The West American Scientist.

Vol. XIII. No. 4.

Nov. 1902.

Whole No. 119.

PERIODICALS.

AMERICAN BOTANIST:
Binghamton, N. Y.

AMERICAN ECONOMIST:
No. 135 W. 23d st., New York, N. Y.

AMERICAN GARDENING:
No. 136 Liberty street, New York, N. Y.

AMERICAN GEOLOGIST:
Minneapolis, Minn.

AMERICAN HOMES:

516 5th ave., New York. A magazine that has become a credit to the nation's taste in architecture, which it is doing much to improve.

AMERICAN ORNITHOLOGY:

Chas. K. Read, Sta. A. Worcester, Mass.; 50 cts a year (monthly). "The best illustrated bird magazine." Send 10 cts for 3 months' trial. Pictures of birds, nests and eggs.

BOTANICAL GAZETTE:

BRYOLOGIST: 78 Orange st., Brooklyn, N. Y.

CANADIAN ENTOMOLOGIST:

No. 429 Wellington st., London, Ont., Canada.

CONDOR:

Bi-monthly bulletin of the Cooper ornithological club.

ENGINEERING AND MINING JOURNAL:

253 Broadway, New York.

"The best and most influential mining paper in the world." Weekly edition, \$5 a year; monthly, \$1.50 a year. Specimen copy free.

EVANGEL: Scranton, Pa.

FARM AND FIRESIDE:
Springfield, Ohio.

FERN BULLETIN: Binghamton, N. Y.

HEALTH-CULTURE:

No. 503 Fifth Avenue, New York.

INTERNATIONAL PRINTER: 210 Lippincott bldg., Philadelphia, Pa.

JULIAN MINER: Julian, San Diego Co., Cal.

Published in the center of a rich mining belt where orchards, gardens, grain fields, creameries, and apiaries flourish, timber & water are plentiful, and picturesque resorts are numerous, where mineral springs are of great benefit to hundreds of health seekers at all seasons. John G. Overshiner, editor and proprietor,

MEEHAN'S MONTHLY:

Devoted to general gardening and wild flowers. \$2 a year. Germantown, Philadelphia, Pa. Each issue contains a colored portrait by Prang of some American wild plant or flower, with description, and various notes on horticulture.

MINERAL COLLECTOR:

No. 238 Greene street, New York, N. Y.
MINING: Spokane, Washington.

Journal of the northwest mining association. \$1 a yr. Monthly.

MUHLENBERGIA:

No. 547 W. Walnut st., Lancaster, Pa. A journal of botany edited and published by A. A. Heller. \$1 a volume.

MONITOR: Hamburg, Ill.

NATURE STUDY: Manchester, N. H.
NAUTILUS:

Cor. 19th and Race sts., Philadelphia, Pa.

Devoted to the interests of conchologists. Monthly, \$1 a year.

OHIO NATURALIST: Columbus, O.

Published by the biological club of the Ohio state university. 50c a year of 8 numbers.

OOLOGIST: Albion, N. Y.

PACIFIC FLORIST: Orchard and Garden Magazine, 514 Pine st. San Francisco, Cal.

An illustrated monthly of useful information to all interested in the cultivation of fruits and flowers, ornamental horticulture, agriculture and landscape gardening. \$1 a year; 50 cents for 6 months; \$2 to foreign countries. H. H. Lilien, manager.

PHILATELIC West and Camera News:
Superior, Nebraska

Send 10c for 4 months trial, or 50c for a year. 100 pages each month devoted to curios, relics, coins, stamps, photography, history, etc. finely illustrated; organ of 23 societies of 20,000 members; ads pay big at 1 cent a word—write today!

VERMONT JOURNAL: Windsor, Vt.

WEST AMERICAN SCIENTIST:
San Diego, California.

WISCONSIN BULLETIN: 160 N. Professor street, Oberlin, Ohio.

"The best exponent of field ornithology."

