ſides of wells, and ſometimes bogs. The leaves are about three inches long; from half an inch to an inch broad, lying flat on the ground, and adhering cloſely to it by numerous downy radicles, which grow out of the middle and baſe of the leaf on the under ſide. Theſe leaves are ſituated on their edges, their upper ſurface of a dark, ſhining, green colour, reticulated with numerous, minute, rhomboidal, or lozenge-like ſcales; variouſly divided into obtuſe lobes, and in the middle by a blackiſh purple vein; their under ſide is of a paler green, and their ſubſtance coriaceous, and nearly opaque. There are three varieties, from one of which is produced a yellow powder, ſhowing a moſt curious and wonderful mechaniſm when examined by the microſcope. The leaves have a ſtrong aromatic ſmell, and acrid taſte; and are recommended, in a decoction of ſkimmed milk, as good in the jaundice and other diſorders of the liver. 2. The conica, or conic-muſhroom marchantia, with warted leaves, grows on moiſt ſhady banks by the ſides of rivulets. The leaves are broad, flat, about two inches long, dichotomous, obtuſely lobed, and lie upon one another. Their ſurface is of a pale-green gloſſy colour, curiouſly teſſelated with rhomboidal and hexagonal tubercles, each having a white veſicle or wart in the centre, with a puncture on its head. The leaves have a peculiar ſtrong fragrant ſmell, and acrid aromatic taſte. They are ſuppoſed to poſſeſs the ſame attenuating quality as the firſt, but in a higher degree. They are alſo recommended as an antiſcorbutic, and for thinning the blood.

MARCHE, a province of France, bounded on the north by Berry, on the eaſt by Auvergne, on the weſt by Angoumois, and on the ſouth by Limoſin. It is about 55 miles in length, and 25 in breadth, and is pretty fertile in corn and wine.

MARCHENA, an handſome, ancient, and conſiderable town of Spain, in Andaluſia, with the title of a duchy, and a ſuburb as large as the town, ſeated in the middle of a plain, particularly fertile in olives, though very deſtitute of water. W. Long. 5. 20. N. Lat. 37. 20.

MARCHERS, or LORDS-MARCHERS, were thoſe noblemen that lived on the marches of Wales or Scotland; who, in times paſt, according to Cambden, had their laws, and *poteſtatem vitæ*, &c. like petty kings, which are aboliſhed by the ſtat. 27 H. 8. *c.* 26. and 1 Edw. 6. *c.* 10. In old records the lords marches of Wales were ſtyled *Marchianes de Marchia Walliæ.* See 1 & 2 *P.* & *M. c.* 15.

MARCHES *(marchia)*, from the German *march*, i. e. *limes*, or from the French *marque*, viz. *ſignum*, (being the notorious diſtinction between two countries or territories), are the limits between England and Wales, or between England and Scotland, which laſt are divided into weſt and middle marches, 4 Hen. 5. *c.* 7. 22 Ed. 4. *c.* 8. 24 Hen. 8. *c.* 9. And there was formerly a court called the *court of the marches of Wales*, where pleas of debt or damages, not above the value of 50 pounds, were tried and determined; and if the council of the marches held plea for debts above that ſum, &c. a prohibition might be awarded. *Hill.* 14. *Car.* 1. *Cro. Car.* 38.

MARCHET, or MARCHETTA, a pecuniary fine, anciently paid by the tenant to his lord, for the marriage of one of the tenant's daughters. This cuſtom obtained, with ſome difference, throughout all England and Wales, as alſo in Scotland; and it ſtill continues to obtain in ſome places. According to the cuſtom of the manor of Dinover in Caermarthenſhire, every tenant at the marriage of his daughter pays ten ſhillings to the lord; which, in the Britiſh language, is called *gwabr-merched*, i. e. *maid's fee*.

In Scotland, and the north parts of England, the cuſtom was, for the lord to lie the firſt night with the bride of his tenant: but this uſage was abrogated by king Malcom III. at the inſtance of his queen; and, inſtead thereof, a mark was paid by the bridegroom to the lord: whence it was called *marcheta mulieris.* See BOROUGH-*Engliſh*.

MARCIANA SILVA (anc. geog.), a foreſt ſituated between the Rauraci and the Danube, before it comes to be navigable; a part of the Hercynia. Now Schwartzwald, or *Black Foreſt*, in the ſouth-weſt of Suabia, near the riſe of the Danube and Neckar.

MARCIANUS, a native of Thrace, born of an obſcure family. After he had for ſome time ſerved in the army as a common ſoldier, he was made private ſecretary to one of the officers of Theodoſius. His winning addreſs and uncommon talents raiſed him to higher ſtations; and on the death of Theodoſius II. A. D. 450, he was inveſted with the imperial purple in the eaſt. The ſubjects of the Roman empire had reaſon to be ſatisfied with their choice. Marcianus ſhowed himſelf active and reſolute; and when Attila, the barbarous king of the Huns, aſked of the emperor the annual tribute, which the indolence and cowardice of his predeceſſors had regularly paid, the ſucceſſor of Theodoſius firmly ſaid, that he kept his gold for his friends, but that iron was the metal which he had prepared for his enemies. In the midſt of univerſal popularity Marcianus died, after a reign of ſix years, in the 69th year of his age, as he was making warlike preparations againſt the barbarians that had invaded Africa. His death was long lamented; and indeed his merit was great, ſince his reign has been diſtinguiſhed by the appellation of the golden age. Marcianus married Pulcheria the ſiſter of his predeceſſor. It is ſaid, that in the years of his obſcurity he found a man who had been murdered, and that he had the humanity to give him a private burial; for which circumſtance he was accuſed of the homicide, and impriſoned. He was condemned to loſe his life; and the ſentence would have been executed, had not the real murderer been diſcovered, and convinced the world of the innocence of Marcianus.——Another emperor of the eaſt, A. D. 479, &c.

MARCIONITES, or MARCIONISTS, *Marcioniſtæ*, a very ancient and popular ſect of heretics, who, in the time of St Epiphanius, were ſpread over Italy, Egypt, Paleſtine, Syria, Arabia, Perſia, and other countries: they were thus denominated from their author Marcion. Marcion was of Pontus, the ſon of a biſhop, and at firſt made profeſſion of the monaſtical life; but he was excommunicated by his own father, who would never admit him again into the communion of the church, not even on his repentance. On this he abandoned his own country, and retired to Rome, where he began to broach his doctrines

He laid down two principles, the one good, the other evil: between theſe they imagined an intermediate kind of deity of a mixed nature, who was the creator of this inferior world, and the god and legiſlator of the Jewiſh nation: the other nations, who worſhipped a variety of gods, were ſuppoſed to be under the empire of the evil principle. Theſe two conflicting powers exerciſe oppreſſions upon rational and immortal ſouls; and therefore the ſupreme God, to deliver them from bondage, ſent to the Jews a being more like unto himſelf, even his ſon Jeſus Chriſt, clothed with a certain ſhadowy reſemblance of a body: this celeſtial meſſenger was attacked by the prince of darkneſs, and by the god of the Jews, but without effect. Thoſe who follow the directions of this celeſtial conductor, mortify the body by faſtings and auſterities, and renounce the precepts of the god of the Jews, and of the prince of darkneſs, ſhall after death aſcend to the manſions of felicity and perfection. The rule of manners which Marcion preſcribed to his followers was exceſſively auſtere, containing an expreſs prohibition of wedlock, wine, fleſh, and all the external comforts of life.

Marcion denied the real birth, incarnation, and paſſion of Jeſus Chriſt, and held them to be all apparent only. He denied the reſurrection of the body; and allowed none to be baptized but thoſe who preſerved their continence; but theſe, he granted, might be baptized three times. In many things he followed the ſentiments of the heretic Cerdon, and rejected the law and the prophets. He pretended the goſpel had been corrupted by falſe prophets, and allowed none of the evangeliſts but St Luke, whom alſo he altered in many places as well as the epiſtles of St Paul, a great many things in which he threw out. In his own copy of St Luke he threw out the two firſt chapters entire.

MARCITES, Marcitæ, a ſect of heretics in the ſecond century, who alſo called themſelves the *perfecti*, and made profeſſion of doing every thing with a great deal of liberty and without any fear. This doctrine they borrowed from Simon Magus, who however was not their chief; for they were called *Marcites* from one Marcus, who conferred the prieſthood, and the adminiſtration of the ſacraments, on women.

MARCO Polo, Paolo, or *Paulo*. See Paulo.

MARCOMANNI, an ancient people of Germany, who ſeem to have taken their name from their ſituation on the limits or marches, to the eaſt of the Higher Rhine, and the north of the Danube. Cluverius allots to them the duchy of Wurtemburg, a part of the palatinate between the Rhine and the Necker, the Briſgau, and a part of Suabia, lying between the ſprings of the Danube and the river Bregentz: they afterwards removed to the country of the Boii, whom they expelled and forced to withdraw more to the eaſt, occupying what is now called *Bohemia*. (Strabo, Velleius.)

MARCOSIANS, or Colobarsians, an ancient ſect in the church, making a branch of the Valentinians.

St Irenæus ſpeaks at large of the leader of this ſect, Marcus, who it ſeems was reputed a great magician. The Marcoſians had a great number of apocryphal books which they held for canonical, and of the ſame authority with ours. Out of theſe they picked ſeveral idle fables touching the infancy of Jeſus Chriſt, which they put off for true hiſtories. Many of theſe fables are ſtill in uſe and credit among the Greek monks.

MARCULUS, among the Romans, a knocker or inſtrument of iron to knock at the doors with.

MARCUS (Aurelius Antoninus). See Antoninus.

MARDIKERS, or Topasses, a mixed breed of Dutch, Portugueſe, Indians, and other nations, incorporated with the Dutch at Batavia, in the Eaſt Indies.

MARE, the female of the horſe kind. See the article Equus, and Horse.

Before a mare is covered, ſhe ſhould be in the houſe about ſix weeks, during which time ſhe ſhould be well fed with good hay and oats well ſifted; and in order to render her conception the more certain, near a quart of blood may be taken from each ſide of her neck, about five or ſix days before covering. Another method to bring a mare in ſeaſon and make her retain, is to give her, for the ſpace of eight days before you bring her to the horſe, about two quarts of hemp-ſeed in the morning, and as much at night; and if ſhe refuſes to eat it, to mingle it with a little bran or oats, or elſe to let her faſt for a while: and if the ſtallion alſo eat of it, it will greatly contribute to generation.

Mares go with foal 11 months, and as many days as they are years old; and therefore the propereſt time for covering them is in the beginning of June, that they may foal the May following, when there will be plenty of graſs, which will afford the mares a great abundance of milk for nouriſhing their foals. After covering, let her, for three weeks or a month, have the ſame diet as before, and be kept clean in the ſtable, with her feet well pared and thin ſhod: If ſhe cannot readily bring forth, hold her noſtrils ſo as to ſtop her taking wind; and if that will not do, diſſolve madder, to the quantity of a walnut, in a pint of ale and give it her warm. In caſe ſhe cannot void her ſecundine, or after-burden, boil two or three handfuls of fennel in running water; then put half a pint of that liquor into as much ſack, or, for want thereof, into a pint of ale, with a fourth part of ſalad-oil, mixed together, and pour it lukewarm into her noſtrils, holding them cloſe for ſome time. Otherwiſe, give her green wheat, or rye, the laſt of which is beſt.

Sportſm. Dict.

If the mare has but little milk, boil as much as you can get from her with the leaves of lavender and ſpike, and bathe the udder with it warm, till the knobs and knots are diſſolved. She ſhould now drink only white water, which is bran put into water; give her alſo ſweet maſhes: and a month after foaling, let her have a maſh with ſome brimſtone or ſavin in it.

MAREOTIS, a lake in Egypt near Alexandria. Its neighbourhood was famous for wine; though ſome make the *Mareoticum vinum* grow in Epirus, or in a certain part of Libya, called alſo *Mareotis*, near Egypt.

MARETS (Jean de), a Pariſian, one of the fineſt geniuſes of the 17th century, became at laſt a viſionary and a fanatic. He was a great favourite of cardinal Richelieu, and poſſeſſed an employment of genius under him; for he was called upon to relax and divert him, after the fatigue of buſineſs, by facetious converſation. He uſed, in order to triumph over the virtue of women, when they objected to him the intereſt of their ſalvation, to lead them into atheiſtical principles. He was a member of the French academy from its firſt erection. He wrote ſeveral dramatic pieces, which were well received. He attempted an epic poem; but after ſpending ſeveral years about it, dropped the deſign to write books of devotion. He likewiſe wrote romances; but not ſuch virtuous ones as uſed to be written at that time. He was a declared enemy of the Janſeniſts. His viſions are well deſcribed by the Meſſieurs de Port Royal. He promiſed the king of France, by the explication of prophecies, the honour of overthrowing the Mahometan empire. In his laſt years he wrote ſomething againſt Boileau's Satires.

Marets (Samuel de), one of the moſt celebrated divines of the reformed church, was born in Picardy, in 1599. In 1620, he was ſettled in the church of Laon; but, in 1624, accepted a call to that of Sedan: in 1642, he obtained a profeſſorſhip at Groningen; and, from that time to his death, exerted himſelf ſo much in the ſervice of that univerſity, that it was reckoned one of the moſt flouriſhing in the Netherlands. His Syſtem of Divinity was found to be ſo methodical, that it was made uſe of at other academies; and at the end of it may be found a chronological table of all his works. Their number is prodigious; and their variety ſhows the extent of his genius. He was moreover engaged in many diſputes and controverſies, and died in 1673.

MARGARET (St), a celebrated virgin who, as is ſuppoſed, received the crown of martyrdom at Antioch in the year 275: the manner of her death is not known. The ancient martyrologiſts make no mention of her name, and ſhe did not become famous till the 11th century. There is no more foundation for what is ſaid concerning her relics and girdles than for the ſtories which are told of her life. A feſtival, however, is ſtill held in honour of her memory on the 20th of July: See *Baillet's Lives of the Saints* for that day. "Her actions (ſays this author) have been ſo falſified and altered, in the opinion even of Metaphraſtus, that the Romiſh church have not thought proper to inſert any of them into their breviary. The Orientals pay reverence to her by the name of *Saint Pelagia* or *Saint Marina*, and the weſtern church by that of *Saint Geruma* or *Saint Margaret*.

MARGARET, the daughter and heireſs of Florent count of Holland, who is famous on account of a ſtory repeated by a hundred compilers even of the preſent century. Having refuſed charity to a woman whom ſhe at the ſame time accuſed of adultery, ſhe was, as a puniſhment from God, brought to bed (A. D. 1276) of 365 children, partly boys and partly girls. The boys, it is added, were all named *John*, and the girls *Elizabeth*. This ſtory is repreſented in a large painting in a village not far from the Hague; and by the ſide of the painting are ſeen two large baſons of braſs, on which it is pretended the 365 children were preſented to be baptiſed. But if a picture is a ſufficient authority for the truth of any thing, it is impoſſible to tell how many fables would be fully atteſted. It has been remarked, that the moſt ancient annals are altogether ſilent concerning this fact; and that it is related only by modern writers, who beſides do not agree with one another concerning either the date of time, or the life of the counteſs, or the number of the children; and in ſhort, that Naſſau, who was at that time biſhop of Utrecht, was called *John*, and not *Gui*, as the chronicles declare. Several learned men have endeavoured to trace the cauſe which could have given riſe to a relation ſo extraordinary. M. Struik fixed upon the epitaphs of the mother and ſon, which appeared to him worthy of ſome attention; and, in conformity to the dates which they bear, he ſuppoſed that the counteſs was brought to bed on Good-Friday 1276, which was the 26th of March. Now, as the year then began on the 25th of the ſame month, there were only two days of the year elapſed when the counteſs was brought to bed, which circumſtance cauſed it to be ſaid *that ſhe had brought into the world as many children as there were days in the year*. In fact only two children are mentioned in hiſtory, John and Elizabeth. The fable thus explained is only a common event, wherein there is nothing of the marvellous, but in conſequence of a double meaning in the expreſſion. Later writers, who have not examined this circumſtance, have aſcribed 365 children to the counteſs. (*Journal des Savans*, February, 1758, on the General Hiſtory of the United Provinces.)

MARGARET (counteſs of Richmond and Derby), the learned and pious mother of Henry VII. was born at Betſhoe in Bedfordſhire, in 1441; and was the ſole heireſs of John Beaufort duke of Somerſet, grandſon to John of Gaunt. Her mother was the heireſs of Lord Beauchamp of Powick. Whilſt yet very young, the great duke of Suffolk, miniſter to Henry VI. or rather to Queen Margaret, ſought her in marriage to his ſon; and ſhe was at the ſame time ſolicited by the king for his half-brother Edmund earl of Richmond. To the latter ſhe gave her hand. Henry VII. was the ſole fruit of this marriage, his father dying when he was but 15 weeks old. Her ſecond huſband was Sir Henry Stafford, knight, ſecond ſon to the duke of Buckingham; by whom ſhe had no iſſue. Soon after his death, which happened in the year 1482, ſhe ſought conſolation in a third huſband, Thomas Lord Stanley, who, in the firſt year of her ſon's reign, was created earl of Derby. He died in the year 1504, without iſſue, being then high conſtable of England. She ſurvived her lord not quite five years, dying at Weſtminſter in June 1509, in the 69th year of her age. She was buried in Henry VII.'s chapel; on the ſouth ſide of which was erected to her memory an altar-tomb of black marble, with her ſtatue of braſs.

From her funeral ſermon preached by her confeſſor biſhop Fiſher, who, ſays Ballard, knew the very ſecrets of her ſoul, we learn, "that ſhe poſſeſſed almoſt all things that were commendable in a woman, either in mind or body." She underſtood the French language perfectly, and had ſome knowledge of the Latin. She was devout even to auſterity, in humility romantic, profuſe in the encouragement of learning, and ſingularly chaſte; but this laſt virtue became conſpicuous only towards the latter end of a third marriage. "In her laſt huſband's days (ſays Baker), ſhe obtained a licence of him to live chaſte, whereupon ſhe took upon her the vow of celibacy." 'A boon (ſays Mr Walpole), as ſeldom requeſted, I believe, of a third huſband, as it probably would be eaſily granted.' Her life, from the turbulence of the times, and viciſſitude of her ſon's fortune, muſt neceſſarily have been ſubject to infinite diſquiet, which however ſhe is ſaid to have ſupported with ſingular fortitude.—She wrote, 1. The mirroure of golde for the ſinful ſoule, tranſlated from a French tranſlation of a book called *Speculum aureum peccatorum*. Emprynted at London, in Flete-ſtrete, at the ſigne of St George, by Richard Pynſon, quarto, with cuts on vellum. 2. Tranſlation of the fourth book of Dr Gerſen's treatiſe of the imitation and following the bleſſed life of our moſt merciful Saviour Chriſt. Printed at the end of Dr Wm. Atkinſon's Engliſh tranſlation of the three firſt books, 1504. 3. A letter to the king; in Howard's collection. 4. By her ſon's order and authority, ſhe alſo made the Orders for great eſtates of ladies and noble women, for their precedence, and wearing of barbes at funerals, over the chin and under the ſame.

MARGARET, the daughter of Woldemar III. king of Denmark, ſtyled the *Semiramis of the North*: ſhe ſucceeded her father in the throne of Denmark, her huſband in that of Norway, and the crown of Sweden was given her as a recompence for delivering the Swedes from the tyranny of Albert their king. Thus poſſeſſed of the three kingdoms, ſhe formed the grand political deſign of a perpetual union, which ſhe accompliſhed, *pro tempore* only, by the famous treaty ſtyled the *union of Colmar*. She died in 1412, aged 59.

MARGARET of Anjou, daughter of René D'Anjou, king of Naples, and wife of Henry VI. king of England; an ambitious, enterpriſing, courageous woman. Intrepid in the field, ſhe ſignaliſed herſelf by heading her troops in ſeveral battles againſt the houſe of York; and if ſhe had not been the authoreſs of her huſband's misfortunes, by putting to death the duke of Glouceſter his uncle, her name would have been immortaliſed for the fortitude, activity, and policy with which ſhe ſupported the rights of her huſband and ſon, till the fatal defeat at Tewkſbury; which put an end to all her enterpriſes, the king being taken priſoner, and prince Edward their only ſon baſely murdered by Richard duke of York. Margaret was ranſomed by her father, and died in Anjou in 1482. See ENGLAND, nº 201—226.

MARGARET, (ducheſs of Newcaſtle.) See CAVENDISH.

MARGARITA, or PEARL-ISLAND, an iſland of South America, the middle of which is ſeated in W. Long. 64. 2. N. Lat. 11. 30. It was diſcovered by Columbus, and is about 35 leagues in compaſs. The ſoil is very fertile in maize and fruits, and abounds in paſture and verdant groves; yet is totally deſtitute of freſh water, which the inhabitants are obliged to bring from the continent. When the Spaniards firſt landed here, they found the natives buſy in fiſhing for oyſters. Columbus ordered ſome of the ſavages aboard his ſhip, who were ſo far from being terrified, that they very ſoon became familiar with the Spaniards. The latter at firſt imagined that the oyſters ſerved them for food; but on opening the ſhells, they found they contained valuable pearls. Upon this diſcovery they immediately landed, and found the natives ready to part with their pearls for the mereſt trifles. In proceſs of time the Spaniards built a caſtle, called *Monpadre*, and employed prodigious numbers of Guinea and Angola negroes in the pearl-fiſhery; cruelly forcing them to tear up the oyſters from the rocks to which they ſtuck, during which time many of them were deſtroyed by the ſharks and other voracious fiſhes. In 1620, this iſland was invaded by the Dutch, who demoliſhed the caſtle upon it: ſince which time it has been in a manner abandoned by the Spaniards; and is now principally inhabited by the natives, to whom ſome particular indulgences were granted by the court of Spain, on account of their ready ſubmiſſion to Columbus.

MARGARITA, the PEARL, in natural hiſtory. See PEARL, and MYA.

MARGARITINI, are glaſs ornaments, made at Venice of ſmall glaſs tubes of different colours, which are blown at Murano, and which the women of the lower claſs wear about their arms and necks. The largeſt ſort are uſed for making roſaries. This work is performed with great diſpatch, the artiſan taking a whole handful of thoſe tubes at once, and breaking them off one after another with an iron tool. Theſe ſhort cylinders are mixed with a kind of aſhes, and put over the fire in an iron pan; and when the two ends begin to melt, by ſtirring them about with an iron wire, they are brought to a round figure; but care is taken not to leave them too long over the fire, leſt the hole through which they are to be ſtrung ſhould be entirely cloſed by the melting of the glaſs. There are ſeveral ſtreets at Franceſco de Vigna entirely inhabited by people whoſe ſole occupation is to make and ſtring theſe margaritini.

MARGATE, a ſea-port town of Kent, on the north ſide of the iſle of Thanet, near the North-Foreland. It is noted for ſhipping vaſt quantities of corn (moſt, if not all, the product of that iſland) for London; and has a ſalt-water bath at the poſt-houſe, which has performed great cures in nervous and paralytic caſes, and numbneſs of the limbs. It lies in St John's pariſh, which is a member of the port of Dover, at the diſtance of 14 miles, and 12 from Canterbury, and 72 from London; and in the ſummer ſeaſon is frequented for ſea-bathing, having become one of the principal watering-places for the idle, the opulent, and the invalid, where they meet with every requiſite accommodation; and the adjacent country abounds with moſt extenſive proſpects and pleaſant rides. E. Long. 1. 30. N. Lat. 51. 24.

MARHATTAS, MERHATTAHS, MARATTAS, or MAHRATTAS; a people of India, and by far the moſt conſiderable of all the Hindoo powers. The Marhattas boaſt a very high antiquity; they profeſs the religion of Brama; ſpeak a dialect of the Sanſcrit language, in which they have introduced all the technical terms of Moghul adminiſtration; uſe a character of their own in writing, though not very different from ſome of the other tribes around them; and are divided into four caſts or claſſes of people, with the various ſubdiviſions of profeſſional diſtinction found over the reſt of Hindoſtan, but with this remarkable difference, that among the Marhattas every individual may, as in fact he occaſionally does, follow the life of a ſoldier.

As a nation inhabiting immemorially the country properly denominated *Marhat* or *Merhat*, and comprehending the greater part of the Paiſhwa's preſent dominion in the Decan, they were completely ſubjugated, and afterwards for many centuries depreſſed, firſt by the Patans, then by the Moghul conquerors of Delhi. At length, towards the end of Alemgeer's reign, they united, rebelled, and under the famous *Sewajee* or *Seeva-jee*, a leader of their own tribe, laid the foundations of their preſent vaſt empire, which has riſen gradually on the ruins of the Mahomedan power, as related under the article HINDOSTAN, p. 531, par. 6.

Seeva-jee was ſucceeded by his ſon Rajah Sahou, who conſiderably extended the Marhatta dominions. When Rajah Sahou grew old and infirm, and the fatigues of government began to preſs heavy upon him, he appointed Biſſonat Balajee, a Brahman born at Gokum, and leader of about 25,000 horſe, to the office of Paiſhwa or vicegerent.

Sketches relating to the Hindoos, vol. ii. p. 280, &c.

Rajah Sahou died without iſſue, but left nephews by his brother. The courage and wiſdom of Balajee had gained him, during the latter years of the old Rajah, the affection and eſteem of all the nation. But, under an appearance of modeſty and ſelf-denial, his prevailing paſſion was ambition; and the ſentiments of gratitude and loyalty were abſorbed in the deſire to command. He made uſe of the influence he had acquired under his benefactor ſo firmly to eſtabliſh his own power, that he not only retained the high office of Paiſhwa during his life, but tranſmitted it to his poſterity. The Marhattas, gradually forgetting a prince they knew nothing of, became accuſtomed to obey his vicegerent only : yet a certain reſpect for the royal race, or the dread of the conſequence of violating the ſtrong prejudice which the nation ſtill retains in favour of the family of its founder, have ſerved perhaps to preſerve it ; and the deſcendants of Rajah Sahou's nephews yet exiſt; but are kept in captivity in the palace at Sattarah. The eldeſt is ſtyled Ram Rajah, or ſovereign ; his name is on the ſeal and coin of the Marhatta ſtate ; but his perſon is unknown, except to thoſe who immediately ſurround him. He reſides in his ſplendid priſon, encompaſſed with the appendages of eaſtern grandeur, but debarred of all power, and kept totally ignorant of buſineſs. The ſeat of government was transferred from the ancient royal reſidence of Sattarah to Poonah ; and the uſurper, as well as his ſucceſſors, ſeem ſtill to have acted under the ſuppoſed authority of the depoſed prince, by their aſſuming no other title or character than that of Paiſhwa or prime-miniſter. From this change, the empire of the Ram-Rajah has been diſtinguiſhed only by the appellation of the *Paiſhwaſhip*, or otherwiſe the *Government of Poonah*, from the name of its preſent capital.

Biſſonat Balajee was ſucceeded as Paiſhwa by his eldeſt ſon Balajee Row (called alſo *Nana Saheb*, or *Nanah Row*), who left three ſons, the eldeſt of whom, Balajee Pundit, ſometimes called Nanah Pundit, ſucceeded him. The two others were Rogobah or Ragonat Row, and Shamſheer Row.

Balajee Pundit left two ſons ; Mahadava Row, who was Paiſhwa twelve years; and Narrain Row, who ſucceeded him.

During the latter part of the life of Mahadava Row, his uncle Rogobah was confined to the palace at Poonah, for reaſons with which we are not acquainted. Mahadava Row died without iſſue ; and upon the acceſſion of Narrain his brother, a youth of about 19 years of age, Rogobah in vain applied to be releaſed from his confinement. He is therefore ſuſpected of having entered into a conſpiracy with two officers in his nephew's ſervice, Somair Jing and Yuſuph Gardie, in order to procure that by force which he could not obtain by intreaty. The correſpondence between the conſpirators was carried on with ſo much ſecrecy, that the court had not the leaſt intimation or ſuſpicion of their deſign, till every avenue leading to the palace had been ſecured, and the whole building ſurrounded by the troops under the command of thoſe two officers. It is ſaid, that on the firſt alarm, Narrain Row, ſuſpecting his uncle, ran to his apartment, threw himſelf at his feet, and implored his protection : " You are my uncle (ſaid he), ſpare the blood of your own family, and take poſſeſſion of a government which I am willing to reſign to you."

Somair and Yuſuph entered the room whilſt the young Paiſhwa was in this ſuppliant poſture. Rogobah, with apparent ſurpriſe and anger, ordered them to withdraw ; but as they either knew him not to be ſincere, or thought they had proceeded too far to retreat, they ſtabbed Narrain with their poignards whilſt he clung to his uncle's knees.

The office of Paiſhwa being now vacant, the chiefs of the nation then at Poonah were aſſembled, and Rogobah being the only ſurvivor of the family of Biſſonat Balajee, to whoſe memory the Marhattas in thoſe parts are enthuſiaſtically attached, he was named to fill it. Being naturally of a warlike temper, he reſolved to undertake ſome foreign expedition ; for beſides gratifying his paſſion for the field, he probably hoped, by the ſplendour of his exploits, to draw off the attention of the public from inquiring into the late cataſtrophe.

A pretence for war was not difficult to be found. He renewed the claim of his nation to the *chout*, and marched his army towards Hydrobad, the capital of the Nizam. The vigour of his meaſures procured him an accommodation of his demand ; and he was proceeding to enforce a ſimilar one upon the Carnatic, when he received intelligence which obliged him to return haſtily to Poonah.

Although the Marhatta chiefs had acknowledged Rogobah as Paiſhwa, yet they and the people in general were much diſſatisfied with his conduct. The murderers of Narrain Row had not only eſcaped puniſhment, but, as was reported, had been rewarded. The crime was unexampled, and the perpetrators were beheld with uncommon horror and deteſtation. The Paiſhwa had hitherto ſo fully poſſeſſed the love of the people, that, till then, guards were conſidered as unneceſſary about the perſon of a man whoſe character rendered him inviolable. Every one therefore had free acceſs to his palace, and he relied with confidence for his ſafety upon the affections of thoſe who approached him.

Theſe reflections operated powerfully upon the minds of the Marhattas ; but perhaps no violent conſequences would have enſued, had it not been diſcovered, ſoon after the departure of Rogobah from Poonah, that the widow of Narrain Row, Ganga Baee, was pregnant. This determined their wavering reſolutions. Frequent conſultations were held among the principal men then in the capital ; and it was finally reſolved to abjure the allegiance they had ſworn to Rogobah, and declare the child, yet unborn, to be the legal ſucceſſor of the late Paiſhwa.

A council of regency was immediately appointed to govern the country until the child ſhould become of age ; and it was agreed to reſerve their deliberations, in caſe it ſhould prove a female or die, till the event ſhould render them neceſſary. They who principally conducted theſe meaſures, and whoſe names will on that account be remembered, were Sackharam Baboo and Balajee Pundit, called alſo Nanah Pher Nevees from his having been long the principal ſecretary of the Marhatta ſtate. Nine other Marhatta leaders approved of theſe meaſures, and ſwore to maintain them.

As the firſt ſtep towards the execution of their plan, the widow of Narrain Row was conveyed to Poorendher, a fort of great ſtrength, ſituated on a high mountain, about 25 miles from Poonah. As ſoon as Rogobah received intimation of this revolution, he marched ed back towards the capital. But diſcontent had already infected his troops; ſome of the chiefs retired to their eſtates, and others joined the ſtandard of the regents. He however riſked a battle with an army of the revolters commanded by Trimbec Row, in which the latter was ſlain; but though he obtained a victory, the ſtrength of the confederates daily increaſed, while his own troops were diminiſhed by continual deſertions. He therefore found it neceſſary to retire to Ugein, and to ſolicit the aſſiſtance of the Marhatta chiefs Sindia and Holkar; but meeting with a refuſal, he went to Surat, and applied for ſuccour to the Engliſh.

Rogobah's ſucceſs in this application was the cauſe of two wars with the Marhatta ſtate; which, after much waſte of blood and treaſure, we were obliged to conclude by relinquiſhing his claim, and acknowledging as legal Paiſhwa the ſon of Narrain Row, who was born about ſeven months after the death of his father. See INDIA, n° 121 and 152; alſo HINDOSTAN, n° 21.

The Marhatta dominions, as already obſerved, are governed by a number of ſeparate chiefs, all of whom acknowledge the Ram Rajah as their ſovereign; and all, except Moodajee Boonſalah, own the Paiſhwa as his vicegerent. The country immediately ſubject to the Paiſhwa, including all the hereditary territories that were left by the Rajah Sahou to the Ram Rajah, and thoſe that have been acquired and added to them ſince in his name, extends along the coaſt nearly from Goa to Cambay; on the ſouth it borders on the poſſeſſions of Tippoo Saib, eaſtward on thoſe of the Nizam and of the Marhatta Rajah of Berar, and towards the north on thoſe of the Marhatta chiefs Sindia and Holkar.

Moodajee Boonſalah, Rajah of Berar, poſſeſſes, beſides Berar, the greateſt part of Orixa (ſee HINDOSTAN, p. 532, par. 6.). This prince being deſcended from the line of the Ram Rajah, eyes the power of the Paiſhwa, by whom a branch of his family is kept in ignominious confinement, with ill-will; has often refuſed to ſupport his meaſures; and, on ſome occaſions, has even ſeemed inclined to act againſt him.

Next to Moodajee, in point of importance, muſt be ranked Madajee Sindia, a bold and aſpiring chief, who poſſeſſes the greateſt part of the extenſive ſoubadary or government of Malva, together with part of the province of Candeiſh. The remainder is under the dominion of Holkar. Both he and Sindia pretend to be deſcended from the ancient kings of Malva. Sindia reſides chiefly at Ugein, near the city of Mundu, once the capital of theſe kings; and Holkar at Indoor, a town little more than 30 miles weſt of it. The dominions of theſe, and of ſome chiefs of leſs conſequence, extend as far as the river Jumna.

The meaſures purſued by the Marhattas for ſome years left little room to doubt that they aſpired at the ſovereignty of all Hindoſtan, or at leaſt at the expulſion of the Mahomedan princes: And in this laſt deſign they appear to have ſucceeded †, and to have gained a great acceſſion of territory, through the arms of Sindia, both by the capture of the cities of Agra and Delhi, with their territorial dependencies, and the conſequent captivity of the unfortunate monarch who ruled there as the laſt imperial repreſentative of the great Moghul race of Timur. "The whole of the dominion thus newly eſtabliſhed is of vaſt extent, ſtretching near 1200 miles along the frontiers of Tippoo and the Nizam in a north-eaſt direction, from Goa on the Malabar coaſt to Balaſore in Oriſſa adjoining to Bengal; and from thence north-weſterly 1000 miles more, touching the confines of the Britiſh and allied ſtates, on the borders of the Ganges and Jumna, to the territory of the Sieks at Paniput, rendered famous in 1761 for the laſt memorable defeat ſuſtained by the Marhattas in their ambitious conteſt for empire with the united declining power of the Mahomedans. From this place, in a ſoutherly courſe, with great encroachment on the old eaſtern boundary of the Rajepoot country of Ajmere, it runs about 260 miles to the little Hindoo principality of Kotta, and thence ſouthweſterly 540 miles further to the extreme point of the ſoubah of Gujerat at Duarka, including the whole of that fertile province; from whence, along the ſeacoaſts of Cambay and Malabar to Goa, the diſtance may be reckoned 800 miles. Thus the overgrown empire of the Marhattas may be ſaid to extend eaſt 19 degrees of longitude, near the parallel of 22 degrees north latitude, from the mouths of the Indus to thoſe of the Ganges, and about 13 degrees of latitude north, from the Kiſtnah to Paniput; comprehending at leaſt an area of 400,000 ſquare geographic miles, being conſiderably more than a third part of Hindoſtan, including the Decan, and equal perhaps in dimenſions to all the Britiſh and allied ſtates in India, with thoſe of Golconda and Myſore, taken together."

MARIA, or SANCTA MARIA, an iſland of the Indian Ocean, lying about five miles eaſt from Madagaſcar. It is about 27 miles long and five broad; well watered, and ſurrounded by rocks. The air is extremely moiſt, for it rains almoſt every day. It is inhabited by 500 or 600 negroes, but ſeldom viſited by ſhips.

MARIA (St), a conſiderable town of South America, in the audience of Panama, built by the Spaniards after they had diſcovered the gold mines near it, and ſoon after taken by the Engliſh. It is ſeated at the bottom of the Gulf of St Michael, at the mouth of a river of the ſame name; which is navigable, and the largeſt that falls into the gulf. The Spaniards come here every year in the dry ſeaſon, which continues three months, to gather the gold-duſt out of the ſands of the neighbouring ſtreams; and carry away great quantities. W. Long. 148. 30. N. Lat. 7. 0.

MARIA (St), a handſome and conſiderable town of Spain, in Andaluſia, with a ſmall caſtle. It was taken by the Engliſh and Dutch in 1702, for the archduke of Auſtria. It is ſeated on the Guadaleta, at the mouth of which is a tower and a cloſe battery. W. Long. 5. 33. N. Lat. 36. 35.

MARIAN ISLANDS. See *LADRONE Iſlands.*

MARIANA (John), a learned Spaniſh hiſtorian, born at Talavera in the dioceſe of Toledo. He entered among the Jeſuits in 1554, at 17 years of age; and became one of the moſt learned men of his time. He was a great divine, a good humaniſt, and profoundly verſed in eccleſiaſtical as well as profane hiſtory. He

---

† *An Hiſtorical and Political View of the Decan.*

taught at Rome, in Sicily, at Paris, and in Spain; and died at Toledo in 1624. His principal works are, 1. An excellent hiſtory of Spain in 30 books; which he himſelf tranſlated from the Latin into Spaniſh, without ſervilely following his own Latin edition. 2. *Scholia*, or ſhort notes on the Bible. 3. A treatiſe on the changes the ſpecie has undergone in Spain; for which he was thrown into priſon by the duke of Lerma, the Spaniſh miniſter. 4. A famous treatiſe *De rege et regis inſtitutione*, which made much noiſe, and was condemned by the parliament of Paris to be burnt by the hands of the common hangman, for his aſſerting in that work, that it is lawful to murder tyrants. 5. A work on the faults of the government of the ſociety of Jeſuits, which has been tranſlated into Spaniſh, Latin, Italian, French, &c.

MARIANUS SCOTUS, an Iriſh monk, was related to the Venerable Bede, and wrote a chronicle which is eſteemed. He died in the abbey of Fuld in 1086, aged 58.

MARIBONE, or ST MARY LE BONE, or rather *Borne*, from the neighbouring brook, a pariſh of Middleſex, on the north-weſt ſide of London. The manor appears to have belonged anciently to the biſhop of London. The houſes in this pariſh are very numerous, compriſing ſeveral extenſive ſtreets and ſquares, which are every year increaſing. The Paddington road from Iſlington paſſes through this pariſh, which gives it communication with the eaſtern part of London without paſſing thro' the ſtreets. Here were three conduits erected about the year 1238, for ſupplying the city of London with water; but anno 1703, when it was plentifully ſerved by the New-River, the citizens let them out at 700l. a-year for 43 years. There were two for receiving its water at the north-eaſt corner of the bridge on the river Tyburn, and over them ſtood the lord-mayor's banqueting-houſe, to which (the uſe of coaches being not then known) his lordſhip and the aldermen uſed to ride on horſeback, as their ladies did in waggons. This banqueting-houſe, after being many years neglected, was taken down in 1737, and the ciſterns arched over. This village, if it may be called by that name, is joined by new buildings to London. The old church, which was a mean edifice, was pulled down, and a new one erected in 1741. Beſides which it has a great number of chapels of every ſect and perſuaſion, and an extenſive work-houſe for the poor.

