Verzino, the oriental Brésil wood (*Cæsalpinia Sappan*) so much used by the Italians from a very early period, would have been infelicitous alone from its fugacity. I say alone, because it was a common practice of the Italians to mix verzino with other colouring matters in making lake, as much, perhaps, with the view of lowering its price, as of adding to its beauty, for there is no denying that some of the lakes prepared from wood, are, which quite fresh, very beautiful, although evanescent.

Cochineal, madder, and verzino, being then rejected for the above reasons, there can be no doubt that the best Italian lakes were, prior to 1525, composed either of lac or of kermes (*grana*—whence our term *in grain*, to denote a permanent dye). The latter was probably the more common pigment, but the former was generally held in greater estimation. Kermes appears to have inclined more to a blood-red colour, but lac approached nearer to a rose-colour. It is to be hoped that pigments whose reputation for beauty and permanency extends over a period of three or four hundred years will again be used, and that those who are desirous that their pictures should descend to posterity with brilliant and unfaded colours, should reject cochineal-lake—unless some means can be devised of rendering it more permanent—and return to the use of the too long neglected lac and kermes lakes. Some few artists, I am informed, now use lac-lake; I trust this may be considered as a revival, and that the practice will become general.

It appears at first sight astonishing that two pigments which, like lac and kermes lakes, combined the property of fine colour with great durability, should have fallen almost into desuetude; but there is no doubt that this must be ascribed to the introduction of cochineal, which delighted the painters by its beauty (in which respect, when in a recent state, it surpasses that of lac), while its novelty prevented them from forming any estimation of its durability. We, however, have the experience of upwards of three hundred years to guide us in our choice of pigments; we have old works on the technical part of the art to teach us what pigments were used, and how they were composed; we have old pictures to prove the durability of some of these pigments; we have the assistance of chemistry in analysing those pigments, and showing whether they were of mineral, animal, or vegetable

origin; and we have further assistance from the history of art, in determining the period when certain colours were introduced, and thus reducing our opinions, formed on other data, almost to a certainty. These advantages were not possessed in an equal degree by the artists of the sixteenth century, who were guided in their choice of materials by the traditions or the mammals of their predecessors, and although the chemists, or rather alchemists, of those days must have been well acquainted with many of the chemical colours which we consider new in their application to art, we do not often find, except in the case of cochineal and madder lakes, painters of reputation employing, or technical manuals inculcating, the adoption of new and untried colours.

It is necessary that the painter should be thoroughly acquainted with the nature and composition of the different pigments, and of their respective affinities, so that he may not attempt to combine them otherwise than on chemical principles. He should also be able to test the purity of the colours he employs. This is not so difficult as might be supposed. When the composition of pigments, and the modes in which they are usually adulterated, are known, it is easy to find some chemical agent which will detect the impurities. To mention one instance only, namely lakes, which are frequently met with in an impure state; these colours, it is well known, are combinations of certain colouring matters with alumina; the alumina is generally procured by decomposing common alum with a carbonate of soda or potash, by which process the alumina is precipitated and another salt is formed, which must be entirely removed by washing, or it will injure the painting on which the lake is used. This is a tedious process, as the colour sometimes requires twenty or thirty washings before it is sufficiently purified; it is frequently performed very inefficiently. The method of ascertaining whether this colour is free from salts, is very simple and easy; it was communicated to me by a scientific friend who has frequently afforded me valuable assistance in these researches. It is as follows:—Wash a small quantity of lake in distilled water; after stirring it well, let it settle, then pour the water into a silver spoon, and evaporate it over a candle or spirit-lamp. If the liquid contain any salts, there will be at the bottom of the spoon, a small opaque spot, consisting of minute crystals; if, on the contrary, the colour be quite pure, the water will evaporate entirely, and leave the spoon perfectly clean.

Most of the preceding observations with respect to the colours used in mural painting are the result of my own personal inspection during a recent excursion in the north of Italy. The other remarks and observations are drawn from the writings of those esteemed the best authors on the subject, and from the observations and experiments of many scientific friends. I have expressed myself in language perhaps too decided, and some of my remarks and concluding observations do not in all respects concur with those of eminent authors. The whole of my remarks however, are open to observation, and I trust that their truth will be verified as far as possible by experiment. They are placed before the public with the hope that they will form some addition to the knowledge of mural painting, an art which, I cannot help believing, will be ultimately established and extensively practised in this country, and which in that case will, in all probability, arrive at the perfection which it attained in the best times of the great Italian masters.

THE JACQUARD LOOM;

ITS CAPABILITIES AS AN ENGINE OF ART.

AMONGST the various manufactures of human ingenuity, none offer so large a field for the application of Ornamental Art, as those numberless fabrics which are the natural result of the wants, the fancy, and the sumptuous habits of civilised society. In them we find Art applied almost everywhere, from the simplest calico print to the

richest damask; from the neat dress of the working class to the most costly garment, and the most elaborate brocade.

The means of application vary with the nature, and the cost of the fabric; simple with cheap prints, the patterns become more and more complicated and perfect for better sorts of goods; and it has doubtless been a matter of wonder and admiration to many of our readers, to know how such perfect effects of light and shadow, such elaborate expression of Art, could be produced, as are shown in many of the handsome silk patterns, in which sometimes as great a perfection is attained as in the most elaborate line engraving.

Art is applied to woven fabrics in two very distinct ways. Its application is *simultaneous* with, or *posterior* to, the making of the cloth.

In the first case, the pattern is a part of the cloth itself; it is the result of a combination in the texture of the warp and shoot threads, and producing it, is nothing else but regulating the action of each thread of warp while each shoot is passed. The fineness of effect is naturally the result of the number of threads contained in a certain square; and an idea can be had of the perfection to which woven fabrics are brought, by the fact that as many as four or five hundred threads are sometimes contained in one square inch; each of these threads acting differently, and producing different results; fineness of effect, therefore, can be produced to the five-hundredth part of an inch!

In the second case, a plain cloth (let it be a calico, a flannel, a merino,) is made on a plain loom, in plain colours; and afterwards patterns are *impressed* upon it by means of blocks and colours, as in printing; or by means of moulds and a sticking material, the same as in embossing. The richness of the patterns in this case depends upon the number of colours, the perfection of the blocks, and the fineness of the cloth; but the colour here produced can never have the beauty, nor the durability of those used in the other case; as they are merely the result of an application upon a part of the cloth *when worn*, whilst the colours in the other case are received by the material in its free state *in skeins*, and afford a greater chance of brightness and durability.

We shall pass over the various methods of applying Art to fabrics after they are woven, and proceed to the question of the *simultaneous* application of Art. There are general rules for producing light and shadows upon woven fabrics, as in the process of line engraving: the artist, instead of working upon a plate of metal, the size of the object to be printed, and enlarging his plate by means of magnifying glasses, works upon a paper whose construction represents the cloth. That paper is the same as is used for Berlin needle-work: one side of it is divided by as many lines as there are warp threads in the pattern; the other side is divided by a number of lines equal to that of the shoot threads. The artist marks with colour to determine the action of each thread in the pattern. By these means every one of the threads becomes visible to the eye, and, in fact, the object to be produced is enlarged on the paper as many as twenty times; a ruled paper for a pattern three inches wide, will have often as much as sixty inches in width.

The principles upon which the effects of light and shadow are based in woven fabrics are these: the warp, or longitudinal threads, are supposed to be *white*; the shoot, or transversal threads, are supposed to be *black*; producing light and shadow is nothing else but allowing such or such threads to show on the face in such or such part of the pattern. The warp and shoot can be so intermixed as to produce an infinite number of lighter or darker shades, and the talent of the artist consists in adapting those various shades to the production of the pattern, in working its threads so as to give effect to the pattern, and still keep firmness in the cloth.

The colours of warp and shoot can be varied in any way; the greater the difference is between them, the greater the contrasts are on the pattern; but if both are the same colour, lights and shadows are produced in consequence of the principles of reflexion of light. The warp and shoot offer to the light surfaces in a direction quite opposite; one of them will reflect light and the other will absorb it; and the same pattern will show as well either shot white upon white, or blue upon white, or pink upon white.

The Jacquard loom is the engine through which the work of the artist is translated from the paper into the cloth. It will be our duty to show what are the capabilities of that engine; whether it leaves any room for the application of Art to fabrics; and then, going into more special details, we shall explain what are the items of the cost of patterns by the Jacquard machine as it actually

exists; what change would be introduced in those items by any alteration of its construction and its working; and what are the practical reasons upon which the actual size of various parts of that loom is based.

The great requisites for such an engine are—1st, *Simplicity of action*, 2nd, *Facility of changes*, 3rd, *Cheapness of working*.

As regards simplicity of action, the Jacquard machine is a great improvement upon all previous inventions; and those who tried to improve it have scrupulously and necessarily preserved its principle of working in any machine whose object is to produce the same effect. It has become so familiar to every weaver, every part of it can be so easily placed and unplaced, that no machine could ever perform so complicated a work with more certainty. Of course, accidents do occur—they are the result of the delicate nature of the work—but they can be avoided, prevented; and no practical man can find any fault with the *simple and easy working* of the Jacquard loom.

To explain the great advantage offered by the Jacquard loom over any earlier machine for the same purpose, as regards facility of changes, we must go back to the means employed before the invention of Jacquard. Each loom had then to be prepared expressly, before weaving any pattern; the cards to which each of the warp threads corresponded had to be picked and tied, each separately, according to the ruled paper. All those taken on every shoot were tied to one string or lash, and there were as many lashes as shoots in the pattern; then a draw-boy had to pull each lash successively. A pattern could not be taken from one loom to another for a new pattern; the cards had to be picked and tied for every loom; great expense was thereby incurred, from the circumstance of a limited number of threads having a different action; four hundred was the highest number ever employed.

Vaucanson tried to improve that process. He constructed his loom the same as an organ; a barrel with a certain number of rows of holes acted upon his threads by means of pegs put into such holes as were wanted, and raising small levers corresponding to the threads; though simpler, that plan was only adopted for small figures, and it is still employed in this country for working satin harnesses; it was an improvement, but it had not sufficient *simplicity of working and facility of changes* to be generally adopted.

Jacquard, whose plan has been adopted by the whole manufacturing world, made use of Vaucanson's idea of constructing looms as an organ. He had not, however, a barrel with a certain number of rows of holes, each row representing a shoot. His cylinder (for it has preserved that original name), had four rectangular faces, covered with as many holes as there were threads to move; each face presented itself successively against a board through which a number of needles, equal to that of the holes, project, and find their place into each of those holes in the cylinder.

The pattern is represented by pieces of card, exactly the size of one of the rectangular sides—these cards have cut on them such holes as the pattern requires, and when placed on the cylinder they will allow such or such thread to act. These cards lace together, one each successively, by the revolution of the cylinder, against the needle board. A longer or shorter pattern is made with a greater or less number of cards. Cards can be taken from one loom to another. Changing a pattern is only putting a fresh set of cards on the same cylinder.

The same pattern can be made on several looms by re-cutting the original set of cards; and, in fact, the *facility of changes* is the characteristic which distinguishes Jacquard's machine from Vaucanson's. For *simplicity of working and facility of changes* nothing has been proposed but what is a copy of Jacquard's loom.

Cheapness of working is decidedly a result of the two qualities we have shown in the Jacquard machine. This machine has rendered possible the large number of patterns now continually brought out. Can further saving be made over the actual manner of working it? This is the only question which can be brought forth. The saving would be advantageous to all parties connected with manufactures. Let us examine how it might be effected.

It is a law of general economy that cheapness is obtained by dividing labour among various hands, by increasing the proportions of material labour, that which is made by men of small intelligence—and lessening the proportion of work made by artists. A sculptor will make a statue out of clay, and will allow a mechanic to change his work into marble.

In the production of patterns for the Jacquard

loom there are two very distinct parts—the *artistic*, and the *mechanical*. To lessen the first and increase the other is decidedly the best way of arriving at cheapness, as the one labour is double or treble the value of the other.

A very general practice for manufacturers is to include under the denomination of *cost of cards*, the whole price of the labour, either artistic or mechanical, required to produce a pattern; so that *mere pieces of paper are very dear*; and were it possible by lessening their size to one-fourth or one-tenth of what it is, to diminish proportionally what is called their cost, it would be decidedly worth trying such an improvement.

But in fact, what are cards in the general cost of a pattern? Something about fifteen per cent. Artistic labour will take from fifty to sixty per cent, the rest is for mechanical labour; thus were cards made smaller the saving would bear merely upon fifteen per cent. of what is called their price; as it would still be necessary to *sketch, draw, and put on lines*, the pattern, and cut the holes in the paper.

Now would a saving of five, ten, or twelve per cent. be worth the introduction of a more delicate Jacquard?—the sacrifice of all the old ones?—this is a matter of consideration for manufacturers, but there are precedents to illustrate the advantage of such a change.

A Jacquard machine was constructed some years ago at very great expense by a very clever maker, to lessen the room generally required by those engines, and the cards in it were somewhere about one-half of the usual size. A card-cutting machine was also made for the purpose, and after all the expense and loss of time, the machine has been laid by as useless. It is still at the Spitalfields School of Design, where manufacturers can see and examine it.

It may be said that improvements in other parts of the engine might remedy the increase of difficulty arising from the smallness of the holes. We do not pretend that the Jacquard machine, as it actually is, cannot be altered; the alteration may be an improvement, it may be the contrary; experience is the criterion of those things, and we find in the various parts of England and the Continent many various shapes of the accessory parts of that engine, adapting it more particularly to such or such purpose; but there is one thing which has never been changed, which has remained the same for all machines, in all countries, for all purposes—it is the size of each hole in the card, the room allowed to each motion for its being safe and regular.

Why does a Dutch clock that costs fifteen shillings perform often better than a lady's watch at forty guineas? Because one has room and the other has not. The damp of temperature is found to have a certain effect upon cards; what would it be if in the same length of a card, on one single line, there were ten times more holes pierced. The liability to accidents would be surely ten times greater.

Various apparatus have been invented and brought into use for the purpose of cutting the holes on the cards, according to the ruled paper; the most usually and advantageously employed is that which consists in a *simple* of cords, every one of which, drawn out, will push a small punch for cutting a corresponding hole in the card. It is generally called the *simple reading-machine*.

This system offers great advantages in practice, inasmuch as all the plain parts of patterns are read in very quickly; all the holes in one card are cut at once by a single stroke; and such is the quickness of women used to tread-in, in going over the cords of the simple, that a great quantity of work is done by them in a very little time.

Some improved system might perhaps present new advantages upon the actual plan, but the improvers must have one thing ever present to their mind, not to increase the artist's labour in

order to lessen that of the mechanic. If for instance an artist were to draw his pattern upon a very large ruled paper, and instead of marking his squares with colour, to make holes in them, there is no doubt that a machine might be constructed to repeat those holes *once cut over the card*, and thereby the time of a *reader* might be saved. But what would be the difference of the time required in the ordinary case, where the artist can often mark a hundred squares in one stroke of his brush, and that required when he would have to cut a hole in every one of these squares? Some ruled papers are 900 cords by 1500 shoots, total number 1,350,000 squares. Let the half be taken, it would be 675,000 holes to cut. Common sense must judge those questions; the artist would be most certainly three times as long over a pattern as in the usual way, and if on one side, one day's work of a mechanic would be saved, two days of an artist would be spent: where would be the saving?

Why not get the artist to draw his pattern upon the cards themselves and cut by hand some millions of holes; the material would be a little harder, but everything would be saved, even those machines that will cut one thousand holes at a stroke; there would be no more *card-cutters*—no more *readers*—nothing but artists! Are there so many of them as to be so prodigal of their labour?

Where manufacturers are to find a saving is in their own taste; in the change of patterns, in the manner in which they are brought out. Those who employ their own artists, and cut their own cards, know very well that drawing and putting upon ruled paper are the largest items in the cost of a pattern. Though the manufacturers of Lyons bring out many more patterns than those of this country, where they try to excel, is in the taste of their patterns. Patterns cost them just as much as they do the English manufacturers, and they never think of changing engines in, but do perfect work for the sake of saving a little of the *paper* of the cards.

Let us then improve as much as possible the taste in patterns, their practical execution, and adopt only those changes that time has proved, and serious economy recommends.

ALPHONSE BURNIER.

THE VERNON GALLERY.

CROSSING THE STREAM.

Sir A. W. Callcott, R.A., Painter. J. Cousen, Engraver. Size of the Picture, 4 ft. 9 in. by 3 ft. 7 in.

At the Royal Academy exhibition in 1834, this picture was catalogued as 'Returning from Market'; we have thought proper to alter the title to one that, perhaps, better indicates the subject. The foreground presents a group which seems composed of a farmer's wife mounted, her daughter leading another horse bearing a young boy, and, apparently, a female farm-servant, carrying a basket of poultry and a pail. The background to the left, through the avenue of trees, shows the road to the village whence they have travelled, and that to the right leads to the farm-house, their probable destination; the space between the figures and the distance stretches away behind these through a flat country to the horizon. The prevailing qualities of this picture are light and air; the breadth of the former and the transparency of the latter are rendered in a very masterly manner; even the thick masses of foliage are most luminously painted, and yet without the least sacrifice of power, for the work throughout exhibits more body than we are accustomed to find in Callcott's pictures generally. There is a degree of elegance too in the *pose* and grouping of the figures, which contributes not a little to its beauty; the respective portions of the composition are also very nicely balanced, and the eye is judiciously led from the centre, the chief point of interest, to each retiring distance. There is one little matter which strikes us as rather a defect, the trunk of the tree behind the dappled horse, and the hind-leg on the near side of the animal form a line of the same inclination, so as almost to appear parts of the same object; had the horse been placed half a step in advance, this would have been obviated. The splash round each of the feet of the same animal makes it seem as if he had brought them all down together into the water at once. These, however, are blemishes scarcely worth alluding to in a picture in every way so beautiful as this, which is worthily rendered in Mr. Cousen's admirable engraving; he has preserved all the spirit and freshness of the original work.

THE NEW GALLERY, 1851.

CHRISTMAS EVE

THE NEW GALLERY, 1851.

CHRISTMAS

COLLARD'S PIANO-FORTES FOR THE PEOPLE.

The progress of popular taste in all matters of intellectual refinement, demands fostering encouragement wherever it is met with; and it is a subject for congratulation to find the people appreciating good Art, or pure mental enjoyments, when offered to them at a reasonable rate. To no branch of the Fine Arts can improvements be limited, and the spread of taste among the humbler classes must ever be regarded as the most humanising of all good gifts. With a keen relish for music amongst them, which is now rarely realised but by listening to the abortive attempts of an itinerant fiddler or organ-player, how much more might this taste be indulged could it be gratified in a higher manner; and what good might result from the superior feeling which

the love for such study would, of necessity, foster and increase? In November of last year, a writer in that widely-spread and justly-esteemed periodical, *Chambers's Edinburgh Journal*, enforced these opinions strongly, saying: "It is in this point of view that music should be regarded by philanthropists: the science should be given to the masses of the people as a bond of sympathy between them and the upper stratum of society. But while many efforts are making in this direction, there is still great sluggishness in one important branch of the business: the lower classes have no good instruments, and have no great artists. The comparatively poor and the really economical do not buy pianos, simply because they are far beyond their means; and in England

the cause of musical science and kindly feeling is deprived of the aid of a family instrument, which in Germany is found even in the parlour of the village public-houses." It is but justice to the Messrs. Chambers to note that it was owing to the suggestion in their Journal that these pianos were constructed; and thus does one Art help the other, and in similar spirit do we note this new musical feature.

It has remained for Messrs. Collard, of Cheap-side, to remove this objection, by the manufacture of instruments, which are in no degree inferior to the best in tone and touch, but greatly so in price. This economy has been effected by bestowing as much thought and labour on the interior construction of the instrument as usual, but adopting a plainer kind of case, constructed of cheaper wood, that of the Norwegian pine, and which, we believe, has never before been used for such a purpose; it is remarkably white, and when French polished, rivals the more expensive satin-wood in the purity and delicacy of its effect. The same amount of simplicity is visible throughout the piano, as will be seen from our engraving, which represents one of the cheapest hitherto manufactured; the price being but thirty guineas, although equal, as a musical instrument, to those sold in more expensive cases. It has the full compass of six and three-quarter octaves, the improved single action, and all the advantages of construction usually adopted. The elasticity of touch and fine quality of tone particularly gratified us, when inspecting the very modestly-priced instrument we have engraved.

It must be admitted that a great boon has thus been rendered available to many of limited means, who cannot fail, we think, to accept it eagerly. The charge urged against us by foreigners that we are not a musical people is perfectly absurd. Not a musical people—why, to what country do those same professional foreigners flock in such abundance as to our own? And would they come here if, to use a mercantile phrase, there was not "a demand for the article?" Men are not accustomed to carry their talents or their goods to a market where

either would be unappreciated. Moreover, it is a well-known fact, that foreign musicians and vocalists are more anxious to gain the good opinion of an English audience, than one gathered from the most refined city of the Continent. It is quite true, nevertheless, that hitherto we are far behind Germany, Italy, and France, in producing and educating first-rate instrumentalists and vocalists, in any large number; but this has nothing whatever to do with the want of taste and the indifference with which we have been charged. There is one fact which at once offers a negative to both—Mendelssohn would not permit his two noble oratorios of "St. Paul" and "Elijah" to be performed, even in his country, till they had undergone the ordeal of an audience here; and surely he would scarcely have done this, had he not felt perfect reliance on our skill in performing and our judgment in discerning. If we could afford sufficient space for the purpose, we could easily point out the numerous channels through which the increasing musical taste of the middle and lower classes has developed itself within the last few years; it will, however, be sufficient to refer to the thronged audiences at the cheap concerts in Exeter Hall, and to the multitude of vocal classes which Mr. Hullah's system has called into existence.

"Music," says the writer above quoted, "has now descended lower in the social scale than it did in the last generation, and thousands of hearts are beating for art and its aspirations, which were formerly cold and silent." We fully concur in the truth of these remarks; and believe that the existence of such feelings augurs well for the social and moral improvement of our country. We are glad to find that the spirited efforts of Messrs. Collard have been at the onset so well rewarded that the demand has outrun the supply. It gives us great pleasure to record this, and to give our testimony to the excellence of the instruments which have gained this well-deserved success, and which we feel sure will be the household furniture of many who have hitherto been debarred from the gratification of possessing a good piano, though inferior ones are to be met with in abundance.

ART-UNION OF LONDON.

THE Fourteenth Annual Meeting of the Subscribers to this Institution was held on the 30th of April, at Drury Lane Theatre, the Duke of Cambridge, President, talking the chair.

Our notice of the Report, which was read by the Honorary Secretary, Mr. G. Godwin, must necessarily be brief; this is of little importance, as we have, at various times since the last meeting, reported the proceedings of the Council. One gratifying fact, however, must not be forgotten, and that is the increase of Subscriptions by 788*l.* over those of the past year. The following is a general statement of the receipts and disbursements. Amount of subscriptions, 11,180*l.* 8*s.* Allotted for purchase of pictures, statuettes, medals, &c., 5,073*l.*; cost of engravings and etchings of the year, 3,250*l.* 4*s.* 3*d.*; cost of report, printing, advertising, rent, &c., and reserve of 2*l.* per cent., 2,854*l.* 3*s.* 9*d.* The sum of 4,260*l.*, appropriated to the purchase of works of Art by the prizeholders, was thus allotted:—20 works of 10*l.*, 16 of 15*l.*, 14 of 20*l.*, 12 of 25*l.*, 12 of 40*l.*, 10 of 50*l.*, 6 of 60*l.*, 6 of 70*l.*, 6 of 80*l.*, 3 of 100*l.*, 2 of 150*l.*, 2 of 200*l.*; 198 sets of proofs, in portfolios, of the designs, in outline, illustrative of "The Pilgrim's Progress," the Society's "Cartoons," "Gertrude of Wyoming," or "The Castle of Indolence;" 307 impressions of "Queen Philippa interceding for the Burgesses of Calais," not yet finished; 307 lithographs of "St. Cecilia;" 30 medals in silver, from the dies already completed, at the option of the prizeholder; 50 statuettes of "Innocence," "Narcissus," or "The Dancing Girl Reposing;" and 20 bronzes, "The Death of Boadicea;" making in the whole 1,021 works of Art as prizes. The illustrations of "The Seven Ages," due to the subscribers of the present year, have been etched on steel by Mr. E. Goodall, and are now at press; as is an impression from a fac-simile engraving, after the premium-design in *basso-relievo*, by Mr. Hancock, "Christ Entering Jerusalem," due last year, and will soon be ready for delivery. Subscribers for the ensuing year will receive an edition of Goldsmith's "Traveller," containing thirty illustrations on wood, and the choice from two engravings, "The Villa of Lucullus," by Mr. Willmore, after Mr. Leitch, and "The Burial of Harold," by Mr. Bacon, after F. R. Pickersgill, A.R.A.

"The Crucifixion," after Hilton, promises to be a fine work. The size and costliness of this engraving, and the risk which would attend electrotyping it, have led the Council to decide on taking from it only a comparatively small number of impressions, and issuing them as prizes in some future year.

Engravings are in progress from "Richard Cœur de Lion pardoning Bertrand de Gourdon," after Mr. Cross, and "The Piper," after Mr. F. Goodall. The porcelain statuettes, bronzes, and casts in iron, awarded in previous years, have all been produced and delivered to their respective owners, in continuation of this portion of the Society's operations, the design in *basso-relievo* by Mr. Armstead, "The Death of Boadicea," has been produced in bronze by Messrs. Elkington. The council have, further, selected an antique Tazza, No. 829, in the Vase Room of the British Museum, the decoration of which is known as the "Quarrel of Agamemnon and Achilles," to be produced in cast-iron for a future year. Hereafter they contemplate producing, in bronze, reduced models of the statues of Hampden, Clarendon, and Falkland—executed for the new Palace of Parliament at Westminster.

The medals commemorative of Wren have been distributed; the reverse, by Mr. B. Wyon, showing St. Paul's Cathedral, is one of the most successful medallie representations of a building ever executed. The Inigo Jones medal, by Mr. Carter, is making satisfactory progress. The reverse will show the Banqueting-House, Whitehall. The Society's medallie series now comprises Reynolds, Chantrey, Wren, Hogarth, Flaxman, and Inigo Jones.

In continuation of the series, a medal of Bacon, the sculptor, has been commissioned for an ensuing distribution. Hereafter, series of these medals will form valuable and interesting prizes.

The council have to regret the loss, by death, of an early and esteemed member of their body, John Noble, Esq., F.S.A. Other vacancies have been caused by the retirement of Edward Wndham, Esq.; T. P. Matthew, Esq.; and Henry Thomas Hope, Esq., M.P. S. M. Peto, Esq., M.P., and the Rev. Dr. Mortimer, head-master of the City of London School, have been elected to fill two of the vacancies thus created.

The reserve fund now amounts to the sum of 3787*l.* 13*s.* 10*d.*

CORRESPONDENCE.

THE GREAT EXHIBITION.—WEAPONS OF WARFARE.

RESPECTED FRIEND,—Wouldst thou kindly spare me the needful space for a practical hint to those who will have the arrangement of the great Exposition?

From one end of the kingdom to the other—and, I doubt not, throughout the whole civilised world, this vast "Exhibition of the Industry of all Nations" has been welcomed as a real international boon. In fact, all parties—prince, peer, private, and peasant—point to this industrial jubilee as a great "practical Peace Congress." They hail it as calculated to animate the visitors with more friendly feelings towards each other, and thus promote, in a collateral but most effectual manner, the brotherhood of nations—as bringing together in harmonious concord the various nations of the world, and withdrawing the attention from that feeling of international jealousy which leads to sanguinary wars—as a means of promoting that intercommunication of knowledge which will increase our respective powers of adding to the comfort of our fellow-creatures—as a plan of industrial and inventive competition which may, at least for a time, engage all nations to abandon the struggle of warfare for a peaceful and civilising emulation in the works of industry and art. And I think I am safe in assuming that the art of war is less accordant with the "end and aim" of the *Art-Journal* than is the art of peace.

But it is not needful, by further extracts, to show that the elements of international discord have "neither part nor lot in this matter," and are to hold no place in this amicable exhibition of amicable international rivalry. I must, however, make two brief quotations from the admirable speech of the Prince Albert at the Mansion House. A contemporary journal, referring to this, and the various speeches throughout the country, has well observed:—"Many of them are such decidedly peace-speeches, that they might have been delivered at the Annual Meeting of the Peace Society, having an occasional sarcasm, which the orator, thinking it decorous and gentle to drop in passing upon the principles and labours of that institution. No such sneering allusions, however, fell from the lips of Prince Albert, in the beautiful speech which he delivered at the Mansion House, at the dinner recently given by the first magistrate of the City of London to the mayors of the principal towns in the United Kingdom." The Prince observes:—"Nobody who has paid any attention to the particular features of our present era, will doubt for a moment that we are living at a period of most wonderful transition, which tends rapidly to accomplish the great end to which indeed all history points—the realisation of the unity of mankind; not a unity which breaks down the limits, and levels the peculiar characteristics, of the different nations of the earth, but rather a unity the result and product of those very national varieties and antagonistic qualities." And again—"I confidently hope that the first impression which the view of this vast collection will produce upon the spectator will be that of deep thankfulness to the Almighty for the blessings which He has bestowed upon us already here below; and the second, the conviction that they can only be realised in proportion to the help which we are prepared to render to each other; not only between individuals, but between the nations of the earth."

It will, doubtless, be universally admitted, that in a temple expressly dedicated to the demon of discord, the sword and the tomahawk, the spear, the musket, and the bayonet, bombshells, cannons, and scapling-knives, would hold a meet companionship. The presiding genius of the temple would shed over them "his selectest influence." And, were the "end and aim" of this coming exhibition, not the unity, but the *disunity* of mankind, the admission of implements of war would be specially appropriate. Now, to some minds (would that they were more in number!) it is equally apparent that in an exhibition, the design of which is the peace, and amity, and unity of nations, the admission of weapons of war would be singularly inappropriate, as incongruous as, in the supposititious *Disunity* Exhibition, would be the display of the calumet, or the flag of truce, or the dove and its olive-leaf, or other similar emblem; or those implements of peace, the plough-share and the pruning-hook, into which the word of prophecy has declared that the sword and the spear shall one day be transmutated.

I therefore venture to suggest, with a solemnity due to the occasion, and in words, I hope, of befitting deference, but with the emphasis of a full conviction of the propriety and congruity of

the proposal, that *no weapon of international warfare shall be admitted into the coming Exhibition*, one great aim of which is allowed to be the promotion of international union, brotherhood, and peace. Such an exclusion would indeed gladden the hearts of thousands who rejoice in believing that the number does increase of those who have a growing faith in the powers of moral force; and in the subduing efficacy of Christian principle. It has recently been declared, by no mean political authority, that opinions are stronger than armies; and statesmen, men of renown, have not concealed their conviction that the venerable classic adage, *Si vis pacem, para bellum*, is more renewed for its antiquity than for its political sapience.

Earnestly desiring that these convictions may more and more prevail on the earth; and that the nations professing Christianity may, in the exercise of "peace, love, and ready assistance to each other," give evidence of their faith by their works; and that they hasten forward the sure progress of that blissful era, when, in the anticipatory language of the poet—

"The warrior's name would be a name abhorred
And every nation that should lift again
Its hand against a brother, on its forehead
Would wear for evermore the curse of Cain"

I am, thy sincere friend,
M. C. J.

Fifth Month, 1850.

THE OLD WATER-COLOUR SOCIETY.

SIR,—Let me call your attention to a subject alluded to in the *Athenæum* of to-day. You are the advocate for justice, and exposure of abuses in all matters connected with Art, or artists, and will surely feel a pleasure in advocating the cause of the ladies.

For the present I will merely advise you that the Annual Committee of Arrangement at the Old Water-Colour Society have thought fit, for the first time, to put the ladies down in the catalogue as *honorary members*, which they are not. It is not necessary now to prove that the committee possessed no power to do this, nor to throw any light upon their object in doing it; it is enough to assert, that no such term as *honorary member* occurs throughout the laws and regulations of the Society. As you know, this is a title implying that the possessor of it is but an amateur and no professed artist—the public so understand it, and would estimate accordingly the works of the said most unjustly, and heedlessly, so called honorary members. In short, the interests of the ladies have been placed, for a time, in great and serious jeopardy; virtually, their names have been struck out of the list of members, without cause assigned. According to the rules, even an *honorary member* can be removed only by a majority of *three-fourths* at a general meeting—a glorious provision against the manœuvring of cabals; it does therefore appear monstrous that some small knot of the members, very ungalant to the fair sex, to say the least of it, but happily not numerous enough to prevent their election into the Society, should have the power to do them so much injury.

It is to be presumed that these gentlemen who have gone so far out of their right path will be brought into it again; in the meantime a reference to the subject in your wide travelling journal may avert some of the evils which their wandring might otherwise occasion.

ONE FOR THE LADIES.

11th May, 1850.

[We entirely agree with our correspondent; the case is one which demands immediate attention. The illegality of the measure referred to is unquestionable—its injustice is quite as clear; honesty, as well as generosity, would have dictated the very opposite course. This is not an age when the inferiority of women is to be maintained. In all departments of Literature and Art, and even of Science, high positions have been, and are, occupied by women; and that is a miserable policy, indeed, which in such a society would seek to humiliate them. We are by no means the advocates of laws that would put women out of their proper sphere; but it is equally wise and just to elevate, instead of to depress them in places for which they are in all ways eligible.—Ed. A. J.]

THE ROYAL ACADEMY.

SIR,—As the Royal Academy begins to afford signs of movement in accordance with the requirements of the period we live in, may I suggest that it would be a courteous boon, if they were to accord a free admission during the Exhibition to the unfortunate artists whose works could not be placed for want of space, or even for the absence of sufficient talent. The study of the Fine Arts is materially advanced by the observance of good works, and it is a severe tax on the heavy hearts of the rejected to pay a shilling several times, during the Exhibition, for the privilege of studying the performances of their more successful brethren.

I am, Sir,

ONE OF THE FOURTEEN HUNDRED REJECTED.

ART IN CONTINENTAL STATES.

MUNICH.—King Louis, who had partly delivered up to his successor on the throne, and partly abandoned, the greater portion of his artistic undertakings, is now finishing them all without exception; and he has arranged his whole time, all his habits and wants, as well as all his economical affairs for the purpose of doing this; in order to be able to see their accomplishment. The "Siegesthor" (Gate of Victory) is finished, with the exception of the bronze Bavarica-Victrix, now being executed. The new Pinacotheca is considerably advanced, and the pictures on the outside are to be commenced in a few weeks. The "Befreiungshalle" (Hall of Delivery) near Kelheim, of which the foundation was originally laid by Girtner, is to be continued after a new plan by Klenze, and ornamented with a great number of colossal sculptures. The Propylæe, a splendid gate in the ancient Doric style, between the Glyptotheca and the Exhibition Hall, is to be commenced this year by Klenze, while the sculptures for the tympana are being executed in the atelier of Schwanthaler. The colossal Bavarica is nearly finished, and is to be erected the 25th of August next, the King's patron saint's day, which is to be celebrated as a general artistic festival. The pictures in the Dome of Spire, executed by Schrandolph, are half finished, and are continued without interruption. Kaulbach, occupied by his great works for the new Museum in Berlin, and by the designs for the new Pinacotheca in Munich, has, notwithstanding, found time to make a cartoon, perhaps the best of all his compositions, destined to be executed in oil for the "Schädel's Institute" in Frankfurt.—Two illustrated books of an important kind have just been completed. The one is the work of Professor Wilhelm Zahn, of Berlin, "Die schönsten Ornamente und merkwürdigsten Gemälde von Herculaneum, Pompei und Stabiz," which contains copies of the most beautiful pictures and ornaments of the above-named cities. Zahn was twelve years in Pompeii, and in full possession of all the artistic and material means to procure the most faithful and perfect designs. The other work is Kallenbach's "Atlas zur Geschichte der deutsch-mittelalterlichen Baukunst," published in Munich.

E. F. BERLIN.—The annual exhibition of paintings was recently opened here; the catalogue is much richer than the walls, many of the pictures specified not having arrived.

Baron Cornelius approaches towards the end of his labours on the cartoons for the frescoes which are to ornament the new royal tombs and walls of the Campo Santo, near Charlottenburg. For these designs the government have given the illustrious artist 380,000 francs, and their execution will cost 620,000 francs more.

PARIS.—The Exhibition of Paintings in Paris has been postponed until November by the Minister of the Interior; the reason stated being the small number of French amateurs and artists likely to be in the French capital early in the season.

One of the last painters of celebrity educated in the school of David has recently died;—M. Broc, whose pictures of the School of Apelles, and the Magdalen, in the Luxembourg, and some others in the churches of Paris, render his style familiar.

The Academy of Fine Arts have filled the vacancy in its architectural section occasioned by the death of M. Debret, by appointing M. Blouet as his successor.

STRASBOURG.—A monument, commemorative of the re-annexation of Alsace to the French territories, is about to be placed in this city. It is proposed to erect a column, which will be surmounted by a statue of France leaning on a shield, with the arms of the city, and a historic inscription beneath.

NAPLES.—Seaforth, the English marine-painter, has been much patronised here by the king's brother, the Prince Luigi. Angelini is executing a group of Telemachus for royalty, and statues of Religion and Hope for the Church of the Madonna at Toledo.

AMSTERDAM.—The valuable collection of pictures, drawings, and statues collected by the late King of the Netherlands, is to be sold towards the end of July. This collection has for several years attracted attention from all travellers who visited it in the King's (so-called) Gothic Gallery in the Hague. It contains some very fine specimens of Van Dyck, and of the best Spanish and Italian masters. A full-length portrait of this king has been painted by order of his present Majesty, and will be presented to the United Service Club in London through the Duke of Wellington, to whom it is to be conveyed by the artist himself, Mr. Pieneman, a distinguished painter of Amsterdam.

A DICTIONARY OF TERMS IN ART.

BREADTH. This term is employed in the language of Art to express that kind of grandeur which results from the arrangement of objects and of the mode of proceeding in delineating them. In painting it is applied both to Design and to Colouring; it conveys the idea of simple arrangement, free from too great a multiplicity of details, following which the lights and shades spread themselves over the prominent parts, without dazzling or interfering with each other, so that the attention of the spectator is arrested and kept fixed, and there is *breadth of effect*, the result of judicious colouring and *chiaro-oscuro*. When a work offers these results, we say it has *breadth*; and 'broad touch,' 'broad pencil,' are terms applicable to this manner of working, when the touches and strokes of the pencil produce *breadth of effect*. In a similar sense, in engraving, we say 'a broad burin.' But although a work of sculpture is susceptible of Breadth, we do not say 'a broad chisel.'

BRECCIA. An Italian name for those stones which consist of hard angular or rounded fragments of different mineral bodies, united by a kind of cement, of which the so-called Pudding-stone is an example, which consists of flint detritus, cemented by quartz. The ancients used Breccia both in Architecture and the Plastic Arts. Porphyry Breccia, or Egyptian Breccia, is one of the most beautiful varieties of this material, of which a fine pillar is contained in the Museo Pio Clementino. Many varieties of Breccia exist, which may be found fully described in Mr. HEAD's very interesting work on ROME.*

BROKEN COLOURS. This term is employed to describe colours produced by the mixture of one or more pigments. Nature presents us with an infinite variety of Broken Colours, which may be regarded as compounds of the three primary colours in various proportions, producing an endless series of BROWNS and GREYS; these the artist, in his desire to represent, may successfully imitate by carefully analysing the colouring qualities of the pigments used for mixtures; but the practice of mixing the tints on the palette generally leads to an irreparable foibles. The great variety of pigments prepared for the artist's use are equal to supply any desideratum in colouring; therefore the necessity and risk of mixing them can to a great extent be avoided. The consideration of this important subject belongs to PRIMA PAINTING, and is fully and ably treated in a work before quoted.†

BRONZE. There are two kinds of Bronze; the *antique* employed by the ancients in casting, and composed of tin and copper; and the *modern*, containing also zinc and lead, by which the fluidity is increased, and the brittleness diminished. The proportions used vary according to the different kinds of Bronze, and it is fluid according to the proportion of tin it contains.‡ It is harder, more fusible, more brittle, and more susceptible of polish than Brass, and cannot be rolled or stretched. Immersed, when hot, in water, it is rendered malleable, and it acquires by time, a beautiful green coating (*Patina*, *Verde nobiliss*), which we endeavour to give to new bronze statues, by rubbing them with a solution of copper. Before iron came into use, the ancients made their swords and axes of Bronze.§ The greater part of ancient Bronzes now preserved in museums have been derived from the ruins of Pompeii and Herculaneum, of which the finest collection is in the Museo Borbonico at Naples. The British Museum contains a very good collection, though small.

BRONZING. The giving a bronze-like appearance to wood, gypsum, or any other material, and implying also the giving a metallic appearance to any object not metal. The surface is first rubbed with linseed oil varnish, and when nearly dry dusted with bronze powder, prepared from leaf-gold, metallic-gold, or precipitated copper, and it is then rubbed with a linen rag; or the varnish may be ground with the bronze-powder, and laid on like a pigment. Gum-arabic is used instead of varnish for Bronzing paper or wood.¶ A better kind of Bronzing is obtained by depositing a film of copper on the object by means of the Electrotype process, and afterwards washing the surface

with finely-powdered plumbago, or crocus powder, or sulphuret of potassium.

BROWN, or Tan-Colour, was used both in ancient and mediæval times as a sign of mourning; regarded as a compound of Red and Black, BISTRE, it is the symbol of infernal love and of treason. By the Egyptians Typhon was represented of a Red colour, or rather of Red mixed with Black; everything in nature of a Brown colour was consecrated to Typhon. In the ancient pictures representing the Passion of Jesus Christ, the personages are frequently depicted Brown. Several religious orders adopt this colour in their costume, as the symbol of renunciation. With the Moors it was emblematic of every evil. Tradition assigns red hair to Judas. Christian Symbolism appropriates the colour of the dead leaf for the type of spiritual death; the Blue, the celestial colour, which gives them life, is evaporated—they become of a dark-yellow, hence the term "dead leaf."*

BROWN OCHRE. A strong dark yellow opaque pigment, very similar in tone to Roman Ochre; it is found native in various countries, is durable, and mixes well with Prussian blue in making Greens, and with Brown red in the Carnations.

BROWN PIGMENTS. Are those in which the three primary colours meet in unequal proportions, red being in excess. They are mostly derived from the mineral kingdom, the earths being used in the raw or burned state, but chiefly the latter. The principal and most useful of them are Asphaltum, Bistre, Umber, Terra di Sienna, Mars Brown, Cassel Earth, Cappagh Brown, Brown Madder, Burnt Terra Verde.

BROWN PINK. A vegetable-yellow pigment, prepared by precipitating the colouring matter of French Berries upon a white earth, such as chalk. It forms one of the class of pigments known as "Yellow Lakes," called by the French *Stil de grain*. Brown Pink is used both in oil and water-colour painting, but it is by no means an eligible pigment. In oil-painting its place is best supplied by MIXTORY mixed with other pigments.

BROWN RED. This pigment is found native, but the greater part that used in painting is made from yellow ochre calcined, the brightness of the red depending upon the purity of the ochre. The *Brun Rouge* of the French is burnt Roman ochre, sometimes called burnt Italian earth. A very fine BROWN RED is obtained by calcining sulphate of iron, which becomes more or less Violet according as the action of the fire has been more or less prolonged; the reds or violet reds so prepared are known as MARS Reds. The reddest of these is not only valuable on account of its durability, but also for the fine CARNATIONS which it yields when mixed with white.

BRUNSWICK GREEN. A pigment used in oil-painting, in colour resembling MOUNTAIN-GREEN, and consisting of the carbonate of the oxide of copper and a calcareous earth. Real Brunswick Green is basic chloride of copper, prepared by acting on copper with sal-ammoniac.

BRUSHES. In Painting, are made of the hair or bristles of various animals, fastened to round wooden sticks, from fifteen to sixteen inches in length, by being bound with thread, or tin; the latter is used to produce the flat brushes. The round Brushes must be conical, without making a real point, and must never be cut with the scissors, but should terminate with the natural weak ends of the hair. In the first case, the pigments would flow streaky; in the second, the Brushes lose their elasticity, and the pigments do not flow readily. Brushes vary from the size of a common knitting-needle to an inch or more in diameter, the small ones being of the finest hair.† While painting, the artist holds his brushes in the left hand, using them according to the pigment required, which is taken up on the point. They must be cleaned immediately upon ceasing to paint; and the readiest way to clean them is to squeeze out all the pigment between the folds of a piece of rag, and then rinsing them in Camphine, wiping them dry upon a piece of clean oiled rag. If the pigments have been suffered to dry upon the Brushes, they are easily softened by Camphine, if allowed to lie in it for a reasonable time.

BUCENTAUR. The name given to the state

* See FONTANA'S *Essai sur les Couleurs Symboliques*.

† Some valuable observations on the choice, preparation, and employment of Brushes will be found in *The Art of Painting Restored*, by L. HUNDETTREFFS, London, 1849. D. Eogus.

galley in which the Doge and senate of Venice went to espouse the sea. In ancient mythology, the Bucentaur was a monster, half man and half ox. (CENTAUR).

BUCCINA. A musical instrument, a kind of horn-trumpet, originally made out of the shell *buccinum*. It was most commonly used by watch-

men, also at festive entertainments, and at funerals. It is the instrument seen in the hands of Tritons.

BUCCULA. The cheek-piece, that part of the helmet which protected the sides of the face, furnished with hinges, by which it was rendered capable of being lifted up or down at will.*

BUHL. This word is a corruption of *Boule*, the name of an Italian artisan who first introduced this kind of ornament into cabinet-work. It is used to designate that sort of work in which any two materials of different colours are inlaid into each other, as brass, tortoiseshell, pearl, &c.; it is applied to chairs, tables, desks, work-boxes, &c.

BUCRANIA (*Lat.*, OX-SKULLS). Sculptured ornaments representing OX-SKULLS, which, with wreaths of flowers or other arabesque-like orna-

ments, were employed to adorn the ZOPHORUS or FRIEZE of the Entablature in the Ionic and Corinthian Orders of Architecture. They have occasionally been employed, very improperly, to ornament Christian temples.

BULLE. Studs or bosses of metal, employed by the ancients to adorn sword-belts. The Bulla was also an ornament worn by children suspended from the neck, and in statues and bas-reliefs we frequently meet with figures of boys wearing the Bulla. As BOSSSES, they were used to ornament shields. (BOSSSES).

BURIN, or GRAVER. An instrument of tempered steel, used for engraving on copper. It is of a prismatic form, having one end attached to a short wooden handle, and the other ground off

obliquely, so as to produce a sharp point. In working, the burin is held in the palm of the hand, and pushed forward so as to cut a portion of the copper. The expressions *brilliant burin*, *soft burin*, are used to characterise the manner of a master.

BURNT PAPER yields a black pigment of very good quality, and is said not to deepen in colour like some other blacks.

BURNT SIENNA. This pigment is the raw Terra di Sienna submitted to the action of fire, by which it is converted into a fine orange-red colour, transparent, permanent, and in every respect an eligible pigment, both in oil and water-colour painting. It mixes well with other pigments,

* The cut exhibits an Etruscan helmet with the cheek piece applied, and a Roman one beneath with the ordinary mode of wearing it.

works freely, and dries quickly. With Prussian Blue it yields excellent GREENS.

BURNT TERRA VERDE. A pigment of a fine warm brown colour, much used by the Italians, mixed with other pigments, for the shadow of flesh. It has been called *Verona Brown*.

BURNT UMBER. The earth UMBER, which, in its raw state, is but little used in painting, is, when burnt, a very eligible pigment of a russet-brown colour. It is permanent, semi-transparent, dries well, and mixes, without decomposition, with other pigments.

BUSKIN (COTHURNUS, Lat.) A kind of boot, or covering for the leg, of great antiquity. It was worn by Diana in representations of that goddess, as part of the costume of hunters. In antique marbles it is represented tastefully ornamented.* Being laced in front it fitted tightly to the leg. Buskin is used in contradistinction to the *Sock*, (*soccus*) the flat-soled shoe, worn by comedians, &c., and both terms are used to express the tragic and comic drama.

BUSKINS, in Ecclesiastical costume, are made of precious stuff, or of cloth of gold; worn on the legs by bishops when celebrating, and by kings at their coronation, and on other solemn occasions. Buskins and sandals, have often been confounded, but they must be kept distinct.†

BUST (IL BUSTO, Ital.) In sculpture, is the representation of that portion of the human figure which comprises the upper part of the body, including the head, neck, shoulders, breast, and arms truncated above the elbow. The extent of the body represented varies, sometimes excluding the trunk to the hips. Busts are supported on pedestals, between which is sometimes a square prop or a column. (See HERMA.)

BYSSUS (Gr.) By this term is understood, the hairy and thread-like beards by which many kinds of sea-shells adhere to the rocks: the *Pinna* is particularly distinguished for the length and silvery fineness of its beard, of which the Sicilians and Calabrians make very durable cloth, gloves, and stockings. The Ancients were acquainted with this production of the *Pinna marina* and wove cloth of it;‡ and it was also used as an ornament for the hair: they also included under this term, a vegetable production prepared from the fibres of certain plants, considered by some to be cotton, by others *linen*, and used to wrap mummies in; most of the mummy-cloths, prove to be of linen-cloth. Yet, notwithstanding this kind of testimony, many eminent scholars, insist that both the garments of the Egyptian priests, and the cloths in which the mummies were wrapped, consisted of cotton (the product of the *Gossypium herbaceum* or *G. arborescens*.) But it is certain that under the term *Byssus* the Ancients included different materials and fabrics, such as the one described above, and both cotton and linen.

CADUCEUS. The staff of Mercury or Hermes, which gave the god power to fly. It was given to him by Apollo, as a reward for having assisted him to invent the Lyre. It was then a winged staff; but, in Arcadia, Hermes cast it among serpents, who immediately entwined themselves around it, and became quiet. After this event, it was used as a herald of peace. It possessed the power of bestowing happiness and riches, of healing the sick, raising the dead, and conjuring spirits from the lower world. On the silver coins of the Roman Emperors, the CADUCEUS was given to Mars, who holds it in the left hand, and the spear in the right, to show how peace succeeds war.

CADMIUM YELLOW. This pigment is prepared from the Sulphuret of Cadmium. It is of an intense yellow colour, possessing much body, and as there is no reason to doubt its permanency, may be regarded as a valuable addition to the palette. Mixed with White-lead it yields many valuable tints. Much of the NAPLES YELLOW now sold is prepared from the Sulphuret of Cadmium mixed with White-lead. Genuine Naples Yellow is of a greenish hue, which readily distinguishes it from

* *TERTULLIAN De Pallio.*

† Our cut represents a very beautiful one, from the statue of Hadrian, in the British Museum.

‡ *PONCE's Glossary of Ecclesiastical Ornament and Costume.*

the substitute, but this latter possesses many qualities which will cause it to supersede the genuine Naples Yellow.

CÆLATURA. From the Latin *Cælum*, the tool used: the art, called also by the Romans, *sculptura*, or chasing, if we mean "raised-work." *CÆLATURA* corresponds to the Grecian term *Toreutike*, derived from *toros*, which in its true sense means only raised-work. Quintilian expressly limits this term to metal, while he mentions wood, ivory, marble, glass, and precious stones as materials for engraving (*sculptura*). Silver was the artist's favourite metal, but gold, bronze, and even iron, were embossed. Closely connected with this art was that of stamping with the punch, called by the Romans *excudere*. Embossings were probably finished by *toreutike*, of which Phidias is called the inventor. The colossal statues of gold and ivory made by him and by Polyctetus belong partly to sculpture by the ivory-work, and partly to toreutic art from the gold-work, the embossing of which was essential to their character, as also to castings: the statue of Minerva was richly embossed. Besides Phidias and Polyctetus, Myron, Mys and Mentor are mentioned as great toreutic artists. Arms, armour, &c., were adorned in this manner; * other articles, such as goblets and other drinking cups, were also embossed, partly with figures in alto-relievo, or with figures standing quite clear: also dishes, the ornaments of which were set in as *emblena*, or fastened slightly on as *crata*. Carriages were ornamented not only with bronze, but even with silver and gold embossings. Other articles of furniture, as *ripods*, *dishes*, *candelabra*, were thus ornamented. With this *toreutike* or embossing, must not be confounded the art of inlaying, *enpaistike*, much practised in antiquity.

CALANTICA, CALVATICA. (Lat.) KERRYPHALOS, (Gr.) A kind of head-dress worn by women in ancient times, and known very early in Greece; there were two kinds, nets and cap-like bags (Fig. 1.) The Grecian *Kerryphalos* was a net worn at night, and also by day in the house; it was called by the Romans, *Reticulum*, and is to be seen in many of the pictures at Herulanum and Pompeii (Fig. 2); in the last they are made of gold thread. They were

Fig. 1.

Fig. 2.

also made of silk; of the costly Elian *Byssus*, and of a more common material. In the thick caps, the hair hangs on the neck as in a bag; these were designated by the Romans as *MITRÆ*, by which is meant *Calantica*, or *Calvatica*; this does not imply merely the Phrygian covering for the head, for the *Mitra* or *Mitella* was also called *Graga* by the ancients, by which is meant the true Hellenic cap. Many varieties of these caps are to be seen upon ancient vases; sometimes they are of a plain material, sometimes having a pattern, and sometimes striped or checked; they are either open behind, so that part of the hair hangs out, or it covers only the two sides of the head.†

CALATHUS (Gr.) QUALUS or QUASSILUS. (Lat.) The ancient term for the baskets in which the spinners kept their wool and their work; it was also called *TALARUS*, and was made of wicker-work, with a wide opening at top and pointed at bottom. We find it represented in many monuments, particularly in *TISCHBEIN'S Vases* (T. 10.)

where a *CALATHUS* is placed on each side of the chair. They were also imitated in metal, as is proved by Helen's silver *Calathus* in the *Odyssey*. The *CALATHUS* was a symbol of maidenhood, and in this sense was employed by artists, as is seen in the reliefs representing Achilles among the daughters of *Lycomedes*. Other antiques show us that these baskets were used for many purposes at the toilette, for flowers, &c. The *CALATHUS* also appears in the basket-like form of the capitals of Corinthian pillars.

* As for example, the fragments of gilt-bronze found in 1820 at Lucania, representing two groups of conquered Amazons, supposed to be the breast-flaps of a coat of mail.

† Two figures in the Albobrandini marriage wear the caps shaped like bags: the cap worn by the Egyptian Gods, Kings, Priests, and even that of the Sphinx, is called a *CALANTICA*. Vide BÖTTIGER, *Archæol. der Malerei*. See Fig. 1, copied from a painting at Thebes.

CALCEUS. A shoe or short boot used by the Greeks and Romans as a covering to protect the feet while walking; the term being used in contradistinction to sandals or slippers, and corresponding to the modern shoes; they varied in form and colour according to the office or dignity of the wearer.

For the various coverings for the feet worn by the Ancients, see the terms, *CALIGA*, *COTHURNUS*, *CREPIDA*, *PERO*, *SANDALUM*, *Soccus*, *SOLEA*.

CALCINATION differs from *BURNING* in the action of the fire being prolonged; as, bones heated in a covered vessel until they become black, are termed *burnt bones*, and constitute *Teary Black* or *Bone Black*; but when, by the further operation of heat with contact of air, they become white, they are termed *calcined bones*, which the old painters used as a *DRYER*.

CALIGA. The shoe worn by the Roman soldiers of the ranks. The officers wore the *Calceus*. It was very strong and heavy, and thickly studded with hob-nails.*

CALPIS, A Water-Jar, characterised by having three handles, two at the shoulders and one at the neck. This, with the *HYDRIA*, is found

in Etruscan tombs, ornamented with red figures on a black ground.

CAMAÏL. This term appears to be an abbreviation of *Cap mail*—the mail or armour appertaining to the head-piece. The cut exhibits the *Camail* on the effigy of Edward the Black Prince at Canterbury.

CAMAÏEU

CAMAÏEU (Fr.) MONOCHROME. By this term, we understand painting with a single colour, varied only by the effect of *chiaro-oscuro*; we apply this term to painting in grey (*en grisaille*) which, as well as red, was used by the ancients. Pictures in two or three tints, where the natural hues of the objects are not copied, may also be called *en camayeu*; we speak of brown, red, yellow, green, and blue *camayeu*, according to their principal colours. The pictures of Polidori Caravaggio, for example, by their heavy brown tint give the impression of monochrome painting, and with all their perfection, they are but pictures *en camayeu*. Drawings in red or black chalk, lead and other pencils, indian ink, sepia and bistre, as well as engraving, may be called *CAMAÏEU*.

CAMEO, CAMEI (Ital.) Gems cut in relief, the most expensive class of cut stones. The custom of ornamenting goblets, eratera, candelabra, and other articles with gems, originated in the East; and was followed at the court of the Seleucids, the greatest extravagance being practised with regard to such ornaments. When the image on the stone was not to be used as a seal it was cut in relief, and the variegated Onyx was generally selected. Great attention was paid to the different colours of the strata of the stone, so that the objects stood out light from a dark ground. Some of the *CAMEOS* preserved to us are wonders of beauty and technical perfection, showing the high degree of Art to

* The cut represents one found in London. The sole is thickly covered with nails.

which the Grecian lapidaries had attained under the luxurious successors of Alexander the Great. The finest specimen now existing is the Gonzaga Cameo, formerly at Malmaison, now in the Imperial collection of gems at St Petersburg. Among the remains of the ancient art of stone-cutting, the gems cut in relief, called on account of the different layers of stone **CAMEI**, are rarer and more valuable than those cut in **INTAGLIO**. **CAMEOS** are not mentioned in the history of medieval art; they were brought forward again in Italy in recent times. The production of Cameos has become an Art-manufacture of considerable importance.*

CAMERA - LUCIDA. An ingenious instrument invented by Dr. Woollaston, for the purpose of enabling any one unacquainted with the art of drawing to delineate natural objects, &c., with great accuracy. It consists of a glass prism of four irregular sides, mounted on a brass frame, supported by telescopic brass tubes, with an eye-piece furnished with a convex lens, through which the paper and the point of the pencil are seen, and the image traced; on account of its simplicity and portability the instrument is valuable.

CAMERA-OBSCURA. An apparatus by which the images of objects are thrown in their proper forms and colours upon a light surface. It consists of a darkened room or box furnished with a convex lens, through which the light is admitted; at the proper focus is placed a screen of ground glass or other material, upon which the external image falls. A very extended application of this instrument has arisen since the discovery of the art of **PHOTOGRAPHY**.

CAMPSTRE. A short garment fastened about the loins, and extending from thence down the legs, nearly to the knees, after the manner of

the **kill**. It was worn by the Roman youths when they exercised in public places, also by soldiers and gladiators for the sake of decency when exercising.†

CANABUS (Gr.), CANEVAS, CANNEVAS (Fr.) The term by which the ancients designated the wooden skeleton covered with clay, or some other soft substance, for modelling larger figures; hence the French word *canevas*. Similar skeletons were used as anatomical studies, by painters and plastic artists.

CANDELÁBRA. Candelabra were objects of great importance in ancient Art; they were originally used as candlesticks, but after oil was introduced, they were used to hold lamps, and stood on the ground, being very tall, from four to seven or ten feet in height. The simplest Candelabra were of wood, others were very splendid both in material and in their ornaments. The largest candelabra, placed in temples and palaces were of marble with ornaments in relief and fastened to the ground; there are several specimens in the Museum Clementinum at Rome. These large Candelabra were also altars of incense, the carving showing to what God they were dedicated; they were also given as offerings, and were then

* The work in precious stones is either depressed **INTAGLIO**, or raised **ECHYVA SCULPTURA** in Pliny, *Cameo Asiæ, Caneytes, Caneso*. The impression is the main object of the former; the chief aim of the latter is to adorn. For the former were employed transparent stones of uniform colour, and such as were spotted and clouded, and precious stones; for the latter, variegated stones, such as the *Gonizes, Corallians*, and similar kinds of stones, which Oriental and African commerce brought to the ancients, of surprising, and now unknown, beauty and size. **MULLER, Ancient Art and its Remains.**

† The engraving represents a Gladiator from a Pompeian painting.

made of finer metals, and even of precious stones. Candelabra were also made of haked earth, but they were mostly of elegantly wrought bronze. They consisted of three parts:—1. the feet, 2. the shaft; 3. the plinth with the tray, upon which the lamp was placed. The base generally consisted of three animals' feet, ornamented with leaves. The shaft was fluted; and on the plinth often stands a figure holding the top, generally in the shape of a vase, on which rests the tray.* The branching

Candelabra are valuable as works of Art, and also those where the shaft is formed by a statue, bearing a torch-like lamp, and each arm holding a plate for a lamp. Another kind of Candelabrum was called **Lampadarii**: these were in the form of pillars, with arms or branches from which the lamps hung by chains. In the Museo Etrusco Gregoriano at Rome, are forty-three Candelabra of various forms, which were excavated at Cervetri. Some have smooth, and some have fluted, shafts, on which is represented a climbing animal, a serpent, lizard, weasel, or a cat following a cock. Sometimes these shafts bear a cup, or branch

into many arms, between which stand beautiful little figures, or they have plates rising perpendicularly above one another. They generally rest on feet of lions, men, or stags, or they are supported by figures of Satyrs, &c. Some Candelabra are in the form of a human figure, bearing the plate in the outstretched hand, and sometimes the pillar is supported by Caryatides.

CANDYS (Gr.) A kind of gown, of woollen cloth, with wide sleeves, worn by the Medes and

Candys.

Canephoros.

Persians as an outside garment; it was usually of purple or similar brilliant colour.†

CANEPHOROS (Gr.) The bearer of the round basket containing the implements of sacrifice, in the processions of the Dionysia, Panathæna, and other public festivals. The attitude in which they appear in works of art, is a favourite one with the ancient artists; the figure elevates one arm to support the basket carried on the head, and with the other slightly raises her tunic.

CANOPY. A covering of velvet, silk, or cloth of gold, extended on a frame, and richly embroidered with suitable devices, supported and carried by four or more staves of wood or silver, borne in processions over the heads of distinguished personages, or over the bier at the funerals of noble persons. In the religious processions of the Catholic Church it is borne over the Host and Sacred reliques. According to Roman use they are white, but in the French and Flemish churches they are generally red. In England, the two colours seem to have been used indiscriminately.‡

* Museo Borbonico, iv. to vii.
† The cut is copied from a Persepolitan bas-relief in Sir R. K. Porter's Travels.
‡ See PUGN'S Glossary of Ecclesiastical Ornament and Costume. SHAW'S Decorations of the Middle Ages, &c.

CANTHARUS (Gr.) A kind of drinking-cup with handles, sacred to Bacchus, who is

frequently depicted on antique vases, &c., holding it in his hand.

CANVAS. One of the materials, and the principal one, upon which oil-paintings are made. Two kinds are prepared for artists' use; the best is called *ticking*. It is primed with a ground of a neutral grey colour, or with other colours, according to the fancy of the painter. Certain sizes being in greater request than others, they are kept stretched on frames ready for use; for portraits, these are known by the names of *Kill-out*, which measures 28 or 29 inches by 36 inches; *Three-quarters*, measures 25 by 30; *Half-length*, 40 by 50; *Bishops' half-length*, 44 or 45 by 56; *Bishops' whole length*, 58 by 94.

CAPPAGH BROWN. A bituminous earth coloured by oxide of manganese and iron, which yields pigments of various rich brown colours, two of which are distinguished as *light* and *dark* CAPPAGH BROWNS; they are transparent, permanent, and dry well in oil when not applied too thickly. CAPPAGH BROWN, also called **ETCHROME MINEKAL**, or **MANGANESE BROWN**, derives its name from Cappagh, near Cork, in Ireland.

CARCHESIUM, CARCHESION. The name of an antique drinking vessel, and also of the goblet peculiar to Bacchus, found on numerous antiques, sometimes in his own hand, as in the

Fig. 1.

ancient representations in which the god is clothed and heaped, and sometimes at the Bacchic feasts. The Carchesium has a shallow foot; it is generally wider than it is deep, smaller towards the centre, and with handles rising high over the edge, and reaching to the foot. Its use in religious ceremonies proves it to have been one of the oldest forms of goblets.*

That part of the mast, in ancient ships, immediately above the yards, answering to the *main-top* of modern ships, as it bore some resemblance to a

Fig. 2.

drinking-cup, was also called **CARCHESIUM**. The sailors used to ascend into it to 'look out,' to manage the sails, and to discharge missiles.†

CARICATURE. A satirical image, or extravagant representation, in which the features of the physiognomy, the expression of the passions, the

* Fig. 1 represents one, adorned with Bacchic figures, given by Charles the Simple to the Abbey of St. Denis.
† See PUGN'S Glossary of Ecclesiastical Ornament and Costume. SHAW'S Decorations of the Middle Ages, &c.

natural defects and habits of the body of the person represented are exaggerated, whence results a grotesque and overcharged figure. **CARICATURE** is to Painting, what the Epigram is to Poetry; every appearance of effort or care is carefully excluded, although the objects must not be represented falsely. A general knowledge of forms, and of the mechanism of the figure, a quickness of hand, keen observation, and a knowledge of character (more or less profound), and of the influence of the passions upon mankind, are indispensable to the caricaturist. Usually caricatures appear as if executed with a pen or pencil. **CARICATURE** can only exist in free states, and although in France and Italy occasionally deeply satirical productions appear, yet it is only in England that political caricature is looked upon as harmless, beyond provoking mirth and checking arrogance and vanity. The names of Gilray, Cruickshank, and HB (Doyle), are sufficient to establish an English school of caricature. Caricatures and inscriptions to illustrate their satirical meaning; these are placed as issuing from the mouths of the figures, or as inscriptions, sometimes convey a pun.

CARMINE. A beautiful Red pigment prepared from cochineal; in colour it forms the nearest approach to the red of the Prismatic Spectrum. It is very useful in water-colour painting, but cannot be depended upon in oil. There is a **CARMINE** prepared from madder, which is considered permanent both in oil and water. **Burnt carmine** is a pigment of a rich purple colour, very useful in miniature painting.*

CARNATION (*Fr.*), **CARNAGIONE**. (*Ital.*) The flesh-tints in painting are termed **CARNATIONS**. The study of the naked human form is of course necessary to the proper delineation of figure, which ought, if possible, to be free from clothing, so that the flesh and natural structure may be visible; the beauty of a picture is reduced to a minimum, if the artist, from prudery, evade the free development of nature. Carnations are of the greatest importance in mythical representations, heathen or christian, for in these subjects the painter has free and ample scope for artistic colouring. The student of flesh-painting must carefully consider his choice of pigments, since they are not all equally serviceable, either in picturesque effect or in chemical action; those which do not blend must be replaced by others which can be mixed without detriment to each other. The local colours should be given with the ochres in preference to vermilion; the shadows with ultramarine ashes; Venetian green mixed with asphaltum is good. In painting flesh, the pigments should be laid on thick and pasty, as the colouring of any large surface requires this treatment in order to produce a good effect. If two large pictures be painted, one with thick and the other with thin colours, the former will have a much more picturesque effect and greater *rounding* than the other, even if the latter be more carefully executed.†

CARPENTUM. A covered two-wheeled carriage drawn by two horses and mules, and capable of containing two or three persons. Its chief use

was to convey the Roman ladies in festal processions, and by private persons on journeys.‡ **CARPENTA**, or covered carts, were extensively used by the Britons and other northern nations.

CARTOON (*Fr.*), **CARTONE** (*Ital.*) Stout paper and pasteboard, hence the term came to be applied by the Italians to the drawings and sketches made on this material. In the language of art, **CARTOONS** are sketches of figures or groups carefully drawn upon pasteboard, the size or thickness of which depends upon the artist's purpose. They are principally used in fresco; the design is pierced in the prominent outlines with pin-holes. When they are fastened to the mortar they are powdered with charcoal-dust, which passing

through the pin-holes, makes the sketches sufficiently visible on the mortar. Cartoons, executed in colours, like paintings, are used for designs in tapestries, of which, those by Raffaello at Hampton Court, are best-known examples.

CARTOUCHE (*Fr.*) A sculptured ornament in the form of a scroll unrolled, used as a field for inscriptions, &c.

CARVING. A branch of Sculpture usually limited to works in wood and ivory. Sculpture, properly so called, being generally applied to carving in stone or marble. Various kinds of wood were used by the ancients, chiefly for images of the gods, to each of which a different or particular kind of wood was appropriated; as, for instance, the images of Dionysus, the God of Figs, were made of the wood of the fig-tree. Ivory was used to great extent by the ancients in their works of Art; and the **CHRYSELEPHANTINE** sculpture, or the union of gold with ivory, was adopted by the greatest artists. For a long period prior to the Reformation in this country, there was an immense demand for fine wood-carvings, as the remains in our cathedrals, churches, colleges, of screens, canopies, desks, chair-seats; and in baronial halls, of door frames, staircases, chimney-pieces, cabinets, picture-frames, sufficiently show. Since that event, the art has in great measure fallen into disuse. One of the most eminent modern artists in wood was Grinling Gibbons, a native of this country. There is one of his best works in the choir of St. Paul's. Machinery has lately been applied with great success to **WOOD-CARVING**, and may serve to revive the taste for such works in interior decoration and in furniture.

CARYATIDES (*Gr.*) Under the article **ATLANTIS** we described the entablature and other parts of ancient buildings. **CARYATIDES** are female statues used for the same purpose, and are very abundant in the remains of ancient architecture, possessing much grace and dignity of bearing, notwithstanding the servile character of their employment.*

CASQUE (*Fr.*) A helmet. Helmets were originally made of leather. Those formed of metal were termed, in Latin, **Cassides**, hence

CASQUETEL. A small steel cap or open helmet, without beaver or visor, but having a projecting umbril and flexible plait to cover the neck behind. In the

reign of Henry VI. they had *oreillets* or plaites, round or oval, over the ears, and sometimes with a spike at the top, called a *charnel*, or *event*. The *oreillets* had spikes sometimes projecting from their centres.

CAST. That which is Cast in a mould; usually applied to works in Plaster of Paris. The art of **CASTING** in metals is more properly termed **FOUNDING**.

CASTING OF DRAPERIES. In painting or sculpture, consists in the proper distribution of the folds of the garments, so that they appear the result of accident rather than of study or labour. The arrangement of draperies sometimes gives the artist much trouble, but this is frequently caused by the material employed in the model being of a different substance to that depicted in the picture.

CATHERINE, *St.*, of **ALEXANDRIA**. The patron saint of Philosophy and the Schools. The pictures of her are almost innumerable; as patron saint or martyr, her attributes are a broken wheel set round with knives, and a sword, the instruments of her martyrdom. After her death, according to the legend, her body was transported by angels to Mount Sinai.† Another class of pictures in which this Saint is a principal feature, is that representing her 'mystic marriage'

with Christ, of which, among the best known, is the picture in the gallery of the Louvre, by Correggio. Other compositions represent her 'disputing with the fifty philosophers.' The "Vision of St. Catherine" has been painted less frequently than the other incidents of her life. There are other Saints of this name, of which the best known are Catherine of Bologna, who is represented holding the infant Jesus; Catherine of Sweden, who bears the insignia of royalty, and leads a hind; Catherine of Sienna, on whose hands are seen the marks of the nails which pierced the Saviour, and who carries a crucifix and wears a ring.

CAUSIA (*Gr.*) A broad-brimmed felt hat, worn by the Macedonian kings.

CECILIA, *St.* The patroness of music, and supposed inventress of the organ; was suffered martyrdom by being plunged into a vessel of boiling oil. She is sometimes depicted with a gash in her neck, and standing in a cauldron, but more frequently holding a model of an organ, and turning her head towards heaven, as if listening to the music of the spheres. In the famous picture by Carlo Dolce, in the Dresden Gallery, she is represented as playing upon the organ, her attitude expressing maidenly grace, and her face heavenly inspiration. At Bologna is a "St. Cecilia listening to the heavenly music," by Raffaello, one of his finest works. Rubens has also painted a Cecilia, well known by the masterly engraving of Bolswert. In the church of St. Cecilia, at Bologna, is a large fresco of scenes from the life of this saint, by Francia and his pupils, which, together with the representation of her marriage and burial, by his own hand alone, forms one of his most remarkable productions, the fame of which led Raffaello to paint the picture mentioned above, and send it to him.* The subject was a favourite one with many of the old painters.

CENOTAPH. A monument erected to a deceased person, but not containing the remains. Originally Cenotaphs were raised for those only whose bones could not be found, who had perished at sea, &c., or to one who died far away from his native town. The tomb built by a man during his life-time for himself and family was called a **CENOTAPH**. We meet with these erections also in the middle ages, **SARCOPHAGI** being placed in churches in remembrance of those buried elsewhere.

CENTAUR. A fabulous Being frequently represented in Ancient Art, with the head, arms, and trunk of a human body joined to the body and legs of a horse, just above the chest. The bas-reliefs of the battle of the Centaurs and Lapithæ, of the Phigalean frieze in the British Museum, are illustrations of the employment of this monster in Ancient Art; it frequently occurs on Greek vases, and in the Pompeian paintings. The union of the human body with that of the ox is termed **BUCENTAUR**.

CERIOPLARIA. A name under which **CANDELABRA** are sometimes mentioned in Roman inscriptions.

CEROPLASTIC. The art of modelling in wax. **CEROSTROTUM**, or **CERTROTUM**. A kind of encaustic painting upon ivory or horn, in which the lines of the design were burnt-in with the **CESTRUM**, and wax introduced into the furrows made by the heated instrument.

CERUSE, commonly called **WHITE LEAD**, is a *Carbonate of Lead*, the basis of white oil-paint. It is also called *Flake-White*, *Krems*, *Nottingham White*, &c. Although used to a greater extent as a pigment than any other material, like all other preparations of lead it is easily acted upon by exhalations from sewers, coals, &c. containing sulphuretted hydrogen, which rapidly destroy its white colour, frequently changing it to a dull leaden hue. It is not prudent to mix it with **VERMILION** or any other pigment containing sulphur, except **CADMIUM Yellow**. It has lately been proposed to substitute the white oxide of zinc as a permanent white pigment.

CESTRUM (*Lat.*), **GRAPHIS** (*Gr.*) The **STYLE** (*vericulum*) or *Spatula* used in the two kinds of encaustic painting practised by the ancients, viz., wax and ivory encaustic. When they began to adorn their war-ships with paintings, a third kind of encaustic painting was introduced, in which the colours were melted by the aid of heat and applied with a brush. The **CESTRUM** was made of ivory, pointed at one end, and flat at the other.

* A very beautiful statue of "St. Cecilia Lyine Dead," executed by Stefano Maderno, representing the body in the attitude in which it was found, is in the church dedicated to this saint at Rome; it is described and engraved in **SIR CHARLES BELL'S Anatomy of Expression**.

‡ Our engraving is copied from a medal of Agricippa, and exhibits a Carpentum of the most enriched form.

* Our example is taken from one at Athens.

† This has been made the subject of a very beautiful picture by Mücke, familiarly known by an excellent lithographic engraving.

SUBURBAN ARTISAN SCHOOLS.
THE NORTH LONDON SCHOOL OF DRAWING AND MODELLING.

It has been rarely our task to record so rapid a progress to maturity as that which is presented by this school—the first attempt to give to the suburbs of the British metropolis advantages similar to those which are enjoyed by the artisans of other cities of Europe. The school has been opened barely a month; its establishment followed a public meeting held early in April, at which Mr. S. C. Hall presided. He spoke in sanguine terms of the results that might be expected; but neither he nor any of the gentlemen by whom he was supported, had the least idea that the success of the experiment would be almost at once placed beyond a doubt. During the last month, it was our duty to attend one of the meetings of the committee, and to witness the school in operation; and we have now the pleasant task of reporting to our readers the issue of our enquiries and examination.

We may first offer a few observations as to the utility of such establishments; it has long been urged as a reproach against our English artisans that they are ignorant of the principles of Art, and consequently of their application to the works upon which they are continually engaged; the reproach, however, has not been deserved, they have never been supplied with even the elements of knowledge; they have never had set before them the results of past experience. Instruction has been withheld, almost systematically, from those who are too frequently misnamed the "lower orders;" and to have denuded excellence from them was something a degree worse than the labour required of old—to make bricks without straw. Meanwhile, our rivals of the Continent, seeing the folly of such a course, have sought out, and employed only, instructed workmen; and they have taken especial care that wherever a manufactory existed, the means of rendering artisans well informed, and, so, practically useful to their employers, should be placed freely at their disposal—nay, that they should be in a degree compelled to avail themselves of the facilities supplied for making them good and effective workmen, able to assign a cause for every item of every article they were called upon to execute.

Is it therefore matter for wonder that the artisans of England are, up to this moment, inferior to the artisans of Germany and France? That we are, in this respect, on the eve of an astonishing change, no one can entertain a doubt; and there can be no question that the project of an "Exhibition of the Works of Industry to be held in London in 1851," has very largely aided to inculcate a general belief—first in the policy of proper instruction among the English working classes, and next in the necessity of their obtaining it, as an additional source of national wealth, as well as of individual benefit. We are of those who predict with confidence that, by the aid of institutions such as that we now consider, a very few years will elapse before the artisans of England will excel those of the Continent in the inventive as well as in the executive of Art-Manufacture.

These prefatory remarks lead to our notice of the "North London School of Drawing and Modelling;" and it is with exceeding pleasure we learn that His Royal Highness Prince Albert, besides liberally aiding its funds, has marked his approval of the institution by becoming its Patron; having first taken the wise precaution to send a gentleman to examine and report to him the condition of the school.

At the present time there are 200 names on the books, all of whom have paid the monthly fee. There are applications for admission from above fifty more; and it is said there would be double that number, but for the knowledge that it is impossible to admit them "for want of room." As each person presents himself for admission, his name, age, residence, and business are taken down. The appended Map exhibits the localities from which the 200 workmen come to this school (each dot shows the residence of one student); and the Table will show their occupations and their average ages.

The map is valuable, chiefly as showing that distance will not prevent persons eager for information from taking journeys to obtain it. Some of the pupils reside nearly three miles from the school. There is no fact connected with its establishment more encouraging than this.

TOTAL	200		

The interest taken by the working-men in the proposed course of instruction is exemplified by this Map, by which it will be seen that the influence of the school extends from Highgate, on the north, to Long Acre, on the south, and from Hatton Garden and Islington, on the east, to Paddington, on the west.

The room is already too small for the attendance, which averages one hundred and sixty; it will be necessary either to enlarge it or to remove. The ventilation has been carefully attended to. It is most gratifying to notice, and to commend the earnestness, order, silence, and thankfulness for advice which have marked the character of each meeting.

The committee have purchased some casts and models, and have been assisted by gifts or

loans of others; but in this part of their arrangements they are still somewhat deficient.

It is intended to form a class for young women. So many applications have been made on this subject that no further delay will take place in opening the class. This is most desirable. There are large numbers of young women of the middle ranks, whose position in life is such, that they have no means of assisting their families in earning a subsistence. Many of these would be able to obtain a regular income in various branches of Decorative Art, if properly instructed; whilst embroideresses, fancy flower-workers, and others, would find high advantage in a correct knowledge of the forms of nature. There is hardly a more difficult social problem, than the establishment of profitable occupations for young women of the class of life between needlewomen and those of independent means. The committee of this school will receive the grateful thanks of hundreds of families, if they open a path by which the daughters may contribute to the general family income, by means consistent with the decency, self-respect, and natural taste of an educated female mind. Of course, every proper precaution will be taken for the care of those who may attend the school.

In conclusion, it may be well to state that the course of instruction is entirely superintended by a sub-committee consisting of four—artists and manufacturers, with the hon. secretary.

In his address at the meeting for the formation of the school, Mr. Hall laid much stress upon the fact that the result of the experiment then about to be tried would have considerable influence upon other suburban districts, which would no doubt move in the matter if success were shown to be practicable. This is not now a question; and we trust the example will be ere long followed in such suburbs as Lambeth, Bayswater, Islington, and Whitechapel. It is needless to say that at the North London School every information may be obtained as to the mode of working the establishment, in order to show what may be done from what has been done.

We believe the importance of this step, so creditable to the northern suburb of London, cannot be too largely estimated; it will prove beyond dispute, that in any district of the kingdom where art-workmen are employed, there exist the elements of success independent of Government aid: that such schools may be self-supporting, or nearly so; for while the manufacturers are more alive to the value of educated artisans, the artisans are becoming daily more and more convinced, not alone of the practical utility of knowledge—its "power"—but of the positive enjoyment to be derived from it.

THE EXHIBITION OF 1851.

We append some memoranda on this subject, but postpone to next month the remarks which naturally arise out of the various reports of proceedings.

It is, however, even now necessary to state that the dissatisfaction to which we have heretofore had occasion to refer, still prevails in many of the quarters to which the Commission look for aid, and from which they ought to expect zealous cooperation. This feeling unhappily now influences the several metropolitan committees, and we greatly fear they are consequently relaxing in their exertions. To please all parties is impossible; but it is not impossible that all parties should be listened to and considered. The committees complain that they are made markedly subordinate to a so-called "Central Metropolitan Committee," that being the name originally given to the body which is now styled a "Sub-committee for corresponding with the London Districts." The London committees do not object to the appointment of such a body; but they object to its construction, that its members are not likely to understand the parties with whom they are to "correspond;" these members are, we believe, Lord Salisbury, Lord Canning, Lord Ashburton, Mr. Cardwell, Colonel Reid, the Lord Mayor, the High Bailiff of Westminster, Mr. Field, and Mr. Mauley, and they are to act under the presidency of Lord Granville. We do not go farther into this subject until we have more information concerning it; but it is certain that the appointment so made has much "alarmed," and greatly "disheartened," the several metropolitan committees.

It is understood that the Building Committee have determined upon the main features of their plan; this plan is, we believe, in preparation by Mr. Digby Wyatt, under the supervision of Mr. Barry, Mr. Cockerell, and the other eminent architects upon the committee; some explanations of the details have reached us, but not in a sufficiently intelligible manner to justify us in publishing them; we learn, however, with some surprise, and with much regret, that the mass of the structure is to be no more than twenty-five feet high, but through the centre is to run an avenue forty-eight feet wide, which is to be forty-five feet high, and there is to be a central dome two hundred feet diameter which will be about sixty feet high. The committee will hear so many reasons against the defect of height, that we have little doubt of an alteration in this respect; we imagine the limitation of plan to have arisen from the comparative paucity of funds, and that the necessity will cease before it is too late to amend an arrangement which cannot fail to carry with it a public reproach.

The subscriptions are augmenting, although by no means with sufficient rapidity. The great manufacturing towns still hold back; and it can hardly be credited that the suburbs of London have actually contributed more than Birmingham, Manchester, Sheffield, and Glasgow. While the manufacturers are comparatively passive, the agriculturists are sufficiently active, but unhappily with utterly mistaken ideas. Attempts have been made, and with some success, to give to the Exhibition a political character—to describe it as a "free-trade festival"—injurious to England and English interests. This is not the place to argue the question; but it is greatly to be deplored that a project so fertile of benefit to the whole community should be impaired by a few mistaken men who may have the ears of many. The following passage, from a speech by Mr. G. F. Young, seems to embody the ideas of this party:—

"The whole proceeding I consider to be that which the *Morning Chronicle* very properly described in—'The Inaugural Festival of Free Trade.' I was never deceived by the speech of his Royal Highness Prince Albert. I could see nothing in it but a specimen of that degrading German mysticism to which unhappily the court is devoted; and although the project is endorsed by the Parliament of Mayors (great laughter), I see quite clearly from the amount of subscriptions that the bill will not be honoured by the commercial community of Great Britain. And when a proposal is made, as I have no doubt it will be, to the House of Commons, to vote a grant of some 50,000, in aid of this absurd and solid project to undermine domestic interests, I hope there will not be wanting those who, resisting all the inducement of court influence, will stand up in the house and do their duty by saying, we will not allow money to be extracted from the pockets of the suffering British people in order to give facilities for the sale amongst them of foreign productions."

It has been stated positively in Parliament that no intention whatever is entertained of calling upon the country for other than voluntary subscriptions.

Meanwhile the "working-men" have not been inactive. At Birmingham, Aberdeen, Bolton, Darlington, Carlisle, Blackburn, Derby, Dundee, Leeds, Edinburgh, Newcastle, Northampton, Nor-

wich, Oxford, Preston, Southampton, and in other places, meetings have been held and subscriptions entered into—having a twofold object—to aid the plan and to enable themselves to visit London during the Exhibition.

The Mayor of Birmingham has had a lengthened correspondence with Mr. J. S. Russell, on the importance of attaching the name of the manufacturer to each article exhibited. The Secretary states that the Commissioners feel it to be "extremely difficult to frame compulsory regulations or to invent any mode of carrying such compulsions into effect." The Mayor in his reply says—

"Let the imperative rule be laid down, that the manufacturer's name shall, in every instance be attached to each article exhibited; and, in the event of any evasion of this rule, that the article be instantly expelled from the Exhibition; and in the opinion of the committee such cases of evasion will be found to be very rare, and will be sure to meet with exposure long before the close of the Exhibition."

"It is the opinion of the committee, that if it is not made compulsory for the manufacturer's name to be attached to every article exhibited, an influence will be used to prevent many of the smaller manufacturers from insisting on their names being attached to the articles; and, thus, the credit due to them will be received only by the proprietor or retailer by whom they may be exhibited; the express object of the Exhibition being to afford an opportunity for manufacturers and others to display their skill and make their works known."

As in most cases, there is reason on both sides. We shall, probably, have to consider this branch of the subject hereafter, when evidence of a more extensive character is before us. The Mayor is endeavouring to collect a meeting of delegates from the various manufacturing towns, with a view to deliberate on the matter, or at all events to procure their opinions concerning it.

On the Continent and in the United States much activity prevails; and there will be no lack of energy or of funds to enable foreigners to compete with us successfully.

FRANCE.—A commission has been formed in France to correspond with the Royal Commission. Its functions are to centralise all the information required for enlightening the French manufacturers as to the regulations of the exhibition, to decide with the English commission on the measures necessary to be taken for the reception, transport, and placing of the French articles sent, and finally to study the exhibition and observe its results, addressing special reports to the Minister of Commerce on each of the branches of industry which it represents. M. Charles Dupin is the president of this French commission.

RUSSIA.—Count Nesselrode has informed Lord Bloomfield, that, in conformity with the will of the Emperor, and anxious to co-operate towards the accomplishment of a work tending to favour the development of every branch of industry of every country, two commissions will be established by him at St. Petersburg and Odessa, charged to collect the articles intended to represent the industry of Russia at the exhibition.

DENMARK.—A committee has been formed at Copenhagen with a view to take such measures as may be likely to answer the purposes of the exhibition, so far as respects Danish merchants, artisans, &c.; and the legation in London will transmit to this committee any communication from the royal committee.

GERMANY.—The Central Federal Commission at Frankfort has addressed a circular to the different governments of Germany, calling their attention to the proposed exhibition, as well calculated, not only to excite great interest in those taking part in it, but also to promote in the highest degree a spirit of chivalry among the exhibitors.

PRUSSIA.—The Prussian government also intends to establish a special commission in Berlin, in order to correspond with the royal commission; and the Prussian minister and consul-general in London have been charged to do all in their power to forward an enterprise destined to display the immense progress made in the industrial arts and professions.

MUNICH.—The central committee of the Polytechnic Society of Munich, being the principal of the Bavarian industries that will send their produce to the exhibition, has undertaken, with the sanction of the government, to put itself in communication with the royal commission.

SWITZERLAND.—Sir Edmund Lyons states, that the Swiss government, and indeed all persons with whom he has had opportunities of conversing on the subject of the exhibition, are heartily disposed to promote the success of the undertaking, and enter into the spirit of it with a laudable feeling of emulation.

BELGIUM.—A committee has been appointed by the Belgian government to co-operate with the royal commission. The same government has addressed a most important circular to the Chamber

of Commerce of Belgium, inviting their hearty cooperation in the objects of the exhibition.

SPAIN.—The Spanish government has issued a circular to the governors of the various provinces, stating that it is the Queen's pleasure that they should give all possible publicity to the documents issued by the royal commission. The governors of the provinces are to take every means in their power to promote the views of the royal commission.

AMERICA.—The American Institute of New York is taking steps to promote the objects of the exhibition, and is considered by the British consul at New York, and by the governor of that State, as a proper medium of intercourse with the American people.

A statement has been circulated to the effect that the citizens of the United States design to purchase the exhibition "bodily," with a view to transport it to America. It was so stated by Mr. Cobden at a public meeting, and several of the public journals gave currency to the assertion. It is, however, as we have stated elsewhere, without foundation.

Thus, while we are really doing here less than half of what it is necessary we should do, the various states of the Continent are taking such steps as might lead to the conclusion that they consider the harvest will be theirs.

At one of the City meetings Lord Overstone declared emphatically that the question of postponing the exhibition had never been entertained by the commissioners; this was said by his lordship in reply to one of the speakers, who intimated that in the *Art-Journal* he found it announced that such postponement was intended. The gentleman could have found nothing of the kind in this Journal; he must have read our remarks very loosely or not at all. We recommended such a course, indeed, but we never even remotely hinted that the idea had ever been thought of by the commission. We continue in the belief that, all circumstances considered, such postponement is desirable; and we may state our reasons for such belief when the general result of the subscriptions is made known, and the plans that have been adopted in reference to the building.

THE GRACES.

FROM THE GROUP IN MARBLE, BY E. H. BAILY, R. A.

The sculptured "Graces" of past times rose to our memory in their exquisite ethereal beauty, when we heard that Mr. Baily was assiduously at work upon a similar subject, but treated in a very different manner; and we greatly doubted whether it would be possible for even the genius of this elegant sculptor to reconcile us to a sight of the "immortal three" in a sitting position. An examination of the group at the Royal Academy, in the past year, induced us to entertain very different ideas, and we turned from it with a feeling that genius had triumphed over prejudice, and compelled applause where we would before have hesitated.

The originality of this group is not its highest merit for originality without excellence, has little wherein to boast. The first point that strikes the spectator, is the exceeding grace of the composition as a whole, the skill with which the eye is carried up from the base on either side, by a succession of waving lines, to the apex of the pyramidal form, and the variety and harmony of those lines. There is the same elegance of arrangement everywhere in the lines that compose the inner portions of the figures; not of detached parts only; we find little undeserving of high commendation; the figure to the left is especially elegant in form and attitude. The sentiment of this sculpture is of the utmost purity; the occupation of the trio is that of innocence. There is no exhibition of rival charms; no display of unseemly attitude to captivate the gazer, and no indication of feeling, beyond that which the most unsophisticated child of nature would have when

"Holding soft dalliance with the flowers of earth."

The execution of this work is of almost marvellous delicacy—a delicacy so complicated as must have occupied some years of unwearied application. It forms a distinguished ornament to the magnificent gallery of Joseph Neeld, Esq., M.P., in his mansion, Grittleton House, near Clippenham, Wiltshire. Mr. Neeld is a gentleman to whom British Art is greatly indebted for liberal and judicious patronage.

The University of Toronto is a public research university in Toronto, Ontario, Canada. It is one of the oldest universities in the country, having been founded in 1827. The university is a member of the Association of Universities and Colleges of Canada (AUCC) and the Association of American Universities (AAU). It is also a member of the Group of Seven (G7) and the Group of Twenty (G20). The university is a member of the Association of American Universities (AAU) and the Association of Universities and Colleges of Canada (AUCC). It is also a member of the Group of Seven (G7) and the Group of Twenty (G20). It is also a member of the Group of Seven (G7) and the Group of Twenty (G20).

PICTURE SALES OF THE MONTH.

THE month of June is generally reserved for the sale of the most important pictures which are offered to public competition, unless there is a probability of more than the usual number being brought into the market, when May is a busy month for the auctioneers. Up to the time of our going to press, little, however, has been done, and that little is recorded below; but Messrs. Christie & Manson announce, that during the current month they will dispose of several valuable collections, as that of Mr. Bacon, of Lameotte House, containing some capital specimens of the British School; of the late Mr. Metcalfe, of Hill Street, of Mr. Meigh, of Shelton; and the final portion of the works of that admirable painter, W. Muller. The drawings and pictures of Mr. De Wint were disposed of at the end of May, too late for us to notice in our last number. By far the most numerous and valuable of these collections is that of Mr. Meigh, a lengthened notice of which appeared in the *Art-Journal* for December, 1845, in our series of "Visits to Private Galleries." We are not acquainted with the reasons which have determined this gentleman to dispose of his pictures, but we know that among them are some of the best works of British artists. In fact, there is not a painter of eminence in our school whose name does not appear in the catalogue; and it is seldom that such an opportunity occurs for securing specimens of the very highest class. We need only refer, as evidence of the fact, to Turner's 'Wreck on the French Coast,' Etty's 'Bathers,' Maclise's noble picture of 'The Choice of Hercules,' the *chef d'œuvre* of Livins, 'The Festa of Monte Virgato,' Herbert's 'Bandit with Captives,' and 'Boar-Hunters taking Refreshment,' T. S. Cooper's 'Halt on the Fells,' Muller's 'Sphynx,' and 'The Interior of a Temple,' 'The World and the Cloister,' by Collins; 'Lear and his Daughters,' by Hilton, &c. &c. The water-colour drawings also are numerous, and have been selected, from the studios of the respective artists and from the exhibition-rooms, with the best possible taste and judgment; in short, we can only express our regret that so admirable a collection of works of Art should be dispersed.

Among other forthcoming sales we notice that of the collection of the late John Noble, Esq., F.S.A. Mr. Noble travelled much in Italy, and obtained several pictures, among which are said to be some examples of the best masters. His library of illustrated books, to be sold also, consists of rare and carefully selected editions.

The season, as far as it has hitherto gone, has not yet exhibited on the walls of the sale-rooms many works of a high class, nor has there been evident among collectors, a disposition to expend large sums upon the pictures of the old masters, whose merits entitle them to consideration. The rage for collecting is undoubtedly on the decline, and paintings now to realise a price, must have other warranty of value than the names they bear. Perhaps the best lot, on the whole, which has come into the market was that belonging to the late Mr. H. Artaria, a dealer in every way of good repute. This collection, consisting principally of Dutch pictures, was sold at the end of April, by Mr. Phillips, and fetched about 6000*l*. There were few among them that sold for more than 100*l*. 'The Angel appearing to the Shepherds,' by P. Wouwermans, realised 88 *gs.*; 'The Virgin and Child,' by Schidone, 175 *gs.*; 'A Pastoral Scene,' by F. Boncher, 110 *gs.*; 'A Moonlight Scene,' by A. Vander Neer, 135 *gs.*; 'A Landscape,' (from the Montcalm Collection,) by Ruysdael, 135 *gs.*; 'View of a Country House, near Amsterdam,' by Vander Heyden, with figures by A. Vander Velde, 210 *gs.*; 'A Frost Scene,' by A. Vander Neer, 120 *gs.*; 'Equestrian Portrait of the Infant Don Balthazar,' attributed to Velasquez, 100 *gs.*; 'A whole-length Portrait of the Spanish Minister, Gonsalvez,' (from the Von Champe Collection,) by Vandycl, 550 *gs.*; this picture, which is engraved in the Le Bruin Gallery, was bought by Mr. Farrer, it was said for the Marquis of Lansdowne. 'A Hunting Party before a Mansion,' by P. Wouwermans, (twice engraved) 260 *gs.*; 'La Collation,' by G. Metzcu, (from the Laiffe Collection,) 350 *gs.*

The ancient Italian School has unquestionably lost all its charms for our collectors; the gallery of Count Pepoli, which contained some genuine specimens, sold by Messrs. Christie & Manson on the 26th of April, produced a very inconsiderable sum. It is necessary, however, to remark that some of the pictures to which we referred in our notice of this collection, in April, were not included in the sale. Eighty paintings were named in the auctioneers' catalogue, of which, 'Confirmation,'

by P. Veronese, was sold for 60 *gs.*; two portraits of the 'Prince and Princess Gonzaga of Mantua,' by Juan de Juanes, 100 *gs.* each; 'The Madonna and Child,' by Guido Reni, 185 *gs.*; 'The Madonna with a Crown of Thorns,' also by Guido, was offered at 150 *gs.* and bought in, there being no bidder for it at that price. Three other pictures sold at 30 *gs.* each; the remainder, for the most part, far below that sum.

On the 27th of April, the collection of the late Dowager Countess of Morton, was offered for sale in the above rooms; it contained many notable names, but the only pictures worth alluding to, were 'A Landscape,' by Teniers, that sold for 50 *gs.*; and 'A Dutch Village,' by Vander Neer, for 61 *gs.*

During an entire week, in the early part of May, Messrs. Christie & Manson were engaged in selling the unfinished pictures and sketches of the late W. Etty, R.A., which realised a very large sum—upwards of 5000*l*. The enormous number of these sketches, the majority of which were made at the Royal Academy, shows the unwearied pains this great painter took to acquire his art; and as many of them were of very recent date, they supply evidence of his diligent study even to the end of his life, as if he felt there was always something to learn. What a lesson did the exhibition of those studies, when they hang on the walls of the sale-rooms, convey to our young artists; to those who foolishly imagine that there is a "short cut" to excellence, and who presumptuously think it can be reached by another road than that wherein difficulties and labours are to be encountered and overcome. Why, those sketches seem the work of a life, even had the painter gone nothing else. We do not quite agree with our contemporary, the *Athenæum*, in his strictures on this sale, although we freely admit there is, at first sight, some ground for his animadversion. He says, they ought not to have been sold at all; in reply to which, we know that the executors had no alternative in the matter; they were compelled to dispose of them in this way. Secondly, we do not believe that either art or morality will suffer by the dispersion of these works. A very large proportion were purchased by artists who, if they make a wise use of them, as we doubt not they will, will profit thereby, for many of them were, in all respects, worthy of close study. That they were bought for any other purpose we cannot believe, for artists generally have not the means to expend their four or five guineas upon superfluous matters. And as to the immorality which might be fostered by pictures of the nude, they who seek for such need only walk into some of the low print-shops to be found in the metropolis, to have their tastes gratified to a far greater extent, and at a marvellously lower rate. The only danger we apprehend, is that many of these half-finished works will be worked up and sold as genuine pictures; we shall see Etty everywhere, and consequently we would caution buyers to beware how they make their purchases.

The collection of Mr. F. Ricketts was sold by Messrs. Christie & Manson on the 18th of May. It contained seventy-four pictures, none of them of a very high class, although there were a few good pictures which fetched fair prices; of these the principal were:—'Peasants Gambling,' Karl du Jardin, 86 *gs.*; a small work by Wilson, 'Peasants Dancing near a River,' 51 *gs.*; another small picture by Wilson, 'A Seaport in the Adriatic,' 32 *gs.*; a beautiful little work by Gaspar Poussin, 41 *gs.*; a cabinet picture by Salvator Rosa, 'A River running under a Woody and Rocky Shore,' 32 *gs.*; 'An Italian River Scene (small), 32 *gs.*; 'A Wood Scene, with a Man keeping Sheep,' a small work of good quality, 82 *gs.*; a cabinet picture by Ruysdael, 'A River running under a high Bank,' a beautiful specimen of this master, 155 *gs.*; a small picture by Rubens, 'A Fête Champêtre,' 52 *gs.*;

'An Inn, with a Post-wagon at the Door,' by Jan Steen, a capital picture, full of subject admirably treated, 200 *gs.*; 'A Dutch Village on the Bank of a River,' the joint production of Van Der Neer and Cuyper, and a good specimen of these painters, 200 *gs.*; 'The Youthful Christ contemplating the Crown of Thorns,' attributed to Murillo, 70 *gs.*; a small picture, also attributed to Murillo, 'The Flight into Egypt,' 56 *gs.*; a large 'Italian Landscape,' said to be by Domenichino, 120 *gs.*; 'A Female seated at a Table,' by Carlo Dolci, was put up at 200 *gs.*, and finding no bidders at that price was withdrawn; as also was a copy by Schidone, of Correggio's celebrated picture of the 'Virgin and Child, with St. Jerome and St. Catherine,' at 100 *gs.*

In all of the above sales of foreign pictures, it will be seen that the Dutch school takes higher rank in the estimation of buyers than the Italian—justifying our preceding remarks.

ART IN THE PROVINCES.

EDINBURGH.—The controversy so long existing here between the Government, the Trustees of the Board of Manufactures, and the Royal Scottish Academy, respecting a new Gallery of Art, in Edinburgh, has not yet terminated. These differences we have gone into in former numbers of the *Art-Journal*, (April, 1847, and March, 1848,) so that we do not consider it necessary to enter again upon the matter, which, for the sake of all parties, and for the benefit of Art—always a loser by unseemly differences—we should be glad to see brought to an amicable conclusion. But the dispute has now taken a new turn between two competitors for the honour of erecting the edifice, Mr. Playfair, the Architect of the Academy and a member, and Mr. Hamilton, the Treasurer and also an architect. The latter, it seems, had prepared a set of designs for the purpose alluded to, which were submitted to Mr. Leveque; previous to this, however, Mr. Hamilton had been similarly occupied, and had also sent in his designs, which were approved of by the Treasury. Subsequently both plans were rejected by the Government, and, instead of inviting a second competition, Mr. Playfair only was called on to prepare a new design, whereupon Mr. Hamilton writes to Lord John Russell, and forwards plans, sections, and perspective views, which he also publishes, that his lordship may have the opportunity of testing their merits. "In other words," according to the Edinburgh paper, *The Scotsman*, "Mr. Hamilton became, in 1847, a competitor with Mr. Playfair for the honours and emoluments of Academy Architect; and the Academy, having then seen no other plans, gave expression to some favourable opinions concerning their treasurer's sketch-plans, which possibly they now rather regret, on receiving from that same generous and disinterested office-bearer a charge of some five-hundred pounds, for these same plans." The same paper remarks that "the arrangement adopted by Mr. Hamilton is not his, but Mr. Playfair's design." We know nothing of the matter but what we have gleaned from the Edinburgh press, and can only express our regret that any circumstances should impede the progress of a great national work.

GLASGOW.—The annual meeting for the distribution of prizes among the subscribers to the Glasgow Art-Union, was held at the end of April last. The society appears in a healthy and flourishing state. The committee have come to the determination of offering a premium for the best painting that may be exhibited in the next exhibition of the West of Scotland Academy, a proposal which has been highly approved of; the Duke of Hamilton having liberally promised to supply any funds that may be required to make up an existing deficiency. The prize-holders selected, according to priority of choice, the prizes purchased by the Association. The holder of the first prize had the first choice, the holder of the second prize, the second choice, and so on with the rest. The pictures selected were the following:—'Highland Landscape,' H. McCulloch, R.S.A.; 'Scene on the South Coast of Madeira,' G. Simson, R.S.A.; 'Walton on the Ribble, Lancashire,' J. Peel; 'Sheep Washing,' H. J. Bodington; 'Statue of a Girl at Prayer,' P. MacDowell, R.A.; 'Sunset—Bodly Head in the distance,' A. Penley; 'The Weekly Dispatch,' T. Clater; 'Game Piece,' W. Duffield; 'Garden Scene,' D. Manne, R.S.A.; 'Bonaparte and Madame Colombe,' C. Lucy; 'Distant View of Naworth Castle,' C. Fielding; 'Heath Scene,' J. Stark; 'Cairn—Glen Messen,' J. M. Donald; 'The Broken Bride,' J. C. Brown, R.S.A.; 'River Scene, Kirby Lonsdale,' H. Jutsum; 'Statue of a Girl Reading,' P. MacDowell, R.A.; 'Scarborough Castle—North Sands,' A. Penley; 'Landing Fish—Katwick, Coast of Holland,' E. W. Cooke; 'Barkimming, Ayrshire,' A. Macdonald; 'Water Mill at Giovanno, Perugia,' W. Oliver; 'Sea Piece—Fresh Breeze,' E. T. Crawford, R.S.A.; 'Young Bird Catchers,' W. Helmslie; 'Glenochie Tower, River Esk,' S. Bough; 'Zion, on the Rhone,' F. H. Henshaw; 'Dutch East Indian Ground,' E. Glover; 'The Lover's Stream in Borrowdale,' H. Jutsum; 'A Mountain View of the Vale of Dynas,' F. Tomb; 'T. Knott'; 'The Dee, at Chester,' A. Vickers; 'Frankville Fishing Boats entering Calais,' E. W. Cooke; 'The New Scholar,' D. Munro; 'Castle Tyrum, Loch Moidart,' J. Williams; 'Pont-y-halla, Caernarvonshire,' J. W. Oakes; 'Braes of Lochaber,' W. Simpson; 'Gypsies,' J. A. Puller; 'Edinburgh, from St. Leonard's,' S. Bough; 'Evening, near Llanwrt, Wales,' A. Vickers. Twenty Statuettes, in Favian porcelain, of 'The Young Mother,' modelled by W. Battie, were also distributed.

MINOR TOPICS OF THE MONTH.

THE VERNON GALLERY.—Preparations are actively making for the removal of the Vernon Gallery from its present most injurious locality to Marlborough House; which her Majesty has been graciously pleased to lend to the public for the purpose. Arrangements have been made for the residence there of the several officers entrusted with the care of the pictures; and it is probable that within a month the Trustees will be enabled to give directions for hanging the several works in the large and lofty rooms of this fine and conveniently-situated mansion. We presume to suggest the propriety of placing with them the other pictures by British artists in the National Collection. Sufficient room would thus be obtained for hanging advantageously all the works of the old masters in Trafalgar Square.

THE NATIONAL GALLERY.—Our cotemporary, the *Athenæum*, says:—"We understand that Mr. Faraday has paid a visit to the National Gallery, for the purpose of investigating, by order of the Trustees, and reporting on the condition, of the old pictures therein contained. The limited scale of the rooms, the condensation of vapour on the pictures in consequence, and other atmospheric influences to which in their present position they are exposed, are said to have an injurious effect on those priceless works—and to suggest the necessity of their removal to some less tainted situation." After all, it will be no matter of surprise if we hear of a grant of money—the whole of the building to be given up to the Royal Academy; a course which we consider far more beneficial to the public, and much more for the interest of British Artists and British Art.

LANDSEER'S PICTURE OF "THE DUKE OF WELLINGTON AND THE MARCHIONESS OF DOUBO, ON THE FIELD OF WATERLOO," belongs to the Vernon Gallery; and will be, of course, deposited at Marlborough House with the other works in that Collection, immediately after it leaves the Exhibition. This picture was one of those commissioned by Mr. Vernon, but being unfinished at the time of his decease, monies were left by his will to pay for them. The painting of the Escape of the Carrara Family, by Mr. Eastlake, now in the exhibition, is similarly circumstanced; and this also will be removed to Marlborough House at the same time. It is scarcely necessary to say that both these pictures will be engraved in the *Art-Journal*, conformably with the pledge given to us by Mr. Vernon, to engrave the whole of the works presented by him to the nation.

AMERICA AND THE GREAT EXHIBITION OF 1851.—At a recent meeting held in the borough of Marylebone—to assist in carrying out the objects of the great National Exhibition—it was stated by Mr. Cobden, that "a project was on foot in the United States of America, for purchasing the exposition as soon as it should be finished, and carrying it off bodily to New York." The honourable gentleman's observation was right, only in part, for the fact of the matter we know to be this: Mr. John Jay Smith, a gentleman of high character and position in Philadelphia, has proposed to the American government that he should visit London during the exhibition, whence he would issue circulars at a proper time, inviting all persons who are desirous to have their articles shown in New York, to make duplicates for America, or to send the originals, after exhibition in London. It will thus be seen, there is no intention on the part of the Americans to purchase the entire exposition; such an idea would be preposterous, speculative as our transatlantic brethren are in all commercial affairs; moreover, Mr. Smith himself says, in a communication he has forwarded to the American Ambassador here, a copy of which is in our hands:—"I do not propose, of course, to bring over all the products exhibited, but such as are practicable and desirable, and not too bulky." Mr. Smith's project has been most favourably received by the highest authorities of his country; and there can be little doubt that the facilities which will be afforded for enabling him to carry out his plan, will be

crowned with success. It would be premature in us, at the present time, to offer any suggestions to our manufacturers upon the subject; it is sufficient that we make known the real intentions of the projector, who will doubtless take his own opportunity of acquainting them more at length with his views on the matter. This gentleman's unquestionable respectability, and that of other parties with whom we have heard he is associated, assure us that whatever is done, will be carried out in entire good faith. We have no fear, that any idle fears of jealousy will deter our manufacturers from assisting in this scheme to their utmost power; England is great and can afford to be generous, even to a rival; much more so to one whose interests are identical with her own. But America is also great, and she can afford to be just, and will be so to those from whom she inherits her greatness; and although she has the credit of exhibiting what lawyers term "sharp practice," and of looking shrewdly after the "main chance," there is honour in her dealings, and uprightness in her character. If there be less of the refined courteousness of the old country among her citizens, they retain much of the honest bluntness and sincerity which have been proverbial among ourselves. Speaking our own language, educated in our own literature, confessing the same religious faith, there is little that separates us from them, save the mighty waters that roll between the two countries, and these cannot divide our common feelings, and our common welfare. It cannot be denied that the future interests of the world are, humanly speaking, in the hands of the Anglo-Saxon race, among which, America now stands securely second in importance; and that the intelligence, the wealth, the spirit of enterprise, and the yearly increasing high moral tone of her inhabitants will materially contribute to the ultimate benefit of mankind.

ARTISTS' GENERAL BENEVOLENT INSTITUTION.—The anniversary dinner of this excellent body took place at the Freemasons' Tavern on the 11th of May, Sir Robert Peel in the chair. The dinner was numerously attended, and the balance sheet of the Institution told a striking tale of the utility and sound benevolence which characterised the working of this body. Fifty-seven applicants have been relieved during the year, all having the strongest possible claims. The money thus expended in charity amounted to 172*l.*, while the working expenses amounted to 172*l.*, a proof of the disinterested manner in which the Society is managed. Since its establishment no less a sum than 12,726*l.* 0*s.* 10*d.* has been given to the wants of applicants, who, but for this excellent charity, would probably have perished. We think that the warm manner in which Sir Robert Peel spoke on the subject did him the greatest honour; and we can conscientiously urge on all, as warmly, the claims of this noble and admirably conducted Institution.

ARTISTS' AMATEUR PERFORMANCE.—At the St. James's Theatre, on the 18th of May, a performance in aid of the funds of the Artists' General Benevolent Institution, took place, the actors being all artists. The plays were "The Rent Day" and "The Poor Gentleman." The performance was exceedingly creditable, and Mr. Toplam won his laurels deservedly in *Martin Hoggwood*. Between the acts George Crankbank delighted the audience by singing "The Loving Ballad of Lord Bateman," almost as well as he has illustrated it. We were glad to find the theatre well filled, and glad, also, to note the earnestness in a good cause which brought both audience and actors together.

DILIGENCE OF BRITISH ARTISTS.—The Academy Exhibition consists of 1456 works of Art; more than 1000, some say 1400, works were declined, and if we add to these, as we have done in former years, the number of those exhibited elsewhere—namely at the British Institution, 500; the Suffolk Street Gallery, 735; the Portland Gallery, Regent Street, 373; the Water-Colour Gallery, 380; and allow for those returned by the British Institution and the Society of British Artists, the total number produced during the year for exhibition in the metropolis will be found to be, at least 5500 works of Art. During this time, too, artists have been turning out

dioramas, panoramas, cycloramas, ecosoramas, &c., &c., without end, various panels in the Palace of Parliament have received their subjects, portrait painting has gone on, book illustrations have been multiplied, and the provincial exhibitions, although partly made up of works previously exhibited in London, have not been without their usual number of new contributions. Last year, the total number of works exhibited in the metropolis was 3796; the number in 1843 was 4023; but the number submitted to the various galleries was calculated on both these occasions at nearly the same as in the present year.—*The Balder*.

THAMES ANGLERS.—Every artist should be an angler—many artists are so; and all who are, should know and aid a Society which preserves for their enjoyment several of the best stations on the Thames—the THAMES ANGLING PRESERVATION SOCIETY. Its object is to prevent the use of illegal nets, and to arrest other unfair practices which have long been resorted to for the destruction of fish. Several water-bailiffs have been appointed, numerous "deeps" have been staked, and various other plans are in progress for securing sport for the angler, custom for the fisherman, and trade to the various villages along the river banks. If the society be supported, as it ought to be, by all who delight in this healthful and tranquil amusement, the Thames will, within a very short period, be as unequalled for its abundance of sport and enjoyment, as it is for its interest and beauty. Already, indeed, the operations of the Society have been extensively felt; and the spring of this year has been rich in its recompense by an abundant supply of trout, and by such preparations as will secure certain sport in less ambitious ways during the coming season, which commences on the first of June. "Old Father Thames" has been too much slighted by the brethren of the angle. Those who can revel among northern lakes, or beside the pleasant rivers which run through the valleys of Wales, would lead others to forget that health, amusement, and enjoyment are to be found within a morning's drive of their homes in the metropolis. Philosophy teaches us to seize the lesser advantage when the greater is beyond our reach. There are many who dearly love the hasty occupations of life is difficult or impossible; we city men have upon our own most glorious river all which the most eager and devoted angler can desire—sport in plenty, if he be not over-fastidious; let his basket carry half a hundred-weight, we can show him where he may fill it between sunrise and sunset; or if he desire to exhibit skill, we may tell him of trout, fine as ever strained the sinews and gladdened the heart of the angler, in the keeping of the king of rivers; that gigantic chub inhabit the silent nooks which skirt his banks; that pike, such as "holy Dee" never dreamt of, fatten upon his wealth. But the "minor fishing" which, to so many whose abiding place is the great city, and to whom a holiday cannot be an every-day treat, is always to be obtained, no matter what is the wind or what the weather, by those who content themselves with roach, dace, and perch, which nowhere in England so largely abound as they do upon our own Thames. And if the Thames affords rare and true sport to the angler, how vastly does it surpass all other rivers in those sources of enjoyment which equally influence, exhilarate, and delight the votaries of the craft. His "idle time is never idly spent;" upon the breast, or by the side of the "most loved of all the ocean's sons," we may revel among luxuries, of which nature is nowhere more lavish; walk where we will, scenery, gentle, joyous, and beautiful, greets the eye and gladdens the heart; at every turn we hear the ripple of some one of the thousand streams that pay tribute to the king of rivers—

"To whose falls
Melodious birds sing madrigals."

Upon the banks of the Thames the noblest of British worthies lived, flourished, and died; philosophers, statesmen, historians, painters, dramatists, novelists, travellers, politicians, brave soldiers and gallant sailors, have given a deep

interest to almost every house, lane, and tree along its sides; fancy may hear "a chorus of old poets" from many a sequestered nook; women celebrated for beauty, famous for intellectual grace and strength, or made immortal by virtue, may seem to move again along its mossy slopes, and imagination picture the pomp and glory of the olden time, when

"Kings row'd upon its waves."

Scarcely can we stand upon a spot which is not hallowed ground, or contemplate an object unassociated with some triumph of the mind. Thus, the Thames angler, while enjoying his sport, is revelling with nature or with memory—the present or the past—

"The attentive mind,
By this harmonious action on her powers,
Becomes herself harmonious."

Without going quite so far as some enthusiasts in the craft have gone, and affirming that "no good angler can be a bad man," we believe that no sport is at once so healthful to mind and body, or so free from the alloy which usually mingles with pleasure. Our principal object in this notice, however, is to state that the members of the Thames Angling Preservation Society dine together at the Star and Garter, Richmond, on Monday, the 17th of June; and our space in this Journal will not have been ill-occupied if we become the means of directing to the Society the attention of brethren of the angle generally, so as to augment its numbers and consequently its strength.

PANORAMA OF THE QUEEN'S VISIT TO IRELAND BY MR. PHILLIPS PHILLIPS.—It is often said that "Paris is France," and it seems almost as universally received an opinion in England, that Killybegs is Ireland. The London world talk of "Mr. Phillips's Killybegs" as if his panorama represented nothing but the lovely and certainly matchless lakes of the "Kingdom of Kerry." Such is by no means the case; the "Lakes," so to say, are not more fully illustrated than other places to which Her Majesty's late visit gave so much interest. The panorama opens with a partial view of the harbour and town of Cove, now gallantly called QUEENSTOWN, and proceeds to give the charming scenery of the Cork river with the most perfect fidelity; this in itself is a great treat to the lovers of the picturesque, and the famous City of Cork is much indebted to Mr. Phillips for having selected the best points for illustration. Leaving Her Majesty in the keeping of her loyal people, we go at once to Glengarriff, which as a single scene we have long considered one of the most beautiful in the world—wood, water, bill and valley, all combining to render it perfection. The difficulties of the landscape have been overcome with nice skill, and the effect produced is both true and animated; the Sugarloaf Mountain is the grand feature of the scene, and Bantry Bay stretches before the spectators in its gorgeous sweep of waters, studded with islands and overhung by magnificent headlands; no harbour in the kingdom combines so much natural beauty with such naval advantages as Bantry Bay. The three lakes of Killybegs, as seen from the police station, are then unrolled, but though perfectly faithful, they seemed to us to want the sunny effect which had so often added brightness to their other beauties. It certainly must be exceedingly difficult to subdue the necessary brightness of those lakes, into the deep and dark grandeur of the mountain pass, called the Gap of Dunloe, which is a great pictorial triumph; on one side rises the Purple Mountain, on the other Macgillivuddy's Reeks: while the river, girdled by a mountain path, dashes through the ravine: the Eagle's Nest, Ross Castle, Torc Mountain, Magerton, Mucross—where Mr. Herbert's new residence and exquisite domain has received more of the artist's attention than the old time-honoured abbey—although enough is shown of the latter to stimulate the curiosity of the tourist and the antiquary; and the contrast between the lake scenery and the half-ruined and half-deserted Irish village, is as faithfully true as it is actually painful. The groups tell the story with silent and subduing eloquence, and the figures there, as well as throughout the panorama, are really "to the life."

It was a brave thing to introduce this scene in such a "record," but it would not have been historically true without it. A common mind would on such a festive occasion have been tempted to falsify the state of things, by painting all *couleur du rose*, but Mr. Phillips is the more entitled to belief from the fact of this very passage appealing to our sympathies on behalf of those whose bones are marrowless from want, and whose ears are so dulled by misery, that they could not hear the shouts of joy rising from the shores over which the standard of England floated as the harbinger of better days to a people stricken by sorrow and famine. We put away this bitter cup, and arrive with the royal cortège in Waterford Harbour; are introduced to the tower of Hook; to "Bag and Bun," where, according to the old rhyme, "Ireland was loste and wonne;" to the Saltees, (which, we beg to observe, cannot be called a "cluster of islands," as there are but two, the property of H. Knox Grogan Morgan, M.P. for the County of Wexford); to the Queen's exquisite bay of Killiney; to the Queen's farewell at Kingston; and then Mr. Phillips proceeds to the Maiden Tower, at the entrance of Drogheda Harbour; to Dundalk; to beautiful Annagh; to Carrickfergus; and, finally, we have again the honour of meeting her majesty in the prosperous City of Belfast. Those who can visit Ireland should see this Panorama, as an earnest of what they may hope to enjoy; and those who cannot, by spending an hour there, will acquire information as well as derive pleasure from its illustrations, not only of mere scenery, but the character of the people.

BURFORD'S PANORAMA OF KILLARNEY.—We have but space this month to notice the introduction of a new picture to the public, by Mr. Burford. The view takes in the whole of the Lower Lake of Killarney, as seen from the tower of Ross Castle; and a more lovely scene, or a better picture, has not fallen to Mr. Burford's lot to exhibit. We shall endeavour to do it justice next month.

SOUTH AFRICAN HUNTING TROPHIES.—An interesting collection of native arms, costumes, skins, skulls of wild animals, and other memorials of the chase, as conducted in South Africa; the gatherings of a five years' hunting tour there, and in India, by the proprietor, R. Gordon Cumming, Esq., are now exhibiting at the late Chinese Gallery, in Hyde Park Corner. The display of skins and ostrich feathers is really magnificent. The naturalist will be gratified by some specimens, such as the triple-horned black rhinoceros, of great rarity. A young Bushman tracker, who was in at the death of most of these animals, is present in the rooms, and is almost as curious as any other part of the exhibition, which is very striking, and excellently arranged.

OVERLAND ROUTE TO CALIFORNIA.—The sketches by Colonel Fremont and Captain Wilkes, of the Topographical Engineers, sent out by the American Government to explore Oregon, Texas, and California, have supplied the materials for the Panorama now exhibiting at the Egyptian Hall, and which is painted by Messrs. Kyle, Dallas, and Lee, American artists. It is divided into four sections, and displays in an excellent manner the peculiarities of the country and its people, and cannot fail to be particularly interesting at the present time. The strikingly peculiar features of the country are truthfully and admirably rendered.

THOM THE SCULPTOR.—James Thom, the self-taught Ayrshire sculptor, who attracted so much notice in his own country and in London some twenty years ago by his groups of "Tam O'Shanter" and "Old Mortality," died recently at New York. He went over to the United States and settled there some twelve or fourteen years ago. His pursuit of his art appears to have been attended with success, for having realised considerable profits, he purchased a farm near Ramapo, in Rockland County, on the line of the Erie Railroad, and erected a residence upon it. The group of "Tam O'Shanter" and his "drouchie" friend, "Souter Johnnie," are preserved in a building attached to Burns' Monument, on the banks of the Doon.

GLOVER, THE LANDSCAPE PAINTER.—This gen-

tleman's death is noted in the Australian papers, to which country he had retired more than nineteen years ago, to practise his art in "fresh fields," he having been one of the oldest exhibitors in the Water-Colour Gallery, and one of the most successful of our landscape-painters. It is likely that we shall ere long supply a more extended notice of this artist.

PORTRAIT OF CHARLES I.—A report has appeared in one of the daily journals which we are induced to notice, more for the purpose of seeking further information than from any credence which we attach to it. It is said that a portrait of Charles I., painted by Vandeyck, in 1640, and which was lost during the Commonwealth, has recently been discovered at Barnstaple, and is now in the possession of a Mr. Taylor of that town, who has declined a very large sum for it; his refusal to part with the picture being strengthened by some favourable opinions concerning it, pronounced by the authorities of the National Gallery, to whose notice it is stated to have been submitted.

THE PICTURES IN KENSINGTON PALACE.—Much interest has been excited among artists and all lovers of painting, by the collection of early pictures of the Byzantine, German, and Flemish schools belonging to Prince Wallerstein, and placed by His Royal Highness Prince Albert in Kensington Palace. But here they are almost useless for information and study, nor is any thing much known of them, but the account formerly given of the collection in the *Art-Journal*. If His Royal Highness would graciously permit them to be placed in Marlborough House for public exhibition, with the Vernon Gallery, now about to be removed thither, he would confer a great boon, for which all students and amateurs would be grateful.

IMPROVED PLAYING CARDS.—Messrs. Whitaker, of Little Britain, have recently issued some cards which exhibit marked improvement in a branch of manufacture which has long been too "stationary." A considerable amount of ornament has been expended in the various suits with excellent effect, while the backs of each card exhibit enriched ornaments of the most elaborate kind. As such articles are in constant demand, we see no reason why they should not improve with other things, and are pleased to notice this proof that they may be made to do so. They are richly coloured and gilt, and are entirely printed at a type press, from separate wood engravings by Mr. N. Whitlock, no part of the colouring or gilding being done by hand.

MR. POTTS' METALLURGICAL WORKS: BIRMINGHAM.—We have frequently had occasion to commend, in terms of strong and deserved eulogium, the productions of this skillful and enterprising manufacturer. On reviewing his specimens exhibited last year at the Society of Arts, we remarked on the novelty and beauty of his combination of statuary, porcelain, and glass with metal, for which he obtained one of the prize medals of the Society. We then alluded to works in progress of a still advanced character, which, upon their near completion we can now report, as in the highest degree satisfactory: they evidence a decided improvement upon any productions of this class we have as yet seen, of English manufacture. When completed, we shall again refer to them in detail by an illustrated notice, which their merits claim at our hands. Mr. Potts' works in the collection at the Society's Room now exhibiting, fully maintain his reputation, though unfortunately placed in a bad situation and very indifferent light, which preclude their executive merits from being appreciated, to the extent a more favourable position would have commanded. Indeed all the specimens of recent manufacture have suffered from the same cause, the principal rooms this year being occupied by the examples of Ancient and Medieval Art. This disadvantage, however, has happily not prevented their acknowledgment by the discriminating judgment of His Royal Highness Prince Albert, who, upon a recent visit, directed a commission to be sent to Mr. Potts for a pair of the larger candle-labrs, and was pleased to express his approbation of the works generally. We are glad to record another instance of the taste and patronage of His Royal Highness, so stimulative and encouraging,

and the frequent recurrence of which, exercises a most salutary influence upon British manufacture generally. We predict that in the industrial struggle of 1851, our continental competitors will find in Mr. Potts one of their most serious and successful rivals.

NEW MODE OF OPENING AND CLOSING DOORS, &c.—We are induced to notice this new invention for the purpose of assisting in giving publicity to what appears to us destined to add much to the elegancies and comforts of our houses, as well as the conveniences of our public establishments; but more particularly do we notice it from its paramount claims for adoption to the doors of all picture-galleries, where swing-doors, hung upon hinges, are extremely objectionable. By a new method, invented by Mr. Shepherd, and which is now on view at No. 15, Parliament Street, Westminster, doors are made to open and shut by the mere turn of a handle, or the pull of a cord, locking and unlocking themselves; indeed so simple and easy is the contrivance, that a pair of gates which have been put up at the North Western Railway, weighing nearly six tons, can be readily opened or shut by a boy. The doors are made to run back into a recess, so that they are admirably suited for galleries, and save that large space in opening which is now wasted. For purposes innumerable, however, whether doors, gates, windows, or shutters, the plan is alike suited; and when it is stated that the inventor has received honours from nine sovereigns of Europe, and letters from men of the highest rank and talent, Baron Humboldt, Prince Metternich, Count Nesselrode, Louis Negrelli the Austrian Engineer, Baron Klenze the Architect of the Glyptothek and Pinacothek, Robert Stephenson, Joseph Locke, William Fairbairn, S. M. Peto, Charles Barry, R.A., C. R. Cockerell, R.A., P. Hardwicke, R.A., and a host of others, we avoid the necessity of doing more than drawing attention to it as one of those useful inventions destined to become universal.

KIDDS' PROCESS FOR SILVERING AND ORNAMENTS GLASS.—A novelty of a very beautiful kind has recently been brought into public notice by Mr. Kidd, of Poland Street; it is a mode of decorating glass, in a most tasteful manner, by engraving the under surface of mirrors, &c., with borders of flowers, fruits, &c., prior to the silvering. The patterns are then silvered, and appear as if in relief on the surface of the glass, and executed in the most delicate silver. He has given the name of "embroidered glass" to this process, and the delicacy and beauty of its effect well deserve the name. The fact of the surface of the glass still preserving its flatness, while the eye is completely deceived by the apparent embossing upon it, is one of the best points of the invention, as it preserves all that cleanness and purity of surface which give it such value and beauty. It is capable of adoption in many various ways,—for the interior fittings of ladies' work boxes, tops of ornamental tables, finger plates, &c. &c. The table may be made still more elegant by the ornamenting of goblets, decanters, wine-glasses, &c. The great application, however, in a commercial point of view, is decidedly for the decoration of rooms, and apartments generally, the illumination of wardrobes, commodes, chiffoniers, the panels of doors, &c., &c. The ready manner in which any pattern, however elaborate, can be first "embroidered" on the glass, and afterwards silvered, affords an opportunity for the introduction of strikingly novel effects in connection with drawing-room furniture. It is almost impossible to convey an idea of the effect produced on crests, coats of arms, and other similar devices, when engraved and silvered by this process. The brilliancy and sharpness of the engraving are beautiful in the extreme.

DRAWING MODELS.—We have recently examined some models of cottages, and also of imitative rocks, with growing plants and mosses, by Albrecht Braubach. We think them well adapted to teachers in small classes, or for instruction in private families; and in such cases where weight and portability were of no consideration, the most interesting and useful groups of real stones and living plants might be fitted up, as examples for students at public institu-

tions. We are sure that the feeling which the artist possesses for truth and the picturesque, only requires encouragement to enable him to produce models of rustic cottages, &c., equal to any that have yet been produced.

MEDIAEVAL ART.—Mr. Cundall is about to publish a series of choice examples of art workmanship selected from the Exhibition of Ancient and Mediaeval Art at present at the Adelphi. There is much yet to be learnt by the study of such works, and a judicious selection (which this seems to promise to be) cannot fail to be useful to the manufacturer as well as the antiquary. The engravings are by Mr. De la Motte, and King John's Cup is a very excellent sample of the care and fidelity with which they will be executed.

PASTEL PORTRAITS.—M. Victor Robert has opened in Oxford Street a small gallery of crayon portraits of a very able kind. The series consists of thirty-six pictures, the best being the portrait of the Princess Lamballe; she is represented in Watteau costume, gathering flowers in the gardens of Versailles. This is an exceedingly graceful and beautiful picture. The portraits of Miss Duchannan of Artois, and the daughters of Mr. Burke, are also capital pictures, and many of the fancy heads are very graceful. The style and mode of treatment are admirably adapted for female beauty; but the only male portrait we conceive to be a failure. Graceful ease, but not strength, are the characteristic of these works.

CASTS AFTER THORWALDSEN.—These casts, purchased by the directors of the Beaux Arts for the Louvre, have sustained great injury by the way. Of the "Mercury" scarcely a fragment is entire; all the others are more or less damaged, the "Hebe" alone escaping.

THE DISNEY MARBLES.—The fine collection of marbles which Mr. Disney of the Hyde, near Chelmsford, has recently presented to the University of Cambridge, is to be preserved intact by that body under the donor's name. It comprises some interesting and beautiful works of early art, and we are glad to see them so well placed and gracefully acknowledged. Our Universities would be none the worse for the admixture of the fine arts with their more laborious and abstruse studies.

THE AUTOHON.—This invention, patented by Mr. Dawson the organ builder, in the Strand, is a clever modification of the organ, affording the means of mechanically performing pieces of music by means of sheets of paper perforated in various places, and moveable on a cylinder beneath the opening of the pipes, which speak or are silent as the paper or its perforation passes over them, and thus performs the tune. The advantage possessed over the barrel organ consists in the employment of simple sheets of perforated paper in place of cumbersome barrels, liable to injury, and the ease with which the tunes may be varied by the cheap process of fresh sheets of paper.

COLOSSAL STATUE BY J. B. LEYLAND.—A gigantic statue by this artist has recently been placed in the gardens of the baths at Halifax. The figure is undraped and in a sitting position, the right hand elevated, the left resting on a club. A correspondent of a local paper has informed the public, that it is intended as the emblement of the stupendous characteristics of our modern roads; it is highly spoken of as a work of Art by the provincial press, who entertain a hope that it may be reproduced in metal in place of its present frail material.

EGYPTIAN STATUE.—At a recent sale, in the Isle of Wight, of the property of the late George Ward, Esq., an Egyptian statue of "Antinous" was put up, and purchased, it is said, for the Queen, to be placed at Osborne House. The statue is sculptured in dove-coloured marble, and stands five feet four inches high, displaying remarkable beauty of proportion and symmetry, and is in excellent preservation. It was originally intended as a present from Napoleon to the King of Naples, but in its transit, the vessel which conveyed it was captured by a British cruiser and taken to Gibraltar, where the statue was bought by its late owner, and removed to England. Mr. Ward is reported to have refused a thousand guineas for this ancient work of Art.

MONUMENT TO LORD JEFFREY.—The subscriptions for this work are going on well, and about 2,000*l.* is reported to have been collected.

MONUMENT TO JOHN BUNYAN, IN BEDFORD.—A noble edifice has just been completed on the site of the old meeting-house and of its ancient predecessor, the "Barn of John Ruffhead," where the glorious dreamer himself ministered to his townfolk. The style of the building is that in use immediately after the time of Inigo Jones and Sir Christopher Wren, of which there are but few good examples in the country, and those generally by Gibbs, the celebrated architect of St. Martin's Church. The material of the base, which shows about four feet above ground, is hammer-dressed limestone from a neighbouring quarry, capped with Yorkshire plinth, giving a bold footing to the pilasters. The superstructure is red brick with stone dressings; the two side elevations are each divided into six compartments, by pilasters with stone mounted bases, and capitals surmounted by a stone architrave and modillion cornice. The front is elevated on a basement of three steps, extending the whole width of the building, but divided by massive blocks to receive the pilasters, which are uniform with those on the side elevation. In the centre compartment is the principal entrance, with semi-circular head in rusticated masonry. The architrave corresponds to the side elevations, and is surmounted with a bold pediment. The outer dimensions of the building are 80 feet by 50 feet, and the height 32 feet from floor to cornice. The ceiling is paneled, and the centre division is covered, to give an additional height of seven feet. The building is lighted by a wide-light chandelier, which gives a beautifully soft yet sufficient light for the whole place. The architects are Messrs. Wing and Jackson, and the builders, Messrs. Berrill, Maxcy and Ward, all of Bedford. It cost in its erection 37,000*l.*

ALFRED'S TOMB, WINCHESTER.—A paragraph appeared towards the end of the last month, in several newspapers and periodicals, denouncing an act of Vandallism about to be committed at Winchester, it being nothing less than the sale of the tomb and remains of Alfred the Great. The most indignant remarks have been elicited, but the true facts of the case show how much fire has been wasted. Alfred's tomb is not in existence; neither is the Abbey Church, in which it was erected; the very ground upon which it stood (a layer of clay, ten feet thick) was carted away some seventy years ago. All that was done was merely to sell the land upon which the Abbey was built!

COMMEMORATIVE WINDOWS.—In our number for April, 1849, we announced that the windows of St. Mary-at-Hill were to be filled with stained glass by Mr. Willement; the two largest have been completed, at the solo expense of two private individuals, Mr. Hanson and Mr. Trowers, both eminent merchants of the parish, who have placed them there as memorials of their parents. The centre of each window is three large medallions, *en grisaille*, of acts of mercy, surrounded by rich borders. The upper part of each window contains the arms and crests of the persons commemorated. These appropriate memorials cannot be too generally introduced.

THE BRITISH INSTITUTION.—The following pictures have been sold since our last report in April, and up to the close of the exhibition; which, upon the whole, has been very satisfactory, eighty-seven paintings, or nearly one-fifth of the entire number, having found purchasers:—

No. 43. 'A Welsh Cottage, Afternoon,' A. W. Williams, 30*l.*; No. 44. 'An Italian Peasant,' C. Roll, 10*l.*; No. 70. 'Scene near Cuckfield, Sussex,' Capley Fielding, 15*gs.*; No. 83. 'A Scene from the Bathing-Cove, Torquay,' W. Williams, 10*l.*; No. 97. 'Harvest Time,' and No. 120. 'Gypsy Trampers,' F. Taylor; No. 228. 'Porto Fesumo, Gulf of Spezia,' G. E. Hering, 200*l.* (bought by Mr. A. J. Scott on the Exe, Topham, Morning); W. Williams, 15*l.*; No. 279. 'Lock and Mill at Sludge-ton,' No. 283. 'The Cottage Girl, a Study from Nature,' Miss M. Rend, 10*gs.*; No. 281. 'Roderick, the Last of the Goths,' T. Jones Barker, 70*l.*; No. 285. 'View in the Black Forest, near Baden Baden,' Capt. J. D. King, 5*gs.*; No. 297. 'Kirby Lonsdale and the Valley of the Lune,' H. Jutsum, 40*l.*; No. 333. 'Interior of a Cottage, Kent,' G. Hardy; No. 377. 'A Scene on the Exe, Topham, Morning,' W. Williams, 15*l.*; No. 379. 'Lock and Mill at Sludge-ton,' No. 383. 'J. Radford, 15*l.*'; No. 413. 'Landing Fish,' T. Clater, 30*gs.*; No. 414. 'The Review,' J. Jones Barker; No. 466. 'Interior of a Dartmoor Cottage,' G. Hardy; No. 393. 'The Missa,' J. Stephanoff.

REVIEWS.

COUNSEL TO INVENTORS OF IMPROVEMENTS IN THE USEFUL ARTS. By THOMAS TURNER, of the Middle Temple. Published by J. ELSWORTH, London.

Our former acquaintance with the author of this book, encouraged us to look for some useful "counsel" to artists, in the present volume, which is written in a pleasant, sociable vein, well suited for general readers. The portion of the work which contains advice on the subject of Patents, Registrations, and Specifications, is preceded by an epitome of the history of inventions, enlivened and illustrated by anecdotes of eminent scientific men. It, in this part of the treatise, we meet with much that already has been made familiar to us, we also are agreeably reminded of much that we would not willingly forget. It is Mr. Turner's merit, that he has carefully studied the temperament and mental peculiarities of the artist, and by blending the severe truths of science, and the recognised maxims of political economy, with the inflexible rules of jurisprudence, he controls, while he encourages, the daring flights of inventive genius. The author takes a cheerful view of the Future of Art and Science, in connection with British Manufactures, and his aim is to encourage their full development, by pointing out the mode by which the property and value attached to works of Art may be secured to those who originate them. It seems to be of opinion that the doctrine of "Copyright has been gradually gaining ground in several directions," and complains that the law is not sufficiently flexible and discriminating. But we must remind him of a numerous and powerful body of jurists who demand that the law shall be upon this, as on other subjects, more rigorously inflexible. The enormous expense of litigation on the subject of Copyright and Patents, very properly rouses his indignation, as it must do, that of every just man. It is impossible that the present system can be allowed to prolong its existence. We recommend the author of this little volume, in his next edition, to direct his attention to some definite and specific plan for ameliorating the present legal machinery for testing and protecting the originality of inventions. He will then himself become an inventor, and render an invaluable service to Art. Whilst it has ever been the aim of the *Art-Journal* to render the great writers of Art accessible to all classes, and while we have made many sacrifices to insure this result, we have no faith in the present *manie* for "sheepskins," which can only give a temporary premium to superficial and inferior workmanship. Mental labour of the highest order cannot be gauged and measured by any human standard. The best will ever be the cheapest. To produce the works of the highest excellence, must be the aim of every one who aspires to the dignity of an artist; and that the law of Copyrights and Patents can do, will be to protect the rights of property where they have existence. The value of these rights will be liberally estimated by those judges and patrons of Art, who really deserve to be so considered.

SECTIONS OF THE LONDON STRATA. By ROBERT W. MYLNE, C.E. Published by WYLD, London.

