# A NEW ORCHARD and Garden :

O R

The best way for planting, grafting, and to make  
any ground good, for a rich Orchard : Particularly in the North,  
and generally for the whole kingdome of England, as in nature,  
reason, situation, and all probabilitie, may and doth appeare.

With the Country Housewises Garden for herbes of common vse, their  
vertues, seasons, profits, ornaments, varietie of knots, models for trees, and  
plots for the best ordering of Grounds and Walkes.

A S A L S O

The Husbandry of Bees, with their severall vses and annoyances, all being the  
experience of 48. yeeres labour, and now the second time corrected and  
much enlarged, by William Lawson.

Whereunto is newly added the Art of propagating Plants, with the true ordering  
of all manner of Fruits, in their gathering, carrying home, and preseruation.

Skill and paines bring fruitfull gaines.

Nemo sibi natus.

TO THE RIGHT  
WORSHIPFULL,  
SIR HENRY BELOSSES  
Knight and Baronet.

Worthy Sir,

Hen in many yeeres by long ex-  
perience I had furnished this  
my Northerne Orchard and  
Countrey Garden with need-  
full plants and vsefull herbes,  
I did impart the view thereof  
to my friends, who resorted  
to me to conferre in matters  
of that nature, they did see it,  
and seeing it desired, and I

must not denie now the publishing of it (which then I al-  
lotted to my priuate delight) for the publike profit of  
others. Wherefore, though I could pleade custome the  
ordinary excuse of all Writers, to chuse a Patron and Pro-  
tector of their Workes, and so shroud my selfe from scan-  
dall vnder your honourable fauour, yet haue I certaine rea-  
sons to excuse this my presumption : First, the many cour-

## *The Epistle Dedicatory.*

testies you haue vouchsafed me. Secondly, your delightfull skill in matters of this nature. Thirdly, the profit which I receiued from your learned discourse of Fruit-trees. Fourthly, your animating and assisting of others to such endeouours. Last of all, the rare workes of your owne in this kinde : all which to publish vnder your protection, I haue aduentured (as you see.) Vouchsafe it therefore entertainment, I pray you, and I hope you shall finde it not the vnprofitablest seruant of your retinue : for when your serious employments are ouerpassed, it may interpose some commoditie, and raise your contentment out of varietie.

*Your Worships*

*most bounden,*

WILLIAM LAWSON.

# THE PREFACE to all well minded.

**A**rt hath her first originall out of experiance, which therefore is called the Schoole-mistresse of fooles, because she teacheth infallibly, and plainly, as drawing her knowledge out of the course of Nature, (which never failes in the generall) by the senses, feelingly apprehending, and comparing (with the helpe of the minde) the workes of nature; and as in all other things naturall, so especially in Trees: for what is Art more than a prouident and skilfull Collectrix of the faults of Nature in her particular workes, apprehended by the senses? As when good ground naturally brings forth thistles, trees stand too thicke, or too thin, or disorderly, or (without dressing) put forth unprofitable suckers, and such like. All which, and a thousand more, Art reformeth, being taught by experiance: and therefore must we count that Art the surest, that stands upon experimentall rules, gathered by the rule of reason (not conceit) of all other rules the surest.

Whereupon haue I of my meere and sole experiance, without respect to any former written Treatise, gathered these rules, and set them downe in writing, not daring to hide the least talent ginen me of my Lord and Master in Heauen: neither is this iniurious to any, though it differ from the common opinion.

## The Preface.

in diuers points, to make it knowne to others, what good I haue found out in this facultie by long triall and experience. I confesse freely my want of curious skill in the Art of planting. And I admire and praise Plinie, Aristotle, Virgil, Cicero, and many others for wit and judgement in this kinde, and leauue them to their times, manner, and severall Countries.

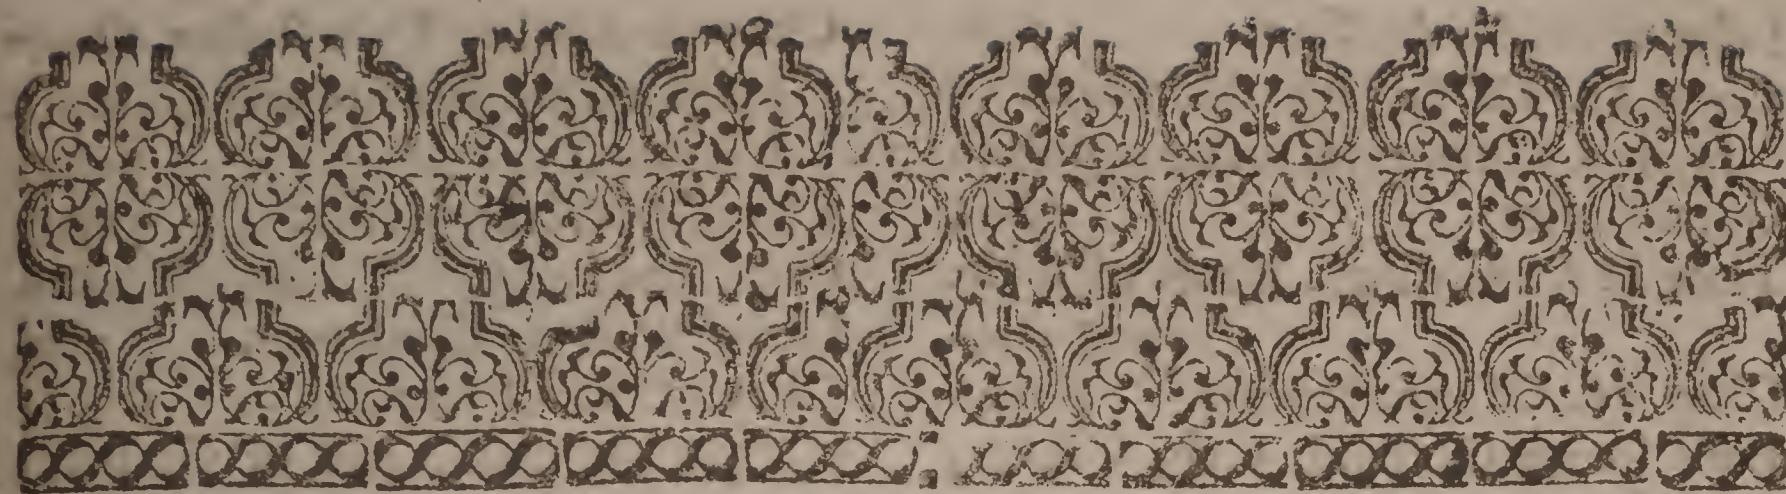

I am not determined (neither can I worthily) to set forth the praises of this Art: how some, and not a few, euen of the best, haue accounted it a chiefe part of earthly happiness, to haue faire and pleasant Orchards, as in Hesperia and Thessaly, how all with one consent agree, that it is a chiefe part of Husbandry (as Tully de senectute) and Husbandry maintaines the world; how ancient, how profitable, how pleasant it is, how many secrets of nature it doth containe, how loued, how much practised in best places, and of the best: This hath already beene done by many. I only aime at the common good. I delight not in curious conceits, as planting and grafting with the root upwards, inoculating Roses on Thornes, and such like, although I haue heard of diuers, proued some, and read of moe.

The Stationer hath (as being most desirous with me, to fur-  
ther the common good) bestowed much cost and care in hauing  
the Knots and Models by the best Artizan cut in great varietie,  
that nothing might be any way wanting to satisfie the curious  
desire of those that would make use of this booke.

And I shew a plaine and sure way of planting, which I haue found good by 48. yeeres (and moe) experience in the North part of England: I preiudicate and enuie none, wishing yet all to abstaine from maligning that good (to them unknowne) which is well intended. Farewell.

Thine, for thy good,

W. L.

# THE BEST, SVREST, AND READIEST WAY TO make a good Orchard and Garden.

## CHAP. I.

### Of the Gardner, and his Wages.

Whosoever desirereth and endeuoureth to haue a pleasant, and profitable Orchard, must (if he be able) prouide himselfe of a Fruiterer, religi-  
ous, honest, skilfull in that faculty, and there-  
withall painfull : By religious, I meane (be-  
cause many thinke religion but a fashion or cu-  
stome to goe to Church) maintaining, and cherishing things re-  
ligious : as Schooles of learning, Churches, Tythes, Church-  
goods, and rights ; and aboue all things, Gods word, and the  
Preachers thereof, so much as he is able, practising prayers,  
comfortable conference, mutuall instruction to edifie, almes, and  
other workes of Charity, and all out of a good conscience.

Honestie in a Gardner, will grace your Garden, and all your house, and helpe to stay vnbriuled Seruingmen, giuing offence  
to none, not calling your name into question by dishonest acts,  
nor infecting your family by euill counsell or example. For there  
is no plague so infectious as Popery and knauery, he will not  
purloine your profit, nor hinder your pleasures.

Concerning his skill, hee must not be a Scholler, to make  
shew of or take in hand that, which he cannot performe, espe-  
cially in so weighty a thing as an Orchard : than the which,  
there can be no humane thing more excellent, either for plea-  
sure

Religi-  
ous.

Honest.

Skilfull.

sure or profit, as shall ( God willing ) be proued in the treatise following. And what an hinderance shall it be, not onely to the owner, but to the common good, that the unspeakable benefit of many hundred yeares shall be lost, by the audacious attempt of an unskilfull Arborist?

Painfull.

The Gardner had not nedēd be an idle, or lazie Lubber, for so your Orchard being a matter of such moment, will not prosper. There will easē be some thing to doe. Weedes are alwaies growing. The great mother of all living Creatures, the Earth, is full of seed in her bowels, and any stirring giues them heat of Sunne, and being laid nere day, they grow: Mowles worke daily, though not alwaies alike. Winter herbes at all times will grow ( except in extreme frost. ) In Winter your young trees and herbes would be lightned of snow, and your Allyes cleansed: drifts of snow will set Deere, Hares, and Conyes, and other noysome beasts ouer your walles and hedges, into your Orchard. When Summer cloathes your borders with grēne and peckled colours, your Gardner must dresse his hedges, and antike workes: watch his Bees, and huue them: distill his Roses, and other herbes. Now begins Summer Fruit to ripe, and craue your hand to pull them. If he haue a Garden (as he must nedēd) to keepe, you must needs allow him good helpe, to end his labours which are endlesse, for no one man is sufficient for these things.

Wages.

Such a Gardner as will conশionably, quietly and patiently, trauell in your Orchard, God shall crowne the labors of his hands with ioyfulnesse, and make the clouds drop fatnesse upon your trees, he will prouoke your loue, and earne his wages, and fees belonging to his place: The house being serued, fallen fruit, superfluity of herbes, and flowres, seedes, grasses, sets, and besides other offall, that fruit which your bountifull hand shall reward him withall, will much augment his wages, and the profit of your Bees will pay you backe againe.

If you be not able, nor willing to hire a Gardner, keepe your profits to your selfe, but then you must take all the paines: And for that purpose ( if you want this faculty ) to instruct you, haue I undertaken these labours, and gathered these Rules, but chiefly respecting my countries good.

CHAP.

## CHAP. II.

## Of the Soyle.

Knot-Trees most common, and mettest for our northerne Countries: (as Apples, Peares, Cherries, Filberds, redde & white Plumms, Damsons, and Bulles,) for we meddle not with Apricockes nor Peaches, nor scarcely with Quinches, which will not like in our cold parts, unlesse they be helped with some resle of Sunne, or other like meanes, nor with bushes, bearing berries, as Barberies, Gobberries, or Grouers, Raspberries, and such like, though the Barberie be wholesome, and the tree may be made great: doe require (as all other trees doe) a blacke, fat, mellow, cleane and well tempered soyle, wherin they may gather plenty of god sap. Some thinke the Hasell would haue a chaniile rocke, and the Hallow, and Eller a waterish marish. The Soile is made better by deluing, and other meanes, being well melted, and the wildnesse of the earth and weeds (for everie thing subject to man, & seruing his vse, not well ordered, is by nature subject to the curse,) is killed by frostes and drought, by fallowing and laying on heapes, and if it be wild earth, with burning.

If your ground be barren (for some are forced to make an Orchard of barren ground) make a pit three quarters deepe, and two yards wide, and round in such places, where you would set your trees, and fill the same with fat, pure, and mellow earth, one whole foot higher than your Soyle, and therein set your Plant. For who is able to manure an whole Orchard plot, if it be barren? But if you determine to manure the whole site, this is your way: digge a trench halfe a yard deepe, all along the lower (if there be a lower) side of your Orchard plot, casting vp all the earth on the inner side, and fill the same with good short, hot, and tender mucke, and make such another Trench, and fill the same as the first, and so the third, and so throughout your ground. And by this meanes your plot shall be fertile for your life. But be sure you set your trees, neither in dung nor barren earth.

Your ground must be plaine, that it may receive, and Plaine.

Kynnes  
of trees.

Soyle.

Barren  
Earth.

Moyst.

keepe moysture, not onely the raine falling thereon, but also wa-  
ter cast vpon it, or descending from higher ground by sluices,  
Conduits, &c. For I account moysture in Sommer very need-  
full in the soyle of trees, and drought in Winter. Provided,  
that the ground neither be boggie, nor the inundation be past 24.  
houres at any time, and bat twise in the whole Sommer, and so  
oft in Winter. Therefore if your plot be in a Banke, or haue a  
descent, make Trenches by degrees, Alpes, Walkes, and such  
like, so as the Water may be staid from passage. And if too  
much water be any hinderance to your walkes (for drie walkes  
doe well become an Orchard, and an Orchard them:) raise  
your walkes with earth first, and then with stones, as bigge as  
Walnuts: and lastly, with grauell. In Sommer you need not  
doubt too much water from heauen, either to hurt the health of  
your body, or of your trees. And if ouerflowing molest you af-  
ter one day, auoid it then by deepe trenching.

Some for this purpose digge the soyle of their Orchard to re-  
ceiuē moisture, which I cannot approue: for the rootes with dig-  
ging are oftentimes hurt, and especially being digged by some  
unskilfull seruant: For the Gardiner cannot doe all himselfe.  
And moreouer, the roots of Apples and Peares, being laid neere  
day, with the heat of the Sunne, will put forth suckers, which  
are a great hinderance, and sometimes with euill guiding, the  
destruction of trees, unlesse the deluing be very shallow, and the  
ground laid verie leuell againe. Cherries and plummes without  
deluing, will hardly or never (after twenty yeares) be kept  
from such suckers, nor alpes.

Grasse.

Grasse also is thought needfull for moysture, so you let it not  
touch the rootes of your trees: for it will breed moiste, and the  
boall of your tree neare the earth would haue the comfort of the  
sunne and ayre.

Some take their ground to bee too moist when it is not so, by  
reason of wates standing thereon, for except in soure marshes,  
springs, and continuall ouer-flowings, no earth can be too moist.  
Handy and fat earth will avoid all water falling by receipt. In-  
deed a stiffe clay will not receive the water, and therefore if it  
be grasse or plaine, especially hollow, the water will abide,  
and it will seeme waterish, when the fault is in the want of  
manuring, and other good dressing.

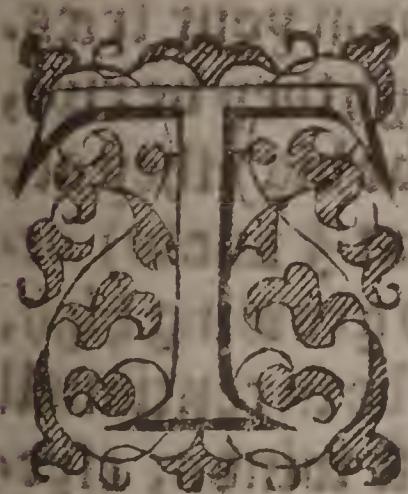

This

This plainnesse which we require; had need be naturall; because to force an uneven ground will destroy the fatnesse. For every sile hath his crust next day wherein trees and herbes put their rootes; and whence they drawe their sap, which is the best of the soile, and made fertile with heate and cold, moisture and drought, and vnder which by reason of the want of the said temperature, by the said fourre qualities no tree nor herbe (in a maner) will or can putroot. As may bee seene if you digging your ground, you take the weeds of most growth: as grasse or docks, (which will grow though they lye upon the earth bare) yet bury them vnder the crust, and they will surely dye and perish, and become manure to your ground. This crust is not past 5. or 8. inches deepe in good ground, in other grounds lesse. Hereby appeares the fault of forced plaines, viz: your crust in the lower parts, is couered with the crust of the higher parts, and bothe with worse earth: your heights having the crust taken awaie, are become mereley barren: so that either you must force a new crust, or haue an evill soile. And be sure you keuell, before you plant, lest you bee forced to remoue, or hurt your plants by digging, and casting amonst their roots. Your ground must be cleared as much as you may of stones, and grasse, walls, hedges, bushes and other weeds.

Natural-  
ly plain.

Crust  
of the  
earth.

### Of the Site of Good and Bad Soile.

Here is no difference, that I find betwixt the necessity of a good soile, and a good site of an Orchard. For a good soile (as is before described) cannot want a good site, and if it doe, the fruit cannot be good, and a good site will much mend an evill soile. The best site is in low groundes, (and if you can) neare unto a Riuier.

Low and  
neare a  
Riuier.

High groundes are not naturally fat. And if they haue any fatnesse by mans hand, the very descent in time doth wash it away. It is with groundes in this case as it is with men in a common wealth. Much will haue pride: and once pore, seldomie or never rich. The raine will scrye, and wash, and the wind will blow fatnesse from the heights to the hollowes, where it

it will abide, and fatten the earth though it were barren before.

Hence it is, that we haue seldeome any plaine grounds, and low; barren; and as seldeome any heights naturally fertill. It is unspeakable, what fatnesse is brought to low grounds by Inundations of waters. Neither did I euer know any barren ground in a low plaine by a Riuier side. The goodnesse of the soile in Howl or Hollow-dernes, in Yorkshire, is well knowne to all that know the Riuier Humber, and the huge bulkes of their Cattell there. By estimation of them that haue seeuen the low grounds in Holland, and Zealand, they farre surpassee the most Countries in Europe for fruitfulness, and onely because they lye so low. The world cannot compare with Egypt<sup>a</sup>, for fertility, so farre as Nilus doth ouer-flow his bankes. So that a fitter place cannot be chosen for an Orchard, than a low plaine by a riuier side. For besides the fatnesse which the water bringes, if any cloudy mist or raine be stirring, it commonly falls downe to, and folloues the course of the Riuier. And where see we greater trees of bulk and bough, then standing on or neare the waters side? If you aske why the plaines in Holdernes, & such countries are destitute of Woods? I answer that men and cattell (that haue put trees thence, from out of plaines to void corners) are better then trees. Neither are those places without trees. Our old fathers can tell vs, how woods are decayed, & people in the roome of trees multiplied. I haue stood somewhat long in this point, because some doe vtterly condemne a moist soile for fruit-trees.