MARIDUNUM (anc. geog.), a town of the Demetæ in Britain. Now *Caer Mardin*, or *Caermarthen*, the capital of Caermarthenſhire.

MARIGALANTE, an iſland of North America, and one of the leaſt of the Caribbees, lies in N. Lat. 16. 32. and W. Long. 61. 5. from London, at the diſtance of four leagues from Guadaloupe, to the ſouth. The ſoil, produce, and climate, are pretty much the ſame as the other Caribbees. Columbus diſcovered it on his ſecond American voyage in 1483, and called it by the name of his ſhip Maria Galanta, or Gallant Mary. It is about ſix leagues long, and between three and four broad. Viewed at a diſtance from on board a ſhip, it appears like a floating iſland, becauſe, as it is for the moſt part flat, the trees ſeem to ſwim; but a nearer proſpect ſhows it to be interſected by ſome riſing grounds, which give a fine variety to the landſcape. The French ſettled here in 1648; and it was taken by the Engliſh in 1691, but the French ſoon got poſſeſſion of it again. It was again taken by the Britiſh in 1759, but afterwards reſtored at the peace 1763.—This iſland was thought, on its firſt diſcovery, to want water; but a charming running ſtream has in time been diſcovered, no leſs convenient than refreſhing and wholeſome, on the banks of which are ſome wealthy planters, and excellent plantations of ſugar. A little village in a ſmall bay is the capital of the iſland, and here the commandant reſides. The whole iſland is very capable of improvement; the ſoil being almoſt equally good, and the land riſing no where too high. The coaſt affords many little bays, and ſafe anchorage and ſhelter to ſhips.

MARINE, a general name for the navy of a kingdom or ſtate; as alſo the whole economy of naval affairs; or whatever reſpects the building, rigging, arming, equipping, navigating, and fighting ſhips. It comprehends alſo the government of naval armaments, and the ſtate of all the perſons employed therein, whether civil or military.

The hiſtory of the marine affairs of any one ſtate is a very comprehenſive ſubject, much more that of all nations. Thoſe who would be informed of the maritime affairs of Great Britain, and the figure it has made at ſea in all ages, may find abundance of curious matter in Selden's *Mare Clauſum;* and from his time to ours, we may trace a ſeries of facts in Lediard's and Burchet's Naval Hiſtory, but above all in the Lives of the Admirals, by the accurate and judicious Dr Campbell.

MARINES, or *MARINE FORCES*, a body of ſoldiers raiſed for the ſea-ſervice, and trained to fight either in a naval engagement or in an action aſhore.

The great ſervice of this uſeful corps was manifeſted frequently in the courſe of the war before laſt, particularly at the ſiege of Belleiſle, where they acquired a great character, although lately raiſed and hardly exerciſed in military diſcipline. At ſea they are incorporated with the ſhip's crew, of which they make a part; and many of them learn in a ſhort time to be excellent ſeamen, to which their officers are ordered by the admiralty to encourage them, although no ſea-officer is to order them to go aloft againſt their inclination. In a ſea-fight their ſmall-arms are of very great advantage in ſcouring the decks of the enemy; and when they have been long enough at ſea to ſtand firm when the ſhip rocks, they muſt be infinitely preferable to ſeamen if the enemy attempts to board, by raiſing a battalion with their fixed bayonets to oppoſe him.

The ſole direction of the corps of marines is veſted in the lords commiſſioners of the admiralty; and in the admiralty is a diſtinct apartment for this purpoſe. The ſecretary to the admiralty is likewiſe ſecretary to the marines, for which he has a ſalary of L. 300 a-year; and he has under him ſeveral clerks for the management of this department.

The marine forces of Great Britain in the time of peace are ſtationed in three diviſions; one of which is quartered at Chatham, one at Portſmouth, and another at Plymouth. By a late regulation, they are ordered to do duty at the ſeveral dock-yards of thoſe ports, to prevent embezzlement of the king's ſtores, for which a captain's guard mounts every day; which certainly requires great vigilance, as ſo many abuſes of this kind

have

have been committed, that many of the inhabitants, who have been long uſed to an infamous traffic of this kind, expect theſe conveyances at certain periods as their due, and of courſe reſent this regulation in the higheſt degree as an infringement of their liberties as Britiſh ſubjects.

The marine corps are under the command of their own field-officers, who diſcipline them, and regulate their different duties.—His late majeſty in 1760 formed a new eſtabliſhment of marine officers, intitled, the *general*, *lieutenant-general*, and *three colonels* of marines (one for each diviſion), to be taken from officers in the royal navy. The two firſt are always enjoyed by flag-officers, the laſt by poſt-captains only. This eſtabliſhment was formed to reward ſuch officers who diſtinguiſhed themſelves in the ſervice of their country.

Marine-Diſcipline, is the training up ſoldiers for ſea-ſervice, in ſuch exerciſes as the various poſitions of the firelock and body, and teaching them every manœuvre that can be performed on board ſhips of war at ſea. See Exercise.

Marine-Chair, a machine invented by Mr Irwin for viewing the ſatellites of Jupiter at ſea, and of courſe determining the longitude by their eclipſes. An account of it is given in the *Journal Eſtranger* for March 1760. An account of its accuracy was publiſhed the year following by M. de L'Iſle aſtronomer in the imperial academy of Peterſburg: but notwithſtanding the encomiums beſtowed upon it by this gentleman, it hath never come into general uſe; and therefore we may conclude, that it is much inferior to the inventions of Mr Harriſon for the ſame purpoſe. See Harrison and Longitude.

Marine-Surveyor, is the name of a machine contrived by Mr H. de Saumarez for meaſuring the way of a ſhip in the ſea. This machine is in the form of the letter Y, and is made of iron or any other metal. At each end of the lines which conſtitute the angle or upper part of that letter, are two pallets, not much unlike the figure of the log; one of which falls in the ſame proportion as the other riſes. The falling or pendant pallet meeting a reſiſtance from the water, as the ſhip moves, has by that means a circular motion under water, which is faſter or ſlower according as the veſſel moves. This motion is communicated to a dial within the ſhip, by means of a rope faſtened to the tail of the Y, and carried to the dial. The motion being thus communicated to the dial, which has a bell in it, it ſtrikes exactly the number of geometrical paces, miles, or leagues, which the ſhip has run. Thus the ſhip's diſtance is attained; and the forces of tides and currents may alſo be diſcovered by this inſtrument: which, however, has been very little uſed.

Marine-Acid, a name given to one of the component parts of ſea-ſalt. An account of various methods of procuring this acid from common ſalt, of moſt of its chemical properties, and of ſeveral uſes it may be put to in the arts, is given under the articles Chemistry, *Colour-Making*, Bleaching, &c. M. Chaptal obſerves, that the marine acid cannot be obtained by diſtilling ſalt with powdered flints. He made the experiment by mixing ten pounds of flints with two pounds of ſea-ſalt, but obtained only a maſs of the colour of litharge, and the fumes were not perceptibly acid. Clay will decompoſe this ſalt for once, but not in the ſmalleſt degree if uſed a ſecond time; which ſhows that in all probability the decompoſition is owing to a portion of vitriolic acid contained in the clay. In France there is a very impure kind of ſoda named *Blanquette*, which, according to M. Chaptal's analyſis, contains 21 pounds of ſea-ſalt out of 25; and yet, when treated with vitriolic acid, affords little or no ſpirit of ſalt, but abundance of volatile ſpirit of ſulphur. Our author aſcribes this to the quantity of charcoal contained in the blanquette, which unites with the vitriolic acid and volatilizes it: and his conjectures appeared to be right; becauſe, if the coal is deſtroyed by calcination, the blanquette yields marine acid in proportion to the quantity of common ſalt it contains.

Under the article Bleaching we have taken notice of the properties of the dephlogiſticated acid of ſea-ſalt in whitening cloth: but though this has been often attempted, it does not appear likely to come into practice; nor does even the offer of a premium ſeem to encourage the bleachers of this country to make any ſerious endeavour to introduce it. This we can only account for in two ways: 1. From the very noxious and ſuffocating ſmell attending the operation, by which the health, and even the life of thoſe who prepare this acid in an unſkilful manner, as well as of the bleachers who make uſe of it, are greatly endangered. 2. From the exceſſive waſte of vapour in the ordinary mode of preparation, which renders the liquid too dear for ordinary uſe.

To avoid theſe inconveniences, it has been recommended by chemiſts to force the vapour violently into larger quantities of water, and by compreſſing the fumes to a great degree, to render the liquid extremely ſtrong, and then dilute it when it is to be uſed. By this means, however, the vapour forces out at the joinings of the diſtilling veſſel in ſuch a manner that no lute can keep it in; at the ſame time that the liquor being impregnated with an over-proportion of gas, lets go the ſuperfluous quantity as ſoon as the preſſure is taken off, thereby loſing its power, and annoying with its noxious and indeed poiſonous ſmell every one who comes near it. The trouble attending this preparation may be eaſily judged from the following deſcription of the proceſs given by M. Chaptal.

"To extract this acid (ſays he), I place a large glaſs alembic, of one ſingle piece, upon a ſand-bath. To the alembic I adopt a ſmall receiver; and to the receiver three or four ſmall bottles nearly filled with diſtilled water, and arranged according to the method of Mr Woulfe. I diſpoſe the receiver and bottles in a ciſtern, the places of junction being luted with fat lute, and ſecured with rags ſoaked in the lute of lime and whites of eggs. Laſtly, I ſurround the bottles with pounded ice. When the apparatus is thus diſpoſed, I introduce into the alembic half a pound of manganeſe of Cevennes, and pour upon it, at ſeveral repetitions, three pounds of fuming muriatic acid. The quantity of acid which I pour at once is three ounces; and at each time of pouring, a conſiderable efferveſcence is raiſed. I do not pour a new quantity until nothing more comes over into the receivers. This method of proceeding is indiſpenſably neceſſary when the operator is deſirous of making his proceſs with a definite quantity of materials: for if too large a quantity of acid be poured on at once, it is impoſſible to reſtrain the vapours; and the effervefcence will throw a quantity of manganeſe into the receiver. The vapours which are developed by the effuſion of muriatic acid are of a greeniſh-yellow colour, and they communicate this colour to the water when they combine with it. When this vapour is concentrated by means of the ice, and the water is ſaturated with it, it forms a ſcum on the ſurface, which is precipitated through the liquid, and reſembles a congealed oil. It is neceſſary to aſſiſt the action of the muriatic acid by means of a moderate heat applied to the ſand-bath. The ſecure luting of the veſſels is alſo an eſſential circumſtance; for the vapour which might eſcape is ſuffocating, and would not ſuffer the chemiſt to inſpect his operation cloſely. It is eaſy to diſcover the place where it eſcapes through the lutes by running a feather dipped in volatile alkali over them; the combination of theſe vapours inſtantly forms a white cloud, which renders the place viſible where the vapour eſcapes.

“ The ſame oxygenated muriatic acid may be obtained, by diſtilling in a ſimilar apparatus ten pounds of marine ſalt, three or four pounds of manganeſe, and ten pounds of *ſulphuric* (vitriolic) acid.

“ Mr Reboul has obſerved, that the concrete ſtate of this acid is a cryſtallization of it, which takes place at three degrees of temperature below the freezing point of Reaumur. The forms which have been obſerved are thoſe of a quadrangular priſm, truncated very obliquely, and terminated by a lozenge. He has likewiſe obſerved hollow hexahedral pyramids on the ſurface of the liquor.

“ To make uſe of the oxygenated acid in the arts, and in order to concentrate a greater quantity in a given volume of water, the vapour is made to paſs thro' a ſolution of alkaline ſalt. A white precipitate is at firſt formed in the liquid; but a ſhort time afterwards the depoſition diminiſhes, and bubbles are diſengaged which are nothing but the carbonic acid. In this caſe two ſalts are formed, the oxygenated muriate and the ordinary muriate. The mere impreſſion of light is ſufficient to decompoſe the former, and to convert it into common ſalt. This lixivium contains indeed the oxygenated acid in a ſtronger proportion. The execrable ſmell of the acid is much weakened. It may be employed for various uſes with the ſame ſucceſs, and with great facility; but the effect is very far from correſponding with the quantity of oxygenated acid which enters into this combination, becauſe the virtue of a great part is deſtroyed by its union with the alkaline baſis.—The oxygenated muriatic acid has an exceſſively ſtrong ſmell. It acts directly on the larynx, which it ſtimulates, excites coughing, and produces violent headaches.”

The apparatus recommended by Mr Berthollet is on the ſame plan with M. Chaptal's, though the ſcale is much larger. Both are evidently troubleſome; and cannot by any means be introduced into ordinary practice, where the *preparation*, as well as the method of uſing the liquor, muſt be left to workmen of little underſtanding and leſs attention. For theſe it is neceſſary to have an apparatus which may not readily be broken, which requires little trouble or dexterity in the uſing, and which may prepare great quantities at once. The principal difficulty is the condenſation of the fumes. To attempt violently to force ſteam of any kind into water is always improper, and ſeldom anſwers any purpoſe, unleſs when for chemical experiments the liquors are wanted of extraordinary ſtrength. Water naturally attracts a certain proportion of every kind of vapour; and when once this natural attraction is ſatisfied, it is vain to attempt to force more into it. In proportion to the quantity of ſurface expoſed to the ſteam, water will imbibe it in ſhorter or longer time; and therefore a broad ſhallow veſſel is always preferable to a round or narrow deep one where diſtillations of this kind are to be performed.

It muſt alſo be obſerved, that the vapour with which the water is to be impregnated, ought not to ruſh out of the diſtilling veſſel with too great haſte; as in this caſe a great quantity will unavoidably be loſt, by reaſon of the water not having time to abſorb it all. To avoid this, matters ſhould be managed in ſuch a manner, that, without ſenſibly interrupting the operation, the vapour may iſſue from the diſtilling veſſel gradually, and without ſudden exploſions; by which means the water will imbibe as faſt as the veſſel diſtils for a certain time; and in order to preſerve all the vapour, there ought to be ſeveral receivers, one above the other, communicating by pipes, that the vapour which does not condenſe in one may do ſo in the other.—The following apparatus may be uſed with ſucceſs:

1. For the diſtilling-veſſel. A large bottle of common brown earthen-ware, ſuch as is repreſented on the margin, is undoubtedly the cheapeſt, and moſt eligible diſtilling-veſſel that can be made uſe of; as it is not liable to break, and may be uſed for a long time without being corroded. It may be placed in a ſand-bath; or in caſe it is luted, it may be put on an open fire, which, however, ought not to be raiſed to any great height.

2. The receivers ought to be large ſquare ciſterns of wood, covered over on the inſide with white wax, on which the acid has no effect; and they may be placed, for the greater convenience, one above the other, with cocks ſo ſituated, that the water of the upper ciſterns may be diſcharged into the lower ones as occaſion requires. The lowermoſt ciſtern muſt alſo be furniſhed with a cock, for running off the liquor into the veſſels in which the cloth is to be ſteeped.

3. The bottle muſt be furniſhed with a glaſs tube to convey the ſteam from it into the receiver; but to prevent any of the acid from getting in amongſt the liquor deſigned for bleaching, it will be neceſſary to have a ſmall caſk interpoſed betwixt it and the receivers; which will alſo prevent the liquor from being dirtied by any ſudden ſwell of the mixture in the bottle.

4. It will be convenient, and which may be eaſily accompliſhed in moſt bleaching-houſes, to have a ſmall ſtream of clear water running into it, higher than the level of the uppermoſt reſervoir; by which means they can all be filled to a ſufficient depth with very little trouble. The apparatus then will be as repreſented on Plate CCLXXX. where A is the bottle containing the mixture; B the ſand pot, furnace, door, and aſh-hole; C the glaſs tube to convey the ſteam into the

caſk D, placed there on purpoſe to catch any acid which may diſtil, or ſmall quantity of the mixture which may boil over. E is another glaſs-tube communicating with the lowermoſt reſervoir *d*, into which it conveys the ſteam to be abſorbed by the water lying in its bottom. The three ciſterns communicate on their upper parts by means of the pipes *m* and *n*, by which the ſteam which does not condenſe in the lower reſervoir is conveyed to the middle one *e*, and that which does not condenſe in the middle one is conveyed to the upper one *f*; in which a vent is finally given to it at *g*; or if it is found that three reſervoirs are not ſufficient, there may be one or more placed on the top of theſe, in a manner ſimilar to what we have already deſcribed.

The operation is to be begun by putting into the bottle A, a quantity of ſtrong ſpirit of ſalt diluted with at leaſt four times its quantity of water, ſufficient to fill ſomewhat more than one half of it. The mangaueſe, reduced to as fine a powder as poſſible, is to be made up into ſmall pellets or balls, with water, and thrown in at the lateral neck of the bottle. A few only are to be thrown in at once, and the mouth inſtantly ſtopped with a cork; a briſk effervefcence will immediately enſue, and a conſiderable quantity of vapours will come over without heat, paſſing thro' the pipes C and E into the reſervoir *d*; from thence through *m* into the reſervoir *e*, and from *e* into *f*; the ſmall quantity which ſtill remains uncondenſed paſſing out at the vent *g*, which ought to be under a chimney, or to be fitted with an upright pipe going through the roof of the houſe.

A fire being applied, the vapour will begin to iſſue out through the pipes in greater quantities, but by the time the liquor has begun to boil, the dephlogiſticated vapour will have entirely paſſed over. This may be eaſily known to be the caſe by the heat of the glaſs tubes. On this the cork is to be pulled out, and two or three more pellets of manganeſe are to be thrown in, and the mouth ſtopped up as quickly as poſſible. The vapour from theſe will be quickly diſſipated, and the operation muſt be repeated until no more effervefcence ariſes upon throwing in the manganeſe. When this is the caſe, a freſh quantity of ſpirit of ſalt diluted, but not ſo much as the preceding, is to be added, and this again treated with more manganeſe as before; continuing the operation till the bottle be ſuppoſed as full as is convenient for the operation. The whole muſt now be allowed to cool; and it would be proper to have another furnace, ſand pot, and bottle, to join immediately to the reſervoirs, that the operation may not be interrupted.—The water in the lowermoſt reſervoir will always be moſt ſtrongly impregnated, and may be known to be of ſufficient ſtrength when a few threads of flax put into it are viſibly whitened in two or three minutes. It is then to be let off into the large reſervoir for ſteeping the cloth; the water in the middle receiver, which is alſo partly impregnated with dephlogiſticated gas, muſt be let down into the lowermoſt one by turning the cock of the pipe *i*, which runs off the water to the bottom. In like manner, the water in the upper ciſtern *f* is let down into the middle ciſtern *e*, by turning the cock belonging to the pipe *h*, while that in *f* is to be replaced by freſh water from the ſtream which runs into the houſe.—The reſiduum of the diſtillation is a ſolution of manganeſe in common ſpirit of ſalt, from which the metal may be precipitated by cauſtic volatile alkali, and the liquid will afford ſal ammoniac: the precipitate, by being calcined again till it grows black, may be uſed as freſh manganeſe; but conſidering the low price of this mineral, we can ſcarce recommend this proceſs as worth the trouble. It is certain, however, that a great part of the marine-acid will remain undecompoſed, even after we have added as much manganeſe as will excite any effervefcence. This may be extemporaneouſly recovered by pouring into the diſtilling veſſel a ſmall quantity of oil of vitriol. This expels the marine acid from the manganeſe with which it is united, and renders it again capable of acting upon more; but when the addition of a ſmall quantity of this acid has no effect in producing the proper gas, we may then be ſure that the operation is totally finiſhed. The reſiduum is now a combination of manganeſe with vitriolic acid, and may be decompoſed by volatile alkali, ſo that it can ſtill be of uſe to the makers of ſpirit of hart's-horn and ſal ammoniac.

Thus we ſee, that by a very eaſy proceſs, without the ſmalleſt danger to the health of the workman, an unlimited quantity of dephlogiſticated ſpirit of ſalt may be prepared of a ſufficient ſtrength to anſwer every uſeful purpoſe; and it is evident from the foregoing deſcription of the proceſs, that the moſt is made of the materials, ſo that we can ſcarce expect a cheaper method. The practice of mixing together the ſalt, oil of vitriol, and manganeſe, all together in the diſtilling veſſel, is by no means to be commended; for thus the matter always runs into an hard lump, which cannot be got out without breaking the veſſel; and the vapour is, beſides, forced out with ſuch rapidity, that great part of it is unavoidably loſt.

The next and moſt important conſideration is the method of uſing the liquor after it is diſtilled. And here, as the volatility of the gas is the principal obſtacle to the preſervation of its ſtrength, it is indiſpenſibly neceſſary to have it to run from a covered ſpout into a covered veſſel where the cloth is placed. It is likewiſe a matter of importance to have the cloth ſpread among the liquid in ſuch a manner that the power of the gas may be equally diffuſed over its whole ſurface; for if it lies in folds upon one another, it will undoubtedly be ſpotted, let us do as we will. To prevent this in the moſt effectual manner, it is neceſſary to roll the cloth as is done by dyers to make their colours ſtrike equally; for this operation we may account a kind of dyeing *white*; and the ſame precautions are undoubtedly neceſſary to make this colour equal as any other. It is probable, that veſſels and rollers might be ſo conſtructed, that a number of pieces of cloth might be whitened all at once; and the operation of driving the rollers might be performed by a machine driven by water.

With regard to the uſe of this liquid itſelf, it muſt be obſerved, that though very cheap when made as above directed, yet water itſelf is ſtill cheaper; and whatever can be done by mere water, ought to be previouſly done to the cloth before it is immerſed in the dephlogiſticated liquor. With this view it ought to undergo a long continued but gentle fulling, a ſtream of warm water conſtantly running upon it all the while. Thus an incredible quantity of filth will be ſeparated; and it will be matter of ſurpriſe to thoſe who have not made the experiment, to be told, that they could not, in 24 hours, waſh a piece of cloth as it comes from the weaver ſo clean in repeated quantities of water but that it would ſtill render the laſt quantity dirty. Cloth, when treated in this manner for a conſiderable time, will be very nearly as well whitened as that which has been boiled in alkali. Boiling in water has not an effect nearly equal to that of gentle beating while the cloth is immerſed in water, neither are violent ſtrokes ſo uſeful as thoſe which are gentle; and it might undoubtedly be worth while to contrive a machine for the purpoſe of giving this gentle fulling, which, without injuring the texture of the cloth, might be continued for a long time, and would be advantageous either on the old or new plan of bleaching.

If this method of fulling ſhould not be adopted, that of *ſtreaming* the cloth, or immerſing it for ſome time in a ſtream of running water, would be of very conſiderable uſe as a preparation: but boiling with alkaline ſalt ſeems more advantageouſly to be omitted till after the cloth has undergone two or three operations in the dephlogiſticated liquor; becauſe this liquid, even when very weak, will cleanſe conſiderably, and extract a great quantity of ſordes, which would load the alkali and deſtroy its force.

Having prepared the cloth in ſome of the methods above mentioned, it is to be put into the veſſel deſigned for whitening, put over the roller, and a quantity of the liquid let into it. As the cloth whitens, the liquor gradually loſes its ſmell, and ſoon becomes incapable of giving any additional whiteneſs. This may be perceived by having a ſmall door in the ſide of the veſſel, which may be opened occaſionally, and a bit of the cloth pulled out through it and looked at. When the firſt quantity of liquid, therefore, appears to have no more effect, it muſt be allowed to run off into another veſſel; but is not yet to be thrown away, becauſe it is ſtill much more powerful than water, and will have a conſiderable effect upon cloths which have undergone the aqueous preparation.

After the firſt quantity of liquid is run off, another muſt be admitted from the lowermoſt reſervoir, and is to be uſed in the ſame manner with the former; only it will now be ſomewhat longer before its ſtrength is exhauſted. When this is the caſe, a third quantity is to be employed, and ſo on till we find that the effect of the liquid is beginning to diminiſh. The cloth muſt then be taken out, fulled, and thoroughly cleaned of the acid by water, before the next operation, which is boiling with alkali. The lixivium ought to be of conſiderable ſtrength, that the liquor may eaſily be evaporated, and part of the alkali recovered by a proceſs related under the article POTASHES; but as the cloth will neceſſarily retain a conſiderable quantity of this ſtrong lixivium, it muſt be wrung out by a proper inſtrument for that purpoſe, and the liquid which falls from it ſaved and returned again into the kettle. The cloth, ſtill retaining a quantity of alkali which could not be wrung out, muſt be thrown into a cauldron of boiling water, and allowed to remain there for a quarter of an hour; after which it is to be taken out and wrung as before. The water of the ſecond cauldron will be ſlightly alkaline, and may be uſed as a preparation for cloth, or for filling up the veſſel containing the ſtrong alkali as it evaporates.

Before the cloth is returned into the dephlogiſticated liquor, it is abſolutely neceſſary that the alkaline ſalt be entirely taken out of it, which can only be ſpeedily done by fulling, ſtreaming, or at leaſt ſteeping in repeated quantities of water. When all this is done, it will moſt probably be of a darker colour than before; but this will go off in a few minutes, and the cloth will become much whiter than ever. The remainder of the operation is only a repetition of the proceſſes already deſcribed, and for which no other directions are requiſite than that both alkali and acid, the latter eſpecially, always looſen a quantity of ſordes, which, unleſs waſhed off, ſoon prevents their own operation. As ſoon, therefore, as the cloth is taken out of either the alkaline or acid liquor, there is a neceſſity for uſing every method conſiſtent with the ſafety of its texture to clear it of this looſe matter, which will allow the liquor into which it is next plunged to have the greater effect. It muſt be remembered, however, that the nearer the cloth approaches to perfect whiteneſs, the leſs effect has either of the liquids upon it; and therefore there is a neceſſity either for increaſing the ſtrength of the dephlogiſticated acid, or allowing it a longer time; but the latter is by much the preferable method: and, after all, it would be far from being improper to expoſe the cloth for a few days to the air, which will effectually prevent any change of colour afterwards, as frequently happens to cloths bleached after this manner.

Could a ready method be fallen upon to bleach flax by itſelf, it would be greatly in favour of the linen manufacture; as the ſtrength of the threads are vaſtly increaſed by this method. The great difficulty in this operation; ariſes from the filamentous nature of the flax; by which, when put into any liquid, it becomes matted together in ſuch a manner as not to be ſeparated afterwards by any means whatever ſo as to be ſpun with the ſame eaſe as before. The fairer and better dreſſed the lint is, the greater is this difficulty; and to obviate it, there ſeems to be no other poſſible method but that of uſing flax juſt as it comes from the mill, without any other dreſſing. Thus, indeed, the tow muſt be bleached as well as the flax; but when we conſider, that thus it may be ſpun into much finer and ſtronger yarn than otherwiſe could be done, we cannot ſuppoſe this to be any diſadvantage.

Another obſtacle is the difficulty the liquid has in getting into the heart of the flax; ſo that the outſide will be well whitened, when the inſide is ſcarce altered. For this no other remedy ſeems adequate, beſides the dividing it into many ſmall parcels, tying them together in pairs, putting them over rods as candle-makers do their candles, and thus ſuſpending them for a time in the liquid. They muſt be dipped in an hot ſolution of alkali in the ſame manner, afterwards for a conſiderable time in freſh water, to take out all the alkali; after which, they are to be again put into the acid liquor, and treated exactly as directed for the cloth. Thus, in two or three days, the flax will attain a ſurpriſing whiteneſs. It is then to be dreſſed and treated exactly as other flax, but muſt be dried without any kind of wringing or preſſure,

ſure.—This method would appear to be uſeful, even though the utmoſt degree of whiteneſs ſhould not be given, as the texture of the threads will be much leſs injured by the ſubſequent bleaching than if the flax had been ſpun in its natural ſtate.

Mr Chaptal obſerves, that this acid may be applied to the whitening of paper and old prints; and by its means (he ſays) they obtain a whiteneſs which they never had before. Common ink diſappears by its action, but it has no effect upon printer's ink.—It thickens oils, and calcines metals to ſuch a degree, that the proceſs may be much expedited by its means. It diſſolves metals without efferveſcence, and precipitates mercury from its ſolutions, converting it into corroſive ſublimate.—It acts, likewiſe, very vigorouſly upon metallic calces, forming with them ſalts more readily than other acids.

M. Chaptal obſerves, that the combination of the marine acid with vegetable alkali, named *febrifuge ſalt of Sylvius*, is found, though in ſmall quantities, in ſea-water, plaſter, and the aſhes of tobacco. "The exiſtence of this ſalt (ſays he) in the aſhes of tobacco, might with juſtice have ſurpriſed me, as I had reaſon to expect the muriate of ſoda, which is employed in the operation called *watering*. Was the ſoda metamorphoſed into pot-aſh by the vegetable fermentation? This may be determined by direct experiments."

Method of preſerving the health of MARINERS. See SEAMEN.

MARINER's *Compaſs*. See COMPASS.

ST MARINO, a ſmall town and republic of Italy, ſituated in E. Long. 13. 44. N. Lat. 44. 21. This ſmall republic conſiſts only of a mountain, and a few hillocks, that lie ſcattered about the bottom of it. The number of the inhabitants is about 5000. The mountain yields good wine, but they have no other than rain or ſnow water. The founder of the republic was a Dalmatian, and a maſon, who upwards of 1300 years ago turned hermit, and retired to this mountain. Here his devotion and auſterity, and, in conſequence of that, his reputation for ſanctity, were ſuch, that the princes of the country made him a preſent of the mountain; on which many, out of veneration for the ſaint, ſoon after took up their abode. Thus was the foundation laid of the town and republic, which ſtill bears the name of the ſaint. The town ſtands on the top of the mountain, and there is only one way by which it can be come at. In the whole territory are only three caſtles, three convents, and five churches. The largeſt of the churches is dedicated to the ſaint, and contains his aſhes and his ſtatue. He is looked upon as the greateſt ſaint, next to the bleſſed Virgin; and to ſpeak diſreſpectfully of him is accounted blaſphemy, and puniſhed as ſuch. The republic is under the protection of the pope. All that are capable of bearing arms are exerciſed, and ready at a minute's call. In the ordinary courſe of government, the adminiſtration is in the hands of the council of 60, which, notwithſtanding its name, conſiſts only of 40; one half of the members of which are of the noble families, and the other of the plebeian: on extraordinary occaſions, however, the arengo, in which every houſe has its repreſentative, is called together. The two principal officers are the capitaneos, who are choſen every half year; and next to them is the commiſſary, who judges in civil and criminal matters, and is joined in commiſſion with the capitaneos; both he and the phyſician muſt be foreigners, and both have their ſalaries out of the public ſtock. When any perſon, after due ſummons, neglects to aſſiſt at the council according to their ſtatute-book, he is to be fined in about a penny Engliſh; and when an ambaſſador is to be ſent to any foreign ſtate, he is to be allowed about 1 s. a-day.

MARINO (John Baptiſt), a celebrated Italian poet, born at Naples in 1569. His father, who was an able civilian, obliged him to ſtudy the law; at which being diſguſted, he left his parents, and retired to the houſe of the Sieur Manzi, who was a friend to all perſons of wit. He at length became ſecretary to Matthew of Capua, great admiral of the kingdom of Naples, and contracted a friendſhip with Taſſo. A ſhort time after, he went to Rome, and entered into the ſervice of cardinal Aldobrandini, nephew to pope Clement VIII. who took him with him to Savoy. Marino was in great favour with the court of Turin; but afterwards created himſelf many enemies there, the moſt furious of whom was the poet Gaſpard Murtola, who, attempting to ſhoot him with a piſtol, wounded one of the duke of Savoy's favourites. Marino being obliged to leave Turin, went to Paris at the deſire of queen Mary de Medicis, and publiſhed there his poem on Adonis. He afterwards went to Rome, where he was made prince of the academy of the humoriſti; from thence to Naples, where he died while he was preparing to return home. He had a very lively imagination, but little judgment; and, giving way to the points and conceits then in vogue, his authority, far from correcting the falſe taſte of the Italians, ſerved rather to keep it farther from reformation. His works, which are numerous, have been often printed.

MARINUS, an engraver who flouriſhed about the year 1630, and reſided principally at Antwerp. His plates, Mr Strutt obſerves, are executed in a very ſingular ſtyle, with the graver only: The ſtrokes are very fine and delicate, and croſſed over each other in a lozenge-like form, which he filled up with thin, long dots. His prints, though generally very neat, want the ſtyle of the maſter in the determination of the folds of the draperies and the outline of the human figure; the extremities of which are heavy, and not marked with preciſion. Fine impreſſions from his beſt plates are, however, much ſought after by collectors; thoſe eſpecially after Rubens and Joardens are held in very high eſtimation.

MARIONIS, (anc. geog.) a town of Germany: now Hamburg, a famous trading city on the Elbe, in Lower Saxony, in the duchy of Holſtein. Another Marionis (Ptolemy), thought to be Wiſmar, a town of Lower Saxony, in the duchy of Meclenburg.

MARIOTTE (Edme), an eminent phyſician and mathematician, was born in Burgundy, and was made a member of the academy of ſciences. He died in 1684. His works, which are much eſteemed, were printed at Leyden in 1717, 2 vols 4to.

MARJORAM, in botany. See ORIGANUM.

MARITAGIUM, in the feudal cuſtoms, *maritagium* (as contradiſtinguiſhed from *matrimonium*), ſignifies

Maritime
Maritime
State.

ſies the power which the lord or guardian in chivalry had of diſpoſing of his infant ward in matrimony. For while the infant was in ward, the guardian had the power of tendering him or her a ſuitable match without diſparagement or inequality: which if the infants refuſed, they forfeited the value of the marriage, *valorem maritagii*, to their guardian; that is, ſo much as a jury would aſſeſs, or any one would *bona fide* give to the guardian for ſuch an alliance: and if the infants married themſelves without the guardian's conſent, they forfeited double the value, *duplicem valorem maritagii*.

MARITIME, ſomething relating to, or bounded by, the ſea. Thus a maritime province or country is one bounded by the ſea; and a maritime kingdom is one that makes a conſiderable figure, or that is very powerful at ſea. Hence, by *maritime* powers among the European ſtates, are underſtood great Britain and Holland.

Maritime State, in Britiſh polity, one of the three general diviſions of the laity: (See Laity). This ſtate is nearly connected with the military; though much more agreeable to the principles of our free conſtitution. The royal navy of England hath ever been its greateſt defence and ornament; it is its ancient and natural ſtrength; the floating bulwark of the iſland; an army from which, however ſtrong and powerful, no danger can ever be apprehended to liberty: and accordingly it has been aſſiduouſly cultivated from earlieſt ages. To ſo much perfection was our naval reputation arrived in the 12th century, that the code of maritime laws, which are called the *laws of Oleron*, and are received by all nations in Europe as the ground and ſubſtruction of all their marine conſtitutions, was confeſſedly compiled by our king Richard I. at the iſle of Oleron on the coaſt of France, then part of the poſſeſſions of the crown of England. And yet ſo vaſtly inferior were our anceſtors in this point to the preſent age, that even in the maritime reign of queen Eliſabeth, Sir Edward Coke thinks it matter of boaſt, that the royal navy of England then conſiſted of *three and thirty* ſhips. The preſent condition of our marine is in great meaſure owing to the ſalutary proviſions of the ſtatutes called the *navigation acts*; whereby the conſtant increaſe of Engliſh ſhipping and ſeamen was not only encouraged, but rendered unavoidably neceſſary. By the ſtatute 5 Richard II. c. 3. in order to augment the navy of England, then greatly diminiſhed, it was ordained, that none of the king's liege people ſhould ſhip any merchandize out of or into the realm, but only in ſhips of the king's ligeance, on pain of forfeiture. In the next year, by ſtatute 6 Ric. II. c. 8. this wiſe proviſion was enervated, by only obliging the merchants to give Engliſh ſhips (if able and ſufficient) the preference. But the moſt beneficial ſtatute for the trade and commerce of theſe kingdoms is that navigation-act, the rudiments of which were firſt framed in 1650, with a narrow partial view; being intended to mortify our own ſugar iſlands, which were diſaffected to the parliament, and ſtill held out for Charles II. by ſtopping the gainful trade which they then carried on with the Dutch, and at the ſame time to clip the wings of thoſe our opulent and aſpiring neighbours. This prohibited all ſhips of foreign nations from trading with any Engliſh plantations, without licence from the council of ſtate. In 1651, the prohibition was extended alſo to the mother-country: and no goods were ſuffered to be imported into England, or any of its dependencies, in any other than Engliſh bottoms; or in the ſhips of that European nation of which the merchandize imported was the genuine growth or manufacture. At the Reſtoration, the former proviſions were continued, by ſtat. 12 Car. II. c. 18. with this very material improvement, that the maſter and three-fourths of the mariners ſhall alſo be Engliſh ſubjects.

Maritime
State.

Many laws have been made for the ſupply of the royal navy with ſeamen; for their regulation when on board; and to confer privileges and rewards on them during and after their ſervice.

1. For their ſupply. The principal, but the moſt odious, though often neceſſary method for this purpoſe, is by impreſſing; ſee Impressing. But there are other ways that tend to the increaſe of ſeamen, and manning the royal navy. Pariſhes may bind out poor boys apprentices to the maſters of merchantmen, who ſhall be protected from impreſſing for the firſt three years; and if they are impreſſed afterwards, the maſters ſhall be allowed their wages: great advantages in point of wages are given to volunteer ſeamen, in order to induce them to enter into his majeſty's ſervice: and every foreign ſeaman, who, during a war, ſhall ſerve two years in any man of war, merchantman, or privateer, is naturalized *ipſo facto*. About the middle of king William's reign, a ſcheme was ſet on foot for a regiſter of ſeamen to the number of 30,000, for a conſtant and regular ſupply of the king's fleet; with great privileges to the regiſtered men; and, on the other hand, heavy penalties in caſe of their non-appearance when called for: but this regiſtry, being judged to be rather a badge of ſlavery, was aboliſhed by ſtat. 9 Ann. c. 21.

2. The method of ordering ſeamen in the royal fleet, and keeping up a regular diſcipline there, is directed by certain expreſs rules, articles, and orders, firſt enacted by the authority of parliament ſoon after the Reſtoration; but ſince new-modelled and altered, after the peace of Aix-la-Chapelle, to remedy ſome defects which were of fatal conſequence in conducting the preceding war. In theſe articles of the navy almoſt every poſſible offence is ſet down, and the puniſhment thereof annexed: in which reſpect the ſeamen have much the advantage over their brethren in the land-ſervice; whoſe articles of war are not enacted by parliament, but framed from time to time at the pleaſure of the crown. Yet from whence this diſtinction aroſe, and why the executive power, which is limited ſo properly with regard to the navy, ſhould be ſo extenſive with regard to the army, it is hard to aſſign a reaſon; unleſs it proceeded from the perpetual eſtabliſhment of the navy, which rendered a permanent law for their regulation expedient, and the temporary duration of the army, which ſubſiſted only from year to year, and might therefore with leſs danger be ſubjected to diſcretionary government. But, whatever was apprehended at the firſt formation of the mutiny-act, the regular renewal of our ſtanding force at the

entrance

entrance of every year has made this diſtinction idle. For, if from experience paſt, we may judge of future events, the army is now laſtingly ingrafted into the Britiſh conſtitution; with this ſingularly fortunate circumſtance, that any branch of the legiſlature may annually put an end to its legal exiſtence, by refuſing to concur in its continuance.