Specimen copy free.

BOOKS.

GRAY'S BOOK EXCHANGE::

1641 F St., San Diego, Cal.

FOR SALE —

BOOKS AND MAGAZINES.

- Back numbers of leading magazines and standard old and new books supplied promptly at reasonable prices.
- Agricultural, Stockraising and Mineral Resources of Colo., Utah, Washington, Kas., Oregon, Nebr., Wyo., Idaho and Montana, ill., about 100 pp. each, all for50

among a hundred is but little over an inch in height and diameter, and in earlier days they were literally worth their weight in gold. The flowers are open only in sunlight.

Variety PECTINATA KS.

Genus PHYLLOCACTUS Link.

Epiphytal plants with spineless flattened leaf-like branches, with a prominent midrib, mostly with large showy flowers, from creamy white to the richest crimson and scarlet, produced from notches in the margins of the stems.

Readily produced by cuttings or seeds, the phyllocacti are established favorites, and hundreds of varieties have been produced by hybridization. Young growth often cylindrical, then triangular, finally assuming the flattened form.

PHYLLOCACTUS ACKERMANNI Walp.
The King cactus was taken from Mexico to England prior to 1829 by George Ackermann, and bears the most gorgeous flowers, 6 to 8 inches in diameter, the acutely pointed, wavy petals of a deep brilliant crimson, bordered at the base with bright magenta, the interior decorated with a mass of white filaments and antlers, the 11 stigmata and style also white. The plant blooms freely and may be seen in many San Diego gardens. The plant before me is about a foot high and bears one open flower and three buds today (May 3, 1900).

PHYLLOCACTUS ACUMINATUS KS.
State of Rio de Janeiro, Brazil.

PHYLLOCACTUS ANGULIGER Lem.
PHYLLOCACTUS BIFORMIS Lab.
Honduras, Central America.

PHYLLOCACTUS CRENATUS Walp.
Honduras, Central America.

PHYLLOCACTUS HOOKERI S.

PHYLLOCACTUS KAMPMANNI Hort.

Kampmann's Case-knife cactus is a less robust plant than the King cactus, and the flowers are only about 3 inches in diameter, the petals broader in proportion, of a bright, but lighter, crimson. Filaments white, antlers canary yellow. This is a general favorite in San Diego gardens, also, producing its lovely flowers in the greatest profusion.

PHYLLOCACTUS LATIFRONS Walp.
The Queen cactus is quite the giant among the Phyllocacti, the stout flattened stems 4 to 5 inches broad, deeply crenated and commonly 8 to 10 feet high. The flowers are 7 to 8 inches long, about 6 inches in diameter, the petals of a delicate, clear, creamy white, the

sepals and tube of a reddish hue. Native of Mexico.

PHYLLOCACTUS PHYLLANTHOIDES
Link.

PHYLLOCACTUS PHYLLANTHUS
Link.

PHYLLOCACTUS RUSSELLIANUS S.

PHYLLOCACTUS STENOPETALUS S.

PHYLLOCACTUS STRICTUS Lem.

PHYLLOCACTUS THOMASIANUS KS.

PHYLLOCACTUS WRAYI Hort.

Genus PILOCEREUS Lemaire.

Included under the genus Cercus.

Tribe OPUNTIEAE.

Calyx tube not extending beyond the ovary; stems branched and jointed.

Genus HARIOTA Adans.

Adans Fam 2:243 (1763).

This genus is generally treated as a synonym of Rhipsalis, to which we refer all the species. Schumann maintains the genus as defined by De Candolle.