The vexed question of the water-supply for this great metropolis has led to the publication of these sections. They are five in number; and a black plan of London and the suburbs, with the sectional lines laid down upon it, is adopted. The geology of the London Basin has been very imperfectly understood, and hence the most erroneous notions have been entertained, and the most impracticable plans projected. The publication of these sections will do much towards removing some of the errors, and they will therefore prove of much value in practice. The five lines embrace very fairly the great City—extending from Chiswick to West Ham, and from Kensington to Greenwich Marshes; also from Hampton to Camberwell; from Highgate to Peckham, and from Stoke-Newington to Lewisham. Most of the information here collected has been derived from the sections of the deep wells which occur in the various localities of these lines, the depths of the wells, in most cases, being given. As the author says, "To trace the deep wells over such an extensive area has been a work of time; and much labour has been expended in testing the accuracy of the data collected from so many quarters." In the first section only is the strata delineated in detail; in that one we have all the information, so really valuable, of the alterations in the thickness of the gravel and clay formations, whereas in the others we have only the undulations of the chalk formation shown. We regret this, for without for a moment denying the value of the infor-

mation relative to the chalk of the London Basin, that being the water-bearing stratum, we have so many causes for enquiring into the relative thicknesses of the gravels, sands and clays, that much disappointment will be felt by many who, from the title of the publication, will be led to believe that "the sections of the London strata" include these more superficial beds. We have no intention of entering into any discussion on the water-question, but we are satisfied, from our enquiries, that the supply of water to be hoped for from the chalk is comparatively limited; that the levels of the water in existing wells has been constantly falling lower, with the increase of the number of wells, and the consequent additional drainage from the Basin. When, let us ask, are we to have anything determined relative to the water-supply, and the sewerage of London? We fear not until the approach of pestilence again terrifies the people, and they awake the sleeping Commissioners.

PERSPECTIVE: ITS PRINCIPLES AND PRACTICE. By G. B. MOORE. Published by TAYLOR, WALTON, & CO., London.

There is considerable "agitation" just now among the learned on the subject of Perspective, an agitation which may be in some measure traced to the system propounded by Mr. Herdman in the columns of the *Art-Journal*: certain it is that since the publication of those papers we have received as many manuscripts, for and against the theories which they contain, as would, if printed, fill half-a-dozen of our monthly parts: we have had "line upon line, and precept upon precept." Mr. Moore's work, although not professedly addressed to Mr. Herdman's doctrine as its text-book, does not lose sight of it, for the two writers agree upon one essential point, perhaps the most essential, as it forms the groundwork of the argument on both sides, namely, that the laws of Perspective "are in universal nature, and are not confined to the picture, or to those portions of planes and lines included in it." Mr. Moore, while disputing the conclusion which Mr. Herdman arrives at, that right-lined Perspective, as at present taught, is incorrect, agrees with him that the writers on Perspective have regarded it, in general, as confined to pictorial representation, instead of a science comprehending the ordinary laws that govern the appearance of all objects. Hence, in his work, he shows the general appearance of lines and planes situated in any position to the eye on some surface common to all, so that their relative position to each other may be closely ascertained, and how such appearances may be applied to pictorial representation. Now this appears to us to bear out the truth of an observation which, many years back, we remember to have heard Professor Turner make at the conclusion of a series of lectures on Perspective, at the Royal Academy:—"After all, gentlemen, that I have been saying to you—the theories I have explained, and the rules I have laid down—you will find no better teachers than your own eyes, if used aright, so as to permit you to see things as they are." There may not be the precise words of Mr. Turner, but they give the sense of his remarks, and we would commend them to all interested in the matter, adjuring them, however, not to neglect the aids of such books as that before us, with its well-defined rules and careful diagrams.

LESSONS ON TREES. By J. D. HARDING. Published by D. BOGUE, Fleet Street.

This is another of those valuable books of instruction which Mr. Harding has put forth for the benefit of the student in landscape-drawing; and it is as likely to prove equally useful with any of its predecessors. It treats, as the title indicates, solely of trees—those beautiful, but, to the learner, most troublesome, natural objects, which so often put his patience and his skill to the severest tests; like the well known problem in Euclid to the young mathematician, they are a kind of *pons asinorum*, which it is very difficult to master. These "Lessons" are arranged progressively, from the simple trunks, branches, and foliage, in outline, to the perfect tree, single and in groups; and they embrace the principal varieties to be found in wood and forest. But, as the author judiciously remarks in his preface, "The object of the work is not so much to supply the pupil with examples for imitation, as, through their instrumentality, to make him capable of observing nature truly for himself, and of leading him to acquire, from the study and imitation of these, or any other models, some means by which he may successfully transcribe those forms and features of nature which he would desire to record." This is the true mission of the teacher of art; his aim should be to give his pupils thoughts and ideas, which, under certain prescribed rules and laws, he may carry out in his

own way; rather than to make them copyists of a style which they may successfully imitate, and yet all the while be left in the dark as to the principles whereon they are working. Mr. Harding's free and forcible touch, his graceful handling of the pencil, and his simple yet effective treatment of subject, were never more apparent than in the examples here given. They are also most admirably printed by Hulmandel; the gradations of tint, light, and shade, have been carefully preserved; while their clearness and delicacy leave no room for the complaint we have frequently heard from the learner who has had a lithograph put before him to copy, "It looks so confused, I cannot see which way the touches run, nor how they are made." The work cannot fail to prove a valuable addition to the student's library.

THE DRIVE; SHOOTING DEER ON THE PASS. Painted by E. LANDSEER, R.A. Engraved by T. LANDSEER. Published by GAMBART & Co., London.

In all respects this is a great work; of extraordinary size as to its dimensions, and great in its artistic qualities. The picture, which was exhibited at the Royal Academy in 1847, and was painted for Prince Albert, is the largest we ever remember to have seen from the pencil of Mr. Landseer; and, perhaps, from that circumstance, it did not strike us as either so interesting in subject, or so attractive in treatment, as the majority of his smaller productions. And, moreover, the low tone in which it was painted, however according with the time and place of the incident pictured, gave to the work a sombre character approaching to dullness. Hence we prefer the engraving to the painting; because in the former, we get rid of much of what appeared a defect in the picture. The scene lies in a wild and rugged pass in the Black Mount, in Glen Urchy Forrest, where of old the Macgregors used to "gather"; two figures, a sportsman and a Highland keeper, with a brace of dogs, lie in ambush behind a rugged bank in the foreground, waiting the rush of a herd of deer up the pass; one of those noble animals has just been dropped by a shot from the rifle which the sportsman is reloading for the next victim; and there seems every chance of his getting another or two after this, for the hills are alive with the stag and the hart, many of which seem little disposed to get out of harm's way, notwithstanding the danger which threatens them: it seems a regular *batue*, mountain, through whose broken masses a stream winds here and there, catching at intervals, in a most beautiful manner, the rays of light from the morning sun, which is just "lifting" the mists, and rolling them onwards with a majesty peculiar to such localities.

Mr. T. Landseer has, undoubtedly, done ample justice to his brother's composition, but he still seems to have felt the disadvantage to which we have alluded, and which is most apparent in the middle distance: had a little more breadth of light, and a very little is needed, been thrown over the ground, the engraving would be much improved, inasmuch as greater relief would have been afforded to the figures in position there, which appear to require it; nor would the harmony of the whole subject be disturbed thereby. Still it is a noble print; the varied textures of flesh, drapery, and skin, in the animal world, and of rock, herbage, and sky, in the inanimate, have been admirably preserved; and while there is great delicacy in many portions of the work, there is no lack of power where this is required. The style of the engraving is well adapted to its large size, being a combination of mezzotint and stipple, with the introduction of some line-work where such has been deemed necessary, as in the dogs, &c.

THE FARMER'S DAUGHTER. Painted by J. F. HERRING. Engraved by W. H. SIMONS. Published by GAMBART & Co., London.

A pleasing subject, most agreeably placed before us, though, we apprehend, it is the result of the artist's fertile imagination rather than a sketch from the life; not because it is deficient in truth, as to what might be and what used to be, but because farmers' daughters now-a-days find other employment than in tending their father's straw-yard and stable. Perhaps, however, Mr. Herring wishes to teach them a lesson of what may be their occupation by and by, if, as some suppose, the interests of the agriculturists are on the decline, and the maidens will again have to shorten their skirts and bare their arms, while assisting in the operations of the farm. But it is not our business to prophesy dark things, nor to echo back forebodings for which there may be, and we heartily trust there is, no reason; our task is both easier and more pleasant, for artist and engraver have here combined to pro-

duce as pretty a print of its class as we have met with. The head of a white horse is protruding from a stable door to feed from the lap of the "Farmer's Daughter," which contains a quantity of what appears "green food." The figure of the female is half-length; she is a buxom maiden, with a pleasing expression of countenance, free from vulgarity and clownishness. The horse's head is capital.

SCOTLAND DELINEATED, Parts 7 & 8. Published by GAMBART & Co., London.

If the circulation of this series of lithographic prints be at all commensurate with their excellence, they must have a wide-spread reputation, for assuredly we have never seen the picturesque beauties of this romantic country set before us in a more charming and intelligent form. The last two numbers published are Parts 7 and 8; the first contains two views of "Edinburgh," from drawings by D. Roberts, R.A., taken from opposite sides of the city, the one from Calton Hill, the other from the Castle; points which show the architectural features of the "modern Athens" to the best advantage. The "View of Loch Lomond" from the south, after H. McCulloch, is a well arranged composition judiciously treated. A "View of the Coast of Skye, Isle of Skye," also after McCulloch, shows, under the effect of a quiet evening sunset, a range of bold and lofty rocks jutting out into the sea. The next subject is "Berwick Castle," from a drawing by G. Cattermole, who has caused a hurricane of rain and wind to sweep over trees and towers with terrific violence; this is an exceedingly clever print. The last subject in this number, is a view of "The Nith," from a drawing by Leitch; the scenery of broken masses of rock covered with noble trees, through which the river winds, is exceedingly picturesque, but the lithograph is ineffective, because deficient in power. In Part 8, we have the "Isle of Staffa," and "Fingal's Cave," from drawings by Nesfield, neither of which we greatly admire as works of Art; "Falkland Castle," after D. Roberts; the "College Church, Low Calton," from a drawing by Leitch—an interesting view which embraces various other edifices of much pretension, that make up an attractive picture; "Cora Linn, Falls of the Clyde," a grand scene, treated by the artist, J. A. Houston, with masterly skill; and "Glencoe," from a sketch by McCulloch, which, as here depicted, might not inappropriately be called the "Valley of the Shadow of Death," so gloomy is its aspect, and so forcibly recalling the deeds of blood that are associated with its history. If these two numbers are not an improvement upon the earlier portions of the series, they do not, at least, lessen its character for the judgment with which the views are selected, and for the general excellence which characterises the publication.

SPRINGTIDE; OR, THE ANGLER AND HIS FRIENDS. By I. Y. ACKERMAN. Published by BENTLEY, London.

Under a pleasant title we have here as pleasant a little *comie*, one which may be carried in the pocket and read in a field-walk. It is redolent of enthusiasm for the art and for country life, "the moral of the whole" being given in the author's quotation from Shakespeare in his title page.

"Lord, who would live tumbled in the court,
And may enjoy such quiet walks as these."

This intense love of nature is ever the true test of a true angler, from Isaac Walton downwards; but our present writer has other good companionable qualities, he has read much and widely, and without parade, he brings much curious and agreeable learning into his dialogues, descending learnedly but never prosily on "the old time before us," and defending well and stoutly the rustic population from the charge of utter vulgarity of language, proving its pure Anglo-Saxon origin; they have staunch advocates in Mr. Akerman, who says:—"To me there is something affecting in the hard and simple lives of these people, who, when well-disposed, present better examples of Christian patience and resignation, than may be found even among the educated. I can never forget that our Great Master and Teacher chose for his companions on earth men of the simplest habits and humblest walk of life; and often as I have looked upon the cluster of white frocks in the aisle of our village church, and watched the serious upturned weather-beaten countenances of the group,—often, I say, have I, while contemplating this sight, prayed for the simple faith of those poor clowns." There are many capital country stories told in country dialect, much agreeable gossip in that of "gentles born," and altogether as much good sense and

pleasant reading as we know in any other volume of its size and modest pretension.

THE BRITANNIA TUBULAR BRIDGE, OVER THE MENAI STRAITS. Drawn and Lithographed by G. HAWKINS. Published by ACKERMAN & Co., London.

A highly picturesque view of one of the greatest triumphs achieved by modern mechanical science. Marvellous indeed, it seems, when we look upon that huge iron tube, stretching from shore to shore, to the length of more than one-third of a mile, and at upwards of a hundred feet above high water-mark of the river below; standing out in dark solid relief against the blue sky, as if placed there by other agency than the hands of man, and yet having nothing in common with the beautiful scenery by which it is surrounded. Mr. Hawkins was frequently employed during the construction of the work, in making drawings of the various portions, while in progress, and he has here produced it in its completed state, in a very artistic manner. Independent of the interest which is attached to such a structure in itself, he has so treated the subject as to make a very pleasing picture of it, and has lithographed it with much skill.

INQUIRY INTO THE NATURE AND APPLICATION OF PERSPECTIVE AND FORESHORTENING. By H. TWining, Esq. Published by LONGMAN & Co., London.

It is at all times gratifying to find men of wealth and position employing their leisure in furthering the ends of Science or of Art. Such instances are not rare in our day, and every fresh case that presents itself, we consider as so much gain from idle or frivolous pursuit to the interests of mankind at large. Mr. Twining has already done some service to Art in his admirable volume entitled the "Philosophy of Painting," in which he has touched upon the subject that he here enters into more fully; "finding," as he says, "since completing the volume, and after allowing my thoughts to dwell with perfect leisure on points previously investigated, that some had been left open to further inquiry, whilst one or two, perhaps, had not been exhibited in the simplest and clearest form to which they are reducible." His present work, therefore, forms a kind of supplement to the preceding, and is written with a view to afford guiding principles in those branches of Art which its title indicates. In treating his subject the author appears to have divided his work into two parts, one referring to what may be called Theoretical or Linear Perspective, and the other to the knowledge of the science which may be acquired by observation. Our limited space will not allow of our analysing his doctrines; we can only say they are clearly and simply laid down, and well worthy of attention.

EVANGELINE: A Tale of Acadie. By H. W. LONGFELLOW. Published by D. BOOZE, London.

The name of Longfellow, among the hardis of America, has long had an English reputation with those of his countrymen, Bryant, Willis, &c. His poetry is of that order which takes its rise from an cultivated intellect disporting amid the quiet beauties of nature, and the gentle thoughts that associate themselves with the troubles and enjoyments of his fellow-man. "Evangeline" is, perhaps, the most popular of his poems. It is a sad tragedy, told in beautiful, simple, and pathetic language. It refers to the expulsion, in 1755, of the French settlers from the province of Acadie, or Nova Scotia, by the British forces, for refusing to assist the latter in the hostile movements then carried on between them and the Indians. But our remarks must be confined to the illustrations which ornament this new edition of the poem; they consist of between forty and fifty exquisite little engravings on wood, from designs by Miss Jane Benham, Birket Foster (whose beautiful drawing of "Morning," in our present number, must attract attention), and J. Gilbert. There are among these subjects many of a very superior quality; and all are engraved in first-rate style; they look more like delicate etchings than woodcuts. The whole work is beautifully got up in illustration, type, and printing.

WAITING FOR THE COUNTESS. Painted by E. LANDSEER, R.A. Engraved by C. W. WASS. Published by T. AGNEW, Manchester.

The title of this work by no means declares its subject, yet it is most appropriate. A graceful bloodhound lies at the foot of a flight of steps with his head raised in eager expectation of the descent of some well-known person. The dog was a favourite hound of the late Countess of Blessington, to whom it was presented by the King of

Naples, and in the engraving, is presumed to be waiting her approach; hence the title. The print is an elegant one of its class; the animal is drawn with the power and truth which Mr. Landseer imparts to all such subjects; the head is full of intelligent expression, which Mr. Wass, in his engraving, has most happily caught.

ORNAMENTAL WINDOW-GLASS. Published by the CROWN GLASS COMPANY, St. Helen's, Lancashire.

In the *Art-Journal* for May, of last year, we introduced an illustrated article on the manufacture of modern ornamental window-glass; which article was courteously supplied by a gentleman connected with the above extensive factory. The Company have recently published a thick quarto volume (one of which is now before us), of patterns and designs for every description of window, those of a superior order being by Mr. Frank Howard, many of which are given in colours. In looking through this work, it is impossible to deny the fact that Art, in this phase of manufacture, has made rapid progress within the last two years; and with the means which this Company has at command, and the taste it has exhibited in getting up the volume, such progress must still go on. But we find much in this book that cannot fail to be of service to manufacturers of other matters besides glass, so varied are its contents, and so adapted for general application; it ought not therefore to be regarded simply as a pattern-book of that particular trade alone, but a book of useful and elegant ornamental designs.

AURORA, AND OTHER POEMS. By MRS. H. R. SANDBACH. Published by W. PICKERING, London.

It would, indeed, be somewhat remarkable if the authors of this volume, who is a daughter of the late William Roscoe, did not inherit some portion of the cultivated intellect and gentle spirit of her father. We know that genius is not hereditary, yet it is impossible for the young mind to grow up amid "thoughts that breathe and words that burn," without feeling their influence. The fragrance of the flowers which grow on Parnassus must be inhaled by those whose footsteps tread among them; and the fruit of the young tree, if it bear fruit at all, must resemble that of the parent stock. This is not the first nor the second time that Mrs. Sandbach has appeared as a writer of poetry, though it has not been our good fortune to have had her previous publications brought under our notice; but to judge from that which we are now called upon to review, we are persuaded they are worthy of her lineage. A part of the contents of this volume reminds us how frequently Art begets Art, how poetry produces painting and sculpture, and the latter arts call forth the inspirations of the poet, for the poem of "Aurora" and several of the other pieces have been suggested by the sculptures and drawings of Gibson, whose earliest patron was Roscoe, and to whom the present work is appropriately dedicated. None of these poems are of sufficient length to demand an analysis of their subject-matter; it is sufficient to say that, in all, a spirit of gentle or of holy melody is heard in their music, which is poured from a mind at once elegant in conception and well-attuned to harmonious numbers. It is a book one should take for a companion into some quiet, leaf-shaded corner, when thought and heart are at rest, and the sun, to quote the writer's own words—

"Casts off his burning robes of light,
And lets the purple draperies of the Eve
Fall on his crimson couch."

HELENA AND HERMIA. Painted by R. THORBURN, A.R.A. Engraved by F. JOUBERT. Published by HERING & REMINGTON, London.

Two distinguished members of our female aristocracy are here represented under the above titles, the Marchioness of Waterford, and her sister, the Viscountess Canning. They stand on a lordly terrace, which overlooks a wide range of country, but the extreme pensiveness of their countenances would lead to the supposition that their thoughts are engaged on other subjects than those around them. This expression of melancholy, and the style of dress in which they are habited, partaking of the mediæval age, carry back the imagination of the spectator to remote ages, when the cloister and the convent were not unfamiliar to high-born ladies. This, however, is no detriment to the work, but rather otherwise; it is a relief to the ordinary ungraceful attire with which we are everywhere familiar in modern portraiture. The composition is elegant, classically picturesque, and well studied. It has been well engraved by Mr. Joubert.

THE ART-JOURNAL.

LONDON, JULY 1, 1850.

ELECTROTYPING
APPLIED TO ART-MANUFACTURES.

ELECTROTYPING is one of the most successful applications of the discoveries made in the domain of science to the Fine Arts. It involves the possibility of transferring the forms created by sculpture to a noble and solid material, without destroying by such a process, the freshness and bloom of the original in the slightest degree. Those who are not aware how hard is the struggle which, for thousands of years, has been carried on between artists seeking to embody their ideas in the firm and sharply defined forms conferred by bronze casting, and those physical conditions which impede the settling of the floating metal in the moulds, prepared with anxious care, will not be able at once to appreciate the incomparable value of such a discovery. But artists who have gone through the trials to which the uncertainties of casting subject them, and who have seen, totally wasted away in the process, all the refinements of their carefully studied modelling, have been struck by the results of this new method, as by a miracle. Thorwaldsen, who saw only the first experiments made, when this mode of workmanship was yet in its infancy, hailed the discovery as one of the greatest that has ever been made in the department of technical reproduction. He, whose towering imagination had busied, during his long and active life, the hands of numerous artists in reproducing in marble the creations of his genius, in a style which afforded him little satisfaction and which rendered, indeed, but little justice to his merit, foresaw at a single glance how immense, how incalculable an advantage, was to be derived by great sculptors from this new manufacturing process. To this great artist, however, befel that which was the fate of many men of distinguished talent, and which is so touching in the fatal destiny of Moses, who was allowed to cast his eyes upon the fertile plains of Canaan, but not himself to enter the promised land. With his cooperation, this branch of Art would rapidly have shot up into a mighty tree, while it is still even at the present moment regarded as a weakly sapling, little cared for, without promise of fruitfulness, and considered by many amateurs of Art, as of an equivocal and even suspicious origin.

Prejudices have stifled in their prosperous commencement more than one useful invention. We may mention as an instructive instance, and one well adapted to our case, the anecdote of Nero who ordered the man to be put to death who presented him with a cup of transparent glass, which was elastic like metal, fearing lest gold and silver should lose their value by such a discovery.

Electrotyping has encountered a reception nearly as chilling. The political disturbances of Europe, it is true, have contributed much to withdraw the attention of the public from the astonishing results obtained by this process; but still more than these unhappy circumstances have the false notions current respecting its

true character, contributed to throw it into the shade and to rob it of the favour of real protectors and lovers of Art.

What in former times would have been the greatest recommendation, the very moderate price at which such reproductions of the finest workmanship can be presented to the public, has been perverted into an objection against their real value. The wealthy have been told that this description of workmanship is wanting in solidity, and the many find it always dearer than plaster, papier maché, and such like worthless and perishable materials.

Perhaps, however, the public has not been alone in the wrong, and the proportionably small encouragement which this manufacture has met with, may be attributed in great measure, to the not always successful choice of models selected for production. Not every subject that looks well in marble or clay, presents a similar fine or striking appearance in bronze, the smooth untransparent surface of which displays the whole form with such a hard distinctness, that finishing touches sufficiently sharp for any other material, here seem to have entirely lost their power. The laws of style, and the conditions under which modelling associates itself in a suitable and harmonious manner with such a material, must therefore be thoroughly studied, before that success can be attained which is aimed at in such a process of artistic reproduction.

Every attempt to acquire a clear understanding of what is meant by style, in reference to Art-manufactures, would be vain and useless without the help afforded by a comparative glance at the history of Art. Here we learn at the first view, how important is, not the material itself selected as the medium of ideas to be artistically expressed, but the specific manner in which it is treated. The striking effect of Egyptian sculptures depends entirely upon the assimilation of the forms created by the plastic hand of man with those huge masses of rock employed for this purpose, which still continue to exercise a peculiar power over our imagination as products of nature. The moment that the artist ceases to consider these indestructible qualities of the substance made use of, the latter enters into a hard conflict with the forms impressed upon it by the human mind, and it happens, not infrequently, that the whole artistic effect is entirely destroyed by such a contradictory action of the maltreated and offended material. A comparison made between a statue of Bernini and any sculpture of Egyptian, Indian, or Greek Art, will bring immediately before the eyes of our readers the difference to which we allude. Whilst in the Art-productions of the ancients the idea grows out of the dead masses themselves, as leaves and blossoms burst out from the stem of an old tree after a night of spring rain, the sculptures of the modern artist leave upon us the impression, as though the subjects represented by them were entangled in some harassing conflict of passion, and the lively movements they display are those of a convulsive state of agony rather than the free action of an organic development.

This radical defect, which appears in the most striking manner in the works of the seventeenth century, is, however, a general quality of the sculpture of modern times; and not only Michael Angelo's Moses partakes of it, but even Ghiberti's gates of the Baptistery at Florence, which the former declared worthy to be the gates of Paradise, are open to censure in this respect. Although they are of so elevated an order of beauty and so masterly a perfection, that no bronze of the classical epochs which has come down to our times, can be compared with them either in excellence of workmanship or in the overflowing riches of a sublime and poetical conception, these same sculptures, as works of bronze, are surpassed by the most common Art-manufactures of the Greek and Roman epochs, which bear almost without exception, the stamp of genuine plastic workmanship. Is it not as if a magic spell had transformed the figures put into action by the Florentine artist, into beings which have become strange to themselves, and therefore ill at ease and seeming to be in a perpetual struggle with the material with which

they are associated? With the bronzes of the ancients we find precisely the contrary. The figures adorning the bas-reliefs of Siris, in the British Museum, are to such a degree amalgamated with the metal, that, were we desirous of bringing them down to the level of actual life, they would appear like beings belonging to a higher sphere in the midst of this common and low existence. We should immediately be aware that they are not composed of the same clay as our own bodies, but of a nobler material; and as a bird, whose lungs are fitted for inhaling the pure and rarified atmosphere of the higher regions of the empyrean, is unable to inhabit the denser element for which a fish is adapted by its inferior organisation, so, the metal figures of a Greek sculpture seem to require quite a different medium for their more subtle and merely poetical existence.

This is not the place to enter farther into the details of such a question, the solution of which requires great experience in matters of Art, and an uncommon delicacy in the perception of different degrees of artistic excellence, and perfection of style. Here we are interested in it only in a practical point of view. We can, therefore, refer directly to the experience made by all those who have been occupied in electrotyping, that it is not sufficient to convert any monument of Art whatever into metal, but that the success of galvanoplastic reproductions depends entirely upon the subjects chosen. The contrast between form and material we alluded to above, becomes much more striking when all the details of artistical execution reappear in a material for which they are not intended. This unexpected result has been frequently so startling in effect, that many electrotypers have been disappointed by it to such a degree as to be induced entirely to abandon a process presenting in itself advantages not to be obtained from any other mode of mechanical reproduction. Mismangement of the most useful of scientific discoveries threatens, therefore, to rob our century of the glory of having made it, and it is strange enough to see how the story of the inventor of the application of steam-power is repeated even on this occasion. Whilst Napoleon was inclined to shut up in a lunatic asylum the man who offered him steam-vessels, our artists are disposed to wish for zealous electrotypers a fate perhaps even more cruel.

It is not my intention to give, on this occasion, any description of the chemical process or technical improvements which have been introduced into the electrotyping manufacture. Such things are now universally known and afford little interest to those who do not concern themselves about the means by which a work of Art is produced, but who wish only to enjoy good workmanship on the best terms. The question which occupies us at the present moment, regards, exclusively, the results obtained by the application of a scientific discovery, which has done wonders in other branches of industry. For although even the gilding and plating process does not always receive full justice, this newly established branch of trade has struck deep root and will not easily be abolished by the old process, which offering only apparently greater advantages, has ruined the health and destroyed the lives of so many persons, and is far from being able to enter into competition with electrotyping. If the credit of the latter has suffered in any quarter, the fault is entirely due to bad workmen and not to the process itself, the perfection of which depends of course on the method adopted in its application, and on the conscientiousness with which it is put in practice. Manufacture-spoilers end at last by spoiling only their own reputations.

The finest philosophical instrument put into the hands of a savage will soon become an object for laughter and ridicule, and more matter-of-fact men cannot be forced to acknowledge the most evident results of science, even when placed before their eyes. I remember that when Sir Humphrey Davy in his journey through Italy was kind enough to explain one of his wonderful discoveries to some Roman chemists, after having pointed out the result of the experiment perceptible only to the scientifically educated

eye of the philosopher, he exclaimed joyfully at the appearance of the magic spark—"L'hanno viduto!" "Did you see it?" He was afterwards ridiculed by a sceptical professor of chemistry, who in a spirit of malicious mockery frequently repeated the words of the great founder of electro-chemistry, whom he ignorantly looked upon as a visionary. Thus we see, that one of the branches of galvanoplastic industry, which affords the greatest advantages for the diffusion of knowledge, has been cultivated within very narrow limits only, whilst its usefulness, if properly understood, ought to have assured it an universal application. We speak of the reproduction of engraved copper-plates, which on the Continent, in Germany at least, has an astonishing success, whilst in England it is scarcely practised at all. The cause of such neglect is the same as in the case of other useful inventions, which lose their character only by mismanagement. Failure is followed by discouragement and the latter by indifference, which has always a most injurious effect upon national industry. I know an establishment where several thousand copper-plates have been reproduced in this manner, and where the number of engravers, instead of being diminished, has been considerably increased by it. The workmanship is enabled by this means to improve, while the prices of such productions become cheaper in proportion, and Art itself, as well as the public, is benefited in the highest degree. A reformation in trade of the most advantageous character takes place, which is profitable both to the producer and to those who enjoy what is produced, without injury to either party. Yet in spite of this it is difficult to persuade even a practical man of business that progress is insured by so admirable an invention, and this, for no other reason, than because it has been subject to mismanagement.

If prejudices are so great an obstacle to the improvement of the most useful methods, we cannot wonder that these difficulties should be still greater in the higher regions of Art, where the machinery is much more complicated, and where fashion exercises a potent sway. When the first notices of the application of electrotyping to sculpture reached the present director of the royal foundry of Munich, he immediately went to Paris to assure himself of so powerful a means, promising to supersede the fire process, the imperfection of which was known to no one so well as to this clever and experienced artist. The opinion, however, which he laid before the public after his return to Munich, was quite opposite to the results afterwards obtained by long practice. His impression was that this process would never be applicable to works of large size, whilst now every electrotyper knows that small sized objects occasion sometimes much greater trouble than can be made to answer in a commercial point of view. Mr. Müller produced a bust about the size of life to show that he was well acquainted with the process, of which he had entertained such bright hopes, and in which he had found himself suddenly so disappointed. To those, however, who are initiated in the secrets of the manufacture, he has only offered a positive proof that he did not sufficiently understand it. The copper produced by him in fact deserved the blame, whilst he endeavoured to lay the fault upon a method, upon which he had bestowed so little time and patience, and the study of which requires as many years as he had allotted weeks to it. It is indeed to be regretted that this skilful and zealous artist should have so hastily abandoned the process, as he, in all probability, with the aid of scientific men, would soon have been enabled to bring it to that degree of perfection which others have at last attained at a far greater expense of means and time, than he would have required for the purpose. The artistical execution was masterly, and of all persons who have occupied themselves with electrotyping, perhaps no one had so decided a vocation for it as he.

It is generally supposed that the scientific is more essential than the artistical part to insure success in this branch of technical reproduction, but this is a great mistake. As the most accurate knowledge of the theory of fire-eating would enable no one successfully to establish a

foundry dedicated to Art-manufacture, so it is quite as hazardous to look for great results in electrotyping from the theoretical knowledge of electro-chemistry alone. It is true that a galvanoplastic workman cannot dispense with the study of the primary elements of galvanic action, but I have frequently seen those, who had a large store of patience and skilful perseverance, succeed much better than those who could boast of considerable scientific attainments. Even here the old saying of a practical philosopher holds good, that "a part is greater than the whole," as it is frequently more essential to apply a very small portion of scientific knowledge than to aim at becoming master of the secrets of nature, by peeping into her laboratory for a few moments. Only an apple falling from a tree enabled Newton to discover those laws which the whole apparatus of science could not so easily have made evident; and thus we find, that in the improvement of great inventions, those have succeeded best who have endeavoured to simplify the means and to reduce the problem to a matter-of-fact question, the solution of which has not unfrequently been discovered by a child.

Those who have no confidence in this new method of converting artistic models into a noble and enduring material, usually allege in support of their scepticism, that, as yet, almost all the establishments of this kind have come to an untimely end, with the exception of the few sustained by means not derived from commercial resources. This, indeed, cannot be denied. There is scarcely a capital in Europe where one or more electrotypers do not deplore their folly in having gone too far in this branch of speculation. Although the political disturbances of Europe may have had some share in so complete a failure of success, it must still be confessed, that even in more favourable times they would have gone to ruin, as the practical direction chosen by them could not lead to any good result. The fault lies, however, not in any defect of the method, but exclusively in the wrong application of it.

To explain our meaning, we may venture to say, that had the art of copper-engraving been discovered in our own times, it would probably have met with the same result. And has it not been so with lithography? The inventor of this incomparable multiplying process, to which our century is indebted for the unlimited propagation of cheap and useful knowledge, of instruction and amusement, euded as a bankrupt, as many electrotypers have done, who deserved a better reward than the malicious ridicule with which the thoughtless many have saluted them. The invention succeeded, however, immediately after having passed from the hands of the man of genius to those of dry but shrewd and practical men of business, who availed themselves of this powerful means for satisfying the wants of the million. The history of discoveries and inventions is not less rich in tragical combinations than that of political events. Ungrateful are the many, and therefore we must not wonder if those who make a fortunate discovery should endeavour to derive some immediate personal advantage from it, without much considering the common good. The world will be deceived, "therefore," says the man of business, "you must deceive it." This maxim is carried into practice perhaps more in Art-manufacture than in any other branch of human industry, with the exception of medicine, where the most clever and conscientious physicians are compelled to adapt themselves to the folly and credulity of mankind by assuming a mask either of charlatanism or of exterior roughness. To prove what we have ventured to assert, it will be sufficient, for the present, to direct the attention of those who have any capacity for appreciating correctness and refinement in Art, to the small-sized bronzes which are manufactured, in enormous quantities, at Paris, at Rome, and in England. Without speaking of the artistical treatment, which is, of course, subject to the caprices of fashion, we shall allude only to the style of workmanship generally displayed by them. And here we must be, in the first instance, just, in acknowledging the astonishing progress made by fire-casting since the bright epoch of the sixteenth century. Frequently

these Art-manufactures of the present day are so perfect, that they seem to be made with the same facility as plaster-casts. Such reproductions, however, as they do not attain the sharpness of the latter, are not fitted for catching the crowd, and are therefore condemned to undergo a process much more cruel than that to which Maryas and Bartholomew were subjected. The artists who are commissioned to put such bronzes into a condition for sale, are generally unable to model a single object, but are acquainted with the means requisite for tricking out works of this description in a seductive manner. They obtain what is desired, principally, by two contrivances. The first consists of a mode of execution which throws over them a veil, not allowing the eye of the spectator clearly to distinguish any details of form, and the second gives a deceptive effect to some prominent parts. The former is obtained by a particular kind of file, by means of which the whole surface is rubbed over, without any regard to the modelling; the latter is produced by the chisel, commonly used in the most arbitrary manner. Both modes of treatment proceed upon the attempt to produce a false illusion, and their striking effect arises from mutual contrast. The file-rubber has no other intention than that of converting the whole surface of the sculpture into one smooth plane, by destroying the modelling wherever the casting process has left any trace of it; and he succeeds with the multitude in making them believe that every part of the work is of the same perfection; the chiseller endeavours to revive the plastic expression, on those parts, at least, where even the inexperienced eye of the unreflecting amateur would discover that the pith and marrow of the original are entirely gone, and that the whole has lost all character.

This system of imposition in Art-manufacture is accomplished by the skilful management of picturesque accessories, without which no sculpture can hope to obtain the applause of the many. This is even acknowledged by the ancients, who assigned to those statues of Praxiteles the highest value, which were painted by Nicias. But this fact proves clearly that the utmost discretion and a very subtle refinement are required to associate advantageously the two branches of Art. This requisite delicacy is far from being observable in the present mode of colouring our bronzes, by giving them a kind of patina, which imitates, it is true, that bestowed upon ancient bronzes by the effects of time, but only in a manner setting taste and common-sense at defiance.

With such an apparatus of seductive means have those to contend, who hailed, in electrotyping, the rising star of a better era in Art-manufacture, relying with bright hopes upon a process which would enable the workman, to whom is confided the reproduction of a masterpiece of sculpture, to preserve the expression of every individual touch coming from the plastic hand of the inspired artist as the expression of the soul within. The first experiments proved that these prospects were not mere delusions. A general cry of astonishment was heard all over Europe; artists and connoisseurs expressed the most entire satisfaction at the results obtained; but electrotypers soon became aware that they could not continue to work upon praise alone, and that to sustain the new art in successful rivalry with her older sister, they stood in need of some means of competing with that outside gloss and polish, without which even the prostitute children of the latter would fail to achieve success.

In despite of such difficulties electrotyping has still held on its course. Large bronze works have been executed, and the thoroughly satisfactory result yielded by them has shown to the world that science has presented Art with an offspring of real genius, which has not only talent, but also courage and perseverance enough to fight its own way. Artists of impartial judgment have gone further, and have declared, that should they be required to execute their works in bronze, electrotyping must be the process, and no other, this method being alone worthy to be entrusted with the reproduction of a finely executed model.

If the life-and-death question with reference

to a method presenting the brightest reflection of the most astonishing discoveries made in the highest regions of science may be considered as decided, the practical question respecting its useful application to industry and commerce is as yet barely touched. Although there is scarcely any branch of manufactures that does not derive great advantages from the galvanoplastic process, there are, on the other hand, very few men engaged in business acquainted with the real resources which it affords, and whose ideas are sufficiently clear to enable them to know what opinion to form of it. As it is not so easy a matter to obtain the information necessary for an authentic statistic account, I thought that it might prove useful to lay my own experience, and the convictions derived from it, before the public, partly to destroy prejudices, partly to show what powerful means have been placed in our hands, and bow ungrateful a return has been made for it during the last ten years.

To do full justice to the argument, we must begin by pointing out the limits which electrotyping, as a branch of manufactures, is not allowed to transgress but at its own risk. Whoever undertakes to conduct such a power in the hope of benefit, must endeavour to know how far it is able to reach, or, still better, what are its boundaries. The latter may be, on one side, very near, nay, so close at hand, that a feeble-minded man will shrink back and lose all courage, whilst in another direction the far-reaching eye of a prophet will scarcely be able to determine whither the combinations of which such a discovery is capable, may lead us. And has not the experience of a few years shown that the sphere of this branch of industry is almost unlimited? Certainly it is so; but it has happened not unfrequently that the instrument dropped from the hand of one, proves to be most valuable in that of another. Was it not Minerva who flung aside the flutes which did not suit her expressive mouth, while in the hands of Marsyas they became an enchanting instrument, the magic effects of which it required Apollo himself to neutralise! This significant story is daily repeated, and it would be highly advisable and useful to pay some attention to the lesson of practical truth which it conveys.

Electrotyping was invented nearly at the same time with the different photographic processes, which offered likewise a means of art so full of promise to artistic reproduction. These prospects have, however, proved illusory, the latter not having approached the boundaries of real Art. We have learnt by photography how far this merely naturalistic process is able to go, and know now, that common reality, fixed mechanically by a mirror, without having passed through the poetical and reproductive medium of an artistic eye, soon becomes destitute of interest. On their first exhibition we see such shadowy images surrounded by a gaping crowd, but we soon perceive in those who do not speedily make their escape, evident tokens of mortal weariness. With creations of real power and meaning such disappointments do not occur, and artists may learn by this great experiment the full force of the influence which they possess. *Mind* can alone stir and touch the many, and the most brilliant outward accessories cannot long continue to affect the multitude, although it is often caught at first by bright colours and attractive forms. Retzsch, with his slight outlines has, as well as Flaxman, electrified whole nations, while the most elaborate works of Art have not exercised half the effect produced by the sight of these figured poems.

From such a fact the electrotypist may learn what he is able to expect from his reproductive power. He will not raise the dead by it, but he may be sure that the sculpture of the present days will make the most extensive and varied use of his assistance. Products of nature covered with a film of copper or silver, even repetition of ancient monuments, will not move the public; but if he succeeds in embellishing our daily existence by the introduction of poetical elements adapted to every-day use, he will be able to effect a reform, and in many respects even a revolution such as has been hitherto unknown in the history of industry. In the following

articles we shall, without entering into any merely vague schemes, give an account only of those departments of sculpture where electrotyping has already met with an unrivalled success, and whence Art has derived not only an enlargement of her domain, but, what is of much more value, a real and solid improvement. Such a review will be not less interesting to the sculptor and Art-manufacturer, than to those who indulge in the elevating pleasures afforded by plastic means. Sculpture possesses in a higher degree than any of the sister Arts the power of amalgamating itself with those objects which the ingenuity of man has devised in aid of the organs bestowed upon him by nature, and exercises therefore a more widely diffused influence upon habitual and practical life.

EMIL BRAUN.

THE BRITISH INSTITUTION.

THE ANNUAL EXHIBITION OF OLD MASTERS.

THE collection of this year affords a catalogue wherein are found the greatest names that have adorned Art. Every school is worthily represented, but the collection is perhaps more especially signalled by transcendent examples of the Low Country schools. The contents of all the more famous Art-stores of that country are well known, but there is yet an extensive diffusion of charming works, variously and remotely distributed, of which but for these interesting annual exhibitions we should remain in ignorance. The names which appear after the artists are those of the present owners of the pictures, who have lent them for exhibition.

No. 4. 'An Interior,' A. OSTADE (J. Haywood Hawkins, Esq.) This is a small picture, resembling very much, as to subject and general treatment, the well-known Ostade in the Louvre. The colours employed in these pictures are exclusively red and blue skillfully broken and varied in strength and tone, and supported by warm and cold greys.

No. 5. 'A Calm with Vessels at Anchor,' W. VANDERVELDE (T. Baring, Esq., M.P.) The composition presents, on the left, boats and figures, and in the right middle distance, a ship of war, drawn with extraordinary care and accuracy. The picture, like the best of the master, is remarkable for the sparing use of colour.

No. 6. 'A Horse Fair,' WOUVERMAN (T. Baring, Esq., M.P.) A small picture containing numerous groups of figures, painted with infinite nicety.

No. 7. 'Moses Striking the Rock,' MURILLO (Earl of Normanton). This is a sketch, and if a veritable Murillo it must be an essay professedly in the taste of the school of Rubens, after the painter had seen the works of Pedro de Moya. It is charming in colour.

No. 9. 'River View with Boats,' CUYP (T. Baring, Esq., M.P.) A most beautiful and valuable example of the painter, and in a high state of preservation. The view and material are somewhere near Cuyp's dear Dort, perhaps a little below the town. We have never seen a more perfect example of Albert Cuyp.

No. 11. 'Portrait of Himself,' J. MEMLINCK (S. Rogers, Esq.) This is a small portrait which came into the hands of its present possessor from the collection of Mr. Aders. This painter is also called Hemling and Memling, and is supposed by some persons to be the Juan Flamenco who painted the pictures in the monastery of Miraflores in Spain, between the years 1496 and 1499. However that may be, the picture has an undoubted reputation of originality, and is an extremely valuable specimen of its time.

No. 13. 'The Alchemist,' JAN STEEN (Lord Overstone). This is perhaps the gravest subject we have ever seen by the tavern-keeper of Leyden; it presents, however, the unmistakable characteristics of his works, that of a higher finish in the circumstance and accessory than in the figures. For spirit, expression, and execution, we might say that Hogarth had looked closely at the productions of Jan Steen.

No. 15. 'Spanish Peasant Girl,' VELASQUEZ (Earl of Yarborough). This picture is not in the manner which is recognised as the best of

the master. It is somewhat hard, and this is rarely a disqualification of Diego Velasquez.

No. 17. 'The Magdalen,' TITIAN (Earl of Yarborough). This is a valuable picture; the figure is a life-sized half-length, having the face turned upward. The head is not painted from the same model which characterises the "Flora," at Florence, and the picture in the Louvre. It has been probably painted after these. The background is open, and the drapery is of a striped material, similar to that of the pictures in the collections of the Duke of Sutherland and Mr. Holford. The hand is spread much in the manner of that of the "Flora."

No. 19. 'Rubens and his Wife,' RUBENS and SNYDERS; from the Collection at Hewell, belonging to the late Earl of Plymouth (Hon. R. H. Clive, M.P.) Rubens and his Wife occupy the left of the composition, the right presenting a display of all kinds of game, from the wild boar downwards. The merits of the work are of a very high order, but like many pictures painted by two artists the composition is deficient in unity.

No. 20. 'Landscape and Figures,' CUYP (J. J. Martin, Esq.) A large picture, the right of which is closed by a cliff, a rare feature in the works of this painter; the left is open, and retires with a succession of ridges, a favourite manner with Cuyp of describing distance. The left section of the work is equal in brilliancy to his best works.

21. 'Duchess of Lotrine,' REMBRANDT (Earl of Yarborough). Fuseli said of the female figures of Rembrandt that they were all "prodigies of deformity." This Duchess is certainly not a Hebe, and Rembrandt, in painting her, has done more for the honour of his brush than in celebration of the lady. This is one of the works which he may have painted at little more than a single sitting.

No. 22. 'Holy Family with St. Jerome,' &c. TIVOTORTO (H. F. Hope, Esq., M.P.) This is a large picture, careless in drawing, but containing many beautiful passages of colour.

No. 24. 'The Embarkation of William III. for England,' BACKHUYSEN (H. T. Hope, Esq., M.P.) A large picture of admirable quality, representing a Dutch port, with a ship of war as a principal object, surrounded by numerous boats and other craft. The picture is painted in a very low key, but worked out in all its detail with a care and nicety that are extended as well to every minute object of the work as to its more prominent component. It is an admirable example of the master.

No. 25. 'The Adoration of the Magi,' J. VAN EYK (Lord Northwick). This work equals in elaboration the most highly wrought examples of painting. It has not the breadth of the picture in the National Gallery, and it would almost appear that the painter has been so long occupied on it that his manner has even been undergoing change during its progress.

No. 28. 'Landscape,' RUBENS (Samuel Rogers, Esq.) This is a small picture—the tree composition—for Mr. Rogers possesses, we believe, another landscape by Rubens. It is a study of effect and harmony, and, doubtless, was intended as the scene of some larger work. It is generally low in tone, but exquisitely mellow in all its hues and gradations, and manifests, in the painting of the foliage, an impatience of definition.

No. 32. 'Portrait,' REMBRANDT (Samuel Rogers, Esq.) This is a portrait of the painter himself, with all the depth of his most successful efforts. There are at Florence four portraits of Rembrandt by himself, but they are all generally painted with a richer impasto, and wrinkled with the end of the brush.

No. 35. 'Death of Mary of Burgundy,' MARTIN SCHÖN (Sir C. M. Burrell, Bart., M.P.) Martin Schön of Colmar stands high also as an engraver, and in his works in this department there is a pronounced affinity with the manner of the Van Eyks. Schön's pictures are extremely rare, and it is certain that he is but little known out of Germany. Waagen in his "Künstler und Künstler in Deutschland," ventures to say, that up to the period of his publication, "no genuine works of Martin Schongauer are known except at Colmar." The composition is precisely of that kind in which Schön delighted.

No. 37. 'View of Scheveling,' RUYSDAEL (Earl of Carlisle). A study, painted with the utmost fidelity to nature.

No. 38. 'The Virgin and Child,' CARLO DOLCE (Lord Overstone). There is more texture in this picture than we generally see in the works of the artist—that which he considered a disqualification is generally regarded, to a judicious extent, as indispensable to richness.

No. 39. 'Landscape and Figures,' RUYSDAEL and A. VANDERVELDE (H. T. Hope, Esq., M.P.). The material consists of a close rocky scene—with a stream, the banks of which are shaded by trees. It is the finest Ruysdael we have ever seen—perfect as to condition—as definite in all its parts as when removed from the easel—full of charmingly painted objective in all its shaded passages, and brilliant and substantial in its light; it is altogether, and especially in its trees, an example of landscape art that can never be surpassed.

No. 43. 'Landscape and Figures,' BOTH (J. J. Martin, Esq.). The landscape is painted by John Both, and the figures by his brother Andrew. The foreground of this work is the most beautiful in truth and elaboration that can be conceived; the weeds and herbage are, every leaf, studiously imitated from nature, with an imitatively clean and sharp touch.

No. 44. 'The Holy Family,' SCRIBONE (Earl of Yarborough). Works of this painter are extremely rare. This is a picture of a high degree of excellence; it is elegant in design, and impressive in sentiment.

No. 47. 'Landscape,' KOSICK (T. Baring, Esq., M.P.). A large picture, presenting a composition according to the known taste of the painter—an extensive view over a flat country. There is much truth in the near material, and the distance is effective, but the shaded passages are extremely heavy.

No. 48. 'An Interior,' METZU (T. Baring, Esq., M.P.). A beautiful example of the painter, and, like many of his best works, it affords a story sufficiently intelligible.

MIDDLE ROOM.

No. 51. 'Trowse Lane—near Norwich,' CROME (Mrs. Sherington). The artist never painted a better picture than this. The subject is extremely simple, but it is treated with much dignified feeling that is not discountenanced by the very careful definition in every part. The dispositions are effective, and the textures judicious and appropriate.

No. 55. 'Dionysius, the Areopagite, a nobleman of Athens and disciple of St. Paul,' SIR J. REYNOLDS (John Bentley, Esq.). This is a profile painted from the same model that was employed in realising the Ugolino picture. It is admirable in colour, and painted with so full a brush that here and there the end of the tool has been employed to turn the curls in the hair. The picture is in perfect preservation; it is painted on a very thinly primed canvas, which appears through the glazings.

No. 56. 'Cattle on the Bank of a River,' GALINSBOROUGH (Samuel Rogers, Esq.). A small picture, slight in execution, but charming in feeling and colour.

No. 57. 'Figures at a Repast,' and 'A Domestic Scene,' JAN STEEN (H. T. Hope, Esq., M.P.). Two valuable pictures in the most perfect preservation, and constituting admirable examples of the painter's manner. His independence and originality are the first qualities in these works that strike the spectator. From Jan Steen's close observation of human nature, he makes, with the most perfect ease, every figure contribute to the story. The depth of these pictures is obtained without artifice, and the force and nature of the figures have the simplest version of truth.

No. 58. 'Portrait of Bartolomei Bianchini,' attributed to RAFFAELLE (Lord Northwick). The head is, at least, a good imitation of the manner of the Doni portrait in the Pitti Palace.

No. 60. 'Landscape, with Tobit and the Angel,' SALVATOR ROSA (J. J. Martin, Esq.). This is a large picture, of a grand style of composition, free in execution and harmonious in colour.

No. 61. 'Dead Game,' WEENIX (H. T. Hope, Esq., M.P.). A production of John Weenix. The principal object in the picture is a dead

buck, the coat of which is painted with a reality we have never yet seen attained in animal painting.

No. 65. 'St. Sebastian,' DOMENICHINO (the Duke of Northumberland). The figure is, as usual, tied to a tree. It is painted in a high key, telling forcibly against a dark background. This manner of bringing the figure forward gives power and concentration, but it is not according to nature.

No. 67. 'Cattle in a Storm,' PAUL POTTER (H. T. Hope, Esq., M.P.). This picture is accompanied by another, No. 69, by the same painter, entitled 'Landscape, with Horses and Figures.' They are both small, and very highly finished.

No. 68. 'Exterior of a Cottage,' A. OSTADE (H. T. Hope, Esq., M.P.). A careful study made in the court-yard of an ordinary residence: there are one or two figures to give life to the composition, but its charm consists in the disposition of light and shade, and the extreme nicety of pencilling which covers the entire surface.

No. 75. 'Consecration of a Bishop, with Portrait of Paul III., who officiates,' TINTORRETTO (Earl of Yarborough). A gallery picture, containing numerous figures, all of which effectively support the subject. The Pope is seated, and confides to the newly-made bishop, who kneels before him, the pastoral staff. Behind him is a priest, who holds a cardinal's hat, and on the other side is another ecclesiastic with a mitre. The picture is very powerfully painted; it is fine in colour, and remarkable for its ingeniously disposed chiaroscuro.

No. 76. 'A River View,' VANDER CAPELLA (W. Strahan, Esq.). This is a charming picture—the composition consists simply of a few boats on a breadth of water, brought forward under an evening effect.

No. 86. 'A View of Chelsea,' WILSON (The Ladies Proby). The view is taken from the opposite side of the river, and represents principally, the hospital as it appeared from the Vauxhall side of the river towards the end of the last century.

No. 87. 'The Shrimpers,' COLLINS (E. R. Tunno, Esq.). Two female figures brought forward in an open leach scene; the picture is brilliant, and contains passages of very skillful execution.

No. 88. 'The Breakfast,' SIR D. WILKIE (Duke of Sutherland, K.G.), and—

No. 92. 'The Penny Wedding,' SIR D. WILKIE (Her Majesty). Both of these pictures continue in admirable preservation, and are certainly not much lower in tone than when they were fresh from the easel.

No. 89. 'Portrait of Lady Farnborough,' SIR J. REYNOLDS (S. Long, Esq.). The lady wears a most unbecoming head-dress, but the exquisite colour and sentiment of the features are such as Reynolds only could paint. The background is much cracked by the asphaltum or vehicle with which it has been worked. No. 93. 'Mrs. Braddy,' the property of Lord Charles Townsend, is also by Reynolds, but this picture seems to have been subjected to a process of cleaning, which has brought up a raw surface that never can have been left by Reynolds. It is charming in colour and expression.

No. 94. 'Le Malade malgré lui,' STEWART NEWTON (E. R. Tunno, Esq.). This is one of the earlier examples of a class of subject now extensively popular in the profession, but at the time that Newton painted the picture he stood almost alone in his *genre*. The picture is remarkable for its colour, spirit, and character.

No. 97. 'An Italian Landscape,' SIR A. CALLCOTT (E. R. Tunno, Esq.). The view opens from a terrace which occupies the lower breadth of the canvas. The nearest objective consists of buildings and ruins, and beyond these flows a river, the banks of which are crowned by the prominent edifices of a city; and hence the eye is carried into a wide expanse, like the Campagna. The work is distinguished in a high degree by the elasticity and elegance of conception and realisation which distinguish the works of this painter. The theme is light and air, and these are rendered with the most perfect felicity.

SOUTH ROOM.

No. 109. 'Gipsy Fortune-Teller,' G. Dow

(Charles Peers, Esq.). A small picture, in which the figures are relieved against a dark background; it is in very fine preservation.

No. 123. 'Christ at Emmaus,' TITIAN (Earl of Yarborough). A large picture, presenting the figures of the size of life. The point of time is that usually chosen—the moment of the discovery of the Saviour before his disappearance: This is pointedly rendered.

No. 133. 'A Snow Storm,' A. VANDER NEER (James Gray, Esq.). A small picture, in which the subject is realised with the utmost fineness of execution.

No. 142. 'Prometheus,' RUBENS (Duke of Manchester). A large picture, showing Prometheus bound to the rock, and the eagle prying upon his liver. The composition of this picture is admirable, and the foreshortened figure is among the most careful of the studies of this painter.

No. 143. 'A Corn Field,' RUYSDAEL (T. Baring, Esq., M.P.). This is a veritable study from nature, without any independent treatment. It is very careful, and strikingly characteristic.

No. 151. 'Virgin and Child,' P. PERUGINO (Beriah Botfield, Esq.). A small picture, better in drawing and less hard than the works of PerUGINO generally.

No. 157. 'Cesar Borgia,' CORREGGIO (H. T. Hope, Esq., M.P.). This is a fine study; the features are pencilled with infinite delicacy.

No. 163. 'The Salvation,' MANZUOLI DI SAN FRIANO (H. T. Hope, Esq., M.P.). A large composition painted on panel, and originally an altar-piece, we presume. The figures, which are of the size of life, are conceived and realised with incomparable elegance. It is brilliant in colour, and is a fine example of the painter.

Many of the pictures which we have noticed merit a larger consideration than we have been able to afford them, but the collection contains so many productions of rare excellence, that we have been anxious to cumulate as many as possible, rather than dwell upon a few.

EVE LISTENING TO THE VOICE.

FROM THE STATUE IN MARBLE, BY E. H. BAILY, R.A.

This beautiful piece of sculpture may be considered as a companion to Mr. Baily's well known "Eve at the Fountain;" it is, indeed, almost a repetition of it, the difference being chiefly in the upturned position of the face, and in the raising of the left hand. The subject, in fact, admits of little variation from his preceding work, for Eve is still seated beside the fountain in which she first sees her reflection; and the passage from Milton, illustrated by the sculptor, follows immediately that wherein she describes to Adam her thoughts at the sight of the shadow.

We know not what others may think of this figure in comparison with the former, but to our mind it possesses a beauty not at all inferior to the "Eve at the Fountain." The expression of the face is more feminine and intellectual; the half-opened lips, and the eyes raised, as if every sense were occupied in the work of listening, afford a certain index to the sentiment, while it is faultless in form and attitude. The lower limbs are finely moulded, full and round, but not massive, as we sometimes see them in sculptures of the female figure, and they are foreshortened with unusual ability. The only alteration we would desire to see in it, is in the arrangement of the hair which falls over the shoulders; this, we think, would have looked less heavy and stone-like, had the curls, described by the poet, indeed, as "thick-clustering," been a little more separated; they seem now to hang as a heavy weight on the shoulder, and to press it down. This, however, is a matter of opinion, and it may not strike others as it does us.

Mr. Joseph Neeld, M.P., in whose gallery is Baily's group of "The Graces," also rejoices in the possession of this statue; it was expressly executed for him, and is one of which he may well congratulate himself on being the owner. We should be glad to know there were, in this country, many such patrons of our sculptors, in the highest range of the art, as Mr. Neeld.

[The following text is extremely faint and illegible due to the quality of the scan. It appears to be a multi-column article or report.]

THE SLEEPING IN THE MOUNTAIN

—

THOUGHTS AND SUGGESTIONS ON
THE EXPOSITION OF 1851.

We proposed entering, in the present number of the *Art-Journal*, upon a series of suggestive hints for the consideration of manufacturers and producers, as auxiliary influences on their operations for 1851; but find it necessary to resume our review of the rules and decisions to which these operations are to be submitted, and by which they are to be judged. This course is rendered imperative, for as at present constituted, they are mainly instrumental in engendering much distrust and discouragement; and, until some modification in their most objectionable feature takes place, it is hopeless to expect that concentration of energy, and devotion to the task, so vitally requisite to its satisfactory fulfilment, and which mistake direction alone prohibits. It must, indeed, be an ungracious return for the personal zeal and indefatigable industry His Royal Highness Prince Albert has devoted to a project which might have operated as a vast stimulus to British Industrial Art, to find, that through exceptional direction in the executive details, its present position is most discouraging and its future success greatly endangered. The causes of this are, to us, sufficiently obvious.

It must not be forgotten that on our artists and manufacturers lie the onus of the struggle in which they find themselves unwittingly involved, and in the termination of which they are so deeply interested. The challenge has been none of their seeking; they have had the forthcoming contest, as some more fortunate possessors find honours, "thrust upon them," and, expected to redeem the hardy pledge so confidently given, they naturally looked to be consulted in the requirements of their hazardous position. But, singularly enough, these classes have had no voice in the deliberations which so largely affect their future prospects, nor even when they speak in deprecation, or remonstrance against, questionable or mistaken courses, is their pleading met with that consideration which, under their peculiar circumstances, should have been promptly and gladly rendered; and yet it is with some assumed a matter of marvel and reflection that the manufacturing districts generally show signs of apathy and indecision. Of the sum already collected or subscribed for some 60,000*l.*—they announce that London has contributed about one half, but they fail to follow out and improve by the inference to which this fact leads; *viz.*, that the subscribers to the Metropolitan fund were, with few exceptions, *not engaged in manufactures*. The general proposition was upon its first submission, recorded with considerable, and, in some degree, natural enthusiasm, and funds flowed rapidly and freely in from contributors who had never weighed, nor were practically competent to estimate, the more difficult and delicate specialities which the prudential working of the plan involved. With these, the scheme in its broad and bold outline was deemed a sufficient claim to sanction and support; but when the scene of

action extended to the great provincial manufacturing localities, when, submitted to the class whose personal and direct interests were connected with its development and involved in its result, some details of the plan were asked for—these were long in coming, and when published, being found, in many respects, objectionable and inapplicable, they led to attempts at revision and adaptation; and until these be admitted, the matter will remain, to a serious extent, in abeyance.

Consequent upon these hindrances the progress of the scheme is comparatively slow—we wish we could add sure; but the confirmation of doubt and misapprehension becomes more decided; and the time, limited enough at its utmost, which should have been wholly devoted to preparatory labour, is being frittered away in necessary, though (we regret as yet, ineffectual) agitation, to modify and amend the objectionable clauses of the competitive regulations which English manufacturers feel to press on them, not only with undue severity by seriously limiting their prospects of success, but also dispiriting from the very questionable manifestation which such success will eventually realise. Various local committees of important manufacturing districts are now, by protest, urging on the consideration of the Royal Commissioners, those results of their experience and practical knowledge which should in the first instance have been solicited from them, and which should have had such weight on their decisions as justice and expediency might have deemed their due.

The idea of binding the operations of the provincial local boards by regulations, which, while they seriously risked the commercial interests of their localities, were at the same time arranged without sufficient reference to, or intimate knowledge of, their peculiar and technical requirements, was illusory, and the attempt to enforce them, destructive of that unanimity of feeling and action necessary to successful operations.

This error in judgment has been a most serious obstacle, and we regret, that attention having been pointed to the subject before, the justice and propriety of conciliatory measures were not sufficiently evident to have ensured their ready admission. What at first was considered but an oversight, unadvised and unintentional, now appears to be a purposed and determined course.

The scheme in itself, as admitting *universal competition*, was bold and comprehensive enough, as we shall eventually find it; but the competition, as we have heretofore urged, should have been restricted to the productions of *individual skill and cost*, and not have included those which have resulted from the *outlay of national funds*. Comprehensiveness is certainly a high and admitted excellence, but there are other qualities quite as essential, which, in this instance, have unfortunately been seriously jeopardised.

The very novelty of such a movement in England bespoke necessary caution and circumspection in its primary impulse and direction, and we had for reference examples of its working in other countries upon which we could well have based the groundwork of our first step. We think that England, with a due estimate taken of her qualifications, and regard held to the maintenance of her present commercial position, was scarcely warranted in throwing down the gauntlet for universal competition in Art-products. Her initiatory lesson should have been learned in a *national arena*, the necessity for which we have long and earnestly pleaded; and this preparatory trial safely and satisfactorily passed, we might on a future occasion have entered the lists against all comers with reasonable hopes of well-earned honours or creditably contested defeat. It was, however, decided otherwise; with what results time will show; but unless special and earnest efforts be promptly made to meet the critical emergency, they must inevitably be disastrous and humiliating. We have already the shadow of coming events gloomily cast over future operations by the "Report of the Committee appointed to consider all matters relating to the building, made to Her Majesty's Commissioners." In the list A of those gentlemen whom the committee

deem "entitled to honourable and favourable mention, on account of architectural merit, ingenious construction or disposition, or for graceful arrangement of plan," we find thirty-seven English architects and thirty foreigners; but mark the sequel:—"The committee beg further to recommend that the following gentlemen be selected from this list for *further higher honorary distinctions*, on account of their designs of distinguished merit, showing very noble qualities of construction, disposition, and taste:—

C. Badger, architect, Rue Blanche, Paris.
Thomas Bellamy, architect, Charlotte Street, Bedford Square.
J. H. Bertrand, C.E., Reading.
A. Borra, architect, 121, Rue Polissonniere, Paris.
J. Calloux, architect, 25, Marché St Honoré, Paris.
Henri Van Cleemputte, architect, Laon, France.
Mons. Cremont, architect, 10, Place des Vosges, Paris.
A. Delage, architect, 6, Place de l'Oratoire du Louvre, Paris.
A. G. le Dreux, Clermont, France.
M. G. Pétrar Van Biven, architect, Amsterdam.
J. Henard, architect, 98, Rue St. Lazare, Paris.
H. Horeau, 79, Rue Richelieu, Paris.
C. Huchon, 28, Rue Meslay, Paris.
H. le Père, architect, 48, Grande Rue de la Chapelle, St. Denis, Paris.
Casimir Fétoux, Paris.
Paul Sprenger, architect, Vienna.
Richard and Thomas Turner, Hammersmith Works, Dublin.
—Yéron, 2, Quai des Ormes, Paris."

So that the relative proportion of those entitled to "further higher honorary distinctions" is *three English to fifteen foreigners*. This fact requires no comment; and if it plead not with irresistible force, an absolute demand for the immediate concentration of England's productive resources, we fear that such a desired result is altogether hopeless.

It remains in a great degree with the Commission, by timely and judicious consideration and concession, to avert such a catastrophe; and we feel confident that unless this be promptly acceded, the time will have passed when either will be available.

Already many who under more propitious influences might have been proudly and zealously working in the cause, are enlisted in the ranks of the disaffected or indifferent; and difficult as the task is to maintain in such an arduous struggle the supremacy or equality of England's industrial skill, even with the concentration of all her forces, how hopeless must it become when apathy and opposition so seriously tend to weaken and divide their operation.

This is a painful conclusion to premise, and it is with deep regret that we feel bound to enforce it; but advocating as we have the expediency and necessity of a National impulse to British Industrial Art, and ardently as we have urged its adoption through years of indifference and delay, we cannot silently or passively notice the glorious opportunity at length offered for its fulfilment (though in some respects exceptional) rendered nugatory, if not positively detrimental, by injudicious and exceptional direction. We therefore, at the risk of iteration, must enforce our previous recommendations on the consideration of the Royal Commissioners, *viz.* :—

"That a class of awards or honorary distinctions should be expressly allotted for native competition only.

"That no works which are the production of manufactures supported by government grants—the Royal Manufactories—shall be eligible to compete for prizes.

"The admission of drawings of original designs for manufacturing purposes, for exhibition and competition.

"That it should be the primary and conditional stipulation on the reception of a work, that the exhibitor be bound to state the capacity in which he claims acknowledgment.

"That prizes should not be awarded in reference to 'co-operation' on the part of exhibitors, but solely in consideration of the merits of the works to which they are adjudged."

The grounds upon which we advocate these propositions we have detailed at some length in previous numbers of this Journal, still it is necessary again to refer to them generally before we hasten to the consideration of other matters.

The determination to give but one class of medal (in bronze) is liable to strong objection;

* Since these remarks were written, evidence of concurrence in some of our views, is manifestly operating, and we most gladly recognise and acknowledge it. Dr. Lyon Playfair, as a Special Commissioner, has visited some of the most important seats of manufactures and taken the sense of their respective committees in various parts of the details of the plan which are considered liable to objection. Discussion has been fairly and honestly invited and a full and frank expression of opinion courted. The decisions of the Royal Commission are not laid down as irrevocable, and there is every reason to believe that on those points where it is clearly proved that an undue pressure bears, initiated to the interests of the English Manufacturer, suggestions will be readily received and allowed their due weight. Of course we do not imply, and are far from advocating, that any concession will be made as a matter of favour; we should repudiate such a course strongly, but merely infer, that fair and just arguments will receive an acknowledgment and admission. It was further proposed to hold a conference in London, under the presidency of His Royal Highness Prince Albert, on the 27th ult., to receive deputations from some of the chief manufacturing districts, to assist in the deliberations on the present decisions, which we trust will lead to an ultimate satisfactory termination, and all impediment to immediate, zealous, and general co-operation be thus effectually removed. We were compelled to go to press before this meeting had taken place, but its results shall be duly reviewed.

and, as we anticipated, the general feeling of manufacturers, particularly of the better class of producers, is decidedly adverse to the uniformity of the prizes to be bestowed. The effect of this "decision" is so palpably certain to extinguish emulation, and damp the ardour of aspiring talent—so adapted to flatter the self-sufficiency and sanction the incompetence of mediocrity and indifference, as to be positively *dispiriting* and *mischievous*. Attention is therefore drawn to a reconsideration of its policy, with a confident reliance that the result will be the material modification of this proposition.

The proposal of but one uniform class of prizes is we believe altogether unprecedented, and its positive injustice is such as to have warranted the presumption that such a recommendation could never have found either advocacy or toleration: more particularly coming as it does in lieu of the original proposition for a graduated scale of large money prizes, ranging as high as five thousand pounds each.

We are not declaiming against the intrinsic value of the awards; this, as we have before stated, is a matter of secondary consideration; whether *all be gold* or *all bronze*, our objection would be just as decided; it is in the *uniformity* of the distinctive honour they are intended to mark, wherein lies their misleading and fatal characteristic—misleading by the false estimate they will infer of equality of claim—and fatal in repressing the exercise of the more elevated efforts of genius which it should have been the chief aim, as it might have been the proud boast of the Exposition, to have stimulated, recognised, and duly rewarded. What mockery of distinctive acknowledgment will it not be, to the producer of a work involving in its execution the application of the highest range of intellectual and scientific attainments, to find his success, as far as the impress of the judicial fiat of the Royal Commission can effect it, stamped as on a level with those whose merits are wholly dependent upon mere manipulative and executive ability.

In the dearth of appreciation and encouragement under which efforts for the improvement of English Art-manufactures have so long laboured, the promise of the Industrial test of 1851 was by all sincere wishers for a decisive and permanent stimulus to her progress, hailed as fraught with the highest expectancy and most cheering reliance; and of all countries boasting any high degree of eminence in Art and Manufacture, England stood most in need of a consenship which should justify, fearlessly, and conclusively have declared the relative status of her Artistic and Industrial products, not only as affecting her position with the world at large, but prominently so as regarded the comparative excellence of her own manufacturers.

In the confusion and error so inextricably mingled, consequent upon long educational neglect, by which simplicity and naivety of design had been cast aside for the more attractive because more congenial frivolities of gaudy and obtrusive pretence, it was a hopeful feature of the scheme, to dispel these mists of ignorance and doubt, and to mark the dawn of an awakening and amended perception.

The bias of both producer and consumer required this wholesome and corrective lesson, the prospective influence of which would have been most extensively and permanently beneficial; and in resigning this high though difficult position, and contenting itself with the inefficient and futile task of attempting to level to one uniform standard of distinctive acknowledgment the varying merits and claims of competitive efforts, the Commission has signally and lamentably failed in its duty.

Far better no awards at all, and the public be left to its own unbiased judgments, than thus directly foster and sanction, by such high authority, an inference which must tend to confirm all previous error and misconception. The very principle of relative excellence, that of all others by which the advancement of taste in the producer, and appreciation in the consumer, is most stimulated and encouraged; which should have been the proud prerogative of the Commission to have promulgated, as tending directly to a great Art-lesson to the million, is abandoned,

and from no conceivable cause, but a desire to win the suffrages of the majority of incompetents, to whom, the exercise of such a declaration must be obnoxious. Lethargic and indifferent as our manufacturers have confessedly been to the higher impulses of productive skill, some extraordinary stimulus was necessary to arouse them to active remedial courses, especially when involving outlay and risk. The hope of primary position, as the head of a branch, or even a section of a branch, might have braced the resolution to energetic and worthy tasks, which the present relaxing level of uniform acknowledgment "in token of co-operation," must inevitably weaken and destroy.

In this "decision," lies a prolific source of cavil and objection, powerfully instrumental in arousing hostile and adverse feelings; and these, too, in the very class whose cordial sympathy it should have been the primary object of the Commission to have enlisted.

That the adoption of its spirit, where attempted, is fraught with infernal error, is evident in the proceedings of the Barnsley manufacturers, as illustrated in the following extract:—

"NATIONAL EXPOSITION. Barnsley.—The subscription of this town towards the objects of this national undertaking amounts to about 200*l*. At a meeting held a few days since, by the linen manufacturers, it was agreed that they should not compete against each other, but, for each to exhibit different articles of linen manufacture. A meeting was held in the court house on Tuesday, for the purpose of agreeing upon the articles that each would manufacture, but such was the *jealousy* which prevailed amongst them that they could come to no definite terms, and the meeting separated, leaving each to exhibit what he thinks proper."

Here the principle of *competition made easy* in accordance with the doctrine of the Sectional Committee of Manufacturers, that the prizes should be awarded "rather as testimonials of co-operation on the part of manufacturers towards the Exhibition than of marking an *individual superiority* which might chance to be accidental," &c., was doubtless at first attempted to be carried out, in an unquestionable reliance upon the discretion and judgment of the Metropolitan board; but, happily, the *good sense* of the Barnsley manufacturers, not their *jealousy*, came to the rescue, and saved them from the results of a recommendation that must have led to present well merited ridicule, and future failure. We rejoice to record that such an absurd and insane proposal came to no definite terms. Its adoption could but have ensued in the complete frustration of the very spirit and means by which the hoped-for beneficial results of the Exhibition can be realised—emulative and competitive exertion.

The writer of the paragraph has, either purposely or unconsciously, lent himself to an expression, which is too often accepted as inferring a signification to which we demur. Surely it is high time to have done with this stale and flippant nonsense about the *jealousy of manufacturers*. It is a derogation of the feeling with which an honourable mind views the well merited success of an opponent, at the same time determining to further, and if possible, excellent efforts on his own part, to call it "jealousy;" while it is a compliment to the narrow-minded grudge, who, envious of a distinction which he has neither the ability to equal nor the spirit to contest, to apply the epithet to him. In both cases the term is misapplied.

Let us take heed, that in an attempt to avert this so-called "jealousy," we do not damp or extinguish that stimulative feeling of honourable rivalry, on which our expectation of future progress must chiefly depend; and which, so far from being checked, should exact the highest encouragement. It is a libel on manufacturing enterprise, to call it "jealousy," and does but tend to excite and extend individual prejudices. We trust that British manufacturers generally, will eschew the charge of being actuated by such petty and ungenerous influences, which, we are willing to believe, form the exception to their character, and not the rule—an exception that it would be well either to leave in contemptuous obscurity, or expose to open and deserved reprobation.

Amongst other questions of importance now agitating the productive interests, are the following, which we had also previously advocated, viz.—"The necessity for exhibitors, generally, to state the capacity in which they claim acknowledgment respecting the works they exhibit," and the stipulation that "retailers should be required to state the name of the manufacturers of the articles they forward for exhibition," of course in conjunction with their own. As we have previously expressed our reasons for urging these requisitions, we shall now merely refer to the views adopted by others on the same subject. We extract a resolution passed at an influential meeting of the Birmingham Local Committee, which has been submitted to the consideration of the various provincial committees throughout the Kingdom, and is now exciting considerable and deserved attention.

"That as, in the opinion of this committee, the success of the Exhibition of Industry of all Nations in 1861, mainly depends upon the opportunity afforded for manufacturers and others to display their skill and make their works known, not only in this Kingdom but to the whole world; this committee expresses its regret that the Royal Commissioners have not made it a condition that the name of the manufacturer shall in all instances be attached to the article exhibited; and it is further the opinion of this committee that great injustice will be thereby inflicted, more especially on the smaller manufacturers, whose works in the absence of the above provision will in many cases be of advantage only to the proprietor or retailer by whom they may be exhibited; and the result of the absence of the said provision is, that many manufacturers in this neighbourhood have expressed their great disinclination to exert themselves in the contribution of articles for the Exhibition."

In forwarding this resolution to the Royal Commissioners the Mayor of Birmingham, who is also chairman of the local committee, urges its adoption on the following grounds:—

"I consider that the subject of this resolution is of the utmost importance to the manufacturers generally, and that unless the latter make such representation to the Royal Commissioners as will induce them to make it imperative that the names of the manufacturers of the articles exhibited shall in all instances be published, both the interests of the manufacturers and the success of the Exhibition will be seriously injured; as, should shopkeepers be allowed to collect and exhibit articles under their own names only, an undue influence will be exercised over the smaller manufacturers, and the exhibition will become a mere bazaar, instead of accomplishing its real object of a *bona fide* display of manufacturing skill."

And further—

"In illustration of the practicability of the proposed regulation, it may be mentioned, that in the Exhibition of Manufactures, which was held in Birmingham in the last year, and was, perhaps, the most important and successful one yet held in this country, the rule was carried out that the manufacturers' names must be attached to all the articles exhibited, and only a single case occurred of articles having to be expelled from the Exhibition in consequence; and it may be further mentioned, that no prizes of any description were awarded at that Exhibition."

In acknowledging the receipt of the letter and resolution, the Commissioners state the subject to have been long and earnestly considered, and they hope "that the manufacturers will largely avail themselves of the opportunity to exhibit their own productions, and to attach their own names to their works, so as to make their merit extensively known. But however strongly they may desire that every exhibitor of an article should attach to it the name or names of those who have the greatest merit in its production, they feel it to be extremely difficult to frame compulsory regulations, or to invent any mode of carrying such compulsions into useful effect."

In admitting that in the cases where the manufacturer is himself the sole producer, that is, where the whole processes involved in the execution of the articles exhibited are under his own direction, there can be no difficulty in ascertaining the amount of credit due to his exertions, they proceed—

"But there are also many cases, and those probably the most numerous, in which the merit is shown in various degrees by a number of persons,

to all of whom it seems impossible for the Commissioners by any enactment to ensure the due reward of their respective merit. A common fowling-piece, for example, is the production of many manufacturers; one makes the barrels, another bores them, a third makes the lock, another the stock, and a fifth manufactures the mountings. The union of these into a finished fowling-piece is itself a process of much division of labour and of various ingenuity, and is probably conducted in the name of a retailer, who may contribute nothing but his name and his capital to the process. How can the Commissioners ascertain all the facts in such instances? and even if they know them, how could they frame regulations to insure that every name should be attached to each article in such a manner as to exhibit to the spectator the exact degree of merit due to each?"

In reply to the last case submitted for consideration (and which we suggest should be viewed as purely exceptional, and in no degree affecting the general rule which the committee enforce), the Birmingham Committee thus maintain their position:—

"In the case alluded to of the common fowling-piece, when complete it is the manufacturer's article, and the party who combines the several parts and completes the article must be considered as the manufacturer; but if any of the separate parts, such as gun-locks or barrels, &c., are exhibited separately as specimens of excellence of workmanship, the names of the makers of such separate parts must be attached as the manufacturers of them. That persons supplying the raw material and wages for the execution of their designs, are to be of course regarded as the manufacturers. Let the imperative rule be laid down, that the manufacturer's name shall, in every instance, be attached to each article exhibited; and, in the event of any evasion of this rule, that the article be instantly expelled from the Exhibition; and in the opinion of the committee such cases of evasion will be found to be very rare, and will be sure to meet with exposure long before the close of the Exhibition. It is the opinion of the committee, that if it is not made compulsory for the manufacturer's name to be attached to every article exhibited, an influence will be used to prevent many of the smaller manufacturers from insisting on their names being attached to the articles; and thus the credit due to them will be received only by the proprietor or retailer by whom they may be exhibited; the express object of the Exhibition being to afford an opportunity for manufacturers and others to display their skill and make their works known."

We conclude our extracts with the following paragraph from the answer to the above, from the Secretary to the Commission, J. Scott Russell, Esq.:

"I am directed to repeat to you the desire of the Commissioners that manufacturers should exhibit their goods, and attach their names as manufacturers of their own productions, and their desire that the names of all the meritorious producers of articles exhibited should be in all cases attached to them in such a manner as to do justice to their respective claims. But I am also to express their continued conviction of the impracticability of framing compulsory regulations which shall secure that object; and their opinion that each exhibitor must be left free to state in what capacity he exhibits, and who are the parties who have co-operated with him in each production."

We should have been limited to our previous expression of feeling on the subject, but the matter having now become officially recognised as one of doubt and difficulty, we considered it advisable to give every facility for its due deliberation, so that it may be ultimately arranged to the satisfaction of those whose position is seriously affected by its present aspect.

The objectionable "decision" of the Commission is as follows:—

"All persons, whether being the designers or inventors, the manufacturers or the proprietors, of any articles, will be allowed to exhibit, and that it will not be essential that they should state the character in which they do so. In awarding the prizes, however, it will be for the juries to consider, in each individual case, how far the various elements of merit should be recognised, and to decide whether the prize should be awarded to the exhibitor without previous inquiry as to the character in which he exhibits."

We are at a loss to conceive how so vague a proposition could ever have been classed as a

"decision" at all. The whole hearing is contingent and doubtful, with no indication of "decision" or firmness of purpose resolved.

It has therefore been deemed advisable that a conference should be held in London, H.R.H. Prince Albert in the chair, at which deputations from the principal manufacturing towns will be received, and then to report the opinions of the districts they represent upon these and other points of importance. This meeting was proposed to take place about the 27th of June, but it will fall too late to allow us to notice its proceedings in our present number.

Upon the general policy of manufacturers attaching their names to their productions, and its influence in a variety of ways, not only upon their individual interests, but also upon its general beneficial tendency, we shall very fully enter in a future number.

In continuation we would offer a suggestion as to the disposal of surplus funds; we may be reminded of the old proverb of "counting chickens before they are hatched," but we risk this, as inapplicable to the case. It is but fair and requisite to make some proposed provision known, in case of such a desirable, and we trust probable, contingency arising, particularly when such a provision as may be generally approved, will mainly assist in realising the contingency itself.

It is assumed by many, and we think with good reason, that the Exhibition will be self-supporting and therefore they do not contribute to the extent they otherwise would, as the surplus might not be devoted to purposes they may think advisable. The decision of the Commission on this point is this:—

"Should any surplus remain, after giving every facility to the exhibitors, and increasing the privileges of the public as spectators, Her Majesty's Commissioners intend to apply the same to purposes strictly in connexion with the ends of the Exhibition, or for the establishment of similar Expositions for the future."

Now this appears too wide a latitude, and leaves the matter in a very vague and indefinite form. We doubt the expediency of reserving any portion of the funds raised for the express purposes of the Exhibition of 1851, to meet the requirements of any future time. We think they should entirely be devoted to working as complete and successful an issue to the specific object for which they were raised, as it is possible by every adventitious help to realise; and this effected there can be no doubt that future claims would meet with ready and cheerful acknowledgment.

We would recommend for consideration that some portion of the surplus likely to arise from the profits of the Exposition (and when speculators were readily found to risk 20,000*l.* on the venture the chances cannot be so very problematical), be expended in the purchase of a selection from the best works exhibited in the various branches of manufacture, particularly those of foreign productions in which we are excelled, and these should be sent round to the different provincial towns in which those branches are prominently carried on.

In towns where Museums are already formed, these examples might be deposited as heirlooms; and where at present they are without those advantages, the hope of securing such valuable deposits will be mainly instrumental in causing their speedy establishment. The results to the practical operative classes attending the examination, and their repeated observation of the best products of their separate trades, would be of a most salutary and immediate nature. Access to the works should be ready, and investigation into the processes which have achieved the successes, invited, encouraged, and assisted. Volumes of description fail to convey to the general mind what one glance of the actual object will presently reveal. This is the practical teaching so much required; it is not only the most permanently effective, but is also the most readily imparted and most thoroughly understood.

And when such vast advantage is expected, and justly expected, to result to the artisans of the Metropolis, from the facilities offered by the Exhibition for four months' study of the choicest productions of the collected industry of the World, what incalculable benefits might not be

reasonably assumed to await those of the provinces, from the possession of a selection of choice examples of their particular branch of manufacture, so placed as to be available for their constant reference and examination?

We cannot refrain from commenting on the absolute necessity for some movement by which deposits, either as loans or gifts, of eminent and successful works in connection with Art and Art-manufacture, should be secured to the provincial districts. At present, to the want of objects for reference of sufficient merit to arouse and stimulate the powers of those engaged in similar productions, and the inspection of whose processes would at the same time materially assist in the attainment of their excellence, English Art-manufacture generally owes its depressed state. The only marvel is, all considerations fully weighed, that it is not worse.

The artists of these towns, particularly those engaged upon the decoration of the manufactures in figure, landscape, and flower departments, from the difficulty, and, in some cases, utter impossibility of gaining access to worthy examples of Art, the study of which would not only be corrective but impulsive, labour under very serious disadvantages. There are but comparatively few towns which can boast of even an annual exhibition of pictures, and that but for a very limited period; admittance to these, of course, involves a pecuniary consideration, and copying in any way is strictly prohibited; so that even in these instances the benefits are very slight compared with the necessities of the case. It would result as an incalculable advantage to the artists and students of their localities if some of the national pictures, for instance, a selection from the Vernon Gallery, were sent in rotation, say three or four, to each of the Provincial Schools of Design, and deposited there for a stated time. Necessary precautions should, of course, be taken for their security; and the grateful feeling with which the boon would be received would ensure all possible care and vigilance in their safety.

The advantage of such a plan is so self-evident (but it is unnecessary to enlarge upon it; but we shall endeavour shortly to bring the subject under the consideration of those who will, we hope, be instrumental in its execution. It should not be overlooked that the works are national property, and we think will best advance the national progress when their merits are made as readily available and extensively influential as possible. The small number required for the purpose would scarcely be missed from the general collection.

In concluding our present remarks we cannot too strongly enforce the warning we have already given to our manufacturers against standing aloof and apathetic at the pending crisis. Nothing can excuse such pusillanimity and indifference, the result of which will be unmarked by future regret and mortification. No error on the part of the Commissioners can warrant such a position, for doubtful or wrong as some of their conclusions may be deemed, still we must presume they are open to conviction, and proof given of their injustice or inexpediency would assuredly lead to a revision. The high character and eminent talent which the Commission includes, proceeding from the illustrious Prince at its head, and extending throughout its members, are fully declaratory of the good faith and honest intention which must essentially influence their judgment, however it may be warped by lack of practical experience.

If the odds be already so greatly in favour of the foreigner, supposing every possible exertion be used, how must their advantage be increased, by the voluntary withdrawal of any from whom England might reasonably and should confidently rely on for help in the hour of trial.

Let it be distinctly understood, that the contest will take place, that is now we believe beyond a doubt; and it is as positive that a sufficient number of English manufacturers will enter the competitive lists to constitute it a National struggle for pre-eminence as far as her position is concerned; and therefore all desertion in those capable of assistance is erant treason against the well being and security of her commercial supremacy. B.

THE NATIONAL INSTITUTION.

The first exhibition of this society in their new gallery has hitherto proceeded most favourably, for not only in the number of visitors to the rooms, but in the amount of sales already effected, there is abundant evidence that the public appreciate the efforts of the members, so that there cannot be a doubt but the National Institution will now take its place among the standard exhibitions of the metropolis, of which it is every way worthy. The following is a list of the pictures sold, up to the middle of the past month, and we hope to publish in our next number a considerable accession to it. The amount realised by these sales is upwards of 2000l.

'The Sevenoaks, Kent,' G. B. Willcock, 2l. 2s.; 'Reflection,' D. Pasmore, 12l. 12s.; 'Barnham Church, Kent,' G. A. Williams, 10l. 10s.; 'The Cottage Door,' G. A. Williams, 10l.; 'Evening,' G. A. Williams, 3l. 3s.; 'Morning,' G. A. Williams, 3l. 3s.; 'Night,' G. A. Williams, 8s.; 'A Sandy Road,' A. W. Williams, 20l.; 'The Hay to the Farm,' S. R. Percy, 20l.; 'A Wild Part of the Thames,' S. R. Percy, 10l.; 'A Bright Autumn Day,' S. R. Percy, 10l.; 'The Skirt of a Common, Isle of Wight,' S. R. Percy, 20l.; 'Pasture on the Welsh Hills,' S. R. Percy, 20l.; 'Sketch on Wimbledon Common,' E. G. Williams, 5l.; 'A Study,' L. W. Desanges, 30l.; 'Fra Bartolomeo in the Convent of St. Mark,' D. W. Deane, 20l.; 'St. Augustin's Gate, Canterbury,' E. I. Niemann, 12l. 7s.; 'The Gate Tower, Himmensness,' E. I. Niemann, 21l.; 'Medmenham Ferry,' A. W. Williams, 20l.; 'Night,' G. A. Williams, 10l.; 'Captivity and Liberty,' Mrs. M'lan, 100l.; 'A Mountain Torrent,' E. I. Niemann, 12l. 12s.; 'Evening—a Study,' E. I. Niemann, 12l. 12s.; 'The Cherry Maid,' D. Pasmore, 8l. 8s.; 'A Winter Morning,' E. G. Williams, 10l.; 'Smugglers on the Watch,' H. P. Parker, 10l. 10s.; 'The Knightfisher,' T. Earl, 5l.; 'The Barons' Kitchen,' D. Pasmore, 15l.; 'The Beachamp Chapel,' S. Rayner, 210l.; 'Bolton Abbey,' J. Peel, 6l.; 'New Forest, near Lyndhurst,' Mrs. Oliver, 10l. 10s.; 'The Sordid Armourer,' D. W. Deane, 10l.; 'Temple of Channus, near Spolito, Italy,' W. Oliver, 6l.; 'The Yard of the Luttrell Arms Inn, Dunster, Somerset,' F. J. Niemann, 7l. 7s.; 'Wounded Mallard,' T. Earl, 10l.; 'Old Mill, near Yvetot,' W. E. Bates, 8l. 8s.; 'On the Moea, near Rotterdam,' W. E. Bates, 10l. 10s.; 'A Lane near Woking,' F. W. Hulme, 15l.; 'The Duck House,' J. Thorpe, 3l. 3s.; 'Near Rothbury, Northumberland,' J. Peel, 5l.; 'Noon,' O. R. Campbell, 6l.; 'A River Scene from Nature,' Gilbert, 10l.; 'Landscape,' G. Middleton, 52l. 10s.; 'Devotion,' J. G. Middleton, 52l. 10s.; 'A Merry Time—Scene in Kent,' G. A. Williams, 65l.; 'Knowle Park,' E. J. Cobbett, 20l.; 'River Scene—Moonlight,' E. Williams, 50l.; 'Cupid and Psyche,' Fatal Curiosity, L. W. Desanges, 21l.; 'Cupid and Psyche, Psyche Punished,' L. W. Desanges, 21l.; 'Lane Scene, near Sevenoaks, Kent,' L. J. Wood, 10l. 10s.; 'The Nest of Birds,' E. J. Cobbett, 15l.; 'Dress for Conquest,' M. Wood, 9l. 9s.; 'A Meadow Scene at Midling Time,' H. B. Willis, 20l.; 'Solitude,' E. J. Niemann, 45l.; 'The Water Mill at Clive, Oxon,' L. J. Wood, 10l.; 'The Evening Star,' L. W. Desanges, 10l. 10s.; 'Needles Passage—Evening,' C. Gregory, 4l.; 'The Burning Glass,' W. Hensley, 25l.; 'A Highland Ford,' R. R. M'lan, 80l.; 'A Summer's Evening,' G. A. Williams, 20l.; 'A Showery Day on the Thames,' A. W. Williams, 15l.; 'Fisherman's Children on the French Coast,' E. J. Parker, 20l. 2s.; 'A Storm Clearing-off Dwyddelan Valley, North Wales,' A. W. Williams, 100l.; 'Here's his Health in Water! (Rich Shames go brath mo mhac)' R. R. M'lan, 60l.; 'The Sun dispelling a Mist, with Smugglers Landing their Cargoes,' H. P. Parker, 60l.; 'A Welsh Farm,' S. R. Percy, 30l.; 'Norman Spinster,' D. W. Deane, 15l.; 'Young Crabcatchers,' H. P. Parker, 20l. 5s.; 'Summer,' E. Williams, 30l.; 'A Roadside Inn,' H. B. Willis, 21l.; 'Halling the Pottery,' E. Williams, 30l.; 'Laying the Dust at the Fountain,' H. B. Willis, 45l.; 'A Farm Cottage,' G. A. Williams, 15l.; 'A Woodland River,' S. R. Percy, 200l.; 'Landscape on the Thames,' L. J. Wood, 10l.

ART-UNION OF LONDON.

The following pictures have been selected by the prize-holders of the current year, up to the time of our going to press; the capital letters distinguish the several galleries from which they have been chosen:—

'Grisedale,' 231l., R. Redgrave, R.A.; 'Venice,' 250l., W. Linton, R.A.; 'Porto Tesano, Gulf of Spezzia,' 150l., G. E. Herring, B.I.; 'Peter denying Christ,' 150l., J. Hollins, R.A.; 'San Pietro, near Verona,' 100l., J. D. Harding, R.A.; 'James II. in his Palace of Whitehall receiving the news of the landing of the Prince of Orange, in 1688,' E. M. Ward, R.A.; 'View of BenCruchan,' 84l., Copley Fielding, W.C.S.; 'A Welsh Funeral,' 84l., D. Cox, W.C.S.; 'The Bazaar, Algiers,' 70l., C. Vacher, N.W.C.S.; 'The Odd Trick,' 70l., T. Clater, T.B.A.; 'Venus and Cupid,' 70l., G. Patten, R.A.; 'Windsor,' 60l., J. Stark, R.A.; 'A Storm Clearing-off,' 70l., C. W. Williams, N.I.; 'A Fly in the Grog,' 60l., H. J. Pidding, S.B.A.; 'Waterfall, near Hay,' 80l., W. West, S.B.A.; 'A Scene during the

Invasion of Italy by Charles VIII.,' 70l., F. R. Pickerskill, R.A.; 'The Sun dispelling a Mist,' 60l., H. P. Parker, N.I.; 'Here's his Health in Water,' 50l., R. E. M'lan, N.I.; 'A Gipsy Family,' 50l., W. Shayer, S.B.A.; 'View from near the Heights of Abraham, Matlock,' 50l., J. Tennant, S.B.A.; 'Going to Service,' 50l., J. H. Mole, N.W.C.S.; 'Blue-bell Hills, Kent,' 50l., J. Fahey, N.W.C.S.; 'Hawkers of Helies exhibiting them to the Sick Daughter of a Peasant,' 53l. 3s., J. Godwin, B.I.; 'Colchester Fishing Smacks,' 52l. 10s., T. S. Robins, N.W.C.S.; 'The Country Inn,' 52l. 10s., W. Shayer, S.B.A.; 'Ben Nevis, from Lock Hill,' 52l. 10s., W. C. Smith, W.C.S.; 'Autumn Scene in Wales,' 40l., H. J. Boddington, R.A.; 'Pazzetta de San Marco,' 40l., J. Holland, B.I.; 'On the Lledder,' 40l., A. Clint, S.B.A.; 'Kirby Lonsdale and Valley of the Lime,' 40l., H. Jutsum, B.I.; 'The Lucky Gamekeeper,' 40l., A. Fraser, S.B.A.; 'Peveler Castle, Castleton, Derbyshire,' 52l. 10l., J. Tennant, S.B.A.; 'Leaving Port,' 40l., R. Watson, R.A.; 'Mount Bay, Cornwall,' 25l., J. W. Yarnold, R.A.; 'The Burning Glass,' 25l., W. Hensley, N.I.; 'Summer,' 25l., E. Williams, N.I.; 'A Study of Beech-trees, Knowle Park,' 25l., C. Davidson, N.W.C.S.; 'Scene in Dove Dale, Derbyshire,' 31l. 10s., R. W. Lucas, S.B.A.; 'From the "Pleasures of Memory,"' 25l., H. Manly, N.W.C.S.; 'A Summer's Morning on the Coast,' 25l., F. R. Clater, S.B.A.; 'Laying the Dust at the Fountain,' 31l. 10s., H. B. Willis, N.I.; 'A Dutch Madonna,' 25l., C. Brocky, B.I.; 'A Summer's Evening,' 20l., G. A. Williams, N.I.; 'The Crystal Stream,' W. Burnett, N.W.C.S.; 'A Mountain Stream, Borrowdale,' 21l., H. Bright, R.A.; 'Scene in a North Welsh Valley,' 20l., J. Wilson, Jun., S.B.A.; 'Blackberries,' 15l., 15s., W. Hunt, W.C.S.; 'A Roadside Inn,' 20l., H. B. Willis, N.I.; 'Wreck on the Coast of North Wales,' 21l., C. Bentley, W.C.S.; 'At Ruislip, Middlesex,' 20l., R. P. Noble, R.A.; 'Ducks and Green Peas,' 20l., T. Clater, S.B.A.; 'Halling the Pottery,' 21l., E. Williams, N.I.; 'From "The Horse,"' 20l., G. H. Laporte, N.W.C.S.; 'Scene near Cuckfield,' 13l. 18s., C. Fielding, B.I.; 'On Wimbledon Common,' 15l., J. Tennant, S.B.A.; 'Lake Gwent, N. Wales,' 20l., J. Danby, R.A.; 'The Missal,' 15l., J. Stephanoff, B.I. Fruit Piece,' 25l., W. Duffield, S.B.A.; 'A Showery Day on the Thames,' 15l., A. W. Williams, N.I.; 'Young Crabcatchers,' 15l., H. P. Parker, N.I.; 'At Bettws,' 15l., T. S. Rowbotham, N.W.C.S.; 'Woodglancers crossing a Brook,' 15l., H. Jutsum, R.A.; 'Old Water Mill at Uwell, Dorset,' 15l. 15s., G. Frigg, W.C.S.; 'Youth and Age,' 15l., W. Bromley, S.B.A.; 'A Breeze on the Thames,' 15l., C. Taylor, S.B.A.; 'St. Catherine's Rock, near Penby,' 10l. 10s., C. Bentley, W.C.S.; 'Dulwich Fields,' 10l. 10s., W. Bennett, N.W.C.S.; 'Distant view of the Castle and Town of Arundel,' 10l. 10s., C. Fielding, W.C.S.; 'A Welsh Lane,' 15l., G. A. Williams, R.A.; 'The Shower,' 10l., E. J. Cobbett, S.B.A.; 'The Skid on the Wharf, near Bolton Abbey,' 12l. 12s., G. Frigg, W.C.S.; 'View on the Rhine,' 10l. 10s., H. C. Selous, R.A.; 'A Farm Cottage,' 10l., G. A. Williams, N.I.; 'In Langdale, Westmoreland,' H. Gastineau, W.C.S.; 'The Lords in Waiting,' 10l. 10s., J. Stephanoff, W.C.S.

ART IN THE PROVINCES.

DUBLIN.—The triennial Exhibition of Manufacturers by the Royal Dublin Society takes place this year, and will be open from the 8th of July to the 25th, according to the circular issued to many of the principal manufacturing houses in England, inviting them to co-operate in this good work. We trust the invitation will be liberally responded to, and regret the intentions of the Society were not made known to us at an earlier period, that we might have had a larger opportunity of urging the subject upon our manufacturers. Ireland, requiring all the aid we can afford to assist her in the efforts to make her working classes intelligent in their several occupations, and industrious, it is our duty, for the mutual advantage of both them and us, for our interests are identical, that we should not withhold from them any of the good we have, and in which they may beneficially participate. We shall, therefore, be glad to find that the call from the Dublin Society will not be answered niggardly or churlishly.

LIVERPOOL ART-UNION.—The Report for 1849 of this Institution is now before us, and the result is extremely favourable, the subscription amounting to 630l., being more than double the amount of the two preceding years, and all this in the face

of commercial depression. Out of the amount subscribed, the sum of 315l. is set apart for the purposes of prizes, of which twenty-six are named, the highest being one of 50l. Besides the chances of these prizes, the subscribers are entitled to an impression from Ratcliffe's engraving after Absolon's "Incident in the Life of Burns;" a free admission to the Liverpool Academy's exhibition of paintings during the whole of the season; and the chance of obtaining one of the statues by Copeland, of Lady Godiva Unrobing, after Macbride: with these solid attractions, there can be little doubt of the continued and improving success which the energy of the managing committee so richly deserve.

MANCHESTER SCHOOL OF DESIGN.—The Report of the annual meeting of this "branch" of the Government School of Design is a much more favourable one than that brought forward last year; then the students did not exceed ninety in number, now they are more than trebled; the greater proportion who attend being adults anxious for self-improvement; the elder and more meritorious of the former pupils of the school have returned; and the establishment of a life-class has attracted some of the most eminent artists and designers in Manchester and its neighbourhood. The list printed of pupils classified according to the professions they follow, show how widely useful is the instruction rendered here. A series of valuable lectures have been delivered during the past year; new rooms provided, and a good collection of casts and books, for the use of students. Mr. J. A. Hammsley has been appointed head master, and we are glad to find his exertions are so well bestowed, and so well appreciated, as they appear to be.

CORRESPONDENCE.

CLEANSING TOOLS AND SABLES.

SIR,—I beg to send you a few lines descriptive of the plan I pursue for cleansing my hog tools and sables after painting. I venture to think it will be found an easy, cheap, and expeditious mode of accomplishing that which I, at least, have always found a disagreeable operation.

Let a common dell-jar or crock be provided, say of six inches diameter and eight inches depth; next let a tin-box be so made as to pass freely, though pretty closely, down to the bottom of the jar; the depth of this box may be about one inch, and its tightly-fitting cover should be perforated with holes, about the size of a pin's head. The box is now to be filled with common soft soap, and placed at the bottom of the jar, then half fill the jar with boiling soft water.

To wash the hog tools and sables, let the water in the jar be quite cold; squeeze as much of the colour out of the brush as you can, by passing it through a cloth held between the finger and thumb; drop each brush into the jar, and taking hold of the handles, work them in the liquid as if you were freeing a water-colour brush from colours in a tumbler of water. In a few seconds the solution of soap will have perfectly cleansed the tools, but to get rid of the soap they should thereafter be rinsed in some clean water.

I have found this such a comfort, that I have ventured to trouble you with an account of the method, feeling assured that my brother artists who may not be aware of it will find it a great boon.

House-painters who use large quantities of turpentine might find this method, applied, of course, on a larger scale, a great saving of expense, while it will not injure the tool, which turpentine does, by rendering the hair brittle.

H. G. F.

SIR,—In your number for March, Art "State of the Arts on the Continent," your correspondent of Paris, in mentioning the appointment of M. de Nieuwerkerke to the Directorship of the Louvre Galleries, says that M. de Nieuwerkerke is "little known in the artistic world."

I will not enter into the merits of M. de Nieuwerkerke's appointment, but it is only fair to state, that of the author of one of the finest, if not "the" finest modern equestrian statue, namely, that of William, last Prince of Orange, at the Hague, and of so many other meritorious works of sculpture, it cannot be said he is little known in the artistic world.

M. de Nieuwerkerke is known in the artistic world as an artist of the first merit.

I beg to call your attention to this, and have the honour to remain,

Your most obedient Servant,
Y. D. E. SHERMOND,
One of the Subscribers to the Art-Journal
at Utrecht, Holland.

Frederick Goodall

MR. FREDERICK GOODALL is a son of Mr. Edward Goodall, the eminent engraver; he has courteously furnished us with the following brief but interesting sketch of his professional career:—

"I was born in London, September 17th, 1822. I left school at the age of thirteen, and entered my father's studio of engraving, under whose direction I commenced my studies. He soon abandoned the idea of my following his profession, and as he had occasionally used the pencil and palette, as well as the graver, he was fully capable of giving me all necessary instruction in painting; indeed, I am proud to say I never received a lesson from any other artist. He instilled into me at the outset the necessity of varying my studies; and although I commenced with the idea of being a landscape painter, he never lost sight of the figure, but kept me, during the winter months, drawing from casts, and studying anatomy. In the summer months, for the first three years, I sketched from nature, in the vicinity of London, devoting a great portion of the time at the Zoological Gardens, sketching the animals, which gave me facility of drawing objects in motion.

"At the age of fourteen, R. H. Solly, Esq., kindly took notice of my sketches, and gave me commissions for drawings of 'Lambeth Palace,' and 'Willesden Church'; for the former I received the 'Isis' medal at the Society of Arts. About the same time I made a series of drawings of the Thames Tunnel in its working state for B. Hawes, Esq., M.P. My sketches there also afforded me materials for my first oil-picture, which I commenced at the age of fifteen; the subject was 'Finding the dead Body of a Miner by Torchlight,' for which the Society of Arts awarded me the large silver medal. It was purchased by my kind friend, Thomas Page, Esq., then acting engineer of the Thames Tunnel.

"It was there I became acquainted with Sir Isambard Brunel, who strongly advised me to visit his native country, Normandy; accordingly, in September, 1838, my father accompanied me thither, and when we arrived at Rouen, I was so enchanted with the picturesque beauties of the city that I did not wish to go any further, and persuaded him to leave me there, to which, after some hesitation, he consented; for I was not quite in my sixteenth year. He gave me ten pounds, telling me to make it last as long as I could, saying, at the same time, 'to be sure and save enough to bring me home again.' This was

my first lesson in economy, for after staying there a fortnight, and going down the Seine to Havre, I reached London with a folio of sketches, and five pounds in my pocket. It was from this folio I painted my first picture exhibited at the Royal Academy in 1839, some 'French Soldiers playing at Cards in a Cabaret'; it was noticed in the *Art-Journal* of that year.* I visited Normandy again in the summers of 1839 and 1840, and Brittany in 1841 and 1842, and painted during these years the following pictures; the names appended to them are those of the purchasers:—

"'Entering Church,' W. Wells, Esq.; 'The Soldier Defeated,' Sir W. James; 'Coming out of Church,'—Dawkins, Esq.; 'The Christening,' for which I received the prize of 50*l.* at the British Institution, Sir Charles Coote; 'The Return from Christening,' W. Wells, Esq.; 'The Veteran of the Old Guard describing his Battles,' Sir W. James; 'The Fair of Fougères,' Alexander Glendinning, Esq.; 'The Tired Soldier,' Robert Vernon, Esq.; 'Rustic Music,' W. Wells, Esq.; 'Passing the Cross,' W. Wells, Esq.; 'La Fête de Mariage,' Sir Charles Coote; 'The Wounded Soldier returned to his Family,' Marquis Lansdowne; 'Le Bon Curé,' Thomas Baring, Esq.

"In 1843 I visited North Wales; and in 1844, Ireland, from which sketching trip I produced 'The Widow's Benefit,' Sir J. Wigram; 'Connamara Market Girls,' W. Wethered, Esq.; 'The Fairy-Struck Child,' S. Oxenham, Esq.; 'Irish Courtship,' S. Oxenham, Esq.; 'The Holy Well,' W. J. Broderip, Esq.; 'The Irish Piper,' W. J. Broderip, Esq.; 'The Departure of the Emigrant Ship,' Lord Overstone.

"In 1845 I revisited Brittany, and painted on my return 'The Conscription Leaving Home,' and 'Going to Vespers.' For the last few years I have studied in England, and painted the following pictures:—'The Village Festival,' Robert Vernon, Esq.; 'A Gipsy Encampment,' Thomas Miller, Esq.; 'The Pet Rabbit,' Baring Wall, Esq.; 'The Soldier's Dream,' R. Colls, Esq.; 'The Angel's Whisper,' R. Graves, Esq.; 'Hunt the Slipper,' F. Rufford, Esq., M.P.; 'The Post-Office.'

"In conclusion, I should not omit to add, that I attribute a great deal of my success at the

* It always affords us exceeding pleasure to find our expectations of future excellence verified in after years. We spoke very favourably of this work, and augured from it great success to the painter. Ed. A. J.

commencement of my career, to the exceeding kindness of the late W. Wells, Esq., and Samuel Rogers, Esq."

It would seem almost unnecessary to add a word of commendation in favour of an artist who has, at so early an age too, already become so popular, and has elevated himself, by his own efforts, to the position he enjoys. But it is this very circumstance—the absence of such adventitious, or any academical, aids, which renders his success the more honourable to himself, and the more worthy of being held up to the admiration of others. It shows that the seeds which nature has deeply implanted in the mind will spring up and bear abundant fruit, though not reared under the most favourable auspices, nor tended by the hands of the most skilful cultivator. It proves, in fact, that it is not absolutely essential for the young artist, at all times, to go through the long process of academical instruction ere he can become a painter. The only school which Mr. Goodall seems ever to have attended has been the living world around him, the rules he has followed are those which his own judgment pointed out, the lectures he has heard have been uttered by the lips of nature, his wisdom has been gathered from his own experience and practice. Yet while we think all credit is due to him who has so educated himself, we must not be thought to undervalue the benefits which every one who accepts them must receive from that valuable Institution, whose professed object it is—one that it zealously and conscientiously carries out—to lead the student in that path wherein he should walk. Genius is proverbially erratic, and is as likely, perhaps more likely, to go wrong as right, without directing guides; to take false steps which can never be recovered, or to stumble at the very threshold through inexperience, and then to become disheartened and to yield up its pursuit in dismay. But we have tolerably clear evidence just now, that with the assistance of scholastic instruction, young artists will mistake its object, and that, without it, there are others who can win their way to fame. What is Art-education doing for those painters who so ostentatiously announce themselves as the "Pre-Raffaëlle Brethren?" Just this. It is carrying Art back to that state from which the glorious Italian laboured so nobly to extricate it; it is idly searching for beauty in the lazar-house, and ransacking the musty storerooms of half-barbarous ages for thoughts and conceptions with which the mind of the present generation can have nothing in common, and which, when found, have neither "form nor comeliness" to make them desirable. All this is greatly to be deplored, as a wilful waste of talents that ought to be engaged on worthier objects, and in a way that will instruct the multitudes who, in our day, come to worship at the shrine of Art. If painting had reached the highest point of excellence under Il Perugino and his successors, what value can be attached to the long array of glorious names that succeeded him? These antiquated "Brethren," who would thus call the long-hurried spirits of five centuries back to "revisit the glimpses of the moon," may rest assured they will never lead the popular taste; nor, after a time, are they likely to find patrons except among those who may desire to possess a specimen of the "curiosities of art" of the nineteenth century.

Mr. Goodall has made a wiser use of his gifts; his pictures are altogether of a popular class, by which we mean, not works of a low order of subject, but such as may be appreciated by all, because intelligible to all. He paints with the greatest care, and many of his pictures are finished with the utmost nicety; his subjects are not picked up off-hand as it were, but are thoughtfully culled from the living masses whom he has studied and whom he so truthfully presents to us. We trust the time is not far distant when he will receive that reward of honorary distinction to which he is justly entitled. The fact of his never having been a pupil of the Royal Academy will not, we should hope, prove a bar to his entrance among its members, whether or not it be the intention of this Institution, as we have heard, to increase its numerical strength.

"A simple scene! yet hence Britannia sees
Her solid grandeur rise,"

THOMSON.

John Glover

ANOTHER of the old school of Art is numbered with the dead; one who had studied long and diligently, one who had acquired fame by the slow acquisition of knowledge, and triumph in the appreciation of its results. After many years success in this country he had retired to one of our distant colonies, and ended his life in Tasmania.*

Mr. Glover was the youngest of three children. He was born at Houghton-on-the-Hill, in Leicestershire, on 18th February, 1767. His parents were engaged in agricultural pursuits—humble but industrious. They carefully instructed him in Christian duties, and he was favoured to receive a good plain education. But as an artist he was self-taught; his success as a painter entirely depended on his own acute observation and keen enjoyment of those rural beauties which surrounded his birth-place.

His first step in life was his appointment as writing-master to the free school at Appleby, in his native county, and it was during the little leisure his avocations allowed him at this place that he first began to practise Art, and to gain employment as a delineator of local seats, &c.

In 1794 he removed to Lichfield and commenced his career as an artist, being principally engaged in public and private tuition; using his hours of relaxation for the study of his art in the neighbourhood, or in the practice of music, to which he was much addicted. He now also began to paint in oil-colours, and soon achieved considerable success; as he did also in the practice of etching.

At this time public taste became elevated and refined, and works of high merit were multi-

* We are indebted to the *Launceston Examiner*, a journal published in Van Dieman's Land, for the principal particulars of the artist, which were obtained from a relative; and to Mr. J. Skinner Prout for the above portrait. Mr. Prout passed some years in Australia with Mr. Glover, and sketched him thus while sleeping in his chair.

plied. The exhibitions of the Royal Academy of London were so crowded with the products of amateurs, that the pictures of professional painters could not obtain that prominence they deserved. A new project was started, and a separate "Society of British Artists in Water Colours" was established. Mr. Glover, whose talents were now widely known and appreciated, contributed to the first exhibition at Spring Gardens, and incurred some expence in forwarding his pictures to the metropolis. A pleasing accord of sentiment distinguished the members of this association, and one trait merits mention. To further their personal improvement they met by rotation at each others' houses, and on such occasions all produced sketches or studies, which were left with the host. They thus communicated principles and ideas calculated to inform and direct.

Finding that London was the grand centre of patronage, in 1805 he removed from the country to Montague Square, and became a member and liberal contributor to the Water Colour Society. He now obtained access to the various institutions and collections of art, public and private. Many British *virtuosi* had periodical days for admission to their *salons*, where rising talent might luxuriate, and mature criticism expatiate at freedom; and it was by availing himself of the favourable position thus presented to him that he rapidly improved his mind in the due knowledge of Art-principles.

Mr. Glover paid a visit to France soon after the restoration of Louis XVIII, and while at the Louvre painted a large oil picture, of which that sovereign formed so elevated an opinion, that after it was exhibited in Paris, he transmitted to the artist, who had returned to England, a gold medal in testimony of his appreciation of his talent. The court patronage of France did not end here, and in his last visit, Louis Philippe, then Duc D'Orleans, commissioned him to paint some pictures of Van

Dieman's Land, hearing that was to be the future destination of the artist, and wishing to become familiar with its peculiar features.

Glover now sought to improve his mind and perfect his knowledge of nature by extended foreign travel, and he passed through France to Switzerland and Italy.

His untiring efforts were crowned by success, and some of his pictures fetched large prices. His view of Durham Cathedral, now in Lambton Hall, realised five hundred guineas; and his view of Loch Lomond, as well as many others, gained also liberal sums, and in 1820 he had so far employed his industry as to be enabled to furnish a gallery in Bond Street with his own productions.

In London he prosecuted his art for many successive years, and then thought of retiring to the neighbourhood of Ullswater, in Cumberland, a favourite locality for his pencil, and where he had often sat and studied under his tent for days together. He purchased a house and some land, but the vision was never realised.

From Ullswater Mr. Glover turned his thoughts to the remote and newly-formed colony of Swan River; but his steps were directed to Tasmania. He arrived there in March, 1831. Every object was new to his eye, and the aspect of the landscape was different from what he had ever before beheld. He prosecuted his beloved art with fresh animation and renewed vigour; his pencil was never idle. Some of his best works in local scenery were executed for liberal colonists, who sent them to England; others he transmitted for sale on his own account, but at a season when general embarrassment retarded their disposal. Yet he industriously pursued his course, and increased his gallery at his home. In one of his excursions in the island, he ascended the summit of Ben Lomond (5000 feet above the level of the sea), the first who had travelled there on horseback. He was accompanied by the late Mr. Batman, with his Sydney natives, whose name will ever be associated with Australia Felix as the explorer and first "squatter" at Port Philip.

For some years past Mr. Glover had all but ceased from painting, and spent the most of his time in reading, principally books of a religious kind. His venerable partner in life, six years his senior, still survives, and children and grand-children were within his view to the last. Mr. Glover was tall, and of robust frame, with a healthy glow on his cheek, and a forehead which closely resembled that of the late Sir Walter Scott; his disposition was amiable, and his society extremely pleasing. He was assiduous in his own pursuits, high-principled himself, and an admirer of correct deportment in others. He was frugal in his habits, and an example of temperance; truly patient under affliction, and during his last illness he restrained every appearance of suffering lest it should pain those by whom he was surrounded. He had lived at peace with all men in this world, and died, calm and untroubled, on 9th December, 1849, at the advanced age of eighty-two.

Mr. Glover's style of drawing was peculiar to himself, and the result of deliberate and careful study: delicacy of effect was its chief characteristic. This is seen in the extreme misty haze of the morning sun, or in the overpowering blaze of the sinking luminary, with which he invested his subjects: it is distinctly obvious, too, in the bold but feathery lightness of towering foliage, by which lofty trees in his pictures relieve themselves from more distant objects. To attain freedom and facility of handling with exquisite expression was his constant aim. Perhaps few artists ever spent so much time in studying from nature. Many of his works were executed with the sole design of imprinting natural beauty on his mind—informing his own soul with the inspiration of such study, that he might with truth and facility embody his rich and debate conceptions. His sketch-books are crowded with scraps of peculiar effects which arrested his attention. He held it as a dogma that those who would represent nature in her true colours must be familiar with all her varying features, and his success as an artist proved the truth of the principles upon which his ruling principle was founded.

A DICTIONARY OF TERMS IN ART.

CELEBE. A vase, found chiefly in Etruria, distinguished by its peculiarly shaped handles,

which are pillared. Its form is shown in the annexed woodcut.

CESTUS, CESTUS. Thongs of leather round the hands and arms, worn by boxers for offence and defence, to render their blows more powerful. The Cestus was introduced when athletics were generally practised, and the name is Roman. It was a stronger defence than the *Himantes* of the ancient Greeks; the simple thongs of leather were still used occasionally in boxing, and in the exercises of the *Agonista*, and were called *Melichai*, because the blows they gave were less formidable than those of the Cestus. There are many kinds of Cestus, in some the thongs of leather are studded with nails. Works of ancient Art abound in which the Cestus is represented.*

CHALCEDONY. A kind of quartz, semi-transparent, of a bluish white, but frequently striped and clouded with other colours. It is seldom found crystallised, but in kidney-shaped, irregular masses. Common CHALCEDONY is of a uniform bluish grey; the other kinds, Heliotrope, Chrysopease, Plasma, Onyx, Sardonyx, Sardine, and Carnelian, are distinguished by their colours. **AGATE** is a mixture of Chalcedony and varieties of quartz, often beautifully tinted. Chalcedony and Agate were used for seals and other works of Art. **CAMEOS**, of the former, and of the different sorts of Onyx, were preferred, on account of their numerous layers.

CHALCOGRAPHY. A modern term for engraving on copper, compounded from the Greek *Chalkos*, copper, and *grapho*, to cut. The term must be applied to copper engraving only; *grapho* gives, in Greek, an idea of Art, and engraving on steel or zinc must not, as often happens, be designated as Chalcography. For zinc engraving we have the spurious term **ZINCOGRAPHY**.

CHALICE. A vessel used in the sacramental service to contain the wine. The form has undergone many variations in different ages, always preserving, however, its cup-like shape. **CHALICES** are made of gold, but more commonly of silver,

either whole, or parcel gilt and jewelled. They have sometimes been made of crystal, glass, and agate, but these materials are now prohibited on account of their brittle nature. Some very curious and elegant **CHALICES** are preserved in public and private collections.†

CHALK. An earthy *Carbonate of Lime*, of

* See *IGNIHRANI Monumenti Etruschi*. PIROLI and PIRANESI's *Antichità d'Ercoleo*. TASSI's *Pietres gravées*. CLARAC's *Musée de Sculpt.* anc. et mod.

† See *SHAW'S Encyclopædia of Ornaments*; *POOR'S Glossary of Ecclesiastical Ornament and Costume*. Our cut exhibits the ordinary forms of the Chalice in the middle ages. The first is copied from a Brass of a Priest in Wensley Church, Yorkshire, about A.D. 1369. The second, from a similar memorial at Broxburne, A.D. 1495.

an opaque white colour, converted, by burning, into lime. It is the basis upon which many vegetable colours are precipitated to form pigments, such as the **PINKS**. Chalk has been used as a pigment, but it is a bad drier. **RED CHALK** is Clay coloured by the oxide of iron.

CHARACTER. That which distinguishes each species of being in each genus, and each individual of each species. In man Character consists of the form of the body, stature, and gait, which distinguish him from other animals. In mankind, the natural or accidental peculiarities resulting from sex, temperament, age, climate, the exercise of the passions, the position of the individual in the social scale, and his mode of living. These peculiarities and differences are, after the study of the human figure in general, the most important subjects of the study of the painter and sculptor, since upon these peculiarities and differences depend all the significance of their compositions. Each genus, each family of animals, has also its general and particular Character. So also in the inanimate productions of nature, trees, rocks, fields and meadows, which vary in reality as well as in appearance, according to the climate, season, time of day, accidental condition of the sky, and also according to the modifications they receive at the hands of man, the effect of time, or by the effect of natural accidents. If all these things, observed with sagacity and selected with taste, are faithfully represented in a picture, we say that the animals, the trees, the rocks of the picture have good Character.

CHARCOAL is prepared by burning wood in close vessels, or by burying the substance in sand in a covered crucible. The woods best adapted for making **CHARCOALS** are hox and willow; the former produces a dense hard crayon, the latter a soft and friable one.

CHARCOAL BLACKS are of both animal and vegetable origin; consisting of burnt ivory, bones, vine-twigs, peach-stones, nut and almond-shells, the condensed smoke of resin, &c. The blacks from vegetable substances are usually of a blue tint when mixed with white.

CHARFRON, or **CHAMP-FREIN**. In plate-armour, pieces of leather or plates of steel used to protect the face of a horse.*

CHASING, CHALETURA (Lat). The art of embossing on metals, by which the design is punched out from behind, and sculptured or CHASED with sharp tools, as gravers, &c. are gold, silver, and bronze, and among the ancients, iron also. The remains of ancient art show to what degree of perfection it was carried; and in our own times, some very fine works have been executed.

CHASUBLE, CHESABLE, CHESIBLE. Called also a vestment. The upper or last vestment put on by the priest before celebrating the mass. In form it is nearly circular, being slightly pointed before and behind, having an aperture in the middle for the head to pass through, and its ample folds resting on either side upon the arms. It is richly decorated with embroidery and even with jewels.†

* Our example is copied from *MEYER'S Ancient Armour*.
† See *SHAW'S Dresses and Decorations* for an incised slab representing a priest in a large Chasuble richly diapered. The stiffness of modern vestments is almost as great a defect as their form; indeed, the unpliant nature of the material has, in a great measure, led to the reduced front. They cannot be too pliable either for convenience or dignity. Every artist is aware that the folds of drapery constitute its great beauty; the most majestic manly extended flat, is unshightly. Ever since the **CHASUBLES** have been made of a stiff material, they have been avoided by sculptors and painters in their works, and they invariably select the copy, based solely on account of its folds, where if the **CHASUBLES** were made of the ancient graceful materials, they would form the most beautiful combinations of folds. — *POOR'S Glossary of Ecclesiastical Ornament and Costume* (from whence our cut is copied).

CHEF-D'ŒUVRE (Fr.) A work of the highest excellence in itself, or relatively to the other works of the same artist. Thus the *Apollo Belvedere*, or the *Transfiguration* of Raffaele, are chef-d'œuvres of Sculpture and Painting.

CHENISCUS. In works of ancient Art, ships are seen with ornamental prows, shaped to represent the head and neck of a goose, or other aquatic bird; this part was called **CHENISCUS**, and was constructed of bronze and other materials. Sometimes, but rarely, the **CHENISCUS** is affixed to the stern of a ship.

CHERUBIM. In Christian Art, a higher class of angels, the nearest to the throne of God, of which they are the supporters.

Their forms are known by the poetical writings of the Old Testament. They appear first as guardians of Paradise, whence our first parents were expelled by a **CHERUB** with a flaming sword. Jehovah rested between the wings of the Cherubim on the cover of the ark; and in the history of Ezekiel they are represented with four wings, two of which covered the body and drew the chariot of the Lord through the air.

In the heavenly hierarchy the Cherubim* form one of the three high angel choirs—SERAPHIM, CHERUBIM, and ANGELS, which constitute the first and upper order of angels; they rank next to the SERAPHIM.

CHIARO-OSCURO (Ital.) That important part of painting which relates to light and shade.† The aim of painting is to form a picture by means of light and shade, and by colours and their gradations; the more truly painting accomplishes this end, the more artistic it will be. Correggio and Rembrandt are famous for their **CHIARO-OSCURO**.

CHILLED (CHANCEISURE, Fr.) When a cloudiness or dimness appears on the surface of a picture that has been varnished, it is called **CHILLED**, and we say the varnish has **CHILLED**. This defect arises from the presence of moisture, either on the surface of the picture, or in the brush, or in the varnish itself, and can easily be avoided by making the former thoroughly dry, and the latter hot before it is applied.

CHIMERA. A misshapen monster of Grecian myth, described by Homer as having a lion's head, a goat's body, and the tail of a dragon. The **CHIMERA** appears in Art as a lion, except that out of the back grow the head and neck of a goat, and gigantic carvings of it are found on rocks in Asia Minor, according to Homer the native country of the monster.‡ There are innumerable small antique statues of **CHIMERA**, and Bellerophon, by whom the Chimera was killed, of which one of the most remarkable is in the Uffizi palace at Florence. In Christian Art, the **CHIMERA** is a symbol of

* Cherubim signifies the plenitude of knowledge and wisdom; they are represented young, having four wings to cover their faces and feet, and standing on wheels of fire, of a bright red colour, to set forth the intensity of divine love, in reference to the vision of the prophet Ezekiel. Art cannot adequately represent their spiritual agency and rapid movements, therefore they are drawn as the ancient Persians drew Ormuz, who unable to represent their god as a pure being of light, implied his nature by a half-figure ending in a winged body, sweeping through the air. P. Cornelius, in his picture of the "Creation" at Munich, makes their bodies terminate in wings: in it the cherubim support the globe which the Almighty, towards whom they look with reverential love, uses as a footstool.

† According to the common acceptation of the term in the language of Art, **CHIARO-OSCURO** means not only the mutable effects produced by light and shade, but also the permanent differences in brightness and darkness. ‡ One of these has been brought by Sir Charles Fellows to this country, and deposited in the British Museum.

cunning. It is frequently seen on the modillions and capitals of architectural works executed in the

eleventh and twelfth centuries, and again in the fifteenth and sixteenth centuries.

CHINESE WHITE. An empirical name given to the white oxide of zinc, a valuable pigment recently introduced into the Arts as a substitute for the preparations of white lead. It is little liable to change, either by atmospheric action or by mixture with other pigments. Its only defect appears to be a want of body, as compared with white lead.

CHIRODOTA. A kind of tunic with long sleeves, worn sometimes by the Trojans, and generally, in Asia Minor; but among the Greeks they

were seldom worn by males; the remains of works of Art show that it was commonly worn by females.*

CHITON. The under-garment of the Greeks, corresponding to the TUNIC of the Romans, mentioned as early as Homer; it was made of woollen cloth. After the Greek migration it was called *Chitoniscos*, while the light loose garment or HIMATION was also called *Chlania*, or *Chlanis*. The Doric CHITON, worn by men, was short and of wool; that of the Athenians and Ionians, of linen, in earlier times worn long, but with the former people, after the time of Pericles, it was shorter. The CHITON, worn by freemen, had two sleeves, that of workmen and slaves only one. A girdle (called, when worn by men, *Zona*), was required when the garment was long, but that of the priests was not girded. The Doric CHITON

for women was made of two pieces of stuff sewn together, and fastened on the shoulders by clasps.

* Our cut is copied from a bas-relief in Montfaucon, where it is seen on a suppliant German.

In Sparta it was not sewn up the sides, but only fastened, and had no sleeves. The CHITON appears to have been generally grey or brown. Women fond of dress had saffron-coloured clothing; and the material (cotton or fine linen), was striped, figured, or embroidered with stars, flowers, &c. With regard to statues, we need only remark that Artemis, as a huntress, wears a girdle over the CHITON, which is fastened on the shoulders and falls in folds over the bosom. Pallas Athene often wears a double CHITON, reaching to the feet, and leaving the arms free. On the statues of Amazons the CHITON is sleeveless, clasped up in two places, leaving the left breast uncovered, and drawn up sufficiently to show even above the knees.*

CHILAMYS. An ancient Greek riding-dress, brought by the Ephebes to Athens from Thessaly, the province of Greece most celebrated for horses. It was a light cloak, or rather scarf, the ends of which were fastened on the shoulder by a clasp or buckle. It hung with two long points as far as the thigh, and was richly ornamented with purple and gold. When the *fibula* was unclasped the

CHILAMYS hung on the left arm, as with Hermes, or served as a kind of shield, as Poseidon, on the old coins, protects his arm with the CHILAMYS. It is fastened on the right shoulder, in the statues of Theseus and the heroic Ephebes, in a wrestling attitude, covering the breast and enveloping the left arm, which is somewhat raised. The figures of Heracles and Hermes, are quite covered by the CHILAMYS, even below the body, whence the Hermes pillar tapers; the right hand lies on the breast under the CHILAMYS, and the left arm, covered to the wrist, hangs by the side; in the centre of the breast depends Heracles' claw at the opening of the scarf. In the Hermes' statues, the CHILAMYS, when fastened on the right shoulder, forms a triangle from the neck.

CHONDRIN. The basis of the tissue of cartilage as it occurs in the ribs, nose, &c.; it is obtained from them, like GELATIN or GLUE, to which it is analogous in many of its properties; but unlike GELATIN, the salts of lead, and ALUM. Upon this peculiar property is based the so-called KAL-SOMNE TEMPERA, in which the MEDIUM animal glue (chondrine) is converted by alum into a horny substance, insoluble in water.

CHORAGIC MONUMENTS. The small monuments to which we apply this term originated in the time of Pericles, who built an Odeon at Athens for musical contests, not of single persons, but of choruses. The richest and most respectable man was chosen from the ten Athenian tribes, as choragus, to make the necessary arrangements, in return for which distinction he had to defray the expenses. If his chorus were victorious, he had also the right of placing upon a monument erected at his own cost, the tripod, which was given as the prize. The rich citizens whose chorus conquered in these contests, displayed great splendour in their monuments, which were so numerous that at Athens there was a street formed entirely of them, called the "Street of the Tripods."†

CHRISMATORY. A vessel to contain the chrism and holy oils.

CHRISTINA, ST. The attributes of this Saint, who suffered

* The cut represents the Doric or short Chiton, without sleeves, and the Ionic or long Chiton, with sleeves. † A fine specimen still exists in the monument of Lycabettus, mentioned by older travellers under the name of "Diogenes' Lantern," and which is engraved above. A second monument, still existing at Athens, is the Thersyllion, which is very simple, being hewn in the rock, and serving as the front to a cave. It bears two tripods, that of Thersyllion, and that won by his son, who took advantage of his father's monument, being neither rich nor a proper choragus, but having superintended a chorus at the expense of the state.

martyrdom in the year 300, are a millstone by her side, and an arrow; sometimes also a knife, and a pair of pincers; also, the crown and palm as martyr. When the arrow is the only attribute, it is difficult to distinguish her from St. Ursula. Pictures of this saint abound in central and northern Italy, particularly at Venice, and at Boisena, of which city she is the patroness.

CHRISTOPHER, ST. We frequently meet with this saint in old woodcuts; he is represented as a giant, his staff being the stem of a large tree, and he is carrying the infant Jesus on his shoulders across a river. This was a favourite subject with the artists of the middle ages, and the saint is placed in the side entrances of German churches as the symbol of the transition from heathenism to Christianity. The incidents in the life of this saint chosen for illustration by painters, consist of the passage of the river, the conversion of the heathen at Samos, and his martyrdom.

CHROME GREEN. A beautiful dark-green pigment, prepared from the *Oxide of Chromium*. Different shades of this pigment are used in porcelain and in oil-painting. Mixed with Prussian Blue and Chrome Yellow it is called Green Cinabre.

CHROME RED. The pigment known at present by this name is not prepared from *Chrome*, but is a beautiful preparation of RED LEAD. The name CHROME RED was given to it by speculators, in order to secure a good sale and a high price. RED LEAD is an *Oxide of Lead*, while CHROME RED is a *Chromate of Lead*, which is a durable pigment, and admissible in oil-painting.

CHROME YELLOW. The most poisonous of the Chrome pigments, and to be entirely rejected in oil-painting; it is not durable. When mixed with white lead it turns to a dirty grey. By itself, and as a water-colour pigment, it is less objectionable.

CHRYSELEPHANTINE. Religious images of gold and ivory. These, the earliest images of the Gods in Greece, were of wood, gilt or inlaid with ivory, whence were derived ACROLITES, the heads, arms, and feet of which were of marble, the body still of wood, inlaid with ivory, or quite covered with gold. From this arose the Chryselephantine statues, of which the foundation was of wood, covered with ivory or gold, with drapery and hair of thin plates of gold, chased, and the rest of the exterior was of ivory worked in a pattern by the scraper and file with the help of isinglass. The ivory portion of these works belongs to SCULPTURE, and the gold part to TOREUTIC ART; they were long in favour as temple statues, as marble and brass were used for common purposes.

CHRYSOCOLLA (Gr., GOLD-GREEN.) The Greek term for a Green pigment prepared from Copper (GREEN VERDITER) and one of the most beautiful Ancient Greens, ARMENIAN GREEN; it was obtained by grinding varieties of MALACHITE and green Carbonate of Copper, also by decomposing the Blue Vitriol of Cyprus (*Sulphate of Copper*) as a secondary form of dissolved copper ore. This pigment is identical in colour with our different shades of MOUNTAIN GREEN; the best was brought from Armenia; a second kind was found near copper mines in Macedonia; the third, and most valuable, was brought from Spain. CHRYSOCOLLA, (called by ancient painters *pea* or *grass green*) was valued in proportion as its colour approached to the colour of a seed beginning to sprout.*

CIBORIUM. Lat. (pl. CIBORIA). Synonymous with TABERNACLE, Sacrament-house, God's-house, or Holy-roof; the terms for the richly adorned pyramidal structure in the high choir, in which the Host is kept. The CIBORIUM is often merely an addition to the high altar, and is then a SYNODOCKE.† In the early Christian times, the CIBORIUM was merely a pro-

* Pliny's account of CHRYSOCOLLA is as confused as his account of GEMMUM; we learn thus much from it, that real Chrysocolla was a native oxide of copper, but that those pigments passed under the same name, which, though originally blue, perhaps clay-coloured with copper, were rendered green by a yellow vegetable acid. The herb *betum* produced this effect.

† The most splendid CIBORIA are those belonging to ancient German Art; the finest of these, which was in the cathedral of Cologne in the preceding century, exists no longer. The most remarkable Ciborium in Italy are the Tabernacle over the high altar of St. Paul's at Rome, that

tion to the altar table, first a TABERNACLE, then a BALDACHIN over the altar, of which, the CANOPY used at solemn processions and under which the priest wears the *Casula*, still reminds us. The CIBORIUM was generally supported by four pillars, and is above the altar; between the pillars were curtains, which were opened only while believers made their offerings, but closed in the presence of catechumens or infidels. CIBORIUM also signifies a vessel in which the blessed Eucharist is reserved. In form it nearly resembles a CHALICE with an arched cover, from which it derives its name.*

CICERONE (*Ital.*) The title given to the person who acts as a guide to strangers, and shows and explains to them the curiosities and antiquities with which Italy and other countries abound. A good CICERONE must possess accurate and extensive knowledge, and many distinguished archaeologists have undertaken this office, which, while serving others, affords them also an opportunity of making repeated examinations of the works of art, and enabling them to increase their familiarity with them. One of the most distinguished archaeologists and CICERONI is Signore Nibbi of Rome.

CINCTORIUM. A leather belt worn round the waist, to which the swords worn by the officers of the Roman army were suspended. The common men wore their swords suspended from a BALTEUS, which is worn over the right shoulder.

CINNABAR (CINNABARI, *Gr.*) One of the red pigments known to the ancients, called also by Pliny and Vitruvius MISIUM; supposed to be identical with the modern VERMILION (the bisulphuret of mercury), and the most frequently found in antique paintings. The Roman Cinnabar appears to have been DRAGON'S BLOOD, (*Pterocarpus Draco*), a resin obtained from various species of the Calamus Palm, found in the Canary Isles. It is beyond a doubt that the Greeks applied the term CINNABARI, generally meaning Cinnabar, to this resin. Cinnabar, as well as dragon's blood, was used in monochrome painting; afterwards ruddle, especially that of Sinopia, was preferred, because its colour was less dazzling. The ancients attached the ideas of the majestic and holy to CINNABAR, therefore they painted with it the statues of Pan, at well as on feast days those of Jupiter Capitolinus and Jupiter Triumphans. It was used upon gold, marble, and even tombs, and also for mural letters in writing, down to recent times. The Byzantine Emperors preferred signing with it, as is said in the sixth synod *imperator per cinnabarium*. Its general use was for walls, on which much money was spent: in places which were damp and exposed to the weather it became black, unless protected by eucastic wax.†

CINQUE-FOLL. A figure of five equal segments derived from the leaf of a plant so called, particularly adapted for the representation of the mysteries of the Rosary. It is frequently seen in irregular windows, one of which is engraved as a specimen.

CIPPUS. A sepulchral monument in the form of a short column, sometimes round, at others rectangular; Cippi have frequently been mistaken for altars. In the British Museum are several CIPPI, one of which is represented in the annexed engraving.

CIRCLE. The Circle has always been considered as the emblem of Heaven and Eternity, hence many figures in Christian design are constructed on its principle, such as the Rotation of the Seasons, which are constantly returning; or the Adoration of the Lamb, and other subjects which are found in the

in the cathedral at Milan, and that in the church of the Lateran.—See AGINCOURT, *Script.* tab. 23, 26, 13, 36.

* FROST'S *Glossary of Ecclesiastical Ornament and Costume*. Also the *Art-Journal*, April, 1843.

† Being very dear, it was provided by the builder, by which custom painters profited to enrich themselves; they took the brush very full of the pigment, and raised it in their water-pails, and good Cinnabar being very heavy, sank to the bottom, and became the requisite of the artist. Also, to spare the Cinnabar, they laid a ground of Syriacum under it.

great wheel-windows of painted churches. See WHEEL.

CISTA (*Lat.*) Chest, box. The so-called mystic chests found in the Etruscan Necropolis are bronze boxes, in which the beautiful bronze Mirrors (*patere*), known by engravings, as well as other ornamental vessels, were kept. The chests themselves are graven. They are wrongly called *Ciste mystica*, not being objects of mythic worship as earlier archaeologists supposed. The CISTA found at Preneste, and now in the *Collegio Romano*, is of surpassing beauty; on it is represented the expedition of the Argonauts in a style not unworthy of Grecian art, but by the inscription apparently of Italian workmanship.*

CITHARA. A musical instrument somewhat resembling a guitar, of the greatest antiquity,

being mentioned by Homer. It is seen depicted, in the hands of the performer, upon Egyptian and other monuments.†

CLICHÉ. (*Fr.*) The impression of a die in a mass of melted tin or fusible metal. Medallists or Die-sinkers employ it to make proofs of their work, to judge the effect, and stage of progress of their work before the die is hardened. The term CLICHÉ is also applied to the French stereotype casts from woodcuts.

CLYPEUS. Part of the armour worn by the heavy infantry of the Greeks, and a portion of the Roman soldier, consisting of a large shield or buckler, circular and concave on the inside, sufficiently large to cover the body from the neck to the middle of the leg. It was formed of ox-hide stretched upon a frame of wicker-work, and strengthened with plates of metal; sometimes it was formed entirely of bronze. See ASTUX.

COA VESTIS. FINE COA ROBE. A garment worn chiefly by dancing girls, courtesans, and other women addicted to pleasure, of texture so fine as to be nearly transparent, and through which the forms of the wearers were easily seen.

COCHINEAL. (*Fr.*) A dried insect in the form of a small round grain, flat on one side, either red, brown, powdered with white, or blackish brown. This splendid colouring material is soluble in water, and is used for making the red lake pigments known by the names CARMINE, Florentine and other Lakes; the names of these Lakes are vague, as many Brazil-wood Lakes are substituted for COCHINEAL LAKES.