3. With regard to the privileges conferred on ſailors, they are pretty much the ſame with thoſe conferred on ſoldiers, with regard to relief, when maimed, or wounded, or ſuperannuated, either by county-rates, or the royal hoſpital at Greenwich; with regard alſo to the exerciſe of trades, and the power of making nuncupative teſtaments: and, farther, no ſeaman aboard his majeſty's ſhips can be arreſted for any debt, unleſs the ſame be ſworn to amount to at leaſt twenty pounds; though, by the annual mutiny-acts, a ſoldier may be arreſted for a debt which extends to half that value, but not to a leſs amount.

MARIUS, the famous Roman general, and ſeven times conſul, who ſullied his great military reputation by ſavage barbarities. He was born at Arpinum, of obſcure and illiterate parents. He forſook the meaner occupations of the country for the camp; and ſignalized himſelf under Scipio, at the ſiege of Numantia. The Roman general ſaw the courage and intrepidity of young Marius, and foretold the æra of his future greatneſs. By his ſeditions and intrigues at Rome, while he exerciſed the inferior offices of the ſtate, he rendered himſelf known; and his marriage with Julia, who was of the family of the Cæſars, contributed in ſome manner to raiſe him to conſequence. He paſſed into Africa as lieutenant to the conſul Metellus againſt Jugurtha; and after he had there ingratiated himſelf with the ſoldiers, and raiſed enemies to his friend and benefactor, he returned to Rome and canvaſſed for the conſulſhip. The extravagant promiſes he made to the people, and his malevolent inſinuations about the conduct of Metellus, proved ſucceſsful. He was elected and appointed to finiſh the war againſt Jugurtha. He ſhowed himſelf capable in every degree to ſucceed to Metellus. Jurgurtha was defeated, and afterwards betrayed into the hands of the Romans by the perfidy of Bocchus. No ſooner was Jugurtha conquered, than new honours and freſh trophies awaited Marius. The provinces of Rome were ſuddenly invaded by an army of 300,000 barbarians, and Marius was the only man whoſe activity and boldneſs could reſiſt ſo powerful an enemy. He was elected conſul, and ſent againſt the Teutones. The war was prolonged, and Marius was a third and fourth time inveſted with the conſulſhip. At laſt two engagements were fought, and not leſs than 200,000 of the barbarian forces of the Ambrones and Teutones were ſlain in the field of battle, and 90,000 made priſoners. The following year, A. U. C. 651, was alſo marked by a total overthrow of the Cimbri, another horde of barbarians; in which 140,060 were ſlaughtered by the Romans, and 60,000 taken priſoners. After ſuch honourable victories, Marius with his colleague Catullus entered Rome in triumph; and for his eminent ſervices he received the appellation of the *third founder of Rome.* He was elected conſul a ſixth time; and as his intrepidity had delivered his country from its foreign enemies, he ſought employment at home, and his reſtleſs ambition began to raiſe ſeditions, and to oppoſe the power of Sylla. This was the foundation of a civil war. Sylla refuſed to deliver up the command of his forces, with which he was empowered to proſecute the Mithridatic war; and he reſolved to oppoſe in perſon the authors of a demand which he conſidered as arbitrary and improper. He advanced to Rome, and Marius was obliged to ſave his life by flight. The unfavourable winds prevented him from ſeeking a ſafer retreat in Africa, and he was left on the coaſt of Campania, where the emiſſaries of his enemy ſoon diſcovered him in a marſh, where he had plunged himſelf in the mud, and left only his mouth above the ſurface for reſpiration. He was violently dragged to the neighbouring town of Minturnæ; and the magiſtrates, all devoted to the intereſt of Sylla, paſſed ſentence of immediate death on their magnanimous priſoner. A Gaul was commanded to cut off his head in the dungeon; but the ſtern countenance of Marius diſarmed the courage of the executioner: and when he heard the exclamation of *Tune, homo, audes occidere Caium Marium*, the dagger dropped from his hand. Such an uncommon adventure moved the compaſſion of the inhabitants of Minturnæ. They releaſed Marius from priſon; and favoured his eſcape to Africa, where he joined his ſon Marius, who had been arming the princes of that country in his cauſe. Marius landed near the walls of Carthage, and he received no ſmall conſolation at the ſight of the venerable ruins of a once powerful city, which like himſelf had been expoſed to calamity, and felt the cruel viciſſitude of fortune. This place of his retreat was ſoon known; and the governor of Africa, to conciliate the favour of Sylla, compelled Marius to fly to a neighbouring iſland. He ſoon after learned that Cinna had embraced his cauſe at Rome, when the Roman ſenate had ſtripped him of his conſular dignity, and beſtowed it upon one of his enemies. This intelligence animated Marius; he ſet ſail to aſſiſt his friend only at the head of 1000 men. His army, however, was ſoon increaſed, and he entered Rome like a conqueror. His enemies were inhumanly ſacrificed to his fury; Rome was filled with blood; and he, who once had been called the father of his country, marched through the ſtreets of the city, attended by a number of aſſaſſins, who immediately ſlaughtered all thoſe whoſe ſalutations were not anſwered by their leader. Such were the ſignals for bloodſhed. When Marius and Cinna had ſufficiently gratified their reſentment, they made themſelves conſuls; but Marius, already worn out with old age and infirmities, died ſixteen days after he had been honoured with the conſular dignity for the ſeventh time, A. U. C. 666. Such was the end of Marius, who rendered himſelf conſpicuous by his victories and by his cruelty. As he was brought up in poverty and among peaſants, it will not appear wonderful that he always betrayed ruſticity in his behaviour, and deſpiſed in others thoſe poliſhed manners and that ſtudied addreſs which education had denied him. He hated the converſation of the learned only becauſe he was illiterate; and if he appeared an example of ſobriety and temperance, he owed theſe advantages to the years of obſcurity which he paſſed at Arpinum. His countenance was ſtern, his voice firm and imperious, and his diſpoſition untractable. He was in the 70th year of his age when he died; and Rome ſeemed to rejoice at the fall of a man whoſe ambition had proved ſo fatal to many of her citizens. His only qualifications were thoſe of a great general; and with theſe he rendered himſelf the moſt illuſtrious and powerful of the Romans, becauſe he was the only one whoſe ferocity ſeemed capable to oppoſe the barbarians of the north.

C. Marius, the ſon of the great Marius, was as cruel as his father, and ſhared his good and his adverſe fortune. He made himſelf conſul in the 25th year of his age, and murdered all the ſenators who oppoſed his ambitious views. He was defeated by Sylla, and fled to Præneſte, where he killed himſelf.

Marius, (M. Aurelius), a native of Gaul; who, from the mean employment of a blackſmith, became one of the generals of Gallienus, and at laſt cauſed himſelf to be ſaluted emperor. Three days after this elevation, a man who had ſhared his poverty without partaking of his more proſperous fortune, publicly aſſaſſinated him, and he was killed by a ſword which he himſelf had made in the time of his obſcurity. Marius has been often celebrated for his great ſtrength; and it is confidently reported, that he could ſtop, with one of his fingers only, the wheel of a chariot in its moſt rapid courſe.

Marius (Maximus), a Latin writer, who publiſhed an account of the Roman emperors from Trajan to Alexander, now loſt. His compoſitions were entertaining, and executed with great exactneſs and fidelity. Some have accuſed him of inattention, and complain that his writings abounded with many fabulous and inſignificant ſtories.

MARIVAUX (Peter Carlet de), a French writer in the dramatic way and in romance, was born of a good family at Paris in 1688. A fine underſtanding, well improved by education, diſtinguiſhed him early. His firſt object was the theatre, where he met with the higheſt ſucceſs in comic productions; and theſe, with the merit of his other works, procured him a place in the French academy. The great characteriſtic of both his comedies and romance was, to convey an uſeful moral under the veil of wit and ſentiment: "My only object (ſays he) is to make men more juſt and more humane;" and he was as amiable in his life and converſation as he was in his writings. He died at Paris in 1763, aged 75. His works conſiſt of, 1. *Pieces de Theatre*, 4 vols 12mo. 2. *Homere traveſti*, 12mo; which is not ſuppoſed to have done much honour to his taſte. 3. *Le Spectateur François*, 2 vols 12mo. 4. *Le Philoſophe Indegent*, 12mo. 5. *Vie de Marianne*, 2 vols 12mo; one of the beſt romances in the French language. 6. *Le Payſan Parvenu*, 12mo. 7. *Pharſamon*; inferior to the former.

MARK (St.) was by birth a Jew, and deſcended of the tribe of Levi. He was converted by ſome of the apoſtles, probably by St Peter; to whom he was a conſtant companion in all his travels, ſupplying the place of an amanuenſis and interpreter. He was by St Peter ſent into Egypt, fixing his chief reſidence at Alexandria, and the places thereabout: where he was ſo ſucceſsful in his miniſtry, that he converted multitudes both of men and women. He afterwards removed weſtward, towards the parts of Libya, going through the countries of Marmorica, Pentapolis, and others thereabouts; where, notwithſtanding the barbarity and idolatry of the inhabitants, he planted the goſpel. Upon his return to Alexandria, he ordered the affairs of that church, and there ſuffered martyrdom in the following manner. About Eaſter, at the time the ſolemnities of Serapis were celebrated, the idolatrous people, being excited to vindicate the honour of their deity, broke in upon St Mark, while he was performing divine ſervice, and, binding him with cords, dragged him through the ſtreets, and thruſt him into priſon, where in the night he had the comfort of a divine viſion. Next day the enraged multitude uſed him in the ſame manner, till, his ſpirits failing, he expired under their hands. Some add, that they burnt his body, and that the Chriſtians decently interred his bones and aſhes near the place where he uſed to preach. This happened in the year of Chriſt 68. Some writers aſſert, that the remains of St Mark were afterwards, with great pomp, tranſlated from Aexandria to Venice. However, he is the tutelar ſaint and patron of that republic, and has a very rich and ſtately church erected to his memory. This apoſtle is author of one of the four goſpels inſcribed with his name. See the following article.

St Mark's Goſpel, a canonical book of the New Teſtament, being one of the four goſpels.

St Mark wrote his goſpel at Rome, where he accompanied St Peter in the year of Chriſt 44. Tertullian and others pretend, that St Mark was no more than an amanuenſis to St Peter, who dictated this goſpel to him; others affirm, that he wrote it after St Peter's death. Nor are the learned leſs divided as to the language it was wrote in; ſome affirming that it was compoſed in Greek, others in Latin. Several of the ancient heretics received only the goſpel of St Mark: others, among the Catholics, rejected the 12 laſt verſes of this goſpel. The goſpel of St Mark is properly an abridgement of that of St Matthew.

St Mark the Evangeliſt's Day, a feſtival of the Chriſtian church, obſerved April 25.

Canons of St Mark, a congregation of regular canons founded at Mantua, by Albert Spinola a prieſt, towards the end of the 12th century. Spinola made a rule for them, which was approved, corrected, and confirmed by ſeveral ſucceeding popes. About the year 1450 they were reformed, and followed only the rule of St Auguſtine. This congregation having flouriſhed by the ſpace of 400 years, declined by little and little, and is now become extinct.

Knights of St Mark, an order of knighthood in the republic of Venice, under the protection of St Mark the evangeliſt. The arms of the order are, gules, a lion winged or; with this device, Pax tibi Marce Evangelista. This order is never conferred but on thoſe who have done ſignal ſervice to the commonwealth.

Mark, or *Marc*, in commerce, denotes a weight uſed in ſeveral ſtates of Europe, and for ſeveral commodities, eſpecially gold and ſilver. In France, the mark is divided into eight ounces, 64 drahms, 192 derniers or penny-weights, 160 eſterlines, 300 maills, 640 felins, or 4608 grains. In Holland, the mark weight is alſo called *Troy-weight*, and is equal to that of France. When gold and ſilver are ſold by the mark, it is divided into 25 carats.

Mark is alſo uſed among us for a money of account, and in ſome other countries for a coin. See *Money-Table*.

The Engliſh mark is two thirds of a pound Sterling, or 13 s. 4 d. and the Scotch mark is of equal value in Scots money of account, viz. $13\frac{1}{3}$ d.

MARKET, a public place in a city or town, in which live-cattle, proviſions, or other goods, are ſet to ſale; and alſo a privilege, either by grant or preſcription, by which a town is enabled to keep a market.

Court of the Clerk of the Market, is incident to every fair and market in the kingdom, to puniſh miſdemeanors therein; and a court of *pie poudre* is to determine all diſputes relating to private or civil property. The object of this juriſdiction (ſee ſtat. 17. Car. II. cap. 19. 22 Car. II. cap. 8. 23 Car. II. cap. 12.) is principally the cognizance of weights and meaſures, to try whether they be according to the true ſtandard thereof or no: which ſtandard was anciently committed to the cuſtody of the biſhop, who appointed ſome clerk under him to inſpect the abuſe of them more narrowly; and hence this officer, though now uſually a layman, is called the clerk of the market.—If they be not according to the ſtandard, then, beſide the puniſhment of the party by fine, the weights and meaſures themſelves ought to be burnt. This is the loweſt court of criminal juriſdiction in the kingdom.

MARKHAM (Gervaſe), an Engliſh author, was the ſon of Robert Markham of Gotham, Eſq; in Nottinghamſhire, and bore a captain's commiſſion under Charles I. in the civil wars. He was eſteemed both a good ſoldier and a good ſcholar. He was particularly maſter of the French, Italian, and Spaniſh. He wrote, 1. The tragedy of Herod and Antipater, which was printed in 1622. 2. Many volumes upon huſbandry and horſemanſhip. 3. A piece on the art of fowling. 4. The ſoldiers accidence and grammar.

MARKLAND (Jeremiah,) one of the moſt learned ſcholars and penetrating critics of the age, was born in 1692, and received his education in Chriſt's hoſpital. He became firſt publicly known by his *Epiſtola Critica*, addreſſed to biſhop Hare. In this he gave many proofs of extenſive erudition and critical ſagacity. He afterwards publiſhed an edition of Statius, and ſome plays of Euripides; and aſſiſted Dr Taylor in his editions of Lyſias and Demoſthenes, by the notes which he communicated to him. He has alſo very happily elucidated ſome paſſages in the New Teſtament, which may be found in Mr Bowyer's edition of it; and was author of a very valuable volume of remarks on the epiſtles of Cicero to Brutus, and of an excellent little treatiſe under the title of *Quæſtio Grammatica*. He died in 1775, at Milton, near Dorking in Surry; and was a man not more valued for his univerſal reading than beloved for the excellency of his heart and primitive ſimplicity of manners.

MARLBOROUGH, a town of Wiltſhire in England, ſituated near the ſource of the Kennet, at the foot of a chalky hill, 75 miles from London. It has its name from its chalky ſoil, which was formerly called *marle*. It was a Roman ſtation. In the year 1627, a parliament was held in the caſtle here, which made thoſe laws called *Marlborough ſtatutes*. There are ſtill ſome ſmall remains of its walls and ditch. The town, which is an ancient borough by preſcription, ſends two members to parliament. It is governed by a mayor, 2 juſtices, 12 aldermen, 24 burgeſſes, a town-clerk, 2 bailiffs, 12 ſerjeants at mace, &c. It conſiſts chiefly of one broad ſtreet, with piazzas all along one ſide of it, two pariſh churches, and ſeveral commodious inns, it being the grand thoroughfare from London to Bath and Briſtol. To the ſouth are ſome relicts of a priory, particularly the Gate-houſe; and the ſcite of a Roman Caſtrum, the foundations of which have been diſcovered there, with Roman coins. The ditch is ſtill in ſome parts 20 feet wide; and towards the river, without the garden walls, one angle of the Caſtrum is very viſible with the rampart and ditch entire. The mount at the weſt end of the town, which was the keep or main-guard of the caſtle, is converted into a pretty ſpiral walk; at the top of which is an octagon ſummer-houſe. This town has often ſuffered by fire, particularly in 1690, whereupon the parliament paſſed an act to prevent its houſes from being thatched. The markets here are Wedneſdays and Saturdays; and it has five fairs. Here is a charity-ſchool, which was erected in 1712, for 44 children.

Marlborough (duke of). See Churchill.

Marlborough-Fort, an Engliſh factory on the weſt coaſt of the iſland of Sumatra in Aſia; ſeated three miles weſt of the town of Bencoolen. E. Long. 101. 12. S. Lat. 4. 21.

MARLE, a kind of calcareous earth, very much uſed in agriculture as a manure. See Agriculture, n° 216, 217.

Marle is dug in many places of Great Britain and Ireland. In digging for it in Ireland, they meet with horns and other curious foſſils. The marle always lies in the bottoms of low bogs, and is found by boring with augres made for that purpoſe. It uſually lies at five, ſeven, or nine feet depth. The obtaining it in many places is attended with very conſiderable expence in draining off the water. The manner of digging it is this: They employ ſix able labourers and a ſupernumerary; and theſe cut up a hole of 12 feet ſquare, which is ſuppoſed a pit that this number of men can manage in one day. Two men dig, two throw it up, and two throw it by, and the ſupernumerary man ſupplies defects on all occaſions. For the firſt three feet they dig through a fuzzy earth, fit for making turf or fuel. Under this lies a ſtratum of gravel, of about half a foot; under this often, for three feet more, there is a more kindly moſs, which would make better fuel. This lower ſtratum is always full of foſſile wood, which is uſually ſo ſoft that the ſpade cuts as eaſily through it as through the earth it lies in. Under this, for the thickneſs of about three inches, is found a ſeries of leaves, principally of the oak. Theſe appear very fair to the eye, but fall to pieces on being touched; and this ſtratum is ſometimes interrupted by vaſt heaps of ſeed, which ſeem to be broom or furze ſeed. In ſome places there appear berries of different kinds, and in others ſeveral ſpecies of ſea-plants; all lying in the ſame confuſed manner as the oak leaves. Under this vegetable ſtratum there lies one of blue clay, half a foot thick, and uſually full of ſea-ſhells. This blue clay is not ſo tough as common clay; but is thrown carefully up, and uſed as marle in ſome places. Under this always appears the true marle; the ſtratum of which is uſually from two to four feet thick, and ſometimes much more.—This marle looks like buried lime, and is full of ſhells, which are uſually of a ſmall ſize, and of the periwinkle kind; but there are ſeveral other ſorts at times found among them. Among this marle, and often at the very bottom of it, are found great numbers of very large horns of the deer kind, which are vulgarly called *elk's horns*. Theſe, where they join to the head, are thick and round; and at that joining there grows out a branch, which is about a foot long, and ſeems to have hung juſt over the creature's eyes: it grows ſtill round for about a foot above this; and then ſpreads out broad, and terminates in branches long and round, terminating with a ſmall bend. The labourers are obliged to work in a hurry in all theſe pits, ſo that they ſeldom bring out the horns whole. There are alſo, at times, found the leg-bones and other parts of the ſkeletons of the ſame beaſts; but this more rarely, only a few together, and but in few places.

Dr Black is of opinion, that all kinds of marle derive their origin from the calcareous matter of ſhells and lithophyta.

Shell-marle, ſays he, is compoſed of the ſhells of aquatic animals, which are ſometimes very entire, and often decayed or mixed down with other earthy ſubſtances. Examining this matter as occurring in different places, it may be diſtinguiſhed into freſh water marle, and the marle of ſea-ſhells. Of the firſt we have an example in the Meadow at Edinburgh. Wherever the ſoil is turned up to the depth of ſix inches, a quantity appears. It is compoſed of the ſhells of a ſmall freſh-water ſnail or welk. This animal, when alive, is not eaſily diſcernible, the ſhell being much of the ſame obſcure colour as the ſtones covered with the water. But we can obſerve a great number of them in all running brooks and other collections of freſh water; and as the animal dies, the ſhells are depoſited where the water ſtagnates in very great quantity. That compoſed of ſea-ſhells, conſtitutes greater collections that are found in innumerable places now far removed from the ſea. That moſt particularly deſcribed by Reaumur is a collection of this kind in a province of France, and at Turin. That part of the country where it is found is computed to contain 80 ſquare miles of ſurface; and wherever they dig to a certain depth, they find this collection of ſhells: the country at preſent is 108 miles from the ſea. They find the marle eight or nine feet below the ſurface, and they dig it to the depth of 20 feet. It is ſtill deeper, but they find it too expenſive to ſearch for it. He ſuppoſes it to be only 18 feet deep; and even at this depth the quantity will appear enormous. It will amount to 140 millions of cubic fathoms of ſhells that are moſtly decayed and broken into fragments, and mixed with other marine productions, as millipores, madripores, and other coralline bodies, which are all productions of the ſea.

MARLINE, in ſea affairs, are tarred white ſkains, or long wreaths or lines of untwiſted hemp, dipped in pitch or tar, with which cables or other ropes are wrapped round, to prevent their fretting or rubbing in the blocks or pullies through which they paſs. The ſame ſerves in artillery upon ropes uſed for rigging gins, uſually put up in ſmall parcels called *ſkains*.

MARLOE (Chriſtopher), an Engliſh dramatic author, was a ſtudent in the univerſity of Cambridge; but afterwards turning player, he trode the ſame ſtage with the inimitable Shakeſpeare. He was accounted an excellent poet even by Ben Johnſon himſelf. He wrote ſix tragedies, one of which called *Luſt's Dominion*, or the *Laſcivious Queen*, has been altered by Mrs Behn, and acted under the title of *Abdelazar*, or the *Moor's Revenge*. Some time before his death, he had made a conſiderable progreſs in an excellent poem entitled *Hero* and *Leander*; which was afterwards finiſhed by George Chapman, who is ſaid to have fallen ſhort of the ſpirit and invention diſcovered by Marloe. Mr Anthony Wood repreſents him as a free-thinker, in the worſt ſenſe of the word; and gives the following account of his death. Falling deeply in love with a low girl, and having for his rival a fellow in livery, Marloe, imagining that his miſtreſs granted him favours, was fired with jealouſy, and ruſhed upon him in order to ſtab him with his dagger; but the footman avoided the ſtroke, and, ſeizing his wriſt, ſtabbed him with his own weapon; of which wound he died, in the year 1593.

MARLOW, a town of Buckinghamſhire, in England, 31 miles from London, lies under the Chiltern Hills, in a marly ſoil. It is a pretty large borough, though not incorporated, with a bridge over the Thames, not far from its conflux with Wycomb, and has a handſome church and town-hall, with a charity-ſchool for 20 boys, who are taught and clothed. It firſt ſent members to Parliament in the reign of Edward II. Bone lace is its chief manufacture. The Thames brings goods hither from the neighbouring towns, eſpecially great quantities of meal and malt from High-Wycomb, and beech from ſeveral parts of the county, which abounds with this wood more than any in England. In the neighbourhood are frequent horſe-races; and here are ſeveral corn and paper mills, particularly on the river Loddon, between this town and High-Wycomb. There are, beſides, the Temple-mills, for making thimbles, and another for preſſing oil from rape and flax ſeeds. Its market is on Saturdays, and fair October 29.

MARLY, a palace belonging to the king of France, between Verſailles and St Germain; ſeated in a valley, near a village and foreſt of the ſame name. It is noted for its fine gardens and water-works, there being a curious machine on the river Seine, which not only ſupplies them with water, but alſo thoſe of Verſailles. It is 10 miles N. W. of Paris. E. Long. 2. 11. N. Lat. 48. 52.

MARMANDE, a town of France, in Guienne, and in Agennois. It carries on a great trade in corn and wine, and is ſeated on the river Garonne, in E. Long. 0. 15. N. Lat. 38. 35.

MARMALADE, a confection of plums, apricots, quinces, &c. boiled up to a conſiſtence with ſugar. In

Scotland, it is made of Seville oranges and ſugar only.

MARMOR. See MARBLE.

MARMORA, the name of four iſlands of Aſia, in the ſea of the ſame name. The largeſt is about 30 miles in circumference; and the ſoil of them all produces corn, wine, and fruits. The ſea of Marmora is a large gulph, which communicates both with the Archipelago and the Black Sea by that of Conſtantinople, being 120 miles in length and 50 in breadth; and all ſhips muſt paſs through it that ſail to Conſtantinople from the Mediterranean. It was anciently the *Propontis*.

MARMORICA, a country of Africa anciently inhabited by the Libyans. It was bounded on the eaſt by Egypt, on the weſt by Cyrenaica, on the ſouth by Sahara, or the deſart of Libya Interior, and on the north by the Mediterranean; and was reckoned a part of Egypt. There is no diſtinct hiſtory of the country.

MAROBUDUM (anc. geog.), the royal reſidence of Marobuduus, king of the Marcomanni; and hence the appellation. Now thought to be *Prague*, the capital of Bohemia.

MAROLLES (Michel de), born in 1600, was the ſon of Claude de Marolles, whom French memoirs make a military hero. Michel, however, was of a different compoſition. He entered early into the eccleſiaſtical ſtate, and by the intereſt of his father obtained two abbeys. He was formed with an extreme ardour for ſtudy, which never abated all his life long: for, from 1619 when he publiſhed a tranſlation of Lucan, to 1681 the year of his death, he was conſtantly employed in writing and printing. He attached himſelf unfortunately to the tranſlating of ancient Latin writers: but, being devoid of all claſſical taſte and ſpirit, they ſunk miſerably under his hands, the poets eſpecially. He was certainly, however, a man of great learning, and diſcovered all his life a love for the arts. He was one of the firſt who paid any attention to prints; and collected about 100,000, which make at this day one of the ornaments of the French king's cabinet. He compoſed memoirs of his own life, which were publiſhed by the Abbé Goujet, 1755, in 3 vols. They contain, like ſuch ſort of things, ſome intereſting facts, but an infinity of minute and inſipid nothings.

MARONITES, in eccleſiaſtical hiſtory, a ſect of eaſtern Chriſtians, who follow the Syrian rite, and are ſubject to the pope; their principal habitation being on mount Libanus.

Moſheim informs us, that the doctrine of the Monothelites, condemned and exploded by the council of Conſtantinople, found a place of refuge among the Mardaites, a people who inhabited the mounts Libanus and Antilibanus, and who, about the concluſion of the ſeventh century, were called *Maronites*, after *Maro* their firſt biſhop; a name which they ſtill retain. None (he ſays) of the ancient writers give any certain account of the firſt perſon who inſtructed theſe mountaineers in the doctrine of the Monothelites: it is probable, however, from ſeveral circumſtances, that it was John Maro, whoſe name they had adopted; and that this eccleſiaſtic received the name of Maro from his having lived in the character of a monk in the famous convent of St Maro, upon the borders of the Orontes, before his ſettlement among the Mardaites of mount Libanus. One thing is certain, from the teſtimony of Tyrius and other unexceptionable witneſſes, as alſo from the moſt authentic records, viz. that the Maronites retained the opinions of the Monothelites until the 12th century, when, abandoning and renouncing the doctrine of one will in Chriſt, they were readmitted in the year 1182 to the communion of the Roman church. The moſt learned of the modern Maronites have left no method unemployed to defend their church againſt this accuſation; they have laboured to prove, by a variety of teſtimonies, that their anceſtors always perſevered in the Catholic faith, in their attachment to the Roman pontiff, without ever adopting the doctrine of the Monophyſites, or Monothelites. But all their efforts are inſufficient to prove the truth of theſe aſſertions to ſuch as have any acquaintance with the hiſtory of the church and the records of ancient times; for to all ſuch the teſtimonies they allege will appear abſolutely fictitious and deſtitute of authority.

Fauſtus Nairon, a Maronite ſettled at Rome, has publiſhed an apology for Maron and the reſt of his nation. His tenet is, that they really took their name from the Maron, who lived about the year 400, and of whom mention is made in Chryſoſtom, Theodoret, and the Menologium of the Greeks. He adds, that the diſciples of this Maron ſpread themſelves throughout all Syria; that they built ſeveral monaſteries, and, among others, one that bore the name of their leader; that all the Syrians who were not tainted with hereſy took refuge among them; and that for this reaſon the heretics of thoſe times called them Maronites.

Moſheim obſerves, that the ſubjection of the Maronites to the ſpiritual juriſdiction of the Roman pontiff was agreed to with this expreſs condition, that neither the popes nor their emiſſaries ſhould pretend to change or aboliſh any thing that related to the ancient rites, moral precepts, or religious opinions, of this people: ſo that in reality there is nothing to be found among the Maronites that ſavours of popery, if we except their attachment to the Roman pontiff, who is obliged to pay very dear for their friendſhip. For, as the Maronites live in the utmoſt diſtreſs of poverty, under the tyrannical yoke of the Mahometans, the biſhop of Rome is under the neceſſity of furniſhing them with ſuch ſubſidies as may appeaſe their oppreſſors, procure a ſubſiſtence for their biſhop and clergy, provide all things requiſite for the ſupport of their churches, and the uninterrupted exerciſe of public worſhip, and contribute in general to leſſen their miſery. It is certain that there are Maronites in Syria who ſtill behold the church of Rome with the greateſt averſion and abhorrence; nay, what is ſtill more remarkable, great numbers of that nation reſiding in Italy, even under the eye of the pontiff, oppoſed his authority during the laſt century, and threw the court of Rome into great perplexity. One body of theſe non-conforming Maronites retired into the valleys of Piedmont, where they joined the Waldenſes; another, above 600 in number, with a biſhop and ſeveral eccleſiaſtics at their head, fled into Corſica, and implored the protection of the republic of Genoa againſt the violence of the inquiſitors.

The Maronites have a patriarch, who reſides in the monaſtery of Cannubin, on mount Libanus, and aſſumes the title of patriarch of Antioch, and the name of Peter, as if he ſeemed deſirous of being conſidered as the ſucceſſor of that apoſtle. He is elected by the clergy and the people, according to the ancient cuſtom; but, ſince their reunion with the church of Rome, he is obliged to have a bull of confirmation from the pope. He keeps a perpetual celibacy, as well as the reſt of the biſhops his ſuffragans: as to the reſt of the eccleſiaſtics, they are allowed to marry before ordination; and yet the monaſtic life is in great eſteem among them. Their monks are of the order of St Antony, and live in the moſt obſcure places in the mountains, far from the commerce of the world.

As to their faith, they agree in the main with the reſt of the eaſtern church. Their prieſts do not ſay maſs ſingly; but all ſay it together, ſtanding round the altar. They communicate in unleavened bread; and the laity have hitherto partaken in both kinds, though the practice of communicating in one has of late been getting footing, having been introduced by little and little. In Lent they eat nothing, unleſs it be two or three hours before ſun-riſing: their other faſtings are very numerous.

To MAROON, to put one or more ſailors aſhore upon a deſolate iſland, under pretence of their having committed ſome great crime. This deteſtable expedient has been repeatedly practiſed by ſome inhuman commanders of merchant-ſhips, particularly in the Weſt Indies.

MAROT (Clement), the beſt French poet of his time, was born at Cahors in 1495; and was the ſon of John Marot, valet de chambre to Francis I. and poet to queen Anne of Brittany. He enjoyed his father's place of valet de chambre to Francis I. and was page to Margaret of France wife to the duke of Alençon. In 1521 he followed that prince into Italy, and was wounded and taken priſoner at the battle of Pavia; but at his return to Paris was accuſed of hereſy, and thrown into priſon, from whence he was delivered by the protection of king Francis I. He at length retired to the queen of Navarre, then to the ducheſs of Ferrara, and in 1536 returned to Paris: but declaring openly for the Calviniſts, he was obliged to fly to Geneva; which he at length left, and retiring to Piedmont, died at Turin in 1544, aged 50. His verſes are agreeably filled with natural beauties. La Fontaine acknowledged himſelf his diſciple, and contributed greatly to reſtore to vogue the works of this ancient poet. Marot, beſides his other works, has tranſlated part of the Pſalms into verſe, which was continued by Beza, and are ſtill ſung in the Proteſtant churches abroad.—*Michael Marot*, his ſon, was alſo the author of ſome verſes; but they are not comparable to thoſe of *John*, and much leſs to thoſe of *Clement Marot*.—The works of the three *Marots* were collected and printed together at the Hague in 1731, in 3 vols 4to, and in 6 vols 12mo.

MARPURG, a ſtrong and conſiderable town of Germany, in the Upper Rhine, and in the landgravate of Heſſe-Caſſel, with an univerſity, a caſtle, a palace, a handſome ſquare, and a magnificent townhouſe. It is ſeated on the river Lohn, in a pleaſant country, 15 miles ſouth of Waldeck, and 47 ſouth-weſt of Caſſel. E. Long. 8. 53. N. Lat. 50. 42.

MARPURG, a handſome town of Germany, in Lower Styria, ſeated on the river Drave, 25 miles ſouth-weſt of Gratz, and 60 north-eaſt of Laubach. E. Long. 16. 10. N. Lat. 46. 42.

MARQUARD (Freher), an eminent German civilian, born at Augſburg in 1565. He ſtudied at Bourges, under the learned Cujas; and acquired great ſkill in polite literature, and in the laws. At his return to Germany, he became counſellor to the elector Palatine, and profeſſor of law at Heidelberg; and was afterwards ſent by the elector Frederic IV. as his miniſter, into Poland, to Mentz, and ſeveral other courts. He died at Heidelberg in 1614. He wrote many works which are eſteemed; the principal of which are, 1. *De re monetaria veterum Romanorum, et hodierni apud Germanos imperii.* 2. *Rerum Bohemicarum ſcriptores.* 3. *Rerum Germanicarum ſcriptores.* 4. *Corpus hiſtoriæ Franciæ*, &c.

MARQUE, or *Letters of* MARQUE, in military affairs, are letters of repriſal, granting the ſubjects of one prince or ſtate liberty to make repriſals on thoſe of another.—They are ſo called from the German *marcke*, "limit, frontier;" as being *jus conceſſum in alterius principis marckas ſeu limites tranſeundi, ſibique jus faciendi;* as being a right of paſſing the limits or frontiers of another prince, and doing one's ſelf juſtice.

Letters of marque among us are extraordinary commiſſions granted by authority for reparation to merchants taken and deſpoiled by ſtrangers at ſea; and repriſals is only the retaking, or taking of one thing for another*. The form in theſe caſes is, the ſufferer muſt firſt apply to the lord privy-ſeal, and he ſhall make out letters of requeſt under the privy-ſeal; and if, after ſuch requeſt of ſatisfaction made, the party required do not, within convenient time, make due ſatisfaction or reſtitution to the party grieved, the lord chancellor ſhall make him out letters of marque under the great ſeal; and by virtue of theſe he may attack and ſeize the property of the aggreſſor nation, without hazard of being condemned as a robber or pirate.

MARQUESAS ISLANDS, the name of certain iſlands in the South Sea, lying between 8 and 10 degrees of ſouth latitude, and between 139 and 140 degrees of weſt longitude. They are five in number, viz. La Magdalena, St Pedro, La Dominica, Santa Chriſtina, and Hood Iſland. All the natives of theſe iſlands may be ſuppoſed to be of the ſame tribe. Thoſe ſpots that are fit for culture are very populous; but as every iſland is very mountainous, and has many inacceſſible and barren rocks, it is to be doubted whether the whole population of this group amounts to 50,000 perſons. The Spaniards, who firſt viſited here, found the manners of this people gentle and inoffenſive; but theſe qualities did not prevent thoſe who landed from wantonly butchering ſeveral of the natives at Magdalena.

The inhabitants of theſe iſlands collectively, ſays Captain Cook, are, without exception, the fineſt race of people in the South Sea. For ſymmetry of ſhape, and regular features, they perhaps ſurpaſs all other nations. Not a ſingle deformed or ill-proportioned perſon was ſeen on the iſland; all were ſtrong, tall, well-limbed, and remarkably active. The men are about

---

* See *Prerogative*.

five feet ten or ſix inches high ; their teeth are not ſo good, nor are their eyes ſo full and lively, as thoſe of many other nations : their hair is of many colours, but none red ; ſome have it long, but the moſt general cuſtom is to wear it ſhort, except a bunch on each ſide the crown, which they tie in a knot : their countenances are pleaſing, open, and full of vivacity : they are of a tawny complexion, which is rendered almoſt black by punctures over the whole body. They were entirely naked, except a ſmall piece of cloth round their waiſt and loins. The punctures were diſpoſed with the utmoſt regularity, ſo that the marks on each leg, arm, and cheek, were exactly ſimilar. The women, in two days time, began to appear in conſiderable numbers, and the ſailors found them not leſs kind than thoſe of the other iſlands which they had viſited : they were inferior to the men in ſtature, but well proportioned ; their general colour was brown ; no punctures were obſerved upon them ; they wore a ſingle piece of cloth made of the mulberry bark, which covered them from the ſhoulders to the knees.

The principal head-dreſs uſed in the iſlands, and what appear to be their chief ornament, is a ſort of broad fillet, curiouſly made of the fibres of the huſks of cocoa-nuts ; in the front is fixed a mother-of-pearl ſhell, wrought round to the ſize of a tea-ſaucer ; before that another ſmaller, of very fine tortoiſe-ſhell, perforated into curious figures ; alſo before, and in the centre of that, is another round piece of mother-of-pearl, about the ſize of half a crown ; and before this another piece of perforated tortoiſe-ſhell, the ſize of a ſhilling. Beſides this decoration in front, ſome have it alſo on each ſide, but in ſmall pieces ; and all have fixed to them the tail-feathers of cocks, or tropic-birds, which when the fillet is tied on ſtand upright, ſo that the whole together makes a very ſprightly ornament. They wear round the neck a kind of ruff or necklace made of light wood, the outward and upper ſides covered with ſmall peaſe, which are fixed on with gum ; they alſo wear ſome bunches of human hair faſtened to a ſtring, and tied round the legs and arms. But all the above ornaments are ſeldom ſeen on the ſame perſon. All theſe ornaments, except the laſt, they freely parted with for a trifling conſideration ; but the human hair they valued very highly, though theſe bunches were the uſual reſidence of many vermin. It is probable, that theſe were worn in remembrance of their deceaſed relations, and therefore were looked upon with ſome veneration ; or they may be the ſpoils of their enemies, worn as the honourable teſtimonies of victory. However, a large nail, or ſomething which ſtruck their eyes, commonly got the better of their ſcruples. The king, or chief of the iſland, came to viſit Captain Cook ; he was the only one ſeen completely dreſſed in this manner. Their ordinary ornaments are necklaces, and amulets made of ſhells, &c. All of them had their ears pierced, though none were ſeen with ear-rings. The king had not much reſpect paid him by his attendants : he preſented Captain Cook with ſome fruit and hogs ; and acquainted him that his name was *Honoo*, and that he was *he-ka-ai*, which title ſeems to correſpond with the *aree* of Otaheitee, and *arekee* of the Friendly Iſles. Their dwellings are in the valleys, and on the ſides of the hills near their plantations. They are built in the ſame manner as thoſe at Otaheitee, which will be particularly deſcribed when we ſpeak of that iſland ; but they are much meaner, and are only covered with the leaves of the bread-fruit tree : in general, they are built on a ſquare or oblong pavement of ſtone, raiſed ſome height above the level of the ground ; they likewiſe have ſuch pavement near their houſes, on which they ſit to eat and amuſe themſelves. Along the uppermoſt edge of the mountain a row of ſtakes or palliſadoes, cloſely connected together, were ſeen like a fortification, in which, by the help of glaſſes, appeared ſomething like huts, which ſeemed to bear a great reſemblance to the hippas of New-Zealand, which will be deſcribed in ſpeaking of that country. Their canoes reſemble thoſe of Otaheitee, but not ſo large ; their heads had commonly ſome flat upright piece, on which the human face was coarſely carved ; and their ſails were made of mats, triangular in ſhape, and very broad at the top ; the paddles which they uſed were of heavy hard wood ; ſhort, but ſharp-pointed, and with a knob at the upper end ; they were from 10 to 20 feet long, and about 15 inches broad.