H. alternata Lem Hort Univ i t 50, is R. paradoxa.

H. cassytha Cels ex Foerst Handb 458, is R. cassytha.

H. cibrata Lem Ill Hort iv Misc 12 (1857), is R. saglionis?

H. floccosa Cels, ex Foerst Handb 458, is R. floccosa.

H. funalis Cels, ex Foerst Handb 457, is R. funalis.

H. mesembrianthemooides Lem Cact Aliq Nov Desc 29, is R. mesambrianthemooides

H. pentaptera Lem ex Foerst Handb 453, is R. pentaptera.

H. prismatica Lem Ill Hort x Misc 84 (1863), is R. tetragona?

H. caglionis Lem Cact Aliq Nov Desc 39, is R. saglionis.

HARIOTA SALICORNIOIDES DC.

Rhipsalis salicornioides Haworth, of Brazil.

Variety BAMBUSOIDES Weber.

HARIOTA VILLIGERA KS.

KS Fl Br 266; S Paulo, Brazil.

H. clavata Web U S, is R. clavata.

Genus RHIPSALIS Gaertn.

RHIPSALIS CASSYTHA Gaertn.

RHIPSALIS SALICORNIOIDES Haw.

Schlumbergera epiphyloides Lem, is Phyllocactus Russellianus.

Stromatocactus Kotschubeyi Karw, is Anhalonium sulcatum S.

Tephrocactus andicola Lem, is Opuntia andicola.

Tephrocactus aoracanthus Lem, is Opuntia aoracantha.

Tephrocactus diadematus Lem, is Opuntia diademata.

Tephrocactus platyacanthus Lem, is Opuntia platyacantha.

Zygocactus Altensternii KS, is Epiphyllum truncatum fide KS.

Genus PFEIFFERA Salm.

PFEIFFERA CEREIFORMIS Salm.
A synonym of Rhipsalis cereiformis.

Genus MAIHUENIA Phil.

M. POEPPIGII Weber.

M. BRACHYDELPHYS KS.

M. PHILIPPPII Weber.

PTEROCACTUS KUNTZEI KS.

Rebutia minuscula KS, is Echinocactus minusculus.

Genus PERESKIA Plum.

PERESKIA ACULEATA Mill.

The Barbadoes gooseberry or Blad-apple; the leaves resemble those of the orange; much used for grafting purposes. West Indies.

PERESKIA BLEO P DC.

PERESKIA LYCHNIDIFLORA P DC.

PERESKIA PANAMENSIS Web.

PERESKIA TAMPICANA Web.

Genus NOPALEA Salm.

Erect, branching plants, with flattened elongated joints; flowers red or crimson, petals erect and slightly approaching each other at the apex, stamens longer than the corolla.

NOPALEA AUBERI Salm-Dyck.

Cuba; rapid growth; arborescent in form, and bearing numerous rose-colored flowers with exert stamens; the branches armed with stout spines; readily grown from cuttings.

NOPALEA COCCINELLIFERA Salm.

The cochineal cactus, a native of Mexico.

NOPALEA DEJECTA Salm.

Salm-Dyck, Hort Dyck ed 2, 64, 233. Cuba.

NOPALEA KARWINSKIANA S.

NOPALEA MONILIFORMIS KS.

Genus OPUNTIA Tournefort.

"Tube of the flower very short, cup-shaped: petals spreading or rarely erect: ovary with bristle-bearing areolae in the axils of small terete deciduous sepals: berry succulent or sometimes dry, marked with blistly or spiny areolas, truncate with a wide umbilicus: seeds large, white, compressed, with the embryo coiled round the albumen; cotyledons large, foliaceous.—Articulated, much-branched plants, of various shapes, low and prostrate or erect and shrub-like; young branches with small terete subulate early deciduous leaves, and in their axils an areola with numerous short easily detached bristles, and, usually, stouter spines, all barbed. Flowers on the joints of the previous year, on the same areolas with the spines, mostly large, open only in sunlight. Fruit often edible, often large."—E.

Opuntia auberi Pf, is Nopalea auberi.

Opuntia camuessa Web, is robusta.

Opuntia decumana Gris, is monacantha.

Opuntia flavicans Lem, is robusta.

Opuntia maxima Hort (non Web), is robusta.