COLORES FLORIDI. The name given by the ancients to the expensive and brilliant pigments, as distinguished from the four hard rough principal pigments of earlier times. The COLORES FLORIDI were supplied by the employer, and often purchased by the artist: they were CHRYSOCOLLA; INDICUM (*Indigo*) introduced into Rome in the time of the Emperors; CÆRULEUM (a blue smalt made at Alexandria, from sand, saltpetre, and copper); and CINNABARIS, which was partly natural and partly artificial VERMILION; but also an Indian pigment, procured from the sap of the *Pterocarpus Draco*, and called also DRAGON'S BLOOD. Other pigments were called COLORES AUSTRI.

COLOSSUS. A statue of exaggerated dimensions, very much larger than nature, examples of which abound in all nations. Among the most famous was the Colossus of Rhodes, regarded as one of the seven wonders of the world; it was about one hundred feet in height. Other COLOSSI celebrated in antiquity are the Minerva and Jupiter Olympus, works of Phidias, the Farnese Hercules, the gigantic Flora of the Belvedere.

COMPOSITION. This word expresses the idea of a Whole created out of single Parts, and to this idea the Whole ought to conform. In the Whole there ought never to be too much or too little; all Parts must be necessary, and must refer to one another, being understood only under such relationship. This does not imply that every Part must be co-ordinate, some Parts must be of more importance than others, and all must be subordinate to a centre-point, which raises them, while it is raised by them. This quality, which is seen in natural landscape, we call *organicism*; we desire to produce it in Art, and require pictures to be *organic*. This is valid as well in simple Composition as in compound, which as a composition of

See MULLER and OSTERLEY'S *Monuments of Ancient Art*, tab. 61, No. 369.

† Our cut is copied from an Egyptian painting at Thebes, engraved by Rosellini.

compositions, represents many Wholes. All this, though not attained, is at least attempted by those who call themselves artists. The following is less acknowledged but not less important, viz., every composition consists of three elements, whose one-sided predominance in painters and connoisseurs produces three schools of error; while the fervent working together of these elements alone makes the work a living Whole, and gives it that which is expressed by the Latin word *Compositio*—a quieting satisfying effect. The artist's subject furnishes the first element. Every subject has its own law of representation, which the artist must clearly understand if he would depict it truly upon the canvas. This comprehension is to be acquired only by his forgetting himself in the contemplation of his subject. It is the power of doing this which we prize so highly in poetry under the term *objectivity*. For the highest laws are equally pre-emptory in every Art; so in Plastic Art, that is true which, apparently paradoxical, was said of music, "that the musician does not carry the composition through, but the composition the musician." By thus treating the subject the artist becomes a splendid Organ, through which Nature speaks like a history to sentient man; thus followed out, the Majesty of Rome in Rubens, and the Cheerfulness of Nature in Claude, are conveyed to posterity.* The second element of COMPOSITION is fixed by the given space which is to be filled by colour, form and light, harmonised according to the laws of art; then a history adorning a space becomes the property of Art.† The third element lies in the mind of the artist; as "Woman's judgment is tinged by her affections," so the artist who cannot imbue his subject with his own feelings will fail to animate his canvas. For though every legitimate subject dictates the laws of its representation, yet every cultivated man sees objects in his own light, and no one may say that he alone sees rightly. A law or rule finds many exemplifications. A thousand poets have sung of the soft shade of the Linden tree, yet each has sung it differently; is the artist to be blamed who gives forth the holy memory of his best hours in the creations of his pencil? who clothes the work of his hands with the hues of his feelings? He who feels, touches the feelings of others, and how can that exhibit nature which does not proceed from nature. He who knows not how to give that to his pictures, by which they become, not from manner but from subject, his pictures is no artist, but a mere copyist, even could he imitate Phidias or Scopas perfectly. Excess of individualism leads the artist to depict himself instead of the subject, to sacrifice this to a favourite caprice, and in allegorising his own dreams to confuse the action as well as the spectator; but if he represent it truthfully, working it with pictorial effect and stamping it with his genius, he has composed, and his work is completed, satisfying all requirements.

COPY, in the Fine Arts, is a multiplication or reproduction of a work, whether painting, statue, or engraving, by another hand than the original. If a master copies his own picture, we call it merely a *repetition*, which the French designate by the term *Doublette*. COPIES are of three kinds; the most general are those in which the copyist imitates the Original with anxious exactitude; in this case the difficulty of copying is but slight. The second kind is where the copyist avoids exact imitation, but renders the Original freely in its principal traits. These COPIES, exact imitations in style and colouring, are soon seen to be apocryphal pictures. The third, and most important kind of COPY is, that in which the picture is imitated with the freedom of a skilful hand, but at the same time with a truthful feeling of the original, and with the inspiration of genius, finding satisfaction not in copying, but in an imitation little short of creation.

* The artist will also try to include in his plan the whole subject, whether Nature or History, so that the spectator easily understanding it, may be capable of judging and feeling it. But he must be aware that there are two kinds of completeness and breadth, and that an object may be exhausted by being made clear. To find the essential of an event or a poem, and to condense it in pictorial action, has difficulties which need not be discussed here. Those who are ruled by this element of the subject mistake the boundaries of their art; they would make the canvas express the poem or the history, or if connoisseurs, they would see it expressed. An example of this one-sidedness is afforded by the ancient manner of representing two succeeding actions in one space.

† The works left by the ancients prove that they understood this maxim, and predicted it, and Göthe, who regarded them as triumphant in Art, proved his existence in the Laocoon, and represented this painful group as a splendid ornament. It is certain that the most touching or important action does not speak to us from the canvas unless treated pictorially; on the other hand, extreme in space is possible, so as to sacrifice the essential points of the subject in favour of a harmony of colour flattering to the eye—accustomed to it in academic works—and thus degrade characters to arabesques.

THE BUILDING
FOR THE EXHIBITION OF 1851.

THE numerous plans sent to the Building Committee appointed to superintend the erection of this important "Palace of Industry," have been recently made the subject of a temporary Exhibition, in the large meeting room of the Institution of Civil Engineers, in Great George Street, Westminster. It is a really curious exhibition, on its own merits alone, irrespective of the use to which it may be applied, if it be only to see in how varied a manner the subject may be treated, in spite of the circumscribed nature of the regulations which have been enforced on each person, owing to the shape of the ground upon which the building is to be erected,

and the necessity for preserving certain groups of large trees, which are not allowed to be either removed or damaged. Among the 245 plans, we see every variety of style and treatment, and some of so ambitious a character, that the building itself would be almost "exhibition" enough for country visitors. This is especially the case with our foreign friends, who, in some degree, bring to mind the "Palaces of Enchantment" which gratify theatre-goers in the last scenes of the Christmas and Easter spectacles. The descriptions are sometimes as grandiloquent; one gentleman talks of his entrance as an "octastyle, tripostyle, and polystyle pedimented portico." But he is an Englishman.

Among the number we may notice Mr. Bunning's as one of the most simple and "practical;" Mr. Fripp's as exceedingly picturesque; Mr. Reilly's as possessing most original features; Mr. Tait's reminds one too forcibly of that "grotesque," the

Pavilion at Brighton; Mr. Harrison's and Mr. Russell's have many points of similarity, and also good simple ground-plans, while that of M. Jayne is remarkable for the odd form it takes; Mr. Erskine's design consists of a kind of maze, the visitor going in at a central door, and winding round and round until he reaches the middle of this vast building; Mr. Ralton gives us an Egyptian erection; Mr. Kennedy a series of kiosks and miarets; and Mr. Duesbury proposes a railway through its entire length, upon which trucks may be stationed with heavy machinery, &c. Mons. Victor Horeau's building is proposed to be mainly of glass; Mr. Mackenzie's of glass and iron; Mr. Marchant's an enormous "corrugated iron" tent. The designs by Cremat, Brandon, and Ricardo are among the best. One of the most elaborate is by Turner, of the Hammersmith Iron and Glass Works, Dublin; it is for one enormous covered building, with a central dome, and circular domed buildings at each angle, devoted, one to each quarter of the globe. Of this a large model has been prepared. There is also a series of drawings from the same hands, remarkable for their striking and picturesque originality; but while we afford them all praise as designs, we cannot consider them practically adapted for the wants of 1851.

We have enumerated but a very small number of designs contributed, yet it appears "The committee have been unable to select any one design which fulfils all the conditions prescribed by the nature of their undertaking; but they have derived from the various plans submitted a great amount of valuable suggestion to guide them in preparing a design of their own."

Thus, after all the trouble given to artists native and foreign, the competition ends where all such things generally end in this country, in the ultimate employment of some person who has quietly "bided his time," certain, from the first, of his own position and safety. In fact, this belief has operated so strongly on the minds of our native artists, that this must account for the few men of eminence who have competed.*

Our contemporary, the *Builder*, has published the plan and elevation of the building determined on by the committee, and which is of much simplicity throughout.† It will be about 2000 feet long, rather more than 300 feet across, and the roofed area will probably extend to about 900,000 square feet, or upwards of 20 acres. In the centre of the south front, opposite Prince's Gate, will be placed the principal entrance and offices. There will be other entrances at the hack and sides of the building. Passages 48 feet wide, clear and uninterrupted, excepting by seats, will connect the entrances, and at the intersection of these main lines it is proposed to form a grand circular hall for sculpture, 200 feet in diameter. Considerable spaces surrounding the old trees will be fitted up with refreshment-rooms, surrounding ornamental gardens. The building will be covered with a remarkably simple iron roofing, of 48 feet span, running from end to end, supported by hollow iron columns, and resting on brick piers. The lowest line of the main roofing will be 24 feet high, and the clear height of the central passage will be about 50 feet. The floor will, for by far the greater portion of the area, be formed of hoarding laid on joists and sleeper-walls. The external inclosures will in all cases be constructed of brick. The light will be principally derived from skylights. The central hall will be a polygon of sixteen sides, four of which will open into gardens reserved around it. Its main walls will be of brick, and about 60 feet high. The covering of this splendid apartment will be a dome "about twice the size of that of St. Paul's," a notion which will most likely receive much modification. The building is to be "finished and delivered up by the first of January, 1851."

The preponderance and apparent superiority of foreign designs is a striking feature in the affair, and one upon which much augury of a gloomy character has been expended with regard to the exhibition in general. But we must confess that we do not feel "the superiority" quite so strongly,

* It is notorious that, whether right or wrong, among "the Profession" there prevailed a very general opinion, that no matter what building plans were submitted to the Commissioners, no one of them was to be selected; the architects on the Commission having previously made up their minds on the subject, and needing only to see plans in order to draw from them beneficial suggestions for their own. This was roundly and broadly stated long before the plans were sent in; and whether erroneous or otherwise, the result is precisely that which was predicted. The consequence is that hardly a single British architect of note is to be found among the competitors. The architects of France had no such idea; and consequently the best among them did compete.

† By the courtesy of the proprietors we are enabled to present our readers with the two engravings representing the principal elevations of this building.

nor do practical men in general. Our contemporary the *Builder*, a sound and able judge on the point, says, "We have not been able to detect the principles which guided the committee in the selection of the eighteen names entitled to distinc-

tion; but certainly they could not have been governed by the considerations which have guided them in framing the adopted plan, namely,—the provisional nature of the building; the advisability of constructing it to be available for other purposes;

and extreme simplicity demanded by the short time in which the work must be completed."

Now our native artists have restrained their fancy and have not done all they *would* and *could* do. Their foreign rivals have allowed theirs to run riot in the imaginary construction of grand erections, which would be impracticable and ruinously extravagant to carry out. A writer in the journal just quoted properly comments on the injustice of praising "our illustrious continental neighbours," as is done in the report of the building committee, for "not confining themselves to suggestions only, which were invited by the programme," and for producing "compositions of the utmost taste and learning, worthy of enduring execution,—examples of what might be done in the architectural illustration of the subject (the conditions strictly enjoined contributors not to enter into architectural detail), when viewed in its highest aspect, and, at all events, exhibiting features of grandeur, arrangement, and grace, which your committee have not failed to appreciate." It then places in contradiction to these—no doubt admirable, but—out-of-place productions of architectural genius, the "practical character of the designs of our own countrymen," which it states, "as might have been expected, has been remarkably illustrated in some very striking and simple methods, suited to the temporary purposes of the building, due attention having been paid by them to the pecuniary means allotted to this part of the undertaking. Yet, notwithstanding this comparison, clearly and indisputably in favour of our own countrymen, as regards the object sought and the conditions stipulated by the committee, we find by the selected list of those authors who are to receive the "highest honorary distinction" the commissioners can award, that the committee can only discover, out of 195 English and 38 foreign contributors, *three* Englishmen entitled to reward, the remaining *fifteen* out of the eighteen selected being foreigners; or, as regards the whole numbers, in the proportion of 1 to 65 of "our own countrymen," the authors of the "striking and simple methods," so admirably "suited to the temporary purpose of the building," and 1 to about 2½ of foreigners, who, in designing for a temporary building, to be simple, cheap, and readily constructed, have so overshoot the mark as to produce "compositions" commendable only for "the utmost taste and learning, and worthy of enduring execution." Surely something must be wrong here; either the report, or the selected list; possibly both.

HONORARY MEDAL FOR 1851.

So large a number as 129 designs have been sent to the Committee for the Medal proposed to be given as an honorary distinction to the successful exhibitors of 1851. With very few exceptions they are modelled in plaster, and exhibit great variety and originality. The fault of the generality of these designs is the inconvenient, and, in some degree, impracticable crowding of the field with figures and emblems. In Medallion Art, the chief thing to study is simplicity of composition, and such an use of allegory that it may clearly tell its own tale. Of such designs, perhaps one of the most pleasing is that representing "Peace standing on the Rocks of Britain with her Beacon lighted, and the hand of welcome extended to all." Nos. 68 and 57 are also very simple—"Britannia awarding her Laurel Crown." Many of the more elaborate, however, possess much artistic merit; and there are a great number of really fine designs excellently wrought out, all tending to prove the large amount of latent ability which may be brought forth when the occasion presents itself; of these, No. 108, "Minerva Pacifica recommending to Maukidi the Useful and Graceful Arts," is good both in treatment and conception. No. 85, "Industry rejoicing at War doing Honour to Peace," is another good idea. "Science and Handicraft attending on each other" is also simple and appropriate. "Peace distributing Plenty" is also gracefully composed. A design with good classic features is seen in the one representing "Britannia presenting Fame to an Artisan." Another with "Britannia, supported by Justice and Peace, and surrounded by Natives of all quarters of the Globe, pouring forth their Treasures at her Feet," Labour and Industry holding a Shield for the name of the successful candidate is good and simple. But one of the most finished and elaborate is intended to be emblematic of the universal emulation awakened by the Exhibition; persons of all nations are surrounding a statue of "Peace," and inscribing her name on a pedestal with a broken sword. It is impossible for us to enumerate or do justice to the varied inventions presented here; but we can certainly speak to the great amount of originality and ability displayed by the artists.

MEMORIES OF MISS JANE PORTER.

BY MRS. S. C. HALL.

HE frequent observation of foreigners is, that in England we have few 'celebrated women.' Perhaps they mean that we have few who are 'notorious,' but let us admit that in either case they are right; and may we not express our belief in its being better for women and for the community that such is the case. 'Celebrity' rarely adds to the happiness of a woman, and almost as rarely increases her usefulness. The time and attention required to attain 'celebrity,' must, except under very peculiar circumstances, interfere with the faithful discharge of those feminine duties upon which the well-doing of society depends, and which shed so pure a halo around our English homes. Within these 'homes' our heroes—statesmen—philosophers—men of letters—men of genius—receive their first impressions, and the *impetus* to a faithful discharge of their after callings as Christian subjects of the State.

There are few of such men who do not trace back their resolution, their patriotism, their wisdom, their learning—the nourishment of all their higher aspirations—to a wise, hopeful, loving-hearted and faith-inspired Mother; one who believed in a son's destiny to be great; it may be, impelled to such belief rather by instinct than by reason; who cherished (we can find no better word), the 'Hero-feeling' of devotion to what was right, though it might have been unworlly; and whose deep heart welled up perpetual love and patience, towards the overhailing faults and frequent stumblings of a hot youth, which she felt would mellow into a fruitful manhood.

The strength and glory of England are in the keeping of the wives and mothers of its men; and when we are questioned touching our 'celebrated women,' we may in general terms refer to those who have watched over, moulded, and inspired our 'celebrated' men.

Happy is the country where the laws of God and Nature are held in reverence—where each sex fulfils its peculiar duties, and renders its sphere a sanctuary! and surely such harmony is blessed by the Almighty—for while other nations writhe in anarchy and poverty, our own spreads wide her arms to receive all who seek protection or need repose.

But if we have few 'celebrated' women, few, who impelled either by circumstances or the irrepresible restlessness of genius, go forth amid the pitfalls of publicity, and battle with the world, either as poets—or dramatists—or moralists—or mere tale-tellers in simple prose—or, more dangerous still, 'hold the mirror up to nature' on the stage that mimics life—if we have but few, we have, and have had some, of whom we are justly proud; women of such well balanced minds, that toil they ever so laboriously in their public and perilous paths, their domestic and social duties have been fulfilled with as diligent and faithful love as though the world had never been purified and enriched by the treasures of their feminine wisdom; yet this does not shake our belief, that, despite the spotless and well-earned reputations they enjoyed, the homage they received (and it has its charm), and even the blessed consciousness of having contributed to the healthful recreation, the improved morality, the diffusion of the best sort of knowledge—the *woman* would have been happier had she continued enshrined in the privacy of domestic love and domestic duty. She may not think this at the commencement of her career; and at its termination, if she has lived sufficiently long to have descended, even gracefully from her pedestal, she may often recal the homage of the *past* to make up for its lack in the *present*. But so perfectly is woman constituted for the cares, the affectionate, the duties—the blessed duties of *womanly* life—that if she give nature way it will whisper to her a text that 'celebrity never added to the happiness of a true woman.' She

must look for her happiness to HOME. We would have young women ponder over this, and watch carefully, ere the veil is lifted, and the hard cruel eye of public criticism fixed upon them. No profession is pastime; still less so now than ever, when so many people are 'clever,' though so few are great. We would pray those especially who direct their thoughts to literature, to think of what they have to say, and why they wish to say it; and above all, to weigh what they may expect from a capricious public, against the blessed shelter and pure harmonies of private life.*

But we have had some—and still have some—'celebrated' women of whom we have said 'we may be justly proud.' We have done pilgrimage to the shrine of Lady Rachel Russell, who was so thoroughly 'domestic' that the Corinthian beauty of her character would never have been matter of history, but for the wickedness of a bad king. We have recorded the hours spent with Hannah More; the happy days passed with, and the years invigorated by, the advice and influence of Maria Edgeworth. We might recal the stern and faithful puritanism of Maria Jane Jewsbury; and the Old World devotion of the true and high-souled daughter of Israel—Grace Aguilar. The mellow tones of Felicia Hemans' poetry lingers still among all who appreciate the holy sympathies of religion and virtue. We could dwell long and profitably on the enduring patience and life-long-labour of Barbara Hofland, and steep a diamond in tears to record the memories of L.E.L. We could,—alas, alas!—barely five and twenty years' acquaintance with literature and its ornaments, and the brilliant catalogue is but a *Memento Mori!* Perhaps of all this list, Maria Edgeworth's life was the happiest; simply because she was the most retired, the least exposed to the gaze and observation of the world, the most occupied by loving duties towards the most united circle of old and young we ever saw assembled in a hot happy home.

The very young have never, perhaps, read one of the tales of a lady whose reputation, as a novelist, was in its zenith when Walter Scott published his first novel. We desire to place a chaplet upon the grave of a woman once 'celebrated' all over the known world; yet who drew all her happiness from the lovingness of home and friends, while her life was as pure as her renown was extensive.

In our own childhood romance reading was prohibited, but earnest entreaty procured an exception in favour of the 'Scottish Chiefs.' It was the bright summer, and we read it by moonlight, only disturbed by the murmur of the distant ocean. We read it, crouched in the deep recess of the nursery window; we read it until moonlight and morning met, and the breakfast bell ringing out into the soft air from the old gable, found us at the end of the fourth volume. Dear old times! when it would have been deemed little less than sacrilege to crush a respectable romance into a shilling volume, and our mamma considered *only* a five volume story curtailed of its just proportions.

Sir William Wallace has never lost his heroic ascendancy over us, and we have steadily resisted every temptation to open the 'popular edition' of the long-loved romance, lest what people will call 'the improved state of the human mind,' might displace the sweet memory of the mingled admiration and indignation that chased each

* In support of this opinion, which we know is opposed to the popular feeling of many in the present day, we venture to quote what Miss Porter herself repeats, as said to her by Madame de Sévigné—"She frequently praised my revered mother for the retired manner in which she maintained her little domestic establishment, yielding her daughters to society, but not to the world! We pray those we love, to mark and the world." "I was set on a stage," continues De Sévigné, "I was set on a stage, at a child's age, to be listened to as a wit and worshipped for my premature judgment. I drank adulation as my son's nourishment, and I cannot now be without the poison; it has been my lot, never an allment. My heart ever sighed for happiness, and I ever lost it, when I thought it approaching my grasp. I was admired, made an idol, but never beloved. I do not accuse my parents for having made this mistake, but I have not repeated it in my Albertine, (her daughter)." "She shall not

"Seek for love, and fill her arms with bays."
I bring her up in the best society, yet in the shade."

other, while we read and wept, without ever questioning the truth of the absorbing narrative.

Yet the 'Scottish Chiefs' scarcely achieved the popularity of 'Thaddeus of Warsaw,'—the first romance originated by the active brain and singularly constructive power of Jane Porter, —produced at an almost girlish age.

The hero of 'Thaddeus of Warsaw,' was really Koschusko, the beloved pupil of George Washington, the grandest and purest patriot the Modern World has known. The enthusiastic girl was moved to its composition, by the stirring times in which she lived; and a personal observation of, and acquaintance with, some of those brave men whose struggles for liberty only ceased with their exile, or their existence.

Miss Porter placed her standard of excellence on high ground, and—all gentle-spirited as was her nature—it was firm and unflinching towards what she believed the right and true. We must not therefore judge her by the depressed state of 'feeling' in these times, when its demonstration is looked upon as artificial or affected. Towards the termination of the last, and the commencement of the present century, the world was roused into an interest and enthusiasm, which now we can scarcely appreciate or account for; the sympathies of England were awakened by the terrible revolutions of France, and the desolation of Poland; as a principle, we hated Napoleon, though he had neither act nor part in the doings of the democrats; and the sea-sons of Dibdin, which our youth *now* would call unchristian and ungraceful rhymes, were key-notes to public feeling; the English of that time were thoroughly 'awake,' the British Lion had not slumbered through a thirty years' peace. We were a nation of soldiers and sailors and patriots; not of mingled cotton-spinners and railway speculators and angry protectionists; we do not say which state of things is best or worst, we desire merely to account for what may be called the taste for *heroic* literature at that time, and the taste for—we really hardly know what to call it—literature of the present, made up, as it too generally is, of shreds and patches—bits of gold and bits of tinsel—things written in a hurry to be read in a hurry and never thought of afterwards—suggestive rather than reflective, at the best; and we must plead guilty to a too great proneness to underrate what our fathers probably overrated.

At all events we must bear in mind, while reading or thinking over Miss Porter's novels, that, in her day, even the exaggeration of enthusiasm was considered good tone and good taste. How this enthusiasm was *fostered*, not subdued, can be gathered by the author's ingenious preface to the, we believe, tenth edition of 'Thaddeus of Warsaw.'

This story brought her abundant honours, and rendered her society, as well as the society of her sister and brother, sought for by all who aimed at a reputation for taste and talent. Mrs. Porter, on her husband's death (he was the younger son of a well-connected Irish family, born in Ireland, in or near Coleraine, we believe, and a major in the Enniskillen Dragoons), sought a residence for her family in Edinburgh, where education and good society are attainable to persons of moderate fortunes, if they are 'well born'; but the extraordinary artistic skill of her son Robert required a wider field, and she brought her children to London sooner than she had intended, that his promising talents might be cultivated. We believe the greater part of 'Thaddeus of Warsaw' was written in London, either in St. Martin's Lane, Newport Street, or Gerard Street, Soho, (for in these three streets, the family lived after their arrival in the metropolis); though, as soon as Robert Ker Porter's abilities floated him on the stream, his mother and sisters retired, in the brightness of their fame and beauty, to the village of Thames Ditton, a residence they loved to speak of as their 'home.' The actual labour of 'Thaddeus'—her first novel—must have been considerable; for testimony was frequently borne to the fidelity of its localities, and Poles refused to believe that the author had not visited Poland; indeed, she had a happy power in describing localities.

It was on the publication of Miss Porter's

two first works in the German language that their author was honoured by being made a Lady of the Chapter of St. Joachim, and received the gold cross of the order from Wurtemberg; but 'The Scottish Chiefs' was never so popular on the Continent as 'Thaddeus of Warsaw,' although Napoleon honoured it with an interdiction, to prevent its circulation in France. If Jane Porter owed her Polish inspirations so peculiarly to the tone of the times in which she lived, she traces back, in her introduction to the latest edition of 'The Scottish Chiefs,' her enthusiasm in the cause of Sir William Wallace to the influence an old 'Scotch wife's' tales and ballads produced upon her mind while in early childhood. She wandered amid what she describes as 'beautiful green banks, which rose in natural terraces behind her mother's house, and where a cow and a few sheep occasionally fed. This house stood alone, at the head of a little square, near the high school; the distinguished Lord Elchies formerly lived in the house, which was very ancient, and from those green banks it commanded a fine view of the Frith of Forth. While gathering 'gownans' or other wild flowers for her infant sister (whom she loved more dearly than her life, during the years they lived in most tender and affectionate companionship), she frequently encountered this aged woman with her knitting in her hand; and she would speak to the eager and intelligent child of the blessed quiet of the land, where the cattle were browsing without fear of an enemy; and then she would talk of the awful times of the brave Sir William Wallace, when he fought for Scotland 'against a cruel tyrant; like unto them whom Abraham overcame when he recovered Lot, with all his herds and flocks, from the proud fomy of the robber kings of the South,' who, 'she never failed to add, 'were all rightly punished for oppressing the stranger in a foreign land; for the Lord careth for the stranger.' Miss Porter says that this woman never omitted mingling pious allusions with her narrative, 'Yet she was a person of low degree, dressed in a coarse woollen gown, and a plain *Mutch* cap clasped under the chin with a silver brooch, which her father had worn at the battle of Culloden.' Of course she filled with tales of Sir William Wallace and the Bruce, the listening ears of the lovely Saxon child who treasured them in her heart and brain, until they fructified in after years into the 'Scottish Chiefs.' To these two were added 'The Pastor's Fireside,' and a number of other tales and romances; she contributed to several annuals and magazines, and always took pains to keep up the reputation she had won, achieving a large share of the popularity, to which as an author she never looked for happiness. No one could be more alive to praise or more grateful for attention, but the heart of a genuine, pure, loving woman, beat within Jane Porter's bosom, and she was never drawn out of her domestic circle by the flattery that has spoiled so many, men as well as women. Her mind was admirably unsullied and unshaken to the end of her days. She had, in common with her three brothers and her charming sister, the advantage of a wise and loving mother—a woman pious without cant, and worldly-wise without being worldly. Mrs. Porter stowed her hand and heart on Major Porter; an old friend of the family assures us that two or three of their children were born in Ireland, and that certainly Jane was amongst the number,* although she left Ireland when in early youth, perhaps almost an infant, she certainly must be considered 'Irish,' as her father was so both by birth and descent, and esteemed during his brief

* Miss Porter never told me she was an Irishwoman, but once she questioned me concerning my own parentage and place of birth; and upon my explaining that my mother was an English woman, my father Irish, and that I was born in Ireland, which I quitted early in life, she observed *her own circumstances were very similar to mine*. For my own part, I have no doubt that she was Irish by birth and by descent on the father's side, but it will be no difficult matter to obtain direct evidence of the facts; and we hope that some Irish patriotic friend will make due inquiries on the subject. During her life, I had no idea of her connection with Ireland, or I should certainly have ascertained if my own country had a claim of which it may be justly proud.

life as a brave and generous gentleman; he died young, leaving his lovely widow in straitened circumstances, having only her widow's pension to depend on. The eldest son—afterwards Colonel Porter—was sent to school by his grandfather.

We have glanced briefly at Sir Robert Ker Porter's wonderful talents, and Anna Maria, when in her twelfth year, rushed, as Jane acknowledged, 'prematurely into print.' Of Anna Maria we knew personally but very little, enough however to read with a pleasant memory her readiness in conversation and her bland and cheerful manners. No two sisters could have been more different in bearing and appearance; Maria was a delicate blonde, with a *riant* face, and an animated manner—we had said almost *peculiarly Irish*—rushing at conclusions, where her more thoughtful and careful sister paused to consider and calculate. The beauty of Jane was statuesque, her deportment serious yet cheerful, a seriousness quite as natural as her younger sister's gaiety; they both laboured diligently, but Anna Maria's labour was sport when compared to her older sister's careful toil; Jane's mind was of a more lofty order, she was intense, and felt more than she felt; while Anna Maria often said more than she felt; they were a delightful contrast, and yet the harmony between them was complete; and one of the happiest days we ever spent, while trembling on the threshold of literature, was with them at their pretty road-side cottage in the village of Esler before the death of their venerable and dearly beloved mother, whose rectitude and prudence had both guided and sheltered their youth, and who lived to reap with them the harvest of their industry and exertion. We remember the drive there, and the anxiety as to how those very 'clever ladies' would look, and what they would say; we talked over the various letters we had received from Jane, and thought of the cordial invitation to their cottage—their 'mother's cottage'—as they always called it. We remember the old white friendly spaniel who looked at us with blinking eyes, and preceded us up stairs; we remember the formal old-fashioned curtsy of the venerable old lady, who was then nearly eighty—the blue ribands and good-natured frankness of Anna Maria, and the noble courtesy of Jane, who received visitors as if she granted an audience; this manner was natural to her; it was only the manner of one whose thoughts have dwelt more upon heroic deeds, and lived more with heroes than with actual living men and women; the effect of this, however, soon passed away, but not so the fascination which was in all she said and did. Her voice was soft and musical, and her conversation addressed to one person rather than to the company at large, while Maria talked rapidly to every one, or *for* every one who chose to listen. How happily the hours passed!—we were shown some of those extraordinary drawings of Sir Robert, who gained an artist's reputation before he was twenty, and attracted the attention of West and Shee* in his mere boyhood. We heard all the interesting particulars of his panoramic picture of the Storming of Seringapatam, which, the first of its class, was known half over the world. We must not, however, be misunderstood—there was neither personal nor family egotism in the Porters; they invariably spoke of each other with the tenderest affection—but unless the conversation was *forced* by their friends, they never mentioned their own, or each other's works, while they were most ready to praise what was excellent in the works of others; they spoke with pleasure of their sojourns in London; while their mother said, it was much wiser and better for young ladies who were not rich, to live quietly in the country, and to escape the temptations of luxury and display. At that time the 'young ladies' seemed to us certainly *not* young; that was about two-and-twenty years ago, and Jane Porter was seventy-five when she died. They talked much of their previous dwelling at Thames Ditton, of the pleasant neighbourhood they enjoyed there, though their mother's health and their own had

* In his early days the President of the Royal Academy painted a very striking portrait of Jane Porter, as 'Miranda,' and Harlowe painted her in the coronet dress of the order of St. Joachim.

much improved since their residence on Esher hill; their little garden was hounded at the back by the beautiful park of Claremont, and the front of the house overlooked the leading roads, broken as they are by the village green, and some noble elms. The view is crowned by the high trees of Esher Place, opening from the village on that side of the brow of the hill. Jane pointed out the *locale* of the proud Cardinal Wolsey's domain, inhabited during the days of his power over Henry VIII., and in their cloudy evening, when that capricious monarch's favour changed to bitterest hate. It was the very spot to foster her high romance, while she could at the same time enjoy the sweets of that domestic converse she loved best of all. We were prevented by the occupations and heart-beatings of our own literary labours from repeating this visit; and in 1831, four years after these well-remembered hours, the venerable mother of a family so distinguished in literature and art, rendering their names known and honoured wherever art and letters flourish, was called home. The sisters, who had resided ten years at Esher, left it, intending to sojourn for a time with their second brother, Doctor Porter, (who commenced his

career as a surgeon in the navy) in Bristol; but within a year the youngest, the light-spirited, bright-hearted Anna Maria died: her sister was dreadfully shaken by her loss, and the letters we received from her after this bereavement, though containing the outpourings of a sorrowing spirit, were full of the certainty of that re-union hereafter which became the hope of her life. She soon resigned her cottage home at Esher, and found the affectionate welcome she so well deserved in many homes, where friends vied with each other to fill the void in her sensitive heart. She was of too wise a nature, and too sympathising a habit, to shut out new interests and affections, but her *old ones* never withered, nor were they ever replaced; were the love of such a sister-friend—the watchful tenderness and uncompromising love of a mother—ever 'replaced,' to a lonely sister or a bereaved daughter! Miss Porter's pen had been laid aside for some time, when suddenly she came before the world as the editor of 'Sir Edward Seward's Narrative,' and set people hunting over old atlases to find out the island where he resided. The whole was a clever fiction; yet Miss Porter never con-

kindly loving heart; her appearance in the London *coleries* was always hailed with interest and pleasure; to the young she was especially affectionate; but it was in the quiet mornings, or in the long twilight evenings of summer, when visiting her cherished friends at Shirley Park, in Kensington Square, or wherever she might be located for the time—it was then that her former spirit revived and she poured forth anecdote and illustration, and the store of many years' observation, filtered by experience and purified by that delightful faith to which she held,—that 'all things work together for good to them that love the Lord.' She held this in practice, even more than in theory; you saw her chastened yet hopeful spirit beaming forth from her gentle eyes, and her sweet smile can never be forgotten. The last time we saw her, was about two years ago—in Bristol—at her brother, Dr. Porter's house in Portland Square: then she could hardly stand without assistance, yet she never complained of her own suffering or feebleness,—all her anxiety was about the brother—then dangerously ill, and now the last of 'his race.' Major Porter, it will be remembered, left five children, and these have left only one descendant—the daughter of Sir Robert Ker Porter and the Russian Princess whom he married, a young Russian lady, whose present name we do not even know.

We did not think at our last leave-taking that Miss Porter's fragile frame could have so long withstood the Power that takes away all we hold most dear; but her spirit was at length summoned, after a few days' total insensibility, on the 24th of May.

We were haunted by the idea that the pretty cottage at Esher, where we spent those happy hours, had been treated even as 'Mrs. Porter's Arcadia' at Thames Ditton—now altogether removed; and it was with a melancholy pleasure we found it the other morning in nothing changed; it was almost impossible to believe that so many years had passed since our last visit. While Mr. Fairholt was sketching the cottage, we knocked at the door, and were kindly permitted by two gentle sisters, who now inhabit it, to enter the little drawing-room and walk round the garden; except that the drawing-room has been re-papered and painted, and that there were no drawings and no flowers, the room was not in the least altered; yet to us it seemed like a sepulchre, and we rejoiced to breathe the sweet air of the little garden, and listen to a nightingale, whose melancholy cadence harmonized with our feelings.

'Whenever you are at Esher,' said the devoted daughter, the last time we conversed with her, 'do visit my mother's tomb.' We did so. A cypress flourishes at the head of the grave; and

JANE PORTER'S COTTAGE AT ESHER.

visited its authorship, we believe, beyond her family circle; perhaps the correspondence and documents, which are in the hands of one of her kindest friends (her executor), Mr. Shepherd, may throw some light upon a subject which the 'Quarterly' honoured by an article. We think the editor certainly used her pen as well as her judgment in the work, and we have imagined that it might have been written by the family circle, more in sport than in earnest, and then produced to serve a double purpose.

After her sister's death Miss Jane Porter was afflicted with so severe an illness, that we, in common with her other friends, thought it impossible she could carry out her plan of journeying to St. Petersburg to visit her brother, Sir Robert Ker Porter, who had been long united to a Russian princess, and was then a widower; her strength was fearfully reduced; her once round figure became almost spectral, and little beyond the placid and dignified expression of her noble countenance remained to tell of her former beauty; but her resolve was taken; she wished, she said, to see once more her youngest and most beloved brother, so distinguished in several careers, almost deemed incompatible,—as a painter, an author, a soldier, and a diplomatist, and nothing could turn her from her purpose: she reached St. Petersburg in safety, and with apparently improved health, found her brother as much courted and beloved there as in his own land, and his daughter married to a Russian of high distinction. Sir Robert longed to return to England. He did not complain of any illness, and everything was arranged for their departure; his final visits were paid, all but one to the Emperor,

who had ever treated him as a friend; the day before his intended journey he went to the palace, was graciously received, and then drove home, but when the servant opened the carriage-door at his own residence he was dead! One sorrow after another pressed heavily upon her, yet she was still the same sweet, gentle, holy-minded woman who had ever been, bending with Christian faith to the will of the Almighty,—'bidding her time.'

How differently would she have 'watched and waited' had she been tainted by vanity, or fixed her soul on the mere triumphs of 'literary reputation.' While firm to her own creed, she fully enjoyed the success of those who scramble up—where she bore the standard to the heights—of Parnassus; she was never more happy than when introducing some literary 'Tyro' to those who could aid or advise a future career. We can speak from experience of the warm interest she took in the Hospital for the cure of Consumption, and the Governesses' Benevolent Institution; during the progress of the latter, her health was painfully feeble, yet she used personal influence for its success, and worked with her own hands for its bazaars. She was ever aiding those who could not aid themselves; and all her thoughts, words, and deeds, were evidence of her clear powerful mind and

the following touching inscription is carved on the stone:—

HERE SLEEPS IN JESUS A CHRISTIAN WIDOW,
JANE PORTER
OBIT JUNE 15TH, 1831, ETAT. 58;
THE BELOVED MOTHER OF W. PORTER, M.D., OF SIR ROBERT
KER PORTER, AND OF JANE AND ANNA MARIA PORTER,
WHO MOURN IN HOPE, HUMBLY TRUSTING TO BE BORN AGAIN
WITH HER INTO THE BLESSED KINGDOM OF THEIR
LORD AND SAVIOUR.
RESPECT HER GRAVE, FOR SHE MINISTERED TO THE POOR.

PICTURE SALES OF THE MONTH.

On the 26th of May Messrs. Christie & Manson sold a miscellaneous collection of pictures, a few of which were formerly in the gallery of the late Mr. E. Solly. The following works realised the sums respectively placed against them:—'Lucretia,' by Andrea del Sarto, 90 gs. (it sold for 30 gs. at Mr. Solly's sale); 'The Madonna and Infant Christ,' B. Lanini, 42 gs.; 'The Madonna and Infant Christ,' Leonardo da Vinci, 251 gs.; 'St. Jerome at his Devotions,' by the same artist, 90 gs. (sold for 31 gs. at Mr. Solly's sale); 'The Incredulity of St. Thomas, with St. Francis and a Patron kneeling,' by Il Perugino, 41 gs. (bought at Mr. Solly's sale for 145 gs.); 'The Passage of the Red Sea,' the celebrated picture by Mazzolino di Ferrara, 220 gs. (it realised at Mr. Solly's sale 230 gs.); 'Christ on the Cross,' by F. Francia, 205 gs. (fetched 355 gs. at Mr. Solly's sale); 'The Virgin and Infant,' by A. Del Sarto, 80 gs.; 'The Virgin, Infant, and St. John,' Fontorno, 40 gs.; 'Christ rising from the Tomb,' Scarsellini di Ferrara, 40 gs.; 'A Landscape,' G. Poussin, 20 gs.; 'A Sea-shore in the Mediterranean,' Claude, 60 gs. (No. 26 in the *Liber Veritatis*); 'An Italian Landscape,' Wilson, 36 gs.; 'A Landscape with a Woody Foreground,' Wilson, 20 gs.; 'A Bridge across a River, near some Ruins,' Wilson, 59 gs.; a large oval picture by Gainsborough, 'A mounted Peasant driving Cows and Sheep across a Bridge,' 53 gs.; 'An Italian Landscape, with Roman Ruins,' Wilson, 45 gs.; the celebrated picture by Sir Joshua Reynolds, of 'A Little Girl with a Spaniel,' 1020 gs. This work may be considered, perhaps, as the most important of Sir Joshua's, which has, for many years, been offered to the public, if we except the 'Age of Innocence,' in the Vernon Gallery, engraved for a former number of the *Art-Journal*; with less of refinement than we are accustomed to see in the pictures of this painter, it has perhaps more expression than the Vernon picture, and is in fresher condition. After a short but spirited bidding, it was knocked down at the price above stated, and, we learn, was bought for the Marquis of Hertford.

The sale of the water-colour sketches and framed drawings of that much esteemed painter of English scenery, the late P. De Wint, occupied five days at the end of May. There were nearly five hundred lots, and the whole were disposed of at sums highly complimentary to the talents of the deceased artist, though the prices at which the finished drawings were knocked down were small when compared with those realised by the sketches. The proceeds of the sale must have amounted to upwards of 2000l.

Some exquisite designs in sepia, by Stothard, for silversmith's work, were sold at Messrs. Christie & Manson's at the end of May, at the sale of the late Mr. John Gawler Bridge, of the well-known firm of Rundell and Bridge. Lot 209, Design for a Plate, with Cupids and Fruit, brought 157.5s., and lots 211 and 212, a Semicircular Frieze of Bacchante, with Fruits, 30s. 18s.

In the early part of June, Mr. Phillips sold, among a very interesting collection of pictures, which altogether produced upwards of 6000gs., 'Flowers in an antique Vase,' Van Huysum, 230 gs.; 'A Landscape,' from the Pallavicini Palace, by Rubens, 450 gs. There were also some good specimens of Hobbima and Ruysdael, which varied in price from 115 to 190 gs.; and of Murillo and Rembrandt, which reached from 200 to 230 gs.

At the sale of a miscellaneous collection, chiefly of old pictures of a very inferior quality, by Messrs. Christie & Manson, on June 4th, Cope's, R.A., 'Cup of Cold Water,' fetched 55 gs.; 'The River in the Glen,' Creswick, A.R.A., 115 gs.; Webster's sketch for his larger work of 'Sickness and Health,' 48 gs.; his little picture of 'The Grandmother,' 155 gs.; and his celebrated picture, 'Please to remember the Grotto,' 470 gs.

On June 5th Messrs. Christie & Manson sold a number of English pictures, of which the principal were a small half-length figure of a 'Girl carrying Fruit,' by D. Maclellan, R.A., 32gs.; a small 'Landscape,' in P. Nasmyth's best style, 21s.; 'Hush!' a mother and child, by H. Le Jeune, 34 gs.; 'Head of Sancho Panza,' C. R. Leslie, R.A., 21 gs.; 'The Widow casting off her Weeds,' a good specimen of H. Richter, 30 gs.; a small picture by Callcott, 'Yarmouth Jetty,' 39 gs.; 'A Fête Champêtre,' by Stothard, 37 gs.; 'A Lady and Child,' Sir J. Reynolds, the flesh-tints all faded, 41 gs.; 'The Reprieve,' J. R. Herbert, R.A., 37 gs.; a small work by Linnel, 'Evening—View of a Village on a River,' 42 gs.; 'A View on the Rhine,' a very small upright sketch by Callcott, 13 gs.; 'Crossing the Brook,' by the same painter, the small sketch

for the picture in the Vernon Gallery, and engraved in the *Art-Journal*, 30 gs.; and a noble 'Classical Landscape,' one of Callcott's grandest compositions, but somewhat cool in colour, 450 gs.

The collection of Mr. G. Bacon, of Lamcote House, near Nottingham, was also sold in the same rooms on the above day. It contained twenty-one pictures of a high class, all by English artists, with three or four exceptions. An excellent copy of Guido's picture of 'Lot and his Daughters,' in the National Gallery, was bought in at 100 gs.; 'An old Waterbowl of Newark,' life-size and full of expression, by Hilton, R.A., sold for 19 gs.; 'The Woodman's Return,' Morland, 20 gs.; 'Waiting for the Herring Boats,' a large picture by Shaver, 70 gs.; 'Scene from Lalla Rookh,' A. J. Woolmer, 30 gs.; 'The Sicilian Mother,' W. Salter, 18 gs.; 'The Dröver's Repast,' Frazer, 32 gs.; 'Landscape, with Cattle,' T. S. Cooper, A.R.A., a small and inferior specimen of this artist, 38 gs.; 'The Fortune-hunter,' by Redgrave, A.R.A., 110 gs.; 'The Spring Noddy,' a little child with her lap filled with flowers, by Mrs. Carpenter, 60 gs.; 'Sunday Morning,' the well-known picture by Collins, R.A., 410 gs. (this work was bought at the sale of Mr. Knott's collection for 294 gs.); 'The Quiet Lake,' Creswick, A.R.A., 165 gs.; 'Chapel in the Church of St. Jean, at Caen,' D. Roberts, R.A., 270 gs.; 'The Blighted Beech,' Lee, R.A., 90 gs.; 'Scene near Zeldkirch, in the Tyrol,' C. Stanfield, R.A., 190 gs.; 'A Summer Afternoon,' T. S. Cooper, A.R.A., 170 gs.; 'Dutch Boats, running into Rotterdam,' 290 gs. With the exception of the Collins we should by no means class the above pictures among the best works of the respective painters, but the prices they realised show how eagerly good works of the English school are coveted.

On the 7th of June the small gallery of pictures formed by the Duc Lante, of Monte Feltrio, was sold, with numerous others, by Messrs. Christie & Manson. The only picture worth notice among the whole was a small work by that early Flemish painter Hemmelinck, or Hemling, who lived soon after the time of Van Eyck; the subject was 'The Decollation of St. John,' represented in a Gothic archway, and the painting was remarkable for the extraordinary finish and delicacy given to the architecture and the sculptured figures which are placed in the niches. It was knocked down to Mr. Farrer for 80 gs.

If it were necessary to repeat the warning we have so frequently and so urgently given to amateur purchasers of the old masters, we would instance the sale, by Messrs. Christie & Manson, on the 11th of June, of the collection of the late John Noble, Esq., F.S.A. Our long personal and intimate acquaintance with this gentleman afforded us the opportunity of knowing that, in many instances, he paid large sums for his pictures, particularly for the two Guidos, purchased a few years back at Bologna, and which at this sale could not find a bidder, at 300 gs. And yet his whole collection, estimated by himself at a very high value—a value depending upon what it had cost him—was sold, with the exception of four pictures bought in, only realised about 400 gs. Fifty-two pictures with the names A. del Sarto, Titian, Cavalotti, Ruysdael, Tintoretto, C. Dolce, Hobbima, &c. &c. attached to them, selling for much less than half of the cost of a modern English painter, a week or two before, under the same hammer. Now there was nothing in the character of this sale to excite suspicion; Mr. Noble was long known to be a collector, and the pictures were offered as his *bona fide* property; they would not in fact have been sold at all, so greatly did he esteem them, but for his death; and there is no question he thought he was bequeathing a valuable property to his heirs, in his gallery. What a pity is it that they who have no higher motive in encouraging art, than the making a good investment—not that we attribute such to Mr. Noble—should not do so by making themselves acquainted with the works of our young artists of genius—our future Maclellans, and Eastlakes, and Eytts, Stanfields, Creswicks, &c. &c., and so lay out their thousands of spare cash as to benefit the rising generation of painters, and insure for themselves an advantageous return of their capital. There are many who have found this more profitable than the purchase of houses and lands.

But there are still among collectors many whose taste for old pictures is not yet gone by, who have not yet imbibed a relish for modern works, or who, having perhaps in years past got together a number of the former works, are unwilling to disturb the harmony of a collection by the introduction of what is altogether of an entirely different class. Whenever, therefore, an opportunity presents itself of purchasing pictures whose authenticity may scarcely be doubted, and whose merit cannot,

such works are sure to find buyers at a high price. Thus among the pictures belonging to the late Mr. H. Metcalfe, collected, we understand, under the guidance of Sir Joshua Reynolds, and sold by Messrs. Christie & Manson on June 15th, were a few which reached very high biddings. The examples of Sir Joshua's own pencil were much below par, with the exception of one, 'A Boy holding a paper and pen in his hand,' this was in tolerable condition, and had some rich colour in it, it sold for 162 gs.; 'Interior of the Cathedral of Antwerp,' by Peter Neefs, 210 gs.; a doubtful work of Teniers, 'A Gardener wheeling a barrowful of Vegetables in a Barn,' 91 gs.; 'The Temptation of St. Anthony,' also ascribed to Teniers, 104 gs.; 'A View on the Shore near Scheveling,' J. Ostade, 126 gs.; 'A Landscape,' with a large dun crouching down, a black and white one standing, and a peasant boy lying on a bank, by Cuyt, sold for 415 gs. We were surprised at the price this picture fetched; there is nothing in it to make it worth a fourth part of this sum, the animals are coarse, ill-composed, badly drawn, and wretchedly coloured, and the boy is still worse; the work would never have gained a place, even near the ceiling, in any room of our Royal Academy, nor indeed in that of any other Society here. 'Interior of a Guard-House,' Teniers, 175 gs.; 'The Departure for the Chase,' Wouvermans, 430 gs.; 'The Israelites worshipping the Golden Calf,' a picture by Claude, of rare excellence, but requiring the aid of a most careful and judicious cleaner to bring out its beauties, was put up at 500 gs., and finally reached 1050 gs., when it was knocked down to Mr. King; 'The Kermess,' or 'Feast of Peasants,' a brilliant work by Teniers, though not one of his very highest productions, fell to the bidding of Mr. Smith, of Bond Street, for 790 gs.; and a life-sized 'Portrait of Stanislaus Sigismund, King of Poland,' ascribed to Rubens, sold for 220 gs.; this picture was by no means of a high quality, nor in good condition.

The sale of Mr. McEigh's gallery took place after our number was prepared for the press. We had an opportunity, however, of inspecting the pictures while on view, and certainly a finer collection of good works was scarcely ever got together by a private individual. The rooms were crowded during the "view" days with visitors, who were not sparing of their expressions of delight at the exhibition. We shall doubtless have to make a good report of the sale next month.

THE VERNON GALLERY.

THE DUETT.

W. Ety, R.A., Painter. R. Bell, Engraver.
Size of the Picture, 1 ft. 6 in. by 1 ft. 2 in.

THIS picture, in subject and treatment, at once carries away the thoughts to that land

"Where lutes in the air are heard about,
And voices are singing the whole day long;
And every sigh the heart breathes out
Is turned, as it leaves the lips, to song."

It is quite evident, from many of Ety's pictures, that he learned in Italy not only how to imitate the colouring of the great Venetian masters, but how to select such subjects as would best enable him to put forth the knowledge he had acquired. This little work might have been painted by Titian or Giorgione, so completely is it Venetian in character. The figures are placed on a kind of elevated terrace (such as are frequently to be found in the country residences of the higher Italian classes); they are beguiling the hours, when evening is passing into night, with music; the cavalier and the lady sing a duett which the latter accompanies on her lute, the young page holding the music-score before them. On a marble slab to their left are refreshments—fruits and a flagon of wine; and to their right is seen a little bit of open country, which gives distance and atmosphere to the composition.

There is a beautiful harmony of tints in this picture, which has become very mellow in tone since it was painted. The balance of colours is also most effectively arranged by being repeated with some slight variations on different objects; thus the crimson of the shawl hanging over the balustrade, is repeated in the centre feather of the cavalier's cap; and the green, in the lower part of the lady's dress, in another feather. The richer hues of the fruit tend greatly to keep down those of the draperies, so as to preclude them from offering too strong a glare; while the whole subject is well brought forward against a sky and distance fading into the purple grey of twilight.

Faint text or caption located at the bottom of the illustration area, which is illegible due to fading.

W. H. WOODS, ENGRAVER.

NINEVEH AND PERSEPOLIS.*

ANTIQUARIAN researches have recently added so greatly to our knowledge of history and ancient manners, that it is not too much to demand for those who have prosecuted them, a full share of the honours awarded to all who aid the onward march of knowledge. By the help of the learned travellers of our own and other countries we are now enabled to enjoy the most familiar knowledge of the modes of life of the earliest nations of antiquity, their mechanical and intellectual state—all, indeed, that made them renowned for ever; and this by no vague reasoning, nor conjectural "grain of fact" to a large amount of "fancy," but by satisfactory reference to the records left by their own hands, wondrously preserved through thousands of years for the benefit of present inquirers. It is thus that ancient Assyria has given up its history of the past, to be imperishably impressed upon our minds, not for the gratification of curiosity merely, but to assist the historian and the student, and, more than all, to bring forth its witnesses to Biblical truth in its wondrous sculptures—these extraordinary "sermons in stones."

It is not too much to say, that the minute truthfulness with which every

The history of the cities Nineveh and Persepolis was literally buried beneath the debris of centuries, and it remained for the untiring energies of M. Botta and Mr. Layard to exhume the wondrous sculptured records which tell of their past greatness and of the extraordinary civilisation they enjoyed. Unaided by Government grants, Mr. Layard had but his undaunted love of science to aid him in his Herculean task—no less a one than that of resuscitating the lost history of ages. To Major Rawlinson also the world is

indebted for a clue to the power of interpreting the arrow-headed inscriptions, which, by the aid of himself and other European scholars, bid fair to

action of life has been rendered by these early artists, has produced a total revolution in the style of Biblical annotation, as far as its Archaeology is concerned; and that all authors now refer to these pictures or sculptures as to a pictorial commentary, wonderful for its true and perfect accordance with the most minute allusions made by the inspired writers.

be as clearly understood as the hieroglyphic writing of ancient Egypt, which was at one time entirely unreadable.

The work before us is a full exposition of all that has been done of late years in the East in the way of Archaeological study, as well as a clear and condensed history of the ancient people whose sculptured remains have so recently attracted our attention. As a record of history almost entirely neglected, this cheap and unpretending volume deserves much praise. Its author has cleverly and clearly condensed the past and present state of these great kingdoms, and offered, in a good and succinct narrative, an instructive history of all recent discoveries made there.

The cuts in this page give an idea of the interest of the sculptures recently excavated. The first represents a Divinity carrying a gazelle, and clothed in the garments rich with embroidery and fringes, for which the nation is specially noted in Holy Writ. The Head of a King below depicts the clear and beautiful manner in which these sculptures are executed; as also does the cut exhibiting a Groom reining his richly caparisoned Horses. The upper cut shows the Sacred Tree and Two Deities (the Nisroch) worshipped

by this early people; and the lower one the Siege of a City, in which a moveable stage with archers, and a battering ram, exhibit the advances they had made in the art of war; the beauty of execution in each of these sculptures as strongly speak of their acquirements also in the arts of peace.

* "Nineveh and Persepolis: An historical sketch of Ancient Assyria and Persia, with an account of the recent researches in those countries." By W. S. W. Vaux, M.A. London: Arthur Hall & Co.

ORIGINAL DESIGNS FOR MANUFACTURERS.

We are once more enabled to present to our manufacturing readers a page or two of designs, which the press of more immediate matters has compelled us to lay aside for some months. The time is rapidly approaching when an opportunity will be afforded, by the comparison of our own manufactures with those of foreigners, of judging how far the purposes we hope to have served are likely to prove effective. We can only trust that the interests of British industry will not be altogether behind in this great international struggle for pre-eminence.

DESIGN FOR A TAPER-STAND. By R. P. CUFF, (17, Owen's Row, Goswell Road). It is formed of leaves and berries arranged in the shape of a cockle-shell, so as to make a very ornamental object.

DESIGN FOR A TEA-CADDY OR WORK-BOX. By A. AGLIO, (4, Oval Road, Regent's Park). As it was not possible to give, in a perspective view, such an idea of the design on the lid of the box, as would be of any practical use, it has been engraved separately, and is seen in the woodcut immediately

below. There is abundant room for the display of taste and richness in such objects as these, especially when made of *papier-mâché*, by the introduction of painting. The combination of ivory and ebony, also well answers the purpose of showing up a design advantageously. The principal portions of

Mr. Aglio's ornamentation consists of floral decoration gracefully disposed. The shape of the caddy is both original and good; a vast improvement upon the old-fashioned parallelogram.

DESIGNS FOR DRAWER HANDLES. By W. HARRY ROGERS, (11, Carlisle Street, Soho). We know of no designer whose taste in this description of artistic matters is purer than that of Mr. Rogers; many of the best examples which have adorned

our pages have emanated from his pencil. These handles, with their grotesque faces, are in all respects excellent, and would well repay the attention of the manufacturer.

DESIGN FOR A WHIP-MOUNT. By J. STURD-WICK, (14, New Bond Street). In this design the artist has made use of the grotesque figure to terminate the handle; this should be manufactured

of silver, while ivory would serve best for the other portion. Without the final ornament, which would make it awkward to carry, the design would serve well for the purpose of an umbrella handle.

DESIGN FOR A STAIR-CASE BANNISTER. By J. TOWNSEND (11, Cropley Terrace, New North Road). It is not a very easy matter to combine lightness with elegance in objects of this description; but both have been attained here. The scrolls connect themselves with the upright bars by means of slight tendrils, as they may be called; the whole being well put together.

DESIGN FOR A CARD-RACK. By J. STRUDWICK. The ivy-leaf, branches, and berries, make up the constituent parts of this design, which is exceedingly novel in its form and in the disposition of its component portions. It should be made of papier-mâché, as being more durable than ordinary card-board.

ingly novel in its form and in the disposition of its component portions. It should be made of papier-mâché, as being more durable than ordinary card-board.

DESIGN FOR A BALUSTRADE. By G. R. CLARKE (15, Chester Place, Kennington). Without affecting anything beyond an arrangement of simple scrolls, the designer has here so disposed them as to present a singularly pleasing combination, the interstices being filled in with the *fleur-de-lys*, or something that approaches it.

DESIGN FOR A DOOR-KNOCKER. By G. R. CLARKE. This design partakes somewhat of the style of the preceding, but approximates more closely to the Gothic. It is massive, but not unwieldy, and if not manufactured upon

too large a scale might be of general application. The door to which it is affixed should be, however, of similar character.

ORNAMENTAL BOOKBINDING.

THE economic movements which characterise the onward march of modern literature, and the abundance of "shilling volumes" which pour forth on all sides to satisfy the thirst for knowledge, or the desire for mental amusement, now so generally felt by all, render the scarcity and value of literary information in past ages one of the wonders of the present. We can scarcely now form an idea of the great mass of ignorance which clouded the minds of the majority of the population (including even the lower class of priests) in the middle ages. Great minds there always have been, and original thinkers; but learning, or even the plain knowledge of books, was the privilege of few. A library of some fifty volumes was considered a treasure to be most vigilantly guarded; and we have instances of book-lending, when sovereigns were obliged to borrow from such stores, conducted with as much legal care and formality, as much provision against detention or carelessness, as would now be exercised for the security of an estate. Books were in those days very precious things, but their "mode of manufacture," if we may use such a term, of course, made them so. Every word had to be written, every ornament to be carefully drawn, painted, or gilt, and the labour of a pains-taking life was sometimes bestowed on a single volume.

Bookbinding was at that time as precious and artistic as the volumes themselves. Ivory inlaid with gems was used for the covers; gilded bosses and elaborate ornament on the leather of a later era. The fancy of the artist and the skill of the workman combined to render the exterior of the volume as attractive to the eye, as its interior would be to the mind of the student. The printing-press came in the fifteenth century to multiply books, and now "the new light" spread itself; the trammels of ignorance were burst by that giant power, and books became the familiar friends and counsellors of hundreds of readers, who had increased from

the units of the written libraries. A love for those silent advisers, those records of the lively words of the great departed, was rapidly generated, and the rich made the learned their fellow-students. Thus Grolier, in the early part of the sixteenth century, stamped his books "Jo. Grolierii et Amicorum," to show his desire that his friends should freely avail themselves of the knowledge his volumes contained. Perhaps bookbinding at no time reached a higher degree

of excellence than under the patronage of this book-loving treasurer of France. His volumes are remarkable for the taste, elegance, and variety of design which their covers exhibit; and Dr. Dibdin, in his *Bibliographical Decameron*, has noted the high prices obtained for these volumes when they appeared at sales. One not worth more than a ducat realised 42l. solely on this account. This same author has noted much more that is curious in the history of bookbinding; and his notices of the famous Roger Payne

and others bring down the history of the art to our own times.

Books have for centuries past been decorated by the same process, namely, impressing gold upon leather, by means of hot band types—a practice still continued in the best class of binding—which is the means of obtaining great richness of effect; but such is the want of the commonest principles of construction among workmen, the poverty of the tools or types, and

the expense of providing suitable drawings for single books, that one of the best houses in that department effects less than ever in what is called "finishing" by hand, not from any incapacity to

do what has been done before, so much as from a dislike to perpetuate bad art. The superiority of hand-tooled over blocks is as apparent to an educated eye, as the difference between cast and wrought iron. During the last twenty years, and more particularly the last seven, the common class of binding, or "boarding," as it is termed, has reached a superiority unrivalled by any country. Until about 1830 the majority of

books was published in paper, with slight boards and a white label, somewhat resembling the Edinburgh or Quarterly Reviews, entirely destitute of decoration; books are now published in

cloth, of various colours, and ornamented, at one blow of a press, in a style that would have been impossible a few years since; thus many modern works take their stand upon the shelves in their original bindings, and remain for years; a dozen years ago they would have been out of their jackets in as many months.

The specimens of modern stamps we have selected from several now exhibiting at the Society of Arts. They are by "Luke Limmer," and were designed by him for the factories of Leighton & Son, and Josiah Westley. They are intended to be worked in gold; we have selected those only which are best adapted to the printing press, impressed from the brass originals.

No. 1 is in the manner of *hand-tooting*, or working with types,—style of the seventeenth century. No. 2 is a back, and evidently intended for the life of some princess, the cross, lily, and strawberry-leaves being taken from the coronet. No. 3 is a Gothic design for a Bible cover, issued by Her Majesty's printers, illuminated. It contains a sacred monogram, formed of the I.H.S. and cross, reading, "Fear God and keep his Commandments, for this is the whole duty of man." No. 4 is a centre ornament, partaking of the Spanish style, peculiar to books printed in that country about the year 1600.

The engravers of this class of art, extensive as it is, have yet much to learn; and though many artists of eminence have designed covers on peculiar occasions, it has been with but indifferent success; for it seems very difficult to divest themselves of old prejudices; they have drawn them as if to print with letterpress, in black, and not in white or gold, upon a black background, as they would appear when worked properly. Artists might etch their designs upon the brass, engravers removing the blacks.

Great, indeed, has been the change in book-binding. The "extra work" that, in olden days, received the greatest attention from the artist, now scarcely gets any; and the "boarding," which some time ago received none at all, monopolises all the art,—the secret being quantity. The bookbinder who has a large number, say several thousands of volumes to place in the same covers, can spend a good sum upon a stamp that is worked in an instant, whilst the "extra" leather binder cannot afford to pay any thing for a design for a single book; thus, in the end, he cannot compete in either art or price. Stamped work is not nearly so durable as hand work or tooling, which we regret; for some dies are very beautiful, some of the best being by "Luke Limmer," who last year received reward from the Society of Arts for his designs. We hope to record many other artists in the ranks of those who direct attention to this subject, books being now on every table, the necessities as well as the monitors of life.

FANCY SCOTCH WOOD-WORK

OF MESSRS. SMITH, MAUCLINE, AYRSHIRE.

It has been frequently our task to reflect, in the course of our visits to manufactories, on the large amount of ingenuity and talent brought to bear on articles of little intrinsic value, and which, by proper exertion, are made to be the cherished ornaments of the boudoir, or the tasteful adjuncts of every-day convenience and luxury. We have been seldom more forcibly impressed with this truth, than while examining the objects upon which we are about to offer some remarks. Comparatively worthless pieces of wood have been rendered beautiful and valuable, and have been elevated to the rank of works of Art by the process under notice. We have therefore been induced to furnish our readers with a brief history of this branch of ornamental industry, as a curious instance of the construction of a large and successful trade out of a very slight beginning. Our attention was first called to the manufactory by the publication of a work on Scottish Tartans, reviewed in the *Art-Journal* for May. We have since had an opportunity to inspect the several articles referred to, and we gladly make our readers acquainted with the following curious and interesting facts.

The objects of ornamental wood-work, for which this manufactory is celebrated, originated in the making of snuffboxes, at the village of Lawrence-

kirk, in the north of Scotland. These boxes, from the great beauty of the hinge, soon acquired considerable celebrity, and one of them falling into the hands of the late Wm. Crawford, of Cumnock, in Ayrshire, a very clever and ingenious man, he immediately applied himself to produce a similar box, but found he was greatly at a loss for the mechanical apparatus with which the hinge was made; he persevered however, and ultimately discovered a method of making the hinge, entirely different from that pursued by the Lawrenceckirk makers, but equally effective. For many years Mr. Crawford managed to keep his secret, and thereby obtained very high prices for his snuffboxes; he employed a gunsmith in the neighbouring village of Auchinleck, to construct his tools for making the hinge; ultimately, Mr. Crawford, from some circumstance or other, took up a suspicion (which proved groundless) that the gunsmith had exposed his secret; being a man of a rather dogmatic temper, he went to a clock-maker in Douglas, (a distance of nearly thirty miles, where he was unknown) and employed him to make these secret tools; he did so, without having the least idea of the purpose for which they were intended. It happened, however, that in course of a short time, the Douglas clock-maker's apprentice, Archibald Sliman, came to commence business in Cumnock, where he soon met Mr. Crawford, for whom he had made the little mysterious tools, and learning the celebrity of his snuffboxes, he at once saw the mode in which they were applied to the making of the hinge. Sliman at once entered into a partnership with a carpenter of the name of Adam Crichton, and commenced snuffbox making; the tools for the hinge were to be produced by Sliman, and as an equivalent, Crichton was to provide wood, and do the carpenter's work of a new house for Sliman.

When Sliman produced the hinge tools, in a small piece of paper which scarcely occupied the hollow of his hand, Crichton thought himself cheated. A violent altercation ensued, and they began manufacturing snuffboxes separately. Very soon several other people began to make them, so that in course of a few years—say about 1820—the manufacturing of snuffboxes alone was supposed to bring eight or ten thousand pounds yearly into the small village of Cumnock.

Till this time, and for a few years after, the ornament upon the outside of these snuff boxes was done entirely with Indian ink upon the plain white wood, and there were some very clever men among the painters, who executed Wilkie's and others' subjects upon the tops of the boxes, with great fidelity of drawing and beauty of tint. About the year 1825, a young man (Andrew Smith) residing in the neighbouring village of Mauchline,* invented an instrument, to which scientific men gave the name of "the Apograph," for copying and reducing prints or pictures of any kind—this instrument does its work, where the original copy is not very large, with much greater precision than the Pencilograph, and perceiving how useful it would be in bringing down pictures to the size of a snuff box, having also considerable taste for drawing, he was induced to commence the snuffbox business in connection with his brother William, who took up his residence in Birmingham, where the boxes are chiefly sold; this single branch of their manufacture was, however, then rather on the wane and has continued to decline ever since.

We continue our history in Mr. Smith's own words:—"Soon after commencing the business," he says, "we began to introduce a greater variety into the ornamental part, and discovered various mechanical means of doing so, in styles both entirely new and esteemed very beautiful. As the snuffbox business continued to fall off, we sought out other articles of wood-work,† to which we could apply our ornaments; these now consist of every article which you can almost conceive it possible to make, from postage-stamp boxes, up to tea-trays. Among them many articles more suited to the wants and tastes of ladies than gentlemen, such as, card-cases, memorandum-books, work-boxes, dressing-cases, &c., and by this means we have not only kept up and extended our establishment, but, we are sure we have made our articles known over

* This village is celebrated as the poetic residence, "par excellence," of Burns, and the farm-house of Mossiel is within half a mile of the Manufactory we are describing. The village lies on the slope of the hill, commanding a fine prospect. It contains about 1200 inhabitants, the parish altogether about twice that number.

† The wood used in this manufactory, is chiefly of native growth, and is of that species called sycamore in England and plane-tree in Scotland. The required qualities of the wood being whiteness, compactness, and no liability to warp, all which the plane is found to possess in a higher degree than any other species of our native timber, and to preserve which, requires peculiar care.

nearly the whole civilised world. A lady from our neighbourhood was introduced a year or two ago, to one of the cardinals at Rome—a man who interested himself a good deal in matters of taste and vertu. On learning that the lady came from this quarter, he immediately went to his cabinet, from which he brought forth one of our snuffboxes, with the name of our village upon it.

"A few years ago, we applied our ornament to buttons made of wood, which in tone of colour we managed to adapt to all shades of cloth; from the extreme lightness of these buttons (which we call the 'Bredalbane button,' from the circumstance of the noble Marquis being the first to patronise them) and their smoothness, never cutting or injuring the hole, they became popular, and for some time we manufactured 1000 dozen daily; they have rather gone out of use in this country, though they still hold their place in the French market, where the people seem more able to appreciate the beauty of our articles than in England; it is, perhaps, indeed, questionable whether the articles made by us, in the remote village of Mauchline, is not the only instance, where the usual order of transactions in fancy goods, between this country and France is completely reversed,—among other things, we have made large quantities of fans, ornamenting them in our own peculiar styles for the French market.

"We employ at the present time upwards of sixty people, mostly natives of the village and neighbourhood; we have more than once brought hands from Birmingham and London, but our best workmen have been reared by ourselves. The wood part of the work is considered unrivalled in 'trueness' and excellence, and in the painting we have some hands that we think almost entitled to the name of artists. Our varnish is an *oil Copal*, and therefore very durable, but as we cannot use a stronger heat than from seventy to eighty degrees, it is a very slow process, every article being generally from six weeks to three months in this department. Our premises are situated in a garden, light and airy; the people enjoy health far above the average, are all cleanly in their persons and sober in their habits; the girls look so superior to factory girls generally that their appearance always excites the admiration of our numerous visitors. Among those sixty men, women, and boys there is not one who cannot read, and not more than one or two who cannot write. My brother, a man of the most excellent taste, and of the most sober and industrious habits, died two or three years ago; his son now manages our mercantile business in Birmingham, while my son who had so far 'taken his degrees' as an artist, as to have been admitted a permanent student at the Royal Academy, employs his time and talents at the manufactory here. Of the style of work (which you might call *diapering*) which we call 'ebecking,' an infinite variety is done, but the purely 'Scottish style,' that is, that consisting of the clan tartans, is, as you are aware, has been long the most prized; and is just now particularly so in France. It was the circumstance of finding great difficulty in ascertaining the real sets of the different clans, that made us direct our endeavours to bring out a *text book* on this subject."

Our testimony to the excellence of the work alluded to has been given in our May number; and we can as cheerfully give it to the other works of Messrs. Smith, which are not literary,—although their tartan printing has been adapted with much ability to the covers of books which are thus "in boards" of the greatest durability and beauty. Paper knives and many other articles comprising all that makes fancy wood-work famous, are produced with a beauty entitled to the highest praise, and we cheerfully award this firm that amount of publicity the artistic ingenuity of its works so fully warrants.

These simple facts, communicated to us by Mr. Smith, in answer to our enquiries, cannot fail to interest all classes of readers. The objects we have seen at their London depot are very numerous, and all in the best taste, executed with exceeding neatness, and always in a pure style of ornamentation. We have, indeed, in the produce of this manufactory, evidence of the benefits conferred by the artist, who will consider nothing too insignificant to be influenced by Art.

Many who, in our shops, examine these graceful utilities, will deem their value augmented by knowing something of the ingenuity which gave them birth—thus creating a large branch of commerce; and their thoughts may revert to the little village of Scotland, made prosperous and happy by that enterprise, which is the great characteristic and the justly proud boast of the country.

It is one of the privileges of our Journal thus to give extended publicity to so much taste, skill, and general ability, as we find displayed in the articles produced at the manufactory of Mauchline.

ITALIAN AND FLORENTINE SCHOOLS.

SOME years ago, when the love of Art was more exclusively the luxury of the wealthy, when costly plates and more costly volumes were almost entirely confined to the portfolios and the libraries of the rich, William Young Ottley, the well-known labourer in the field of early Art, and the author of the History of Engraving, published two volumes of exquisite fac-similes, after the works of the best old masters, under the respective titles of "The Italian School of Design," and "The Early Florentine School."* The first of these works consisted of eighty-four plates in folio, being a series of fac-similes of original drawings by the most eminent painters and sculptors of Italy, with biographical notices of the artists, and observations on their works. The second consisted of fifty-four plates, with brief descriptions, and comprised specimens of the paintings and sculptures of the most eminent masters of the Florentine school, intended to illustrate the history of the restoration of the Arts of Design in Italy, commencing with a specimen by an unknown artist of the Greek school about 1230, and including others by Pisano, Taddeo Gaddi, Orcagna, Ghiberti, &c., concluding with Luca Signorelli, who died 1521.

The careful and deep research, which was the peculiar characteristic of Ottley, and his intimate acquaintance with the history of early Art, gave great value to his labours, which are consequently deeply prized by all competent judges. The volumes have long since undergone the ordeal of criticism, and have taken their position among the most valued works which form the historic books on Art. They range over a period when the greatest and noblest minds devoted their energies to the resuscitation of the best days of Greece and Rome, seeking by deep study and earnest endeavour to revive, for their own age, a Christian Art as great as the Pagan one. There is an intensity of aim in all these works, however much they are shackled by conventionalism, that is worthy the attention of the modern student; an earnest search after the hidden force of natural expression which occasionally peeps forth in full intensity, as in the powerful group of "Angels listening to the Denunciations of the Wicked," by Andrea Orcagna, from his wondrous fresco of the "Last Judgment," in the Campo Santo at Pisa. The mental anguish denoted in the faces of these angels has seldom been surpassed; and the horror with which the foremost of the group is cowering beneath the shadow of his wings, repressing his very breathing with his hand, and by his eye only, telling of the conflict in his mind, is as extraordinary as any work which early Art can show. The exquisite bassi-relievi which decorate the bronze gates, designed by Lorenzo Ghiberti for the Baptistery at Florence, are given in the present work with great truthfulness, and show us how truly Michael Angelo judged of them when he declared them "worthy to be the gates of Paradise." The extreme simplicity and beauty of the females and children by Benozzo Gozzoli, and the remarkably pure and powerful design by Masaccio—"St. Paul visiting St. Peter in Prison"—the grace and simple purity of Fra Angelico, are all so many instances of the dignity and beauty of many of these works of early Art; and a testimony at once of their merit, and of the judgment and taste displayed by Ottley in their selection.

Of Leonardo da Vinci and Raffaele there are some beautiful specimens, drawn with a care and a simple adherence to truth, of the highest value to the student, if it be only to point out to him that there is no royal road to excellence, and that the greatest and best men, in ancient and modern art, have had to master difficulties as painfully and laboriously as the humblest.

* These volumes may be said to have been privately printed, they being done at the author's own risk; and the very high cost of each (about twelve guineas), precluding the general sale or popular knowledge of their contents; but Messrs. Colnaghi, of Pall Mall East, having recently obtained the remainder of the copies, they believe, as we do ourselves, that they are really conferring a boon on the student and lover of Art, by offering them at very reduced prices, which they are prepared to do.

THE VERNON GALLERY.

THE WINDMILL.

J. Linnell, Painter.

J. C. Bentley, Engraver.

Size of the Picture, 1 ft. 6 in. by 1 ft. 3 in.

MR. LINNELL is an old and valuable contributor to the Royal Academy and the British Institution, both in landscapes and portraiture; the last named works are distinguished by great simplicity of treatment, united with vast depth and brilliancy of colour. His pictures of rural scenery have rarely a name attached to them which would identify them with any particular locality, but, if not actually sketched from nature, they have so much of English character about them as at once to connect them in the mind with the most picturesque spots in the country. The most poetical and imaginative of his works is "The Eve of the Deluge," exhibited at the Royal Academy in 1848; we know of no picture of a similar class that shows a more elevated conception carried out with corresponding grandeur of effect; the sky especially is a wonderful piece of aerial painting.

In the little picture of "The Windmill," the sky also forms a very attractive feature; a thunder storm is passing over the landscape, and the heavy purple clouds are rolling away into the horizon, and throwing their deep shadows over the middle distance; the mill and the rising ground whereon it stands are lighted up with sunshine, but the ground is yet wet and reflects back, in parts, the varied tones of the sky; and the pool in the foreground, where the cattle are drinking, receives light from the white clouds above. There is throughout the picture an intensity of colour, as beautiful as it is natural, painted with extreme solidity, transparency, and decision of touch, yet with infinite delicacy. The scene is altogether one of great beauty; the picturesque old mill and bridge; the village which lies in the hollow, hidden, save the church steeple, by the high ridge of ground; the river winding its way through the valley till lost among the wooded hills; the herd, hot and thirsty, either already in the pool or hastening to it—all compose into as charming a subject as the most ardent admirer of nature could desire to have before him.

The picture was exhibited at the Royal Academy in 1847.

ON THE APPLICATIONS OF SCIENCE
TO THE FINE AND USEFUL ARTS.

THE CURIOSITIES OF STEEL MANUFACTURE.

STEEL PLATES FOR ENGRAVING—STEEL PENS.

IT is often one of the most instructive exercises of the human mind to trace back the progress of those efforts of skill and industry in the technical arts,—and to study their gradual advancement from some insignificant beginning towards perfection,—which operate by improving the intellectual condition of a people, or by exalting their powers of estimating the beautiful.

It is curious to observe how slowly a full perception of the truth advances—a long twilight precedes the rising sun—and the eye of man is gradually familiarised with the subdued radiations, struggling through mists and clouds, that he may not be "blinded with the excess of light," as he would be, if it was allowed at once to flash upon his mental vision. In science the examples of this are most numerous, and many of them sufficiently striking. A truth—an abstract truth—declared by all the world to be valueless, is the result of days of toil and nights of wearying study; the discoverer feels he has the end of a clue, through what labyrinth to guide him he cannot divine, but he works and hopes, and in due time this dry truth is found to have a use; an application is made of it, and by a regenerating power it appears to quicken human energy, and man rises to a nobler position—the circle of his view is enlarged, and he sees truths, beyond the horizon of his earlier truths, which never passed across the mirage of his dreams. The laws of heat, slowly developed, were at last applied in the steam engine. The old world story of electricity, after man had pondered on it for two thousand years, was at length made to girdle the earth with the quickness of thought; and light, "the first creation," is only now beginning to unfold its mysteries,

and bend to the controul of human power. But to descend from these higher class studies to those of a more humble kind, let us look at that great revolutionising agent which so distinguishingly marks modern,—and so broadly separates it from ancient, civilisation—Printing. From the rude process of gluing a written sheet upon a block of wood and cutting away all those parts upon which nothing was traced, which process existed in China five hundred years before even Europe awoke to the advantages of this, in the thirteenth century; to the discovery of the utility of moveable types, which in an extraordinary degree advanced the art; and from the days of John Guttenburg of Mentz and his partner—the hero of wide-spread tradition, Faustus—step by step have better applications been made; and books, once the luxury of the rich, are now become the necessity of the poor.

From the volume—an almost endless roll of papyrus—the work of the scribe, containing that wisdom which the plebeian races were not permitted to enjoy, the printing from moveable types has advanced mankind so far—that the thoughts of the holy and the good, of the philosopher and the poet, are the common property of every member of the civilised world. But for this little aid, so simple in its character and so easily reached, but so world-embracing in its powers, Europe would still have lingered in that eclipse of mind which is so appropriately distinguished as the Dark Ages.

As the improvements introduced into the processes of printing have facilitated the production of books to a wonderful extent, diffusing widely the thoughts of the learned few—thus letting in light on the souls of all—and awakening the chaos of the ignorant mind into life and power; so the advancement of those means by which the studies of the beautiful are multiplied, has tended to improve the tastes of the mass, and give to all a more exalted tone of feeling.

Engraving, an art springing beyond a doubt from the circumstance that the Florentine goldsmiths were in the habit of cutting ornaments of various kinds upon their wares, and, many of them being exceedingly beautiful, that there arose a desire to obtain copies of them upon paper that they might be thus multiplied, has progressed until now we are enabled to diffuse the productions of the artist to the great end of humanisation.

If any of our readers will be at the trouble of comparing the illustrations of the magazines and poetical works of half a century since, with those which are to be found in any of the illustrated literature of the present day, they cannot but be struck at the wonderful advances which have been made in the general character of the engravings.

In addition to the introduction of new processes of engraving on the ordinary material—copper—which has been usually employed, because it is soft enough to cut when cold, and yet hard enough to resist the action of the press, the use of steel plates has greatly tended to extend the advantages of the art. Previously to drawing attention to the numerous points in which steel, as a material upon which to engrave works of art, where a very large number of copies are required, is superior to copper, it will be advisable to speak of the introduction of this beautiful metal for the use of the engraver, and to describe the processes to which it must be subjected before it is adapted for the graver. Iron and steel had for a long period been ornamented by engraving; but the substitution of steel for copper as the material upon which the burin could be employed with facility, is quite of modern introduction.

In 1810 Mr. Dyer obtained a patent "for certain improvements in the construction and method of using plates and presses," as the communication of a foreigner. This was Mr. Jacob Perkins of New England, to whom we owe the introduction of roller press printing from hardened steel plates. It must not however be forgotten, that some of the earliest specimens of engraving on steel for the purpose of printing, were produced by Albert Durer in the beginning of the sixteenth century. This extraordinary man, with unusual energy of

J. C. BEVELDE. DEL.

J. APPEL. DVS. DEL.

THE WINDMILL.

THE SCENE OF THE CONQUEST.

character, appears to have tried his powers upon every branch of industry which could possibly tend to circulate the works of art among the German people, to the elevation of whose taste and language this artist devoted his busy life.

There are four impressions of plates, by Albert Dürer, in the British Museum, which are stated to be from steel plates; one of these bearing the date 1510. Although attempts appear to have been made from time to time to employ steel in the place of copper, there were so many difficulties in the processes of execution that no progress was made, and its use was abandoned until the experiments of Mr. Perkins.

This ingenious artist employed plates, on the average about five-eighths of an inch thick, of either tempered steel, or steel so changed by a process presently to be described, that it becomes analogous to soft iron.

This has been termed *decarbonating*, but this name involving an idea that the carbon is separated from the steel, is of exceedingly doubtful propriety. A plate of cast-steel was placed by Perkins in an iron case, and covered to the thickness of about an inch with rusty filings, or with the oxide of iron. The case being carefully luted, was placed in a fire kept to a tolerably uniform temperature, and a red heat was maintained for from three to nine or ten days. Analysis of steel before and after this process does not prove the loss of carbon, and whether wrought iron turnings or filings, or those of cast iron are employed, the result is the same. Steel has been popularly spoken of as a carburet of iron—iron combined with an equivalent proportion of carbon. Now, the only chemical differences between bar iron and different varieties of steel are that—

Bar iron contains of carbon	$\frac{1}{2}$ per cent.
Bar steel	" " 1 "
Cast steel	" " 1 $\frac{1}{2}$ "

while in some specimens it has even been found to reach to two per cent. The mode in which this carbon combines with the iron is not understood, but we have no evidence in proof of the assertion that there is any loss of carbon by the process to which Perkins subjected his plates. If we cast steel and cool it quickly, it is hard and exceedingly brittle; if, on the contrary, we cool it very slowly, it is so soft that it may be readily cut with the graver, and is very ductile. It is therefore most probable that the change is entirely a physical one, depending on some difference in molecular arrangement.

When the engraving or etching was executed on the plate, it was subjected to a process of cementation, by placing it in a box, as before, but covering it, instead of with iron, with a powder of horned animal matter. In this condition in the box, closely luted, it was exposed to a cherry red heat for some hours, and then plunged edgewise in cold water. It thus became very hard, and consequently brittle, and an operation of tempering was rendered necessary. This was effected by polishing the under surface, and placing it on an inclined lead until the polished portion acquired a straw colour. In the specification the patentee, however, expressed himself in favour of an oil bath at the temperature of 400° Fahrenheit. The plate being cooled and polished was now ready for use.

Mr. Perkins has also the merit of introducing the *indenting cylinders*. These were rollers of steel of a few inches diameter, which being softened by the process described, were rolled under a very powerful press over the surface of one of the engraved and hardened steel plates, until every indentation was communicated to the cylinder, upon which it was presented in sharp relief. The cylinder was then carefully hardened, and employed to impress soft steel plates. By this method the time required to re-cut a plate is entirely saved, and we obtain from the cylinder a fac-simile of the original plate.

This process is now usually employed for impressing upon different steel plates any emblematical designs, ornamental borders, or the like; as, with but little labour, the operation being purely mechanical, the original design can be imparted to any number of plates, or on any part of one, by the application of the cylinder. The process, difficult as it may appear, is now

commonly employed, and not unfrequently some of the highest works of Art are thus transferred from plates to cylinders, and again to plates. In connection with the involved machine engraving, introduced with the view of preventing the forgery of bank notes, this operation has been of the highest utility, economising both time and labour. In the process of the mint, a similar operation is commonly performed. The original die being executed by the engraver under the direction of the artist, is subjected to the process of hardening, and a copy is obtained from it upon softened steel, which, being hardened, is employed in striking coins or medals, the original being thus preserved from the chance of accident; the fracture of the die in the violent operation of striking not being at all an unusual occurrence.

In the Transactions of the Society of Arts for 1824, will be found a very interesting paper on steel engraving. This paper arose out of the award by the society of their large gold medal to Mr. Warren for his improvements in the art of engraving on steel.

Mr. Warren had been in his youth employed in engraving on metals for the calico printers, and also in ornamenting gun locks and barrels; and from the education thus obtained he turned his attention to the subject of steel engraving, with a view of applying it to the Fine Arts. The success which ever attends industry, when it is directed by experience, followed the labours of Mr. Warren; and with exemplary patience he pursued his experiments, learning the various difficulties by which the process was retarded, and gradually removing them.

Adopting the process of softening the steel, and then case-hardening it after a method, somewhat modified, employed by the Birmingham manufacturers of ornamented steel goods, Mr. Warren's plan was as follows:—As already described, a steel plate was placed in a box upon a bed of iron filings and powdered oyster shells; then another layer of the same kind and thickness was placed on the plate, upon which another steel plate was disposed; and so on, alternately, until the box was quite full. The case thus charged was carefully closed and exposed to the greatest heat it would bear without melting for several hours. The whole was then allowed to cool very slowly, and usually the result was a very uniform softening of the steel. Mr. Hughes, however, appears to have improved upon the process of Mr. Warren. Finding that sometimes a plate was harder in some parts than in others, Mr. Hughes imagined that this arose from deficiency in the quantity of heat employed, and he substitutes a casing of fire clay for the one of iron, which enabled him to expose the plates to a much higher temperature. The result of this was the production of plates of the utmost ductility.

Mr. Warren had to contend with two very opposite difficulties in preparing his steel plates. When a plate of steel of the same thickness as the ordinary copper plates was subjected to the so called *decarbonating* process, and subsequently to the operation of *steeling* or case-hardening, it was liable to warp, and of course any inequality in the surface of a plate from which impressions are to be printed would be fatal to its use. Plates of this thickness possessed all the advantages offered by copper, but for this difficulty. They were soft enough to cut with the graver and other tools, and the errors of the engraver could be readily removed by what is technically called *knocking up*—that is, scraping out the error, and beating the back until the face of the plate was again free from all unevenness when polished. To prevent the warping, plates of three or four times the thickness of the copper plates were employed. By the use of these the warping was prevented, but the *knocking up* was impracticable; the only method by which an error could be removed, being that of drilling a hole in the under part of the plate, and forcing in a screw, by which the face of the metal was raised, a delicate and tedious operation, now seldom resorted to. The experience gained by the general practice of employing steel plates, has enabled the manufacturer to secure much greater uniformity throughout the plate, and even to prevent, when plates not more than the eight-

hundredth of an inch thick are employed, any warping. From Sheffield the engraver can now procure plates of any degree of hardness, and this is so very nicely adjusted to the purposes for which the steel is to be employed, that the subsequent case-hardening is entirely dispensed with, except in some very peculiar instances.

The manipulatory processes of etching and gravure steel plates so nearly resembles those practised upon copper plates, that they need not be described in this place. A practical writer on this subject says:—

"Concerning the great superiority of steel plate over copper plate for all works that require a considerable number of impressions to be taken there can exist no doubt; for though the use of the graver and other tools, requires more time on steel than on copper, and though the process of re-biting has not yet been carried to the degree of perfection in the former that it has been in the latter, yet the texture of steel is such, as to admit of more delicate work than copper; and the finest and most elaborate exertions of the art, which on copper would soon wear, so as to reduce them to an indistinct smeaury tint, appear to undergo scarcely any deterioration on steel; even the marks of the burnisher are still distinguishable after several thousand impressions."

It should have been noticed that the operations of acid in the etching processes, technically called biting in, is much more rapid on steel than on copper, although from some peculiarity in the structure of the metal, a double line is sometimes formed by the acid, particularly when the required line is a thick one, a little ridge running along the bottom of the main line parallel to its edges.

Previously to the introduction of steel engraving, it was not practicable to obtain a large number of impressions from any plate. Copper, however well prepared, is a soft metal, and by the friction of applying the ink, cleaning off, and eventually the pressure of printing, is speedily worn, and the delicate lines of any work were soon destroyed. We have inspected one of the very first impressions taken from one of the steel plates on which the Vernon Gallery pictures are executed for this Journal, and compared it with another printed after twenty-two thousand impressions, including proofs, had been obtained, and it was only upon close examination that the difference between them could be detected. The quality of the steel plate materially influences this result, many plates wearing unequally, owing to defects in its manufacture. Again much depends on the skill and care of the printer, and the quality of the ink employed. And it must be stated that the process of taking a proof engraving is supposed to wear the plate as much as the operation of taking four ordinary prints; this is not caused so much by any increased pressure of the printing machine as by the extra wiping and cleaning out of the ink, which the plate undergoes, so as to get the delicate gradations of tint required in a first class impression.

Examples such as these are the strongest proofs of the great advantages to be derived from this process. It is true by the electrotype copper plates can be multiplied—every copy being an exact fac-simile of the original plate. But, the electro-deposited copper wears rapidly, and the finer parts of an engraving fail after a few hundreds.

Had it not been for the introduction of steel plates, it would not have been practicable to have circulated, as is now circulated, into every corner of the United Kingdom—we may almost say of the world—copies of those choice productions which constitute the Vernon Gallery. By its aid they are circulated, at a price within the reach of the humblest, to do their work in improving the taste, and cultivating a love for the beautiful in Art and Nature. A few years since, rudely coloured, badly executed, and often vulgar prints were the only things to be obtained by those of the great masses of society, whose feelings led them to delight in mimic representations of nature, and their houses were consequently decorated with objects which ministered to a depraved taste. A better order of things is now in progress—works of good Art

are circulated, and for a few pence any man may obtain fine copies of the best works of the best masters. From this is arising a refined taste and feeling, the moral influence of which must be infinitely great. This has steel engraving—like printing from movable types—ministered to a grand cause.

The manufacture of steel pens may now be included among the curiosities of the manufacture we have been considering. For producing them the best Dannemora—Swedish iron—or hoop iron is selected. It is worked into sheets or slips about three feet long, and four or five inches broad, the thickness varying with the desired stiffness and flexibility of the pen for which it is intended. By a stamping press, pieces of the required size are cut out. The point intended for the nib is introduced into a gauged hole, and by a machine pressed into a semi-cylindrical shape. In the same machine it is pierced with the required slit or slits. This being effected the pens are cleaned by mutual attrition in tin cylinders, and tempered, as in the case of the steel plate, by being brought to the required colour by the application of heat. It unfortunately happens, however, that the process of tempering, upon which entirely the quality of the pen depends, is in most cases most carelessly performed.

Some idea of the extent of this manufacture will be formed from the statement, that nearly 150 tons of steel are employed annually for this purpose, producing upwards of 250,000,000 pens.

ROBERT HUNT.

THE NEW HOUSES OF PARLIAMENT.

We could pity Mr. Barry for the attacks which have lately been made upon him in the House of Commons, did not we know that, inasmuch as he has right and justice on his side, he requires no commiseration, for he must eventually turn the tables on his accusers. On the 24th of May, Mr. Osborne, supported by Sir B. Hall and Lord Robert Grosvenor, opened a heavy battery upon this unfortunate gentleman—unfortunate, because his accusers are they who put obstacles in his way—charging him with unnecessary delay, with excessive expenditure, and intimating that what had been done, in so far as related to their own house, was ill-adapted to its purpose; and although these attacks were replied to by the Chancellor of the Exchequer, Mr. Greene, Sir W. Clay, Mr. Cubitt, and others, yet the voice of the house was unquestionably against him; and the economists succeeded in knocking off a paltry sum of about 1000 guineas which Mr. E. Lansdowne was to have received for painting three frescoes in the Peers' Refreshment room. This is really a pitiful economy for a great and wealthy country to pursue—one that must cause us to be made the laughing-stock of our Continental neighbours. With respect to the delay in carrying on the building to completion, it was truly remarked by Earl de Grey, in his address to Mr. Barry when presenting him with the Royal Gold Medal at the Institute of Architects:—"Your great predecessor, Wren, laid the first stone and the last stone of St. Paul's Cathedral. I trust the same fate may be yours. On that building he was occupied thirty-four years; you have not yet spent half that time upon yours; and if it had depended on yourself alone, more of it would already have been done,—the means have been withheld, and difficulties have been unnecessarily created. Wren, in his building, had but one purpose to consider; you have many; and what he did was for people who knew what they wanted. This is not the case with you; your masters are legion; and numbers of the gentlemen of the House of Commons, when they ask questions, positively do not know what it is they want. The Westminster Palace is at once the most difficult and most magnificent work ever attempted. The wants are so varied, and the means of supplying them were so little understood, when it was commenced, that the task is most complicated. As one of those appointed to overlook the works, I have had opportunities of seeing the difficulties in your path and the way in which you have overcome them, that others had not."

This is a true statement of facts; the difficulties Mr. Barry has had to encounter, in every shape and form, while carrying on his most arduous undertaking, have been sufficient to drive his reason from his stronghold, and would have in-

duced a less energetic mind to resign his post in utter hopelessness of ever bringing his work to a conclusion. Honourable members cavil at delay; what has caused it but the parsimonious spirit which withholds the means for effecting greater expeditions? Wood, and stone, and artisans are to be had in abundance, but there must be money forthcoming to pay for them. We have on more than one occasion walked through the length and the breadth of the vast edifice, and seen, perhaps, a man and a boy at work where a score could have been advantageously employed. Moreover, it should be borne in mind by those who would use such unseemly haste, that a richly decorated building like this, composed of heavy materials requiring time to season and settle down, cannot be erected in half a dozen years, even with all the means and appliances which the utmost liberality of expenditure could bring to bear upon it. There is a class of tradesmen who undertake to make you "a suit of clothes in the first style of workmanship, and of gentlemanly fit, in six hours;" but Houses of Parliament are not built at this rate, nor is it desirable they should be.

On the 10th of June, in the House of Commons, on the motion for bringing up the report of the committee of supply, Mr. Hume (who, by the way, was very angry with Lord De Grey for his observations, quoted above) on reading the resolution relative to the grant for the new Houses of Parliament, moved the following amendment, with a view to lessen the amount by the sum proposed in the estimate for the expense of the Commission of Fine Arts, until the Houses of Parliament may be habitable for the transaction of public business, to leave out the words "one hundred and three thousand six hundred and ten pounds," and to insert the words, "one hundred thousand six hundred and ten pounds."—The Chancellor of the Exchequer opposed the motion for a committee to inquire into the whole proceedings since the commencement of the buildings, but he would not object to a committee to inquire into the accommodations, &c. of the new House of Commons.—Sir R. Peel contended that Mr. Barry was not responsible for the alterations which had been made from the original plans of the Houses of Parliament, those alterations having been suggested by various members of either House of Parliament, and amongst others by Mr. Hume. The right hon. baronet then proceeded to defend the course pursued by the committee appointed to superintend the building and decorations of the new Houses of Parliament, and contended that they were deserving of the confidence of the house for all their proceedings.—Lord J. Russell supported the vote as originally agreed to in committee.—The house afterwards divided, and the amendment of Mr. Hume was negatived by a majority of 144 to 62.

Mr. Hume then moved that a select committee be appointed to inquire into and examine the various reports, statements, and plans of the architect relative to the new Houses of Parliament, and also into the manner in which the works have been conducted, and the different estimates made, with a view to ascertain the cause of the great increase of charges above the estimate for the plan delivered by Mr. Barry, and examined by proper officers, amounting to the sum of 707,000*l.*, on which estimate the sanction of Parliament was obtained for the adoption of the plan; and that the committee be instructed to obtain from Mr. Barry plans and estimates of all the additions and alterations made by him upon his own responsibility; also, those that have been made at the suggestion of or under the authority of the Lords of the Treasury, the Commissioners of Woods and Works, or any other parties; also what further plans and projected works are intended to be carried out for the completion of the said Houses of Parliament, with proper estimates for the various items, so as to arrive at the total expense for the whole building, fittings, and decorations.—Lord J. Russell said that in a few days all the proposed information would be communicated to the house, and until then he thought it would not be convenient to appoint the committee.—After some discussion the house again divided, and the motion of Mr. Hume was negatived by a majority of 85 to 55.

After all that has been urged upon the subject, we agree with what Mr. Roehuck said on the occasion:—"As to that House pretending to give an opinion upon architectural despatches it was perfectly preposterous. With regard to the new House of Commons, it was impossible to form any opinion yet, as whenever they had met there all the members were at once talking and keeping up conversations. He believed there was a great deal of pleasure in finding fault, but in his opinion the House of Commons was not a proper judge of the accommodation that was provided for them."

SCENERY OF THE STAGE.

AMONG the marvellous dramas of Shakspeare, eminently suited to the Lyric Stage, "The Tempest" may be designated as the most perfect. Rossini has wedded immortal strains to the tragedy of Othello; and still later, Mendelssohn has given sublime inspirations to the Midsummer's Night Dream. Although other dramas of the great bard have afforded librettos to musical composers, yet it was reserved for Mr. Lumley's enterprise and good taste to present the "Tempest" as a grand opera. The fascination of a subject so redolent of the finer feelings of humanity, conducted by the spell of enchantment, is felicitously adapted for the development of the choreographic and choral arts of Her Majesty's Theatre.

Shakspeare has described the locality of the action to have been a solitary island of fearful approach, from a stormy and tempestuous sea which freed its enchanted shores from human intrusion; and conjectures have been hazarded that he intended the scene to have occurred in the island of Bermuda, from the words spoken by Caliban:—

"Thou shalt fast me up at midnight to fetch dew
From the still vexed Bermooches."

The Rev. Joseph Hunter, F.S.A., in a privately printed pamphlet of 150 pages on this play of Shakspeare, brings forward many serious arguments and authentic relations from travellers, to prove that the actual locality is a small island lying midway between Malta and the coast of Africa, known to geographers by the name of Lampedusa.

"It is," says the learned commentator, "thus precisely in the situation which the circumstances of every part of the story require. Sailors from Algiers first land Syracusa, the mother of Caliban, on a desert isle. Prospero, Duke of Milan, is borne from an Italian port with his daughter Miranda "some leagues to sea," and then cast adrift in a boat without sails or mast, to be saved by landing on a small island. This could not possibly be Bermuda, situated across the vast Atlantic. The improbability is increased that Alonso, the king, should steer any such course in sailing from Tunis to his capital of Naples, while Lampedusa lies exactly in the route."

In receiving Mr. Hunter's proposition as granted, the scenery of Southern Europe, and the African's shore, combines admirably with the traces of Ariel's mystical evolutions, her attendant Sylphs and Fairies, with the consequent enchantment, of a shipwreck without danger to life or damage to attire. Mr. Marshall has taken this view in the scenic decorations he has been called on for illustration of this poetic drama.

The first scene is, of course, the ship annihilated and submerged by Ariel's magical agency, and represents the deck of one of those elegant galleys which Claude Lorraine has transmitted to posterity, on the canvas of his numerous Italian sea-ports. The armorial bearings of the Milanese dukedom are embroidered on the masthead of the ship, which spans the entire stage; and on the deck, a gorgeous awning protects the couches of the princely personages who repose beneath.

The cavern scenes on the island, which succeed, exhibit the convulsive *Striae* of volcanic formations untrammelled into form or convenience by the rude labours of man, and profusely strewn with the luxuriant and singular vegetation of the floral regions where sunshine never fails. A succeeding scene of dazzling brightness, admirably in harmony with the stage business, is painted with a happy effect; the clear sea gently breaking on the shores of a bay, here and there fringed with a few graceful palms. The carouse of the joyous seamen, the exhilarating strains of Stephano, and of the monster, Caliban, form a perfect realisation of the poet's dream. Surely Shakspeare has divined that this latter creation of his fertile genius was eventually to be fulfilled by the libretto, when he made Prospero say—

"Come, thou tortoise!"

The concluding scene presents an ethereal throne with its prismatic rings and golden rays gradually vanishing at the appearance of a fairy ship, conducted by groups of floating zephyrs—the masts rigged with silvered sails and garlands of roses for cordage, emblematical of the universal felicity that terminates the story, and realising the poet's inspiration with the attributes of all the elegant arts. Mr. Marshall has worthily completed a series of scenery, remarkably illustrative of the story, with the highest artistic skill in this particular branch; and it is a singular feature, that throughout the varied changes, not a single vestige of any architectural construction has been employed, the entire reliance having been upon the forms of Nature, and the illusious of natural phenomena.

MINOR TOPICS OF THE MONTH.

THE NATIONAL GALLERY.—Some steps have been taken by the Government during the past month, with reference to the future disposition of the National Gallery and the Royal Academy. On 7th ult. Colonel Rawdon rose to ask Lord John Russell "whether the inquiry which was instituted respecting the state of the pictures in the National Gallery, with a view to their better preservation, has terminated, and if so, will the information be given to the House? Whether any proposal has been made by the Government to the Royal Academy, with a view of obtaining for the public collection of pictures the entire of the National Gallery building; and, if so, what answer has been given? Whether any supplemental vote in the present estimates will be called for to carry out the proposition. Whether it is the intention of Government, before taking final steps for permanently locating the pictures on the present site, to institute an inquiry, by a committee of this House or otherwise, in order to ascertain whether or not it is expedient to allocate the pictures in Trafalgar Square?" Lord John Russell said, "with respect to the first question as to the inquiry instituted into the state of the pictures, with a view to their better preservation, he had received a report from the gentlemen composing that committee, and they had made some suggestions as to their better preservation, but they requested to be allowed to make further inquiry, particularly with respect to the collections of pictures on the continent. He should be ready, ere long, to lay that report on the table of the House, although it was not a final report. With respect to the second question, in conformity with the opinion of the committee of this House, which sat on the question of the building in Trafalgar Square, he made a proposal to the Royal Academy, with the view of having the entire building of the National Gallery devoted to the exhibition of the pictures. He had received an answer expressing their desire to comply with the wishes of the Government on that subject. With respect to the third and fourth questions, he should say, with that additional information which he now had before him in regard to the present state of the pictures, he thought it was desirable that some further inquiry should be made before any vote was proposed to be sanctioned by the House, and, therefore, he proposed early next week to move for a select Committee, consisting, as far as possible, of the members of the present Commission, to consider that further information, and to state their opinion of the most desirable manner of preserving the pictures in the National Gallery, and whether the present site was the most desirable for the institution." In pursuance of this promise, on the 11th of June, Sir George Grey, in the absence of the First Lord of the Treasury, moved "that the following members be appointed as a select committee, to consider the present accommodation afforded by the National Gallery, and the best mode of preserving and exhibiting the public works of art given to the nation, or purchased by parliamentary grants:—Lord John Russell, Sir R. Peel, Mr. Hume, Lord Seymour, Mr. Goulburn, Mr. B. Wall, Mr. S. Herbert, Sir B. Hall, the Marquis of Granby, Mr. Tuffnell, Mr. Wakley, Mr. D'Israeli, Mr. V. Smith, Mr. Bankes, and Colonel Rawdon." We wait with some anxiety the issue of this inquiry; the expression of any opinion regarding the result would be, to a certain extent, problematical, and at all events, premature. One fact, however, we may notice in Lord John Russell's reply to Col. Rawdon, that the Royal Academy has expressed its readiness to comply with the wishes of the Government, in case it should be deemed desirable to remove that Institution from the place it now occupies. We think it by no means improbable that the whole of the present building in Trafalgar Square will be given up to the Royal Academy; we believe such an arrangement would be best for the public service and the interests of British Art; but of course, under such circumstances, the Royal Academy would become a public and not remain a private Institution, when it would be in many important particulars remodelled; it is high time that the Nation should take the Arts under its protection.

THE ROYAL ACADEMY.—We are indebted to our contemporary the *Athenæum* for the following list of pictures now on the walls of the Royal Academy, which have been purchased either direct from the artist's easels, or while being exhibited. The class to which the majority of the purchasers belongs is evidence that we have not laboured in vain in directing the attention of the wealthy merchant and manufacturer, who have now become the great patrons of Art, to the best channels for acquiring works of sterling merit and of unquestionable monetary value. Gemina pictures of the old masters that are worth a price, are seldom now brought into the market; and, moreover, amateurs have, within the last few years become, in a great measure, connoisseurs, and are not to be entrapped by the *ignis fatuus* of a great name. Let our readers just glance over the columns of our "picture sales" for this month, and if the account there given does not verify the old proverb, "all that glitters is not gold,"—does not satisfy them how much rubbish may be acquired without a pearl amid the heap,—they must be obtuse indeed. The environs of Liverpool, and Manchester, and other great marts of business, independent of the metropolitan suburbs, are now the chief spots where Art, and especially British Art, is finding a home; it is meet that the wealth which makes a nation powerful, should be judiciously expended on those things which tend to make it intellectually great—on luxuries that strengthen its moral constitution instead of enervating it.—Mr. Leslie's 'Scene from Henry VIII.' and Mr. Cope's from 'King Lear,' are the property of Mr. Brunel; Mr. Leslie's 'Beatrice,' belongs to Mr. Gibbon. The same artist's 'Tom Jones and Sophia,' is sold, we know not to whom. Mr. Stanfield's 'Scene on the Maas-Dort,' was painted for Sir Robert Peel; Mr. Edwin Landseer's 'Field of Waterloo,' was painted, as our readers know, for the late Mr. Vernon; his picture of 'Rescuing Sheep from the Snow,' for Mr. Bicknell; Mr. Macleise's 'Allegory of Justice,' is sold; 'Moses and the Gross of Green Spectacles,' was painted for Mr. Clowe, of Liverpool; Mr. Dye's 'Meeting of Jacob and Rachel,' is purchased by Mr. Prior; Mr. Lee's 'Calm Morning,' Mr. Hart's 'Arnolfo di Lapo,' and Mr. Stone's 'Scene from the Tempest,' belong to Mr. Miller, of London; Mr. Loyd is the proprietor of Mr. Elmore's 'Queen of the Day'; Mr. Frith's 'Scene from Don Quixote,' was painted for Mr. Frederick Huth; the 'Scene from the Good Natured Man,' for Mr. Sheepshanks; Mr. Hart's 'Interior of a Synagogue,' was painted for Mr. Sigismund Rucker, Junior; Mr. Linton's picture of 'Venice,' has been purchased by Mr. D. W. Wire, with his Art-Union prize, to which he added a considerable sum from his own pocket. Mr. Webster's pictures were all sold previous to exhibition, so were Mr. Stanfield's; Mr. Eastlake's 'Good Samaritan,' has been bought by H.R.H. Prince Albert; Mr. John Dillon is the proprietor of 'The Gardener's Daughter,' by Mr. Frank Stone; Mr. Charles Landseer's 'Girl in a Hop Garden,' was purchased by Mr. Alderman Salomons; his 'Scene from Æsop,' is also sold; Mr. Miller, a provincial merchant, is the proprietor of Mr. Egg's 'Peter the Great,' and of Mr. Elmore's 'Griseldo'; Mr. Roberts's 'Interior of the Church of St. Jacques,' is the property of Mr. Rucker; the 'Interior of the Church of St. Gomer,' belongs to Mr. Bicknell; Lord Northwick is the purchaser of Mr. Hook's 'Venetian Scene'; Mr. Seymour Bathurst, of Mr. Reed's 'Giorgione at his Studies'; Alderman Salomons, of Mr. Knight's 'Blind Man's Buff'; Mr. Witherington's 'Summer,' and Mr. George Stanfield's 'Old Bridge, at Frankfurt,' belong to the same gentleman; Mr. Eastlake's picture of 'The Escape of Francesco di Carrara and his Wife,' was painted for the Vernon Gallery.—To this list we may add, Mr. E. M. Ward's large picture of 'James II. Receiving the News of the Landing of the Prince of Orange, at Torbay,' bought by Mr. Jacob Bell, for 500*l.*, and selected by him as a prize holder of 50*l.* in the Art-Union of London. Mr. Bell has, of course, paid the difference from his own pocket; an act of liberal patronage we should often be glad to record on the part of those who hold small prizes and can afford to add to them.

THE LATE MR. COTTINGHAM'S MUSEUM.—This multifarious assemblage of all that is curious and instructive in mediæval Art, is about to be disposed of by the son of the indefatigable collector by private contract. It contains much that is practically valuable to the architectural student, for Mr. Cottingham's long connexion with the reparation and restoration of ancient buildings (Westminster Abbey included) gave him great opportunities for adding to his stores. Of these opportunities he availed himself thoroughly; he amassed, in his own residence, a most extensive series of casts of fine architectural enrichments of the middle ages, as well as many actual specimens of wood carving, &c., obtained from many quarters, all illustrative of the Arts of that period. With these various specimens, which range from ceilings and doorways, monumental effigies and bas-reliefs, down to the minutest examples of foliated curlicues, he has crowded his house until no inch of room remains. In visiting Sir John Soane's Museum, we have always been forcibly reminded of its cramped and uncomfortable dimensions, notwithstanding the ability and care which the master mind of the architect exerted to make his house fit for the treasures it held. But Mr. Cottingham was even less happily circumstanced; he had still less space at command, and he has been consequently obliged to turn a range of cellars into a subterranean museum, as instructive and as valuable as that above ground. It is impossible to do justice to the collection by an examination of it in its present confined space; it is so over-crowded that one object destroys the other, and literally confuses the spectator by its multifariousness. But if such a collection were well and properly laid out, its immensity and importance would be at once visible. It has been compared to that formed by Monsieur du Sommerard, in the Hotel Chny at Paris; but this is not a just comparison, inasmuch as the Hotel Chny contains examples of furniture, and the thousand and one articles of domestic life used two centuries ago, but Mr. Cottingham's collection is a preponderance of architectural and monumental Art, with the smallest possible sprinkling of furniture and domestic decoration. It is to be looked at chiefly as an architectural museum, and as such it is an exceedingly valuable one, comprising the finest and most judiciously selected specimens of Art from the Norman era upwards to the days of Charles I. As a school-house for young architects, the collection would be an invaluable reference-place, and a proposed memorial has been framed bringing under the notice of Government the advisability of purchasing the collection for national use, in which the great advantages continental manufacturers, decorative artisans, and others, have obtained by access to similar museums, is specially and properly dwelt upon. Certainly Mr. Cottingham's collection would form an admirable groundwork for an extensive mediæval museum, an establishment much wanted in England, and which we have every reason to believe would be speedily augmented by the bequests of many collectors who would gladly aid the progress of study by the deposit of their stores where they could be generally available, provided any place was set apart as the national repository for the reception of such contributions to knowledge and artistic study. Mr. R. R. REINAGLE, late a member of the Royal Academy, has published in the *Literary Gazette* several letters in which he has sought to exculpate himself from the charge which led to his "retirement" from the Academy. His wiser course would have been to let the matter rest. It will be recollected that he was accused, and convicted, of purchasing at a broker's shop a picture painted by a young and comparatively unknown artist named Yarnold, and of publicly exhibiting and selling such picture as his own; his defence now is, it seems, that but little of the said picture was actually painted by Mr. Yarnold; that he, Mr. Reinagle painted over every part of it; and, therefore, considered himself justified in describing it as his own. This is directly and distinctly denied by Mr. Yarnold, who affirms that the picture so exhibited and sold was the entire work of his

hand, except a few unimportant touches on the sea and sky. Mr. Yarwood produced to the Royal Academy evidence which abundantly satisfied its members; and the consequence was the withdrawal of Mr. Reinagle from the body. We have no desire to aggravate the position in which Mr. Reinagle was placed by this decision, but we must affirm it to have been a just one; of its justice we are the more convinced after the perusal of the statements offered by Mr. Reinagle. His defence, indeed, mainly rests upon the assertion that many artists, from time to time, have committed similar irregularities: among others he accuses the late Sir Francis Chantrey of a decided fraud, in placing his name, as the artist, to a series of engraved drawings, which drawings were really the work of Mr. R. R. Reinagle, made from "nintelligible scratches" by the said Sir F. Chantrey; this assertion is met by Mr. John Britton, who says "having before me a proof from one of the plates in question, and also Chantrey's sketch made from the original object, I cannot hesitate in affirming the one to be a faithful copy of the other, without any aid from Mr. Reinagle's pencil." The engravers are both dead. Again, Mr. Reinagle asserts that he wrote the life of Ramsay in Cunningham's "Lives of the Painters," which Mr. Cunningham "promised to state to the public, but this he always omitted to do, and had received any merit which accrued from it as his own." This assertion is met by Mr. Peter Cunningham, who affirms that Mr. Reinagle did not write such life, but that such assistance as Mr. Cunningham received from him he did acknowledge, such acknowledgment being to be found in the published volume. The statements concerning Ramsay, Beechey, Constable, Lawrence, and others, have as yet met with no denial; all the parties whom Mr. Reinagle charges with fraud are dead, and we cannot suffer their monuments to be defaced by one who certainly has not clean hands; but even if they had committed dishonourable acts, such acts are not made less dishonourable by imitation; there are no precedents to justify frauds. We do not go into this topic at greater length: Mr. Reinagle is an aged gentleman, and there could have been no pleasure in birthing his decline of life with charges discreditable to him.

Mr. BARRY, R.A., has been presented with the Royal Gold Medal, by the Institute of Architects. The presentation took place at the rooms of the Society, before a very numerous meeting of the members, with the president, Earl de Grey, in the chair. The award of this honour is some little compensation for the rough usage which this accomplished architect has recently had to endure, from the House of Commons, and to which we have referred elsewhere.

MONUMENT TO WORDSWORTH.—A committee for the erection of a proper tribute to so great and philosophic a poet as Wordsworth, was sure to number many, but we had scarcely expected so large a number as eighty or one hundred individuals all possessing different characteristics. This "multitude of councillors," has rather eluded the activity of the body, which, however, has not yet held a regular meeting or taken official notice of any artistic claimant for the erection of the monument. The *Athenæum* remarks with much practical sense:—"What we recommend is, that some half-dozen men of business habits, as well as of literary and artistic attainments, should be selected from the main body of the committee in order to take decisive measures for accomplishing the object. If necessary, they can, at any time, resort to the unwieldy general mass for instructions and information. This will be the best, if not the only way of carrying the matter forward; for in the present state of things, there appears to be little chance of progress."

MONUMENT TO COWPER.—Our contemporary *The Builder* announces, that a monument in honour of this poet is proposed to be erected in Westminster Abbey, from a design by Marshall the Sculptor, exhibited at the Royal Academy in 1849.

THE DISNEY MARBLES.—Arrangements have been made for the reception of this magnificent gift in the large west room of the Fitzwilliam Museum, Cambridge, which is now reported

ready for that purpose. The museum has been visited by 40,848 persons during the past year, and not the slightest injury, misconduct, or annoyance has occurred: another among the many cheering proofs of the safety and policy of providing intellectual gratification for all.

WIMBLEDON PARK.—Few persons are, we believe, aware that within the short distance of five miles from the Waterloo Bridge Station is one of the most beautiful spots which can be met with within fifty miles of London. Wimbledon Park has been, hitherto, but little frequented, owing to its being private property, hence its beauties are unknown; but a certain portion of it is now about to be appropriated to the erection of villa residences, to which purpose it is peculiarly adapted. Its elevated situation, and the immediate contiguity of its fine open common, extending to Combe Wood and Richmond Park, render it peculiarly healthful—of no little importance at the present moment. In addition to its own peculiar attractions, this favoured neighbourhood presents the most delightful rides and drives, extending through Combe Wood and Richmond Park to Hampton Court, Kingston, Claremont, Esher, and other pleasant and salubrious localities. We feel that we are discharging a duty to the public in directing their attention to this very pleasing spot, the beauty and salubrity of which are almost unequalled. The late Sir Richard Phillips, in an interesting volume entitled "A Morning's Walk from London to Kew," gives the following description of this delightful spot:—"Having ascended from Wandsworth to Putney Heath, I came to the undulating high land on which stands Wimbledon, its common, Roehampton, Richmond Park and its lovely hill. A more interesting site of the same extent is not, perhaps, to be found in the world. The picturesque beauty and its general advantages are attested by the preference given to it by ministers and public men, who select it as a retreat from the cares of ambition. It was here that Pitt, Dundas, Horne Tooke, Addington, Sir Francis Burdett, and Goldsmid were contemporary residents." Sir Richard laments that the residences are so "few and far between." "When," says he, "does Woollet enchant us but in those rich landscapes in which the woods are filled with peeping habitations, and scope given for the imagination by the curling smoke rising between the trees." The plan now proposed to be carried out of erecting villa residences on the preferable portions of the magnificent park of Wimbledon will, we understand, realise the first imaginings of this writer. The want of residences will be supplied so far as to give the desired animation to the scene, without destroying its charming character and privacy; and many will now enjoy those advantages of pure and invigorating air, panoramic scenery, and most healthful walks and drives, which have hitherto been confined to the wealthiest members of the aristocracy. Wimbledon Park came into possession of the present proprietor from Earl Spencer; the adjoining mansion of West Hill having, until recently, been occupied by the Duke of Sutherland.

THE ASCOT PRIZE PLATE for the present year is, perhaps, the most successful design that Mr. Cottrell, the distinguished modeller, has hitherto produced for the purposes of the race-course. The subject is the eighth labour of Hercules,—"The Destruction of Diomedes, King of Thrace, and his Horses." The story is admirably carried out, and the work is executed with exceeding spirit and delicacy.

HIRAM POWERS'S STATUE OF "EVE."—This fine work of the celebrated American sculptor, equal, if not superior, to his "Greek Slave," engraved and introduced into our Journal some short time back, is unfortunately lost to the world of Art, by being in a vessel which was recently wrecked on the coast of Spain, on its passage to the United States.

WATER-COLOUR ENGRAVINGS.—Such is the title given to some coloured prints recently issued by Messrs. G. Rowney & Co.; these prints much resemble coloured drawings, and are, we believe, executed entirely on a number of wood blocks, similar to works in chromo-lithography. But they have a decided advantage over the latter,

in the varieties of tints and half-tints, in the clearness and decision of the tints, and in the transparency of the shadows; in fact, they approach so nearly to original drawings that they may very easily be mistaken for them. Clever and ingenious as these specimens are, we believe they have not yet reached that degree of excellence, which the printer, Mr. Leighton, who has devoted great labour and much time to the subject, hopes ultimately to attain. We may be in a position hereafter, to present our readers with an example of this very useful invention. In the meanwhile we would commend the two views now published, one "At East Malling, Kent," and the other, "Claines, near Worcester," to the attention of those students of water-colour painting who find it difficult to meet with original drawings to copy. It is highly to the credit of Messrs. Rowney that they have been among the first to exhibit the capabilities of this "new Art."

DEVONSHIRE SILVER.—We some time ago noticed "the safety chain brooch" and other articles, manufactured in so praiseworthy a manner by Ellis, of Exeter. The same energetic proprietor is now manufacturing a variety of new designs; and in addition to the peculiarity of their being of Devonshire silver, they have a novel effect in being "parcel-gilt" and oxidised.

SCOTTISH NATIONAL GALLERY.—The foundation stone of this important building is to be laid at the end of July by H.R.H. Prince Albert. The site chosen is the Mound at Edinburgh.

THE SCULPTOR WYATT.—We have this month to record the sudden death of this admirable artist at Rome, on the 29th of May. We abstain from all details relating to his career, as it is our intention to give a portrait and memoir in our next number.

MEDIAVAL ART EXHIBITION.—We perceive that the Society of Arts have wisely and properly thrown open this curious collection at the reduced price of three-pence, in order that artisans and mechanics may avail themselves of its inspection.

DR. WAAGEN.—This distinguished foreigner, so well known for his writings on Art, is at present in England for the purpose of adding to his knowledge of our private collections of pictures, but principally to make himself acquainted with our ancient illuminated manuscripts.

STATUE OF THE MARQUIS OF LONDONDERRY.—Westminster Abbey has recently received this monumental figure, the production of Mr. J. E. Thomas, who was commissioned by the present Marquis to execute this tribute to his brother's memory. It is of white Carrara marble, life-size. The attitude is that of speaking, a scroll is in one hand; the other supports the robes of the Garter.

PROPOSED TESTIMONIAL TO PRINCE ALBERT.—A project having been set on foot to raise subscriptions to the extent of 5000*l.* to present His Royal Highness "a vase of pure gold," in acknowledgment of his exertions in reference to the Exhibition of the Industry of all Nations, in 1851, a meeting has been held on the subject at Willis's Rooms, at which H.R.H. the Duke of Cambridge presided. But we understand the project has been abandoned, in consequence of the expression of H.R.H. Prince Albert's disapproval thereof—a result which the public, no less than those who know the Prince, might have anticipated.

WAX WATER-COLOURS.—Messrs. Reeves & Sons, one of the oldest firms in London, as artists' colourmen, submitted to us some time back a box of water-colours prepared with wax, which we have not had an opportunity of testing till now. We can speak of them as well worthy the attention of those who paint in these materials, as they work with remarkable fluency from the pencil, and are brilliant and transparent in tone. These advantages are derived principally from the absence of gum, at all times an objectionable ingredient in a cake of colour, though not without its advantages in enriching deep tints when they are already laid on.

ROBERTS'S PICTURE OF THE DESTRUCTION OF JERUSALEM exhibited at the Royal Academy last year, is at present to be seen at the Hanover Square Rooms; it is to be drawn in coloured lithography by Haghe, and will be his largest and most important work.

REVIEWS.

COLLECTIONS TOWARDS A HISTORY OF POTTERY AND PORCELAIN IN THE 15TH, 16TH, 17TH, AND 18TH CENTURIES; with a description of the Manufacture, a Glossary, and a List of Monograms. By JOSEPH MARRYAT. Published by J. MURRAY, London.

A work on the Plastic Art, from the pen of a celebrated collector of china, Mr. Marryat, which has been long expected, has just made its appearance. Its publication is well timed, since, in the progress of the manufacture of specimens for the Great Exhibition of 1851 much of the information this book affords must be of considerable value if rightly studied. It is very important on the part of the manufacturer, that he should know what has already been done, and learn where specimens of his art are to be seen, if he desires to issue to the public productions which shall at once satisfy an educated taste, and educate an immature one. It is equally important that the public should be in possession of such an illustrated volume as the one now before us, that they may be enabled to compare the works of the present day with the productions of other ages.

This book which with much humility is made to bear the title of "Collections towards a History of Pottery and Porcelain" is beautifully "got up." In its printing, its coloured plates and its woodcuts, it may be pronounced faultless, and the illustrations themselves, copied as they are from well selected examples, by Sir Charles Price, with the strictest regard to correctness, impart a very high value to this production.

Yet, we cannot but regret after so much has been done, after so large an amount of valuable material has been gathered together, that Mr. Marryat should have wanted industry, or lacked the perseverance necessary to have completed his own design.

Our author says in his preface—"When first I became a collector of china, I found great difficulty in obtaining the information I desired to aid me in my pursuit. The majority of publications on the subject were either learned disquisitions upon the mythology of the Greek classical paintings, or, on the other hand, mere technical details of the manufacture, while a knowledge of the different kinds of Pottery and Porcelain appeared limited to the dealers. This induced me, in a tour which I subsequently made, to visit the principal collections and manufactures on the continent, and conjointly with my friend Sir Charles Price, I began to compose, for my amusement, a manuscript work upon Pottery and Porcelain, to be illuminated by his pen, and illustrated by drawings of specimens of porcelain, with portraits of the principal patrons of the art, and views of the various places connected with its manufacture. The work remains incomplete, but the information collected being deemed by many of sufficient interest for publication as a Handbook of Pottery and Porcelain, I was led to prepare it for the press," &c.

We cannot but regard this as a very poor apology for infirmity of purpose. The book remains a Handbook, which might have been a History; but taking the work as we find it, it bears evidence of great knowledge of the subject, and it contains a large amount of most curious information. It is the work of a gentleman imbued with an earnest love of his subject; knowing more than most men of it; and, therefore, it must prove an acceptable publication to all, who, like himself, desire some information to guide them in making their collections. It is in every sense an elegant production, in many respects a very useful one. The subjects embraced within the volume, are the "Soft Pottery" of Italy—*Majolica*—of France, including a particular notice of Faience ware—and of Germany and Holland, "Hard Pottery," *Fayence à pâte dure*—Stoneware and Porcelain, both Oriental and European; comprehending some account of all the varieties of "Hard paste," and of naturally and artificially "Soft paste," to be found in many of the celebrated collections. The terms thus employed, as technical expressions, to distinguish peculiar kinds of Pottery, have been long used, but they are exceedingly indefinite. *Soft paste*, or Pottery, is of the character of common earthenware, and may be scratched with a knife or file; while Queen's ware and Stone ware are *Hard paste*. Porcelain is again said to be of *Hard* or *Soft paste*, according as its composition has a greater or less proportion of clay or alum relatively to the flint or silica. "The most practical test by which to distinguish these descriptions of Porcelain," says Mr. Marryat, "is, that the soft paste can be scratched by the knife, which is not the case with the hard paste."

From the above list, it will be seen how wide is

the range embraced by our author; although he limits his attention, in his title, to the four centuries immediately preceding the present, in the text he is often obliged to step beyond this circle. How much we desire that he had done so more frequently and freely. Since our space will not allow of our giving even an outline of that portion of the History of the Ceramic art, which these "collections" embrace; we must hope to give our readers some idea of its varied and curious details by the selection of one or two characteristic passages.

In speaking of the *Majolica* pottery, which appears to have derived its name from the island of Majorca, where the pottery was of a very superior character—much of which bears the name of "Raffaello ware"—Mr. Marryat draws particular attention to the advantages which wealth can bestow upon efforts of industry and taste, he says:

"This celebrated manufacture owed its great perfection to the princely house of Urbino, by whom it was patronised for 200 years. The first Duke of Montefeltro (1444) who was a celebrated warrior as well as a man of letters, continued to uphold the manufacture of *Majolica*. His son, Guidobaldo, established another manufacture at Pesaro, in which the first artists of the age were employed. His nephew and successor, Francesco Maria della Rovere, added to them that of Gubbio. The next Duke, Guidobaldo 2nd, took great pains to improve the style of painting. He assembled at Urbino the most celebrated artists of the school of Raphael, who furnished the designs from which the finest specimens of the art were produced. He painted some vases with his own hand. He also formed the celebrated collection of the Speziara, or medical dispensary attached to the Palace of Urbino. But overwhelmed with debt, he was obliged to contract the expenses of these establishments, and the quality of the ware deteriorated rapidly in consequence. The last Duke, Francesco Maria 2nd, after having built the magnificent palace of Castel Durante, which he adorned with choice specimens of *Majolica*, was compelled from a similar cause, to dismiss his best artists, a necessity which completed the ruin of the manufactory. In his dotage he abdicated his Duchy, in favour of the Holy See, and dying in 1631, his valuable collections of *Majolica* became the property of Ferdinand de Medici, who removed them to Florence; that of the Speziara, already mentioned, was presented to the shrine of Loreto. The immortal Raffaello Sanzio d'Urbino, who was born at Urbino, in 1483, and died at Rome, in 1520, has given his name to the ware. But this general use of the term "Raffaello ware," has, doubtless, arisen from an erroneous supposition that its splendid designs were either painted by him, or under his immediate direction; whereas, the finest specimens are not of earlier date than 1540. The designs for many of them were, however, furnished by his scholars, from the original drawings of their great master."

This brief story of a peculiar kind of pottery needs no comment, it should tell its tale at the present time; and that enlarged spirit which led the princes of Italy to encourage a native manufacture, should under our improved social system instruct, not our princes merely, but all lovers of refined taste, as exhibited in the labours of the manufacturer, to promote, by the reward of their patronage, the association of high art with those productions which are destined to be familiarised with every house and hearth.

There are few more ingenious people on the face of the earth than the Chinese; and the curiosities of their porcelain manufacture would of itself furnish a very entertaining and instructive volume. They are as ingenious in their frauds as in other things; and Mr. Marryat, quoting Father Solis, informs us:—

"That the people, by giving high prices for antique china, have brought it into great credit; and that, then, by means of a yellow clay, and oils of several kinds, some of which are metallic, and by laying the china some months in mud as soon as it comes from the furnace, they produce the very same sort that is so highly valued by the vulgar, as being five or six hundred years old."

Chelsea porcelain is now becoming so rare that specimens of it fetch a very high price in the market. The porcelain manufactory in this locality appears to have been founded previously to 1698, and to have continued in operation until 1765. The character and quality of the Chelsea ware may be inferred from the following description of it given by Horace Walpole:—"I saw yesterday a magnificent service of Chelsea china, which the King and Queen are sending to the Duke of Mecklenburg. There are dishes and plates without number; an epergne, candlestick, salt-cellars, saucers, tea, and coffee equipage. In short it is complete, and cost 12000."

Previously to the dissolution of the establish-

ment," says our author, "the proprietors presented a memorial respecting it to the government, requesting protection and assistance, in which they stated, that the manufacture in England has been carried on by great labour and large expense. It is in many points to the full as good as the Dresden; and the late Duke of Orleans told Colonel York, that the metal or earth had been tried in his furnace, and was found to be the best made in Europe. It is now daily improving, and already employs at least one hundred hands; of which is a nursery of thirty lads, taken from the parishes and charity schools, and bred to designing and painting, arts very much wanted here, and which are of the greatest use in our silk and painted linen manufactures."

So rapidly do things pass away from the memory of man, that the very site of this once famous production of the British potteries Mr. Marryat does not speak. His design stops with the close of the eighteenth century. He indicates in his preface that the early history of the plastic arts is confided to other—he says "abler—hands, and will form a separate volume."

The glossary of terms, and the fac-similes of the marks and monograms of the different manufactures—the latter principally derived from Brongniart—will be found of great value to the curious in the productions of that most ancient of workmen, the potter.

THE ROYAL FAMILY. Painted by F. WINTERHALTER. Engraved by S. COUSINS, A.R.A. Published by ALBERMAN MOON, London.

We English are unquestionably a domestic people; every thing that partakes of home comforts and enjoyments is dear to us, no matter how elevated the position or how ennobled the rank of the possessor; for there is not a palace nor a mansion in the land in which the apartments where state and revelry receive their guests, are not gladly exchanged, on fitting occasions, for the less sumptuous but far more inviting chambers wherein the family circle is accustomed to gather. The interest universally felt in this subject is evident from the anxiety which is always expressed to see and know how they who occupy high places look and act in their "air house at home," when the trammels of external show and of fashion are laid aside, and the heart is of the world within and not of that without. This interest has never been excited more than in the case of the illustrious family that forms the subject of this engraving; all that appertains to its various members is regarded with feelings that denote the respect and esteem in which they are held individually and collectively; while the little we hear of that domestic happiness which they enjoy increases the desire to learn more, could such knowledge be obtained without that intrusion upon privacy which is less the privilege of royalty than of the peasant.

It is no wonder then that when Mr. Winterhalter's picture of "The Royal Family" was allowed by her Majesty to be exhibited at St. James's Palace, vast crowds of people were attracted thither to see it, for the subject was one which could not fail of becoming popular. Our opinion of it, as a work of art, we then expressed, cordially recognising its merits, while we regretted that the task of painting a picture of the Queen of England, her accomplished and graceful consort, and the group of their beautiful children, had not been deputed to an English artist, of whom there were many who would have done the work equal justice, and still more, who would feel proud and honoured by the commission. The picture, however, was painted, and it now comes before us again, in one of Mr. Cousins's most powerful and effective engravings. In the hands of a less skilful engraver we are persuaded the arrangement of the composition would never have made a good print; but his refined style of execution, his excellent drawing, and truly artistic feeling, have combined to render it one of the best of its class which this country has produced. The formal attitudes, and air of *mauvaise honte* given to some of the figures in the original, are immeasurably improved; and the expression in the faces of the Queen and the Prince has far more of the natural benignity belonging to them than the painter had given. Altogether it pleases much better than we could have anticipated; and it deserves to find a place in the home of every loyal British subject.

THE BOOK OF NORTH WALES. By C. F. CLIFFE. Published by LONGMAN & Co., London; and W. SHONE, Bangor.

The tourist in the northern part of the principality can have no better guide-book than this of Mr. Cliffe's, whose companion-work on South Wales

we reviewed some time ago. It contains every information for every class of traveller, the pleasure-seeker, the searcher after health, the antiquarian, and the historian. Its notes on Welsh angling are particularly valuable, and had we seen them in our earlier days they might have spared us some miles of wearisome walking after what previous writers have called "a good fishing station," but which we found to be a station without fish. A concise glossary of words, and a few ordinary Welsh phrases are annexed, and will be most useful to those who venture among the glens, and by the side of streams that are usually unfrequented by tourists. We have travelled, with rod in hand and knapsack at our back, into localities of this country where not a single word of English was spoken, and could only make our wishes known by signs, not always easily understood. At such times we should have thought Mr. Cliffe's book a treasure had we fortunately possessed a copy.

RUDIMENTARY DICTIONARY OF TERMS IN ARCHITECTURE, FINE ART, MINING, &c. Published by J. WEALE, London.

One of an extremely cheap series of rudimentary works on the exact sciences issued by Mr. Weale, and which will be found eminently useful to all who want cheap and good introductions to such knowledge. Their price renders them accessible to all, and their utility should make them equally welcome. The present is a particularly good sample of the class.

VESTIGES OF OLD LONDON. Part II. Published by DOGUE, Fleet Street.

Of the "vestiges" which this second part introduces to the public, the most curious is an interior view of a tower belonging to the wall of London, and which was accidentally discovered at the back of some premises in the Old Bailey a few years ago by performing what was then considered to be a solid wall. It is a memorial of London in its fortified state, of much interest, inasmuch as it is the only vestige of a tower belonging to its wall, in its entire height and with the original roof existing. Such etchings as these cannot fail to be very acceptable and give value to Mr. Archer's work. On the contrary we cannot help thinking that such a subject as the remains of the Gate of Bermondsey Abbey is totally unworthy of his ability or his time. A mere fragment of flat wall adopted for the front of a modern dwelling and exhibiting only the staples of an old gate, having no architectural feature remaining, cannot be worth perpetuating.

THE DECORATIVE ARTS OF THE MIDDLE AGES. By H. SHAW. Parts II. & III. Published by PICKERING, London.

A cup designed by George Wechter in 1620, and a book-cover of the same period, are the most noticeable features of these two numbers. They are excellent examples of good taste in antique Art-manufactures. It is impossible to look over this work, however, without abundant proof of the able manner in which the artist aided the workman in the olden time, and a lesson may thence be obtained which may be adopted with benefit to both in the present. This work promises to equal any of Mr. Shaw's previous publications, and as their character ranks high we can offer no better opinion of its merits.

THE WOUNDED HOUND. Engraved by W. T. DAVEY, from the picture by R. ANSDALL. Published by OWEN BAILEY, London.

It is scarcely necessary now to pass eulogium on Mr. Ansdall as a painter of animals; in this class there is but another who has any pretensions to appear as his rival in depicting the forest herds. We saw his picture of "The Wounded Hound" last year when it was on exhibition in Regent Street, and spoke of it as a work of great interest, and one we considered would tell admirably as an engraving, for its subject and the treatment. A hound is stretched on the straw of his kennel, with his leg bandaged, and an old man kneels before the animal, with his sleeves tucked up and a sponge in his hand, having just finished the operation of dressing the wound; the expression of the two figures is quite to the point. There are some subordinate characters introduced with the happiest effect, the whole harmoniously combining into a forcible and highly attractive group. The engraving, in the mixed style, is large, and is of a character to bring the engraver into high repute; it is a worthy companion to the many of a similar class which modern taste has rendered popular.

WESTMINSTER: Memorials of the City, St. Peter's College, the Parish Churches, &c. By the REV. M. E. WALCOTT, M.A. Published by MASTERS, New Bond Street.

"To a city, its histories, memories, and busy throngs, are what the glades and soothing calm are to the retired country," says our author at the commencement of one chapter of his work, and he has accordingly recorded with much instructive industry the chief events which have "made the city famous," together with biographical notices of the principal residents within its boundaries. The very name of Westminster conjures up remembrances and associations which range over the most important periods of British history; and when we remember that from the earliest times recorded in that history it has been the royal seat of kings, the chief place of parliamentary meeting, has been celebrated for its important ecclesiastical foundations and schools, and for the residence of some of our most celebrated men; that it was also the cradle of printing in this country, we may feel sure the annals of the parish are well worth research. The volume before us proves that a due amount of that qualification has been bestowed in its construction by the reverend author, who has industriously collected from many sources the notices of all kind which are devoted to Westminster; there have, indeed, been many volumes upon the subject, but they are of a disjointed, expensive, and peculiar kind; and a volume like the present, which is the careful result of a proper research in all quarters, does good service to the topographical student. Mr. Walcott's volume is particularly good from the condensed manner in which he treats his facts; there is no extraneous "gossip," but the reader obtains the information he wants without wading through too many words. There is so much in this well-filled volume, that its author has had no space to devote to the glory of Westminster—its Abbey—which he proposes to describe in a companion volume, which cannot fail to be deeply interesting, and prove, as the present one does, that "the study of antiquities is a fruitful source of the pleasures of imagination," recalling, as it does, so vivid a picture of bygone days.

A SELECTION OF STUDIES FROM THE PORTFOLIOS OF VARIOUS ARTISTS. Drawn from Nature, and on Stone. Part II. By H. B. WILLIS; Part III. By J. SYER. Published by ROWNEY & Co., London.

The first part of this folio publication was the work of Mr. G. Barnard; the two now published are, respectively, by Messrs. Willis and Syer; and each is excellent in its way. Mr. Willis offers six subjects from the scenery of the Rhine, the majority of which are old familiar places nowadays. Without pretending to vie with the drawings that Harding, Stanfield, and Prout, have done of these or similar views, Mr. Willis depicts his subject with taste and freedom of execution, and his studies will be found abundantly useful to the learner. We may say quite as much for Mr. Syer, who is content to gather his materials nearer home, in Devonshire, and thereabouts, where he has picked up some very picturesque bits, and put them on the lithographic stone in a highly picturesque manner. We should, however, like to see a little more variety in his trees, they are almost all of one sort; in other words, he seems to have but one touch to imitate the foliage of all.