A low ground is good to auoid the danger of winds, both for shaking down your vnripe fruit, and blowing down your trees. Fruit blowne vnripe, are small worth: and though they be ripe, yet being bruised with the fall, (especially if they be big) they are not good but for present use. Trees the most (that I know) bearing loaden with wood, for want of propning, and growing high, by the unskilfulness of the Arborist, must needs be in continuall danger of the South-west, West, and North-west winds, especially in September and March, when the aire is most temperate from extreme heat, and cold, which are deadly enemies to great winds. Wherefore chuse your ground low. Or if you be forced to plant in a higher ground, let high and strong walls, houses, and Trees, as Wall-nuts, Plane-trees, Dkes, and Ashes, placed in good order, be your fence for winds.

Mark-  
ham.

Winds.  
chap. 13

The

<sup>a</sup> Psal. 1. 3.  
Eze. 17. 8.  
Eccl. 39. 17.

The sucken of your Dwelling house, descending into your Orchard (if it be cleanly conueighed) is good.

The Sunne (in some sort) is the life of the world. It maketh proud growth, and ripens kindly, and speedily, according to the golden teame: *Annis fructificat, non tellus.* Therefore in the Countries, neerer approaching the Zodiake, the Sunnes habitation, they haue better, and sooner ripe fruit, then we that dwell in these frozen parts.

This prouoketh most of our great Arborists, to plant Apricockes, Cherries, and Peaches, by a wall, and with tacks, and other meanes to spred them vpon, and fasten them to a wall, to haue the benefit of the immoderate reflexe of the Sun, which is commendable, for the haing of faire, good, & sone ripe fruit. But let them know it is more hartfull to their trees then the benefit they reapre thereby can require: as not suffring a Tree to liue the tenth part of his age. It helpes Gardners to wozke, for first the wall hinders the roots, because into a dry and hard wall of earth or stome, a tree will not, nor cannot put any root to profit, but especially it stops the passage of sap, whereby þ barke is wounded, and the wood, and diseases grow, so that the tree becomes short of life. For as in the body of a man, the leaning or lyng on some member, wherby the course of bloud is stopt, makes that member as it were dead for the time, till the bloud returne to his course, and I thinke, if that stopping should continue any time, the member would perish for want of bloud (for the life is in the bloud) and so endanger the body: so the sap is the life of the Tree, as the bloud is to mans body: neither doth the tree in winter (as is supposed) want his sap, no more then mans body his bloud, which in winter, & time of sleep drawes inward. So þ the dead time of winter, to a tree, is but a night of rest: for the tree at al times, euен in winter is nourished with sap, & groweth as well as mans body. The chilinge cold may well some little time stay, or hinder the proud course of the sap, but so little & so short a time, that in euery calme, & mild season, eu'en in the depth of winter (if you marke it) you may easily perceive, the sap to putt out, & your trees to increase their buds, which were formed in the Summer before, and may easily then bee discerned: for leaues fall not off, till they be thrust off, with the knots or buds, whereupon it comes to passe that Trees cannot beare fruit plens,

Sunne.

Trees a-  
gainst a  
wall.

plentifully thre yeres together, and make themselves ready to blossom against the seasonablenesse of the next Spring. And if any frost be so extremitie, that it stay the sap too much, or too long, then it killis the forward fruit in the very bud, and somtimes the tender leaues and twigs, but not the tree. Wherefore (to returne) it is perillous to stop the sap. And where, or when, did you ever see a great tree packt on a wall? Nay, who did euer know a tree so unkindly splat, cometoage? I haue heard of some, that out of their imaginary cunning, haue planted such Trees on the North side of the wall, to avoid drought, but the heat of the Sunne is as comfortable (which they should haue regarded) as the drought is hurtfull. And although water is a soveraigne remedy against drought, yet want of Sun is no way to be helped. Wherefore to conclude this Chapter, let your ground be so that it may haue the benefit of the south, and west Sunne, and so low and close, that it may haue moisture, and increase his fatnesse (for trees are the greatest suckers and pillars of earth, and (as much as may be) free from great winds.)

## CHAP. IIII.

## Of the quantitie.

It would bee remembred what a benefit riseth, not onely to every particular owner of an Orchard, but also to the common-wealth, by Fruite, as shall be shewed in the 16. chapter (God willing) whereupon must needs follow: the greater the Orchard is (being good and well kept) the better it is, for of good things, being equally good, the biggest is the best. And if it shall appeare, that no ground a man occupieth (no, not the Corne-field) yeldeth more gaine to the purse, and house-keeping (not to speake of the unspeakable pleasure) quantity for quantity, than a good Orchard (besides the cost in planting, and dressing an Orchard, is not so much by farre, as the labour and seeding of your Corne-fields, nor for durance of time, comparable, besides the certainty of the one before the other) I see not how any labour, or cost in this kinde, can be idly or wastefully bestowed, or thought too much. And what other thing is a

Orchard  
as good  
as a corne  
field.

Wine,

Vineyard (in those Countries where Wines do thrive) than  
a large Orchard of trees bearing fruit? Or what difference is  
there in the juice of the Grape, and our Cyder and Perry, but  
the goodnesse of the Soile and Clime where they grow: which  
maketh the one more ripe, and so more pleasant then the other.  
Whatsoever can be said for the benefit rising from an Orchard,  
that makes for the largenes of the Orchards bounds. And (me  
thinks) they doe preposterously, that bestow more cost and  
labours, and more ground in and vpon a Garden than vpon an  
Orchard, whence they reap and may reap both more pleasure  
and more profit, by infinite degress. And further, that a Gar-  
den never so fresh, and faire, and well kept, cannot continue  
without both renewing of the earth, and the herbs often, in the  
short and ordinary age of a man: whereas your Orchard well  
kept shall dure diuers hundred yeeres, as shall be shewed chap-  
ter 14. In a large Orchard there is much labour saued, in fenc-  
ing, and otherwise: for three little Orchards, or few trees, be-  
ing (in a manner) all out-sides, are so blasted and dangered, and  
commonly in keeping neglected, and require a great fence; wher-  
as in great Orchards, trees are a mutuall defence one to an-  
other, and the keeping is regarded, and lesse fencing serues sixe  
acres tegether, than three in severall inclosures.

Now what quantity of ground is meetest for an Orchard can  
no man prescribe, but that must be left to euery mans severall  
judgement, to be measured according to his ability and will, for  
other necessaries besides fruit must be had, and some are more  
delighted with Orchards then others.

Let no man hauing a fit plot pleade poverty in this case, for  
an Orchard once planted will maintaine it selfe, and yeeld infi-  
nite profit besides. And I am perswaded, that if men did know  
the right and best way of planting, dressing, and keeping trees,  
& felt the profit and pleasure thereof, both they that haue no Or-  
chards would haue them, and they that haue Orchards, would  
haue them larger, yea fruit trees in their hedges, as in Worster-  
shire, &c. And I thinke, that the want of planting, is a great losse  
to our common-wealth, & in particular, to the owners of Lord-  
ships, which Landlords themselves might easily amend, by  
granting longer terme, and better assurance to their Tenants,  
who haue taken vp this Proverbe, Botch and sit, Build and slit:

land.

for who wil build, or plant for another mans profit? Or the Parlement might enioyne every occupier of grounds, to plant and maintaine for so many acres of fruitfull ground, so many seuerall trées or kind of trées for fruit. Thus much for quantity.

## CHAP. V.

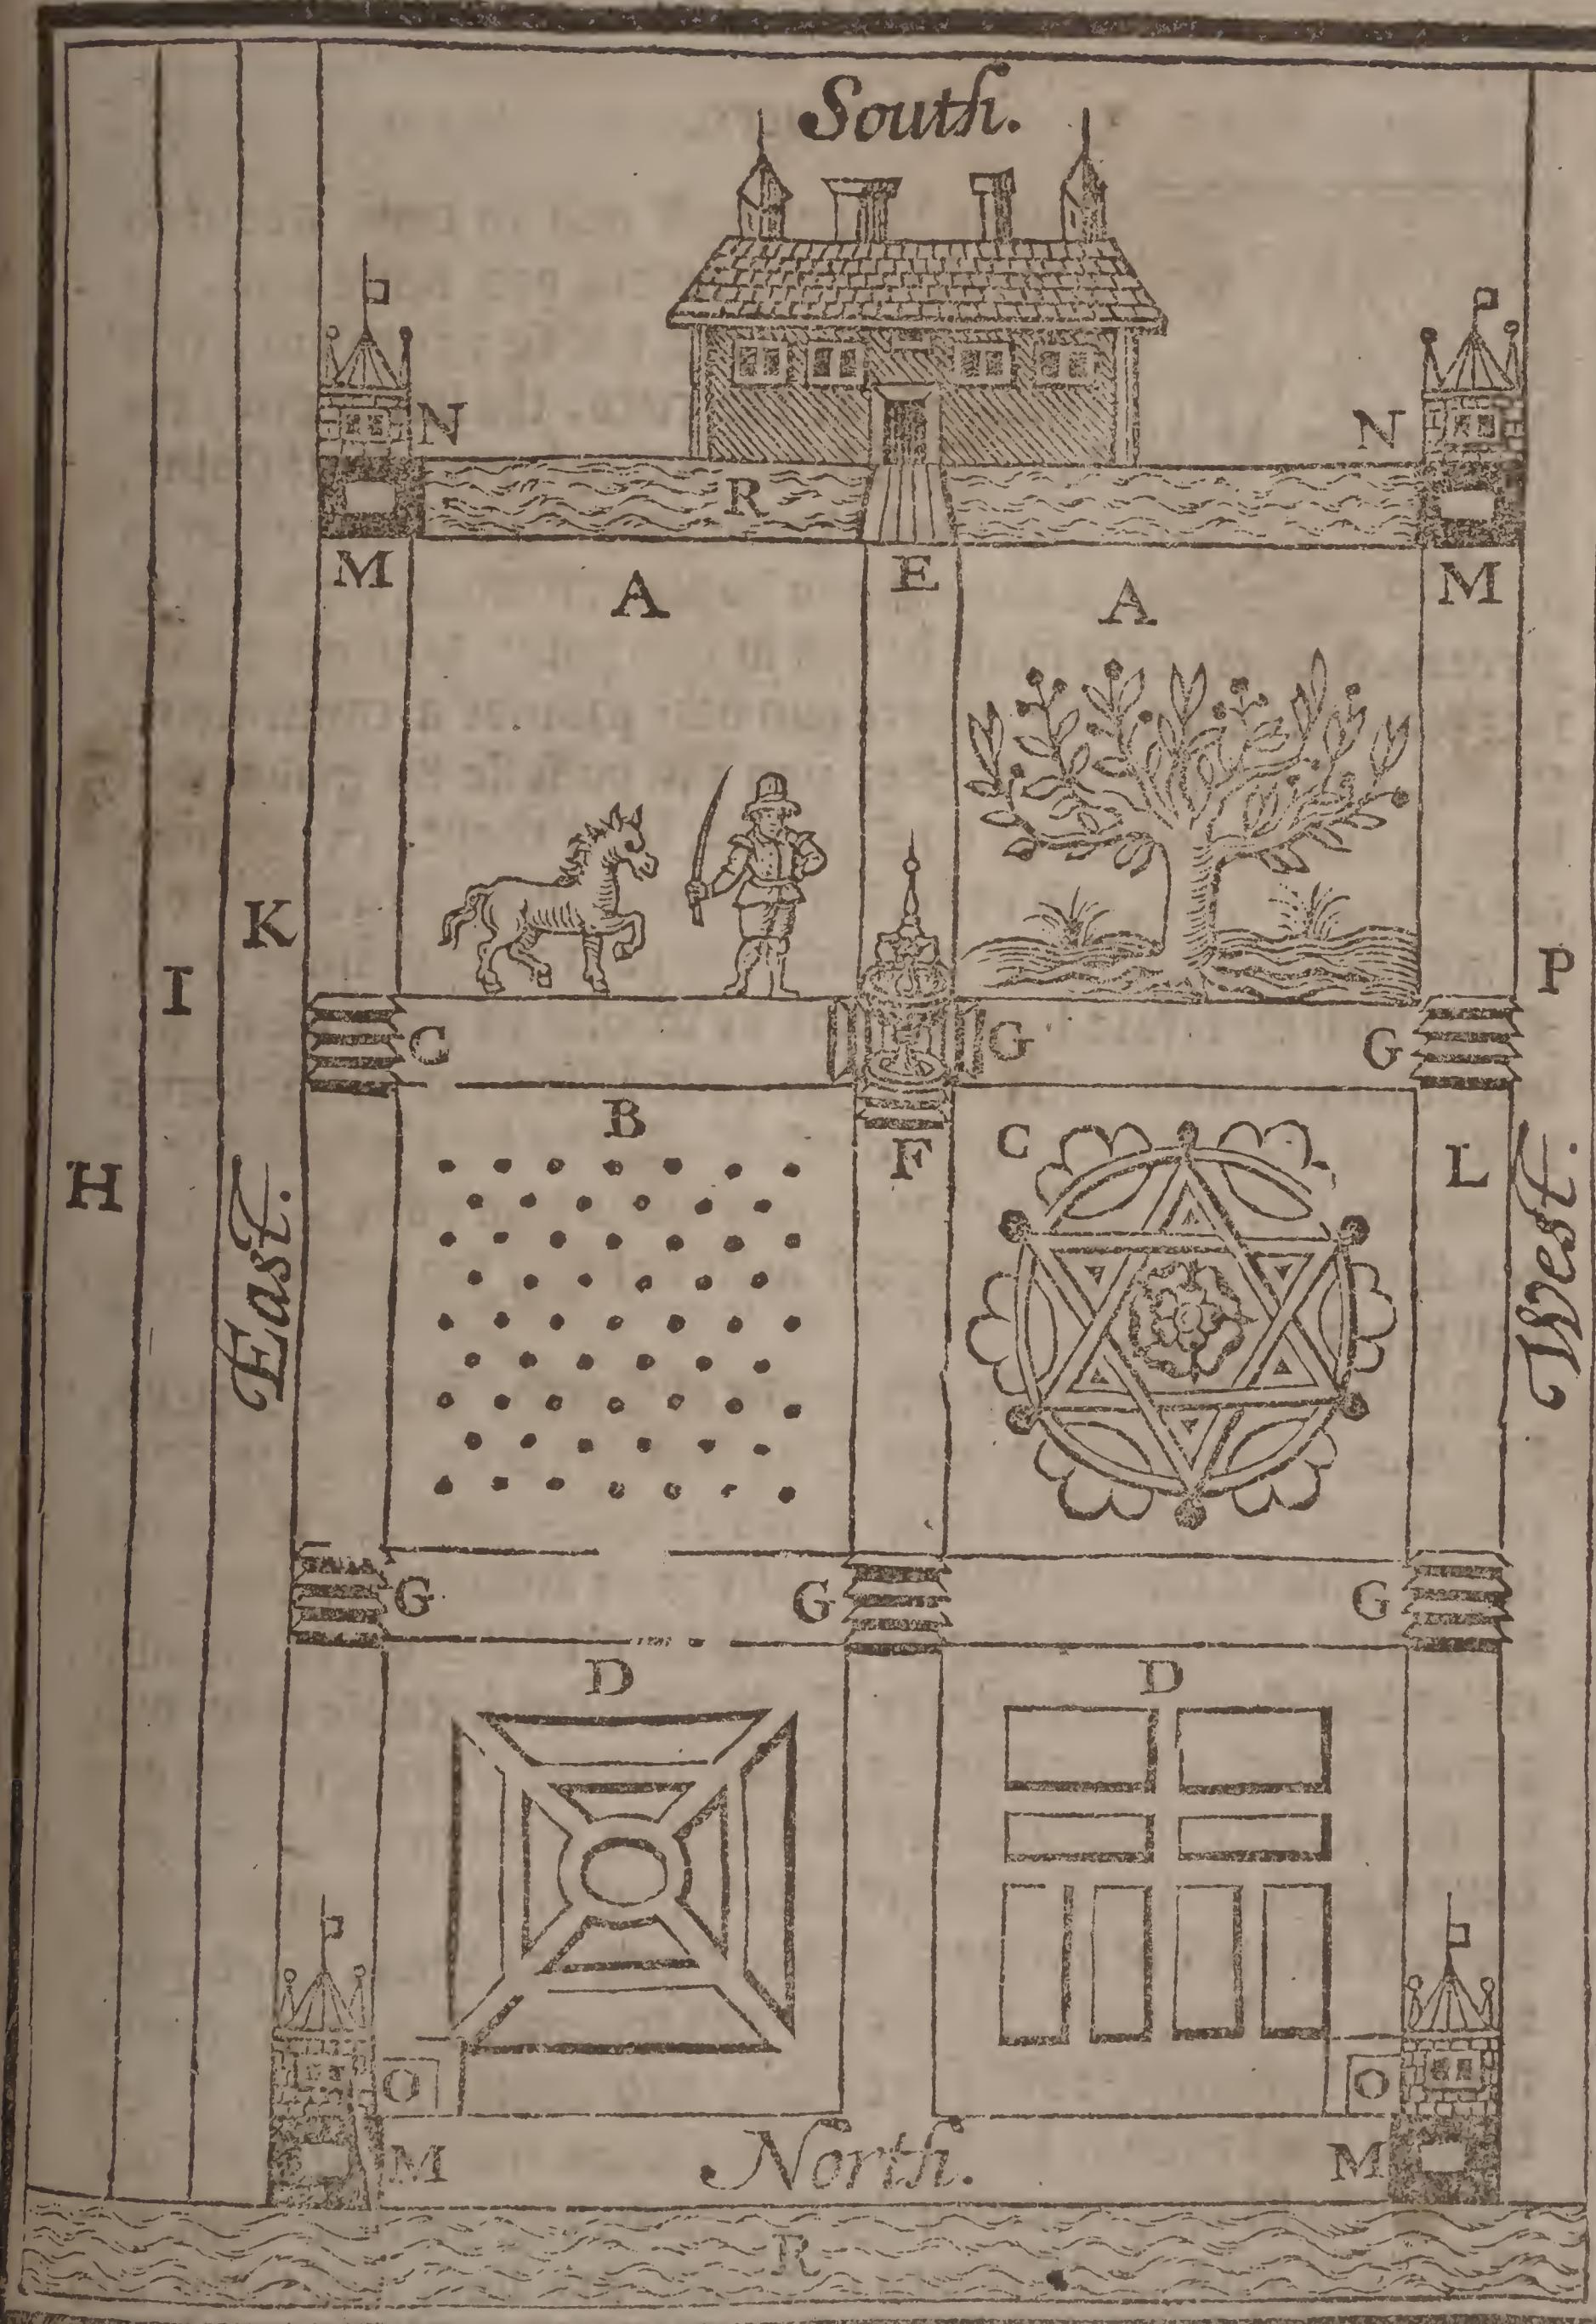

## Of the Forme.

The v-  
suall  
forme is  
a square.