Opuntia stenopetala E, is glaucescens.

Subgenus CYLINDROPUNTIA E.—

"Joints cylindrical, more or less tubercu- lated; raphae usually not prominent, therefore seed not margined; embryo forming less than one circle around the more copious albumen; cotyledons inconstant, contrary, oblique, or parallel to the sides of the seed."—E.

OPUNTIA ACANTHOCARPA E. & B.

"Arborescens; ramis alternis adscen- dentibus; articulis cylindricis; tuberculis elongatis; aculeis 8-25 stellato-divaricatis; bacca subglobosa tuberculata aculeata; seminibus multangularis. Mountains of Cactus Pass, between Santa Fe and the western Colorado. Stems 5-6° high; branches few, alternate, and separating from the stem at an acute angle. Joints as in [O. arborescens] 4-6 or 8' long, about an inch in diameter; tubercles 9-19 lines long; interior spines 1-1¼", exterior ones 4-10 lines long. Spines of fruit on the depressed tubercles 3-6 lin. long. Seeds large, unlike those of any other Opuntia seen by me."—E syn 308.

?O. californica E Emory's rep 157 f II.

OPUNTIA ALCAHES Web.

OPUNTIA ANDICOLA Pfeiffer.

OPUNTIA AORACANTHA Lem.

OPUNTIA ARBORESCENS Engelm.

"Caule ligneo erecto, ramis horizon- talibus, ramulis cylindricis, tuberculatis aculeatissimis; areolis oblongis, brevissime tomentosis, aculeos 12-30 corneos stramineo-vaginatos teretes undique por- rectos gerentibus; ramulis versus apicem floriferis; ovario tuberculato, tuberculis sub-20 apice sepala subulata et areolas tomentosas cum setis paucis albidis gerentibus; sepalis interioribus 10-13 obovatis; petalis obovatis, obtusis s. e marginatis; stigmatibus sub-8 patulis; bacca fla- va, sicca, ovato-globosa, tuberculata, profunde umbilicata. Mountaius of New Mexico to Chihuahua, Parras and Saltillo; flowers in May and Je; fruit, at least about Santa Fe, ripening the 2nd year (Fendler); in the north 5-10, south 20 and more feet high, 5-10' in diam, last branches 2-4' long; spines of the speci- mens on Waggon-mound 20-30 in each bunch; further south only 12-20, gener-

ally fewer on the under side of the branchlets; spines horn-colored, with straw-colored loose sheaths, from 3-10 lines, generally about 6 lines long. Flowers purple, 3' in diam; stamens red; fruit about 1' long, yellow.

'On Waggon-mound the first (flowerless) specimens of a strange *Opuntia* were found, with an erect, ligneous stem, and cylindrical, horribly spinous horizontal branches. The plant was here only 5 ft high, but grows about Santa Fe to the height of 8 or 10 ft, and continues to be found as far as Chihuahua and Parras. In the latter more favorable climate it grows to be a tree of 20 or 30, and perhaps even 40 feet high, as Dr. Wislizenus informs me, and offers a most beautiful aspect when covered with its large red flowers. It is evidently the plant which Torrey and James doubtfully, though incorrectly, refer to *Cactus Bleo* HBK. It is nearly allied to *Opuntia furiosa*, Willd. but well distinguished from it; *** the tree cactus, or Foconoztle, as called by the Mexicans, according to Dr. Gregg. The stems of the dead plant present a most singular appearance; the soft parts having rotted away, a net-work of woody fibres remains, forming a hollow tube, with very regular rhombic meshes, which correspond with the tubercles of the living plant.'—E Wislizenus' report, 90.

OPUNTIA ARBUSCULA E.

OPUNTIA AUSTRALIS Web.

OPUNTIA BERNARDINA Engelm.

OPUNTIA BIGELOVII Engelm.