THE FIRST LESSON. Painted by C. R. LESLIE, R.A. Engraved by J. H. BAKER. Published by — WHITE, London.

The picture from which this engraving is copied is in the collection of Samuel Rogers, Esq.; it represents a young mother teaching her first-born child his earliest lesson of practical piety; the boy stands, in his night-gear, by the side of his parent, who reads to him from a book. We presume this to be the sentiment of the work, although the book seems more like one of the alphabet than of prayer; the furniture of the room declares its occupants to be of the humbler class, yet there is a refinement in the elder figure which associates it with those of a higher sphere. The treatment of the picture is somewhat severe, approaching to the modern German school, but it possesses considerable merit, and is rendered very effective by the management of the *chiaroscuro*. It is engraved, we believe, by a young hand, for his name is quite new to us, but the plate is executed in the true spirit of the original, and has in it some very careful and solid work.

SYER'S MARINE AND RIVER VIEWS. In Six Numbers. Published by G. ROWNEY & Co., London.

We can cordially recommend these books of studies to the pupil who has had some little practice with his pencil. They are, we think, even superior to Mr. Syer's "Rustic Scenes," of which we spoke favourably some few months since. The views are well chosen, and treated in a style very far from common-place.

MEMORIALS OF THE CASTLE OF EDINBURGH. By JAMES GRANT. Published by BLACKWOOD & Co., Edinburgh.

In a portable 8vo, of some three hundred pages, we have here a record of what is best worth securing of the old "Castrum Pucellarum," which has so nobly stood for ages above the good city of Edinburgh, at once its chief feature and protection. The history of Scotland is in a great degree connected with this metropolitan stronghold, and many and varied are the tales dark and romantic which the author of this volume has given us, all striking samples of the sort of life endured in "the good old times," it is our good fortune *not* to have lived in. The memorials end with a melancholy tale of the wretched fate of the unfortunate revolutionists at Leith in 1779, and the notes terminate with the awful words of the executioner, after doing his ghastly office on a traitor. So does the history of a warlike stronghold terminate, and suggest thoughts of gratitude for more peaceful days, when its ramparts are the airing places of the citizens, and its commanding site enjoyed chiefly for its noble view. The volume is illustrated with many interesting engravings, and abounds with stirring and well told narratives; there is an evident but excusable tendency towards "Prince Charlie," but the author has certainly done his best with his materials, and made a book acceptable to all readers who wish for information on this ancient and important fortress.

THE LEGEND OF SLEEPY HOLLOW. Illustrated by F. O. DARLEY. Published by the AMERICAN ART-UNION.

The charmingly quaint original legend told with so much quiet humour by Washington Irving, is here illustrated by a native artist in a congenial spirit, and his scenes realised in a manner which must give its author satisfaction, and redound to the credit of the designer. We have before noticed the great ability exhibited by Mr. Darley for the mode of illustration he adopts, which we may add is that rendered famous by Ketzsch. The series we are now noticing are quite as meritorious as that designed by the same artist to Rip Van Winkle; but the subject matter is not equally capable of such broad content in drollery as that legend presents. Nevertheless, Mr. Darley has executed his task in the truest appreciation of his author; and his hero is the veritable Ichabod Crane of Irving; his love-making scene with "the peerless daughter of Van Tassel" is exquisite in its quiet humour; so also is the merry making in the Dutch Farmer's home. Altogether, the series is extremely good, and does the greatest credit to the designer. American literature thus illustrated by American artists cannot fail to achieve honour to that country in the old world as well as the new. We believe Mr. Darley, in his line, to be as great as any American artist whose works have fallen under our notice.

THE GALLERY OF ILLUSTRIOUS AMERICANS. M. B. BRADY, New York. Published by T. DELP, Bow Lane, London.

This work is as its title imports, of a strictly national character, consisting of portraits and biographical sketches of twenty-four of the most eminent of the citizens of the Republic, since the death of Washington; beautifully lithographed from daguerotypes. Each number is devoted to a portrait and memoir, the first being that of General Taylor (eleventh President of the United States), the second, of C. Calhoun. Certainly, we have never seen more truthful copies of nature than these portraits; they carry in them indelible stamps of all that earnestness and power for which our trans-Atlantic brethren have become famous, and are such heads as Lavater would have delighted to look upon. They are truly, speaking likenesses, and impress all who see them with the certainty of their accuracy, so self-evident is their character. We are always rejoiced to notice a great nation doing honour to its great men; it is a noble duty which when properly done honours all concerned therewith. We see no reason to doubt that America may in this instance rank with the greatest.

THE ART-JOURNAL.

LONDON, AUGUST 1, 1850.

ON THE APPLICATIONS OF SCIENCE TO THE FINE AND USEFUL ARTS.

THE CHEMISTRY OF POTTERY—CLAY.

In some previous articles (*Art-Journal*, vol. XI., p.17, &c.) on "Artificial Stone—Statuary—Porcelain, &c.," this subject has already received some, but very partial, attention. The interest of it is, however, so great that it is thought desirable to enter more fully into the peculiarities of the chemical compositions of the various kinds of stitile manufacture, which have obtained any degree of celebrity, and to give a popular view of the physical conditions under which combination is effected.

All varieties of earthenware and porcelain are formed with clay for a base; and as this natural production varies greatly with the localities in which it is found, so, necessarily, the proportions in which it is combined, with flint and the other materials employed, are only determinable by experiment, and even then the resulting ware differs according to the chemical and physical differences of the clay originally.

Clay may, in all cases, be regarded as the depositary matter, resulting from the decomposition of the primary feldspathic rocks by the action of atmospheric causes. In the greater number of cases the debris of the rocks has been removed by the influences of flowing water to a considerable distance; and, in many instances, it is not possible, with any degree of certainty, to ascertain the locality from which the clays have been derived. Since most of the clay deposits are composed of finely powdered matter, capable of remaining suspended in water for a long period; it necessarily follows, that beds of coarse material are first deposited, and that, eventually, only the most attenuated argillaceous particles remain to be precipitated slowly in some situation where the waters are at rest or moving with comparative slowness. All varieties of *Porcelain clay* or *Kaoilin*, (a corruption of the Chinese Kealing, meaning *High ridge*, the name of a hill where this material is obtained,) are produced by the disintegrating power of atmospheric air and moisture, aided by alternations of temperature, upon rocks, holding in their composition crystals of the feldspathic class, such as Granite, Gneiss, Sicnite and the Porphyries.

The Chinese and Japanese kaolins are whiter and more unctuous to the touch than those of Europe; the principal deposits of which are found in Saxony; in France, at St. Yrieux-la-Perche, near Limoges; and in Cornwall; in America it is found in the neighbourhood of Wilmington, Delaware. The varieties of feldspar (a name derived from the German *feld*, meaning *field*) are silicates of alumina, with either potash, soda, lime or magnesia; and from the peculiarity of its composition it is more liable to decomposition than are the other constituents of the rocks to which it belongs.

The extensive China clay works of Cornwall are best described in the official Reports, by Sir Henry de la Beche, on the Geology of Cornwall and Devon, and from that work we extract the

following important particulars of the modes of occurrence and the processes to which it is subjected to fit it for the use of the potter.

"In a district of decomposed granite, such as much of the eastern part of the St. Austel mass, those places are selected in which the rock contains as little matter, except that formed from the decomposition of the feldspar, as possible, and where water can be turned on conveniently. The decomposed rock, usually containing much quartz, is exposed on an inclined plane to a fall of a few feet of water which washes it down to a trench, whence it is conducted to catch-pits. The quartz, and other impure particles are, in a great measure, retained in the first catch-pit; but there is, generally, a second or even a third pit in which the grosser portions are collected, before the water charged with the finer particles of the clay is allowed to come to rest in the larger tanks or ponds. There the China-clay sediment is allowed to settle, the supernatant waters being withdrawn as it becomes clear, by means of plug-holes in the side of the tank. By repeating this process the tanks become sufficiently full of clay to be drained of all the water, and the clay is allowed to dry so much as to be cut into cubical or prismatic masses of about nine inches or one foot sides, which are carried to a roofed building, through which air can freely pass, and where the cubical or prismatic lumps are so arranged as to be dried completely for the market. When considered properly dry, the outsides of the lumps are carefully scraped and exported to the potteries, either in bulk or in casks as may be agreed upon."

Attention appears to have been called to this artificially prepared China-clay by Mr. Cookworthy of Plymouth, who is stated to have made some experiments with China-stone from Breague, in Cornwall, between the years 1758 and 1778, and to have established porcelain-works—the first that ever existed in England—in the commencement at Plymouth, and afterwards at Bristol.

Natural China-clay beds are also found in the deposit upon the chalk at Bovey-Tracey, of which large quantities are shipped at Teignmouth for the Potteries. In this locality, that has been done naturally which is now effected by artificial means at the Cornish clay-works; the decomposed granite from Dartmoor having been washed down into a lake or estuary, so that while the grosser particles were first lodged at its higher end, nearest the granite, the fine sediment was accumulated at the lower parts. It is raised by sinking a pit—cutting out the clay in cubical lumps, weighing about thirty pounds each, which are properly dried in the clay cellars.

We have already given the compositions of the Cornish China-clay, but we repeat an analysis of the clay of another district in the following table, to compare it with similar clays from various parts of the Continent.

	Rocky Residue.	Lime and Magnesia in Solution.	Combined with Alumina.	Silica.	Alumina.	Water.

The above analyses, which are selected from many others made by Alexander Brongniart, Berthier, Malaguti, and the author, fairly represent the peculiarities of the various porcelain-clays. The last three columns in the above table represent the plastic constituents of the clay. In examining a porcelain earth it is first important to remove the soluble silica or flint, which is done by boiling it for from one to two minutes in a solution of caustic potash. After this it is boiled in sulphuric acid, which sepa-

rates the alumina, forming sulphate of alumina—alumina—and then with potash, which dissolves the silica which has been left by the acid in a readily soluble state.

To obtain alumina in a state of purity, the best mode of proceeding is to add carbonate of potash to a solution of alum; a bulky precipitate falls, which is to be washed on a filter with distilled water, and dried. We thus procure a bulky gummy mass, which is a hydrate of alumina, still containing some water, which can only be entirely expelled by a white heat.

Alumina, the pure earthy base of alum, the plastic constituent of clay, is, when dried at moderate temperatures, quite white, and dissolves freely in acids and caustic alkalis; but if heated highly it is dissolved with much difficulty. Alumina has a peculiar property of absorbing and retaining moisture, in consequence of which it produces a very peculiar sensation when it is applied to the tongue. The quality of soils in regard to their retention of moisture depends upon the quantity of alumina they contain; and probably also to this substance must be referred the property of soils to purify water percolating through them. Much nonsense has been talked and written about the drainage of cultivated lands into the river, being one source from which the waters of the Thames received large amount of contamination. No such evil exists; all the saline matters and organic substances existing in any water, are very rapidly separated by filtration through the soil, from which the water flows off in comparative purity.

The physical properties of clay are that it is very plastic, and hence admits of being moulded into any form, and that on the application of heat it exhibits some peculiar phenomena. On drying at a temperature far below redness it collapses; water is driven off and its particles are brought closer together, a much denser mass being obtained. In this state it may be cut with a knife, and by water may be again brought back to its plastic state. If we expose clay to the most intense heat of our furnaces it will not fuse, its particles however cohere most strongly together, and the mass is hard and sonorous; and although it is still porous enough to absorb a large quantity of water, it cannot be again rendered plastic. This does not arise from the circumstance that the interstitial spaces between the atoms of alumina are reduced in size, but from a physical change having taken place in the alumina itself. Laurent has proved by experiment that a mass of a given size of clay, which by being heated to 300° of the centigrade scale, had a density equal to 40.61, became at a *cherry red heat* 42.17; but the heat being increased to a *livid red*, its density was only 41.24; at a low *white heat* 39.05; and at an intense *white heat* only 38.74. Thus we learn that water is expelled and the particles brought closer together up to that temperature indicated by cherry redness; but that after that point the particles are themselves enlarged, and consequently occupying more space, account for the diminishing density.

We must now enumerate the varieties of clay which are employed:— Ordinary potter's clay is only used for common earthenware, as it is always red or yellow after burning. This arises from its containing, in varying proportions, oxide of iron. Its composition is usually—Silica 60, Alumina 30, Iron 7, and Lime 2. The *red or brown clay* of the neighbourhood of Glasgow, which is employed only for the common black ware and flower-pots, contains in addition to the above ingredients about six per cent. of magnesia. The ware manufactured from this clay will not endure any high degree of heat without undergoing fusion. A peculiar clay called *blue clay* which is of a greyish colour is much used, because, whether in flint ware or porcelain, its biscuit burns beautifully white; it is not liable to crack in the fire or in cooking; its chemical composition is, Silica 46, Alumina 38, Oxide of Iron 1, Lime 1, and water in combination. There is also a *black clay* sometimes employed, containing much carbonaceous matter, which is burnt off during the baking of the biscuit, and the clay is left of a beautiful whiteness. *Cracking clay* was used by the Wedgwoods, but from the peculiarity to which it owes its name, it could only be

employed with a large quantity of flint; when carefully manipulated it is capable of forming a very hard and white ware.

It will be evident from what has been stated, that all the peculiarities found to belong to various kinds of pottery, depend upon the character of the clay, which is the main base of its composition. Upon its physical and chemical characteristics, depend the colour, texture, fracture, hardness, sonorosity, and transparency or opacity of the resulting ware.

Porcelain, by which is designated a dense body too hard to be scratched by a knife, translucent, and white, was manufactured from a very early period in China; the remote antiquity of this manufacture is proved by the discovery of bottles of Chinese porcelain, with inscriptions in that language, in the tombs of Tbebes. The porcelain tower, near Nankin, was built A.D. 1277, but as early as 163 B.C. it is stated that porcelain was common in China. Marco Polo, the Venetian traveller, penetrated into China in the thirteenth century, and he describes with much accuracy the mode then, as now, employed by the Chinese in the preparation of their clays. "They collect," he says, "a certain kind of earth, as it were from a mine, and laying it in a great heap, suffer it to be exposed to the wind, rain, and sun, for thirty or forty years, during which time it is never disturbed. By this means it becomes refined and fit for being wrought into the vessels above mentioned. Such colours as may be thought proper are then laid on, and the ware is afterwards baked in ovens or furnaces. These persons, therefore, who cause the earth to be dug, collect it for their children or grandchildren."

Mr. Marryat, in his "History of Pottery and Porcelain," gives an interesting account of the Chinese manufacture at various periods. The following anecdote is amusing:—"Every trade in China has its peculiar Deity or Idol. Pousa is the Idol worshipped to this day by the fraternity of porcelain-makers. An Emperor once ordered that some porcelain, after a certain pattern, should be executed for him; the manufacturers represented to the mandarin charged with this commission, that the execution of the order was impracticable; the only result was, that the Emperor ordered the performance of the task the more strenuously, and gave the strictest orders for its completion. The manufacturers once more exerted all their energies, but again their attempts failed. The mandarin tried by means of the bastinado to excite them to new exertions. The workmen were in despair, and one of them, named Pousa, to escape further ill usage, sprang into the glowing furnace, and was immediately consumed in the flames. When the burning was over, the porcelain was found perfect and beautiful, just what the Emperor desired, and Pousa the martyr received divine honours. The little corpulent figures, so common in collections, and which the French call *mayots*, are images of this divinity."

Notwithstanding the high antiquity of the Chinese porcelain, the porcelain and stone-ware of Japan is of a finer character, owing no doubt to the less stringent laws of the Japanese, by which they were allowed to introduce improvements, that were forbidden by the laws of the Celestial Empire. In Japan they manufacture a white porcelain of great delicacy of colour, and their red stoneware is of beautiful body; this evidently arises from the circumstance of their possessing clays which are either naturally superior to the kaolin of the Chinese, or that they are more minutely comminuted in the process of manufacture. The Portuguese missionaries appear to have introduced many novelties into the manufactures of Japanese pottery. They not only taught the natives better methods of mixing their clays, but they also introduced the art of printing on china, with which the Japanese were not previously acquainted.

In connexion with this subject, and illustrating the antiquity of the manufacture of earthenware in the East, we have much pleasure in being permitted to give some exact information of the extraordinary discoveries lately made, by Mr. William Kennett Loftus, at Warka, in Mesopotamia of the

COFFINS OF BAKED CLAY OF THE CHALDEANS.

This gentleman, who is attached to the surveying staff of Colonel Williams, appointed to settle the question of the boundary line between Turkey and Persia, writes thus:—

"Warka is, no doubt, the Erech of Scripture, the second city of Nimrod, and it is the Orchoe of the Chaldees. The remains of two massive temples still raise their heads eighty feet above the plain. The bricks of which they are composed are all marked with a single cuneiform stamp. Another lofty structure of sun-dried brickwork occupies the centre of the ruins, which are surrounded by a wall, five miles and a half in circumference; traces of man's handiwork are, however, to be seen for a distance of fifteen miles in circumference. But the mounds within the walls afford subjects of high interest to the historian and antiquarian; they are filled, nay, I may say, they are literally composed of coffins piled upon each other to the height of forty-five feet. It has, evidently, been the great burial-place of generations of Chaldeans, as Mesad Ali and Kerbella, at the present day, are of the Persians. The coffins are very strange affairs; they are in general form like a slipper-bath, but more depressed and symmetrical, with a large oval aperture to admit the body, which is closed with a lid of earthenware. The coffins themselves are also of baked clay, covered with green glaze and embossed with figures of warriors with strange and enormous coiffures, dressed in a short tunic and loag under garments, a sword by the side, the arms resting on the hips, the legs apart. Great quantities of pottery and also clay figures, some most delicately modelled, are found around them; and ornaments of gold, silver, iron, copper, glass, &c., within. I obtained many specimens of cuneiform inscriptions, and from their very simple and straight-lined character I believe they will prove of very early date. They are very distinct from the Persian style. Forty small inscribed tablets of clay are among the number of articles of this description: an inscription in relief is quite a new feature too, in bricks from this country, though common in Egypt. Some intercourse has evidently existed between the Chaldeans and Egyptians; for I obtained a small Scarabeus—many Egyptian forms of pottery, and an ivory much defaced. One of the most interesting of these apparently Egyptian derivatives, is a carving on a broken shell; it represents two horses in the act of drawing a chariot, and much resembles some of the Nineveh sculptures; the lotus bud and flower are introduced into every available space; on the reverse side is a basket filled with the same flowers."

Mr. Kennett Loftus is the first European who has visited these ancient ruins of Mesopotamia, and he is now visiting Luse Diz in the heart of the Persian mountains, and Susa (according to Major Rawlinson, "the palace" of Scripture), so that we may expect many important discoveries from this interesting locality, Mr. Loftus having already given such striking evidence of his zeal and industry.

The coffins of earthenware are exceedingly curious, as giving evidence of a somewhat novel application of the plastic manufacture among the ancients of the East; and certainly they are the largest examples of any manufacture of pottery with which we have been made acquainted. The presence of a green glaze shows that they must have been submitted to the action of a high temperature, and thus they prove a much more advanced knowledge of the art than any of those sun-dried urns and vases which have been found in other districts in the East and in Central America.

In a future paper the peculiar constitutions of the principal varieties of pottery and porcelain which have been manufactured in Europe, will be entered upon; and we shall endeavour to explain all those chemical and physical conditions which go to the production of earthenware and porcelain, and particularly to examine the correctness, and the definitions "hard" and "soft" paste, as these terms are usually employed.

ROBERT HUNT.

ELECTROTYPING

APPLIED TO ART-MANUFACTURES.

RULES AND BOX-LIDS ADORNED BY BAS-RELIEFS EXECUTED ON GALVANOPLASTIC BRONZE-WORK.

If necessity may be called the mother of great inventions, chance has been often that of useful cases in the Fine Arts, where the adaptation of poetical creations to every-day wants is a question of vital importance. The skillful management of artistical compositions in strict reference to the necessities of common-life is the very soul of Art-manufacture; and to this particular talent not only ancient Art, but even the industry arising from refined taste, was indebted in the middle ages for its prosperous increase, and the wide-spread sway which it exercised over a large portion of Europe. Whole manufacturing towns owe their renown and even their wealth to traditional methods of Art-manufacture, enabling them to keep pace with the rapid development of foreign industry; and did not the French excel so much in this particular branch of human knowledge, their industry would have suffered much more from English and German rivalry than it has already done.

As English Art-manufacture has been obliged to follow of necessity the capricious variations of French fashion, the consequence is, that, at length, some departments of it have chosen to rid themselves entirely of all elements of Art, and dedicate themselves to an exclusive utility. An eminently sober character has been the result of such a decision. To escape from bad taste or a thoughtless and servile imitation of foreign customs, all ornamental aim has been in modern times driven out from the system of our daily life, and we are banished into the desert of that sterile monotony, now exercising a crushing sway over so grand, immense, and wealthy a metropolis as London. The time seems now to be past when such an exclusively practical direction can longer prevail, and the conviction gains ground that the spiritual pleasures afforded by Fine Art have a higher aim than that of an evanescent and frivolous luxury. If we go back to the history of civilisation, we are soon convinced that nations can as little dispense with the excitement innocently furnished to them by the pleasures of Art, as individuals can forego the delicacies which are pleasing to the palate, although the latter neither produce strength nor afford nourishment, as is proved to us by modern chemistry. Public education has therefore a sacred duty to perform in improving this inborn tendency of human nature, and preventing it from falling into degeneracy, an evil that inevitably follows any relaxation of fostering care. It is a general law of nature, that nothing which the world produces can be saved from decay and destruction except by diligent culture. This law is not more applicable to the natural world than to the realm of Art, where a wise and careful superintendence is requisite to guard against every lowering effect or deteriorating influence.

It was to one of these happy combinations of which we spoke in the beginning of this article, that the fancy of man is indebted for the decoration of that part of a Greek column, representing its supporting power. Callimachus is said to have seen, accidentally, a basket placed in a burial-ground, which was surrounded and almost hidden in so poetical a manner by the leaves of the acanthus, that he was struck by the charm conferred upon an ordinary object, reminding him, by a natural association of ideas, of the basket-shaped capital surmounting the top of a column. The idea suggested by chance was soon put into practice, and the Greek temple, so rich and splendid in itself, received from it an increase of beauty acting most powerfully upon our imagination. This example shows us, in a very instructive manner, how ornamental Art is enabled to lend a charm even to those parts of a building which are already distinguished by refined proportions and tasteful adaptation; and the Art-manufacturer will find that, wherever he has been unusually successful in turning to account objects of common use, he has pro-

ceeded, perhaps unconsciously, on a similar principle.

By this preface we think it right to introduce to the world of fashion a small frieze representing a series of winged children busied with the

reduced to a few motives, by which these graceful figures are either put in action or withdrawn from it. Each group that follows strikes us by its novelty. We pass through the whole series with ever renewed and still increasing pleasure, and

in a resting attitude, reminding us of the *dolce far niente* of the inhabitants of the south. He holds a vase in his hand, which he seems to intend to fill with the milk of the willing animal. But now the scene changes entirely, and assumes

delightful toils of rural life, which has been adapted more by chance than by original intention as the ornament of a ruler. The uncommon success obtained by this adaptation of a fine design must strike us with surprise that rulers have not been, in former times, decorated with similar charming subjects, which tell us long and amusing stories without interrupting the course of our wandering thoughts, presenting to the eye longing for rest, a tranquil point of attraction, till our ideas return again to the writing-desk before us. The cause is probably to be found in the want of means to reproduce so fine a design in a manner as perfect as inexpensive. Electrotyping affords both, and enables the Art-manufacturer to enliven not only the surface of such a ruler, but of every similar object, in the most suitable and delightful manner.

This graceful composition has been the favourite of persons of refined taste long before it could be imagined, that, one day, a process would be invented able to afford us reproductions of such a work of Art, once as solid and of equal excellence with the original. In former times people were satisfied with cast copies, which reproduced, very coarsely, merely the general idea of the design; and a few persons, only, thought it worth while to have them chiselled, the workmanship being so exceedingly expensive, and remaining still so far behind the refined beauties of the original. Now reproductions may be had at a cheaper rate than common casts, and thus so lovely a work of Art has become the property of the million.

Now, when we ask what is so attractive in this design, we are at first entirely at a loss for an answer. Graceful as the composition is, it still presents nothing but one of these commonplace subjects seeming to convey no particular idea to our minds, and which are easily overlooked by those who wish that artistical representations should be not only pleasing but also instructive. A heifer amongst five goats, all surrounded by boys, who are busied with them, seems to present no argument worthy of serious consideration. If we examine, however, the artistical motives by which this cheerful company is linked together, we soon perceive that the composition is full of poetry, and that here we find the contrary of that which so often occurs in historical compositions, announcing themselves rich in important ideas, whilst in reality they afford us only common and every-day thoughts, masked outwardly with the attributes of a higher world of poetry. The most ordinary occupations of rural life are shown in a point

at last tempted again to pass them in review, unwearied by the fanciful play of such simple combinations.

Thoroughly to understand and to appreciate a design, we must analyse it as scholars are accustomed to do a poetical composition, measuring every line and rendering account of every turn of the sentences. Artists who are constantly reading pages written in this figurative language are in the habit of doing so almost unconsciously, whilst the public at large, being generally satisfied with a vague idea signifying nothing, maintain that matters of taste are not subject to the laws of reason. This is, however, a great mistake, which has not a little contributed to degrade the study of aesthetics. We shall therefore endeavour to take an opposite direction, and to examine such designs with the intention of discovering a sound reason for every part of the artistical arrangement, and, if our readers have patience to follow us, the result will certainly

a more sportive aspect. A pouting boy throws himself upon a ruminating goat stretched on the grass, seizing it by the horns. Another runs away with a vase, which he embraces with both arms, while a floating drapery indicates the rapidity of his movements. He looks backward, and is, by this slight motive, strictly connected with the former group, thus terminating the first half of the frieze. Now begins a general movement. One of the boys is running after a goat with hasty steps, while his companion with a milk-pail has overtaken the peevish animal, who seems to yield unwillingly the precious liquid. Another pair of boys is moving on, the one loaded with two full vessels, while the other carries an empty one, pointing out to those who follow him something that may regulate their conduct. The goat, which is now milked by a kneeling boy, seems to be likewise of an impatient temper, but is tamed by gentle treatment, the companion of the milker presenting to the animal some delicate food.

Another boy comes up in haste to lift a large vase standing on the ground, and the efforts made by him to raise it, show its full contents. The last boy, who stands turned in an opposite direction, stretching out his hand, and thus opening a new series of figures, would, by this gesture alone, be unable to render intelligible the motive intended by the artist, who however, stopping short, allows his admirers to imagine what they please.

Winged boys are commonly called Cupids or Amoretti, the attribute of the wings being a privilege of the Love-god. We have,

however, intentionally abstained from this denomination, which so easily conveys a false idea of the subject into which they are introduced. Our artist might certainly as well have represented simple children, did not the wide-spreading wings, which increase the bulk of these little beings without altering their character, afford him the great advantage of filling up all the interstices of the composition by this means, so that one figure is thus linked to the other with the utmost ease and propriety. Besides which, this symbolical addition heightens the expression of every individual figure, and to judge of the powerful effect attained by this artistical contrivance, we have only to look at the little boy who is leaning on the back of the goat nearest to the cow, whose wings are hidden by his own body and that of the animal. How small and insignificant is his appearance! Does he not seem to belong to quite another and almost inferior order of beings?

be to the advantage of both parties in coming to a mutual understanding, a thing of no small importance in an affair of so much difficulty. The first group we find to the left of the spectator represents a winged boy kneeling down to milk a goat. He appears to be in a perfect solitude, although there is not the slightest indication of a locality. The cause of it is the circumstance of the next group terminating completely in itself, the figures which compose it not being linked in any way either with the preceding or the following ones. Here a boy loaded with a heavy vase is kneeling on a pedestal to relieve himself from his burden. His companion, standing by, offers to aid him in the task. While this subject shows us a fellowship of labour, the next places before us the feeling of mutual enjoyment. A boy resting from his toils receives from another who approaches him a cup of sweet liquid to quench his burning thirst, while a third at a little distance contemplates

of view, leading to this humble stage of existence a charm of freedom and peaceful harmony which is enchanting. Seventeen children present themselves in as many different situations, although this whole variety may be

the friendly group, leaning on the back of a patient goat; a graceful motive which is repeated in a more striking manner in the arrangement of the succeeding scene, where another boy, supporting himself against a cow, stands likewise

Having thus analysed this graceful composition, which is charming and attractive in proportion to its freedom from pretension, we see that its merits assert their full value only when we apply to the composition the method of

testing it shown in the above exposition. Without this analytical process the aspect of the whole, although delightful and attractive, is rather dazzling to the eyes, than capable of affording real nourishment and ultimate satisfaction to the understanding.*

A composition of which the subject is mythological, taken from a frieze of Greek workmanship, more than thirty feet long and nearly three feet high, to be seen in the Glyptothek of Munich, has been likewise adapted to a ruler (No. 2), on the borders of which Mr. Henry Elkington has engraved the divisions of an English foot, so that this useful instrument unites in itself the three qualities of foot-rule, ruler, and work of fine art. The latter represents to us the marriage-procession of Neptune and Amphitrite, who seated on a chariot are drawn by a pair of Tritons playing the lyre and flute. Doris, the mother of the veiled bride, meets the wedded pair on the back of a sea-horse with two torches, which, according to the Greek custom, the mother of the bride was accustomed to kindle on this solemn occasion. A Cupid, who has taken his seat on the winding tail of the hippocamp, draws after him a bitted sea-bull, on the back of which another of the daughters of Nereus is carrying a dressing-hox, to be presented to the newly-wedded spouse of Neptune. On the other side of the composition a third Nereid reclining on the back of a sea-horse is offering a cup to make the libation, in conformity with the prescriptive rite of the sacred ceremony. Even this hippocamp is led by a Cupid, while another winged boy is seated at his ease on its long winding fish's tail.

These three surrounding groups form the principal elements of the design, belonging to the main action. But now the artist has added another episodic representation, which exhibits to us on the left the Goddess of Love riding on a sea-goat, and giving her orders to two Cupids soaring in the air, one of whom holds a burning torch, while the other is flying away with a fish in his hand. The latter may be considered as a love-gift intended to be presented to newly- affianced maidens, while Eros himself, riding on a dolphin, watches with peculiar satisfaction the wedded pair brought by him under the yoke of marriage. These three love-gods are the constant companions of Venus; and their names, Eros, Himeros, and Pothos, indicate the different stadia that love is wont to go through in conformity with the fluctuating passions to which the human heart is subject. We see in this additional group the whole composition once more repeated in an inverse sense, as here is prepared what there appears accomplished; Venus disposes of the love-gifts, while Doris and her daughters are offering marriage-gifts corresponding symbolically with the attributes of the husky brother of Eros, who appears himself to be the prime mover of the whole story, while Himeros (desire) alludes to the fire of newly-awakened passion, and Pothos (the representative of mature love) is only happy when he is allowed to gratify the wishes of the beloved object.

This beautiful design, which, as far as we know, has never before been published, and was therefore only known to those who had an opportunity of visiting the Glyptothek of Munich, is now brought before the eyes of the public in a manner not less satisfactory than pleasing. The most elaborate design would not be able to render so much of the refined charms and rich details of the original design as is afforded by this plastic reproduction. But while the most precious drawing might be condemned to remain hidden for years beneath the dust of a gloomy library, here this beautiful work of art appears raised again to new life, adorning and giving completeness to objects of daily utility. It is only in this manner that Art can regain the sway exercised by her in the classical epochs over the human mind, calling into existence ideas and diffusing around her charms which she alone, of all the various developments of the

* Of the composition of this frieze little is known. It is said to be the work of an Italian artist of twenty years ago, who went to America.

human faculties, possesses the power of bestowing upon mankind.

Sculpture has in this respect prerogatives entirely denied to other branches of art and this must be ascribed to the circumstance of its productions being better able than others to associate and even to identify themselves with the objects of our common occupation. Colour and design cannot so easily develop the same power when adapted to our furniture, unless we can make to them the sacrifice of considerable space, or incur on their account great expense. This can seldom be the case, and if the million are to enjoy the gifts of art, the artist must be content to adapt his powers to a lower scale of excellence, so as to bring them within the sphere of the numbers upon whom he has to act. Electrotyping, however, affords the means of effecting such an artistical communism, without degrading Art itself; nay, it enables the skilful artist to aim at a refinement of execution, which as yet has been attained in Art-manufactures only within very narrow limits. Sculptors have, however, been but little aware of the immense power thus placed within their reach by science, and ancient prejudices blind them to such a degree that they let slip the best opportunity of competing with those other branches of design, which for several centuries have availed themselves, with astonishing success, of the multiplying processes obtained by various methods of printing. Of these sculpture makes advantageous use only in the reproduction of dies and coins.

It will prove perhaps not less amusing than instructive to our readers to compare with the classical representation of the marriage-procession of Neptune and Amphitrite, the modern design of a similar subject, translated into sculpture from a picture, and by this means adapted to the adornment of a box-cover. We see in this fine composition (of which Copoliti, one of the first painters of the modern Roman school, is the Author,) Thetis carrying the arms of Achilles on the back of a dolphin, floating on the waves of the sea. Two Nereids, who support her on each side, hold the veil, which swelling under the effect of a light breeze forms a kind of canopy over her head. She holds the helm on her knees; and a spear and sword in each hand, while the sea-nymph on her right takes charge of the shield. This principal group, occupying the centre of the composition in a triumphant and imposing manner, is preceded and followed by various other episodic groups, where a character of mythical lore forms a strong contrast with the more solemn aspect of the main figure. A Triton blowing his shell announces the approaching goddess. The love-stricken nymph, mounted on a capricious sea-horse, is aided by a Cupid, who holds one of the reins of her steed. On the opposite side a Nereid is passionately embraced by a Triton, while another Triton, leaning on a dolphin, watches the happy pair with envious eyes. Two little Cupids riding on a dolphin form by their child-like innocence a lovely contrast to the coy Nereid and the enamoured Triton.

This design, being taken from a painting, presents of course a picturesque character. But as the modelling of the figures and the general outlines of the composition are of great purity and aim at a high degree of perfection, the whole presents, even as sculpture, a striking aspect. The plastic part of the reproduction deserves praise, and those who wish to acquire a more solid knowledge of form, which conveys to us in art the ideas awakened in poetry by words, may derive from the study of similar plastic translation, the same advantage as painters themselves obtain by comparing with pictures the power of action granted to the sister art, and even by exercising themselves in modelling. This was the practice not only of Michel-Angelo, but even of Correggio, who by these auxiliary means attained the deep knowledge of that chiaroscuro which lends to his pictures so unrivalled a charm, and bestows upon them that magic power, which they exercise over the imagination—a power that has been felt by all, even by those who knew not whence it came, from the period of their production until now.

EMIL BRAUN.

GRIEF.

FROM THE BAS-RELIEF BY J. H. FOLEY, A.R.A.

MONUMENTAL sculpture has given birth to some of the best productions in modern Art, especially among ourselves. Bacon, Banks, Flaxman, Chantrey, and the two Westmacotts, have gained as much honour in commemorating the dead as in immortalising the living; the fame of the two first-mentioned sculptors, indeed, rests mainly upon their monumental works.

There are difficulties in the way of a successful practice of this class of Art not very easily surmounted; it must be poetical, or it degenerates into the common work of the mere artisan; it must have sentiment, but not of that vulgar, meretricious order which offends both taste and feeling; and it must express something more than the skill of the sculptor in chiselling a graceful design, or it will convey to the spectator a different idea from what is intended—a monumental group should excite reverence for the dead, no less than respect for the living mind, whose aim is, or ought to be, to search the deep fountains of the heart, and draw from it thoughts in unison with his subject. Men visit not the churchyard and the tomb for amusement, but for instruction; the sculptor has, therefore, the power to teach a wholesome lesson.

The little bas-relief by Mr. Foley, which we have here engraved under the title of "Grief," is a very beautiful composition, most touching in sentiment and graceful in treatment. A mother and her daughter kneel by the grave of the husband and father; this, we presume, is the intention of the sculptor, although, that the grave should not occupy too large a space in the design, it is made smaller than, in such case, it would naturally be. The action given to the elder figure by the covering the face with her hand is a felicitous idea, for Grief, as intense as hers, must not be scanned by every intrusive eye. And how closely and tenderly are the two entwined together, each finding comfort in the other; yet both sorrowing over the link that is broken, and the staff that has been taken away from them.

It is rare to meet with a theme of this class so eloquently and expressively dealt with; apart from the melancholy subject of the work, it is one we could long gaze upon and admire with thoughts that cannot find utterance. As of Chantrey's "Sleeping Children," so it may be said of this, a man must be made of unaturally stern stuff who can contemplate it unmoved.

Most of our readers will remember Mr. Foley's beautiful group of "Ivo and Bacchus," engraved in the *Art-Journal* for January, 1849; his little bas-relief of "Grief," though of an entirely different sentiment, is in no way inferior to the former work in every quality which constitutes the value of poetic sculpture. The artist has not yet reached, by some years, what is generally considered the prime of life; we may therefore reasonably look forward to much of a still higher order of excellence.

OBITUARY.

MR. HUME LANCASTER.

It is our duty to record the death of this artist on the 3rd of July, at his residence, Erith, Kent. As an old member of the Society of British Artists, his name was favourably mentioned every year in our report of the exhibition of this Institution. Mr. Lancaster was a painter of marine subjects and coast views, especially of Dutch scenery; and had circumstances permitted him the free exercise of his talents, he would doubtless have reached considerable eminence in this branch of art. But it is painful to know that a man of education, and of unquestionable ability in his profession, should, from domestic troubles, have been compelled to pass the prime of his life in obscurity, and to paint for picture-dealers at prices barely sufficient to afford him subsistence. The latter part of his history is a sad one, yet, so far as we can learn, without in any degree reflecting upon his character or conduct, which we believe to have been beyond imputation; still necessity often drives a man to do what, though by no means dishonourable, his self-respect would urge him to avoid.

THE RECORDS

The table contains several columns of text, likely representing names, titles, or dates. The text is extremely faded and cannot be read. The table appears to be organized into at least three or four columns, with varying numbers of rows. The overall appearance is that of a historical record or ledger.

GRIEF

ENGRAVED BY J. W. P. FROM THE
ORIGINAL DRAWING BY H. H. W. A. R. I.

CARVED CRADLE FOR THE QUEEN.

BY W. G. ROGERS.

We have already had occasion more than once to allude to this remarkable production of the art of wood carving, and to notice its progress in Mr. Rogers's hands; we are now happy to be able to present our readers with careful illustrations of its more prominent and beautiful details, accompanied by a general view of the whole, so as to render these completely intelligible. The cradle is carved in the finest Turkey box-wood, and has been in hand nearly two years, delays having been occasioned by various circumstances, but principally by the difficulty of procuring wood of high quality and sufficient size, to render as few joints as possible necessary. The shape of the cradle, which consists of flat head and foot boards elaborately carved in high relief and united by a semi-cylindrical trough, was suggested by Her Majesty, partly in consideration of those representations of cradles which generally appear of this form in early Italian and Flemish pictures; and, perhaps, no form which could have been adopted, so well exhibits to the eye all the minutiae of the enrichments which are profusely introduced throughout the greater part of the work.

The style employed in the design is Italian, of the first part of the sixteenth century, modified, however, to suit the feelings and characteristics of the present age. Upon this subject we have been supplied with some remarks by the designer of the cradle, Mr. W. Harry Rogers, who thus expresses himself:—"It appears that if we throw aside the style of ornament which originally sprung up in Venice in the seventeenth century, and was soon transplanted to France under Louis XIV., whose name it bears,—a style now generally repudiated by most persons of taste,—our only alternative, in the absence of any style of entirely new creation, is to revert either to that of the classical epoch or to that of the middle ages, unless, indeed, we direct our attention to that style which, rising in Italy, extended itself in various dialects all over Europe in the first half of the sixteenth century. And how far Decorative Art can be a gainer by the implicit imitation of Grecian and Roman remains, has been sufficiently tested without any desirable results under Napoleon in France and George III. in England; while the Gothic style, admirable in all matters ecclesiastical, and suited to the few stern wants of feudal life, is but ill capable of accommodating itself to the various habits and comforts of modern civilisation. These objections cannot be said to hold good with the Italian style of ornament of the sixteenth century. This style in its infancy consisted of a somewhat close imitation of such remains of classical Art as the improving spirit of the age had rescued from oblivion; but the Italian artists could not long remain satisfied with servilely copying the productions of any school, however fine, but soon branched off into originality, blending with much of the antique some lingering features of Gothic detail, and many new adaptations from nature. Decorative painting, goldsmiths' work, and wood-carving were the principal arts which gained from this new channel for their capabilities; and under the tasteful patronage of the Medici family in Italy, of Francis I. of France, and of Charles V. of Spain, soon developed the extraordinary talents of Udine, Benvenuto Cellini, and hundreds of spirits equally choice whose names have not descended to us. Wood-carving, in particular, received a new impulse from its great facility of execution in the realisation of those effects which the taste of the times demanded, and from the fashion among the nobility of presenting marriage-chests, carved in walnut-tree, often in the highest class of Art. Many of these chests exist in private collections in this country, and are a strong testimony of the perfection which was attained, not only in general form, but in the beauty of composition and delicacy of finish of raised arabesque enrichments upon a flat or plain hollow field. This introduction of ornaments in relief was a great characteristic of the new style, and it was occasionally accompanied, often to too great an

extent, with scroll strap-work, which, however, from its bold style of execution, successfully contrasted with the elaborate finish of the bas-reliefs. The style may be said to have reached its greatest perfection towards 1520, which is about the date of the celebrated papal bedstead pillars in the possession of the Earl Cadogan, among the most exquisite specimens of furniture-carving of the period in existence. The early arabesques of Italy almost invariably consist of delicate raised stems and tendrils conventionally decorated with flat bunches of heart-shaped leaves, birds, and grotesque animals, and having here and there extremely prominent masses carved into masks, flowers, or figures of boys. The same descriptions hold good with the contemporary productions of Flanders, and those of England after the time of Holbein, excepting that in these the contrast of relief was sometimes more extravagant.

"The Italian style, as applied to the domestic purposes of Decorative Art, possesses recommendations of which few other styles can boast, but it appears to require some modifications to reduce it to the wants and tastes of the present day. It has the advantage of being bound down by no such rules as those which should universally direct the formation of Gothic ornament, and its beauties must always be developing themselves in proportion as the study of nature accompanies its employment. But particularly in the present instance I have thought it expedient to divest the style of those 'monsters and hydras and chimeras dire' which form so prominent a feature in most productions of the sixteenth century, as the fashion of the day now requires that in matters of ornament no objects should be introduced unless having a positive meaning to portray. The flowers also throughout the cradle have been drawn and carved from nature, instead of being executed with the conventional treatment they would have received three centuries ago."

"In making the design for the cradle it was my intention that the entire object should sym-

"The most ancient form of cradle differed little from that adopted by the designer of Her Majesty's. The early Norman MSS. give representations of cradles which bear an affinity to the best then in use; they much resembled square boxes protected at the sides like a modern cot, to prevent the bedclothes or sleeper from falling out. The only difference between them was that the cradle was smaller, and the feet placed upon rockers. In the Royal MS. 2 B. vi. (a work of the fourteenth century, known generally as 'Queen Mary's Psalter') is a very excellent representation of a nurse rocking a child asleep in such a cradle. In the succeeding century they were made to swing from the side-posts, as seen in the cut here given of

one of the most interesting remaining; the cradle in which reposed the great hero, Henry V. when a baby. It is preserved in Monmouth Castle, the glory of which, Lambard quaintly declares, "had elaine perished, had not it pleased God in that place to give life to the noble King Henry V., who of the same is called Harry of Monmouth." A curious anecdote is told of the first Duke of Beaufort, who especially directed his granddaughter, the Marchioness of Worcester, "to lie in of her first child in a house lately built within the Castle of Monmouth, near that spot of ground and space where our great hero, Henry V. was born."

Cradles in the middle ages were frequently richly decorated by the wood carver, and were painted and gilt. The old Christmas Carol declares of the Saviour—

"He neither shall be rocked in silver nor in gold,
But in a wooden cradle that rocks on the mould."

In the *Archæologia*, vol. viii., is a representation and description of an ancient cradle which formerly belonged to the great and brave, but unfortunate, Charles Neville, the last Earl of Westmoreland, of Brancepeth Castle, who being engaged in the northern rebellion of 1570, was attacked, fled beyond seas, and died in poverty. It is of oak, richly ornamented with mosaic gilt work, and the arms and crests of the family and its connections, at the head, feet, and sides, among which appears the white rose of the house of York, denoting the attachment of the Nevilles to that branch of the royal family of England, during the Wars of the Roses.—F. W. FAIRBOLT, F.S.A.

bolise the union of the Royal House of England with that of Saxo Coburg and Gotha; and with this view I arranged that one end should exhibit the arms and national motto of England, and the other those of H. R. H. Prince Albert. The last-mentioned portion is nearly covered with raised arabesques, all however for the most part of equal projection, while the flatness is relieved by six circular moulded bosses, which occurred to me as qualified to carry off the massiveness of the centre shield, and at the same time appropriate to receive the six crests confirmed to His Royal Highness by the Royal College of Arms. Beneath the shield occurs the motto 'Treu und fest' in the contracted lettering of the time of Henry VIII., and below this, upon the exterior of the rocker, is a bold head of 'Somnus' with closed eyes, and over the chin a wimple, which on each side terminates in poppies. In the upper part of the panel is a handful of pinks taken from nature and bound round with ribands, which support and connect the whole of the arabesque work of this part.

"The Queen's end or foot of the cradle, which is indeed the principal front, is, like the head, bordered by moulding; in the centre are the arms of England surmounted by the lion crest, which is represented standing upon the topmost scroll of the shield, and round it, grouped among fanciful lines and masses of foliage, are English roses, between which birds are sporting or flying. Here the ornaments, though intricately spreading over the entire panel, uniformly spring from two stems which rise out of a vase at the bottom crossed by ribands, which bear the motto 'Dieu et mon Droit.' The point of juncture between the heraldic panel and the exterior of the rocker is occupied by a luxuriant garland of poppies, more prominently executed than other parts of the work; beneath it is the head of Nox represented as a beautiful female with closed eyes, supported upon bat's wings and surrounded by seven stars. The top of this end above the arabesque work is held together by dolphins, introduced also in other places among the details, partly in allusion to the maritime pursuits of this country, and partly as furnishing one of the most lovely forms ever created, and one indeed, against the adoption of which the arguments which apply in condemnation of the use of monsters and grotesques in general cannot be urged. The inscription 'Anno 1850' was placed between the dolphins by Her Majesty's special command. The royal crown, with foliage issuing from between the bars, is introduced over the head, standing upon a ball, encircled by the motto of the Order of the Garter in raised ornamental letters.

"The sides of the cradle are bounded at the top by Italian friezes of arabesque, among which English roses and poppies, emblematic of sleep, are occasionally introduced. Below the friezes are nine projecting bulbs, on each side divided by pinks."

To this description we may add, that even the insides of the rockers, portions which can scarcely ever be seen, are highly ornamented with abundant taste, the pattern of the moulding at the bottom being quite novel to us, consisting of perpendicular incisions, from which buds and leaves alternately issue. The very edges of the headboard and footboard have received decoration, and that too of an extremely graceful kind. Instead of being left flat they have a central hollow, in which lie eight pendent ornaments, all various, springing out of acanthus leaves. Of five of these with which we were most pleased we offer to our readers engravings (real size) at page 244, believing them to be really useful as suggestions to manufacturers, who could apply them to a hundred different purposes; and we are sure that Mr. Rogers's position is such that he would feel more pleased at finding his performances thus useful to others, than jealous of the attempts of co-labourers in the field of Art.

In conclusion we would only say, that we believe the cradle in question to constitute one of the most important examples of the art of wood-carving ever executed in this country, reflecting equal credit both on manipulator and designer, and a proof of the enlightened taste and liberal discernment of the august personages for whom it has been produced.

We also venture a hope that Her Majesty and His Royal Highness Prince Albert will be graciously pleased to permit the cradle to be placed among the objects in the Exhibition of the Works of Industry

of all Nations. It will be, at least, one example of our ability to compete with the most accomplished manufacturers of the Continent, and go far to maintain the honour of our country.

The engravings on the present page represent a general view of the cradle looking from head to foot, and therefore presenting in the foreground the arms and crests of H R H. Prince Albert, followed by a highly-finished elevation of the opposite end, dedicated to Her Majesty,

which surmounts one portion of the ornamental frieze running along the top of the cradle on either side. The drawings from this frieze, of which we give altogether three portions, are exactly half the size of the originals; and, consequently, sufficiently large for our present purpose.

We next offer an elevation of the head of the cradle, the principal decorations of which consist of the insignia of His Royal Highness Prince Albert. The top has been so drawn as to

exhibit its relative projection to that of the arabesque enrichments of the panel. The crown, with its dependent leaves and side acanthus flowers, are carved in such a way as to

have the appearance of being excessively light, and at the same time to present no protruding points which might be likely to catch the hand and be broken off. This is a principle which ought always to be studied in decorative furniture. The next engraving, which is to

the same scale, shows the flat ornaments of the interiors of the two rockers, both represented in the same illustration, for the sake of saving space, instead of each spandril being repeated, as in the carving. At the foot of the page we give a second portion of the side frieze, which is a most successful composition, and well worthy the attention of manufacturers generally, who may use it in a variety of ways.

The first engraving on the present page represents that part of the interior of the headboard of the cradle which is intended to form a flat canopy over the infant

Prince. Two angels' heads are here introduced into a receding shell ornament surrounded by arabesques. Here the bold top ornament, containing ball and

crown, has been omitted for the sake of giving the arabesque work of sufficient size to show the delicacy of its details, which slightly vary at the sides. This subject is followed by (full size) engravings of five out of the eight edge-pieces to which we have already alluded; besides individually presenting many beauties, they show much ability in variously enriching the same given space with an equal balance of

quantity. The first and last are mere arrangements of Italian foliage, and remind us of the decorated pilasters which Mabeuges so frequently introduced into the backgrounds of his pictures. The centre one has a foliated mask, and the second and fourth severally the monogram V. A., and an anchor of ancient form. At the foot of the page is a third portion of the side frieze, which again is recommended to manufacturers.

THE EXHIBITION OF 1851—
ITS ERRORS AND DANGERS.

We have on a former occasion stated, that four years ago we suggested and advocated the plan of an Exhibition in England similar to Expositions which take place in Paris, Brussels, and elsewhere—which it had been our duty to visit—and that we had corresponded on the subject with three leading members of Her Majesty's Government, whose response was, in brief, that "the time was not ripe for the experiment." Our plan, indeed, was less extensive than that which the autumn of 1849 saw announced under the special patronage of His Royal Highness Prince Albert. We did not contemplate (at all events for a first exhibition) the generous and self-sacrificing invitation to all Nations, nor the covering so immense an area with buildings to receive the Industry of the World. As public journalists, we considered we should be out of place if we did more than suggest what might be, and ought to be, done; and accordingly we hailed as an auspicious event the more enlarged project of the Society of Arts and its illustrious President Prince Albert, and at once gave to it our hearty and zealous support. We did not limit such support to mere words of encouragement, but were the earliest of the public journals to tender, in aid, a contribution in money. While, however, we thus endeavoured to promote an object we had ourselves long and earnestly advocated, our confidence was not with those who, it appeared, were guiding and governing the movement; and we guarded ourselves, for the future, by stating it would be our duty to watch with scrupulous—possibly with suspicious—care, over the proceedings then but commenced.*

From this task we shall not shrink—ingracious though it may be; and while we stigmatise, as most unjustifiable and most impolitic, the clamour that has been raised against the Exhibition, we must admit that to us the altered feeling regarding it is by no means unaccountable. And while, on the one hand, we desire to prevent the Prince from being held responsible for oversights and errors which have been disastrous, we, on the other hand, desire to preserve the public from a charge of caprice, or apathy, or incapacity for forming a right judgment as to the result.

The time has arrived when it becomes our duty to speak out. One oversight has so regularly followed another; mistakes have been so continued; want of judgment has become so notorious; the "choppings and changes" have been just as numerous as the plans and proposals; every body seems to be suspicious, and nobody confiding; to collect further subscriptions will, we fear, be a vain effort; to persuade manufacturers to exertion extremely difficult; and all these misfortunes have now to be endured in association with difficulties always hazardous, if not insurmountable—that we cannot but share the general apprehension of the issue being prejudicial to the best interests of Great Britain.

That which should have been our glory is in peril of becoming our shame; a course which might have been eminently useful to the British manufacturer is in danger of impeding his progress for many years to come. In the markets of the world, buyers will not pause to consider

the circumstances which trammelled Great Britain in the race with the other nations of the world. The Exhibition was planned by us; we invited competition; the "show" is to be arranged by us; the inference will naturally be that we have done our best under circumstances peculiarly favourable to us.

We have been in communication, more or less, with a large majority of the leading manufacturers of England, and we speak from personal knowledge when we assert that their energies have been to a great extent paralysed by the lack of understanding, and absence of system, manifested by the Commission; by want of confidence in "the Executive," arising out of matters still more inauspicious; and, in particular, by the recent awards of the Building Commissioners, whose decisions the public regard as the shadows of coming events—believing such decisions to have been based on injustice, as they could not have been the results of ignorance. While, on the one hand, British manufacturers have been disheartened, on the other, foreign manufacturers are elated at the prospect that is to follow the opening of the Exhibition in 1851; and while the latter are making those active preparations which accompany the hope of success, and go far to ensure it, the former are—even in the month of July, 1850—postponing their exertions until they can obtain a clearer insight into the arrangements upon which will depend a verdict that is to be to them life or death.

The Prince—we say it with regret and with reluctance—the Prince has, from the commencement of this affair, been unworthily supported. His Council was not indeed of his own choosing; it was the creation of circumstances; but it is to be lamented that their

"Indirect and crooked ways,"

so opposed to the fair courses and day-light dealing that usually characterise and distinguish transactions in which Englishmen are engaged, have made so many lukewarm who were zealous, so many indifferent who were cordial, so many hostile who were at least neutral.

Let us not be misunderstood: the Royal Commission consists of noblemen and gentlemen of the nicest honour, entitled to the respect and confidence alike of the high and the humble; but it is no reproach to them to say they were entirely ignorant concerning the work they undertook, and very naturally supposed they were to be instructed by persons fully capable of guiding them aright; such instructors they expected to find in "the Executive," and especially in their Secretaries. All the disasters which have followed, we trace to the fact that these gentlemen were incapable of directing the Commission: their incapacity is the best excuse we can conceive for the "blunders" which have succeeded—one after another—up to the very moment at which we write. This evil might have been remedied if a few practical men had been added to the Commission; but whether it was considered *infra dignum* to mix up such men with the aristocracy, we cannot say: at all events, if we sift the Commission, we shall scarcely find one to compensate for the absence of experience, and other advantages, in the Commission generally, and in their Secretaries.*

Of the Prince who is the head of the Commission it is impossible to speak too highly; he has secured the respect—may we not say the affection—of all classes in this country; and that by the exercise of sound judgment no less than by generous and considerate sympathies. But it was not to be expected that he could be the director of a project so novel; he had to delegate to others the duties to which he lent his

* The jury in France consists of manufacturers of porcelain, muslins, carpets, instrument-makers, printers, &c.; manufacturers resident in various parts of the Kingdom; and although some eight or ten are "representatives of the people," i.e. members of parliament, nineteen out of twenty are "practical men;" including, among others, the inspector of the veterinary schools. We cannot say who are their secretaries, but we have no doubt their selections to these important offices have manifested at least as much forethought and prudence as we might expect in a dealer choosing his foreman, or a gentleman the bailiff to his estate.

high name. The end in view was creditable to his sagacity; but it is not to be concealed, that from the commencement, he lacked, to carry out the project, the means that should have been procured to him by ability, integrity, and experience in combination.

We say, the Council of the Prince was not of his own choosing; and we know it would not have been the choice of the Royal Commission. It was composed of a few members of the Society of Arts, while the Council of that society knew little or nothing of what was going on; the name of the society was used until it became inconvenient. But the Prince was in a manner compelled to be the lever by which the "Managing Committee of the Society of Arts" was to be elevated into notoriety; that Committee ultimately became the "Executive" of the Exhibition. Upon the construction of this "Executive" we have much to say—and may say it hereafter—in order to explain why, from the very commencement of the scheme, suspicions were engendered, which subsequently became—not subdued, but fostered. Themselves, their brothers, brothers-in-law, sons, and sons-in-law, and cousins, have been so amply provided for as to create very general suspicion that personal and family advantages had more weight than public benefits in those upon whom the issue of the experiment was made mainly to depend. These and similar "unfortunate events" are more widely commented upon than the Prince, and perhaps the commissioners, have an idea of. They have had a grievous effect on the subscription list; although few have been held enough to assign the real motives for holding back.*

The secretary of the Society of Arts became the Secretary of the Commission—the most responsible position of the whole—one that required a large mind and great experience—far removed from the suspicion of wrong motives or undue influences: he was, in fact, the pilot of the ship when manned and at sea; and of his capabilities the proofs are before us—in the acts that have been done, those which are contemplated, and the general position of affairs up to the end of July, 1850.

Concerning the private contract entered into between certain members of the Society of Arts and Mr. Drew, the attorney for Messrs. Munday, wealthy capitalists who were to have made a private speculation of the concern, rumour has had much to say. It is asserted that the said contract took by surprise the then Council of the Society of Arts. It was not drawn up by their solicitor; nor could they distinctly ascertain by what solicitor it was drawn up. It was presented to them for signature, and they found in it clauses, which they considered and pronounced to be "monstrous," and refused to sign it. This was the beginning of differences between the Council and the certain members referred to, which ended in the ejection of the Council, and the substitution of another Council, more yielding, in its stead.

"O, what a tangled web we weave,
When first we practise to deceive."

The various interviews which took place between the movers of the matter and H.R.H. Prince Albert were kept as "dead secrets" for a long time; in the end, after several visits to Balmoral and Osborne, as well as to Buckingham Palace, the Prince was effectually trammelled, and, as there was no occasion for secrecy, the matter came out. It is known that the first change made in the affair was the withdrawal of the contract with Messrs. Munday—a contract which, if there had been open and fair dealing, never would have been entered into—and an

* When the Westminster meeting was about to be held, a young gentleman (the son of one of the executive committee), applied to be employed as *honorary secretary*. He was so. He has since been appointed *secretary* at a salary of 200*l.* a-year, with an assistant *secretary*—we understand, a near relation of his own. We do not say that his services were unnecessary, or that they are overpaid, but this is another example of the underground way of working, of which we complain. It is said, indeed, that this young gentleman has recently obtained another appointment as secretary to another "subscription board," and with another salary attached to it.

* Now we should ill discharge our duty if we did not give to this project our zealous and cordial aid; it may not be all we could desire, either in its origin or procedure, but it is, in many respects, that for which we have been some years *hoping*. We have, indeed, as many of our readers know, continually laboured to impress upon the public mind the policy of such an exhibition, and also its feasibility; and now when we see not only a probability, but an almost absolute certainty of its achievement, we shall not be among its lukewarm supporters. At present we shall do little more than supply, as we have done, an outline of the plan; from time to time we shall be called upon to report upon details, and to examine them carefully,—not with suspicion, indeed, but without blind confidence,—giving to the directors of the Exposition such service as we can give, but retaining the right and power to watch closely and inquire minutely, for the protection of the Manufacturer and the good of the Public."
—*Art-Journal*, Oct. 1849.

agreement to return the money they had advanced, and to give them "compensation" for the disappointment to which they had been subjected. The claim for compensation under this agreement is understood to be £12,000; it is to be settled by arbitration; and it appears, according to Mr. Labouchere, that the Treasury has taken upon itself to liquidate this claim, taking the security of the Commissioners for repayment; such security meaning nothing more nor less, than that if there be funds to repay the Treasury, the Treasury will be repaid, if not, the sum must be paid out of the public exchequer; for the Chancellor of the Exchequer would not seek to persuade us that he contemplates proceeding against the Royal Commissioners individually or collectively.*

The next step—the next public step, that is to say—was the selection of missionaries to feel the pulse of the provinces; they were, we speak from our own knowledge, the relatives or personal friends of the gentlemen who subsequently became the Executive, and who were at that time much more truly the Executive than they have since been. Of the gentlemen so engaged we have no desire to speak with disrespect; but there was scarcely one of them—if there were one—at all fitted for the task: not one who was acquainted with the towns visited, the manufactures to be considered, or the general purpose of the project then promulgated. This was very rapidly discovered by the shrewd manufacturers of Manchester, Birmingham, Sheffield, the Potteries, and other places; and even the less calculating citizens of Exeter quickly ascertained that the gentlemen sent to consult or to school them, knew nothing of the business they were about. These gentlemen, coming as emissaries of the Prince, were indeed feasted at mayors' tables, and a vote of thanks for their "eminent services"—prepared beforehand—closed every meeting, at which they explained the wishes of His Royal Highness. They were honored as men "having authority," but were listened to with impatience—as children instructing grown men. We say what we know when we affirm, that in every town in which they appeared, there was less anxiety to aid the movement after they quitted it than there had been before their arrival; and this, not alone in Manchester, where deception on the part of the missionaries gave great offence to the magnates of the town.

From the commencement then, there was, almost invariably, an underhand and un-English mode of procedure, which gradually diminished confidence and increased suspicion. There was nothing "open and above board." All hesitations were met and all objections refuted by a mysterious use of the Prince's name. He was made—most unfairly as regards him, and most unconstitutionally as concerns the public—personally responsible for all the statements that were put forth, for the good faith of preliminary arrangements, and for the ultimate results to the country; and opposition was construed into insult to His Royal Highness.

It is said, indeed, as a sort of apology for the appointments, that the Executive have no power; that they are mere servants to obey the orders

* In the House of Commons, in answer to Colonel Sibthorp, Lord John Russell said, with respect to the question whether any engagement had been entered into, the only one that had been entered into was under these circumstances—before the Royal Commission was appointed there had been a contract with an individual with respect to an undertaking to pay the expense of the erection of a building, and other expenses connected with the exhibition, on certain conditions. When the commission was appointed, there were representations from various places in the country, very strongly urging that that contract should be annulled. The commissioners (he was not present that day) took into consideration these representations, and were unanimously of opinion that the contract ought to be annulled, but in order to do that it was necessary to enter into some assurance that the contractor should be paid the sum which under certain circumstances, it had been agreed should be paid to him. The only engagement that the Treasury took was, that they would immediately find the money that was necessary to get rid of the contract, provided that they had security that the money should be repaid to them. They got what they considered sufficient security, and, therefore, there would be no expense to the public.—Colonel Sibthorp: May I ask the amount?—Mr. Labouchere: The amount is to be ascertained by an arbitration, which has not yet been made.—Colonel Sibthorp: What security?—Mr. Labouchere: The security of the commissioners.

they receive;—but herein is the source of the evil. If they had the confidence of the Commissioners and also of the public, such confidence being founded upon faith in their ability and trust in their integrity, all would go right; such an Executive we ought to have had at any cost. The experience of all public bodies may be adduced in proof that "confusion worse confounded" invariably attends the movements of any institution of which the managing committee is distrusted.

It is not only of dark and narrow alleys into which public feeling was forced out of broad and fertilising channels—that we complain. The whole procedure has been conspicuous for indecision; yesterday, there was to be this, and to-day it was to be that. The Monday contract was displaced by an arrangement which gave the honour of the enterprise to the public. The Exhibition was to be, like our great charities, "supported by voluntary contributions." Prizes of twenty thousand pounds were to be awarded yesterday; to-day success was to be recompensed by a brass medal, nominal value; and again, it is understood, prizes to the amount of twenty thousand pounds are to be given; yesterday, as announced by one of the commissioners, America was contracting to purchase, bodily, the whole collection; to-day it turns out that they will borrow as many things as exhibitors please to lend, and return them in safety when done with—copied and imitated; yesterday there was to be a building of brick and mortar; to-day it was to be of wood and plaster; yesterday there was to be a dome double the size of St. Paul's; to-day the dome had vanished into thin air; and now it appears the building is to be the very opposite of the thing asked for—and for which so many architects laboured in vain—a huge conservatory of iron and glass; yesterday, the building was to be temporary; to-day it is more than likely to be permanent; yesterday a time was fixed for receiving applications for space; to-day that time is extended by six months. In fact, and in brief, we cannot call to mind a single arrangement that has not been changed, or a solitary rule that has not been to some extent altered. Do we regret these changes? No! principally, they were improvements; but we complain that the public was thus trifled with; that the Commission had no fixed principles; that its resolutions were like the ghosts of Banquo and his race—to

"Come like shadows, so depart."

And we affirm that thus was public confidence shaken; that thus enthusiasm was suffered to evaporate; and that now a very large majority of the Exhibitors are manifesting a disposition to strike their colours before competitors arrive in sight.

At the commencement of the plan the Prince's name was a "tower of strength;" the public were gratified to see another proof of his identification with British interests. There was something so agreeable in his dedicating time and energy (which so many illustrious personages devote to selfish enjoyment) to the promotion of commerce and manufactures, only of late years removed from the category of low pursuits, that his project (or, at least, the project called "his") was received with a degree of popularity approaching to enthusiasm.

And it becomes necessary to inquire, why not only this enthusiasm has subsided, but why that which was popular has become almost unpopular, and the generous exertions of His Royal Highness made, very nearly (most ungratefully as well as groundlessly), the foundation of charges against him.

Into the subject of a SITE it is needless for us now to enter; this has been decided; the sense of the House of Commons was taken, and it was determined by the votes of nearly four to one, that the Exhibition ought to take place in Hyde Park. It is not a little singular, that the outcry against the site was raised, only when operations there had actually commenced; Lord Brougham we believe, was the only person who publicly objected to it, and it is no exaggeration to say, that he was rewarded with obloquy for his pains.

Thus, the outcry commenced only when the scheme had become unpopular. Persons who did not clearly see their way to urge, openly, objections against the Exhibition—because of the errors that had been committed, and apprehensions of mistakes, still more serious, to be made in due course—took up the site as a ground of hattle. We feel assured that no expression of dissatisfaction against Hyde Park would have been heard, if there had been contentment with the scheme generally, and confidence in the commissioners, their secretaries, and the "executive" of the body.

It was, indeed, all-sufficient to create general alarm when a monstrous, costly, and picturesque "dome" was threatened as a temporary erection: when the expense of a temporary building was expected to be ten times the cost of a temporary building, for similar purposes, in France; and, above all, when a mass of foreign competitors were recompensed for plans which were not only unasked for, but which nobody ever thought of carrying out; which were, in nearly every instance, at variance with the stipulations distinctly laid down, and which did not contain a single suggestion; while the plans of English architects, which strictly adhered to such stipulations, which were entirely capable of being worked out, and from many of which "suggestions" were taken, were passed over without the reward of commendation.

These, and other startling facts, were received as "heavy blows and great discouragements" by British manufacturers and the British public; and the earliest available moment was taken advantage of to find cause of quarrel: that cause was the choice of site—selected though it had been so long before, and chosen as if by common consent of all orders and classes, with but one dissenting voice. We repeat, if there had been no growing and increasing discontent with the scheme generally, there would have been no opposition to it on this ground: a fact which receives confirmation strong from the paucity of argument against Hyde Park, and in favour of any other site.

It seems to have escaped the attention of both writers and speakers on this subject, that, although the building is to be "temporary," it is to be reconstructed at the end of five years—and of course in the same place. It has been clearly understood—and, for that very reason, little talked about—that the Exhibition of 1851 is to be the first of a series; otherwise, the project could have received no cordial support from those who desired to find England triumphant in a contest with the other nations of the world. We are fully prepared to have the worst of it in 1851; and all advocacy of the plan is based upon knowledge that our opponents will be our teachers; and that we shall thus be taught to beat them in 1856. If there were to be no struggle hereafter; if we were to know that the supremacy of continental manufacturers—to be manifested in England, to the world, in 1851—were to be a thing settled for the remainder of the century, and that no future occasion were to be afforded for renewing the contest upon terms more equal than those which now exist, we should look upon the Exhibition of the Industry of all Nations as to the last degree disastrous to the best interests of the British manufacturer; for, of a surety, his inferiority in 1851 will be proclaimed everywhere; and it is only hereafter that will be his recompense. After the beating he will receive in 1851, he will "go into training." He will gird up his loins to meet an adversary of whose strength of muscle and cunning of fence he has been made aware; and thus, forewarned and forearmed, he will as certainly beat as he will surely be beaten. We do not hesitate to say, therefore, that the ground in Hyde Park must be occupied every fifth year under precisely similar circumstances to those which are to exist in 1851; and the inhabitants of that neighbourhood must make up their minds accordingly.

An early announcement of the Commissioners in soliciting subscriptions was, that a surplus was hoped for and expected—why? to form a fund for future exhibitions of the works of Industry of all Nations in London!

The mode resorted to for raising monies has been much and severely commended upon.

Without by any means going so far as a gallant member of the House of Commons, in asserting that "the promoters of this delusive undertaking were not content with begging, they also resorted to intimidation"—an assertion reiterated by Lord Brougham in the House of Lords,—we must admit that a course has been generally pursued by the subordinates of the Commission very discreditably to the national character. This has been caused principally by employing collectors, who receive a per centage upon all sums collected, and who are by no means nice in their arguments to persuade people of the worldly wisdom of appearing upon subscription lists.* Add to this an unbecoming suggestion of a respected journal (with which a member of the executive is known to be intimately connected), that if people would now put down their names for certain sums they need not be called upon to pay for some months to come—i. e. that they should have nine months' credit; and a most unseemly rumour that a certain wealthy peer, in gratitude for the honour recently conferred upon him, meant to draw his purse strings, and make up whatever deficiency might be found between amount subscribed and amount expended; consider the pitiful resource of "Benefits" such as that at Sadler's Wells; and we cannot avoid arriving at the conclusion that money was to be got by any means; and that thus our national character has been in no small degree humiliated, by the very circumstances which should have elevated it in our own opinions as well as in the estimation of foreign countries.

Far better, far more straightforward, and far more worthy of England would it be at once to declare, that having issued invitations to our table, there should be no lack of entertainment; that the National fund would supply the National Exhibition. To this complexion must we come at last; and it is right as well as wise to avow it. *Parliament will be called upon for a grant to make up the deficiency; and so it ought to be; the very foundation of a cause for holding this Exhibition is that it will greatly benefit Great Britain.* If so, the country should pay for it; if otherwise, it ought not to be held at all. There is no reason why private subscriptions should not be asked for, inasmuch as some persons will be more advantaged than others by the issue, and a tax for the purpose would affect all alike; but there can be no just cause why a National benefit should not be purchased out of the National resources—as it must ultimately be.

We are told, indeed, to believe that the receipts of the Exposition will be large. Large they ought not to be. These receipts are to be derived solely (so it is understood, at least), from admissions at the doors. There are to be no charges for space; or for any other advantage. The admissions will be very numerous, but the price of admission ought to be as low as possible, or the primary intent of the Exposition will be defeated. The scheme is designed mainly to instruct our artisans. It is not intended as a show, or to teach the wealthy where they can get the best goods cheapest; the project was avowedly started—and upon that principle only was it encouraged by Prince Albert—as a means of improving those who were the actual producers of manufactured articles—in short, the working classes. Now, one inspection of eight miles of counters, foreign and home, will be of no sort of value to any artisan. He must study what he sees. He must go again and again; if possible, every day—as many days as he can, while the Exhibition is open; and if the admission on each day be one shilling, it will be a virtual exclusion of the classes for whose behoof the project was suggested, and has been supported. We desire the admission not to exceed three-pence; if it exceed sixpence, the Exhibition, for all useful purposes, will be a nullity. It is already announced by something more than rumour, that on the first day, the private view day, the admission is to be one guinea for each person! It is not insinuated that visitors will on that day look at nought but the company; and it would be honest and manly to advertise at once, that those who pay this enormous sum will be admitted to a private view of—the Royal and Illustrious party who will be there, "on that occasion only." Again, it is said the admission for the first week is to be five shillings—to diminish gradually until it reaches the minimum price. This project would be ruinous; it will be a death-blow to the vital principle of the Exposition, by doing away with that spirit of equality which forms its best recommendation; the aristocracy would go first, and the commonality follow. It would be, in short, the strongest move that has been yet made to render a mere phrase for laughter—that "dignity of labour"—about which so much was said, and so eloquently, by peers and prelates, who at the Westminster

meeting sat side by side with shopkeepers of Oxford Street and Piccadilly.

Another paltry and un-English mode of making money, is understood to be by selling to the highest bidder the privilege to print catalogues; to be charged, as a matter of course, at such price as the contractor pleases: to be executed, equally as a matter of course, in any way he likes. Upon this topic we shall have more to say when the subject is officially before us; but the contractor may rest assured that in this age of anti-monopoly he will not have the affair all to himself. "Competition" is the chosen motto of the Exposition of the Industry of all Nations in 1851.

If we are a nation of shopkeepers we are not a nation of beggars; and we shall enter our protest against being so described to the other nations of the world.

"They manage these things better in France!" The two Expositions of 1844 and 1849—which it was our lot to visit, and which are described so fully, and so extensively illustrated, in our Journal—taught us much, and ought to have taught as much to all who have been entrusted with the plans of the Great Exposition of 1851. The policy of England is indeed far more liberal than was that of France. We, who had so much reason to fear competition, boldly dared and chivalrously invited it; but if we scorned to imitate the French in the narrow and selfish view of "taking care of ourselves," we might at least have condescended to accept lessons from their experience in the business details in which they were proficient.

Their Exposition is paid for out of the public purse, and is free to all who seek admission to it. Every day and all day long (for six days out of the seven) the high and the humble may study there. The catalogue is not cheap, it is charged 10*s.*, but this evil is obviated to the humble, who can hire it for one penny a day. No mere vendor of an article is allowed to exhibit it. When you see an article you know by whom it is manufactured; you see nothing but what is French produce; it is only Frenchman competing against Frenchman for the honour of France. He participates in the glory of the prize he does not himself receive, and he shares in the advantage of the custom thus obtained for his neighbour.

Neither in the Chamber, in the public press, in the atelier of the artisan, in the clubs or in the coffee-houses, is there overheard a murmur against the cost of the building in the Champs Elysée. It is paid for out of the National fund; it was so under the Monarchy and is so under the Republic; but no one grumbles at a tax which he believes will be productive a thousand fold—not only in the actual sales effected thereby—but in the improvement of manufactures, by lessons given to manufacturer and artisan.

It is not yet too late; and earnestly do we hope that Parliament may be applied to for a grant of money, before, and not after, the Exposition; to render it worthy a great country, and not to supply a deficiency, evidencing apathy or want of confidence; and that the people will be invited to see, *free of charge* (or, at all events, nearly so,) that which they will have paid for. It will be far more creditable, and infinitely more profitable to do at once that which we have no doubt we shall be ultimately compelled to do—impose upon ourselves a tax to secure an Exhibition, in all respects, worthy; and we do not in the least doubt that such a proposition would be well received by the country, and not ill received by the House of Commons.

Surely we may not only imitate continental nations in the past, but in the present. France is not the only nation that will contribute a grant of public money, for the purpose of aiding its manufacturers and artisans to surpass the English in this very Exhibition, to be held in London in 1851. We have no doubt as the time approaches, every government in Europe, except our own, will have, so to speak, "taxed the people," in order to secure evidence of foreign supremacy in manufactured art; and it will be a shameful policy on the part of England if no encouragement is held out by our government of equal weight.

If then the blunders that have been perpetra-

made lightly, but after closely looking into the subject, and very minute inquiries of persons whose opinions were safe for guidance. It is as follows:—

PROBABLE RECEIPTS.	PROBABLE EXPENSES.
Private subscriptions 70,000	Prizes 20,000
Admissions of one million persons, at one shilling each. 50,000	Munday claim . . . 12,000
	Per Centage (15 per cent. allowed by the Commissioners) on 70,000 collected 10,500
	Printing and advertising 3,000
	Expenses incurred by missionaries to the provinces . . . 3,000
[N.B.—Probably the exhibition will be visited by more than a million of persons; but there must be some mode devised by which, during part of the time, less than one shilling will be the admission fee.]	Executive committee (two years) . . . 8,000
	Secretaries (three) . . . 6,000
	Secretaries (London, Westminster, &c., &c., and provincial and other assistants, porters, clerks, &c. 5,000
	Building 100,000
	Police, watchmen, servants, messengers, &c., during the exhibition . . . 5,000
	£120,000
	£172,500

The Westminster Committee alone have employed for some six months six collectors at three guineas a week each. They now pay ten per cent. on the sums collected; the other expenses, for printing, &c., must be considerable. A nearly similar course has been pursued throughout the country. We believe the most sanguine of the supporters of the exhibition expect that the subscriptions will barely suffice to meet the expenses, irrespective of the building, to be met entirely by the admission monies.

Our estimate, therefore, which we believe to be underrated, in all the items, leaves a deficiency of 52,500*l.*—a deficiency "for the consideration of the House of Commons."

* The authority upon this matter who will claim most attention is Sir Frederick Roe (formerly one of the metropolitan magistrates); in a letter inserted as an advertisement in the *Times*, he thus writes:—"During the spring of this year I have frequently conversed with many of my neighbours carrying on business in St. George's and St. James's parishes, and others residing in more distant quarters, on the subject of the projected exhibition. It is not necessary for my present purpose to trouble you with their views at any length, it is quite sufficient to state that a very considerable number—I should be afraid to state how many, assured me that they were decidedly opposed to it; but that such had been the canvassing by powerful and distinguished persons, such had been the influence used, such had been the threats of withdrawal and loss of custom, together with menaces of having their names reported in the highest and most influential quarters if they refused to contribute, that with the conviction they were giving their money in support of a mischievous and suicidal measure, they did not dare refuse."

† The *Times* has given an estimate of the probable expenses and receipts of the undertaking—receipts arising from subscriptions and admissions, and makes the balance against the receipts amount to 35,000*l.*, "a balance for the consideration of the House of Commons;" but this appears to us to be underrated; the *Times* gives the receipts from subscriptions at 60,000*l.*; there will be nothing like that sum clear of expenses incurred up to this date, to say nothing of salaries to be due between this and the 1st of May next, and other items of expense, omitting all consideration of Messrs. Munday's claim for "compensation." The cost of "the executive," the three secretaries, and the various other "officials," for the two years of their services, will not be less than 30,000*l.*—a sum which the *Times* has not taken into consideration.

We have ourselves made a calculation of the probable receipts and the probable expenditure. It has not been

ted by commissioners, executives, and secretaries, have been so obvious, so numerous, and so utterly indefensible, we are compelled to believe that those to be committed hereafter will be as unpardonable in character and as disastrous in their effects. The difficulties to be surmounted have not in reality been yet met; we have but crossed the stile and struggled through the thicket which leads to the Slough of Despond; and we have neither Faith nor Hope to guide us among the pitfalls that encompass our path. Whose province will it be to determine where Mr. A. shall have his stall, and where shall be the stall of his rival in manufacture, Mr. B.? Who is to settle what amount of space shall be accorded to Mr. C.; and what articles shall he, and what shall not be exhibited by Mr. D.? What proportion of the judges will be foreign? What places in the Exhibition will be accorded to foreigners? Will the foreign manufacturer be enabled to exhibit through a London agent, and so make known to all enquirers where duplicates of his goods may be at once obtained? Where English patents have been used by foreign manufacturers, in part, or in whole, will such articles be admitted, and who will bring such articles to the test? May dealers generally exhibit the objects they do not make but sell?—and if so, may a score or half-a-hundred of the very same objects be exposed on as many dealers' stalls? Who will be entrusted with the delicate and thankless duty of accepting or rejecting the various articles sent in? Even in France this is a task of great difficulty; and the moral machinery by which it is managed is by no means simple. Which of the Royal Commissioners will be daring enough to undertake it? Is this labour and this responsibility to devolve upon the Executive? If so, we anticipate what will follow. Especially, who will be the judges to make the awards—to award the medals and the prizes of twenty thousand pounds—of which, by the way, we venture to prognosticate eighteen thousand pounds will go abroad? These duties must be discharged by persons of unquestionable integrity; and such persons it will be no hard matter to find; but integrity is only one of the qualities absolutely necessary to enable them to perform the work.

Above all, the determination of the Commission not to demand to know the quality in which an Exhibitor exhibits, will involve them in a maze, out of which they will never find their way. This subject, of paramount importance, requiring so much consideration and so much space to consider it fitly, will be found treated at length in another part of this number of our Journal.

A hundred other cases of difficulty present themselves to our minds; they might be overcome, but it can only be by confidence in the forethought, wisdom, and integrity of those whose duty it will be to encounter them.

We have thus said our say—it was a duty we imposed upon ourselves when we gave the Exposition our support; if we have either exaggerated or misstated, we shall gladly rectify the error; if our statements be arraigned, or our assertions contradicted, we shall endeavour to sustain them by proofs.

We tremble for the consequences that must be expected to ensue, burthened as we shall be with the weight of so many blunders; under the most favourable circumstances we had a contest to sustain against powerful opponents—opponents backed by the money of their respective governments, armed and trained for the contest by their sovereigns, with public feeling in their favour, and, it may be, old animosities stimulating the ordinary allurements to profitable rivalry; long experienced in all things appertaining to their several callings, knowing precisely what they want, and exactly where to find it. Could we hope for conquest? As well might we have looked for a victory at Waterloo if we had met the Old Guard and the legions of Napoleon with bayonets hunted and balls too big for the calibre of our cannon.

But if we knew we should be worsted in the contest, we expected that compensation for defeat which might have been better than a victory; and even some exasperation may be

justified against a system of errors, which retaining all the disadvantages of the struggle, threatens to deprive us of all its advantages.

These disadvantages are not merely a diminution of public feeling, and a fierce array of hostility at home, but it is beyond all doubt that our manufacturers are arming as combatants reluctantly fighting for distinctions and rewards. We speak from positive knowledge when we assert that a very large proportion of these manufacturers are delaying preparations until they are better satisfied as to the result; and our dread is that they will so delay them until any attempt at competition will be useless. This, however, ought not to be; the manufacturers of Great Britain are, to use a common phrase, *in for it*; they must compete; and under the very worst circumstances that can happen, they must not be held back from those exertions upon which their very existence depends—at all events for some time to come.

They must be "up and doing," it would be idle now to counsel that *postponement* for a year, which we advocated some months back. They must be prepared by the 1st of May next; that is *now* the time fixed; and if altered (as we think it will be) it will only be by prolonging the period for another month, and if they have already lost much time, they have not another moment to lose.

To succeed in spite of obstacles is far more honourable than to prosper with all "appliances and means," and those who manifest energy and liberal enterprise must be regarded as patriots in the truest sense. We urge upon our manufacturers the duty they owe to themselves and their country; let them not relax because difficulties instead of being removed out of their way, have been created or increased by those who should have been their protectors. Difficulties are things made to be overcome!

With encouragement such as we had a right to expect, with time sufficient for all purposes, with judgment and equity evident in those whose arrangements and decisions must be of deep and lasting import, and with confidence in the Executive and officials of the Exposition, we might reasonably have hoped that British energy, enterprise, and capital, would have enabled Great Britain to make an appearance at "The Great Peace Congress of the World" worthy of her high renown; so that Peace might not take from her the laurels she had gained in War, at some period or other, from every nation of Europe and of Asia.

As these advantages have been denied to us we must do the best we can without them, and the public may be sure that, after all, the mighty resources of England will be largely exhibited; that its honour will be upheld, and its glory asserted in many important branches of the Industrial Arts.

Probably in our next number we shall be enabled to dwell upon this topic more at length, and to explain our prospects more fully than our space at present permits us to do; there are few of the Manufacturing Districts with which we are unacquainted—few of our manufacturers of whose capabilities we are ignorant, and we shall ere long revisit them for the purpose of making our readers aware of their progress; we are not without hopes that our report may be less disheartening than it must at present be.

Just now we must content our readers with a contracted and imperfect view of the prospect before us. We may, indeed, yield, without a struggle, the palm of excellence to the silks of Lyons, the ribbons of St. Etienne, the lace of Brussels, the bronzes of Paris, the jewellery of Paris, the paper-hangings of Paris, the carpets of Paris, the painted glass of Germany, the coloured glass of Bohemia, and some other objects of elegance and utility, or of both combined; in children's toys, the produce of Sonneberg; in articles in manufactured zinc, and terra-cotta; in fringes, braids, and carriage-furniture; in marquetric, in wood and wind instruments of music, the manufacture of Adorf, in Saxony; in brass instruments of music; and in all sorts of designs for manufactures (the productions of artists); but we shall

not be ashamed or afraid to challenge "the Industry of the World" to compete with the cottons,—at least in as far as price and quality are concerned—of Manchester; the chintz of Preston; the broad-cloths of Somersetshire and Yorkshire; mathematical and philosophical instruments; models of new arrangements of machinery; marine architecture; agricultural instruments; rifles, and fowling-pieces; the machinery of a score of places of renown, from the steam-engine of a thousand horse power to the crank and fly-wheel which turn a coffee-mill; with the stuffs of Leeds; with the hardware and cutlery of Sheffield; the fire-grates and their accessories of Sheffield; the pressed brass-work of Birmingham; the cast-iron (so far, that is to say, as solidity and substance go,) of Coalbrookdale, Derby, and Northampton, and of Loudon also; with the cotton stockings of Leicester; with the machined net-work of Nottingham; the plain shawls of Paisley; the worsted-work of Norwich; the papier maché of Birmingham and Wolverhampton; with the linens of Belfast (even the cambric of the commercial capital of Ireland will not much suffer now by comparison with that of France); with the tabbets of Irish manufacture; with the pure crystal glass of Stourbridge and Birmingham; the plate glass of Birmingham and St. Helens; the fishing-hooks of Redditch (which supplies nearly the whole world with the best); in oil-cloths and floor-cloths; in metals, such as alhata, Sheffield plate, &c.; in ecclesiastical appointments, in metal, &c.; in gothic stone-carving, hookbinding, both in cloth and tooled leather; encaustic tiles for churches, halls, &c.; in tessere; in the earthenware of Staffordshire; and, above all, in the porcelain of Staffordshire, which (the statuettes especially) we venture to assert will surpass the best produce of France or Germany,—putting aside, as we ought to do, the productions of government works, at Sévres and Dresden, and admitting into competition only those of manufacturers depending solely upon personal resources, and manufactured only for sale; and in the electro-plating of Elkington which, we have the authority of our honoured associate, Dr. Emil Braun for saying, will surpass the best efforts of all other nations.

The list, indeed, comprises chiefly those objects which are independent of ornamentation; but we have no design so to limit our prospects of success in the rivalry we have courted. Within the last five years British manufacturers have made large advances; and these will, we trust, be displayed notwithstanding the "discouragements" which have so considerably marred their efforts. It is whispered indeed that Spitalfields will not be very far behind Lyons; and that Coventry will not shrink from comparison with St. Etienne—their improvements having certainly been derived from the employment of those French artisans, who may be once again described as "Refugees." In carved wood, by hand and by machinery, we are doing and have done much; there is at least one artist-workman who will distance all competitors in this branch of Industrial Art. We cannot say if the great firms in Glasgow, Edinburgh, and York, have been of late making a move; but many of their productions, in carpeting, have promised to rival those of France—always leaving out of sight the produce of public establishments sustained by national funds.

While therefore we anticipate that, generally, in the Exhibition of 1851, we shall be far surpassed, we by no means admit that we shall not supply ample and satisfactory proofs of our progress; and conclusive evidence that, to the Exhibition of 1856, we may look forward as establishing our claim to pre-eminence in nearly all the branches of Industrial Art.

And we earnestly intreat the Manufacturers of Great Britain to labour as if there were no incompetent Commission to chill their energies and to hamper their resources—but that, each man working for himself, to augment his own honour, to increase his own trade, and at the same time to uphold the repute of his country, will do his best—taking as his motto, that famous sentence which can never be hackneyed.—"ENGLAND EXPECTS THAT EVERY MAN WILL DO HIS DUTY."

The death of this accomplished sculptor, and excellent man, took place at Rome on the 29th of May last, under circumstances of interest unusually touching. The pleasure with which we had seen, and briefly written of, his work now in the Royal Academy—"A Marble group—a Huntress with a Leveret and Greyhound"—was yet a sensible emotion when he had perished, and it was far from the thoughts of ourselves or any of his friends, that this might be the last of his productions that would be seen within these walls, for he was not yet "full of years," having far beyond the average run of human chances in his favour. Our school is comparatively poor in poetic sculpture; one substantial cause of which is, that it is by far the most expensive department of the profession; not that if it were less so the genius would be the greater, but the means of development would be more accessible. An education in purely poetic sculpture, to the mastering of any considerable works in marble, is so arduous and costly, that very few venture on this exclusive path, and hence can we but ill afford the loss of one who has so signally distinguished himself, and who notwithstanding the pronounced excellence of his works, might yet have hoped to conceive his best—

"But the fair quærens when we hope to find,
And think to burst out into sudden blaze,
Comes the blind Fury with the abhorred shears
And slits the thin-span life."

Wyatt* was born on the 3rd of May, 1795, in Oxford Street, in London, where his father Edward Wyatt was then settled. The latter died at Merion, in Surrey, in 1833. The profession of sculpture was determined on at an early age by the subject of our memoir, and he was accordingly articled to Charles Rossi, R.A., for the term of seven years; and during that term his studies at the Royal Academy were so successfully prosecuted as to entitle him to the award of two medals upon different occasions. At the time that Wyatt was under the tuition of Rossi, the latter executed several national monumental works which had been voted by parliament to commemorate the services of men who had deserved well of their country, and some of the earliest productions of Wyatt were of the monumental class, as that in the church of Esher, in memory of Mrs. Hughes, and another in the chapel at St. John's Wood.

* We are indebted to Mr. S. Pearce, a friend of the late Mr. Wyatt, and an artist who has painted some excellent portraits, for the above likeness of the deceased sculptor.

But it is to Canova, in a great measure, that Wyatt was indebted for the ultimate refinement of his tastes; his natural genius was at all times impressive in narrative, but it was under the great Italian sculptor that he began to verify in marble with the purest feeling. And Canova was his friend until his death—indeed Wyatt numbered as friends all who knew him. He had seen and admired the works of Canova, even while under the instruction of Rossi; and when Canova visited this country, through the kindness of Sir Thomas Lawrence, who justly estimated his talent, Wyatt was introduced to Canova, who became so far interested in him, as at once to promise him his protection and the permission to work in his studio at Rome. After an interview so favourable to his prospects, Rome became the goal of all his desires; and he proceeded thither in the early part of the year 1821, after having spent some time in Paris under the celebrated Italian sculptor Bozio; and so devotedly did he prosecute the labours of his profession, that only once in this lengthened term of nearly thirty years, did he revisit his native country—and that occasion was in the year 1841. During Canova's lifetime the closest intimacy subsisted between him and the subject of this memoir; and all the circumstances of a long and arduous profession,—a fact honourable to both parties. Our countryman Gibson was also a pupil of Canova at the time of Wyatt's entrance into the studio of this great man, and from that time the greatest friendship existed between the two distinguished English sculptors. The industry of Wyatt was singularly constant. In summer, long before five in the morning, he was to be seen on his way to the Caffè Greco, where artists of all nations assemble; and in winter, long before daylight, he was to be seen at the same place reading the papers by the light of a taper which he always carried with him for that purpose. At daylight he was in his studio, and not only thus early, but he also remained at work sometimes until midnight. It was only by such exertion that he could have possibly produced such a number of exquisite works, many of which are equal to those of antiquity. He was blessed with a good constitution; neither the malaria of Rome nor his incessant labour seemed in anywise to affect him; but a few years since he met with an accident whereby one of his legs was broken, which caused a degree of lameness. It was during his visit to England in 1841, that he was honoured by the Queen with

a commission for his statue of Penelope, which in Rome was considered the best of his works. His studio and residence were remarked by all for their superior neatness; his removal, however, being necessary, he took three study in the Via dell'Incurabile, but never entered them. The life, preferably led by Wyatt, was more than usually retired even for a studious artist. The incidents of his life were the works which he perfected on his own account as he advanced in experience, and each according to its degree of merit was one of the greater or less landmarks of his career. Of these may be instanced as works of high merit, a group of "Ino and the Infant Bacchus;" a statue of "Glycera;" "Musidora," a statue; two statues of Nymphs, and "Penelope," a charming statue, the property of Her Majesty, which has been engraved in the number of our Journal for June, 1849.

Every inhabitant of Rome was in some degree affected by the convulsions which shook first the dignitaries of the Holy See, and then reacted upon every class of society. All denominations of artists suffered, and especially those whose position was as yet precarious. Rome however was, and had long been, the home of Wyatt. All ties of consanguinity could not be otherwise than binding on the heart of such a man; but he had no other household affections than those of his Roman studio. During the operations of the French against Rome, he sustained great injury, of which he writes as follows to a friend:—

"I had (as you have already been informed) a most providential escape in the attack the French made at Popolo the last day of June; I was awakened one hour and a half after midnight by the roar of cannon, the explosion of shells, the smashing of windows and tiles; the inhabitants of my quarter alarmed, and flying through the streets in all directions. I expected there would probably be an attack at the Popolo, as the French, after gaining possession of Ponte Molle, had taken up a position on the high ground beyond the *arco seuro*. I had put all my works in marble in places where they would be least exposed, and had selected for myself, in the event of being surprised at night by an attack, to go and remain at the bottom of a stone spiral staircase, which leads from my apartment to my studio on the ground-floor; on entering the second study for a chair, a shell burst in the wall, which is full two feet and a quarter in thickness; this was only four feet from where I was. If I had been another step in advance I must have been seriously wounded, perhaps killed, but, thanks to Providence! I escaped with a few slight scratches and contusions; the lamp I held was broken, and, I believe, protected my hand; I picked up nine pieces of the shell in my study; several cups were broken, but happily none of my marble works were injured."

It is difficult to determine the remoter causes of Wyatt's decease. He was apparently a hale and robust man, more so than any of his brother artists. It is, however, conjectured that the circumstance of his having received notice to quit his studio had so far affected his sensitive temperament as to cause death; for he had so attached himself to his abode that the idea of quitting it was a source of inexpressible anguish to him. The attack which destroyed him took place on the morning, it may be presumed, of the 28th of May; for at six o'clock, struggling between life and death, he was found on the floor of his bedchamber by the woman whose business it was to attend to his rooms. She had entered by means of her own keys; and having raised him into his bed, she instantly sent for Mr. Freeborn, the British Consul, who immediately brought to his aid Dr. Pautaleone, and Mr. Spence, the sculptor. The doctor bled him, and did everything that his knowledge and experience suggested, but without avail; poor Wyatt never spoke, nor did he show any decided sign of consciousness. He breathed his last at ten o'clock.

His friends and professional brethren, Gibson and E. Spence, have kindly offered their aid in superintending the completion of the works that were in progress at the decease of Wyatt; and Gibson, with a feeling that does him honour, has signified his intention to erect a testimonial over the grave of his friend, at his own expense.

PASSAGES FROM THE POETS

THE POWER OF LOVE.

AN ILLUSTRATION OF THE GERMAN "LEBEN EINER STENNE," BY DONAVENTURA GENELLI.

THE HOME OF WORDSWORTH.

WILLIAM LINTON was born at Liverpool, and at an infant age was removed to Lancaster. His maternal relatives residing on their territory at the foot of Windermere Lake, the early portion of his education was received during his long and frequent visits to that pleasant retreat, at the little district school once presided over by the grandfather of the late Lord Chief Justice Ellenborough. At eight years of age he was sent to a large boarding-school in the south of the county, where he continued six years. Soon after his departure from what may be called his native hills, his recollections of their beauties impressed him with an earnest desire to be able to portray them; and the days appropriated to the drawing-master were always anticipated with rapture, while more severe but less imaginative studies, although pursued with less enthusiasm, were not suffered to be slighted. The painting days, however, were eventually suspected of boding little good to his future prospects; he was, therefore, again despatched to the lakes, ostensibly for the completion of the mathematical portion of his education, but too evidently for the repression of what was considered by his kind but prudent parents his unhappy attachment to the Arts, a study for which no peculiar aid was afforded in his new quarters. During an early tour among the lakes he became acquainted with his friend William Havell, whose bold and manly drawings from Nature made a strong impression upon him.

Finding it utterly impossible to subdue his artistic ardour, his relations applied to an old friend of Fuseli's upon the anxious subject of pursuing the Arts as a profession: this gentleman having relinquished portrait-painting for stock-broking, declared the Arts to be an extremely precarious path to either competence or wealth; and he had, doubtless, the best reasons for urging that advice. Under this grave assurance, the young would-be landscape painter was sent to Liverpool to receive preparatory instructions for a mercantile life. As, however, every indulgence was conceded during this state of probation, and little time exacted for the performance of his mercantile duties, in the futile hope that some new and less engrossing caprice might extinguish the old passion, he speedily took advantage of his privileged position, and

paid truant visits to the neighbouring mountains of North Wales, not forgetting a pilgrimage to the birth-place and tomb of our renowned Wilson, as well as to some of his finest works at Wynnstay and Ince Blundell. His mercantile services being "coldly furnished forth," and offering no prospect of future energy, his little patrimony being considerably diminished too, he was ordered back to Windermere, where he was guided through a course of classical and mathematical study by a talented "Donnie" in the vicinity, for nearly four years, by way of refreshing and advancing his earlier acquisitions, as well as damping his pictorial enthusiasm. During this period, which was intended for one of transition, the old flame was nourished by frequent trips to the adjacent lakes with such visitors as took the domicile of their "Windermere foot" friends into their route. As neither Theocritus nor Virgil were found to be of any use in creating a distaste for the surrounding scenery, he was permitted to leave the provinces for London, where he commenced his career as an artist, under the usual flattering assurances of friends; reaping, of course, the usual harvest of disappointments, for a considerable period. Having, from year to year, visited the various romantic districts of his own country from Jersey to the Scottish Highlands, he made the tour of France, Germany, Switzerland, and Italy. A few years more, and the tour was repeated, with Greece, Sicily, and Calabria in addition. On his return to town he formed a private exhibition of all his foreign sketches at the New Water Colour Gallery in Pall Mall, which was visited by nearly all the *élite* then in London, as well as by Royalty. Another trip to Italy ensued, after the lapse of a year or two:—so ended his travels' history.

Among Mr. Linton's more prominent works may be mentioned his "Morning after a Storm," a scene near Linton, in North Devon, which was exhibited at the British Gallery above twenty years ago. "Italy," now over the mantel-piece, as a fixture, in the room for British painters at Woburn Abbey, for which place it was commissioned by the late Duke of Bedford. "The Vale of Lonsdale," at Sir William Fielding's, Bart., in Lancashire. "The Vale of Keswick," at Mr. Hargrave's, Broad Oak. "Delos," purchased by Mr. Broadhurst, and honourably illustrated by

his accomplished friend Mrs. Hemans. "The Greek City, with the return of a Victorious Armament," and "Marius at Carthage" both engraved for Finden's Gallery of British Art. "Venus and Æneas before Carthage," distinguished by a beautiful poem from the pen of his friend T. K. Hervey. "Jerusalem, at the time of the Crucifixion," finely engraved by Lupton; first subscribed for by the Archbishop of Canterbury (Dr. Howley), and honoured by a superb case of large silver medals from Pope Gregory XVI. "The Embarkation of the Greeks for Troy," and "The Ruins of Paestum," exhibited at Westminster Hall. "The Temple of Jupiter, with the Athenian Acropolis," at the Royal Academy. "Positano," painted for the Earl of Ellesmere. "The Lake of Orta: Bellinzona," bought from the Academy by Mr. Arden. "Corfe Castle," "The Temple of Fortuna Mulcibris," purchased from the Academy by Sir Robert Peel, Bart., last year. "Ætna and Taormina," painted for Mr. Ellison, of Sudbrooke House, Lincoln. "The Wreck on Scylla Rocks," for Mr. Bradley, of Cicut House, Stourbridge. And "Venice," now in the Exhibition of the Royal Academy, by Mr. D. W. Wire, the worthy Sheriff Depute of the city of London.

Mr. Linton's career is one among the numerous instances to be found in all professions of the utter inability of thwarting, or attempting to check, the natural impulses which tend to a certain object. Perhaps there is no pursuit which an enthusiastic mind follows so ardently, certainly none require more fixedness of purpose, than that of an artist. There is but little at the outset, and even through a large number of years, with a large majority of painters and sculptors, to encourage them in the course they have chosen, and rarely anything on which to fall back, if so inclined, in the event of failure. In most cases, they must work or starve; in some, they do both. But it is not the apprehension of the latter misfortune which generally urges them onward; ambition of an honourable kind is the mainspring of action, and the hope of leaving a name among the worthies of the earth, is the laudable inducement to undergo labour and privation, unknown to, because unseen by, their fellow-men, till their end is accomplished. We know not under whom Mr. Linton studied, but he certainly must have paid great attention to the works of Claude, especially in those pictures where this elegant painter introduces his beautiful combinations of architecture and water with groups of classic figures. We can trace not only a similarity of composition in their productions, but the same method of treating their subjects, and the same exquisite aerial tone of colour. The composition of many of Mr. Linton's ideal works certainly presents richer and more poetical features than those of his great prototype. Claude never designed any picture showing so magnificent a combination of noble architecture and gorgeously appointed figures as Mr. Linton's "Greek City, with the Return of a Victorious Armament," and his "Venus and Æneas before Carthage." His "Marius at Carthage" is another picture full of the highest poetical feeling; we remember standing intently before it when it was exhibited many years ago, and thinking how aptly it seemed to describe the noble Roman, when ordered to quit the temporary asylum he had found among the ruins of the city his prowess had formerly devastated:—

"Silent the wanderer sat—but on his cheek
The burning glow, far more than words might speak;
And, from the kindling of his eye, there broke
Language, where all th' indignant soul awoke,
Till his deep thoughts found voice—then, calmly stern,
And sovereign in despair, he cried,—Return!
Tell him who sent thee hither, thou hast seen
Marius, the exile, rest where Carthage once hath been."

Without the remotest idea of depreciating the talents of Mr. Linton, in his pictures of natural scenery, we give a decided preference to that class of subject to which more immediate reference has been made. His genius seems more at liberty when roaming through the regions of his own imagination than when fixed to a certain and known locality. Still, in whatever he does, there is abundant evidence that the work is that of a master-hand, and of a poet's mind.

A WEEK AT KILLARNEY.

BY MR. AND MRS. S. C. HALL.*

For this season of the year, when the autumn approaches, and so many of all grades are considering how most profitably and pleasantly to expend a few weeks away from their homes, we cannot, we think, employ some pages of our Journal better than by a review of this book, the object of which is to direct attention to Ireland, and, in especial, to that district of the island which unquestionably claims the meed of beauty above all other parts of the kingdom. In the advertisement which introduces the volume the authors trust they have so far detailed the advantages presented by the KILLARNEY LAKES as to "induce many persons to visit them who have been, hitherto, accustomed to make annual tours on the Continent. Those," they say, "who require relaxation from labour, or may be advised to seek health under the influence of a mild climate, or search for sources of novel and rational amusement, or draw from change of scene a stimulus to wholesome excitement, or covet acquaintance with the charms of nature, or wish to study a people full of original character—cannot, we feel assured, project an excursion to any part of Europe that will afford so ample a recompense."

ble to make the tourist acquainted. Bearing in mind that much of his pleasure will depend upon the manner in which he manages his time, and pre-arranges his plans, they have not considered any circumstance too trivial for comment, where they believed that minute explanation might advance the purpose of the visitor to Ireland, who—

OUTSIDE JAUNTING-CAR.

secing all of the sublime and beautiful that may be seen—aims at obtaining information while receiving enjoyment.

The book before us is the result of three tours to the Irish Lakes, the latest being during the May of the present year, 1850. The authors are favourably known to the public by their work entitled

BIANCONI'S CAR.

They have therefore collected and communicated information upon all topics with which it is desirable

"Ireland: its Scenery and Character;" portions of which, with the illustrations, are here republished, an arrangement by which the publisher has been enabled to issue this volume, containing two

hundred pages of letterpress, twenty engravings on steel and about one hundred and fifty woodcuts, at the price of half a guinea. It forms therefore a very superb publication, and which may be described as singularly "cheap" even in these days, when a multitude of purchasers may be calculated upon for any production of merit, and so justify a publisher in a course which a very few years ago must have entailed ruin. Among the pages which we devote to this review we shall scatter some of the woodcuts. They are from drawings by various artists. We regret that we cannot give one of the examples of the engravings on steel, which are all from paintings either by T. Creswick, A.R.A., or J. H. Bartlett; of which, as we have said, the book contains no fewer than twenty, chiefly of subjects connected with the Lakes; and they are all engraved in a very masterly manner.

The readers of the *Art-Journal* need not be told that Mrs. Hall has laboured long, ardently, and we trust successfully, to make Ireland better known to England, and the people of that country more justly appreciated in this. Married to an English gentleman, and having, consequently, her home in England, her visits to the country of her birth have been but occasional; they were refreshments to pleasant memories; revivals of early impressions; stimulants to earnest sympathies; and prompters to exertions out of which she hoped and believed might arise good to a people

"Ever hardly used;"

and to whom only the present generation of English has adopted justice—tardy in its operations as it must be in its fruition. Mrs. Hall has been accused of giving to her pictures of Ireland too much *couleur de rose*. Perhaps, with a woman's delicacy and a woman's kindlier nature, she has seen less than others of the coarser features, and more of the natural advantages of the Irish people; at least we believe we are justified in saying she has disappointed few who visit Ireland with a generous and considerate disposition towards the country, and that she has helped to dissipate many of the errors and to destroy some of the prejudices which have kept the English and the Irish far too much apart; their interests being mutual and inseparable. Mrs. Hall has never lent her pen to a party—never advocated the demands of a sect. It is a melancholy truth that in Ireland no popularity can be general; he or she who is lauded by one class being sure to be condemned by the other. Mrs. Hall's object has been, no doubt, answered by the good she has done to Ireland in England. The introduction to "A Week at Killarney" briefly presses upon the reader the temptations to visit Ireland; these we take leave to quote.

"The English may be induced to see and judge for themselves, and no longer incur the reproach of being better acquainted with the Continent than with a country in which they cannot fail to be deeply interested, and which holds out to them every temptation the traveller can need; a people rich in original character, scenery abundant in the wild and beautiful, a cordial and hearty welcome for the 'stranger,' and a degree of safety and security in his journeyings, such as he can meet in no other portion of the globe.* Ireland will, unquestionably, supply every means of enjoyment that may be obtained in any of the Continental kingdoms, and without calling for the sacrifices of money and comfort that will inevitably be exacted by the leeches of Germany, France, and Italy. Irish civility and hospitality to strangers have been proverbial for ages—existing even to a fault.

* "To the 'safety,' and 'security,' of travelling in Ireland, it may seem superfluous to refer; but there are many who, in utter ignorance of the country and its people, have formed unaccountably erroneous opinions on the subject. It may, therefore, be well to lay peculiar stress upon the testimony supplied by every writer concerning the country, and the report of every tourist by whom it has been visited. For ourselves, we have never hesitated to make journeys at all hours of the day or night, through any part of the island, upon ordinary jaunting-cars, under the full conviction that we were as safe as we should have been between Kensington and Hyde Park. It is not enough to say that we never encountered insult or injury; we never met with the smallest interruption, incivility, or even discourtesy; that could induce a suspicion that wrong or rudeness was intended. During our various wanderings, we have been located at all sorts of 'Houses of Entertainment,' from the stately hotel of the city, to the poor 'cabaret' of a mountain village; we never lost the value of a shilling by misconduct on the part of those to whom our property was entrusted. We should, indeed, ill discharge our duty, if we did not testify, as strongly as language enables us to do, to the generosity and honesty of the Irish character. It may be judicious to remark, that at no period has the security of travelling in Ireland been more certain than it is at this moment. We repeat, therefore, that a safer country for a stranger to travel in, is not in the world."

* Published by George Virtue, Ivy Lane, London.

Strangers will find, wherever they go, a ready zeal and anxiety, among all classes, to produce a favourable impression on behalf of the country; and in lieu of roughish couriers, insolent douaniers, dirty inns, and people courteous only that they may rob with greater certainty and impunity, they will encounter a people naturally kind and intelligent, in whom it is impossible not to feel interested; and even where discomfort is to be endured, it will be deprived of its character of annoyances by the certainty that every effort has been, or will be, exerted to remove it. We shall rejoice if our statements be the means of inducing English travellers to direct their course westward, knowing that for every new visitor, Ireland will obtain a new FRIEND.*

At the present moment especially, the inducements to visit Ireland are more than usually many; one of them, assuredly, is the smallness of the cost at which the enjoyment may be purchased; the English and Irish railway companies have combined to bring the expenses of the journey within very narrow limits.* The visit of the Queen has been an example to her subjects; most happily, the agitation for 'Repeal' is but a sad theme of history; poverty and misery are operating in Ireland with diminished power; and the confused condition of the Continent is such, that few persons will desire to encounter the annoyances incident to a visit to either of the European states.

Let, therefore, those who are pondering how a week or a month may be most pleasantly and most profitably spent, during the Summer or Autumn, consider the claims of Ireland, and believe that nowhere can there be found so many.

The authors commence by conducting the tourist to Dublin via Holyhead (a journey which now occupies but twelve hours) and thence by railway to Killarney. We shall endeavour to follow them on their route.

A day in Dublin will give the visitor a good idea of its leading points of interest; for its principal streets and leading attractions lie within a comparatively small compass. His journey to the south will be by one of the best constructed and best conducted railways in the kingdom; and *en route* he will travel through many of the most interesting localities in Ireland—Kildare, Cashel, Kilmallock—cities rich in ruins and traditions of the past. He will visit the two great provincial ports, Cork and Limerick; pass on his way several of the famous Round Towers, numberless ruined castles, Druidic remains, and of course through scenery unsurpassed for grandeur and loveliness; nearly all the objects of interest along the line, with those which occur by verging off the direct route, will be found pictured and described in the volume under notice.

The railway to Killarney stops short at Mallow, distant from the Lakes forty-two miles; a journey that must be made by coach, in the common ear of the country—the far-famed Irish jaunting-car—or by private carriage with post horses.

Some will consider this an advantage; for while the journey is an easy one, a few hours must be spent on the ordinary coach-road, during which the traveller has leisure and opportunity to look about him; and it may not be a disadvantage that, after he leaves the train, he has to pass through a wild and unimproved district, until he arrives at Killarney, the marvellous beauties of which will be enhanced by contrast with the comparative nakedness and misery he will have encountered on his way. The Irish jaunting-car is an exceedingly pleasant conveyance. It is light, presses very little upon the horse, and is safe as well as convenient; so easy is it to get on and off, that both are frequently done while the machine is in motion. It is always driven with a single horse; the driver occupies a small seat in front, and the travellers sit back to back, the space between them being occupied by 'the well'—a sort of boot for luggage; but when there is only one passenger, the driver usually places himself on the opposite seat to balance the car, the motion of which would be awkward if one side was much heavier than the other. The public ears of Mr. Bianconi have, to a large extent, displaced the regular coaches, and are to be encountered in every district of the south of Ireland. In form they resemble the common outside jaunting-car, but are calculated to hold twelve, fourteen, or sixteen persons; they are well horsed, have cautious and experienced drivers, are generally driven with three horses, and usually travel at the rate of seven Irish miles an hour; the fares for each person averaging about two-pence per mile.

* The cost of the journey to Holyhead (first class), thence to Dublin (four hours across, best cabin), thence to Killarney (first class railway and inside coach, if desired), together with the cost of the same journey back—RETURN TICKETS in short permission being given to remain three weeks at Killarney or in any other part of Ireland—is SIX POUNDS!

They are open cars; but a huge apron affords considerable protection against rain; and they may be described as, in all respects, very comfortable and convenient vehicles.

All travellers to Killarney should proceed to Cork by railway, and there select one of the several routes to the Lakes. These routes are clearly and at some length described by the authors; that which they advise to be taken is by Gougane Barra, the Holy Lake, Bantry, Glengariff, and Kenmare; but a brief delay will be necessary in Cork, in order to examine the city styled par excellence "the beautiful;" not so much for its streets and buildings as for the scenery by which it is surrounded. Cork harbour is famous all over the world.

The route through Gougane Barra, Bantry, and Glengariff is, indeed, inexpressibly charming.

The tourist will greatly enjoy a visit to the Holy Lake, not only as introducing him to one of the strongholds of which superstition held possession for centuries; but the stern and steric grandeur of the place will astonish him, if perchance here his first acquaintance shall have been formed with the wild magnificence of Nature in Ireland.

The far-famed Bay of Bantry is, perhaps, unsurpassed by any harbour of the kingdom for natural beauties combined with natural advantages. It is impossible to do justice to the exceeding grandeur and surpassing loveliness of the scene; the whole of it is taken in by the eye at once. We are not called upon to turn from side to side for new objects to admire—we gaze upon it all; and he must be indeed dead to nature who does not here drink in as delicious a draught as Nature, in the fulness of her bounty, ever presented.

Language utterly fails to convey even a limited idea of the exceeding beauty of Glengariff—"the rough glen"—which merits, to the full, the enthusiastic praise that has been lavished upon it by every traveller by whom it has been visited. It is a deep alpine valley, enclosed by precipitous hills, about three miles in length, and seldom exceeding a quarter of a mile in breadth. Black and savage rocks embosom, as it were, a scene of surpassing loveliness—endowed by nature with the richest gifts of wood and water; for the trees are graceful in form, luxuriant in foliage, and varied in character; and the rippling stream, the strong river, and the foaming cataract, are supplied from a

BANTRY BAY.

thousand rills collected in the mountains. Beyond all, is the magnificent bay, with its numerous islands,—by one of which it is so guarded and sheltered as to receive the aspect of a serene lake.

The reader will not require to be told that there are many matters of deep interest to be enquired about and examined before he reaches Killarney. If he be a stranger in Ireland his curiosity will be

stimulated and his interest excited at every step; and the book we are reviewing is well designed as a companion in places, and a guide concerning subjects, of even deeper importance than the grandeur and beauty of the scenery amid which he is about to seek enjoyment.

The main purpose of the authors, however, is to visit Killarney; although a large portion of the book is occupied concerning things, objects,

GOUGANE BARRA.

and places, which on the way thither prepare his mind for the treat the tourist is to enjoy. Arrived at Killarney, the first question of the tourist will naturally concern the hotels. Of these there are now four which border the Lakes. These

are all admirably managed—the "Victoria" especially so. The landlord understands his business; and the landlady, an Englishwoman, rules her establishment according to English plans and habits. Every apartment is as neat, as clean, and

as well ordered and arranged, as the room of a private mansion; and few private houses are better furnished; the waiters are capital auxiliaries; civil, attentive, and zealous to promote the comforts of the guests; they are, too, well informed upon

MUCROSS ABBEY.

every subject on which the tourist will require information.*

Having introduced the visitor to "the beggars," unhappily so closely associated in idea with Ireland, although the evil has unquestionably diminished—

THE EAGLE'S NEST.

described the town of Killarney, "a poor town" — the new workhouse and the several other matters to be thought of previous to commencing the actual survey of the Lakes, the authors proceed:—
"The Lakes of Killarney are three in number

ROSS CASTLE.

the LOWER LAKE, the UPPER LAKE, and the

* "Everywhere the tourist will find civility; security for his property, whether he looks after it or not; and an attentive zeal in ministering to his wants. We have never met a traveller who had lost property at an hotel in Ireland."

MIDDLE, or TORE, LAKE. In reality, however, the three must be considered as one; they are divided only by narrow channels; the passage between the lower and middle lakes being, indeed, only of a bridge's breadth. They are understood to be thirty miles in circumference—the distance between the two extremes being eleven miles; the greatest breadth being two and a half miles. They are situated in the centre of a range of lofty mountains, among which are Carran Tucl and Mangerton, the former the highest in Ireland. The mountains that run directly from the water are dotted with evergreen tree-shrubs and magnificently grown forest trees, reaching from the base almost to the summit. This, indeed, forms one of the leading peculiarities of Killarney."

The tourist, on approaching the Lakes, is at once struck by the singularity and the variety of the foliage in the woods that clothe the hills by which on all sides they are surrounded. The effect produced is novel, striking, and beautiful; and is caused chiefly by the abundant mixture of the tree-shrub (*Arbutus Uvedo*) with the forest trees. The *Arbutus* grows in nearly all parts of Ireland; but no where is it found of so large a size, or in such rich luxuriance, as at Killarney.

The charm of Killarney Lakes, however, does not consist in the varied graces of foliage, the grandeur of encompassing mountains, the number of green or rocky islands, the singularly fantastic character of the island-rocks, the delicate elegance of the shores, the perpetual occurrence of bays; but in the wonderful variety produced by the combination of their attractions, which, together, give to the scenery a character inconceivably fascinating—such as the pen and pencil are utterly incompetent to describe. The shadows from the mountains, perpetually changing, produce a variety of which there can be no adequate conception; inasmuch that the very same spot shall present a different aspect twenty times within a day.

The plan adopted by the authors is to devote five days to the Lakes, that much may be seen in ONE DAY, a good deal in TWO DAYS, nearly every prime object of interest in THREE DAYS, and the whole in FOUR DAYS; and the addition of several striking matters in the neighbourhood, in FIVE DAYS.

Next to the choice of an hotel is the choice of a guide, without whom, indeed, half of the Killarney beauties would be lost. A very large number of candidates for the honour will present themselves at each of the hotels. Of these the best is, or rather was (for he is now unhappily aged and infirm), Sir Richard Courteny, who obtained his title by being once *be-nighted*, in company with Lord Normanby, upon the summit of lofty Mangerton. The guide who has succeeded him, in all that can render a guide useful, is Stephen Spillane, son of the long famous bugler.

"Stephen is better fitted for the new, than he would have been for the old, order of things; for he is of new, rather than of old, Ireland; a young man of good education, a teetotaler, and although quite as courteous and actively obliging as his predecessors, he is acquainted with none of the 'tricks,' which, it must

be confessed, have given their renown to Irish guides. He is a good angler, plays a bagle second only to his father; and, in addition to being exceedingly well read in the history of the district, he is familiar with all the legends concerning which the tourist should be anxious to hear."

The important matters of hotel and guide being adjusted, the tourist is called upon to make his FIRST DAY'S TOUR—to the Upper Lake, Tore Waterfall, and Mucross Abbey; the Tore Waterfall is the most famous and beyond comparison the most grand and beautiful of all the cascades about the Lakes.

"The cascade is a chasm between the mountains of Tore and Mangerton: the fall is between sixty and seventy feet. The path that leads to it by the side of the rushing and brawling current, which conducts it to the lake, has been judiciously curved so as to conceal a full view of the fall until the visitor is immediately under it; but the opposite hill has been beautifully planted—Art having been summoned to the aid of Nature—and the tall young trees are blended with the ever-green arbutus, the holly, and a vast variety of shrubs. As we advance, the rush of waters gradually breaks upon the ear, and at a sudden turning the cataract is beheld in all its glory."

The ruins of Mucross Abbey are among the most interesting of the many interesting objects about the Lakes. The site was chosen with the usual judgment and taste of the monks of old, who invariably selected the pleasantest of all pleasant places. The Abbey stands in the beautiful demesne of Mr. Herbert, "a good and considerate landlord;" and one who takes especial care that Art shall be in harmony with Nature, in the fair district of which so large a portion is his own.

The Abbey, with all its singularities, is minutely pictured; and occasion is here taken to describe the funeral ceremonies of the Irish and the formalities of the Wake. The portrait of a Keener cannot fail to interest our readers.

"The Keener is usually paid for her services;—the charge varying from a crown to a pound, according to the circumstances of the employer. They—

"Live upon the dead,
By letting out their persons by the hour
To mimic sorrow when the heart's not sad."

It often happens, however, that the family has some friend or relation rich in the gift of poetry, and who will, for love of her kin, give the unbought eulogy to the memory of the deceased. The Irish language, bold, forcible, and comprehensive, full of the most striking epithets and idiomatic beauties, is peculiarly adapted for either praise or satire; its blessings are singularly touching and expressive, and its curses wonderfully strong, bitter, and biting. The rapidity and ease with which both are uttered, and the epigrammatic force of each concluding stanza of the Keen, generally bring tears to the eyes of the most indifferent spectator, or produce a state of terrible excitement."

The SECOND DAY OF THE TOUR is expended in the ascent either of Carran Tucl or Mangerton. The former (one of the Macgillicuddy's Reeks), is the highest mountain in Ireland—3114 feet above the level of the sea.

From the summit of Carran Tucl the prospect is inconceivably grand. Past counting are the Lakes, seen everywhere among the minor Reeks, the lesser hills, and the valleys near and distant. Within immediate ken, are the Bays of Tralee, Kenmare, Dingle, and Bantry; farther off is Cape Clear on the one side, and on the other the mighty Shannon; while, beyond all, is the broad Atlantic. A glorious day—a day never to be forgotten,—a day full of profitable and most rich enjoyment,—will have spent who passed it ascending Carran Tucl. Carran Tucl has fewer pilgrims than Mangerton, obviously because Mangerton is more accessible, while the ascent is easier; and perhaps it would be unjust to say that the recompense is much less. To those, indeed, whose grand object is to form acquaintance with "The Lakes," Mangerton has attractions greater than even those of Carran Tucl.

It is needless to say that the ascent of either of these mountains is no light nor easy task; although the labour is much lessened by sure-footed ponies, who bear tourists nearly half way to the top; and refreshment is always at hand—"goat's milk and poteen"—of which an ample supply is furnished by young girls and old women, each with a greeting—"Yer honour's welcome to the mountain."

After the day of somewhat severe toil and exceeding enjoyment, the authors advise that—
"Advantage should therefore be taken of the opportunity to hear Gaudy play, and to make acquaintance with the Irish boggies, under circumstances peculiarly favourable to the reputation

of that much over-landed and much over-abused instrument of music. The truth is that the pipes are delicious or abominable—just according to the skill of the hand that rules them."

An opportunity is thus supplied for introducing a descriptive history of the bagpipes, with some anecdotes of the Irish pipers, a race now rapidly departing; and a few brief remarks on Irish music,

VENDOR OF GOAT'S MILK.

so long, and even yet, emphatically "the voice of the people."

"Whether excited by joy, or sorrow, or love, or injustice, their feelings found vent in music: their grief for the dead was relieved by a dirge; they roused their troops by song, and offered their prayers in chorus and chant: their music was poetry, and their poetry music."

THE THIRD DAY'S TOUR is through the Gap of Dunloe, and, by boat, through the Three Lakes, visiting, in the way, the far-famed Eagle's Nest, passing under the Weir Bridge, stopping at beau-

A KEENER.

tiful Glens, and so on shore, after a full day of surpassing enjoyment.

The very entrance to THE GAP is a sudden introduction to its marvels; the visitor is at once convinced that he is about to visit a scene rarely

paralleled for wild grandeur and stern magnificence; the singular character of the deep ravine would seem to confirm the popular tradition that it was produced by a stroke of the sword of one of the giants of old, which divided the mountains and left them apart for ever. Any where, and under any circumstances, this rugged and gloomy pass would be a most striking object; but its interest and importance are, no doubt, considerably enhanced by the position it occupies in the very centre of gentle and delicious beauty.

After leaving the Gap of Dunloe the tourist is rowed through the Upper Lake, and into a narrow channel called "The Long Range," in which is "The Eagle's Nest," famous as the source of the most perfect, glorious, and exciting of all the Killarney Echoes. We copy the authors' description of this scene:

"The rock is of a pyramidal form, exactly 1103 feet high, thickly clothed with evergreens, but bare towards the summit; where the nest of the bird is pointed out, in a small crevice nearly concealed by stunted shrubs. We put into a little creek on the opposite side of the river; but remained in our boat, having been recommended to do so. Our expectations of the coming treat had been highly raised, and we were in breathless anxiety to enjoy it. The bugle-player, Spillane—of whose skill and attention we gladly add our testimony to that of every traveller who has preceded us—landed, advanced a few steps, and placed the instrument to his lips; the effect was MAGICAL—the word conveys a poor idea of its effect. First he played a single note; it was caught up and repeated, loudly, softly,—again loudly, again softly, and then as if by

a hundred instruments, each a thousand times more musical than that which gave its rival birth, twirling and twisting around the mountain, running up from its foot to its summit, then rolling above it, and at length dying away in the distance until it was heard as a mere whisper, barely audible, far away. Then Spillane blew a few notes—ti-ra-la-ti-ra-la; a multitude of voices, seemingly from a multitude of hills, at once sent forth a reply; sometimes pausing for a second, as if waiting for some tardy comrade to join in the marvellous chorus, then mingling together in a strain of sublime grandeur, and delicate sweetness, utterly indescribable. Again Spillane sent forth his summons to the mountains, and blew, for perhaps a minute, a variety of sounds; the effect was, indeed, that of 'enchanted ravishment'—giving

Resounding grace to all Heaven's harmonies."

When Spillane had exhausted his ability to minister to our enjoyment, preparations were made for firing off the cannon. As soon as they were completed, the match was applied. In an instant every mountain for miles round us seemed instinct with angry life, and replied in voices of thunder to the insignificant and miserable sound that had roused them from their slumbers. The imagination was excited to absolute terror. The gnomes of the mountains were about to issue forth and punish the mortals who had dared to rouse them from their solitude; and it was easy for a moment to fancy every creek and crevice peopled with 'sly things.' The sound was multiplied a thousandfold, and with infinite variety. At first it was repeated with a terrific growl; then a fearful

crash; both were caught up and returned by the surrounding hills, mingling together, now in perfect harmony, now in utter discordance; while those that were nearest became silent, awaiting the on-coming of those that were distant; then joining together in one mighty sound, louder and louder; then dropping to a gentle lull, as if the winds only created them; then breaking forth again into a combined roar that would seem to have been heard hundreds of miles away. It is not only by these louder sounds the echoes of the hills are awakened; the clapping of a hand will call them forth; almost a whisper will be repeated—far off—ceasing—re-suming—ceasing again. The most eloquent poet of our age has happily expressed the idea we desire to convey—

"A solitary wolf-dog, ranging on,
Through the bleak convaya, wakes this wondrous chime
Of airy voices locked in unison—
Faint—far off—near—deep—solemn and sublime."

THE FOURTH DAY'S TOUR is to the islands and shores of the Lower Lakes. These islands are in number twenty-seven, Ross and "Fair Inisfallen" being the principal as to size and beauty. The castle is a fine ruin; much less injured by time than the majority of its co-mates in Kerry.

Inisfallen receives from all tourists the distinction of being the most beautiful, as it is certainly the most interesting, of the lake islands. Its peculiar beauty is derived from the alternating hill and dale within its small circle, the elegance of its miniature creeks and harbours; and the extraordinary size as well as luxuriance of its evergreens, while it far surpasses in interest any one of its graceful neighbours, inasmuch as here, twelve centuries ago, was founded an Abbey, of which the ruins still exist, from which afterwards issued "the Annals of Inisfallen"—among the earliest and the most authentic of the ancient Irish histories.

But it is unnecessary to inform the reader that we are precluded from entering at any length into this subject. Of the volume many pages are devoted to a gathering together of all the legends which have been so long associated with these beautiful islands. They are all deeply interesting. They have been collected with much industry, and will be considered by many to form the most agreeable parts of the book. These are not, however, the only islands from which the tourist will derive exceeding enjoyment. Each of the twenty-seven will possess some attraction, and each, if time permitted, would repay the trouble of a visit.

THE FIFTH DAY'S TOUR is, as we have intimated, to various points of interest in the vicinity of the Lakes. Many of these points may be inspected *en route* to the principal places; and others it is by no means necessary to visit; although, undoubtedly the pleasure of the tour will be enhanced by examining them. It is, therefore, needless to follow the authors through the latter pages of their book.

THE APPENDIX, however, should be carefully read by all who contemplate a visit to the far-famed and beautiful Lakes. In these GUIDES—NOTES the authors say—

"Our object is not only to communicate necessary instructions for his guidance, but to offer such information as may be useful and agreeable, and pre-dispose him to receive the enjoyment offered to him in many different ways on many different occasions. In order to do this effectually, we have not suffered ourselves to fear any danger of being too minute, of descending to trifling particulars, or of treating seriously topics which some persons may consider beneath their notice. Generally we have kept in view the wants and wishes of persons who—like ourselves—desire to see all of the beautiful that may be seen, and to convert leisure hours into lessons of information as well as into sources of enjoyment; yet who are compelled continually to bear in mind that no purse was ever inexhaustible."

In conformity with this plan, they give the various routes, with the charges incident to each; the modes of proceeding from place to place; the several inns upon the various roads; with the charges made at each; the distances from town to town; the prices at leading hotels; the fees to guides; boatmen, fishermen, &c. &c. In short, all that is desired in a mere guide book—which may save the tourist a world of trouble by enabling him, beforehand, to know what he is to do and see, and what will be the cost of his enjoyment.

The main object of the volume is—as we intimated at the commencement of this notice—to induce persons who are in search of pleasure and information, to seek for both in Ireland; this purpose we hope and believe will be fully answered by a visit to Killarney, among the many interesting Irish localities.

MANUFACTURERS *versus* DEALERS IN THE EXHIBITION OF 1881.

At the conference to which we alluded in our last number, as arranged to take place in London on the 27th June, between the deputations from some of the principal manufacturing districts and the Royal Commissioners, touching several of the "regulations and decisions" which were deemed objectionable and impolitic—the first consideration urged upon the notice of the Commissioners, was as to "Whether it should be a compulsory requirement that the name of the manufacturer should be attached to the articles exhibited?" The simple justice, and stimulating policy of this requisition we had, from the first, foreseen and advocated; it has been most ably and zealously adopted and enforced by the local committee of Birmingham, whose chairman, (the Mayor) in opening the proceedings, very lucidly discussed its merits. On the ground of "right" we think its necessity, supported by the arguments which have been already used, to be incontrovertible; indeed, it is only on the plea of "expediency" that its opposers can make any show of resistance, and we contend, in reference to a project so exalted as that with which it is connected, it had been well that higher views should be taken of its purpose and the means of its realisation.

The Royal Commissioners recommend that the publication of the manufacturer's name be left "optional" with exhibitors, and the chief argument with those who would prefer this to the "compulsory" stipulation, is, that many wholesale dealers and retailers now pass as the manufacturers of the articles they vend, who, by this enactment, would be bound to appear in their real capacity, and they object to the exposure of their present false position. It will appear singular that such an unjust concession as here lies involved, should find any advocates among the manufacturing class; but such is the case, and trade interests form the inducements which compel them to a course from which their better and unbiased judgment would revolt. In some cases it is stated that particular wholesale houses will take the whole production of a manufacturer, and in many instances the individual dealings of this class are of such amount as to cause the fear of their withdrawal (threatened if the "compulsory" regulation be required) to be held a matter of such serious consideration, that the manufacturer hesitates to hazard a risk so imminent, particularly from the position in which, by the present decision of the Commission, he finds himself placed.

To all in any degree conversant with the present state of trade, this difficulty was immediately and forcibly apparent, was as also the absolute necessity that it should be avoided or overcome by stringent corrective measures. The scheme was promoted to ascertain the productive standard of English Industrial Art, and to determine the relative position which her manufacturers were entitled to assume in reference to its present support and future advancement, and no technical obstruction caused by existing tolerated customs which militated against its complete development, should have been allowed to interfere with or thwart its object. The task was undertaken with the wish to foster, extend, and create an improved productive intelligence, and where its operation was found, to demonstrate to its possessor—to the originating and active agent in its application to commercial wants—the approving testimony of a powerful and distinctive confirmation, alike honourable and conclusive. It was not for the Commission to have taken cognisance of any class or connection prejudicial or inimical to this just and peremptory duty, which, simple in its demand, should have met a prompt and ready response.

The Commission, in this respect, has shrunk from encountering a difficulty which they should have met boldly and decisively; with them it was solely a question of "justice"; but left to manufacturers to decide, other influences are allowed to weigh with undue and injurious preponderance, and the question which to the former was simple and plain, becomes to the latter, through conflicting interests, complex and dubious. The onus of the adoption or rejection of the "optional" clause, as decided on by the Royal Commission, should not have been thrown on the shoulders of manufacturers—they are not, and cannot be, free agents in the matter, and should have been relieved from a responsibility which must be felt to be critical and hazardous.

It was ungracious to ask whether a course which was manifestly just towards them would be required and exacted, or whether, to conciliate a rival interest, its advantages would be foregone. The Commission might be assured that if it

directly leave the matter "optional" whether the names of the manufacturers are to be attached to the articles exhibited; they will indirectly furnish the means to the retailers of making it "compulsory" on the manufacturer, as far as they can possibly exercise such an influence, to withhold his name, and this coercion will fall with great severity upon the smaller manufacturers, among whom, at the present time, may be found many who, with fitting opportunity for publicity, would immediately command a distinctive and remunerative position, but who, under the present dispensation, will find their interests seriously injured, and their progress fatally retarded.

We confess that in an Exhibition formed to illustrate the comparative merits of the Productive Industry of the world, we are bound to consider retailers as intruders; any claim to acknowledgment which they may have is, and must necessarily be, foreign to the purposes of the scheme, which is to stimulate and reward *productive* skill and intelligence. We admit and would duly recognise the value of the encouraging stimulus which a judicious and discriminating dealer must exercise upon the success and progress of the manufacture with which he is connected, and would willingly see an acknowledgment made to him whose good taste and patronage was strikingly evidenced in a creditable selection of superior stock, but this would be a consideration altogether distinct and apart from the present purpose. The declaration that "they manage these things better in France" may surely be fitly emphasised in reference to this subject. There, after upwards of half a century's experience in these matters, we find their decision upon this precise point thus declared:—

"Several retail dealers who sell works of art, &c., of which they are not the makers themselves, have at different times caused to be manufactured from models and designs purchased from artists, have put forward pretensions to be considered as producers, and admitted under this title to the Exhibition. The central jury, after much discussion, has decided that, notwithstanding its wish to recognise the services rendered by commerce to industry, it should not lose sight of that object for which it was principally instituted, namely, to reward the results of the efforts and talents of originators; that it was on such alone that reward could be bestowed; and that the participation in this great competition of dealers, not being manufacturers, would be followed by the inevitable and unwished-for result of often excluding the humble designer who might find himself in an absolutely dependent situation. It was consequently decided that no one should be permitted to display any other than his own productions, and that articles not made by, but manufactured from designs or models furnished by the vendors and would-be exhibitors, should not be regarded as coming under that denomination."

And they further proceed to carry out this decision in the following stringent directions:—

"The central jury having remarked the tendency of certain dealers to apply to their own profit, the success rightly due to the talent of the inventor, decided—That all tickets indicating that the articles exhibited had been ordered or purchased by retail houses should be removed; as well as those which should make mention of orders executed for public or private establishments; this regulation not applying to purchases or commissions from members of the royal family."

While thus rigidly excluding those who have no immediate or active agency in the production of the articles, they are at the same time careful to include within their recognition all who exercise this influence. As immediately applying to a question that has been subject to much discussion, a reference to our own projected Exposition, we extract the following from the same report:—

"The dyers, who contribute so largely to the commercial success of the manufacture of woven goods, having experienced in many cases difficulties in making understood the extent and nature of their co-operation, the jury decided, that in the exhibition of fabrics or other dyed articles, it should be allowed to indicate by tickets the name of the dyer, making known that he had been admitted by the jury of his department, in the case of this part of the labour not having been executed in the establishment of the chief exhibitor; and that it shall be specially expressed on the ticket that the fabric exposed is admitted as a specimen of dyeing."

This is a regulation that might well be grafted on our own code, and we trust to find it so. In addition to other difficulties attending the admission of the retailer to exhibition honours, is the certain influx of *numerous copies of the same work* which will be sent in, and we do not see how

this is to be avoided. Those retailers purposing to exhibit will of course be anxious to secure some of the best works of various manufacturers, and each will secure copies of the same articles. How will this be met—are all to be admitted? If so, what endless repetition will weary the eye on every side; and if not, whose will be received and whose rejected?

Another very anomalous position will present itself by the admission of retailers in competition with manufacturers, which seems to have been overlooked. As the bulk of the works exhibited will have been previously published, it may in many cases occur, particularly in some branches, subject to peculiar hazards and liabilities, in a considerable degree uncontrollable, that the retailer at the time of sending in the specimens, may possess a better copy than the manufacturer himself; and as the "decisions" now stand, he would undoubtedly be entitled to a priority of award, to the exclusion of the producer.

But to return to the question from which we have somewhat digressed—the importance of the manufacturer's name being attached to his products. The views of the Birmingham committee on this point, as expressed in the following resolution, are entitled to serious consideration from the practical knowledge of its members:—

"It is the opinion of the committee, that if it is not made compulsory for the manufacturer's name to be attached to every article exhibited, an influence will be used to prevent many of the smaller manufacturers from insisting on their names being attached to the articles; and thus the credit due to them will be received only by the proprietor or retailer, by whom they may be exhibited; the express object of the Exhibition being to afford an opportunity for manufacturers and others to display their skill and to make their works known."

This is the plain fact; and its statement is but the detail of a sequence that must result from the indiscriminate admission of mere "possessors" to the position that could only consistently and fairly be assumed by "producers."

The interest of the better class of manufacturers, particularly of those in immediate connection with Art, will never be efficiently protected till each and every product bears legibly the impress of its maker. This would be an effectual blow to those who exist, mainly by pirating the successful efforts of others, and who are encouraged in this course by the difficulties that now shield the delinquency from being generally detected and exposed. This course would tend, in a marked degree, to secure the benefit arising from an extensive demand, induced by the publication of a novel and improved production, to its originator; his name appearing on the article, would afford a very valuable publicity; not only would the patronage be remunerative in respect to its immediate object, but also beneficial in its prospective influence on the future labours of the same manufacturer; the "consumer" would be in closer alliance with the "producer," and efforts to divert the tide of encouragement from its legitimate, and deserving source, would be less effectual and less frequently attempted.

It would be a powerful check upon the encouragement too often given to piratical advertisers; for it is a case of common occurrence, that when a superior article, offered by the original manufacturer at a fair valuation, is realising a satisfactory return, the work has been surreptitiously copied by another, who not incurring the expense of design, and the attendant cost of primary production, involving perhaps repeated and laborious trials, offers his unprincipled imitation at such a reduced price as tempts the retailer to a purchase, to the total exclusion of the original, whose invention is not only thus seriously injured, but the public also duped.