He goodnesse of the Soile, and Site, are necessary to the well being of an Orchard simply, but the forme is so farre necessary, as the owner shall thinke meet, for that kind of forme wherewith every particular man is deligh-  
ted, we leauue it to himselfe, *suum cuique pul-  
chrum*. The forme that men like in generall  
is a square, for although roundnesse be *forma perfectissima*, yet  
that principle is good where necessity by art doth not force some  
other forme. Now for as much as one principall end of Or-  
chards is recreation by walkes, and uniuersally walkes are  
straignt, it followes that the best forme must be square, as best  
agreeing with straignt walkes: yet if any man be rather deligh-  
ted with some other forme, or if the ground will not beare a  
square, I discommend not any forme so it bee formall. And a  
square may be drawn out of any forme to make straignt walkes;  
and no forme of it selfe is either god or bad for the trées. If  
within one large square the Gardner shall make one round La-  
byrinth or Maze with some kind of Berries, it will grace your  
forme, so there be sufficient room left for walkes, so will four  
or moe round knots doe. For it is to be noted, that the eye must  
be pleased with the forme. I haue séene squares rising by degrées  
with staires from your house-ward, according to this forme  
which I haue, *Crassa quod aiunt Minervam*, with an unsteady  
hand, rough helwen, for in forming the Country Gardners,  
the better sort may use better formes, and more costly wozke.  
What is needfull more to be said, I referre that all (concerning  
the Forme,) to the chapter 17. of the ornaments of an Orch-  
yard.

## Of Fences.

If your labour passe and to come about an Orchard is lost vntesse you fence well. It shal grieue you much to see your young sets rubb loose at the roots, the barke pild, the boughs and twigs cropt, your fruit stolne, your trees broken, and all your many yéeres Labours and hopes destroyed, for want of Fences. A chiefe care must be had in this point. You must therefore plant in such a soile, where you may prouide a conuenient, streng, aud seemely fence. For you can posseſſe no goods, that haue ſo many enemies as an Orchard, looke chapt. 13. Fruits are ſo delightsome, and desired of ſo many (nay, in a manner of all) and yet few will be at cost and take paines to prouide them. Fence well therefore, let your plot be wholly in your owne power, that you make all your fence your ſelue: for Neighbours ſencing is none at all, or very careleſſe. Take heed of a doore or window (ysa of a wall) of any other mans into your Orchard: yea, though it be naild vp, or the wall be high, for perhaps they will proue thāues.

All Fences commonly are made of Earth, ſtone, Bricke, Wood, or both earth and wood. Dry wall of earth, and dry Ditches, are the worſt fences ſauē pales or railes, and doe waste the ſcenſt, unleſſe they be well copt with gloe and morter, whereon at Highill-tide it will be good to ſow Wall-flowers, commonly called Bee-flowers, or winter Gilly-flowers, because they will grow (though amonſt ſtones) and abide the ſtrongest froſt and drought, continually greene and flowing euē in Winter, and haue a pleasant ſmell, and are timely, (that is, they will ſcoure the firſt and laſt of flowers) and are good for Bees. And your earthen wall is good for Bees dry and warme. But th̄ſe fences are both vnſemly, euill to repaire, and onely for need, where ſtone or wood cannot be had. Whosoeuer makes ſuch walls, muſt not poll the ground in the Orchard, for getting earth, nor make any pits or hollowes, which are both vnſemly and unprofitable. Old dry earth mixt with ſand is best for theſe.

This

This kinde of wall will soone decay, by reason of the trees which grow neere it, for the roots and boales of great trees, will increase, undermine, and ouerturne such walls, though they were of stone, as is apparant by Ashes, Rountrees, Burt-trees, and such like, carried in the chat, or berrie, by birds into stone walls.

Fences of Dead-wood, as pales, will not last, neither will railes either last or make good fence.

Stone walls (where stone may be had) are the best of this sort, both for fencing, lasting, and shrouding of your young trees. But about this must you bestow much paines and moze cost, to haue them handsome, high and durable.

But of all other (in mine opinion) Quickwood, and Moates or Ditches of Water, where the ground is leuell, is the best fence. In unequall grounds, which will not keepe water, there a double ditch may be cast, made streight and leuell on the top, two yards broad for a faire walke, five or sixe foot higher then the soyle, with a gutter on either side, two yards wide, and foure foot dēpe set without, with three or foure chesse of Thornes, and within with Cherry, Plumme, Damson, Bullys, Filberds, (for I loue these trees better for their fruit, & as well for their forme, as priuit) for you may make them take any forme. And in every corner (and middle if you will) a mount would be raised, whereabout the wood may claspe, powdered with wood-binde: which will make with dressing a faire, pleasant, profitable, and sure fence. But you must be sure that your quicke thornes either grow wholly, or that there be a supple betime, either with planting new, or plashing the old where want is. And assure your selfe, that neither wood, stone, earth, nor water, can make so strong a fence, as this after 7. yeares growth.

Moates, Fish-ponds, and (especially at one side a Blythe,) Moates, within and without your fence, will afford you fish, fence and myssure to your trees, and pleasure also, if they be so great & dēpe that you may haue Swans, & other water birds, good for deuouring of vermine, and a boat for many good uses.

It shall hardly auaille you to make any fence for your Orchard, if you be a niggard of your fruit. For as liberality will saue it best from noysome neigbor's, liberality I say is the best fence, so Justice must restraine rioters. Thus when your ground is tempered, squared, & fenced, it is time to prouide for planting.

## CHAP. VII.

## Of Sets.

Here is not one point (in my opinion) about an Orchard more to be regarded, than the choice getting and setting of good plants, either for readinesse of hauing good fruit, or for continuall lasting. For whosoeuer shall faile in the chiose of good Sets, or in getting, or gathering, or setting his Plants, shall never haue a good or lasting Orchard. And I take want of skill in this facultie to be a chiefe hinderance to the most Orchards, and to many for hauing of Orchards at all.

Slips.

Some for readinesse vse slips, which seldom take root: and if they doe take, they cannot last, both because their root hauing a maine wound will in shourt time decay the body of the tree: and besides that rootes being so weakely put, are soone nipt with droughe or frost. I could never see (lightly) any slip but of Apples onely set for trees.

Bur-knot.

A bur-knot kindly taken from an Apple tree, is much better and surer. You must cut him close at the root end, an handfull vnder the knot, (Some vse in Summer about Lammas to circumcise him, and put earth to the knot with hay reaps, and in winter cat him off and set him, but this is curiositie, needlesse, and danger with remouing, and droughe.) and cut away all his twigs saue one, the most principall, which in setting you must leauue aboue the earth, varyng his trunk in the crust of the earth for his root. It matters not much what part of the bough the twig growes out of. If it grow out of or neere the root end, some say such an Apple will haue no coare nor kernell. Or if it please the Plantor, he may let his bough be crooked, and leauue out his top end, one foot or somewhat more, wherein will be good grafting, if either you like not, or doubt the fruit of the bough (for commonly your Bur-knots are Summer fruit) or if you thinke he will not, couer his wound safely.

Vfuall  
Sets.

The most vsuall kinde of Sets, is Plants with rootes growing of kernells of Apples, Peares, and Crabs, or stones of Cherries, Plummes, &c. remoued out of a Nursery, Wood, or other Orchard, into, and set in your Orchard in their due places.

I grant this kinde to be better than either of the former, by much, as more sure and more durable. Herein you must note, that in sets so remoued, you get all the rootes you can, and without bruising of any; I utterly dislike the opinion of those great Gardiners, that following their Bookes would haue the maine rootes cut away, for tops cannot grow without roots. And because none can get all the rootes, and remouall is an hindrance, you may not leauue on all tops, when you set them: For there is a proportion betwixt the top and root of a tree, euē in the number (at least) in the growth. If the rootes be many, they will bring you many tops, if they be not hindred. And if you vse to stowe or top your tree too much or too low, and leauue no issue, or little for sap, (as is to be seene in your hedges) it will hinder the growth of roots and boale, because such a kinde of stowing is a kinde of smothering, or choaking the sap. Great wood, as Dake, Elme, Ashe, &c. being continually kept downe, with sheeres, knise, axe, &c. neither boale nor root will thriue, but as an hedge or bush. If you intend to graffe in your Set, you may cut him closer with a greater wound, and neerer the earth, with, in a foot or two, because the graft or grafts will couer his wound. If you like his fruit, and woulde haue him to be a tree of himselfe, be not so bold: this I can tell you, that though you doe cut his top close, and leauue nothing but his bulke, because his rootes are few, if he be (but little) bigger than your thumbe (as I wish all Plants remoued to be) he will safely recover his wound within seuen yéeres; by good guidance that is: If the next time of dressing immediatly aboue his uppermost sprig, you cut him off aslope cleanly, so that the sprig stand on the backe side, (and if you can Northward, that the wound may haue the benefit of Sunne) at the upper end of the wound: and let that sprig onely be the boale. And take this for a generall rule; Every young Plant, if he thriue, will recover any wound aboue the earth, by good dressing, although it be to the one halfe, and to his very heart. This short cutting at the remoue, saues your Plants from Winde, and neede the lesse or no staking. I commend not Lying or Leaning of Trees against Holes or Stayres; for it breedes obstructiōn of Sappe and wounds incurable. All remouing of Trees as great as your arme, or aboue, is dangerous: though some-

Maine

Stow  
sets re-  
moued.

Generall  
rule.

Tying  
of Trees.  
Generall  
rule.

time

time some such will grow, but not continue long: Because they be tainted with deadly wounds, either in the root or top. ( And a tree once thoroughly tainted is never good.) And though they get some hold in the earth with some lesser saw, or tawes, which give some nourishment to the body of the tree: yet the heart being tainted, he will hardly ever thrive; which you may easily discerne by the blacknesse of the boughs at the heart, when you dress your trees. Also, when he is set with moe tops than the rootes can nourish, the tops decaying, blacken the boughs, and the boughes the armes, and so the boale at the very heart. Or this taint in the remouall, if it kill not presently, but after some short time, it may be discerned by blacknesse or yellownesse in the bark, and a small hangred leafe. Or if your remoued Plant put forth leaues the next and second Summer, and little or few sprays, it is a great signe of a faint, and next yeares death. I haue knowne a tree tainted in setting, yet grow, and beare blossomes for diuers yeeres: and yet for want of strength could never shape his fruit.

Suckers  
good  
sets.

Next unto this, or rather equall with these Plants, are Suckers growing out of the rootes of great Trees, which Cherries & Plummes doe seldom or never want: and being taken kindly with their roots, will make very good Sets. And you may helpe them much by enlarging their rootes with the tawes of the tree, whence you take them. They are of two sorts: Either growing from the very root of the tree: and here you must be carefull, not to hurt your tree when you gather them, by ripping amongst the rootes; and that you take them cleane away: for these are a great and continuall annoyance to the growth of your tree: and they will hardly be cleansed. Secondly, or they doe arise from some saw: and these may be taken without danger, with long and good rootes, and will soone become Trees of strength.

A Run-  
ning  
Plant.

There is another way, which I haue not thoroughly proued, to get not only Plants for grafting, but Sets to remaine for Trees, which I call a Running Plant: the manner of it is this: Take a Roote or kynell, and put it into the middle of your plot, and the second yere in the Spring, geld his top, if he haue one principall, ( as commoally by nature they haue) and let him put forth only fourre Cyons toward the fourre corners of the

Orchard,

Orchard, as neere the earth as you can. If hee put not four, (which is rare) stay his top till he haue put so many. When you haue such four, cut the Stocke aslope, as is aforesaid in this Chapter, hard aboue the uppermost sprig, and keepe those four without Cyons cleane and streight, till you haue them a yard and an halfe, at least, or two yards long. Then the next spring in grafting time, lay downe those four sprates, towards the four corners of your Orchard, with their tops in an heape of pure and good earth, raised as high as the root of your Cyon, (for sap will not descend) and a sod to keepe them downe, leauing nine or twelue inches of the top to looke vpward. In that hill he will put roots, and his top new Cyons, which you must spread as before, and so from hill to hill till hee spread the compasse of your ground, or as farre as you list. If in bending, the Cyons cracke, the matter is small, cleanse the ground and hee will recover. Every bended bough will put forth branches, and become Trees. If this Plant be of a burre knot, there is no doubt. I haue proued it in one Branch my selfe: and I know at Wilton in Cleeue-land a Peare-tree of a great bulke and age, blowne close to the earth, hath put at every knot rootes into the earth, and from root to top, a great number of mighty armes or trees, filling a great roomth, like many trees, or a little Orchard. Much better may it be done by Art in a lesse Tree. And I could not mislike this kinde, sauz that the time will be long before it come to perfection.

Many ffe to buy Sets already grafted, which is not the best way: for first, All remoues are dangerous: Againe, there is danger in the carriage: Thirdly, it is a costly course of Planting: Fourthly, every Gardiner is not trusty to sell you good fruit: Fifthly, you know not which is best, which is worst, and so may take most care about your worst trees. Lastly, this way keepeſ you from practise, and so from experience, in so good, Gentlemanly, Scholerlike, and profitable a Faculty.

The onely best way (in my opinion) to haue sure and lasting Sets, is neuer to remoue: for every remoue is an hinderance, if not a dangerous hurt or deadly taſt. This is the way: The Plot-forme being laid, and the Plot appointed where you will plant every Set in your Orchard, dig the roomth, where your Sets shall stand, a yard compasse, vnde-

and make the earth mellow and cleane, and mingle it with a fewe coale ashes, to auoid Wormes: and immediatly after the first change of the Moone, in the latter end of February, the earth being a fresh turned ouer, put in every such roomth threé or fourē Kernels of Apples or Peares, of the best: every Kornell in an hole made with your finger, finger-deepe, a foot distant one from another: and that day Moneth following, as many moe, (lest some of the former misse) in the same compasse; but not in the same holes. Hence (God willing) shall you haue rootes enough. If they all, or diuers of them come vp, you may draw (but not dig) vp (nor put downe) at your pleasure, the next Nouember. How many soever you take away, to giue or bessow elsewhere, be sure to leau two of the proudest. And when in your second and third yeere you Grafte (if you Grafte then at all) leau the one of those two vngrafted, lest in grafting the other you faile: For I finde by tryall, that after first or second grafting in the same Stocke, being misse (for who hits all) the third misse puts your Stocke in deadly danger, for want of issue of sap. Yea, though you hit in grafting, yet may your graftes with vnlinde or otherwise bee broken downe. If your graftes or graffe prosper, you haue your desire, in a Plant vntremoued, without taint, and the fruit at your owne choise, and so you may (some little earth being remoued) pull, but not digge vp the other Plant or Plants in that roomth. If your graffe or Stocke, or both perish, you haue another in the same place, of better strength to worke vpon. For thrusing without snub hee will overlay your grafted Stocke much. And it is hardly possible to misse in grafting so often, if your Gardiner be worth his name.

Sets vn-  
grafted  
best of  
all.

It shall not bee amisse (as I judge it) if your Kernels be of choice fruit, and that you see them come forward proudly in their body, and beare a faire and broad lease in colour, tending to a greenish yellow (which argues pleasant and great fruit) to try some of them vngrafted: for although it be a long time ere this come to beare fruit, ten or twelue yeeres, or moe; and at their first bearing, the fruit will not seeme to bee like his owne kinde: yet am I assured, vpon tryall, before twenty yeeres growth, such Trees will increase the bignesse and goodnesse of their fruit, and come perfectly to their owne kinde.

Trees.

Trees (like other breeding creatures) as they grow in yeeres, bignes, and strength: so they mend their fritt. Husbands and Huswifes finde this true by experiance, in the rearing of their yong Stoare. More then this, there is no tree like this for soundnesse & durable last, if his keeping and dressing be answerable. I grant, the readiest way to come sone to fruit is grafting: because in a maner, all your Grasses are taken of fruit-bearing Trees.

Now when you haue made choise of your Sets to remoue, the ground being ready, the best time is, immediatly after the fall of the Leafe, in, or about the change of the Moone, when the sap is most quiet: for then the sap is in turning: for it makes no stay, but in the extremity of drought or cold. At any time in winter, may you transplant trees, so you put no Ice nor Snow to the roote of your Plant in the setting: and therefore open, calme, and moist weather is best. To remoue, the leafe being ready to fall, and not fallen, or buds apparantly put forth in a moist, warme season, for need, sometime may doe well: but the safest is to walke in the plaine trodden path.

Some hold opinion that it is best removing before the fall of the leafe, and I heare it commonly so practised in the South by our best Arborists, the leafe not fallen: & they giue the reason to be, that the descending of the sap will make speedy roots. But marke the reasons following, and I thinke you shall find no soundnes, either in that position or practise, at least in the reason.

1. I say, it is dangerous to remoue when the sap is not quiet, for euery remoue giues a main checke to the stirring sap, by staying the course thereof in the body of your plant, as may appeare in trees remoued any time in Summer, they commonly die, nay hardly shall you save the life of the most young and tender plant of any kind of wood (scarcely herbes) if you remoue them in the pride of sap. For proud sap vniuersally stayed, by remouall, euer hindres, often taints, and so presently, or in very short time kills. Sap is like bloud in mans body, in which is the life, Cap. 3. pag. 8. If the bloud vniuersally be cold, life is excluded; so is sap tainted by untimely remouall. A stay by drought, or cold, is not so dangerous (tho dangerous if it be extreme) because more naturall.

2. The sanue descends, as men suppose, but is consellidated and transubstantiated into the substance of the tree, and

Time of  
remo-  
ving.

Generall  
rule.

passeth (alwayes aboue the earth) vpward, not only betwixt the barke and the wood, but also into & in both body and barke, tho not so plentifullly, as may appeare by a tree budding, nay fructifying 2. or 3. yeeres, after he be circumcised, at the very root, like a Riner that inlargeth his chanell by a continuall descent.

3. I cannot perceiue what time they wold haue þ sap to descend. At Midsummer in a biting drought it staies, but descends not, for immediatly vpon moisture it makes second shotts, all or before rather ) Michael tide, wherit shapens his buds for next yeres fruit. If at the fal of the leafe, I grant, about that time is þ greatest stand (but not descent) of sap, which begins somewhat before the leafe fall, but not long, & therefore at that time must needs be the best remouing, not by reason of the descent, but stay of sap.

4. The sap in his course hath his profitable and apparent effects, as the growth of the Tree, couering of wounds, putting of buds, &c. Whereupon it followes, if the sap descend, it must needs haue some effect to shew it.

5. Lassly, boughs plash't and laid lower than the root, die for want of sap descending, except where it is forced by the maine stream of the sap, as in top boughs hanging like water in pipes, or except the plash't bough lying on the ground put roots of his owne, yea vnder boughs which wee commonly call waters-boughs, can scarcely get sap to liue, yea in time dye, because the sap doth presse so violently vpward, and therefore the fairest shott's and fruit are alwaies in the top.