"Ramus erectis adscendentibus; articulis ovato-cylindricis pallide virescentibus congestis; tuberculis subhemisphaericis depresso confertis: aculeis 6-10 robustioribus et totidem gracilioribus inferioribus; ovario tuberculato; bacca tuberculata subinda (sterili!) aculeolata; seminibus parvis.

"On William's river of the Californian Colorado. Stem 3-4' thick and 10-12 ft

high, the branches forming a dense contracted head, with joints 2-6' long; tubercles 3-4 lines long; larger spines are about 1' long, smaller ones 4-7 lines long."—E Am ac pr 3:307.

OPUNTIA WHIPPLEI E. & B.**OPUNTIA TETRACANTHA Toumey.**

§*Cylindropuntia*. "An irregularly branching shrub 6-15 dm high; primary branches erect or ascending from a stout woody trunk 5-8 cm in diameter, and bearing numerous short, lateral branches at irregular intervals; ultimate branches 12-15 mm in diameter; joints cylindrical, 25-30 cm long, with a reticulated woody skeleton; tubercles at first prominent, 16-22 mm long, but on old stems more or less inconspicuous; pulvini sparingly covered with wool and bearing a small crescent-shaped tuft of light brown bristles at the upper margin; spines usually 4, stout, loosely sheathed, straw-colored, strongly deflexed, flattened, 2-3.5 cm long, occasionally 1 or 2 smaller ones, not increasing in size and number after first season's growth; glands conspicuous, a half dozen or more between the spines and bristles; flowers greenish purple, 1.5-2 cm broad; fruit ovate to subglobose, narrowly but deeply umbilicate, 2-25 cm long, juicy, scarlet, usually nearly smooth, but sometimes some of the pulvini bearing 1-3 strong deflexed spines; seeds irregular, 3-5 mm in diameter, commissure broad, with conspicuous spongy appearance."—Toumey Garden and Forest 9: 432 (28 N 1896).

"An interesting species of *Cylindropuntia* grows in considerable abundance about 5 miles east of Tucson, but, so far as known, only in this one locality. It seems to be nearest related to *Opuntia Thurberi* E., but differs from that plant, so far as one can judge from the incomplete description and examination of type material in the Engelmann herbarium, in its longer more strongly deflexed spines, smaller and different-colored flowers, etc. It may be known from all related species by its bright scarlet fruit, 4 strongly deflexed spines and peculiar cork-like margin to the seeds. This plant and *O. leptocaulis* are the only *Opuntias* with which I am familiar that produce small lateral branches no larger than the fully developed fruits, the function of which seems to be to drop to the ground and develop into new plants. The fruit matures in Dec., but remains attached to the plant until the following May. It has an agreeable acid flavor and its bright color makes it very conspicuous against the green stems."—Toumey l.c.

This is probably *O. Stanlyi*, of which the following description is all that is known:—"Opuntia?" Oct. 22, 1846. Abundant on the Del Norte and Gila. A remarkable plant, apparently more like a *Mamillaria* than like an *Opuntia*. The fruit is also represented without areolae or tubercles, exactly like the smooth fruit of a *Mamillaria*; but this may be an oversight of the artist. The habit of the plant suggests the belief that it is an *Opuntia* of the section *Cylindraceæ*. Joints or branches ascending, cylindrical, tuberculated, 4-6 inches long, 1-1½ inches in diameter; tubercles very prominent, with about 8 long (1-1½ inches) straight spines; fruit obovate, umbilicate, scarlet, towards the top of the branches, about 9 lines long and 6 in diameter. It is a distinct species, which I am gratified to dedicate to the skilful artist who has drawn all these figures,—Mr. J. M. Stanley."—E in Emory r 158 f 9.

Subgenus *PLATOPUNTIA* E.—"Joints compressed; rhaphe forming a prominent bony margin around the seed; embryo completing a little more than one circle around the scanty albumen; cotyledons contrary to the sides of the seed."—E.

OPUNTIA TRELEASII Coulter.