Their weapons were all made of the club-wood, or caſuarina ; and were either plain ſpears about 8 or 10 feet long, or clubs which commonly had a knob at one end. They have alſo ſlings with which they throw ſtones with great velocity, and to a great diſtance, but not with a good aim.

The language of theſe people is much nearer to that of Otaheitee than any other dialect in the South-Sea, except that they could not pronounce the letter *r*.

The only quadrupeds ſeen here were hogs, except rats ; here were fowls, and ſeveral ſmall birds in the woods, whoſe notes were very melodious. The chief difference between the inhabitants of the Marqueſas and thoſe of the Society Iſlands ſeems to conſiſt in their different degrees of cleanlineſs : the former do not bathe two or three times a-day, nor waſh their hands and face before and after every meal, as the latter do ; and they are beſides very ſlovenly in the manner of preparing their meals. Their diet is chiefly vegetable ; though they have hogs and fowls, and catch abundance of fiſh at certain times. Their drink is pure water, cocoa-nuts being ſcarce here.

It was not long before the propenſity of the natives was diſcovered to be rather to receive than give ; for when they had taken a nail as the price of a bread-fruit, the article ſo purchaſed could not be obtained from them. To remove this diſhoneſt diſpoſition, captain Cook ordered a muſket to be fired over their heads, which terrified them into fair-dealing.

Soon after the natives had gathered courage enough to venture on board the ſhip, one of them unfortunately ſtole an iron ſtanchion from the gang-way, with which he ſprang into the ſea, and, notwithſtanding its weight, ſwam with it to his canoe, and was making to the ſhore with all ſpeed. A muſket was fired over his head to frighten him back, but to no effect, he ſtill continued to make off with his booty ; the whiſtling of another ball over his head was as ineffectual : an officer, leſs patient of ſuch an injury than reaſon and humanity ſhould have taught him to be, levelled a muſket at the poor fellow, and ſhot him thro' the head. Captain Cook had given orders to fire *over* the

the canoe, but not to kill any one; he was in a boat, and came up with the canoe ſoon after. There were two men in her: one ſat bailing out the blood and water in a kind of hyſteric laugh; the other, a youth of about 14 or 15 years of age, who afterwards proved to be the ſon of the deceaſed, fixed his eyes on the dead body with a ſerious and dejected countenance. This act of ſeverity, however, did not eſtrange the iſlanders to the ſhip, and a traffic was carried on to the ſatisfaction of both parties; bread-fruit, bananas, plantains, and ſome hogs, were given in exchange for ſmall nails, knives, and pieces of Amſterdam cloth; red feathers of the Amſterdam-Iſland were greatly eſteemed here. Captain Cook, accompanied with the gentlemen of the ſhip, in their walks about the country, lighted on the houſe which had been the habitation of the man who had been ſhot; there they found his ſon, who fled at their approach: they enquired for his female relations, and were told that they remained at the top of the mountain, to weep and mourn for the dead. Notwithſtanding they were then among the relations of a man who had been killed by them, not the leaſt tokens of animoſity or revenge were diſcernible among the natives.

The weather being extremely hot, the inhabitants made uſe of large fans to cool themſelves, of which great numbers were purchaſed; theſe fans were formed of a kind of tough bark, or graſs, very firmly and curiouſly plaited, and frequently whitened with ſhell-lime. Some had large feathered leaves of a kind of palm, which anſwered the purpoſe of an umbrella.

The natives at length became ſo familiar as to mount the ſides of the ſhip in great numbers. They frequently danced upon deck for the diverſion of the ſailors: their dances very much reſembled thoſe of Otaheitee; their muſic too was very much the ſame.

A ſailor having been inattentive to his duty, received ſeveral blows from Captain Cook; on ſeeing which, the natives exclaimed, *tape-a hei-te tina*, "he beats his brother." From other inſtances that had occurred, it was clear that they knew the difference between the commander and his people, but at the ſame time they conceived them all brethren; and, ſays Mr Forſter, "to me the moſt natural inference is, that they only applied an idea to us in this caſe, which really exiſted with regard to themſelves; they probably look on themſelves as one family, of which the eldeſt born is the chief or king."

MARQUETRY, IN-LAID WORK; a curious kind of work, compoſed of pieces of hard fine wood of different colours, faſtened, in thin ſlices, on a ground, and ſometimes enriched with other matters, as tortoiſe-ſhell, ivory, tin, and braſs.

There is another kind of marquetry made, inſtead of wood, of glaſſes of various colours; and a third, where nothing but precious ſtones and the richeſt marbles are uſed: but theſe are more properly called *moſaic-work*. See MOSAIC.

The art of inlaying is very ancient; and is ſuppoſed to have paſſed from the eaſt to the weſt, as one of the ſpoils brought by the Romans from Aſia. Indeed it was then but a ſimple thing; nor did it arrive at any tolerable perfection till the 15th century among the Italians: it ſeems, however, to have arrived at its height in the 17th century among the French.

Till John of Verona, a cotemporary with Raphael, the fineſt works of this kind were only black and white, which are what we now call *Moreſco's*; but that religious, who had a genius for painting, ſtained his woods with dyes or boiled oils, which penetrated them. But he went no farther than the repreſenting buildings and perſpectives, which require no great variety of colours. Thoſe who ſucceeded him, not only improved on the invention of dyeing the woods, by a ſecret which they found of burning them without conſuming, which ſerved exceedingly well for the ſhadows; but had alſo the advantage of a number of fine new woods of naturally bright colours, by the diſcovery of America. With theſe aſſiſtances the art is now capable of imitating any thing; whence ſome call it the *art of painting in wood*.

The ground whereon the pieces are to be ranged and glued, is ordinarily of oak or fir well dried; and to prevent warping, is compoſed of ſeveral pieces glued together. The wood to be uſed, being reduced into leaves, of the thickneſs of a line, is either ſtained with ſome colour, or made black for ſhadow; which ſome effect by putting it in ſand extremely heated over the fire, others by ſteeping it in lime-water and ſublimate, and others in oil of ſulphur.—Thus coloured, the contours of the piece are formed according to the parts of the deſign they are to repreſent.

The laſt is the moſt difficult part of marquetry, and that wherein moſt patience and attention are required. The two chief inſtruments uſed herein are the ſaw and the vice; the one, to hold the matters to be formed; the other, to take off from the extremes, according to occaſion. The vice is of wood, having one of its chaps fixed; the other moveable, and is opened and ſhut by the foot, by means of a cord faſtened to a treadle. Its ſtructure is very ingenious, yet ſimple enough.

The leaves to be formed (for there are frequently three or four of the ſame kind formed together) are put within the chaps of the vice, after being glued on the outermoſt part of the deſign whoſe profile they are to follow; then the workman preſſing the treadle, and thus holding faſt the piece, with his ſaw runs over all the outlines of the deſign.—By thus joining and forming three or four pieces together, they not only gain time, but the matter is likewiſe the better enabled to ſuſtain the efforts of the ſaw; which, how delicate ſoever it may be, and how lightly ſoever the workman may conduct it, without ſuch a precaution would be apt to raiſe ſplinters, to the ruin of the beauty of the work.

When the work is to conſiſt of one ſingle kind of wood, or of tortoiſe-ſhell, on a copper or tin ground, or *vice verſa*, they only form two leaves on one another, *i. e.* a leaf of metal, and a leaf of wood or ſhell: this they call *ſawing in counter-parts*; for by filling the vacuities of one of the leaves by the pieces coming out of the other, the metal may ſerve as a ground to the wood, and the wood to the metal.

All the pieces thus formed with the ſaw, and marked to know them again, and the ſhadow given in the manner already mentioned; they vaneer or faſten each in its place on the common ground; uſing for that purpoſe the beſt Engliſh glue.

The whole is put in a preſs to dry, planed over, and poliſhed with the ſkin of the ſea-dog, wax, and ſhave-graſs, as in ſimple vaneering; with this difference, however, that in marquetry the fine branches, and ſeveral of the more delicate parts of the figures, are touched up and finiſhed with a graver.

It is the cabinet-makers, joiners, and toy-men among us who work in marquetry; it is the enamellers and ſtone-cutters who deal in moſaic-work: the inſtruments uſed in the former are moſtly the ſame with thoſe uſed by the eboniſts.

MARQUIS, a title of honour, next in dignity to that of duke. His office is to guard the frontiers and limits of the kingdom, which were called the *marches*, from the Teutonic word *marche*, a "limit:" as, in particular, were the marches of Wales and Scotland, while they continued hoſtile to England. The perſons who had command there, were called *lords marchers*, or *marqueſſes;* whoſe authority was aboliſhed by ſtatute 27 Hen. VIII. c. 27. though the title had long before been made a mere deſign of honour, Robert Vere earl of Oxford being created marquis of Dublin by Richard II. in the eighth year of his reign. A marquis is created by patent; his mantle is double ermine, three doublings and a half; his title is *moſt honourable;* and his coronet has pearls and ſtrawberry-leaves intermixed round, of equal height.

MARR, that part of Aberdeenſhire ſituated between the rivers Dee and Don.

MARRACCI (Lewis), a very learned Italian, was born at Lucca in Tuſcany in 1612. After having finiſhed his juvenile ſtudies, he entered into the congregation of regular clerks of the mother of God, and diſtinguiſhed himſelf early by his learning and merit. He taught rhetoric ſeven years, and paſſed thro' ſeveral offices of his order. He applied himſelf principally to the ſtudy of languages, and attained of himſelf the knowledge of the Greek, the Hebrew, the Syriac, the Chaldee, the Arabic; which laſt he taught ſome time at Rome, by the order of pope Alexander VII. Pope Innocent XI. choſe him for his confeſſor, and placed great confidence in him. He would have advanced him to eccleſiaſtical dignities, if Marracci had not oppoſed him.—Marracci died at Rome in 1700, aged 87.—He was the author of ſeveral pieces in Italian; but the grand work, which has made him deſervedly famous all over Europe, is his edition of the Alkoran, in the original Arabic, with a Latin verſion, notes, and confutation of his own. It was beautifully printed in 2 vols folio at Padua in 1698. The Latin verſion of the Alkoran, by Marracci, with notes and obſervations from him and others, and a ſynopſis of the Mahometan religion, by way of introduction, was publiſhed by Heineccius at Leipſic, 1721, in 8vo. Marracci had alſo a hand in the "Biblia ſacra Arabica, ſacræ congregationis de propaganda fide juſſu edita, ad uſum eccleſiarum orientalium," *Romæ* 1671, in 3 vols folio.

MARRIAGE, a contract, both civil and religious, between a man and a woman, by which they engage to live together in mutual love and friendſhip for the ends of procreation, &c. See *MORAL Philoſophy*.

Marriage is part of the law of nations, and is in uſe among all people. The Romaniſts account it a ſacrament.—The woman, with all her moveable goods, immediately upon marriage, paſſes wholly *in poteſtatem viri*, "into the power and diſpoſal of the huſband."

The firſt inhabitants of Greece lived together without marriage. Cecrops, king of Athens, is ſaid to have been the firſt author of this honourable inſtitution among that people. After the commonwealths of Greece were ſettled, marriage was very much encouraged by their laws, and the abſtaining from it was diſcountenanced and in many places puniſhed. The Lacedemonians were very remarkable for their ſeverity towards thoſe who deferred marriage beyond a limited time, as well as to thoſe who wholly abſtained from it. The Athenians had an expreſs law, that all commanders, orators, and perſons intruſted with any public affair, ſhould be married men. Polygamy was not commonly tolerated in Greece. The time of marriage was not the ſame in all places. The Spartans were not permitted to marry till they arrived at their full ſtrength; the reaſon aſſigned for which cuſtom by Lycurgus was, that the Spartan children might be ſtrong and vigorous: and the Athenian laws are ſaid to have once ordered, that men ſhould not marry till 35 years of age. The ſeaſon of the year which they preferred for this purpoſe was the winter, and particularly the month of January, called *Gamelion*. The Greeks thought it ſcandalous to contract marriage within certain degrees of conſanguinity; whilſt moſt of the barbarous nations allowed inceſtuous mixtures.

Moſt of the Grecian ſtates, eſpecially ſuch as made any figure, required their citizens ſhould match with none but citizens, and the children were not allowed to marry without the conſent of their parents. The uſual ceremonies in promiſing fidelity was kiſſing each other, or giving their right hands, which was a general form of ratifying all agreements. Before the marriage could be ſolemnized, the gods were to be conſulted, and their aſſiſtance implored by prayers and ſacrifices, which were offered to ſome of the deities that ſuperintended theſe affairs, by the parents or neareſt relations of the perſons to be married. When the victim was opened, the gall was taken out and thrown behind the altar, as being the ſeat of anger and malice, and therefore the averſion of all the deities who had the care of love, as well as thoſe who became their votaries. For the particularities relating to the bride and bridegroom, ſee BRIDE and BRIDEGROOM.

The Romans, as well as the Greeks, diſallowed of polygamy. A Roman might not marry any woman who was not a Roman. Among the Romans, the kalends, nones, and ides of every month were deemed unlucky for the celebration of marriage, as was alſo the feaſt of the *parentalia*, and the whole month of May. The moſt happy ſeaſon in every reſpect was that which followed the ides of June.

The Roman laws ſpeak of ſecond marriages in very hard and odious terms: *Matre jam ſecundis nuptiis funeſtata*, L. iii. C. de ſec. nuptiis. By theſe laws it was enacted, that the effects of the huſband or wife deceaſed ſhould paſs over to the children, if the ſurvivor ſhould marry a ſecond time. By the law *Hac* *edictali* (Cod. de ſec. nupt.), the ſurvivor, upon marrying a ſecond time, could not give the perſon he married a portion more than equal to that of each of the children. In the primitive church the reſpect to chaſtity was carried ſo high, that a ſecond marriage was accounted no other than a lawful whoredom, or a ſpecies of bigamy; and there are ſome ancient canons which forbid the eccleſiaſtics from being preſent at ſecond marriages.

Marriage, by the Moſaic law, was ſubject to ſeveral reſtrictions: thus by Levit. chap. xviii. ver. 16. a man was forbid to marry his brother's widow unleſs he died without iſſue; in which caſe it became enjoined as a duty. So it was forbid to marry his wife's ſiſter, while ſhe was living, ver. 18.; which was not forbidden before the law, as appears from the inſtance of Jacob.

The ancient Roman law is ſilent on this head; and Papinian is the firſt who mentions it, on occaſion of the marriage of Caracalla. The lawyers who came after him ſtretched the bonds of affinity ſo far, that they placed adoption on the ſame foot with nature.

Affinity, according to the modern canoniſts, renders marriage unlawful to the fourth generation, incluſive; but this is to be underſtood of direct affinity, and not of that which is ſecondary or collateral. *Affinis mei affinis, non eſt affinis meus.* It is farther to be obſerved, that this impediment of marriage does not only follow an affinity contracted by lawful matrimony, but alſo that contracted by a criminal commerce; with this difference, that this laſt does extend beyond the ſecond generation; whereas the other, as has been obſerved, reaches to the fourth.

In Germany they have a kind of marriage called *morganatic*, wherein a man of quality contracting with a woman of inferior rank, he gives her the left hand in lieu of the right; and ſtipulates in the contract that the wife ſhall continue in her former rank or condition; and that the children born of them ſhall be of the ſame, ſo that they become baſtards as to matters of inheritance, though they are legitimate in effect. They cannot bear the name or arms of the family. None but princes and great lords of Germany are allowed this kind of marriage. The univerſities of Leipſic and Jena have declared againſt the validity of ſuch contracts; maintaining that they cannot prejudice the children, eſpecially when the emperor's conſent intervenes in the marriage.

The Turks have three kinds of marriages, and three ſorts of wives; *legitimate*, *wives in kebin*, and *ſlaves*. They marry the firſt, hire the ſecond, and buy the third.

Among all the ſavage nations, whether in Aſia, Africa, or America, the wife is commonly bought by the huſband from her father or thoſe other relations who have an authority over her; and the concluſion of a bargain for this purpoſe, together with the payment of the price, has therefore become the uſual form or ſolemnity in the celebration of their marriages. The Hebrews alſo purchaſed their wives by paying down a competent dowry for them; and Ariſtotle makes it one argument to prove that the ancient Grecians were an uncivilized people, becauſe they uſed to buy their wives; and in proportion as they laid aſide their barbarous manners they left off this practice.

The Engliſh law conſiders marriage in no other light than as a civil contract; the holineſs of the matrimonial ſtate being left entirely to the eccleſiaſtical law, to which it pertains, to puniſh or annul inceſtuous or other unſcriptural marriages. The law allows marriage to be good and valid, where the parties at the time of making it were willing and able to contract, and actually did contract, in the proper forms and ſolemnities required by law. The diſabilities for contracting are of two ſorts: firſt ſuch as are canonical, and therefore ſufficient by the eccleſiaſtical laws to void the marriage in the ſpiritual court; ſuch as pre-contract, conſanguinity, or relation by blood; and affinity, or relation by marriage, and ſome particular corporal infirmities. But theſe diſabilities in our law do not make the marriage *ipſo facto* void, but voidable only by ſentence of ſeparation; and marriages are eſteemed valid to all civil purpoſes, unleſs ſuch ſeparation is actually made during the life of the parties. Thus when a man had married his firſt wife's ſiſter, and after her death the biſhop's court was proceeding to annul the marriage and baſtardiſe the iſſue, the court of king's bench granted a prohibition *quoad hoc*; but permitted them to proceed to puniſh the huſband for inceſt.

By 32 Hen. VIII. c. 38. it is declared, that all perſons may lawfully marry but ſuch as are prohibited by God's law, &c. And that nothing (God's law excepted) ſhall impeach any marriage but within the Levitical degrees: theſe are enumerated in the 18th chapter of Leviticus, and are illuſtrated by Lord Coke in this manner: a man may not marry his mother, father's ſiſter, mother's ſiſter, ſiſter, daughter, daughter of his ſon or daughter, father's wife, uncle's wife, father's wife's daughter, brother's wife, wife's ſiſter, ſon's wife or wife's daughter, and daughter of his wife's ſon or daughter. And a woman may not marry her father, father's brother, mother's brother, brother, ſon, ſon of her huſband's ſon or daughter, mother's huſband, aunt's huſband, ſiſter's huſband, huſband's brother, and ſon of her huſband's ſon or daughter. By the civil law firſt couſins are allowed to marry; but by the canon law both firſt and ſecond couſins are prohibited. Therefore when it is vulgarly ſaid that firſt couſins may marry but ſecond couſins cannot, this probably aroſe by confounding theſe two laws; for firſt couſins may marry by the civil law, and ſecond couſins cannot by the canon law. But by the foreſaid ſtat. 32 Hen. VIII. c. 38. it is clear, that both firſt and ſecond couſins may marry. By the ſame ſtatute all impediments ariſing from pre-contracts to other perſons were aboliſhed, and declared of none effect unleſs they had been conſummated with bodily knowledge; in which caſe the canon law holds ſuch contract to be a marriage *de facto*. But this branch of the ſtatute was repealed by 2 & 3 Ed. VI. c. 23. How far the act of 26 Geo II. c. 33. (which prohibits all ſuits in eccleſiaſtical courts to compel a marriage in conſequence of any contract) may collaterally extend to revive this clauſe of Henry VIII.'s ſtatute, and aboliſh the impediment of pre-contract, judge Blackſtone leaves to be conſidered by the canoniſts. We ſhall here obſerve, that on a promiſe of marriage, if it be mutual on both ſides, damages may be recovered in caſe either party refuſes to marry; and tho' no time for the marriage is agreed on, if the plaintiff avers that he offered to marry the defendant who refuſed it, an action is maintainable for the damages; but no action ſhall be brought upon any agreement except it is in writing, and ſigned by the party to be charged. The canonical hours for celebrating marriage are from 8 to 12 in the forenoon.

The other ſort of diſabilities are thoſe which are created, or at leaſt enforced, by the municipal laws. Theſe civil diſabilities make the contract void *ab initio*, by rendering the parties incapable of forming any contract at all. The firſt legal diſability is a prior marriage, or having another huſband or wife living; in which caſe, beſides the penalties conſequent upon it as a felony, the ſecond marriage is to all intents and purpoſes void. See BIGAMY and POLYGAMY.

The next legal diſability is want of age: therefore if a boy under 14, or a girl under 12 years of age, marries, when either of them comes to the age of conſent, they may diſagree and declare the marriage void, without any divorce or ſentence in the ſpiritual court. However, in our law it is ſo far a marriage, that if at the age of conſent they agree to continue together, they need not be married again. Another incapacity ariſes from want of conſent of parents or guardians. By ſeveral ſtatutes, viz. 6 & 7 W. III. c. 6. 7. 8. W. III. c. 35. 10 Ann. c. 19. penalties of 100l. are laid on every clergyman who marries a couple either without publication of banns, which may give notice to parents or guardians, or without a licence, to obtain which the conſent of parents or guardians muſt be ſworn to. And by 4 & 5 Ph. & M. c. 8. whoſoever marries any woman child under the age of 16 years, without conſent of parents or guardians, ſhall be ſubject to fine or five years impriſonment; and her eſtate during her huſband's life ſhall be enjoyed by the next heir. Thus alſo in France the ſons cannot marry without conſent of parents till 30 years of age, nor the daughters till 25; and in Holland the ſons are at their own diſpoſal at 25, and the daughters at 20. And by the marriage act, viz. 26 Geo. II. c. 33. it is enacted, that all marriages celebrated by licence (for banns ſuppoſe notice), where either of the parties is under 21, not being a widow or widower, without the conſent of the father, or if he be not living of the mother or guardians, ſhall be abſolutely void. However, proviſion is made where the mother or guardian is non compos, beyond ſea, or unreaſonably froward, to diſpenſe with ſuch conſent at the diſcretion of the lord chancellor; but no proviſion is made in caſe the father ſhould labour under any mental or other incapacity. A fourth incapacity is want of reaſon. It is provided by 15 Geo. II. c. 30. that the marriage of lunatics and ſons under phrenſies (if found lunatics under a commiſſion or committed to the care of truſtees by any act of parliament) before they are declared of ſound mind by the lord chancellor, or the majority of ſuch truſtees, ſhall be totally void. Laſtly, the parties muſt not only be willing and able to contract, but muſt actually contract themſelves in due form of law, to make it a good civil marriage. Any contract made *per verba de præſenti*, or in words of the preſent tenſe, and in caſe of cohabitation *per verba de futuro* alſo between perſons able to contract, was before the late act deemed a valid marriage to many purpoſes, and the parties might be compelled in the ſpiritual courts to celebrate it *in facie eccleſiæ*. But theſe verbal contracts are now of no force to compel a future marriage. Nor is any marriage at preſent valid that is not celebrated in ſome pariſh church, or public chapel, unleſs by diſpenſation from the archbiſhop of Canterbury. It muſt alſo be preceded by publication of banns or by licence from the ſpiritual judge. A marriage in purſuance of banns muſt be ſolemnized in one of the churches or chapels where the banns were publiſhed. No parſon, vicar, &c. ſhall be obliged to publiſh banns of matrimony, unleſs the perſons to be married ſhall, ſeven days before the time required for the firſt publication, deliver to him a notice in writing of their true names, and of the houſe or houſes of their reſpective abode within ſuch pariſh, &c. and of the time that they have dwelt in ſuch houſe or houſes. And the ſaid banns ſhall be publiſhed upon three Sundays preceding the ſolemnization of marriage during the time of public ſervice: in caſe the parents or guardians, or either of the parties who ſhall be under the age of 21 years, ſhall openly and publicly declare, or cauſe to be declared in the church or chapel where the banns ſhall be ſo publiſhed, at the time of ſuch publication, their diſſent to ſuch marriage, ſuch publication of banns ſhall be void. And when the parties dwell in divers pariſhes, the curate of the one pariſh ſhall not ſolemnize matrimony betwixt them without a certificate of the banns being thrice aſked from the curate of the other pariſh. A marriage in purſuance of a licence (except a ſpecial licence) muſt be ſolemnized in ſuch church or chapel where the licence is granted; and no licence of marriage ſhall be granted by any archbiſhop, biſhop, &c. to ſolemnize any marriage in any other church, &c. than in the pariſh church, &c. within which the uſual place of abode of one of the parties ſhall have been for four weeks immediately before the granting ſuch licence. By the ſame ſtatute all marriages ſhall be ſolemnized in the preſence of two credible witneſſes at the leaſt, beſides the miniſter, who ſhall ſign their atteſtation thereof; and immediately after the celebration of every marriage, an entry thereof ſhall be made in the pariſh-regiſter, expreſſing that the ſaid marriage was celebrated by banns or licence; and if both or either of the parties be under age, with conſent of the parents or guardians, as the caſe ſhall be, ſigned by the miniſter, and alſo by the parties married, and atteſted by the two witneſſes preſent. It is held to be alſo eſſential to a marriage, that it be performed by a perſon in orders; though the intervention of a prieſt to ſolemnize this contract is merely *juris poſitivi*, and not *juris naturalis aut divini*; it being ſaid that Pope Innocent III. was the firſt who ordained the celebration of marriage in the church, before which it was totally a civil contract. And in the times of the grand rebellion, all marriages were performed by the juſtices of the peace; and theſe marriages were declared valid without any freſh ſolemnization, by 12 Car. II. c. 33. But as the law now ſtands, we may upon the whole collect, that no marriage by the temporal law is *ipſo facto* void, that is celebrated by a perſon in orders; in a pariſh-church, a public chapel, or elſewhere, by a ſpecial diſpenſation; in purſuing of banns or a licence; between ſingle perſons; conſenting; of ſound mind; and of the age of 21 years; or of the age of 14 in males and 12 in females, with conſent of parents or guardians, or without it, in caſe of widowhood. And no marriage is voidable by the eccleſiaſtical law after the death of either of the parties; nor during their lives, unleſs for the canonical impediments of precontract, if that indeed ſtill exiſts; of conſanguinity; and of affinity or corporal imbecillity ſubſiſting previous to the marriage.

By 26 Geo. II. c. 33. the ſubſtance of which has been already recited, if any perſon ſhall ſolemnize matrimony in any other place than a church, &c. where banns have been uſually publiſhed, unleſs by ſpecial licence, or without publication of banns, unleſs licence of marriage be firſt obtained from ſome perſon having authority to grant the ſame, every ſuch perſon knowingly ſo offending ſhall be guilty of felony, and tranſported for 14 years; the proſecution to be within three years By the ſame ſtatute, to make a falſe entry into a marriage-regiſter; to alter it when made; to forge or counterfeit ſuch entry, or a marriage licence, or aid and abet ſuch forgery; to utter the ſame as true, knowing it to be counterfeit; or to deſtroy or procure the deſtruction of any regiſter in order to vacate any marriage, or ſubject any perſon to the penalties of this act; all theſe offences, knowingly and wilfully committed, ſubject the party to the guilt of felony without benefit of clergy. But this act doth not extend to the marriages of the royal family; nor to Scotland; nor to any marriages among the people called *quakers*, or among perſons profeſſing the Jewiſh religion, where both the parties are quakers or Jews reſpectively; nor to any marriages beyond the ſeas.

In Scotland, the parties living together as man and wife, or declaring themſelves ſo before witneſſes, makes a valid though informal marriage. See LAW, Part III. n° 160.

For the proportions which marriages bear to births, and births to burials, in ſeveral parts of Europe, Mr Derham gives us the following table.

Names of Places.	Marriages to Births, as	Births to Burials, as
England in general - - - -	1 to 4.63	1.12to1
London - - - -	1 to 4	1. to 1.1
Hantſhire, from 1569 to 1658 - - -	1 to 4	1.2 to 1
Tiverton in Devonſhire from 1656 to 1664 -	1 to 3.7	1.26to1
Cranbrook in Kent, from 1560 to 1649 - -	1 to 3.9	1.6 to 1
Aynho, in Northamptonſhire, for 118 years -	1 to 6	1.6 to 1
Upminſter in Eſſex, for 100 years - - -	1 to 4.6	1.8 to 1
Franckfort on the Maine, in 1695 - -	1 to 3.7	1.2 to 1
Old, Middle, and Lower Marck, in 1698 - -	1 to 3.7	1.9 to 1
Dominions of the Elector of Brandenburg, in 1698	1 to 3.7	1.5 to 1

The following Table, ſimilar to the preceding, is formed from the obſervations collected and referred to by Dr Price.

Chambers's Cyclopædia, by Dr Rees.

Names of Places.	Marriages to Births, as	Births to Burials, as
London, annual medium from 1716 to 1736 -	— — —	18,000 to 26,529, or 1 to 1.4, &c.
——————— from 1759 to 1768 -	— — —	15,710 to 22,956, or 1 to 1.4, &c.
Northampton, ditto, from 1741 to 1770 - -	— — —	155 to 191, or 1 to 1.2, &c.
Norwich, ditto, from 1740 to 1769 - - -	— — —	1057 to 1206, or 1 to 1.1, &c.
Shrewſbury, ditto, from 1762 to 1768 - -	— — —	301 to 329, or 1 to 1.09, &c.
Mancheſter and Salford, excluſive of diſſenters, -		
Ditto, from 1755 to 1759 - - - - -	— — —	756 to 743, ————
Ditto, ditto, including diſſenters, from 1768 to 1772	— — —	1098 to 958, or 1.14, &c. to 1.
Gainſborough in Lincolnſhire, ditto, from 1752 to 1771	1 to 3.7	126 to 105, or 1.2 to 1.
Madeira, ditto, from 1759 to 1766 - -	1 to 4.68	2201 to 1293, or 1.7 to 1.
Boſton in New England, from 1731 to 1752 -	— — —	538 to 608, or 1 to 1.13, &c.
Chriſtiana in Norway, in 1761 - - -	— — —	11,024 to 6929, or 1.5 to 1.
Paris, mean of ſome of the laſt years - - -	1 to 4.3	19,100 to 19,400, or 1 to 1.01, &c.
Vienna, annual medium from 1757 to 1769 -	— — —	5800 to 6600, or 1 to 1.1, &c.
Amſterdam, ditto, for ſome of the laſt years -	1 to 1 9, &c.	4600 to 8000, or 1 to 1.1, &c.
Copenhagen, ditto - - - - -	1 to 3.04, &c.	2700 to 3300, or 1 to 1.2, &c.
Berlin, ditto, for five years, ending at 1759 -	1 to 3.9, &c.	3855 to 5054, or 1 to 1.3, &c.
Breſlaw, ditto, from 1633 to 1734 - - -	— — —	1089 to 1256, or 1 to 1.15, &c.
———, ditto, from 1717 to 1725 - - -	— — —	1252 to 1507, or 1 to 1.2, &c.
Rome, ditto, from 1759 to 1761 - - -	— — —	5167 to 7153, or 1 to 1.3, &c.
Vaud in Switzerland, ditto, for 10 years before 1766	1 to 3.9	3155 to 2504, or 1,2, &c. to 1.

For an account of the numbers of male and female ſtill-born children and chryſoms, and of boys and girls under ten, of married men and married women, and of widows and widowers, who died for a courſe of years at Vienna, Breſlaw, Dreſden, Leipſic, Ratiſbon, and ſome other towns in Germany, ſee Phil. Tranſ. Abr. Vol. VII. Part IV. p. 46, &c.

Chamb. Cyclop. Dr Rees.

The reader may find many curious calculations and remarks relating to this ſubject in Dr Price's excellent work, intitled, Obſervations on Reverſionary Payments. From the preceding table it appears, that marriages, one with another, do each produce about four births, both in England and other parts of Europe. Dr Price obſerves, that the births at Paris, as may be ſeen in the table, are above four times the weddings; and therefore it may ſeem, that in the moſt healthy country ſituations, every wedding produces above four children; and though this be the caſe in Paris, for reaſons which he has given, he has obſerved nothing like it in any other great town. He adds, that from comparing the births and weddings in countries and towns where regiſters of them have been kept, it appears, that in the former, marriages one with another ſeldom produce leſs than four children each; generally between four and five, and ſometimes above five; but in towns ſeldom above four, generally between three and four, and ſometimes under three. It is neceſſary to be obſerved here, that though the proportion of annual births to weddings has been conſidered as giving the true number of children derived from each marriage, taking all marriages one with another; yet this is only true, when, for many years, the births and burials have kept nearly equal. Where there is an exceſs of the births occaſioning an increaſe, the proportion of annual births to weddings muſt be leſs than the proportion of children derived from each marriage; and the contrary muſt take place where there is a decreaſe: and by Mr King's computation, about one in an hundred and four perſons marry; the number of people in England being eſtimated at five millions and a half, whereof about forty-one thouſand annually marry.

In the diſtrict of Vaud in Switzerland, the married are very nearly a third part of the inhabitants.

Major Graunt and Mr King diſagree in the proportions between males and females, the latter making 10 males to 13 females in London; in other cities and towns, and in the villages and hamlets, 100 males to 99 females: but Major Graunt, both from the London and country bills, computes, that there are in England 14 males to 13 females; whence he juſtly infers, that the Chriſtian religion, prohibiting polygamy, is more agreeable to the law of nature than Mahometaniſm and others that allow it.

This proportion of males to females Mr Derham thinks pretty juſt, being agreeable to what he had obſerved himſelf. In the hundred years, for inſtance, of his own pariſh-regiſter of Upminſter, though the burials of males and females were nearly equal, being 633 males and 623 females in all that time; yet there were baptized 709 males and but 675 females, which is 13 females to 13.7 males.

From a regiſter kept at Northampton for 28 years, from 1741 to 1770, it appears, that the proportion of males to females that were born in that period is 2361 to 2288, or nearly 13.4 to 13. However, though more males are born than females, Dr Price has ſufficiently ſhown, that there is a conſiderable difference between the probabilities of life among males and females in favour of the latter; ſo that males are more ſhortlived than females; and as the greater mortality of males takes place among children, as well as among males at all ages, the fact cannot be accounted for merely by their being more ſubject to untimely deaths by various accidents, and by their being addicted to the exceſſes and irregularities which ſhorten life. Mr Kerſſeboom informs us, that, during the courſe of 125 years in Holland, females have in all accidents of age lived about three or four years longer than the ſame number of males. In ſeveral towns of Germany, &c. it appears, that of 7270 married perſons who had died, the proportion of married men who died to the married women was 3 to 2; and in Breſlaw for eight years, as 5 to 3. In all Pomerania, during nine years, from 1748 to 1756, this proportion was nearly 15 to 11. Among the miniſters and profeſſors in Scotland, 20 married men die to 12 married women, at a medium of 27 years, or in the proportion of 5 to 3; ſo that there is the chance of 3 to 2, and in ſome circumſtances even a greater chance, that the woman ſhall be the ſurvivor of a marriage, and not a man; and this difference cannot be accounted for merely by the difference of age between men and their wives, without admitting the greater mortality of males. In the diſtrict of Vaud in Switzerland, it appears, that half the females do not die till the age of 46 and upwards, though half the males die under 36. It is likewiſe an indiſputable fact, that in the beginning of life, the rate of mortality among males is much greater than among females.

From a table formed by Dr Price, from a regiſter kept for 20 years at Gainſborough, it appears, that of thoſe who live to 80, the major part, in the proportion of 49 to 32, are females. Mr Deparcieux at Paris, and Mr Wargentin in Sweden, have farther obſerved, that not only women live longer than men, but that married women live longer than ſingle women. From ſome regiſters examined by Mr Muret in Switzerland, it appears, that of equal numbers of ſingle and married women between 15 and 25, more of the former died than of the latter, in the proportion of 2 to 1.

With reſpect to the difference between the mortality of males and females, it is found to be much leſs in country pariſhes and villages than in towns; and hence it is inferred, that human life in males is more brittle than in females, only in conſequence of adventitious cauſes, or of ſome particular debility, that takes place in poliſhed and luxurious ſocieties, and eſpecially in great towns.

From the inequality above ſtated between the males and females that are born, it is reaſonable to infer, that one man ought to have but one wife; and yet that every woman without polygamy may have a huſband: this ſurpluſage of males above females being ſpent in the ſupplies of war, the ſeas, &c. from which the women are exempt.

Perhaps, ſays Dr Price, it might have been obſerved with more reaſon, that this proviſion had in view that particular weakneſs or delicacy in the conſtitution of males, which makes them more ſubject to mortality; and which conſequently renders it neceſſary that more of them ſhould be produced, in order to preſerve in the world a due proportion between the two ſexes.

That this is a work of Providence, and not of chance,

chance, is well made out by the very laws of chance by Dr Arbuthnot; who ſuppoſes Thomas to lay againſt John, that for 82 years running more males ſhall be born than females; and giving all allowances in the computation to Thomas's ſide, he makes the odds againſt Thomas, that it does not ſo happen, to be near five millions of millions of millions of millions to one; but for ages of ages, according to the world's age, to be near an infinite number to one.

According to Mr Kerſſeboom's obſervations, there are about 325 children born from 100 marriages.

Mr Kerſſeboom, from his obſervations, eſtimates the duration of marriages, one with another, as in the following Table.

Thoſe whoſe ages, taken together, make

40, live together between	24 and	25 years.
50	22	23
60	23	21
70	19	20
80	17	18
90	14	15
100	12	13

Phil. Tranſ. N° 468. ſect. iii. p. 319.