Obiect. If you say that many so remoued thrive, I say that somewhat before the fall of the leafe (but not much) is the stand, for the fall and the stand are not at one instant, before the stand is dangerous. But to returne.

The sooner in Winter you remoue your Sets, the better; the latter the worse: For it is very perillous if a strong drought take your Sets before they haue made good their rooting. A plant set at the Fall, shall gaine (in a manner) a whole yeeres growth of that which is set in the Spring after.

I vse in the setting to bee sure, that the earth bee mouldy, (and somewhat moist) that it may runne among the small tangles without straining or bruising: and as I fill in earth to his root, I shake the Set easily to and fro, to make the earth settle the better to his roots: and withall easily with

Remoue  
soone.

The  
manner  
of set-  
ting.

my

my foot I put in the earth close; for ayre is noysome, and will follow concavities. Some prescribe Dates to be put in with the earth. I could like it, if I could know any reason thereof: and they vse to set their plant with the same side toward the Sun: but this conceit is like the other. For first I would haue every tree to stand so free from shade, that not onely the root (which therefore you must keepe bare from grasse) but body, boughes, and branches, and every spray, may haue the benefit of Sun. And what hurt, if that part of the tree, that before was shadowed, be now made partaker of the heat of the Sun? In tunning of Bees, I know it is hurtfull, because it changeth their entrance, passage, and whole worke: But not so in Trees.

Set as deepe as you can, so that in any wise you goe not beneath the crust. Looke Chap. 2.

Set in  
the crust.  
Moyster  
good.

We speake in the second Chapter of moysture in generall: but now especially having put your remoued plant into the earth, powre on water (of a puddle were good) by distilling presently, and so every weeke thicke in strong drought, so long as the earth will drinke, & refuse by overflowing. For moysture mollifies, & both giues leauue to the roots to spread, & makes the earth yeld sap and nourishment, with plentie & facilitie. Purles (they say) giue most and best milke after warme drinke. If your ground be such that it will keepe no moysture at the root of your plant, such plant shall never like, or but for a time. There is nothing more hartfall for young trees than piercing drought. I haue knowne trees of good stature after they haue bene of diuers yeares growth, and thrive well for a good time, perish for want of water, and very many by reason of taunts in setting.

It is meet your sets and grafts be fenced, till they be as big as your arme, for feare of annoyances. Many waies may sets receive damages, after they be set, whether they be grafted or vngrafted. For, although we suppose, that no noysome beast, or other thing must haue accessse among your trees: yet by casualtie, a Dog, Cat, or such like, or your selfe, or negligent friend bearing you company, or a shrewd boy, may tread or fall vpon a young and tender plant or graft. To auoyd these and many such chances, you must stake them round a prettie distance from the set, neither so neere, nor so thicke, but that it may haue the benefit of Sunne, raine, and aire.

Your

Your stakes (small or great) would be so surely put, or driven into the earth, that they breake not, if any thing happen to leane upon them, else may the fall be more hurtfull, than the want of the fence. Let not your stakes shelter any weedes about your sets, for want of Sunne is a great hinderance. Let them stand so far off, that your grafts spreading receive no hurt, either by rubbing on them, or of any other thing passing by. If your Stocke be long, and high grafted (which I much discommend (except in need) because there the sap is weake, and they are subject to strong wind, and the lighting of birds) tie easily with a soft lill three or four prickes vnder the clay, and let their tops stand aboue the grafts, to auoid the lighting of Crows, Pyes, &c. upon your grafts. If you sticke some sharpe thornes at the roots of your stakes, they will make hurtfull things keepe off the better. Other better fences for your grafts I know none. And thus much for sets and setting.

### CHAP. VIII. Of the distance of Trees.

Know not to what end you should prouide good ground, well fenced, & plant good sets; & when your trees should come to profit, haue all your labours lost, for want of due regard to the distance of placing of your trees. I haue seene many trees stand so thicke, that one could not thrue for the throng of his neig-

Hurts of hours. If you doe marke it, you shall see the tops of trees rubb toooneere off, their sides galled like a galled horses backe, and many trees planting. haue more stumps than boughs, and most trees no well thriving, but short, stumpy, & euill thriving boughs: like a Corne-field ouer-seeded, or a towne ouer-peopled, or a pasture ouer-laid, whiche the Gardiner must either let grow, or leau the tree very few boughs to beare fruit. Hence small thrist, galls, wounds, diseases, and short life to the trees: and while they liue greene, little, hard, worme-eaten, and euill thriving fruit arise, to the discomfort of the owners.

Remedy. To prevent which discommoditie, one of the best remedies is, the sufficient & fit distance of trees. Therefore at the setting of your plants you must haue such a respect, that the distance of them

them be such, that every tree be not annoiance, but an helpe to his fellowes : for trees ( as all other things of the same kinde ) shold shrowd, and not hurt one another. And assure your selfe that euery touch of trees ( as well vnder as aboue the earth ) is hurtful. Therefore this must be a generall rule in this Art: That no tree in an Orchard well ordered, nor bough, nor Cyon, drop vpon, or touch his fellowes. Let no man thinke this vnpossible, but looke in þ eleuenth chapter of dressing of trees. If they touch, the winde will cause a forcible rub. Young twigs are tender, if boughs or armes touch and rub, if they are strong, they make great galls. No kinde of touch therefore in trees can be good.

Now it is to be considered what distance amongst sets is requisite, and that must be gathered from the compasse and roorth, that each tree by probability will take and fill. And herein I am of a contrary opinion to all them, which practise or teach the planting of trees, that ever yet I knew, read, or heard of. For the common space betweens tree and tree is ten foot: if twenty foot, it is thought very much. But I suppose twenty yards distance is small enough betwixt tree and tree, or rather too too little. For the distance must needs be as far as two trees are well able to overspread, and fill, so they touch not, by one yard at least. Now I am assured, and I know one Apple-tree, set of a slip-finger-great; in the space of twenty yeares, (which I count a very small part of a trees age, as is shewed Chapter 14.) hath spred his boughs eleuen or twelue yards compasse, that is, five or six yards on euerie side. Hence I gather, that in forty or fiftie yeares ( which yet is but a small time of his age ) a tree in good soile, well bringing, by good dressing ( for that is much available to this purpose) will spread double at the least, viz. twelue yards on a side, which being added to twelue allotted to his fellow, make twenty and foure yards, and so farre distant must every tree stand from another. And looke how farre a tree spreads his boughs, aboue, so far doth he put his roots vnder the earth, or rather further, if there be no stop, nor let by walls, trees, rocks, barren earth, and such like: for an huge bulk, and strong armes, massie boughs, many brancheys, and infinite twigs, require wide-sprea ding rootes. The top hath the vast aire to spread his boughs in, high and low, this way and that way: but the roots are kept in the cruste of the earth, they may not goe downeward, nor upward.

Generall rule.  
All touches hurt full.

The best distance of trees.

Parts of a tree.

upward out of the earth, which is their element, no more than the Fish out of the Water, Camelion out of the Aire, nor Salamander out of the Fire. Therefore they must needs spread far vnder the earth. And I dare well say, if nature would giue leauue to man by Art, to dresse the roots of trees, to take away the tawes, and tangles, that lap and fret and grow superfluously and disorderly, (for euery thing sublunary is cursed for mans sake) the tops aboue being answerably dressed, we should haue trees of wonderfull greatnesse, and infinite durancie. And I perswade my selfe that this might be done sometimes in Winter, to trees standing in faire plaines and kindly earth, with small or no danger at all. So that I conclude, that twenty foure yards are the least space that Art can allot for trees to stand distant one from another.

Waste  
ground  
in an or-  
chard.

If you aske me what vse shall be made of that waste ground betwixt tree and tree? I answer: If you please to plant some tree or trees in that middle space, you may, and as your trees grow contiguous, great and thicke, you may at your pleasure take vp those last trees. And this I take to be the chiese cause, why the most trees stand so thicke. For men not knowing (or not regarding) this secret of needfull distance, and louing fruit of trees planted to their hands, thinke much to pull vp any, though they pine one another. If you or your heires or successors would take vp some great trees (past setting) where they stand too thicke, be sure you doe it about midsummer, and leauue no maine rootes. I destinate this space of foure and twenty yards, for trees of age and stature. More than this, you haue borders to be made for walkes, with Roses, Berries &c.

And chiefly consider: that your Orchard, for the first twenty or thirtie yéeres, will serue you for many Gardens, for Safron, Licoraz, roots, and other herbes for profit, and flowers for pleasure: so that no ground need be wasted if the Gardiner be skilfull and diligent. But be sure you come not nare with such deepe delving the rootes of your trees, whose compasse you may partly discerne, by the compasse of the tops, if your top be well spread. And vnder the droppings and shadow of your trees, be sure no herbs will like. Let this be said for the distance of Trees.

## CHAP. IX.

## Of the Placing of Trees.

**I**H E placing of Trees in an Orchard is well worth the regard: For although it must bee granted, that any of our foresaid Trees (chap. 2.) will like well in any part of your Orchard, being good and well drest earth: yet are not all Trees alike worthy of a good place. And therefore I wish that your Filberd, Plummes, Damsons, Bulesse, and such like, be utterly remoued from the plaine soile of your Orchard into your fence: for there is not such fertilitie and easefull growth, as within: and there also they are more subiect, and can better abide the blasts of Æolus. The Cherries and Plummes being ripe in the hot time of Summer, and the rest standing longer, are not so soone shaken as your better fruit: neither if they suffer losse, is your losse so great. Besides that, your fences and ditches will deuoure some of your fruit growing in or neare your hedges. And seeing the continuance of all these (except Nuts) is small, the care of them ought to be the lesse. And make no doubt, but the fences of a large Orchard will containe a sufficient number of such kind of Fruit-trees in the whole compasse. It is not materiall, but at your pleasure, in the said fences, you may either intermingle your severall kinds of fruit-trees, or set every kind by himselfe, which order doth very wel become your better and greater fruit. Let therefore your Apples, Peares, and Quinches, possesse ihe soile of your Orchard, unlesse you be especially affected to some of your other kinds: and of them let your greatest Trees of growth stand furthest from Sunne, and your Quinches at the South side or end, and your Apples in the middle, so shall none be any hindrance to his fellowes. The Warden-tree, and Winter Peare will challenge the preheminence for stature. Of your Apple-trees you shall finde difference in growth. A good Pippin will grow large, and a Collard tree: sted them on the North side of your other Apples, thus being placed, the least will giue Sun to the rest, and the greatest will shroud their fellowes. The fences and out-trees will guard all.

## CHAP. X.

## Of Grafting.

Of  
gra-  
uing or  
caruing.

Grafting  
what.

A Graffe

Kinds of  
grafting.

Now are we come to the most curious point of our faculty: curious in conceit, but indeed as plaine and easie as the rest, when it is plainly shewne, which we commonly call Grafting, or (after some) Grafting. I cannot Etymologize, nor shew the originall of the word, except it come of grauing and caruing. But the thing or matter is: The reforming of the Fruit of one Tree with the fruit of another, by an artificiall transplacing or transposing of a twig, bud or lease, (commonly called a Graft) taken from one tree of the same, or some other kind, and placed or put to, or into another tree in due time and manner.

Of this there be divers kinds, but three or fourre now especially in vse: to wit, Grafting, incising, packing on, grafting in the scutchion, or inoculating: whereof the chiese and most vsuall, is called grafting (by the generall name, *Catabexocen:*) for it is the most knowne, surest, readiest, and plainest way to haue store of good fruit.

It is thus wrought: You must wish a fine, thin, strong, and sharpe Saw, made and armed for that purpose, cut off a foot above the ground, or thereabouts, in a plaine without a knot, or as neare as you can without a knot (for some Stocks will be knotty) your Stocke, set or plant, being surely stayed with your foot and legge, or otherwise streight overthwart (for the Stocke may bee crooked) and then plaine his wound smoothly with a sharpe knife: that done, cleave him cleanly in the middle with a cleaver, and a knocke or mall, and with a wedge of wood, Iron or Bone, two handfull long at least, put into the middle of that clift, with the same knocke, make the wound gape a straw bredth wide, into which you must put your Graffes.

The graft is a top twigge taken from some other Tree (for it is folly to put a graffe into his owne Stocke) beneath the uppermost (and sometime in need the second) knot, and with a sharpe knife fitted in the knot (and sometime out of the knot when neede is) with shoulders an ync downeward, and so put into the Stock with some thrusting (but not straining) barke to barke inward.

Let your graffe haue thre or four eyes, for readinesse to put forth, and giue issue to the sap. It is not amisse to cut off the top of your graffe, and leaue it but five or sixe inches long, because commonly you shall see the tops of long graffes die. The reason is this. The sap in grafting receiuers a rebake, and cannot worke so strongly presently, and your graffes receiuers not sap so readily, as the natarall brancheis. When your graffes are cleanly and closely put in, and your wedge puld out nimblly, for feare of putting your graffes out of frame, take well tempered morter, soundly wrought with chaffe or horse dung (for the dung of cattell will grow hard, and straine your graffes) the quantity of a Geesse egge, and diuide it iust, and therewithall, couer your Stocke, laying the one halfe on the one side, and the other halfe on the other side of your graffes (for thrusting against your graffes) you moue them, and let both your hands thrust at once, and alike, & let your clay be tender, to yeeld easilly; and all, lest you moue your graffes. Some vse to couer the clift of the Stocke, vnder the clay with a peece of barke or leafe, some with a sear-cloth of ware and butter, which as they be not much needfull,

of old  
trees.

full, so they hurt not, balesse that by being busie about them, you move your graftes from their places. They vse also mosse tyed on aboue the clay with some brier, wicker, or other bands. These profit nothing. They all put the graftes in danger, with pulling and thrusting: for I hold this generall rule in grafting, and planting: if your stocke and graftes take, and thriue (for some will take, and not thriue, being tainted by some meanes in the planting or grafting) they will (without doubt) recover their wounds safely and shortly.

The best time of grafting from the time of removing your stocke is the next Spring, for that saues a second wound, and a second repulse of sap, if your stocke bee of sufficient bignesse to take a graffe from as big as your thumbe, to as big as an arme of a man. You may graffe lesse (which I like) and bigger, which I like not so well. The best time of the yeere is in the last part of February, or in March, or beginning of Aprill, when the Sunne with his heat beginnes to make the sap stirre more rankely, about the change of Moone before you see any great apparancy of leafe or flowers, but onely knots and buds, and before they be pround, though it be sooner. Cherries, Peares, Apricocks, Quinces and Plummes would be gathered and grafted sooner.

The graftes may be gathered sooner in February, or any time within a moneth, or two before you graffe, or vpon the same day (which I commiend) If you get them any time before, for I haue knowne graftes gathered in Decembor, and doe well, take heed of drought. I haue my selfe taken a bur knot of a tree, and the same day when he was laid in the earth about mid Februarie, gathered grafts and put in him, and one of those graftes boore the third yeere after, and the fourth plentifully. Graftes of old Trees would be gathered sooner than of young trees, for they sooner breake and bud. If you keepe graftes in the earth, moisture with the heat of the Sunne will make them sprout as fast, as if they were growing on the tree. And therefore seeing keeeping is dangerous, the surest way (as I judge) is to take them within a weeke of the time of your grafting.

The grafts would be taken not of the proudest twigs, for it may be your Stocke is not answerable in strenght. And therefore (say I) the grafts brought from South to vs in the North, although

although they take and thriue (which is somewhat doubtfull, by reason of the difference of the Clime and carriage) yet shall they in time fashion themselves to our cold Northerne Soyle, in growth, taste, &c. Nor of the poorest, for want of strength may make them vnireadie to receiue sap (and who can tell but a pore graft is tainted) nor on the outside of your tree, for there should your tree spread but in the middest: for there you may be sure your Tree is no whit hindered in his growth or forme. Hee will still recover inward, more than you would wish. If your clay clift in summer with drought, looke well in the Chinkes for Emmits and Earwigs, for they are cunning and close theves, about grafts you shall finde them stirring in the morning or euening, and the rather in moist weather. I haue had many young buds of Graftes, euuen in the flourishing, eaten with Ants. Let this suffice for grafting, whch is in the faculty counted the chiese secret, and because it is most vsuall, it is best knowne.

Graftes are not to be disliked for growth, till they wi-  
ther, pine, and die. Usually before Midsummer they breake, if they liue. Some (but few) keeping proud and greene, will not put till the second yeare, so is it to be thought of sets.

The first shew of putting is no sure signe of growth it is but the sap the grasse brought with him from his tree.

So soone as you see the graft put for growth take away the clale, for then doth neither the Stocke nor the grasse need it (put a little fresh well-tempered clale in the hole of the Stocke) for the clale is now tender, and rather keepe moisture than drought.

The other waies of changing the naturall fruit of Trees, are more curious than profitable, and therefore I minde not to beslow much labour or time about them, onely I shall make knowne what I haue proued, and what I doe thinke.

And first of incising, which is the cutting of the backe of the boale, a rine or branch of a tree at some bending or knee, shoul-  
derwise with two gashes, onely with a sharpe knife to the wood: then take a wedge, the bignesse of your grasse sharpe en-  
ded, flat on the one side, agreeing with the tree, and round on the  
other side, and with that being thrust in, raise your bark,  
then

stocke.

Packing  
thus.

Inocula-  
ting.

then put in your grasse, fashioned like your wedge iust: and lastly couer your wound, and fast it vp, and take h̄d of straining. This will grow but to small purpose, for it is weake hold, and lightly it will be vnder growth. Thus may you graft betwixt the barke and the tree of a great stocke that will not easilly bee clifted: But I haue tried a better way for great trees, viz. First, cut him off straight, and cleanse him with your knife, then cleave him into fourre quarters, equally with a strong cleauer: then take for euery Clift two or th̄ee small (but hard) wedges iust of the bignesse of your grafts, and with those wedges driven in with an hammer open the fourre clifts so wide (but no wider) that they may take your fourre grasses, with thrusting, not with straining: and lastly couer and clay it closely, and this is a sure and good way of grafting: or thus, clift your stocke by his edges twice or thrice with your cleauer, and open him with your wedge in euery clift one by one, and put in your grafts, and then couer them. This may doe well.

Packing on is, when you cut aslope a twig of the same bignesse with your graft, either in or besides the knot, two inches long, and make your graft agree iumpe with the Cyon, and gash your graft and your Cyon in the middest of the wound, lengthway, a straw breadth deepe, and thrust the one into the other, wound to wound, sap to sap, barke to barke, then tie them close and clay them. This may doe well. The fairest graft I haue in my little Orchard, which I haue planted, is thus packt on, and the branch whereon I put him, is his plentifull roote.

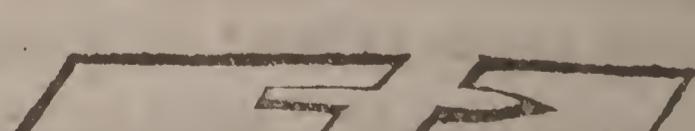

To be short in this point, cut your graft in any sort or fashion, two inches long, and joyne him cleanly and close to any other sprig of any tree in the latter end of the time of grafting, when sap is somewhat rife, and in all probabilitie they will close and thriue: thus

The sprig.  
Or any other fashion you thinke good.