We are aware of instances where manufacturers have been tempted by dealers to this debasing course, but we will not dwell upon a feature so repulsive and discreditable, and allude to it but as enforcing the strength of our argument.

Registration will not effectually remedy this, as such a deviation as evades the law may be easily accomplished without causing a too evident difference. The advantage attending the "stamp" would be in other respects beneficial; not only would manufacturers, who have already attained eminence, be stimulated to further progress, but those of more recent standing engaged in the execution of a creditable class of productions, and who merely require recognised publicity to secure an immediately remunerative acknowledgment, would find this the essential desideratum to a certain result. To the latter classes the question is one of vital import; they are now labouring under disadvantages, which the skill and talent of their works are but gradually lessening; these need only a direct appeal to the judgment of an

influential and competent tribunal, to secure the success their labours so well merit. Let the consumer know the name of the manufacturer whose product he prefers; he will then feel an interest in his progress—will seek his works—and thus be instrumental in realising a commensurate demand. In the comparative oblivion in which he now labours, the manufacturer is too often at the mercy of the dealer; not only is his name suppressed, but in many instances he is required and compelled to substitute that of the retailer instead of his own. By reflection this regulation would also eventually benefit the more eminent and extensive producers, as lessening the injurious competition to which they are now subject, arising from the inadequate and unremunerative prices, which his humbler rival thus situated is obliged to accept.

If a higher standard of Art is to be allied to English manufactures, it must mainly be effected through these means. It is rarely, in any profession, that eminence is content to remain anonymous; there is a repute beyond a mere mechanical success in the achievement of a task which taxes the exercise of innate taste and studious intelligence, which publicity can alone attest and secure. We append an extract from the address of the Birmingham Committee on this point:—

"It may be observed that in the case of manufacturers who have gained a celebrity, retailers have no scruple in exhibiting the manufacturers' names to the public, to show that they sell goods manufactured by such parties, as in the case of Rogers' cutlery and Broadwood's pianos. But there are at the present time many clever and deserving manufacturers whose commercial fame is obliterated in the name of the retailer; and to give such manufacturers their proper position, and recognise their merit, forms one of the purposes which exhibitions were framed to accomplish: and the Birmingham Committee, recognising this, contend that it is only an act of justice that the names of the manufacturers be appended to all the articles exhibited. Under the present arrangement there will be a peculiarly anomalous position presented in the conditions under which the French and English exhibitors appear—the former contributing under the restrictions which guide their national exhibitions—viz., as manufacturers, but the English as a medley of manufacturers and retailers. If it is decided that the manufacturer's name be not appended to every article exhibited, one of the most important ends to be served by the Exhibition of 1851 will be defeated, viz., the plading before the people of England and the world the true state of our manufactures, in reference alike to their design, substantiality, and finish; and it is necessary this should be known, no opportunity having yet presented itself for making a comparison, until the proposed Universal Exhibition."

Also the following paragraph from the excellent Report of the Commissioners for Sheffield:—

"The question as to whether or not the manufacturer is to exhibit in his own name, has demanded and received our serious attention. Notwithstanding that the Royal Commissioners have recently decided that this shall be left to the option of the manufacturers, our own opinion is, that no goods should be exhibited but such as bear the mark of the *bona fide* manufacturer; any other system—conceal it under what name we may—is manifestly a deception upon the public. The principal objection to the manufacturer's name or mark being on the goods is, that by so doing, we shall injure the retailer; the idea being that the public will pass over the shopkeeper, and go direct to the manufacturer. We cannot regard this objection as tenable. The peculiar nature of a large manufactory has hitherto been found incompatible with the carrying on, at the same time, of a retail trade. The principle upon which the manufacturer conducts his business, his convenience, his interests, are all equally opposed to any interference with the retail dealers. The shopkeeper, by his energy, capital, and enterprise, at one view displays before the eyes of his customers articles from every manufactory in Great Britain; this circumstance at once places the competition of the manufacturer (were he so inclined) out of the question. The retailer's legitimate strength is with the public, who, we may be sure, will always deal where their tastes are amply catered for, and their convenience in every way consulted. We, therefore, repeat that our opinion is, that the names of manufacturers should be on their goods; whilst we are willing to render every justice to that eminently useful and enterprising class, the shopkeepers, we cannot recommend their fictitious aggrandisement by the annihilation of the manufacturer."

We are aware there are exceptions to the general statement that—"the peculiar nature of a large manufactory has hitherto been found incompatible

with the carrying on, at the same time, of a retail trade." Many first-rate manufacturers have been compelled from the want of patronage from the retailer to make a direct appeal to the suffrages of the consumer; and with the best results, but this course has been coercive not voluntary in the first instance.

The arguments here adduced, supported by such important localities as Birmingham and Sheffield, should have been held conclusive; they are sound and practically just, and deserved a more considerate acknowledgment than they have received. In the case of manufacturers of known and esteemed excellence, it is found that the publication of their names is to some extent a certain guarantee for the quality of the production, which of itself alone gives positive value to the article in the estimation of the purchaser. The very fact of an article being made without the mark of its maker alone gives cause for doubt, and this has been so seriously felt by retail dealers who trade with the inferior and cheaper houses whose names, if known at all, would but militate against a sale, that they often require, as we have before stated, their own names to be put upon them, thus passing as the manufacturers themselves. We will not allude to those fraudulent cases where a name is attached to spurious works, so closely resembling that of a first-class producer as to deceive the public eye, further than as they testify irrefragable evidence of the commercial value which attaches to established repute, which can alone be gained by publicity of name. Its advantage once secured, is incalculable, and often continues a profitable source long after the master-spirit with which it originated has "shuffled off this mortal coil" and even survives when the taste and talent which guided his efforts and achieved his fame have ceased their influence and operation. It would indeed be impossible for a mind to possess the requisite qualifications for the due appreciation that attaches to the production of the more elevated efforts of artistic skill and scientific investigation, and yet be content to barter that honourable fame for the mere market value the commodities will bring. A mind so nerved will never compass aught beyond what an ordinary commercial return will amply repay.

If the "optional" clause be supported by any manufacturers of eminence—by any whose products boast more than average merit, this may be safely inferred, either that private interest, from causes already stated, compel them to this act of self-immolation, or that their share in the credit of the works is of very small account, and that they but profit by a *prestige* derived from extraneous resources which they are incompetent adequately to esteem.

Consider this rule as applied to Art generally: what would be the result if our Fine-Art institutions, if the efforts of our painters and sculptors were exhibited anonymously?—or even if a print-seller attempted to publish an engraving without the painter's and engraver's names? The principle is just the same, applied to its influence upon Art-labour. In the instance just quoted, all the parties instrumental in the execution of a work of talent, as the painter, the engraver, and the publisher, are anxious for the fame which attaches to it, beyond its mere money return; and so will it be with all our manufacturers who thoroughly appreciate and fulfil the higher duties of their position.

We have dwelt upon this question at greater length than we should have felt warranted in doing; but its importance, not only upon the temporary interests of the Exposition, but on the permanent welfare of English manufactures, rendered it imperative. We regret to record that the "optional" course was decided on—it will be found a prolific source of future contention and prejudice.

Our disappointment is in some degree lessened by the probability that a condition which we have zealously sought to enforce, will be adopted; indeed, such was distinctly understood to be the expressed determination of the Royal Commissioners, though not up to the present time promulgated; it is as follows: "That it should be imperative on every exhibitor to state the capacity in which he claims acknowledgment or reference to the works he exhibits."

This stipulation will, to some extent counter-balance the evil of the previous decision, though a more discriminating judgment in drawing up the preliminary detail, would have obviated the necessity for such an after consideration. The requirement is so palpably right and politic, that it should form an indispensable regulation, affecting the reception of all exhibitive works; upon this point, at least, manufacturers should be firm and determined; it is in the highest degree essential to their interests; and without this proviso the hitherto unequalled advantages of such a publicity as the

Exhibition will insure, must to a great extent be rendered nugatory and void. If the mere "possessor" of an article of merit is to be held entitled to an award and *collet* from which its "value" is to be excluded, it will be a "heavy blow and great discouragement" to that class whose study and toil are too often, even in a pecuniary sense, but very indifferently acknowledged.

We will not further discuss this matter, as we confidently rely on its being satisfactorily arranged. The advantage resulting from its adoption will be, that, as the regulations now determined on will cause in many cases the names of the manufacturers to be suppressed, still this stipulation will, if duly enforced, prevent the possibility of a mere "possessor" assuming that character.

PICTURE SALES OF THE MONTH.

The collection of pictures formed by Charles Meigh, Esq., of Grove House, Shelton, Staffordshire, was brought to the hammer by Messrs. Christie and Manson, on the 21st and 22nd of June. The sole reputation of this gallery rested on the works of modern British artists, to which we alluded in our last number. It contained, however, some sixty pictures ascribed to the old masters, a few only of which realised a price worth recording:—A *Fête Champêtre*, by Watteau, 46 gs.; *Diana and Nymphs Bathing*, by Dietrich, 45 gs.; *A Group of Fruits and Flowers*, J. Van Oss, 39 gs.; a small picture by Ruysdael, 'View near Haarlem', 51 gs.; *An Interior, with Figures*, by Netseher, 81 gs.; a good 'Landscape with Peasants', &c. D. Teniers, 120 gs.; *A Woody Landscape*, by Wynants, with figures by Lingelback, 95 gs.; the 'St. Cecilia' of Rubens was passed at 100 gs.; as were the 'Dead Christ with the Maries', a large and powerfully painted picture by Lud. Carracci, and 'St. John baptising Christ in the Jordan', by P. Bordone. A small work by K. Du Jardin, 'Landscape with Peasants and Cattle', sold for 69 gs.; a 'View in Amsterdam', Van der Heyden (small), 51 gs.; a small oval picture, by S. Ferrato, exceedingly delicate in execution, entitled 'Parce Somnum Rumpere', was knocked down at 94 gs.; a 'Head of the Virgin', in fresco, very curious, and ascribed to Raffaele, realised 51 gs.; Rembrandt's 'Abraham offering up Isaac', a *replica* of the Houghton picture, sold for 60 gs.

The influence of taste and fashion was very apparent in the prices paid for the English pictures; some of them going beyond their real value, while others scarcely reached it; yet the average sums they fetched were good, showing that native talent of superior order is fully appreciated by collectors, and that we had not over-estimated the quality of the works which Mr. Meigh had gathered together. The catalogue contained 112 pictures, whereof three were not offered for sale.—Kedgrave's 'Catherine Douglas', and Herbert's 'Love's Levee', retained by Mr. Meigh; and the 'Reprieve', ascribed to Herbert but denied by that artist; it was consequently withdrawn. The following list includes the most important pictures, with the prices at which they were sold:—'A Cottage on the Bank of a River, with a Group of Children', W. Mulready, R.A., a small work, 30 gs.; 'A Classical View in Italy' (small), Colcott, R.A., 17 gs.; Stothard's large picture of 'The Death of Nelson', engraved, realised only 10 gs.; a large 'Woody Landscape', by Gainsborough, 40 gs.; Hilton's fine picture of 'Leer condemning Cordus', an excellent specimen of this painter, sold for 191 gs., a sum far below its value; 'The Poachers Alarmed', a small but very clever specimen of Bird, R.A., 56 gs.; 'Helen', by Faulkner, 26 gs.; 'A Rustic Landscape, with Boys angling in a River', by Linnell, an early picture we should presume, 53 gs.; 'Four Smugglers in a Cavern', a large work by Morland, and an unusual subject for this artist, 101 gs.; 'A Sea View, with a Ruined Castle', &c., by Wilson, a large picture much subdued in tone, 70 gs.; 'A Woody Landscape', Louthborough, 40 gs.; 'The Forester in Search of Game', Hancock, 31 gs.; 'Portrait of Nelly O'Brien', Sir J. Reynolds (small), with the flesh-tints almost gone, 49 gs.; 'The Maid of Corinth', by Wright, of Derby, was passed at 89 gs.; these, with the foreign pictures, occupied the first day's sale. The second day's sale commenced with a number of minor works, which it is not necessary to particularise; they were succeeded by 'The Locket', a little picture by Leslie, R.A., 25 gs.; 'Figures at a Well', Lee, R.A., and F. Goodall, 121 gs., bought by Mr. Davis; an upright 'Landscape with Cattle', Creswick, A.R.A., 65 gs.; 'The Gleaner', a clean and well-coloured example of R. Westall's pencil, 29 gs.; a small picture by D. Roberts, R.A., 'The Church of St.

Jaques, at Dieppe, 32 gs.; B. West's, P.R.A., gallery picture of 'Postus and Arria,' in good preservation, was knocked down for 31 gs.; one of T. S. Cooper's, A.R.A., finest compositions, a large upright picture, entitled, 'A Halt on the Fells,' was bought by Mr. Davis for 380 gs.; 'Head of a Peasant Girl of Gensano,' Uwins, R.A., 40 gs., bought by Mr. Grundy; a rich and powerfully painted 'Landscape,' by Muller, 104 gs.; 'A Romantic Woody Landscape,' very bright in colour, Gainsborough, 65 gs.; two small cabinet pictures by Witherington, R.A., 'The Corn-field,' and the 'Harvest Home,' were bought by Mr. Agnew, for, respectively, 14 gs., and 17 gs.; a small sketch by E. Landseer, R.A., 'A Landscape—Sunset,' 35 gs.; 'Interior of the Chamber of Agnes Sorel, at Orleans,' Muller (small), 41 gs.; 'A Group of Cows,' &c., J. Burnet (brother of the engraver), 41 gs.; 'Portrait of Lavater,' Fielding, 30 gs.; 'A Dog in a Stable,' an early work of E. Landseer, was bought by Mr. Agnew for the enormous sum of 215 gs.; 'A Landscape, near a Lake, with a Lady seated under an Umbrella,' by Wilson, a rather small but favourite composition with the painter, 70 gs.; a small upright work by T. S. Cooper, A.R.A., 'Noon,' fell to the bidding of Mr. Evans, for 57 gs.; as did another small work to Mr. Grundy, 'The Grandmother,' by F. Goodall, for 60 gs.; 'Evening Prayer,' Webster, R.A., an early picture, very different, and far inferior to this esteemed artist's present finished style, was knocked down to Mr. King for 155 gs.; a noble picture by Muller, perhaps his very best of oriental subjects, 'A View in the Temple of Egypt, with Groups of Arabs,' reached 430 gs.; it was purchased by Mr. Cole; 'The Choice of Hercules,' painted in the early part of D. Maclise's career, a highly poetical composition which obtained the gold medal of the Royal Academy has become the property of Mr. C. W. Wass, at the price of 210 gs.; a small and elegant picture by Herbert, R.A., 'Francesca,' 20 gs.; bought by Mr. Lenox; Frazer's large and engraved work, 'Robinson Crusoe,' was sold to Mr. Grundy for 105 gs.; 'Mountaineers returning from the Festa of Monte Vergine,' the chef-d'œuvre of Uwins, R.A., 255 gs., bought by Mr. King; 'A Scene on the French Coast, with the Wreck of an English Ship of War,' by Turner, R.A., after an animated bidding, was knocked down to Mr. Lenox, at 600 gs.; this picture is a good example of the artist's style twenty years back, and consequently partakes less of his present extravagancies. An elegant picture by Etty, a charming specimen, 'Two Nymphs Bathing,' was bought by Mr. Agnew for 260 gs.; 'View over the Thames, from Richmond Hill,' Pyne, 60 gs.; an inadequate sum for a large picture by this clever artist; 'The Careless Messenger detected,' a very small sketch by Mulready, R.A., 25 gs.; 'The Sphinx,' Muller, 200 gs.; bought by Mr. Davis; a small circular picture by Liversidge, 'Musiadora Bathing,' 21 gs.; 'The Broken Egg,' large landscape, with accessories, Gainsborough, 90 gs., bought by Mr. Carr; 'Pigs in a Fodder Yard,' Morland, 85 gs.; it is a rare thing to meet with so perfect a specimen of the painter as this picture exhibits; 'Beacon Dull Care,' Kidd, 32 gs.; 'A Mill on the River Teign, near Crediton, Devonshire,' a small upright picture by Lee, R.A., 47 gs.; 'Conversation,' Morland, 48 gs.; a sketch by Collins, R.A., entitled 'A Rustic Landscape,' 53 gs.; 'Cain meditating the Murder of Abel,' by the French painter, David, 70 gs.; 'Puck, seated on a Toadstool, surrounded by Fairies dancing,' by Dadd, that most promising but unfortunate young artist, 50 gs., bought by Mr. Agnew; 'Portrait of Edmund Burke,' Sir J. Reynolds, 45 gs.; the sketch for Collins's picture of 'The World or the Cloister,' 59 gs.; 'Captives detained for Ransom by Banditti,' Herbert, R.A., 210 gs., bought by Mr. Wallis; 'Boar Hunters taking Refreshment at the Gate of a Monastery,' also by Herbert, 205 gs., bought by Mr. Davis.

Messrs. Foster & Son sold a few English pictures among a miscellaneous collection, at their gallery in Pall Mall, on the 28th of June; among them a small landscape by Calloet, 46 gs.; a small circular picture by Collins, 'Roman Beggars,' 19 gs.; 'A Study of Kids,' small, by J. F. Herring, 17 gs.; a large work of good character by Scott, R.S.A., 'The Old English Ballad Singer,' 28 gs.; 'Venice—Sunset,' rather small, by J. B. Pyne, 65 gs.; 'Interior of a Stable, with a horse saddled, poultry, &c., by J. F. Herring, 67 gs.; and a small picture by T. S. Cooper, A.R.A., 'Cattle proceeding to a Watering Place,' 71 gs. These pictures were the property of Mr. Brooks, of Regent Street.

The final portion of the sketches in oil and water-colours, and of unfinished pictures, by the late W. J. Müller, were sold by Messrs. Christie & Manson, at the commencement of the past month, Müller's powers as a great colourist, (he was in landscape what Etty was in figures,) are abundantly

manifest in these slight but most expressive studies, which were eagerly purchased at high prices. Of the few unfinished oil-pictures sold, the principal were two different views 'On the East Lynn—Lynnmouth,' 34 gs., and 38 gs., respectively; 'Conham on the Bath River,' 31 gs.; 'The Pyramids, as seen during the Overflow of the Nile,' 26 gs.; 'Hambrook Stapleton—near Bristol,' 50 gs., bought by Mr. Wethered; 'Pensford Church—near Bristol,' a brilliant picture, 72 gs.; another 'View of East Lynn,' was bought by Mr. Wallis for 60 gs.; 'Turkish Merchants, with Camels, fording a River by Torch-light,' bought by Mr. Carr for 100 gs.; and 'Tureomans Encamped,' by Mr. Bought for 241 gs. The last two pictures were finished works. We have every reason for supposing that the major part of these pictures are not in the precise condition in which the artist left them; they have evidently been carried forward by some hand well acquainted with the method and style of the deceased painter.

The highly important collection formed by John, Earl of Ashburnham, about the middle of the last century, through which it came into the possession of the present Earl, was sold by Messrs. Christie & Manson on July 20th. We regret that we cannot find space to enlarge upon the merits of many of these noble productions of the Italian, Dutch, French, and Flemish schools; it must suffice to say, that few finer specimens of the respective painters have, of late years, been brought into the market, and the sums they realised speak loudly of the estimation in which they are held. It is believed that none of these works have been in the hands of a picture-cleaner, consequently they appeared in a genuine state. The collection contained ninety-one paintings, of which we subjoin a list of the principal, with the prices they fetched, and the names of the purchasers, so far as we could learn them. It will be noticed that most of the buyers were dealers, who most probably received commissions to purchase. 'A Frozen River,' Schellincks, 95 gs.; 'A Dutch River Scene,' S. Ruysdael, 81 gs.; 'The Marriage of St. Catherine,' N. Poussin, 180 gs.; 'Story of Apollo and Cyparissus,' the joint production of Rubens, Snyders, and Breughel, 130 gs.; 'Portrait of Titian,' by himself, 370 gs., this is a valuable work; 'The Daughter of Herodias,' a noble specimen of Carlo Dolce, 700 gs. (bought by Mr. Segner); 'The Martyrdom of St. Andrew,' also by C. Dolce, 200 gs.; 'Portrait of Van der Werff,' by himself, 126 gs.; 'A Landscape,' by S. Rosa, with Apollo and the Sybil in the foreground, 1785 gs.; this picture is presumed to be the finest landscape of the painter; it was bought by the founder of the collection at the sale of M. Julien's gallery, against the agent of the Empress Catherine of Russia, who subsequently sent an offer of double the amount at which it was purchased, which offer was refused.

'Portrait of Don Juan,' Odescaldi, Van Dyck, 450 gs.; 'Portrait of a Cavalier,' Rembrandt, 690 gs. (Farrer); 'Bacchus and Ariadne,' Guido, 420 gs. (Worsley); 'A View in the Bay of Naples,' Claude, 1123 gs. (Worsley); 'Portrait of the Painter, Murillo, 790 gs. (Lord Spencer); 'View of Tivoli,' G. Poussin, 504 gs.; 'St. John in the Island of Patmos,' Mola, 150 gs.; 'Lucretia,' Guido, 390 gs. (Ryman); 'St. Peter Preaching,' Guido, 320 gs.; 'Peter accused by the Danseur,' Caravaggio, 110 gs.; 'A Calm,' and 'A Storm,' a pair by W. Van der Velde, 160 gs. (Farrer); 'Nature unveiled by the Graces,' Rubens, 1000 gs. (Fuller). We could write a column concerning this comparatively small but wonderful work; the history of it is said to be briefly this. It was painted at the desire of Villiers, Duke of Buckingham, and when finished, the painter could scarcely be induced to part with it, so highly did he esteem it; the figures are not large, but the composition is filled in with groups and festoons of flowers and fruit, most exquisitely painted, and as some connoisseurs suppose, by Breughel; other authorities, however, are inclined to think the picture is the entire work of Rubens. The two following lots were by N. Poussin; 'The Triumph of Bacchus,' knocked down to Mr. Segner for 1100 gs.; and his companion, 'The Triumph of Pan,' sold to Mr. Hume for 1180 gs.; they are known to the connoisseur as the 'Montmorency Poussins,' and may be regarded as equal to any thing which this great artist ever painted. 'A View in Italy,' Lingelback, 250 gs. (Williams); 'Two Cocks Fighting,' Snyders, 200 gs. (Williams); 'A Basket of Grapes on a Table, with a Parrot, Cat, and dead Birds,' Snyders, 200 gs. (Williams); 'The Holy Family,' A. Caracci, 300 gs. (Morris); 'A Mountainous Landscape,' G. Poussin, 100 gs. (Ryman); 'A View on the Coast of Italy,' G. Poussin, 100 gs. (Ryman); 'An Old Man seated before a Cottage, playing the Hurdy-gurdy to a group of Children,' a very small but

charming specimen of Teniers, 300 gs. (Barker); a cabinet picture, rich and luminous in colour, by Giorgione; 'A Youth conversing with a Female,' 250 gs. (Mr. Stuart); 'A View near Rome, with the Ponte Mollo in the distance,' Claude, engraved, as is the preceding work by the same hand, in the *Liber Veritatis*, 1800 gs. (Carr); 'The Horn-Book,' the celebrated engraved picture from the King of Naples's private collection, by Schedone, 750 gs. (Cromlin); 'St. John Baptising Christ in the Jordan,' Albano, 300 gs. (Williams); 'St. Joseph and the Virgin presenting the Infant Christ to the High Priest,' Guercino, 400 gs.; 'A Landscape, with Cephalus and Procris,' N. Poussin, 400 gs.; 'St. Francis kneeling in Prayer, resting on his Staff,' a grand work by Murillo, 1000 gs. (Wilmot); 'St. John Preaching in the Wilderness,' S. Rosa, 500 gs.; and his companion, 'Philip Baptising the Eunuch,' S. Rosa, 500 gs. (both bought by Mr. Carr); 'A Mathematician leaning over a Table, measuring with compasses, and a Pupil at his side,' engraved by McArdell, Rembrandt, 1000 gs. (Gilbert); 'Coast Scene,' Pynacker, 110 gs. The last three pictures had reserved prices put upon them, which no one present at the sale was disposed to outbid, although the works were of the very highest quality; we may perhaps say no finer specimens of the respective painters exist anywhere. 'A Ruined Château,' by Cuyp, was bought in at 2000 gs.; 'A Village Fête,' by D. Teniers, at 3000 gs.; and the large gallery picture by Rembrandt, 'Portraits of Raimond Anso and his Mother,' at 4000 gs. The entire collection, exclusively of those bought in, realised upwards of 23,000.

THE VERNON GALLERY.

MARLBOROUGH HOUSE.

At length Mr. Vernon's magnificent collection of pictures has found a home where the respective beauties of each can be properly seen and its merits fairly appreciated. The English public will now, for the first time, have the opportunity of testing the value of the gift which the liberality of a private individual has placed in their hands; and foreigners that of determining whether our school has not a just title to the distinction we claim for it. It is pretty generally known that, through the kindness of her Majesty, Marlborough House has been assigned for their present location, and during the past month the officers of the National Gallery, under the superintendence of Mr. Uwins, R.A., have been engaged in removing the pictures thither, and hanging them in the rooms set apart for them. This latter part of the task has been one of no slight difficulty, requiring taste, judgment, discrimination, and above all, impartiality; and we are bound to say that Mr. Uwins has exercised all these in a manner that cannot fail to satisfy both the public and the artists whose pictures are under his charge. In the arrangement he has adopted, it has been his object not only to produce in each room an attractive general view, but to assign to each work that position, and that particular light which are best adapted to it; taking especial care that the peculiar character of any picture should not suffer by the others which surround it; a fault that is often perceptible in the hanging in public exhibition rooms—where, however, it is frequently unavoidable.

The Vernon Pictures, including also those by English masters which were formerly in the National Gallery, are placed in a suite of eight rooms on the ground floor of Marlborough House; the majority of these face the garden, consequently they have the advantage of almost uninterrupted light, for the windows extend nearly the entire height of the rooms. Excepting two, the rooms are not large, while the ornamental ceilings and decorations of each add a richness to its general appearance.

On entering the mansion from the court-yard, the visitor ascends a short flight of steps into the noble hall, the ceiling of which, with the exception perhaps of that of Whitehall, is the finest in the kingdom, being decorated with the paintings which Gentileschi painted for Charles I., and which were originally in the palace at Greenwich. There stand Gibson's group of "Hylas and the Nymphs," and the busts that were bequeathed by Mr. Vernon with the paint-

ings. The entrance to the picture-gallery, is from the right-hand corner of the hall; the public pass through the whole suite, and leave by a door on the left-hand, close to the entrance, thus avoiding all occasion of collision by parties going in and coming out: this arrangement cannot be better, when we consider the numbers that will now visit the collection with the certainty that they can see what they go to see.

The first two rooms are filled with the pictures that, as we before stated, have been brought from the National Gallery, and certainly they appear to far greater advantage here, than in their old abode. Reynolds and West, Wilson, Gainsborough, Constable, Hogarth, and Wilkie, seem arrayed in new garments. The other six rooms contain the Vernon Pictures; in the first, Turner, Collins, Etty, Reynolds, Landseer, and Eastlake are conspicuous; in the second, Leslie, Stanfield, J. Ward, Herbert, Aileu, and Lauce; in the third, Eastlake, Webster, Lawrence, Turner, Stothard, Calcott, Roberts, Milneady, P. S. Cooper, and Lee; in the fourth, Dunby, Redgrave, Urwins, and Wilson; in the fifth, Hill-tou, Etty, T. S. Cooper, Milneady, Gainsborough, Stothard, E. Goodall, and Jones; and in the sixth, Wilkie, E. M. Ward, Calcott, Macdise, Briggs, Collins, and Constable. In this enumeration we have of course only alluded to the principal pictures; and it is right to mention that, with the exception of the lesser works, as regards size, there are, generally, only two lines of pictures, so that in no case, is there one *out of sight*; the whole arrangement is, we repeat, all that can be desired—until we obtain a new National Gallery.

We understand the trustees have peremptorily forbidden any future copies to be taken of any one of the pictures at Marlborough House—excepting those of the Vernon Gallery, for the *Art-Journal*—considering that students will do better in making themselves acquainted with the methods and merits of the old masters, than in imitating the moderns.

The private view of the Gallery will take place on the first of the present month and the two following days, and it will be opened to the public on the fifth.

SOCIETY OF ARTS.

THE annual distribution of prizes by the Society took place in their rooms, John Street, Adelphi, on Monday July 22. Lord Colborne presided, and explained that his Royal Highness Prince Albert had been prevented from being present and occupying the chair by the death of His Royal Highness, the Duke of Cambridge. His lordship also alluded to the loss which the arts had sustained in the demise of Sir Robert Peel.

The Secretary then read the address of the council to the society, which stated the increased prosperity of the body, the average number of new members elected in former years being 105, but during the past session not fewer than 250 new members had been elected. Towards the great Exhibition of 1851 the members of the society have contributed 7288*l.* 12*s.* The address speaks with gratification of the success which has attended the Exhibition of Ancient and Mediæval Art, lately closed, and explains that its own annual exhibition for the present year presents no very remarkable features in consequence of the preparations for 1851. Among the objects of Art and Manufacture in the exhibition for which prizes have been awarded, is particularly noticed—the wide furniture damask of Messrs. Lings & Keith; the wide ribands of Messrs. Cornell, Lyell, & Webster; the machine-made lace of Messrs. Reckless & Hickling; the tamboured lace of Messrs. Lambert & Bury, interesting on account of the new branch of industry which it has afforded to the very poor population of a part of Ireland; and the printed shawls of Messrs. Keith & Shoobridge. The wood-carvings of Mr. Wallis also deserve honourable mention. The goblet which last year the council announced as being in preparation from the designs of Mr. MacIse, R.A., in accordance with the provisions of the Swiney Bequest, has been perfected, and the cup has been for some time before the society. The council feel that they can congratulate the society on having in this cup obtained a work of Art worthy of the fame of Mr. MacIse and of the intentions of the late Dr. Swiney. The council offer, in the name of the society, the large medal and 25*l.* for the best, and the society's small

medal and 10*l.* for the second best, treatise on the objects exhibited in the section of Raw Materials and Produce in the Exhibition of 1851; and the same for treatises on the objects exhibited in the section of Machinery, Manufactures, and the Fine Arts. Each treatise must occupy, and not exceed, eighty pages of the size of the "Bridgewater Treatises." The society will also award its large medal and 25 guineas for the best general treatise upon the Exhibition considered commercially, politically, and statistically; and small medals for the best treatises on any special object or class of objects exhibited. The treatises for which rewards are given are to be the property of the society, and if deemed suitable for publication, should thenceforth see fit, they will cause the same to be printed and published, and will award to the author the net amount of any profits which may arise from the publication after the payment of the expenses. The treatise to be delivered at the society's house on or before the 30th of June, 1851.*

Subjoined is the list of the prizes presented by Lord Colborne, in the respective sections of Fine Arts and Manufactures.

1. To Messrs. Ruffard & Finch, for their porcelain bath in one piece, the gold Isis medal. 2. To Messrs. Campbell, Harrison, & Lloyd, for their figured silks for dresses, the gold Isis medal. 3. To Messrs. John Crossley & Sonnet, for their printed shawls, the gold Isis medal. 4. To Messrs. Ebenezer Henry & Sons, for their embroidered garment fabrics, the gold Isis medal. 5. To Messrs. Keith & Co., for their silk furniture damasks, the gold Isis medal. 6. To Messrs. Keith & Co., for their printed shawls, the gold Isis medal. 7. To Messrs. Reckless & Hickling, for their machine-made lace, the gold Isis medal. 8. To Messrs. Swainson & Denny, for their tamboured lace, the gold Isis medal. 9. To Messrs. George Baedens & Sons, for their specimens of table glass, the silver medal. 10. To Messrs. Cornell, Lyell, & Webster, for their seven-inch ribands, the silver medal. 11. To Messrs. Keith, Shoobridge, & Co., for their printed shawls, the silver medal. 12. To James Cornish, for his damasks, the silver medal. 13. To Miss Stanley, for her Norwich hand-made lace, the silver medal. 14. To Messrs. Stone & Kemp, for their silk damasks, the silver medal. 15. To T. W. Wallis, for his specimens of carving in wood, the silver medal. 16. To Edward Webb, for his horse-hair damasks, the silver medal. 17. To Messrs. J. & W. Wilson, for their carpets, the silver medal. 18. To Messrs. R. S. Cox & Co., for their seven-inch ribands, the Isis silver medal. 19. To George Cook, for his specimens of carving in wood, the Isis silver medal. 20. To Mrs. Temple, for her flowers in wax composition, the honorary testimonial. 21. To the Manager of the school of St. Clair, for specimens of knitting, executed by the children under her charge, the honorary testimonial. 22. To Johan M. Levin, for his introduction and application of New Zealand woods for furniture, the honorary testimonial. 23. To W. Potts, for his ornamental metal-work, the honorary testimonial.

EXHIBITION OF MANUFACTURES IN DUBLIN.

THE rooms of the Royal Dublin Society have been devoted, within the last month, to the Exhibition of Articles of Manufacture, &c., which as they are principally the produce of native artisans, may be considered as a fair exponent of modern Irish Manufactures, and the industrial powers of that country. The Exhibition is very varied in its character, ranging through the useful Arts, and including many things that belong to the ornamental, while in some instances the two qualities are excellently combined. It is utterly out of our power to give any notion of the great variety and merit of the many articles which crowd these Exhibition rooms, but we can strongly recommend the attention of the Irish public towards them, feeling as we do, that the best interests of their country are most intimately connected with the welfare of its industrial Arts, and that Exhibitions such as the present do good service, in spreading a knowledge of the abilities of their manufacturers, and a demand for Irish labour which must be the greatest boon to Ireland, ultimately doing incalculable benefit to all classes of the community.

THE BUILDING FOR THE EXHIBITION OF 1851.

THE great conservatory to be erected in Hyde Park is to cover eighteen acres, and it is to be 110 feet in height, that extreme height having been rendered necessary in order that a group of trees (eighty-eight feet high) opposite the Prince's Gate may be covered in and not removed. The estimate of the contractors, Messrs. Fox & Henderson, is 86,000*l.* for what is technically termed "use and wear;" if the structure remains and becomes the

* We may here not improperly call attention to our own premium of one hundred guineas for an Essay on the best mode of making the Exhibition practically useful, and which took precedence of all other offers of the kind.

property of the public (of which, indeed, we have little doubt), the cost is to be 150,000*l.* It is to be prepared with galleries, in the event of larger space being required, than will be afforded by the ground-floor. There will be, however, on the ground-floor alone eight miles of tables. There will be 1,200,000 square feet of glass (to be manufactured by Chance, of Birmingham); twenty-four miles of one description of gutter, and 218 miles of "sash bar;" and in the construction 4000 tons of iron will be expended. The wooden floor will be arranged with "divisions," so as to allow the dust to fall through. Within a very short period, 2000 men will be employed in the building. Mr. Faxon has been long known to the public as one of the agents of the Duke of Devonshire, and as the author of several admirable works on horticulture and botany; the conservatories at Chatsworth were constructed under his directions; and it is understood that he refers to them as affording satisfactory proofs that the ventilation will be better than it could be in buildings of brick. The plans will be published as soon as they can be got ready. We have reason to believe that the elegance of the structure, for the gratification of "the people" in Hyde Park, as a *Jardin d'Hiver*, will change its character from temporary to permanent; and that there will be no likelihood of its removal. In that case, it will of course be ready for subsequent Exhibitions of the Industry of all Nations, which it is clearly understood are to take place periodically in London, as they do in all the leading cities of the Continent. There is no question that the principal motive for adopting Mr. Paxton's plan was to get rid of a difficulty; but on the whole, we are inclined to think the public will be gainers thereby.

THE VERNON GALLERY.

LAKE OF COMO.

C. Stanfield, R.A., Painter. J. Cousen, Engraver.
Size of the Picture, 2 ft. 63 in. by 1 ft. 63 in.

THIS is a small and comparatively early work by Stanfield, but it is a picture of high character, distinguished by a low-toned brilliancy of much sweetness. The water is tranquil and lustrous, and the distant mountains, described with singular truth, are seen through an atmosphere painted with great delicacy. This picture exhibits all those excellent qualities which the artist has subsequently put forth in richer abundance, in the numerous Italian views of a similar character with which the public has been made familiar.

The Lake of Como is a favourite resort of the English traveller in Italy, forming, as it does, a distinguishing feature amid the beautiful scenery of the province of the same name, situated in the Lombardo-Venetian territories. It is a noble piece of water, long, narrow, and winding; it abounds with promontories, gulfs, and small bays, which render it peculiarly picturesque for the purpose of the artist. The breadth of the lake is very unequal; towards the middle, just above the separation of the two arms, its width is about three miles. The climate of this locality is as salubrious and delightful as any to be found in the country; the soil is productive of the choicest fruits, the neighbourhood is filled with pleasant and thriving villages, and the banks of the lake are studded with fine villas and noble mansions, the residences of the aristocratic and wealthy Italian families, a list of which would occupy a column of our pages.

CORRESPONDENCE.

MY DEAR SIR.—Will you be kind enough, in the ensuing number of the *Art-Journal*, to correct one or two mistakes which have occurred in the brief sketch of my life. I am really anxious to have them rectified, as by their remaining I must appear to do great injustice to a gentleman, to whose taste for the Arts I was at an early period of my artistic career much indebted. In a note, appended to my autobiography, the late T. W. Beaumont, Esq., is mentioned as my "earliest Patron." This is incorrect, as the first commissions which I received in marble (namely, a group of Cephalus and Procris, from Ovid, and a life-sized bust, also in marble, besides some portrait models) were given me by Edward Cooper, Esq., of Markree Castle, the then member for Sligo. The other mistake occurs in the date of my election as an associate of the Academy. It should have been Nov. 1st, 1841. Trusting, my dear Sir, that under the circumstances, you will excuse the trouble I have given you,

I remain, yours faithfully,
P. MacDOWELL.

75 A, MARGARET STREET, June, 1850.

PHOTOGRAPHY

ON PAPER AND ON GLASS.

It is now more than eleven years* since Mr. Fox Talbot announced to the Royal Society, that he had succeeded in fixing by chemical agency, on a sheet of ordinary paper, the forms and lights and shadows of the beautiful images of the camera obscura. This was good news to the few lovers of the then new art of sun-painting, whose admiration at Daguerre's marvellous landscapes had not been unmixt with regret that a heavy and expensive metallic plate, joined to a delicately constituted and easily destroyed image, should be characteristic of his invention—detracting materially from its usefulness.

The failure of such eminent and practical men as Sir H. Davy and Mr. Wedgwood half a century ago, in their attempts to draw on paper with pencils of light, rendered the success of Mr. Talbot the more interesting.

In 1840 further improvements took place, by which the image could be produced in a much shorter space of time, and with a greater degree of perfection. A patent for the new discoveries was taken out; and the Talbotype at this moment remains the best and most practical of all the photographic methods hitherto proposed. As is usual with new inventions many modifications have been introduced in its manipulation, and new mediums proposed for the reception of the chemical substances used. Even the latter themselves have not altogether escaped the ingenuity of the improver.

Mr. R. Hunt's sulphate of iron is perhaps the best of all substitutes for gallic acid. Unfortunately, some differences in its state or in the qualities of the papers employed, render failures in its use not unfrequent. A thorough examination of this subject has yet to be made, and would doubtless prove very instructive to the chemist and the photographer. We believe the deoxidising power of the iron salt to be quite as great as that of the recently introduced pyro-gallic acid, and its inexpensiveness gives it the advantage.

The great difficulty experienced in procuring good paper has kept back the Talbotype from its legitimate position. It is by its merits entitled to take precedence of the Daguerreotype in public estimation; but since interested advocates are justly looked upon with suspicion, this claim, in behalf of the genius of our country, must not rest on our testimony alone. Let us therefore refer it to an impartial arbitrator. The Baron Gros, a gentleman whose labours in diplomacy are just now better known than his "Notes on Photography," speaking of the Daguerreotype, asks—"Is it not easy to foresee that it has almost run its time, and that its rival on paper is destined by incontestable advantages to carry the day against it (*porter le jour sur elle*)?"

In justice we must acknowledge that photography on paper has received great assistance from France. We can almost forgive M. Blanquart Evard his piracy of Mr. Talbot's process, on account of what we have learned about the properties of French paper. It is more sensitive generally, and particularly to rays of feeble intensity, giving the half-tints and foliage of landscapes with a great degree of perfection, insuring a more natural gradation of light and shades, and consequently a more aerial perspective, than is obtained on animal-sized English paper. Starch and a resinous soap are the peculiar features of French size, and on these vegetable substances its superiority probably depends.

The uncertainty in the manufacture of a paper uniformly homogeneous in texture, out of the varied and impure materials generally used, and by a process the philosophy of which is so little understood, has led to the device of many substitutes. Glass plates coated with various liquids capable of leaving an organic film on drying, have as yet proved most successful. Albumen is now generally used; it was introduced by M. Niepce de Saint-Victor, who published in the *Technologiste* for 1838 the method of applying it. In repeating his experiments we have been led to modify his plan, and this not only with success but with the production of a perfectly novel result, an account of which has already appeared in the *Athenæum*.[†] We shall transcribe its substance, adding some particulars which the recent experiments of ourselves and others have furnished.

To the white of an egg its own bulk of water is to be added; the mixture, beaten into a froth, is then strained through a piece of linen cloth, and preserved for use in a glass stoppered bottle; then a piece of plate glass, cleaned with a solution of

caustic potash, or any other alkali, is to be washed in water and dried with a cloth. When the glass is about to be used, breathe on it and rub its surface with clean new blotting paper; then to remove the dust and fibres which remain, use cotton wool, or a piece of new linen. Unless this latter, and indeed, every other caution is taken to prevent the presence of dust, the picture will be full of spots, produced by a greater absorption of iodine (in a subsequent process), in those than in the surrounding parts.

On the clean glass, pour the albumen, inclining the plate from side to side until it is covered, allow the excess to run off at one end of the corners, keeping the plate inclined, but nearly vertical. As soon as the albumen ceases to drop rapidly, breathe on or warm the lower half of the plate; the warmth and moisture of the breath will soon cause it to part with more of its albumen, which has now become more fluid; of course, care must be taken to warm only the lower half. Wiping the edges constantly hastens the operation.

Until this plan was adopted the coatings were set on uniform; the upper half of the plate retained less than the lower. When no more albumen runs down, dry the plate by a lamp or by a common fire, if the dust that it is inclined to impart be avoided.

The film, when dry, is quite free from cracks, and is so thin and transparent that the brilliancy of the glass is unimpaired. It is almost necessary to mark it to know which side has been coated.

The next operation is to iodise the plate. Dilute pure iodine with dry white sand in a mortar, using about equal parts of each. Put this mixture into a square glass vessel, and over it place the albumen plate, previously heated to about 100° Fahr. As soon as the film has become yellow in colour, resembling beautifully stained glass, remove the plate into a room lighted only by a candle, or through any yellow translucent substance; yellow calico, for instance; then plunge it vertically and rapidly into a deep narrow vessel containing a solution of aceto-nitrate of silver, made by adding one hundred grains of nitrate of silver to fifty minims of glacial acetic acid diluted with five ounces of distilled water. Allow it to remain until the transparent yellow tint disappears, to be succeeded by a milky-looking film of iodide of silver. Washing with distilled water leaves the plate ready for the camera.

It may here be noted that the plate is heated in iodising for the purpose of accelerating the absorption of the iodine; an exposure to the vapour for ten minutes, with a few seconds immersion in the silver solution, has been found sufficient.

Hydrochloric acid, chlorine, or bromine, may be used with the iodine to gain increased sensitiveness when making negatives. I merely notice this in passing, as it is not quite certain that all these substances conduce to the perfection of the positive image to be presently described.

The albumen and other films may be iodised in a shorter space of time by using an alcoholic solution of iodine, which, on evaporation, quickly leaves a good uniform coating. The alcohol must be perfectly free from water.

Returning to the plate which has just been submitted to the light in the camera, we pour over its surface a saturated solution of gallic acid. A negative Talbotype image on albumen is the result. At this point previous experimentalists have stopped. We have gone further, and find that by pouring upon the surface of the reddish brown negative image, during its development, a strong solution of nitrate of silver, a remarkable effect is produced. The brown image deepens in intensity until it becomes black. Another change commences—the image begins to grow lighter; and finally, by perfectly natural magic, black is converted into white, presenting the curious phenomenon of the change of a Talbotype negative into apparently a positive Daguerreotype; the positive still retaining its negative properties when examined by transmitted light.

To fix the picture, a solution of one part of hyposulphite of soda in sixteen parts of water is poured upon the plate and left for several minutes, until the iodide of silver has been dissolved. Washing in water completes the process.

The phenomena of the Daguerreotype is in this case produced by very opposite agency no mercury being present, metallic silver here producing the lights, while in the Daguerreotype it produces the shadows of the picture. We at first hesitated about assigning a cause for the dull white granular deposit which forms the image, judging it to be due simply to molecular arrangement. Later experiments, however, have given us continuous films of bright metallic silver, and we find the dull deposit becomes brilliant and metallic when burnished.

It should be observed, that the positive image we speak of, is, on glass, strictly analogous to the Daguerreotype. It is positive when viewed at any angle but that which enables it to reflect the light of the sky. This is one of its characteristics. It must not be confounded with the continuous film image which is seen properly only at one angle; the angle at which the other ceases to exist.

It is also curious to observe that details of the image, absent, when the plate is viewed negatively by transmitted light, appear when viewed positively by reflected light.

Professor Wheatstone has suggested the desirableness of substituting blackened wood or blackened ivory for glass plates. We should probably then have the novelty of a Daguerreotype on wood, free from some of the disadvantages attendant on polished metal.

Mr. Cundall suggests its application to wood blocks for wood engravers for certain purposes, making the drawings by light instead of by hand.

Mr. Talbot views it as the link between the Talbotype and the Daguerreotype; some appellation referring to its *silver* origin would probably be desirable to avoid confusion when speaking of it.

T. A. MALONE.

THE PATENT OF MR. FOX TALBOT.

MR. FOX TALBOT'S specification of his new patent for "Improvements in Photography" having been just published, we place an abstract of it before our readers.

"The first part of the patentees' invention consists in the use of plates of unglazed porcelain, to receive the photographic image. A plate intended for photographic purposes should be made of the finest materials employed by the manufacturers of porcelain; it should also be flat, very thin, and semi-transparent; if too thin, so that there would be a chance of breaking, it may be attached by means of cement to a piece of glass, to give it strength. The substance of the plate should be slightly porous, so as to enable it to imbibe and retain a sufficient quantity of the chemical solution employed. To prepare the plate for use, it is first required to give it a coating of albumen or white of eggs, laid on very evenly, and then gently dried at a fire. According as the plate is more or less porous, it requires more or less of the albuminous coating; it is best to employ a very close grained porcelain, which requires but very little white of egg. The prepared plate may be made sensitive to light, in the same way in which a sheet of paper is rendered sensitive; and we generally find the same methods applicable for photographic pictures on paper, applicable to those on porcelain plates; and one of the processes employed by the patentees is nearly the same as that patented by Mr. Talbot in 1841. The prepared plate is dipped into a solution of nitrate of silver, made by dissolving twenty-five grains of nitrate in one ounce of water, or the solution is spread over the plate uniformly with a brush; the plate is then dried, afterwards dipped into solution of iodide of potassium, of the strength of about twenty-five grains of iodide to one ounce of water; again dried, and the surface rubbed clean and smooth with cotton. The plate is now of a pale yellow colour, owing to the formation on its surface of iodide of silver. The plate, prepared as above directed, may be kept in this state until required for use, when it is to be rendered sensitive to light by washing it over with a solution of gallo-nitrate of silver, and then placed in the camera; and the image obtained is to be rendered visible, and sufficiently strengthened by another washing of the same liquid, aided by gentle warmth. The negative picture thus obtained is fixed by washing it with water; then with bromide of potassium, or what is still better, in the hyposulphite of soda, and again several times in water. The plate of porcelain being semi-transparent, positive pictures can be obtained from the above-mentioned negative ones, by copying them in a copying-frame. The picture obtained on porcelain can be altered or modified in appearance by the application of a strong heat,—a process not applicable to pictures taken on paper. With respect to this part of their invention, the patentees claim:—The obtaining, by means of a camera or copying-frame, photographic images or pictures upon slabs or plates of porcelain."

The second part relates to the process which has been discovered and improved upon by Mr. Malone (who is associated with Mr. Fox Talbot in the patent), who has communicated to the *Art-Journal* more exact details of the manipulatory processes than are included in the specification.

"The patentees' next improvement is a method of obtaining more complete fixation of photographic

* January 31, 1839.

† "Quelques Notes sur la Photographie," Paris, 1850.

‡ June 1, No. 1179.

pictures on paper. For this purpose the print, after undergoing the usual fixing process, is dipped into a boiling solution of strong caustic potash, which changes the tint of the print, and usually, after a certain time, acquires something of a greenish tint, which indicates that the process is terminated. The picture is then well washed and dried, and if the tint acquired by it is not pleasing to the eye, a slight exposure of it to the vapours of sulphuretted hydrogen will restore to it an agreeable brown or sepia tint. Under this treatment the picture diminishes in size, inasmuch that if it were previously cut in two, and one part submitted to the potash process and the other not, the two halves, when afterwards put together, would be found not to correspond."

The advantages of this process for removing any iodine which even after fixing with the hyposulphite remains in the paper is great, and it will tend much to preserve those beautiful transcripts of nature.

The patentee then claims as an improvement the use of varnished paper, or other transparent paper impervious to water, as a substitute for glass, in certain circumstances, to support a film of albumen, for photographic purposes. A sheet of writing-paper is brushed over with several coats of varnish on each side,—it thus becomes extremely transparent. It is then brushed over on one side with albumen, or a mixture of albumen and gelatine, and then dried. This film of albumen is capable of being rendered sensitive to light by exposing it to the vapour of iodine, and by following the rest of the process indicated in the preceding section of this specification. The advantages of using varnished or oiled paper do not consist in any superiority of the images over those obtained upon glass, but in the greater convenience of using paper than glass in cases where a large number of pictures have to be made and carried about for considerable distances; besides this, there is a well known kind of photographic pictures giving panoramic views of scenery, which are produced upon a curved surface, by a movement of the object glass of the camera. To the production of these images glass is hardly applicable, since it cannot be readily bent with the required curve, and again straightened, but the case is met by employing talc, varnished paper, oiled paper, &c., instead of glass. It will be seen that the varnished paper acts as a support to the film of albumen or gelatine, which is the surface on which the light acts, and forms the picture.

The next improvement consists in forming photographic pictures or images on the surfaces of polished steel plates. For this purpose, one part (by measure) of a saturated solution of iodide of potassium is mixed with 200 parts of albumen, and spread as evenly as possible upon the surface of a steel plate, and dried by the heat of a gentle fire. The plate is then taken, and, whilst still warm, is washed over with an alcoholic solution of gallo-nitrate of silver, of moderate strength. It then becomes very sensitive, and easily receives a photographic image. If the plate be cold, the sensibility is considerably lower. The image obtained is fixed by washing with hyposulphite of soda, and finally with water. The print adheres to the steel with much tenacity, and forms a process very useful to engravers.

With respect to this part of the invention, the patentees claim the production of a photographic image upon a plate of steel.

Upon a careful examination of this patent it will be evident that the substitution of porcelain for glass, with very doubtful advantage, constitutes its only real novelty, excepting the process above described by Mr. Malone. The images on oiled paper are said to be exceedingly good, and this may be a valuable suggestion; but it should never have entered into this patent, seeing that varnished paper has been used for other purposes for a great many years, and Mr. Talbot can no more patent a right to tracing paper, than he can to writing or other paper, for receiving photographic images.

M. Blanquard Evrard has recently communicated to the Paris Academy of Sciences, in a note through M. Regnault, the following improved process, by which he states instantaneous images may be obtained in the camera. The copy of the note of M. B. Evrard, which appears in *L'Institut* and *Comptes Rendus*, is not very clear, but we have no means of making up its deficiencies at present, and we can only therefore, give an exact translation, leaving our ingenious readers to follow the indications it contains. Mr. Robert Hunt was the first to employ the Fluorides, and in his "Researches on Light" a process called the "Fluorotype" is described, by which pictures could be obtained in half a minute.

"Fluoride of potassium, added to iodide of potassium, in the preparation of the negative proof,

produces instantaneous images on exposure to the camera. To assure myself of the extreme sensibility of the fluoride, I have made some experiments on the slowest preparation employed in photography—that of plates of glass covered with albumen and iodide, requiring an exposure at least sixty times longer than the same preparation on paper. On adding the fluoride to albumen and iodide, and substituting for the washing of the glass in distilled water after treatment with the aceto-nitrate of silver, a washing in fluoride of potassium, I have obtained the image immediately on exposure in the camera. I have even obtained this result (but under conditions less powerful in their action,) without the addition of the fluoride to the albumen, and by the immersion only of the glass plate in a bath of fluoride after its passage through the aceto-nitrate of silver. This property of the fluorides is calculated to give very valuable results, and will probably cause, in this branch of photographic art, a change equally as radical as that effected by the use of bromine on the iodised silver plates of M. Daguerre."

M. Blanquard Evrard has, in another communication, stated that he has found the serum of milk capable of producing a very fine surface on glass or paper for the reception of photographic images.

ART IN THE PROVINCES.

BIRMINGHAM SCHOOL OF DESIGN.—The annual general meeting of this institution took place at the end of June. Around the large room in which the meeting was held, was ranged a collection of the productions of the pupils in the shape of drawings, models, and paintings in oil and water-colours; the greater portion of the latter were copies, but they included also a considerable number of studies from nature. The display was one which the friends of the institution had a right to regard with no considerable share of satisfaction, giving token, as it did, of careful training and intelligent application. Several outline drawings were highly meritorious for their freedom and vigour of execution. The number of models, both copies and originals, was much larger than usual, and indicative of awakened attention to this important department of the institution.

PLYMOUTH.—Wm. Cotton, Esq., M.A., F.S.A., has munificently presented to the Public Library of Plymouth an excellent collection of books, drawings, and works of Art. The collection consists of several hundred volumes of printed books, among which are many rare and valuable specimens of early Typography, works on the Fine Arts, Greek and Latin classics, and the productions of French and Italian authors; upwards of four thousand prints and engravings, after works of the most celebrated masters of the Italian, French, Flemish, and English Schools. Illustrated works of Italian and Spanish literature. Historical and other works, illustrative of the Fine Arts. Several paintings, and framed prints and drawings; Illuminated MSS., Terra Cottas, Bronzes, &c., and between two and three hundred original drawings by the old masters, of considerable value and interest. There are also some magnificent suites of book-cases, cabinets, &c. This valuable donation has been received in a spirit akin to that of the giver, and Plymouth has set an example which the metropolis may follow with advantage. A general meeting of the proprietors of the Library has been held, and it has been determined to enlarge the building, in order to provide fitting room for the collection, for which purpose the present facade of the building is to be removed, and a finer one erected, taking in the necessary space. This munificent benefactor has thus conferred upon his native town a benefit of almost incalculable value. We trust his example may be extensively imitated, and that he will live to see the results of his gift manifested upon all classes.

MANCHESTER.—ARY SCHEFFER'S PICTURE, "CHRISTUS REMUNERATOR," is now exhibiting through the medium of Mr. J. C. Grundy, at his rooms in Exchange Street. His works are well known and appreciated in England, through the medium of engraving; but the pictures themselves are comparatively unknown, not one having ever appeared on the walls of the Royal Academy, or in any of our public galleries. We cannot but congratulate our manufacturing friends on the opportunity Mr. Grundy has afforded them of inspecting so chaste and beautiful a work, and we strongly feel the advantage that must accrue to art and artists by such provincial exhibitions of pictures thus high in character and feeling, which cannot fail to spread and improve public taste.

PAINTINGS AND DECORATIONS OF POMPEII.*

We have here Parts XXI. and XXII. of a work of much importance to Art, which was begun in the year 1828, and which will be completed in about twelve months, according to the hope of the author. Each of these parts contains, besides a table of explanatory text in the German and French languages, ten plates illustrating the chief discoveries made within the last twenty years in these celebrated towns of antiquity. These prints are executed in an admirable manner in chromo-lithographic colouring, invented by Professor Zahn, in 1818, and practically applied since 1827, and which has never been yet surpassed. The great esteem in which Germany's greatest poet, Goethe, held this work from its first appearance, is evident from his "*Art and Antiquity*," from his elaborate eulogy of the ten first parts in the "*Wiener Jahrbücher*," (Viennese annuals) of 1830, as well as from his correspondence with Professor Zahn, in which he expresses himself in the strongest terms of praise.

During a stay of twelve years at Herculaneum and Pompeii, the author had not only the privilege of copying all newly discovered objects of art directly after their exhumation, and of imitating them, especially the beautiful wall-paintings, in all their freshness of colour, but also he had granted to him permission from His Majesty the King of the two Sicilies—which had never yet been obtained by any foreign government—to take moulds from the originals of all objects of classic Art, Sculptural, and otherwise, in the Museums of Naples, Herculaneum and Sicily. Among the fac-similes before us, the wall-paintings are especially conspicuous, the execution of which took place in the most flourishing eras of Greek and Roman Art. We may assert, that this series contains a collection of more beautiful plates than the first twenty parts. Although this third series must be considered as a continuation of the first and second (each of which consists of ten parts, comprising exactly one hundred plates in colours, with French and German text) yet we can take each of them separately as an independent and complete work, and we give a short critical notice of the contents of these numbers inasmuch as it really forms a record of an interesting class of discovery peculiarly valuable in the history of Art. Plates I. 2, and 3. Wall-painting of a found apartment, dug up in Herculaneum, in composition, drawing and colouring, the most valuable yet discovered. The subject of the painting is Telephus, suckled by a doe, and led by a Genius; he is recognised by his father Hercules, through the intercession of the Goddess of Arcadia, who is sitting on the left. The whole scene is acting in the sanctuary of Pan, the tutelary deity of Arcadia, whose figure is visible over the head of the Goddess. The figures are a little larger than life, which enhances the value of the painting, as only three or four were found with figures as large as life. The whole group is charming, simple and natural. Plate 4. A wall-painting, the size and in the colours of the original, dug up in 1833, in the "*Casa de Capitelli colorati*," at Pompeii. It represents Venus as the Goddess of the Sea on the back of a Triton, sailing calmly over the deep. Plate 5. Wall-painting in the "*Casa della Cuccia*," at Pompeii, dug up in November 1834, one of the largest discovered. Its subject is a hunt of men and of rapacious animals trained for hunting. In the foreground, on the right, Ulysses is killing, with a dexterous throw of his spear, a boar, whilst, on the left, a lion is pursuing a flying bull, which is still fighting against a small tiger. Plate 6. A Mosaic floor, composed of coloured marble tesserae, conspicuous as well for its simplicity as for its great beauty. Plate 7. Painted frieze from the temple of Isis, at Pompeii. The arabesques are the finest parts of it, and are not equalled. Plate 8. A wall-painting, probably from the temple of Isis, at Pompeii. It represents the arrival of Io in Egypt. Plate 9. Painted pillars and borders from the "*Casa del Poeta tragico*," at Pompeii. They surround the *Viridarium*, and are of the highest interest on account of their Polychromy. Plate 10. A wall-painting of the size of the original also from the "*Casa del Poeta tragico*," dug out at Pompeii, in 1825. It represents Ariadne on Naxos, deserted by Theseus. At her side Cupid is standing sorrowfully, looking on the sea after the ship of Theseus. Plates 11 and 12 contain the wall-paintings of the "*Casa del Centauro*," at Pompeii, at

* The Paintings and Ornamental Decorations of Pompeii, Herculaneum, and Stabii. By William Zahn, Royal Prussian Professor, Knight of the Order of the Eagle, &c. Third Series, First and Second Parts." Published by Dietrich Reimer, Berlin; Colnaghi & Co., London.

present in the Royal Museum at Naples, and which was discovered on the 27th of April, 1829. They carried the story of the centaur Nessus, who carried the spouse of Hercules, Dejanira, over the river Evenus, and for heauty of expression and composition is very remarkable. Plate 13, represents a wall-painting, discovered at Pompeii, in 1840, from the "Casa del Pavone," in the Strada della Fortuna (Strada della Porta di Nola). It served for a sign-board of a wine-house, representing a wine-press. Three satyrs (the middle figure, covered with vine-leaves, is probably the god of wine himself,) are pressing the grapes with their feet under an arbour of vines. The picture is very carefully executed and is conspicuous by the powerful colouring which pervades it. Plate 14 represents a magnificent wall-painting, in the colours of the original, from the "Casa di Castore e Polluce," at Pompeii, discovered on the 8th of July, 1828, and preserved at present in the Royal Museum at Naples. It pictures Jupiter on his throne, crowned with a laurel-wreath by the goddess of Victory, and holding in his hands the attributes of his omnipotence. Plate 15 contains an easel-painting, of the size of the original, from Herculaneum. The painting before us represents, perhaps, the toilette of a bride, a mother with her two daughters, and a slave. It is a characteristic composition on account of its simplicity, calmness and innocence. Plate 16. Two mosaic floors in coloured marble, from Pompeii, at present in the Royal Museum of Naples. Plate 17. The chief part of a wall-painting in the "Casa del Poeta tragico," at Pompeii, discovered in 1825, representing the births of Castor, Pollux, and Helen. A very naive composition. Leda is showing to her husband, Tyndarus, the nest with her three babies. Plate 18 and 19. Painted walls, in the colours of the original, from the "Casa della Danzatrice," at Pompeii. Plate 20. A wall-painting of the size of the original, from the "Casa di Melagro di Pompeii," discovered in 1830. It will be seen from this notice of the contents of these numbers, that M. Zahn will produce a work, which will take its rank among the most important Art-volumes we possess; recording as it does, the talent and taste displayed by the painters of antiquity, whose works, the rarest of their kind, are here reproduced with singular faithfulness and beauty, and with all their original brilliance. Our space compels us to a brief description only of the plates, which we would otherwise gladly have enlarged upon.

THE VERNON GALLERY.

A GREEK GIRL.

C. L. Eastlake, R.A., Painter. R. Graves, A.R.A., Engraver.
Size of the Picture 2 ft. 6 in. by 1 ft. 8 in.

THIS picture is most probably from a sketch made by Mr. Eastlake when he visited Italy and Greece, in the early period of his artist-life. They who remember the pictures from his hand till within the last ten or fifteen years, will recollect that he principally chose his subjects from those countries; and even now his pencil occasionally reverts to the sketches he made on his foreign travels. There cannot be a doubt that his residence in those classic regions had a powerful influence on a mind formed by nature to appreciate whatever is refined and intellectual, and confirmed it in the pursuit of a path to which his inclination led. The result has been a degree of refinement and elegance in his works which are the characteristics of the schools wherein he studied; still no study would have so terminated without a powerful mental bias in its favour; for we have known artists visit the most renowned galleries of Italy, and yet return to their own studios without incorporating into their systems a single drop from the pure fountains of Art which are there opened up for all who have the capacity to receive them, and without bringing back a form or a tint from a land that, for ages, has been a garden of flowers to the painter.

As in most that Mr. Eastlake paints, this little work is distinguished by grace and elegance, rather than power, for he aims more at the heart than the eye; the face has a pensive expression, almost approaching to melancholy, as if the thoughts were busy with past ages, when Greece was making herself immortal, and a Grecian maiden was a name to be honoured; not as now, one of an oppressed and degenerate race. The arrangement of the hair, head-dress, and costume, is highly picturesque; and the picture is painted in a quiet subdued tone that well harmonises with the feeling of the subject. It is satisfactory to know that there are two other pictures by this accomplished artist in the Vernon Gallery—the "Escape of Carriera," and "Christ Mourning over Jerusalem."

THE LIFE OF A WITCH.

SUCH is the title of a series of designs, one of which occupies a place in our poetical passages, yet this name is in nowise descriptive of the deeper myth on which the compositions are founded. They are intrinsically pictures imbued with the spirit of the German drama and prompted by the genius of German philosophy. They suggest to us at once Goethe, Ludwig Tieck, and others who have distinguished themselves in the ideal or the metaphysical epode. The superficial narrative of these plates is the history of a woman who in her childhood was stolen from her friends by a witch who educated her in every vice that pollutes humanity. The successive pictures show her as she grows up in her utter perdition, from which, however, she is at length raised by Love, which (durch Leiden und Tod zum wahren Leben) through suffering and death conducts her to the true life. The more profound allusion is to the pilgrimage of the human soul upon earth—the temptations to which it is exposed—the struggle and the fall—and, in continuation, its rescue by the inextinguishable element, Love, implanted in it by the Creator. In order that the plate which we have selected may be understood, it may be well in a few words to describe the subjects. The first composition shows three female pilgrims, who in their weariness have fallen asleep, and during their rest a witch seizes and carries off the child of one of them; hence we may read this plate as an illustration of the entrance of Evil, even into the infant heart, if the parents watch not, without ceasing. In the second place we are introduced to the home of the Witch, and a third figure is hrought forward, an impersonation of a young fiend that she protects. In the third, we find her aiding her mistress in wresting from another figure a volume of incantations; and in the fourth, being now supposed to be arrived at mature womanhood, we find her on the way to the fiendish revels of the Blocksberg, on which, according to the popular belief of the middle ages, were held the licentious orgies of the witches. We have then a scene on the Blocksberg, in which Faust is introduced, borne by the Centaur Chiron, and lighted by an ignis fatuus. The sixth plate instances the commencement of that Love which is eventually to prove the salvation of the pilgrim soul. We here find the Witch's protégée sailing down a wide river in company with two Jews, to the younger of whom she becomes attached. In succeeding plates is described the death of her lover, a loss which deprives her of reason.

In the ninth (that which we borrow from the series) having decked her hair with wild flowers, we find her on the summit of a mountain, and by means of the unhalloved art which she formerly practised, in the act of summoning to her presence the ghost of her departed lover, before which she has sunk on one knee in repentance and remorse. She commits suicide by drowning herself in the sea, and her body being thrown on shore is thus discovered by the Witch, who with Satan contemplates the wreck before them, the former reproaching the latter for having deprived her of her disciple. The cut selected is a good example of the whole series, which it will be seen is not pure outline, but shaded into a middle tone. The drawing throughout is masterly, and the style and feeling are not adopted from any of the meagre absurdities which preceded the best period of Continental art. In the principal impersonation there is little intention of refinement, it exhibits more of the breadth of nature than of the refined classic.

The character of the composition is so sculptural as to suggest the idea that the composition has been studied with a view to bas-relief, and this is the feeling which distinguishes the entire series. The figures and their details, as the features and limbs, afford evidence of the study of Raffaele, and here and there of Michael Angelo. The apparition of the lover reminds us of the vision seen by Faust at the Sabbath—

— "Mephisto, siehst du dort
Ein blosses schönes Kind nitelnd und ferno stehen?
Sie schiebt sich langsam nur vom Ort,
Sie scheint mit geschloss'nen Flüssen zu gehen."

But the positions are reversed. There is, moreover, in the apparition a resemblance to the Saviour—allusive to forgiveness and redemption, and in the last plate appears the rainbow, the symbol of peace. Thus the narrative, with medieval disposition, combines Mythology and Christian theology, a form in which the artist is justified by the most celebrated antecedents.

* "Das Leben einer Hexe in Zeichnungen von Bonaventura Genelli, gestochen von H. Morz und Gousserbach." London: Dulau and Co.

ART IN CONTINENTAL STATES.

THE EXPOSITION OF WORKS OF ART, AT THE ACADEMIE ROYALE, GHEENT, opened on Sunday, June 30th. This Exposition takes place alternately each year, at Brussels, Antwerp, and Ghent. The exhibition rooms are well adapted to their purpose, being spacious, lofty, and well lighted; they consist of a suite of three apartments, and a small salon of sculpture.

The Collection, as a whole, is extremely creditable, and a favourable display of the talent of the painters, natives of the soil which gave birth to the immortal artists Rubens and Vandyck.

The exposition is strong in figure and genre pictures, and weak in landscape. Many pictures have not yet arrived, as artists are allowed, by the singular regulations here, to send in their works after the opening of the Exposition. The finest and most important works are by Portaels, Alexandre Robert, Louis de Traye, and Van Schendel. "Luca Signorelli, célèbre peintre Italien, faisant le Portrait de son fils, mort accidentellement," strongly reminds the spectator of the works of Paul De la Roche; the expression of the head of the sorrowing father is admirable, and the violet hues of death are already on the lips and cheek of the lovely boy; the tale is told with touching effect, and the quiet tone of colour throughout, is quite in harmony with the triste subject; it is by Alexandre Robert. I. Portaels, of Brussels, has also a remarkably fine picture, "Le Convoi funèbre du Desert," an Arab chief, who has perished in fight, is borne by his camel, surrounded by his sorrowing family, to his final resting-place. The composition is skilful, the drawing careful, and the heads possess much dignity and expression; whilst the arid look pervading the picture is quite suggestive of the fervent heat of an African sun.

Louis de Traye, of Antwerp, has a picture commissioned by the Government, of the "Fondation de la Commune de Grembergen, près de Termonde." It contains a great number of figures, and is composed with skill, and powerfully painted. A touching episode in the foreground, the recovery of an infant from the waves around, and his restoration to the terror-stricken mother, is rendered with great feeling.

Van Schendel has a "Nativity," which is finely conceived. The light emanates from the newly-born Saviour of the World, and illuminates with dazzling brilliancy the humble place of his birth. There is rather a want of elevation of character in the head of the Virgin Mother, which nevertheless possesses a charming simplicity and beauty.

Louis Tiberghien has a "Christ carried to the Sepulchre;" and there are other works by Wauters, Haysmans, Woolfaert, &c.

In landscape, to an English eye, accustomed to the beautiful scenery so finely rendered by our painters, the Belgians do not greatly excel. The exception must be made, however, in favour of the distinguished painter E. Verboeckhoven, of Brussels, who has a very beautiful "Landscape and Cattle." An "Interior," by Baert, and Landscapes, by Gelissen, Broméis, and Emile Bert, are good specimens of the school, in this department. There are also the works of a Russian landscape painter, Le Plus; and several pictures by the English artist Stark, who has a small picture, painted in his best style, and P. W. Elen. A fair country-woman also, Mrs. Shaw, has made a successful début, and her "Chien attendant son Maître," displays much feeling, and considerable power of hand.

The works in sculpture are good, although but few in number. A group of "L'Amour entraînant sa Victime," by Geefs, of Antwerp, is carefully studied. The victim of the mischievous son of Venus is represented with much of the grace of a Bally or a Gibson.

There is also a vase by Van Diesbroch, representing the labours of agriculture, which is finely conceived and of great beauty.

Other works are expected to be sent to the Exposition by De la Roche, De Brackelar of Antwerp, and other distinguished painters.

P. W. E.

AMSTERDAM.—The exhibition of Art will open here on the 30th of August, and will continue for a month only; it takes place in the Academy of Fine Arts.

BRUSSELS.—The statue, representing this city, has recently been placed over the Louppe Fountain, opposite the Station du Midi. It is the work of M. Fraikin, and is executed in white marble.

PARIS.—The papers report the death, aged eighty, of M. Mulard, the painter, Professor of Drawing at the Manufactory of the Gobelins.

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY and the other Art-Societies of the Metropolis have now closed their galleries; after, we may venture to say, a season as prosperous as any that has preceded it, both as regards the number of visitors and extent of the pictures which have been sold. In every way there is abundant reason for congratulation on the high position our native school has attained, and the estimation in which it is held; powerful incentives these for our artists to gather up their strength for future campaigns.

NEW SOCIETY OF WATER-COLOUR PAINTERS.—At a visit paid by the Queen to the Gallery of this Society, Her Majesty purchased Mr. Warren's picture of "The Wise Men of the East," and Mr. E. Corbould's "Florette de Nerc."

MR. ALBERT SMITH—one of the especial favourites of the public, whose brilliant sketches of character have amused and instructed many—having made a run to the East, has written a clever hook and prepared a most agreeable entertainment; he has thus turned to valuable account his few months of rapid travel. His "entertainment" is a striking picture from beginning to end; song and story succeed each other. His descriptions of persons and things are racy and full of humour. But it is with the painted illustrations that we have most to do. A moving series of views are made to keep pace with him on his journey; these are the work of Mr. William Beverley. They are singularly fine, and do him honour as an artist; they consist of views of Alexandria, Cairo, the Pyramids, Malta, Marseilles, and various other important objects on the Overland Route; some of them, with which we are familiar, are remarkably accurate representations; and in the whole, much talent is exhibited. The grouping and general arrangements of the pictures are, in all cases, admirable; and taken together, they are excellent instructors to the old as well as to the young.

ALLON'S NEW PANORAMA of the Dardanelles, Constantinople, and the Bosphorus, is opened at the New Rooms, adjoining the Polytechnic, Regent Street. The painter's intimate acquaintance with the country he has delineated, as well as the great artistic ability he possesses, entitle him to considerable attention. The number of these instructive exhibitions now in London is a striking feature of the day, and it is our intention, perhaps in our next number, to give a history of the rise of Dioramas and Panoramas; and a more enlarged notice of those at present exhibiting in London.

PANORAMA OF THE NILE.—The Nubian Desert and Dongola have been added to the attractions of this excellent and instructive exhibition, carrying the spectator onward to a land little visited by Europeans. It is characterised by all that truth of delineation and admirable colouring which transport the spectator as by magic to the land of the Pharaohs. There are no books of travel or single pictures, which can give so clear and satisfactory a notion of the wondrous rock temples, the gigantic and beautiful ruins, or the lonely sands of Egypt, as this well-constructed panorama does. The cradle of ancient art and science, the scene of early bible history, cannot fail to be of interest to all who travel over it so well and so agreeably as they now can do in the Egyptian Hall.

OVERLAND JOURNEY TO INDIA.—This extremely well-painted panorama has had some interesting additions made to it of late, particularly a View of Madras from the Sea, showing the peculiar nature of that unique landing-place, and the many dangers which its surf presents to all visitors. The modes of approach are clearly and powerfully indicated, and we almost seem to feel a living interest in the fragile boats which are carrying the natives and passengers. A view of the principal part of the town, with its native and European soldiers, and the many lookers-on, is a splendid *coup d'œil*, which gives an imposing finish to the entire series of pictures so admirably rendered by the artists engaged in showing the untravelled at home, the varied scenes and adventures of all who go "abroad" to the sunny land of the East.

In the list we gave last month of the Royal

Academy pictures sold, we should have named Mr. Poole's beautiful and touching "Messenger announcing to Job the Irruption of the Sabeans;" it was purchased from the artist's studio by Mr. C. W. Wass.

MR. WEBSTER'S beautiful and very favourite picture of "The Boy and many Friends," is in course of engraving by Mr. Gibson for Mr. McClean. We rejoice to learn that this admirable work is in good hands; we have had too few engravings from the paintings of Mr. Webster, yet his subjects are admirably calculated to gratify as well as to instruct; and we have sanguine hopes that his popularity will ere long relieve us from an overdose of horses and dogs.

THE DUKE OF CAMBRIDGE.—The death of this highly respected member of the royal family is a loss to the world of Charity and of Art. Energetic in all things, he was ever to be depended on in committees of all kinds for assistance and advice. He was far-seeing, and of good practical habits, and his interest and attention were much engrossed by the Art-Union of London, who found in him an eager friend, without any pretension of deep knowledge, or affectation of *connoisseurship*, which make some persons of position so weak in the eyes of real judges. His death has certainly left a void, where once the charitable applicant never called in vain.

THE LATE SIR ROBERT PEEL.—The death of this illustrious statesman has been a heavy—almost irreparable—loss to Art; of its cause he was the ablest advocate in that class of society to which we ought to look for its best and most generous patrons. There has in his time been propounded no worthy measure for the advancement of art, for the promotion of art education, to which he has not at once given his cordial support. He has ever been the firm friend of the Royal Academy collectively, and of very many of its members individually. He has laboured earnestly upon the Commission for the decoration of the New Houses of Parliament. He was a governor of the British Institution, and subscribed liberally to institutions established for the relief of decayed artists and their families, and was, indeed, a leader of the Art-movement of this country. A little knowledge of art is dangerous, and perhaps the most expensive of all little acquirements. If we turn to the senate we find there every conceivable subject treated with an amount of learning and research calculated to impress an auditor with the conviction that the speaker is reading an elaborate treatise. Be the subject what it may, it is developed in its every phase; but it is not thus on the subject of monumental, or decorative, or fine, art. We listen with pain to the opinions of men who, on other subjects, charm us with their appropriate eloquence. To examples of this kind Sir Robert Peel has ever presented a remarkable contrast; it is universally agreed that *quod tetigit ornavit*; and it was not less so with respect to art than to other things. The country laments him as one to whom in periods of difficulty she could turn with faith and hope; but the profession of art deploras him as an immediate friend and protector; and it may, indeed, be asked to whom we shall look to see fulfilled in any wise the vacuum which he leaves.

MONUMENTS TO SIR R. PEEL.—The death of our great statesman bids fair to offer an opportunity for the patronage of an art, in which there are unfortunately too few chances of employment. Sculpture is not liberally known amongst us for the decoration of our homes, and is sometimes too exclusively connected with "monumental woe." There are now many propositions afloat for the erection of monuments to his memory. One proposition is to erect a statue in Drayton Bassett Church, the place of his burial; another for the erection of one in Manchester; another for a penny subscription throughout the country for a Poor Man's Monument. In Parliament it is proposed that a National Monument in Westminster Abbey be erected. Altogether, there is work here of a great and an important kind of national interest, and which must be useful to aspiring sculptors. But we would most urgently protest against the erection of any public monument in Westminster Abbey; the fittest place for such a testimonial is, beyond

question, in some portion of the New Houses of Parliament, where the associations connected with his talents and national services would render its being placed there most appropriate. We trust, when the vote comes to be taken for the necessary funds, that some influential member will look to this matter, which is one involving both taste and consistency.

HONORARY MEDALS FOR THE EXHIBITION OF 1851.—The committee appointed to select the best designs for medals, consisting of Lord Colborne, Mr. Dyce, R.A., Mr. Gibson, R.A., Mons. Eugène Lami, Mr. C. Newton, Herr J. D. Passavant, and Dr. Gustavo Waagen, have selected as most deserving of notice:—Nos. 64, 24, 105 (1), 104 (3), 28, and 68. The Commissioners accordingly decided that the 1007 prizes should be awarded to Nos. 65, 24, and 105 (1), and the 507 prizes to Nos. 104 (3), 28, and 68. On opening the papers attached to these designs, they were found to have been submitted by the following gentlemen:—65, 'Mons.' Hippolyte Bonnardel, of Paris; 24, Mr. Leonard C. Wyon, of London; 105 (1), Mr. G. G. Adams, of London; 104 (3), Mr. John Hancock, of London; 28, Mons. L. Wiener, of Brussels; 68, Mons. G. Yarnard, of Paris. In this instance England and the Continent are on an equality, so far as merit is concerned, and we have not the degradation of such an award as that given in the case of the design for the building in Hyde Park.*

AMERICAN TRANSFER OF THE EXHIBITION OF 1851.—The peculiar expectations too rapidly engendered by the speech of Mr. Cobden sometime since in parliament, announcing an intention on the part of America to transfer the Exhibition of 1851 to that country, is doomed to much diminution. A selection only is to be made, of the principal or most striking objects exhibited; and how small that selection may be cannot yet be certain. The proposals of the projector, as stated by the American minister, are thus given in his own words:—"Mr. John Jay Smith, a gentleman of standing and character at Philadelphia, has, with the sanction of the American government, made a proposal for transferring to the United States, for exhibition there, such portions of the London exhibition as it may be possible to carry over after the termination of the exposition here." The matter, therefore, becomes one of individual speculation, Mr. Smith being the authorised agent to take what he chooses, but nothing more. It is urged that a new field for our manufactures will be thus opened:—"To this end the earnest endeavours of the eminent American merchants who will receive the goods will be employed to procure orders from the samples sent, and they will look for repayment of their outlay in this source, and to the usual charge of commission merchants or auctioneers at the close of the sale." The conditions are these:—

"1. Every article deemed suitable for the American Exposition must be named or partially described to the American Commissioner, 5, Bank-chambers, Lothbury, London, at as early a day as practicable. This exposition will take place at one of the principal cities of the United States, as early in the year 1852 as arrangements can be made compatible with the movement. Consignments will be received at any time in 1851.

"2. The articles will be exhibited to pay the expenses of the building in which they are exposed, and for the profits of the city which erects it.

"3. The prices of each invoice, where it is so specified, shall be *à titre* below which the goods shall not be sold, and in all cases when it is so expressed, the goods shall be returned to Europe in as good condition as they are received, without any cost whatever to the owner or agent.

"4. The charges to the owner will be as small as possible, being the usual ones in case of sale of a commission-merchant, with guarantee and immediate cash returns through means of undoubted

* The *Builder* states as a fact this very remarkable circumstance:—"We would here take the liberty of remarking, that when gentlemen accept office to examine into the merits of works submitted in competition, they ought in justice to make a point of attending. In the present case, we are told, that on the first day appointed for the examination, only three of the Committee were present; and a well-known wood-carver, who happened to put his head into the room, was actually invited to assist in the decision."

bills of exchange, and successive cash remittances will be made for all duplicates that may be ordered in America.

"5. Nothing can be received except such results of human industry as are capable of transportation without too great cost, and of being preserved during many months; and in general, all those articles excluded from the London exposition will not be admitted to the American. There may, however, be others entirely suitable and unimported abroad, which may be unsuitable for London, while they are adapted to a Transatlantic market. On this subject the American commissioner will be qualified to decide."

It will be our duty to look into this matter; and to make special enquiries, so as to be quite sure that the affair is not "a job."

JOHN WATSON GORDON, Esq., President of the Royal Scottish Academy, and Queen's Limner for Scotland, and EDWIN LANDSEER, Esq., R.A., have received the order of knighthood. The former in compliance with old custom, and no doubt also in testimony of respect for his talents as a portrait-painter; and the latter in acknowledgment of his genius as an artist. We may desire that other painters had also obtained the honour accorded to Sir Edwin Landseer. No one will dispute that he is unrivalled in his particular walk of art, but that art is not the highest; and we may not forget that we have artists, whom it is not necessary to name, whose glories are more emphatically the glories of art as well as of their country.

DEALERS IN FORGED PICTURES.—We are glad to find the *Athenæum* promising to take up this subject and to "deal with it at length." Our contemporary, however, speaks of the modern manufacture of old masters as if he had made a discovery; forgetting altogether that in the *Art Journal* the subject has been "dealt with at length" repeatedly, during the last six or seven years; and that we have left him little to say—unless he will refer back to our columns and quote the numerous facts he will there find recorded. We can assure him there are now very few instances of frauds practised upon Manchester cotton-spinners by inducing them to exchange their goods for Titians, and Raffaels, and Vanderveeldes—worth the value of the frames and "robbery boxes" in which they are exhibited. The whole process and practice, from beginning to end, we have successfully exposed; and those who are now-a-days cheated, are at all events cheated with their eyes open. On the other hand, we have frequently shown the wisdom of purchasing works by British artists—not alone for the enjoyment they give and the benefits thus conferred, but as a prudent investment. The following passage from the *Athenæum* is but a faint echo of that which has been stated in the *Art Journal*, a score of times at least:—

"The result of the sales of modern pictures which have lately taken place—from that of the collection of the late Mr. Knott down to the present—serves to show, that if the collector would but visit the artist himself in his studio, dispensing himself with the services of the middleman, he might select for himself, avoid deception, and probably save money in his purchases."

MODEL OF THE BATTLE OF WATERLOO.—Sight-seers, a few years ago, were much gratified by the exhibition of a model of the greatest of modern victories, by the hand of Captain Siborne, which gave a truer and better notion of this important battle than all the books can do. It is now proposed to give it a final resting-place in the United Service Institution; and a committee of officers has been formed to carry out this intention, which we need scarcely say we consider a praiseworthy and proper one.

MEDAL TO SIR ROBERT PEEL.—MESSRS. ALLEN & MOORE, the well-known medallists of Birmingham, have determined on the production of a medal of first-rate excellence to the memory of the great statesman, to be superior in beauty and finish to any they have yet done. It is to be in bronzo or copper electro-gilt; and, from the high reputation of the firm, we confidently look forward to a specimen of their art possessing no ordinary attraction.

M. SALAMANCA'S PICTURES.—The collection of ancient art formed by the late Spanish Minister of Finance, has been consigned to the care of Mr. Henry Farrer, for disposal in England. The collection includes several of Velasquez's choicest

works; two fine Rubens; and among other rare performances, some of the most extraordinary specimens of Snyder's animal subjects.

THE DEATH OF NELSON.—A picture of large dimensions, measuring twenty-four feet by seventeen in height, painted by Ernest Slingeneyer, of Brussels, has been brought to England, and by permission of Her Majesty, was placed in the Banqueting Room of St. James's Palace. Here it has been seen only by H. R. H. Prince Albert and a few select persons of rank. As the picture will in all probability be shortly brought before the public, it is superfluous to descant on its great artistic qualities. The *locale* on board the ship where the event occurred, the features and costumes of the individuals present, with other minor details, have been faithfully interpreted by a visit to the *Victory*, now lying at Portsmouth, and by reference to all other existing authorities. His Majesty the King of the Belgians has conferred the cross of the order of Leopold upon the painter, for the talent he has displayed in this grand historical composition.

ETTY'S "JUDGMENT OF PARIS."—Mr. Wass's engraving after this magnificent picture, which we noticed in our January number as almost completed, is now entirely finished and in the hands of the printer. A proof which we have seen fully justifies the encomiums we formerly pronounced upon it; it is altogether a fine work; one of a class which we should be glad to see multiplied in this country. Mr. Wass deserves all praise for his spirit in entering on the work, which we believe to be at his own risk, and for the manner in which he has carried it through.

FRENCH PICTURE HANGING.—The mode adopted by the French for hanging pictures possesses some advantages over our own in its simplicity and utility. A screw having a fixed ring in a line with it, is fastened to the back of the frame; this is hooked on to the hold-fast in the wall, thus occasioning the frame to project forward at the upper part, and giving an advantageous position to the picture without any unsightly rod or nail appearing.

THE BARON WAPPERS.—This distinguished artist, the chief of the modern school of painting in Belgium, and director of the academy of Antwerp, visited London for the first time during a few days of the past month; his object being to become acquainted with our national school of painting in the present exhibitions. It would scarcely be just or proper to detail his observations on this subject, as they must naturally partake of a private character; but without any breach of confidence, it may be said that he expressed in the highest terms his appreciation of the works of the living painters of England, and of the future advent of a great school of art in our country. The few works of Sir Joshua Reynolds he had the opportunity of viewing, and these included the rare examples in the State Apartments of St. James's Palace and in Mr. Samuel Rogers's possession, induced the remark that Sir Joshua was truly a great artist, and was justly placed in the highest rank among the great names of former days. In our National Gallery, although he expressed the fullest admiration of the many superb *chefs d'œuvre* we possess, he could not restrain his astonishment at the degraded and filthy condition in which most of them were suffered to remain, obscuring every thing like the truth and beauty of their actual tints, and referring with complete approbation to the perfect condition of the "Peace and War" of Rubens, and the "Bacchus and Ariadne" by Titian. The Baron proposes a more lengthened visit to England next year, and there is a probability that not only he, but several other distinguished artists of Belgium, will be induced to exhibit their productions in the annual display of the Royal Academy, when the locality will allow of better accommodation than befel Van Schendel's elaborate picture in the Octagon Room.

IMPROVEMENTS IN WATCHES.—We have recently inspected a watch, the manufacture of M. Patek, of Geneva; it has the advantage of rendering watch-keys unnecessary, by simply turning a screw in the handle, that winds up the watch, and which, by another movement, regulates the hands. So simple and ingenious a piece of mechanism deserves to be generally known. The watch-

case is also a curious work of art, inasmuch as it is made historically interesting as well as beautiful; the watch being designed for America, the outer case contains within an ornamental border a view of the famous "Charter Oak" in Connecticut, of which the history is curious. Charles II. granted to that state a singularly liberal charter, in 1662, which he was anxious to rescind in 1687, for which purpose he sent Sir E. Andros to obtain it, and in solemn council to close the proceedings of the state under its auspices. The minute book was closed with the word "finis" by the royal emissary, when the room was suddenly darkened, the charter abstracted, and no clue to it discovered until the expulsion of the Stuarts, when it was brought forth from an old oak tree, in which it had been placed by the hands of those who had carried it from the council table. The tree became ever after celebrated as the depository of this important document. It is a good action thus to make a watch-case teem with historic association without destroying its ornamental beauty.

PATENT GLASS SILVERING.—Mr. Hale Thomson has recently introduced a new and beautiful process for coating glass surfaces with a deposit of pure silver. It has been well described by Professor Donaldson in a lecture delivered by him at the Royal Institute of British Architects:—"The deposit of silver is exceedingly thin, and the expense of working has been reduced within such limits as give every prospect of its adaptation to a multitude of useful and ornamental purposes—especially as the brilliancy is greater, and the colour warmer and more agreeable, than that of the amalgam of tin and quicksilver, with which our ordinary looking-glasses are coated, and as it is applicable to every variety of curved surface, the inside of the smallest glass tube being silvered with the same facility as a flat surface; coloured glass thus coated adds its colour to the metallic brilliancy of the silver seen through it; and thus the effect of gold, bronze, and steel can be produced in addition to the many harmonious combinations of silver and coloured glass, which the cutting and engraving of surfaces flashed with a thin layer of coloured glass will produce. The silver is protected from tarnishing by the glass to which it adheres, and at its outer surface by a preservative coating of cement; and thus, by its permanent reflective brilliancy, it is pre-eminently suited for reflectors for lighthouses and railway signals, and for reflectors generally. Its application to ornamental table glass, to épergnes, toilet bottles, flower vases, for instance, are endless; and it is no less suitable for shop-front fittings, for covering up iron pillars, for curved panels; and when embossed, or in combination with marbles, ebony, &c. for interior decorations, to cornice mouldings, chandeliers, finger-plates, door-knobs, &c." A brilliant and beautiful colour is produced of different tints even in the same goblet, which may have all the variety and beauty of the Bohemian glass, with the extra brilliancy of metallic tints, and a totally different colour for the interior to that used in the exterior of the articles fabricated.

PUBLIC WALKS.—A contemporary paper informs us that public walks around the town of Nottingham have been recently opened, and that it is now possible to walk twenty-five miles by following their paths. All persons who have indulged in continental travel, know how to value the public places for air and exercise, so constantly and so wisely provided in European towns. The *allées* and *places vertes* are the general airing places of the people. Here we think little of such things, yet they are always cheerfully welcomed; the walls of such cities as York and Chester are so appropriated, and the environs of some few others. We hope to find such healthy places more general; the artisan may then leave the beer-shop and skittle-ground, and enjoy the free air of nature.

BRIGHTON PAVILION.—After many vicissitudes, much ridicule and dislike, this eccentric edifice has at last ended in being devoted to public purposes. The grounds have been thrown open, and many thousands have availed themselves of the power of strolling thence. It is to be hoped that the edifice may be devoted to the useful purpose of a museum, or public place of an

intellectual order, which must be wanted, and could be well supported, in so large and important a town.

MOSAIC PAVEMENT.—A magnificent pavement discovered at Antun, in the south of France, (the Augustodunum of the Romans,) and which formed part of the decoration of a magnificent structure of the Gallo-Roman period, has been brought to this country by M. Jovel, its proprietor, and exhibited in Pall Mall East. It is the central portion of a beautiful floor, and the subject represents Bellerophon on the winged horse Pegasus, destroying the Chimera. It is admirably executed, and the beauty of the outline, the truthfulness of the shadows, and *pose* of the figures are infinitely better than we have heretofore seen in works of this class; looking more like the work of the painter than the labour of the artisan in mosaic. It is seven and a half feet in diameter, but the entire pavement, of which this is a portion, measures thirty-five feet by thirty.

MR. WORNUM'S LECTURE at the Government School of Design, on Ornamental Art, on Friday, July 14, was characterised by much learning and sound judgment. It was devoted to a consideration of the varied styles of decoration since that known as the *Renaissance*, or *Chouquecento*. We are exceedingly gratified to notice his honourable and manly demand for a due appreciation of the labours of the King of Bavaria, Ludwig I.; he contrasted what King Louis had done, with small means, with the much-vaunted doings of Louis XIV. at Versailles. He said, and with truth:—

"If Europe can, at the present moment, very generally congratulate itself on the substantial revival of the Arts, this is certainly very greatly owing to the example of a single individual,—Ludwig I., of Bavaria, who has done more for the permanent benefit of taste during the last quarter of a century, in the small city of Munich alone, than was ever before accomplished, by whole generations of kings, either in ancient or modern times. All the munificence of Pericles and of Lorenzo the Magnificent combined, would not reach one tithe of the patronage of Ludwig I., of Bavaria. His works in every department of Art are truly surprising, and all accomplished in half the time spent by Louis XIV. over the gorgeous accumulations of his one palace at Versailles. During the quarter of a century that he was active the King of Bavaria raised on an average one great public monument every year, and occupied constantly about two hundred artists in their decoration,—in sculpture, stucco, scagliola, mosaic, marquetry, fresco, and encaustic. Half these artists have earned an independent European reputation, and some a lasting one, as the architects Gaehtner, Klenze, Ziehlend, and Ohlmüller; the sculptors Schwandl, Schnorr, Hess, and Kaulbach, and many others little less distinguished.—'I once stood alone,' said the lecturer, 'in the magnificent throne-room of the state-buildings, and could not help exclaiming to myself, 'Do I see one only of a hundred magnificent saloons, in one only of the palaces, of the king of less than five millions of subjects?' I then thought of Buckingham House, and that lumbering piece of Gothic in St. James's; but we are improving; still there is something humiliating in such comparisons, when we reflect that it is not money, but taste, which effects these master-achievements of Art.—It has been said by some that this vast outlay in Art was, in fact, unbounded extravagance; but the King of Bavaria could see further than such people. Twenty years ago a stranger was a rarity in Munich; few people had ever heard its name; even in 1834 there was very little, and bad, hotel accommodation there, because there was little demand for it. Now it swarms with strangers, pouring their hundreds of pounds daily into the coffers of the Munich tradesmen, who are already reaping the golden harvest which their late enlightened king has sown for them, and Munich now rivals Paris or Rome."

SPIEFELDS SCHOOL OF DESIGN.—The annual meeting of this branch of the Government School was held on the 7th, the Earl of Carlisle in the chair, who expatiated on the value of giving the aid offered by these institutions to the humble student:

"He did not mean to tell them that schools of design could create an imagination,—that could only be done by Him who clustered the stars and foliaged the flowers; but they could do much;

they could light up the dark and rugged paths of evil, and make the humble labourer discover new beauties in the common rays of the sun."

It has been the mistake of many to expect too much and too quickly from these institutions. An article in the *Birmingham Gazette* speaks forcibly on the point:

"For a time everybody was in raptures; but finding that the schools could not effect impossibilities, and that they really were not immense machines for evolving new patterns (the great manufacturing intellect not rising to designs), the schools were neglected, the old system of vamping up worn-out designs, worthless even when new, was again resorted to, and the night-mare of foreign competition again startles the English manufacturer from his lethargy. He does not stop to inquire the cause of the foreigner's success,—that they have employed schools of design for many years past, and have been content to wait till the Art-education of the pupil was complete before they expected him to furnish them with complete designs, or to reflect that by employing the same means we may do more than our foreign rivals have done,—may carry our distress into their territory, and show that English workmanship, united to sound design, will carry the world's market before it. The mass of manufacturers will not move. They are ready to admit, theoretically, that the school does good to themselves, to their workmen, to the public,—but they will afford no help to extend the benefit. For their own sakes we entreat them to shake off this apathy."

PORTRAIT OF SHAKESPEARE.—Mr. Ford Madox Brown, an artist of considerable talent and reputation, has lately added to his credit for ability, by the production of an admirably composed portrait of our great national poet. The picture has been exhibited at Messrs. Dickinson's, Bond Street, and is a three-quarter figure of the bard, represented standing at his writing-desk, whereon appear various time-honoured volumes which he is known to have used as material in the construction of his dramas. He is habited in a slashed doublet, and gown of sober hue, as he is represented in his monumental effigy at Stratford, which has indeed been the principal authority for the construction of this portrait. It is our firm conviction that the Stratford bust is the only representation to be implicitly depended on as a likeness of the bard, and Mr. Brown has shown how admirably it may be made into a living picture of "the gentle Shakespeare" when treated with taste and ability.

"**THE KING'S STONE.**"—The pleasant little market-town of Kingston-upon-Thames has long been held to derive its name from the stone upon which some of the Saxon kings sat when they were crowned. A similar coronation stone once was preserved at Scone, on which the monarchs of Scotland seated themselves during the same ceremony; it is now placed beneath the Coronation chair in Westminster Abbey. Not so honoured is the Saxon relic, which has been allowed to remain neglected and obscure until the present day. It is now proposed to place it in front of the Market Place, on a septagonal block of stone, in the centre of seven pillars of polished porbeck marble, with capitals of Caen stone; these pillars are typical of the Seven Monarchs which tradition says were crowned in the town. We can only express a hope that simplicity and good taste may characterize the erection.

COPPER-PLATE PRINTERS' BENEVOLENT FUND.—We are especially glad to record in our pages the establishment of a fund for the relief of a class to whom all persons connected with literature and art are more or less indebted, as indeed are the public themselves, for much of the enjoyment which results from engraving. One of their rules informs us—"That any person desirous of contributing to the fund, may be qualified an honorary member by subscribing a sum not less than five shillings per annum, or by a donation of one guinea." We need not urge their claims, nor do more than announce that their Committee Room is at 57, High Holborn, where all communications, addressed to the Secretary, are respectfully requested to be sent.

VISITORS TO PUBLIC MONUMENTS.—According to a recent return the number of visitors to the armoury of the Tower of London, from the 1st of February, 1845, to March 31, 1850, has been 249,338; and the amount received, at the rate of

6d. each for admission, is 62337. 9s. During the above period 1426l. has been expended in the purchase of armour and ancient weapons; and the allowances to warders, collectors, &c., have been 4320l. The annual number of visitors to the jewel houses, from January 1, 1845, to January 1, 1850, has ranged from 46,737 (in 1846) to 41,482 (in 1849), the receipts from the admission fee of 6d. being for the corresponding years 1168l. and 1037l. The yearly amount expended in keeping up the establishment varies from 1354l. (in 1849) to 1339l. (in 1845). The total number of visitors admitted without charge to the Gardens and Palace of Hampton Court during the year 1849 amounted to 168,195, the largest numbers being in the months of May, June, July, August, and September, ranging from 49,476 (in August) to 14,505 (in September). The number of visitors admitted gratis to the Botanical Gardens at Kew in the same year was 137,865, from June to September, being the period when the greatest number of visitors were admitted. The Royal Pleasure Grounds at Kew, which are open from Midsummer to Michaelmas, were visited in the same year by 41,455 persons. The total yearly amount of money taken at Westminster Abbey from 1845 to 1849 inclusively has ranged from 1306l. (in 1845) to 968l. (in 1849). The public is admitted gratis to the nave, transepts, and choir, and a charge of 6d. is made on each individual for exhibiting the chapels. The money thus levied, after payment of the tomb-showers and the expenses of cleaning the monuments, is devoted to such ornamental improvements of the Abbey and buildings belonging thereto as do not fall within the ordinary repairs of the fabric. The yearly amount received for the admission of visitors to St. Paul's Cathedral at the rate of 2d. for each individual during the same period ranges from 539l. (in 1845) to 429l. (in 1848). The sums so received are divided, according to long-continued practice, among the four vergers of the Cathedral for their own benefit.

MR. A. PENLEY.—This able artist has resigned his appointment at the Cheltenham College, as Professor of Drawing, after having occupied that position for many years with great credit to himself, and advantage to the many pupils under his care. He has returned to the Metropolis, where his merits are well-known; the Manchester Silver Medal was awarded him last year for the best picture in water-colours.

A RELIQUY OF THE PREFETTER.—The unfortunate Prince Charles Edward, "the young Pretender" of this country, but "the rightful heir" of Scotland's Jacobites, in the course of his melancholy wanderings, carried a portable knife, fork, and spoon, in a leathern case about his person; on his departure from Scotland they were given as a *souvenir* to the Primrose family, with whom Flora Macdonald was connected, and having been guarded with jealous care, were ultimately presented to Sir Walter Scott, as the most befitting recipient. When George IV. visited Edinburgh, Sir Walter presented this curious historic monument to that sovereign as the greatest gift a national writer could make to his king. From the king it passed to her son, the Lord Londesborough, who has possession of it. The intrinsic value of the article is not great, but the historic value is priceless, no doubt, to many Scotsmen.

CANBARIQ DECORATION.—This patented composition, which has been exclusively used for the decoration of the Opera House, in Covent Garden, is of Italian origin, and takes its name from its principal material, hemp or flax; that only being used which is the refuse of the mill or the rope manufactory, which is mixed with a heated resinous compound, and then pressed into sheets of different thicknesses, and about twenty feet diameter. These sheets are as close and as firm as papier-mâché, which they in some degree resemble; and by means of metallic dies are made to assume any of the decorative forms usually supplied by plaster or carved ornaments, particularly as they can be coloured and gilt. The material is cheap, and possesses the quality of great lightness, all of which combine to render it worth the attention of decorative artists.

REVIEWS.

A LETTER TO LORD JOHN RUSSELL, ON THE FUTURE LOCATION OF THE NATIONAL GALLERY AND ROYAL ACADEMY. By JOHN DOYLE. Published by J. W. PARKER, London.

Public opinion is beginning to manifest itself on these important matters in a way that cannot be mistaken, and that will not brook much longer postponement of some definite arrangement of a subject in which all are, more or less, interested. That portion of the community, and it is by no means an insignificant one, which attaches any value to the fine arts of the country, is fully persuaded that in neither of these two institutions, the National Gallery and the Royal Academy, are affairs managed in such a manner as best promote the objects for which they were primarily appointed; that the National Gallery is in every way unworthy of its name, and ill suited for its purpose; and that such a change is necessary in the constitution of the Royal Academy, as will more satisfactorily develop the strength of the English school of Art at this period. The author of this "Letter," whom we believe to be the celebrated political caricaturist known under the monogram of H.B., in a few sensible, moderate observations, points out to the Premier, from the testimony of competent witnesses, the injuries which the pictures of the nation are yearly receiving from being placed in their present unwholesome locality, and the necessity that exists, therefore, for their being immediately removed. It is right, however, to mention that this pamphlet was written before the re-appointment of the committee on the National Gallery, and of the scientific men who, as we stated last month, have been requested to furnish a report on this particular matter. He also shows beyond dispute that the very reason why Trafalgar Square has hitherto been considered a suitable spot for locating the pictures; namely, because of its ready accessibility and nearness to the great thoroughfares and centres of business, is just that one which makes it the least desirable. This he shows by adducing facts of which we ourselves have frequently been eye-witnesses, that the rooms are constantly made the rendezvous of crowds of idlers, who, for want of other employment, congregate there, not with the motive of seeing the pictures, but "to make an improper use of a public building." Attention is next directed to the Academy, which, Mr. Doyle thinks, should have the whole of the present edifice assigned to its use, which would then enable that body to extend its powers of usefulness as a school of Art, and to open its doors more widely to those who possess a title to membership, but are excluded on the ground of insufficient space to do justice to all. He lastly ventures an opinion upon the site for a new National Gallery, and fixes upon that where Kensington Palace now stands, as in all respects most desirable for the purpose. We are strongly inclined to the same opinion, and could we now spare room for his remarks, we would gladly quote his arguments in confirmation of our own. All, however, we can now do is to express a hope that this pamphlet will be the means of urging the government to take up the matter at once, and vigorously; the season ought not to be permitted to pass away, and the future fate of these institutions be still left in uncertainty. We would that the Academy should retain its present abode, with the enlarged accommodation which the other wing would give it; and that the national pictures should be removed to some place where they may be seen under the pure light of heaven, be preserved from the elements of decay, and be studied in comparative quietude and peace: it is not amid the din and turmoil of an overgrown city that the beauties of Art are most satisfactorily seen, or its lessons most effectually taught.

THE LIFE OF FRA ANGELO. Printed for the ARUNDEL SOCIETY.

At the first institution of this society we pointed out its peculiar claims to attention, and now after some lapse of time we are enabled to review its works. The Life here translated by G. A. Bezzi, from the Italian of Vasari, with notes and illustrations, is their first literary production; it is accompanied by a series of twenty plates executed by Mr. G. Scharf, Jun., being outline copies from the principal works of this celebrated old artist; and a large engraving from one of his *chefs d'œuvre*, is also offered to subscribers as their first engraving of importance. The funds of the society are small, and, as they mention in their report, "to execute such works as they originally contemplated, the list of members must be considerably extended."

It is evident that the original intentions of the society were too extensive to be carried out without an outlay which would require five times the amount they at present have at command. The objects of the society were good, and we hope they may yet be fully developed. The Life here given is chiefly valuable for the corrections and additions published in the notes, inasmuch as Vasari is familiar to all Art-scholars. The illustrations are well selected, and executed with much delicacy, fully bearing out the character of the artist-priest. The large print of St. Lawrence distributing Alms, from a fresco in the Vatican, is an exquisitely pure and beautiful specimen of the master. It has already been engraved by Outley in his Florentine School, pl. xli., but smaller and with much less accuracy of delineation or delicacy of expression. The minor details are also singularly defective, as an examination of the two together will abundantly prove. The society have therefore done well in restoring to us the simple beauty and purity of the original in a true and worthy manner. It is very charmingly engraved by Mr. Gruner, after an original copy by M. Tunner. There is an evident desire on the part of the society to do their work well; and we hope to hear of an accession of strength in numbers and funds, that they may continue their labours as well as they have commenced them.

A GRADUATED SERIES OF DRAWING COPIES ON LANDSCAPE SUBJECTS FOR THE USE OF SCHOOLS. By F. W. HULME. Published by the NATIONAL SOCIETY FOR PROMOTING THE EDUCATION OF THE POOR, &c., Westminster.

Whatever award of praise we are inclined to bestow on this publication, for its merits as a useful guide to the learner, is small in comparison with the object which has induced the society, under whose direction it has been executed, to put it forth. We are no advocates for giving the humble classes an education unsuited to that sphere of life wherein Providence has placed them, but we are earnestly solicitous that every facility should be afforded them for improving their mental condition,—for raising themselves, when it is in their power, to a higher position,—and that every means should be employed which may the better enable them to appreciate and enjoy whatever is worthy the regard of an intelligent and enquiring mind. It is therefore with sincere gratification we find a large and powerful institution like the National Society introducing a system of instruction in drawing into their schools, not to supersede other and more important teaching, but as a means of general enlightenment in the pathway to knowledge. We have in our day seen the highest offices in church and state worthily filled by men who learned the elements of their profession in establishments scarcely more dignified than a "National School;" and they who come after us may find a future Ely, or Turner, or other great painters acknowledge that in a "National School" he took his first lesson in Art, and imbued his love of it. The three parts which constitute this series are excellently adapted to their purpose; Mr. Hulme's name is too well known to our subscribers as an elegant landscape-draughtsman to render any eulogy necessary; his lithographed sketches in the work under review are simple, clear, free, and well-arranged in progressive lessons. We can conscientiously commend them to any learner.

AN AUTUMN IN SICILY; being an Account of the Principal Remains of Antiquity existing in that Island, with Short Sketches of its Ancient and Modern History. By the MARQUIS OF ORMONDE. Published by HODGES & SMITH, Dublin.

The press of Ireland has, for so long past, brought forth little but political pamphlets and partisan tracts, that it must be hailed as a good omen for the future when publishers venture upon a work that has nothing in common with these, and that comes, in itself, within a higher order of literature. The tourist of the present day who places the results of his travels before the public, must aim at something more than a pleasant sketch to render his work agreeable; the charm of novelty has long been taken away, by a multitude of travellers, from almost every place to which civilisation extends; and the critic whose lot it is to sit daily and hourly at his table, surrounded with these literary labours, now knows as much, from report, concerning the wonders of the world as he who has seen them with his own eyes. The Marquis of Ormonde, apparently conscious of this fact, has endeavoured rather to make his volume acceptable to the scholar and the antiquary, than to produce a book of entertaining gossip; still it must not be discarded on this account by the general reader, who will find here both instruction and entertainment. His Lordship writes like a man of

erudition, and his remarks on the classic antiquities of the island are characterised by taste and judgment; the field which he has selected for the display of these qualifications is a fine one for the purpose, and he has used it to good advantage. We must not omit to notice the illustrations accompanying this volume from sketches by the Earl of Ossory, G. Petrie, R.H.A., and others, chosen from some of the most attractive points of the country, and etched with the well-known ability of the Messrs. Cooke.

BLACK'S PICTURESQUE TOURISTS IN ENGLAND AND SCOTLAND. Published by ADAM & CHARLES BLACK, Edinburgh.

Travelling in the present day possesses an abundance of advantages unknown to our forefathers. The amount of comfort and convenience of transit we now possess, and the care with which all information necessary for its due enjoyment can now be obtained, are such as the most wealthy of past times could not procure. If we look back to the books which a century ago were published sparingly and at a high price, such as Pennant's "Tours," how strongly do they contrast with such cheap volumes as the present; printed widely and published expensively, their utility was merely that of amusing the leisure of the rich and untraveller, not of supplying the wants of the many. Now we have works really containing fifty times that amount of information at one-fifth of the price of those by-gone tomes. That these books are largely patronised is evident by the number of editions which each runs through. No man travels now without such useful monitors. Publishers also appear to do their parts well, and, as in the present instance, continually add and improve on the original work until it is complete in every necessary point. "The Tourist in England" is excellently arranged, and with its maps and views, and well condensed information, is a very useful handbook. "Scotland" is far more diffuse, and is a volume containing so much of a "readable" and amusing character, that it may be advantageously perused by those who only "travel in books."

LIVES OF THE MOST EMINENT PAINTERS, SCULPTORS, AND ARCHITECTS. Translated from the Italian of Giorgio Vasari, by Mrs. J. FOSTER. Vol. I. Published by H. G. BOHN, London.

The student in art, literature, and science, is greatly indebted to Mr. Bohn for the many valuable publications contained in the "Standard Library;" the extremely moderate cost of which enables almost any one to procure it. The present volume forms a portion of the series. Vasari's work has been a text-book for every continental writer upon Italian Art since its first appearance in 1550, and has always been consulted as a guide by the picture-collector. But to the majority of English it has hitherto proved almost a sealed volume, inasmuch as, till now, no translation in our language has been published. Vasari himself published four low editions in Florence, the latter of which, with considerable additions and numerous portraits engraved on wood, was carried down to the year 1667. Since then, eight other editions have been circulated in Italy; the last of these was published in six volumes, at Florence also; and the eleventh edition, commenced in 1846, is still in course of publication. This demand shows the estimation attached to the book in the country where it was first compiled. Germany has also an excellent translation by Schorn, formerly editor of the "Kunsts-Blatt;" and France one, which Mrs. Forster considers quite unworthy of the name.

Vasari tells us in his "Life," which forms the concluding part of his voluminous biographical work, that it was undertaken in consequence of a suggestion of the celebrated Paolo Gióvio, and at the request of Cardinal Farnese. Vasari was himself a painter and architect of no mean reputation, and the intimate friend of Michel Angelo; living in the midst of the Art-world of that period, and associating with all the great painters whom the high character of the schools of Rome and Florence had collected in those cities, in each of which he was professionally engaged, he had both ability and opportunity for the efficient discharge of the important literary labours he undertook. And notwithstanding subsequent writers, such as Lanzi, who confines himself, by the way, to a history of painting only, have discovered inaccuracies of dates, and have disputed his statements, still, as Mrs. Foster justly remarks, "They have generally found in him their best resources; in his book almost every subsequent performance in the same department is based, nor do we open a work on the Arts in any language without finding his authority extensively cited." Vasari's "Lives" is a vast compilation, and must have cost the author infinite labour

and research; considering the period, in which it was written, it is admirable in style—eloquent and powerful in language.

We hail Mrs. Foster's clever and interesting translation as a valuable and most welcome addition to artistic literature; she has brought a large amount of professional knowledge, independent of her skill as a translator, to bear on the subject, in the shape of notes and text-illustrations, correcting numerous errors which appear in former editions, and informing us of the present localities where many of the pictures referred to are now placed: this, her intimate acquaintance with the principal European galleries, has enabled her to determine.

Without in any way deviating from the letter of the original, she gives us its spirit in a style that cannot be too highly commended. We would therefore advise those collectors who are still in search of examples of the early Italian schools of painting, to consult her work, as a means to an end which need not be mentioned in *extenso*. The young historical painter ought to read it for its erudition in his own profession; and even the Young England school of painting may gather wisdom from its pages by learning that the great masters of three centuries ago mistook not deformity for beauty, nor contorted countenances for expression. For ourselves we anticipate with pleasure the remaining volumes, to enrich the shelves of our library among those publications that treat of Art.

THE BARON'S CHARGER. Engraved by R. GRAVES, A.R.A., from the Picture by J. F. HERRING. Published by H. GRAVES & Co., London.

If a national taste be indicated, as we hold it in a great measure to be, by the popularity of a peculiar class of artistic works, then assuredly we are the most horse-loving and dog-loving people in Christendom, for pictures wherein these animals are the prominent features are unquestionably those having the greatest demand from us. We,—that is the critic, not the English public,—confess to have been almost surfeited with engravings of this description, and have oftentimes written as much, yet when such as this, from the pencil of Herring, *nulli secundus*, and from the *burin* of Robert Graves, comes before us, we cannot regard it as one too many, but feel far more inclined to give it a hearty welcome. The sentiment of the work has, with us, a charm even greater than the excellence of its manner; with such a subject we revert to times when, with less of profession, and perhaps less of selfish worldly-wisdom, there was infinitely more of hearty sincerity, and of what, with all its apparent rudeness, had in it more of the romance and the chivalry of life; for the dark archway, and the iron-bound portulicos, enclosed the noble, and the generous, and the fair, nor was the gate shut against the claims of wretchedness and poverty. Charity and benevolence dispensed their gifts with no grudging hand then, though through other channels than we now see them at work, and there were fewer opportunities of the world knowing how much good was done by stealth; every age has its virtues. "The Baron's Charger" is a noble white horse, which, with another horse, a page is holding in the court-yard of the old mansion. A young girl is amusing herself and her companion by teaching a dog to beg; a fine hound has reared himself against the breast of the page; other dogs are sitting about, and a peacock is perched on the end of a wall that flanks a picturesque fountain. The composition is most effective; the head of the female very beautiful, and the "Charger" capably drawn, except the upper part of the near hind leg, which appears to us, who do not presume to have studied the anatomy of the horse, too *waxy* in the outline. The picture is beautifully engraved in every part, so much so as to cause us to think we never saw work more excellent in any similar subject. It will make a most fitting companion to Mr. Watt's plate, after E. Landseer, of "Horses at the Fountain."

SIR TATTON SYKES, Bart. Engraved by G. R. WARD, from the Picture by F. GRANT, A.R.A. This is an excellent portrait of the worthy Yorkshire baronet, so well known and esteemed in sporting circles—one of the last of the old English gentlemen, now almost an extinct race. He is pictured hooded and mounted, with his head uncovered, and is placed under the shade of a tree, which stands in a meadow where sheep are grazing. Both figures, the horse and his rider, are vigorously drawn, while the expression of Sir Tatton's face is marked by that benevolence and frankness which distinguish his "order." The work is well engraved in mezzotint, by Mr. Ward, who has attained nearly as much celebrity in this class of art, as his present model has among the most enthusiastic admirers of the hold fox-hunter.

PICTURES OF NUREMBERG; and RAMBLES IN THE HILLS AND VALLEYS OF FRANCONIA. By H. J. WHITTING. Published by R. BENTLEY, London.

Mr. Whitting is a pleasant, chatty fellow-traveller; he established his claim to this in his journey to "Heidelberg," and he fully sustains his reputation in the present volumes. Few parts of Germany have been so little noticed by literary tourists as Nuremberg, notwithstanding the many attractions which the old city with its historical associations, and its interesting relics, architectural and others, holds out for the study and observation of the writer. Mr. Whitting has found in these a sufficient supply whereon to pen two most agreeable volumes, interspersed with judicious and sensible observations of his own, and with some local and traditional stories of an amusing character. There is no useless show of learning in what he writes; nevertheless, there is abundant information conveyed in a very pleasant and instructive form; we do not often meet with a traveller's tales in which there is so little to condemn, and so much to commend.

ANECDOTES OF THE ARISTOCRACY. Second Series. By J. BERNARD BURKE, Esq. Published by E. CHURTON, London.

That "truth is strange, stranger than fiction," is a saying so familiar and so constantly brought before us, that it is tacitly allowed by all, and has passed almost into a proverb. Mr. Burke has contrived by the aid of his intimate knowledge of family history to present a series of narratives remarkable for their curiosity and variety, and no teller of invented tales is more amusing than he. His stories range over early and recent times; and the legend of the fourteenth century, with its tale of blood and honor like that of "the tragedy of Sir John Eland," fraught with savage revenge, and speaking loudly of the insecurity of life in the middle ages, is succeeded by a tale of modern heroism in the narrative of Lady Harriet Acland. The quaint peculiarities of Sir John Dinely, and his eager and humorous advertisements for a wife, may excite the risibility of those who seek the volumes for amusement; while the lovers of the marvellous may find a satisfactory enjoyment in the "true" ghost stories, related even by the famous Lord Castlereagh but a few years since. Past ages and present contribute their quota of amusing narratives; and although we think some few of them too slight to deserve a place in such volumes, we cannot but consider this as belonging to the rare class of works which administer to amusement through the aid of instruction, and "open the page of life" in a manner which may give scope to the thoughtful who ponder on "the great and little creature—man!"

A SYSTEM OF WATER-COLOUR PAINTING. By AARON PENLEY, Member of the New Society of Painters in Water-Colours. Published by WINSOR & NEWTON, Rathbone Place.

The instructions contained in this book are intended, we observe, to follow "Rowbotham's Art of Painting in Water-Colours," a little work which we lately noticed, and which contains such initiative lessons as suppose a perfect ignorance of the Art. Thus, this system of water-colour painting proposes to conduct the student to a skillful execution of all the final manipulation processes employed in the present advanced state of the Art. We have never seen, even in productions of more considerable magnitude, so varied and abundant—nay, profuse—a list of landscape tints as is contained in this little book. So comprehensive is it in this part of its instruction, that we think that even many already accomplished in the Art might gather much valuable information from it. The work is purely practical; the student is not embarrassed by any theoretical jargon, which is very often unintelligible to the long practised artist, but the precepts are laid down with perfect distinctness, and their application and results easily understood. The "Practice" begins with instructions for the first general tint, and then proceeds to describe the method of manipulating the sky all the phenomena of which are treated of, and ample rules laid down for every variety of sky. After a few judicious observations on the "Force of Colour" distances are treated of; and for painting these, a list of colours and tints are given, suitable to every phase. The succeeding heads are "Calm Water," "Brooks, and Running Streams," "Rough Water, or Sea," "Shipping and Boats," "Rocks," "Foliage," "Fire-grounds," "Banks and Roads," "Buildings," "Figures and Cattle," &c. The utility of brief notes of natural appearances, is pointed out—a practice adopted by all artists who work from nature, and desire to preserve their own memoranda of transient effects.

In short, the entire practice of water-colour Art is laid open, by a series of plain directions, which render this work the most valuable that has yet appeared on the subject.

DRAWING FROM OBJECTS. By HANNAH BOLTON. Published by GROOMBRIDGE & SONS, London.

The name of the authoress of this book is altogether new to us in connexion with the Arts; but it appears from her introductory remarks that she has been engaged for some years past as a teacher of drawing; and it is quite evident from what she here writes that she is eminently qualified for her profession. It is long since we met with a work on the subject of linear drawing so well calculated to be of infinite service to the learner; and this, chiefly, because of its exceeding simplicity. Perspective, that "monster of such hideous mien," to every beginner is, in its elementary nature, taught without the mention of its name; all technicalities and phrases ordinarily used in relation to it are avoided, as also every "hard word" which might require a second book for its elucidation. This has been the great aim of the writer, as expressed in her own words; and it is so far judicious that, without overlooking the difficulties which beset the introductory steps to the acquirement of the science of perspective, it renders them comparatively easy of attainment, and clears the way for the study of more abstruse works. Another point insisted on, to which, indeed, the whole argument of the book inclines, is the absolute necessity of drawing from objects rather than from copies, if you desire to make a correct draughtsman of your pupil; we know right well this practice is rarely adopted by the modern teacher, whose purpose it is to get up a *finished* drawing to gratify a parent's pride, or to exhibit his own skill in attempting to make an artist of one who, perhaps, is ignorant of the very first principles of Art; but it is, nevertheless, a point we would always contend for as the only true method by which drawing can be practically taught or satisfactorily learned. The system recommended in the work before us embraces the education of the eye, the cultivation of the mind, and the training of the hand; when these are effected there will be no difficulty in applying them to every purpose of Art, whether the merely useful and mechanical, or the picturesque and decorative; and we certainly know of no more direct and pleasant road by which the student may arrive at the end of his wishes than by taking the lady, who here brings forward the results of her experience at the Home and Colonial Training Schools, as a guide.

ROMAN TESSELLATED PAVEMENTS DISCOVERED AT LEICESTER. Published by J. R. SMITH, London.

The elaborate and beautiful pavement of the Romano-British period, discovered in 1830, a few yards west of the well-known fragment known as "the Jury-wall," at Leicester, is admirably delineated in one of these plates. For elaboration and richness of design it is believed to be unequalled by any other yet discovered in this country; it is so faithfully rendered in coloured lithography as to leave nothing to be wished, and cannot fail to be gratifying alike to the antiquary, the historian, and the lover of Art. With it is published a smaller pavement, chiefly remarkable for its curiosity, and apparently representing Cupid aiming his darts at Diana; the goddess being accompanied by her favourite stag. Unlike the other, it is a very rude work of Art. Mr. J. Eroyd Smith, a zealous, but not a rich, country amateur, proposes to publish a series of the most remarkable pavements discovered in this country, many of which remain undelineated. He has shown himself so admirably fitted for the task that we hope he will be properly encouraged. In other countries the government would aid such a task; here private patronage can only be depended on.

VIEW OF QUEEN'S COLLEGE, COBK.

This very beautiful lithograph, after a drawing by Mr. R. L. Stupford, gives an exceedingly agreeable view of the new educational college erected on the cliff which overhangs—

"The pleasant waters of the river Lea."

Beauty of situation is a great advantage to an architect, and the designer of the present building, Sir Thomas Deane, has fully availed himself of so happy a chance, and has adopted that picturesque style of architecture, the Early Tudor, for his building. Towers, halls, and gables are seen to great advantage, and in most picturesque variety, and the print does full justice to the building and its fortunate locality; while it makes better known to us an architect who is famous in his own country.

THE ART-JOURNAL.

LONDON, SEPTEMBER 1, 1850.

MODERN MOVES IN ART.

"CHRISTIAN ARCHITECTURE." "YOUNG ENGLAND."

Among the active steps made by Art in this country, of late, there are some of a retrograde character, and others, though new, doubtfully progressive. Progress be our motto; the slave of an idea is not less a slave because he is a voluntary one, or

because he himself neither feels nor sees his chains. All honour to enthusiasm, be its tendency progressive, however slightly so. It would be a somewhat novel sight in the present generation to see the busy Londoner promenading Regent Street in wooden shoes, but few in their senses, whatever their respect for the "good old days" of the Sabot, would prefer it to the light elegant close-fitting caoutchouc galoches. Modern civilisation is but the aggregate of a series of progressions infinitely small in their individual steps; and its varieties are more or less accomplished, exactly in so far as they are an aggregation of the contributions of all times. Few of the habits of the day are essentially its own; and if any generation could possibly abide by the habits of its fathers, then would it certainly merit not only the forgetfulness, but the execration, of posterity; it would be a generation lost.

This position is sufficiently evident in science, but though less obvious in Art, or in all matters in which we do not as yet recognise exact laws, it is nevertheless an essentially true. Varieties in art cannot of course be so much material, as intellectual or moral; the habits, however, are completely within the control of Art; the limits of Art must not be estimated by the capacity of the artist, any more than we can measure science by the capabilities of any individual piece of machinery.

Assuming therefore that every time, taken as a whole, has done its work, it must be evident that we have no particular faith in "the good old times" of our grandmothers, which many among us seem so dolefully to regret; they were doubtless very respectable old times, of very respectable old ladies, as we may see for ourselves in our ancestral halls where they are arrayed in their brocaded sacks and high-heeled pantofles.

First among modern moves is the new-fangled veneration for the Gothic, or the species Teutonic of pointed architecture; to this, as a resurrection of one of the good labours of our forefathers, there can be no objection. But to a bigoted fanatical devotion to this old pointed style as "Christian Architecture" *par excellence*, there is an objection. Like every historic style it has its merits, but it has also its demerits, for if it were given to select a style which should produce the least effect by the greatest possible amount of labour, the choice must fall on the decorated or perpendicular Gothic. To maintain further that Gothic architecture is essentially Christian architecture is preposterous. Such an idea may of course be excused where the only known buildings devoted to the service of the Christian religion are in this style; and in some of our old

provincial towns, as Coventry and a few others, where the Arts have been stationary for the last two or three centuries; but elsewhere Doric has as much claim to be styled Christian architecture as Gothic. It is true there are no heathen Gothic buildings, but then this only goes to prove that Gothic is not heathen architecture, not that it is Christian. The Gothic did not even generally prevail at any period of the history of Christianity; it appeared only a thousand years after the establishment of the Church by the state, and it never flourished in Asia, in Africa, in the east of Europe, or in Italy or Sicily; it is therefore a comparatively late style, and was spread over a small portion of Christendom only,—a few hundred miles east and west of the Rhine, and in England. In point of time also, its duration was short; it did not survive four centuries, whereas other styles have not only been more widely spread in Christendom, but have endured longer, so that neither in point of space nor time can Gothic be termed "Christian architecture." The great mass of Christian churches have been Roman, Byzantine, Lombard, Norman, Moorish, Italian, or classical; and for the first twelve hundred years, Romanesque, and subsequently, shared by Gothic with the Italian and classical.

If any style could arrogate to itself the proud title of Christian, it is that of the Mahomedan Mosques: the first great Christian church was the Sultan's Mosque at Constantinople, the St. Sophia of Justinian, and from which nearly all the oriental churches, whether Christian or Mahomedan, have derived their model. The Byzantine Greeks added the dome and transept to the heathen Basilica; the Gothic spire of the north was preceded eight hundred years by the Byzantine dome; for it was not until the fourteenth century that the Gothic was developed in all its pointed glories. Cologne cathedral, the most magnificent monument of Gothic in the world, was consecrated in 1322, in the time of Pope John XXII. The great period of the Gothic, therefore, was "the good old time" of the Avignon popes; a period of all others notorious for ecclesiastical persecution and religious intolerance; a period of internecine war between Church and State; of ecclesiastical seclusion, and inquisitorial tyranny; when bon-fires of living Jews were lit up in the public streets, because the "Black Death"—as the plague of 1347 was called—respected neither burgher privileges nor monastic vows. Such are the associations, if any, from which Gothic must derive its claim to the exclusive style of "Christian architecture." We say all this without the slightest intent at disparagement of Gothic itself, but simply by way of protest against that singular modern move which would arrogate to it a superior title to our respect as eminently the ecclesiastical or Christian architecture; it certainly has a local prestige in this country by reason of our great cathedrals, but nearly all these were Norman beginnings.

Another remarkable theory of modern birth is, that we must devote our Art-labour to the Church, as a sacrifice to the Deity, and in no sense for its own sake as regards its operation on ourselves. To this we give our most unqualified opposition; no fruitless labour can be healthy labour. There are too many good works, of necessity to be done, to allow us to waste our energies over useless labours: "And these are they which are sown on good ground; such as bring forth fruit." (Mark iv., 20.) There is fruit, or absolute use, in even the most elaborate decoration of what is seen, because its way is open to the mind, for "the light of the body is the eye," and through the mind to the soul; there it is to read its constant though varied lesson to all beholders; but to bestow exactly the same amount of labour upon what is not visible, and from its situation never can be visible, simply in a spirit of "sacrifice," is wanton waste of labour, perversely fruitless, which might have been bestowed on good work useful to mankind; and surely the end of all our work is to be fruitful, to be useful to our neighbour. None will assert that the bare employment of workmen is use sufficient; such things may be sanctioned by emergencies where there is a

superabundance of labour which cannot be usefully employed, but this is of extremely rare occurrence and certainly can never be the case in works of Art. Also the labour of a nation is an essential portion of its wealth, and to bury labour is to bury wealth; in all concealed parts the work is done when the work of necessity is done; the wasted labour, on this principle of "sacrifice" in a large cathedral, would be sufficient to build a magnificent church of itself, and therefore it would be burying all the amount of good that such a structure could effect; it would be of a verity lighting a candle and placing it under a bushel, certainly not giving light to those who are in the house. We are ordered, "Let your light so shine before men that they may see your good works, and glorify your Father which is in heaven." (Matt. v., 16.)

A piece with this theory also is the idea that we should devote exclusively our works of decoration to buildings destined for the service of religion, that is to say, for churches or monasteries, and by no means to such works as are devoted to man's own peculiar use. But is the church for the use of God or of man—and if there is any benefit at all to be derived from the contemplation of Art, or beauty, in any of those shapes and appearances which the artist can, in the overflowing of his own soul, produce for his neighbours' "light"—why in one only of the mansions of man's use?—why not everywhere?

We may assume the novelty of this doctrine, as there are no traces of it whatever in even the works of the "good old times" of ecclesiastical dominion; either in the spirit of fruitless sacrifice to an idea, or in an exclusive devotion of the best labours to ecclesiastical purposes. The affections and the fears of our forefathers gave much to the Church, and much was gathered for it by other means; but at no time did they bestow more or better labour over ecclesiastical structures than over those of a different character, as royal and municipal palaces, and other non-ecclesiastical edifices. Three examples may suffice—Charlemagne's Palace at Aix-la-Chapelle, Westminster Hall, and the Electoral residence at Heidelberg. Rather the contrary is the case; for there is scarcely a single old middle-age cathedral that was ever completed: such structures as have been finished belong to the Romanesque and Moorish, and to the comparatively modern periods; as St. Peter's, Rome; St. Paul's, London; or Isaac's Church, St. Petersburg; and they are not in "Christian" Gothic. This last idea, however, of devoting our masterpieces exclusively to the Church, is, as now impossible in practice, a very innocent one, but not so that which would sanctify a particular style.

Whatever may be the technical beauties of Gothic, conventional or natural, its moral associations are much more closely allied with ecclesiastical abuses than Christian principles; it is simply one of many ecclesiastical styles of the past, and it can only be considered Christian in as far as its moral associations are identified with Christianity; this is perhaps matter of individual feeling, and we are told "to render unto Caesar the things which be Caesar's, and unto God the things which be God's." And with individual convictions we are not disposed to interfere.

With reference to Art, however, we should greatly deplore the extensive spreading or adoption of any such notion; it would be in the highest degree detrimental to architecture and ornamental Art generally. Men are sufficiently prone already to the partial cultivation of single ideas; and the progress of Art only wants a superstitious reverence for some particular forms and arrangement of forms, to wholly subvert it, and render useless the most comprehensive minds; as, instead of labouring in the infinite provinces of Nature herself, the artist's sphere is limited to the hacknied field of a bygone time. The difference is this—given a certain space which shall admit light yet exclude wind and rain, to be enclosed by an ornamental covering; and—given a certain space which shall admit light and exclude wind and rain, to be enclosed by a covering, arranged out of certain middle-age curves and angles—the one unlimited, the other confined within very narrow limits indeed. The Gothic belongs to the past, and cannot be revived

in anything like the importance and splendour of its pristine development, however ably such a eousummation may be attempted by a few. That it may find a place among many other revivals of the beautiful, we sincerely hope, but it can be for the future but one of many styles, new as well as old.

The most remarkable perhaps of all the modern moves in Art is the recurrence to an old and imperfect style of design in painting; and in sculpture likewise to a slight extent, but in this case it is only a Gothic harmony with a Gothic revival. In painting, this revival has been conspicuous for the last two or three years in the London exhibitions; the painters who have given themselves up to this crotchety, are sometimes styled "the Young England," and sometimes the "Pre-Raphael School;" they certainly have gone back to the style of design of the painters of the fifteenth century, the style technically known as the *quattrocento*.*

This peculiar revival, which, if it were to maintain itself, would amount to a sacrifice of one of the noblest of Arts, appears to have arisen solely from a mistaken impression—that there is something inherently prejudicial to Art in the prevailing excellence in its sensuous or technical development; that is, in painting. It is either this notion or the idea that where there is less material there must be more spiritual; or at all events it seems evident that spirit and matter (except of a certain kind) are incompatible. There may certainly be a sentimental school and a sensuous school; but why not sentimental and sensuous at the same time; there is surely nothing antagonistic between soul and body; the soul can operate through the body only, and the less perfect or efficient its instrument, the less perfect and efficient must be its operation.

As in nature we do not infer a superior soul or sentiment from a deformed, imperfect, or disenged body, how can such an idea possibly obtain recognition in Art—and if it did, wherein would society be the gainer? What is disagreeable in nature, is disagreeable in Art; and to stereotype the disagreeable is an abuse of Art.

It is not so difficult to trace the source of this peculiar movement in Art; though new to this country, it is by no means new to Europe; it is about half a century old. It has been rather somewhat late in crossing the channel, and we will hope that it has crossed it only to pass onward to the ungenial north, and there for ever lose itself in the arctic regions.

The German painter Carstens was one of the first to deprecate the purely physical tendency of the last cinquecento and subsequent schools, which arose out of the intemperate and indiscriminate imitation of Michelangelo and his immediate followers. Overbeck, another German settled in Rome, comprised the works of Michelangelo himself in the deprecation as the source of the corruption: making it altogether a religious question, and transplanting the most morbid asceticism of the cell to the hitherto glowing face of Art.

This decided revival of the earlier schools, with all their defects and peculiarities, ten times more conspicuous in the copy than in the original, has met with considerable, though generally very temporary, responses, in the ultramontane schools; and it appears now in Europe gradually subsiding,—a natural death.

It is a purely ascetic movement, corresponding to that intolerable idea that sanctification consists in the mortification of the body; and in so far it is a monastic resuscitation in perfect harmony with its sister revival of the ecclesiastical Gothic: in point of time, likewise, they are in good historic harmony.

But how different the spirit of the originals, in both cases, from their copies! In painting, the

* *Quattrocento* is opposed to *Cinquecento*; we prefer using these established terms in art literature, though Italian, to the coining of new ones in the English language. The *quattrocento* prevailed immediately before the *cinquecento* which completely superseded it; the *quattrocento*, which means simply *four hundred*, signifies the Art which flourished about and after the year 1400; and the *cinquecento* (*five hundred*) that which superseded it about and after the year 1500. The word *mille* or *thousand* is in both cases understood, on the same principle that we occasionally date 50 for 1850. Therefore broadly, *quattrocento* and *cinquecento* mean respectively fifteenth and sixteenth century Art.

quattrocento masters did their utmost to attain perfection of form and expression in accordance with the prevailing religious sentiment of the day; and the architectural decorators, likewise, strove their utmost in the attainment of beauty without the slightest deference to what had been previously done, or with the slightest reverence for a single one of their minute details: many of these forms were derived from Byzantine symbolism, but the manner in which they were perpetually disregarded, changed, or altogether superseded, for something new, shows that their spirit was long gone, and that they were then mere forms.

The mere accidental materials, therefore, of a superstitious priest-ridden age are, in the sixteenth century, to be thrust before us as special objects of veneration; a veneration which it would very much puzzle the old *quattrocentisti* themselves to account for; with them, it certainly never existed: each successive generation used its utmost endeavours to improve upon its present, and none more than those very painters, sculptors, and architects, whose works it is now pretended must be the key and standard of posterity. We may now examine this peculiar revival in its details.

Setting aside the swaddling clothes or *incunabula* of Art, it has undergone three stages; these are the *Quattrocento*, the *Cinquecento*, and the *Eclectic* or *Academic*—the rise, the establishment, and the decline: these have been subdivided into many schools, all similar in essentials, differing only in technical details, or in the prevalence of some one or other of the essentials. The *quattrocento* is that in which the Art was gradually developing itself, and it ceases with the accomplishment of a fair individual representation of nature, independent of any æsthetic or theoretical influence. It appears in three distinct characters or styles, in which *Sentiment*, *Form*, and *Colour*, respectively, dominate; to the first school belong Gentile da Fabriano and Fra Angelico da Fiesole; to the second the great mass of the remaining quattrocento painters of Florence and many of those of Rome; and to the third the early Venetians,—the Vivarini, Giovanni Bellini, Marco Basaiti, and many others; and the old School of Cologne.

Such painters as Perugino and Francia, combining all the excellences of the style in a nearly equal degree (and the large Francia in the National Gallery is a fine example), are the *quattrocento* masters *par excellence*; Francia, perhaps, best represents the heavenly ideal of the style.

Masaccio, Filippo Lippi, Luca Signorelli, and a few others, whose great excellence in form contributed much to the advancement displayed in the cinquecento, belong strictly to neither one nor the other; they exhibit the transition, but they are generally reckoned with Perugino and Francia as the great masters of the *quattrocento*. This first great stage of Art is sufficiently well represented in all its bearings by the following six masters: Gentile da Fabriano and Fra Angelico, Masaccio and Lippi, Perugino and Francia.

With these masters, or with Francia rather, closes the first great epoch of modern painting, the *Quattrocento*; Michelangelo marks the era of the *Cinquecento*, and this is the epoch of its greatest perfection among the moderns. Now the *quattrocento* is essentially a period of progress; all that it displays was accomplished by long and slow degrees, and it exhibits only the victory over the essential difficulties of the Art, more especially those of a technical character; and it is a matter of necessity that the technical difficulties of an Art must be overcome before that Art can appear in all the glory of its fully developed powers. The *quattrocento* exhibits the Art simply in detail, many perfect parts but no unity, no whole; the *imitative* faculty is fully developed, but it was always displaying a faculty without using it; it was ever painting. Compared with the cinquecento, or with the school of Raphael, there is neither life nor motion in the *quattrocento*. The compositions of this period are full of sentiment certainly, but only to those who can sympathise with it; knowing the sentiments of the age to which the works of this style belong, we recognise and can appreciate

their sentiment, but it is all thoroughly conventional. Every figure, as a general rule, is an actor hired for the express attitude in which we find it; it seems to say "this is the position which essentially belongs to me, and I am not fit for any other." The best figures in the best *quattrocento* works seem all to have assumed their attitudes for a particular effect; they have sentiment, but it is nearly always the same, chiefly a parade of pious resignation, and has, like their attitude, been put upon them, and not proceeded naturally from any emotions of their own affections.