"Erect, diffusely branching: joints orbicular to obovate, fl sh. with terete base, 15-25 cm long; pulvini not depressed, with long (5 cm) dense dirty-yellow bristles; leaves on young shoots 5 mm long, spreading (more than twice as long as those of basilaris and darker-red): flower and fruit not seen.—Type, growing in Mo. Bot Gard. 1893, from collection made by Trelease in 1892. At Caliente, in the Te-

hachapi Mountains, California. Specimens examined: California (Trelease of 1892). This species is near *O. basilaris*, but differs in its rounder more fleshy joints (terete below), pulvini not depressed (in *O. basilaris* there is a depression for the pulvinus with a furrow on either side in the genicula surface), yellowish bristles, and especially in its much larger leaves."—Coulter Contr. a hb 3:431-435.

OPUNTIA TRIACANTHA P DC.

OPUNTIA TUNA Mill.

OPUNTIA URSSINA Weber.

Opuntia ursina is a name given by Albert Weber to a curious and beautiful plant of the Mohave desert, advertised as the Grizzly Bear cactus. The joints are about 3 by 5 inches, densely covered with slender flexuous ivory white spines, the longest over 6 inches long, and completely hiding the plant. A cutting reminds one of the "Old Man" cactus of Mexico, but this belongs among the prickly pears—forming low wide spreading masses of interlacing snow white spines.

CEREUS GEOMETRIZANS Mart.

Arborescent, 20 feet high or more, assuming somewhat an umbrella form from its manner of branching; joints mostly short, thick; ribs 5 or 6, acute when young, with sharply defined intervals—in old plants often very obtuse, bearing large woolly spineless areolae; stems of young growth 3 inches in diameter, areole $1\frac{1}{2}$ inch apart, woolly—in age the enlarged bulbous bases of the spines are in close contact, covering the areolae completely (or spineless!); radial spines 3-5, $\frac{1}{4}$ - $1\frac{1}{2}$ inches long, central spine $1\frac{1}{2}$ inches in maximum length, straight or twisted, all stout, angled, ashy black, woody; central spine sometimes absent, lateral radials usually the longer, very variable. Plant smooth, bright apple green or glaucous, known as the garambullo. Fruit rarely over $\frac{1}{2}$ inch long, half as great in diameter, or globose, attached to a small tomentose areole, remains of flower often persistent, when deciduous leaving a small round scar; epidermis usually smooth, with 1-6 tomentose areolae bearing minute scales (more rarely bearing in their axils a more minute spine), purple (sometimes glaucous) with purple pulp; fruit bursting irregularly at maturity. As many as 14 fruits were seen growing from one areole; one rib of 11 areolae on a joint of 5 ribs bore 36 fruits, only 1 of the areolae without fruit, and this is frequent on the hundreds of branches—old and young alike, almost to the trunk. Seeds large, black, 63 from one berry. Fruit ripening in June, 1902, in the state of Caxaco, Mexico (Orcutt 2670); in July near San Luis Potosi (2609), where its growth is smaller, and large

quantities are collected by the inhabitants and eaten fresh, or dried; Tehuacan (2630).

Console made this the type of his genus *Myrtillocactus*. *Cereus cochal* Orcutt, from Lower California, is closely allied, and treated as a variety by some authors.

CEREUS TRIANGULARIS Miller.