The graft.

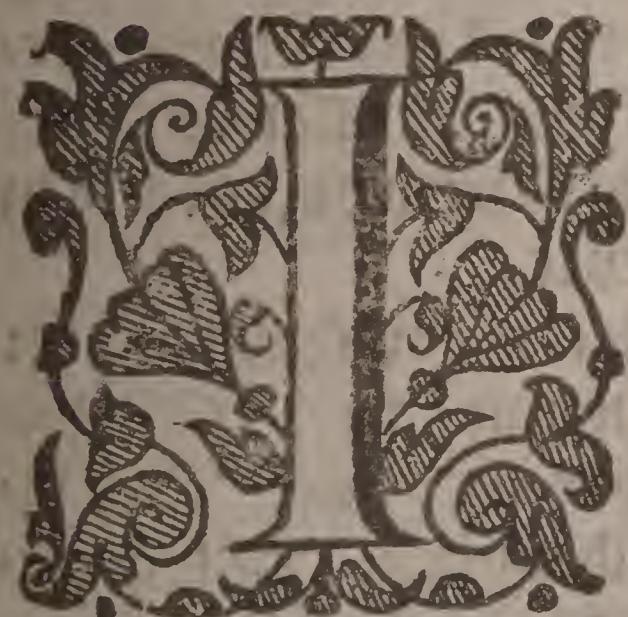

The twig. The graft.

Inoculating is an eye or bud, taken barke and all from one tree, and placed in the roome of another eye or bud of another, cut both of one compasse, and there bound. This must be done in Summer, when the sap is pround.

Much like unto this is that, they call grafting in the scutchion. They differ thus : That here you must take an eie with his leafe, or (in mine opinion) a bud with his leaues. (Note that an eie is for a Cyon, a budde is for flowers and fruit.) and place them on another tree, in a plaine (for so they teach) the place or barke where you must set it must be thus cut with a sharpe knife, and the barke raised with a wedge, and then the **H**eie or budde put in and so bound vp. I cannot de-  
nie but such may grow. And your bud if he take wil flowre and beare fruit that yeere: as some grafts and sets also, being set for bloomes. If these two kindes thriue, they reforme but a spray, and an vnder-growth. Thus you may place Roses on Thornes, and Cherries on Apples, and such like. Many write much more of grafting, but to small purpose. Whom we leauue to themselves, and their followers; and ending this secret we come in the next Chapter to a point of knowledge most requisite in an Arborist, as well for all other woods as for an Orchard.

## CHAP. XI.

## Of the right dressing of Trees.

If all these things aforesaid were indeed performed, as wee haue shewed them in words, you should haue a perfect Orchard in nature and substance, begunne to your hand : And yet are all these things nothing, if you want that skill to dresse and keepe your trees. Such is the condition of all earthly things, whereby a man receiueth profit or pleasure, that they degenerate presently without good ordering. Man himselfe left to himselfe, growes from his heauenly & spirituall generation, and becommeth beastly, yea devillish to his owne kind, unlesse he be regenerate. No maruell then, if Trees make their shoothes, and put their sprates disorderly. And truly (if I were worthy to iudge) there is not a mischiefe

Grafting  
in the  
Scutchi-  
on

Necessi-  
ty of  
dressing  
trees.

Generall  
rule.

chiefe that breedeth greater and more generall harme to all the Orchard (especially if they be of any continuance) than the want of the skilfull dressing of trees. It is a common and vnskilfull opinion, and saying, Let all grow, and they will beare more fruit: and if you lop away superfluous boughes, they say, what a pity is this? How many apples would these haue borne? not considering there may arise hart to your Orchard, aswell (nay rather) by abundance, as by want of wood. A sound and thriving plant in a good soyle, will euer yeld too much wood, and disorderly, but never too little. So that a skilfull and painfull Arborist, need never want matter to effect a plentifull and well drest Orchard: for it is an easie matter to take away superfluous boughes (if your Gardner haue skill to know them) whereof your plants will yeld abundance, and skill will leauе sufficient well ordered. All ages both by rules and experience doe consent to a prunning and lopping of trees: yet haue not any that I know described vnto vs (except in darke and generall words) what or which are those superfludus boughes, which we must take away, and that is the chiefe and most needfull point to be knowne in lopping. And we may well assure our selues, (as in all other Arts, so in this) there is a vantage and dexterity, by skill, and an habit by practise out of experiance, in the performance hereof for the profit of mankind; yet doe I not know (let me speake it with the patience of our cunning Arborists) any thing within the compasse of humane affaires so necessary, and so little regarded, not only in Orchards, but also in all other timber trees, where or whatsoeuer.

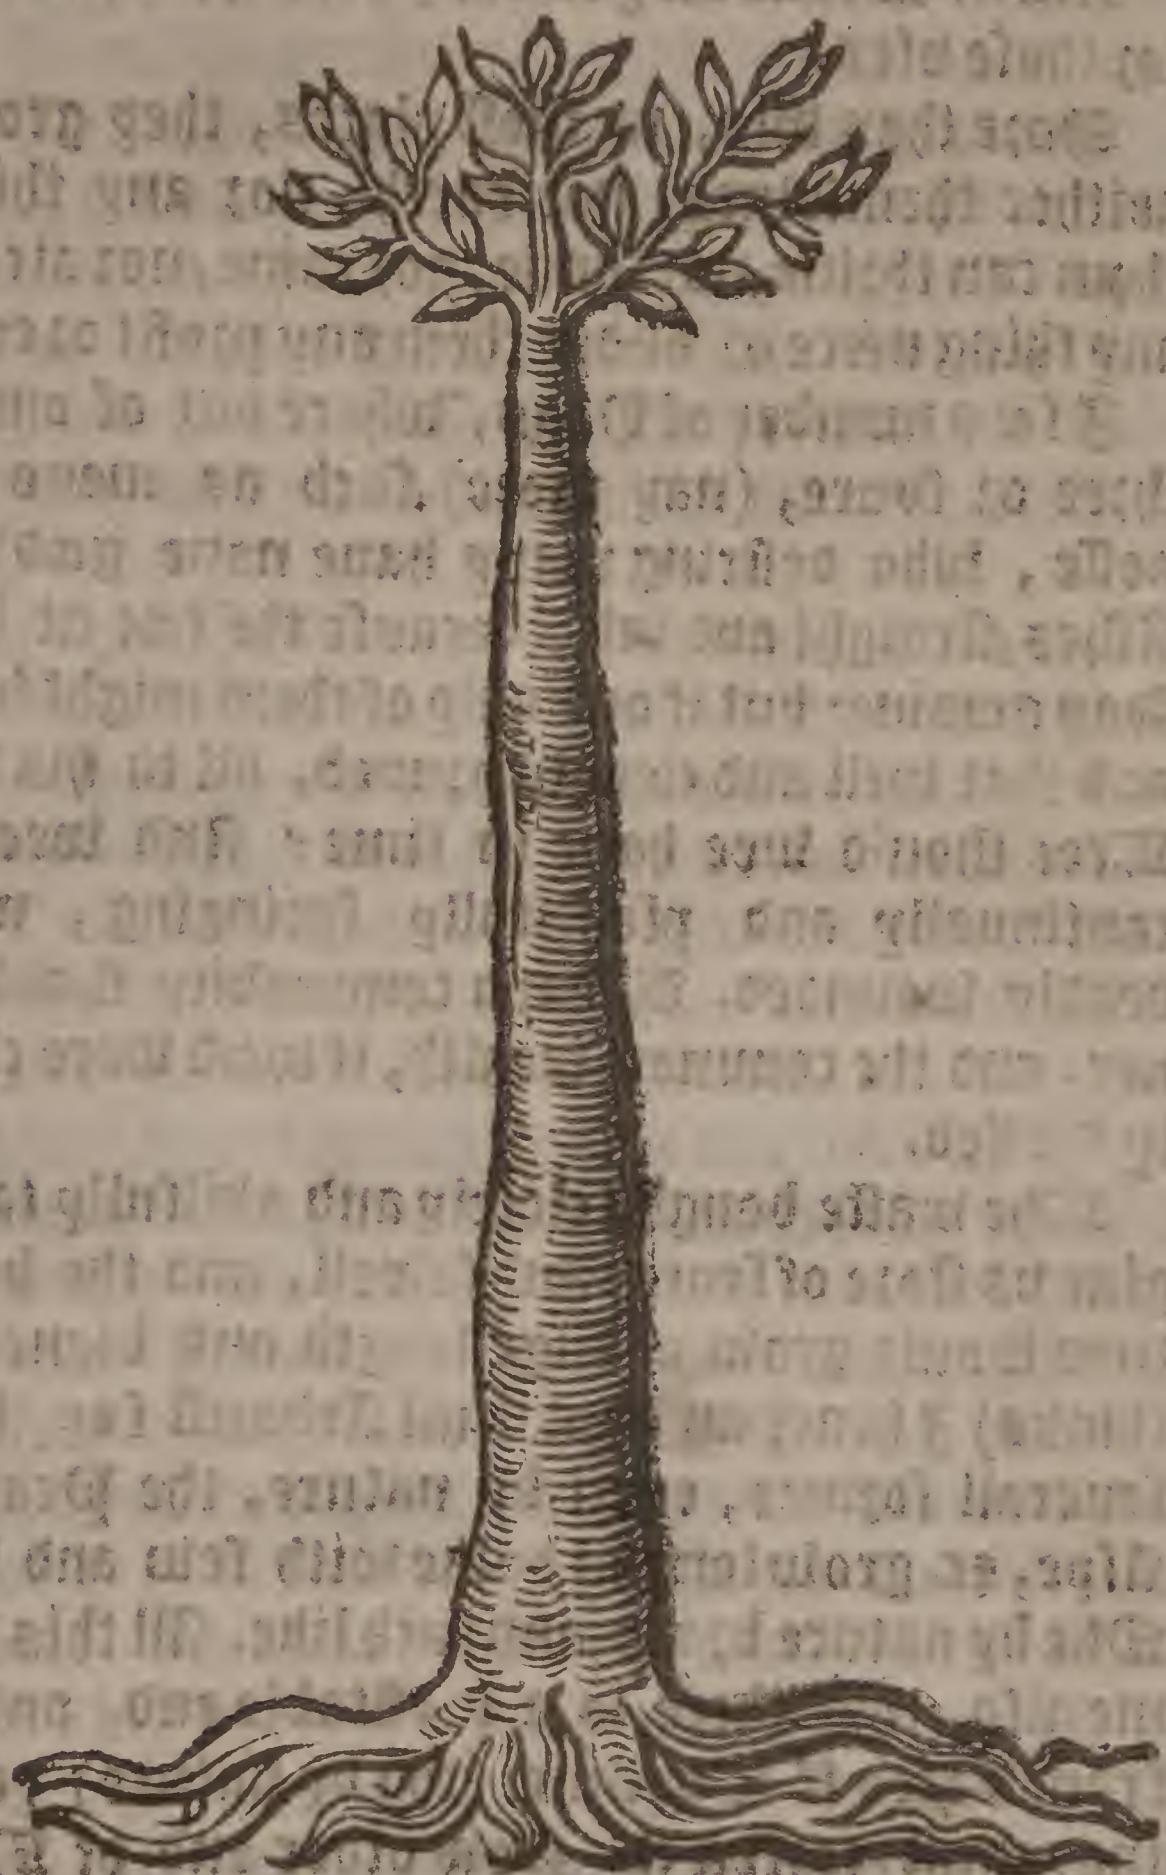

Timber  
wood e-  
will drest.

How many forestts and woods: wherein you shall haue for one lively thriving tree, foure (nay sometimes 24.) euill thriving, rotten and dying trees, euен while they liue. And instead of trees thousands of bushes and shrubbes. What rottenesse: what hollownesse: what dead armes: withered tops: curtailed trunkes: what leades of mosses: drooping boughes: and dying branches shall you see euery where? And those that like in this sort are in a manner all unprofitable boughes, canked armes, crooked, little and shott boales: what an infinite number of bushes, shrubs, and skroggs of hazels, thornes, and other profitable wood, which might be brought

brought by dressing to become great and goodly Trees. Consider now the cause: The lesser wood hath beeene spoiled with carelesse, buskilfull, and untimely stowing, and much also of the great wood. The greater Trees at the first rising haue filled and ouer-loaden themselves with a number of wastfull boughs and suckers, whiche haue not onely drawne the sappe from the boale, but also haue made it knottie, and themselves and the boale mossie

for want of dressing, whereas if in the prime of growth they had beeene taken away close, all but one top (according to this patterne) and cleane by the bulke, the strenght of all the Sap shoulde haue gone to the bulke, and so he shoulde haue recovered and couered his knots, and haue put forth a faire, long and streight body (as you see) for timber profitable, huge great of bulke, and of infinite last.

If all timber Trees were such (will some say) how should we haue crooked wood for wheeles, corbs, &c.

The cause of hurts in wood.

Dresse timber trees how.

Answ.

Answ. Dresse all you can, and there will be enough crooked for those uses.

More than this, in most places, they grow so thicke, that neither themselves, nor earth, nor any thing vnder or neare them can thrive, nor sunne, nor raine, nor aire can do them, nor any thing neare or vnder them any profit or comfort.

I see a number of Hags, where out of one roote you shall see three or fourre, (nay more) such as mens buskilfull greedynesse, who desiring many haue none good) pritty Oaks or Ashes, straight and tall, because the root at the first shot giues Sap amaine: but if one only of them might be suffered to grow, and that well and cleanly pruned, all to his very top, what a Tree should wee haue in time? And wee see by those roots continually and plentifullly springing, notwithstanding so deadly wounded. What a commodity shoulde arise to the owner, and the common-wealth, if wood were cherished, and orderly dressed.

Profit of  
trees  
dressed.

The end  
of trees.

Trees  
will take  
any  
forme.

The walle boughs closely and skilfully taken away, would giue vs store of fences and fewell, and the bulke of the tree in time would grow of huge length and bignesse. But here (me thinks) I heare an buskilfull Arborist say, that trees haue their severall formes, euē by nature, the Peare, the Holly, the Aspe, &c. grow long in bulke with few and little armes. The Oke by nature broad, and such like. All this I grant: but grant me also, that there is a profitable end, and vse of every tree, from which if it decline (tho by nature) yet man by art may (nay must) correct it. Now other end of Trees I never could learne, than good timber, fruit much and good, and pleasure. Uses phisicall hinder nothing a good forme.

Neither let any manuer so much as thinke, that it is unpro-  
bable, much lesse unpossible, to reforme any tree of what kinde-  
soever. For (believe me) I haue tried it, I can bring any tree  
(beginning by time) to any forme. The Peare and Holly may  
be made to spread, and the Oke to close.

But why doe I wander out of the compasse of mine Orchard  
into the Forests and Woods? Neither yet am I from my pur-  
pose, if boales of timber-trees stand in need of all the sap, to  
make them great and freight (for strong growth and dressing  
make strong trees) then it must needs be profitable for fruit (a  
thing

thing more immedately serving a mans need) to haue all the sap The end his root can yeld: for as timber sound, great and long, is the good of timber trees; and therfore they beare no fruit of worth: so fruit, good, sound, pleasant, great and much, is the end of fruitfull trees. That Gardner therefore shall perorme his duty skilfully and faithfully, which shall so dresse his Trees, that they may beare such and such sorte of fruit, which he shall never doe. (I dare undertake) vntille he keape this order in dressing his Trees.

A fruit Treē so standing, that there ned none other end of dressing but fruit (not ornaments for walkes, nor delight to such as would please their eye only, and yet the best forme can not but both adorne & delight) must be parted from within two foot (or thereabouts) of the earth, so high to giue liberty to dresse his root, and no higher, for drinking vp the sap that shoulde feede his fruit, for the boale will be first, and best serued and fed, because he is next the root, and of greatest ware and substance, and that makes him longest of life, into two, thre, or foure armes, as your Stocke or grasse yeld twigs, and every arme into two or more banches, and every branch into his severall Cyons, still spreading by equall degress, so that his lowest spray be hardly without the reach of a mans hand, and his highest be not past 2. yards higher, rarely (especially in the middest) that no one twig touch his fellow. Let him spread as far as he list without any master-bough, or top equally. And when any bough doth grow sadder and fall lower, than his fellowes (as they will with weight of fruit) ease hym the next spring of his superfluous twigs, and he will rise: when any bough or spray shall amount aboue the rest; either snub his top with a nip betwixt your finger and your thumbe, or with a sharpe knife, and take hym cleane away, and so you may use any Cyon you would reforme, and as your tree shall grow in stature and strength, so let him rise with his tops, but slowly, and early, especially in the middest, and equally, and in breadth also, and follow hym upward with lopping his vnder growth and water-boughs, keeping the same distance of two yards, but not aboue thre in any wise, betwixt the lowest and highest twigs.

1 Thus shall you haue well liking, cleane skind, healthfull, great, and long lasting treēs.

How to  
dresse a  
fruit tree

Benefits  
of good  
dressing

2 Thus shall your Tree grow low, and safe from winds, for his top will be great, broad and weighty.

3 Thus growing broad, shall your trees beare much fruit (I dare say) one as much as sise of your common trees, and good without shadowing, dropping, and fretting: for his boughs, branches, and twigs shall be many, and those are they (not the boale) which beare the fruit.

4 Thus shall your boale being little (not small but low) by reason of his shorthenesse, take little, and yeld much sap to the fruit.

5 Thus your Trees by reason of strength in time of setting shall put forth more blossomes, and more fruit, being free from faints; for strength is a great helpe to bring forth much and safely, whereas weaknesse failes in setting though the season be calme.