In this style then, interiorly, there is little if anything of genuine nature; what is natural in it is on the surface, and this it owes to its skill in individual imitation, and certainly not to any generic knowledge or power, such as characterises the antique. Perhaps no painter was ever more capable of making an exact picture of an individual model set before him, than Francia; and yet it would probably have been utterly impossible for Francia to have given even three figures a unity of action; in ornamental opposition he was sufficient master, but dramatic unity of composition was no better appreciated by him than by painters who preceded him a hundred years; Masaccio indeed understood it far better, and this is just one of the points which constitutes Masaccio one of the masters of the transition.

If Francia's model had happened to be deformed or mis-shapen, so would most certainly his picture have been; but doubtless so great a master as Francia would select his model; still, having selected it, he would scrupulously abide by its peculiarities at least, such from their works; seems to have been the principle of the best *quattrocento* masters. In sentiment they were thoroughly, what we now term in Art-criticism, *subjective*; that is, all their figures had to be imbued with their own prevailing idea, religious aspiration in some shape or other, but chiefly in the spirit of resignation or mortification; this feeling, which seems to have been a characteristic of the age, pervaded the whole province of Art, and therefore, in so far as this is only a very limited field indeed in the human emotions, so the Art of the period was only a very limited picture of nature, even in its own conventional Art sphere, and therefore, if we are correct in our view, the *quattrocento* presents not only an imperfect picture of the species, but also an imperfect picture of the individual, for though the body is often given with surprising skill and fidelity of imitation, it is a body with little life and a very limited and conventional spirit. The merit accordingly of this style, to put it for the sake of argument, in its most disadvantageous shape, is a mere isolated elaborate objective finish, and the sentiment being a species of "fixed quantity," it is only a kind of *shell painting*.

This is said without the slightest idea of depreciating the *quattrocento* masters, than which nothing can be further from our sentiments; but solely with a view to fairly contrast the natures of these two great historic stages of Art—the *quattrocento* and *cinquecento*, and by laying down clearly the peculiarities or characteristics of each, and bringing them into critical comparison, to show their relative merits; and it is in this spirit of criticism that we term the *quattrocento* mere *shell-painting* in comparison with the *cinquecento*.

It is literally true that every defect or deficiency of the *quattrocento* is supplied in the *cinquecento*. The mere individual representation becomes generic; for simple, ornamental, or symmetrical opposition, we have dramatic action; and to the expression of an austere piety, pity, or despair, is added that of every human emotion joyful or painful. And though we cannot predicate perfection of any of its individual works, still the style is, in its broad principles, perfect in itself. As the large picture of Francia in the National Gallery served as our illustration of the *quattrocento*, we may take the cartoons of Raphael as our examples of the *cinquecento*.

We have not in these works that minute elaboration of external accidents such as we find in the more limited style; but such finish,

however, is not incompatible with the cinquecento; it is only unnecessary, for it may fairly be dispensed with, as too trivial a merit to add either truth or dignity to the grand qualities of this consummate style of Art. With the impressive dramatic action, imposing dignity of appearance of the actors, extraordinary fitness of incident, accessory and principal, and the interesting and exalted nature of the subjects, there is but slight occasion to regret a clean line, a glossy surface, or a rosy complexion. Such superficial excellencies can be of importance only in the absence of more substantial merits, and where *imitation*, and not representation, constitutes the chief aim of the artist. If then this style exhibits such great qualities as to render mere superficial beauties immaterial to its effect, though perfectly admissible, how much more easily can it dispense with local accidents of the skin, superficial blemishes; they are so thoroughly out of place, that admit them, and they at once become the picture, as in the "Lame Man at the Beautiful Gate," and many other similar great cinquecento designs. *Individual treatment* in works of this kind, in which great events or sentiments constitute the subject, are so generally irrelevant, that, when they occur, they must be a part of the subject, as in "Christ healing the Sick," "Curing the Leper," or in a picture of a lazar-house or a lunatic asylum.

If age is to be represented, give the characteristics of age, but universal, not individual; so with youth, grief, or joy; a general treatment will be universally understood, while a special treatment to those unacquainted with the special symptoms adopted, is sure to be misunderstood; and by those who might understand them there is danger of the work being mistaken for a "pathological" illustration.

When painting is the mere handmaid to morbid anatomy, its path is clear and its duties fixed; it is then no longer Art, but an administrator to science, and it is without the pale of artistic criticism; but so long as painting is employed as an Art, its duty is to instruct and delight, certainly not to disgust. Should a painful subject be its theme, which it often may be, it will be the effort of the great painter to render his picture as becoming as his subject will admit, as instructive as a lesson, and as attractive as a work of Art, as it is in his power to make it. Indeed the lesson is clearly lost if the mode of conveying it is revolting or disagreeable; the very end of the work is completely counteracted, which is the more deplorable in proportion as the subject or its motive be good or great.

It is the high ground, in point of subject generally, taken by the "Young England School," which renders their mistaken treatment so much the more to be deprecated. None can hail with more delight than we do their recourse to the higher realms of sentiment for their subjects; for the gradual encroachment of dogs and horses, threatening to completely overrun the province of taste in this country, is calculated to drive the true lovers of Art almost to despair, unless a few stalwart champions on the other side rise up to dispute the field with these four sided favourites.

So it is that we argue their principles with this school rather than condemn their works. We wish them to persevere, but in the spirit of world-artists, not ascetic fanatics. The school exhibits, in our opinion, two capital defects; it breathes in the spirit of its works the miserable asceticism of the darkest monastic ages; and exhibits in their execution quite the extreme littleness of style that ever disfigured the works of any of the early middle-age masters.

In the first place it appears to assume sorrow or gravity as the normal state of man; whereas all our faculties teach us that exactly the reverse is our normal state, and that we bring all our miseries on ourselves by the abuse or neglect of these faculties. In the second, disregarding the fruits of the earnest and skilful labour of ages, it goes back to the puerile achievement of the infants of Art—an illusive elaboration of a local accident; as the skilful rendering, for instance, of the dirty corrugated skin of an emaciated frame; thus giving prominence to a condition which a master of a healthier school would not

even twice look at—unless he wished for a specimen for a lazar-house—much less select as that of his model for a sacred or historic character.

No exalted sentiment can possibly be aided by either ugliness or disease; it is true that there are certain physical conditions that are admitted to be antagonistic to certain moral conditions, but their antagonisms are as well defined as the physical conditions themselves. Neither health nor comeliness are incompatible with sorrow or piety, though the combination would require a greater artistic skill to represent it.

No painter probably would dream of selecting the Hercules of Glycon as his model for John the Baptist preaching in the Wilderness, because this figure of Hercules is a generic or ideal figure of physical power, which John the Baptist was not; and none but the most incompetent could overlook the incompatibility of character. At the same time, it would be less absurd to give this robust character to John the Baptist, than to imitate the example of those who have represented him as an emaciated lazar; for his very office proves that he must have been a man both of healthful vigour, and of great powers of endurance.

There is certainly not a more paltry subterfuge in Art than that of attempting to represent intellectual or spiritual power at the expense of the physical condition; it was all very well for a middle-age monk who saw little more of humanity than his cloister fellows, among whom some such test between the fat and the lean might induce him to suppose that indolence and indifference were the characteristic of the former, and assiduity and devotion of the latter; but the very fact of such being extremes proves the mean to be the true state. Those minds sufficiently strong to overcome bodily defects are rare exceptions, and that *mens sana in corpore sano* is the rule, is the perpetual experience of the world.

Directly the activity of the mind encroaches upon the resources of the body, both fall together. The physical ideal alone can harmonise with the spiritual ideal; in Art, whatever it may be in Nature in its present condition, the most beautiful soul must have the most beautiful body; lofty sentiment and physical baseness are essentially antagonistic; even in the lowest sinks of poverty in the world, the purest mind will shine transcendent—there will always be a comparative cleanliness of person and calmness of expression, which will widely distinguish its possessor from those whose debasement of physical condition is reciprocated by that of the soul. No darkness is so thick that the light of innocence will not shine in it, and no body can be so debased that true nobility of soul will not envelop it with a halo of dignity.

We have all of us, beyond the age of boyhood, had opportunities of experiencing the truth of these observations; and how strange does it appear that we should have educated artists in the nineteenth century, selecting physical misery of condition for the special incorporation of the very beau ideal of the moral greatness of which humanity is capable!

We may pardon the quattrocento masters for doing this occasionally, both because asceticism was one of the virtues of the monastic age in which they lived, and because as artists they had not yet attained to the grand power of idealising or generalising; their skill was still limited to making a faithful copy of the individual model set before them. However, as it was with the quattrocento, so it is with the "Young England School," the ugliness of their figures is as much in the sentiment as in the physical treatment.

There are perhaps only two great essentials to the healthy expression of exalted sentiment generally, and these are the appearance of cleanliness, and the absence of disease; mere form of feature is not essential either way, either for the expression of beauty or of ugliness; beauty of expression consists in the management of the features more than in their shape, as very ordinary features may be rendered extremely agreeable by a noble expression, and the most beautiful features are capable of the most diabolical expression. It shows, therefore, that here the figures of various compositions are

uniformly disagreeable, in works of this quattrocento class of Art, their authors are as circumscribed in their range of sentiment as they are limited in the appreciation of physical beauty; for, notwithstanding their meagre forms, the utmost variety of effect might still be produced by a comprehensive grasp of character, as indeed we find in many of the best works of Fra Angelico and other great masters of this school, in its genuine original development.

It is, therefore, a wholly groundless notion that there is anything antagonistic to sentiment in the magnificent physical development of the cinquecento. The greatest cinquecento masters themselves, as Raphael or Michelangelo, were always true to the spirit of their style; soul and body were equally refined upon, equally generalised; and they did not surpass the quattrocento masters less in sentiment than they did in their physical development.

That the cinquecento degenerated into the Academic in the seventeenth century, is no fault of the style itself; the eclectics of Bologna, though they might profess to bestow equal attention upon the exalted character and the physical of the cinquecento, could not so easily point out to their pupils in what this elevation of character consisted; but as it was evident something was to be imitated, these naturally fell upon the more obvious characteristics of technical qualities—form, colour, light and shade; hence the utter preponderance of these qualities in all the Eclectic and subsequent Academic schools, even to this day. Commendation and blame, themselves, are almost comprised in six notions: a picture is well or badly drawn; is rich, or dull and muddy in its colour; is flat, or masterly in its light and shade. Whether the subject is dramatically treated, historically or aesthetically true or probable, common-place or judicious in its selection, hackneyed or new, instructive or mischievous, worthy or inferiorly rendered, painful or delightful, are all considerations too subordinate to participate in the absorbing question as to the mechanical handiness with which the paint has been laid upon the canvas.

This is a matter the "Young England School" may attempt to remedy without retrograding four hundred years, or visiting the high qualities of Art developed in the cinquecento, with that judgment which is due alone to those who have made only a partial or improper use of them—and we leave them with a hope that they will fulfil this great destiny for Art.

R. N. WORMUM.

THE EXHIBITION OF THE PRIZES OF THE ART-UNION.

THE works selected by the prize-holders of the Art-Union were exhibited to visitors with private tickets on Saturday the 10th of last month. The number of pictures is seventy-nine, and that of water-colour drawings is thirty, which together with small bronzes and bas-reliefs, form a total of one hundred and twenty one works of Art. The collection presents many very interesting pictures. The sales have this year been extensive, and it is somewhat surprising that some of these pictures had not been purchased very early in the season. The most attractive picture of the exhibition is "James II. receiving the news of the landing of the Prince of Orange," E. M. Ward, A.R.A., which was selected by Mr. Jacob Bell, in right of a prize of 80*l.*, and paying the difference of the price. This picture is seen here certainly more favourably than in the Royal Academy. In the cases also of "Venice," W. Linton, the price paid was 250*l.*, the prize amounting only to 200*l.*, and "The Marquis, having chosen Patient Griselda for his Wife, causes the Court ladies to dress her," R. Redgrave, A.R.A., selected by Mr. Mann, the prize was 200*l.*, and the price paid 231*l.* "Peter denying Christ," J. Hollins, A.R.A., represents a prize of 150*l.*; "Porto Fesano," G. E. Hering, 150*l.*; "Kidley refusing to do homage to the Pope's name," 100*l.*; and "San Pietro near Verona," J. D. Harding, 100*l.* There are many other works of rare excellence, and some of them gain considerably in the places in which they are now hung; as "Clearing the Wood—Early Spring," J. Middleton; "The Road, 50 Years ago," J. Peel; "At Rowe, North Wales," Mrs. Oliver; "Hailing the Ferry, Morning," E. Williams, Sen.; "Scene near Cneek-

field," Copley Fielding; "Hazy Morning on the Thames, near Medenham," H. J. Boddington; "Straw Yard," J. F. Herring; "At Cologne on the Rhine," J. B. Payne; "Mornings—the Stream in the Hills," T. Groszwick, A.R.A.; "Here's his Health in Water," R. R. M'lan; "A Mountain Stream, Borrowdale," H. Bright; "Wood Gleaners crossing a Brook," H. Jutsum; "Hawkers of Relics exhibiting them to the sick daughter of a Peasant," James Godwin; "The Shower," E. J. Cobbett; "Piazzetta di S. Marco," J. Holland; "In Marlborough Forest," W. F. Witherington, R.A.; "A Farm Cottage," G. A. Williams; "A Scene during the Invasion of Italy by Charles VIII.," F. R. Pickersghill, A.R.A.; "Peversill Castle," J. Tennant; "Windsor," J. Stark; "View on the Rhine," H. C. Selous; "Waterfall near Haeg, between Christiana and Bergen—Norway," W. West; "Venus and Cupid," G. Patten, A.R.A.; "Calais Fish Girl," H. M. Anthony; "On the Trent," F. W. Hulme; "A Dutch Madonna," C. Broeky; "Lady Maebeth," F. W. Hurlstone; "A Showery Day on the Thames," A. W. Williams; "A Welsh Scene," G. A. Williams; "The Gospel in the Wilderness," R. R. M'lan; "Lake Gwerit," J. Danby; "A Welsh Farm," S. R. Percy, &c. No. 80 is a bronze, "The Entry into Jerusalem," after the bas-relief by J. Hancock, which obtained the premium of one hundred pounds. We have already spoken of this bas-relief in the terms of praise which it merits; it has, we presume, been electrotyped from a model which would have served admirably for a mould for plaster, but was not sufficiently careful for metal. "The Death of Boadicea," also a bronze, after the original by H. H. Armstead, is distinguished by the finest qualities of bronze. It is sharp and decided in its outline, and all its surfaces are extremely clean. One of the engravings for the current year is exhibited; it is entitled "The Villa of Lucullus at Misenum," and has been engraved by J. T. Willmore, A.E.R.A., after the original by W. L. Leitch; it is extremely classical in feeling, and is certainly one of the best of the works that have been issued by the society. It is executed in line with a charming feeling for the nearer surfaces and remoter gradations. The proof is, however, unfinished, and the perfected plate will be among the engraver's best works. This part of the exhibition contains also bronzes which have formed prizes in antecedent years, as "Hebe," "The Eagle-Slayer," "A Youth at a Stream," "Iris Ascending," and a small bust of the Queen, copies of which were distributed as prizes in 1848 and 1849. "Narcissus" is a small work in Parian, executed by Mr. Copeland, from a reduced model by E. B. Stephens, after the original by Gibson. Another work in the same material is entitled "Innocence;" it has been executed for the society by Mr. Copeland, from a model reduced by B. Cherterton, from the original by J. H. Foley; also a "Dancing Girl Reposing," from the original by W. C. Marshall, A.R.A. These three works are, we believe, the first that have been executed for the society in Statuary-porcelain; they are exclusively intended for distribution as prizes by the society. The "Entry into Jerusalem," already mentioned as a bronze, has been engraved by the anglo-tyrograph, but the scale of tone in this work much more limited than anything we have ever before seen by the same process. If the impression be unfinished it is not marked so; the appearance of the entire surface is that of a white metallic plate. In the engraving of Flaxman's Shield a relief is given to the figures, which brings them forward almost as much as on the original surface; but here we humbly submit that the relieving shades are many tones short of their necessary depth.

We find among the water-colour drawings a greater proportion of excellence in the whole than among the oil pictures; the number of drawings is also considerably greater than might be supposed, when it is remembered that there were four exhibitions of oil pictures open to prizetakers. "A Welsh Funeral, Bettws-y-Coed, North Wales," by Cox, is one of the best drawings of the season; the artist indeed has never surpassed it. "Christ with his Disciples in the Corn-field," by Warren, is also one of the best productions of its author. There are other works of great merit, as "Blackberries," W. Hunt; "The Strid on the Wharf," G. Frupp; "A bit at Bettws-y-Coed," T. S. Rowbotham, Jun.; an "Arab Horse," G. H. Laporte; "Collector Fishing Smacks," T. S. Robins; "A Study of Beech Trees," Charles Davidson; "Blue Bell Hill and Kitt's Cotty House," James Fahy; "View of Ben Cruchan," Copley Fielding; "River Scene in North Devon," W. Bennett, &c.

The collection is entirely superior to those of preceding years; it contains works which in their respective genres are rarely excelled.

THE EXHIBITION OF 1851.

To the Editor of the Art-Journal.

SIR.—We recognise in you one who has subscribed largely, who has advocated strongly, and who, we think, wishes well to the great Exhibition of all Nations in 1851; we therefore regret the more the tone of an article in the last number of your Journal.

Though there may be cause to complain of many things, yet you have added so much exaggeration and also so much error that an enemy to the object we all have at heart could not have endeavoured more to damp ardour or to bring discredit on the undertaking.

In reference to your observations on the Westminster Local Committee you have evidently been misinformed; first, as regards our Secretary Mr. G. H. Drew, at the preparatory meeting on the 18th February, he acted as honorary Secretary to the gentlemen who met at the Thatched Horse, to arrange the proceedings on the 21st February; but on the 22nd February when the Local Committee had been constituted, he was appointed our secretary, with the full understanding that his services were not gratuitous. In the course of a month afterwards, when his duties had been ascertained, on the recommendation of our Local Commissioners, and with the full and unanimous approval of our Committee, we named his salary 200*l.* a year; his labours have been very great, and the extra assistance that has been found necessary has been ungrudgingly rendered, and no assistant Secretary, with or without salary, has been asked for or appointed; we cannot speak too highly of the services that Mr. G. H. Drew has given to us, and we consider ourselves fortunate in having secured them: we add also that he has not been appointed to any other situation in any other Board.

You next quote from a *paid* advertisement inserted in the *Times Newspaper*, by Sir Frederick Roe, a communication containing so much false statement that we thought it would be duly estimated, and therefore considered it was unnecessary to notice it, till it acquired importance in your Journal; we deny that anything like intimidation has been employed by us or any person authorised by us; but we name Sir Frederick Roe himself, as having *tried* to intimidate a tradesman because he was in favour of the Exhibition.

Again you charge us with misapplying the funds collected by us in paying six Collectors three guineas a week for six months, or about 450*l.*; the whole amount paid by us to these Collectors is about 150*l.*; this is a serious accusation which you could have rectified upon proper enquiry, and is the more unfortunate as it remains a month uncontradicted.

We look to you, the Editor of a Journal that should have a powerful influence on Art-Manufacture, we look to you as a friend to the Exhibition, not an enemy; we invited you to form one of our Local Committee, and to serve as a Local Commissioner, regretting that you felt bound to refuse; yet we hoped you would seek to aid, encourage, and support us, not abuse.

Our proposed Exhibition has escaped many dangers and difficulties inseparable from so vast an undertaking; many yet remain to be overcome; we feel the necessity now of avoiding all trifling differences. There is much to be done; it is difficult to do it; let us who wish well to this grand enterprise labour with all our energy to bring it to a successful result, and make the Exhibition of 1851 redound to the glory of our country and our age.

We call upon you to insert this explanation in the next number of your valuable Journal, and we feel assured you will in fairness do so.

We are, Sir, your obedient servants,

THE WESTMINSTER LOCAL COMMITTEE FOR THE GREAT EXHIBITION IN 1851.

COMMITTEE ROOM, PALE MALL EAST
August 13, 1850.

[We do not a moment hesitate to print this letter: the Westminster Committee are entitled to all respect, not alone because of the position they

occupy, but as practical and experienced men working with ardour and unity of purpose for the common good. We are by no means disposed to enter again at length into those "errors" (to use a mild term) which have marked the career of the Commission and its employees from the commencement: we have said that which we believed it was necessary to say; and trust that our future may be devoted entirely to the aid of a great movement, which, if wisely and honestly managed, cannot but redound to the honour of our country and be in the end essentially serviceable to its best interests.

Our "exaggerations" and "errors" pointed out by the Committee are few, and comparatively unimportant; we have no doubt whatever that Mr. Drew is an efficient Secretary—we thought, and think, it not over-dedicate to have appointed to this office the son of one of "the executive," of a gentleman too, who was, and we presume is, the agent of Messrs. Munday, who make an enormous claim for "compensation" upon the commission; and we hold to the opinion that to have appointed him "honorary Secretary" one day, and a "paid Secretary" the next, was at all events injudicious. It is of course correct that Mr. Drew, Jun., has not been appointed to any other situation on any board; but it is certain that he was recommended to such other situation, and that his appointment to it was intended.

With respect to the paragraph concerning Sir Frederick Roe, we can only say that we prefer relying upon his statement rather than upon that of the collecting clerks from whom the Committee obtain their information; and that his testimony does not by any means stand alone.

We assure the Committee that we had made "proper enquiry" concerning the expenses they had incurred through collecting clerks; and are somewhat surprised to find that this expense has not much exceeded 150*l.*—*paid, and to be paid:* for so we understand it.

With respect to the observation that we had been invited by the Committee to form one of the Committee, and also to act as a Local Commissioner, we have to say that, while fully sensible of the honour proffered to us, the invitation to join the Committee was not conveyed to us until about two months after the Committee was formed; and that we declined the office of Local Commissioner for Westminster on the ground that we could not reconcile the duties we should be called upon to perform with those which devolved upon us as the conductor of a public journal, in which all proceedings connected with the Exhibition must be commented upon fearlessly, and without reserve.

The City of London honoured us with a precisely similar application; an application which we also felt bound to decline: thus holding ourselves free to treat the subject without incurring the hazard of being charged with breaches of confidence in communicating such information as we might obtain.

As we have said, we shall hope that our future may be dedicated to the service of the Commissioners and the several Committees, and that our exertions will be without drawback in aiding them in the arduous and onerous task they have undertaken; many difficulties they will have to encounter, and we readily admit that it will be our duty, as far as we can, to lessen them; we hope and believe that in the article we put forth in our last number we shall have shown, that, while on the one hand the proceedings of the Commission will be narrowly watched, the public will be protected on the other, and that much good will arise to both parties out of this conviction.

We have stated elsewhere that we design to work for the purpose of the Exhibition by every means which may be suggested to us, and that we shall spare neither labour nor cost to be its effective reporter; before this number of the *Art-Journal* is in circulation we shall be on our way to Germany, visiting the various manufacturing towns of the Rhine, Prussia, Bavaria, Austria, and the principal German States; on our return we shall, on the same grand visit, the several towns of Belgium, and, at the close of the year, those of France; and before the Exhibition opens we shall hope to have revisited each of the manufacturing districts of England, Scotland, and Ireland.

We make these Tours not without the hope to aid the manufacturers of our own country; to show them their advantages, and to explain to them their necessities; and, we trust, to make manifest that the one may be permanent, and the other temporary.

The Westminster Committee may rest assured that we are fully impressed with the weight of their caution and counsel, to "let all who wish well to this grand enterprise labour with all energy to bring it to a successful result, and make the Exhibition of 1851 redound to the glory of our country and our age."—Ed. A.-J.]

THE BRITISH ASSOCIATION FOR THE
ADVANCEMENT OF SCIENCE,
AT EDINBURGH.

UNDER the Presidency of Sir David Brewster, the British Association has just held its twentieth meeting in Edinburgh. So many matters of interest present themselves upon a review of this assemblage that we should ill perform our duty of making the *Art-Journal* a record of the progress of the nation if we did not place before our readers a summary of its proceedings.

We have long been impressed with an idea that there was a great want of earnestness in our men of science—that they contented themselves too much with the smaller details of observation, and allowed the mind to lose its power of making mere enlarged generalisations. This appears to have arisen in a great measure from the constant desire to apply abstract science to purposes of utility; from the pressure of the *cui bono* cry, which necessarily disturbs that tranquillity which is essential to the cultivation of philosophy. We have plainly proved our desire to aid in applying all the truths of science to some useful end. We have used our powers, humble though they be, to direct attention to this, and to show to our manufacturers and to our artists, that science has a peculiar ministrations for them, and that seeking her aid they will find their reward. At the same time, we strongly desire to see man advancing in the scale of intellect, and it is by adding truths to our knowledge that this is to be effected, rather than by applying those truths we already know. It becomes therefore of the highest importance that the balance of mental energy should not be allowed to preponderate too much on the side of utility; a full amount of interest should be cultivated for all those researches which tend to advance man's knowledge of the wonderful machinery which regulates creation. A truth once born never dies; it goes on gathering strength with time, and it is certain eventually to be made available by man to some of the important wants of his being.

The *cui bono* cry cannot, therefore, be too loudly deprecated; the worth of every fact new to man's knowledge is great beyond human reckoning, and it tends from the first moment of its development to exalt the mind and give a higher tone to its aspirations.

With these feelings we went to Edinburgh, that celebrated seat of learning, hoping that amongst the numerous matters, which would necessarily occupy the different sections of the British Association, we might acquire some truths new to our knowledge, and we have not been disappointed. The evidences of progress have been very decided. There has been less manifestation of that rail-road impatience which admitted only a cursory survey of the bare externals of a truth. There has been more deep seeking—mining for the hidden and strongly guarded treasure—than formerly, and the healthful tone of the general body, as representing British science, argues most pleasingly for its future.

In commencing our notice of this "gathering" we cannot avoid making a few extracts from the opening address of Sir David Brewster, which was marked by his usual intellect and elegance, somewhat subdued and solemnised under the influences of those sorrows from which no human being can be free. In making his review of the progress of knowledge, he said—

"I begin with Astronomy, a study which has made great progress under the patronage of this Association; a subject, too, possessing a charm above all other subjects, and more connected than any other with the deepest interests, past, present, and to come, of every rational being. It is upon a planet that we live and breathe. Its surface is the arena of our contentions, our pleasures, and our sorrows. It is to obtain a portion of its alluvial crust that man wastes the labor of his days, and prostrates the energies of his mind, and risks the happiness of his soul; and it is over or beneath its verdant turf that his ashes are to be scattered or his bones to be laid. It is from the interior, too, from the inner life of the earth that man derives the materials

of civilisation; his coal, his iron, his gold. And deeper still, as geologists have proved, and none with more power than the geologists around me; we find in the bosom of the earth written on marble, the history of primeval times, of worlds of life created and worlds of life destroyed. We find there, in hieroglyphics, as intelligible as those which Major Rawlinson has deciphered on the slabs of Nineveh, the remains of forests which waved in luxuriance over its plains; the very bones of huge reptiles that took shelter under its foliage, and of gigantic quadrupeds that trod uncontrolled its plains; the lawgivers and the executioners of that mysterious community with which it pleased the Almighty to people his infant world. But though man is but a recent occupant of the earth, an upstart in the vast chronology of animal life, his interest in the Paradise so carefully prepared for him, is not the less exciting and profound. For him it was made, he was to be the lord of the new creation, and to him it especially belongs to investigate the wonders it displays and to learn the lesson which it reads."

Passing the President's review of the Sciences allied to Astronomy, and correcting an error into which he was evidently betrayed by his recent visit to the French metropolis—he stated that Arago had discovered that the central parts of the sun have a higher photographic action than the edge of his disc; whereas the discovery was made in 1840, by Sir John Herschel and the author of this paper, by entirely independent observations—we shall content ourselves with quoting Sir David Brewster's remarks on our Patent laws, which are in their operation so exceedingly oppressive and unsatisfactory to our manufacturing community:—

"A man of genius completes an invention, and after incurring great expense, and spending years of anxiety and labour, he is ready to give the benefit of it to the public. Perhaps, it is an invention to save life,—the lifeboat; to shorten space and lengthen time,—the railroad; to guide the commerce of the world through the trackless ocean,—the mariner's compass; to extend the industry, increase the power, and fill the coffers of the state,—the steam engine; to civilise our species, to raise it from the depths of ignorance and crime,—the printing press. But, whatever it may be, a grateful country has granted to the inventor the sole benefit of its use for fourteen years. What the statute thus freely gives, however, law and custom as freely take away or render void. Fees, varying from 200L to 500L, are demanded from the inventor; and the gift thus so highly estimated by the giver bears the Great Seal of England. The inventor must now describe his invention with legal precision. If he errs in the slightest point, if his description is not sufficiently intelligible, if the smallest portion of his invention has been used before, or if he has incautiously allowed his secret to be made known to two or even one individual, he will lose in a court of law his money and his privilege. Should his patent escape unscathed through the fiery ordeal, it often happens that the patentee has not been remunerated during the fourteen years of his term. In this case, the State is willing to extend his right for five or seven years more; but he can obtain this extension only by the uncertain process of an act of parliament, a boon which is seldom asked, and which, through rival influence, has often been withheld." Sir David Brewster then refers to the recent Acts "*For amending the laws touching letters patent for inventions*," and for "*Registering Designs*," and continued:—"These are doubtless valuable improvements, which inventors will gratefully remember; but till the numerous fees which are still exacted are either partly or wholly abolished, and a real privilege given under the Great Seal, the genius of this country will never be able to compete with that of foreign lands, where patents are cheaply obtained and better protected."

These remarks have a double weight at this time, when all the energies of our manufacturers are stimulated by the Exhibition of 1851; and it is pleasing to record that the new Attorney-General has accepted his office on the express

condition that the large fees which he derives from patents will be subject to revision.

The following in conclusion is too valuable in its suggestions to be omitted from our pages:—

"Were a Royal Academy or Institute, like that of France, established on the basis of our existing Institutions, and a class of resident members enabled to devote themselves wholly to science, the youth would instantly start for the prize, and would speedily achieve their full share in the liberality of the State; our universities would then breathe a more vital air. Our science would put forth new energies, and our literature might rise to a high level. But it is to the nation that the greatest advantages would accrue. With gigantic manufacturing establishments, depending for their perfection and success on mechanics and chemistry; with a royal and commercial marine almost covering the ocean,—with steam-ships on every sea; with a system of agriculture, leaning upon science as its mainstay; with a network of railways, demanding for their improvement and for the safety of the traveller, and for the remuneration of their public spirited proprietors, the highest efforts of mechanical skill; the time has now arrived for summoning to the service of the State all the theoretical and practical wisdom of the country, for rousing what is dormant, combining what is insulated, and uniting in one great institution the living talent which is in active, but undirected and unsupported, exercise around us."

The subjects which occupied the attention of the physical and mathematical section were necessarily of an order, which, in their details, would not prove interesting to the readers of the *Art-Journal*. The greater number of communications were on meteorological subjects; there was some interesting information given on cometary phenomena by Professor Smyth; and Mr Mallet continued his valuable report upon earthquakes; magnetic phenomena claimed much attention; Sir David Brewster exhibited a series of Photographic specimens procured from albuminised glass plates by Messrs. Ross and Thomson of Edinburgh, which were remarkable for the extreme sharpness of their outline, the minuteness of detail and the charm of aerial perspective; others by M. Constant of Rome, and also by Mr. Buckle of Peterborough, from negatives on paper, and from negatives on gelatine executed by M. Balard in Paris. As exhibiting the progress of photography these were very interesting, but another set communicated by Mr. Hill, the joint productions of that talented artist and of the late Mr. Adamson, were remarkable for the picturesque character of the groups, and the general disposition of the parts in every feature. These were not merely portraits or copies of still-nature, but they formed studies of a higher artistic character, and exhibited effects which prove the truth of the elder masters in the arrangements of their lights and shadows. In connection with this Mr. Claudet exhibited and described an instrument used by himself for correcting the focal distances of lenses when employed in the daguerreotype processes. This instrument called the dynactinometer promises to be of much utility to the practical Photographer.

In the chemical section many interesting and valuable communications were made; as most of them were of a purely chemical character, and had reference to theoretical views, we shall confine our notes to the few which bore more directly upon subjects of usefulness. Mr. Gassiot exhibited a diamond which had undergone a very remarkable change in the heat of the galvanic arc. It will be remembered by many of our readers that M. Jaqueline proved that diamonds could be converted into coke by the exposure to a very high temperature, thus proving by synthesis that the diamond was only charcoal in a new form. In Mr. Gassiot's experiment the diamond was fused, and on suddenly cooling it assumed a curious shape resembling in some respects that of a honey-comb, but its cells were spotted with small crystalline formations. At the meeting of the British Association at Swansea Mr. Nasmyth exhibited many specimens of coke, which had become so hard in the process of manufacture, that they would cut glass. This

announcement appears to have started Mr. Sorby of Sheffield on the enquiry, and he gave the chemical section a valuable paper on the trimorphism of carbon. His researches appear to show that carbon is susceptible of three distinct crystalline forms, to which he is disposed to refer the difference exhibited by coke, graphite and the diamond.

An account of some curious amalgams of mercury with iron, copper, platinum, and other metals, was given by Mr. Joule; these were formed by the process of electrolyte deposits upon the surface of mercury. The solid amalgam resulting after the compounds were exposed to a very powerful pressure was found to be a true chemical combination, and hence, we may expect, susceptible of some use in Arts or Manufactures.

Following a report, made at the request of the Association by the author, "On the present state of our knowledge of the Chemical Action of the Solar Radiations," Dr. George Wilson made a most important communication—*On the Influence of Sunlight over the Action of Dry Gases on Colours*. The enquiry was not confined to those gases known to have a bleaching property, but extended to hydrogen, nitrogen, oxygen, carburetted hydrogen, and other gases which are likely to be met with in the atmosphere of crowded cities. Under the influence of the sun's rays it was found that nearly all these gases exerted a chemical action, producing changes of colour, but not constantly bleaching them, which they did not exhibit when they were kept in the dark. Although this enquiry is far from complete—indeed, a committee has been appointed by the Association for continuing the investigations, with a grant of 50*l.* at their disposal, consisting of Drs. G. Wilson and Gladstone, and Mr. Robert Hunt—yet it has been sufficiently shown that the destruction of colour is due to combination between the bases of the colours and some gaseous body, which combination is much quickened by the agency of the solar rays. This enquiry necessarily points towards the means for preserving works of Art. It has been shown that the principle producing those changes can be separated from light; and it appears not to be difficult to illuminate our picture galleries in such a way—that no light should be obstructed; that the colours of the paintings should be but slightly, if at all, affected; and that the agent producing chemical changes should be entirely cut off. In building any new gallery for our national pictures it will be wise to bear this in memory.

Professor Buckman gave a paper upon some curious chemical facts connected with the Roman tessellated pavements recently discovered at Cirencester. This communication was illustrated with some beautiful copies, full size, of the original pavements. These were afterwards placed in the Library of the College, in the exact positions in which they were discovered, so that every one was enabled to judge of the merit of these curious productions of the Romans during their rule in England. The designs are in themselves of a very fine character; one of the centrepieces, Actæon attacked by his dogs, is exceedingly spirited, the attack of the dogs being distinguished by more energy than we should have thought compatible with the material employed. A head of Pomona is also a fine example of the Art. The tesserae are all selected from the rocks found within a short distance of Cirencester; they have been chosen with particular reference to their colours with much care, and varieties of colour have also been produced by burning and by smoking them—so as to peroxidise the iron contained in the Oolitic rocks—or to impregnate them with carbon. An example or two of manufactured tesserae occurs; a red-glass, stained with oxide of copper, being a remarkable example. A head of Flora when discovered was ornamented with a peculiar verdigris green representation of flowers, the effect of which was anything but harmonious—but on scraping the tessera it was found to be a red-glass which had undergone decomposition and thus become covered with carbonate of copper. Professor Buckman, who has been assisted in his investigation by Dr. Voelcker, has published an account of these interesting remains, to which we refer our readers.

Geology, the most popular of the modern sciences, telling, as it does, the story of ages during which the world appears to have been undergoing those mutations which were eventually to fit it for the abode of intellectual man, did, at this meeting, as it always does, attract the greatest number of listeners. The Geological Section was almost always crowded, and the communications were generally listened to with much interest. Mr. Robert Chambers gave an interesting account of the Glacial Phenomena of the neighbourhood of Edinburgh, and a Geological excursion was made under the direction of that gentleman, to visit some of those remarkable smoothings and groovings of the rocks which are now most satisfactorily referred to the grinding action of Glaciers, at a period when this country was covered with those gigantic ice-formations. Mr. Robert Chambers has, it appears to us, taken a very wise course in confining himself to the collection of facts, not venturing, in the present state of our knowledge, to theorise on the subject. It is an unfortunate feature in modern science that men, reasoning by analogy, rush to conclusions on the faith of some resemblance, without stopping to examine all the conditions of the circumstances, whatever they may be, under discussion. Several other papers were read upon the same subject, of glacial action, which is, among geologists, exciting considerable discussion.

In the department of Natural History the papers were more numerous than usual, and many new and important discoveries were announced. With most of these, notwithstanding their value, we have little to do. We cannot, however, pass this section without noticing that Mr. D. R. Hay brought forward a paper—"Observations on the Geometrical principles of Beauty in general, and more particularly as applied to Architecture and to the Human Form." As this hypothesis of Mr. D. R. Hay has already been the subject of a communication to the Society of Arts, and having been published by the author, we are not satisfied that it correctly found a place in the proceedings of an Association, the object of which is purely the advancement of science by the announcement of new facts or statements of the progress of investigations. Mr. Hay's paper is not, however, a solitary example of this republication, to which we see many serious objections. Having said thus much, we may remark that Mr. D. R. Hay has done good work in drawing attention to the beautiful in Art; and although disposed to regard the really beautiful as the result of a spiritual power which will not be controlled by any set formula, or bound within any geometrical lines, it is pleasing to see that the spontaneous emanations of the Greek mind conform to laws—undreamed of by the Greek artists themselves—which are found to prevail through the mechanism of the universe. In the sub-section of Ethnology, Dr. Edward Hincks gave some very valuable information on the language and mode of writing of the ancient Assyrians; and Major Rawlinson announced the discovery, by Mr. Layard, of a Hall of Records, within which, piled from the floor to the ceiling, were found slabs of terra-cotta, inscribed with what appeared to be the history of that mighty monarchy. A great quantity of these slabs are being transported to this country, and there is not much doubt but these will, by the aid of Dr. Hincks and Major Rawlinson, place us in possession of important knowledge concerning the great empires of antiquity. This discovery, in connexion with the valuable investigations of Mr. Loftus, the important results of which we communicated in our last, may be regarded as among the most valuable acquisitions made within our own time to our historical knowledge. In Mechanical Science there were many really useful communications; and it is pleasing to perceive, that by the efforts of a small knot of honest and earnest men, the mechanical section has been rescued from the low condition into which it had fallen, it having served for many years no other purpose than an advertising medium for smoke consumers and similar patent inventions.

At the evening meetings two lectures were given, one by Dr. Bennett and another by Dr.

Mantell, with an incidental one by Mr. Nasmyth at the second soirée, on the condition of the lunar surface. By means of his beautiful and most complete reflecting telescope, Mr. Nasmyth has been able to institute a series of observations of the moon's surface, such as have never before been attempted; and with his artistic capabilities he has been enabled to represent to us on a true scale the remarkable condition of our satellite. It would appear from these observations, that the moon must still be in a state of igneous disturbance, judging from the evidence of active volcanic action which marks some parts of its disc, and the distinct indications of mountain formations under the influence of intense heat which everywhere prevails.

Blending pleasure with science several excursions were got up, and a great number of the members availed themselves of the opportunity thus afforded of visiting some of the remarkable scenes within a short distance of the Scottish capital. We have endeavoured, within the limited compass afforded by the numerous other matters which claim our space, to give an outline of such portions of the business of this meeting as we think will prove interesting to our readers.

The value of these interesting meetings of the British Association has been questioned, and its benefits doubted by occasional visitors and superficial observers. The result of a close attendance for many years furnishes the most conclusive evidence, that, wherever the British Association holds its meetings, there it leaves a vital germ, which, like the grain of mustard seed, exerts its vitality and becomes a noble growth. Again, in the union of minds, otherwise widely divided, fresh thoughts are kindled, and in their light new and important investigations are undertaken, and often carried on to a most satisfactory end. If no other gain than this arose from the annual meeting of this great association, it would have done its work of good. The meeting is to be held at Ipswich in the year 1851, and the time, to be arranged by the council, adjusted to suit the convenience of the strangers who may be expected to visit the metropolis during the Great Exhibition of Industry. It is to be desired that the members of the Association, particularly the chemists and mechanics among its members, should bear the objects of this great national gathering in view, and be prepared with communications which might, on this occasion, particularly serve to illustrate the science of manufacture. By working to such an end many very important results might be obtained, and the utility of abstract inquiry placed in its most striking position, as ministering to the necessities of the human race.

ROBERT HUNT.

THE VERNON GALLERY.

A HIGHLAND COTTAGE.

Painter, A. FRASER. Engineer, G. COOPER.
Size of the Picture, 2 ft. 11½ in. by 1 ft. 11 in.

THERE must be few travellers through the Highlands of Scotland, especially among those who adopt the best method of exploring a country, namely, on foot, who have not witnessed some such scene as that which the artist has here depicted. The cleanliness, comfort, and orderly arrangement generally found in the English cottage, are rarely to be seen in the dwellings of the Scotch mountaineer or the Irish peasant.

Mr. Fraser, himself, we believe, a native of the northern parts of Scotland, has represented with much truth one of these Highland homes. There are, of course, in such a scene, few points of attraction to the painter, unless by the introduction of some domestic incident. Here the artist has brought forward a young bare-legged urchin left in charge of the "wee-bit bairn" and the "seething pot," while the elders of the family are most probably engaged in their out-door occupations; the little fellow seems to have fallen asleep himself while rocking the other to its slumbers. The light falls on the centre of the picture, sideways, from the open door in the further compartment, and it is rendered more forcible on the surrounding objects by the huge log which, placed in shadow, comes out in strong relief against it. Mr. Fraser generally selects subjects connected with Scottish history, public or domestic, for his pictures, and always treats them with success.

THE ART-JOURNAL

The drawing is a complex architectural plan, likely a floor plan or site plan, oriented vertically. It features a central area with a grid-like pattern, possibly representing a courtyard or a central building. Surrounding this central area are various rectangular and irregular shapes, which could represent different rooms, corridors, or outdoor spaces. There are several columns of text interspersed within the drawing, likely providing labels or descriptions for different parts of the plan. The overall appearance is that of a technical drawing or a detailed site plan from a historical architectural journal.

THE ROYAL GENERAL ANNUITY SOCIETY.

We have frequently felt it a duty as well as a privilege to direct the attention of our friends and subscribers to various new Institutions, founded by benevolent persons to meet the increasing demands made upon society as the results of circumstances, and events which from time to time occur, to plunge those who have been once prosperous and industrious into want and misery. We have found liberality and kindness go hand in hand, and the aid so readily bestowed has made us exult in the wealth and generosity of England; but while we support the new, we must not neglect the old charities—or imagine that they have not as much need of public sympathy and assistance as they had in former times.

Two Saint Patrick's days have passed without the usual "dinner and subscription" for the children of poor Ireland, who have never, except in the two dire years of famine, required it so much. The Caldonian Asylum has been shorn of half its glory by the dismissal of some of the finest and most promising children in England, because the directors dare not encroach, more than they have already done, upon their capital, and the annual income is not sufficient for the maintenance of so many; but these are the claims of HOPE—the hope which we have in the future of young England. The education and protection of the young properly belong to the legislature—it is in reality a National question; but if the nation will not do its duty, Christian people are the more called upon to protect the helpless, especially the aged, who have toiled up the hill of life, and instead of being rewarded at its summit by the fruits of labour, are surrounded by difficulties and sorrows upon which they had never calculated.

To provide an asylum for the aged and infirm is most especially a Christian privilege; and we feel pleasure in giving information that the Royal General Annuity Society has it in contemplation, and that under the direct patronage of our gracious Queen, to erect an asylum—to be called "The Royal Victoria Annuity Asylum"—where the more infirm and distressed will receive shelter, and that tender care, which a small annuity cannot procure. For the facts connected with this admirable Institution we must refer our readers to the report, which they can obtain either at the office of the Institution, 18 A, Basinghall Street, or by a letter addressed to the most painstaking of all secretaries, Mr. Stephen Aldrich, at the office; and they will be startled to learn, that for these small annuities, which to men must not exceed 2*l.* 5*s.* per month, and to women not more than 1*l.* 10*s.*, there are this month (August) thirty-three male candidates and eighty-eight female candidates—of whom only NINE can this summer attain to the comforts of annuitants. Of the latter candidates, there are three who are the daughters of clergymen, two who are widows of bankers, one who is the daughter of a baronet, and numbers who are the children of merchants and tradesmen; some whose fathers have held commissions in the army; and ALL, male and female, prove the respectability of their stations, and their great need of the benefits of such an Institution. Before we go to press, the hope of these small annuities will be extinguished in far the greater number, while the nine, who must have attained the age of sixty, retire in thankfulness from the palpitating contest, on their small stipend; we entreat our friends to think of those who are doomed to wait for "another election" and who are almost reduced to despair when they consider how they may subsist until then. Those who look over the reports will see that the rules are so stringent as to guarantee to subscribers that none but the deserving can be admitted to the benefits of this excellent Institution. There are some who object to the restrictions of an asylum for the aged; such may subscribe their millium or their mite to the annuity fund—while others who agree with us in preferring the shelter and comfort of an asylum, cannot embark their money in a more righteous cause than in aiding the building of the Royal Victoria Annuity Asylum.

A. M. H.

AUTOBIOGRAPHY OF JOHN BURNET.

My father, George Burnet, was a native of Boroctoness, near Edinburgh, descended from a brother of the Bishop of that name. In the earlier part of his life he resided with the late Earl of Dundonald, at Culross, where he married Anne Cruikshanks, sister of the celebrated William Cruikshanks, the anatomist, the friend of Dr. Johnson and Sir Joshua Reynolds. By this marriage there were six daughters and five sons, now all deceased, except my brother, the Rev. Dr. Burnet of London, and myself. My youngest brother, James Burnet, it is unnecessary to enquire in this brief memoir; his works, both in landscape and cattle subjects, are familiar to all the admirers of such paintings; and though dying at the early age of twenty-eight, he has left a name behind as one of the most chaste and truthful colourists of the English school. After my father's marriage, being appointed to the situation of General Surveyor of Excise, he resided in Edinburgh, at a bathing-place, near which, viz., in Fisher-row, I was born, on the 20th of March, 1784.

Both my mother and father having a taste for drawing, I early imbibed a predilection for artistic pursuits; and though educated by Mr. Leeshman, the schoolmaster of Sir Walter Scott, and a strict disciplinarian, I received less advantage than I would otherwise have derived had my love for the Fine Arts not been paramount. This induced my parents to place me with Mr. Robert Scott, the landscape engraver, of Edinburgh, with whom I learned the management of the practical part of etching and engraving. While with Scott I at the same time attended daily at the Trustees' Academy, under the guidance of Mr. John Graham, where I acquired a knowledge of refined design from the study of antique statues; and was fortunate in having for my fellow students Sir William Allan and Sir David Wilkie, both of whom are too well known to require any eulogiums of mine.

I have often thought that my following the profession of an engraver and painter at the same time cramped the greater extension of either, as both are of sufficient difficulty to require the undivided attention to arrive at a high degree of excellence. With regard to myself, my arrangements precluded my having the palette so often on my thumb as is absolutely necessary to acquire a good style of colouring independent of manual dexterity.

During my apprenticeship with Mr. Scott in the Parliament Square, which lasted for seven long years, I was principally engaged in engraving, and the hours being from seven o'clock in the morning till eight in the evening, there was little spare time for the cultivation of the art of design, except the hours when I was engaged at the Trustees' Academy, then open from ten till twelve in the forenoon. Being more devoted to figure engraving than landscape, my style was formed on small prints, from the graver of James Heath, whose hook illustrations were at that time held in high estimation; and for elegance of workmanship have never yet been surpassed. In larger works my favourite master was Cornelius Vischer. Wilkie having preceded me by twelve months, the fame created by his picture of the "Village Politicians" produced such a sensation in Scotland that I hastily finished every engagement, and set sail for London in a Leith and Berwick smack. On my arrival on Miller's wharf, I seemed to feel what most Scotsmen feel, "ample room and verge enough;" and though with only a few shillings in my pocket, and a single impression from one of my plates for Cooke's Novelists, I felt myself in the proper element, having all that proper confidence peculiar, I believe, to my countrymen. I went instinctively towards Somers Town, where many of my brother artists resided; and next morning to No. 10, Sol's Row, Hampstead Road, to call on Wilkie. He was delighted to see me, and exclaimed, "I am glad you are come, for London is the proper place for artists." On his easel was the picture of the "Blind Fiddler," which struck me as a wonderful work for one who had seen so little of such paintings in his youth.

My first engravings after settling in London

were for Cooke's "Novelists," Britton and Brayley's "England and Wales," Mrs. Inchbald's "British Theatre," &c.; but I longed for some larger work upon which to employ my graver, and bespoke the engraving of the "Jew's Harp," of the same size as the painting. This was the first picture by Wilkie that was engraved, and formed the commencement of the long series of prints after the pictures of Wilkie, now so well known to the public.

Of my engravings, it is impossible I can speak with any propriety; but in noticing them I may mention any circumstance or anecdote connected with their publication. I remember with great satisfaction that the plate of the "Jew's Harp" brought me in acquaintance with William Sharp, the celebrated historical engraver, the great founder of the English school in this department; and that our late master, Graham, of the Edinburgh Academy, having received a presentation proof, carried it into the class to show the students, and mentioned how proud he was of his two pupils. It is also gratifying to me to have seen proofs, originally published at one guinea, selling at twelve; and, indeed, one, with a variation rendering it unique, purchased for twenty guineas by an eminent collector, Mr. George Smith, the distiller; a large increase in value to be effected in the life-time of the artist. The success of this plate led to the publication of others, and the picture of the "Blind Fiddler" was fixed upon to be engraved, of a larger size, more like the "Wolfe," and the "Battle of La Hogue," by Woollett.

As the "Jew's Harp" was more in the style of Le Bas, I executed the "Blind Fiddler" in the manner of Cornelius Vischer. It exhibits more graving than etching; and as far as the approbation of the public went, was highly popular from the beginning. I ought also to record the approbation of my brother artists.—Mr. George Doo and Mr. James Watt, two of our first historical engravers, told me that their master, the late Mr. Charles Heath, bought a proof to be hung up in the studio for an example. This was very gratifying for me to hear, knowing, as I did, that my friend Wilkie thought so coldly of the first state of the plate, that he sold his third share for fifty pounds. This, though small, was nevertheless the exact sum that Sir George Beaumont agreed to pay for the picture. I notice this here, as I shall have occasion to revert to the subject of copyrights, which I have always considered highly detrimental to the remuneration of the engraver.

Another anecdote I wish to mention respecting the engraving of the "Blind Fiddler," is, that when the first proofs were delivered, Mr. Tomkins, the writing-master, touched upon his impression with pen and ink, making several alterations, which proof being shown to Sir George Beaumont, he brought over Wilkie and Boydell to his view of the matter; the consequence was that the whole proofs were agreed to be destroyed, and fresh ones with the alterations printed. This gave rise to two sets of proofs now being in existence. I was certainly surprised to find that at Messrs. Boydell's sale the whole of the two hundred and fifty proofs were still in existence, and sold as first proofs. Several are still on hand, having passed into the possession of Messrs. Moon, Boys, & Graves, after Hurst & Robinson's bankruptcy. The first proofs have, amongst other particularities, the hat of the boy with the bellows in single line. To the public at large these matters may appear of small consequence, but to collectors, especially those who may collect many years hence, they will not be found, I trust, altogether without value.

The success attending the publication of the print of the "Blind Fiddler" induced me to think of a companion, and the "Village Politicians" was agreed upon, but the terms proposed were such as precluded my entering upon the speculation. The copyright was to be considered as equivalent to the engraving of the plate, which was to be completed entirely at my own expense, and the proceeds of every print sold were to be equally divided between the painter and engraver. These terms I considered as too stringent upon engravings, and therefore I gave it up to Mr. Rainbach, who undertook the plate subject to such arrangements, but upon the publica-

tion of the lives of Wilkie and Raimbach, I was somewhat surprised to find that the terms had been very much modified, and rendered more in accordance with my view of the matter.

As I am now upon the subject of copyrights, I may mention that their value depends entirely upon the ability of the engraver in bringing the various works successfully before the public; thus Wilkie's first copyright was valued at fifty guineas, while, in junction with Boys & Graves, we paid him eleven hundred for the copyright of the "Chelsea Pensioners;" which, with the presentation proofs, must have made it nearly equivalent to the price of the picture. So it has progressed with the pictures of Landseer; his first plate of any consequence was the "Highland Drovers," and the copyright charged to Mr. James Watt, the engraver, was two hundred guineas, but the excellence of his engraving producing many thousands of pounds, Mr. Landseer's copyrights, from the competition of publishers, rose gradually in market value. For the "Peace" and "War" Mr Graves paid three thousand guineas; and for the copyright of the Wellington picture recently in the Academy he has agreed to give the same large sum. These things work very detrimentally to the Fine Arts in general; first, the engraver cannot receive so large a price as he would otherwise do, were the sum less; neither can any other painter bring his works advantageously before the public. The large sum locked up by the publication of the works of a popular painter necessarily precludes any competition by other artists. The whole machinery and country trade are necessarily engaged to repay so large an outlay, and one artist alone is kept constantly before the public, to the exclusion of all others; hence it is that several artists have had the whole command of the market for a certain time, such as Morland, Wilkie, and now Landseer. This, though a digression, is nevertheless necessary to the proper understanding of the progress of the Fine Arts.

After the plate of the "Blind Fiddler," my other prints from Sir David Wilkie were the "Reading of the Will," the "Chelsea Pensioners reading the Gazette of the Battle of Waterloo," the "Rabbit on the Wall," the "Letter of Introduction," the "Death of Tippoo Saib," and the "Village School." After the peace of 1813 I took the opportunity of visiting Paris; and for five months was a constant visitor to the Louvre, copying and studying from the magnificent collection at that time brought from all parts of Europe and deposited in the gallery.

From my notes and remarks emanated my "Practical Hints on Painting," and other literary works connected with the Fine Arts. I ought to notice here the late change produced on engraving by the invention and introduction of steel, in place of copper. This power of multiplying prints to the extent of twenty or thirty thousand laid the foundation for a series of Annuals and other illustrated works where multiplicity produced cheapness. It also brought the art of mezzotint into the field, in competition with the more laborious and expensive style of line engraving, and has at present nearly extinguished the production of large works executed by the graver. The invention of lithography also has been the means of excluding stippled or dotted engravings from the public eye.

Since the career of David Wilkie (who was a great advocate for the superiority of line engravings) there has been a gradual falling off in this branch of the art, while mezzotint engraving, on the other hand, has rapidly increased. Even in landscape, where line is so much better adapted than mezzotint, especially in the representation of foliage, there is a great declination; so much are the public guided by what is generally before their eyes. No greater proof of this can be given than in the inimitable landscapes after Turner, several of which, though engraved by the most celebrated artists, have proved failures. Mr. Allnutt, a great patron of the arts, had the beautiful view of "Tivoli" engraved by Goodall, at his own expense, and was a loser to the amount of four hundred guineas. Another inroad made upon legitimate line engraving is the introduction of machine ruling, to produce a broad tint over loose etching. This is gene-

rally becoming united with mezzotint, and often produces a very beautiful tone.

As a means of counteracting the various inroads made on legitimate engraving, an association of nine of the most eminent engravers was formed under the patronage of John Sheepshanks, Esq., one of the most liberal encouragers of the fine arts. The pictures in the "National Gallery" were fixed upon as most likely to be a standard work on account of their intrinsic merit: it, however, could not keep its position, owing in some measure, if not altogether, to the quicker production of ephemeral works, the restricted allowance to the retail trade (which has now increased to fifty and sixty per cent.), combined with the dilatory production of the different numbers. I may mention this without disparagement to any individual member of the body to which I had the honour to belong. The plates I engraved for this work were the "Jew," the "Nativity," and the "Crucifixion," all after Rembrandt. Previous to my engaging in this work I had engraved several plates for Foster's British Gallery; of these, the "Letter Writer," after Metzau, and the "Salutation of the Virgin," after Rembrandt, are considered the best.

During my professional engagements many changes have taken place which, though trivial, have nevertheless affected the art of engraving in England: the increased number of publishers, but above all, the prodigious increase of the retail trade, require so large a variety of prints, that an engraving becomes out of fashion in a few weeks, whereas, in the time of Woollett, Strange, and Sharp, a print had possession of the public notice for years; this enabled engravers to bestow a greater amount of talent and labour on a single plate, from the great interval between the publication of each. It also secured a finer set of impressions from a fewer number being struck off. Woollett and others seldom exceeded sixty proofs; whereas, even in highly engraved line-plates, sometimes six hundred are printed of a copper-plate, a number so large that it must in all instances prove highly detrimental to the artist's reputation; add to which, electrotype is often resorted to as a means of getting several fresh plates, but these indeed are always greatly inferior to the original. Another source of a great alteration in the taste of the public, is, reducing the duty on the importation of foreign prints to one penny; hence the market is glutted with cheap lithographic works which, though often cleverly executed, have led the eye into an appreciation of meretricious French design. A combination of all these drawbacks has excluded, in a great measure, fine line engraving from the public view, and given an impulse to mezzotint. Great praise ought to be given by the amateur of line engraving to Messrs. I. H. Robinson, G. T. Doo, and James Watt, for upholding the purity and superiority of this branch, at the greatest personal sacrifice.

In small works neither mezzotint nor lithography can interfere, as the number of impressions steel-plates are capable of yielding, secures a sufficient remuneration. The Waverley Novels, though only a halfpenny a volume was charged for each embellishment, enabled Mr. Cadell, the publisher, to give eighty guineas for each engraving. These digressions are necessary, as affording reasons for the gradual decay of highly-finished line engravings of a large size. But, to return to my own matters; in mentioning my engravings from various masters, I ought to notice those from my own designs, such as "Feeding the Young Bird," the "Draught Players," and the print of the "Greenwich Pensioners," engraved as a companion to the "Chelsea Pensioners," after Wilkie. I ought to mention, also, as a source of gratification, that the original hangs as a companion to Wilkie's in the collection of the Duke of Wellington. As I am known to the public professionally as an engraver, I may only be permitted to notice my pictures as being confided chiefly to landscape and cattle.

While on the subject of painting, I must add my meed of praise to the rising young painters of the present day, giving, as they do, so sure promise of carrying on those excellencies of the English school, begun by Reynolds, Hogarth, West, and Wilkie.

Having given a slight sketch of my life, I cannot consider it complete without taking a retrospective view of the progress of the Arts from 1806 to the present time. And for the clearer understanding of such progress, I intend dividing the subject into the several heads of painting, sculpture, and engraving. Previous to the present century, the great names in these several departments were Reynolds, Hogarth, West, Gainsborough, and Wilson, who may be considered as the founders of the English School of painting; Rouillie, Nolckens, Banks, Bacon, and Flaxman, as the notable names in sculpture; and Strange, Woollett, Sharp, and Heath in engraving. There are, of course, many others who were and are known to fame, but in a matter of this kind we are obliged to deal with principals only; besides these, are several who have been celebrated both in the last and the present century, such as Smirke, Lawrence, Wheatley, &c., but I have stated sufficient to show the difficulty of making much advance upon the works emanating from the founders of the English School. The great work, projected by John Boydell, the Shakspeare Gallery, though including many pictures of a high class, both in design and colour, such as the "King Lear," by West, the "Children in the Tower," by Northcote, and the "Macbeth" of Sir Joshua Reynolds, were not carried far enough to stamp them as first-rate works of Art, deficient as they were in the combination of many qualities so especially requisite to enable a picture to rank with the higher-priced works of the Italian, Flemish, and Dutch Schools. Hence it is, that though the quaintness of Smirke and the gracefulness of Stothard are excellent, as far as they go, yet Mulready, Leslie, Cope, Frith, &c., have given a greater degree of finish and completeness. The three great artists who belong to both centuries, are West, Turner, and Lawrence, whose works have influenced the practice of the present painters in a high degree. What has tended to improve the taste, and give a better style to the rising artists, is the annual exhibition of the finest works of the several schools in the British Institution; also the permanent examples in the National Gallery, a collection which ought to be added to whenever excellent pictures come into the market. These works are as necessary for the progress of painting, as the Greek and Roman classics are for the several purposes of refined literature.

No one was more sensible of these advantages than Sir David Wilkie, whose strong perceptions of character and natural expression were heightened by the colouring of Ostade and the handling of Teniers; hence the completeness of his works through all their variety; nor do I know any picture in its class at all comparable to his "Chelsea Pensioners reading the Gazette after the Battle of Waterloo;" his pictures now form a test of reference to all works of this character in the English School. We can trace the same purifying principles in the pictures of Mulready and Webster, in the landscapes of Lee, Creswick, and Linnell, and in the cattle pieces of Cooper; nor can we imagine any one capable of carrying fruit and flower-pieces into competition with the inimitable works of Lance, without long contemplation and deep study of the pictures of Van Os and Van Huysum. Trained in this school I must also exemplify the excellence existing in the sea-pieces of Cooke, breathing the true spirit of Vanderveelde and Backhuysen. Nature, of course, is to be the great object of our imitation, but we shall always perceive her more clearly and render her with greater force, by the example of those who have excelled in the particular path in which we are following. No one, perhaps, has given a greater look of studying Nature alone, without reference to any particular artist, than the late John Constable, but he told me he seldom painted a picture without considering how Rembrandt or Claude would have treated it. Were it not so, the art would be lost in its infancy, for no one could carry it to perfection without a knowledge and reference to what has been done by his predecessors. Reynolds, who gives this advice, is a great example himself, as he says, in his "outset in life, instead of accumulating money he laid it out (often faster than he acquired it) in purchasing works for improve-

Le Brun

ment and study. To this source I must also refer the great improvement that has taken place in miniature painting. The first to avail himself of such advantages was the late George Sanders, for though his earlier works were more in the style of Cosway, at that time in high repute, his later breathe the true feeling of Vandyke and Titian, both in arrangement and colour. Sanders has been able followed by Mr. Thorburn and Sir William Ross; and though the excellent miniatures of the latter remind one more of Sir Thomas Lawrence, yet they are constructed upon the principle of a miniature being a reduction of a portrait, the size of life, or Nature diminished, retaining however the same broad principles observable in the highest works of Art so apt in the miniatures of Cooper. We look in vain through the oval prettinesses of Petitot and others, who have preceded these men I have noticed; and, let me observe, though in all the departments of the Arts there are many equally celebrated with those I have quoted as examples, I avail myself of those first coming to my memory, or who are most familiar to my observation. Reverting back to earlier times, I must mention here one of my early acquaintances, the late William Etty, certainly one of the best colourists of the English School. This excellent artist, after studying the works of Titian and Paul Veronese in Venice, confined himself to the close copying of Nature, in the Life Academy. The consequence is, we perceive in all his works the greatest truth of colour, on the broad principles of Nature, with all the gorgeous accessories of the Venetian masters.

As Historical painting is certainly the highest branch of the Art, it ought to have been noticed in the first instance; but I have purposely omitted it to the last, as the stimulus created by the competition in Westminster Hall has done much to draw the public attention to this department, as also to create a purer style of design in the artists themselves. In the depart-

ment of Landscape no one has advanced the art to the same extent as Turner, or has made a greater revolution in the treatment of colour and composition. He has exemplified the power of hot and cold colour performing the same solidity of effect as the opposition of light and shade; thus, avoiding heaviness, he has taught the power of assembling many small objects of detail without destroying the greatest breadth, and also giving a highly poetical appearance to his works, from the absence of anything vulgar and common-place. Both in composition and colour, they strongly remind one of delicate antique frescoes. To his example we owe the refined works of Calcott, Stanfield, and Roberts, and in the department of water-colour, the great superiority this branch has attained is mainly owing to the study of his principles. The great proficient in this department, are still highly original and apparently very different in many respects from the great artists of whom I am speaking, such as Cattermole, Lewis, Haghe, Harding, Nash, and Hunt; yet, still, in all their varieties, we perceive his influence. We observe the same improvement in scene painting, panorama painting, and in the moving dioramas, especially in "The Overland Route."

I must now mention the progress of Historical painting, kept only alive since the later days of West, by the genius of Hilton. To this excellent artist we refer as to one keeping in the dying embers, unaided by the patronage of an apathetic public.

The encouragement now given by the Government in the designs for the new Houses of Parliament, has, however, given a fresh stimulus, and called forth the talents of Cope, Dyce, Herbert, Maclise, Pickersgill, and other rising men, capable of raising the arts from obscurity, and improving the taste of the country. Peace alone, and a long continuance of it is the only source to which we must look for bringing to perfection what has been so promisingly begun. Of sculpture I do not find myself so well quali-

fied to speak, having paid less attention to this branch of the fine arts; but I may notice the superiority of the busts by Chantrey, to those of Nolckens, and others of his time; and also the statues and fancy figures of Westmacott, Wyatt, and Gibson to all that has preceded them in England, not even excepting those of Roubillac, whose works, could they have been extricated from the affected French taste prevalent at the time, would bear comparison with any, both before and since; witness his admirable figure of Eloquence in the monument of the Duke of Argyll, in Westminster Abbey. I naturally turn to engraving as a subject more under my particular observation, and here we perceive a struggle for mastery between the eminent men of the last century and the present. Our followers in the art have never equalled Sir Robert Strange in all that pertains to colour and texture, particularly in the management of the naked portions of a picture; in fact, his engravings are hung up in the studio of our most celebrated artists, and though in individual portions he has been surpassed by Robinson, Doo, and Watt, in tone and texture he remains pre-eminent; the same may be also said with regard to Woollett in landscape; we have more refinement in the works of Pye, Goodall, Smith, &c. but for boldness of style, both in the etching and finishing of his plates, he still remains an example to the rising engravers of the day. In small plates, however, we certainly are eminently superior; except James Heath there are none on record whose works can compete with the plates of Charles Warren, W. Finden, and several of their pupils. This in some degree has arisen from the introduction of steel, which permits of a greater degree of finish; and, from a greater number of impressions being taken off, the publisher is enabled to pay more liberally than of old. In this short notice it only remains to say a few words on wood engraving. Bewick's cuts were superior to all before his time, but the art has since been carried to greater perfection and finish by Nesbit, Thomson, Williams, &c.

While I am upon the subject of wood-cutting, I cannot refrain from noticing the great advantage the taste of the public has received from this branch of the Art; the facility and cheapness arising from the employment of wood blocks to be printed off with the type, has given rise to the employment of the means of diffusing a love for pictorial embellishment. Since the success of the "Illustrated London News," which has done the most ample service in inoculating the million with a propensity for the Fine Arts, men's eyes are drawn from the contemplation of types to pictures, and the "still small voice" that used to be unheard in the streets, is now echoed in the halls of palaces. As pictorial embellishment speaks to the bosoms of the uneducated in literature, we cannot confine the ultimate good that these cheap publications may produce upon the taste of the country within any reasonable bounds; these are the victories that painting achieves above literature, and in satire, as in the works of Hogarth, and in our own *Punch*, they become irresistible. This digression must now, however, be brought to a conclusion, as also this autobiography. To compress forty-four years within two pages, is impossible; I must, therefore, draw this autobiography to an end. Before doing so, I must, however, leave space for the mention of two names omitted, viz., Bonington and Newton, both of whom, though dying young, have left an undying fame behind them. There is another name left out, which I wish to mention, as having done good service to the Arts in our time, viz., the late Sir Charles Bell, whose "Anatomy of Expression" has given so great an insight to the causes of outward representation; before his time we were contented with Le Brun's "Expressions of the Passions," but Bell taught us the necessity of "withdrawing the covering" (as Wm. Hunter expresses it), "that we may see the causes of the projections and undulations." One more name, and I conclude; my brother,—the late Dr. Burnet, of the Navy, who studied in the Hunterian School in Windmill Street, and who assisted me in the various dissections, at a future time so enthusiastically pursued by all the pupils of Sir Charles Bell.

A GARDEN.

"Give me, O indulgent Fate,
Give me yet, before I die,
A sweet, but absolute retreat,
Amongst paths so lost, and trees so high,
That the world may ne'er invade,
Through such windings and such shade
My unshaken liberty."
COUNTESS OF WINCHELSEA.

VISITS
TO THE MANUFACTURING DISTRICTS.

DERBY.

The situation of Derby on the rapid River Derwent long since pointed out its applicability to the purposes of the manufacturer. Its central situation also, when considered geographically or commercially, rendered it a befitting locality for the Industrial Arts; and hence, from a comparatively early period, it has been a famed home of trade. The silk-mills which still remain there are the earliest founded in this country; but the trade thus established has spread extensively, and the Derby silk trade is now scarcely to be considered in a flourishing condition. The history of its first foundation is not without a tinge of romance; it is one of those tales of real life that seems strange as fiction. Until the commencement of the eighteenth century the Italians had the exclusive knowledge of the art of silk-throwing; and so lucrative was it to that people, that they rigidly guarded its secrets from any foreigner, and the merchants and traders of all countries were consequently dependent upon them for their supply. It had frequently been a matter of regret in England that this was the case, and a resident in Derby, named Crocket, constructed a small mill, but owing to defective machinery, without any success in rivalling foreign work or even in equalling it. A young mechanic, named John Lombe, nothing deterred thereby, and eagerly wishing the success of the scheme, conceived the idea of visiting Italy, to obtain a practical knowledge of the secret. To gain access to the Italian mills he was obliged to bribe their workmen, and, in secret, to make working-drawings of their machinery; and he had scarcely completed them when he was discovered by the mill-owners. Their fears were fully roused, and he with great difficulty escaped to an English vessel, where he concealed himself from his pursuers, along with the two Italians who had clandestinely admitted him to the silk-mills, and they all reached

succeeding in persuading one to administer the poison, which she had brought for Lombe. The victim lingered in the agonies of a slow and incurable disease for two or three years, and died in 1722; only five years after the first foundation of the important trade he had been the means of introducing to Derby.

His mill yet stands overlooking the Derwent, and its busy occupant still exercises his trade there. But the famous China Factory, which once made Derby also celebrated for ingenuity and taste of another kind, has completely passed away, and a convent now stands on its site.*

It is not our intention here to enter into a history of the manufactories of Derby, but merely to notice a few of the most remarkable at present there, one of the most peculiar being that of the conversion of the native spars into various useful and ornamental articles, well known and sought after by all visitors and others who seek to possess memorials of the peculiar manufacture of the county.

THE DERBY MARBLE-WORKS were commenced upwards of a century ago by Mr. Brown, and carried on by him, in a small way, for some years, until, by the introduction of machinery, worked by water power in a mill on the banks of the River Derwent, belonging to the corporation of Derby, he was enabled to cut and work the spars and marbles with so much greater facility, that the business was largely increased and became famed. On the termination of the lease in 1802, the establishment was removed to larger and more convenient premises, erected on the site of the old monastery of St Helen, and the motive power was a steam engine. Here it has continued ever since, and is one of the largest establishments of the kind in the kingdom. It was carried on successively by Mr. Brown, Messrs. Brown & Son, Brown & Mawe, Mr. Hall, and now by his sons, Joseph and Thomas Hall, who, in conjunction with their late father, have much simplified their machinery and increased its quantity; by which means, and by paying great attention to beauty of form, they have been enabled to greatly extend this branch of manufacturing

Entrochal marble is the most abundant, and is found in several parts of the county, the figure and colour varying in the different localities; in some the fossils are very large, and in others so small as to be scarcely perceptible; the prevailing colour is grey, of different shades, but it is occasionally found of a red colour. It is used principally for chimney-pieces, but latterly has been extensively adopted for columns and shafts in churches, as it is more durable, is not affected by damp, and is less expensive than Purbeck marble, which is the kind that has been mostly employed for that purpose.

Black marble is found in several localities, but the finest is from the Duke of Devonshire's quarries, at Ashford-in-the-Water. This is the best black marble that is known, but is so subject to white veins, and shakes or vents, that it can only be used to advantage in Derbyshire, where the small pieces can all be worked up into chimney ornaments. It receives a deeper black, according to the greater amount of polish it obtains, and in its native state seems to be of a grey tint. It is found in beds or layers, the thickest being about nine inches in depth, and the shallowest, about two.

Rosewood marble is also found at Ashford, and has great resemblance to the wood from which it takes its name. It is a very beautiful marble, and is procured in large blocks, but is so very liable to fracture that it is difficult to procure large slabs.

Red marble, very much resembling rosso antico, is also found on the Duke of Devonshire's estate, but only in small pieces.

There are endless varieties of other coloured marbles, madreperes, &c., found in small detached pieces, which are made into small ornaments, and cut up into thin slices for veneering and inlaying.

Amethystine fluor-spar, or, as it is locally called, "Blue John," is a variety of fluate of lime peculiar to this county, being found only at one place, namely, Castleton, in the High Peak. Fluor-spar is found in many parts of the world in small detached crystals, but nowhere in the massive form in which it is found in Derbyshire. The beautiful colours and varied markings of this stone, and the

ARTICLES IN MARBLE, MANUFACTURED BY JOSEPH AND THOMAS HALL, OF DERBY.

England in safety, in the year 1717, and began their first work in Derby. Lombe purchased at a low rent an island or swamp in the River Derwent, and there built his mill. In the following year he obtained a patent, and all went on with him well and prosperously; his trade rapidly increased, and by consequence that of Italy decreased. But Italian vengeance seldom sleeps, and his life was devoted to appease its rage. An Italian woman found her way to Derby, and became associated with her countrymen in their labours, ultimately

Art, and spread its knowledge over various parts of the Continent, India, and the United States. Their business includes the manufacture of monuments, chimney-pieces, spar and marble ornaments, stone garden-vases, stone filters, &c.

The county of Derby is celebrated for the variety of the spars and marble it produces, some of which are procured in blocks of very large size. Fossil

* The business has, however, been removed to another place, of a humbler kind, within the town.

size of which it is found, render it capable of being worked into many ornamental forms, and cause it to be well known all over the kingdom; on the Continent it is especially prized, few mineralogical cabinets being without a specimen of it. Its comparative rarity renders it of value, the rough stone being worth at the mine from 40l. to 60l. per ton, according to size and quality.

Gypsum or alabaster* (sulphate of lime) is found

* In this county it is this variety of stone only which

at Chellaston, about three miles south of Derby, and is very abundant; several hundreds of men are employed in the mining of it, and thousands of tons annually are ground up in Derby for making plaster of Paris, and for agricultural purposes. It is generally of a dirty-green colour, but occasionally it is found quite white, and beautifully variegated with red and green veins.

Satin stone, or fibrous gypsum, is another variety, and has a beautiful silky appearance. It is used for necklaces, brooches, crosses, &c.

The mode of manufacture is as follows:—In making what is called flat work, that is where the surfaces are all flat, the blocks of marble are first sawn into slabs of the thickness required by a machine consisting of an iron frame, in which are stretched a number of saws; these are merely long plates, about four inches wide and one-eighth of an inch thick, of soft iron, without teeth, which can be placed side by side in the frame, and any distance apart. The marble being fixed underneath this, a reciprocating motion is given to the frame, and sand and water being constantly dropped upon the saws, the friction wears a groove through the marble, separating it into thin slabs. These are cut by similar machines into pieces of the size required, and rubbed true upon a grinding machine, which is a large circular plate of iron, with a perfectly flat face, fixed to an upright shaft, and made to rotate with considerable velocity; by throwing upon it sand and water, and holding the stone forcibly thereon, it grinds the surface quite flat and to the size required. A number of these small slabs are then plastered to a larger one for the convenience of polishing them altogether, and made perfectly free from scratches. It is then placed upon the polishing machine, which is a large flat table, movable sideways upon a short railway; the polisher is an iron box, containing rolls of coarse cloth which project below the sides, and is connected by a pole to a pendulum, to which motion is given by a crank on the engine shaft. Flour-emery and water is put upon the marble, and by the action of the polisher backwards and forwards on its surface it is brought to a certain degree of polish, which is afterwards completed by a similar polisher charged with putty powder (an oxide of tin). The table is moved to and fro sideways according to the width of the marble slabs, by simple machinery underneath, and the extra amount of polish which the centre would necessarily get by the rubber passing most over that portion, is compensated for by a slight stoppage made by the machine when it reaches each side.

MOULDINGS are worked by a machine something similar to the polishing apparatus, but having plates of cast iron (made the reverse shape of the moulding) attached to the pendulum; sand and water being thrown on, the marble is rubbed to the required form and polished with polishers made to fit the moulding. In cases where the moulding does not run through the whole length of the marble, another kind of apparatus is used; the edge of a circular iron cutter is turned to the reverse of the moulding and fixed in a frame which moves on a railway, and the marble being fixed underneath, a rapid rotatory motion is given to the cutter, which advances as the marble wears away, and of course can be stopped at any point; the end of the moulding is finished by hand.

CIRCULAR WORK such as vases, tazzas, &c. are made as follows:—A slab of marble of the required thickness is placed under a circular sawing machine; this is an upright spindle, which will slide up and down through bearings, and to which a rapid rotatory motion can be given; at the bottom end of this spindle is fixed a thin iron cylinder of the proper diameter, and by supplying it with sand and water, it cuts a circular piece out of the marble. This piece is fastened by a strong cement to an iron chuck which is screwed on to the lathe, and a very slow motion being given, it is turned to the required form; the tool used is a bar of steel about two feet long and half an inch square, drawn down to a fine point and hardened; this tool requires very frequent sharpening, and in turning large diameters it is necessary to let a stream of water constantly run on the marble in order to keep the point of the tool cool, otherwise the great friction would soften the steel. Some notion of the density of the material may be formed from the fact, that a similar tool used for iron would last without sharpening for nearly an hour, but in marble cutting it is sharpened every five minutes. When the article is turned to the proper outline, a rapid motion is given to the lathe, and the object is polished with the same materials as before described.

goes by the name of alabaster, but in Italy the stalactitic carbonates of flux are also called alabaster, under the names of oriental alabaster, golden alabaster, agate alabaster, &c.

FLUOR-SPAR being composed of a mass of irregular crystals whose cleavage is in different directions, is exceedingly difficult to work, and requires more delicate manipulation than almost any other stone; the processes it goes through are very similar to those just described, but requires very skilful workmen. All the turnings and scraps of this stone are sold to the chemist for the manufacture of fluoric acid.

ALABASTER is, comparatively, very easily worked; it can be cut with a joiner's hand-saw, and turned in the lathe almost as readily as wood. The dust which is turned off is made into plaster of Paris by calcination, and is made upon the premises in a circular box, which turns over a fire until all steam evaporates.

MOSAIC WORK, similar to the "picta dura" of Florence, is now carried on here to a great extent. The subject to be inlaid is first drawn carefully on paper and coloured; it is then copied in outline upon the marble, and cut out with small chisels to the depth of a shilling, or rather more. Marbles of the proper colours are now chosen, and cut and filed till they will fit the incisions, and are then fastened in with cement; and when the whole subject is completed, it is ground down to a level surface, and all polished together.

A method of ornamenting black marble has recently been discovered, which is by extracting the colouring matter of the marble (bitumen) without injuring its surface; and by extracting the colour to a greater or less degree, different shades are

produced, giving it the effect of an engraving; indeed, the method pursued is nearly the same as in aquatint engraving. Another mode of ornamenting black marble is by scratching the polished surface with a steel or diamond point, which produces a white mark of different degrees of intensity according to the depth of the scratch, by which means, in skilful hands, beautiful engravings are produced.

Mr. Hall's show rooms are near the Railway Station, and contain a striking and varied assemblage of useful and ornamental articles. Our engraving exhibits a selection of the most graceful of those he has lately constructed. The figured ornaments upon them are produced in the manner already described, and are very beautiful in their general effect.

There are other manufacturers in Derbyshire, who work up the native marbles and spars, and whose show-rooms are scattered over various parts of the county, generally visited by the tourist. We may mention Woodruffe of Bakewell, Redfern of Ashford, Vallance of Matlock, and others, but Mr. Hall is the most extensive, and certainly the most meritorious, manufacturer of these peculiarly native works.

THE BRITANNIA FOUNDRY

is situated on the banks of the River Derwent, and gives its proprietor, Mr. Handyside, the full advantage of a good water communication to London, Liverpool, and Hull, a circumstance which adds greatly to the utility of the locality

he occupies. The coal used is also obtained by canal or railway, from mines in the neighbourhood, and it would be difficult to select a better

position, altogether, than that in which he is located. The works are very extensive, covering at least three acres of ground.

The space occupied by the establishment is 6490 superficial yards. The different kinds of work done are very various; amongst them may be enumerated Founding in all its branches, from Heavy Castings of some Tons weight, down to the lightest Ornamental. Amongst the Heavy, may be enumerated Girders, Columns, and Pipes; and amongst the Light, Iron Casements, (in great variety,) Ornamental and Plain Railings, Ornamental Vases and Fountains for gardens, of different designs. The different kinds of work done for Railway Companies is very great; such as Coal Waggon complete, Wheels and Axles, Locomotive Cylinders finished, Carriage Breakers, or any other part made to order. All kinds of Mill-work and Machinery, Screw and Hydraulic Presses, as well as

Steam Engines, of high and low pressure. The number of men employed varies from 220 to 250. The iron used is obtained from various quarters, some being procured in the county of Derby, some

from Yorkshire, Staffordshire, Scotland, South Wales, &c. The great variety of articles manufactured by Mr. Handyside has already been alluded to; but we may especially notice one fact connected with but one branch of his business—the casting of ornamental frame-work for church and other windows. In his model room, there are no fewer than two thousand different models for these windows alone. Indeed an inspection of these model rooms gives a good notion of the largeness and rarity of his trade, ranging from the heaviest wheels and girders to the most delicate ornament upon a vase handle. To supply these models, one portion of his premises is devoted to workmen who are entirely engaged in their construction. They are all most delicately formed; indeed, such work is more particularly and carefully constructed than the finest cabinet work. To preserve these models in their necessary sharpness and purity, they are, as soon as completed, covered with a solution of sealing-wax, prepared by spirits of wine, which gives them a red colour, and effectually prevents the contraction of damp from the mould, which would injure or warp the wood. The most florid and beautiful designs for Gothic screens, &c., are thus obtained, and the utmost sharpness preserved in the delicate operation of casting.

The inspection of so large an establishment as that at present under our notice almost imperceptibly leads a casual spectator into a train of useful reflection, which cannot fail to induce him to consider with no slighting eye the large amount of thought, ability of a peculiar kind, and manual labour, necessary to found and keep up an establishment so vigorous and ever-working, producing its regular amount of certain labour, its new constructions; and all that apparently widely spread labour and skill over the production of small portions of that which, when finished, strikes the eye only in its totality as a simple work, but which is the product of a dozen different hands, guided by as many varied mental operations. It is this which constitutes the interest and beauty of the Manufacturing Arts, and adds to the "dignity of labour." The ease with which each workman perfects his own peculiar branch of his art, and the great variety of tool he uses, all applicable to his portion of the general labour alone, are all instances of the long experience which has brought each trade to its present point of perfection, and the concentration of thought which characterises the modern products of the Useful Arts.

To persons unused to inspect the manufacture of iron goods, there may be a difficulty of comprehending the great amount of delicacy necessary in preparing the mould for the casting of the most ordinary article, such as a stove-front; but there is scarcely a more delicate operation than this. It requires a careful certainty of hand, which none but practised workmen can attain. The mould is constructed of red sand from Mansfield, fine wood charcoal, and equally fine coal-dust, mixed in various quantities; the sand itself being liable, if unmixed, to adhere to the molten iron. Upon this the mould is laid and impressed, and the great care necessary to remove it, so as not to injure the necessary sharpness and delicacy of the impression, may be easily estimated, particularly when the work is in high relief, or consists of over-lapping leaves, &c., inasmuch as every flaw or loose piece of clay would show in the iron work as a blemish; and it is curious to observe the number of peculiarly shaped instruments adopted by the workmen to obliterate any blemish in his mould, or to take away any fragments which may have fallen into the hollows. In very deep castings it becomes a difficult operation. We saw one workman clearing out the bottom of a narrow aperture in his mould, not more than two inches in width and about eighteen in depth. Of course the bottom could not be seen; and so a candle was let down the narrow aperture, scarcely wide enough to receive it, and the clay which had fallen to the bottom removed by a flat instrument, at right angles with a long rod which formed a handle, and so piece by piece was cleared away into a corner and carefully lifted, inasmuch as a scratch on the side walls of the clay might injure or destroy the entire cast.

The entire floor of the casting room is composed of this modelling sand to a considerable depth, and pits are dug in it when wanted by the workmen; the quantity used may be estimated by the fact of twenty tons of modelling sand being used weekly.

An interesting combination of wrought and cast iron occurs, when a wheel is formed of a solid piece of iron. The spokes being necessarily of great strength, are wrought and laid in their places in the mould; the edges of each spoke projecting both into the spoke and outer wedge, and the hot iron when cast into each of these firmly adheres to and

becomes part of the entire wheel, which is thus an entire work of unsoldered iron, compact in the highest degree.

It is thus that the useful and the most ornamental works in iron are constructed on the same premises, whether it be the ponderous work of a Railway contract or the delicate exigencies of the flower-garden. The same amount of care is exerted on all, and the result is made equally satisfactory.

Our cuts exhibit the principal varieties of ornamental vases made in the establishment, many of which are remarkable for their classic purity of form and ornament. A fountain of very graceful design, capable of much enlargement and enrichment of detail, and a pair of very ornamental gates designed with much elaboration and elegance.

The extensive manufactory of Messrs. Holmes, where all that appertains to coach making is executed on the largest scale, and with the newest improvements, is also remarkable for the beauty and perfection of the machinery, which is there made to do important portions of their work. So very delicately does it effect its various tasks, that their machines may be said to do everything but think; and there is scarcely anything in the manufactory that is not more or less aided by this power. We had intended to conclude our notice of Derby

with a more detailed account of all that is here executed, but our space for the present preventing this, we may recur to the subject on a future occasion.

COPYRIGHT OF DESIGN
AMENDMENT ACT.

THE intended Exhibition in 1861 seems to have suggested to the Legislature the necessity of some additional powers for protecting artists, manufacturers, and inventors. We have, in several earlier numbers, called the attention of our readers to the subject of Copyright,* as it exists, independently of statutory regulations, and as it is governed by express enactment. The act, which has recently received the Royal assent, is so general in its nature, and so penal in its consequences, that we feel imperatively called upon to advert to it, for the sake of the numerous body of artists and manufacturers, who may not yet be aware of its existence, or of the objects of its provisions. The framers of the act have doubtless been influenced by laudable motives, but, it is to be regretted that they have not expressed themselves with more perspicuity. Unless we are very much mistaken, the protection intended to be given to inventors and artists, for one year, by what is termed "provisional registration," will be wholly or materially defeated by the language in which the Legislature has chosen to embody its ideas. Identified as we ourselves are in a very high degree with the interests of artists, inventors, and manufacturers, we regret that any boon which Parliament may have intended to confer upon these classes, in the shape of a monopoly for one year, should not have been placed beyond the reach of doubt or difficulty.

We will endeavour to lay before our readers an outline of the statute, in order to convey the information which, as Journalists of the Arts, it is our duty to give, in connection with the rights incident to them. Mr. Emmons Tennant's act of 1842, and the subsequent act of 1843, were directed exclusively to Designs applicable to manufactures. A monopoly or protection was granted to certain classes of designs, respectively, for three years, for nine months, and for a year, according to the subject-matter to which such designs were applied. The act just passed, and which we suppose dates from the 15th of August, when it received the Royal assent, in its original shape was not confined merely to designs, but extended to new manufactures or inventions, for which Letters Patent are usually granted. Its provisions were afterwards applied to sculpture, models, copies, and casts, and to designs for the ornamenting of ivory, bone, papier-mâché, &c. Such are the subjects to which the act relates, and this statement of them will enable our readers to judge how far they are personally or professionally interested in the new law.

The act professes to "extend" as well as "amend" the existing Acts relating to the copyright of designs. As it came from the House of Lords, it recited, as a reason for doing so, that it was expedient to encourage the Exhibition of works of Art. This part of the preamble was struck out in the Commons. We believe that the effect of the act, even as it stands, will be to create doubt, difficulty, and needless expense;—doubt, in consequence of the wording of the sections; difficulty, from the imperfect machinery of the act, the efficacy of which may depend on regulations yet to be made by the Board of Trade; and expense, by reason of the double registration pointed at by the statute, namely, what is called provisional registration, and the usual existing registration under the Designs Acts of 1842 and 1843. We may observe that it is doubted by the best lawyers, whether foreigners (or, as they are termed in law, aliens) have any right to participate in the privileges given by the English laws of copyright. This will probably have to be decided by the House of Lords, as the highest Court of Appeal. On the other hand, there is nothing in those laws which prevents foreigners from carrying abroad any design, manufacture, or invention, and profiting thereby in their own country. We believe that it is contemplated to have an international copyright law; but the difficulty of inducing other nations to agree upon the principles and terms of such a law, appears almost insuperable. We merely allude to these matters to show the real extent to which the act before us can have any operation. This has been still more limited by the important amendments made by the House of Commons, only a few days before the prorogation;—so hasty have been the proceedings of those who originated this act of Parliament. As all the Copyright Acts are of a penal nature, they will have to be construed with strictness. This was a reason for postponing the measure until the next session, by which time its provisions could have been penned in plain English, and arranged with greater precision and accuracy. Without exposing ourselves to the charge of

captiousness or hypercriticism, we may venture to say, that there is scarcely a section of this act upon which any lawyer of ordinary acuteness may not raise objections before a magistrate, who may be called upon to impose a penalty of 30*l.* for any alleged pirated "copy" or cast of any sculpture, or for the application of any ornamental design which has been registered, and to any substance. We must admit that the subject is one of extreme difficulty for legislation to grapple with. But this was a reason for exercising the greater care and precision.

The first section provides as follows:—

"That the Registrar of designs, upon application by or on behalf of the proprietor of any design not previously published within the United Kingdom of Great Britain and Ireland or elsewhere, and which may be registered under the Designs Act, 1842, or under the Designs Act, 1843, for the provisional registration of such Design under this act, and upon being furnished with such copy, drawing, plan, or description in writing or in print as in the judgment of the said registrar shall be sufficient to identify the particular design, in respect of which such registration is desired, and the name of the person claiming to be proprietor, together with his place of abode or business, or other place of address, or the style and title of the firm under which he may be trading, shall register such design, in such manner and form as shall from time to time be prescribed or approved by the Board of Trade; and any design so registered shall be deemed 'provisionally registered,' and the registration thereof shall continue in force for the term of one year from the time of the same being registered as aforesaid; and the said registrar shall certify, under his hand and seal of office, in such form as the said board shall direct or approve, that the design has been provisionally registered, the date of such registration, and the name of the registered proprietor, together with his place of abode or business, or other place of address."

It may be doubted whether this section in any respect alters the existing law of Copyright, except in those classes of cases as to which an exclusive property was given by the act of 1842, for nine months, the additional period of three months being conferred by the present act. It may further become a question as to the publication, what latitude of meaning is to be given to the words "or elsewhere," preceded as they are by the limits of "Great Britain or Ireland." Nor is it very obvious, what the legislature intended by making a distinction between ordinary registration and "provisional" registration. Other difficulties occur to us upon the words and working of the act, but we are compelled to refrain from mentioning them in detail. It seems scarcely possible to doubt that in the session of 1851, this statute will require explanation and amendment, as its predecessors have done.

Our readers will ere this have inquired what benefits are to be conferred by this proposed provisional registration. The answer to this question is given by the second section, which provides—

"That the proprietor of any design which shall have been provisionally registered shall, during the continuance of such registration, have the sole right and property in such design; and the penalties and provisions of the said Designs Act, 1842, for preventing the piracy of designs, shall extend to the acts, matters, and things next hereinafter enumerated, as fully as if those penalties and provisions had been re-enacted in this act, and expressly extended to such acts, matters, and things respectively; that is to say,

"1. To the application of any provisionally registered design, or any fraudulent imitation thereof, to any article of Manufacture or to any substance.

"2. To the publication, sale, or exposure for sale of any article of manufacture or any substance to which any provisionally registered design shall have been applied."

To those who have ready access to the Designs' Act of 1842, section 7, it will be unnecessary to point out the peculiarity of this provision, in attempting to define acts of piracy. The section in the former Act is clear and intelligible; that of the present statute vague and unsatisfactory. It will be seen that in speaking of "imitation," the framers of this Act have guarded themselves by using the word "fraudulent." We venture to submit that as fraud is of the essence of piracy of another man's copyright, it should have been expressly named as part of the definition of the offence. In Mr. Emmons Tennant's Act this was provided for in a very careful manner. The party who "sold, exposed to sale, or published," by the Act of 1842, was deemed innocent, unless previously affected by express notice of the registration. It seems difficult to imagine why the present enactment should have been left with its present apparently stringent aspect. Can it be intended that every manufacturer, before applying a design, or that every tradesman, before exposing to sale, any article of manufacture having any ornamental design, is to search through the Registrar's Book at Somerset House, and inspect all the drawings there deposited.

The 3rd section relates to the Exhibition of

Designs, or articles ornamented with such designs, and it is so peculiar, merely considered as a literary composition, that we shall be forgiven for extracting it at length:—

"That during the continuance of such provisional registration neither such registration nor the exhibition or exposure of any design provisionally registered, or of any article to which any such design may have been or be intended to be applied, in any place, whether public or private, in which articles are not sold or exposed or exhibited for sale, and to which the public are not admitted gratuitously, or in any place which shall have been previously certified by the Board of Trade to be a place of public exhibition within the meaning of this act, nor the publication of any account or description of any provisionally registered design exhibited or exposed or intended to be exhibited or exposed in any such place of exhibition or exposure in any catalogue, paper, newspaper, periodical, or otherwise, shall prevent the proprietor thereof from registering any such design under the said Designs' Acts at any time during the continuance of the provisional registration, in the same manner and as fully and effectually as if no such registration, exhibition, exposure, or publication had been made; provided that every article to which any such design shall be applied, and which shall be exhibited or exposed by or with the licence or consent of the proprietor of such design, shall have thereon or attached thereto, the words 'provisionally registered,' with the date of registration."

The plain meaning of this enactment is, that provisional registration shall not prevent the ordinary registration under the acts of 1842 and 1843, and that proprietors of designs shall not be precluded from the latter process or privilege by exhibition in public or private. It preserves, we conceive, to the proprietor the right of double registration, but why this should be given, or whether it is not a burden rather than a benefit, we must leave to artists and manufacturers themselves to determine. We presume that there will be fees payable for both species of registration.

The legislature next proceeds to consider the effect of a sale of articles to which provisionally registered designs have been applied. It is declared that in such a case, the copyright acquired by provisional registration shall be defeated, but it is added that the design may be sold; a privilege, we presume, that exists without the permission of Parliament. The obvious intention of the framers of this clause was, to compel a fresh registration on every sale of the design. It would appear to have been much more simple and judicious, had the interests of artists and manufacturers been consulted, to allow the protections acquired by registration to accompany the design, into whatever hands it might chance to find its way, by sale, assignment, or transfer. The section itself is as follows:—

"That if, during the continuance of such provisional registration the proprietor of any design provisionally registered shall sell, expose, or offer for sale any article, substance, or thing to which any such design has been applied, such provisional registration shall be deemed to have been null and void immediately before any such sale, offer, or exposure shall have been first made; but nothing herein contained shall be construed to hinder or prevent such proprietor from selling or transferring the right and property in any design."

The next section (5) is very unjustifiably drawn. It gives power to the Board of Trade to extend the period of provisional registration for six months, in any "particular" case, or with respect to any "particular" class of designs. We do not find a definition of the term "particular" in the interpretation clause, and we presume that the discretion of the Board of Trade as to extension, must be deemed perfectly arbitrary. The clause stands thus in the act:—

"That the Board of Trade may, by order in writing, with respect to any particular class of designs, or any particular design, extend the period for which any design may be provisionally registered under this act for such term not exceeding the additional term of six months as to the said board may seem fit; and whenever any such order shall be made, the same shall be registered in the office for the registration of designs; and during the extended term the protection and benefits conferred by this act in case of provisional registration shall continue as fully as if the original term of one year had not expired."

It is unnecessary to trouble our readers with the next section, relating to sculpture, as it does not in any way affect the existing copyright, but leaves the manner and form of registration to the future regulations to be promulgated by the Board of Trade.

The rights of sculptors have been defined by the 54 Geo. III, c. 56, which gave a copyright in models, copies, or casts of the human figure, or of animals, for a term of fourteen years, and enabled the artist to proceed by special action upon the case, and if he recovered a verdict, to obtain double costs. The act of this session enables the proprietor of any designs in sculpture, to recover for every act of infringement, a penalty of 5*l.*, or not exceeding 30*l.*, by summary proceeding before a magistrate. It was originally proposed that all pirated copies

* Vide Art-Journal, Nos. 131, 139, and ante.

should be given up to the proprietor of the copyright, but this part of the clause was erased in the House of Commons.

The former acts had not expressly named and classified "designs for ornamenting of ivory, bone, papier-mâché, the present statute declares that these and other solid substances not already comprised in the classes 1, 2, or 3, in the Designs Act of 1842, shall be deemed and taken to be comprised within the class numbered 4 in that act, and such designs shall be so registered accordingly. Protection will therefore be given to this class of designs for three years. They were, we presume, previously entitled only to one year's copyright privilege, under class 13 of the act of 1842, being included in the words "any article of manufacture or substance not comprised in any preceding class." This appears to be a just and reasonable provision, and may tend to encourage a branch of art, hitherto neglected in this country, but assiduously cultivated in France.

Power is given to the Board of Trade to extend the copyright of any design, registered under the act of 1842, for three years, or to revoke any order for such extension as they may think proper. The effect of this section is, therefore, to enlarge very considerably the powers of the Board of Trade, and to add to their present very large discretionary jurisdiction on these subjects. The subsequent sections empower this Board to make regulations for registrations, and to publish them in the London Gazette. The Registrar of Designs is authorised to dispense with copies, drawings, or prints, in certain cases. Public books and documents in the Designs Office, are not to be removed except under a judge's order, by virtue of which also, copies may, when necessary, be given in evidence, such copies having been previously signed and sealed by the registrar.

We have already intimated that the act before us is one that was wholly uncalled for, by the present condition of the arts and manufactures of this country. Nor is it too much to say, that if further legislation were necessary, the "Designs Act of 1850" is likely to create much doubt, difficulty, and expense. The piracy of design, we have reason to hope, is not of so frequent occurrence as to call for enlarged powers or increased penalties. If it were, we answer, that the existing laws were adequate to any infringement.

"Jura inventa metis injusti fatcare necesse est,
Tempora si fastosque velis evolvere mundi."

But there is also a spirit of justice as well as of injustice, in the community, which promptly and judiciously fixes a stigma on those who make a profit by piracy. And upon this the legislature might, at least for the present, have relied, especially as a remedy is always open by injunction, and as the policy of copyright laws is by no means a question upon which there is perfect unanimity amongst statesmen and political economists.

THE

PROJECT OF THE UNITED STATES

REGARDING THE EXHIBITION OF 1851.

OUR readers are aware that a proposal has been made to convey to America portions of the materials which form the great Exhibition of 1851. The proposal, be it remembered, in no respect emanates from the United States Government; it originated with public spirited individuals, who placed it in the hands of the best merchants, in order that their interests should be enlisted for the benefit of the manufacturer, and to insure proper care of the goods. We may premise, however, that it is not only directly sanctioned, but warmly encouraged and strongly supported, by the several heads of the government—the President, the various Ministers of State, all the Ministers to European Courts, and by the public in general, who see in the scheme vast national advantages, which will be of immeasurable service to the people of America.

Although, then, the project is not—any more than our own—a Government project; like our own, it is the work of the most eminent and wealthy men of the United States, who will be, in a great degree, pledged for the issue, and who are, even already, guarantees for the good faith of the transaction.

Mr. J. Jay Smith, the missionary accredited to England and to other countries of Europe, by the Committee for conducting this affair, has submitted to us his various testimonials, and the recommendatory documents, by which he expects to establish confidence on the part of those among whom he seeks contributors. They are entirely satisfactory; furnished by many of the chief statesmen of his

country; the minister to England, (Mr. Lawrence) and the ministers to other European states; and they completely remove from our minds—as they will do from the minds of all who peruse them—any apprehension that may have existed on the subject. The English public may be fully sure that the plan will be carried out in integrity, and that the contract, whatever it may be, will be faithfully and honourably fulfilled.*

Whether manufacturers will consider it their interest to send to America their productions for exhibition there, is another question; we think, however, they must do so. The Americans of the United States form a wise, a politic, and a powerful people; they are even now the great customers of the world; it is their custom which supports a majority of the manufactures of England, as all know who visit Sheffield, Manchester, Birmingham, Leeds, the Potteries, and other districts where men are busy. Their trade is largely increasing daily; not alone because of their augmenting population, but because of their additional wants—the wants created by prosperity and advanced civilisation.

It is clear, therefore, that every nation will desire to place its "patterns" before its best customer. We know that Prussia, Belgium, France, so effectually; and for England to hesitate would be absolute *folie de se*. Mr. J. Jay Smith informs us that he has visited the capitals of all the European states—held repeated interviews with their heads, and the several committees appointed to conduct their transactions regarding the Exhibition in London—and received pledges of support from a large majority of the principal manufacturers throughout Europe, that upon the close of the Exhibition in London they will send their goods to America as contributions to the Exhibition there; and he has supplied to us proofs conclusive that the success of the scheme, in so far as regards ample supply, may be considered as secured.

He has now returned to America, for a short period, and requests us to explain that time did not permit his visiting the manufacturers of England generally; but that he means to do so, under the conviction that the English are, more than any other people, interested in exhibiting such a display in the United States as shall not only secure but extend their market there. And this is to us so obvious, as to render explanatory comments needless.

Other occasions will offer for taking note of the various details; at present we may observe only that the shipping agents will be Messrs. Baring, Brothers & Co., to whom reference may be made; that the Exhibition will take place in the spring of 1852, and that the object of an early notice is to allow full time to the manufacturer of Europe, who designs to exhibit in London, and who has a prospect of vending his goods there, or of keeping them for his own use, to prepare a duplicate for the Exposition in America in 1852; this, in numerous cases, will not be attended with the expense of the original outlay, wherever a model has first to be prepared; that the manufacturer will be called upon to incur neither risk nor expense; in case of sales, or of orders, the usual mercantile charges will be made; but in the event of return, no cost will be incurred by the contributor; such, we understand the arrangement is to be, and information may be obtained either of Mr. J. Jay Smith, Philadelphia, or of Mr. Fishery Thompson, American Agency, 5, Bank Chambers, London.

* It is unnecessary for us to print more than one of these documents; the following is from the Governor of the State of New York:—

State of New York, Executive Department,
Albany, March 1, 1850.

"Mr. John Jay Smith having been favourably introduced to me, and having detailed a plan of bringing to America such portions of the Exposition of Art and Industry of all Nations, to be held in London, 1851, as are antiques and portable; and having always taken a great interest in the Arts and Manufactures, and believing that the introduction of this Exposition to the view of our citizens would eminently promote the progress of the United States, foster a taste for Art, and be the means of displaying, side by side, the products of the Old and the New World: the undersigned, Governor of the State of New York, is free to say, the project meets with his full and entire approval, and that he will be happy to be considered one of the number who will look with great interest to its accomplishment—recommending to all manufacturers at home and abroad of articles intended for the Great Fair in London to make such arrangements with Mr. Smith as they shall deem proper and right in a mercantile sense to be made.

"And moreover, the undersigned would express his full and unequalled belief that such an Exposition in the City of New York would be attended with great benefit, not only to the community, but with eminent success in every point of view.

"HAMILTON FISH."

THE ART-JOURNAL ILLUSTRATED
CATALOGUE
OF THE EXHIBITION OF 1851.

We have to announce our intention of reporting very fully the Exhibition of 1851, in the ART-JOURNAL. For this purpose we design to issue Three Supplementary Parts for the months of May, June, and July; each Part to consist of at least Fifty-two pages, to contain between 250 and 300 Engravings on Wood.

This Exhibition will be of the deepest interest to every civilised nation of the world. It will be a display of the best productions of manufactured Art, contributed by all the nations of Europe, by the several states of America, and by the numerous countries and colonies attached to the British crown. It will, therefore, supply suggestions for improvements to all orders and classes of manufacturers and artisans; and operate as a great school of Art, in which its true principles are to be studied and taught.

It is, therefore, above all things essential that the Exhibition should be properly reported; mere descriptive matter could not do this—so as to be useful for practical purposes, the only way by which the collection can be effectually represented is by a series of engravings so extensive as to embrace all the leading objects it contains.

THE ART-JOURNAL will be naturally looked to, to achieve this object: we are now actively making such arrangements as will enable us to answer the expectations and meet the wishes of our subscribers, not only at home but abroad.

It cannot be presumptuous in us to say that our facilities for working out this plan are peculiar; the great circulation of our Journal justifies a large expenditure: we have established relations with nearly all the leading manufacturers of Great Britain; they have confidence in our executing the task with fidelity: the artists who will co-operate with us are at our hand; experience will point out to us the articles from which engravings ought to be made as most suggestive as well as most attractive; and all contributors to the Exhibition will be aware not only of our resources, but that, from the character and circulation of our Journal, it will become an "authority" upon the subjects of which it treats.

We have already held communications, personal or by correspondence, with a large proportion of the English manufacturers who will be contributors; and before the time for action approaches, we shall have had intercourse with all those whose productions we are likely to desire to describe and engrave; and we are about to visit the Continent, with a view to arrange for similar co-operation.

When this notice is in the hands of our readers we shall be en route to the various cities and towns of Germany, visiting Munich, Vienna, Prague, Dresden, Berlin, Leipzig, Hanover, Amsterdam, and all intermediate places where information is to be obtained. Subsequently we shall arrange to visit Brussels, and the various districts of Belgium famous for manufactures; and at the close of the year our visits will be to Paris, Lyons, St. Etienne, and the other manufacturing cities of France.

We shall arrange with the principal manufacturers of the Continent concerning the principal objects they design to contribute.

The engravings will be executed and published in the ART-JOURNAL without cost to the manufacturer. It will only be necessary that the Manufacturer supplies the Editor with drawings of the principal objects he designs to exhibit, together with such information concerning his establishment as it may benefit him to communicate: but it is essential that these drawings be received at the earliest possible period, in order that they may be in all respects worthily executed and carefully printed.

When these illustrated Reports have been issued with the ART-JOURNAL, they will be collected into a Volume, which will contain, probably, more than a Thousand Engravings, and become—as a catalogue of its most beautiful and valuable contents, a permanent record of the Exhibition, and a key to the most meritorious Manufactures of all parts of the world.

A DICTIONARY OF TERMS IN ART.

CINQUE CENTO (*Ital.*) This generic term, which is a mere abbreviation for *five hundred*, is used to designate the style of Art which arose in Italy shortly after the year 1500, and therefore strictly the Art of the sixteenth century. Its characteristics are, a sensuous development of Art as the highest aim of the Artist, and an illustration of subjects drawn from classical mythology and history.

COBALT BLUE. This beautiful pigment is a compound of Alumina and Phosphate of Cobalt. It was discovered in 1802 by the French chemist Berard. There is no reason to doubt its durability, although, when imperfectly prepared, it is subject to change.* **COBALT** is the colouring matter of **SMALTS**†.

COBALT GREEN (RINMANN'S GREEN, GRÜN ZINNOBER, *Germl.*) A preparation of Cobalt, the green colour of which is due to the presence of iron: it works well both in oil and water.

COCK. This bird is regarded as the emblem of watchfulness and vigilance; and from a very early period its image was placed on the summit of church crosses. A **COCK**, in the act of crowing, is introduced among the emblems of our Lord's passion, in allusion to the sin of St. Peter.

COLOGNE EARTH. A bituminous earth of a violet-brown hue, transparent and durable in water-colour painting.

COLOUR. The type of Colour is found in the *prismatic spectrum* or the *rainbow*. In which we discover that a ray of white light is capable of being decomposed into three *primitive colours*—**RED, BLUE, and YELLOW**; these, by their mixture, produce three other colours, which are termed *secondary*; thus, the union of Red with Blue yields, when in varied proportions, the different hues of Purple and Violet; Red, mixed with Yellow, yields Orange; Yellow, with Blue, produces Green. Every hue in nature is a compound of two or more of the primitive colours in various proportions. **GREENS** and **BROWNS** are compounds of all three of the primary colours in unequal proportions. **BLACK** results from a mixture of Blue, Red, and Yellow, of equal intensity and in equal proportions. Of material colours (pigments) there is but one (**ULTRAMARINE**) that approaches the purity of the type in the Spectrum—all the others are more or less impure; thus we cannot obtain a pure Red pigment, since all are more or less allowed with Blue or Yellow. If we could obtain a Red and a Yellow of the same purity and transparency as Ultramarine, we should need no other pigments for our palette, since, by judicious mixture, they would yield every tint in nature.—**LOCAL COLOURS** are those peculiar to each individual object, and serve to distinguish them from each other.—**COMPLEMENTARY COLOURS** are composed of the opposites of any given Colour. If this Colour is a *primitive*, such as **BLUE**, the *complementary colour* is composed of the other two primitive colours, viz., **Red and Yellow**, or **Orange**; the complementary colour to any *secondary* is the other primitive colour; thus the complementary to green (composed of Blue and Yellow), is **Red**, and so on, for the remainder.—**HARMONY OF COLOURS** results from an equal distribution of the three primary colours, either pure, or compounded with each other, as **Greys and Browns**.—**CONTRAST OF COLOUR** is either simple or compound. Each of the primitive colours forms a *contrast* to the other two; thus Blue is contrasted by Yellow and by Red—either of these forms a simple contrast to Blue; but by mixing Yellow and Red together, we produce Orange, which is a *Compound Contrast*, consequently Orange, the *Complementary Colour*, is the most powerful contrast that can be made to **BLUE**. Colours are regarded as warm or cold, positive or negative; thus Blue is a *cold*, and Orange a *warm*, colour. Red, neither warm nor cold. All *warm* colours are contrasts to *cold* colours.†—**SYMBOLIC COLOURS.** Colours had the same signification amongst all nations of remotest antiquity. Colour was evidently the first mode of transmitting thought and preserving memory; to each Colour appertained a religious or political idea. The history of Symbolic Colours testifies to a triple origin marked by the three epochs in the history of religion—the Divine, the Consecrated, and the Profane. The

first regulated the costume of Aaron and the Levites, the rites of worship, &c. Religion gave birth to the Arts. It was to ornament temples that sculpture and painting were first introduced, whence arose the *Consecrated language*.* The *Profane* language of colours was a degradation from the Divine and Consecrated languages.†

COLORIST. A painter whose works are remarkable for beauty of colour. Titian, Correggio, Paul Veronese, Rubens, Vandyk, are in the first rank of Colorists. The Venetian and the Flemish Schools have supplied the greatest number of Colorists, as well as the best; always excepting Correggio, the founder of the Lombard School, who is by many regarded equal to Titian. Colour being, as well as Design, an essential part of a Picture, every Colorist is, at the same time, more or less a draughtsman. But experience shows, and theory furnishes good reasons for believing, that these two qualities, which many artists possess together in a moderate degree, are rarely found in an eminent degree, united in the same individual, and still less in the same picture.

COLUMBA, St. This saint is represented with a crown upon her head, and standing on a pile of burning wood, an angel by her side; sometimes she holds a sword. According to the legend, the angel is said to have extinguished the flames with his wings, whereupon she was beheaded by order of the Emperor Aurelian, at Cordova, A.D. 273. The idea that she was of royal blood appears to have arisen from the crown, which, on the contrary, refers to her being a martyr.

COMB. A well-known instrument for separating and adjusting the hair. That it was employed by the ancients for the former purpose is evidenced by those found at Pompeii and in Egyptian tombs. It does not appear that the hair was fastened by Combs; they are not found in the remains of Ancient Art; the Acus, or Bodkin, was used for that purpose.

CONNOISSEUR (*Fr.*) The **CONNOISSEUR** is 'one who knows,' as opposed to the **DILETTANT**, who only 'thinks that he knows.' These two distinctions are often confounded; hence the latter, being the most numerous and dogmatic, hold the sway in what is popularly considered to be **CRITICISM** in Art, much to the prejudice of artists and of Art itself. The Connoisseur is the true friend of Art; he judges of works from their intrinsic excellence, regardless of the influence or bias of popular names upon the indiscriminating crowd. He is prompt to recognise, seek out, and foster genius in its early struggles and obscurity, and help it to occupy that position too frequently usurped by the pretender, who, pandering the imperfect or perverted taste of the crowd, obtains an ephemeral reputation at the expense of future neglect. The qualities necessary to constitute a **CONNOISSEUR** are—a natural feeling for Art, a keen perception, and a sound judgment; by study and observation he has become familiar with the technics of art, the manner and method of various schools and masters. He has no prejudices or predilections; hence he is impartial. He can appreciate details as well as merits, and distinguish an original from a copy. The *retouchers* and *repainters* are his abomination. Painters are seldom or never good connoisseurs.

CONSTANT WHITE, PERMANENT WHITE. A pigment prepared from the sulphate of barytes, useful in water-colour painting, possessing great body. It is very poisonous.

COPALBA, COPAIBA. A kind of turpentine or oleo-resin, of an amber colour, obtained from West Indies and Brazil. Being destitute of oxygen, it readily attracts it from the atmosphere, and dries into an excellent varnish, for which purpose it is sometimes used, as well as for a **VEHICLE**.

COPAL. A hard resin, the product of a tree growing in India and Africa, used in making Varnishes; it is of a tawny yellow colour, transparent, and vitreous, without taste or smell, and is nearly as hard as **AMBER**. The Copal Varnish, employed in painting from a very early period, is the resin dissolved in boiling linseed oil; turpentine will dissolve this resin, though with difficulty. Copal Varnish, as well as Amber Varnish, has

* The large glass windows of Christian churches, like the paintings of Egypt, have a double signification—the apparent and the hidden; the one is for the uninitiated, the other applies itself to the mystic secrets. The hieroglyphic era lasts to the *Renaisance*. At this epoch symbolic expression is extinct; the divine language of colours is forgotten; painting becomes an art, and is no longer a science.

† The aristocratic era commences. Symbolism, banished from the church, takes refuge at court; disdained by painting, it is found again in heraldry.

‡ This subject is amply and ingeniously illustrated in PORTAL'S *Essay on Symbolic Colours*. Translated by F. Man. London, 1845. Weale.

been extensively employed as a **VEHICLE** in Oil Painting.*

COPE. An ecclesiastical vestment, like a cloak (which it originally was, and used to protect the wearer from the inclemency of the weather), worn in processions, at vespers, during the celebration of mass, by some of the assistant clergy, at benediction, consecration, and other ecclesiastical functions. Its form is an exact semicircle, without

slaves, but furnished with a hood, and is fastened across the breast with a moose or clasp. **COPEES** were ornamented with embroidery and jewels, (**APPARELLS**), wrought with elaborate splendour, at a very early period. In the thirteenth century they became the most costly and magnificent of all the ecclesiastical vestments.†

CORAL. A marine zoophyte, which, when removed from the water, becomes as hard as a stone. It is of a fine red colour, and will take a fine polish. It is much used for small ornaments, but is not so susceptible of a high rank in gem-sculpture, as many precious stones.

CORIUM. Leathern body armour, cut into scale form, occasionally worn by the Roman soldiers. A specimen is here given from Trajan's Column.

CORN. Ears of corn are the attribute of Ceres, and also of Dike (Goddess of Justice) and Juno Martialis, who is represented on a coin of Trajanianus Gallus with some ears of corn in the right hand. They were also the symbol of the Year. The harvest month, September, was represented by a maiden holding **EARS OF CORN**, and Ceres were a wreath of them or carried them in her hand, as did also the Roman divinity *Bonus Eventus*. The Ears of Corn were also used as a symbol of tillage, fruitfulness, culture and prosperity, and we find on the reverse of a silver coin of Metapontis, an ear of barley, with a field-mouse beside it; the barley alludes to the sacrifice of golden ears at Delphi, and the mouse to Apollo Sminthios.

CORONA. A crown or circlet suspended from the roof or vaulting of churches, to hold tapers, lighted on solemn occasions, the number of which is regulated according to the solemnity of the festival. Sometimes they are formed of triple circles, arranged pyramidically.

COSTUME. The study of Costume requires, on the part of the artist, the observance of propriety in regard to the person or object represented; an intimate knowledge of countries, their history, manners and customs, arts, and natural productions; the vestments peculiar to each class; their physiognomy, complexion, their ornaments, arms, furniture, &c. All should be conformable to the scene of action and historical period. Many of the old masters, and not a few of the moderns, have committed some very glaring improprieties in their Costume; we may instance Paul Veronese, while, on the contrary, Nicolas Poussin is remarkable for

* See *Materials for a History of Oil-Printing* by C. L. ESTLAKE, THEOPHILUS, *Arts of the Middle Ages*, by G. LEONIE, Mrs. MENZIEBOLD'S *Ancient Practice of Oil-Printing*, &c.

† See PUGN'S *Glossary of Ecclesiastical Ornament and Costume*. Our illustration is copied from Rubens's famous picture of St. Ignatius Loyola, the founder of the Order of Jesuits, which picture is now in Warwick Castle. It very clearly exhibits the form and decoration of the Cope.

* See *ART-JOURNAL*, Sept., 1849.

† The quality of this pigment varies in the hands of different makers, some being tinged with a red hue, forming a violet colour. The finest specimens we have met with, approaching in purity of hue to Ultramarine, were prepared by M. Edouard, Rue Neuf Brema, No. 6, Paris; a most conscientious and trustworthy manufacturer of artist's pigments.

‡ The practical investigation of this subject is nowhere so usefully explained as in HENDERSTEDT'S *Art of Painting Restored*. London, 1849. D. Bogue.

his accuracy in this respect. The observance of correct Costume is a great merit in an artist, at the same time, it must be subservient to pictorial effect. The subject does not meet with that earnest attention from artists that its importance demands. We have made COSTUME a special feature in this DICTIONARY, and have endeavoured to refer the reader to the best authorities on the subject. We subjoin the titles of a few of the books most valuable for the reference of the artist.*

COUNTER PROOF, CONTRA PROOF. Engraving, is an impression yielded by a newly-printed proof of a copperplate, for the purpose of rigorously inspecting the state of the plate. The proof is the Reverse of the Plate, but the COUNTER-PROOF shows every thing the same way.

COWL (CUCULLUS, Lat.) The hoods which protect both head and neck from the cold. St. Basil and St. Anthony commanded their monks to wear them, and latterly they have come into use by travellers, sailors, and huntsmen.

CRAYONS (CHALKS, Fr., PASSEL-STIFT, Ger.) Cylinders of soft clay, white or coloured with various pigments, used for delineating objects upon paper, which are usually termed *Chalk Drawings*.

CREST. A device placed upon a wreath, and originally surmounting the knightly helmet. It is now placed over family arms, and has sometimes a punning allusion, as in our engraving, the Moor's head being the crest of the Moore family.

CROSS-BOW. This ancient weapon, a great improvement on the wooden long-bow, was brought to Europe by the Crusaders. It was made of steel, with a peculiar handle, and the string was stretched by means of a small wheel called a *gaffe*. The bolts or arrow were generally shod with iron, and were either round, angular, or pointed. Burning

materials were also discharged from the Bow, in order to set fire to buildings and machines of war. Those Bows made wholly of iron were called **BALISTERS**.† The share which Art had in the Cross-Bows of the middle ages may be seen by a glance into the Armouries. The most artistic specimen is the bow which Charles V. used for his amusement. It was inlaid with ivory carved by Albert Durrer.

CREWETTS. Small vessels of glass or metal, used at the Altar to hold the wine and water intended for consecration.

CRIMSON. The colour known by this name is *Red*, reduced to a deep tone by the presence of *Blue*.

CROCKETTS. Enrichments modelled generally from Vegetable productions, such as Vine or other leaves, but sometimes Animals and Images are introduced, employed in Gothic architecture to decorate the angles of various parts of ecclesiastical edifices, such as spires, pinnacles, mullions of windows, &c. The forms are infinite, almost every kind of leaf or flower being employed for this purpose, generally with some pointed reference to local circumstances; thus, at Westminster we find a succession of roses and pomegranates; at Magdalen College Chapel, lilies. They only appear in pyramidal and curved lines, never in horizontal.

CROSS. The Cross occupies a very important place in Christian Art. It is the sole and universal symbol of our Redemption, and of the person of our Saviour; he is symbolised under this form, as he is also under that of the **FISH**, the **LION**, or the **LAMB**. The Cross is either historic or symbolic, real or ideal; in the one it is a gibbet, in the

* *Hoppe's Costume of the Ancients.* Two vols. 8vo. *Fairnott's Costume in England.* 8vo. 600 woodcuts. *Hébert's Costumes Français.* Folio. *Ferrario, Il Costume Antico e Moderno.* 4to. *Heinen, Costume des Moyen Age Chrétien.* 4to. *Costumbuch für Künstler.* 4to. *Pugin's Glossary of Ecclesiastical Ornament and Costume.* 4to.

† Two Popes forbade the use of the Crossbow; it was most in favour in the time of Richard Coeur de Lion and Philip Augustus of France. It was used as a weapon of war in the fourteenth and fifteenth centuries; when a great part of the infantry of many armies consisted of cross-bowmen, or archers; those of Genoa and Venice were particularly famous, and were often hired by foreign powers.

other an attribute of glory. There are four species of Cross. 1. The cross without a summit, in the form of a T; this is the Egyptian cross, the cross of the Old Testament. Many ancient churches, especially the Basilicas of Constantine, St. Peter and St. Paul at Rome, are, in their ground-plan, nearly of this form. 2. The cross with summit; it has four branches; this is the true cross, the cross of Jesus and of the Evangelist. This form of cross is divided into two principal types, which also partake of many varieties; they are known as the Greek, and the Latin cross; the first is adopted by the Greek and Oriental Christians, the second by the Christians of the West. The **GREEK CROSS** is composed of four equal parts, the breadth being equal to the length.* In the **LATIN CROSS**, the foot is longer than the summit or the arms. The Greek Cross is an *ideal* cross; the Latin Cross resembles the real cross upon which Jesus suffered. 3. The Cross with two cross-pieces and summit. 4. The Cross with summit and three cross-pieces.† When the Cross retains its simple form, and is not loaded with attributes or ornaments, we must distinguish the **CROSS OF THE PASSION** from the **CROSS OF THE RESURRECTION**. The **CROSS OF THE PASSION** is a real cross, the gibbet upon which Christ suffered. This is the

cross in common use in our churches; it is employed by painters and sculptors; and which, in Catholic countries, meets us at every turn, by the roadside, in the street, chapels, and cathedrals. It is also called the **TRUMPET CROSS**. The **CROSS OF THE RESURRECTION** is the symbol of the true Cross; it is that put into the hands of Christ in representations of his resurrection. It is a Lance, the staff of which terminates in a Cross instead of a Fluke; it carries a Flag or Banner upon which is depicted a Cross, which is suspended from the point of intersection of the arms. It is the cross held by the Paschal Lamb; it is that carried at the head of religious processions. It is not a tree, like the *Cross of the Passion*, but a staff; the first is the *Cross of Suffering*, the other is the *Cross of Victory*; they are of the same general form, but the latter is spiritualised, it is the **GIBBET** transfigured.‡ There are many other Crosses which are purely emblematic, some of which have been adopted in heraldry, to which names, characteristic of their nature and forms, have been given. And it is somewhat remarkable that all those used in blazonry are Greek and not Latin, being brought from the East at the time of the Crusades.§ The full consideration of this interesting subject would fill a large volume. We must refer our readers to the interesting work of M. Didron, *Iconographie Chrétienne, Histoire de Dieu*, 4to, Paris, 1843.

CROWN, CORONA (Lat.) An ornament of various forms and materials worn round the head; and by the ancients sometimes round the neck; by kings and others as emblems of authority; and as

* The **MALTESE CROSS** and the **CROSS OF JERUSALEM**, are varieties of the Greek Cross.

† These varieties of the Cross must be regarded as somewhat fantastic, yet they were adopted by the Church. The **TRIPLE CROSS** was carried only before the Pope; the **DOTTED CROSS** was appropriated to Cardinals and Archbishops, while the **SINGLE CROSS** was left to the Bishops.

‡ The *Cross of St. John the Baptist* is nearly identical with this, but it has not the Cross depicted on the Banner.

§ See *Glossary of Heraldry*, 8vo, Oxford, 1847. The crosses used by the Church may be classed conveniently as follows:—

1. Altar Crosses.
2. Processional.
3. Roods on lofty.
4. Reliquary Crosses.
5. Consecration Crosses.
6. Marking Crosses.
7. Pectoral Crosses.
8. Spire Crosses.
9. Crosses pendant over Altars.

See *Pugin's Glossary of Ecclesiastical Ornament and Costume*.

a mark of honour for civil, military, and naval achievements. Nine specimens of Crowns are enumerated in Heraldry.—1. The **ORIENTAL CROWN**; 2. The **TRIUMPHAL or IMPERIAL CROWN**; 3. The **DIadem**; 4. The **OBSIDIONAL CROWN**; 5. The **CIVIC CROWN** (this is the Crown in which Cybele is represented); 6. The **CROWN VALLARY**; 7. The **MURAL CROWN**; 8. The **NAVAL CROWN**; 9. The **CROWN CELESTIAL**.—In Christian Art, the **Crown**, from the earliest times, is either an attribute or an emblem. It has been employed as an emblem of victory, and hence became the special symbol of the glory of martyrdom. Its form varied at different periods; in early pictures it is simply a wreath of palm or

myrtle, afterwards it became a coronet of gold and jewels. Generally, the female martyrs only wear the symbolical Crown of glory on their heads. Martyrs of the opposite sex bear it in their hands, or it is carried by an angel. Sometimes, as in St. Catherine and St. Ursula, the Crown is both the symbol of martyrdom, and their attribute as royal princesses. The Virgin, as 'Queen of Heaven,' wears a Crown.*

CROZIER. A Staff surmounted by a Cross, borne before an archbishop. It is about five feet long, hollow, and generally made of tin, gilt and ornamented. It is often confounded with the **PASTORAL STAFF** of a bishop, which is quite dissimilar, being made in the form of a Crook. The

Fig. 1. Fig. 2. Fig. 3.

early **CROZIER**s were exceedingly simple, terminated only by a floriated Cross.† The **BYZANTINE CROZIER** has at the top either a knob or a Cross, which is sometimes in the form of a T, with curved serpents on both sides. It is also found in the Latin church among the old bishops.‡

CROCIFIX (CROCEFIXUS, Lat.) The representation of the Saviour on the Cross, but especially that plastic one seen on the altars of Catholic churches, in the centre of which it stands, overtopping the tapers, and only removed at the elevation of the Host. Its intention was to lead the mind back to the Cross, which was set up on the altar or in some convenient spot. It was first

* No. 1, in our cut, represents the Laurel Crown of ancient Rome, from Montfaucon. No. 2, the Mural Crown worn by Cybele, as given by Caylus. Fig. 3, the Radiated Crown of its ordinary form, from a coin of Gordian. No. 4, the square Saxon Crown, as delineated in a MS. of the period, in the Cottonian collection (Tiberius, C. 6). No. 5, the Crown of Edgar, from a grant to Winchester, A.D. 966 (Vespasian, A. B.). No. 6, the Crown of William the Conqueror, from one of his coins. No. 7, the Imperial Crown of Germany. No. 8, that worn by Charlemagne.

† In *Shaw's Dresses and Decorations*, vol. 1, an archbishop is figured with a Crozier of simple but beautiful design.

‡ Fig. 1 represents the Crozier held by Archbishop Walsley, A.D. 1307, in his edify at Westminster. Fig. 2 is of very early date, in the Cathedral, Durham; Fig. 3 in the Museum, Newcastle: both are pastoral staves.

known in the time of Constantine, and takes the place of the real CRUCIFIX in the Eastern church. The latter was not common till the end of the eighth century. The Greek church never publicly accepted it, although it appears in the quarrel about images, but used the simple CROSS. It was not general in the Latin church until the Carolingian era. From the *disciplina arcani* and the early prohibition of IMAGES by the Synod of Elvira (305), an early use of the Crucifix may be supposed, as it referred immediately to the first Christian dogma. At first the simple Cross was sufficient—*crux immissa* or *capitata* +; *crux decussata* X; and *crux commissa* T—the Lamb standing under a blood-red Cross. The addition of the Saviour's bust at the head or foot of the Cross while the Lamb lay in the centre, was the next step towards the CRUCIFIX; and afterwards Christ himself was represented clothed, his hand raised in prayer, but not yet nailed. At last he appeared fastened to the Cross by four nails (seldom by three), and on the older Crucifixes alive, with open eyes; on the

later ones (from the tenth to the eleventh century), sometimes dead. Christ was often clad in a robe, having the regal crown on his head; more recently the figure wore only a cloth round the loins, and the crown of thorns.* This representation was continued, and the CRUCIFIX regarded as an indispensable attribute of churches and altars. The number of them increased, as they were particular objects of veneration; and large ones of wood or stone were placed at the entrances of the church. The ALTAR CRUCIFIX was generally of gold or silver, adorned with pearls or precious stones.

CUIRASS. The covering of plate-armour used for protecting the body from the waist upwards.
CUIR-BOULLI (Fr.) Boiled leather. Frequently mentioned by medieval writers. It consisted of leather adapted to various purposes, both of defence and ornament, by the process of boiling.† It has lately been revived under the name of *impressed leather*, and brought to a high degree of perfection.

CUSTODIA. The shrine or receptacle for the Host in Spanish churches. They are frequently constructed of gold and silver, upon which all the riches of the goldsmith's art were lavished.

CYATHUS (Gr.) A single-handed drinking-cup, probably used as a ladle. It is often met with

on painted vases in the hands of Bacchus; but the

* Later artists, such as Schinkel of Berlin, have enveloped the Saviour in drapery, leaving the body in its customary position; he has also added the angel by the side, by which addition these crucifixes intended in the spirit of Christian Æsthetics for Protestant churches, become mere symbolic representations of Christian Ideas. The unpleasant sight of the nailed feet is avoided by their resting free and unbound on the globe, so that only the arms are fastened by nails to the cross. We are now too much accustomed to the naked figure to allow of the innovation of representing Christ after the old custom; we may also question, whether the great simplicity of the

vessel peculiarly sacred to that divinity is the two-handed cup, **CANTHARUS**.

CYCLAS. A large robe of thin texture, with a border embroidered with gold, worn by the Roman women. It was worn in the same manner as the **PALLIUM**.

CYLLIX, CYMBRIUM. A two-handed drinking-cup, made of earthenware and of the precious

metals. Numerous specimens have been found at Pompeii and Etruria.

DAGGER. A weapon of various sizes, two edged and pointed, similar in appearance to a sword, but smaller.*

DAGUERRETYPE. An ingenious invention, named after the originator, M. Daguerre, the inventor also of the *Biorama*. The process consisted of exposing silver plates to the vapour of Iodine; these were then placed in the *CAMERA OSCURA*, and after sufficient exposure, the light acted upon the iodised surface of the plates, which were then exposed to the vapour of Mercury, by which the latent image was developed. The iodine was then washed off by a solution of Salts of Soda, (the Hyposulphite or the Sulphate) by which further action of the light was stayed, and the image on the plate rendered permanent. Such was the state of the discovery when first made known; many improvements were suggested, which resulted in the *CALOTYPE* and the *TALBOTYPE*, full details of which have appeared in this Journal.†

DAIS. A Canopy or covering. When the Ciboria fell into disuse, the altars were protected by a Canopy of cloth of gold or silk suspended over it. These Canopies were sometimes composed of wood, painted and gilt. The raised step at the upper end of the great dining-halls has been termed **DAIS**, from being the place of dignity, over which a canopy of state or **DAIS** was suspended.‡

DALMATIC, DALMATICA. The vestment worn by the Deacon at mass; it resembles the **PLANETA** worn by the priest, cut straight, with open sleeves hanging over the upper part of the arm. It has not the large cross stripes of the **PLANETA**, but two narrow stripes of colour or lace, having between them two gold tassels. The deacon's Dalmatica is larger than that worn by the bishop over the **TUNICA** or **TUNICELLA**. It is not made of linen, but of the same heavy silken fabric as the **PLANETA**,

original crucifix had not more effect; since the restoration of Art the haggard sorrowful character of the figure has disappeared, and artists have represented the Ideal of human beauty in the form as a token of the concealed Godhead.

* The shield of Edward, the Black Prince, at Canterbury, is a veritable specimen of *Cuir-bouilli*, the *Cuir-puly* of Chanson.
† The cut exhibits two daggers from the armory at Goodrich Court. The first is of the time of Edward III.; the second, which has the more modern improvement of a guard for the hand, is of Italian workmanship, of the latter end of the fifteenth century.
‡ See SNELLING'S *History and Practice of Photography*, 12mo, New York, 1850.

‡ PUGIN'S *Glossary of Ecclesiastical Ornament and Costume*.

STOLA, MANIPULUS, and MITRA. The **TUNICA**

of the sub-deacons is exactly like the **DALMATICA**.*

DAMARA, or DAMMAR RESIN. This resin is the produce of a tree growing in the Indian Archipelago and New Zealand, and is employed in making a valuable Varnish, when dissolved in Turpentine or Alcohol. There are several varieties of Dammar Resin, one, as hard as Amber and Copal. The soft kind usually met with in commerce is completely soluble in cold Turpentine. It is a valuable substitute for MASTIC.

DAMASK. A fabric of silk, linen, wool, also partly or wholly of cotton, woven with large patterns of trees, fruits, animals, landscapes, &c., and one of the most costly productions of the loom. It consists throughout of a body of five or eight shanks, the pattern being of a different nature to the ground. Damask weaving first attained perfection at Damascus, whence this large-patterned fabric derives its name. We find the art flourishing in the mediæval times of Art at Bruges, and other places in Flanders; attempts were also made in Germany and France.

DAMASKENING. This term, derived from the Syrian Damascus, so renowned in Art, designates the different kinds of steel ornamentation. The first is the many-coloured watered Damascus blades; the second kind consists in etching slight ornaments on polished steel-wares; the third is the inlaying of steel or iron with gold and silver, as was done with sabres, armour, pistol-locks, and gun-barrels. The designs were deeply engraved, or chased in the metal, and the lines filled with gold or silver wire, driven in by the hammer, and fastened firmly. This art was brought to great perfection by the French artist Corsinet, in the reign of Henry IV.

DANCE OF DEATH. This edifying subject is very frequently met with in ancient buildings, stained glass, and in the decorations of manuscripts, &c. The best known is that by Hans Holbein. It is frequently found in the margins of early printed books. One, from the press of Simon Vostre, in 1502, has a most interesting series, beautifully designed and executed. The earliest representation of this impressive subject dates from the fourth century; but it was rapidly multiplied, and introduced into many English and Continental churches.†

DECOLLATION. A term in frequent use, synonymous with beheading, and used in reference to the decapitation of St. John the Baptist, St. Cecilia, &c.

DECORATION. The ornamental parts in an edifice, comprising the Columns, Pilasters, Friezes, Bas-reliefs, Cornices, Festoons, Niches, Statues, &c., and which form the decorations of the façade of a palace or temple; and the Gilding, Arabesques, Paintings, Panellings, Carvings, the Draperies, &c., which compose the decoration of an interior. The discoveries at Pompeii have furnished some

* The Dalmatic is, in its signification, a robe of dignity, and therefore appropriated to the Diaconate, as being the first hierarchical order; it is distinguished from the *Tunicella*, by the greater length and amplitude of its proportions.—See PUGIN'S *Glossary of Ecclesiastical Ornament and Costume*. The most ancient form of Dalmatic is exhibited in our cut, copied from an early Christian writing.

† The most celebrated in this country was painted round the cloister of Old St. Paul's, in the reign of Henry VI. at the expense of Jenkyn, a carpenter and citizen of London. It is described as having been executed after one in the Cemetery of the Holy Innocents at Paris. There were also painted **DANCES OF DEATH**, at Amiens, Basle, Dresden, Lucerne, Minden, Dresden, &c. At Rouen, in the cemetery of St. Maclois, is a Dance of Death sculptured in relief on the pillars of the great cloister which surmounted the inclosure.

very beautiful interior decoration, quite classical in taste.*

DESIGN. The Art of Illusion. A design is a figure traced in outline, without relief being expressed by light and shade. Also a Sketch in water-colour, in which the Chiaroscuro is expressed by Indian Ink, Sepia, or Bistre; or a sketch in which the object represented is clothed in its proper colours. **DESIGN** is sometimes used synonymously with **SKETCH**, **STUDY**, to indicate the first composition for a picture, &c.; here it embodies all the inventive genius of the artist—**INVENTION**, **COMPOSITION**, **COLOURING**, &c., and is preliminary to the execution of the work on the chosen scale.

DETACHED. When figures stand out from the background and from each other in a natural manner, so as to show that there is space and atmosphere between, we say they appear detached.

DEVICE. A motto, emblem, or other mark by which the nobility and gentry were distinguished at tournaments.