Climbing over rocks and trees, joints 3-sided, $1\frac{1}{4}$ inches in diameter, 1 or 2 to many feet long, curving, the side next to tree or rock nearly flat, the others slightly concave; ribs acute, rounded-acute-tuberculate, bearing in the depressions between the undulations small tomentose areolae $1\frac{1}{4}$ - $2\frac{1}{4}$ inches apart, with 3-4 stout bulbous brown or blackish spines 1-2 mm long. Flowered (28 Je 1902) in the night; flower a foot long; tube of corolla 5 inches long, light apple green, spineless, with about 20 greenish yellow sepaloid scales, $\frac{1}{2}$ inch wide or less, acuminate, yellowish, about 20; petals snowy white, an inch wide, 5 inches long, acuminate, about 20; filaments white, 2 inches shorter than the petals, anthers sulphur yellow; style 9 inches long, $\frac{1}{4}$ thick, white; 25 spreading slender white stigmata three-fourths inch long; fruit light crimson, 3 inches in diameter, 5 in length, with about 20 sepaloid apple green scales, forming a pretty color-contrast, epidermis an eighth of an inch thick, pulp white, filled with about 3,000 small black seeds (fruit bought in Tehuacan market for 6 cents, 28 Je 1902). Plant rather light green, the acute ribs narrowly margined with brown, 1-2 mm wide or less on either side. Pitahalla or pitajaya of the Indians. States of Puebla and Caxaco, Mexico (Orcutt 2710, 2711).

CEREUS GIGANTEUS Engelm.

The 'Suwarro' or giant cactus of Arizona and Sonora, 25-60 feet high, 1-2 in diameter, thickest about the lower third where generally the 2 or 3 alternate or sometimes opposite branches start, and from thence slightly taper toward the summit. Stems and branches marked by superficial transverse furrows, indicating, as it seems, the annual periods of growth, forming rings of 4-8 inches in height. Branches unequal, and always of less height than the main stem, mostly 5-6 feet long, with 12-18 ribs.

The contents and paging of the West American Scientist, volume 13. of California Art & Nature volume 2, and of the Review of the Cactaceæ volume 3, are identical (issued in order named).

EXCHANGES.

Brief notices inserted free for subscribers,

BRUNETTI, E.:

No. 353 Strand, London, England.

North American Diptera mounted on long pins wanted in exchange for European and other insects, stamps, etc.

FRUHSTORFER, H.:

Thurm-Strasse 37, Berlin, N. W., Germany.

North American Papilionidae, Pieridae, Parnassus and Lycaenidae wanted in exchange for showy Papilionidae from Java. Butterflies, beetles, and other insects in perfect condition, carefully named, for sale cheap.

Eggs to exchange for eggs.

We offer our services for the procurement of any seeds, bulbs or plants that may be desired. Our correspondence is world wide, and our facilities and experience insure satisfaction to our patrons.

Terms: CASH WITH ORDER, except by special contract. All goods travel at the risk and expense of purchaser. Packing and material (boxes, bags, etc.) charged at cost. Complaints must be made within ten days of receipt of goods to receive recognition.

THE STRAWBERRY GUAVA.

The Cattley Guava (*Psidium Cattleyanum*), better known as the strawberry, is rapidly gaining in popular favor throughout Florida and Southern California, and has been highly recommended for cultivation in Arizona and New Mexico. It is unquestionably the most desirable and useful of the many varieties of fruits known under the name of guava. It is a shrub or small tree that adapts itself to a dwarfish habit when grown in the house in cold climates, but in a congenial clime attains a maximum growth of 15 to 20 feet in height, of compact form, and with dense, glossy evergreen foliage, which makes it a very ornamental tree, especially when loaded with its rich colored fruit.

Seeds \$2.00 per pound, 10c. a packet.

PHOENIX CANARIENSIS Hort.

The Canary Islands date palm is an ele-

gant, hardy, ornamental species, often planted in Southern California lawns.

Seeds 50 cents per 100.

PHOENIX RECLINATA Jacq.

One of the hardest and strongest growing date palms, withstanding sun and wind in the most exposed positions, and valued for its dark green, feathery foliage.

Seeds 75 cents per 100.

LATHYRUS SPLENDENS Kellogg. By far the most gorgeous and beautiful flowering vine in the west, producing masses of brilliant crimson flowers.

Seed 25 cents a packet, \$1 an ounce.

ORCUTT SEED and PLANT Company,
San Diego, California.