Some vse to bare Trees roots in Winter, to stay the setting till hotter seasons, which I discommend, because,

1 They hurt the roots.

2 It staies it nothing at all.

3 Though it did, being but small, with vs in the North, they haue their part of our Aprill and Maies frosts.

4 Hindrance cannot profit weake trees in the setting.

5 They waste much labour.

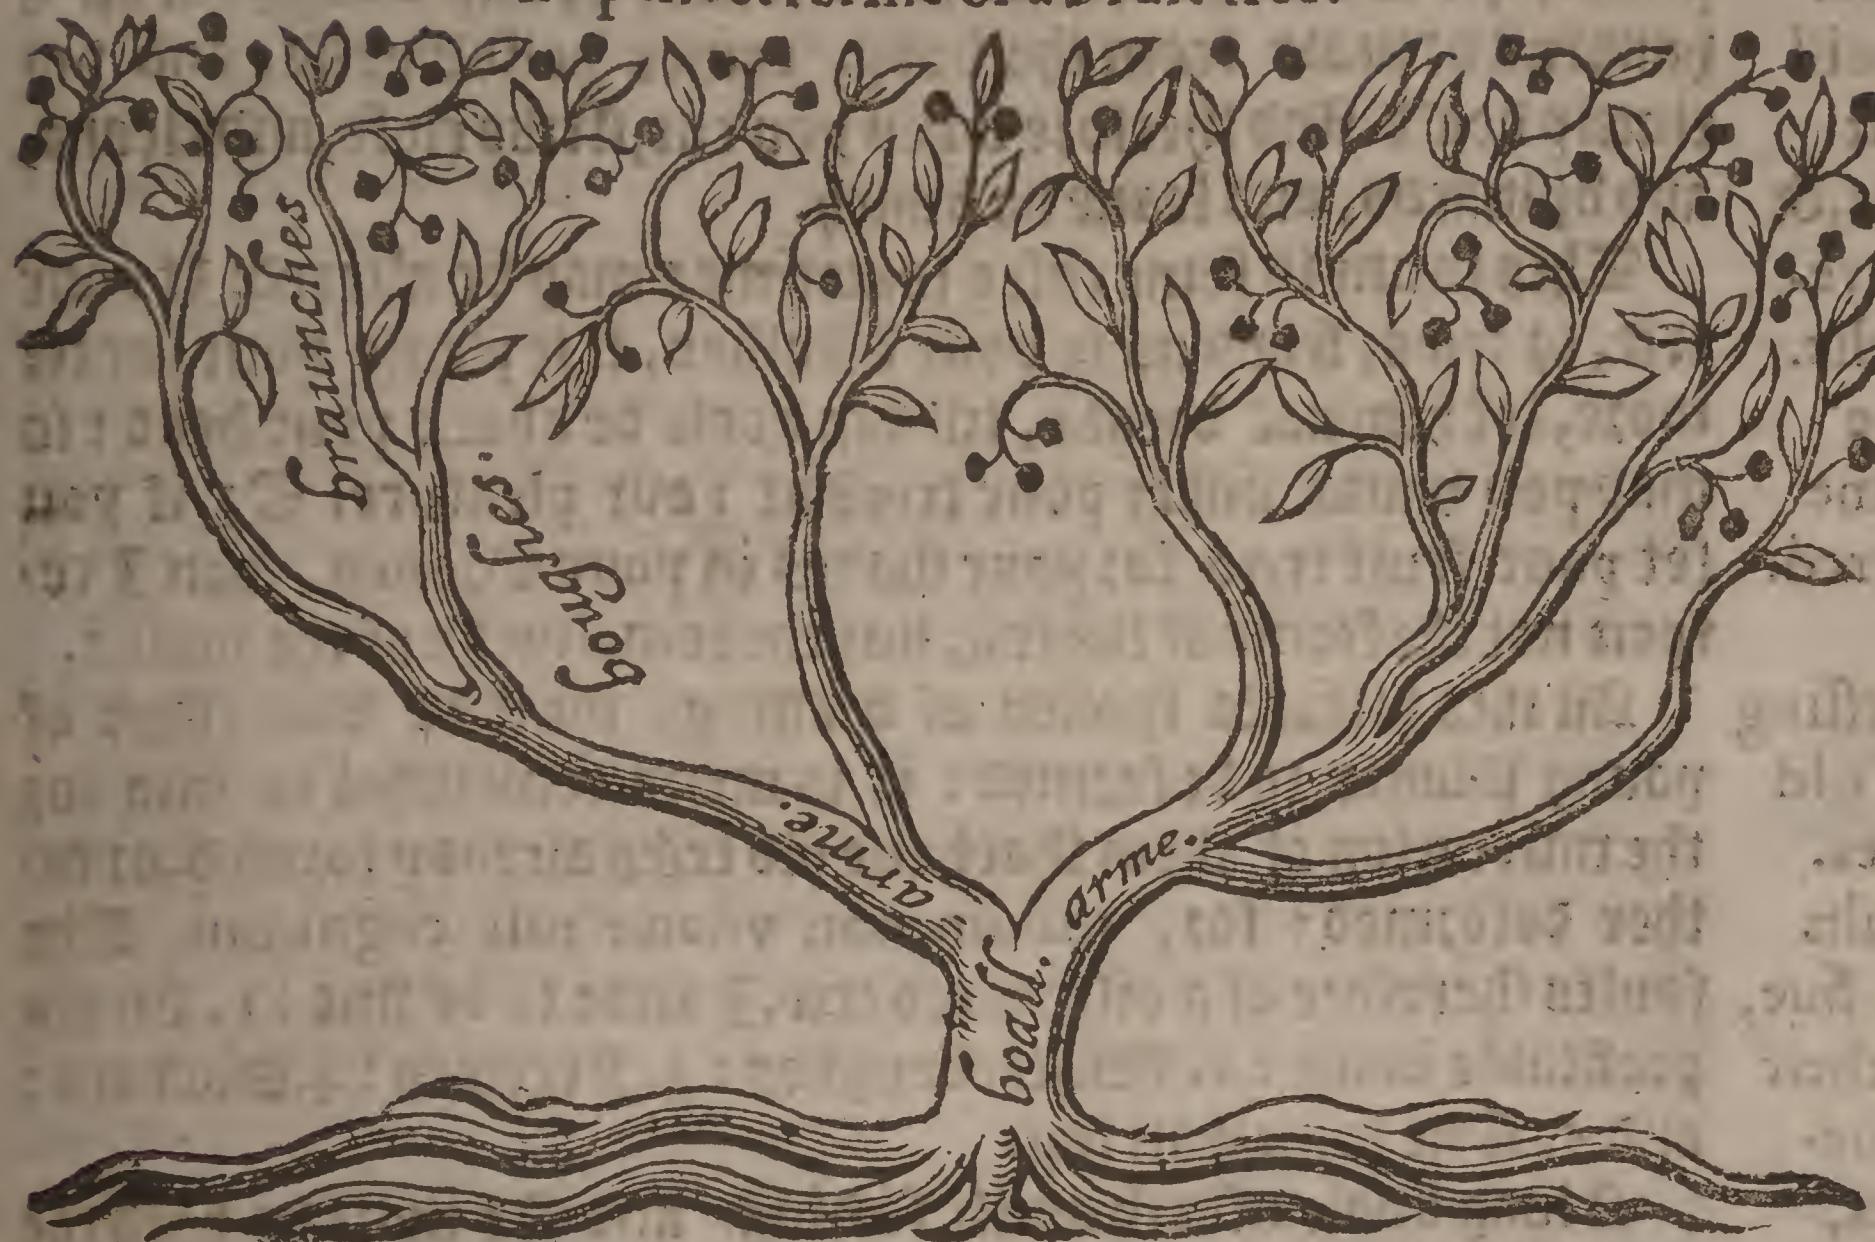

6 Thus shall your tree be easie to dress, and without danger, either to the tree or the dresser.

7 Thus may you safely and easily gather your fruit without falling, bruising or breaking of Cyons.

This is the best forme of a fruit-tree, which I haue here only shadowed out for the better capacity of them that are led more with the eye, than the mind, crauing pardon for the deformity, because I am nothing skilfull either in painting or caruing.

Imagine that the paper makes but one side of the Tree to appeare, the whole round compasse will giue leaue for many more armes, boughs, branches and Cyons.

The perfect forme of a Fruit tree.

If any thinke a tree cannot well be brought to this forme: Exerto crede Roberto. I can shew diuers of them vnder twenty yeares of age.

The fittest time of the Moone for propynge is as of grafting, when the sap is ready to stirre (not proudly stirring) and so to couer the wound, and of the yere, a month before (or at least when) you graffe. Dresse Peares, Apricoks, Peaches, Cherries, and Bullys sooner. And old trees before young plants, you may dresse at any time betwixt Leafe and Leafe. And note, that where you take any thing away, the sap the next summer will be putting: be sure therefore when he puts a bud in any place where you would not haue him, rub it off with your finger.

And heere you must remember the common homely Proverbe: Soone crookes the tree that good Camrell must bee. Dresse betime. Beginne betime with trees, and doe what you list: but if you let them grow great and stubborne, you must doe as the trees list. They will not bend but breake, nor be wound without danger. A small branch will become a bough, and a bough an arme in biguelle. Then if you cut him, his wound will fester, and hardly, without god skill, recover: therefore, obsta-

medie.

principijs. Of such wounds, and lesser, or any bough cut off a handfull or more from the body, comes holtownesse, and untimely death. And therfore when you cut, strike close, and cleane, and vpwards, and leauue no bunch.

This forme in some cases sometimes may be altered: If your tree, or trees, stand neare your Walkes, if it please your fancies more, let him not breake, till his boale be aboue your head: so may you walke vnder your trees at your pleasure. Or if you set your fruit træs for your shades in your Groues, then respect not the forme of the tree, but the comelinesse of the walke.

All this hitherto spoken of dressing, must be vnderstood of young plants, to be formed: it is meete somewhat be said for the instruction of them that haue old træs already formed, or rather deformed: for, malum non vitatur nisi cognitum. The faults therefore of a disordered tree, I finde to be fwe: 1. An vns profitable boale: 2. Waterboughes: 3. Fretters: 4. Suckers: and 5. One principall top.

A long boale asketh much feeding, and the more he hath the more he desires, and gets (as a drunken man drinke, or a covetous man wealth) and the lesse remaines for the fruit, he puts his boughes into the aire, and makes them the fruit, and it selfe more dangered with windes: for this I know no remedie, after that the tree is come to growth, once euill, never god.

Water boughes, or vndergrowth, are such boughes as grow low vnder others and are by them ouergrown, ouershadowed, dropped on, and pinde for want of plentie of sap, and by that meanes in time die: For the sap presseth vpward; and it is like water in her course, where it findeth most issue, thither it floketh, leaving the other lesser suces dry: even as wealth to wealth, and much to more. These so long as they beare, they beare leſſe, worse, and fewer fruit, and waterish.

The remedie is easie, if they be not growne greater than your arme. Lop them close & cleane, & cover the middle of the wound, the next Sommer when he is dry, with a salve made of tallow, tar, & a very little pitch, good for the couering of any such wound of a great tree: valesse it be barke-pild, and then a scar-cloth of fresh Butter, Honey, and Ware, presently (while the wound is græne) applyed, is a soueraigne remedie in summer especially. Some bind such wounds with a thumbe rope of Hay, moist, and rub it with dung.

Fret-

Fretters are, when as by the negligence of the Gardner, two, or moe parts of the tree, or of divers trēs, as armes, boughs, branches, or twigs, grow so nāre and close together, that one of them by rubbing, doth wound another. This fault of all other shewes the want of skill, or care (at least) in the Arborist: for here the hurt is apparant, and the remedy easie, sēne to betime: galls and wounds incurable, but by taking away those members: for let them grow, and they will be worse and worse, and so kill themselues with ciuill strife for roomth, and danger the whole trēe. Avoid them betime therefore, as a common wealth doth basome-enemies.

A Hucker is a long, prouid, and disorderly Cyon, growing streight vp (for pride of sap makes prouid, long & streight growth) out of any lower parts of the trēe, receiuing a great part of the sap, and bearing no fruit, till it haue tyrannized ouer the whole trēe: These are like idle and great Drones amongst Bees: and prouid and idle members in a common-wealth.

The remedy of this is, as of water-boughes, unlesse he be grāne greater, then all the rest of the boughs, and then your Gardner (at your discretion) may leau him for his boale, and take away all, or the most of the rest. If he be little, slip him, and set him, perhaps he will take: my fairest Apple-tree was such a Slip.

One or two principall top boughs are as euill, in a manner, as Huckers, they rise of the same cause, and receive the same remedy: yet these are more tolerable, because these beare fruit, yea the best: but Huckers of long doe not beare.

I know not how your trēe should be faulty, if you reforme all your vices timely, and orderly. As these rules serue for dressing young trēs and sets in the first planting: so may they well serue to helpe old trēs, though not exactly to recover them.

The Instruments fittest for all these purposes, are most commonly: For the great Trēs an handsome, long, light Ladder of Firpoles, a little, nimble, and strong armed Haw, and Sharpe. For leſſe Trēs, a little and Sharpe Hatchet, a broad mouthed Chesell, Strong and sharpe, with an handbētle, your Strong and Sharpe Cleaue, with a knock, and (which is a moſt neceſſary Instrument amongſt little Trēs) a great hafted and Sharpe knife or Whittle. And as needfull is a Stake

Stole on the top of a Ladder of eight or moe rungs, with two backe feet, whereon you may safely and easefully stand to grasse, to dresse, and to gather fruit, thus formed: The feet may be fast wedged in: but the Ladder must hang loose, with two bands of iron. And thus much of dressing trees for fruit, formally to profit.

## CHAP. XII.

## Of Foyling.

Necessi-  
ty of fo-  
ling.

Here is one thing yet very necessary for to make your Orchard both better, and more lasting: Pea, so necessary, that without it your Orchard cannot last, nor prosper long, which is neglected generally both in precepts and in practise, viz. manuring with Foile: whereby it hapneth that when trees (amongst other euils) through want of fatnesse to feede them, become mossie, and in their growth are euill (or not) thriuing, it is either attributed to some wrong cause, as age (when indeed they are but young) or euill stan- ding (and they never so well) or such like, or else the cause is altogether unknowne, and so not amended.

Trees  
great  
suckers.

Great  
bodies.

Can there be devised any way by nature, or art, sooner or soundlier to seeke out, and take away the heart and strength of earth, than by great trees? Such great bodies cannot bee sustained without great store of sap. What living body haue you greater than of trees? The great Sea-monsters (whereof one came a land at Teesmouth in Yorkeshire, hard by vs, 18. yards in length, and neere as much in compasse) seeme hideous, huge, strange, & monstrous, because they be indeed great: but especially, because they are selde me seen: But a tree liking, come to his growth and age, twice that length, and of a bulke never so great, besides his other parts, is not admired, because he is so commonly seen. And I doubt not, but if he were well regarded from his kynell, by succeding ages, to his full strength, the most of them would double their measure. About fifty yeeres agoe I heard by credible and constant report, That in Brooham Parke in West-moore-land, neere unto Penrich, there lay a blowne

blowne Dake, whose Trunke was so bigge, that two Horsemen being the one on the one side, and the other on the other side, they could not one see another: so which if you adde his armes, boughs, and roots, and consider of his bignesse, what would he haue bee[n], if preserued to the vantage. Also I read in the History of the West-Indians, out of Peter-Martyr, That sixtene men taking hands one with another, were not able to fathome one of those trees aboat. Now Nature having giuen to such a faculty by large and infinite roots, lawes and tangles, to draw immediatly his sustenance from our common mother the Earth (which is like in this point to all other mothers that beare) hath also ordained that the Tree ouer-loden with fruit, and wanting sap to feed all she hath brought forth, will waine all she cannot feed, like a woman bringing forth moe chil[dr]en at once then she hath teats. See you not how Trees especially, by kind being great, standing so sticke and close, that they cannot get plenty of sap, pine away all the grasse, weeds, lesser shrubs, and trees, yea and themselues also for want of vigor of sap? So that trees growing large, sucking the soile whereon they stand, continually, and amaine, and the soylzon of the earth that feeds them decaying (for what is there that wastes continually, that shall not haue end?) must either haue supply of sucken, or else leane thriuing and growing. Some grounds will beare Corne while they be new, and no longer, because their crust is shallow, and not very good, and lying high they scind and wash, and become barren. The ordinary Corne soilles continue not fertill, without following and foyling; and the best requires supply, eu[n] for the little body of Corne; How then can wee thinke that any ground (how good soever) can sustaine bodies of such greatnessse, and such great feeding, without great plenty of Sap arising from good earth? This is one of the chiefe causes, why so many of our Orchards in England are so evill thriuing when they come to growth, and our fruit so bad. Men are loth to bestow much ground, and desire much fruit, and will neither set their trees in sufficient compasse, nor yet feed them with manure. Therefore of necessity Orchards must be foiled.

The fittest time is, when your Trees are growne great, Time fit  
and haue neare hand spread your earth, wanting new earth to for foy-

Kind of  
foyle.

sustaine them, which if they do, they will seeke abroad for better earth, and shun that, which is barren (if they find better) as catell euill pasturing. For nature hath taught every creature to desire and seeke his owne good, and to auoid hurt. The best time of the yeere is at the Fall, that the Frost may bite and make it tender, and the Raine wash it into the roots. The Summer time is perillous if ye dig, because the sap stirs amaine. The best kinde of Foile is such as is fat, hot, and tender. Your earth must be but lightly opened, that the dung may goo in, and wash away; and but shallow, lest you hurt the roots: & in the spring, closely and equally made plaine againe for feare of Suckers. I could wish, that after my Trees haue fully possessed the soile of mine Orchard, that euery seuen yeeres at least, the soile were bespread with dung halfe a foot thicke at least. Puddle water out of the dunghill poured on plentifully, will not only moisten but fatten especially in June and July. If it bee thicke and fat and applied euery yeere, your Orchard shall need none other foiling. Your ground may lye so low at the River side, that the flood standing some daies and nights thereon, shall saue you all this labour of foiling.

## CHAP. XIII.

*Of Annoyances.*

Two  
kinds of  
euils in  
an Or-  
chard.

These helpe to make euery thing god, is to auoid the euils thereof: You shall never attaine to that god of your Orchard you looke for, unlesse you haue a Gardner, that can discerne the diseases of your trees, & other annoyances of your Orchard, & finde out the causes thereof, and knewe & apply fit remedies for the same. For be your ground, site, plants, and trees as you would wish, if they be wasted with hurtful things, what haue you gained but your labo: for your trauel? It is with an Orchard & every tree, as with mans body. The best part of physick for preseruation of health, is to foresee & cure diseases.

All the diseases of an Orchard are of two sorte, either inter- nall or externall. I call those inward hurts which breed on and in particular trees.

I Galles.

1 Galles.

5 Barke bound.

2 Canker.

6 Barke pild.

3 Mosse.

7 Worme.

4 Weaknes in setting. 8 Deadly wounds.

Galls, Canker, Mosse, weaknesse, though they bee diuers diseases: yet (howsoever Authors thinke otherwise) they rise all out of the same cause.

Galles we haue described with their cause and remedy, in Galls. the i i. Chapter vnder the name of fretters.

Canker is the consumption of any part of the tree, barke and wood, which also in the same place is deciphered vnder the title of water-boughes. Canker.

Mosse is sensibly seene and knowone of all, the cause is pointed out in same Chapter, in the discourse of Timber-wood, and partly also the remedy: But for Mosse adde this, That at any tyme in summer (the Spring is best) when the cause is remoued, with an Harecloth, immediately after a shoure of raine, rub off your Mosse, or with a peice of weed (if the Mosse abound) formed like a great knife. Mosse.

Weaknesse in the setting of your fruit shall you finde there also in the same Chapter, and his remedy. All these flow from the want of roomth in god soile, wrong planting, Chap. 7. and cuill or no dressing. Weak-  
nesse in  
setting.