Dr Price has ſhown, that on De Moivre's hypotheſis, or that the probabilities of life decreaſe uniformly (ſee *COMPLEMENT of Life)*, the duration of ſurvivorſhip is equal to the duration of marriage, when the ages are equal; or, in other words, that the expectation of two joint lives, the ages being equal, is the ſame with the expectation of ſurvivorſhip; and, conſequently, the number of ſurvivors, or (which is the ſame, ſuppoſing no ſecond marriages) of widows and widowers, alive together, which will ariſe from any given ſet of ſuch marriages conſtantly kept up, will be equal to the whole number of marriages; or half of them (the number of widows in particular) equal to half the number of marriages. Thus, the expectation of two joint lives, both 40, is the third of 46 years, or their complement, *i. e.* 15 years and 4 months; and this is alſo the expectation of the ſurvivor. That is, ſuppoſing a ſet of marriages between perſons all 40, they will one with another laſt juſt this time, and the ſurvivors will laſt the ſame time. In adding together the years which any great number of ſuch marriages, and their ſurvivorſhips, have laſted, the ſums would be found to be equal. It is obſerved farther, that if the number expreſſing the expectation of ſingle or joint lives, multiplied by the number of ſingle or joint lives whoſe expectation it is, be added annually to a ſociety or town, the ſum gives the whole number living together, to which ſuch an annual addition would in time grow: thus, ſince 19, or the third of 57, is the expectation of two joint lives whoſe common age is 29, or common complement 57, 20 marriages every year between perſons of this age would in 57 years grow to 20 times 19, or 380 marriages always exiſting together. The number of ſurvivors alſo ariſing from theſe marriages, and always living together, would in twice 57 years increaſe to the ſame number. Moreover, the particular proportion that becomes extinct every year, out of the whole number conſtantly exiſting together of ſingle or joint lives, muſt, wherever this number undergoes no variation, be exactly the ſame with the expectation of thoſe lives at the time when their exiſtence commenced. Thus, if it were found that a 19th part of all the marriages among any body of men, whoſe numbers do not vary, are diſſolved every year by the deaths of either the huſband or wife, it would appear, that 19 was at the time they were contracted, the expectation of theſe marriages. Dr Price obſerves, that the annual average of weddings among the miniſters and profeſſors in Scotland for the laſt 27 years has been 31; and the average of married perſons for 17 years ending in 1767, had been 667. This number, divided by 31, gives $21\frac{1}{2}$, the expectation of marriage among them; which, he ſays, is above $2\frac{1}{2}$ years more than the expectation of marriage would be, by Dr Halley's table, on the ſuppoſition, that all firſt, ſecond, and third marriages, may be juſtly conſidered as commencing one with another ſo early as the age of 30; and he has proved, that the expectation of two equal joint lives is to the expectation of a ſingle life of the ſame age as 2 to 3: conſequently, the expectation of a ſingle life at 30, among the miniſters in Scotland, cannot be leſs than 32.25. If we ſuppoſe the mean ages of all who marry annually to be 33 and 25, the expectation of every marriage would be 19 years; or one with another they would be all extinct in 19 years: the marriages which continue beyond this term, though fewer in number, enjoying among them juſt as much more duration as thoſe that fall ſhort of it enjoy leſs. But it appears from the obſervations and tables of Mr Muret, that, in the diſtrict of Vaud (dividing half the number of married perſons, *viz.* 38,328, by the annual medium of weddings, *viz* 808), the expectation of marriage is only $23\frac{1}{2}$ years: ſo much higher are the probabilities of life in the country than in towns, or than they ought to be, according to De Moivre's hypotheſis.

MARRIAGE *(Maritagium)*, in law, ſignifies not only the lawful joining of man and wife, but alſo the right of beſtowing a ward or a widow in marriage, as well as the land given in marriage.

Diſſolution of MARRIAGE. See DIVORCE.

Forcible MARRIAGE. See *FORCIBLE Marriage.*

Frank MARRIAGE. See FRANK.

Jactitation of MARRIAGE, in law, is one of the firſt and principal matrimonial cauſes, when one of the parties boaſts or gives out, that he or ſhe is married to the other, whereby a common reputation of their matrimony may enſue. On this ground the party injured may libel the other in the ſpiritual court; and unleſs the defendant undertakes and makes out a proof of the actual marriage, he or ſhe is enjoined perpetual ſilence on that head; which is the only remedy the eccleſiaſtical courts can give for this injury.

MARRIAGE Settlement, is a legal act, previous to marriage, whereby a jointure is ſecured to the wife after the death of the huſband. Theſe ſettlements ſeem to have been in uſe among the ancient Germans, and their kindred nation the Gauls. Of the former Tacitus gives us this account: *Dotem non uxor marito, ſed uxori maritus affert: interſunt parentes et propinqui, et munera probant* (De Mor. Germ. c. 18.) And Cæſar, De Bell. Gallic. lib. vi. c. 18. has given us the terms of a marriage ſettlement among the Gauls, as nicely calculated as any modern jointure: *Viri, quantas pecunias ab uxoribus dotis nomine acceperunt, tantas ex ſuis bonis, æſtimatione facta, cum dotibus communicant. Hujus omnis pecuniæ conjunctim ratio habetur, fructuſque ſervatur.*

Uter eorum vita ſuperavit, ad eum pars utriuſque cum fructibus ſuperiorum temporum pervenit. The dauphin's commentator ſuppoſes that this Gauliſh cuſtom was the ground of the new regulations made by Juſtinian, Nov. 97. with regard to the proviſion for widows among the Romans; but ſurely there is as much reaſon to ſuppoſe, ſays Judge Blackſtone, that it gave the hint for our ſtatutable jointures. Comment. vol. ii. p. 138.

See an excellent marriage ſettlement by Blackſtone in the appendix to the ſecond volume of his Commentaries.

Duty of MARRIAGE, is a term uſed in ſome ancient cuſtoms, ſignifying an obligation on women to marry.

To underſtand this, it muſt be obſerved, that old maids and widows about ſixty, who held fees in body, or were charged with any perſonal or military ſervices, were anciently obliged to marry, to render thoſe ſervices to the lord by their huſbands, or to indemnify the lord for what they could not do in perſon. And this was called *duty* or *ſervice of marriage*.

Policy of encouraging MARRIAGE. Dr Halley obſerves, that the growth and increaſe of mankind is not ſo much ſtinted by any thing in the nature of the ſpecies, as it is from the cautious difficulty moſt people make to adventure on the ſtate of marriage, from the proſpect of the trouble and charge of providing for a family; nor are the poorer ſort of people herein to be blamed, who, beſides themſelves and families, are obliged to work for the proprietors of the lands that feed them; and of ſuch does the greater part of mankind conſiſt. Were it not for the backwardneſs to marriage, there might be four times as many births as we find; for by computation from the table given under the article MORTALITY, there are 15,000 perſons above 16 and under 45, of which at leaſt 7000 are women capable of bearing children; yet there are only 1238, or little more than a ſixth part of theſe, that breed yearly: whereas, were they all married, it is highly probable that four of ſix ſhould bring forth a child every year, the political conſequences of which are evident. Therefore, as the ſtrength and glory of a kingdom or ſtate conſiſts in the multitude of ſubjects, celibacy above all things ought to be diſcouraged, as by extraordinary taxing or military ſervice: and, on the contrary, thoſe who have numerous families ſhould be allowed certain privileges and immunities, like the *jus trium liberorum* among the Romans; and eſpecially, by effectually providing for the ſubſiſtence of the poor.

MARROW, in anatomy, a ſoft oleaginous ſubſtance contained in the cavity of the bones. See ANATOMY, n° 5.

MARRUBIUM, WHITE HOREHOUND: A genus of the gymnoſpermia order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 42d order, *Verticillatæ*. The calyx is ſalver-ſhaped, rigid, and ten-ſtriated; the upper lip of the corolla bifid, linear, and ſtraight. There are nine ſpecies, the moſt remarkable of which is the vulgare, a native of Britain, growing naturally in waſte places, and by way-ſides near towns and villages, but not common. It has a ſtrong and ſomewhat muſky ſmell, and bitter taſte. It is reputed attenuant and reſolvent; an infuſion of the leaves in water, ſweetened with honey, is recommended in aſthmatical and phthiſical complaints, and moſt other diſeaſes of the breaſt and lungs.

MARS, in aſtronomy, one of the five planets, and of the three ſuperior ones; its place being between the earth and Jupiter. See ASTRONOMY, n° 40.

MARS, in Pagan worſhip, the god of war. He was, according to ſome, the ſon of Jupiter and Juno; while others ſay that he was the ſon of Juno alone, who, being diſpleaſed at Jupiter's having produced Minerva from his brain, without female aid, in revenge conceived without the aſſiſtance of the other ſex, by touching a flower ſhown to her by Flora in the plains of Olenus, and became the mother of this formidable deity. The amours of Mars and Venus, and the manner in which Vulcan caught and expoſed them to the laughter of the other gods, have been deſcribed by ſeveral of the ancient poets. He is repreſented as having ſeveral wives and miſtreſſes, and a conſiderable number of children. He was held in the higheſt veneration by the Romans, both from his being the father of Romulus their founder, and from their inclination to conqueſt; and had magnificent temples erected to him at Rome.

Mars is uſually repreſented in a chariot, drawn by furious horſes. He is completely armed; and extends his ſpear with the one hand, and graſps a ſword, imbrued in blood, with the other. He has a fierce and ſavage aſpect. Diſcord is repreſented preceding his car; and Clamour, Fear, and Terror, appear in his train. The victims ſacrificed to him were the wolf, the horſe, the wood-pecker, the vulture, and the cock.

MARS, among chemiſts, denotes *iron*; that metal being ſuppoſed to be under the influence of the planet Mars.

MARSAIS (Ceſar Cheſneau du), was born at Marſeilles 1676. He attached himſelf at an early period of life to the order of the congregation of the oratory; but the ſituation was too narrow for his genius, and he ſoon left it. At Paris he married, became advocate, and entered on this new profeſſion with great ſucceſs and approbation. Diſappointed, however, in his expectations of making a ſpeedy fortune, he abandoned the law alſo. About this time the peeviſh humour of his wife occaſioned a ſeparation. We next find him as governor to the ſon of the preſident de Maiſons; and when the premature death of the father deprived him of the fruits of his induſtry, he engaged with the famous Law in the ſame capacity. After the fall of this extraordinary projector, he completed the education of the Marquis de Beaufremont's children, and reared pupils worthy of his genius and induſtry. Although he was accuſed of a tendency to Deiſm, and though there was good reaſon for the accuſation; yet he never infuſed into the minds of his ſcholars any principle inconſiſtent with ſound morality, or with the Chriſtian religion. When he left M. de Beaufremont's family, he took a boarding houſe, in which, after a method of his own, he educated a certain number of young men. Unexpected circumſtances obliged him to abandon this uſeful undertaking. He was even conſtrained to give ſome occaſional leſſons for the bare neceſſaries of life. Without fortune, without hope, and almoſt without reſource, he was reduced to extreme indigence. In this ſituation he was found by the authors of the *Encyclopédie*, and made a partner in conducting that great work. Among many other excellent pieces, the article *Grammar* breathes the ſpirit of ſound philoſophy. His principles are clear and ſolid. He diſcovers an extreme knowledge of the ſubject, great accuracy in the rules, and great propriety in the application. M. le Comte de Lauraguais was ſo much affected with the diſtreſſes, and ſo much convinced of the merit of *Du Marſais*, that he procured him a penſion of one thouſand livres. Du Marſais died at Paris on the 11th June 1756, in his eightieth year, after having received the ſacrament. The compliment which he paid to the prieſt on this occaſion has been conſidered by ſome as rather equivocal. But there is no neceſſity to deprive religion of this triumph, or philoſophy of that honour which conviction and penitence muſt confer on it. "The faith of a great genius (ſays Bayle, who is intitled to credit on this ſubject) is not totally extinguiſhed : It is like a ſpark under the aſhes. Reflection and the proſpect of danger call forth its exertions. There are certain ſituations in which philoſophers are as full of anxiety and remorſe as other men." Whatever were the laſt ſentiments of Du Marſais, it cannot be denied that in the vigour of health he furniſhed ſeveral examples of irreligion, and to theſe have been added many abſurd ſtories. The ſuperiority of Du Marſais's talents conſiſted in exactneſs and perſpicuity. His ignorance of the world, and of the cuſtoms of mankind, together with the greateſt latitude in expreſſing whatever he thought, gave him that frank and unguarded ſimplicity which is often the chief ingredient of genuine humour. Fontenelle uſed to ſay of him, "that he was the moſt lively ſimpleton, and as a man of wit the moſt ſimple, he ever knew." He was the Fontaine of philoſophers. In conſequence of this character, he was a nice judge of what was natural in every production, and a great enemy to all kind of affectation. His principal works are, 1. *Expoſition de la doctrine de l'Egliſe Gallicane par rapportaux pretenſions de la Cour de Rome*, 12mo. This accurate work was begun at the deſire of the preſident de Maiſons, and did not appear till after the death of the author. 2. *Expoſition d'une methode raiſonée pour apprendre la langue Latine*, 12mo, 1722, rare. This method appears conformable to the natural unfolding of the powers of the mind, and on that account renders the acquiſition of the language leſs difficult ; but it was liable to two great objections to vulgar and unenlightened underſtandings, namely, its novelty, and the cenſure which it conveyed againſt the former method. 3. *Traite des tropes*, 1730, 8vo ; again printed in 1771, 12mo. This work is intended to explain the different ſignifications of the ſame word. It is a maſter-piece of logic, of accuracy, of perſpicuity, and preciſion. The obſervations and the rules are illuſtrated by ſtriking examples calculated to ſhow both the uſe and the abuſe of the rhetorical figures. It is wonderful at the ſame time that this excellent book had very little ſale, and is ſcarcely known. A gentleman who wanted to compliment the author on this extraordinary performance, told him that he had heard a great deal of his *Hiſtoire des Tropes*, and begged to know in what particular part of the world the nation flouriſhed. 4. *Les veritable Principes de la Grammaire raiſonée pour apprendre la langue Latine*, 1729, 4to. There was only the preface of this work publiſhed, in which he introduced the greateſt part of his *methode raiſonnée*. 5. *Labiege de la fable du Pere Jouvenci*, arranged after the manner of the original plan, 1731, 12mo. 6. *Une reponſe manuſcrite a la Critique de l'hiſtoire des oracles par le Pere Baltus*. There are only imperfect fragments of theſe papers to be found.—7. *Logique, ou reflections ſur les operations de l'eſprit*. This is a ſhort tract, which nevertheleſs contains every thing neceſſary to be known on the art of reaſoning. It was reprinted at Paris, in two parts, together with the articles which he had furniſhed for the *Encyclopédie*, 1762. We ſhall altogether omit ſeveral other performances, calculated to diſſeminate the principles of Deiſm or profanity ; which, though they are publiſhed in his name, may be ſpurious, and at any rate deſerve not to be drawn from that oblivion into which they have fallen.

MARSAL, a town of France, in Lorrain, remarkable for its ſalt-works ; ſeated in a marſh on the river Selle, of difficult acceſs, which, together with the fortifications, render it an important place. E. Long. 6. 43. N. Lat. 48. 46.

MARSALA, an ancient and ſtrong town of Sicily, in the valley of Mazara. It is well peopled, and built on the ruins of the ancient Lilybœum. E. Long. 12. 37. N. Lat. 37. 52.

MARSAN, or MOUNT-MARSAN, a town of France, in Gaſcony, and capital of a ſmall territory of the ſame name, fertile in wine ; ſeated on the river Miduſe, in W. Long. 0. 39. N. Lat. 44. 0.

MARSAQUIVER, or MARSALQUIVER, a ſtrong and ancient town of Africa, on the coaſt of Barbary, and in the province of Beni-Arax, in the kingdom of Tremeſen, with one of the beſt harbours in Africa. It was taken by the Spaniards in 1732. It is ſeated on a rock near a bay of the ſea, in W. Long. 0. 10. N. Lat. 35. 40.

MARSEILLES, a ſtrong ſea-port, and the richeſt town of Provence, in France. Here is a good harbour, where the French galleys are ſtationed ; for it will not admit large men of war. The entrance of the harbour, which is extremely narrow and ſurrounded by lofty mountains, protects and ſhelters veſſels during the moſt violent ſtorms. The port itſelf forms a delightful walk even in the middle of winter, as it is open to the ſouthern ſun, and crowded with vaſt numbers of people not only of all the European nations, but of Turks, Greeks, and natives of the coaſt of Barbary. The whole ſcene is one of the moſt agreeable that can be imagined, if the chains of the galley ſlaves heard among the hum of buſineſs did not tincture it with the hateful idea of ſlavery. The galleys themſelves, uſeleſs and neglected, rot peaceably in their reſpective ſtations ; and it is ſaid that no others will ever be conſtructed to ſupply their place, as they have long ceaſed to be of any utility to the ſtate, and are ſcarcely even navigable in ſevere weather. Marſeilles pretends to the moſt remote antiquity ; a colony of Phocians, in ages unknown, having given it birth. It is divided into the Old Town and the New ; which are ſeparated by a ſtreet, bordered with trees on each ſide. The Old Town is one of the moſt ill built of any in Europe. The New has ſprung up ſince the commencement of the 18th century, and has all that

that regularity, elegance, and convenience, which diſtinguiſh the preſent times. It is ſaid to contain 100,000 inhabitants, and is one of the moſt trading towns in France. Without the walls is the caſtle of Notre-Dame, which is very well fortified. It is a biſhop's ſee, and there is a French academy; it having been noted at all times for men of learning. In 1660, Louis XIV. built the citadel and fort St John to keep the inhabitants in awe, becauſe they pretended to be free. The Jeſuits had a very fine obſervatory here; and in the arſenal, built not long ago, there are arms for 40,000 men. In the Houſe of Diſcipline they weave gold, ſilver, and ſilk brocades. The drugs are brought thither from all parts of the world. It is ſeated on the north ſhore of the Mediterranean, in E. Long. 4. 27. N. Lat. 43. 18. The ſurrounding country is rocky and barren, but covered for ſeveral miles on all ſides with villas and ſummer houſes, which commerce has erected.

MARSH (Narciſſus), an exemplary Iriſh prelate, born at Hannington in Wiltſhire in 1638. He was made principal of St Alban's hall, Oxford, in 1673, but removed to the provoſtſhip of Dublin college in 1678. He was promoted to the biſhopric of Leighlin and Ferns in 1682, tranſlated to the archbiſhopric of Caſhel in 1690, to Dublin in 1694, and to Armagh in 1703. While he held the ſee of Dublin, he built a noble library for the uſe of the public, filled it with choice books, and ſettled a proviſion for two librarians. He repaired, at his own expence, ſeveral decayed churches, beſides buying in and reſtoring many impropriations, and preſenting a great number of oriental MSS. to the Bodleian library. He was a very learned and accompliſhed man; was well verſed in ſacred and profane literature, in mathematics, natural philoſophy, the learned languages, eſpecially the oriental, and in both the theory and practice of muſic. He publiſhed, 1. *Inſtitutiones logicæ.*—2. *Manuductio ad logicam*, written by Philip de Trieu; to which he added the Greek text of Ariſtotle, and ſome tables and ſchemes. 3. An introductory eſſay on the doctrine of ſounds, &c. He died in 1713.

MARSH, ſignifies a piece of ground flowed with water, yet ſo that the graſs and other vegetables riſe above the ſurface of the water, and, by their decaying, give riſe to putrid effluvia, which are very pernicious to the human body.

MARSHAL, or MARESCHAL, (*mareſcallus*), primarily denotes an officer who has the care or the command of horſes.—Nicod derives the word from *polemarchus*, "maſter of the camp;" Matthew Paris from *Martis ſeneſcallus*. In the old Gauliſh language, *march* ſignified "horſe;" whence *marechal* might ſignify "him who commanded the cavalry." Other derivations have been given by different authors; and the name itſelf has been applied to officers of very different employments.

MARSHAL of France, the higheſt dignity of preferment in the French armies. The dignity of marſhal came to be for life, though at its firſt inſtitution it was otherwiſe. They were then only the king's firſt ecuyers under the conſtable; but in time they became the conſtable's lieutenants in the command of the army, the conſtable himſelf being then become captain-general. At firſt they were but two in number; and their allowance was but 500 livres *per annum* in time of war, and nothing in time of peace: but in the reign of Francis I. a third was added; Henry II. created a fourth. Since it has been various; Louis XIV. increaſed it to 20. Their office at firſt was, to marſhal the army under the conſtable, and to command in his abſence. They did then what the *marſhals de camp* do now; to which laſt they have given their title, and the leaſt conſiderable part of their authority.

Earl MARSHAL of Scotland. His office was to command the cavalry, whereas the CONSTABLE commanded the whole army. They ſeem, however, to have had a ſort of joint command, as of old all orders were addreſſed "to our conſtable and mariſchal." The office of earl mariſchal has never been out of the noble family of Keith. It was reſerved at the union; and when the heritable juriſdictions were bought, it was in the crown, being forfeited by the rebellion of Geo. Keith, earl mariſchal, in 1715.

Earl MARSHAL of England is the eighth great officer of ſtate. This office, until it was made hereditary, always paſſed by grant from the king, and never was held by tenure or ſerjeanty (by any ſubject) as the offices of lord high ſteward and lord high conſtable were ſometimes held. The title is perſonal, the office honorary and officiary. They were formerly ſtyled *lord marſhal* only, until king Richard II. June 20. 1397, granted letters-patent to Thomas Mowbray, earl of Nottingham, and to the heirs male of his body lawfully begotten, by the name and ſtyle of *earl marſhal;* and further, gave them power to bear in their hand a gold truncheon, enamelled with black at each end; having at the upper end of it the king's arms engraven thereon, and at the lower end his own arms.

King James I. was pleaſed, by letters-patent, dated Auguſt 29th 1622, to conſtitute Thomas Howard, earl of Arundel and Surrey, earl marſhal for life; and the next year, the ſame king granted (with the advice of the privy-council) letters-patent, wherein it was declared, that during the vacancy of the office of lord high conſtable of England, the earl marſhal had the like juriſdiction in the court of chivalry, as both conſtable and marſhal jointly ever exerciſed. See CHIVALRY (*Court of.*)

On the 19th of October 1672, king Charles II. was pleaſed to grant to Henry lord Howard, and the heirs-male of his body lawfully begotten, the office and dignity of earl marſhal of England, with power to execute the ſame by deputy or deputies, in as full and ample a manner as the ſame was heretofore executed by Henry Howard, lord Maltravers, late earl of Arundel, Surrey, and Norfolk, grandfather to the ſaid Henry lord Howard; or by Thomas Howard late duke of Norfolk, grandfather to the ſaid Thomas Howard, late earl of Arundel, Surrey, and Norfolk; or by Thomas Howard duke of Norfolk, grandfather of the ſaid Thomas Howard duke of Norfolk; or by John Mowbray duke of Norfolk, or any other earl marſhal of England; with a penſion of L. 20 each year, payable out of the Hanaper office in chancery; and on default of the iſſue-male of the ſaid Henry lord Howard,

Howard, with limitation to the heirs-male lawfully begotten of the body of the ſaid Thomas Howard, earl of Arundel, &c.; and, on the default of ſuch iſſue, to deſcend in like manner to the heirs-male of Thomas late earl of Suffolk; and, on default of his iſſue-male, to the heirs-male of lord William Howard, late of Naworth in the county of Cumberland, youngeſt ſon to Henry Howard late duke of Norfolk; and, on default of his iſſue-male, to Charles Howard earl of Nottingham, and the heirs-male of his body lawfully begotten.

Field-MARSHAL, an office of high rank in the European armies. It is now, however, diſuſed in the Britiſh army; Lord Tyrawley was the laſt, appointed in 1763.

Knight MARSHAL, or *MARSHAL of the King's Houſe*, an Engliſh officer, whoſe buſineſs, according to Fleta, is to execute the commands and decrees of the lord ſteward, and to have the cuſtody of priſoners committed by the court of verge. Under him are ſix marſhal's men, who are properly the king's bailiffs, and arreſt in the verge of the court, when a warrant is backed by the board of green-cloth. The court where cauſes of this kind, between man and man, are tried, is called the *Marſhalſea*, and is under the knight-marſhal. See MARSHALSEA.

This is alſo the name of the priſon in Southwark; the reaſon of which may probably be, that the marſhal of the king's houſe was wont to ſit there in judgement, or keep his priſon.

MARSHAL of the King's Bench, an officer who has cuſtody of the priſon called the *King's Bench* in Southwark.—He gives attendance upon the court, and takes into his cuſtody all priſoners committed by the court; he is fineable for his abſence, and non-attendance incurs a forfeiture of his office. The power of appointing the marſhal of the king's bench is in the crown.

In Fleta, mention is alſo made of a *marſhal of the exchequer*, to whom the court commits the cuſtody of the king's debtors, &c.

MARSHAL (Thomas), a very learned Engliſh divine in the 17th century, was educated at Oxford. This city being garriſoned upon the breaking out of the civil wars, he bore arms for the king. Afterward he had ſeveral ſucceſſive preferments in the church; and died at Lincoln-college, of which he was rector. By his will he left all his books and MSS. to the univerſity of Oxford, and money to Lincoln-college for the maintenance of three ſcholars. He was a noted critic, eſpecially in the Gothic and Engliſh-Saxon tongues; and eminent for his piety and other valuable qualities. He wrote, 1. *Obſervationes in Evangeliorum verſiones per antiquos duos, Goth. ſcilicet & Anglo-Sax.* &c. 2. Notes on the church-catechiſm, &c.

MARSHALLING *a* COAT, in heraldry, is the diſpoſal of ſeveral coats of arms belonging to diſtinct families in one and the ſame eſcutcheon or ſhield, together with their ornaments, parts, and apurtenances. See HERALDRY, chap. vi. p. 466.

MARSHALSEA *(the Court of)*, and the *Palace-court* at Weſtminſter, though two diſtinct courts, are frequently confounded together. The former was originally holden before the ſteward and marſhal of the king's houſe, and was inſtituted to adminiſter juſtice between the king's domeſtic ſervants, that they might not be drawn into other courts, and thereby the king loſe their ſervice. It was formerly held in, though not a part of, the *aula regis*; and, when that was ſubdivided, remained a diſtinct juriſdiction: holding plea of all treſpaſſes committed within the verge of the court, where only one of the parties is in the king's domeſtic ſervice (in which caſe the inqueſt ſhall be taken by a jury of the country); and of all debts, contracts, and covenants, where both of the contracting parties belong to the royal houſehold; and then the inqueſt ſhall be compoſed of men of the houſehold only. By the ſtatute of 13 Ric. II. ſt. 1. c. 3. (in affirmance of the common law), the verge of the court in this reſpect extends for 12 miles round the king's place of reſidence. And, as this tribunal was never ſubject to the juriſdiction of the chief juſticiary, no writ of error lay from it (though a court of record) to the king's-bench, but only to parliament, till the ſtatutes of 5 Edw. III. c. 2. and 10 Edw. III. ſt. 2. c. 3. which allowed ſuch writ of error before the king in his place. But this court being ambulatory, and obliged to follow the king in all his progreſſes, ſo that by the removal of the houſehold actions were frequently diſcontinued, and doubts having ariſen as to the extent of its juriſdiction, king Charles I. in the ſixth year of his reign, by his letters-patent, erected a new court of record, called the *curia palatii*, or *palace-court*, to be held before the ſteward of the houſehold and knight-marſhal, and the ſteward of the court, or his deputy; with juriſdiction to hold plea of all manner of perſonal actions whatſoever, which ſhall ariſe between any parties within 12 miles of his majeſty's palace at Whitehall. The court is now held once a week, together with the ancient court of marſhalſea, in the borough of Southwark: and a writ of error lies from thence to the court of king's-bench. But if the cauſe is of any conſiderable conſequence, it is uſually removed on its firſt commencement, together with the cuſtody of the defendant, either into the king's-bench or common-pleas by a writ of *habeas corpus cum cauſa*: and the inferior buſineſs of the court hath of late years been much reduced, by the new courts of conſcience erected in the environs of London; in conſideration of which the four counſel belonging to theſe courts had ſalaries granted them for their lives by the ſtat. 23. Geo. II. c. 27.

MARSHAM (Sir John), a very learned Engliſh writer in the 17th century. He ſtudied the law in the Middle-Temple, and was ſworn one of the ſix clerks in the court of chancery in 1638. In the beginning of the civil wars he followed the king to Oxford; for which he was ſequeſtered of his place by the parliament at Weſtminſter, and plundered. After the declining of the king's affairs, he returned to London; compounded, among other royaliſts, for his real eſtate; and betook himſelf wholly to his ſtudies and a retired life, the fruits of which were ſome excellent works. He wrote *Diatriba Chronologica; Chronicus Canon, Ægyptiacus, Ebraicus, Græcus*, &c. He died in 1685.

MARSHFIELD, a town of Gloceſterſhire, 7 miles from Bath, 12 from Chipping-Sodbury, 12½ from Briſtol, 35 from Gloceſter, and 104 from London, on the road to Briſtol, and on the very borders of Wilts. It is a conſiderable clothing-town, drives a good trade in malt, and is famous for cakes. It conſiſts chiefly of one ſtreet of old buildings near a mile long; and is governed by a bailiff. It has a large church, with a well-endowed alms-houſe and a chapel to it for eight poor people, and a charity-ſchool; and it has a weekly market and two fairs.

MARSHLAND, a marſhy peninſula in the county of Norfolk, oppoſite to King's-Lynn, almoſt ſurrounded with the Ouſe and other navigable rivers, and an arm of the ſea. It ſeems formerly to have been recovered out of the ocean, from whoſe inundations it could never be altogether defended; and in Sir Henry Spelman's time it ſuffered two general ones, viz. one from the ſalt-water, the other from the freſhes; by the laſt of which the inhabitants ſuffered 42,000 l. damage. It contains about 30,000 acres, which turn to more profit by grazing than ploughing. It is about 10 miles in the wideſt place, and has no leſs than 111 brick bridges. The commonage of it belongs to ſeven villages that ſurround it. The air is ſo unhealthy, that an ague is commonly called the *Marſhland-bailiff.*

MARSHMALLOW, in botany. See ALTHÆA.

MARSI, a nation of Germany, who afterwards came to ſettle in Italy, where they occupied the territory in the environs of the Fucine Lake. They at firſt proved very inimical to the Romans, but in proceſs of time they became its firmeſt ſupporters. They were allowed by the Romans to be the moſt intrepid ſoldiers of their legions when in friendſhip, and the moſt formidable of their enemies when at variance; and it was a common ſaying, that Rome could neither triumph over the Marſi nor without them. They are particularly celebrated for the civil war in which they were engaged, and which from them has received the name of the *Marſian war.* The large contributions they made to ſupport the intereſt of Rome, and the number of men which they continually ſupplied to the republic, rendered them bold and aſpiring; and they claimed, with the reſt of the Italian ſtates, a ſhare of the honour and privileges which were enjoyed by the citizens of Rome. This petition, though ſupported by the intereſt, the eloquence, and the integrity of the tribune Druſus, was received with contempt by the Roman ſenate; upon which, in the 662d year of Rome, the Marſi put themſelves at the head of the ſocial war, one of the moſt obſtinate and dangerous oppoſitions ever made to the progreſs of the Roman power. They obtained ſeveral victories: but they were at laſt defeated: though the war was not terminated but by a grant of thoſe privileges for which they contended.

MARSICO NUOVO, a ſmall, rich, and handſome town of Italy, in the kingdom of Naples, and in the Hither Principato, with a biſhop's ſee. It is ſeated at the foot of the Apennines, near the river Agri, in E. Long. 15. 49. N. Lat. 20. 42.

MARSIGLI (Lewis Ferdinand, count), an Italian famous for letters as well as arms, was deſcended from an ancient and noble family, and born at Bologna in 1658. He acquired a great knowledge in the art of war and fortification; ſerved under the emperor Leopold II. againſt the Turks, by whom he was taken priſoner in 1683 but redeemed, after a year's captivity. In the Spaniſh ſucceſſion war, Marſigli, then advanced to the rank of marſhal, being in the fortreſs of Briſac, which ſurrendered to the duke of Burgundy in 1703, when the place was deemed capable of holding out much longer, was ſtripped of all his commiſſions, and had his ſword broke over him; and the count d'Arco who commanded was beheaded. Marſigli now ſought for conſolation in the ſciences; as, amidſt all the hurry and fatigue of war, he had made all the advantages the moſt philoſophic man could do, who had travelled purely in queſt of knowledge. He had a rich collection of every thing proper to the advancement of natural knowledge, inſtruments aſtronomical and chemical, plans of fortifications, models of machines, &c. all which he preſented to the ſenate of Bologna by an authentic act in 1712, forming at the ſame time out of them what he called *the inſtitute of the arts and ſciences at Bologna.* He alſo founded a printing-houſe, and furniſhed it with the beſt types for Latin, Greek, Hebrew, and Arabic, which he preſented in 1728 to the Dominicans at Bologna, on condition of their printing all the writings of the *inſtitute* at prime coſt: this was called *the printing-houſe of St Thomas Aquinas.* His writings on philoſophical ſubjects are numerous and valuable, in Latin, Italian, and French: he died in 1730.

MARSTON (John), an Engliſh dramatic writer, who lived in the time of James I. Wood ſays he was a ſtudent in Corpus Chriſti college, Oxford; but we neither know his family nor the time of his birth. He contributed eight plays to the ſtage, which were all acted at Black-friars with applauſe; and one of them, called the *Dutch Courtezan,* was once revived ſince the Reſtoration, under the title of the *Revenge,* or a *Match in Newgate.* There is no account when he died; but we find his works were publiſhed after his death by Shakeſpeare, and may thence reaſonably conclude that it happened about the year 1614. He was a chaſte and pure writer; avoiding all that obſcenity, ribaldry, and ſcurrility, which too many of the play-wrights of that time, and indeed much more ſo in ſome periods ſince, have made the baſis of their wit, to the great diſgrace and ſcandal of the ſtage.

MARSYAS (fab. hiſt.), a celebrated muſician of Celænæ in Phrygia, ſon of Olympus, or of Hyagnis, or Œagrus. He was ſo ſkilful in playing on the flute, that he is generally deemed the inventor of it. According to the opinion of ſome, he found it when Minerva had thrown it aſide on account of the diſtortion of her face when ſhe played upon it. Marſyas was enamoured of Cybele, and he travelled with her as far as Nyſa, where he had the imprudence to challenge Apollo to a trial of his ſkill as a muſician. The god accepted the challenge, and it was mutually agreed that he who was defeated ſhould be flead alive by the conqueror. The Muſes, or (according to Diodorus) the inhabitants of Nyſa, were appointed umpires. Each exerted his utmoſt ſkill, and the victory with much difficulty was adjudged to Apollo. The god upon this tied his antagoniſt to a tree, and flead him alive. (See APOLLO.) The death of Marſyas was univerſally lamented; the Fauns, Satyrs, and Dryads, wept at his fate; and from their abundant tears aroſe a river of Phrygia, well known by the name of *Marſyas.*

ſyas. The unfortunate Marſyas is often repreſented on monuments, as tied with his hands behind his back to a tree, while Apollo ſtands before him with his lyre in his hands. In independent cities, among the ancients, the ſtatue of Marſyas was generally erected in the forum, to repreſent the intimacy which ſubſiſted between Bacchus and Marſyas as the emblems of liberty. At Celænæ, the ſkin of Marſyas was ſhown to travellers for ſome time. It was ſuſpended in the public place, in the form of a bladder or a foot ball.

The ſources of the Marſyas were near thoſe of the Mæander, and thoſe two rivers had their confluence a little below the town of Celænæ.

MART, a great fair held every year for buying and ſelling goods. Public marts, or places of buying and ſelling, ſuch as markets and fairs, with the tolls thereunto belonging, can only be ſet up by virtue of the king's grant, or by long and immemorial uſage and preſcription, which preſuppoſes ſuch a grant. The limitation of theſe public reſorts, to ſuch time and place as may be moſt convenient for the neighbourhood, forms a part of economics, or domeſtic polity; which, conſidering the kingdom as a large family, and the king as the maſter of it, he has clearly a right to diſpoſe and order as he pleaſes.

MARTABAN, a province of Aſia, in the kingdom of Pegu, lying in the gulph of Bengal. It is a country that produces rice and all kinds of fruits proper to the climate. It has mines of ſeveral ſorts of metals, and carries on a great trade. The chief town, which is of the ſame name, is rich, handſome, and very populous, with a good harbour. E. Long. 97. 50. N. Lat. 15. 35.

MARTEAU, the name given by French naturaliſts to a peculiar ſpecies of oyſters, called alſo *malleam* by others. It is one of the moſt curious ſhells in the world. Its figure is that of a hammer, with a very long head, or rather of a pick-ax. It has a body of moderate thickneſs, and two long arms. It is of a browniſh colour, with a beautiful tinge of a violet-blue. Notwithſtanding the ſtrange ſhape of theſe ſhells, they cloſe very exactly.

MARTHA (St), a province of South America, on the coaſt of Terra Firma, bounded on the north by the North Sea, on the eaſt by Rio de la Hache, on the ſouth by New-Granada, and on the weſt by Carthagena. It is 300 miles in length and 200 in breadth, is a mountainous country, and the land very high. Here begins the famous ridge of mountains called the *Cordilleras des los Andes*, which run from north to ſouth the whole length of the continent of South America. It is extremely hot on the ſea-coaſt; but cold in the internal parts, on account of the mountains. It abounds with the fruits proper to the climate; and there are mines of gold and precious ſtones, as alſo ſalt-works. The Spaniards poſſeſs but one part of this province, in which they have built Martha the capital. The air about the town is wholeſome; and is ſeated near the ſea, having a harbour ſurrounded with high mountains. It was formerly very conſiderable when the galleons were ſent thither, but is now come almoſt to nothing. W. Long. 74. 11. N. Lat. 11. 20.

Martha (St), or *Sierra Neveda*, a very high mountain in New Spain. Some ſay it is 100 miles in circumference at the bottom, and five miles in height. The top is always covered with ſnow in the hotteſt weather; and the French affirm, that they can perceive it from the iſland of St Domingo, which is 370 miles diſtant. W. Long. 74. 35. N. Lat. 8. 0.

Martha's Vineyard, an iſland of North America near the coaſt of New-England, 80 miles ſouth of Boſton. The inhabitants apply themſelves chiefly to their fiſheries, in which they have great ſucceſs. W. Long. 70. 35. N. Lat. 41. 0.

MARTIAL, is ſometimes uſed to expreſs preparations of iron, or ſuch as are impregnated therewith; as the martial regulus of antimony, &c.

Martial-Court. See *Court-Martial.*

Martial Law, is the law of war that depends upon the juſt but arbitrary will and pleaſure of the king, or his lieutenant: for though the king doth not make any laws but by common conſent in parliament, yet, in time of war, by reaſon of the neceſſity of it to guard againſt dangers that often ariſe, he uſeth abſolute power, ſo that his word is a law. *Smith de Repub. Ang. lib. 2. c.* 4.

But the martial law (according to Chief Juſtice Hale), is in reality not a law, but ſomething indulged rather than allowed as a law; and it relates only to members of the army, being never intended to be executed on others, who ought to be ordered and governed by the laws to which they are ſubject, though it be a time of war. And the exerciſe of martial law, whereby any perſon might loſe his life, or member, or liberty, may not be permitted in time of peace, when the king's courts are open for all perſons to receive juſtice.

MARTIALIS (Marcus Valerius), a famous Latin poet, born at Bilbilis, now called *Bubiera*, in the kingdom of Arragon in Spain, was of the order of knights. He went to Rome at the age of 21, and ſtaid there 35 years, under the reign of Galba and the ſucceeding emperors, till that of Trajan; and having acquired the eſteem of Titus and Domitian, he was created tribune. At length, finding that he was neglected by Trajan, he returned to his own country Bilbilis, where he married a wife, and had the happineſs to live with her ſeveral years. He admires and commends her much, telling her that ſhe alone was ſufficient to ſupply the want of every thing he enjoyed at Rome. "*Romam tu mihi ſola facis*," ſays he, in the 21ſt epigram of the 12th book. She appears likewiſe to have been a lady of a very large fortune; for, in the 31ſt epigram of the ſame book, he extols the magnificence of the houſe and gardens he had received from her, and ſays that ſhe had made him a little kind of monarch."