DIADEM. The frontlet worn by the kings and princes of antiquity, and also by their wives. It was made of silk, wool, or yarn, narrow, but wider in the centre of the forehead, and generally white. Those of the Egyptian gods and kings are adorned with the emblem of the sacred serpent. The Bacchic Diadem, or *Credemnon*, which the Indian Bacchus wore, consisted of a folded band encircling the forehead and temples, and fastened behind with hanging ends.† With the Parsees (Persians) the Diadem was wound round the Tiara, and was bluish white.‡ The Greeks presented a Diadem to every victor in the public games; and it was also an attribute of priests and priestesses. We find from Homer that the term Diadem was unknown in the early ages of Greece, *Stephanos* being the name used in the "Iliad" for the ornament. The more recent Greek was *Stephanos* (wreath), and the still later equivalent *Koronis* (whence the Latin *Corona* and our word *CROWN*), was a garland of honour far more important than the **DIADEM**, and quite distinct from it in signification. We allude to the myrtle crown of the archons, senators, and public speakers, and to the wreaths of olive which were given to meritorious citizens, and which were afterwards exchanged for a golden circlet. The wreaths worn by the Grecian women were very splendid, varying from the simple garland of laurel worn at feasts, to a costly ornament, often, though improperly, termed a **DIADEM**.

The real Diadem, like the sceptre, is a symbol of power, especially in the representation of Juno (Hera), who is thereby designated as the consort of the sovereign of the gods and men, and partaking of his power.

DILETTANT (Ital.) The **DILETTANT** is one who treats Art empirically, a lover of art who is not satisfied with looking and enjoying, but must needs *criticise* without a shadow of qualification for so important a function. We except the case of those born with a real talent for Art, but who are prevented by circumstances from receiving an artistic cultivation. The dilettant holds the same

* The Art of Decoration was for a long period after the Reformation almost entirely lost in this country. Taste was banished; caprice and fashion long usurped its place. Within a few years, however, a revival of former excellencies has taken place, though not nearly to the extent we could wish. Decorators still appear greatly at a loss for good models; we can refer them to Mr. GRUNER'S *Frescoes and Decorations of Italy*; Mr. WEATT'S *Geometrical Classics of the Middle Ages*; and especially the works of Professor ZAHN, whose volumes form together an almost inexhaustible storehouse of the most exquisite designs for the use of the decorator.

† One similar is represented above, as given in a Greco-Egyptian coin of Ptolemy XII. (A.C. 65).

‡ The early Roman Emperors did not wear this ornament, perhaps to avoid displeasing the people by reminding them of the hated kingly dignity. A Dilettant was the first who wore it, and after the time of Constantine the Great, it was adorned with rows of precious stones or pearls. At last the caprices and ostentation of rulers were not satisfied with the diadem, and rich crowns were worn, and are still in use.

§ One of the most splendid of these, with the necklace and bracelet belonging to it, was lately found at Apulia; it surpasses all works of the kind hitherto discovered.

|| In an old picture which a century ago was to be seen in the baths of Titus, and of which a coloured drawing is preserved in the Vatican library, Juno gives the diadem to Paris, promising him great power if he will declare her, the wife of Zeus, the most beautiful of all women. This diadem had at the back two strings for fastening it, and it is red like those worn by the victors in the games appointed by J. Eneas.

relation to the artist, that the bungler does to the artisan, he takes hold of Art by the weak end; conscious that art is learned according to rules, he errs in treating its laws as mechanical when they are spiritual. He confounds Art with material; he regards neatness and finish, which are mechanical, as the highest excellences. Invention, composition, colouring, being spiritual, are invisible to him. Having no confidence in the application of his rules, he applies them empirically, and follows, as nearly as he can, the direction of popular taste. While the aim and endeavour of the Artist is the highest in Art, the dilettant has no aim; he sees only what is beside him—nothing beyond. On this account he is always comparing; for the most part praises extravagantly, blames unskillfully; he is partial to the curiosities of Art, and regards its technics as an arena of tricks, and sleight of hand; he is ever searching for, and finding, the 'lost Medium' of the old masters; is curious in Megalys, considering that in them will be found a ready substitute for deep and patient study, and earnest feeling for Art. Wanting in a true idea of Art, he ever prefers the many and the indifferent or the rare and costly, to the choice and good. Many dilettants are collectors; they are fond, if possessed of the means, of raking together, their object being to possess, not to choose with understanding, and he content with a few good things. The dilettants do great injury to artists, by fostering the mechanical, rather than the spiritual, in Art, and by bringing them down to their own level. Yet, on the other hand, Dilettantism has its advantages; it prevents an entire want of cultivation, and as it is in some sort a necessary consequence of a general extension of Art, it may even be the cause of it. Under certain circumstances it may excite and develop a true artistic talent, and substitute a certain idea of Art, in place of entire ignorance, and extend it to where the artist would not be able to reach; though few artists can be connoisseurs, many are Dilettants. See *GOETHE'S Essays on Art*.

DIOTA (HYDRIA, CALPIS, CROSSOS). Urns. A large full-bodied vessel, narrow at top, with a

foot and two handles (*diotas*), holding a certain measure, and carried on the head.*

DIPLOIS. In Grecian costume, a kind of

doubled cloak, which, when worn, was folded back in the manner shawls are usually worn (**PALLIUM**) **DIPTYCH (DIPTYCHA)**. Folding tablets used in later Roman times; they were made of ivory, beautifully carved, covered on the inner side with

* The word *HYDRIA* means a water-vessel; by *DIOTA*, a vessel with handles is designated, and under this term are also comprised all vessels with a narrow neck used for holding and carrying liquids. The Panathenæic prize-vessels are mostly *ASPIKOTE*, but also *HYDRIE* and *CALPIDE*. The Corinthian *Hydria* were double *DIOTIS*, having two handles at the top, and a smaller one in the middle. The Attic prize for wrestlers was a *DIOTA* filled with oil.

wax, and used for letters of friendship. The letters were written inside these tablets, and on the outside were slight reliefs, making the specimens still extant not a little interesting in the history of Art. The whole class of **DIPTYCHA**, together with the **TRIPTYCHA** and **PENTAPTYCHA**, belong to the later Roman Empire, and are, therefore, curious as the last effort of Antique and also as remnants of

Early Christian Art; they are distinguished as *Consular*—those presented by the magistrates upon receiving that office;* and *Ecclesiastical*. They were made of wood as well as of ivory, and some are extant of chased silver. The *Diplycha Consularia* bore the portraits of the Consuls, representations of the Games in the Circus and Scenes of Triumph, &c. The *Diplycha Ecclesiastica* are decorated with scenes from Biblical history. They were very common during the middle ages, and were often most exquisitely wrought.† (See **TRIPTYCH**).

THE VERNON GALLERY.

THE PORT OF LEGHORN.

Painter, Sir A. W. Calcott, R.A. Engraver, J. C. Bentley. Size of the Picture, 59 1/2 in. by 31 1/2 in.

A REFERENCE to the dimensions of this picture, as given above, will inform the reader that it is a work of very considerable size, but the scene is such as fully justifies its representation on a large scale; and the combination of water with the classic architecture of Italy is precisely that character of material with which Calcott so ably dealt. The view is here taken under the effect of a warm sunny evening, but it is painted in sober tones, and with much delicacy, for even those parts left in deep shadows reflect the clear mellow tints of a southern atmosphere. There is little positive colour to be seen in the picture except in some of the figures, and even these are kept down so as not to disturb the general harmony.

Leghorn, a word which is an English corruption of Livorno, stands on the west coast of Italy, in the grand duchy of Tuscany. It is a sea-port of considerable commercial business, but the view here presented shows very little of the maritime bustle actually prevailing in the town. That part which is seen in the picture is towards the north, and is termed the Pisa Gate, as the way leads to that city, from which it is distant about fourteen miles. Leghorn has little claim to classical antiquity; it was formerly regarded only as a part of the more important inland city of Pisa, but its commerce, in the course of a very few centuries, raised it to a higher position than the place to which it had been subordinate. This success was mainly attributable to the influence and patronage of the Medici family in the sixteenth century, the Florentines having purchased Livorno from the Genoese soon after Pisa had fallen in their hands. From that time to the present, except when Bonaparte invaded Italy, it has gradually increased in wealth and population; the latter, including the two suburbs, of which Calcott's view is one, is reckoned to consist of nearly one hundred thousand persons.

* The Consuls and Prætors were accustomed to greet their nearest friends on the day of their entrance into office with these tablets, on which their portraits were drawn.

† Figured in Willem's *Monuments Français* Inédits, pl. 42. Besides those which are proper diptychs, and which may be classed among the sacred ornaments of the Church, were folding tablets of ivory or metal, with the representation of some sacred mysteries in relief. They vary considerably in size, but seldom exceed eight inches by four. Our engraving is copied from a very curious Diptych of the ninth century, published by Montfaucou, and contains sacred subjects as well as the Roman "Wolf and Twins," &c.

[Faint, illegible text columns surrounding the illustrations]

THE HARBOUR OF GENOVA

W. P. ...

THE GOLDSMITHS' WORK OF
M. MOREL.

For a very considerable time England has been excelled by France in the manufacture of jewellery, and it must be confessed that the best home productions in this branch are, for the most part, adaptations of Continental designs. Even in our boasted racing plate, upon which the best artists and the most approved goldsmiths are employed, we seldom evince that elegant feeling for design which France displays in works of infinitely less labour or importance. This fact is to be variously accounted for, but perhaps most conclusively on the following grounds:—In England it has been too much the fashion among the wealthy classes to award to intrinsic value the palm over artistic workmanship, or, in other words, to give the preference to a huge stone massively set, rather than to such a jewelled combination of excellent forms as might have emanated from the studio of Cellini. Again, in France, Art-instruction has been so much more widely diffused than in this country, that the inventive and creative faculties of our Continental neighbours have had better opportunities of expanding, thus rendering failures in composition far less frequent; to these may be added the fact that, from the cheapness of labour, metals and gems may be most easily prepared for the hand of the *artist-workman*, who can therefore expend upon an object of "orfèvrerie" double the amount of time that could be allowed him here. We endeavoured, as far as possible, to do justice to the large predominance of beautiful plate and jewellery brought together in the French Exposition, in our Report of the collection last year, and upon that occasion we gave a list, as far as possible, of the best manufacturers of Paris in these departments; to that list we must now make an addition by a series of engravings, which will, we think, be acceptable to all our readers.

M. Morel, a French manufacturer, originally goldsmith to His Majesty Louis Philippe and the Duke and Duchess of Orleans, has, since the abdication of his royal patron, settled in London, where he is carrying on a very extensive business among the nobility and gentry, and executing works of the highest order of merit. We believe his establishment is chiefly famed for its productions of jewellery, and particularly diamond settings, but we have also had the pleasure of seeing in M. Morel's rooms objects in gold and silver plate, calculated to reflect honour upon any manufacturer in any period of Art. Of the choice performances of this establishment we now offer to our readers a set of carefully executed illustrations from the pencil of Mr. W. Harry Rogers, and we believe they will not only prove interesting to most persons from their beauty and novelty, but by showing to the British manufacturer what the French are able to produce, will be really useful in explaining somewhat of the attitude which the art will assume in the great Exhibition of 1851.

For clearness and convenience we divide our review of the works of M. Morel into four sections, each represented by a separate page, viz., Goldsmith's work of purely ornamental character—Utilities in silver plate—Diamond settings—Enamelled jewellery. Had they been more suitable for the purposes of engraving, we might have included in the first section a superb centre for a dinner-service, richly modelled with subjects of hoys, bacchanalian trophies, &c., united by ornament of Louis XV., and a mounted agate cup of richly enamelled gold in the style of the best part of the sixteenth century. The last named piece of Decorative Art is so pure in character and at the same time so elaborate, as to remind us only of some of the ancient crystal mountings preserved in the Salle des Bijoux at the Louvre, which enjoy a European reputation. Among other productions which English manufacturers seldom even attempt, are seal-handles, composed of full-length figures finished with the delicacy of a miniature, card-cases, souvenirs, tazzi, vases, clocks, and ewers, as eminent for their just "balance" of ornament as for the anatomical correctness of their figure details.

The style mostly employed by M. Morel, as the accompanying engravings will explain, is a species of compromise between the "Renaissance" and that of "Louis XIV."

The first engraving on the present page represents a magnificent silver tazza and cover made for one of the princes of Russia, and therefore surmounted by his armorial bearings and supporters. Its form is novel and exceedingly graceful, and the lightness of its handles goes far towards supplying an agreeable contrast with the surface arabesques upon the body.

Following this will be seen an irregularly shaped vase, upon which the style of ornament-

tation partakes much of that universally adopted during the reign of Henri II. of France. The monster forming the handle, and the boys supporting a tablet are finished with much delicacy.

This page is dedicated to objects in plate of a useful character. The sugar-basin presents different features from the rest, being designed

rather with playfulness than severity. It is, nevertheless, very exquisite, and a considerable advance in form on the ordinarily manufactured

silver sugar-basins of the day. The set of which it forms a part was, we believe, intended for the Duchess of Orleans. The remaining utilities on

the page consist of coffee-pot, cream ewer, bread-basket, and tea-urn, all selected from one service,

which is both beautiful and original, somewhat reminding us of those pieces of plate which were

artists of France under Louis XIV. The masked and foliated handles, however, and quatrefoil

executed in Venice in the seventeenth century, and were so largely imitated by the decorative

plans of the bodies, bespeak the study of a purer school and attention to better principles.

The beauties and the capabilities of the diamond were a sealed book to our forefathers. These, consisting almost solely in the perfection of cutting and polishing, could not be developed

out of a solid stone, were it not that the various directions of the rays of light remove such an impression. In the settings both gold and silver are employed. The last subject on

by coarse workmanship, and the adoption of insufficient means for producing a fair surface. The few facets into which stones were formerly cut constituted another barrier against fully drawing out the brilliancy of the diamond.

this page is a brooch of the same character, but drawn of its actual size. The leaves of aquatic plants have supplied the materials for its composition. The remaining brooch consists partly

Modern science has, however, given to the stone an equal position for beauty as for rarity, and, in comparatively recent times, a discovery has been made whereby diamonds may be set trans-

parently, so that they can in nearly every direction receive and admit the light, and thus possess themselves of a radiance they could not formerly present. The French jewellers have most successfully availed themselves of this valuable invention, and have learned to unite transparently-set diamonds with such minute wires of metal as to render the junctions scarcely perceptible. But, perhaps, no manufacturer has brought modern art and science so happily together in the fabrication of diamond ornaments, by uniting with the best means of securing dazzling effect, the most graceful combination of good form, as the gentleman whose establishment is now under consideration.

The whole of the engravings on the present page are representations of some of M. Morel's mounted diamonds. The "gigette" at the top and its companion brooch, which is introduced at the foot of the first column, and will please most from its graceful distribution of forms, are considerably reduced from their original size. In design they consist of natural leaves and flowers arranged

with something of Italian treatment. The diamonds are all set transparently, and so closely studded together that each individual leaf would have the appearance of being chiselled

of diamonds and partly of enamelled gold, and is extremely beautiful both in design and workmanship. It is impossible for anything to surpass the brilliancy of these graceful ornaments.

Our concluding page of illustrations of M. Morel's manufactory exhibits brooches and

brackets of less pretension, but perhaps of equal beauty and interest. They are all formed of gold, variously enamelled and set with gems.

The first brooch is profusely garnished with hanging pearls; the bells and leaves are enamelled green, and the cinquefoil in the centre is

of white enamel, studded in the centre with a pearl. The next brooch which, in point of de-

sign, forms a kind of knob, is of gold engraved and decorated with pearls, while its foliations are elegantly enamelled with pale blue. The third brooch is more severe in treatment, and presents features which are altogether wanting in those already described. The field upon which the centre sprig is placed is of rich blue bordered with gold, the serrated leaf in the centre being white, relieved with pearls. These also appear in the border of laurel, the leaves of which are formed of green enamel. The brooch at the top of the next column is a beautiful example of interlaced design adapted to jewellery. It will be seen that the whole is an intricate arrangement of the stems of plants. These are all of gold, and the foliations which issue from them are the same with the under edges, enamelled green; a fine pearl, supported by two others, forms an agreeable centre. The three bracelets with which the page concludes are simply but beautifully designed. In the first, white and blue are the colours of the enamel introduced; the gold ground being first fashioned into scroll-work foliage, much after the style of design employed in this country under James I. Pearls, set as if growing from beneath leafage, add considerable life to the bracelet. The next bracelet is particularly unpretending, but has been composed with a great deal of judgment and knowledge of effect. The stalks and tendrils are of burnished gold; the two leaves are of blue enamel, upon which the centre stems formed of diamonds stand out in rich contrast of colour. The only other accessories are three pearls of a size

rather above the average of such as are employed for similar purposes. Our last subject is a bracelet, the ornaments of which seem to have been taken from the leaves and branches of the vine; the leaves are enamelled, and the grapes represented by pearls; the principal stalk is of gold, having the surface grooved and knotted, as in nature. The art of enamelling, which our Continental neighbours have carried to so great perfection, we do not remember to have seen more successfully employed in modern times, than in the various objects of luxury or personal adornment brought into being by the good taste and able discrimination of M. Morel.

We really think that our own manufacturers ought to direct their attention more assiduously to the art of enamelling on metals, particularly on gold. There can be but little doubt that in this country it had, in Anglo-Saxon times, been carried to a very high degree of perfection, if we receive the testimony of such remains as the Alfred Jewel, the famous brooch in the possession of Mr. C. R. Smith, and the various other examples which are met with in public and private collections; and although in subsequent times the practice became almost the peculiar province of the French, who established manufactories at Limoges and Avignon, there can be no reason why the Englishman should not take advantage of the advancement of chemistry in the present century, to apply it with equal success to the working of the precious metals in colours.

M. M. Morel has certainly done wonders in

applying enamel decoration not only to such personal ornaments as are represented on this

page, but also to works of a larger and more important character.

We understand that M. Morel's intention is to naturalise (so to speak) his establishment in England, and to graft on English industry the

resources which have made him famous in his own country. He already employs English workmen in his manufactory, and purposes gradually to increase their number; thus, by blending the undisputed qualities of the work-

men of both countries, to render a really important service to our own, and to give a vigorous impulse to the advancement of the arts of working precious metals in England. We are there-

fore advancing the interests of our own manufacturers by aiding M. Morel in his laudable design.

AN ACCOUNT OF SAMUEL COOPER,
MINIATURE PAINTER TO CROMWELL AND TO
CHARLES II.ALSO NOTES AS TO THOSE PERSONS WHOM HIS
PICTURES REPRESENT."Mine eye doth his effigies witness
Most truly lim'd and living."
SHAKESPEARE.

SAMUEL COOPER has been the successful rival of Oliver, Peitot, Hilliard, and Zincke, in "the limner's art," and his miniatures are no less interesting to the lovers of Art than they are to persons well read in the history and memoirs of his day. They were painted at the most important period, and during the most romantic annals, of English history—the Commonwealth and the Restoration of the Stuarts to power. Although the latter event seems greatly to have affected the miniature painter—probably occupied with his daily work—neither poets nor painters seem much to have concerned themselves with revolutions or politics, with change of men or with change of measures. Dryden's "Ode to Charles II." follows his panegyric "Stanzas to the Memory of Oliver Cromwell;" and Waller's "Lines on the Death of the Protector" but precede his rejoicings at the King's Restoration. Cowley alone it was, who, amongst the poets of England, remained faithful and attached to the Royal cause.

Cooper was the favourite painter of the Cromwell family. He drew, or painted, most of the heroes of the Republic. Oliver Cromwell sat to him several times; so did Richard and Henry Cromwell, and Oliver's two sons-in-law, Ireton and Fleetwood, as well as others of the Cromwell connexion, whose miniatures are not now forthcoming; yet Cooper was immediately in favour, and patronised by Charles II., at the Restoration; and Evelyn notices this in his memoirs, "The First Coinage of Money:"—1661. "Being called into the King's closet, where Mr. Cooper, the King's limner, was engraving the King's face and head to make stamps by, for the new minted money now contriving."

Cooper was also employed by Louis XIV. He went to France and Holland, and on the Continent he was known by the name of the little Vandike. It was a portrait of a person of the name of Swingfield that first brought him into notice at the French Court; for the Royal family he painted pictures of a larger size than ordinary; and his widow received a pension for her life from Louis. The King offered Cooper 150*l.* for his picture of "Oliver Cromwell," but Cooper would not sell it. The value of Cooper's miniatures, though excellent in Art, is much increased from their representing persons celebrated or historical in those stirring times of the Rebellion; and Pepys, in his precise manner, states the value in which they were held as works of great merit, during the life of the painter—"Pepys's Diary," 1669. "My Wife sat to Cooper; he is a most admirable workman and good company."—"To Cooper's, where I spent the afternoon, seeing him make an end of my wife's picture, a most rare piece of work as to the painting. He hath 30*l.* for his work, and the crystal and gold case comes to 8*l.* 3*s.* 4*d.* more." Aubrey, the famous English Antiquary, author of the "Life of Hobbes," also writes in the same terms of commendation of Cooper's painting. Speaking of Sir William Petty, the philosopher and physician, he says, "about 1659, he (Hobbes) had his picture drawn by his friend and mine, Mr. Samuel Cooper (the Prince of Limmers of his age), one of the likest that ever he drew."

This praise of Cooper is repeated as often as he is mentioned by Aubrey. The high estimation in which these miniatures are held renders it desirable that a catalogue should be made out of Cooper's numerous works, both to identify the persons they represent, and enable others to ascertain whose portraits they may have in their possession.

To begin with the old engravings, of which a complete collection has lately been procured.

1. 'Samuel Cooper,' painted by himself. T. Chalmers, sculptor.

I, 2. Samuel Cooper, born 1609, died 1672.

2. 'Samuel Cooper.' Engraved from the portrait at Strawberry Hill for Horace Walpole, in the book called "Anecdotes of Painters."

3. 'Oliver Cromwell, Lord Protector, 1653,' from a picture in the possession of Sir Thomas Frankland, engraved by Vertue.

4. 'Oliver Cromwell,' from another miniature engraved by Vertue in 1724.

5. 'Oliver Cromwell,' etched by Lamborn, from an original picture by Cooper at Sydney College, Cambridge.

6. 'Oliver Cromwell,' from a profile in the possession of the Duke of Devonshire.

7. 'General Ireton,' from a picture in the possession of David Polhill, Esq.

8. 'John Thurloe, Secretary to Oliver Cromwell,' from a picture in the possession of Lord James Cavendish.

9. 'Thomas Lord Fairfax,' from a picture in the possession of Bryan Fairfax, Esq.

10. 'Lord Fairfax.' Engraved by Worlidge, from a miniature in the possession of G. Scott, Esq.

11. 'John Thurloe.' Engraved by Golder. Published 1784.

12. 'John Thurloe.' Engraved by Cosmo Armstrong. Published 1821.

13. 'Fleetwood.' Without name or date. Engraved from a small miniature.

14. 'Mary Fairfax, Duchess of Buckingham,' Engraved from a miniature at Strawberry Hill, now Lord Northwick's, and published by Harding in 1798.

15. 'Richard Cromwell, Lord Protector,' from a miniature in the possession of Lord Orford, at Strawberry Hill. Engraved by Harding in 1792.

16. 'Richard Cromwell, Lord Protector,' from the same miniature. Engraved by Gardner. Published by Harding in 1797.

3, 4, 5, 6, Oliver Cromwell, born 1599, died 1658. 6, 7, 8, 9, are engraved by Houbraken of Amsterdam, and were published 1738—1742.

7. Ireton, the Parliamentary General, was the first husband of Cromwell's eldest daughter Bridget; she esteemed and admired him, but for her second husband, Fleetwood, showed a proportionate degree of contempt.

9, 10. Thomas, Lord Fairfax, was a noble author. Lord Orford, in his *Royal and Noble Authors*, treats his character with great contempt; he says, of this Parliamentary General, "one can easily believe his having been the tool of Cromwell when one sees by his own memoirs how little idea he had of what he had been about. . . . Of all his works the most remarkable were some verses that he wrote on the horse whereon Charles II. rode to his coronation, which had been bred and presented to the king by his lordship."

8, 11, 12. John Thurloe or Thurlo, as it is often spelled, was educated a lawyer; he became Secretary of State under Cromwell's government, and was continued in his office under Richard Cromwell. He made an offer of his services to Charles II., at the Restoration, who declined accepting of them; accused of high treason, he was arrested in May 1660, but being released, he retired to Great Milton in Oxfordshire, and was often solicited by Charles to return to office. He died 1668; he was a man of moderation in politics and of an amiable character in private life.

His collection of state papers is in seven volumes folio.

13. Fleetwood, Lord Deputy of Ireland, the son-in-law of Cromwell, having married the widow of Ireton, Bridget Cromwell.

On the death of the Protector, Fleetwood joined in inducing Richard Cromwell to abdicate.

14. This lady was a great heiress and a good kind of woman, but without beauty; yet with a good countenance, as her portrait denotes, and very short and fat. She was the only child of the republican General Fairfax, and became the wife of George Villiers, the second Duke of Buckingham.

"Her witty and eccentric husband, who was all mankind's epitome, could assume any character he pleased, and may have loved her in her turn; she never opposed his humour or interfered with his course of life." Lord Orford describes her husband as one who alike ridiculed his wife, his presbyterian father-in-law, Fairfax, the witty king, and the solemn Chancellor Clarendon, but who could charm them all when he had a mind to do so.

15, 16. Cromwell's eldest son, Richard, was known by the name of the *peaceable man*; his character early in life came out as one opposed to violence and bloodshed. His father writes to a friend—"I hope he (Richard) may be serious; the

17. 'Henry Cromwell.' Engraved from a miniature in the possession of Dr. Hayes, of Oxford. Published by Jeffrey, Pall Mall, 1807.

18. 'His Royal Highness James Duke of York and Albany, afterwards James II.' An oval 4*to*. S. Cooper, p. R. Williams, fecit, E. Cooper, ex.

19. 'James, Duke of York, afterwards James II.' Engraved by Scriven. Published by Millar & Carpenter, 1810.

20. 'Prince Rupert, when young, in a black hat.' Engraved from a miniature in the possession of Mr. Edwards, Pall Mall, and published by Whitefleet, Strand, 1808.

21. 'Prince Rupert in middle age.' Drawn in armour. Engraved by J. H. Sherwin. Published by Stockdale, 1787.

22. 'Edmund Waller, the Poet.'

23. 'Mr. Abraham Cowley, the Poet.' Engraved by Vertue.

24. 'Milton.' Published by Caroline Watson, 1786.

times require it." Again, as to answering his father's letters, Oliver Cromwell writes—"As for my son Dick, knowing his idleness, I do not much expect it from him." Richard was of a humane disposition, one made for private life, fond of hospitality, not objecting to a gay town existence, and much attached to his lady, Mrs. Dorothy Cromwell, who was distinguished for her purity of morals, as well as for her graceful manners. Richard was nearly crushed to death when he was elected Chancellor of the University of Oxford, which appears to have taken place in London, as it was occasioned by the fall of the stairs of the Banqueting House at Whitehall, upon which Secretary Thurloe writes in the language of the Presbyterian. "This has been a great affliction to His Highness and family; . . . if a sparrow fall not to the ground without the providence of God, much less do such things fall upon a person of his quality, by chance." Richard was a Colonel in the army, and took his seat as one of the lords in the Upper House by Oliver Cromwell's desire. He was far from being the timid imbecile creature as thought by some of his party; on the contrary, he saw the end of all things sooner than others.

17. Henry Cromwell, second son to Oliver Cromwell was Lieutenant of Ireland, and died in 1674.

18. This print is one of great beauty and rarity.

19. The history of James II. is too well known to insert here.

20, 21. For the history of Prince Rupert, see Lodge. He was entrusted by Charles I. with the command of some of the armies in the civil war; being his nephew, a son of his sister Elizabeth, Queen of Bohemia. He was fond of the arts and sciences, of chemistry, and the first who, in England, engraved in mezzotint.

22. Waller was born 1625, educated at Eton and Cambridge, and was in Parliament; he died in 1687. In his discourse Waller was agreeable; his wit was much admired, and his speeches were listened to with great attention. Though courted as a man of the world, he was, in other respects, says Clarendon, of an affect temper, without courage to support him in any virtuous undertaking, and of the most insinuating flattery.

23. Cowley, born in 1618, educated at Westminster and Cambridge. The noble independence of his conduct displeased the republicans, and he was ejected from the University. He was a friend of Lord Falkland, and managed the correspondence between the Loyalists and the king, living for ten or twelve years on the Continent. He died in 1667, and is buried in Westminster Abbey, near Chaucer and Spenser. See Johnson's "Lives of the Poets," for further particulars.

24. Milton, born 1608, died 1674, for particulars of his life, see Johnson and other Lives of this great Poet.

Sir Joshua Reynolds believed in the authenticity of this portrait, so beautifully engraved by C. Watson. Along with it, he possessed another miniature, by Cooper, of Cromwell, and bequeathed them both to Mason the Poet, and to R. Barse, junior. He observes, "This picture is admirably painted, and with such a character of nature, that I am perfectly sure it was a striking likeness. I have now a different idea of the countenance of Milton, which cannot be got from any of the pictures I have seen."

Beneath the Portrait is engraved, in an oval form, the following. "This picture belonged to Deborah Milton, who was her father's amanuensis; at her death it was sold to Sir William Davenant's family. It was painted by Mr. Samuel Cooper, who was painter to Oliver Cromwell at the time that Milton was Latin secretary to the Protector, the Painter and Poet were of the same age.

25. 'Henry Rich, Earl of Holland.' Engraved by Godefroy.

26. 'William, second Duke of Hamilton,' from a pencil drawing by Cooper, in the possession of the publisher, Woodburn, 1815.

27. 'William, second Duke of Hamilton.' Engraved by Stow, from a miniature in the possession of William Smith, of Chelsea. Published 1814.

28. 'Charles Stuart, Duke of Richmond.' Engraved from a miniature at Strawberry Hill. Published by Harding, 1796.

29. 'George Monck, Duke of Albemarle,' from a miniature at Strawberry Hill. Published by Harding, 1798.

30. 'Thomas Wriothesley, Earl of Southampton, Lord High Treasurer of England.' Engraved by Harding, after the miniature at Strawberry Hill.

31. 'Rachel Wriothesley, Lady Russell.' A round small miniature, as a widow, without inscription.

32. 'Rachel Wriothesley, Lady Russell,' as a widow. Engraved by Scriven, from a miniature at Woburn.

33. 'Lady Russell.' Introduced in Lodge's "Portraits;" in some editions of the book it is given as the work of Cooper, in others as that of another artist.

Milton was born in 1608 and died in 1671, Cooper was born in 1609 and died in 1672. They were companions and friends till death parted them. Several encouragers and lovers of the fine arts, at that time wanted this picture, particularly Lord Dorset, John Somers, Esq., Sir Robert Howard, Dryden, Atterbury, Dr. Oldbuck, and Sir John Denham.

Under the above writing, inscribed beneath the engraving, is as follows: "The above is a facsimile of the manuscript on the back of the picture which appears to have been written some time before the year 1693, when Mr. Somers was knighted, and afterwards created Baron Evesham, which brings it to within nineteen years after Milton's death. The writer was mistaken in supposing Deborah Milton to be dead at that time, she lived till 1727, but in indigence and obscurity, married to a weaver in Spitalfields. I have only to add that Cooper appears to have exerted his utmost abilities on his friend's picture, and that Miss Watson has shown equal excellence in this specimen of her art. The likeness to the original picture which is in my possession, is preserved with the utmost exactness. J. Reynolds."

25. The Earl of Holland was known as ambassador, in early life, at Paris, by the name of Lord Kensington. For the circumstances of the curious life of this fickle nobleman, see "Lodge's Memoirs," and "Clarendon's History." He was beheaded in Palace Yard, on March 9, 1649.

26, 27. William, Duke of Hamilton, whose life may be found treated at length in "Lodge," was the friend of Charles I., and killed at the Battle of Worcester, in 1651.

28. Charles Stuart, Duke of Richmond and Lennox, was the last duke of his family; at his death his fortune and hereditary honours devolving on his nearest relation, Charles II., as his next heir male. He was sent ambassador extraordinary to Denmark in 1672, and died that same year at Elsinore. He was the husband of "La Belle Stuart," of the court of Charles II. This lady survived him thirty years, passing her old age at Lennox House, in Scotland, now the seat of the Blantyre family; where, it was said, "the great beauty that set the world on fire divided her time between cats and eards."

29. Monck, Duke of Albemarle, died in January, 1769, in the sixty-second year of his age.

30. Thomas Wriothesley, Earl of Southampton, was the second son of the friend and patron of Shakespeare, Lord Southampton; see the excellent character given of him in "Lodge," which accords entirely with the expression of the miniature and engraving, more than with Sir Peter Lely's portrait, engraved for "Lodge;" he was three times married, and died at Southampton House, in Bloomsbury Square, 1667, and is buried at Titchfield. He has been painted by Vandyke also; "like another Sully, he was placed at the head of the Treasury after the ravages of war, and in that office he was what his friend, Lord Clarendon was in the High Court of Chancery."

31, 32, 33. His eldest daughter, Rachel, by his first wife, Madame De Rouvigny, a private lady, was the wife of the great Lord Russell, and the numerous memoirs of this great lady detail her heroism and her wisdom.

34. 'Sir Edward Harley, Knight of the Bath, 1660, of Brampton Bryan Castle in the County of Hereford.' Engraved by Vertue, 1749.

35. 'Thomas Hobbes at the age of 76,' having a Latin inscription round the portrait. Engraved by Faltborne.

36. 'Anthony Ashley Cooper, Earl of Shaftesbury, Lord Chancellor, 1672' Engraved by Baron 1744.

37. 'Thomas Lord Clifford of Chudleigh, Lord High Treasurer of England.' Engraved by Scriven in 1819.

38. 'Robert Lilburne.' Engraved by Caroline Watson, published by Wilkinson, 1807.

39. 'William Leutball, Speaker of the House of Commons.' Engraved by R. Cooper.

40. 'Endymion Porter.' Published by Woodburn. From a miniature in the possession of Lady Sutton, 1810.

41. 'Jemima, Countess of Sandwich.' Published by Woodburn, 1813.

42. 'Duchess of Portsmouth.' Engraved by Scriven, published by Millar and Carpenter in 1810.

43. 'Eleanor Gwynne.' Published by Woodburn, engraved by Richard Earlow, and inscribed "Actress and Mistress to Charles II."

44. 'A Miniature.' Engraved by William Sharpe for "Paradise Lost," published 1802, and thought to be a portrait of Milton, but representing Noah Brydges, the writing-master.

The following miniatures by Samuel Cooper

34. Sir Edward Harley was the father of Queen Anne's minister, Harley, Earl of Oxford. See "Peerage."

35. Thomas Hobbes of this picture, by Cooper, Pepps says, "he drew Mr. Hobbs's picture as like as art could afford, and one of the best pieces that ever he did, which His Majesty upon his return bought of him, and conceives as one of his greatest rarities at Whitehall." Hobbes was born in 1588, and lived in perpetual activity of mind for ninety-one years. He was a decided Episcopalian, he was both the friend and tutor of William Cavendish, Duke of Devonshire, in 1647; mathematical tutor to the Prince of Wales; and amongst his personal friends he counted Lord Bacon and Ben Jonson. The above is a beautifully engraved print.

36. Lord Shaftesbury's bust on his monument was taken from a painting by Cooper. This is a fine engraving of that curious character, so celebrated for wit and abilities; his history, too long for insertion, may be found at length given in Walpole's "Royal and Noble Authors," third volume.

37. For the history and character of Lord Clifford, see Lodge's "Memoirs of Illustrious Persons," he was born in 1630, and died in 1673. He was a friend of Evelyn's, who names him often. To form a judgment of a portrait from an engraving, this appears Cooper's finest work; it is a remarkable countenance of a very remarkable man, in his life and character. Sir Peter Lely's representation of him appears very inferior to Cooper's. It was the last of Cooper's works, painted the year of his death, 1672. Under the engraving, is inscribed, "This picture belonged to Anne Clifford, his lordship's grand-daughter, who married George Carey, Esq., of Tor Abbey, Devonshire, and descended in the family until 1819, when it was presented to John Gage, Esq., of Lincoln's Inn, to whom this plate is respectfully dedicated, and superbly engraved, by Scriven that same year."

38. Under the engraving of the miniature is as follows, "Robert Lilburne, heir of the ancient family of Lilburne, of Thicketley Pancherion in the Bishoprick of Durham, in the Grand Rebellion Colonel of Horse, Major-General of the North of England, Commander-in-Chief in Scotland, and one of the Regicides; born 1613, died a prisoner in St. Nicolas Island, Plymouth, August, 1665. From an original picture in the possession of Mr. R. Graves, N.B.—He was elder brother of the famous John Lilburne." The miniature now belongs to Mr. F. Graves, of Pall Mall.

39. Lenthall was born in 1591, died 1663.

40. Endymion Porter accompanied Charles and the Duke of Buckingham in their expedition to Spain.

41. Lady Sandwic was a daughter of Lord Crews.

42. Louise de Querouille, Duchess of Portsmouth. See Mrs. Jameson's "Court of Charles II.," for the account of this French lady's power in England.

43. See the same work.

44. is Noab Bridges, the writing-master.

were collected by Horace Walpole, and sold at Strawberry Hill in the spring of 1842:—

1. 'Lady Heydon.'
2. 'Richard Cromwell.'
3. 'Lord Loudon, Chancellor of Scotland.'
4. 'Mrs. Lucy Waters,' the mother of the Duke of Monmouth.'
5. 'Waller, the Poet.'
6. 'George, Lord Digby.'
7. 'George Monck, Duke of Albemarle.'
8. 'Thomas Wriothesley, Earl of Southampton.'
9. 'Lady Anne Watson.'
10. 'Lady Bellasis.'
11. 'A Lady of the time of Charles I.'
12. 'Samuel Cooper,' painted by himself.
13. 'Mary Fairfax, Duchess of Buckingham.'
14. 'Lady Penelope Compton.'
15. 'Charles Stuart, Duke of Richmond and Lennox.'

16 & 17. Two copies, from Cooper, one representing Oliver Cromwell, the other the Duke of Lauderdale.

Of miniatures dispersed in various collections, the following are ascertained as Cooper's works:

18. 'Sir William Petty,' philosopher, antiquary, and physician.
19. 'Cowley the Poet.'
20. 'Archbishop Sheldon.'
21. 'Lucasia's Portrait.'
22. 'Mrs. Pepys.'
23. 'Lord Rich,' eldest son of Henry Rich, Earl of Holland.
24. 'The Duchess of Somerset.'
25. 'Thomas Howard, Earl of Arundel,' copied by Cooper, from the Vandyke in the possession of the Duke of Sutherland.
26. 'Eleanor Gwynne and her two Sons.'

Besides this numerous list of ascertained pictures, Lord Orford states that in his day large collections existed in Queen Caroline's closet at Kensington; that there were also miniatures of Cooper's at Blenheim, Castle Howard, Burleigh Castle, Donnington, at the Duke of Buccleuch's, and at the Duke of Northumberland's. Horace Walpole's account of Cooper being concisely written and particularly well expressed, is here inserted.

6. George Lord Digby, afterwards second Earl of Bristol, is thus described in the "Royal and Noble Authors":—"A singular person, whose life was one contradiction. He wrote against Popery, and embraced it. He was a zealous officer of the Court, and a sacrifice for it. Was conscientiously converted in the midst of his prosecution of Lord Strafford, and was most unconscientiously a prosecutor of Lord Clarendon. With great parts he always hurt himself and his friends; with romantic bravery he was always an unsuccessful commander. He spoke for the Test Act, though a Roman Catholic, and addicted himself to astrology on the birthday of true philosophy." Lord Digby's history is given at full length in "Lodge."

9. Lady Anne Watson was a daughter of the Earl of Strafford.

10. Susan Armine, Lady Bellasis, one of King Charles's beauties.

14. Lady Penelope Compton, a daughter of the Earl of Northampton, and the wife of Sir Edward Nicholls, Secretary of State.

20. Gilbert Sheldon, successor to Juxon in the see of London, and in 1667 succeeded Lord Clarendon as Chancellor of Oxford. In 1663 he was promoted to the primacy, but became so obnoxious at court, in consequence of his advice to Charles II. to put away Barbara Villiers, Lady Castlemaine, that he retired to Croydon, where he died, 1667, aged near 80. His munificence and charitable donations were very great, and of his liberality the theatre at Oxford is a noble monument.

23. Lord Rich, son of the Earl of Holland. His mother was a great heiress, the daughter of Sir John Cope, of Kensington, whom the interest of Buckingham procured as a wife for the Earl of Holland, by which he became possessor of what is now Holland House, afterwards purchased by Sir Stephen Fox.

24. The miniature of the Duchess of Somerset was set in a silver case, and at one time made part of Mr. Beckford's collection. There were two Duchesses of Somerset in Cooper's time; one was Frances, the second wife and widow of the Duke of Somerset, better known as Mr. Seymour, whose first wife was the Lady Arabella Stuart. The other was Sarah, Duchess of Somerset, well known as a foundress of alms-houses, and a benefactress to colleges.

"Samuel Cooper owed great part of his merit to the works of Vandyke, and yet may be called an original genius, as he was the first who gave the strength and freedom of oil to miniature. Oliver's works are touched and retouched with such careful fidelity, that you cannot help perceiving that they are nature in the abstract. Cooper's are so bold that they seem perfect nature, only of a less standard. Magnify the former, they are still dimly contrived; if a glass could expand Cooper's pictures to the size of Vandyke's, they would seem to have been painted for that proportion.* If his portrait of Cromwell could be so enlarged, I don't know but Vandyke would be less great by the comparison. To make it fairly, Vandyke must not be measured by his most admired piece, Cardinal Bentivoglio; the quick fineness of eye in a florid Italian writer was not a subject equal to the Protector, but it would be an amusing trial to balance Cooper's 'Oliver Cromwell' and Vandyke's 'Lord Stafford'; to trace the lineaments of equal ambition, equal intrepidity, equal art, equal presumption, and to compare the skill of the masters in representing—the one, exalted to the height of his hopes, yet perplexed with a command he could scarce hold, did not dare to relinquish, and yet dared to exert;—the other, dashed in his career, willing to avoid the precipice, searching all the recipes of so great a soul to break his fall, and yet ready to mount the scaffold with more dignity than the other ascended a throne. This parallel is not a picture drawn; if the artists had worked in competition, they could not have approached nigher to the points of view in which I have traced the character of their heroes.

"Cooper, with so much merit, had two defects; his skill was confined to a mere head, his drawing even of the neck and shoulders so incorrect and untoward, that it seems to account for the number of his works unfinished. It looks as if he were sensible how small a way his talent extended; this very poverty accounts for the other, his want of grace, a signal deficiency in a painter of portraits, yet how seldom possessed!

"Bounded as their province is to a few tame attitudes, how grace atones for want of action. Cooper, content like his countrymen with the good sense of truth, neglected to make truth engaging. Grace in painting seems peculiar to Italy. The Flemings and the French ran into opposite extremes. The first never approach the line, the latter exceed it, and catch at most but at a lesser species of it—the genteel, which if I were to define I should call familiar grace, as grace seems an amiable degree of majesty. Cooper's women, like his model, Vandyke's, are seldom very handsome. It is Lily alone that excuses the gallantries of Charles II. He painted an apology for that Asiatic court!

"The anecdotes of Cooper's life are few, nor does it signify; his works are his history. He was born in 1609, and instructed with his brother Alexander by their uncle Hoskins, who was jealous of him, and whom he soon surpassed. The variety of tints that he introduced, the clearness of his carnations and loose management of hair exceed his uncle, though in the last, Hoskins had great merit too.

"Cooper died in London, May 5, 1672, at the age of sixty-three, and was buried in St. Pancras Church, where there is a monument to him with a Latin inscription."

Cooper had skill in music and played well on the lute; he had attained proficiency in crayons, and as it would appear practised them for likenesses, from which he finished his miniatures. They are described by Norgate much as Sir Thomas Lawrence's sketches for his oil pictures:—

"But those crayons made by the gentill Mr. Cooper, with black and white chalk upon a coloured paper, are for lightness, neatness, and roundness, *abbastanza da far maravigliose ogni oculissimo ingegno.*"

Mr. Pope's mother was sister of Cooper's wife. At the sale at Strawberry Hill in 1842 a drawing

* In the Master's house at Sydney College, Cambridge, is a drawing by Cooper, which was given in 1763 by Mr. Hollis. It was probably taken from the life for a miniature.

by Cooper was sold, representing Pope's father as he lay dead in his bed.

Almost every painter has had verses addressed to him by the poets, his contemporaries.

"Poets are liners of another kind,
To copy out ideas in the mind;
Words are the paint by which their thoughts are shown,
And Nature is their object to be drawn."

Vandyke had lines addressed to him by Waller, as Lely had by Cowley; Kneller and his works were lauded to the skies by both Pope and Addison; Mrs. Anne Killgrew, the lady artist of the days of Evelyn and Pepys, had an ode written by Dryden, lamenting her untimely death; and Cooper had verses addressed to him by "the matchless Orinda," the name by which Mrs. Katherine Philips was known. She and her friend, Mrs. Anne Killgrew, both died of the small-pox.

"Heaven by the same disease—
—did both translate.
As equal were their souls,
So equal was their fate."—DRYDEN.

Mrs. Katherine Philips had the reputation of being the greatest poetess England could boast at the time of her death, which happened in 1664. She had verses addressed to her by Cowley, and she could glory in possessing the friendship of Jeremy Taylor. Her poetry is quaint and old-fashioned, and the editions of her works are rare and scarce. Her lines to Cooper may terminate this account of his works.

TO MR. SAMUEL COOPER,
HAVING TAKEN LUCASIA'S PICTURE, GIVEN DEC. 14, 1662.

If noble things can noble thoughts infuse,
Your art might even in me create a Muse,
And what you did inspire you would excuse.

But if it such a miracle could do,
That Muse would not return you half your due,
Since 'twould my thanks, but not the praise pursue.

To praise your art is then itself more hard,
Nor would it the endeavour much regard,
Since it and Virtue are thine own reward.

A pencil from an angel newly caught,
And colours in the morning's bosom sought,
Would make no picture if by you not wrought.

But done by you, it does no more admit
Of an encomium from the highest wit,
Than that another hand should equal it.

Yet whilst you with creating power dye,
Command the very spirit of the eye,
And then reward it with eternity;

Whilst your each touch does life to air convey,
Fetch the soul out like overcoming day,
And I my friend repeated here survey;

I by a passive way may do you right,
Wearing in what none ever could indite,
Your panegyrick and my own delight.

ART IN AMERICA.

MONUMENTS TO WASHINGTON.—Our transatlantic brethren have cherished the notion of erecting a national monument to their great Patriot, from the close of the War of the Revolution until the present day. It was first proposed in Congress in 1783, when an equestrian statue was named, which was afterwards altered into a "marble monument," but various causes occasioned its postponement; and although different States took measures to construct their monuments, or to express, in some other way, according to their means, their gratitude and respect for Washington; no great national commemoration was undertaken until a committee was organised in 1833 for that purpose, to be effected by voluntary subscriptions, which went slowly on until 1848, when the President of the United States set apart a suitable piece of ground for its erection, near the Potomac River, on the ground selected by Washington for public use, when he laid out the city. The design prepared embraces the idea of a grand circular colonnaded building, two hundred and fifty feet in diameter, and one hundred feet high, and standing on a raised terrace, from which springs an obelisk five hundred feet in height, the shaft measuring seventy feet at the base; the corner stone of the obelisk was laid on the 1st of

July, 1849. It is proposed that statues of great men fill the Pantheon, and a tomb in the centre be prepared for the remains of Washington, should it be approved of. Meanwhile an opposition to the erection of this monument has arisen, and a memorial signed by the artists of Boston presented to the Senate, in which it is denounced as "so contemptible in point of taste that its erection will be a disgrace to the country." It is proposed that each State of the Union should send a block of stone to aid in its construction. A block of gold bearing quartz is the contribution of the Californian State; it has been procured from the Mariposa diggings near Fremont's mines, and weighs about 125 lbs. The gold it is estimated to contain is about eighty dollars worth. We understand that the circular colonnaded substructure has been abandoned, and all the funds are to be appropriated to the completion of the obelisk alone. The inartistic nature of such an erection is commented upon by an American writer, who says with much truth that "they are of slight importance as works of Art, while they are at the same time so solidly built, that they prevent the erection of more suitable monuments."

At the end of the last year the Governor of Virginia offered a premium of 500 dollars for the best design for a monument to Washington, in his native province; and that submitted by Mr. Crawford was approved of. It is proposed to be constructed of Virginian marble, the base of the monument to be adorned with five statues of the most distinguished men of Virginia, and an emblematic figure of the State; an equestrian statue of Washington to occupy the central summit, which is not intended to be a classic travertine of the General; for, with the best judgment, Mr. Crawford says, "I propose to follow strictly the dress worn by the personages during their public duties, and to make them, in every sense of the term, 'full length portraits.' " A national work by a national artist treated in a true spirit cannot fail to do honour to the State, if well and properly conducted, as this promises to be.

AMERICAN ART-UNION.—Since the year 1849, when this Institution was founded for the purposes of promoting the Fine Arts in the United States, the committee have done their work well, and honourably contributed to the diffusion of a due knowledge and appreciation of the works of mind which elevate a people. We question whether America can have better friends than those who assiduously cultivate the spread of artistic tastes over the length and breadth of the land. So great a country as America, physically and morally, should have a National Art and Literature as great. We are glad to read the cheering account of success with which the committee greet the members. Beginning with few subscribers, and consequently with limited means, it has now nearly 13,000 members, a considerable increase over the London Art-Union. During the eleven years of its progress more than 200,000 dollars have been expended on American Art, and it has created both works and purchasers; its direct patronage being far exceeded by that which, indirectly, has been called into existence by its means; inasmuch as many artists, who greatly depended on the society, now find employment enough in satisfying the wants of private purchasers, called into the market by the increase of taste. "Our association is for our country, the mother of Art-Unions," says the President in his eloquent address; it is an honour to be proud of, and we sincerely hope it may be "the fruitful parent" of many others. The establishment of a permanent picture-gallery for the exhibition of the best works cannot fail to be greatly useful to art and artists. A new feature for 1851 is proposed, in the issue of a series of five smaller finished engravings, in addition to the large print after Leslie's picture of "Anne Page, Slender, and Shallow." These five engravings are to be executed by the best American engravers, and are intended as records of the genius of five of the most distinguished American painters, Cole, Durand, Leutze, Edmonds, and Woodville. This forms the commencement of a gallery of American Art, and will extend to America in general a knowledge of artists, whose works might otherwise be hidden from the eyes of all but a select few in the parlours of private mansions."

THE WESTERN ART-UNION.—The proceedings of this body during the last year were reported in the Melodæan Hall of the City of Cincinnati, from which we gather the good prospects which they hold forth for the encouragement of American talent. In the purchase of pictures and statuary for distribution among prize-holders, they have endeavoured to give all classes of artists a fair chance of sale; they also engrave yearly a picture by an American artist for the members' use, as in the London Art-Union; and here we think the

managers have a right to complain, inasmuch as they desire annually to engrave a work of this class, and say, "in the three years of our existence there has not been one picture painted and offered to the society for this purpose." It is a noble thing to record a nation's greatness, and this might be done by a body like the present if aided by native artists. They have also the wish to engrave portraits of their great men; these are all moves in the right direction. A picture-gallery has been formed which is the permanent property of the society; it is increased by donations and purchases, and is always open free to all subscribers and their families, in addition to the other advantages they enjoy as members. In this gallery, artists, whether members or not, may be accommodated with a place, and many pictures and statues are lent to increase its attractions. The liberal and proper spirit evinced in the government of the society merits the encouragement of all who wish well to America. During the three years of its existence it has distributed amongst its members 106 oil-paintings, 50 casts from the bust of Egria by Baker, and 2497 prints; all this cannot have been done without great moral good to the country over which they have been spread.

PHILADELPHIA ART-UNION.—This body has recently received an act of incorporation from the legislature of Pennsylvania, and is progressing favourably. Huntington's picture of "Mercy's Dream" is engraving by Mr. Ritchie of that city; and is to be followed by its pendant, "Christiana and her Children," to be executed by Andrews of Boston. The result of both is expected to be most striking.

NEW ENGLAND ART-UNION.—A society bearing this name has at length been organised with Mr. Everett as president, and one of Allston's pictures is spoken of as the work to be engraved for the first year's subscribers.

NEW JERSEY ART-UNION.—At the commencement of the present year this new society was founded at Newark, Mr. A. Coles as president. The managers propose to open a free gallery in that city, and to distribute paintings by lot, but not to engrave plates at present.

AMERICAN COINS.—The bulletin of the American Art-Union for May contains some good remarks on the coin of the country, when speaking of the new "Double Eagle." They testify with great judgment and truth to the valuable record formed by ancient coins of great events; how truly, how minutely, and how beautifully they describe national movements—by means of them many striking facts in chronology, geography, natural history, and architecture, have been ascertained. Modern coins are almost worthless, except as means of barter. They express a hope that America may set the good example of restoring an historic coinage like that which was so characteristic of the past. It is a new and a great country; it would be a noble work, and a great opportunity for America to make its money its historic record, which would be more enduring than marble.

TORONTO MECHANICS INSTITUTE.—The third annual exhibition in connexion with this body is to be held at Toronto (Canada West) in the month of September next, continuing for three weeks. The works sent by exhibitors are proposed to be rewarded according to their deserts, and the objects so selected to be the best specimens of Decorative Art manufactured in the province; painting, modelling, and sculpture, joiners work, iron work, ladies' needle work, the best collection of Canadian insects, &c. Thus a wide range for useful competition is opened, and it is announced—"Should any specimens be exhibited, which may be deemed worthy by the committee of being exhibited at the great Exposition of Manufactures, &c., to be held in London in the year 1851, the committee will make arrangements for meeting the expense of sending them there for that purpose—the owners consenting thereto." The Institution comprises about three hundred members, owning a building which has cost 5000., a library of 1500 volumes, and apparatus to the value of 2500., all entirely free of debt. It is in contemplation to add to these advantages a drawing class, to form the nucleus of a school of design. It is impossible to estimate too highly the value of such foundations.

PORCELAIN MANUFACTURE IN MISSOURI.—The *St. Louis Republican* notices the establishment of the above novel manufacture in Missouri. A clay, called Kaolin clay, or decomposed granite, is the material from which the ware is made; and it is found in quantities sufficient to supply the whole States. The labour to obtain this substance, of which the Ozark Mountains are composed, is not great. It is visible in the ravines, near the top of the ground; and wood and water being abundant in its vicinity, every facility presents itself for extensive use.

THE ROYAL ASSOCIATION

FOR THE PROMOTION OF THE FINE ARTS IN SCOTLAND.

The Annual General Meeting of this Society, for the distribution of works of Art selected by the committee, and for other business, was held in the Music Hall of Edinburgh on July 20th. The pictures, &c. which had been chosen, were suspended over the platform, attracting universal attention, especially Noel Paton's elegant composition of the "Quarrel of Oberon and Titania," which has been purchased by the Association, at the price of 700 guineas, and is to be placed in the National Gallery of Edinburgh.

We make the following extracts from the Report, which was read by the secretary, Mr. J. A. Bell:—

"The matter which required the attention of the committee in the first instance, was the fulfilment of the instructions they had received at the last annual meeting to obtain an engraving, to be distributed among the members for the year 1850. Their choice was limited by their wish to meet, if possible, with a painting by a Scottish artist, portraying, as the early works of Wilkie so imitatively do, some picturesque and interesting incident in the domestic life of our native peasantry. A painting of this description, entitled 'The First Letter from the Emigrants,' was at length met with in the possession of Alexander Mitchell James, Esq., for whom it had recently been painted by Mr. Thomas Faed, Associate of the Scottish Academy.

"Considering that the members of the preceding committee had recorded their conviction that Scotland possesses within herself the means of having the works of her painters engraved in an adequate manner, the committee felt desirous of meeting with a resident engraver whose other engagements did not preclude him from undertaking to execute a line-engraving after this painting on a large scale, within a limited period. Eventually, they secured the services of Mr. Howison of this city, who has undertaken, under a heavy penalty, to complete it by the end of December, 1850. It is almost unnecessary to state that Mr. Howison, by the ability he has displayed in engraving 'The Curriers' after Harvey, the 'Polish Ladies,' after the late Sir William Allan, and other important works; as well as by the masterly manner in which he is advancing with the engraving of the 'First Letter from the Emigrants,' after Faed, has proved himself to be fully entitled to the trust which, in this instance, the committee have placed in him.

"About the end of the year 1849, it came to the knowledge of the committee that Mr. Steel, the eminent sculptor, had nearly completed a marble statuette after the colossal public statue of Sir Walter Scott, executed by him some years ago for the Scott monument, and it appeared to them to be exceedingly desirable, more especially as the execution of the statuette by the same artist who had executed the statue rendered it equal to an original work, that it should form a portion of the works of art to be distributed among the subscribers to the Association, together with a certain number of copies of it, if they could be obtained at a reasonable rate, executed in Parian composition or statuary porcelain. After consultation with Mr. Steel, and correspondence with Mr. Copeland, one of the principal manufacturers of porcelain in the United Kingdom, the committee purchased the marble statuette, including the copyright, for one hundred guineas, and entered into an agreement with Mr. Copeland, who undertook to deliver, by July 1850, one hundred copies in statuary porcelain of the marble statuette, executed in his best and most careful manner, for the sum of two hundred guineas."

After referring to the circumstances connected with the purchase of Mr. Paton's picture, the Report says—

"As it has always been felt of the greatest importance that the annual fund of the Association should be realised at as early a period of the year as possible, and as it has been represented that an early delivery of the engravings would much facilitate the accomplishment of this object, the committee beg to suggest that with this view the following paintings be placed in the hands of competent engravers without loss of time, for the purpose of being engraved for the members of 1850-51; it being understood that the subscribers to whom they may be awarded as prizes, will receive them under this suspensive condition, viz. :—

- 'Curiosity,' by John Faed.
- 'The Shepherd's Grace,' by Alexander Fraser.
- 'A Forest Glade,' by Horatio Macculloch.
- 'The Castle of Bishopstoun,' by T. M. Richardson.
- 'A Border Raid,—the Peel Defended,' by John A. Houston.

"It is proposed that two of the engravings shall be executed in line, and the remainder in the mixed style; and though of larger dimensions in engraving, that they shall be printed upon paper of an equal size with that which was used for the eleven engravings distributed among the subscribers of 1848-49, in order that they may form a continuation of that series, which it is understood has given so much satisfaction to the subscribers.

"The committee also beg leave to suggest that a prize of 50*l.* be offered for the best model of a group for a bronze, with a view to the distribution of copies among the subscribers.

"The amount of the subscriptions for the year is 3480*l.*, of which 1258*l.* has been expended on paintings, 405*l.* on the productions of sculpture, and 773*l.* on engravings."

The Report having been unanimously adopted, the meeting separated, after speeches had been made by Mr. Dennistoun and Dr. MacLagan. The former stated that since the foundation of the society about fifteen years ago, upwards of 60,000*l.* had been expended by it in furthering the interests of the Arts in Scotland.

THE VERNON GALLERY.

THE COUNTESS.

Painter, Sir T. Lawrence, P.R.A. Engraver, R. A. Artlett.
Size of the Picture, 2 ft. 0 in. by 1 ft. 9 in.

This is an unfinished work, the commencement of a full-length portrait of the Dowager Countess of Darley. The head only is painted, and it is probable that Lawrence would have done little more to the face, as it was his general practice to get such portions of his pictures nearly completed before he proceeded to the other parts of the figure. The colouring of this picture is very brilliant, and, although it was painted during the last year of his life, it shows no decline of those powers which gained for him so wide-spread and well-merited a reputation; it is full of sweetness and of animated expression.

No painter was ever better adapted by his peculiar talent and disposition to depict feminine grace and elegance, than Lawrence; it has been said that "the blandishments of his pencil were only equalled by those of his tongue." Hence his female portraits possess such qualities which, from their very nature, we have no right to look for in those of the opposite sex; while, on the other hand, the latter are in a manner deficient in that one quality—dignity—which is essential to the subject. Let any one mark well the line of portraits in the Gallery at Windsor, and, with perhaps the exception of that of the Earl of Liverpool, there is not one characterised by the nobility of expression which distinguishes the works of Vandeyke and Reynolds. The portraits of Pope Plus and Lord Casereagh are masterly productions, beautifully painted, full of life and individuality; but there is an absence of *mind*, for which no other excellencies can in our judgment atone. This defect arose, probably, from a desire to produce an indubitable resemblance, to effect which he laboured upon the drawing of each feature with the greatest care and with the most refined taste; and when he had produced a likeness which could not fail to please by a certain amount of living expression, he was regardless of imbuing it with the attribute of thought. We have always felt when looking at Lawrence's portraits, that we are charmed, but not satisfied.

The picture here engraved was purchased by Mr. Vernon at the sale, by Christie and Manson, of Lawrence's unfinished works.

MONACHISM IN ART.*

This work is the necessary companion to Mrs. Jameson's former volumes. Monachism in Art completes the cycle of those legendary themes treated of in Christian Mythology, for both flowed from the same source, were fed by the same tributary streams, and poured their waters over the same desolate expanse; both alike had their origin in that love of the Divine, that yearning after the spiritual which attests their being in the soul of man. Yet both suffered by the imperfections of his nature, and the calamities

* "Legends of the Monastic Orders as represented in the Fine Arts," forming the second series of Sacred and Legendary Art. By Mrs. Jameson. London, 1850. Longman & Co.

[The text in this section is extremely faint and illegible. It appears to be a multi-column layout of an article or report, possibly discussing art-related topics. The text is arranged in approximately three columns across the page.]

of his position in time. In the infancy of all nations, faith and doctrine, however imperfect, are generally in advance of their mental condition. To a rude savage race the idea of Deity is a mere instinct, a conviction, and a desire; their minds are impressed by the majesty of Nature; "the sun in his strength," "the moon walking in brightness;" but unable to "rise to the height of this great argument, they corrupt what they cannot comprehend. They observe the course of what to them are animate bodies, with awe, and shrink from natural phenomena with fear; yet still seeking to decipher and to explain, but unable to reflect their thoughts in language, they attempt to convey these by symbolic signs and physical representations. Hence Art is invoked to give expression to the Ideal of Faith; the Imagination being at this period more exercised than Reason, strives also after similar utterance in Poetry. These combined become a religious history and a doctrine, by elevating and re-creating in a living form, or with dramatic incident, all that a discipline has related, tradition has transmitted, imperfect faith and fanatic zeal have invented, received, and taught as true. Thus we enter into the circle of *Legendary Art*. Another feature purely natural and historical, accounts for that tendency of the mind which forms the subject of *Monachism in Art*. The possible combination of the Divine and the Human is found as a tradition amid all tribes. Now, as it must ever be the desire of the mind to strive after the perfection of the Deity, so must this desire be always subject to those hindrances which imperfect faculties and ignorant or superstitious interpretations of the Creator's will occasion. That maxim of ancient philosophy, that "in order to the attainment of true felicity and communion with God, it was necessary that the soul should be separated from the body, even here below, and that the body should be macerated and mortified for this purpose," led in the earliest centuries of the Church to those fanatical migrations which swarmed together under the government of *Pachomius* and *Antony*. These monastic institutions absorbed and employed subsequently all these restless spirits endowed with high and noble faculties, generous intellectual feelings, which every age produces. Monachism was the result of various causes; the danger of the times, the illness of some, the satiety of others, the hope of religious exercise, the desire of religious communion; it was the centre of action for the fervent spirit, and its solitude was the preparation unto death for the recluse. Yet even in a monastery, the "ruling passion" is as distinctly seen as in the world. "St. Benedict was sent to Rome to study Literature and Science, and made so much progress as to give great hopes that he was destined to rise to distinction as a pleader;" and it is doubtless to this intellectual tendency we owe the literary wealth inherited by the world in the continuous labours of the *Benedictines*. Ho who sorrows over the spiritual degradation of our men, and seeks their restoration, should read the story of *St. Boniface*; he who would trace the combination of the ecclesiastic and the politician, of the implacable adversary and subtle theological disputant, that of *St. Bernard of Clairvaux*. Who can deny the influence of the mendicant orders, those "Spiritual Democrats," sent forth to combat the frenzied companies of *Patarini*, *Cathari*, *Bons Hommes*, *Flagellants*, *White Hoods*, &c., which were spawned as insects on a mud-bank, in all lands? Who can read untouched the story of *St. Francis of Assisi*, the wild, the gentle, but indomitable enthusiast, who fled from the world to espouse "Our Lady of Poverty?" Who has not shrunk from the text which recorded the unrelenting fervour of him, who as *Dante* portrays him, "Benigno ai suoi ed ai nemici crudo," has left his name to the *Dominicans*? "Learned and the most energetic, we find them constantly arrayed on the side of power. Their greatest canonised saints were men who had raised themselves to eminence by learning, by eloquence, by vigorous intellect, or resolute action." The founders of *Jesuitism* were men of no common mould. We may condemn their doctrines, their method of teaching; but they must always receive the homage due to great and earnest minds. "To contemplate the motives and the career of such men may teach much which well deserves the knowing, but nothing more clearly than this, that no one can have shrines erected to his memory, in the hearts of men of distant generations, unless his own heart was an altar on which daily sacrifices of fervent devotion and self-denial were offered to the only true object of human worship." We cannot doubt the influence of such minds at any time, still less can we wonder that in those periods, which *Mr. Digby* has traced with such loving reverence in his "Ages of Faith," the Monastic Reformers,

or Founders of Monastic Institutions, should become the themes of *Legendary Poetry*, or *Legendary Art*. *Rio* has remarked that the works of painters as those of poets, are the faithful mirror of national genius. They were undoubtedly so of national doctrine and feeling during the middle ages. Artists worked then with a deep intensive religious feeling; and their works were not submitted to a public condemning their themes or but faintly sympathising with their expression, but devout believers of the legends they narrated, of the suffering they portrayed; earnest readers of the mysterious and consoling language they addressed to the heart. Every work of Art, not merely imitative, to be appreciated must be understood; and this can never be the case unless they are studied and judged in relation to the age of their production, and not merely with reference to their technical excellence. The poetry of *Dante* is deprived of half its force, that of *Petrarch* of its lyric beauty, if we exclude from our hearts all knowledge of their times, and of their material and mental life. It is to instruct us how to study the works of the great masters that *Mrs. Jameson* has written this and her former volumes. By these we are taught the connexion of every work of Art with history and character; we have a deeper insight into its meaning and intention; we can decide at once to what community it belongs, of what legend it is the exponent, and the relation all such pictures bear to each other and to their age. Nor is this all, the artists' excellence is aesthetically treated; we are initiated into the technicalities of Art, and we learn "that while we have been satisfied to regard sacred pictures merely as decorations, valued more for the names appended to them than for their own sakes, we have not sufficiently considered them as books, as poems, as having a vitality of their own, for good or for evil, and that we have shut out a vast source of delight and improvement in their contemplation." Thus, by habits of thought, partly exclusive, partly uninforming, we have passed—to use the words of *M. Rio*—in proud disdain before pictures which have exercised a benignant influence on an innumerable multitude of souls during the course of many ages. Those only who have examined works relating to this subject, who are but even casually acquainted with the "Acta Sanctorum," or however slightly with but a few of the sixty-three pages of authors cited by *Helyot*, can estimate the many difficulties of the task. Free from all middle age frenzies of style, to which some artists are now given, narrating the theme as it was narrated, and not being a Roman Catholic, not imitating "the tone of thought, feeling, conviction, natural and becoming in one of that faith," bearing in mind her subject belonged both to Literature and Art; to be sacredly treated in relation to the first, as historic truth; artistic and æsthetic, but not religious, as regards the latter; in style always clear, in research generally extensive, her judgment largely informed and always impartial; *Mrs. Jameson* has contributed another work to many, excellent both in conception, material, and execution. We may differ in creed, in its spiritual exercise, dissent from the ritual, and deny the efficacy of its ceremonial, doubt the evidence which is adduced to attest the purity of Ages of Faith, and refuse to be charmed with the productions of their Literature and Art, charm they ever so wisely,—but no well-constituted mind rightly derides the Faith and the religious monuments of any nation. "To my mind no subject is so solemn as that of the faith of any race of men; their sustaining and actuating faith, be its objects what they may; and the objects of a sustaining and actuating faith must always be solemn and noble. Whatever their names may be, they have in them a majesty and endearment which place completely in the wrong all who ignorantly abhor or despise them. How ignorant and how guilty we ourselves may have been in our earliest contempt of the idolatries of the world, we may come to perceive when we have learned to do as we would be done by, in separating the ideas of any faith from its outward celebrations—its philosophy from its corruptions—and when we become wise enough to discern the close relations which we have now reason to believe exist among all the effectual faiths which have ever operated widely upon mankind." So writes *Miss Martineau*, and it is in this spirit we must use the "Legends of the Monastic Order" and of *Christian Art*, if we would rightly comprehend the works of *Francesco Francia*, *Giotto*, *Gentil Bellini*, *Michael Angelo*, and *Raphael*. Great works of Art are the bonds of union of nations throughout all times.

"They are the secret sympathy,
The silver link, the silver tie,
Which leads to heart and mind to mind,
In body and in soul can bind."

H.

MINOR TOPICS OF THE MONTH.

THE PRESIDENT OF THE ROYAL ACADEMY.—On the eve of our going to press, we received intimation of the death of this accomplished painter. *Sir M. A. Shee* had been, for some time, in a declining state of health, so that his decease was not altogether unexpected. He died at Brighton, on the 19th of August, in the eightieth year of his age.

THE BUILDING FOR THE WORKS OF INDUSTRY has been commenced in Hyde Park. Hundreds of labourers are there at work; a huge space has been boarded in; and there can be no doubt that the contractors will apply such force as must insure the completion of their task by the time specified. All doubts, therefore, as to the Exposition taking place—and in this locality—are now removed: a structure will be erected which, possessing many advantages, has unquestionably fewer disadvantages than any other project that had been, or perhaps could have been, proposed. Scores of architects and contractors have had labour in vain for the commission: the former (those of France, at all events) have had the honour to see their names in print; while the latter have, we understand, had returned to them the five guineas they had paid for plans which of course became useless, although very costly to the Commission; and to *Mr. Paxton* alone belongs the glory of suggesting and arranging a mode by which otherwise insurmountable difficulties were met and overcome. If the structure had been of brick and mortar, it would have been utterly impossible to have used it in May 1851; parts of it were to have been actually nine feet thick; to have dried it in time would have been out of the question. The polished steel of *Sieffield* would have been rusted, and the delicate silks of *Lyons* discoloured in a week: to say nothing of the danger to health from the moisture which must have been continually evaporated from the ever-green building. Those who have visited *Chatsworth* and have seen the gigantic conservatory there, will have no difficulty in believing that *Mr. Paxton* will triumph over all obstacles of light, air, and damp. We are ourselves entirely satisfied that no plan could have been arranged, within the time, that would have so thoroughly mastered all the difficulties to be contended against. The light may be, and certainly will be, ample and judiciously distributed—so that where more or less may be required, it will be had. The ventilation will be perfect, inasmuch as air may be admitted to any extent; while protection against damp arising, either from rain or from congregated multitudes, will be as effectual. Under all circumstances, therefore, we consider it most fortunate that *Mr. Paxton* came to the rescue, at the very moment when all parties were disposed to abandon hope; and we have faith in the working out of the plan, after a careful examination of those immense collections of glass at *Chatsworth*, which are of such a nature as entirely to remove all apprehensions as to the issue. That the building will be "permanent" and not "temporary," we do not doubt; good reasons will be shown why it ought to be so; although just at present it may be inconvenient to put them. It seemed to us, from the first, absurd to pay an enormous sum for the hire of materials that would be required again at the end of five years, and again at the end of other five years. This argument will no doubt have weight; but if the building, structure, edifice, or whatever it is to be called, turns out to be what it may be expected to be, the public will be very loth to part with that which will be a perpetual source of enjoyment and instruction—useful in a hundred ways when not needed for a display of the Industry of all Nations.

THE MEDALS sent in competition for the Exposition of 1851, have been returned to their producers; and we presume the successful artists are at work upon those which are to be the "presentations." To *Mr. Wyon* is to be entrusted the task of designing and engraving the heads of the Queen and Prince Albert, and he is at present taking sittings for that purpose.

THE EXHIBITION OF 1851.—It has been determined by her Majesty's Commissioners, that the

last day for receiving applications for space, on the part of exhibitors of the United Kingdom and the Channel Islands, shall be the 31st of October next. Parties failing to give notice to the respective local committees, after this date, will run the hazard of having their claims disregarded, for there is no question that the demands from the Continent, and other foreign parts, will be sufficient to fill up the remaining places. It must therefore be obvious, that all here who intend to exhibit must not postpone their applications beyond the time specified.

HIRSH POWER'S MARBLE STATUE OF EVE, which it will be remembered, was lost in the vessel in which it was embarked for shipment to America has, we rejoice to say, been recovered, and is now on its pedestal in New York. As a set-off against this comforting intelligence, the sculptor has had to endure another calamity by shipwreck; his marble statue of Calhoun, commissioned by the Senate, was also shipwrecked off the entrance to the harbour of New York. The shippers, however, had the precaution to pack it in huge enclosures of timber—so huge as to be sufficient to float the statue; there are, consequently, hopes of this work being also recovered.

FOLEY'S STATUE OF JOHN HAMDEN, which we had an opportunity of seeing, previously to its removal to the new House of Commons, is a fine work of Art, and must greatly tend to advance the reputation of the sculptor. It is of heroic size, in attitude noble and commanding; the right hand rests upon a sword, and the left hears a scroll, indicative of his twofold capacity, of statesman and warrior. The face, which was modelled from the best authenticated portraits, well expresses the character of the man, hold, energetic, loving, and just. The statue is executed in white marble, and will be an ornament to the edifice wherein it is ultimately to be placed. In Mr. Foley's studio we also saw a very beautiful model of a "Mother and Children," of which we may probably have more to say hereafter.

THE ARCHITECTURAL EXHIBITION.—The gallery of the New Society of Painters in Water Colours contains many very clever works, many useful hints, many "*châteaux en Espagne*," that no one, or no body of men, would think of erecting. The Exhibition is free (except on Saturdays), containing about 190 drawings, which are certainly of a finer order than those of previous exhibitions. We have been particularly pleased with many little "useful" designs, such as Seddon's for a Staircase banister; iron-work by Mr. Potter, &c.; and balcony by Nichols, &c. The whole presents a very satisfactory proof of progress.

TREASURER OF THE ROYAL ACADEMY.—Sir Robert Smitke has resigned this appointment in consequence of continued indisposition, and has been succeeded in that honourable office by Mr. P. Hardwick, R.A.

MR. BEAUMONT'S DESIGNS FOR IMPROVEMENTS AT BUCKINGHAM AND ST. JAMES'S PALACE, &c. &c.—We have been much pleased by the inspection of some designs for the alterations of the approaches to Buckingham Palace, and for other desirable street improvements connected with St. James' and Hyde Park, by Mr. Alfred Beaumont, Architect, of Warwick Chambers, Regent Street. The first plan proposes to add new wings, forming decorated screens of columns, to the arch at Constitution Hill. The central portion as it now stands, to be used as the Queen's private entrance. The east wing for the public into the Green Park, and the west carried across Grosvenor-place, and adjoining the hospital,—to make this side correspond with the opposite entrance into Hyde Park. The second relates chiefly to the Marble Arch. Mr. Beaumont proposes to remove this *bodily*, 200 yards in front of Buckingham Palace at the junction of a road, about the third avenue of the Park Mall. The space forming a semicircle between this and the palace, to be enclosed with balustrading and a sunken area, decorated with sculpture. In the central portion of this enclosure, to place the statue of George IV., now driven from the society of men and sitting in lonely grandeur at the east corner of Trafalgar Square. In front of the marble arch he proposes to erect a fountain and spacious basin. In a direct line from this, it is suggested to continue the avenue up to Charing Cross, and obtain a

new and striking entrance into the park at a point adjacent to the Statue of Charles I. This design provides also for the completion of the east end of Carlton Terrace. It cannot be denied, improvements of this kind are desirable, as neither the Green nor St. James's Park may be said to have an approach becoming their position or their beauty. The effect looking up from Charing Cross to the marble arch, would give importance to the palace, and by the removal of the iron palisading and thus throwing the Green Park more open, with some slight alterations in the carriage road, obtain greater breadth of effect to the general view. Another equally important feature consists in the removal of the houses on the north side of Cleveland Row, and the block by the side of Lord Ellesmere's mansion, and thus obtaining another entrance into the Green Park, by the continuation of Pall Mall. To this, Mr. Beaumont would add the following extensive alterations, connected with St. James's Palace. By enlarging and elevating the west end, and continuing the east wing towards Marlborough House, the tower would occupy a more central position, ranging with St. James's Street, and on the south or Park side, the palace would present a frontage of 500 feet. The gardens before this to be thrown open to the park, and laid out as a parade. A thoroughfare might be obtained, we think, through the central tower, to lead to the Suspension Bridge, as proposed by Mr. Beaumont, across the ornamental water, to the Bird Cage Walk. We must add, this latter is a design of very great merit, and there is much originality in the decorative parts of the piers and supporters of the iron-work.

THE KING OF HOLLAND'S PICTURES were sold last month; our sheets before had been prepared for the press before the sale was concluded, we prefer waiting another month to inserting an incomplete statement now; but in our next number we shall be in a position to give a correct account of the sale, which appears to have attracted a host of connoisseurs and buyers from all parts of Europe. For the present we merely add, that the number of pictures contained in the Gallery amounts to nearly 200, comprising many first-rate examples of the great European schools, together with a most valuable collection of drawings, formed by Sir Thomas Lawrence, which Lord Melbourne on the part of the government refused to purchase from the executors of Lawrence.

BUST OF SIR ROBERT PEEL.—We have just inspected a very admirable bust of this lamented statesman and patron of the Fine Arts, which has been executed in statuary porcelain by Messrs. Copeland, from a bust by the younger Westmacott, in which he has been assisted by a portrait executed by Mr. Palmer. As a likeness it is most satisfactory; preserving the most minute trait of Sir Robert's features, and cannot fail to be an acceptable memorial to all who venerate his memory.

THE BRITISH INSTITUTION.—An amateur artist, of long practice and considerable talent, who takes great interest in all Art-matters, complains to us of the neglect with which our artists treat the annual exhibition of pictures by the old masters and deceased British painters, at this gallery. He has a personal knowledge of a very large number of the profession, and yet he says that he rarely meets with one in the rooms, though he is accustomed to visit them himself, twice, and sometimes thrice, in the week. On our own observation will, in a great measure, bear out his assertion; and we must say there is small inducement for noblemen and gentlemen, anxious for the improvement of our native school, to strip their walls of their most valuable appendages, if no practical use is made of the advantages they offer; for it should be remembered that these advantages are not solely intended for the *tyro* in Art, they are for the benefit of all; and there is not one in our ranks, however high his position, who may not gain something by the study of many of the pictures annually exhibited here. True genius is ever ready to acknowledge its deficiencies, and is willing to embrace every opportunity of instruction, and to add to the stock of knowledge already acquired. If many of such pictures as hang here year after year, were contained in the Galleries of the Continent,

pilgrimages would be made thither constantly, and at any disadvantage, to study them; but, because they are brought to our own doors, they are treated with indifference, or entire neglect. We frequently see many foreigners in these rooms, interested in their contents, examining and descanting on the pictures closely and intelligently, and to all appearance, acquiring what they will endeavour, hereafter, to turn to a valuable account. We just throw out these hints for those whom they more especially concern, and shall be glad to find they have not been offered in vain.

MR. PATON'S PICTURE OF OBERON AND TITANIA.—This very extraordinary work has been for a few weeks in London, exhibiting privately in the rooms of Messrs. Graves & Co., Pall Mall, by permission of the Society for the Promotion of Art in Scotland, by whom it was purchased, we understand, for the sum of seven hundred pounds. We presume the Society had sufficient warrant for thus devoting so large a portion of its funds, and that the subscribers were satisfied. We question, however, if the principle is a good one; although in thus securing for their country a work so honourable to it, they have done wisely, if they have acted rightly. The artist is a young man. His first work of importance obtained one of the premiums at Westminster Hall: it was a production of the same class; but in this picture he has manifested that improvement which might have been wished for, as the result of three or four years of thought and study. The passage which Mr. Paton has here selected is that which describes the quarrel between the Fairy King and Queen concerning the Indian boy:—

"I did but beg a little changeling boy,
To be my henchman."

The two figures occupy the centre of the picture; it was the great difficulty to be encountered, and it has been completely overcome. They are human in form and aspect, but of the most perfect order of humanity. The Indian boy, a marvellous triumph of Art, seeks the protection of his divinely beautiful mistress; while the anger expressed by Oberon is that of a deity. To describe the several details of the work is out of the question, unless we devoted to it a page or more. Every part of it is crowded with episodes; there are altogether, we imagine, considerably more than a hundred figures. Every episode is made to tell with singular felicity upon the great point of the whole. The gambols of the faeries, exhibited in every conceivable variety, are but subsidiary to incidents which bear a moral—such as that of the treasure-gnome, at whose feet money-loving imps are grovelling. Nor is the lower world forgotten—flies, butterflies, snails and serpents are made tributary to the scene; while the varied foliage, from the gnarled oak to the blossoms of the smallest wild flower, are introduced with the rarest and nicest skill. In conception and execution the work is entitled to the highest possible praise. On the whole, it is, of its class, the greatest achievement of Modern Art; exhibiting, in masterly combination, rare fertility of invention, wonderful fancy, deep thought and accurate reading, and a perfection of finish creditable to the industry of the artist, who has not been content to leave the evidence of his high genius unsupported by proofs of his belief in the value of labour.

MEDAL TO JENNY LIND.—The artists of Stockholm have just completed a medal to the Stockholmer who has shed such a halo over her native country. There is a delicacy and grace in this acknowledgment from one branch of the refined arts, to the worth and talent displayed by the queen of another. By the way, an absurd paragraph has been printed in some of the newspapers about "Miss Lind and her brother." Miss Lind never had a brother; and has no sister alive. **THE EXHIBITION OF FANCY ILLUSTRATION** which has been for some time in George Street, Hanover Square, has recently closed under less favourable circumstances than its projectors anticipated. Many persons considering it strictly as a shilling exhibition (which it purporting to be) did not think of visiting it for purchases; but as this was really the chief object of the

exhibitors, they became sometimes troublesome in looking after customers. Ultimately visitors became fewer; and then "the remainder" was advertised for sale "at reduced prices," and after this had continued for some time, the whole was announced "for sale by auction." A reserve was placed upon most lots and they were either passed over like Eteux's sculptures, without a bidding, or "knocked down" at higher prices than they were in some instances marked when on view. There cannot be a doubt that the whole thing has been a failure in a mercantile point of view, although the end and aim of the entire speculation was certainly to make a market by establishing a bazaar, with money to pay for entrance.

MODERN COSTUME.—A paper has been placed in our hands by a gentleman unconnected with, but taking much interest in, Art-matters, the object of which is to draw attention by means of the approaching great Exhibition, to the inelegant and unartistic character of modern costumes, now prevailing in Europe. The writer suggests, that foreigners as well as English, should be invited to supply "examples of the best style of dress, both male and female, combining dignity, simplicity, elegance, comfort, and convenience, with especial regard to artistic representation and to the employment of the various fabrics now in use, or that can be introduced; and, further, that every European court should be invited to concur in the adoption of a costume possessing these advantages, and capable of being modified in accordance with the seasons, the climate, and the circumstances of each country." The document goes on to say:—"Let it not be supposed that any sudden or extravagant departure from the present style is requisite, nor fixed forms precluding the display of individual taste and fancy; still less any sumptuary regulations. What it is desired to suggest to designers and makers of every article of dress is, to exhibit on the approaching most favourable opportunity such forms as may afford a series of *transitional changes* (for which the public evince a decided tendency,) from the existing fashions to a style according with the advanced tastes of the age." There is really in this idea much well worthy of consideration, though we may have our fears of its practicability; we believe that nothing in the shape of dress could be fashioned, more ungraceful, undignified, and ridiculous, if we would take the trouble to analyse its several portions, than what we, of the male sex more especially, wear at the present time. Not that we are much worse off in this respect, than were certain generations of our forefathers, who however took care to have some redeeming points about them to qualify their otherwise *outré* appearance. None but artists know the difficulty there is in dealing pictorially with modern costume, so as to make it the least offensive to the eye; and what is objectionable in a picture, cannot be less so in the reality, only we are used to it. And why is it that the landscape-painter and the painter of architectural subjects, generally goes as far back as he can from the present period, for the dress of the figures he introduces? Simply because that of his own time would destroy the harmony of his work. And in sculpture the difficulty is still greater. We should therefore rejoice to see some system generally adopted which will show that, while convenience and suitability have been studied, we have not lost sight of that taste which would convert an article of dress into one of picturesque Art. A "Declaration," to be, we understand, submitted to the Royal Commission, relative to this project, lies for signature at Messrs. Colnaghi's, in Cockspur Street; it has already received the signatures of several of our leading painters and sculptors, members of the Royal Academy, &c.

THE LATE W. BURNING, MEMBER OF THE SOCIETY OF BRITISH ARTISTS.—The premature death at the age of thirty years of this excellent painter, has bequeathed to the sympathy of his brother artists and the lovers of the Arts, his widow and five young children totally unprovided with the future means of existence. A reference to our advertising columns will afford every information relative to this melancholy case.

ITALIAN SCULPTURE.—There are now being exhibited at Messrs. Paul and Dominic Colnaghi and Co., Pall Mall, East, four pieces of modern Italian sculpture, by Raffaello Monti, of Milan, some of whose works have already been exhibited here. The most important is a statue of Eve—representing her after having tasted the forbidden fruit.—The particular passage selected is:—

"——— destitute and bare
Of all her virtue, silent, and in face
Confounded, long she sat as stricken mute."

She is seated according to the letter of the verse with an expression of remorse and abasement. The figure is admirably modelled, perhaps too strictly physical and individual, but yet displaying much skill and knowledge. Another work is a portrait group of two young ladies fishing; they are draped, and the relation between the figures is most perfectly established. There is also a veiled head, representing most perfectly the face with a veil drawn closely over the features. Nothing can exceed the felicity with which the veil is sculptured on the face. The fourth is a small head entitled by the sculptor "The First Communion."

REVIEWS.

EXAMPLES OF ARCHITECTURAL ART IN ITALY AND SPAIN. By J. B. WARING and T. K. MACQUOID. Published by McLEAN, London.

If the introduction of lithography had rendered no other service to the cause of Art than the power to produce such works as this, at a comparatively moderate cost, it must ever be regarded as one of the most practically useful of modern inventions. Five-and-twenty years ago such a mass of valuable illustrative matter as is here brought forward would have entailed so vast an expense, by ordinary engraving, as would have deterred almost any artist singly or jointly from undertaking such a risk; and even with the aid of lithography, in turning over the leaves of this thick folio volume, we scarcely know which are most worthy of commendation, the spirit and enthusiasm that suggested and carried it through, or the taste and talent which have selected the numerous specimens and executed them upon the stone. Architecture, in England, has certainly not made that progress which might have been expected from the means that our architects have at command for becoming acquainted with the great works of the architects of former ages. Until a style altogether new shall be introduced, and we much question whether such an event will ever happen, the architect must fall back on what has been done before, so that his genius exhibits itself rather in adaptation than in invention; but even in this is ample scope for ability, if wisely and judiciously exercised, and with such examples before them as we find in this fine publication, and in the many others to which the last quarter or half century have given birth, they can be at no loss for suggestive matter, nor for actual subject. Messrs. Waring and Macquoid are members of the Royal Institute of British Architects, and with a zeal for the interests of their profession which cannot be too highly commended, they have visited Italy and Spain for the purpose of bringing back to their own land, some of the best examples which the architecture of those countries supplies. This is done not only by giving most artistic pictures of exteriors and interiors, but by a very large variety of details in outline, portions of elegant and picturesque edifices, doorways, windows, balustrades, fountains, tombs, fonts, mosaic pavements—in short, of every thing that appertains to the noble science of architecture. Most of these belong to the thirteenth and sixteenth centuries, and the authors have divided, or rather arranged, their plates according to the various styles then in use. Thus the first ten plates refer to the *Romanesque* as seen in the "Cloisters of San Giovanni Laterano, in Rome;" the Sicilian and Florentine pulpits; the marble pavements of Florence; the "Forch of Luca Cathedral;" the very singular "Church of San Giovanni at Pistoia," of the date of 1166; some of the church towers of Rome, &c. Eight plates are devoted to the *Florentine* style, the link between the *Romanesque* and *Cinquecento*, massive and comparatively plain, except in the cornices: most of these examples are from the *palazzi* of Tuscany, with the lamps, knockers, and torch-holders belonging to them. The plates numbering nineteen to forty-three inclusive, embrace the style known to architects as the *Cinquecento*, with its richly sculptured orna-

ments, prevailing in Venice, Bologna, Ferrara, Mantua, and other Italian cities. The pure *Italian* style comes next, in eight plates, selected from Verona, Rome, Venice, &c.; and finally the *Spanish Renaissance*, represented in ten plates, as the "Town Hall of Seville," the "Staircase of the Hospital de la Cruz, at Toledo," the "Casa Miranda, Burgos;" the "Pulpit of San Ertelhan, Burgos," &c. &c., in all of which, sculpture is a more prominent feature than architecture, the latter seeming to hold a place between the *Renaissance* of France, and our own Elizabethan, and having an infusion of the Moorish and Gothic types on which both are founded. The authors of this work are content that the examples they furnish should be their own interpreters of the beauties or defects of their several styles; there is no explanatory text, except two or three pages of introduction; nothing more, indeed, is required, for so much has been written within the last few years by travellers, professional and otherwise, upon the edifice of the continent, that little practical information can be further derived. Their book is, nevertheless, valuable to the professional man, and almost equally so to the manufacturer engaged in ornamental decoration of every kind, for the numerous examples it affords of beautiful designs which might be made available to an inconvertible extent. We know of no class connected with Art to whom it will not prove both interesting and instructive.

THE PILGRIM'S PROGRESS. With Memoir of the Author, by JOHN CHEEVERS, D.D., and Engravings on Wood, by G. E. and J. Dalziel, from Designs by WILLIAM HARVEY. Published by D. BOGUE, London.

Macaulay has written that the "Pilgrim's Progress" is the only work of its kind which possesses a strong human interest: "other allegories," he says, "but amuse the fancy; the allegory of Bunyan has been read by many with tears." This is true, it is the "human interest" of the "Pilgrim's Progress" which carries us along with it from first to last, which renders it admired by the learned and beloved by the simple. It worked its way up from "the people" to the palace, until it has become the fashion to illustrate its pages and bind it in costly raiment. The present is the most beautiful edition of its size which has issued from the press. Many of Mr. Harvey's designs are full of exquisite feeling, and are beautifully rendered by the Brothers Dalziel. The ample index is an important and acceptable addition to the usefulness of the work; and Doctor Cheevers' Introductory Memoir is eloquently written and is full of the deepest interest. He has endeavoured to give a history of the *spiritual life* of Bunyan, and inclines to the idea so ably combated by Southey, that the Tinker of Elstow was amongst "the chief of sinners." On this point we differ from Doctor Cheevers. That Bunyan was wild and reckless, and addicted to swearing and sabbath-breaking in his "hot youth," we admit; but even then his conscience was smiting him for his offences; and he was ever at war with himself, until his soul, rescued from destruction, wrote its experience in letters of light that will shine to the end of time. His vivid imagination led him to exaggerate his own feelings and his own propensities; and we do not take all he says *literally*, but rather allegorically, for his thoughts took the tone of metaphor unconsciously. We know that many will not agree with us, but rather incline to the interpretation of Dr. Cheevers than of Dr. Southey; all, however, must appreciate the eloquent and powerful oration on the spiritual character of the author of "The Pilgrim's Progress," which—we may even say—*enriches* the noble allegory written in the gloomy prison-house of Bedford. Independent of its great worth, and the affection with which the work is greeted by every denomination of Christian, the "getting up" and embellishments of this edition recommend it as an ornament to the drawing-room, the library, and the lover of Art.

THE GREEK SLAVE. Engraved by J. THOMSON, from the Statue by HERMAN POWERS. Published by H. GRAVES & Co., London.

Our readers are acquainted with this fine example of American Art through the engraving which we gave of it in our last February number. Captain Grant, the owner of the statue, has had it engraved upon a scale considerably larger than our own, and most beautifully has Mr. Thomson executed his work. The position of the figure differs somewhat from ours, in being turned more to the front, consequently it has a greater breadth, and its exquisite outlines are more freely developed. Mr. E. Rolfe made both drawings from which the two engravings have been done, but it was thought

advisable to alter the attitude, that the subject should present a totally different aspect in each, yet each has its own points of merit irrespective of the other.

POEMS. By H. W. LONGFELLOW. 2 vols. Published by TICKNER, REID, and FIELD, Boston. U.S.

The spirit of poetry never slumbers—her song is never altogether lushed; no time nor circumstance has power entirely to subdue it—there is neither "speech nor language where her voice is not heard." At intervals through the lapse of years it comes to us like the blast of a trumpet, with sounds that stir every living soul, and with echoes that continue for ever, when some great master-hand has swept across the strings, and awoken the melody that all love to hear; but its tones are also murmuring, low and sweet, the whole day long from a thousand hidden sources of which the busy world is scarcely cognisant, and whose music dies away almost as soon as its chords are struck. Though the minstrel and the bard are no longer to be found in the halls of the noble, and the troubadour lives only in the romance of history; still the spirit is not dead that quickened the one, nor the fire quenched which, in olden time, lighted up the other. But poets, in our day, have to struggle with a generation antagonistic to their principles, no matter how elevated in sentiment, or how eloquently delivered; every note they sound may be one of harmony, but it attracts few listeners, and every written line may bear the impress of a high order of genius, and yet it falls on ears that refuse to hear the voice of the charmer. Still they ring on, while, from among the number, one now and then contrives to gain an audience sufficiently large to prove that the world is not all given up to utilitarianism, nor all unwilling to travel sometimes with him into the regions of imagination. From across the broad Atlantic we have occasionally heard sounds that tell us the true spirit of poetry has found a home amid the dwellings of the New World, and that intellect is not necessarily, as it might be supposed it would be, immediately enlisted into the ranks of utility, and thus called into a service for which other capacities are as well, if not better qualified; for there is a natural tendency in all new and popular governments to make both Literature and Art subservient to political ends, instead of permitting them to revel in absolute freedom. Among these sounds the poems of Longfellow take a distinguished position for originality of thought and construction, sweetness, though not unfrequently quaintness, of expression, and for natural description. His imagery, drawn from the visible world around him, is beautifully simple; there is a pure and elevated feeling in his devotional strains, and a vigorous healthy tone throughout all. Some of his translations from the German and Spanish, retain all the spirit of the originals, although we are of opinion that the melody of rhythm is occasionally sacrificed to preserve this originality. Nor do we think that the Sapphic measure, as it is generally termed, is ever judiciously introduced into English verse; our language seems ill adapted to it; wherever rhyme is disregarded, and even where it is used, either in epic, didactic, or descriptive poetry, Iambic verse is preferable. It must not be thought, however, that we consider these as blemishes in Mr. Longfellow's poems, where they occur, and perhaps our objection arises chiefly from being unaccustomed to this kind of poetical composition; examples of it in this country are very rare, those only we know of any extent are in Martin Tupper's volumes of "Proverbial Philosophy," where many noble thoughts and much poetical language are clothed in so grotesque a garb as to render it not very easy to arrive at the truth of their meaning. We bring no such charge, indeed, against the American poet, for his "Evangeline" (which, by the way, we reviewed some months back) and his "Children of the Lord's Supper," to which our remarks apply, are exquisitely simple and elegant in expression. We leave Mr. Longfellow with the conviction that all who can read the English language will recognise in him a poet of no ordinary rank, possessing a mind fraught with good things, and having the ability to place them advantageously before others. We will not quote against his volumes his own lines:

"The book is completed,
And closed like the day;
And the hand that has written it
Lays it away.
Dim grow its fleecies;
Forgotten they lie;
Like coals in the ashes,
They darken and die."

We shall rather hope to have their society once and again; such companionship can never weary.

MORNINGS AT MATLOCK. By R. SHELTON MACKENZIE, D.C.L. Three Vols. Published by H. COLBURN, London.

Dr. Mackenzie became favourably known to the public some few years ago as the author of "Titan, an Art Novel." He has not met the public this season, so to say, single-handed, but rendered his "Mornings at Matlock" agreeable, by recounting a number of tales. Since the days of Boccaccio this mode of "story-telling" has frequently been resorted to, with considerable or inconsiderable success, according to the ability of the author, so that there is nothing "new" or "taking" in the plan; but Dr. Mackenzie has lived a good deal "in the world," both in the "great Babylon" and in the little Babylons which increase all over England. He has had frequent opportunities of observing "character" and various phases of society. His perceptions are acute; and he has collected a great deal of information and anecdote; is very fond of Art and fond of society. His style is easy and *vigilant*; and he *vacantes* his various tastes with much grace and spirit. The tale-telling group consist of an artist, an author, a major in the army, and an Irishman; so there are stories by each, and scenes where the peculiarities of each, either single or contrast; thus the reader may feel assured that the contents of the volumes are very varied, and the style is strong, yet flexible. Dr. Mackenzie, however, renders men and the ways of the world better than women and the more delicate tracings of the feelings and affections; he lacks tenderness, and is too actual—too lightly read in the purchased history of woman's nature to appreciate what of course he has failed to describe. One instance of this occurs in "Tressilian's" clever story, where the young lady he had stared out of countenance more than once, *announces* herself to *him*, after an interval of two years—during a very casual meeting—as "the Widow Stanley," and tells him he does no unwise thing to cultivate her acquaintance. This is throwing the handkerchief the wrong way; and we think we are justified in saying that no one who understood female delicacy could have so described the first step in woman's love-making; particularly as the author intended the lady to be a "paragon of perfection." But when Dr. Mackenzie gets amongst the more stirring matters of the world—"The Great Wil Cause," "The Kings of the Peak," "The Millionaire Malgré Lui," "The Last Throw of the Dice," and his favourite "Art Stories"—his perceptions quicken, and his style carries him forward triumphantly, even over incidents which to a less experienced author might be very disastrous. In particular, his Irish stories are admirable for their truth of character and dramatic effect. We hope to meet him again in a long story; for although these volumes are the very things for the sea-side and a large family circle, much talent is frittered away in short stories, which would, had the same amount of time and constructiveness been applied thereto, produce a connected tale more worthy of Dr. Mackenzie's reputation.

VOICES OF THE NIGHT. LONGFELLOW. With Illustrations by A. LADY. Published by DICKINSON, BROTHERS, London.

We have printed the title of this book as it stands in the original page, but it does not clearly indicate who has given utterance to the "Voices"; we presume, however, they have proceeded from the American poet, Longfellow, and sweet and gentle strains they are—music that lulls to slumber, and disturbs not the sleeper from his pleasant dreams, or that wakes him only, as one of our old poets expresses it, "to feed his soul with melody." But our business is rather with the pictures than the poetry of the volume; they consist of six etchings on rather a large scale, by Mrs. Lees, a lady with whose name, as an artist, we are unacquainted; but she has afforded us so much pleasure in what is here produced, as to make us desirous of meeting her again in similar company. Her style is founded on the German school, which seems to be gaining ground with our amateurs; and although we should regret its prevalence to the exclusion of what appears to us to have more of the freshness, elegance, and truth of nature, we are not unwilling to see it referred to as embodying certain principles of excellence which, combined with greater latitude of poetical feeling, would go far to ensure perfection. Mrs. Lees' illustrations are little more than outlines, with a small amount of shading in the principal figures; they are designed with great taste, show an intimate knowledge of the structure of the human form, and are imbued with a sentiment of an epic and devout. The figure of the old man asleep in the chair, illustrating the poem entitled "The Footsteps of Angels," and the design for the "Hymn to the Night," are especially beautiful, and worthy of the matured powers of a practised artist.

BLACK'S GUIDE THROUGH EDINBURGH. Published by A. & C. BLACK, Edinburgh.

We must confess to a love of the modern Athens, a love as much for its own beauty as for the many associations of a real and a fanciful kind, which its history, or the pages of Scott have thrown around it. Mr. Black's little volume is an agreeable and useful pocket-companion for Edinburgh and its neighbourhood, and it is better illustrated than such books usually are; the small steel plates are beautifully engraved, and the woodcuts also good. Enough of fancy has been given in the local description, and quotations from the poets to relieve the heaviness of topographical minutiae. It is a well arranged volume, which cannot fail to be agreeable to the tourist.

THE CAMBRIAN MIRROR; OR THE TOURIST'S COMPANION THROUGH NORTH WALES. By EDWARD PARRY, WHITTAKER, & CO., London. T. CATHERALL, Chester.

A very portable and useful little volume which, while it points out all worth a tourist's notice, does not trouble him with too much florid description which is generally the bane of such effusions. All that is necessary to know is clearly narrated, and the most minute information as to inns, &c., included. There is just enough of Welsh history and Welsh poetry to give nationality and a piquancy to the volume, which cannot but be useful and acceptable to all who would avail themselves of such aid in a tour—certainly equal in beauty and grandeur to the be-praised continental trips.

THE DECORATIVE ARTS OF THE MIDDLE AGES. By HENRY SEAW. No. VI. Published by W. PICKERING, London.

This is one of the best numbers of a work which promises to equal any of the previous ones from the same hand. The Morse or fastening for the breast of a Priest's Cape, belonging to H. Magniac, Esq., is a magnificent specimen of the art of design in the fourteenth century. The Candlestick of the time of Henry II., of France, of the rarest fettle ware, is also a fine example of taste. The wrought iron door, from Mr. Cottingham's collection, is a specimen of the fine design which characterised all the manufacturing arts in early times; and we are assured that its resuscitation may be effected by the proper study of such admirable examples as are here given.

CHARACTERS, COSTUMES, AND MODES OF LIFE, IN THE VALLEY OF THE NILE. Illustrated from designs taken on the spot, by E. PRINSE; with Descriptive Letter-press, by J. A. ST. JOHN. Parts I. & II., Published by J. MADDEN.

Some two or three years since, we reviewed this work under the title of "The Oriental Album," at some length. It is not, therefore, necessary to reiterate the very favourable opinions we then expressed of the excellent manner in which the publication was altogether got up. But as it has now assumed another form, by the publishers producing it in separate parts, it is only due to its merits to say that, both in this and in its original shape, it is well deserving of public encouragement. The two parts now before us contain, "Armees and Osmanli Soldiers;" "Egyptian Lady in the Harem;" "Habesh, or Abyssinian Slave;" "Ghazvi, or Dancing Girls;" "Camels resting in the Sherkiyeh;" "Ottoman of Cairo, his Shop and Customers." They are lithographed on a large scale, and tinted in imitation of the original drawings.

"TO THREE ANGELS CRY ALOUD." Engraved by C. TOMKINS, from the Picture by H. LE JEUNE. Published by H. GRAVES & CO., London.

To use a mercantile phrase, whatever article is brought before the public and secures its approbation, "the supply will always keep pace with the demand," or to adopt another term with the same signification, "like produces its like." This engraving belongs to the class of which we have had several examples within the last few months, and the appearance of another goes far to prove that the community, to whose taste they are more especially addressed, is not yet weary of them. But Mr. Le Jeune's picture takes a higher range than its predecessors, for instead of chorister-boys and charity-girls, he has painted three winged figures, draped, the centre one bearing a crucifix on its breast. We know he has the authority of some of the ancient masters for such an introduction, still we think its omission in beings that are evidently not of the earth, would have harmonised better with their character, even regarding it only as a symbol of their faith. In other respects the work is well conceived, and its spirit bears out the title.

THE ART-JOURNAL.

LONDON, OCTOBER 1, 1850.

ART IN THE HOUSE OF COMMONS.
THE STRUGGLES OF TASTE.

It is perhaps well to premise that the following remarks on the public patronage of Art have no reference to artists, or the encouragement of Art as a profession, but only to the part taken by the State in the development of one of

the great means for the national recreation and general social improvement. It is a prevailing notion that both Science and Art flourish best when left entirely to their own resources; and the idea is, probably, on the whole, correct. But as there is an active encouragement, so there is such a thing as a passive or negative depression. The natural development is therefore impeded. The House of Commons, as the supreme committee of Taste in this country (as committee of supply), has the power both of the initiative and the preventive; we believe it has yet to appear in the first capacity, the other it has often exercised; but it has also on a few important recent occasions very materially scolded the efforts of the administration in the cause of Art; it is only to be regretted that its opportunities of this class have not been more numerous.

Many of the greatest patrons of Art in this country have certainly been, at some time or other, members of the House of Commons, but they have been patrons almost exclusively in their private capacity, as English gentlemen, and not as members of the legislature; for their own gratification therefore, and not upon any public consideration; not as representatives for the People. What is it to us—what is it to the nation—if a picture is removed from a painting-room in the neighbourhood of Tavistock Square or Pimlico to a dining-room in that of Hyde Park? it is no more a concern of the people than when a fine turbot is transported from Hungerford Market to Great Queen Street. The public see or know as much about the one as the other, and have no interest whatever in either.

To such patronage the people are in no way bounden, yet it is only to these private patrons who may be members of the House of Commons, that the people can look for any aid or benefit in this respect, for they certainly could not help themselves but by their agency. Our newspapers report miles of eloquence expended by the representatives of the people over every possible subject, important, trivial, or vexatious, excepting, perhaps, the one only subject of Art for the people; nearly every debate about Art or public monuments, is a mere series of cavils about expense. We have religion for the people, education for the people, health for the people, protection for the people, but no taste for the people; that is, perhaps, something too refined even for the nineteenth century, or at least, for the British Treasury of that date. "No one," said Lord Goderich, when Chancellor of the Exchequer, in 1821, "ever suspected the Treasury of Taste; but he did not think a minister should have his head cut off for bad taste." Heaven forbid! but why then leave the initiative in such a matter to a body so notoriously

incompetent, as that its incapacity should be a matter of course? Lord Goderich supported his opinion by quoting that of Burke,* namely, that it "was hopeless that the government of this country should pay much attention to the Fine Arts, for it was impossible that our statesmen, both from the nature of their education and their occupations, could be skilled in such matters." This is an extremely melancholy prospect for this country, if true. Of the past, it may have been true, but is it necessarily true of the future? We believe it to be no more true than that the government can do nothing for the public morals of the country; and if it should be true of Art, there is a gross neglect somewhere. It is with this feeling that we cast a stone into these stagnant waters, with the hope that they may derive some benefit even from the ripple of their surface, which will still reach the banks though imperceptible to the eye.

To say that public taste cannot be cultivated in this country because the education of youth is defective, is something like saying that a library is of no earthly use after dark; as in the latter case we should say "light a candle," so in the former we say "reform your system of education." The one is quite as practicable as the other, but for our own prejudices; at all events bad education is no excuse. It is perfectly true that if a youth is brought up to consider matters of taste as unmanly, or as inferior to boating, horse-racing, or cock-fighting, the improbability of his afterwards becoming accomplished in such matters, amounts very nearly to a certainty. If, however, only one generation took care of the public taste, taste itself would afterwards take care of the public, and collegiate or private efforts would be in a measure superseded; but this is a part of the question we may leave to itself at present. It is to be hoped the Royal Commission will leave our privileged universities rather more worthy of the name than they are at present; and a hundred years hence, perhaps, Art, as well as Arithmetic, may claim an occasional hour of the student aspiring to the honours of the legislature. All eminently civilised states, from the Pharaohs or Semiramis to the present day, have devoted much attention to the public cultivation of the Arts. What should we now know of Egypt but for its public monuments? How much glory have the Arts not added to Greece, notwithstanding its finished literature? How much glory have the Arts added to Great Britain?—We know what Greece did after the Persian war; its Arts seem to have raised it as it were by enchantment to an almost unapproachable grandeur; a single one of its public monuments, the Olympian Jupiter, was for many hundreds of years visited as one of the wonders of the world; and even now Elis, after thousands of years, is, we may almost say, the envied of the world for its achievement of this single work, a source of joy and wealth while it endured, and of glory for ever. Now let us turn to another picture: England too, after its great war, determined to commemorate its victories likewise; this was done in the shape of some dozen marble monuments to its admirals, generals, and statesmen, in the Churches of St. Peter and St. Paul; and the British public, who have already paid for the monuments, are allowed at certain times to look at them upon the payment of an additional few pence per head, to defray the expense of the showmen; a proceeding truly worthy of a great nation! Of all the penny-wisdoms and pound-foolies of a state, there is no better illustration than the public treatment of Art in this country. One or two great public monuments would have been infinitely more significant than the numerous petty groups scattered about beneath the dome of St. Paul's, which could scarcely make less show for the 100,000*l.* which they have cost the public. The simple inscription of a name would confer as much glory on the individuals as many of these monuments. Flaxman's proposal for a colossal statue of Britannia, at Greenwich, was rejected by the so-called "Committee of Taste," at that time, as something visionary; so utterly incapable were the members of that committee of even worthily approaching the

subject they had undertaken to glorify; they were evidently filled with their one idea of a tall pillar.

However much economy may be the general plea of incapacity in such matters in this country, it is rarely indeed that it has ever been practised. The right hand has nearly always scattered to the winds, what the left hand has kept back.

The only vote of public funds for the public use, in the cause of Literature or Art in this country, was for years the miserable 3000*l.* granted to the Museum on an annual petition from the trustees; while the House voted its tens of thousands yearly for the monopoly of printing its own acts and journals; sometimes exceeding 50,000*l.* for a single session. Yet all this was not done from principle, but from pure habit; it is just one of the evidences that the Arts were not yet held in any consideration in this supreme committee of taste; or otherwise the votes would have been undoubtedly as liberal in this respect as in any other. Take that of funerals, for instance; it is customary for a gentleman to have what is considered a respectable funeral; and when a public funeral is voted, it must be carried out, as a matter of course, with somewhat more than ordinary pomp. Accordingly 1806 proved a lucky year for the undertakers; Lord Nelson and William Pitt were buried at that time, at the public expense, and the Commons voted close upon 21,000*l.* to defray the charges; very nearly seven times the annual grant to the great National Museum of Art, Science, and Literature.

At this time, however, matters began to change. The acquisition of the Egyptian antiquities captured by the British forces at Alexandria, rendered it necessary to provide some locality to place them in, and a grant was eventually obtained; and the valuable acquisitions of the Townley Marbles and the Lansdowne MSS., and a few others coming close upon this, rendered it henceforth impossible to turn the Museum off with a paltry 3000*l.* per annum, and from the year 1806 the Museum vote has gradually been increased, until it has at last reached an amount not unworthy even of this great nation, though perhaps yet not quite adequate to the wants of the public. Still the Museum owes its prosperity to its Scientific and Literary capacity, and certainly not to that of Art, in which respect it is still under a cloud.

The purchase of the Townley Collection in 1805, for 20,000*l.*, was the first important move of the legislature in the cause of Art; but the nation owes, it would seem, few thanks on the score of generosity on that account, when we reflect that the same Parliament voted more money for two funerals only, and generally voted twice the amount annually for the printing of its own transactions. To estimate fairly these votes for Art, we must only take a relative view of them.

The great Art-votes during the war were exclusively architectural, if mere budding may be dignified with that title; and, of course, these votes were wholly irrespective of Art considerations in their origin, and they have been little less so in their results. Really vast sums were absorbed by the Penitentiary at Millbank; by the New Mint on Tower Hill; by the College at Sandhurst; and by the clearings and repairs at Palace Yard and the two Houses. The restoration of Henry VII.'s Chapel, however, was a genuine work of Art; but perhaps the repairs of St. Margaret's Church might have been better dispensed with; the Abbey would be a great gainer in effect if it were taken entirely away.

By way of illustrating our comparative estimate of social and political votes, take the Museum, and the Army and Navy, for two separate years. While, in 1804, 3000*l.* were voted for the ordinary purposes of the Museum, we find for that year nearly twenty-six millions voted for the Army and Navy; and ten years later, when matters had considerably progressed, we find an equal disparity; the war estimate of

* For Lord Nelson's, 14,769*l.* 15*s.* 6*d.*; and for Pitt's, 6,045*l.* 2*s.* 6*d.*

† For the Navy, Army, Ordnance, and Militia, 55,206,759*l.* 5*s.* 7*d.*; for the Museum, 8231*l.* 11*s.* 4*d.*, and for printed books, 1000*l.*

* Hansard, Debates, April 5th, 1824.

that year (1814) being within a few pounds of fifty-six millions, while the vote for the Museum, comprising an extra grant for printed books, did not amount to ten thousand pounds.

This was, however, time of war—the days of army-contractors and undertakers; and it is very clear that the Museum and all other Scientific, Literary, and Artistic institutions were then of very trifling significance indeed. But how stood matters when the war was ended? Their relative position was certainly different; Art was, however, still not less completely overlooked. We have certainly our marble monuments, for the sight of which threepeuce are charged, and our marble monuments, for the sight of which twopence are charged; the tall pillar, so much more rational than the visionary "Britannia" of Flaxman, has never made its appearance, though many little ones have risen up since that memorable time.

One of the first peace efforts was the destruction of Carlton House, which had been but a few years before put into repair for the Regent at very great expense, to make way for the new street called Regent Street; and we have just now seen its boasted architectural feature, the Quadrant of Pillars, remorselessly swept away as lumber; which does not tell well for the success of that effort; it was evidently not an economical one.

The New Courts of Justice at Westminster, apparently now doomed to the same fate as the Quadrant, are another monument of this period. It was a strange fate for Westminster Hall, after so many tens of thousands were expended in clearing its site, to be thus again buried in a mass of rude Tudor abortions; the deliberate work of a Committee of "Taste" at the recommendations or suggestions of no less a connoisseur than Sir John Soane. But this was not done without remonstrance in the supreme "committee," though remonstrance was in vain. The remonstrators, perhaps, themselves hardly imagined how soon their prophetic warnings were likely to be fulfilled. It was in 1824 that a vote of 30,000*l.* was solicited for the completion of these New Courts, when Mr. W. Villanous moved an amendment that 5000*l.* be voted for the purpose of pulling down what was already done; protesting against a vote for the completion of a building which would hand the then House down to posterity as completely deficient in taste. Mr. Banks likewise objected to the "abominable taste" of these new buildings, quite in a different style from the old; and Mr. Baring complained "that there was nobody connected with the government that was responsible for these ridiculous buildings." However the Treasury, "that no one ever suspected of taste," prevailed, and the buildings were completed under the auspices of Mr. Robinson, afterwards Lord Goderich.

Lord Goderich's chanceryship of the Exchequer was indeed the first active period of modern Art-undertakings in this country; among which stand most prominent the restoration of Windsor Castle, and the remodelling of old Buckingham House, in order to construct a convenient town residence for the sovereign at a "small expense!" as was originally professed. Windsor Castle was completed with comparative expedition, at a cost to the nation of upwards of a million sterling, exceeding the original estimate by only about 800,000*l.*; this, though not a public is still a national work, and had twice the sum been fairly and judiciously expended on the principal residence of the sovereign of these realms, the still neglected People would have been the last to complain of such an outlay. But the original estimate of 300,000*l.* was met in 1824 with very considerable opposition in the House, with all the usual cavillings accompanying nearly every grant of money for such trivial concerns as matters of Art: matters in which the members of this great committee have no concern. The turning old Buckingham House into a comfortable town residence for the sovereign has not been quite so expeditious or so easy an affair; the work has now been going on for more than a quarter of a century, and it is not yet finished. Some of our readers will be astonished to hear that this palace has already cost three times its

original estimate as vouchsafed by Lord Goderich, and on the whole very nearly as much as the works at Windsor; or in round numbers 850,000*l.* exclusive of furniture: the original estimate was 252,000*l.* One reason of the enormous expense of this comparatively small palace is that Mr. Nash uddid a great deal of his work as fast as he did it; and what he did not uddo himself has been uddone by Mr. Blore since, with the exception of the marble arch in the centre (which cost 70,000*l.*), that is yet to be uddone; a vote of a few more thousands was passed only the other day expressly for this little bit of udding, and when the Chancellor of the Exchequer was asked what was to be doue with the arch when uddone, his answer was that he did not know.

The new buildings at the British Museum likewise commenced at this period; and a still more important event for Art in this country, the establishment of the National Gallery, belongs also to this time.

The history of the vicissitudes of the National Gallery at its commencement, to be or not to be, is a curious one, and, more than any other, shows the utter want of purpose, system, or management, as regards the cultivation of public taste, in our legislature. At one moment we find the idea of spending money on a collection of pictures considered as an enormity, and at another we have it proclaimed as a disgrace that this country had no National Gallery long ago: the various opinions depend on the temper of the moment; it would be a perfect infatuation to suppose that a fixed and intelligent purpose to foster a taste for Art had anything to do with the matter in the general sentiments of the House, although doubtless a few individuals did experience such a feeling. Fifty millions are voted for powder and shot by acclamation, we presume not to say that it is right or that it is wrong, and it does seem inconsistent that while millions are voted for the destruction of mankind, we should take any pains to vote even thousands only for their intellectual gratification or improvement; but always with this proviso, that no plea of economy can be advanced for withholding the vote.

The beginning of the National Gallery may be said to be Sir George Beaumont's present of his pictures to the *British Museum*; "the Chancellor of the Exchequer was fully sensible of the extraordinary liberality of that individual, and he trusted that it would lay the foundation of a splendid national collection," a wish that all lovers of Art will cordially respond to. We shall now see what efforts were made to second this "extraordinary liberality;" as far as the legislature is concerned it was long *in proterea nihil*. It was found they had no place to put them in; Sir T. Baring suggested the completion of Somerset House for their deposit; but that involved *expense*, therefore the Chancellor of the Exchequer could not sanction that scheme. This building had remained in an unfinished state for thirty years, as if, said Mr. W. Smith, "the nation had not had a single farthing to bestow on national ornament." Somerset House was further thought to be too near the Thames, and it was insisted that as the pictures were given to the *Museum*, a place must be found for them in that building. So the matter rested till a sudden turn took place in the current of opinion, when George IV. recommended the purchase of the Angerstein collection; which great event for Art in this country took place on April 22, 1824, when a vote of 60,000*l.* was granted by the committee (of supply) and never were 60,000*l.* spent calculated to produce better fruit.

The words of Lord Dover (then the Hon. Mr. Agar Ellis) in the debate on this auspicious event must be here recorded:—"He trusted that the present would form a new era in the history of the Arts in this country. If there were any gentlemen in that house who *disapproved of the expense* to which these pictures were putting the country, he would ask them whether they might not be productive of emolument to the nation even in a pecuniary point of view. What was it that attracted so many travellers to Italy, but the numerous works of genius that were contained in it? And if a similar collection were

made in London, was it not likely that a similar cause would produce a similar resort of strangers to it? He hoped that His Majesty's government would not stop short in the great work which it had undertaken, but would proceed steadily and progressively in it."

The champion of economy too, Mr. Hume, expressed his satisfaction that the country was at length to be rescued from the disgrace which the want of a National Gallery of pictures had so long entailed upon it. These are gratifying and honourable sentiments, and it is a great pity that those entertaining such, should not have long ago thought of urging the necessity upon the government; it is the old story—as long as the government was content to *do nothing* in the matter, the rest of the House were content to help it in.

The Beaumont pictures were now located with the Angerstein; and it was found in a few years, after the munificent Carr bequest, that some new location was absolutely necessary, both for want of space and because the old house in which they were placed, was unsafe and was destined to come down.

What then was to be done with this encumbrance of a National Gallery; the debate on this point (July 8th, 1831) is worthy of record. Mr. Ridley Colborne judiciously suggested that an express gallery might be erected at a small cost. Lord Duncannon proposed that the pictures should be placed in the old mews at Charing Cross. Sir G. Warrender hoped that we had not come to that pass that we could not construct a gallery for a fine collection of pictures. Mr. Alderman Wood observed that he had many thousand constituents who were no lovers of the *Fine Arts*, and they ought not to be taxed with the erection of such a building. Mr. Robert Gordou was "afraid the taste for pictures would be productive of expense—the country should not be saddled with *expense for such things*; let lovers of Art subscribe." Another honourable member hoped they should not be "called upon to erect places for the exhibition of works of the *Fine Arts*, when a *famishing population was crying for bread!*" This was not to be misunderstood; the

Treasurer, it appears, cared no more about the matter than honourable members, and we find the Chancellor of the Treasury (Mr. Spring Rice) vindicating the desire of spending the public money on such a matter; "the government had no intention of doing anything of the kind," said Mr. Spring Rice; upon which Mr. Alderman Wood again observed, that he trusted that such an intention, should it ever exist, would be checked by the opinion then expressed. Mr. Hume very kindly proposed that the poor pictures might be deposited in Buckingham Palace which he thought would make a "comfortable resting-place for them." After many hundreds of thousands of pounds had been spent on that building, the government was at a loss to know what to do with it, for William IV. would not reside in it. The pictures had to remain where they were, in the small tottering house in Pall Mall. Such was the character, and result of the debate on the National Gallery, even then numbering upwards of a hundred valuable paintings; and such the encouragement held out by the supreme "committee" of taste in this country, to any gentleman who might have been disposed to imitate the noble examples of Sir George Beaumont, and the Rev. William Holwell Carr, and entrust their collections to the public keeping for the public good. Where were the patrons of Art on the 8th of July, 1831? One thing is certain, that the whole discussion in this supreme assemblage must appear to every true lover of Art supremely disgusting. Because certain under-headed constituents are no lovers of the *Fine Arts*, their representative is to deprive all the millions of these Islands of every benefit of a refined taste. There are many things men love not, yet for which they are pretty heavily taxed. Poor National Gallery! it was a cold blast indeed that blew on it from St. Stephen's, on the 8th of July, 1831.

Yet how easily this might have been prevented is shown by what took place after so short an interval as to the ensuing July only; a single courageous conscientious effort from one or two

of the known influential patrons of Art would have completely turned the tide of opinion, such a mere vane is the standard of taste in this great assembly.

April 13, 1832, the subject of the National Gallery was again mooted, when Sir Robert Peel proposed a grant of 30,000*l.* for the erection of a plain but appropriate gallery for the national pictures; reminding honourable members that "the interest of our manufactures was also involved in every encouragement being held out to the Fine Arts in this country." This timely word had its effect, and we find no trace whatever of that unseemly opposition which distinguished the debate on the subject on the previous occasion; even the Treasury was now convinced, for on the 23rd of July following, the Chancellor of the Exchequer, still Mr. Spring Rice, not without a certain amount of enthusiasm, moved in the Committee of Supply, and Taste, at once, the first instalment of a vote for the purposes of building a National Gallery, which was carried without a division, and the present building in Trafalgar Square was the result; yet adding only another example to the faculty which seems as yet to hang over all our public efforts in the cause of Art.

Sir Robert Peel "trusted that the erection of the edifice would not only contribute to the cultivation of the Arts, but also to the cementing of those bonds of union between the richer and the poorer orders of the State, which no man was more anxious to see joined in mutual intercourse and good understanding than he was." Such were the sentiments of the most eminent statesman in the House of Commons; it is a pity that there are no fruits to show that they were echoed by the sentiments of other honourable members. It was but a few weeks before that Sir Robert declared that every encouragement given to the Fine Arts in this country was an indirect advancement of the manufactures, and therefore an increase of the wealth and comforts of the people; besides conferring the higher service of cementing the bonds of union between the richer and the poorer orders of the State. Sir Robert spoke the truth, though all, as might be expected, are not sufficiently endowed to see it.

A National Gallery was, however, at length built, but on so mean a scale that it is already discovered that it is wholly unfit for its purpose, owing to the architect paying more attention to the exterior effect than the interior arrangement; and yet the building cost nearly 90,000*l.* But such a limitation of funds was certainly absurd, when it was determined to use the greater part of the grants simply for the purpose of beautifying Trafalgar Square: the chief part of the money has been spent over the entrance hall and the Square front. The picture gallery itself consists of three available rooms, which, accordingly, as the whole 90,000*l.* are scored against the Gallery, amounts to 30,000*l.* for each room, capable of holding about fifty pictures; the piece of wall on which the picture hangs costing therefore in many instances more than the picture itself. This is certainly one of the most extraordinary instances of the misappropriation of funds: a certain sum of money is voted for the accommodation of the national pictures, and it is nearly all spent on the construction of what is intended to be an ornamental side of a square. As far as accommodation for the pictures is concerned, a fitter building might have been constructed for the cost of only the two Correggios, which were bought of the Marquis of Londonderry in 1834, namely, 11,500*l.* It is surprising how the original motive of the grant was generally overlooked and commuted for that of improving the effect of Trafalgar Square; and it is to the account of laying out this square that the cost of this building should be charged, and not to the account of *expense to which our taste for pictures is putting the nation.* If an ornamental building was necessary, the means were ridiculously inadequate, as is at length universally discovered; and though the present structure may well answer at all times the wants of the Royal Academy, with improved accommodation for sculpture, it is wholly unsuited for the purposes of a National Gallery, even for a second-rate German State, much more for the

capital of an empire like that of Great Britain.

The nation would have been much better off if the first suggestion of Sir Robert Peel had been carried out, and a simply suitable gallery constructed at a cost of not more than 30,000*l.*, perfectly adequate if judiciously and economically laid out, however unbecoming this great country.

If there is one public institution of recreation in a country which concerns the People more than any other, it is a national collection of works of Art. Libraries, scientific collections, and others, are all more or less limited in their immediate uses; but a great picture gallery, or a great sculpture gallery is universal in its immediate influence. We can scarcely have too many scientific or literary institutions, but these are secured by the absolute material wants of classes; with public collections of Art the case is very different, they are not an absolute necessity with any class, and no one class could possibly raise them.

In the first place a gallery must be national to be public, no individual or society of individuals could give a gallery the dignity of a national character. Dulwich Gallery is an instance; it is comparatively unknown and without renown, though a very valuable collection. The nearest approach to a national institution not of national origin, is the Städel museum at Frankfort, but the acceptance of the charge of this institution by the state, perhaps, makes it actually a national institution now. This institution is one of the noblest monuments of individual patriotism in the world; Städel, a banker at Frankfort, left his collections of works of Art to the town, with a million of florins as a perpetual capital, to provide for their preservation and gradual increase; this sum yields about 4000*l.* a year, nearly three times the ordinary average grant given by our government to the British National Gallery; and if the present good management continues, the Städel-Institution promises to be one of the first Art-Institutions in the world. The present National Gallery, however really insignificant, has certainly not been without great results to the people generally, both directly and indirectly; Hampton Court Gallery has likewise been a great source of public recreation and improvement, as have also the collections of antiquities of the British Museum. And we may, perhaps, fairly attribute the unquestionably greater activity in matters of Art in this country during the last fifteen years, to the operation, the reaction as it were, of these very collections, on the nation at large, legislators and people.

The Elgin marbles were a great acquisition to this country, but here also our thanks are due to an individual; we certainly owe them to the taste and energy of Lord Elgin; the government, after much trouble, purchased them of that enterprising nobleman, at considerably less than they cost him to rescue them from their precarious fate at Athens. Again, we owe, perhaps, the most important step ever taken by this country, in matters of Art—the establishment of a Royal Commission in connexion with the New Houses of Parliament, to a pure accident—the conflagration of the old Houses—and another most valuable institution in this country, the Schools of Design, is due to the happy turn the Art-argument took when it maintained that the encouragement of the Fine Arts was the encouragement of our fortunes. This argument, first advanced by Sir Robert Peel, told well upon the manufacturing interest in the House of Commons, and accordingly, Mr. Ewart and Mr. Wye found no difficulty in procuring their Committee of Inquiry, in 1835, which ultimately resulted in the establishment of the Schools of Design; and though the parliamentary grant is miserably below what the demands on the schools would justify, they are gradually working their good in the manufacturing towns, and will, by the publicity of their small collections of casts, insensibly work a complete revolution in the provinces, in the popular ideas concerning Art, and co-operate with the metropolitan collections in giving Art that standing in the country which it ought to have had centuries ago, or, perhaps, we may even say, which it *had* centuries ago;

for England promised, in the reign of Charles I. to rival the most prominent states in its patronage of Art, but a fatal suspension was caused by the Civil Wars. It is, however, a remarkable incident that in such disorder and dispersion of works of Art, the most valuable though the least showy of Charles's collections should have been preserved, namely, the seven cartoons of Raphael; and the purchase for the nation of these great works, then mere strips of tapestry patterns, is not one of the least evidences of Cromwell's superiority and greatness. There were, perhaps, scarcely ten men in the country who believed in their value. This is another instance of the practical superiority of one head that knows what it wants to a thousand that are undecided.

Perhaps there is no better exemplification of the old proverb of "too many cooks," &c., than the fate of Art in the House of Commons. What is every one's business in theory, proves to be no one's business in practice. This is the fatality which overwhelms public taste in this country; very materially aided by our paralyzing system of noble and unpaid trustees, some of whom perhaps scarcely give their *trust* three thoughts in the course of a year.

The whole subject appears from this rapid sketch of the records of the struggles of Taste, to be mainly left to the whimsies of a Committee of Supply; no system whatever has been yet adopted by the Executive; the matter is generally left, says Lord Goderich, "to the Board of Works, and to the individual who happens to be at the head of it," who happens to be at the head of the Board of Works, not who was *placed* there from his peculiar fitness to discharge the duties his office was liable to. However, these are mere words; the head of the Board of Works has no influence or power of any kind in this respect, and it has probably never occurred to that individual that he had. He is appointed in a very different capacity, and matters of public taste, especially in the initiative, have not performed any part of his duties. We may say of the Board of Works what Lord Goderich says of the Executive generally, that as yet "nobody ever thought it requisite that it should have any taste." We believe the virtual head of the Board of Works is the chief Commissioner of Woods and Forests, and this office might he made a highly honourable and useful one if it comprised the ordinary duties of the foreign ministries of public works. Of course, the office would be no sinecure, and very great responsibility would be attached to it, but it would be the more honourable in proportion. There will certainly be little chance of the "Executive" ever having any taste until some such measure as this he adopted. The great superiority of France in its public works is entirely owing to this system of appointing one responsible individual to superintend its public monuments. What we require in this country is an *initiative*; the veto or sanction will always remain with the Committee of Supply, and this committee will never act as an impediment to the carrying out of any well defined and well advocated scheme. This is proved by the past; every proposition that has been well advocated in the House has passed, even though ill defined, as, for instance, the restorations of Windsor Castle and Buckingham Palace.

The great drawback to public works of taste in this country is that the House of Commons leaves the initiative to the government which has not in this respect the initiative element in it; men are made ministers from political and family reasons, never by virtue of their taste or public spirit, and, to again quote the words of Burke, "both their education and their occupations render them unfit to legislate in matters of taste."

The whole subject rests therefore with the individual patrons of Art who may be members of the House of Commons. In matters of this kind, which are not political, the government will follow the sense of the House; the vicissitudes of our National Gallery are a remarkable instance of this. In July, 1831, the sense of the House, as Art was not represented, was decidedly against building a National Gallery; and the Chancellor of the Exchequer said that the

government had no intention of doing anything of the kind, but in a little while, a few words from Sir Robert Peel changed the sense of the House; and in July, 1832, we find the same Chancellor of the Exchequer cheerfully proposing a comparatively liberal grant for the erection of this very National Gallery, which the year previous the government had not the least intention of building. There is no doubt this might have been done long before, had Sir Robert Peel or any other influential member made the proposition, and shown by a judicious advocacy that he was in earnest.

The nation now still wants a National Gallery worthy of the name, and the only way in which it is likely to get this will be by some able influential member earnestly taking upon himself the task of showing to the House that such an institution is now a necessity with the public, and anything but a waste of money. We believe that there are several members of the House quite competent to do this if they will. The plea of economy in the face of so many glaring violations of it is an egregious farce; those who set up this plea are only indifferent to the public gratification and improvement, not sparing of the public money. They neither believe in taste nor its effects, because they have none; but it is an obstruction which the genuine patrons of Art may easily overcome with a little reasonable energy. As long as they are lukewarm it is not surprising that the others should be indifferent. With them, therefore, rests the responsibility. If the initiative is left to the Executive we stand a chance of waiting until the "Greek Calends;" next, present, and future opportunities of adding to our collections will have but one brief characteristic history—*neglected*.

There never was a better or greater opportunity of improving our National Gallery of pictures, than has been just now offered at the Hague: and where was the agent of the British government? Our private collections, in which many fine works are annually buried, were well represented, and we find the agent of a British nobleman successfully competing against the highest courts in Europe;—but for the taste of the British public, who is there that cares so much as the value of an old picture frame? "Let the lovers of Art subscribe," suggests an honourable member: they *do* subscribe, and subscribe nobly: the names of Beaumont, Carr, and Vernon bear witness; and how have they been rewarded? their donations and bequests have had to wander here and there for a resting-place, and have not yet found it: a tottering dwelling house, an old stable, a cellar: all have been tried or recommended, as the locations of the contributions of these patrons of public taste, because forsooth the committee of supply has no funds to spare for picture houses *for the People*.

If pictures are worth a nation's acceptance, they are worthy of being taken care of in a manner becoming an important public trust, and no neglect of this on the plea of economy could be by public sanction. Even the most stupid remonstrant against a grant of money for building a National Gallery, would most probably quite change his views when he saw the institution in operation, if properly carried out. The plea of economy does not come from *without* but from *within* the house; not from the people for whose enjoyment the grant would be, but from noblemen and gentlemen, who either have galleries of their own or sufficient access to their friends' galleries, and therefore care little or nothing about a *National Gallery*.

Supposing the Committee of Supply were to vote only as much for the National Gallery as the cost of the furniture of Windsor Castle made for George IV; this is not a very unreasonable supposition; yet by so doing it would not only vote enough to build a suitable gallery, but enough also to endow it with an income sufficient to clear the annual charges of its custody. The furniture of Windsor Castle cost a little less than 300,000*l.*; the annual charges of the National Gallery are about 1500*l.*; double this and you have still sufficient capital left to build a magnificent gallery (provided the money be not thrown away over the outside); and when compared with the Windsor furniture it might

pass for an example of even rigorous economy. The country has lately had exhibited to it a very extraordinary example of legislative economy and Fine Art patronage at once. The War office has decided upon a good-service medal for the private soldier, but in order that the country may not be "saddled with the expense" of this piece of patronage, the poor soldiers who apply for it are to be *swinded of a week's pay* for its cost; they are to *buy* their rewards for good service, on the same principle, it seems, that lovers of Art must buy a National Gallery; by which we are to assume that the country would grudge the poor soldier his medal. Verily this plea of economy cloaks a multitude of shortcomings.

Our picture is not very encouraging, yet we are sufficiently Utopian to trust that the day is not very far off when we shall really have a National Gallery worthy of Great Britain, and this in spite of past experience; because we know that there are many well-wishers of Art in the House of Commons who require only support from *without* to induce them to advocate this great question *within* the House; and in this spirit we here contribute our mite towards the agitation which shall constitute this support, exhorting all true lovers of Art to do likewise: God helps those who help themselves. So, and no otherwise, will England get its National Gallery.

R. N. WORNUM.

THE DUTY OF OUR MANUFACTURERS AT THE PRESENT CRISIS.

THE Great Exhibition of 1851 forms a topic the interest of which is rather increasing than abating. The favourers and the opposers of the scheme are equally alive to its national and individual importance, and public curiosity is watching with eager eye each new phase that the project assumes, and each new decision or series of decisions, on which the Royal Commission may please to determine. But surely this is not all that is required, if England is to maintain that manufacturing position in the scale of nations, of the stability of which it might be presumed that she entertained but little fear when she first challenged the world to competition. More is wanted than inactive solicitude on the one hand, or stagnant alarm on the other. The deed has been done; all the necessary preparations have been made, and it is finally determined that the Exhibition must take place in 1851; and now it is as absurd for British manufacturers to hold back their co-operation because some of the arrangements of the Commission do not coincide with their own particular views, or because, it may be in some instances, unfit persons have been appointed to carry out the intentions of the nation, as it would be for a nation to abandon a religion because advocated by incompetent priests, or to lose the victory in complaining of the generals. It is now too late to discuss the policy or imprudence of positively fixing the date of the Exhibition so soon, and of making our first endeavour of the kind universal instead of national; the question seems now rather to be, how are the exigencies of the times to be best met, and how are British manufacturers to proceed to preserve, and if possible, increase their own reputations, and keep up the credit of the country? It will be in vain for them to plume themselves upon their business connexions and their facilities for cheap execution, arising from quantity produced, and on these grounds to assume the dignity of exclusiveness, and hold themselves aloof from the list of competitors, since the latter argument is already invalid, and the former will certainly be so after the year 1851, for we are firmly grounded in the belief that the result of the coming Exhibition will regulate the standard both of national and individual excellence. Manufacturers have now their own and their country's position to sustain—individual loss must attend withdrawal from the contest; and if in that contest the honour of Great Britain be compro-

mised, personal apathy becomes a public injustice. We know that there has been, and we believe, there still is, to a great extent, among many producers, a want of confidence in the mode in which the merits of respective objects will be estimated, and rewards distributed; and we think that there is considerable dissatisfaction felt at the very nature of the prizes, as being little calculated to stimulate exertion; besides this, there are numerous manufacturers who are fearful of the consequences of coming in contact with foreign rivalry, and who, in the certainty of being defeated, propose to themselves to take no part in the Exhibition. But all this is unphilosophical; since if there be anything wrong in the management of the undertaking, in the selection of the jury, or the nature of the prizes, such disadvantages must fall as heavily on foreign as on native competitors; and if not sufficient to restrain continental manufacturers, why should they have so unwholesome an influence upon our own? But we even yet entertain the hope that the final decisions of the Commission will be only as final as former ones have proved to be, and will eventually give place to plus more consistent and more favourable to the working interests of this country. To those who are backward through fear, we would only say that such a proceeding is unmanly and un-English, besides being individually and publicly imprudent. In the great contest for excellency we would urge them to take courage, and if they cannot all be first in the ranks, at least to fight vigorously for the desired position, rather than by non-appearance in the field to offer a tacit confession of inferiority.

It is now, certainly, rather late to begin. When foreign nations have been for months on the alert; when foreign governments have been zealously considering their manufacturing resources, issuing directions to the public, pointing out the peculiar excellences to which they ought to attain in particular branches, and, above all, assisting their own workmen with grants of public money to facilitate their labours; it is rather late for us to discuss the policy or impolicy of exhibiting, and what species of exhibitions are likely to prove most successful. But we would say to our manufacturers in the familiar tone which a grand peace movement ought to engender, although it be now late to begin, "*Better late than never*."