Barke-bound (as I thinke) riseth of the same cause, and the best, and present remedy (the causes being taken away) is with your sharpe knife in the Spring, length-way to launch his barke throughout, on thre or four sides of his boale. Bark-  
bound.

The disease called the Worme is thus discernid: The barke will be hoald in diuers places like gall, the wood will die & dry, & you shall see easily the barke swell. It is verily to be thought, that therin is bred some worme. I haue not yet thorowly sought it out, because I was never troubled therewithall: but only haue seene such trees in diuers places. I thinke it a worme rather, because I see this disease in trees, bringing fruit of sweet taste, & the swelling shewes as much. The remedy (as I conjecture) is so soone as you perceiue the wound, the next spring cut it out barke & all, and apply Cowes pisse & vineger presently, and so twise or thrice a weeke for a Moneths space: For I well perceiue, if you suffer it any time, it eates the tree or bough round, & so kills. Remedy.

Since I first wrote this Treatise, I haue changed my mind concerning the disease called the worme, because I read in the History of the West-Indians, that their trees are not troubled with the disease called the worme or canker, which ariseth of a raw and euill concocted humor or sap, Whilnesse Pliny, by reason their Country is more hot then ours, whereof I thinke the best remedy is (not disallowing the former, considering that the worme may breed by such an humor) warme standing, sound lopping and good dressing.

Bark-pilde.  
Woods.

Remedy.

Hurts  
on trees.  
Ants,  
Earwigs,  
Cater-  
pillars,  
and such  
like  
wormes.

External  
cuils.

Bark-pild you shall find with his remedy in the 11. Chapter. Deadly wounds are when a mans Arborist wanting skill, cuts off armes, boughs or branches an inch, or (as I see sometimes) an handfull, or halfe a foot or more from the body: These so cut cannot couer in any time with sap, and therefore they die, and dying they perish the heart, and so the tree becomes hollow, and with such a deadly wound cannot live long.

The remedy is, if you find him before he be perished, cut him close, as in the 11. Chapter: if he be hoald, cut him close, fill his wound, tho never so deepe, with morter well tempered and so close at the top his wound with a Seare-cloth doubled & nailed on, that no aire nor raine approach his wound. If he be not very old, and detaining, he will recouer, and the hole being closed, his wound within shall not hurt him for many yeeres.

Hurts on your trees are chiefly Ants, Earwigs, and Caterpillars. Of Ants and Earwigs is said Chap. 10. Let there be no swarme of Bismires neere your Tree root, nor not in your Orchard, turne them ouer in a frost, and poure in water, and you kill them.

For Caterpillars, the vigilant Fruterer shall sone espy their lodging by their Web, or the decay of leaues eaten round about them. And being sene, they are easily destroyed with your hand, or rather (if your tree may spare it) take sprig and all (for the red peckled butter-fye doth euer put them, being her sparm, among the tender sprates for better feeding, especially in drought) and tread them vnder your feet. I like nothing of smoke among my trees. Unnatrall heates are nothing good for naturall trees. This for diseases of particular trees.

Externall hurts are either things naturall or artificiall. Particular things, externally hurting Orchards:

1 Beasts

- |           |          |            |              |
|-----------|----------|------------|--------------|
| 1 Beasts. | 1 Deere. | 2 Birds.   | 1 Bulfinch.  |
| 2         |          | 2 Goates.  | 2 Thrush.    |
| 3         |          | 3 Sheepe.  | 3 Blackbird. |
| 4         |          | 4 Hare.    | 4 Crow.      |
| 5         |          | 5 Cony.    | 5 Pye.       |
| 6         |          | 6 Cattell. |              |
| 7         |          | 7 Horse.   | ec.          |

The other things are,

- 1 Winds.
- 2 Cold.
- 3 Trees.
- 4 Weeds.
- 5 Wormes.
- 6 Mowles.
- 7 Filth.

8 Poysonfull smoke.

Externall wilfull euils are these:

- 1 Walls.
- 2 Trenches.
- 3 Other works noisome done in or neere your Dy-
- 4 Euill Neighbours. (chard)
- 5 A carelesse Master.
- 6 An vndiscreet, negligent or no Keeper.

See you not here an whole Army of mischieves banded in  
troupes against the most fruitfull trees the earth beares : assat-  
ling your god labours. Good things haue most enemies.

A skilfull Fruterer must put to his helping hand, and dis- Remedy  
band and put them to flight.

For the first ranke of beasts, besides your out strong fence, Deere,  
you must haue a faire and swift Greyhound, a Stone-bow,gun, &c.  
and if neede require, an Apple with an hooke for a Deere, and  
an Hare-pipe for an Hare.

Your Cherries and other Berries when they be ripe, wil draw Birds.  
all the Black-birds, Thrushes and Haw-pies to your Orchard.  
The Bul-finche is a deuourer of your Fruit in the bud, I haue  
had whole trees shald out with them in Winter-time.

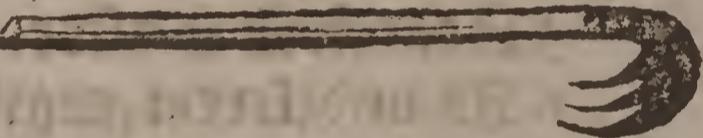

The best remedy here is a Stone-bow, a Piece, especially if Remedy  
you haue a Musket or Spar-hawke in Winter to make the  
Black bird stope into a bush or hedge.

The Gardner must cleanse his soile of all other Trees: but Other  
fruit trees..

fruit træs aforesaid Chapter 2. for which it is ordained, and I would especially name Dkes, Elmes, Ashes, and such other great wood, but that I doubt it should be taken as an admission of lesser træs : for I admit of nothing to grow in mine Orchard but Fruit and Flowers. If Sap can hardly be good to fede our Fruit-træs, why should we allow of any other, especially thosz, that will become their Masters, and wrong them in their livelyhood.

And although we admit without the fence of Walnuts in most plaine places, Træs middle-most, and Ashes or Dkes, or Elmes vtmost, set in comely rowes equally distant with faire Allies twixt row and row to auoid the boisterous blasts of winds, and within them also others for Bæs ; yet we admit none of this into your Orchard-plat : other remedy then this haue we none against the nipping frosts.

Weeds in a fertile soile (because the generall curse is so) till your Træs grow great, will be noysome, and deform your allies, walkes, beds, and squares, your vnder Gardners must labour to kæpe all cleanly and handsome from them, and all other filth with a Spade, weeding-knives, rake with iron teeth: a skrapple of Iron thus formed,

#### For Nettles and ground-Iuy after a showre.

When Weeds, straw, stickes, and all other scrapings are gathered together, burne them not, but bury them vnder your crust in any place of your Orchard, and they will dye and fatten your ground.

Wormes and Moales open the earth, and let in aire to the roots of your Træs, & deform your squares and walkes, & feeding in the earth, being in number infinite, draw on barrennes.

Wormes may easily be destroyed. Any Summer euening when it is darke, after a showre with a Candle, you may fill bushels, but you must tread nimly. And where you cannot come to catch them so ; sift the earth with coale ashes an inch or two thicknesse, and that is a plague to them, so is sharpe grauell.

Moles will anger you, if your Gardner or some skilfull Molecatcher ease you not, especially having made their fortresses among the roots of your træs : you must watch her well with a

Mole-

Winds.

Frosts.

Weeds.

Remedy

Wormes  
Moles.

Remedy

Mole-speare, at morne, noon, and night, when you see her utmost hill, cast a trench betwixt her and her home (for she hath a principall mansion to dwell and breed in about Aprill, which you may discerne by a principall hill, wherein you may catch her, if you trench it round and sure, and watch well) or wheresoever you can discerne a single passage (for such she hath) there trench, and watch, and haue her.

Wilfull annoyances must be prevented and auoided by the loue of the Master and Fruiterer, which they beare to their Orchard.

Wilfull annoyances.

Justice and liberality will put away euill neighbours or euill neighbour-hood. And then (if God blesse and giue successe to your labours) I see not what hurt your Orchard can sustaine.

Remedy

#### CHAP. XIII.

#### *Of the Age of Trees.*

T is to be considered: All this Treatise of trees tends to this end, that men may loue and plant Orchards, whereunto there cannot be a better inducement then that they know (or at least be perswaded) that all that benefit they shall reape thereby, whether of pleasure or profit, shall not be for a day or a month, or one, or many (but many hundreth) yeeres. Of good things the greatest, and most durable is alwaies the best. If therefore out of reason grounded vpon experiance, it bee made (I thinke) manifest, but I am sure probable, that a fruit-tree in such a soile and site, as is described so planted and trimmed and kept, as is afore appointed and duly soiled, shall dure 1000. yeeres, why should we not take paines, and be at two or three peeres charges (for vnder seuen yeeres will an Orchard be perfected for the first planting, and in that time be brought to fruit) to reape such a commodity, and so long lasting.

The age  
of trees.

Let no man thinke this to be strange, but peruse and consider the reason. I haue Apple-trees standing in my little Orchard, which I haue knowne these forty yeeres, whose age before my time I cannot learne, it is beyond memory, tho I haue enquired of diuers aged men of 80. yeeres and vpwards; these trees although come into my possession very euill ordered,

Gath-  
red by  
reason  
out of ex-  
perience.

red, mishaken, and one of them wounded to his heart, and that deadly (for I know it will be his death) with a wound, wherein I might haue put my foot in the heart of his bulke (now it is lesse) notwithstanding, with that small regard they haue had since, they so like, that I assure my selfe they are not come to their growth by more than 2. parts of 3. which I discerne not only by their owne growth, but also by comparing them with the bulke of other trees. And I find them short (at least) by so many parts in bignesse, although I know those other fruit trees to haue binne much hindred in their stature by euill guiding. Herehence I gather thus.

Parts of  
a Trees  
age.

If my træs be a hundred yeres old, and yet want two hundred of their growth before they leauē encreasing, which make threē hundred, then we must needs resolute, that this threē hundred yere are but the third part of a Træs life, because (as all things living besides) so Træs must haue allowed them for their increase one third, another third for their stand, and a third part of time also for their decay. All which time of a Træe amounts to nine hundred yeres, threē hundred for increase, three hundred for his stand, whereof we haue the tearme stature, and threē hundred for his decay, and yet I thinke (for we must conjecture by comparing, because no one man liueth to see the full age of Trees) I am within the compasse of his age, supposing alwaies the foresaid meanes of preserving his life. Consider the age of other living creatures. The Horse and maled Ore wrought to an vntimely death, yet double the time of their increase. A Dog likewise increaseth three, stands three at least, and in as many (or rather moe) decays. Every living thing bestowes the least part of his age in his growth, and so must it needs be with Trees. A man comes not to his full growth and strength (by common estimation) before thirty yeeres, and some slender and cleane bodies, not till forty, so long also stands his strength, and so long also must hee haue allowed by course of nature to decay. Euer supposing that he bee well kept with necessaries, and from and without straines, bruises, and all ether domyng diseases. I will not say vpon true report, that Physicke holds it possible, that a cleane body kept by these 3. Doctors, Doctor Dyer, Doctor Quiet, and Doctor Merriman, may liue neare a hundred yeeres.

Mans  
age.

Neither

Neither will I heere bge the long yeeres of Methushalah, and those men of that time, because you will say, Mans dayes are shortned since the flood. But what hath shortned them? God for mans sinnes: but by meanes, as want of knowledge, euill gouernement, ryot, gluttony, drunkennes, and (to be short) the encrease of the curse, our sinnes increasing in an iron and wicked age.

Now if a man, whose body is nothing (in a manner) but tender rotteness, whose course of life cannot by any meanes, by counsell, restraint of lawes, or punishment, nor hope of praise, profit, or eternall glory, be kept within any bounds, who is degenerate cleane from his naturall feeding, to effeminate niceenesse, and cloying his body with excesse of meat, drinke, sleepe, &c. and to whom nothing is so pleasant and so much desired as the causes of his owne death, as idlenesse, lust, &c. may liue to that age: I see not but a tree of a solide substance, not dammified by heate or cold, capable of, and subiect to any kinde of odering or dressing, that a man shall apply vnto him, feeding naturally, as from the beginning disburdened of all superfluities, eased of, and of his owne accord avoiding the causes that may annoy him, should double the life of a man, more than twice told; and yet naturall philosophy, and the uniuersall consent of all Histories tell vs, that many other living creatures farre exceed man in the length of yeeres: As the Part and the Rauen. Thus reporteth that famous Roterodam out of Hesiodus, and many other Historiographers. The testimony of Cicero in his booke De Senectute, is weighty to this purpose: that we must in posteras & tates ferere arbores, which can haue none other sence: but that our fruit trees, whereof he speakes, can endure for many ages.

What else are trees in comparison with the earth: but as haire to the body of man? And it is certaine, without poisoning, euill and distemperate dyet, and vsage, or other such forcible cause, the haire dure with the body. That they be called excrements, it is by reason of their superfluous growth: (for cut them as often as you list, and they will still come to their naturall length.) Not in respect of their substance, and nature. Haire endure long, and are an ornament and vse also to the body, as trees to the earth.

So that I resolute vpon good reason, that fruit-trees well ordered, may liue and like a thousand yeeres, and beare fruit, and the longer, the more, the greater, and the better, because his bignour is proud and stronger, when his yeeres are many: You shall see old trees put their buds and blossomes both sooner and more plentifully than yong trees by much. And I sensibly perceiue my yong trees to inlarge their fruit, as they grow greater, both for number, and greatness. Yong Heifers bring not forth Calves so faire, neither are they so plentifull to milke, as when they become old Kine. No good Houswife wil breed of a yong but an old bird-mother: It is so in all things naturally, thereforee in trees.

The age of timber trees.

And if fruit-trees last to this age, how many ages is it to be supposed, strong and huge timber trees will last: whose huge bodies require the yeeres of divers Methushalahes, before they end their dayes, whose Sap is strong and bitter, whose Bark is hard and thicke, and their substance solid and stiffe: all which are defences of health and long life. Their strength withstands all forcible winds, their sap of that quality is not subiect to wormes and tainting. Their bark receiues seldom or never by casualty any wound, and not onely so, but he is free from remouals, which are the death of millions of trees, whereas the fruit tree in comparison is little, and often blowne downe, his sap sweet, easily, and soone tainted, his bark tender, and soone wounded, and himselfe vsed by man, as man vseth himselfe, that is either unskilfull, or carelessly.

It is good for some purposes to regard the age of your fruite trees, which you may easily know, till they come to accomplish twenty yeeres, by his knots: Reckon from his root by an arme, and so to his top-twig, & every yeeres growth is distinguished from other by a knot, except lopping or removing doe hinder.

#### CHAP. X V.

#### Of gathering and keeping Fruit.

**A**Lthough it be an easie matter, when God shal send it, to gather and keepe fruit, yet are there certayne things worthy your regard. You must gather your fruite when it is ripe, and not before, else will it wither and be tough and sovre. All fruite generally are ripe, when they beginne to fall.

Generall Rule.

fall. For Trees doe as all other bearers doe, when their yong ones are ripe, they will swaine them. The Dove her Pigeons, the Cony her Rabbets, and women their children. Some fruit tree sometimes getting a faint in the setting with a frost or evill winde, will cast his fruit untimely, but not before he leauing them sap, or they leauing growing. Except frō thys fore-said rule, Cherries, Damsons, and Bullies. The Cherry is Cherries, ripe when he is sweld wholly red, and sweet : Damsons and &c. Bullies not before the first frost.

Apples are knowne to bee ripe, partly by their colour, Apples. growing towards a yellow, except the Leather-coat and some Peares and Greening.

Timely Summer fruit will be ready, some at Midsummer, When. most at Lammas for present use ; but generally no keeping fruit before Michael tide. Hard Winter fruit and Wardens longer.

Gather at the full of the Moone for keeping, gather dry, for Dry stalkes. feare of rotting.

Gather the stalkes withall: for a little wound in fruit, is deadly : but not the stumpe, that must beare the next fruit, nor leaues, for moisture patrisies.

Gather euery kinde severally by it selfe, for all will not keep Seuerally. alike, and it is hard to discerne them, when they are mingled.

If your trees be ouer-laden (as they will be, being ordered, Ouerladen as is before taught you) I like better of pulling some off (tho trees. they be not ripe) neere the top end of the bough, then of prop-ping by much, the rest shall be better fed. Propping puts the bough in danger, and frets it at least.

Instruments: A long Ladder of light Firre: A steele-lad- Instru-  
der as in the iij. Chapter. A gathering apron like a poake be-  
fore you, made of purpose, or a Wallet hung on a bough, or a  
basket with a stue bottome, or skinne bottome, with Lathes or  
splinters vnder, hung in a rope to pull vp & down: bruise none, Bruises.  
euery bruise is to fruit death: if you doe, vse them presently.  
An hooke to pul boughs to you is necessary, breake no boughes.

For keeping, lay them in a dry Loft, the longest keeping Keeping.  
Apples first and furthest on dry straw, on heapes ten or four-  
teene dayes, thicke, that they may sweat. Then dry them with  
a soft & cleane cloth, and lay them thinne abroad, Long keeping  
fruit

fruit would bee turned once in a moneth softly: but not in noz  
immediatly after frost. In a lost couer well with straw, but ra-  
ther with chaffe or bran: For frost doth cause tender rotteness.

## C H A P. XVI. Of Profits.

**N**ow pause with your selfe, and view the end of all your labours in an Orchard: unspeakable pleasure, and infinit commoditie. The pleasure of an Orchard I referre to the last Chapter for the conclusion: and in this Chapter, a word or two of the profit, which thorowly to declare is past my skill: and I count it as if a man should attempt to adde light to the Sunne with a Candle, or number the Starres. No man that hath but a meane Orchard or judgement but knowes, that the commoditie of an Orchard is great: Neither would I speake of this, being a thing so manifest to all; but that I see, that through the carelesse laziness of men, it is a thing generally neglected. But let them know, that they lose hereby the chiefeſt good which belongs to housekeeping.

Compare the commoditie that commeth of halfe an acre of ground, set with fruit trees and hearbs, so as is prescribed, and a whole Acre (say it be two) with Corne, or the best commoditie you can wish, and the Orchard shall exceed by diuers degrees.

In France and some other Countries, and in England, they make great vſe of Cydar and Perry, thus made: Drieſſe every Apple, the stalk, upper end, and all galles away; Stamp them, and straine them, and within 24. houres tanne them vp into cleane, ſweet, and ſound bellung, for feare of cuill ayze, which they will readily take: and if you hang a poake full of Cloues, Mace, Nutmegs, Cinamon, Ginger, and pilſ of Lemmons in the midſt of the bellung, it will make it as wholesome and pleafant as wine. The like uſage doth Perry require. These drinkeſ are very wholesome, they coole, purge, and prevent hot Agues. But I leauē this ſkill to Physicians.

The benefit of your fruit, Rootes and Hearbs, though it were but to eafe and ſell, is much.

Waters diuiled of Roses, Woodbind, Angelica, are both profitable and wonderous pleasant, and conforitable.