Munera ſunt domino: poſt ſeptima luſtra reverſo,
Has Marcella domos, parvaque regna dedit.

There are ſtill extant 14 books of his epigrams, filled with points, a play upon words, and obſcenities. The ſtyle is affected. However, ſome of his epigrams are excellent; many of them are of the middling kind; but the greateſt part of them are bad: ſo that Martial never ſpoke a greater truth, than when he ſaid of his own works,

Sunt bona, ſunt quædam mediocra, ſunt mala plura.

There is alſo attributed to him a book on the ſpectacles of the amphitheatre; but the moſt learned critics think that this laſt work was not written by Martial. The beſt editions of Martial are, that *in Uſum Delphini*, 4to, Paris, 1617, and that *cum Notis Variorum*.

MARTIGUES, a ſea-port town of France, in Provence, with the title of a principality; ſeated near a lake 12 miles long and five broad, which is navigable throughout, and from whence they get excellent ſalt. E. Long. 4. 20. N. Lat. 43. 38.

MARTIN (St.), was born at Sabaria in Pannonia, (at preſent *Stain* in Lower Hungary), in the beginning of the fourth century. His father was a military tribune; and he himſelf was obliged to carry arms, although peace and ſolitude were much more agreeable to his inclination. He was remarkable for every virtue, in a profeſſion which is generally conſidered to give a ſanction to vice. He divided his coat with a naked wretch whom he met at the gate of Amiens; and it is reported, that Jeſus Chriſt appeared to him on the night following, clothed in this half of his coat. Martin was then a catechumen; but he ſoon afterwards received baptiſm, and renounced the military profeſſion for the eccleſiaſtical. After paſſing many years in ſolitude, St Hilary biſhop of Poictiers gave him the power to caſt out devils. On his return to Pannonia, he perſuaded his mother to embrace Chriſtianity; and with great zeal and activity oppoſed the Arians, who governed the church in Illyria. When he was publicly whipt for giving teſtimony to the divinity of Chriſt, he bore the puniſhment with the conſtancy and patience of the firſt martyrs. This illuſtrious champion for Chriſtianity, when he heard that St Hilary was returned from baniſhment, went and ſettled in the neighbourhood of Poictiers. In this retirement, a great number of monks placed themſelves under his direction. His virtues became every day more ſplendid and remarkable, till he was drawn from his ſolitude, and with the general approbation of the clergy and people elected biſhop of Tours in the year 374. To the zeal and charity of a biſhop, he joined the humility and poverty of an anchorite. That he might detach himſelf more from the world, he built the celebrated monaſtery of Marmoutier, which ſtill remains, and which is believed to be the oldeſt abbey in France. It is ſituated near the city of Tours, betwixt the Loire and a ſteep rock. In this ſituation, together with 80 monks, St Martin diſplayed the moſt exemplary ſanctity and mortification, nor were there any monks better diſciplined than thoſe of Marmoutier. After he had converted his dioceſe to the Chriſtian faith, he became the apoſtle of all Gaul. He diffuſed the doctrines of Chriſtianity among the heathens, deſtroyed their temples, and (according to the writers of his life) confirmed the truth by an infinite number of miracles. The emperor Valentinian, at that time in Gaul, received him with every mark of reſpect and honour. The tyrant Maximus, who had revolted againſt the emperor Gratian, and ſeized on Spain, England, and Gaul, received him in a manner no leſs diſtinguiſhed. The holy biſhop attended him at Trieves in the year 383, to ſolicit ſome favours. Maximus made him ſit at his table with the moſt illuſtrious perſons of his court, and placed him at his right hand. In drinking, the uſurper commanded his ſervants to give him a cup, that he might again receive it from him; but this extraordinary prelate gave it to the prieſt who accompanied him on his journey. This holy boldneſs, far from diſpleaſing them, gained him the favour of the emperor and of his court. Martin, who was an enemy to hereſy, but a friend to mankind, employed his influence with this prince to preſerve the Priſcillianiſts, who were proſecuted by Ithace and by Idace, biſhops of Spain. The biſhop of Tours would hold no communion with men whoſe principles of religion inclined them to ſhed the blood of mankind; and he obtained the life of thoſe whoſe death they had ſolicited. On his return to Tours, he prepared himſelf for the reward of his labours in another world. He died at Candes the 8th of November 397, but according to others on the 11th of November 400. His name is given to a particular opinion concerning the myſtery of the holy Trinity. St Martin is the firſt of the ſaints confeſſors to whom the Latin church offered public prayers. His life is written in elegant Latin by Fortunatus, and Sulpitius Severus one of his diſciples. Paul of Perigueux and Fortunatus of Poictiers have given us Sulpicius's life of Martin in verſe; but they have debaſed the admirable proſe of the author by a wretched poetical imitation. Nicolas Gervais wrote alſo the life of St Martin, full of many curious and entertaining facts, publiſhed at Tours in 1699, in 4to. The tradition at Amiens is, that St Martin performed the act of charity which rendered him ſo famous, near an ancient gate of the city, of which the ruins are ſtill viſible. The following Latin verſes, which do more honour to the ſaint than to the poet, are inſcribed on one of the ſtones:

Hic quondam veſtem Martinus demidiavit;
Ut faceremus idem, nobis exemplificavit.

MARTIN (Benjamin), one of the moſt eminent artiſts and mathematicians of the age, was born in 1704. After publiſhing a variety of ingenious treatiſes, and particularly a Scientific Magazine under his own name, and carrying on for many years a very extenſive trade as an optician and globe-maker in Fleet-ſtreet, the growing infirmities of age compelled him to withdraw from the active part of buſineſs. Truſting too fatally to what he thought the integrity of others, he unfortunately, though with a capital more than ſufficient to pay all his debts, became a bankrupt. The unhappy old man, in a moment of deſperation from this unexpected ſtroke, attempted to deſtroy himſelf; and the wound, though not immediately mortal, haſtened his death, which happened February 9th 1782, in his 78th year. He had a valuable collection of foſſils and curioſities of almoſt every ſpecies; which, after his death, were almoſt given away by public auction. His principal publications, as far as they have occurred to recollection, are, The Philoſophic Grammar; being a view of the preſent ſtate of experimental phyſiology, or natural philoſophy, 1735, 8vo. A new, complete, and univerſal Syſtem or Body of Decimal Arithmetic, 1735, 8vo. The young Students Memorial Book, or Patent Library, 1735, 8vo. Deſcription and Uſe of both the Globes, the Armillary Sphere and Orrery, Trigonometry, 1736, 2 vols 8vo.

Memoirs of the Academy of Paris, 1740, 5 vols. Syſtem of the Newtonian Philoſophy, 1759, 3 vols. New Elements of Optics, 1759. Mathematical Inſtitutions, viz. Arithmetic, Algebra, Geometry, and Fluxions, 1759. Natural Hiſtory of England, with a Map of each County, 1759, 2 vols. Philology, and Philoſophical Geography, 1759. Mathematical Inſtitutions, 1764, 2 vols. Lives of Philoſophers, their Inventions, &c. 1764. Introduction to the Newtonian Philoſophy, 1765. Inſtitutions of Aſtronomical Calculations, 2 parts, 1765. Deſcription and Uſe of the Air-pump, 1766. Deſcription of the Torricellian Barometer, 1766. Appendix to the Deſcription and Uſe of the Globes, 1766. Philoſophia Britannica, 1778, 3 vols. Gentleman and Lady's Philoſophy, 3 vols. Miſcellaneous Correſpondence, 4 vols. Syſtem of Philology. Philoſophical Geography. Magazine complete, 14 vols. Principles of Pump-work. Theory of the Hydrometer. Doctrine of Logarithms.

MARTIN (St.), a ſmall but ſtrong town of France, in the iſle of Rhée, with a harbour and a ſtrong citadel, fortified after the manner of Vauban. The iſland lies near the coaſt of Poitou. W. Long. 1. 0. N. Lat. 45. 40.

Cape MARTIN, a promontory of Valencia in Spain, near a town called *Denia*, and ſeparates the gulph of Valencia from that of Alicant.

MARTIN (St.), an iſland of America, and one of the Caribbees, lying on the gulph of Mexico, to the north-weſt of St Bartholomew, and to the ſouth-weſt of Anguilla. It is 42 miles in circumference; has neither harbour nor river, but ſeveral ſalt-pits. After various revolutions, it is at length in poſſeſſion of the French and Dutch, who poſſeſs it conjointly. W. Long. 62. 35. N. Lat. 18. 15.

MARTIN, in zoology. See HIRUNDO and MUSTELA.

Free MARTIN, in zoology, is a name given in this country to a cow-calf caſt at the ſame time with a bull-calf, which is a kind of hermaphrodite that is never known to breed nor to diſcover the leaſt inclination for the bull, nor does the bull ever take the leaſt notice of it. See HERMAPHRODITE.

MARTINGALE, in the manege, a thong of leather, faſtened to one end of the girths under a horſe's belly, and at the other end to the muſs-roll, to keep him from rearing.

MARTINICO, the chief of the French Caribbee iſlands, the middle of which is ſituated in W. Long. 61. 0. N. Lat. 14. 30.

This iſland was firſt ſettled by M. Deſnambuc a Frenchman, in the year 1635, with only 100 men from St Chriſtopher's. He choſe rather to have it peopled from thence than from Europe; as he foreſaw, that men, tired with the fatigue of ſuch a long voyage, would moſtly periſh ſoon after their arrival, either from the climate, or from the hardſhips incident to moſt emigrations. They completed their firſt ſettlement without any difficulty. The natives, intimidated by their fire-arms, or ſeduced by promiſes, gave up the weſtern and ſouthern parts of the iſland to the new comers. In a ſhort time, however, perceiving the number of theſe enterpriſing ſtrangers daily increaſing, they reſolved to extirpate them, and therefore called in the ſavages of the neighbouring iſlands to aſſiſt them. They fell jointly upon a little fort that had been haſtily erected; but were repulſed, with the loſs of 700 or 800 of their beſt warriors, who were left dead upon the ſpot.

After this check, the ſavages for a long time diſappeared entirely; but at laſt they returned, bringing with them preſents to the French, and making excuſes for what had happened. They were received in a friendly manner, and the reconciliation ſealed with pots of brandy. This peaceable ſtate of affairs, however, was of no long continuance; the French took ſuch undue advantages of their ſuperiority over the ſavages, that they ſoon rekindled in the others that hatred which had never been entirely ſubdued. The ſavages, whoſe manner of life requires a vaſt extent of land, finding themſelves daily more and more ſtraitened, had recourſe to ſtratagem, in order to deſtroy their enemies. They ſeparated into ſmall bands, and way-laid the French as they came ſingly out into the woods to hunt, and, waiting till the ſportſman had diſcharged his piece, ruſhed upon and killed him before he could charge it again. Twenty men had been thus aſſaſſinated before any reaſon could be given for their ſudden diſappearance: but as ſoon as the matter was known, the French took a ſevere and fatal revenge; the ſavages were purſued and maſſacred, with their wives and children, and the few that eſcaped were driven out of Martinico, to which they never returned.

The French being thus left ſole maſters of the iſland, lived quietly on thoſe ſpots which beſt ſuited their inclinations. At this time they were divided into two claſſes. The firſt conſiſted of thoſe who had paid their paſſage to the iſland, and theſe were called *inhabitants*; and to theſe the government diſtributed lands, which became their own, upon paying a yearly tribute. Theſe inhabitants had under their command a multitude of diſorderly people brought over from Europe at their expence, whom they called *engagés*, or bondſmen. This engagement was a kind of ſlavery for the term of three years; on the expiration of which they were at liberty, and became the equals of thoſe whom they had ſerved. They all confined themſelves at firſt to the culture of tobacco and cotton; to which was ſoon added that of arnotto and indigo. The culture of ſugar alſo was begun about the year 1650. Ten years after, one Benjamin D'Acoſta, a Jew, planted ſome cocoa trees; but his example was not followed till 1684, when chocolate was more commonly uſed in France. Cocoa then became the principal ſupport of the coloniſts, who had not a ſufficient fund to undertake ſugar-plantations; but by the inclemency of the ſeaſon in 1718, all the cocoa-trees were deſtroyed at once.—Coffee was then propoſed as a proper object of culture. The French miniſtry had received, as a preſent from the Dutch, two of theſe trees, which were carefully preſerved in the king's botanical garden. Two young ſhoots were taken from theſe, put on board a ſhip for Martinico, and entruſted to the care of one Mr Deſclieux. The ſhip happened to be ſtraitened for want of freſh water; and the trees would have periſhed, had not the gentleman ſhared with them that quantity of water which was allowed for his own drinking. The culture of coffee was then begun, and attended with the greateſt and moſt rapid ſucceſs. About the end of laſt century, however, the colony had made but ſmall advances. In 1700, it had only 6597 white inhabitants. The ſavages, mulattoes, and free negroes, men, women, and children, amounted to no more than 507. The number of ſlaves was but 14,566. All theſe together made a population of 21,645 perſons. The whole of the cattle amounted to 3668 horſes or mules, and 9217 head of horned cattle. The iſland produced a great quantity of cocoa, tobacco, and cotton; had nine indigo houſes, and 183 ſmall ſugar-plantations.

After the peace of Utrecht, Martinico began to emerge from that feeble ſtate in which it had ſo long continued. The iſland then became the mart for all the windward French ſettlements. In the ports of it the neighbouring iſlands ſold their produce, and bought the commodities of the mother-country; and, in ſhort, Martinico became famous all over Europe. In 1736, there were on the iſland 447 ſugar works; 11,953,232 coffee trees, 193,870 of cocoa; 2,068,480 plants of cotton, 39,400 of tobacco, 6750 of arnotto. The ſupplies for proviſion conſiſted of 4,806,142 banana trees; 34,483,000 trenches of caſſava; and 247 plots of potatoes and yams. The number of blacks amounted to 72,000 men, women, and children. Their labour had improved the plantations as far as was conſiſtent with the conſumption then made in Europe of American productions; and the annual exports from the iſland amounted to about 700,000 l.

The connections of Martinico with the other iſlands entitled her to the profits of commiſſion, and the charges of tranſport; as ſhe alone was in the poſſeſſion of carriages. This profit might be rated at the tenth of the produce; and the ſum total muſt have amounted to near 765,000 l. This ſtanding debt was ſeldom called in, and left for the improvement of their plantations. It was increaſed by advances in money, ſlaves, and other neceſſary articles; ſo that Martinico became daily more and more a creditor to the other iſlands, and thus kept them in conſtant dependence; while they all enriched themſelves by her aſſiſtance.

The connections of this iſland with Cape Breton, Canada, and Louiſiana, procured a market for the ordinary ſugars, the inferior coffee, the molaſſes, and rum, which would not ſell in France. In exchange the inhabitants received ſalt-fiſh, dried vegetables, deals, and ſome flour. In the clandeſtine trade on the coaſts of Spaniſh America, conſiſting wholly of goods manufactured by the nation, ſhe commonly made a profit of 90 per cent. on the value of about 175,000l. ſent yearly to the caraccas, or neighbouring colonies.

So many proſperous engagements brought immenſe ſums into Martinico. Upwards of 787,000l. were conſtantly circulated in that iſland with great rapidity; and this is perhaps the only country in the world, where the ſpecie has been ſo conſiderable as to make it a matter of indifference to them whether they dealt in gold, ſilver, or commodities. This extenſive trade brought into the ports of Martinico annually 200 ſhips from France; 14 or 15 fitted out by the mother-country for the coaſt of Guinea, 60 from Canada, 10 or 12 from the iſlands of Margaretta and Trinidad; beſides the Engliſh and Dutch ſhips that came to carry on a ſmuggling trade. The private navigation from the iſland to the northern colonies, to the Spaniſh continent, and to the windward iſlands, employed 120 veſſels from 20 to 30 tons burden.

The war of 1744 put a ſtop to this poſperity. Not that the fault was in Martinico itſelf; its navy, conſtantly exerciſed, and accuſtomed to frequent engagements, which the carrying on a contraband trade required, was prepared for action. In leſs than ſix months, 40 privateers, fitted out at St Peter's, ſpread themſelves about the latitude of the Caribbee iſlands. They ſignaliſed themſelves in a manner worthy of the ancient freebooters; returning conſtantly in triumph, and laden with an immenſe booty. Yet, in the midſt of theſe ſucceſſes, an entire ſtop was put to the navigation of the colony, both to the Spaniſh coaſt and to Canada, and they were conſtantly diſturbed even on their own coaſts. The few ſhips that came from France, in order to compenſate the hazards they were expoſed to by the loſs of their commodities, ſold them at a very advanced price, and bought them at a very low one. By this means the produce decreaſed in value, the lands were ill cultivated, the works neglected, and the ſlaves periſhing for want.

When every thing thus ſeemed tending to decay, the peace at laſt reſtored the freedom of trade, and with it the hopes of recovering the ancient proſperity of the iſland. The event, however, did not anſwer the pains that were taken to attain it. Two years had not elapſed after the ceſſation of hoſtilities, when the colony loſt the contraband trade ſhe carried on with the American Spaniards. This was owing to the ſubſtitution of regiſter-ſhips to the fleets; and thus were the attempts of the ſmugglers confined within very narrow bounds. In the new ſyſtem, the number of ſhips was undetermined, and the time of their arrival uncertain: which occaſioned a variation in the price of commodities unknown before; and from that time the ſmuggler, who only engaged in this trade from the certainty of a fixed and conſtant profit, would no longer purſue it, when it did not ſecure him an equivalent to the riſks he ran. But this loſs was not ſo ſenſibly felt by the colony, as the hardſhips brought upon them by the mother-country. An unſkilful adminiſtration clogged the reciprocal and neceſſary connection between the Iſlands and North-America with ſo many formalities, that in 1755 Martinico ſent but four veſſels to Canada. The direction of the colonies, now committed to the care of ignorant and avaricious clerks, ſoon loſt its importance, ſunk into contempt, and was proſtituted to venality. The debts which had been contracted, during a ſeries of calamities, had not yet been paid off, when the war broke out afreſh. After a ſeries of misfortunes and defeats, the iſland fell into the hands of the Britiſh. It was reſtored, however, in July 1763, 16 months after it had been conquered; but deprived of all the neceſſary means of proſperity, that had made it of ſo much importance. For ſome years paſt, the contraband trade carried on to the Spaniſh coaſts was almoſt entirely loſt. The ceſſion of Canada had precluded all hopes of opening again a communication, which had only been interrupted by temporary miſtakes. The productions of the Grenades, St Vincent, and Dominica, which were now become Britiſh dominions, could no longer be brought into their harbours; and a new regulation of the mother-country, which forbad her having any intercourſe with Gaudalupe, left her no hopes from that quarter.

The colony, thus deprived of every thing as it were, and deſtitute, nevertheleſs contained, at the laſt ſurvey, which was taken on the firſt of January 1770, in the compaſs of 28 pariſhes, 12,450 white people of all ages and of both ſexes; 1814 free blacks or mulatoes; 70,553 ſlaves, and 443 fugitive negroes. The number of births in 1766, was in the proportion of one in 30 among the white people, and of one in 25 among the blacks. From this obſervation, if it were conſtant, it ſhould ſeem that the climate of America is much more favourable to the propagation of the Africans than of the Europeans; ſince the former multiply ſtill more in the labours and hardſhips of ſlavery, than the latter in the midſt of plenty and freedom. The conſequence muſt be, that in proceſs of time the increaſe of blacks in America will ſurpaſs that of the white men; and, perhaps, at laſt avenge this race of victims on the deſcendents of the oppreſſors.

The cattle of the colony conſiſts of 8283 horſes or mules; 12,376 head of horned cattle; 975 hogs; and 13,544 ſheep or goats.

Their proviſions are, 17,930,596 trenches of caſſava; 3,509,048 banana-trees; and 406 ſquares and a half of yams and potatoes.

Their plantations contain 11,444 ſquares of land, planted with ſugar; 6,638,957 coffee-trees; 871,043 cocoa-trees; 1,764,807 cotton-plants; 59,966 trees of caſſia, and 61 of arnotto.

The meadows or ſavannahs take up 10,072 ſquares of land; there are 11,966 in wood, and 8448 uncultivated or forſaken.

The plantations which produce coffee, cotton, cocoa, and other things of leſs importance, are 1515 in number. There are but 286 for ſugar. They employ 116 water-mills, 12 wind-mills, and 184 turned by oxen. Before the hurricane of the 13th of Auguſt 1766, there were 302 ſmall habitations and 15 ſugar-works more.

In 1769, France imported from Martinico, upon 202 trading veſſels, 177,116 quintals of fine ſugar, and 12,579 quintals of raw ſugar; 68,518 quintals of coffee; 11,731 quintals of cocoa; 6048 quintals of cotton; 2518 quintals of caſſia; 783 caſks of rum; 307 hogſheads of molaſſes; 150 pounds of indigo; 2147 pounds of preſerved fruits; 47 pounds of chocolate; 282 pounds of raſped tobacco; 494 pounds of rope-yarn; 334 cheſts of liqueurs; 234 hogſheads of molaſſes, &c. 451 quintals of wood for dyeing; and 12,108 hides in the hair. All theſe productions together have been bought in the colony itſelf, for 536,631 l. 9 s. 10 d. It is true, that the colony has received from the mother-country to the amount of 588,412 l. 16 s. 6 d. of merchandiſe; but part of this has been ſent away to the Spaniſh coaſts, and another part has been conveyed to the Engliſh ſettlements.

The iſland is 16 leagues in length and 45 in circumference, leaving out the capes, ſome of which extend two or three leagues into the ſea. It is very uneven, and interſected in all parts by a number of hillocks; which are moſtly of a conical form. Three mountains riſe above theſe ſmaller eminences. The higheſt bears the indelible marks of a volcano. The woods with which it is covered continually attract the clouds, which occaſions noxious damps, and contributes to make it horrid and inacceſſible; while the two others are in moſt parts cultivated. From theſe mountains iſſue the many ſprings that water the iſland. Theſe waters, which flow in gentle ſtreams, are changed into torrents on the ſlighteſt ſtorm. Their qualities are derived from the ſoil over which they flow. In ſome places they are excellent, in others ſo bad, that the inhabitants are obliged to drink the water they have collected during the rainy ſeaſon.

Of all the French ſettlements in the Weſt Indies, Martinico is the moſt happily ſituated with regard to the winds which prevail in thoſe ſeas. Its harbours poſſeſs the ineſtimable advantage of affording a certain ſhelter from the hurricanes which annoy theſe latitudes. The harbour of Fort Royal is one of the beſt in all the windward iſlands; and ſo celebrated for its ſafety, that, when it was open to the Dutch, their ſhipmaſters had orders from the republic to take ſhelter there in June, July, and Auguſt, the three months in which the hurricanes are moſt frequent. The lands of the Lamentin, which are but a league diſtant, are the richeſt and moſt fertile in the whole iſland. The numerous ſtreams which water this fruitful country, convey loaded canoes to a conſiderable diſtance from the ſea. The protection of the fortifications ſecured the peaceable enjoyment of ſo many advantages; which, however, were balanced by a ſwampy and unwholeſome ſoil. This capital of Martinico was alſo the rendezvous of the men of war; which branch of the navy has always oppreſſed the merchantmen. On this account, Fort Royal was an improper place to become the centre of trade, and was therefore removed to St Peter's. This little town, notwithſtanding the fires that have four times reduced it to aſhes, ſtill contains 1700 houſes. It is ſituated on the weſtern coaſt of the iſland, on a bay, or inlet, which is almoſt circular. One part of it is built on the ſtrand along the ſea ſide, which is called the *anchorage;* and is the place deſtined for ſhips and ware-houſes. The other part of the town ſtands upon a low hill: it is called the *Fort* from a ſmall fortification that was built there in 1665, to check the ſeditions of the inhabitants againſt the tyranny of monopoly; but it now ſerves to protect the road from foreign enemies These two parts of the town are ſeparated by a rivulet.

The anchorage is at the back of a pretty high and ſteep hill. Shut up as it were by this hill, which intercepts the eaſterly winds, the moſt conſtant and moſt ſalubrious in theſe parts; expoſed, without any refreſhing breezes, to the ſcorching beams of the ſun, reflected from the hill, from the ſea, and the black ſand on the beach; this place is extremely hot, and always unwholeſome. Beſides, there is no harbour; and the ſhips which cannot winter ſafely upon this coaſt are obliged to take ſhelter at Fort-Royal. But theſe diſadvantages are compenſated by the conveniency of the road of St Peter's, for loading and unloading of goods; and by its ſituation, which is ſuch that ſhips can freely go in and out at all times, and with all winds.

MARTLETS, in heraldry, little birds repreſented without feet; and uſed as a difference or mark of diſtinction for younger brothers, to put them in mind that they are to truſt to the wings of virtue and merit, in order to raiſe themſelves, and not to their feet, they having little land to ſet their foot on. See HERALDRY, Plate CCXXVII. fig. 1. A.

MARTYNIA, in botany: A genus of the angioſpermia order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 10th order, *Perſonata.* The calyx is quinquefid, the corolla ringent, the capſule ligneous, covered with a bark, with a hooked beak, trilocular, and bivalved.—There are two ſpecies; both of them tender, herbaceous, flowery plants of South America; one of them an annual, the other a perennial, riſing with erect ſtalks, from a foot to two feet high, garniſhed with oblong ſimple leaves, and terminated by ſhort ſpikes of large monopetalous, bell-ſhaped flowers, of blue and purple colours. They flower in July and Auguſt, and are very ornamental, but require always to be kept in the hotteſt part of the ſtove.

MARTYR, is one who lays down his life, or ſuffers death, for the ſake of his religion. The word is Greek, μαρτυρ, and properly ſignifies "a witneſs." It is applied, by way of eminence, to thoſe who ſuffer in witneſs of the truth of the goſpel.

The Chriſtian church has abounded in martyrs, and hiſtory is filled with ſurpriſing accounts of their ſingular conſtancy and fortitude under the cruelleſt torments human nature was capable of ſuffering. The primitive Chriſtians were accuſed by their enemies of paying a ſort of divine worſhip to the martyrs. Of this we have an inſtance in the anſwer of the church of Smyrna to the ſuggeſtion of the Jews, who, at the martyrdom of Polycarp, deſired the heathen judge not to ſuffer the Chriſtians to carry off his body, leſt they ſhould leave their crucified maſter, and worſhip him in his ſtead. To which they anſwered, "We can neither forſake Chriſt, nor worſhip any other: for we worſhip him as the Son of God; but love the martyrs as the diſciples and followers of the Lord, for the great affection they have ſhown to their King and Maſter." A like anſwer was given at the martyrdom of Fructuoſus in Spain. For when the judge aſked Eulogius, his deacon, Whether he would not worſhip Fructuoſus? as thinking, that, tho' he refuſed to worſhip the heathen idols, he might yet be inclined to worſhip a Chriſtian martyr; Eulogius replied, "I do not worſhip Fructuoſus, but him whom Fructuoſus worſhips." The primitive Chriſtians believed, that the martyrs enjoyed very ſingular privileges; that upon their death they were immediately admitted to the beatific viſion, while other ſouls waited for the completion of their happineſs till the day of judgment; and that God would grant chiefly to their prayers the haſtening of his kingdom, and ſhortening the times of perſecution.

The churches built over the graves of the martyrs, and called by their names, in order to preſerve the memory of their ſufferings, were diſtinguiſhed by the title *martyrium confeſſio,* or *memoria.*

The feſtivals of the martyrs are of very ancient date in the Chriſtian church, and may be carried back at leaſt till the time of Polycarp, who ſuffered martyrdom about the year of Chriſt 168. On theſe days the Chriſtians met at the graves of the martyrs, and offered prayers and thankſgivings to God for the examples they had afforded them: they celebrated the euchariſt, and gave alms to the poor; which, together with a panegyrical oration or ſermon, and reading the acts of the martyrs, were the ſpiritual exerciſes of theſe anniverſaries.

Of the ſayings, ſufferings, and deaths of the martyrs, though preſerved with great care for the above purpoſe, and to ſerve as models to future ages, we have but very little left, the greateſt part of them having been deſtroyed during that dreadful perſecution which Diocleſian carried on for ten years with freſh fury againſt the Chriſtians; for a moſt diligent ſearch was then made after all their books and papers; and all of them that were found were committed to the flames. Euſebius, indeed, compoſed a martyrology, but it never reached down to us; and thoſe ſince compiled are extremely ſuſpected. From the eighth century downwards, ſeveral Greek and Latin writers endeavoured to make up the loſs, by compiling, with vaſt labour, accounts of the lives and actions of the ancient martyrs, but which conſiſt of little elſe than a ſeries of fables: Nor are thoſe records that paſs under the name of Martyrology worthy of ſuperior credit, ſince they bear the moſt evident marks both of ignorance and falſehood.

MARTYR (Peter), a famous divine, born at Florence in 1500. He ſtudied philoſophy and the tongues at Padua and Banonia, was a regular Auguſtine in the monaſtery of Fiſcoli, and was counted one of the beſt preachers in Italy. Zuinglius and Bucer's writings gave him a good opinion of the Proteſtants, and his converſation with Valdes confirmed it. He preached that doctrine at Rome in private; but, being impeached, fled to Naples, and thence to Lucca, where he brought over to the Proteſtant intereſt Emanuel Tremellius, Celſus, Martinengas, Paul Laſicius, and Jeremiah Zanchy. He was ſent for to England by king Edward VI. and made profeſſor of divinity at Oxford in 1549. In Queen Mary's reign he returned to Straſburg, and was preſent at the conference of Poiſſy. His ſentiments were not the ſame with Calvin's about Chriſt's preſence in the euchariſt. He wrote a great number of works, and died in 1562.

MARTYROLOGY, a catalogue or liſt of martyrs, including the hiſtory of their lives and ſufferings for the ſake of religion. The term comes from μαρτυρ "witneſs," and λεγω *dico,* or λεγω *colligo.*

The martyrologies draw their materials from the kalendars of particular churches, in which the ſeveral feſtivals dedicated to them are marked; and which ſeem to be derived from the practice of the ancient Romans, who inſerted the names of heroes and great men in their faſti or public regiſters.

The martyrologies are very numerous, and contain many ridiculous and even contradictory narratives; which is eaſily accounted for, if we conſider how many forged and ſpurious accounts of the lives of ſaints and martyrs appeared in the firſt ages of the church, which the legendary writers afterwards adopted without examining into the truth of them. However, ſome good critics, of late years, have gone a great way towards clearing the lives of the ſaints and martyrs from the monſtrous heap of fiction they laboured under. See the article Legend.

The martyrology of Euſebius of Cæſarea was the moſt celebrated in the ancient church. It was tranſlated into Latin by St Jerom; but the learned agree that it is not now extant. That attributed to Beda, in the eighth century, is of very doubtful authority; the names of ſeveral ſaints being there found who did not live till after the time of Beda. The ninth century was very fertile in martyrologies; then appeared that of Florus, ſubdeacon of the church at Lyons; who, however, only filled up the chaſms in Beda. This was publiſhed about the year 830, and was followed by that of Waldenburtus, monk of the diocеſe of Treves, written in verſe about the year 848, and this by that of Uſuard, a French monk, and written by the command of Charles the Bald in 875, which laſt is the martyrology now ordinarily uſed in the Romiſh church. That of Rabanus Maurus is an improvement on Beda and Florus, written about the year 845; that of Notker, monk of St Gal, was written about the year 894. The martyrology of Ado, monk of Ferrieres, in the dioceſe of Treves, afterwards archbiſhop of Vienne, is a deſcendant of the Roman, if we may ſo call it; for Du Sollier gives its genealogy thus: The martyrology of St Jerom is the great Roman martyrology; from this was made the little Roman one printed by Roſweyd; of this little Roman martyrology was formed that of Beda, augmented by Florus. Ado compiled his in the year 858. The martyrology of Nevelon, monk of Corbie, written about the year 1089, is little more than an abridgment of that of Ado; father Kircher alſo makes mention of a Coptic martyrology preſerved by the Maronites at Rome.

We have alſo ſeveral proteſtant martyrologies, containing the ſufferings of the reformed under the papiſts, viz. an Engliſh martyrology, by J. Fox; with others by Clark, Bray, &c.

Martyrology is alſo uſed, in the Romiſh church, for a toll or regiſter kept in the veſtry of each church, containing the *names* of all the ſaints and martyrs, both of the univerſal church and of the particular ones of that city or monaſtery.

Martyrology is alſo applied to the painted or written catalogues in the Romiſh churches, containing the foundations, obits, prayers, and maſſes, to be ſaid each day.

MARVELL (Andrew), an ingenious writer in the 17th century, was bred at Cambridge. He travelled thro' the moſt polite parts of Europe, and was ſecretary to the embaſſy at Conſtantinople. His firſt appearance in public buſineſs at home was as aſſiſtant to Mr John Milton Latin ſecretary to the protector. A little before the reſtoration, he was choſen by his native town, Kingſton upon Hull, to ſit in that parliament, which began at Weſtminſter April 25th 1660; and is recorded as the laſt member of parliament who received the wages or allowance anciently paid to repreſentatives by their conſtituents. He ſeldom ſpoke in parliament, but he had great influence without doors upon the members of both houſes; and prince Rupert had always the greateſt regard for his advice. He made himſelf very obnoxious to the government by his actions and writings; notwithſtanding which, king Charles II. took great delight in his converſation, and tried all means to win him over to his ſide, but in vain, nothing being ever able to ſhake his reſolution. There were many inſtances of his firmneſs in reſiſting the offers of the court; but he was proof againſt all temptations. The king having one night entertained him, ſent the lord-treaſurer Danby the next morning to find out his lodgings; which were then up two pair of ſtairs in one of the little courts in the Strand. He was buſy writing, when the treaſurer opened the door abruptly upon him. Surpriſed at the ſight of ſo unexpected a viſitor, Mr Marvell told his Lordſhip, "That he believed he had miſtaken his way." Lord Danby replied, "Not, now I have found Mr Marvell;" telling him he came from his Majeſty, to know what he could do to ſerve him. Coming to a ſerious explanation, he told the lord-treaſurer, that he knew the nature of courts full well; that whoever is diſtinguiſhed by a prince's favour, is certainly expected to vote in his intereſt. The Lord Danby told him, that his Majeſty had only a juſt ſenſe of his merits, in regard to which he only deſired to know if there was any place at court he could be pleaſed with. Theſe offers, though urged with the greateſt earneſtneſs, had no effect upon him. He told the Lord-treaſurer, that he could not accept of them with honour; for he muſt be either ungrateful to the king in voting againſt him, or falſe to his country in giving into the meaſures of the court. The only favour therefore he had to requeſt of his Majeſty was, that he would eſteem him as dutiful a ſubject as any he had, and more in his proper intereſt by refuſing his offers than if he had embraced them. The Lord Danby finding no arguments could prevail, told him, that the king had ordered a thouſand pounds for him, which he hoped he would receive till he could think what farther to aſk of his Majeſty. The laſt offer was rejected with the ſame ſtedfaſtneſs of mind as the firſt; though, as ſoon as the Lord-treaſurer was gone, he was forced to ſend to a friend to borrow a guinea. He died not without ſtrong ſuſpicions of his being poiſoned, in 1678, in the 58th year of his age. In 1688. the town of Kingſton upon Hull contributed a ſum of money to erect a monument over him in the church of St Giles in the Fields, where he was interred, and an epitaph compoſed by an able hand; but the miniſtry of that church forbid both the inſcription and monument to be placed there. He wrote many ingenious pieces; as, The Rehearſal tranſproſed; A ſhort hiſtorical Eſſay concerning General Councils, Creeds, and Impoſitions in matters of religion, &c; alſo Poems and Letters.

Marvel of Peru, in botany. See Mirabilis.

MARY, the mother of our Saviour Jeſus Chriſt, and a virgin at the time that ſhe conceived him; daughter of Joachim and of Anna, of the tribe of Judah, and married to Joſeph of the ſame tribe. The ſcripture tells us nothing of her parents, not ſo much as their names, unleſs Heli mentioned by St Luke iii. 23. be the ſame with Joachim. All that is ſaid concerning the birth of Mary and of her parents is only to be found in ſome apocryphal writings; which, however, are very ancient.

Mary was of the royal race of David, as was alſo her huſband; 'A virgin, eſpouſed to a man whoſe name was *Joſeph*, of the houſe of David,' ſays our tranſlation

tranſlation of St Luke i. 27. which tranſlation Mr Whitby thinks might be better rendered thus: ‘A virgin of the houſe of David, eſpouſed to a man whoſe name was *Joſeph*, and the virgin's name was *Mary*;’ becauſe this agrees better with the words of the angel, ‘The Lord ſhall give him the throne of his father David,’ ver. 32. For ſince the angel had plainly told the virgin, that ſhe ſhould have this ſon without the knowledge of any man, it was not Joſeph's but Mary's being of the houſe of David, that made David his father.

Mary was akin to the race of Aaron, ſince Elizabeth the wife of Zacharias was her couſin (ver. 36). Mary very early made a vow of chaſtity, and engaged herſelf to perpetual virginity. The *Proto-evangelium* of St James tells us, that ſhe was conſecrated to the Lord, and offered in the temple from her earlieſt youth; and that the prieſts gave her Joſeph for a ſpouſe, who was an holy and venerable old man, whom providence appointed for this purpoſe by a miracle, the rod which he commonly carried having grown green and flouriſhed as Aaron's did formerly. He eſpouſed Mary, not to live with her in the ordinary uſe of marriage, and to have children by her, but only that he might be the guardian of her virginity. Though theſe circumſtances are not to be relied on as certain, yet Mary's reſolution of continency, even in a married ſtate, cannot be called in queſtion, ſince her virginity is atteſted by the goſpel, and that herſelf ſpeaking to the angel, who declared to her that ſhe ſhould become the mother of a ſon, told him that ‘ſhe knew not a man,’ (ver. 34.), or that ſhe lived in continency with her huſband: for which reaſon, when Joſeph perceived her pregnancy, he was extremely ſurpriſed at it, knowing the mutual reſolution they had agreed to of living in continence though in a ſtate of marriage.

When Mary was ready to lie in, an edict was publiſhed by Cæſar Auguſtus, which decreed, that all the ſubjects of the empire ſhould go to their own cities, there to have their names regiſtered according to their families. Thus Joſeph and Mary, who were both of the lineage of David, betook themſelves to the city of Bethlehem, from whence was the original of their family. But while they were in this place, the time being fulfilled in which Mary was to be delivered, ſhe brought forth her firſt-born ſon. She wrapped him in ſwaddling-clothes, and laid him in the manger of the ſtable or cavern whither they had retired: for they could find no place in the public inn, becauſe of the great concourſe of people that were then at Bethlehem on the ſame occaſion; or they were forced to withdraw into the ſtable of the inn, not being able to get a more convenient lodging, becauſe of the multitude of people then at Bethlehem.

At the ſame time the angels made it known to the ſhepherds who were in the fields near Bethlehem, and who came in the night to ſee Mary and Joſeph and the child lying in the manger, and to pay him their tribute of adoration. Mary took notice of all theſe things, and laid them up in her heart, (Luke ii. 19. Matth. ii. 8, 9, 10, 11, &c.). A few days after, the magi or wiſe men came from the eaſt, and brought to Jeſus the myſterious preſents of gold, frankincenſe, and myrrh; after which being warned by an angel that appeared to them in a dream, they returned into their own country by a way different from that by which they came. But the time of Mary's purification being come, that is 40 days after the birth of Jeſus, Mary went to Jeruſalem (Luke ii. 21.), there to preſent her ſon in the temple, and there to offer the ſacrifice appointed by the law for the purification of women after childbirth. There was then at Jeruſalem an old man named *Simeon*, who was full of the Holy Ghoſt, and who had received a ſecret aſſurance that he ſhould not die before he had ſeen Chriſt the Lord. He came then into the temple by the influence of the ſpirit of God, and taking the little Jeſus within his arms, he bleſſed the Lord: and afterwards addreſſing himſelf to Mary, he told her, ‘That this child ſhould be for the riſing and falling of many in Iſrael, and for a ſign which ſhould be ſpoken againſt; even ſo far as that her own ſoul ſhould be pierced as with a ſword, that the ſecret thoughts in the hearts of many might be diſcovered.’ Afterwards when Joſeph and Mary were preparing to return to their own country of Nazareth (Matth. ii. 13, 14.), Joſeph was warned in a dream to retire into Egypt with Mary and the child, becauſe Herod had a deſign to deſtroy Jeſus. Joſeph obeys the admonition, and they continued in Egypt till after the death of Herod; upon which he and Mary returned to Nazareth, not daring to go to Bethlehem becauſe it was in the juriſdiction of Archelaus the ſon and ſucceſſor of Herod the great. Here the holy family took up their reſidence, and remained till Jeſus began his public miniſtry. We read of Mary being preſent at the marriage of Cana in Galilee, with her ſon Jeſus and his diſciples (John ii. 1, 2, &c.) On which occaſion Jeſus having turned water into wine, being the firſt public miracle that he performed, he went from thence to Capernaum with his mother and his brethren, or his parents and diſciples: and this ſeems to be the place where the holy virgin afterwards chiefly reſided. However, St Epiphanius thinks that ſhe followed him every where during the whole time of his preaching; though we do not find the evangeliſts make any mention of her among the holy women that followed him and miniſtered to his neceſſities. The virgin Mary was at Jeruſalem at the laſt paſſover that our Saviour celebrated there; ſhe ſaw all that was tranſacted againſt him, followed him to Calvary, and ſtood at the foot of his croſs with a conſtancy worthy of the mother of God. There Jeſus ſeeing his mother and his beloved diſciple near her, he ſaid to his mother, “Woman, behold thy ſon;” and to the diſciple, “Behold thy mother.” And from that hour the diſciple took her home to his own houſe. It is not to be doubted, but that our Saviour appeared to his mother immediately after his reſurrection; and that ſhe was the firſt, or at leaſt one of the firſt, to whom he vouchſafed this great conſolation. She was with the apoſtles at his aſcenſion, and continued with them at Jeruſalem, expecting the coming of the Holy Ghoſt (Acts i. 14.). After this, ſhe dwelt in the houſe of St John the Evangeliſt, who took care of her as of his own mother. It is thought that he took her along with him to Epheſus, where ſhe died in an extreme old age. There is a letter of the œcumenical council of Epheſus, importing, that in the fifth century it was believed ſhe was buried there. Yet this opinion was not ſo univerſal, but that there are authors of the ſame age who think ſhe died and was buried at Jeruſalem.

Mary (Magdalen), who has been generally confounded with Mary the ſiſter of Martha and Lazarus, but very improperly, was probably that ſinner mentioned by St Luke, chap. vii. 36, 37, &c. whoſe name he does not tell us. There are ſome circumſtances ſufficient to convince us, that ſhe is the ſame whom he calls *Mary Magdalen* in chap. viii. 2. and from whom he ſays Jeſus drove out ſeven devils. Jeſus having healed the widow's ſon of Nain, entered into the city, and there was invited to eat by a phariſee named *Simon*. While he was at table, a woman of a ſcandalous life came into the houſe, having an alabaſter box full of perfumed oil; and ſtanding upright behind Jeſus, and at his feet, for he was lying at table on a couch after the manner of the ancients, ſhe poured her perfume on his feet, kiſſed them, watered them with her tears, and wiped them with her hair. The Phariſee obſerving this, ſaid within himſelf, If this man were a prophet, he would know who this woman is that touches him, that ſhe is one of a wicked life. Then Jeſus, who knew the bottom of his heart, illuſtrated her caſe by a parable; and concluded with anſwering the woman, that her ſins were forgiven her. In the following chapter, St Luke tells us, that Jeſus, in company with his apoſtles, preached the goſpel from city to city; and that there were ſeveral women whom he had delivered from evil ſpirits, and had cured of their infirmities, among whom was Mary called *Magdalen*, out of whom went ſeven devils. This, it muſt be owned, is no poſitive proof that the ſinner mentioned before was Mary Magdalen; however, it is all we have in ſupport of this opinion: An opinion which has been ably controverted by others. Mary Magdalen had her ſurname, it is thought, from the town of Magdalia in Galilee. Lightfoot believes that this Mary is the ſame with Mary the ſiſter of Lazarus. Magdalen is mentioned by the evangeliſts among the women that followed our Saviour, to miniſter to him according to the cuſtom of the Jews. St Luke viii. 2. and St Mark xvi. 9. obſerve, that this woman had been delivered by Jeſus Chriſt from ſeven devils. This ſome underſtand in the literal ſenſe; but others take it figuratively, for the crimes and wickedneſs of her paſt life (ſuppoſing her to be the ſinner firſt above mentioned), from which Chriſt had reſcued her. Others maintain, that ſhe had always lived in virginity; and conſequently they make her a different perſon from the ſinner mentioned by St Luke: and by the ſeven devils of which ſhe was poſſeſſed, they underſtand no other than a real poſſeſſion, which is not inconſiſtent with a holy life. This indeed is the moſt probable opinion; and that which has been beſt ſupported. In particular, the author of a "Letter to Jonas Hanway" on the ſubject of Magdalen Houſe, publiſhed in 1758, has ſhown by a variety of learned remarks, and quotations both from the ſcriptures and from the beſt commentators, that Mary Magdalen was not the ſinner ſpoken of by Luke, but on the contrary that ſhe "was a woman of diſtinction, and very eaſy in her worldly circumſtances. For a while, ſhe had laboured under ſome bodily indiſpoſition, which our Lord miraculouſly healed, and for which benefit ſhe was ever after very thankful. So far as we know, her conduct was always regular and free from cenſure; and we may reaſonably believe, that after her acquaintance with our Saviour it was edifying and exemplary. I conceive of her (continues our author) as a woman of a fine underſtanding, and known virtue and diſcretion, with a dignity of behaviour becoming her age, her wiſdom, and her high ſtation: by all which, ſhe was a credit to him whom ſhe followed as her maſter and benefactor. She ſhowed our Lord great reſpect in his life, at his death, and after it; and ſhe was one of thoſe to whom he firſt ſhowed himſelf after his reſurrection."

Mary Magdalen followed Chriſt in the laſt journey that he made from Galilee to Jeruſalem, and was at the foot of the croſs with the holy virgin (John xix. 25. Mark xv. 47.). After which ſhe returned to Jeruſalem to buy and prepare the perfumes, that ſhe might embalm him after the ſabbath was over which was then about to begin. All the ſabbath day ſhe remained in the city; and the next day early in the morning ſhe went to the ſepulchre, along with Mary the mother of James and Salome (Mark xvi. 1, 2. Luke xxiv. 1, 2.). On the way, they inquired of one another, who ſhould take away the ſtone from the mouth of the ſepulchre, and were ſenſible of a great earthquake. This was the token of our Saviour's reſurrection. Being come to his tomb, they ſaw two angels, who informed them that Jeſus was riſen. Upon this Mary Magdalen runs immediately to Jeruſalem, and acquaints the apoſtles with this good news, returning herſelf to the ſepulchre. Peter and John came alſo, and were witneſſes that the body was no longer there. They returned: but Mary ſtayed, and ſtooping forward to examine the inſide of the tomb, ſhe there ſaw two angels ſitting, one at the head and the other at the foot of the tomb; and immediately afterwards, upon turning about, ſhe beheld the Lord himſelf. She would have caſt herſelf at his feet to kiſs them. But Jeſus ſaid to her, "Touch me not, for I am not yet aſcended to my Father." As if he had ſaid, "You ſhall have leiſure to ſee me hereafter; go now to my brethren, my apoſtles, and tell them, I am going to aſcend to my God and to their God, to my Father and to their Father." Thus had Mary the happineſs of firſt ſeeing our Saviour after his reſurrection. (See Math. xxviii. 5, &c. Mark xvi. 6, &c. John xx. 11, 17.)

She returned then to Jeruſalem, and told the apoſtles that ſhe had ſeen the Lord, that ſhe had ſpoken to him, and told them what he had ſaid to her. But at firſt they did not believe her, till her report was confirmed by many other teſtimonies.—This is what the goſpel informs us concerning Mary Magdalen, different from Mary the ſiſter of Martha, though ſhe has been often called by this name. For as to the pretended Hiſtory of Mary Magdalen, which is ſaid to have been written in Hebrew by Marcella ſervant of Martha; this can only relate to Mary ſiſter of Martha, and beſides is a mere piece of impoſture.

Mary, queen and tyrant of England, was eldeſt daughter of Henry VIII. by his firſt wife Catharine of Spain, and born at Greenwich in February 1517. Her mother was very careful of her education, and provided her with tutors to teach her what was fitting. Her firſt preceptor was the famous Linacre, who drew up for her uſe The Rudiments of Grammar, and afterwards *De emendata ſtructura Latini ſermonis*

monis libri ſex. Linacer dying when ſhe was but ſix years old, Ludovicus Vives, a very learned man of Valenza in Spain, was her next tutor; and he compoſed for her *De ratione ſtudii puerilis*. Under the direction of theſe excellent men, ſhe became ſo great a miſtreſs of Latin, that Eraſmus commends her for her epiſtles in that language. Towards the end of her father's reign, at the earneſt ſolicitation of Queen Catharine Parr, ſhe undertook to tranſlate Eraſmus's Paraphraſe on the goſpel of St John; but being caſt into ſickneſs, as Udall relates, partly by overmuch ſtudy in this work, after ſhe had made ſome progreſs therein, ſhe left the reſt to be done by Dr Mallet her chaplain. This tranſlation is printed in the firſt volume of Eraſmus's Paraphraſe upon the New Teſtament, London, 1548, folio; and before it is a Preface, written by Udall, the famous maſter of Eton ſchool, and addreſſed to the queen dowager (A).—Had ſhe been educated in Spain, however, and an inquiſitor had been her preceptor, ſhe could not have imbibed more ſtrongly the bloody principles of Romiſh perſecution; and to the eternal diſgrace of the Engliſh prelacy, though the reformation had taken root in both univerſities, ſhe found Engliſh biſhops ready to carry her cruel deſigns to ſubvert it, into effectual execution. King Edward her brother dying the 6th of July 1553, ſhe was proclaimed queen the ſame month, and crowned in October by Stephen Gardiner biſhop of Wincheſter. Upon her acceſſion to the throne, ſhe declared, in her ſpeech to the council, that ſhe would not perſecute her Proteſtant ſubjects: but in the following month, ſhe prohibited preaching without a ſpecial licence; and before the expiration of three months, the Proteſtant biſhops were excluded the houſe of lords, and all the ſtatutes of Edward VI. reſpecting the Proteſtant religion were repealed. In July 1554, ſhe was married to Philip prince of Spain, eldeſt ſon of the emperor Charles V.; and now began that perſecution againſt the Proteſtants for which her reign is ſo juſtly infamous. Some have ſuppoſed, that the queen was herſelf of a compaſſionate and humane diſpoſition; and that moſt of thoſe barbarities were tranſacted by her biſhops without her knowledge or privity. Without her knowledge and privity they could not be: it would be a better defence of her to ſay, that a ſtrict adherence to a falſe religion, and a conſcientious obſervance of its pernicious and cruel dictates, over-ruled and got the better of that goodneſs of temper which was natural to her. But neither can this plea be reaſonably admitted by any one, who conſiders her unkind and inhuman treatment of her ſiſter the Lady Elizabeth; her admitting a council for the taking up and burning of her father's body; her moſt ungrateful and perfidious breach of promiſe with the Suffolk men; her ungenerous and barbarous treatment of judge Hales, who had ſtrenuouſly defended her right of ſucceſſion to the crown; and of Archbiſhop Cranmer, who in reality had ſaved her life. Shall we excuſe all this by ſaying, *Tantum religio potuit ſuadere malorum?* Her obligations to Cranmer deſerve to be more particularly ſet forth. Burnet ſays, "that her firm adherence to her mother's cauſe and intereſt, and her backwardneſs in ſubmitting to the king her father, were thought crimes of ſuch a nature by his majeſty, that he came to a reſolution to put her openly to death; and that when all others were unwilling to run any riſk in ſaving her, Cranmer alone ventured upon it. In his gentle way he told the king, "that ſhe was young and indiſcreet, and therefore it was no wonder if ſhe obſtinately adhered to

---

(A) As this preface contains many reflections which may very much edify the females of this age, we ſhall for their ſakes here tranſcribe a part of it. Mr Udall takes occaſion in it to obſerve to her majeſty, "The great number of noble women at that time in England, not only given to the ſtudy of human ſciences and ſtrange tongues, but alſo ſo thoroughly expert in the Holy Scriptures, that they were able to compare with the beſt writers, as well in enditing and penning of godly and fruitful treatiſes, to the inſtruction and edifying of realms in the knowledge of God, as alſo in tranſlating good books out of Latin or Greek into Engliſh, for the uſe and commodity of ſuch as are rude and ignorant of the ſaid tongues. It was now (he ſaid) no news in England to ſee young damſels in noble houſes, and in the courts of princes, inſtead of cards and other inſtruments of idle trifling, to have continually in their hands either pſalms, homilies, and other devout meditations, or elſe Paul's epiſtles, or ſome book of holy ſcripture matters, and as familiarly both to read or reaſon thereof in Greek, Latin, French, or Italian, as in Engliſh. It was now a common thing to ſee young virgins ſo trained in the ſtudy of good letters, that they willingly ſet all other vain paſtimes at nought for learning's ſake. It was now no news at all to ſee queens and ladies of moſt high eſtate and progeny, inſtead of courtly dalliance, to embrace virtuous exerciſes of reading and writing, and with moſt earneſt ſtudy, both early and late, to apply themſelves to the acquiring of knowledge, as well in all other liberal arts and diſciplines, as alſo moſt eſpecially of God and his holy word. And in this behalf (ſays he), like as to your highneſs, as well for compoſing and ſetting forth many godly pſalms, and divers other contemplative meditations, as alſo for cauſing theſe paraphraſes to be tranſlated into our vulgar tongue, England can never be able to render thanks ſufficient; ſo may it never be able, as her deſerts require, enough to praiſe and magnify the moſt noble, the moſt virtuous, the moſt witty, and the moſt ſtudious lady Mary's grace, for taking ſuch pain and travail in tranſlating this Paraphraſe of Eraſmus upon the goſpel of St John.—What could be a more plain declaration of her moſt conſtant purpoſe to promote God's word, and the free grace of his goſpel?" &c. Mr Udall was miſtaken; ſhe never meant any ſuch thing: for ſoon after her acceſſion to the throne, a proclamation was iſſued for calling in and ſuppreſſing this very book, and all others that had the leaſt tendency towards furthering the reformation. And Mr Walpole is of opinion, that the ſickneſs which came upon her while ſhe was tranſlating St John, was all affected; "for (ſays he) ſhe would not ſo eaſily have been caſt into ſickneſs, had ſhe been employed on the Legends of St Tereſa or St Catharine of Sienna."

to that which her mother and all about her had been infuſing into her for many years; but that it would appear ſtrange, if he ſhould for this cauſe ſo far forget the father, as to proceed to extremities with his own child; that if ſhe were ſeparated from her mother and her people, in a little time there might be ground gained on her; but that to take away her life, would raiſe horror through all Europe againſt him:" by which means he preſerved her. —Along with Archbiſhop Cranmer, who had thus ſaved her life, the biſhops Ridley and Latimer were alſo condemned for hereſy at Oxford, and afterwards burnt. In 1556, the perſecution became general; and Proteſtants of all ranks and ages, and of both ſexes, fell victims to papal fury. It is obſervable, likewiſe, that the ſame perfidious violation of promiſes and treaties prevailed in the queen's council, with reſpect to public affairs. By the treaty of marriage concluded between the queen and Philip, it was expreſsly ſtipulated that England ſhould not be engaged in any wars with France on account of Spain; yet in 1557, Philip, who had brought immenſe ſums of money into England, procured an offenſive and defenſive alliance againſt France, from the Engliſh adminiſtration, and 8000 of the queen's choiceſt troops were ſent over to the aſſiſtance of the Spaniards in the Low Countries: the loſs of Calais to the French was the firſt fruit of this war; and ſome aſſert, that upon this ſingle occaſion the queen ſhowed a ſtrong attachment to her native country, lamenting this ſtroke ſo deeply, that it occaſioned her death; but it is better authenticated, that ſhe was carried off by an epidemic fever, which raged ſo violently that it did not leave a ſufficient number of men in health to get in the harveſt. She had long, however, been a prey, if not to remorſe, yet to diſappointment and chagrin, ariſing from various croſs accidents, ſuch as want of children, and the abſence and unkindneſs of Philip conſequent thereupon. Her death happened Nov. 7. 1558, in the 43d year of her age, after a reign of five years, four months, and eleven days. There are ſome things of her writing ſtill extant. Strype has preſerved three prayers or meditations of hers: the firſt, "Againſt the aſſaults of vice;" the ſecond, "A meditation touching adverſity;" the third, "A prayer to be read at the hour of death." In Fox's "Acts and monuments" are printed eight of her letters to king Edward and the lords of the council, on her nonconformity, and on the impriſonment of her chaplain Dr Mallet. In the *Sylloge epiſtolarum* are ſeveral more of her letters, extremely curious: one of her delicacy in never having written but to three men; one of affection for her ſiſter; one after the death of Anne Boleyn; and one very remarkable of Cromwell to her. In "Haynes's State Papers," are two in Spaniſh, to the emperor Char. V. —There is alſo a French letter, printed by Stripe from the Cotton library, in anſwer to a haughty mandate from Philip, when he had a mind to marry the lady Elizabeth to the duke of Savoy, againſt the queen's and princeſs's inclination: it is written in a moſt abject manner, and a wretched ſtyle.

MARY of Medicis, wife of Henry IV. king of France, was declared ſole regent of the kingdom in 1610, during the conſternation which the aſſaſſination of that beloved king had occaſioned. By her ambitious intrigues, the nation loſt all its influence abroad, and was torn to pieces at home by contending factions. After ſeveral viciſſitudes of fortune, ſhe was abandoned by her ſon Louis XIII. whoſe reign had been conſtantly diſturbed by the civil commotions ſhe had occaſioned; and died in indigence at Bruſſels, in 1642, aged 68. She built the ſuperb palace of Luxembourg at Paris, and embelliſhed that city with aqueducts and other ornaments.

MARY queen of Scotland, daughter of James V. was born in the royal palace of Linlithgow on the 8th of December 1542. Her mother was Mary, the eldeſt daughter of Claude duke of Guiſe, and widow of Louis duke of Longueville. Her father dying a few days after her birth, ſhe ſcarcely exiſted before ſhe was hailed queen.

The government of a queen was unknown in Scotland; and the government of an infant queen could not command much reſpect from martial and turbulent nobles, who exerciſed a kind of ſovereignty over their own vaſſals; who looked upon the moſt warlike of their monarchs in hardly any other light than as the chief of the ariſtocracy; and who, upon the ſlighteſt diſguſts, were ever ready to fly into rebellion, and to carry their arms to the foot of the throne.—James had not even provided againſt the diſorders of a minority, by committing to proper perſons the care of his daughter's education, and the adminiſtration of affairs in her name. The former of theſe objects, however, was not neglected, though the regency of the kingdom was entruſted to very feeble hands. At ſix years of age Mary was conveyed to France, where ſhe received her education in the court of Henry II. The opening powers of her mind, and her natural diſpoſitions, afforded early hopes of capacity and merit. After being taught to work with her needle and in tapeſtry, ſhe was inſtructed in the Latin tongue; and ſhe is ſaid to have underſtood it with an accuracy, which is in this age very uncommon in perſons of her ſex and elevated rank, but which was not then ſurpriſing, when it was the faſhion among great ladies to ſtudy the ancient languages. In the French, the Italian, and the Spaniſh tongues, her proficiency was ſtill greater, and ſhe ſpoke them with equal eaſe and propriety. She walked, danced, and rode with enchanting gracefulneſs; and ſhe was qualified by nature, as well as by art, to attain to diſtinction in painting, poetry, and muſic. To accompliſh the woman was not, however, the ſole object of her education. Either ſhe was taught, or ſhe very early diſcovered, the neceſſity of acquiring ſuch branches of knowledge as might enable her to diſcharge with dignity and prudence the duties of a ſovereign; and much of her time was devoted to the ſtudy of hiſtory, in which ſhe delighted to the end of her life.

Whilſt Mary reſided in the court of Henry II. her perſonal charms made a deep impreſſion on the mind of the Dauphin. It was in vain that the conſtable Montmorency oppoſed their marriage with all his influence. The importance of her kingdom to France, and the power of her uncles the princes of Lorraine, were more than ſufficient to counteract his intrigues; and the Dauphin obtained the moſt beautiful princeſs in Chriſtendom.

Though this alliance placed the queen of Scotland in the moſt conſpicuous point of view, in the politeſt court of Europe, and drew to her thoſe attentions which are in the higheſt degree pleaſing to a female mind in the gaiety of youth; it may yet be conſidered as having accidentally laid the foundation of the greateſt part of her future misfortunes. Elizabeth, who now ſwayed the ſceptre of England, had been declared illegitimate by an act of parliament: and though the Engliſh Proteſtants paid no regard to a declaration which was compelled by the tyrannic violence of Henry VIII. and which he himſelf had indeed rendered null by calling his daughter to the throne after her brother and elder ſiſter; yet the papiſts both at home and abroad had objections to the legitimacy of Elizabeth's birth, founded on principles which with them had greater weight than the acts of any human legiſlature. Mary was unqueſtionably the next heir in regular ſucceſſion to the Engliſh throne, if Elizabeth ſhould die without legitimate iſſue; and upon her marriage to the Dauphin, ſhe was induced by the perſuaſion of her uncles, by the authority of the French king, and no doubt partly by her own ambition, to aſſume the title and arms of queen of England and Ireland. Theſe, indeed, ſhe forebore as ſoon as ſhe became her own miſtreſs; but the having at all aſſumed them was an offence which Elizabeth could never forgive, and which rankling in her boſom made her many years afterwards purſue the unhappy queen of Scots to the block.

Henry II. dying ſoon after the marriage of the Dauphin and Mary, they mounted the throne of France. In that elevated ſtation, the queen did not fail to diſtinguiſh herſelf. The weakneſs of her huſband ſerved to exhibit her accompliſhments to the greateſt advantage; and in a court where gallantry to the ſex, and the moſt profound reſpect for the perſon of the ſovereign, were inſeparable from the manners of a gentleman, ſhe learned the firſt leſſons of royalty. But this ſcene of ſucceſsful grandeur and unmixed felicity was of ſhort duration. Her huſband Francis died unexpectedly, after a ſhort reign of ſixteen months. Regret for his death, her own humiliation, the diſgrace of her uncles the princes of Lorraine, which inſtantly followed, and the coldneſs of Catharine of Medicis the queen mother, who governed her ſon Charles IX. plunged Mary into inexpreſſible ſorrow. She was invited to return to her own kingdom, and ſhe tried to reconcile herſelf to her fate.

She was now to paſs from a ſituation of elegance and ſplendour to the very reign of incivility and turbulence, where moſt of her accompliſhments would be utterly loſt. Among the Scots of that period, elegance of taſte was little known. The generality of them were ſunk in ignorance and barbariſm; and what they termed religion, dictated to all a petulant rudeneſs of ſpeech and conduct, to which the queen of France was wholly unaccuſtomed. During her minority and abſence, the Proteſtant religion had gained a kind of eſtabliſhment in Scotland; obtained, indeed, by violence, and therefore liable to be overturned by an act of the ſovereign and the three eſtates in parliament. The queen, too, was unhappily of a different opinion from the great body of her ſubjects, upon that one topic, which among them actuated almoſt every heart, and directed almoſt every tongue. She had been educated in the church of Rome, and was ſtrongly attached to that ſuperſtition: Yet ſhe had either moderation enough in her ſpirit, or diſcretion enough in her underſtanding, not to attempt any innovation in the prevailing faith of proteſtantiſm. She allowed her ſubjects the full and free exerciſe of their new religion, and only challenged the ſame indulgence for her own. She contrived to attach to her, whether from his heart or only in appearance, her natural brother, the prior of St Andrew's; a man of ſtrong and vigorous parts, who, though he had taken the uſual oath of obedience to the Pope, had thrown off his ſpiritual allegiance, and placed himſelf at the head of the reformers. By his means ſhe cruſhed an early and formidable rebellion; and in reward for his ſervices conferred upon him a large eſtate, and created him Earl of Murray. For two or three years her reign was proſperous, and her adminiſtration applauded by all her ſubjects, except the Proteſtant preachers; and had ſhe either remained unmarried, or beſtowed her affections upon a more worthy object, it is probable that her name would have deſcended to poſterity among thoſe of the moſt fortunate and the moſt deſerving of Scottiſh monarchs.

But a queen, young, beautiful, and accompliſhed, an ancient and hereditary kingdom, and the expectation of a mightier inheritance, were objects to excite the love and ambition of the moſt illuſtrious perſonages. Mary, however, who kept her eye ſteadily fixed on the Engliſh ſucceſſion, rejected every offer of a foreign alliance; and, ſwayed at firſt by prudential motives, and afterwards by love the moſt exceſſive, ſhe gave her hand to Henry Stuart, lord Darnley, the ſon of the earl of Lenox. This nobleman was, after herſelf, the neareſt heir to the crown of England; he was likewiſe the firſt in ſucceſſion after the earl of Arran to the crown of Scotland; and it is known that James V. had intended to introduce into his kingdom the Salique law, and to ſettle the crown upon Lenox in preference to his own daughter. Theſe conſiderations made Mary ſolicitous for an interview with Darnley; and at that interview love ſtole into her heart, and effaced every favourable thought of all her other ſuitors. Nature had indeed been laviſh to him of her kindneſs. He was tall of ſtature; his countenance and ſhapes were beautiful and regular; and, amidſt the maſks and dancing with which his arrival was celebrated, he ſhone with uncommon luſtre. But the bounty of nature extended not to his mind. His underſtanding was narrow; his ambition exceſſive; his obſtinacy inflexible; and under the guidance of no fixed principle, he was inconſtant and capricious. He knew neither how to enjoy his proſperity nor how to enſure it.

On the 29th of July 1565, this ill-fated pair were married; and though the queen gave her huſband every poſſible evidence of the moſt extravagant love; though ſhe infringed the principles of the conſtitution to confer upon him the title of king; and though ſhe was willing to ſhare with him all the offices, honours, and dignities of royalty—he was not ſatisfied with his lot, but ſoon began to clamour for more power. He had not been married ſeven months, when he entered into a conſpiracy to deprive Mary of the government, and to ſeat himſelf on her throne. With this view he headed a band of factious nobles, who entered her chamber at night; and though ſhe was then far advanced in her pregnancy, murdered her ſecretary in her preſence, whilſt one of the ruffians held a cocked piſtol to her breaſt. Such an outrage, together with his infidelity and frequent amours, could not fail to allienate the affections of a high ſpirited woman, and to open her eyes to thoſe defects in his character which the ardors of love had hitherto prevented her from ſeeing. She ſighed and wept over the precipitation of her marriage: but though it was no longer poſſible to love him, ſhe ſtill treated him with attention and reſpect, and laboured to faſhion him to the humour of her people.

This was labour in vain. His prepoſterous vanity and aſpiring pride rouſed the reſentment and the ſcorn of the nobles: his follies and want of dignity made him little with the people. He deſerted the conſpirators with whom he had been leagued in the aſſaſſination of the ſecretary; and he had the extreme imprudence to threaten publicly the earl of Murray, who, from his talents and his followers, poſſeſſed the greateſt power of any man in the kingdom. The conſequence was, that a combination was formed for the king's deſtruction; and, on the 10th day of February 1567, the houſe in which he then reſided was early in the morning blown up with gun-powder, and his dead and naked body, without any marks of violence, was found in an adjoining field.

Such a daring and atrocious murder filled every mind with horror and aſtoniſhment. The queen, who had been in ſome meaſure reconciled to her huſband, was overwhelmed with grief, and took every method in her power to diſcover the regicides; but for ſome days nothing appeared which could lead to the diſcovery. Papers indeed were poſted on the moſt conſpicuous places in Edinburgh, accuſing the earl of Bothwell of the crime; and rumours were induſtriouſly circulated that his horrid enterpriſe was encouraged by the queen. Conſcious, it is to be preſumed, of her own innocence, Mary was the leſs diſpoſed to believe the guilt of Bothwell, who was accuſed as having only acted as her inſtrument; but when he was charged with the murder by the earl of Lenox, ſhe inſtantly ordered him on his trial. Through the management of the earl of Morton and others, who were afterwards diſcovered to have been partners in his guilt, Bothwell was acquitted of all ſhare and knowledge of the king's murder; and what is abſolutely aſtoniſhing, and ſhows the total want of honour at that time in Scotland, this flagitious man procured, by means of the ſame treacherous friends, a paper ſigned by the majority of the nobles, recommending him as a fit huſband for the queen!

Armed with this inſtrument of miſchief, which he weakly thought ſufficient to defend him from danger, Bothwell ſoon afterwards ſeized the perſon of his ſovereign, and carried her a priſoner to his caſtle at Dunbar. It has indeed been alleged by the enemies of the queen, that no force was employed on the occaſion; that ſhe was ſeized with her own conſent; and that ſhe was even privy to the ſubſcribing of the bond by the nobles. But it has been well obſerved by one of her ableſt vindicators (A), that "her previous knowledge of the bond, and her acquieſcence in the ſeizure of her perſon, are two facts in apparent oppoſition to each other. Had the queen acted in concert with Bothwell in obtaining the bond from the nobles, nothing remained but, under the ſanction of their unanimous addreſs, to have proceeded directly to the marriage. Inſtead of which, can we ſuppoſe her ſo weak as to reject that addreſs, and rather *chooſe* that Bothwell ſhould attempt to ſeize and carry her off by violence?—an attempt which many accidents might fruſtrate, and which at all events could not fail to render him or both of them odious to the whole nation. Common ſenſe, then, as well as candour, muſt induce us to believe, that the ſcheme of ſeizing the queen was ſolely the contrivance of Bothwell and his aſſociates, and that it was really by force that ſhe was carried to Dunbar." Being there kept a cloſe priſoner for 12 days; having, as there is reaſon to believe, actually ſuffered the indignity of a rape; perceiving no appearance of a reſcue; and being ſhown the infamous bond of the nobles; Mary promiſed to receive her raviſher for a huſband, as in her opinion the only refuge for her injured honour. Without condemning with aſperity this compliance of the queen, it is impoſſible not to recollect the more dignified conduct which Richardſon attributes in ſimilar circumſtances to his Clariſſa; and every man who feels for the ſufferings, and reſpects the memory of Mary, muſt regret that ſhe had not fortitude to reſiſt every attempt to force upon her as a huſband the profligate and audacious villain who had offered her ſuch an inſult as no virtuous woman ought ever to forgive. This, however, is only to regret that ſhe was not more than human; that ſhe who poſſeſſed ſo many perfections, ſhould have had them blended with one defect. "In the irretrievable ſituation of her affairs, let the moſt ſevere of her ſex ſay what courſe was left for her to follow? Her firſt and moſt urgent concern was to regain her liberty. That probably ſhe attained by promiſing to be directed by the advice of her council, where Bothwell had nothing to fear." The marriage, thus inauſpiciouſly contracted, was ſolemnized on the 15th of May 1567; and it was the ſignal for revolt to Morton, Lethington, and many of the other nobles, by whoſe wicked and relentleſs policy it had been chiefly brought about, and who had bound themſelves to employ their ſwords againſt all perſons who ſhould preſume to diſturb ſo deſirable an event.

As Bothwell was juſtly and univerſally deteſted, and as the rebels pretended that it was only againſt him and not againſt their ſovereign that they had taken up arms, troops flocked to them from every quarter. The progreſs and iſſue of this rebellion will be ſeen in our hiſtory of SCOTLAND: ſuffice it to ſay here, that upon the faith of promiſes the moſt ſolemn, not only of perſonal ſafety to herſelf, but of receiving

---

(A) *Tytler's Diſſertation on the Marriage of Queen Mary with the Earl of Bothwell*: Tranſactions of the Society of Antiquaries of Scotland, Vol. I.

as much honour, ſervice, and obedience, as ever in any former period was paid by the nobility to the princes her predeceſſors, the unhappy queen delivered herſelf into the hands of her rebels, and perſuaded her huſband to fly from the danger which in her apprehenſion threatened his life. Theſe promiſes were inſtantly violated. The faithleſs nobles, after inſulting their ſovereign in the cruelleſt manner, hurried her as a priſoner to a caſtle within a lake, where ſhe was committed to the care of that very woman who was the mother of her baſtard brother; who, with the natural inſolence of a whore's meanneſs, ſays Mr Whitaker, aſſerted the legitimacy of her own child and the illegitimacy of Mary; and who actually carried the natural vulgarity of a whore's impudence ſo far, as to ſtrip her of all her royal ornaments, and to dreſs her like a mere child of fortune in a coarſe brown caſſoc.

In this diſtreſs the queen's fortitude and preſence of mind did not forſake her: She contrived to make her eſcape from her priſon, and ſoon found herſelf at the head of 6000 combatants. This army, however, was defeated; and, in oppoſition to the advice and intreaties of all her friends, ſhe haſtily formed the rereſolution of taking *refuge in England.* The archbiſhop of St Andrew's in particular accompanied her to the border; and when ſhe was about to quit her own kingdom, he laid hold of her horſe's bridle, and on his knees conjured her to return: but Mary proceeded, with the utmoſt reliance on the friendſhip of Elizabeth, which had been offered to her when ſhe was a priſoner, and of the ſincerity of which ſhe harboured not a doubt.

That princeſs, however, who had not yet forgotten her aſſumption of the title and arms of queen of England, was now taught to dread her talents and to be envious of her charms. She therefore, under various pretences, and in violation not only of public faith, but even of the common rights of hoſpitality, kept her a cloſe priſoner for 19 years; encouraged her rebellious ſubjects to accuſe her publicly of the murder of her huſband; allowed her no opportunity of vindicating her honour; and even employed venal ſcribblers to blaſt her fame. Under this unparalleled load of complicated diſtreſs, Mary preſerved the magnanimity of a queen, and practiſed with ſincerity the duties of a Chriſtian. Her ſufferings, her dignified affability, and her gentleneſs of diſpoſition, gained her great popularity in England, eſpecially among the Roman catholics; and as ſhe made many attempts to procure her liberty, and carried on a conſtant correſpondence with foreign powers, Elizabeth became at laſt ſo much afraid of her intrigues, that ſhe determined to cut her off, at whatever hazard. With this view ſhe prevailed upon her ſervile parliament to paſs an act which might make Mary anſwerable for the crimes of all who ſhould call themſelves her partizans; and upon that flagitious ſtatute ſhe was tried as a traitor concerned in the conſpiracy of Babington: (ſee SCOTLAND). Though the trial was conducted in a manner which would have been illegal even if ſhe had been a ſubject of England, and though no certain proof appeared of her connection with the conſpirators, ſhe was, to the amazement of Europe, condemned to ſuffer death.

The fair heroine received her ſentence with great compoſure; ſaying to thoſe by whom it was announced, "The news you bring cannot but be moſt welcome, ſince they announce the termination of my miſeries. Nor do I account that ſoul to be deſerving of the felicities of immortality which can ſhrink under the ſufferings of the body, or ſcruple the ſtroke that ſets it free." On the evening before her execution, for which, on the ſucceeding morn, ſhe prepared herſelf with religious ſolemnity and perfect reſignation, ſhe ordered all her ſervants to appear before her, and drank to them. She even condeſcended to beg their pardon for her omiſſions or neglects; and ſhe recommended it to them to love charity, to avoid the unhappy paſſions of hatred and malice, and to preſerve themſelves ſtedfaſt in the faith of Chriſt. She then diſtributed among them her money, her jewels, and her clothes, according to their rank or merit. She wrote her will with her own hand, conſtituting the duke of Guiſe her principal executor; and to the king and queen of France ſhe recommended her ſon, provided he ſhould prove worthy of their eſteem.—In the caſtle of Fotheringay ſhe was beheaded on the 8th of February 1587, in the 45th year of her age; and her body, after being embalmed and committed to a leaden coffin, was buried with royal pomp and ſplendor in the cathedral of Peterborough. Twenty years afterwards her bones were by order of her ſon and only child King James I. removed to Weſtminſter, and depoſited in their proper place among the kings of England.

The general character of Mary, which in the regular order of biography ſhould now be laid before the reader, has furniſhed matter of controverſy for 200 years. She is univerſally allowed to have had conſiderable talents, and a mind highly cultivated. By one party ſhe is painted with more virtues and with fewer defects than almoſt any other woman of the age in which ſhe lived. By another ſhe is repreſented as guilty of the groſſeſt crimes which a woman can commit—adultery and the murder of her huſband. By all it is confeſſed, that, previous to her connection with the earl of Bothwell, her life as a Chriſtian was exemplary, and her adminiſtration as a queen equitable and mild; and it has never been denied that ſhe bore her tedious ſufferings with ſuch reſignation and fortitude as are ſeldom found united with conſcious guilt. Theſe are ſtrong preſumptions of her innocence. The moral characters of men change by degrees; and it ſeems hardly conſiſtent with the known principles of human nature, that any perſon ſhould at once plunge deliberately from the ſummit of virtue to the depths of vice; or, when ſunk ſo low, ſhould by one effort recover his original ſtate of elevation. But in this controverſy preſumptions muſt go for nothing. The poſitive evidences which were brought againſt the queen of Scots are ſo concluſive, that if they be genuine ſhe muſt have been guilty; and if they be ſpurious, there can be no doubt of her innocence. They conſiſted of a box with letters, contracts, and ſonnets, ſaid to be written by herſelf and ſent to the earl of Bothwell. In addition to theſe, the ſuppoſed confeſſions of the criminals who had ſuffered for the king's murder were originally urged as proofs of her guilt: but thoſe confeſſions are now admitted by all parties to be either wholly forged, or ſo groſsly interpolated that no ſtreſs whatever can be laid upon them; and during Mary's life it was affirmed by her friends, and not ſufficiently contradicted by her enemies, that the perſons who had accuſed Bothwell, and were doubtleſs his accomplices, inſtead of criminating the queen, had openly proteſted her innocence in their dying moments.

Stuart's Hiſtory of Scotland.