Section

Cydar and  
Perry.

Fruit.

Waters.

Saffron and Lycoræ will yeeld you much Conserues and Preserves, are ornaments to your Feasts, health in your Conserues sicknesse, and a good helpe to your friend, and to your purse.

He that will not be moued with such unspeakable profits, is well worthy to want, when others abound in plenty of good things.

## CHAP. XVII. Ornaments.

**M**E thinks hitherto we haue but a bare Orchard foz fruit, and but halfe good, so long as it wants those comely Ornaments, that shoule giue beauty to all our labours, and make much foz the honest delight of the owner and his friends.

For it is not to be doubted: but as God hath giuen man things profitable, so hath hee allowed him honest comfort, delight, and recreation in all the works of his hands. Nay, all his labours vnder the Sunne without this are troubles, and vexation of minde: For what is grēdy gaine, without delight, but moyling, and turmoylng in slauery? But comfortable delight, with content, is the good of every thing, and the patterne of heauen. A morsell of bread with comfort, is better by much than a fat Oxe with vnquietnesse. And who can deny, but the principall end of an Orchard, is the honest delight of one wearied with the works of his lawfull calling? The very works of, and in an Orchard & Garden, are better than the ease and rest of and from other labours. When God had made man after his owne Image, in a perfect state, and would haue him to represent himselfe in authority, tranquillitie, & pleasure vpon the earth, he placed him in Paradise. What was Paradise? but a Garden and Orchard of trees and hearbs, full of all pleasure: & nothing there but delights. The gods of the earth, resembling the great God of heaven in authoritie, Maiestie, and abundance of all things, whereto is their most delight? And whither doe they withdraw themselves from the troublesome assayzes of their estate, being tyzed nesse. With the hearing and iudging of litigious Controversies? choked (as it were) with the close ayres of their sumptuous buildings, their stomacks cloyed with varietie of Banquets, their eares filled & ouerburthened with tedious discourses?

Delight  
the chiefe  
end of  
Orchards.

An Or-  
chard de-  
lightsome.

An Or-  
chard is  
Paradise.

Causes of  
wearisome-  
nesse.

Orchard is whither? but into their Orchards? made and prepared, dyed theremedy. sed and destinatior for that purpose, to renew and refresh their sences, and to call home their ouer-wearied spirits. Nay, it is (no doubt) a comfort to them, to set open their Cazements into a most delicate Garden and Orchard, wherby they may not onely see that, wherein they are so much delighted, but also to gine fresh, sweet, and pleasant ayre to their Galleries and Chambers.

All delight  
in Or-  
chards.

And looke, what these men doe by reason of their greatnesse and abilitie, prouoked with delight, the same doubtlesse would euery of vs doe, if power were answerable to our desires, whereby we shew manifestly, that of al other delights on earth, they that are taken by Orchards, are most excellent, and most agreeing with nature.

This de-  
lights all  
the sences.

For whereas euery other pleasure commonly filleth some one of our sences, and that onely, with delight, this makes all our sences swimme in pleasure, and that with infinit variety, toy ned with no lesse commodity.

Delighteth  
old age.

That famous Philosopher, & matchlesse Drator, M. T. C. prescribeth nothing moze fit, to take away the tediousnesse and heauy load of three or fourre score yeares, than the pleasure of an Orchard.

Causes of  
delight in an  
Orchard.

What can your eye desire to see, your eares to heare, your mouth to taste, or your nose to smell, that is not to be had in an Orchard, with abundance and variety? What moze delighte some than an infinite varietie of sweet smelling flowers? decking with sundry coloures, the greene mantle of the Earth, the uniuersall Mother of vs all, so by them bespotted, so dyed, that all the world cannot sample them, and wherein it is moze fit to admire the Dyer, than imitate his workmanship. Colouring not onely the earth, but decking the ayre, and sweetning euery breath and spirit.

Flowers.

The Rose red, damaske, velvet, and double double prouince Rose, the sweet muske Rose double and single, the double and single white Rose. The faire and sweet senting Woodbinde, double and single, and double double. Purple Cowslips, and double Cowslips, and double double Cowslips. Primerose double and single. The Violet nothing behinde the best, for smelling sweetly. And 1000. moze will prouoke your content.

And

And all these, by the skill of your Gardiner, so comely, and Borders and orderly placed in your Borders and Squares, and so intermin- squares. gled, that none looking thereon, cannot but wonder, to see, what Nature corrected by Art can doe:

When you behold in diuers corners of your Orchard Mounts. Mounts of stene, or wood curiously wrought within and without, Whence out, or of earth conered with fruit-trees: Kentish Cherry, you may Damsons, plummes, &c. With staices of precious workman- shoothe a ship. And in some corner (or mo) a true Dyall or Clocke, and Bucke. some Anticke workes, & especially silver-sounding Musique, Dyall. mixt Instruments and voices, gracing all the rest: How will Musique. you be rapt with delight?

Large Walks, broad & long, close and open, like the Tempe Walkes. groves in Thessalie, raised with granell and sand, having seats Seats. and banks of Camomile, all this delights the minde, & brings health to the body.

View now with delight the workes of your owne hands, Order of your fruit trees of all sorts, loaden with sweet blossomes, and trees. fruit of all tastes, operations, and colours: your trees standing in comely order whitch way soever you looke.

Your borders on every side hanging and drooping with Fe- berries, Raspberries, Warberries, Currans, and the rootes of your trees powdered with Strawberries, red, white, and greene, what a pleasure is this? Your Gardiner can frame your lesser wood to the shape of men armed in the field, ready Shape of to giue battell: or swift running Greyhounds: or of well sen- men and ted and true running Hounds, to chase the Deere, or hunt the beasts. Hare. This kinde of hunting shall not waste your corne, nor much your coyne.

Mazes well framed a mans height, may perhaps make your Mazes. friend wander in gathering of berries, till hee cannot recouer himselfe without your helpe.

To haue occasion to exercise within your Orchard: it shall Bowle be a pleasure to haue a Bowling Alley, or rather (which is Ally. more manly, and moze healthfull) a paire of Buts, to stretch Buts. your armes.

Rosemary and sweet Eglantine are seemely ornaments Hearbs. about a Doore or Window, so is Woodbinde. Conduit. Looke Chap. 5. and you shall see the forme of a Con- duct.

Riuers.

Moats.

Bees.

Vine.

Birds.

Nightingale.

Robin-red-breast.

Wren.

Black-bird.

Thrush.

buit. If there were two or more, it were not amisse.

And in mine opinion, I could highly commend your Orchard, if either thowt, or hard by it there should runne a pleasant Riuer with siluer Streames: you might sit in your Mount, and angle a peckled Trout, or sleightie Eele, or some other Fish. Or Moats, whereon you might row with a Boat, and fish with Nets.

Sto:re of Bees in a dry and warme Bee-houle, comely made of Firboords, to sing, and sit, and feed vpon your flowers and sprouts, make a pleasant noyse and sight. For cleanly and innocent Bees, of all other things, loue and become, and thrive in an Orchard. If they thrive ( as they must needs, if your Gardiner be skilfull, & loue them: for they loue their friends, and hate none but their enemies ) they will, besides the pleasure, yeeld great profit, to pay him his wages. Pea, the increase of twenty Stocks or Stooles, with other fees, will keep your Orchard. You need not doubt their stings, for they hurt not whom they know, and they know their keeper and acquaintance. If you like not to come amongst them, you need not doubt them: for but neere their Sto:re, and in their owne defense, they will not fight, and in that case onely ( and who can blame them? ) they are manly, and fight desperately. Some ( as that Honourable Lady at Hacknes, whose name doth much grace mine Orchard) vse to make seats for them in the Stone wall of their Orchard, or Garden, which is good, but wood is better.

A Vine ouer-shadowing a seat, is very comely, though her Grapes be vs ripe slowly.

One chiefe grace that adorns an Orchard, I cannot let slip: A brood of Nightingales, who with their severall notes and tunes, with a strong delightsome voice, out of a weake body, will beare you company night and day. She leues (and liues in) hots of woods in her heart. She will helpe you to cleanse your trees of Caterpillers, and all noisome wormes and flies. The gentle Robin-red-breast will helpe her, and in Winter in the coldest stormes will keepe a part. Neither will the silly Wren be behinde in Summer, with her distinct whistle (like a sweet Recorder) to cheere your spirits.

The Black-bird and Throstle (for I take it the Thrush sings not,

not, but deuoures) sing loudly in a May morning, and delights the eare much (and you need not want their company, if you haue ripe Cherries or Berries, and would as glably as the rest doe you pleasure:) But I had rather want their company than my fruit.

What shall I say? 1000. of delights are in an Orchard: and sooner shall I be weary, then I can reckon the least part of that pleasure, which one that hath and loues an Orchard, may finde therein.

What is there of all these few that I haue reckoned, which doth not please the eye, the eare, the smell, and taste? And by these sences as Organes, Pipes, and Windowes, these delights are carried to refresh the gentle, gelerous, and noble minde.

To conclude, what ioy may you haue, that you living to Your owne such an age, shall see the blessings of God on your labours labour. while you live, and leane behinde you to your heires or successors (for God will make heires) such a worke, that many ages after your death, shall record your loue to your Country? And the rather, when you consider (Chap. 14.) to what length of lime your worke is like to last.

# THE COUNTRY HOVS WIFES GARDEN.

CHAP. I.

*The Soyle.*

He soyle of an Orchard & Garden, differ onely in these three points : First, the Gardens soyle would be somewhat dry- Dry. er, because hearbs beeing moze tender than trees, can neither abide moisture nor drought, in such excesse measure, as trees ; and therefore hausing a dryer soyle, þ remedy is easie against drought, if need be: water soundly, whiche may bee done with small labour, the compasse of a garden being nothing so great, as of an Orchard, and this is the cause (if they know it) that Gardiners raise their squares : but if moisture trouble you, I see no remedy without a generall danger, except in Hops, which de- Hops, light much in a low and sappy earth.

Secondly, the soyle of a Garden would be plaine and leuell, Plaine. at least every square (for we suppose the square to be the fittest forme) the reason: the earth of a Garden wanting such helpe, as shoulde stay the water, whiche an Orchard hath, and the roots of hearbs being shorȝt, and not able to fetch their liquor from the bottome, are moze annoyed by drought, and the Soyle being mellow and loose, is soone either wash't away, or sendes out his heart by too much drenching and washing.

Thirdly, if a garden soyle be not cleere of weeds, and namely,

## The Country Housewifes Garden.

of grasse, the hearbs shall never thynge: for how shold good hearbs prosper, when enyll weeds waxe so fast: considering good hearbs are tender in respect of enyll weedes: these being strengthened by nature, and the other by Art? Gardens haue small place in comparison, and therfore may the more easily be fallewed, at the least one halfe yere before, and the better dres- sed after it is framed. And ye shall finde that cleane keeping doth not onely avide danger of gathering weeds, but also is a speciaall ornament, and leaues more plentifull sap for your ten- der hearbs.

### CHAP. II.

#### Of the Site.

I Cannot see in any sort, how the Site of the one shoulde not be good, and fit for the other: The ends of both being one, good, wholesome, and much fruit ioyned with delight, vntesse trees be more able to abide the nipping frosts than tender hearbs: but I am sure, the flowers of trees are as soone perished with cold, as any heathe except Pompions, and Melons.

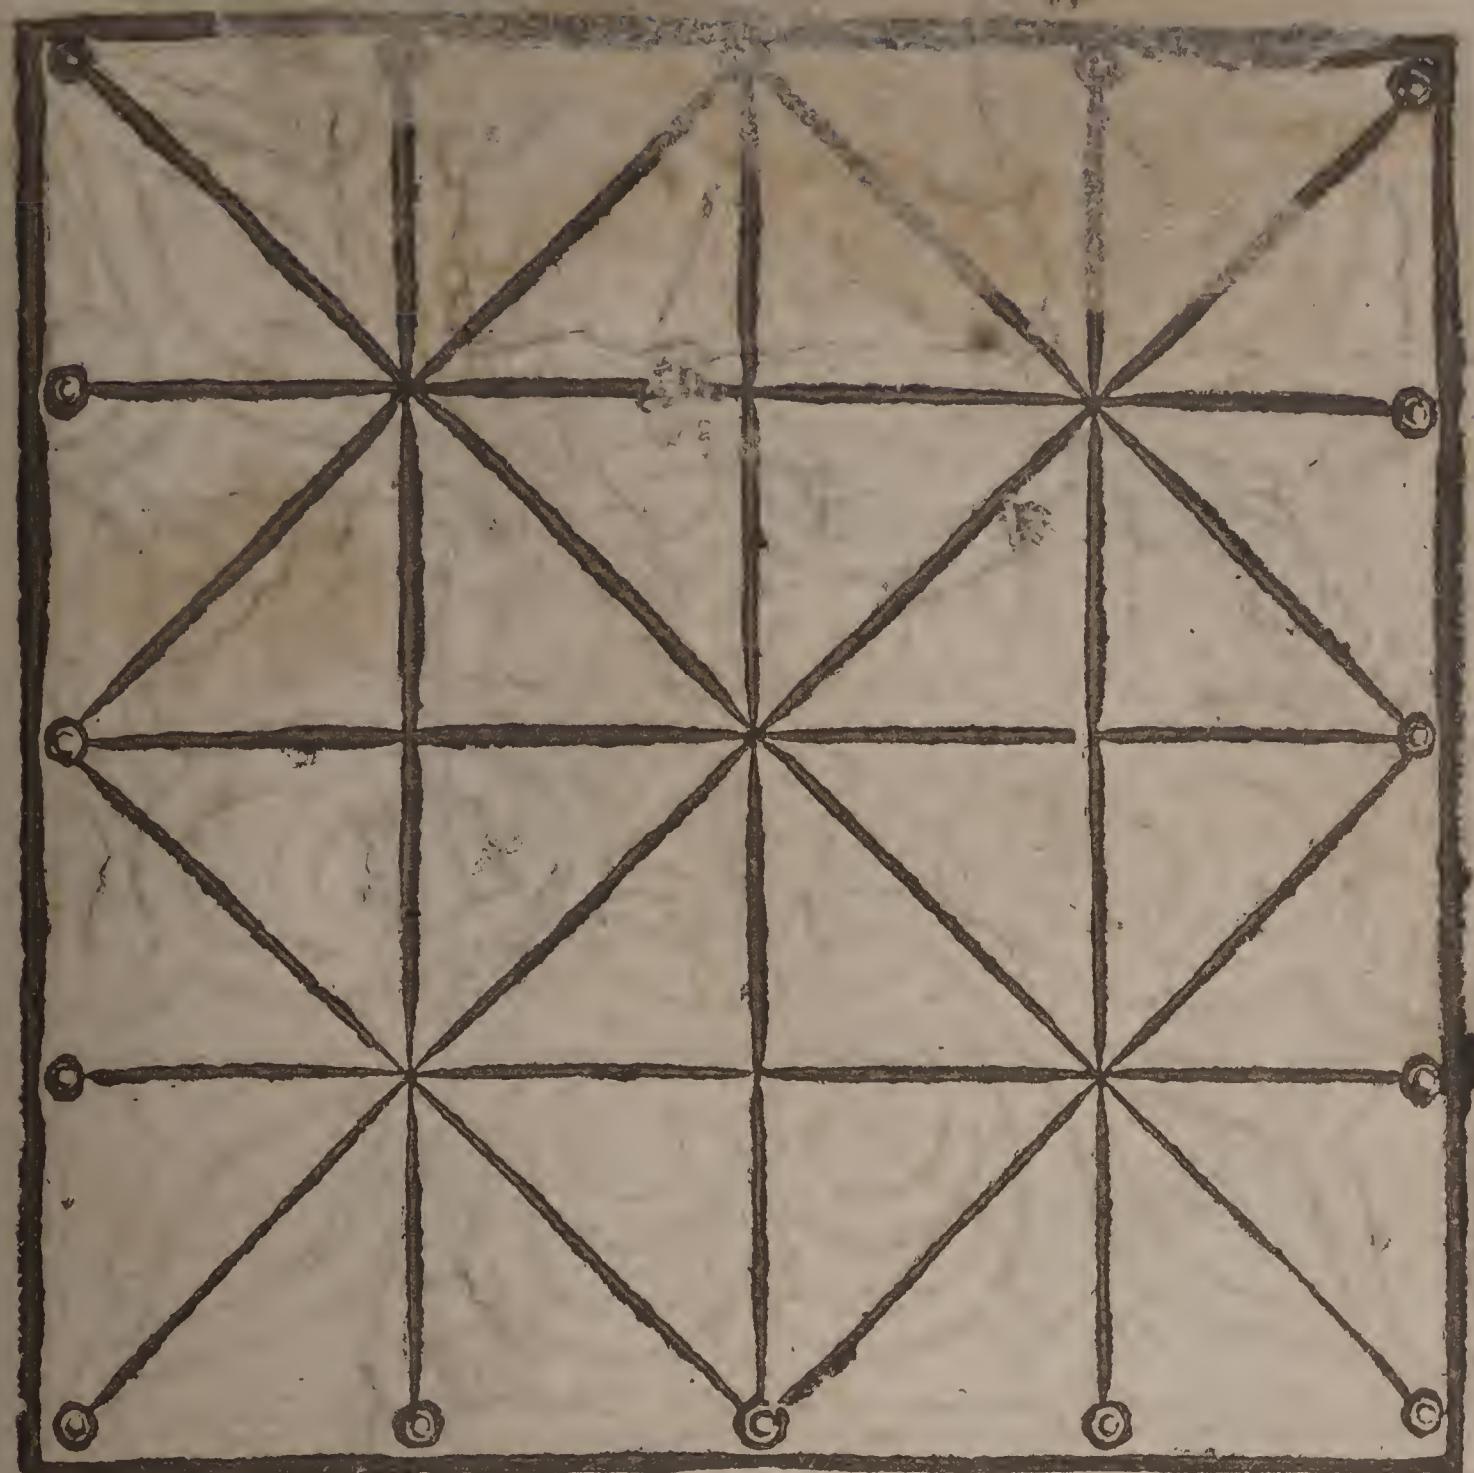

### CHAP. III.

#### Of the forme.

I Et that whiche is said in the Orchardes forme, suffice for a Garden in generall: but for speciaall formes in squares, they are as many, as there are deuices in Gardiners braines. Nei- ther is the wit and art of a skilfull Gardiner in this point not to be commended, that can worke more variety for breeding of more delightsome chiose, and of all those things, where the owner is able and desirous to be satisfied. The number of formes, Mazes and Knots is so great, and men are so diversly deligh- ted, that I leauis every Housewife to her selfe, especially see- ing to set downe many, had been but to fill much paper; yet lest I deprive her of all delight and direction, let her view these few, chiose, new formes, and note this generally, that all plots are square, and al are bordred about with Prinett, Raisins, Fea- berries, Rosees, Thozie, Rosemarie, Bee-flowers, Istop, Sage, or such like.