This box then, with its contents, was the evidence upon which her accuſers had the chief and indeed the only reliance; and it is upon this evidence, whatever it be, that the guilt or innocence of the Scottiſh princeſs muſt finally be determined. It is uniformly affirmed upon the part of the earl of Murray and his faction, that the caſket with the letters and the ſonnets had been left by Bothwell in the caſtle of Edinburgh; that this nobleman, before he fled from Scotland, ſent a meſſenger to recover them; and that they were found in the poſſeſſion of this perſon. The 20th day of June 1567 is fixed as the date of this remarkable diſcovery. The governor of the caſtle at that time was Sir James Balfour. George Dalgleiſh, a ſervant of Bothwell's, is named as his meſſenger upon this erand. He was ſeized, it is ſaid, by the domeſtics of the earl of Morton; and it was the earl of Morton himſelf who made the actual production of the caſket and its contents.

This ſtory is unſupported by vouchers, contains improbabilities, and cannot be reconciled with hiſtory and events. There remains not any authentic or unſuſpicious evidence that the queen had diſhonoured the bed of Lord Darnley; and there is the moſt ſatisfactory evidence†, that though Bothwell was entruſted with the defence of the borders on account of his tried courage and loyalty, he was privately diſliked by Mary for his uncommon zeal in the cauſe of Proteſtantiſm. At the very time when the queen is ſaid to have had the moſt violent love for that nobleman, and with him to have been carrying on the moſt criminal intercourſe againſt her huſband, we know both from Randolph and from Knox, that Bothwell refuſed to gratify her by the ſmalleſt compliance with the ceremonies of her religion, though many of the other Proteſtant peers ſcrupled not to accompany her to the celebration of the maſs. That the villain who could deliberately commit murder, ſhould be ſo ſcrupulouſly conſcientious with reſpect to modes of faith and worſhip, as to ſtand forward with a *peculiar* ſtrain of bravery to oppoſe, in a favourite meaſure, the queen, who was *then* admitting him to her bed, and actually *forming plans* for raiſing him to her throne, is ſurely, to ſay the leaſt of it, extremely improbable.

† *Whitaker's Vindication.*

But let us ſuppoſe this non-compliance on the part of Bothwell to have been a meaſure concerted between the queen and him to conceal more effectually from the eyes of the public the criminal intercourſe in which they were engaged; is it not very ſurpriſing, that of ſuch politicians, the *one* ſhould have *written* thoſe letters, and the *other* have left them in the power of their *enemies?* The earl of Bothwell was expoſed to more than ſuſpicions of a concern in the murder of the king. Theſe papers contained manifeſt proofs of his guilt. It evidently was not his intereſt to preſerve them: or admitting, that till his marriage was ſolemnized with the queen he might look upon them as his beſt ſecurity for the realiſing of his ambitious hopes, yet, after that event, when all his former friends had deſerted him, he muſt have felt the ſtrongeſt inducements to deſtroy ſuch a criminal correſpondence; and Mary muſt have been ardently animated with the ſame wiſh. The caſtle of Edinburgh, where the box is ſaid to have been lodged, was at this time entirely at their command; and Sir James Balfour, their deputy, was the creature of Bothwell. If his enemies, who were now in arms againſt him, ſhould poſſeſs themſelves of this box and its contents, his deſtruction was inevitable. From his marriage till the 5th day of June, it was in his power to have deſtroyed the fatal papers; and if they had exiſted, it is not to be imagined that he would have neglected a ſtep ſo expedient, not only for his own ſecurity and reputation, but alſo for thoſe of the queen. During all this time, however, he made no effort to recover his box and letters: he had lodged them in the caſtle of Edinburgh; and there he choſe to leave them in the cuſtody of a man in whom he could not have one particle of affiance. This was exceſſively fooliſh; but his ſubſequent conduct was ſtill more ſo. Upon the 6th day of June, it is evident that he had reaſon to ſuſpect the fidelity of Sir James Balfour, ſince he avoided to take refuge in the caſtle of Edinburgh and fled to Dunbar. He returned, however, with an army in order to fight the rebels. The balance of empire might then ſeem to hang ſuſpended between himſelf and his enemies; and in that ſtate of things, a man of ſuch commodious principles as Balfour appears to have been, might be inclined to do his old friend and patron a ſecret ſervice, both to efface his former perfidy and to create himſelf a new intereſt with him in caſe he ſhould be victorious over the rebels. Yet in theſe critical moments Bothwell neglected to make any application to him for the caſket and the letters! On the 15th of June, all his towering imaginations were at once daſhed to the ground. He had come to Carberry-hill, followed by an army and accompanied by a queen; but he fled from it attended only by a ſingle ſervant, and was glad to ſhelter himſelf in the caſtle of Dunbar from the vengeance due to his crimes. Yet in this extremity of diſtreſs he is repreſented as trying a bold experiment, which he had not courage to try when he was fortified with the authority of his ſovereign, and when he was facing the rebels in the field. In the very hour when almoſt every friend had deſerted him, he expected a return of friendſhip from a man who had deſerted him at firſt only becauſe he *ſuſpected him to be in danger.* At this period he ſent his ſervant George Dalgleiſh to wait upon Balfour, the acting governor of the caſtle of Edinburgh, with a requiſition for the box of letters, and to bring back the important charge, through ten thouſand dangers, to Dunbar. Though this man was one of his agents in the murder of the king, and might therefore have been ſafely entruſted with any ſecret, he did not order him, as common ſenſe requires he ſhould have done, to deſtroy the letters as ſoon as he ſhould get them into his poſſeſſion. No! he ſent him to fetch them from the caſtle, as if there was no danger in going thither, no doubt of receiving them there, and no difficulty in carrying them back. †To a traveller in an eaſy chair, all roads are ſmooth, and all days are fine. Accordingly this ſame Dalgleiſh, though the well-known ſervant of Bothwell, makes good his entrance at the gates of the city, though theſe were guarded by 450 harquebuſiers all hoſtile to his

† *Whitaker's Vindication.*

his maſter, finds his way to the caſtle, and delivers his meſſage. But what is more aſtoniſhing than all, he actually receives the box of letters from Sir James Balfour. This indeed, ſays Mr Whitaker, is "o'erdoing Termagant; it out-herods Herod." Balfour was the ductile ſlave of ſelfiſhneſs. He had with infinite perfidiouſneſs turned againſt his friend, his patron, and his queen, only becauſe he ſaw them oppoſed by a party which he *thought* would prove too ſtrong for them; but now when they were both plunged into the loweſt ſtate of diſtreſs, and branded with the appellation of regicides, his ſelfiſhneſs was ſuddenly changed into generoſity, his meanneſs gave place to exalted ſentiments, and, at the peril of his own life, he performed an heroical act of kindneſs! "In ſuch circumſtances (aſks a contemporary writer), is it to be thought, either that the earl would ſend to the ſaid Sir James, or that the ſaid Sir James would ſend any thing to the earl? Is it likely? Is it credible?" No matter: Bothwell is made to ſend for his papers at a time when his difficulties and his deſpair render it *improbable* that he could *think* of them, and when it was abſolutely *impoſſible* that he could *recover* them. His meſſenger accordingly is intercepted with the caſket; and the adverſaries of the queen, upon the 20th day of June, became poſſeſſed of vouchers with which they might operate her deſtruction. Theſe inconſiſtencies are glaring, and of a force not eaſily to be controuled; and the ſtory is open to other objections, which are, if poſſible, greater, and altogether inſurmountable.

By comparing different proclamations of the rebels with the ſeveral diſpatches of Throgmorton, who was then Elizabeth's reſident in Scotland, Mr Whitaker has made it appear in the higheſt degree probable, that Dalgleiſh was *not* ſeized *till* the 17th of July; that he was then, in conſequence of an order iſſued by the court of ſeſſion, apprehended, together with Powrie, another of Bothwell's ſervants, in that nobleman's lodgings in the palace of Holyroodhouſe; and that therefore he could not be the bearer of the letters intercepted by the earl of Morton on the 20th of June. What adds greatly to this probability is the account which the rebels themſelves give of his examination. A few days after he was taken, he was examined, ſay they, judicially, in a council where the earls of Morton and Athol are marked as preſent. It was natural upon this occaſion to make inquiries about the caſket and the papers. No queſtions, however, were put to him on that ſubject. He was not confronted with Sir James Balfour, from whom he had received the caſket; nor with the domeſtics of the earl of Morton, by whom it was ſaid that he had been apprehended. He was kept in priſon many months after this examination; and during a period when the rebels were infinitely preſſed to apologize for their violence againſt the queen, there were opportunities without number of bringing him to a confeſſion. Theſe opportunities, however, were avoided; and there exiſts not the ſlighteſt evidence that the caſket and the papers had ever been in his poſſeſſion. Is it then to be ſuppoſed, that if the caſket and the papers had really been diſcovered with *him*, the eſtabliſhment of a fact ſo important would have been neglected by the adverſaries of the queen? No! they would have eſtabliſhed it by the moſt complete evidence; which they were ſo far from attempting to do, that the earlieſt account which they give of their pretended ſeizure of the letters is dated *fifteen months* after the event itſelf, and nearly *nine months* after the death of Dalgleiſh. To have blazoned their diſcovery at the time they pretend it was made, might have been attended with very diſagreeable conſequences; for Dalgleiſh, who at his execution aſſerted the innocence of the queen, and actually charged the earls of Murray and Morton as the contrivers of the murder, might have found proof that the caſket could not poſſibly have been intercepted in his cuſtody.

The 20th of June 1567 is fixed as the æra of the diſcovery of the letters. If this diſcovery had been real, the triumph of the enemies of the queen would have been infinite. They would not have delayed one moment to proclaim their joy, and to reveal to her indignant ſubjects the fulneſs and the infamy of her guilt. They preſerved, however, a long and a profound ſilence. It was not till the 4th of December 1567 that the papers received their firſt mark of notice or diſtinction; nor till the 16th of September 1568, that the earl of Morton was ſaid to have intercepted them with Dalgleiſh. From the 20th day of June to the 4th day of December, many tranſactions and events of the higheſt importance had taken place; and the moſt powerful motives that have influence with men had called upon them to publiſh their diſcovery. They yet made no production of the papers, and ventured not to appeal to them. In the proclamation which they iſſued for apprehending Bothwell, they inveigh againſt his guilt, and expreſs an anxious deſire to puniſh the regicides: yet though this deed was poſterior to the 20th of June, there is no aſſertion in it to the diſhonour of the queen; and it contains no mention of the box and the letters. An ambaſſador arrived in this interval from France, to inquire into the rebellion and the impriſonment of the queen; yet they apologized not for their conduct by communicating to him the contents of the caſket. To Throgmorton, who had inſtructions to act with Mary as well as with her adverſaries, they denied the liberty of waiting upon her at Lochleven, where ſhe was detained a cloſe priſoner; and they were earneſt to impreſs him with the idea that her love of Bothwell was incurable. He preſſed them on the ſubject of their behaviour to her. At different times they attempted formally to vindicate themſelves; and they were uniformly vehement on the topic of the love which ſhe bore to that nobleman. Yet they abſtained from producing the letters to him. "They even ſpoke of her to him with *reſpect* and *reverence*;" which ſurely they could not poſſibly have done had they been then in poſſeſſion of the letters. They were ſolicitous to divide the faction of the nobles who adhered to the queen; and there could not have been a meaſure ſo effectual for this end as the production of the caſket and its contents: yet they called no convention of her friends, to ſurpriſe and diſunite them with this fatal diſcovery. They flattered the Proteſtant clergy, attended aſſemblies of the church, inſtilled into them a belief of the queen's being guilty of murder and adultery, and incited Mr Knox to "inveigh againſt her vehemently in his ſermons, to perſuade extremities towards her, and (as Throgmorton continues) to threaten the great plague of God againſt the whole country and nation if ſhe ſhould be ſpared from her *condign puniſhment*;" but they ventured not to excite the fury of theſe ghoſtly fathers by exhibiting to them the box and the letters. They compelled the queen to ſubſcribe a reſignation of her crown; and they had the ſtrongeſt reaſon to be ſolicitous to juſtify this daring tranſaction. The box and the letters would have ſerved as a complete vindication of them: yet they neglected to take any notice of theſe important vouchers; and were contented with reſting on the wild and frivolous pretence that the queen, from ſickneſs and fatigue, was diſguſted with the care of her kingdom.

To the irrefragable proof of the forgery of the letters ariſing from their having been ſo long concealed, it has been replied, that the rebels could not produce them ſooner with any regard to their own ſafety. "†A conſiderable number of their fellow-ſubjects, headed by ſome of the moſt powerful noblemen in the kingdom, was combined againſt them. This combination they could not hope to break or to vanquiſh without aid either from France or England. In the former kingdom, Mary's uncles, the duke of Guiſe and the cardinal of Lorrain, were at that period all-powerful, and the king himſelf was devotedly attached to her. The loading the queen, therefore, with the imputation of being acceſſory to the murder of her huſband, would be deemed ſuch an inexpiable crime by the court of France, as muſt cut off every hope of countenance or aid from that quarter. From England, with which the principal confederates had been long and intimately connected, they had many reaſons to expect more effectual ſupport; but, to their aſtoniſhment, Elizabeth condemned their proceedings with aſperity. Her high notions of royal authority, and of the ſubmiſſion due by ſubjects, induced her on this occaſion to exert herſelf in behalf of Mary, not only with ſincerity but with zeal: ſhe negociated, ſhe ſolicited, ſhe threatened. From all theſe circumſtances, the confederates had every reaſon to apprehend that Mary would ſoon obtain her liberty, and by ſome accommodation be reſtored to the whole, or at leaſt to a conſiderable portion, of her authority as ſovereign; and *therefore* they were afraid of the conſequences of accuſing her publicly of crimes ſo atrocious as adultery and murder."

This apology for the rebels conſiſts of aſſertions for which there is no evidence, and of arguments which are wholly untenable. There is no evidence that Elizabeth exerted herſelf in behalf of Mary with ſincerity and with zeal. If ſhe had, ſhe would have done more than threaten. An Engliſh army of 3000 men, aided by the Scottiſh combination which continued faithful to the queen, would have overturned the rebel government in the ſpace of a month. It is inconceivable that the rebels were prevented by any aprehenſion of the queen's reſtoration from accuſing her of the crimes of murder and adultery; for we learn from a diſpatch of Throgmorton's dated the 19th of July 1567, that "men of good regard did then boldly and overtly by their ſpeech, utter great rigour and extremity againſt their ſovereign; ſaying, it ſhall not be in the power of any *within* this realm, neither *without*, to keep her from condign puniſhment for her notorious crimes." From another diſpatch of the ſame ambaſſador's, dated five days after the former, we learn, that through him they *actually did* accuſe her to Elizabeth of "incontinency, as well with the earl of Bothwell as with others, and likewiſe of the murder of her huſband, of which, they ſaid, they had as apparent proof againſt her as might be; as well by the teſtimony of *her own hand-writing*, which they had recovered, as alſo by ſufficient witneſſes." This teſtimony, however, was not produced till more than four months afterwards; a certain proof, that though it was now in the hands of the manufacturers, it was not yet ready for inſpection.

But let us take the facts of this ableſt antagoniſt of Mary as he has ſtated them, and conſider the argument which they are made to ſupport. It is apparent, from the laſt quoted diſpatch of Throgmorton †, that it could not be unknown, either to the court of France or the court of England, that the rebels were at all events determined to crown the prince, and either to put the queen to death or to keep her a cloſe priſoner for life. Theſe deſperate enterpriſes, however, could not, it ſeems, be carried into effect without the countenance and aid of Elizabeth or Charles: but Elizabeth's notions of regal authority, and of the ſubmiſſion due by ſubjects, were high; and the French king was devotedly attached to the dethroned queen. If this was ſo, common ſenſe ſays, that the buſineſs of the confederates, ſince they expected aid from theſe princes, was to charge Mary at once with the murder and adultery, and ſupport the charge with the moſt convincing evidence which they had to produce. No! ſays this apologiſt of theirs, Charles IX. would have conſidered ſuch conduct as a crime inexpiable, though he might *reaſonably* be expected to give them his countenance in putting to death, or keeping in perpetual priſon, for a comparatively venial offence, the queen to whom he was devotedly attached! This is ſtrange reaſoning; but it ſeeems not to have occurred to the rebels themſelves. The letters made their firſt appearance in a ſecret council aſſembled by the earl of Murray on the 4th of December 1567; and the reaſon there aſſigned by the confederates for their unwillingneſs to produce them was, "That luif they beare unto hir perſon, wha ſometime was theire ſovereine, and for the reverrance of his majeſtie, whais moder ſhe is, as alſua thay mony gude and excellent gifts and vertues quherewith God ſometimes indowit hir." And they proceed to ſay, that they would not have produced them at all, "gif otherwiſe the ſinceritie of their intentions and proceedings from the beginninge myht be known to forrein nacions and the inhabitants of this ile (of whome mony yet remains in ſuſpence in judgment) ſatisfiet and reſolvit of the richtneſneſs of their quarrel, and the ſecuritie of them and theire poſteritie be ony other meane might be providit and eſtabliſhed." So far were they from dreaming that the production of the letters would injure their cauſe in the court of France, that we ſee they frankly acknowledged that the ſincerity and rectitude of their proceedings could not otherwiſe be manifeſted to foreign nations. In this inſtance they think and talk like reaſonable men; but they do not long preſerve the ſame conſiſtency.

In this act of council the rebels diſcover the greateſt anxiety for their pardon and ſecurity: And "the

‡ *Robertſon's Diſſertation*, 15th edit.

† *Whitaker.*

mattter being largelie and with gude deliberacion reſſonit at great length, and upon ſundry daies; at laſt all the ſaid lords, barrones, and others above expremit, can find no other way or moyen how to find or make the ſaid ſecuritie but be oppynynge and reveling of the truth and *grund of the haill matter fre the beginninge*, plainlie and uprightlie, &c. Therefore the lords of ſecrete council, &c. deſires it to be found and declarit be the eſtates and haill body of the parliament, that the cauſe and occaſion of the tacking of the queen's perſon upon the 15th daie of Junii laſt by paſt, and holding and detaininge of the ſame within the hous and place of Lochlevin continewallie ſenſyne, preſentlie, and in *all tymes comyng;* and generally all other things *inventit*, ſpokin, writtin, or donne be them, or onny of them, ſen the tent daie of February laſt by paſt unto the daie and date *heirof*, towiching the ſaied queen hir perſon: that caus, and all things depending theiron, or that onie wiſe maie apperteine theireto, &c. was in the ſaied queen's awin default, in as far as be DIVERS HIR PRIVIE LETTERS WRITTEN AND SUBSCRIVIT WITH HIR AWIN HAND, and ſent by her to James Erll Bothwell, &c.—and be her ungodlie and diſhonourable proceedinge in a privait marriage, ſoddanlie and unproviſitly, it is moſt certain, that ſhe was previe, art and part, and of the actual deviſe and deid of the for-mencionit murther of the kinge, her lawchfull huſband, our ſovereine lorde's father, committit be the ſaid James Erll Bothwell, &c."

Had the letters been really genuine, into the abſurdity of this declaration no man of common ſenſe could poſſibly have fallen. Truth is always conſiſtent with itſelf; but in a ſeries of forgeries contradictions are ſcarcely avoidable. The confederates roſe in rebellion againſt the queen on the 10th of June; they faced her in rebellion at Carberrie-hill on the 15th; they ſent her away into priſon on the 16th: yet they afterwards juſtified *all* that they had done ſince the *tenth of February* by letters, which, they *ſaid*, they had not till the *twentieth of June!* "This (ſays Mr Whitaker), if we conſider it as folly, is one of the moſt ſtriking and eminent acts of folly that the world has ever beheld. But it ought to be conſidered in a light much more diſhonourable to the rebels; and as knavery, it is one of the rankeſt that has ever been attempted to be impoſed upon the ſons of men." On the 4th of December, it muſt be remembered that they had not fixed *any day* for the diſcovery of the letters. The ſtory of the ſeizure of Dalgleiſh with the caſket was not thought of till near a year afterwards; and when it was invented, they had certainly forgotten the date of their act of council. In that act, therefore, they were free to rove at large; but they roved very incautiouſly. By grounding upon the letters, proceedings prior to the 10th of June, they plainly declare the diſcovery of theſe fatal papers to have been *antecedent to the twentieth*. By grounding upon them their ſecret meſſages for ſedition, their private conventions for rebellion, and "every thing inventit, ſpokin, written, or done be them, or anny of them, reſpecting the queen, Bothwell, or Darnley, ſen the *tent daie of February* laſt by paſt," they even intimate the diſcovery to have been previous to the murder of the king; and yet by their own accounts ſome of the letters were then *actually unwritten*. This is aſtoniſhing; and ſhows the extreme difficulty of carrying to any length a conſiſtent ſeries of falſehoods. Even Murray, Morton, and Lethington, could not do it. They knocked down one ninepin in endeavouring to ſet up another; and they finally threw down all, by making them mutually and ſucceſſively to ſtrike one another.

We have not yet done with this act of council. It was with a view to the approaching convention of the eſtates that it had been formed and managed. It was a preparation for the parliament in which the conſpirators had ſecured the fulleſt ſway, and where they propoſed to effectuate their pardon and ſecurity, and to eſtabliſh the letters as deciſive vouchers againſt the queen. Accordingly, upon the 15th day of December 1567, the three eſtates were aſſembled. The conſpirators invited no candid or regular inveſtigation. The friends of the nation and of the queen were overawed. Every thing proceeded in conformity to the act of council. The conſpirators, by a parliamentary decree, received a full approbation of all the ſeverities which they had exerciſed againſt the queen. A pardon by anticipation was even accorded to them for any future cruelty they might be induced to inflict upon her.—The letters were mentioned as the cauſe of this ſingular law; and this new appeal to them may be termed the ſecond mark of their diſtinction. But, amidſt the plenitude of their power, the conſpirators called not the eſtates to a free and honeſt examination of them. This, indeed, had the letters been genuine, would have annihilated for ever all the conſequence of the queen. Upon this meaſure, however, they ventured not. The letters were merely produced in parliament, and an act founded on them; but the queen was not brought from her confinement to defend herſelf, nor was any advocate permitted to ſpeak for her. We learn from a paper of unqueſtionable authenticity†, that "ſindrie nobilmen that was her Grace's favouraris then preſent, buir with all (the rebel proceedings in this parliament), maiſt principellie for ſafety of hir Grace's lyfe, quhilk, or thair coming to parliament, was concludit and ſubſcryvit be ane greit part of hir takeris, to be taken fra hir in meiſt crewel manner, as is notourlie known." By the power of this magic, the friends of Mary were bound faſt. They durſt not venture to queſtion publicly the authenticity of the letters, from their dread of expoſing the queen to the dagger of the aſſaſſin. The parliament, therefore, ſuſtained theſe forgeries as vouchers of her guilt, without ſcrutiny or debate of any kind. The conſpirators, who were themſelves the criminals, were her accuſers and her judges, and paſſed a law exactly in the terms in which the act of ſecret council had before drawn it up.

It was neceſſary to deſcribe the letters both in the act of council and in the ordination of parliament; and theſe deeds having fortunately deſcended to poſterity, it is apparent, from a compariſon of them, that between the 4th and the 15th days of December, the letters muſt have undergone very eſſential alterations under the management of the conſpirators. In the act of council the letters are deſcribed expreſsly as "written and *ſubſcrivit* with the queene's awin hand;" but in the act of parliament they are ſaid to be only, "*written helilie* with hir awin hand," and there is no intimation

---

† See Whitaker's Vindication.

intimation that they were *ſubſcribed* by her. Whence ariſes this difference? From a *blunder* in the clerk penning the act of council, ſays one: From a habit contracted by the ſame clerk, which made him *mechanically* add *ſubſcribed* to *written*, ſays another: From the *careleſsneſs* of the writer who tranſcribed the copy of the act of council which has deſcended to us, ſays a third. Theſe ſubterfuges have been expoſed in all their weakneſs by Meſſrs Tytler and Whitaker: but in this abſtract it is ſufficient to obſerve, that they are mere ſuppoſitions, ſupported by no evidence; and that the copy of the act of council which we have was given to the miniſters of Elizabeth by the leaders of the faction, who were neither blundering clerks, nor under the habit of mechanically adding *ſubſcribed* to *written*. Under one form, therefore, the letters were certainly exhibited before the council, and under another form they were produced in parliament; but had they been genuine, they would have appeared uniformly with the ſame face. The clerk of the council was Alexander Hay, a notary public accuſtomed to draw up writings and to atteſt them; and what puts his accuracy with reſpect to the letters beyond all poſſibility of doubt, his deſcription of them is authenticated in the fulleſt manner by the ſignatures of Murray, Morton, and a long train of others who formed the ſecret council. The letters, therefore, were actually preſented to the ſecret council with the cuſtomary appendage of ſubſcription to them. But when theſe artificers of fraud came to reflect more cloſely on the approach of parliament, and to prepare their letters for the inſpection of the friends of Mary, they began to ſhrink at the thoughts of what they had done. To ſubſtantiate the charge by letters under her own hand, they had naturally annexed her own ſubſcription, a letter *unſubſcribed* being a ſoleciſm in evidence. But moſt unfortunately for the cauſe of *complete* forgery, Mary was ſtill in poſſeſſion of her own *ſeal*, and he who fabricated the letters was not an engraver. For this reaſon, "the allegit writings in form of miſſive letters or epiſtles," ſays the biſhop of Roſs, in an addreſs to Elizabeth, "are not *ſellit* nor *ſignetit*." They were neither atteſted by her ſubſcription at the bottom, nor ſecured by her ſeal on the outſide. In the ſecret council, where all were equally embarked in rebellion, theſe omiſſions were of no importance. But that letters, containing intimations of adultery and of murder, ſhould be ſent by the queen to the earl of Bothwell, with her *ſubſcription* to them, and yet without any guard of a *ſeal* upon them, ſo far exceeds all the bounds of credibility, that they could not expect it to gain the belief of parliament. They were ſtruck with the abſurdity of their plan, and dreaded a detection. They were under the neceſſity of altering it; but they could not ſupply the defect of the ſeal. They, therefore, wrote over the letters anew, and with-held the ſubſcription.

Theſe letters were now as complete as the conſpirators wiſhed them; yet in this ſtate, while they were unſubſcribed and unſealed, they wanted other formalities which are uſual in diſpatches. They were without directions, and they had no dates. They muſt, therefore, have been ſent by the queen to Bothwell as *open* and *looſe papers*; yet they contained evidence againſt herſelf, and againſt him, of the moſt horrid wickedneſs; and Nicholas Hubert, the perſon who is ſaid to have carried moſt of them, was of the loweſt condition, and, as Dr Robertſon characterizes him, "a fooliſh talkative fellow." He would, therefore, ſurely *read* thoſe papers, which are polluted from end to end with open and uncovered adultery, and as ſurely *report* their contents to *others*. Theſe are moſt incredible circumſtances, on the ſuppoſition that the letters are authentic, unleſs the queen was, what none of her enemies ever repreſented her, an abſolute idiot.

The letters in their compoſition bear no reſemblance to the other writings of the queen. They have a vulgarity, an indelicacy, and a coarſeneſs of expreſſion and manner, that by no means apply to her. They breathe nothing of the paſſion of love beſides the impulſes of the ſenſual appetite; and they repreſent a queen highly accompliſhed in love with one of her ſubjects, as acting with all the ſneaking humility of a cottager to a peer †. A few inſtances will ſhow this. "*The devil ſinder us*," ſhe is made to exclaim, "and God knit us togidder for ever for the maiſt faithful coupill that ever he unitit: *this is my feith; I will die in it*." "I am," ſhe ſays in another place, "varrey glad to wryte unto zow quhen the reſt are ſleipand; ſen I cannot ſleip as they do, and *as I wold deſyre*, that is, *in your armes*, my dear luſe." "Seeing to *obey* zow, my dear luſe, I ſpare *nouther honor, conſcience, haſarde, nor greatnes quhatſumever; tak it, I pray zou, in gude part*, as from the maiſt faithful luifer that ever ze had, or ever ſall have." "Se not hir (his wife), quhais fenzeit teires ſuld not be ſa mikle preiſit nor eſtemit as the trew and faithful trevellis quhilk I ſuſtine for to *merite her place*." "God give zou, my only luſe, the hap and proſperitie quhilk your *humble* and faithful luſe deſyres unto zou, who *hopis to be ſchortly another thing to you* for the reward of my irkſome travelles." "When I will put you out of dout, and cleir myſelfe, *refuſe it not*, my dear luſe; and ſuffer me to make zou ſome pruſe be *my obedience*, my faithfulnes, conſtancie, and *voluntary ſubjection*, quhilk I tak for the *pleſandeſt gude* that I might reſſeif, *gif ze will eccept it*." "Such (ſays Mr Whitaker) was the coarſe *kirtle*, and the homely *neckatie*, in which theſe wretched repreſenters of Mary dreſſed themſelves up, for the exhibition of a queen dignified, refined, and elegant;—a queen whom, according to their own account, 'God had indowit with mony gude and excellent gifts and virtues!"

The evidence which points to the forgery of the letters is profuſe and inſtructive. In its ſeparate parts, it is powerful and ſatisfactory ‡. When taken together, and in the union of its parts, it is invincible. But, amidſt all its cogency and ſtrength, there is a circumſtance moſt peculiarly in its favour, and of which it required no aid or aſſiſtance. By this peculiarity, it is caſed completely in ſteel, and armed at every point. The letters have come down to us in the French, the Scottiſh, and the Latin languages. Now the conſpirators affirmed, that they were written by the queen in the French language. But by a critical examination of them in theſe different languages, Mr Goodall demonſtrated, that the pretended French originals are a tranſlation from the Latin of Buchanan,

---

† *Whita*

‡ *Stuart*

which is itſelf a verſion from the Scotch. This is indeed acknowledged by Dr Robertſon, the ableſt and moſt perſevering of all Mary's enemies, who pretends, that, ſo far as he knows, it never was denied. Determined, however, to ſupport the authenticity of the letters at all events, the ſame elegant and ingenious writer ſuppoſes ‡, that the French originals are now loſt, but that two or three ſentences of each of thoſe originals were retained, and prefixed to the Scottiſh tranſlation; and that the French editor obſerving this, fooliſhly concluded that the letters had been written partly in French and partly in Scottiſh. In ſupport of this ſingular hypotheſis, he proceeds to affirm, that "if we carefully conſider thoſe few French ſentences of each letter which ſtill remain, and apply to them that ſpecies of criticiſm by which Mr Goodall examined the whole, a clear proof will ariſe, that there was a French copy, not tranſlated from the Latin, but which was itſelf the original from which both the Latin and Scottiſh have been tranſlated." He accordingly applies this ſpecies of criticiſm, points out a few variations of meaning between what he calls the remaining ſentences of the original French and the preſent Latin; and thinks, that in the former he has diſcovered a ſpirit and elegance which neither the Latin nor the Scottiſh have retained. His critical obſervations have been examined by Mr Whitaker; who makes it apparent as the noon-day ſun, that the Doctor has occaſionally miſtaken the ſenſe of the Latin, the French, and even the Scotch; and that he has *forgotten* to point out either the elegance or the ſpirit of any particular clauſes in his pretended originals. The ſame maſterly vindicator of Mary then turns his antagoniſt's artillery againſt himſelf; and demonſtrates, that ſuch variations as he has thought ſufficient to prove the exiſtence of a former French copy, are not confined to the firſt ſentence of each of the three firſt letters, but are extended to other ſentences, and diffuſed over all the letters. Hence he obſerves, that this mode of proving will demonſtrate the *preſent* French, and *every* ſentence in it, to be that very original, which it primarily pretended to be, which Mr Goodall has ſo powerfully proved it not to be, and which even the Doctor himſelf dares not aſſert it is. Our limits will not admit of our tranſcribing the obſervations of theſe two illuſtrious critics; nor is it neceſſary that we ſhould tranſcribe them. By acknowledging that "Buchanan made his tranſlation, not from the French but from the Scottiſh copy (of which he juſtly obſerves, that, were it neceſſary, ſeveral critical proofs might be brought)," Dr Robertſon, in effect, gives up his cauſe. Had there been any other French letters than the preſent †, what occaſion had Buchanan for the Scotch, when he himſelf muſt have had poſſeſſion of the originals? It is evident from Mr Anderſon's account, that thoſe letters were tranſlated by Buchanan at London during the time of the conferences. He was one of the aſſiſtants appointed to the rebel commiſſioners, and entruſted with the whole conduct of the proceſs againſt the queen. By him, with Lethington, Macgill, and Wood, the original letters were exhibited, and their contents explained to the Engliſh commiſſioners; and we know from the authentic hiſtory of thoſe papers, that they were neither loſt nor miſlaid for many years afterwards. It cannot be pretended that Buchanan did not underſtand the French; for he paſt moſt of his life in that country, and taught a ſchool there. He was, indeed, a daring zealot of rebellion; but, with all his audacity, he muſt have felt the taſk in which he was engaged a very ungracious one. When he ſat down to defame, in the eyes of all Europe, a queen to whom he owed not only allegiance but alſo perſonal gratitude, it is not conceivable that he could have tranſlated from a *Scotch tranſlation*, had he known any thing of a *French original;* and if the rebel commiſſioners, who were ſaid to produce them, knew nothing of ſuch originals, certainly no body elſe ever did: if they exiſted not with Buchanan, they exiſted no where.

Dr Robertſon, however, has another argument againſt Mr Goodall, which he thinks concluſive. Of the eight letters "the five remaining (he ſays) never appeared in Latin; nor is there any proof of their ever being tranſlated into that language. Four of them, however, are publiſhed in French. This entirely overturns our author's hypotheſis concerning the neceſſity of a tranſlation into Latin."—An authentic fact will indeed overturn any hypotheſis; but, moſt unluckily for this argument, the Doctor advances the hypotheſis, and the fact reſts with Mr Goodall. It is indeed true that Buchanan *publiſhed* only the three firſt letters in Latin at the end of his Detection; but it does not therefore follow, that the other five were never *tranſlated into that language*. Indeed Mr Whitaker has made it as apparent as any thing can be, that the whole eight were turned into Latin for the uſe of the French tranſlator, who, by his own account, underſtood not the Scotch. He has made it in the higheſt degree probable, that this tranſlator was one *Camuz*, a French refugee; and he has demonſtrated, that the tranſlation was made in London under the eye of Buchanan himſelf. We do not quote his arguments, becauſe they conſiſt of a great number of obſervations which cannot be abridged; and becauſe the tranſlator himſelf confeſſes every thing which is of importance to the cauſe maintained by Mr Goodall. "Au reſte (he tells us) epiſtras miſas ſur la fin," *which were all but the eighth*, "avaient eſté eſcrites par la Royne, partie en Francois, partie en Eſcoſſois; et depuis traduictes ENTIEREMENT en LATIN: mais n'ayant cognoiſſance de la langue Eſcoſſoiſe, j'ay mieux aimé exprimer TOUT ce, que j'ay trouve en LATIN, que," &c. "This confeſſion (ſays Mr Whitaker) takes a comprehenſive ſweep. It makes *all* the *ſeven* letters at leaſt, and the *whole* of *each*, to have been tranſlated into Latin, and from thence to have been rendered into French. It ſtarts no piddling objections about ſentences or half-ſentences, at the head or at the tail of any. It embraces all within its wide-ſpread arms. And it proves the fancied exiſtence of a French copy at the time to be all a fairy viſion; the creation of minds that have ſubjected their judgements to their imaginations; the invited dreams of ſelf-deluſion."

The letters, ſo weak on every ſide, and ſo incapable of ſuſtaining any ſcrutiny, give the marks of ſuſpicion and guilt in all the ſtages of their progreſs. Even with the parliamentary ſanction afforded to them by the three eſtates, which the earl of Murray aſſembled upon the 15th day of December 1567, he felt the

‡ ſſertation.

† Tytler's
quiry.

delicacy and the danger of employing them *openly* to the purpoſes for which they were invented. For while he was ſcheming with Elizabeth his accuſation of the queen of Scots, he took the precaution to ſubmit privately the letters to that princeſs by the agency of his ſecretary Mr Wood. The object of this ſecret tranſaction, which took place early in the month of June 1568, was moſt flagitious, and preſſes not only againſt the integrity of Murray, but alſo againſt that of the Engliſh queen. Before he would advance with his charge, he ſolicited from her an aſſurance that the judges to be appointed in the trial of Mary would hold the letters to be true and probative.

By the encouragement of Elizabeth, the earl of Murray was prevailed upon to prefer his accuſation ||. He was ſoon to depart for England upon this buſineſs. A privy-council was held by him at Edinburgh. He took up in it with formality the letters of the queen from the earl of Morton, and gave a receipt for them to that nobleman. That receipt is remarkable and intereſting. It is dated upon the 16th day of September 1568, and contains the firſt mention that appears in hiſtory of the diſcovery of the letters as in the actual poſſeſſion of Dalgleiſh upon the 20th of June 1567. This, as we have already noticed, is a very ſuſpicious circumſtance; but it is not the only ſuſpicious circumſtance which is recorded in the receipt. In the act of ſecret-council, and in the ordination of parliament, in December 1567, when the earl of Murray and his aſſociates were infinitely anxious to eſtabliſh the criminality of the queen, the only vouchers of her guilt to which they appealed were the letters; and at that time, doubtleſs, they had prepared no other papers to which they could allude. But in Murray's receipt in September 1568, there is mention of other vouchers beſide the letters. He acknowledges, that he alſo received from the earl of Morton contracts or obligations, and ſonnets or love-verſes. Theſe remarkable papers, though ſaid to have been found upon the 20th of June 1567, appeared not till September 1568; and this difficulty is yet to be ſolved by thoſe who conceive them to be genuine. The general arguments which affect the authenticity of the letters apply to them in full force; only it muſt be obſerved, that as the original letters were undoubtedly in Scotch, the original ſonnets were as certainly written in French. This has been completely proved by Dr Robertſon, and is fully admitted by Mr Whitaker, who has made it in the higheſt degree probable that Lethington forged the letters and Buchanan the ſonnets. Be this as it may, the ſonnets have every external and internal evidence of forgery in common with the letters, and they have ſome marks of this kind peculiar to themſelves. In particluar, they make the love of Mary ſtill more grovelling than the letters made it; and with a degree of meanneſs, of which the ſoul of Lethington was probably incapable, the author of the ſonnets has made the queen conſider it as "na lytill honor to be maiſtres of her ſubject's gudis!" In this the dignified princeſs is totally loſt in "the maid Marien" of her pretended imitators; and Buchanan, who in his commerce with the ſex was a mere ſenſualiſt, forgot on this occaſion that he was perſonating a lady and a queen.

|| Stuart.

There is, however, in theſe ſonnets, one paſſage of ſingular importance, which we muſt not paſs wholly unnoticed. The queen is made to ſay,

Pour luy auſſi j'ay jetté mainte larme,
Premier qu'il fuſt de ce corps poſſeſſeur,
Duquel aolrs il n'avoit pas le cœur.
Puis me donna un autre dur alarme,
Quand il verſa de ſon ſang mainte dragme.

For him alſo I powrit out mony teiris,
Firſt quhen he made himſelf poſſeſſour of this body,
Of the quhilk *then he had not the hart.*
Efter he did give me ane uther hard charge,
Quhen he bled of his blude greit quantitie, &c.