We have remarked that abroad, activity has been shown for months in making preparations for 1851: in France, in Belgium, throughout Germany, and, indeed, over the whole Continent, artists and manufacturers have been long at work, engaged upon performances which could not be effected in a very limited time; so great has been the enthusiasm displayed, and the increased number of workmen necessarily employed and paid partly by government co-operation, as importantly to influence the commercial state of the respective countries; and we may add, that, in many instances, manufactures brought into being under these favourable circumstances, and which, without them, would not have been produced at all, have found purchasers in other markets, thus giving manufacturers the opportunity of adding to the magnificence of works intended for the great Exhibition. But not to Europe alone has this active spirit of preparation been confined. America, through her vast expanse, has been getting ready the hammer and the chisel, and the molting pot, and devoting her best energies to the accomplishment of those works on which she most prides herself and feels her strength. A movement has taken place in India. The present cheapness of labour in that country gives it an important advantage, which we understand it will turn amply to account. This much at least we know, that in this remote country, furniture executed in ebony and other woods with princely elaboration, and ivory carvings of the utmost intricacy, made by native workmen, from European designs and partly from European models, have been long in hand, and, if we mistake not, will form a feature of peculiar novelty in the collection; for, by the means we have pointed out, such objects will be manufactured as in this country no private speculation unsupported by the highest patronage could venture to attempt. If the

comparatively barbarous treatment which the East almost always imparts to her performances, can be removed, there can be no doubt that in India our own manufacturers will find a powerful and a threatening rival. To every other nook of the civilised world to which we turn, we find the same earnest animation. It is only we who have projected and planned the great movement, the wonder of the age, we who have challenged the world to compete with us in the fabrication of every species of Industrial Art under heaven, in the hopes of establishing our superiority, and improving the state of our commerce; we, who have supported the scheme with our subscriptions, and thanked our Prince for fostering it—it is we only who are remaining inactive, and, like the ostrich, hiding our heads in the sand till overtaken by the pursuer.

The question which now arises is "how is the British manufacturer to act under the present circumstances?" We would reply that in the first place it is essential that he should, as far as possible, compensate for the time that has been thus lost to him, but gained by the foreigner. He must at once prepare his designs and gather together his tools and commence action. It cannot be driven off longer. Let him make up his mind what to do, and do it; and moreover let it be done in the very best way that can be accomplished, by deep study, tasteful exertion, and a temporary sacrifice of capital. The makers of machinery, of instruments of all kinds, whether surgical, scientific, or agricultural, will need no advice from us, nor will those who produce non-decorative manufactures; they have their path before them, a path with which they have been long acquainted, and of the direction of which they ought to feel perfectly confident. It is only necessary for us to glance at the present position of the producers of a few of those objects which are connected with high or decorative art.

As we observed in our August number, we have abundant confidence in the energies of the English people when they are once excited. There are a few tasks which Englishmen are unable to perform. In the world of Art lie their greatest difficulties. And yet we think promisingly of what a British mind may do even in this department, under circumstances of necessity. The last few years have greatly changed for the better the artistic demands of the public, and with them the capabilities of the producer; almost as great a "Renaissance" has taken place in England as did throughout Europe in the sixteenth century. The great majority of our Art-manufacturers have been steadily improving, and a few works have been produced which would have done honour to any age or country. These have been principally the result of unlimited commissions from royal or noble personages, cases which so rarely occur in modern times, that very seldom has the manufacturer the opportunity of showing to the world the full extent of his powers. But when he does display them (and we hope that for the coming Exhibition he will display them) we will venture to say that his efforts are unsurpassed by those of foreign rivalry.

The French are very justly acknowledged to excel us in the ordinary average of manufactured goods, principally because they possess more tasteful and better educated designers than we do, and it is too often the case that a graceful outline is made to conceal clumsy execution and careless finishing. The reverse of the case obtains in this country. In almost every department our execution and finish are the highest in the world; our only wants are in the province of design, and in the few fine things which British manufacturers are occasionally called upon to produce, even this is ably supplied, and indeed in a purer school than the continental artists attain to. We have particularly noticed in reviewing foreign expositions of Industrial Art, that, although crowded with goods of a better order than ours of the same average of workmanship, they presented none of the magnificent labours which now and then emanate from the well of British ingenuity. This we fully believe to be true; if so it is eminently encouraging, and, we think, points to the manufacturer the position he ought to assume. Let

him take a high standing, let him aim at doing things well rather than cheaply, spare no amount of study in procuring a design as perfect as possible, and then (no difficulty to him) let it be equalled by the quality of the execution.

Again, as another broad principle, the following should be remembered: that it will be found more desirable to improve, as far as possible, upon the general features of English work, without depriving them of their identity, than to imitate foreign peculiarities or even foreign excellencies. Nothing can lose through betraying a national character. The time is fast approaching when a work will be judged by its own merits rather than with reference to the site of its fabrication, and when the present ridiculous prejudice in favour of foreign goods will have subsided into air. The particular styles of decoration which manufacturers ought to adopt must be left to their own discrimination and to the nature of the materials employed, but as a general rule we remark that nature cannot be too closely studied, nor too religiously made use of, by the ornamental designer.

The department of metals must always be an important one deserving the most serious attention. Its immense value to the community gives it peculiar claims; but it is seldom or never the case that the same people is equally facile in working all the metals that administer to our daily wants. The French for instance bear the palm for gold and silver plate, jewellery and bronzes, while we plume ourselves upon the merits of our iron and brass-work. In iron-work we are especially strong, and this is the case because in our use of it we are consistent. Let us still not upon the same principles, striving less to rival the ornamental trifles which are imported from Berlin, than to aim at constructive excellence and applying iron to the exterior and interior of our public and private buildings, to ornament it appropriately, instead of excessively, but in no case to introduce features that might interfere with strength and lightness. With reference to our ornamental cutlery, not a word need be said, and we believe that the beauties of our best Sheffield stoves and stove furniture will leave everything in the same department far behind. In articles in gold and silver plate, we think that British manufacturers err in not being sufficiently particular in primary forms, thus spending continued labour and elegant execution upon objects which do not warrant such expenditure. The French act upon so different a plan in this respect, that we must beg our manufacturers to follow their good example. The truth of our remarks will be exemplified by glancing at the works of M. Morel in page 289 of this Journal, where will be seen pieces of table-plate, far less elaborate than many which are constantly manufactured in London, but far excelling them in general effect. The service centres, trifle-stands &c. executed within the last few years in silver, composed in design of such flowers as lilies, crown-imperials, &c., can scarcely be improved upon in point of design, and we especially recommend this implicit resort to nature, which is both English and beautiful.

A similar suggestion may be made with reference to the brasses-fittings, and ornamental pressed brass, the produce of Birmingham. Zinc is a metal, largely used in Paris, in both interior and exterior decorations, but strange to say, in this country we have almost been backward in so applying it. We submit it as worthy of consideration, whether zinc may or may not be made available for many more purposes in the Arts than it has yet been devoted to, and the chance of succeeding by using zinc in combination with other materials.

We hope that for the Exhibition of 1851, a large use will be made of the proficiency of this country in its medieval investigations, as they are connected with a branch of manufacture which at present commands a considerable trade. England is foremost in its true and pure feeling of Gothic forms and ornaments, and the English student in this department is possessed of a better collection of auxiliary works on the subject, than have been offered to the public in any part of Europe. We trust that proper advantage will be taken of this state of things, and that the stained glass windows, gothic stone

carving, and ecclesiastical appurtenances of home production, will stand unrivalled in elegant design, and consistent character. For many other objects the style of the middle ages may be made available, and to some extent it may be employed in wood carving, though in the latter branch we are, as a general rule, more inclined to recommend either a return to nature according to the principle laid down by Grinling Gibbons in his works, or otherwise an adoption of the Italian style of the sixteenth century stripped of its quaint grotesques, and supplied with the most lovely of all enrichments, those taken from the garden and the field.

The competitors with Lyons have a powerful, but, we trust, not an invincible rival. With the long and well-deserved popularity which France has possessed for her silks, and the strong popular bias in their favour, both with respect to texture and design, it will be difficult for the English manufacturer to bring into the field anything which will stand against them; and he must indeed strain every nerve and put his shoulder to the wheel, to outvie the silks of Lyons. Above all things, let him spare no labour nor expense in procuring suitable designs, but let them be of English origin, and not mere imitations of foreign patterns, and there is a chance that there may be a freshness and a novelty in the result sufficient to cheer the desponding, and even surprise the sanguine.

The most successful brocatelles are those of which the patterns are in the style of the backgrounds of old German pictures of the 15th and 16th centuries, and of these some beautiful examples have found their way to the Exhibitions of the Society of Arts during the last three years; but as in this branch also novelty is an important desideratum, we may suggest in combination with such patterns, the use of natural flowers, and that ornaments both of earlier and later date than 1500 may, we think, be resorted to with advantage. The paintings and borders of many early illuminated manuscripts, present exquisite ideas both with respect to design and colour, nor would it be unwise in some cases to apply to brocatelles the intricate strap-work which was so prevalent under Henry II. of France.

With respect to the manufacture of ribbons we hope that some information which has reached us respecting the enlarged acquirements of Coventry, may be correct; and that this city may stand proudly up by the side of the far-famed St. Etienne. This is a department in which we anticipate a warm struggle; there is scarcely any branch of manufacture in which the designs employed must necessarily be so capricious and so little tied down by the ordinary rules of composition; and it is on this account that we can venture to give no counsel in the matter.

We must urge Kidderminster and Glasgow to gird themselves for the battle. It will agreeably surprise us to find that in brilliancy of colour and delicacy of material they can rival the manufacturers of France; but they can at least strive their utmost at those particulars, and above all devote especial attention to design. We think that, in general, a mistaken notion is prevalent as to what constitutes a good carpet design, and we find those patterns too often preferred which consist only of huge masses of flowers in bright colours disposed upon dark grounds. We think that flowers are not in their proper position when they are trodden under foot upon a carpet. Let them be trailed upon our walls, suspended from our cornices, or blooming from our vases, but let the patterns of carpets be rather of a conventional character. We recommend the arrangement of colours which most Turkey carpets exhibit, accompanied by designs more consistent with architectural effect. Carpets should also be of various styles of ornament so as to harmoniously suit the rooms for which they may be destined.

With reference to floorcloths similar arguments hold good, but we may add that absurdity can scarcely go further than to manufacture floorcloths with the intent that they should be mistaken for marble or mosaic. This is perhaps more inconsistent with good taste than sprinkling them with flowers, in which case no deception can be presumed to have been attempted.

Floorcloths, like carpets, seem to us to require conventional treatment in design.

The subject of coverings for the floor leads us to the floor itself, and prompts us to congratulate ourselves at the prospect of standing almost alone in the manufacture of encaustic tiles and tessellated pavements. We believe that in modern times these arts have nowhere been carried to such perfection as in Great Britain. The principal rivalry will probably be between the vitrified tiles of Minton & Co., and the highly glazed tiles of the Worcester Royal Porcelain Works. As is usual in similar cases, each variety has its advantages. But why, we would here ask, are the patterns upon these said tiles only copied implicitly from mediæval authorities, when in the material any design can be so easily rendered, and when the Italian style offers such elegant scope for the decoration of tiles so as to render them suitable for the halls and passages of our dwelling houses?

The earthenware and porcelain of Staffordshire will, we argue, occupy no subordinate place in the Exhibition. It is obviously unfair that the latter should be required to compete with the produce of such government establishments as Sévres and Dresden, but leaving them out of question, we doubt not that Staffordshire may well challenge the world for porcelains executed by private speculation. The stannary porcelain of this country, which has now for a considerable time been adding much to a large and well deserved popularity, may, perhaps, in point of material, outvie the best *biscuit* of the Sévres manufactory; and if Messrs. Copeland and Messrs. Minton spare no pains to procure models which will bear all criticism as works of art, they will be the means of establishing at least one victory, and that of a very important and encouraging nature.

The crystal glass of this country is in all respects far superior to any other of ancient or modern manufacture, and it has recently been united, in some instances, to forms worthy of so exquisite a material. Let deeper attention be given to the study of form and some hints be derived and used from old Venice glasses, and Birmingham will, we think, without difficulty carry the palm over all foreign competitors. This should be the chief and primary object. As a second consideration must come rivalry with Bohemia in colour. And the British manufacturer being grounded in good forms will have an advantage over the Bohemians, who, even in the seventeenth century, manufactured glasses, which, in point of elegance of form, afforded but a sorry contrast to the glasses of Italy. The late Exposition in Birmingham astonished all with the beauty of its glass, and we hope to see the manufacture assume a position even more important with reference to the Exhibition of 1851.

There are two other departments in which we are inclined to believe that the British manufacturer will appear most creditably to himself and to the Nation. We refer to the art of bookbinding, (upon which we have already expressed our sentiments,* as to the grounds for our superiority over the French) and the manufacture of paper mâché. The latter, it must be acknowledged, Englishmen have carried to perfection, and added to it some valuable inventions which are unknown on the Continent. The furniture formed of this material has an effect of extreme lightness and elegance, and would indeed be comparatively perfect, were the painted ornaments upon it executed with a better feeling for Art than is generally displayed, the surface ornaments ordinarily consisting of flowers coloured with but little more pretension than the page of a lady's album. We shall rejoice if the establishments at Birmingham or Wolverhampton take our suggestion, and attempt something of a better school.

We have now enumerated some of the more prominent decorative manufactures, hastily glancing at each, and offering, on the impulse of the moment, such observations as we think may be practically useful to the competitor in preparation. We may from time to time be able to supply further information as to what the

British producer should most actively aim at, and what he should most scrupulously avoid; and in the meantime we would only again urge on him the necessity of at once making ready to join in the hot but peaceful struggle of next year; and trust that no exertions on his part will be wanting, tending as they must to establish more firmly his own moral position, and to maintain the dignity of the nation.

THE LATE KING OF HOLLAND'S COLLECTION.

IN our last number a brief allusion was made to the sale of this important collection at the Hague, commencing on the 12th of August, and continuing through the eight following days. We are now enabled to offer a correct report of the results of the sale, as we have gathered them from an authentic catalogue. A few words by way of introduction are, however, necessary.

The late King of Holland, William II., when Prince of Orange, resided in Brussels, and it was while there that he purchased very many of the pictures which formed his gallery, from the monastic and other ecclesiastical establishments of Belgium, and from private sources. When the late revolution separated the two kingdoms of Holland and Belgium, these works, being private property, were, after some delay, allowed to be transferred to the new palace at the Hague, where they were located till their recent dispersion. It is matter of notoriety that they have been sold by directions of the family to liquidate some debts which the King had left unpaid; and, however much it is to be regretted that so fine a collection of pictures should be scattered, the feeling which prompted the act is honourable to the parties from whom it emanated.*

The entire collection consisted of 358 pictures, besides drawings, busts, and statues. We shall arrange our notice according to the order in which they were sold, but specifying only those that realised something approaching to a good price, as many were disposed of at very insignificant sums; indeed, there were few that reached extraordinary prices, and we are strongly of opinion that, had the sale taken place here, more money would have been given for them. It must, however, be borne in mind, that seven and a half per cent. for the expenses of the sale must be added to the purchase money, which charge, in Holland, always falls on the buyer. The names of the purchasers are placed within parentheses.

The first day's sale consisted of forty-six pictures of the ancient Dutch, Flemish, and French schools, with one by Albert Durer. The principal of these were—A large gallery picture, 'A Family Party in a Garden,' by Van der Helst, 992. (Brunnit); 'Portrait of Van der Helst,' by the painter, 614; 'Portrait of a Rabbi in black costume holding a letter in his left hand, and dated 1631,' by Rembrandt; 283. (N. Veymar, of the Hague); 'Portrait of Rembrandt, wearing a cap of crimson velvet,' by himself, 312. (Nieuwenhuys); 'Portrait of the artist's Son,' Rembrandt, 333. (Brondgeest); 'The Owner of the Vineyard paying his Labourers,' Rembrandt, 293. (Van Cleef, of Utrecht); 'A small Portrait in Oriental Costume,' Rembrandt, 375. (Nieuwenhuys); 'St. Hubert kneeling before a Stag,' Wouvermans, 250. (Nieuwenhuys); 'A large Italian Landscape, with figures, cascades, &c., a very fine work, by J. and A. Beth, 866. (purchased for the Museum at Brussels); 'A Mountainous Landscape,' J. Ruysdael, a picture of the highest class, with figures by A. Van der Velde, 1075. (purchased for the Museum at Brussels); 'A Fleet in a Calm,' W. Van der Velde, 208. (Roos); 'A small picture of Norwegian Scenery,' J. Ruysdael, 76. (Nieuwenhuys); 'Vessels in a Storm,' L. Backhuysen, 471. (G. de

Vries); 'La Fête des Rois,' Jan Steen, 250. (Pescatory); 'Flowers,' J. Van Huysum, 250. (Nieuwenhuys); 'A Dog, with dead Gnat,' Jan Venen, 275. (J. Scheurleer); 'A View in Holland,' A. Van der Neer, 83. (Roos); 'An Allegorical Subject,' L. Lombard, 158. (Roos); 'The Passage of the Red Sea,' L. Lombard, 120. (Roos); a picture entitled 'Les Fleaux de Dieu,' divided into two parts, one of which exhibits a shipwreck, and the other a town infected with the plague, L. Lombard, 153. (Roos); 'The Death of the Virgin,' M. Schoon, 243. (Nieuwenhuys); 'St. Hubert,' a small picture by Albert Durer, 310. (Roos); 'A Seaport,' Claude, 300. (Roos); 'The Marriage of Isaac and Rebecca,' attributed to Claude, 208. (Brondgeest); 'The Departure of the Queen of Sheba,' also attributed to Claude, 208. (Brondgeest). The remaining pictures in this day's sale varied from 51. to 501. each.

The second day's sale comprised eighty pictures by modern painters, chiefly of the Dutch and French schools: it is only necessary to allude to the best of these as indicating to our own artists the value attached to the works of their Continental contemporaries, and those who have immediately preceded them. 'A Landscape with Cattle,' H. Van de Sande Backhuysen, 80. (P. Roos); a similar subject by the same, 110. (A. Lamme, of Rotterdam); 'A Meadow with Cattle,' a very fine work by Brassasat, 512. (P. Roos); 'An Interior,' C. Bria, 300. (A. Lamme); 'A View in Switzerland,' A. Calame, 110. (Laudry); 'Interior of a Court-yard,' Decamps, 95. (P. Roos); 'View in the Ierb Market of Antwerp,' Dyckmans, 267. (Nieuwenhuys); 'The Abdication of Charles V., L. Gallait, 325. (Engelberts of Amsterdam); 'A Capuchin Friar,' L. Gallait, 162. (G. de Vries); 'The Taking of Antioch,' L. Gallait, 84. (A. Lamme); 'A Marine View,' E. Gudin, 108. (L. De Vries); 'A Storm at Sea,' T. Gudin, 158. (Brondgeest); another marine view by the same artist, and sold to the same purchaser, 116. ; 'A View in Algeria,' by the same, 202. (X. Roos); 'A View on the Coast of Algeria,' T. Gudin, 144. (G. de Vries); another 'View on the Algerian Coast,' T. Gudin, 81. (G. de Vries); 'An Historical Subject,' by Hubert van Hove, 85. (Keyser); 'An Historical Subject,' C. Jaequand, 166. (Hoare); 'The Battle of Nieuwport,' N. de Keyser, 475. (Brondgeest); 'The Battle of Senef,' N. de Keyser, 623. (Brondgeest); 'Byron's Giaour,' N. de Keyser, 183. (G. de Vries); 'Albert and Isabella,' N. de Keyser, 390. (Van Twickel); 'Study of an Arab,' N. de Keyser, 134. (Brondgeest); 'Study by Syrian,' N. de Keyser, 166. (Brondgeest); 'Meadow with Cattle,' J. Kobbé, 408. (Brondgeest); 'A Landscape,' B. C. Koelckoek, 292. (A. Lamme); 'A Mountainous Scene in Luxembourg,' Koelckoek, 192. (Baranowski); a similar subject, by the same artist, 206. (Baranowski); 'A View of Heidelberg,' Koelckoek, 98. (Brondgeest); 'A Mountainous Scene in Luxembourg,' Koelckoek, 190. (P. Roos); a similar subject by the same, 112. (Veymar); another by the same, 107. (L. de Vries); and another bought by M. Nieuwenhuys, 83. ; 'St. John Baptist preaching in the Wilderness,' C. Kruseman, 416. (De Vries); 'The Four Reformers,' by Labouehere, an amateur artist, 254. (Gambart); 'Interior of a City,' H. Leys, 204. (Roos); 'An Interior,' H. Leys, 211. (P. Engelberts).

The third day's sale included seventy-two pictures of the ancient Flemish and Spanish schools. Of these the most important were—'The Annunciation of the Virgin,' Van Eyck, 448. (Brunnit, the agent, it was understood, of the Emperor of Russia); 'La Vierge de Luques,' Van Eyck, 250. (P. Engelberts); 'The Emperor Otho and the Empress Maria,' by Dirk Van Haerlem, a painter of the early Flemish school, but little known, 750. (Brondgeest); 'Two subjects from the Life of St. Bertin,' Hemling, 1916. (Roos); 'St. John the Baptist,' and 'Mary Magdalen,' a pair, Hemling, 408. (Brondgeest); 'St. Etienne, and St. Christopher,' a pair, Hemling, 396. (Roos); 'The Répose in Egypt,' Hemling, 216. (Hering); 'The Adoration of the Magi,' Hemling, 535. (Roos); a picture attributed to Hemling, and entitled 'L. Autel portatif de Charles Quint,' 500. (Weber, of Bonn, for the Museum of Berlin); two pictures also attributed to Hemling, 'The Birth of St. John,' and 'The Baptism of Christ,' 334. (Weber); 'The Crowning of the Virgin,' Quintin Matsys, 166. (Brunnit); two subjects, the 'Bust of Christ' and the 'Bust of the Virgin,' Q. Matsys, 196. (De Vries); four subjects from the 'Life of Job' and 'Le Moine Juste,' by B. Van Orley, 534. (Roos); 'The Virgin and Infant Jesus,' Van Orley, 166. (Roos); 'The Descent from the Cross,' J. de Mabuse, 190. (De Vries); 'John the Baptist,' and 'St. Peter,' two pictures, Mabuse,

* Vide Art-Journal, Vol. XI., p. 235.

362L (Roos); 'St. Augustin,' painter unknown, but of the period of Mabuse, 158L (Brougdeest); 'The Falconer,' J. Matsys, 83L (A. Brougdeest); 'Christ bearing his Cross,' J. Matsys, 120L (Brougdeest); 'An Allegorical Subject,' P. Porbus, 88L (Nieuwenhuys); 'The Adoration of the Magi,' L. de Leyden, 370L (Roos); 'The Descent from the Cross,' L. de Leyden, 583L (Brunitt); 'Portrait of a Lady of Quality,' Holbein, 416L (Heris); 'Portrait of Sir Thomas More,' Holbein, 154L (Roos). Of the Spanish school, a noble picture by Murillo, 'The Assumption of the Virgin,' was bought by M. Roos for the large sum of 3000L; 'St. John of the Cross,' Murillo, 208L (Von Sonebeck); 'A Holy Family,' Murillo, 371L (Roos); a similar subject attributed to the same painter, 100L (Brougdeest); two exceedingly fine portraits by Velasquez, 'Philip IV. of Spain,' and 'The Duke d'Alvarez,' were knocked down to M. Brunitt for the Emperor of Russia, for 3240L; and 'The Holy Family,' by Spagnoletto, was bought by M. Roos at the price of 708L.

The sale, on the fourth day, consisted of eighty-four modern pictures; among these were, 'A Stag-hunt,' by Morenhout, 107L (A. Lamme); 'The Cannon-Shot,' by W. J. J. Nuyven, a clever young painter of the Hague, who died in 1839, 375L (the Baron Van Brienen); 'The Fish Market at Antwerp,' by the same, 298L (P. J. Landry); 'A Removal in Winter,' by the same, 170L (D. Van de Vyperse); 'Landscape with Cattle,' Omme-ganck, 212L (Couteau); 'Fruit,' Van Os, 87L (Landry); 'Still Life,' Van Os, 85L (G. de Vries); 'A Naval Engagement between the Dutch and English in 1666,' E. la Pottewin, 100L (De Vries); 'Maternal Love,' Paul de la Roche, 608L (Roos); 'The Three Magicians,' Ary Scheffer, 498L (Brougdeest); 'A View in Holland,' A. Schelfhout, 127L (P. Roos); 'View of Haerlem,' by the same, 106L (Van de Vyperse); 'A Fish Market,' P. Van Schendel, 110L (Dingwall); 'Interior of St. George's Chapel, Windsor,' H. Sehorn, 102L (Roos); 'A Marine View,' J. C. Schotel, 271L (P. de Vries); 'A Calm,' by the same, 290L (Brougdeest); 'A Marine View,' by the same, 271L (Landry); a similar subject, also by Schotel, 180L (purchased for the Museum at Brussels); another of the same description, 208L (Chaplin); 'A Storm,' by the same, 182L (A. Lamme); 'After the Wreck,' by the same, 183L (Chaplin); 'A Landscape,' Tschaghyer, 84L (Baron Van Brienen); 'A Flock of Sheep overtaken by a Storm,' Verhoeckhoven, 258L (Schletter of Leipsic); 'A Landscape,' by the same, 108L (P. Roos); 'A View of Italy,' the same, 130L (Dingwall); 'An Interior with Sheep and Lambs,' the same, 134L (P. Engleberts); 'A Calm,' A. Waldorp, 109L (P. Roos); 'A Marine View,' by the same, 87L (G. de Vries); 'Van der Werf at the Siege of Leyden,' the Baron Wappers, 260L (S. Roos); 'A Scene in the Life of Louis XI.,' by the same, 176L (Van Heeckeren); 'The Family of the Distiller,' Sir D. Wilkie, 811L (Grundy of Liverpool).

On the fifth day were sold fifty-four pictures by the old Italian masters, nineteen of the old Flemish school, and three of the Dutch; many of these realised large sums. 'The Triumph of Venus on the Sea,' F. Albano, 83L (Nieuwenhuys); 'The Virgin under a Palm Tree,' Frá Bartolomeo, 1166L (F. Roos); 'A Son of Gossio de Medicis,' A. Bronzino, 416L (Pleschanoff of St. Petersburg); 'A Dead Christ on the Knees of the Virgin,' Ann Carracci, 192L (F. Roos); 'The Madonna and Infant,' by the same, 125L (P. Veymar); 'Venice,' Canaletti, 162L (O. de Vries); the companion, 160L (O. de Vries); 'St. Luke,' Dominichio, 492L (Dingwall); 'St. Joseph,' Guido, 558L (N. Brougdeest); 'The Magdalen,' attributed to the same, 200L (N. Brougdeest); 'The Martyrdom of St. Catherine,' Guercino, a work of very high quality, 811L (Brunitt); 'Tarquin and Lucretia,' Giordano, 96L (F. Roos); 'Sisera and Jabel,' Giordano, 120L (F. Roos); 'Three Portraits,' two male and one female, attributed to Giorgione, 188L (A. Roos); 'The Holy Family,' Imola, 163L (O. de Vries); 'St. Sebastian,' B. Luini, 617L (F. Roos); 'The Holy Family,' B. Luini, a very fine specimen of the master, 1292L (N. Brougdeest); 'St. Catherine with two Angels,' half-lengths, B. Luini, 583L (O. de Vries); 'Portrait of a Portuguese Officer,' G. B. Moroni, 200L (Nieuwenhuys); 'St. Augustin,' P. Perugini, 617L (F. Roos); 'The Holy Family,' P. Perugini, 1938L, the large sum which this picture reached was fully justified by the beauty of the work; it is unquestionably one of the finest pictures of this early master; it was bought by M. Van Cuyk for the gallery of the Louvre, in Paris; 'The Holy Family,' Jacopo Palma, called *Il Vecchio*, 918L (O. de Vries); 'Portrait of a Lady of the Family of the Medicis,' Seb. del Piombo, 292L (P. Engleberts); 'Christ at the Tomb,' a noble work by the same painter, 2466L

(N. Brougdeest); 'Portrait of J. F. Penni,' ascribed to Raffaele, 250L (K. Veymar); 'The Holy Family,' Raffaele, 1375L (F. Roos, for one of the Royal Family of Holland, it was presumed); 'Portrait of Salésar,' Raffaele, 1333L (Brunitt); 'The Holy Family,' Andrew del Sarto, 708L (N. Brougdeest); 'La Vierge de Paque,' Andrew del Sarto, the competition for this exceedingly fine work was very great, the agents for the various European courts who were present bidding eagerly for it; after the contest had continued for upwards of half an hour, it was finally knocked down to Mr. Mawson, for the Marquis of Hertford, at 2521L; 'The Virgin and Infant,' Sasso Ferrato, 250L (Nieuwenhuys); 'The Magdalen,' Schidone, 225L (F. Roos); 'Philip II. and his Mistress,' Titian, 833L (N. Brougdeest); a pair of pictures, 'The Triumph of Religion,' and 'The Triumph of Science,' Titian, 1042L (O. de Vries); 'Portrait of Clement Marat,' Titian, 204L (O. de Vries); 'The Disciples at Emmaus,' ascribed to Titian, 120L (F. Roos); 'La Colombine,' Leonardo da Vinci, the competition for this picture, like that we have alluded to, was very keen; it was at length knocked down to M. Brunitt, the agent of the Emperor of Russia, at the enormous sum of 40,000 florins, about 3333L sterling, the largest price given for any single picture at this sale. 'Leda,' this is also a grand work by Leonardo da Vinci, it was disposed of to M. F. Roos for 2041L. This concluded the Italian pictures. Of the Flemish works the principal were the following by Rubens:—'Christ giving the Keys to St. Peter,' 1500L (Mawson, for the Marquis of Hertford); 'The Holy Trinity,' 658L (F. Roos); 'The Tribute Money,' 350L (N. Brougdeest); 'The Wild Boar Hunt,' 1666L (F. Roos); 'Portrait of Baron Henry de Vico,' 585L (Van Cuyk, for the Louvre); 'Portrait of Marie de Medicis,' 330L (O. de Vries); Portraits of 'The Archduke Albert,' and of 'The Queen Isabella of Spain,' a pair, 433L (F. Roos); portraits of 'Philippe le Roy' and of 'Madame le Roy,' a pair by Van Dyck; these pictures excited great interest and were eagerly sought after; after a long and spirited bidding Mr. Mawson succeeded in securing them for the Marquis of Hertford, at a cost of 5300L; 'Portrait of Martin Pepin,' Van Dyck, 358L (hought for the Museum of Brussels); 'The Magdalen,' Van Dyck, 208L (J. A. Hoare); 'The Virgin, Infant, an Angel, and St. Jerome,' attributed to Van Dyck, 116L (N. Brougdeest); 'Nuptial and Amphitrite,' Jordans, 158L (F. Roos); 'A Flemish Horse,' D. Teniers, 1023L (H. Brougdeest); 'Le Repos Champêtre,' O. Coceques, 600L (purchased for the Museum at Brussels). The three Dutch pictures sold on this day were 'Portrait of John Pellicorne and his Son,' and its companion, 'Portrait of Madame Pellicorne and her Daughter,' by Rembrandt. This pair of portraits elicited great competition, but they were finally disposed of to Mr. Mawson, for the Marquis of Hertford, for 2516L. The third of the Dutch pictures was a charming picture by Hobbema, 'The Water-Mill,' well known to the amateur and collector, by whom it has generally been considered as the *chef-d'œuvre* of the artist; it was bought by Mr. Mawson for the Marquis of Hertford, for 2250L.

The last three days of the sale were devoted to the marbles and drawings; of the former there is nothing worthy of record. The drawings were comprised in 370 lots, and among the names appended to them were those of almost all the old masters of high repute, especially Raffaele. A large number of these drawings were formerly in the possession of Sir Thomas Lawrence, and the whole collection cost the late King of Holland about 20,000L; they were sold on the present occasion for little more than 7500L, the largest huyer by far being Mr. Woodburn, but we also find the names of Colnaghi, Roos, Engelberts, Van Cuyk, Veymar, Brougdeest, &c., included in the list. It is only necessary to allude to a few of the highest priced. Eight drawings of Saints, by Leonardo da Vinci, were bought by M. Veymar for 666L; a study of the 'Head of the Madonna,' Raffaele, 142L (Woodburn); 'Christ at the Tomb,' Raffaele, considered the finest in the collection, 676L (purchased by Van Cuyk for the Louvre); 'A Study of several Figures,' Raffaele, 126L (P. Engleberts); 'The Annunciation,' Raffaele, 90L (purchased for the Museum at Paris); 'A Drawing,' apparently a design for a ceiling, Raffaele, 87L (Woodburn); 'The Dream of Michel Angelo,' by the artist, 100L (Woodburn); 'Study of St. John,' Correggio, 92L (Woodburn); 'Madonna, Infant Jesus, and St. John,' Michel Angelo, 150L (Woodburn); 'The Holy Family,' Michel Angelo, 108L (Woodburn); 'Christ at the Tomb,' Raffaele, 166L (Hall); another, of the same subject, 80L (Enthoven). The other engravings were sold at prices varying from 30s. to 70L, a considerable number selling at 30L, 40L, and 50L each.

In concluding our notice of this important sale, we would remark that the entire sum for which the pictures were knocked down was about 96,000L, exclusive of the sculptures and drawings; but our correspondent, who is likely to be well informed in the matter, assures us that ninety-five pictures were not disposed of at all, by which we presume that he means they were bought in. So far as this country is concerned, the whole affair is of little moment; the only pictures which we believe are likely to find their way hither, are those that will enrich the already magnificent collection of the Marquis of Hertford, and we heartily congratulate that nobleman upon the accessions to his gallery, acquired by his munificence on the present occasion. At the same time we feel deep regret, and we may add, shame, that a few hundreds could not be spared from the national treasury to make some additions to our National Gallery. A vote for this purpose might have well stood in the place of some lately given in the House of Commons, and this is not the first opportunity our rulers have passed by, during the present season, of adding to the intellectual wealth of the country; the economy thus practised is assuredly not the economy which wisdom teaches.

FOREIGN PREPARATIONS FOR THE EXHIBITION OF 1851.

If the Royal Commission have as yet taken no steps to communicate with the manufacturers of Germany, we presume to advise their doing so forthwith. We have found during our visits to the cities and towns of the Rhine, in Frankfurt, and in the cities of Bavaria, a somewhat widely extended suspicion that our invitation to the nations of the world to contribute to our Exhibition, instead of being generous and self-sacrificing, has been dictated by selfish policy, and that foreign competitors are to be, in reality, victims. We are given to understand that we shall find the same feeling prevailing in Vienna, Dresden, Berlin, and other cities and manufacturing towns of northern Germany. We have obtained unequivocal proofs that such suspicions have been carefully fostered. Some of the leading public journals and several men in high offices have been counselling manufacturers to have "nothing to do with the Exhibition;" and a rumour has been circulated, with no inconsiderable effect, that it is the intention of the Commissioners in London not to give the names and addresses of manufacturers who exhibit, but merely to state that such and such articles are "made in Germany." This absurd idea is by no means limited to a few; it is widely spread, and means should be at once taken to dissipate it.

Causes of a more general and less personal nature are also in operation to keep back contributions. England is just now politically unpopular in Germany. Events, to which it is not our business to refer, have produced feelings anything but friendly in nearly all the German States. Moreover, comparative tranquillity throughout these States has in a degree restored confidence and augmented trade; and many of the principal manufacturers are too busy completing actual orders to desire speculation for a chance of emmerce.

It has been our duty, throughout our Tour, to endeavour to remove such suspicions and allay such prejudices; but to do so effectually must be the business of an agent properly authorised; and again we respectfully urge upon the Royal Commission the necessity of clearly and distinctly explaining to the manufacturing interests of the Continent the precise terms upon which these contributions are asked for, and the probable advantages that will accrue to them; above all, it is important to satisfy them that entire dependence may be placed upon British honour, and that they will be guaranteed "fair play" in the competition, by the Prince Consort and many of the most eminent gentlemen of England; acting in combination with the authorities of the several European nations.

Some months ago we advocated the placing the principal ambassadors upon the list of the Commission: it will be regretted that this has not been done.

At all events, there is plenty of time to do

away with the impression that justice will not be administered impartially. If the Commission let matters take their course, England will see but little of the manufactures of Germany. If, on the contrary, confidence be restored and established, we shall see much that will interest, and something that will teach, from the several countries of central Europe.

Another difficulty in the way is that which arises from the resolution of the Commissioners not to affix prices to the articles sent; the Germans imagine this to be a boon to England and a great disadvantage to them; they seem to admit our superiority in manufacture, but contend that they can produce a variety of articles cheaper—and that in this cheapness consists their power; we believe them to be mistaken; certainly, in many instances where we have been enabled to compare prices, the Germans have no reason to boast. They are, however, possessed with the notion that to withhold prices at the Exhibition would be to sacrifice them, and in many cases, on this ground, decline to contribute. For instance, the pianoforte-makers of Stuttgart (where there are very many) fancy they produce their works at half the cost of the English; but they are not aware that D'Almaine and Collard are manufacturing pianos "for the people" at a charge so low as we think must defy competition—when the charge for transfer to England is taken into account.

We write, at present, from experience comparatively limited: we should, however, express ourselves more guardedly, but that from all quarters our information confirms our own impressions; these impressions being derived from conversations with many experienced and liberal men, and with several heads of local commissions, in the various cities and towns of southern Germany.

There is another point upon which the Commissioners should be informed: the manufacturers of Germany do not appear to be at all aware of the time at which their contributions must be sent in to London, or as to what steps they are to take previously, in reference to the space they require; these matters should be fully explained to them. In short, an emissary duly qualified, and dignified by special appointment, should be at once sent throughout Europe on a mission of explanation, so to speak; he will find no difficulty whatever in ascertaining in every city and town who are the parties intending to contribute, or considering the expediency of contributing; and much service may be rendered by his personally communicating with each and all, which he may easily do.

It is, however, already clear to us that in Germany there has been very little advance—at least in the arts as applied to productions of industry. The German character is proverbially slow; in all things the people seem content to work as their fathers and grandfathers worked before them; and the shops generally exhibit little that is novel or striking to interest those who have formed estimates of what may be, from the energy and activity of England. Moreover, the ancient law which prevents more than a given number of persons of any trade from practising their callings in any city or town—insomuch that an artisan cannot become a master until some master following the same occupation has died or relinquished business—effectually precludes competition, and consequently improvement. New experiments are certainly troublesome, and may be hazardous; and the time is, we think, far distant when the manufacturers and artisans of Germany will effectually compete with those of our own country, either in design or in execution.

For example, in Nuremberg, the birth-place and "workshop" of Albert Durer, Peter Vischer, and Adam Kraft, whose immortal productions on wood, ivory, and iron, surround the people on all sides, these lessons seem to have been lost upon their descendants; and, with the exception of one who is worthy to be their successor, Carl Heideloff, no master-mind has been active in this city of old memories, for at least half a century.

Another point for comment, as operating greatly to the prejudice of manufactures in Germany, is the government monopoly, for so

it must be considered, of certain important branches; the porcelain of Munich, whenever of good order, is excessively dear, yet competition is out of the question; the best artists are engaged, but the cost of all fine objects effectually removes them out of the reach of ordinary purchasers, and the whole of the porcelain in use throughout Bavaria is of the coarsest character and of the worst possible taste.

In our next, we shall, no doubt, be in a condition to report fully the results of our Tour; and probably to state, with something like precision, the nature and extent of the contributions that may be expected from Germany.

As we have intimated in the course of the year, we shall prosecute similar inquiries in Belgium; and before the commencement of Spring, in France. It is likely that evil influences are here also at work; and it would be undoubtedly wise to ascertain how they may be rendered innocuous.

NUREMBERG, Sept. 10.

THE

NEW SCOTTISH NATIONAL GALLERY.

THE disputes which have for so long time past existed with reference to the erection of this structure are now virtually at an end, the ceremony of laying the foundation-stone having been performed by His Royal Highness Prince Albert, on Aug. 30, in the presence of an immense multitude of spectators. Previously to the ceremony taking place, the Prince visited the Royal Institution to inspect the national pictures deposited there till the new building is ready for their reception. Here he was met by the officiating commissioners, the Lord Justice General, Alexander Macdonochie, Esq., the Duke of Buccleuch, Sir George Clerk, M.P., Sir J. W. Gordon, President of the Scottish Academy, and Sir W. G. Craig, M.P. After passing some time in examining the pictures, his Royal Highness, accompanied by the aforesaid commissioners, proceeded to perform the more immediate object of his visit, the details of which it is not necessary we should enter upon. The ceremony passed off in a highly satisfactory manner.

The site selected for the edifice is most striking, and admirably adapted in all respects for a national building. We have before us at the present time an excellent lithographic print by Messrs. Johnston, of Edinburgh, from the design of Mr. Playfair, the architect of the New Gallery, which gives a very accurate and picturesque idea of the whole locality. The Gallery stands on what is called "The Mound," behind it, though at some distance, is the Castle; to its left, as the spectator fronts it, is the Free Church College, with its towers and pinnacles; and to the right, in a direct line, is the Royal Institution, the whole forming a group of a most interesting character. The design of Mr. Playfair is exceedingly simple as regards the exterior; it is a ground-floor building without any windows, receiving, it is presumed, the light from above, and it has a flight of steps surrounding the base. The centre part is elevated above the wings, and projects a little with a portico, supported by six columns of the Ionic order; the extremities of the wings, at right angles with the front, have also two porticoes; the flatness of the walls which form the wings is broken by pilasters harmonising with the columns of the porticoes, and their tops are surmounted by an open balustrade of stonework, which seems to be repeated along the sides of the elevated centre. Such appears to be as accurate a description of the exterior as we can ascertain from the reduced scale on which the edifice is drawn in Messrs. Johnston's print. It is evident the architect was desirous of keeping his work as much as possible in harmony with the Royal Institution, without copying any portion of the latter; and it seems equally evident to us that he has considered a picture gallery ought to be constructed, so that the pictures may be seen to the best advantage, instead of having it stand as a monument of architectural display. This is as it should be; we can only trust that when we are fortunate enough to possess a new National Gallery in London, we shall see it erected on principles as modest and judicious. The whole matter is one on which the friends of Art in the Scottish metropolis have reason to congratulate themselves; and we have no doubt that a new and vigorous impulse will be felt, in connection with the arts, by the move which has now been made to encourage and place them on a sure footing.

THE VERNON GALLERY.

THE BATTLE OF BORODINO.

G. Jones, R.A., Painter. J. B. Allen, Engraver.

Size of the Picture. 7 ft. by 4 ft.

ONE of the most sanguinary engagements that occurred during the invasion of Russia by Napoleon, is represented in this large picture by Mr. Jones, which was exhibited at the Royal Academy in 1829.

The French army, about 120,000 men, advancing upon Moscow from Smolensk was met, on the 26th of September, 1812, by the Russian forces, of nearly equal numerical strength, under Koutousoff. Upon a position naturally strong, the latter had raised very formidable field-works: their right rested on a wood, which was covered by some detached entrenchments; a brook, occupying in its course a deep ravine, covered the front of the right wing and the centre of the position as far as the river of Borodino. From the village of this name the left extended down to another village protected by ravines and thickets in front. It is quite unnecessary for us to enter upon a detailed account of the battle, which appears to have terminated without any great advantage to either side. Upwards of 25,000 men of both armies were left dead on the field, and double this number were wounded. Eight French generals were slain, of whom Monbrun and Caulaincourt were men of distinguished reputation, while the Russians had to lament the death of the gallant Prince Baglioni and of General Truczoff.

There were few prisoners taken on either side, and some ten or twelve pieces of cannon exchanged owners. But though the victory, if such it could be called, was on the side of the French, who remained masters of the field, Napoleon's army had been so reduced in numbers, and there seemed so little prospect of his obtaining early reinforcements, that, like his great prototype, Hannibal, after the battle of Cannæ, he might well exclaim, "Another such victory and I am undone." The French leader evidently felt this when urged by his generals to bring forward, as the contest seemed for a long time doubtful, his reserve, composed of the regiments of the Young Guard. "And what becomes of my army," he exclaimed, "if these are beaten?" The fact was, Koutousoff had withdrawn his troops in such order, notwithstanding they were raw levies, of whom the majority had never been under fire before, and had conducted his retreat in such masterly order, that not a man remained behind, nor could a straggler be fetched in to give intelligence of the route he had taken. Hence Napoleon considered that a fresh attack might probably be made upon him in a day or two by the Russians with an accession of strength, against which it would be utterly impossible for him to cope with the whole of his army dispirited by ill success. Under these circumstances, he hastened on the day following the Battle of Borodino to put his troops in motion, and continue his advance upon Moscow, the "holy city" of the Muscovite, from the palace of which he hoped to dictate such terms to Alexander, as the Russian monarch must submit to. To what extent this object was effected is a matter of history with which few are unacquainted.

The particular part of the engagement shown in the picture is described in Count Segur's narrative, from which the painter has composed his sketch:—"Napoleon is watching the result of an attack made on the great redoubt of the Russians. A column of French infantry is ascending the eminence, supported by light cavalry on its left; and, on its right, cuirassiers are led by Caulaincourt, who forced the redoubt, but was slain in the struggle against the persevering courage of the Russians. Buonaparte was on foot, though indisposition; but this attack proving successful, he mounted and rode over the field of battle. On the left, Murat is advancing and encouraging the troops."

Mr. Jones has successfully grappled with a subject presenting many difficulties, the chief of which, perhaps, is the grouping together large masses of men over widely extended space, without any object or series of objects to form points of attraction to the spectator. In this picture even the principal figures in the foreground are comparatively small, so that the interest of the work depends upon the treatment of the whole, instead of being fixed to one especial passage. The painter has cleverly brought the fire and smoke of the Russian artillery to aid him in producing distance and pictorial effect, while Napoleon and his staff are brought forward in relief against the dark columns of the French troops. We do not think subjects such as these the best suited for the painter, but Mr. Jones has given much graphic character to that he has chosen.

THE MOUNTAIN TRAIL
BY J. H. COLEMAN

1854

D O Hill

THE artist whose portrait occupies our present page* has achieved a reputation in Scotland, the most flattering to a native of the soil, inasmuch as it is based upon the delineation of Scottish scenes. The landscapes of this painter are remarkable for their truthfulness of character—

"Scotia's hills and waterfalls,"

her rugged mountains, romantic glens, and spots hallowed by great names, have been transferred to his canvas with true poetic feeling; and, multiplied by the art of the engraver, have spread a knowledge of the beauties of his native land, giving a world-wide reputation to their attractions. His great work is "The Land of Burns," one of the most beautiful volumes which have emanated from the Scottish press; it is devoted to the delineation and description of every place rendered interesting by the dwelling of the poet or the allusions of his pen. It was the most extensive work of the kind ever entrusted to one native artist, and most worthily has Mr. Hill done his part, completing what was to him a labour of love, in a manner which does him much honour. This beautiful book originated entirely with himself, and was one of the most spirited and expensive speculations in Art-Literature which had been attempted by a Scottish publisher previously to that time. It gave, however, much celebrity to the house of Blackie who had so spiritedly undertaken it, and contributed not a little to the renown of both artist and publisher.

Mr. Hill's love for the scenes hallowed by the Poet continues unabated; and the Exhibition of the Scottish Academy last spring contained a large and noble Landscape of the "Valley of the Nith," with the poet's farm at Ellisland, which is consecrated as the scene of his labours as poet and farmer, in the midst of romantic scenery—scenery certainly not surpassed in pastoral beauty by the Valley of the South, and forming a fitting home for the fostering of the poetic genius of Scotia's greatest bard.

Mr. Hill's productions have been very varied, and evince the industry of many years. They have spread his name widely, and have been much sought after by collectors. His style is characterised by great breadth and purity; his colouring is sober and harmonious, never

"O'erstepping the modesty of nature,"

but always making the most of her grandeur or her

* The portrait is engraved from a drawing by J. Noel Paton, R.S.A., from a medallion executed by his sister.

simplicity, whether exhibited in the solitary mountain pass, or the quiet luxuriant valley. His works are his biography, as is the case with many other men of genius, self-consecrated to its development. He holds the official situation of Secretary to the Royal Scottish Academy, a situation which he has filled with much honour; and it is not too much to say that suavity of manner and absence of all affectation have made him as popular as a man, as his paintings have contributed to his fame as an artist. His quiet and unassuming residence on the Calton Hill is visited by the best men of the day with pleasure, and left by them with regret. As Mr. Hill has "but arrived at middle age," we may hope to see much more of his work; and that he may long live to enjoy the character he has so ably sustained hitherto.

In compiling our necessarily brief notes of living artists we are sometimes unable to avoid a paucity of incident in our remarks on their career. It is not every artist who has the varied adventure and romantic incident of travel which fell to the share of another Scottish artist, the venerable president of the Academy, the late Sir William Allan. Sketching abroad home-scenery, and painting it at home, do not give much of incident to the life of an artist; hence such biographies as those of Constable find few readers except among persons of a contemplative turn of mind, similar to the painter who

— "Holds a living power o'er that fine art,
That fixes thought in forms and hues, to lead
Minds less endowed to recognise the truth
Of beauty, mixed and lost in passing things."

The mere man of business may condemn the poetic fervour and quiet abstraction of the artist's life, but he enjoys a world the richer for being the more ethereal; his convictions run in the same train of thought which distinguished the lines of the old poet Quarles—

"When the spirits spend too fast,
They will shrink at every blast:
You that always are bestowing
Costly pains in life preparing,
Are but always over-tiring,
Nature's work by over-caring."

It is in his studio that the artist lives in the fullest sense of the word; there he must be sought. From his emanations theuco must be judged; and taken by that standard, the estimable and the great that is within him must achieve his enduring reputation.

OBITUARY.

SIR MARTIN ARCHER SHEE, P.R.A.

We briefly alluded in our last number to the death of the venerable President of the Royal Academy, and in the number for January, 1849, we commenced our present series of Portraits of British Artists with that of Sir Martin, accompanying it with a biographical sketch of his professional life. Referring our readers to the notice then given, there remains little to add thereto beyond a few remarks which may with greater propriety be made now than while their subject was living.

It is a rare circumstance for an artist to occupy for upwards of half a century so large a share of public patronage as did the late President. By his death the Academy has not only lost its head, but its oldest member. His first picture was exhibited in 1789, his last in 1845, when he was in his seventy-fifth year; and he was a Royal Academician exactly fifty years. Devoting his energies from the first to the practice of portrait-painting, under the auspices of Reynolds, he never during the long period of his career deviated from the path which he had marked out for himself; hence he acquired a position beyond that of any of his contemporaries, except Lawrence; nor was he far behind his predecessor in the Presidential chair in attracting the nobility and other distinguished characters to his studio; the ladies only excepted, for whom Lawrence's graceful pencil possessed a charm with which no other painter could vie with the least chance of success. A list of the great names who sat to Sir Martin would fill some columns of our pages. He never attempted any works of an ideal or fanciful nature, unless a few portraits of celebrated actors and actresses, in their favourite characters, may come under this denomination; these were chiefly executed during the earlier years of his practice.

We can scarcely attribute Sir Martin's success to his superior attainments as an artist, though he unquestionably possessed very considerable talent. His colouring is good, and there is a *style* in his pictures which bespeaks an accomplished and educated mind on the part of the painter; neither were they deficient in power and truth, as his portraits of the late Marquis Wellesley and of the Right Hon. Charles Wynn especially evince. We remember, too, a portrait of a Jewish Rabbi, exhibited in 1837, as a work which would have done honour to any artist of any period,—bold, vigorous, yet delicately handled. There is great truth in the remarks of a writer who, some years since, said, when referring to the late President:—"The peculiar characteristic of his works is that they all exhibit the gentleman; there is none of the conceit of the mere mechanic conspicuous in them; the mysteries of the palette are not obtruded, although they reach not that intense truth which is to be discovered in the ancient masters; they are fitting ornaments for the proudest palace or the most smiling boudoir."

Undoubtedly Sir Martin Shee owed his eminent position among his brother artists to his literary attainments and his courteous manners. With the exception of West, the President of the Royal Academy, since its institution, has always been a portrait-painter, for Reynolds must be regarded as such notwithstanding his productions in ideal Art; and although it cannot be admitted that the portrait-painter is necessarily a better informed and a more generally accomplished man than he who follows any other branch of Art, his more close and frequent intercourse with the world at large, perhaps qualifies him better for the duties he is called upon to fill, as the representative of his professional brethren, in the chief seat of honour. The President is *ex-officio* the medium of communication between the monarch, the court, and his brother artists; it is therefore essential he should be not only an eminent artist, but a person of erudition, able to advocate the cause of Art, either with his pen, or by word of mouth, with credit to himself and with advantage to the profession. Sir Martin was well qualified for either task; he was an eloquent speaker both at the annual dinners of the Academy and in the lecture-room of the students, while his published writings on subjects connected with, or foreign to, his profession, entitled him to no mean place among the poetical writers of his day. Thus he might fairly lay claim to the triple honours of the painter, the scholar, and the gentleman.

The loss of Sir Martin Shee will not be felt so severely now as it would have been a few years since. As we have previously remarked, he had discontinued painting for a considerable period, and he had also retired from the active duties of the President's office, though he continued his advice and occasional assistance on Academical matters till within a very short period of his death.

PASSAGES FROM THE POETS.

LAVINIA'S COTTAGE.

She, with her widowed mother, feeble, old,
And poor, lived in a cottage, far retired,
Among the windings of a woody vale."

THOMSON.

THE ILLUSTRATED ENGLISH DICTIONARY.*

This is, as we have frequently before had cause to remark, the age of illustrated literature. The artist and draughtsman are invoked to assist the child in comprehending its horn-book, the traveller in representing the scenery he visits and describes, and the man of science to a thorough understanding of the anatomy and construction of the world and all things that are therein. With such aids as are thus supplied, added to the comparative cheapness at which a large class of valuable publications is produced, there is little excuse left to the ignorant who neglect the means of instruction so abundantly and effectually offered. If the increase of knowledge kept pace with the making of books whereby that knowledge is to be acquired, and with the various methods which are constantly brought to bear on the mind of the whole community, without exception, to draw forth its powers and resources, we should be the best-informed, if not the wisest, people that ever tenanted this earth.

Two years ago, when the first volume of Dr.

Scotch Tumbsecer.

Ogilvie's dictionary was published, we noticed it at some length, giving at the same time some specimens of the illustrations which accompanied it. The second volume, which completes the work,

Nilometer.

has recently been issued, and inasmuch as, from the great increase in the number of our subscribers during this intervening period, there are many who have not seen the previous notice, and are conse-

Pericarp.

quently unacquainted with this well-arranged and comprehensive dictionary, the appearance of the second portion may not be thought an unsuitable opportunity for introducing the publication to them,

* The Imperial Dictionary. Edited by John Ogilvie, LL.D. Published by Blackie & Son, London and Glasgow.

even at the risk of repeating what we have before said with reference to it. The entire work consists of two large octavo volumes, each containing upwards of twelve hun-

Sibyl of Delphi.

dred pages, and of one thousand engravings on wood, whereof those here introduced are specimens. These will serve to convey an idea of the manner in which the artistic portion of the Dictionary is

Patena.

executed, and the means thus adopted to convey to the understanding, through the medium of the eye, what scarcely any written description would accomplish. The text embodies many thousand words which the progress of science and other cir-

Proa of Satawal.

cumstances have of late years brought into use, and which do not appear in any other lexicographical publication. These words are defined at considerable length in all their various significations, and the derivation of each is also given. Webster's well-known dictionary has formed the basis on which the present work has been compiled, but it is far more comprehensive than his, inasmuch as it con-

Oriel Window.

tains more than fifteen thousand words and terms than are to be found in the book of the American writer. Dr. Ogilvie, in his introduction, says that "Webster spent thirty years of labour upon his dictionary; of these no fewer than ten were devoted to the etymological department alone, which for

accuracy and completeness is unequalled. In tracing the origin of English words, he cites from more than twenty different languages which he studied attentively. Indeed, he is the only lexicographer

Pressirostres.

who has adduced the Eastern as well as the European languages in the illustration of the English, and by this means he has thrown much light on

Fig.

the origin and primary signification of many words, and on the affinities between the English and many other languages."

Now, when it is remembered that Webster added at least twelve thousand words to Todd's edition of Johnson, and that Dr. Ogilvie has added,

Stays and Staysails.

in his work, upwards of fifteen thousand to those of Webster, the value of the Imperial Dictionary will be sufficiently obvious. Yet, after all, it is the quality, as much as the quantity, by which it must be judged; and this, we have no hesitation in saying, is perfectly satisfactory. It is a book

Lich-gate.

which should have a place in every school-room, reading-room, and library wherever the English language is used. Among the numerous useful and instructive works which have issued from the publishing house of Messrs Blackie and Son, we recollect none of greater intrinsic worth than this.

ON THE APPLICATIONS OF SCIENCE
TO THE FINE AND USEFUL ARTS.

CHEMISTRY OF POTTERY.—EARTHENWARE.

THE pottery of different ages and countries presents many striking individual peculiarities, all of them depending principally upon the chemical and physical variations in the clays and earths, of which the earthenware, stoneware, and porcelain, has been composed. The precise nature, as far as chemical character is concerned, of several of the clays, and some information respecting their physical condition, was given in the former article. (*Art Journal*, No. 146, page 237.) We have now to examine the chemical constitution of each variety of pottery. Previously, however, to this it appears important that some classification should be attempted.

The earliest specimens of futile manufacture, are simply the kneaded clay, moulded by the hand into the required form, perhaps roughly ornamented in the process, and dried by exposure to the sun. Man, probably, by employing these sun-baked utensils for culinary purposes, soon became acquainted with the changes which were produced upon clays, by the action of fire, and hence we have, from a very early period in the history of humanity, examples of earthenware of baked clay. The most interesting illustrations of this, are given to us by the researches of Mr. Layard at Nimrod, and of Mr. Loftus on the Persian frontier; (See *Art Journal*, No. 146.) To China belongs the origin of porcelain—the earliest European imitation being made in France, as late as 1695—the manufacture of real porcelain, however, being discovered by a German, Böttcher, some time between 1703, and 1709, upon which the manufactory at Meissen was established, in which the discoverer died in 1719. These two great divisions of the Ceramic manufacture admit of several subdivisions.

Earthenware.—This includes, 1st, the antique vessels of the Etruscans and other people; the ordinary red brick ware, glazed or porous, such as is found in flower-pots, water-pitchers, bricks, and some architectural ornaments. 2nd, The common white earthenware, which has a finely granulated body, sometimes of a cream colour or yellow, but often white. 3rd, The fine earthenware of France (Faience) which is a white, hard, and sonorous mass.

Stoneware, is an earthenware which is deprived of its porosity, not by any intermixture of a glaze, but by the intensity of the heat to which it is exposed in the kiln producing the first stage of fusion. There are several kinds of stoneware to which a separate article will be devoted.

Porcelain differs from stoneware, in having a flux mixed with the clay, so that a semi-vitrification results in the process of firing; and this lead is included the *Tender Porcelain* of France, iron-stone china, and the English, and the true porcelain.

Common earthenware is distinguished by its complete opacity; and, from its containing undecomposed carbonate of lime in the burnt mass, it is often, in the unglazed state, found to effervesce with acids. Articles of this kind may be regarded as composed of Pottery and Plastic clay, clayey marl, and siliceous sand or quartz.

Of this class are the Italian (Luca della Robbia), the Majolica, Moorish Spanish, as seen in the tiles of the Alhambra, and the ornamental parts of many Saracenic palaces and temples, the Delft, much Persian, Javanese, and other oriental varieties of pottery. All the earlier specimens of Staffordshire, commencing with the butter-pots, down to the time when Josiah Wedgwood so materially improved the productions of this important district; plates, dishes, and all the ordinary utensils for every day life, are varieties of earthenware, porcelain being reserved for especial services, and for the uses of the wealthy. Chimney-pots, drain pipes, tiles, &c., are usually made of earthenware.

All the earlier productions of the Ceramic art were of this kind, and fine and coarse varieties are found among the ancient vases. The hebraymal and cinereal urns and the amphore are usually of the coarse variety. The

body of these is generally of a light colour, although from an admixture of carbon it is sometimes black, and not unfrequently they are lined with a cement composed of quartz, and some calcareous matter, for the double purpose of diminishing the amount of contraction in the process of firing, and of preventing that porosity of the vessel which would otherwise exist.

The superior earthenware of the ancients, as the vases of the Etruscans, and the best specimens of Roman pottery, are of a fine and dense body which is always coloured. Some of these vases are black, others of a dirty red or brown, and others (*terra sigillata*) of a very bright red. The analysis of the Etruscan vases gives for their composition—

Silica	from 60 to 70 per cent.
Alumina	12 to 16 "
Lime	2 to 4 "
Magnesia	2 to 3 "
Iron and Manganese	7 to 8 "

Those vessels which are coloured throughout contain from 11 to 4 per cent of carbon, evidently an artificial mixture. The vessels prepared from the *terra sigillata* contain often as much as from 12 to 15 per cent of oxide of iron. It would not appear that either the iron or the manganese were artificially introduced, they were without doubt naturally in the clays employed. The glaze on the red vessels is composed of 64 parts of silica, 11 of oxide of iron, and 20 of soda. The white castings which form the ornaments on some of the antique vessels are a pure white clay, not at all unlike in composition the Cornish clay, containing no lime or magnesia. These facts show that in chemical composition but little difference exists between the ancient and modern specimens of earthenware.

The Italian ware was, as its name indicates, the production of Luca della Robbia, of Florence, a goldsmith and statuary, who flourished in the fourteenth century. His *terra cotta invetriate*, or glazed earthenware, was manufactured in white, brown, blue, green, or yellow colours, and beside being employed for numerous articles for domestic purposes, specimens of which are still found in the hands of collectors,—figures of saints, busts, &c., were formed of this ware, and also numerous architectural ornaments. These were of exceeding good workmanship, exhibiting great skill in the designer; they were long employed in Italy, and many fine specimens of the Della Robbia ware are yet to be found in the Florentine churches.

Castel Franco in 1510 manufactured at Faenza a ware similar to the Italian *Majolica*, named Faience by the French. This earthenware was of high excellence, and artists of first-rate ability were employed to paint the designs. It was the circumstance of his being employed to paint a piece of this ware which led Bernard de Palissy to make those improvements which have rendered pottery so celebrated. Of humble origin, a draughtsman, a land-surveyor, and an artist, he struggled to obtain a degree of excellence which he saw within the reach of care and industry, and persevering through difficulties of no common character, he achieved the end he aimed at. Numerous stories have been circulated to exalt to the highest the perseverance of this extraordinary man. He is said to have sold his clothes and burnt his chairs, tables, and the floor of his house, to feed his furnaces. That he may have sacrificed all the comforts of life for a season, and reduced himself to beggary, entailing much misery upon his family, is no doubt true; but in a country where wood could be procured with little labour, it is not likely that Palissy had recourse to the destructive means which form a point in the popular story of his life.

The earliest examples of Staffordshire earthenware are the butter-pots, of a very irregular shape and a coarse ware. In the Museum of Practical Geology are some good examples of these, and also of a curious earthenware candlestick, a bear drinking-cup, jugs and other articles manufactured between the years 1500 and 1550, and many of the productions of Thomas Toft and others, showing the manufacture of the seventeenth century. When William III. came over from Holland, two brothers Elers appear

to have followed, and in 1690 they had manufactories at Dinsdale and Bradwell, near Burslem. These foreigners were the first to discover the peculiar clay of this neighbourhood, which is still worked for the *Mocha dip* in Bradwell Wood, near Chatterley. With this clay they manufactured a ware that was a very close imitation of the unglazed red porcelain of the East. Shaw informs us that "their extreme precautions to keep their processes secret, and jealousy lest they might happen to be witnessed accidentally by any purchaser of their wares—making them at Bradwell, and conveying them over the fields to Dinsdale, to be there sold; being only two fields distant from the turnpike road; and having some mode of communication (believed to be earthenware pipes like those for water laid in the ground) between the two contiguous farm houses, to intimate the approach of persons supposed to be intruders, caused them to experience considerable and constant annoyance. In vain did they adopt measures for self-protection in regard to their manipulations, by employing an idiot to turn the thrower's wheel, and the most ignorant and stupid workmen to perform the laborious operations; by locking up these persons while at work, and strictly examining each prior to quitting the manufactory at night; all their most important processes were developed and publicly stated for general benefit. Mortified at the failure of all their precautions, disgusted with the prying inquisitiveness of their Burslem neighbours, and fully aware that they were too far distant from the principal markets for their productions, about 1710 they discontinued their Staffordshire manufactory."

It is affirmed on apparently good authority, that the brothers Elers after this joined some parties connected with the Chelsea Pottery.

To a Mr. Astbury is said to be due, in 1720, the introduction of powdered flint, as a glaze mixed with pipe-clay in water at first, and ultimately the use of it in the body of the ware.

A strange story is, however, handed down to us. It is said by attiring himself in suitable clothes and assuming a complete idiosyncrasy of countenance, Mr. Astbury succeeded in procuring employment from the Messrs. Elers. That although it was attempted to drive him away by enfs, kicks, and varied unkind treatment from masters and idiotic workmen, he submitted to all with ludicrous grimace. This character he maintained for nearly two years; and without being discovered during that period, he registered all the processes he saw—made models of every implement needed, and in this disgraceful manner acquired all the information necessary. Another story is that he learned the use of flint, from seeing an ostler calcine some and reduce it to powder for the purpose of removing a film from his horse's eye. It does not appear that either the first or last of these widely circulated tales can be true. Mr. Astbury is stated to have been a man of much modesty, a man of observation, and much integrity of purpose. The whole tale is inconsistent with such a character, and we cannot believe, if a man had so far forgotten himself in his desire to rob another man of that which fairly belonged to him, that he would have forgotten himself still so much further as to have acknowledged the miserable cheat. The following list is given, from the authority before mentioned, as representing the order in which different materials have been introduced into the composition of Pottery in Staffordshire:—

1. Thomas Toft, aluminous shale or fire-brick clay.
2. William Sams, manganese and galena powdered.
3. John Palmer and William Adams, common salt and Hilage.
4. Elers brothers, red clay, marle and ochre.
5. Josiah Troyford, pipe-clay.
6. Thomas Astbury, flint.
7. Ralph Shaw, besaites.
8. Aaron Wedgwood, red lead.
9. William Little, calcined bone-earth.
10. Enoch Booth, white lead.
11. Mrs. Warburton, soda.
12. Ralph Daniell, calcined gypsum.
13. Josiah Wedgwood, barytes.
14. John Cockworthy, decomposed white granite (*China clay and Cornish stone*).

In examining the history of inventions it is curious to observe the constant tendency which prevails to refer everything to accident, and thus to rob inventors of the merit of industry, observation, or experiment. This is not merely the case with the various improvements in the Fictile Arts, but it applies equally to every application of science. According to traditional evidence, the discovery of glass by the Chaldeans, of a mode of ascertaining the specific gravity of bodies by Archimedes, the law of gravitation by Newton, of the improvements in the steam-engine by Watt, the invention of the safety-lamp by Davy, and a thousand and one other equally important applications between the periods of these widely separated and world-important circumstances, are all due to purely accidental circumstances; whereas we have evidence to show that they were the result of the most industrious investigations.

The use of salt for glazing, evidently the result also of gradual experience, is in this way attributed to the following circumstance:—At Mr. Joseph Yates', Stanley, near Bagnall, the servant was preparing in an earthen vessel, a salt ley for curing pork, and during her temporary absence the liquid boiled over, and the sides of the pot were quickly red hot from the intense heat; yet when cold, were covered with an excellent glaze. The fact was detailed to Mr. Palmer, of Bagnall, who told other potters, and thus introduced it into general use. In opposition to this view, it is only necessary to state that salt glaze, and a glaze made with the ashes of marine plants, yielding abundance of kelp, was in use in Holland long previously to its introduction into this country. We must now proceed with our examination of the varieties of earthenware most deserving attention. The Queen's ware of Wedgwood, and cream-coloured bodies, is composed of Cornish china-clay with a large admixture of *blue clay*, *black clay*, *brown clay*, and *cracking clay*, (most of which are found interstratified with the carboniferous formations of this country,) and calcined flints. In the blue ware, and such as is printed with fancy patterns, there is an addition of a tolerably large quantity of the decomposed granites. In a work already quoted, containing much really valuable information, by Simeon Shaw, but unfortunately of little value from the strange want of arrangement, and the overloading of its facts with illogical theoretical views and inconsistent hypotheses, we have the following given as a specimen of the Staffordshire mode of proportioning their ingredients:—

6	Barrowsful of brick clay.
4	Do. of blue clay.
2	Do. of cracking clay.
8	of the above in slip, i.e., ground up into mud with water.
4	Cornwall clay.
7	Flint.
1½	Cornwall stone.

"Now," continues Mr. Shaw, "as the clay slip may be 27, flint 32, and stone 33 ounces per pint, and this may not be known, or corrected by the slip-maker—need there be any surprise, that from directions thus indefinite, considerable losses have frequently been experienced, although every care has been taken in the manipulation, to cause close integration, toughness, and expulsion of air bubbles, by often wedging and slapping the clay." It should be remarked, that the numbers in this paragraph have reference to the weight of the solid materials named, in a pint measure when the water is evaporated. The preparation of the clay is confined to two operations. It is first mixed with a quantity of water, and in this state permitted to remain for some time, being occasionally turned over and stirred up that the action, whatever it may be, may be uniform. The importance of having good water for this operation has been long admitted, and until lately the Potteries were supplied with very inferior water. Measures have however been recently taken to secure a better supply and a superior quality; waterworks with a Cornish pumping-engine have been erected at Leek, and the advantages are found to be so great, and the demand for water supply is increasing so very rapidly, that it is in contemplation to erect another engine and greatly

enlarge the works. After this the clay is submitted to the operation of *blunging*, or is beaten up into lumps, and worked over several times with a knife or wire in order to detect and remove knots, stones, &c.

The finest cream-coloured printed ware is said to be composed of—

Dorset clay	135 parts
China clay (Cornish)	19 "
Decomposed granite	7 "
Flint	52 "

The fine grey marl found between the coal strata of Staffordshire is used for manufacturing a drab-coloured ware, and sometimes a little oxide of nickel is added to give a greenish tint to the drab ware.

The ferruginous clay of the coal formations which, owing to the peroxidation of the iron it contains, becomes in the fire of a fine brown colour, is used for brown or chocolate bodies. Sometimes, however, amber or hole is added to increase the depth of colour.

The black tea-pots and cream-jugs, technically called *Egyptian black*, are composed of—

Red clay	45
Dorset clay	36
Manganese	13
Protioxide of iron	12

The common white earthenware is composed of alumina, silica and lime. Moderately fine qualities of clay being selected, the bluer bodies, rendered so famous by the cameos and medallions of Wedgwood, are produced by adding to the ware a portion of oxide of cobalt, the ware being, however, in this instance, of a superior kind, and subjected to a more intense heat, so as to produce a partial vitrification; this is, however, rather a stone than earthenware.

Whatever may be the kind of earthenware, or the character of the materials, the mixture is in all cases subjected to much the same treatment. The flints are calcined in kilns, constructed in the same manner as the ordinary lime-kilns, and the red hot stones, as they leave the furnace, are thrown into water; by which process the stone is disintegrated and reduced more readily to powder than it could otherwise be. The Cornish china-stone is also submitted to a process of calcination.

Since the price of the Cornish china-clay is such that it cannot be employed alone in the fabrication of common earthenware, it is mixed with the clays found in the coal districts, as we have already stated. In the first instance the masses of clay are crushed together, and by means of very simply constructed machines mixed up with water until a fine aluminous mud is obtained. The flint being treated in the same manner, both are mixed, having been passed first separately through sieves, and after mixture, to ensure perfect uniformity throughout the mass, it is repeatedly sieved. The mud thus formed is called *slip*, but it is much too liquid, and must be brought to a proper consistence. It is poured into *Slip-kilns*—long brickwork troughs, and evaporated by boiling. During this operation, the ebullition being very briskly maintained, a dirty scum rises to the surface, which is scooped off, and eventually a clean and uniform mass is obtained. Before, however, it passes to the hands of the moulder, it is usual to put it through kneading machines or *pan-nills*. These consist of a perpendicular shaft carrying horizontal arms at right angles, to which are fixed three sharp blades, the whole moving within a cylinder into which the clay is thrown. It sinks in the cylinder, and in its descent is, of course, exposed to the operation of the horizontal arms and vertical blades. The clay is eventually forced out at the bottom of the mill fit for the purposes of the potter.

The manipulatory details of the processes of forming the clay into vessels, whether by the hands of the potter, aided by that ancient machine—the potter's wheel, or by machinery, as is now the case in many manufactories, or by moulding, it is not our purpose to deal with in these articles, desiring to confine attention entirely to the chemistry of the process.

It must be remembered that in the process of *firing* (baking) earthenware, much less heat is

employed than in the case of porcelain. All earthenware would at a high temperature swell, melt, and form a dark glass, therefore of a *first fire* is given to the body, which is not so intense as the second fire by which the glaze is burnt in. To avoid expense, however, the glaze is sometimes applied by dipping or casting before firing, and thus one process made to produce the effect desired.

It will be of course understood that earthenware and porcelain in *biscuit*, or after the first firing, is a porous body, and consequently unfitted for most of the purposes to which earthenware is adopted. It is therefore necessary to apply some coating or varnish which shall obviate this defect. This end is gained by the formation of a vitreous film over the surface of the earthenware.

The ordinary potter's glaze is prepared from litharge, galena, or white lead. The two following receipts will fairly represent the chemical composition of this variety of glaze:—

Decomposed granite	23 parts
Flint	12 "
Callet, or broken earthenware	17 "
White lead	23 "

Or,

Decomposed granite	25 parts
Carbonate of lime	3 "
Flint	10 "
Litharge	46 "
Borax	15 "

The glazes are usually bought by the potter ready prepared; the ingredients are all ground together in glaze mills, and used sometimes in a liquid state, and sometimes in dry powder.

When a liquid glaze is employed, the earthenware has been already *fired*, and is in a state of biscuit; this is called *dipping*. Coating is a process of painting the thick pasty glaze over the article, and sometimes the dry glaze in powder is sprinkled over the moist ware, but this is a very dangerous operation; the lead producing most disastrous affections on the workmen.

Lead glazes are not now so much used as formerly; alkaline or fritted glazes being more generally employed. These are formed of native felspar, or Cornish stone, combined with some alkali to cause the components to flow together at lower temperatures than they would otherwise do.

The glaze-kiln is usually smaller than that which is appropriated to the biscuit only, and in these the heat has to be very nicely regulated. The temperature of these kilns is ascertained by a very simple and ingenious device. The *glazer* is provided with a stock of *ball-watches*; these are balls of red clay, coated with a very fusible enamel. This enamel is so rich, and the clay upon which it is spread, being carefully selected for this special purpose, is so fine grained and compact, that even when exposed for three hours to the brightest flame it does not lose its lustre. The colour of the clay alone changes, whereby the workman is enabled to judge of the degree of heat within the kiln. The balls are at first of a pale red, and they become brown with the increase of temperature. These pyrometric balls when of a slightly dark red colour, indicate a degree of heat for baking the hard glaze of pipe-clay ware; if dark brown, that for ironstone ware; and when they become almost black, the degree of heat is indicated suited to the formation of a glaze upon porcelain.

The baking of enamel, or glazing, is commenced at a low temperature, and the heat is progressively increased until it reaches the melting point of the glaze; after which it is steadily maintained with great care, since, any diminution of the temperature at this point, would lead to serious defects in the ware. The firing is generally continued for about fourteen hours, and then gradually lowered by slight additions of fuel, after which the kiln is allowed six or eight hours to cool.

Printing on earthenware is a process of much interest. A printing ink composed of the desired colour, cobalt blue, manganese black, chromium green, or any other that will stand the action of the furnace, is mixed with linseed oil varnish, and the copper-plate impression is printed with this ink upon the paper in the

ALICE
THE GARDEN

[The text in this section is extremely faint and illegible, appearing as a series of horizontal lines.]

usual manner. This copper plate print is made to adhere with the printed surface towards the earthenware, and the article to which it is applied, is then dipped into water. By this the paper and the adhesive matter is softened, and can be brushed away, while the coloured varnish, which is not affected by water, remains as a picture upon the biscuit, and the varnish being destroyed by heat, or *hardening*, it is glazed and the design burnt in. In the chemistry of the colours used in the arts and manufactures, we have already described the peculiarities of those employed by the potter.

Efforts are being made by some of our most influential and intelligent potters to introduce an earthenware of finer body than that which has been usually sent into the market. It is found, we understand, that a ware can now be made of the china-clay only, as cheap as one into which the common dark-coloured clays enter as an important part of the composition. By this a very uniformly white and beautiful body is produced, and we may expect shortly to see specimens of earthenware rivaling in beauty the superior porcelains. To achieve this object the greatest care is necessary in working and in preparing the clay, since from many apparently trifling causes very serious deterioration of the physical characters of this material ensues.

We have been informed by a gentleman, connected with the extensive clay-works on the property of the Earl of Morley on Dartmoor, in corroboration of remarks which we made in a former paper, that the clays are much affected by the changing circumstances of the seasons;—that unless the quality of the water employed, and the condition of the atmosphere is attended to during the washing season, the character of the clays is not uniform. It appears also to be materially influenced by an uncertain, or irregular mode of drying; and we are informed that clay dried in the spring is very decidedly different from a clay dried in the summer.

From the extreme care with which the Chinese potter boards his clay, we can understand that some peculiar physical change is induced under circumstances, which the European manufacturer but ill understands, but to which it is most important attention should be turned.

The necessity of this has been fully felt by the proprietors of the Dartmoor Clay Works.

The bed of disintegrated granite now open in this district, is equal to a produce of 80,000,000 tons of clay; about nineteen miles of water-course have been made to secure to the works a never-failing supply of water for washing and working the machinery employed. A deep ditch surrounds the Clay Works, to prevent inundations from depositing over the beds of clay any of the earthy matters they bring down from the hills; and every other precaution has been taken to secure uniformity in the raw material, now becoming so important to the potter.

Another peculiar and interesting feature in these Works, is the construction of a railroad from them, to join the South Devon line—so that a very continued iron-road the clay is forwarded from Dartmoor to Stoke-upon-Trent. This is one, —and by no means an unimportant one,—of the great advantages derived by a manufacturing people from the facilities of communication afforded by the railway. Clay is put on a wagon in Dartmoor, and without being disturbed, except by the very unfortunate break of gauge at Gloucester, is safely landed in the manufactory of the potter in Staffordshire. The same wagon is laden with his earthenware and sent back on the same line either to supply the wants of towns remote from the manufacturing centre, or, as we learn is the case, for export to a South American market.

Thus new sources of industry are opened up, and with the spirit of the present age, fresh fountains of wealth developed. It is, however, most important that the manufacturer should avail himself of the additional aid which science can afford him, and that a co-operation of the manufacturer's skill and the experimentalist's suggestions should be made under a well-regulated judgment, and well-trained habits of observation.

ROBERT HUNT.

THE DANCING GIRL REPOSING.

FROM THE STATUE BY W. C. MARSHALL, A.R.A.

MR. MARSHALL'S statue was executed in marble for the Art-Union of London, and exhibited at the Royal Academy in 1848. The committee of the Art-Union had it reproduced in statuary porcelain, and copies of it were issued, in this material, as prizes to their subscribers. Even on the reduced scale in which it thus appears, the beauty of the design is sufficiently obvious.

The subject is by no means new in sculpture; Canova's exquisite figure is well known, and we can scarcely pay Mr. Marshall's a higher compliment than to give it as our opinion that she is quite worthy to stand by the side of her elder sister. It would be idle, however, to institute a comparison between the two, they differ so entirely in conception; while each contains beauties which are lacking in the other, only because they would not, if introduced, be consistent with the idea that each sculptor, respectively, has intended to convey in his work. Thus, in Chantrey's figure, is that undecided posture which may indicate the weariness of past exertion and excitement, or a preparation for recommending her graceful and expressive movements in the dance; in Mr. Marshall's there is nothing left for conjecture; the sense of "repose" is apparent in the general attitude, and in the disposition of the limbs and the drapery, the latter being so arranged as entirely to preclude the idea of motion, in its present state.

The adoption of the semi-nude is well calculated to display the artist's skill in the modelling of the human figure, and in the arrangement of drapery, at all times a difficult task for the sculptor, to do effectively. Mr. Marshall has shown very great taste and artistic knowledge in both departments of his work; the upper part is beautifully modelled, and the light garment is disposed in folds highly ornamental in character, while they do not conceal enough of the form to detract from the idea of perfect freedom when set more at liberty. The statue, as a whole, is one of great originality of conception, elegantly carried out.

VISITS

TO THE MANUFACTURING DISTRICTS.

SHEFFIELD.

IN bygone days, when letters were directed to "Sheffield, near Rotherham," the latter was the most important town of the two, and its now mighty neighbour, an industrious but unobtrusive village, its inhabitants quietly plying their hammers in the beautiful valleys of the Sheaf and the Don. The visitor to the smoke-crowned town in the present century cannot without much mental reflection realise the picturesque old town in his mind's eye, as it must have appeared when the great Earls of Shrewsbury were the lords of the district, and the park of the Talbotts crowned the hills, and overlooked the busy inhabitants, who rented their houses and their workshops of the Bege, round whose Castle in the plain beneath they had clustered their humble dwellings, looking up to their liege lords for due protection in return for feudal homage. From a very early period their ability as manufacturers had been conspicuous; and the readers of Chaucer's immortal Canterbury Tales will remember the description of one article forming the equipment of the miller, on his journey to the shrine of the martyred Becket—

"A Sheffield whittle bare he in his hose."

The fashion of carrying knives in the hose is now confined to the highlanders in our own kingdom, but appears to have been more common when Chaucer wrote. At this time Sheffield was in the possession of the Furnival family, whose house in London still gives name to Furnival's Inn; and from them it came by marriage into the Nevil and Talbot families in the early part of the fifteenth century. During all this time the working men of Sheffield laboured on in feudal dependence; they rented their mills of their titled lords, and were so completely under the influence of their rule that their labour and capital were completely regulated by the power of their courts-leet. It is

almost impossible now to repress the smile of incredulity at the bare mention of the absurd regulations which crippled the free course of mechanical ingenuity in the "old time before us." The wonder to the modern reader is simply this—how with such absurd restriction our commerce and manufactures ever survived.

With these shackles upon each workman it was not likely that Sheffield should increase in prosperity or size. It remained still a small and a poor village in despite of the hard labour of its inhabitants. Of the population just enumerated one-third were returned as "not able to live without the charity of their neighbours: these are all begging poor," and among the 260 householders; for to that small number was the town restricted; "those of the best sort," are calculated at the small number of 100, and these were "but poor artificers;" the rest, "though they beg not, are not able to abide the storm of one fortnight's sickness, but would be thereby driven to beggary." The rest of the inhabitants which comprised the living population of the little town were their work people, servants, &c., "the greatest part of which are such as live on small wages, and are constrained to work sore to provide them necessaries."

From the grave of feudalism arose like a phoenix the living spirit of commercial industry, spreading its untrammelled wings afar over its own and other lands, and asserting its claims to universal welcome. The narrow-sighted policy which had cramped its energies in the middle ages, and prostrated its power beneath the incubus of lordly sovereignty, was abolished by the onward progress of knowledge; and after much peril and slaughter he achieved a liberty for itself in the wars of the Jacquerie in the Low Countries; and the splendid Hotels-de-Ville of the Burgier overtopped in importance the gloomy Castle of the Lord. The Continental persecutions for faith did Sheffield good service, as it did many another English town. In 1570, a number of artisans from the Netherlands having quitted their homes to avoid the cruelty of the Duke of Alva, the emissary of the proud and relentless court of Spain, left their native land and emigrated to the more peaceful shores of England, certain that the hatred at that time felt by our rulers toward Spain, and the enlarged policy of the reigning monarch, Elizabeth, would be their guarantee for a quiet home in the country she governed, where they might be allowed to practise their peaceful arts in befitting quietude, and find a resting-place from persecution. They were cordially received by the Queen, who was fully aware of the importance of fostering the useful arts; and by the advice of her chamberlain, the Earl of Shrewsbury, they were spread over various parts of the kingdom, the practicers of one particular occupation being settled together in one place. By this means manufactures of a peculiar kind increased and gave celebrity to certain localities, and greatly tended to raise the trade and wealth of England, inasmuch that yearly it became less necessary to apply to foreign manufacturers for their produce, and ultimately enabled us to supply the markets of the whole world. Of the emigrants, whose visit we have just recorded, all, or the greater part, were workers in iron; and the Earl of Shrewsbury, with deep-laid policy, besought the Queen's permission that he might take them under his own protection, and give them a residence in his own Yorkshire estates; and permission having been granted him to do so, from this period may be dated the first material improvement in Sheffield cutlery.

In the twenty-first year of the reign of King James I., the cutlers were incorporated; and to prevent fraudulent traders from practising to their detriment, they had the privilege of allowing such as they thought proper, the use of certain marks on their wares as they chose to assign them. Some of the oldest of these marks were of considerable value to their owners; as in many countries they were taken as an unquestionable warranty of the excellence of the articles impressed therewith. The cutlery of Sheffield is known all over the world, and it is not a little curious in going over the manufactories of the town to see knives and other articles fabricated there for the use of far-distant lands, so peculiar in their form, and so peculiarly adapted to uses with which we are not at all familiar, that the traveller in Russia or South America might readily be excused for bringing over some "peculiar" article of native use as "a curiosity" to his friends at home, which had originally been made at "the metropolis of steel"—Sheffield!

During the seventeenth century the gradual increase of prosperity was fully visible in the size and appearance of the town; it was still, however, a small place, and the views extant published at this

period, show that the picturesque character of the town still remained; its houses clustering round the church on the hill side, and descending toward the Sheaf Bridge below, the beautiful amphitheatre of hills surrounding the town unobscured by the volumes of smoke which now envelope them.

Antiquaries are disposed to date the iron trade of Sheffield very far back. Hunter says—"The discovery of many beds of *scorie*, in various parts of the parish of Sheffield, and of several Roman coins imbedded in the refuse of an ancient bloomery, near Bradford, seems to show clearly that the iron mines of Yorkshire were explored by its Roman inhabitants." Nowhere did the ore present itself more obviously by fuming with its beautiful ochre beds of the streamlets in its vicinity; nowhere did it lie nearer the surface; nowhere could there be greater facilities for subjecting the ore to the processes necessary to extract from it its metal than in the forests through which the Don poured its waters. Here might the aborigines of Britain—

"From their leafy houses full oft go forth
And track the yellow streamlet, till they reach
The secret place, where every labour gains
The precious stone which Wolsman subdued
By fire, gives to the warrior's joy the target,
The spear point, and the helm of proof."

It was not until the early part of the last century that any new spirit of enterprise appeared in Sheffield; but the navigation of the Don then attracted attention, and it was found that the stream which had hitherto rendered such essential service to the manufacturer in preparing their wares might be equally useful in conveying them when finished to distant markets. This gave another impetus to industry, and increased the trade of the town. At this time there was about 6000 incorporated trades, and several thousand other workmen in different departments of the iron trade, not within the scope of the corporate laws. The value of the goods manufactured here about the year 1723 was estimated at about 100,000*l.* per annum. There were no large capitalists then engaged in the Sheffield manufactures; the only commercial concerns which could be then called large were the forges and other works for preparing the raw material for the use of the manufacturer. The trade of the town was much circumscribed, and was chiefly supported by the wants of neighbouring towns, the Sheffield manufacturers having little connection with the metropolis, and only sending to the annual fairs of Bristol, Chester, &c., such small consignments of their goods as pack-horses could carry over the very bad roads which intersected the country. The tradesmen were all small manufacturers, and were frequently aided by grants of money from the town trustees; thus in 1682 we find they "lett out 200*l.* to twenty silversmiths on bond" to help them in their business. Of course, where there was little or no communication with the metropolis, there was none whatever with the Continent, and it was not until 1747 that the first direct trade was opened between foreign houses and the Sheffield manufacturer. In that year Mr. Joseph Broadbent set the example, which was speedily followed by other trades, who engaged foreign clerks, and took their share in a business so prosperously begun. The old pack-horses gave way to the stage-wagon; and in 1760 a stage-coach plied between Sheffield and London, called into being by the exigencies of an increased traffic and the progress of the age.

A new manufacture of the utmost importance had been introduced to Sheffield by Mr. Thomas Bolsover in the year 1742, which became a formidable rival to the ancient staple trade of the town, but tended very greatly to the advancement of its interests as a manufacturing mart, and ultimately succeeded in increasing its wealth and rank among our great seats of trading industry. This was the manufacture of plated articles to stand in the place of silver ones. The history of its introduction has thus been told:—

"Mr. Thomas Bolsover, an ingenious mechanic, when employed in repairing the handle of a knife, composed partly of silver and partly of copper, was, by the accidental fusion of the two metals, struck with the possibility of uniting them so as to form a cheap substance, which should present only an exterior of silver, and which might therefore be used in the manufacture of various articles in which silver had before been solely employed. He consequently began a manufacture of articles made of copper, plated with silver, but confined himself to buttons, snuff-boxes, and other light and small articles. Like many other inventors, he probably did not see the full value of his discovery, and it was reserved for another member of the Corporation of Cutlers of Sheffield, Mr. Joseph Hancock, to show to what other uses copper, plated with silver, might be applied, and how successfully it

was possible to imitate the finest and most richly embossed plate. He employed it in the manufacture of waiters, urns, tea-pots, candlesticks, and most of the old decorations of the sideboard, which, previously to his time, had been made solely of wrought silver. The importance of the discovery now began to be fully understood; various companies were formed; the streams in the neighbourhood furnished a powerful agent for rolling out the metals in mills erected for the purpose, and workmen were easily procured from among the ingenious mechanics of Sheffield, who, in a few years, aided by the instruction of Mr. Tudor, Mr. Leader, and a few other operative silversmiths from London, soon equalled in the elegance of their designs and the splendour of their ornaments, the most costly articles of solid silver. Birmingham, 'the great toy-shop of Europe,' as it has been significantly called, early obtained a share in this lucrative manufacture, but the honour of the invention belongs to Sheffield, which still stands unrivalled in the extent to which the manufacture is carried, and in the elegance and durability of its productions."

It was the son of Mr. Hancock, named above, who commenced another manufacture in the town not less important in its consequences. This was the construction of articles in imitation of those made in silver, in a superior kind of pewter, composed of tin, antimony, and regulus, and named "Britannia metal." The first manufacturers were the firm of Messrs. Ebenezer Hancock & Richard Jessop, and from this town emanated an extensive home and export trade in tea-pots, urns, candlesticks, spoons, drinking-cups, snuff-boxes, and other articles usually constructed in silver.

The appearance of Sheffield is strikingly peculiar. Its chief buildings are factories of enormous size; its atmosphere is redolent of coal smoke; its pavements brown with iron-dust. Everywhere is the ear greeted with such sounds as Richard heard on Bosworth Field the night before the battle—

"The clink of hammers closing rivets up."

Here labour seems endless; and factory fires ever burning, with much of hard manual labour; there is, however, mixed vast mechanical aid, which, we are told, has greatly tended to preserve life. The severe labour required in some departments of the cutlery manufacture, formerly occasioned an unusual number of distorted limbs, but the evil has long been remedied by improvements in the methods of working, and in the machinery employed, so that the once numerous race of "crook-leg'd cutlers" is now nearly extinct. The laborious treadle-glazing and polishing-frames of the huffers and finishers have been superseded by the powerful agency of steam. The only really dangerous portion of the Sheffield trade is the "dry-grinding;" and the statistics of this business are really appalling; yet, singularly enough, with strange pertinacity the workmen seldom or never make use of any prevention offered by the humane and scientific, but keep breathing the air of death, and will so continue, says Dr. Holland, "unless enforced" to the use of remedies "by special legislative enactments." Forks are constantly ground on a dry stone, as well as some smaller articles of cutlery; a constant cloud rises from the stone composed of fine particles of stone and metal; this cloud is inhaled by the workman, and produces a wasting disease of the lungs most appalling. Dr. Holland states the difference between the proportion of deaths in this trade and the general run of mortality. An instance will suffice:—The deaths occurring between the ages of thirty and thirty-nine in ordinary cases is as 136 in 1000; but among these artisans it reaches the fearful preponderance of 410.

There are many large manufactories in the town in which the entire processes of the Sheffield trade are carried out in all their ramifications; one of the most extensive being the Sheaf Works of Messrs. Turton & Sons, which is a complete town of workshops, furnaces, and warehouses, all devoted to handicraftsmen, who are enabled by the multi-form appliances contained within its bounds, after receiving the iron at the entrance gates of the factory in its simple state, to convert it into steel, and then to fabricate the various articles of utility for which Sheffield has become famous; sending out to the world finished articles through the same gates which received the ore.

The conversion of iron into steel is an interesting and important process; it is the commencement of that which makes Sheffield famous—it is the A B C of its manufactures. The bars of iron are received here from the various mines, and are converted into steel by the absorption of carbon through the agency of fire. British iron is used frequently, but we are indebted to foreign mines

for the best we obtain, and for that which is particularly selected for the best kinds of steel goods. The Swedish iron is the superior kind, and among the mines of that country there is one which is unrivalled for the production of iron better fitted for conversion to steel than has hitherto been discovered elsewhere. This is the famous mine of Dannemo, which having been originally monopolised by the King of Sweden, and then by the Archbishop of Upsala, is now shared among several proprietors. It yields every year about four thousand tons of iron, which sells for double the price obtained by the very best produce of the Russian mines. Sheffield obtains by far the largest share of this valuable ore, and converts it into steel. Mr. Dodd, in his work on British Manufactures, says:—"Sheffield is as completely the metropolis of steel as Manchester is of cotton or Leeds of woollens. There is not a corner of the world where a British ship is allowed to enter but could exhibit some specimens or other of Sheffield steel goods. The rivers of Sheffield, if they could speak, would tell how busily they are employed in setting in motion the machinery for bringing steel to some one or other of its numerous forms; while the thoughts of the inhabitants, the names of many of the streets, the arrangement of the buildings, and the corporate usages of the town—all point to steel as being indeed a precious metal in Sheffield."

The process of converting iron into steel is thus conducted:—The bars of iron are placed between alternate layers of charcoal in a conical furnace and here are subjected to an intense heat until the carbon is absorbed into the heart of the iron, and the bars come out "blistered steel." From these "converting furnaces" they are taken to the "shear-houses" where they undergo another heating, and are hammered beneath the ponderous hammers that re-echo far and wide, and shake the ground beneath in their fearful intensity of strength. The bars are elongated by this process, and then half-a-dozen heated to a white heat, are welded into one bar by the same powerful blows into a compact mass, and this process is sometimes repeated when the steel is to be of extra hardness.

Cast-steel undergoes a different process, and is a superior kind to that just spoken of. The intense heat to which it is subjected, renders it necessary that the apparatus used be all constructed with much care. The manufacture of the crucibles in which the metal is placed, is one of the curiosities of the place. The clay of which they are formed is obtained from Stourbridge, and it is most carefully wrought to the necessary degree of fineness by the feet of the workmen. The clay being mixed with a proper quantity of water is spread over the floor, and for many hours together it is carefully trodden over by the naked feet of the workmen, who move over it in all directions in order that every particle may be well kneaded. The crucibles made from this clay are then placed to dry in a current of warm air until fit for use; but such is the intense heat to which they are subjected in the furnace, that they only last a single day, and in some instances burst in the fire; but each oven is provided against accidents of this kind. Every four hours the crucibles are taken out and the metal perfectly molten; the heat is fearful, and to look down one of the holes above a furnace, realises the worst picture of Dante's Inferno.

A stranger requires some nerve to walk at ease in a factory of this kind for the first time, where workmen are so fearlessly pouring out molten metal, or carrying bars of red-hot steel; "the rilling-mills" are houses where it behoves him to walk warily. Black, but heated, bars, cover the floor, with others glittering in intense heat. The bars are taken red-hot from the furnace, and placed beneath the rollers, time after time, until they are lengthened to the necessary size required by the various manufacturers who use the bar.

The subdivision of labour is a curious feature in the Sheffield trade. Thus the edge-tool trade has three branches—forgers, grinders, and hardeners. The razor and scissor-makers take in the largest number of subdivisions; the latter in particular, so that every portion of the manufacture is exclusively consigned to a single workman. Thus one man is constantly employed in making the central screw which holds the scissor together; and one woman in polishing the interior of each handle. The spring-knife manufacturers are the largest class of Sheffield operatives, and they have also their subdivisions, as have the table-knife and fork makers, the file and saw manufacturers. By this means that intimate acquaintance with the most minute portions of each article is obtained, and a certainty of action and beauty of finish given to it, which is no doubt one great means by which the manufacture of Sheffield has achieved its far-spread reputation.

Messrs. STUART & SMITH, of Roscoe Place, have achieved some eminence in the manufacture of stoves, a branch of business carried on in Sheffield to a considerable extent, and to which modern science has directed much consideration of a useful kind. It is but rarely that fire-places have been made picturesque or even agreeable objects in a room; they were considered but as necessary adjuncts to comfort and convenience; and that object being effected, their appearance was little regarded. modern Art has, however, done for them quite as much as modern Science, and we find our fire-places quite as beautiful in the present day as they are convenient. Those who remember the time when the Bath or Pantheon stove was looked on as the *ne plus ultra* of beauty and fitness, cannot fail to be astonished at the many admirable designs now so constantly adopted for similar articles, combining the best taste with infinite variety, and great excellence of workmanship. While the appearance of these stoves is thus beautiful and appropriate, their action as mere utilities is increased tenfold; and modes of economising, condensing, and throwing out heat have engaged the thought and occupied the hand both of the philosopher and the artisan, who have worked together to insure the consummation of beauty and utility. Among the best known of these works is Sylvester's patent grate, and we engrave a very tasteful and elegant example, in which the hearth is formed of radiating encaustic tiles, tinted in various colours, and adding to the charm of design the beauties of tint. The gilding upon the ornament is very delicately and chastely executed, and the effect upon the flat steel peculiarly happy. The rests for fire-irons on each side, are of a pyramidal form, combining figures of acanthus with foliage and scrolls of much variety and beauty. The character of these side pieces reminds us forcibly of the old *andirons*, which were so common in the days of Elizabeth, and of which many varied and curious examples still remain in the baronial halls of England. They were, indeed, the precursors of our present stoves, and against the bar which ran between them, billets of wood were reared for fuel; as these open fire-places generally occupied a hearth in the centre of a hall, the *andirons*, or dogs, were generally of tasteful and ornamental design; the smoke ascended to the roof and passed out at an open lantern, or *louvre* there. The Shakespearian reader will remember the graphic exactness with which the poet has described a pair belonging to a lady's chamber, in the play of "Cymbeline." Lachimo, by way of giving proof to Posthumus of a stolen interview with his wife Imogen, says:—

"— the roof of the chamber
With golden cherubims is fretted: her *andirons*
(I had forgot them) were two winking Cupids
Of silver, each on one foot standing, nicely
Depending on their brands."

Something of this kind may be seen in the work before us, but the contrast between these early and rude inventions, and the very exquisite examples of fire-places in Messrs. Stuart and Smith's factory is very great, and perhaps the strides made in "home-civilisation" between the ages of Elizabeth and Victoria could not be better contrasted than in the present case, when all that is picturesque in one age, is taken to add to the elegance and comfort of all that the luxury of civilisation demands for the other. In beauty of design and minutiae of finish we have rarely seen better works than those executed by the firm under notice. It is satisfactory to find how much attention is now paid by our manufacturers of all kinds to Art of the best kind, which can be made available for the purposes of each trade.

Dr. Lardner in his *Cabinet Cyclopaedia* has some good practical remarks on the manufacture of similar articles and the obtainment of good designs. He notices, that although in these cases the artist, of course, is the actual delineator, much, after all, depends upon the judgment and experience of the principal; for, however the fancy or the knowledge of the artist may enable him to invent or combine, they do not often qualify him in the same degree to decide either how far an ornament, which looks well on paper, may be likely to take when actually cast in metal, nor always whether it be exactly proper for the purpose intended. On the other hand, if the master want spirit, taste, or money to patronise new and ingenious designs, it is in vain that the designer taxes his invention, when whatever of originality his designs may exhibit will be sure to be frittered down into common-place productions.

In the spirit of these and similar remarks we heartily concur; it has been our habit (the result of a strong conviction and the experience of some years) to enforce the necessity for a tasteful combination of the fancy of the artist with the practical powers of the manufacturer. There can be no doubt in the minds of all who attend to the onward

progress of our great manufacturing towns, that the same feeling now pervades the constructive arts as exhibited in their work-rooms. A wholesome improvement cannot fail to be the result in most articles of every day utility, which the populace in general demand, and which may at least

be rendered as agreeable in form if not as elaborate in finish, as works designed for the wealthier classes.

The stoves engraved in our present page, are happy examples of the variety and ability brought to bear on articles of the kind. The later style of

Gothic, adopted in one instance with much good effect, exhibits the power of that style to adapt itself to any of the exigencies of design. The other stove is a very luxurious instance of the fanciful, confined to no particular style, but adopting many and varied enrichments from many sources. Its general effect depends very much upon the brilliant contrasts of its colour;

of the bright steel, rich gilding, &c., which its surface exhibits. The encaustic are also not without their value in adding to the beauty of the entire design, which is altogether a favourable example of modern improvement in this branch of British manufactures.

Let us now turn our attention to that branch of Manufacturing Art which has made the town of Sheffield so famed from the earliest times—the making of knives and cutting-tools of all kinds, for which it is still unrivalled as ever; and has a reputation and a trade all over the world, the cha-

termed—and which, consequently, do not absorb heat where the fingers grasp the blade in shaving; the heat and cold of the razor in winter time is pleasantly regulated to a constant medium temperature, and the hand never suffers by contact.

The great improvements in the Sheffield trade

small degree. The horn having been cut and trimmed into thin slices, and rudely fashioned to the size required for the handle, is then placed in a mould, which is constructed like a die for coins or ornaments in general, containing the entire amount of decorations in its sunken surface requi-

acter of its goods being a guarantee both at home and abroad for that high degree of excellence which have made them welcome wherever they are offered.

The establishment of Messrs. RODGERS & CO., (Norfolk Street), is remarkable for the variety and beauty of the articles exhibited in their extensive show-rooms, which are, in fact, an epitome of the town of Sheffield. In one case may be seen a knife with its 1850 blades, and other utilities occasionally appended to such articles; in another may be seen a diminutive pair of scales, containing, on one side, a dozen pairs of scissors, all formed as carefully and as capable of use as the largest manufactured, and yet so minute that they do not outweigh the half-grain placed in the opposite scale. Among the other "fancies" here exhibited, are scissors of a bird form, the beaks making the blades; knife handles, shaped like human legs and arms; all indicative of the amount of thought devoted to each article, although at times more remarkable for their eccentricity than for any other quality.

Our present page exhibits some of the really good and tasteful improvements made in the useful articles for which Sheffield has long been famed. The dessert knives, at the top of the page, are remarkable for the elegance of their outline, and for the adoption of ornament on the blade which is rendered subservient to their uses, and in one instance emblematic; the tendrils and fruit of the grape entwining over its surface. The handles are simply and beautifully designed. Our central cut exhibits two other designs for knife-handles, which merit the same amount of attention. The fish-knife, at the foot of the page, is a very successful example of what may be done towards making a necessary article for the table a really and beautiful work of Art.

The florid elaboration of the blade, and the propriety of the ornament adopted for the handle is especially worthy of commendation, and here the mind of the artist is visible; Messrs. Rodgers having been aided by a resident artist, Mr. Wright, in the designing of this beautiful article. We have often enforced on manufacturers the necessity and wisdom of this junction of the artist's mind with the workman's labour; we have never known it to fail where judiciously embodied, it was

"The simple rule, the good old plan;"

adopted by the manufacturers in the middle ages, whose works are so cherished and admired in our own day; and cannot fail to give an imperishable value, to articles made at the present time, as it has done in those which are the work of the past.

are as visible in the smallest, and apparently the most unimportant article, as in that which would most attract the attention of superficial observers. The handle of the Knife, or the Razor, from being a mere article of necessary utility, constructed simply to suit an ordinary purpose, and never thought of in any other light by the makers, obtaining the smallest amount of attention, and the least

site or the embellishment of the razor handle. The mould is in two halves, and closes together like a pair of pincers; having previously been heated, it is opened to receive the rough piece of horn, which becomes soft as putty when subjected to the heat, the mould being closed is then placed in a powerful vice, and the handles taken out are found to be sharply impressed with the ornament intended for their decoration.

Stags-horn is not thus melted or fashioned, but is cut into pieces from the horn, such pieces being regulated in their size according to the use to be made of them for handles large and small.

An imitation of the horn is however made in mould, particularly for the razors destined for the Russian market, as that material is the favourite one for the handle used there; and the serf is as anxious for his stags-horn handle as his lord can be. Ivory handles are formed by sawing the elephant's tusk into proper lengths, and thin slices, the lifts being small oblong pieces which are fashioned into their proper form by the hand of the workmen; bone undergoing the same process.

Mr. Dodd, in his work on British Manufactures, says, "the finishing of a penknife is a curious instance of minute detail. When the pieces of ivory, pearl, tortoise-shell, horn, or bone, which are to form the outer surface of the handle are roughly cut to shape; when the blade has been forged and ground, and when the steel for the spring is procured, the whole are placed in the hands of a workman who proceeds to build up a clasp-knife, from the little fragments placed at his disposal. So many are the little matters that he has to attend to, that a common two-bladed knife has to pass through his hands seventy or eighty times before it is finished."

It may here be observed that the fancy of the Sheffield knife-handle maker is, in some instances, circumscribed, from the fact of his having generally to follow and not to lead the fashion; forks and spoons being generally designed by London houses, he is obliged to follow their patterns in the formation of knife-handles, which very frequently cripples his fancy and leaves him merely a manufacturing agent when he might be an artistic originator.

The same author also remarks with much truth, that "a table-knife is perhaps, the most important of the different articles of cutlery: not from its quality, for a razor is more highly finished; not from its intricacy, for a clasp-knife has more detail about it; but from the large extent to which its use has risen. Every house in England, except the very humblest, has as many table-knives in it

possible amount of decoration, has ultimately become a most elegant adjunct to the useful blade, and even the blade itself a matter of taste upon which the ingenuity of the workmen may exert itself.

The old horn-handled knives and razors which have for years occupied a considerable share of the manufacturer's attention, and for which there is

In other articles of useful manufacture improvements are constantly being made. We noticed some razors, the blades of which are inserted in ivory "tangs"—as that portion of the razor where the hinge is affixed to the handle is technically

still a considerable demand, exhibit in many instances the same amount of improvement in design; the manner in which they are made is one of "the curiosities" of manufacturing art, one in which the "economy of labour" is visible in no

as there are inmates; and most houses have a great many more." It is therefore evident that this extensive branch of Sheffield manufacture is deserving of great attention, and its improvement a matter of great mercantile interest.

The manufacture of knives, scissors, and razors, may be said to be that for which Sheffield is most famous all over the world—certainly it is that by which it has attained its celebrity; and was that which at one time its makers took pride in chiefly. From the days when Chaucer remarked the "Sheffield whittle" in the hose of the miller, till the seventeenth century, when the maker of a famous article of the kind announced its fabrication in the quaint old lines:—

"Sheffield made
Both haft and blade;
London, for thy life,
Showe me such another knife;"

down to the present time, the men of Sheffield have noted this part of their trade as their chief pride. Strangers are less aware of the delicacy and care requisite in these works, and of the many hands necessary to finish each of that minute subdivision of labour requisite. Let us consider more fully the making of scissors and razors.

We shall confine our remarks to wrought-steel scissors. These should be made of the best steel, as the value of the raw material is only from a tenth to less than a hundredth part of the whole cost, labour being the chief item. Scissors are forged from straight rods of steel, altogether by the hammer, without either models or dies; and it requires much practice to make a well proportioned blade. Each workman will make from sixteen to twenty-four dozen pairs of scissors per week. After being annealed in a slow fire, and paired, they are filed in the bows and shanks into the pattern desired. Although plain scissors do not require great skill in filing, it requires much more to execute the many elaborate designs occasionally adopted. In the establishment of Messrs. Hobson alone there are between five and six thousand such designs entered and drawn in their pattern-books, all which are known to the workmen by quaint and peculiar names. After filing, the scissors are bored for the screws, and then hardened in the blades; the proper temper for cutting is only known by constant practice and observation. The blades are then sent to grind, which is done on stones set in motion by a steam-engine; the dust which is evolved by this process is considerable, and as it is inhaled by the workmen, used formerly to produce a slow consumption, which generally destroyed life at about thirty-eight years of age. The more prudent workmen now place dust fives over their grinding-stones, which carry away most of the injurious particles outside the building, and thus, by preventing their being inhaled, prolong life to upwards of fifty years, giving comfort during the whole period. After grinding, the scissors are sent to the finisher to have the screws made, and the blades set true for cutting; the screws are then turned out, and the blades sent to dress in the bows and shanks. This work is done by women, who earn from 6s. to 12s. per week. After dressing, the blades are again sent to the grinder to glaze or polish, as required; boys are mostly employed at the latter process. After finishing the blades at the grinding-wheel, they are sent to have the bows and shanks burnished (by women), and are afterwards turned, and the edges set on fine hones. This completes the process, which is, however, somewhat varied in the fine or hard polished scissors, also in tailors' and horse scissors. Thus each pair of scissors passes through ten to twenty different stages, and through six to ten persons' hands. Nearly the whole of the work is paid for by the piece; forgers earn 16s. to 28s.; filers, 18s. to 30s.; finishers, 20s. to 35s. per week; grinders, 25s. to 40s. per week; from the latter, however, must be deducted nearly 6s. per week for rent and tools.

Messrs. Hobson employ at present a hundred persons; and we believe there are a hundred and twenty other manufacturers, employing altogether about a thousand persons. Owing to their being few persons of capital in the business to employ the workmen regularly, the earnings of the workmen, from non-employment and low prices, are often considerably depressed from the above scale. Yet experience shows that wages are not high in proportion to the high price of the necessaries of life, and that a low price of food does not produce, as sometimes asserted, a low rate of wages. In 1836 and in 1850, trade was and is more than usually good, and while the necessaries of life are cheaper than ever, the rate of wages is not lower, but rather the contrary. The workmen of Sheffield, from all these favourable circumstances, are at present in the enjoyment of those comforts which their industry deserves. Our engraving exhibits a few of the beauties and varieties of form visible in the scissors manufactured by Messrs. HOBSON & SOX (71, Arundel Street). But there is a delicacy and taste in their works which we can scarcely give in a wood-cut.

The razor manufacture is a great staple branch of Sheffield trade, and razors may be had from the manufacturer varying in price, from four shillings and sixpence a dozen, up to four pounds; the market being thus liberally supplied to all comers. It is a curious and interesting sight to a

figures, &c., are occasionally introduced; razors designed for the Russian market, having pictures of sleighing scenes in winter, hunting the bear, &c.; those for other countries being typical also of national tastes. It is not a little curious to see how peculiarly visible the taste of a country may

stranger, to see the beautiful manner in which a Sheffield workman, with hammer and anvil alone, form, from a bar of steel, a razor or a pair of scissors. In the latter instance, the bar brought red hot from the furnace, swiftly in the process of hammering assumes the form of the blade; a sufficient quantity is then left to be welded into the handle made of a less delicate material, and in which a small hole being punched, it is gradually enlarged by beating round a projecting part of the anvil, until the scissors is roughly formed, to be finished by the filer. Razors in the same way are beaten out of the bar; and are four times passed through the fire. In the first instance, the bar is beaten into the rough form of the blade, and a portion beneath, enough to form the "tang," cut off from the solid piece. It is then heated again, and the "tang" formed on the anvil to the desired shape, the blade being also refined upon. It is a third time subjected to heat for the purpose of refining; and a fourth time for hardening and tempering. The manufacture of good razors is amongst the most difficult of the cutler's arts, only the very best highly carbonated cast steel can be used; some workmen are however from long practice such complete adepts at their business that they can produce on the anvil, razors with an edge so sharp and keen, as only to want setting for use.

The improvements effected in the appearance of

be made by the nature of its demands in the cutlery market. Thus, while the South American requires an ornamental razor in a showy case, gilt and ornamented, the German and the Englishman looks to the plain and the really good article in a simple case of Russia leather, calculated to wear well.

In most articles fabricated, it will thus be seen that artistic tastes may be cultivated, and find sufficient employment for their exertion. There is nothing too far beneath the manufacturer for his due notice. We hope to be able from time to time to note onward courses of improvement, which cannot fail to aid him in a mercantile light, as well as redound to his honour in the field of artistic excellence.

The improvements effected in Sheffield ware of all kinds must strike the most casual observer. The most ordinary Britannia metal works, or the finest cutlery, have received a due amount of attention from the manufacturer, and all tend to prove that desire to meet the growing want of the day in a manner commensurate with the improvements in general taste. It will be our business in a future article to exhibit many more proofs of this fact as exhibited in this, one of our greatest manufacturing towns, and to bring before our readers undoubted evidence of the onward progress which characterises the productions of the present day, whether useful or ornamental, or a combination of

these useful articles will be apparent from our cuts of some manufactured by Mr. PENNEY (80, Division Street). The blades as well as the handles are beautifully decorated, even the outline of the blade has been made subservient to the beauty of his design. The blades are ornamented by slightly corroding the surface with acid, and landscapes,

both. It is a satisfactory thing to be enabled thus to prove to the world, that the home trade of the country is in so improved and healthy a state, as our recent visit to Sheffield has shown it to be in so important a place, from whence not only the markets of our own country are supplied, but those of the world.

The Manufactory of Sheffield Plate of Messrs DIXON & SON (Cornish Place), is a fair example of the large establishments contained within the town, and which give a peculiar feature to the manufacturing districts in general. Ranges of workshops

occupy a quadrangle, all filled with busy occupants, whose labours are destined for a wide and a varied sale, supplying a large demand. The great progress made in recent years in every branch of our manufacturing arts is visible also in the fabrication of Sheffield plate; which, in general taste, is equal to silver work, and is sometimes so close an imitation of the more valuable material, as to deceive the cursory glance. We have selected some examples as specimens of improvements recently brought into the market by this firm.

The coffee-pot is of very graceful form, elegant in outline, and of remarkable "fitness" in all its parts. The ornament indented upon the body of the vessel gives great richness to its general effect. The tea-pot below is remarkable for the originality of its design, while, at the same time, its utility in no degree suffers from the quaint fancy of its form.

The dish and warmer is a graceful adoption of the best style of French ornament, relieved of all that makes the style objectionable. The spoon is

most elaborately and beautifully designed, and is another instance of the great amount of artistic beauty, which may be visible on the most modern article of utility if it pass beneath the hand of the artistic manufacturer.

The powder-flask exhibits a group of game

within a rich border of arabesque ornament, and adds another to the many instances in which the commonest articles of utility may be made beautiful. In the fifteenth and sixteenth centuries such articles were made available for the most varied and

beautiful ornament, and we hail with pleasure this sign of the resuscitation of similar taste, even in so insignificant an object as a powder-flask.

The wine-cooler is a judicious and simple design; the body is composed of reeds entwined with grapes and the tendrils of the plant, and is of very tasteful construction, showing considerable ingenuity.

It is evident from the limited selection of these articles which we are enabled to lay before our readers, how great the general improvement visible in all, and how much more carefully the manufacturer of Sheffield plate attends to the traces of form and the beauty of finish.

The old practice of making the foundation or "body" of articles intended to imitate silver plate, of a preparation of copper, had the bad effect of giving a dull unnatural hue to these articles, and greatly deteriorating their utility as useful adjuncts to the table, inasmuch as the coating of silver

deposited on the exterior surface very rapidly wore off, and displayed the red hue of the copper beneath. This was originally obviated, and is still, by the adoption of edges of solid silver, which edges are stamped by a die into the required pattern, and are then soldered on the article for which they have been prepared. But modern manufacturers now use a purer form of metal for the foundation of silver plated articles, which has not the objectionable tint preserved in the old fashioned "bodies." The metal now used is an alloy, composed of copper, nickel, and zinc, which

is white in its tint, and of very strong consistence, so that such articles as teapots, are not so liable to soften by the action of the hot water they contain, as they used to be; a very high temperature being requisite to render it fusible for the artisan in the

first instance, ere he can fabricate his work.

The great strides made by modern science, and the application of electro-chemical aids, have enabled the workman to coat his articles with pure gold and silver, and the most beautiful effects are consequently produced, completely deceiving the eye, and rivaling the more precious articles.

In a future paper we shall resume the consideration of the Sheffield trade in its various branches, and present a large variety of engraved examples of manufacturing art, all tending to show the present state of improvement in the town, and the ability brought to bear on the various articles for which it has become famous, and which will tend to show how well that fame is sustained.

In an age like the present, when the luxuries and necessities of life render the manufacturing arts matters of such vital importance, we cannot fail to look forward with much interest to still further improvements adopted in their fabrication and ornamentation.

A DICTIONARY OF TERMS IN ART.

DIAPER, DIAPER WORK. A kind of ornamental decoration applied to plain surfaces, in which the pattern of flowers or arabesques are either carved or painted. When they are carved, the pattern is sunk entirely below the general sur-

face; when painted they are generally of a darker shade of the same colour as the plain surface. The patterns are usually square, and placed close together, but other floriated forms are sometimes met with.

DISCOBOLUS. A thrower of the Discus, the

attitude of which is rendered familiar to all by the celebrated statue by the sculptor Myron.

DISCUS. A plate of stone or metal, of circular form, and about ten or twelve inches in diameter, used by the ancients in games of skill, after the manner of quoits. The mode of using it is shown in the woodcut illustrating the preceding article.

DISTAFF (Colours, *Int.*) This implement is of frequent occurrence in Ancient Art. It was made out of a cane-stick, of about three feet in length. At the top it was slit in such a manner that it should bend open, and form a receptacle for the flax or wool to be spun. A ring was put over the top as a kind of cap to keep the ends of the cane together. The Distaff occurs in representations of the FATES, who are engaged in spinning the thread of life. Distaffs of gold were given to goddesses. It was dedicated to Pallas, the patroness of Spinning.

DISTEMPER, DESTEMPER, DÉTEMPE (Fr.), TEMPERA (Ital.) A kind of painting, in which the pigments are mixed in an aqueous vehicle, such as size, and chiefly applied to Scene-painting and Interior Decoration. In former times, when this description of painting was more extensively employed than at present, the vehicles for the pigments were the sap of the fig-tree, milk, and white of egg. Many of the works of the old masters were executed in Distemper, and afterwards oiled, by which process they became almost identical with oil-paintings, or pictures executed with an oleaginous vehicle. By many persons, unacquainted with the processes of painting, Distemper is regarded as identical with Fresco-painting. The difference is this—Distemper is painted on a dry surface, FRESCO on wet mortar or plaster.

DOG. An emblem of fidelity, and generally introduced at the feet of married women in sepulchral effigies with that signification. It also signifies loyalty to the sovereign.

DOLABRA, CELT. An implement of various forms, extensively used both in ancient and modern times, for similar purposes as our hatchets and

chisels. They abound in museums, and are seen depicted on the columns of Trajan and Antoninus at Rome. They are usually formed of bronze and of flint or other hard stone, and to these latter the term CELT is usually applied.

DOLPHIN. An emblem of love and social feeling, frequently introduced as ornaments to Coronas suspended in churches.

DOMINIONS. In Christian Art an order of celestial spirits disposing of the office of angels: their ensign is a Sceptre. (See ANGELS).

DOMINIC, St. Dominicus de Guzman, the founder of the Order of Dominicans; he is represented with a Sparrow by his side, and with a Dog carrying a burning torch in his mouth. The bird refers to the Devil, who appeared to the saint in that shape; the dog, to a dream of his mother's, that she gave birth to a black and white spotted dog, who lighted the world with a burning torch. This dog is also said to be the emblem of watchfulness for the true faith, the Dominicans being the first and most zealous enemies of heresy; for to them Spain owes the iniquitous tribunal of the Inquisition, established for the purpose of kindling funeral piles with the torch of the black and white dog.

DONOR. A term of the middle ages, applied to the giver and founder of a work of Art for religious purposes, viz., the giver of a church picture, statue, or painted window, &c., the founder of a church, or an altar. If the gift were a picture, the portraits of the donor and his wife were introduced; the former, attended by his sons, kneels on one side of the Madonna, who is either standing or enthroned, while on the other side are his wife and daughters, all with hands raised, as if in prayer. Royal founders of churches, whose portrait-statues are placed in or on the buildings they have founded, bear in their hands the titular saint and a model of the church, which latter is also found in the monuments of such donors.

DOOM. The old name for the Last Judgment, which impressive subject was usually painted over the chancel arch in parochial churches. In the reign of Edward VI. these edifying representations were effaced, or washed over, as superstitious.

DOROTHEA, St. This Saint is represented with a rose-branch in her hand, a wreath of red roses on her head, the same flowers and some fruit by her side, or with an angel carrying a basket, in which are three apples and three roses. This angel is a youth barefooted, and clad in a purple garment. St. Dorothea suffered martyrdom in the Diocletian Persecution, A. D. 303, by being beheaded.

DOVE. The Dove, in Christian Art, is the symbol of the Holy Ghost; as such, it is represented in its natural form, the body of a white whiteness, the beak and claws red, which is the colour natural to those parts in white Doves. The Nimbus, which always surrounds its head, should be of a gold colour, and divided by a cross, which is either red or black. A radiance of light invests and proceeds from the person of the Dove, and is emblematical of the Divinity. It is also sometimes represented, in stained glass, with seven rays, terminating in stars, significant of the seven gifts of the Holy Ghost. The DOVE has been constantly adopted in Christian Iconography as the symbol of the Holy Ghost from the sixth century until the present day. In the tenth and eleventh centuries the human form was also adopted for the same object. In the fourteenth and fifteenth centuries we meet

* The Ark of St. Dominic at Bologna, so famous in the history of Art, and containing the bones of the saint, who died in that city, A. D. 1221, is a marble sarcophagus with beautiful sculptures, the lower reliefs of which were carved in 1296-67, by artists in the workshop of Nicolas of Pisa, and not by Nicolas himself, as was long believed.

† A very fine picture of this class is the *Madonna of the Burgomasters's Family* by HOOBENS in the Dresden Gallery.

‡ There is a rude, but interesting DOOM remaining at Cuythorpe Church, near Grantland; another in the Church of the Holy Trinity, Coventry.

§ The legend of this saint is one of the most beautiful in Christian Mythology. It is said, that as they were conducting her from the place of judgment to that of death, the secretary of the judge, Theophilus by name, said to her mockingly, that she might now send him some of the fruit of a rose which grew in the garden of that heaven which she expected to attain, and immediately after her execution the young angel appeared to Theophilus with a basket containing three apples and three roses, at which miracle he was converted to Christianity. See Mrs. JAKESON'S *Sacred and Legendary Art*.

with both together, as the personification of the Holy Ghost in the human form, with the DOVE as his symbol. The Dove is an Emblem of Love, Simplicity, Innocence, Purity, Mildness, Compunction; holding an Olive-branch, it is an Emblem of Peace. DOVES were used in churches to serve three purposes:—1. Suspended over altars to serve as a

Pyx.* 2. As a type or figure of the Holy Spirit over altars, baptisteries, and fonts.† 3. As symbolical ornaments. The Dove is also an Emblem of the human soul, and as such is seen issuing from the lips of dying martyrs and devout persons. A Dove with six Wings has been employed as a type of the Church of Christ: it has certain peculiarities. The front of the body is of silver, the back of gold. Two of the Wings are attached to the head, two to the shoulders, and two to the feet. See DIDRON'S *Iconographie Chrétienne*.

DRAGON. A huge fabulous animal, found in the Sagas of nearly all nations, and generally as an enormous serpent of an abnormal form. The ancient legend represents the dragon as a huge subordinate symbol, as the glorious Eagle was not to be displaced from Helms and Standards. The Dragon was of more importance in German antiquity; as with the early Greeks, it was the symbol of the Hero. In the *Nibelungen Lied*, Siegfried killed a Dragon at Worms. It is found on English shields after the time of William the Conqueror. In modern Heraldry it appears on the shield and helmet; and as a supporter it is called a *Lindworm* when it has no wings, and *Serpent* when it has no feet; when it hangs by the head and wings it means a conquered Dragon. DRAGON, in Christian Art, is the emblem of Sin. The Dragons which appear in early Paintings and Sculptures are invariably representations of a winged Crocodile. It is the form under which Satan, the personification of Sin is usually depicted, and is met with in pictures of St. Michael and St. Margaret, when it typifies the conquest over Sin; it also appears under the feet of the Saviour, and under those of the Virgin, as conveying the same idea. Sin is represented in

the form of a Serpent, sometimes with an apple in its mouth. The Dragon also typifies Idolatry. In pictures of St. George and St. Sylvester it serves to exhibit the triumph over paganism. In pictures

* Our set presents a beautiful Pyx of this kind, exhibited at the Society of Arts recently.

† Doves of carved wood or embossed metal are found remaining on several font-covers in the English parish churches at the present day; and in former times, probably no font would have been considered complete without such an emblem.

of St. Martha, it figures the inundation of the Rhone, spreading pestilence and death. St. John the Evangelist is sometimes represented holding a Chalice from which issues a winged Dragon. As a symbol of Satan we find the Dragon nearly always in the form of the fossil *Icthyosaurus*.

DRAGON'S BLOOD. A resin which exudes from a tree growing in India, the *Pterocarpus draco*. It is of a dark blood-red colour, formerly used in miniature paintings, but its colour is not durable. It is now used principally for colouring varnish.

DRAPERY. Under this term is included every kind of material used in sculpture and painting for clothing figures. Although it is the *natural body*, and not some appendage added by human customs and regulations, that sensibly and visibly represents mind and life to our eyes, and has become the chief object of the Plastic Arts, yet the requirements of social life demand that the body be clothed; the artist fulfils this obligation to his aim,* manner as shall prove least detrimental to his aim.† Drapery has, of itself, no determinate form, yet all its relations are susceptible of beauty, as it is subordinate to the form it covers.‡ This beauty, which results from the motion and disposition of the folds, is susceptible of numerous combinations very difficult to imitate; indeed, *Casting of Draperies*, as it is termed, is one of the most important of an artist's studies. The objects to make the *Draperies* appear naturally disposed, the result of accident or chance. Long continued efforts may fail to produce this result; nevertheless, commensurate study will enable the artist to attain that command over his materials as will ensure his success.

DRYING OIL, BOILED OIL, HUILE SICCATIVE (Fr.). *Olio Cotto (Ital.)* When linseed oil is boiled with LITHARGE (oxide of lead), it acquires the property of drying quickly when exposed in a thin stratum to the air. Its uses as a vehicle and varnish are well known.

DRYERS. Substances, chiefly metallic oxides, added to certain fixed oils, to impart to them the property of *Drying* quickly when used in painting. That most commonly employed for this purpose is the oxide of lead; but *whitite cupperosa* or *whitite vitriol* (sulphate of zinc), oxide of manganese, ground glass, oxide of zinc, calcined bones, chloride of lime, and *verdigris* (di-acetate of copper), have also been used at various periods in the history of Art as **DRYERS**.

DRYNESS. This term is applied to a style of

* In Ancient Art, the feeling and enthusiasm for corporeal beauty was universal, yet the opportunities for representing it were comparatively rare. Only in gymnasium and athletic figures did nakedness present itself as natural, and become the privileged form of representation to the sculptor; it was soon, however, extended to statues of male deities and heroes. Garments that concealed the form were universally discarded; it was sufficient to retain only the outer garment, and even this was entirely laid aside when the figure was represented in action. In seated statues, on the contrary, the upper garment is seldom laid aside; it is then usually drawn around the joints; it denotes therefore rest and absence of exertion. In this way the Drapery, even in ideal figures, is significant, and becomes an expressive attribute. Ancient Art, at the same time, loved a compendious and illusive treatment; the Helmet denotes the whole armour; a piece of the *Chlamys* the entire dress of the Ephoros. It was customary at all times to represent children naked; on the other hand, the unrobing of the developed female body was long unheard-of in Art, and when this practice was introduced, it required at first a connexion with life; here the idea of the Bath constantly preserved itself until the eyes became accustomed to adopt the representation without this justification. The portrait statue retained the costume of life, if it also was not raised above the common necessity, by the form being rendered heroic or divine.—See MULLER'S *Ancient Art and its Remains*.

† A correct notion of the spirit in which Ancient Art treated Drapery in general, is still more important than the knowledge of individual articles of dress. It did so, first, in a thoroughly significant manner, so that the choice of the costume and the manner of wearing it constantly referred to the character and activity of the person represented; as can be shown very distinctly in the different modes of dress among the gods. Secondly, in the genuine times of Art, it was made thoroughly subordinate to the body, fulfilling the destination of showing its form and motion, which the Drapery is capable of doing to a greater extent, as regards time, than the naked figure; because, by the situation and arrangement of the folds, it sometimes enables us to divine the moments preceding the action represented, and sometimes even indicates the intention of the person. The Draperies of the Greeks, which, from their simple, and, as it were, still undecided forms, for the most part only received a determinate character from the mode of wearing, and, at the same time, furnished a great alternation of smooth and folded parts, were especially calculated from the outset for such purposes; but it also became early an artistic principle, to render the forms of the body every where as prominent as possible, by drawing the garments close, and loading the skirts with small weights. The striving after clearness of representation dictated to the artists of the best period a disposition into large masses, and subordination of the details to the leading forms, precisely as in the muscular development of the body.—See MULLER'S *Ancient Art and its Remains*.

painting, in which the outline is harsh and formal, and the colour deficient in mellowness and harmony. It is not incompatible with good Composition and other high qualities, as may be seen in some of the works of Holbein, and the earlier productions of Raphael.

EAGLE. The attribute of Jove, as his messenger. Effigies of this bird, constructed of bronze and silver, were used by the Romans as military Ensigns; and representations of it are of frequent occurrence in Art on Capitals and Friezes, on Medals* and Gems, where it is seen carrying the

Thunderbolt of Jove, or receiving a Garland which it is to carry to a favourite, or carrying a Garland or Palm in its beak. The Eagle killing a Serpent or a Hare on Gems and Coins is an ancient symbol of Victory. Europa is sometimes represented under the form of an Eagle; and in pictures illustrative of the "Rape of Ganymede," the Eagle, as Jove's messenger, carries the boy on its back.—In Christian Art, an Eagle is the Attribute of St. John the Evangelist; the Symbol of authority, of power, and of generosity; it was regarded by St. Gregory as the Emblem of Contemplative Life. It is represented drinking from a Chalice, as an Emblem of the strength the Christian derives from the Holy Eucharist. The conflict between the 'State of Nature' and the 'State of Grace' is represented by an Eagle fighting with a Serpent, and by an Eagle, the body of which, terminating in the tail of a serpent, is turned against the head. A common form for the Lectern, constructed of wood or brass, used to support the sacred volume in the choir of churches, is that of an **EAGLE**.—Elisha, the prophet, is represented with a two-headed Eagle over his head or upon his shoulder, referring to his petition to Elijah for a double portion of his spirit.

EAR-RINGS. This ornament has been worn by both sexes, from the earliest times, in Oriental countries, but among the Greeks and Romans, its use was confined to females. It was usually constructed of gold, of various forms, very finely wrought, and set with pearls and precious stones. The Ears in the statue of the Medicean Venus and other statues are pierced, and probably were at one time ornamented with Ear-Rings.†

EASEL. An apparatus constructed of wood, upon which the Panel or Canvas is placed while a

picture is being painted. **EASEL-PICTURE** is a term employed to designate a picture of small dimensions, such as render it portable.—In Christian Art, St. Luke is often represented sitting before an Easel, upon which is a portrait of the Virgin.‡

ECHINUS. The 'Egg and Tongue' or 'Egg

and Anchor' ornament, frequently met with in classical architecture, carved on the *Ovolo*. The

type of this ornament is considered to be derived from the chestnut and shell.

ECORCHÉE (Fr.) (ANATOMICAL FIGURE.) This convenient word, for which we have no equivalent in our language, signifies the subject, man or animal, flayed, deprived of its skin, so that the muscular system is exposed for the purposes of study. The word **SCHELETON** is limited in its application to the bony structure. The study of the Muscular system is one of the greatest importance to the artist. The difficulties in the way of studying the dead subject are so great, that it has been found necessary to construct models in *papier-mâché* or plaster, in which the prominent muscles are exhibited and coloured after nature, which are used in academies and schools by students.*

EDMUND, St. An Anglo-Saxon king, who in 870 fell a victim to the Danes, by whom England was invaded. He was taken prisoner, scourged, bound to a tree, then killed by arrows; wherefore he, like St. Sebastian, is represented as tied to a tree, with an arrow in his breast, but bearing a crown. The Sword, which is also one of his Attributes, refers to the legend, that he was afterwards beheaded. As St. Edmund does not always wear the insignia of royalty, his picture is often mistaken for that of St. Sebastian; but the beard on the upper lip, denoting military rank, is the attribute solely of the latter.

EDWARD, THE CONFESSOR. An English king, who died A.D. 1066, is represented in royal garments, and with the Symbols of Justice, a Mace, and also his Book of Laws. He sometimes hears a sick person, whom he is said to have healed by carrying him into a church.

EDWARD, THE MARTYR. King of England. He was stabbed at the instigation of his step-mother, while in the act of drinking, A.D. 978. His attributes are, a Goblet, a Dagger, and the insignia of royalty.

EFFECT. The impression produced upon the mind at the sight of a picture, or other work of Art, at the first glance, before the details are examined. Thus, some bold outlines indicating the principal forms, with the masses of light and shade properly thrown in and the local colours put on, are sufficient to produce a picture which at the first view may appear strikingly brilliant and true, although many of the details proper to the subject are omitted, or the drawing not strictly correct, or the colouring deficient in harmony. Such is the state of mind in which most good sketches or designs are made, by which the ultimate **EFFECT** of the work when more carefully executed is judged. **EFFECT** is also the result of all the peculiar excellencies of the true master; the ensemble, which is brilliant and striking, as in the works of Rubens.

EFFIGY. The literal representation or image of a person. Although the word is sometimes applied to a portrait, it is not synonymous with it, but conveys an idea of a more exact imitation, a more striking and authentic resemblance, as we meet with in *wax-figures*. The ordinary application of the word is to the sculptured figures on sepulchral monuments, and to the heads of monarchs, &c., on coins and medals.

EGYPTIAN-BLUE. This brilliant pigment, upon analysis is found to consist of the hydrated protoxide of copper, mixed with a minute quantity of iron. It was long supposed that this fine Blue was an ore of Cobalt.

ELECTROTYPE. The process by which works in relief are produced by the agency of electricity, through which certain metals, such as gold, silver, and copper, are precipitated from their solutions upon moulds in so fine a state of division as to form a coherent mass of pure metal, equal in toughness and flexibility to the hammered metals. The applications of this beautiful Art appear almost unlimited, and as a means of reproducing fac-similes of Art it is most invaluable.†

ELECTRUM. This term is applied in Ancient Art to Amber, and to a compound of gold and silver, which resembled Amber in colour, and was employed for similar purposes to those metals.

* The plates in the Atlas to *Fau's Anatomy for Artists*, translated by Dr. Knox, are the best extant for exhibiting the various conditions of the Muscular System in action and repose.

† See *ART-JOURNAL, Fassin*.

* Our specimen is copied from a medal of Augustus.

† The cut gives examples of two antique Ear-Rings. Fig. 1 is an Egyptian one of gold, half an inch in diameter, published by Wilkinson. Fig. 2 is from one of the Syracuse medallions.

‡ Our cut of an artist of the fifteenth century, at work at his Easel, is from a beautiful illumination in the famous MS. Romance of the Rose (Harl. MS. 4425).

ELGIN MARBLES. An inappropriate name given to the collection of ancient sculptures in the British Museum, brought from the Acropolis at Athens and other places, by Lord Elgin. They consist chiefly of the METOPES, representing for the most part the combats of the Centaurs and Lapithæ; a portion of the frieze of the Cella, representing the Panathenæic procession; and the statues or fragments of them, which ornamented the Tympana of the Pediments of the Parthenon or temple of Minerva at Athens.*

ELISHA. This prophet is represented with a two-headed Eagle over his head, or upon his shoulder; referring to his petition to Elijah for a double portion of his spirit. The subjects usually chosen in works of Art in which Elisha appears, are that of the Bears destroying the Children; Elisha seizing Elijah's mantle; his Raising the Child; his Interview with the King's messenger; and his Causing the Axe to Swim.

ELIZABETH. The position which the mother of John, the precursor of the Saviour, occupies in Christian Art, is of importance only in relation to the *Visitation of the Virgin*. She is found in many pictures of the Holy Family, but, like Anne, is inferior to the mother of the Messiah. The pictures of the *Visitation* are almost innumerable; they consist of the two women—Elizabeth, who is represented as old, and Mary, as youthful, each praising God.†

EMBLEM. This word is used frequently as a synonym with **ATTRIBUTE**, **SYMBOL**, **IMAGE**, and **ALLEGORICAL FIGURE**. So indiscriminately are these terms employed, that it becomes a task of great difficulty to point out their special application, and it must be admitted that the shades of difference are so light, that it would be most convenient to regard them all under the general term **SYMBOL**.‡ An Emblem is a *Symbolical Figure or Composition*, which conveys a moral or historical Allegory; when accompanied with some sententious phrase which determines its meaning, it has the same relation as **DEVISE**.

EMBLEMATA (Gr.) The figures with which the ancients decorated the golden, silver, and even copper vessels, and which could be taken off at pleasure. These belong to **TORIC** art and were generally executed in the precious metals, but sometimes carved in amber. The Romans had the Greek term *Emblematæ*, but applied the word *Crauste* to the ornaments mentioned above. The Greek term is handed down to us in our word **EMBLEM**, a sign or symbol.

EMBOSSING. The art of producing figures in relief from a plane surface of metal by means of a Chisel or Punch. See **CHASING**.

EMBROIDERY. Figures worked in textile fabrics by means of a needle and thread. It is of very ancient practice; it is described by Homer, and remains of Egyptian Embroidery are extant.

EMERALD GREEN (PAUL VERONESE GREEN, Fr.) A pigment of a vivid light green colour, prepared from the arseniate of copper, used both in oil and water-colour painting; there is no doubt of its durability if used unmixt with other pigments, and as no other pigment can supply its place, it is desirable that it should be retained on the palette. It is known in commerce by the names of **SCHIELE'S GREEN**, **MITS GREEN**.

EMPAISTIC (Gr.) Inlaid work, resembling the modern Bull, Marquetry; next to **TORIC** Art (with which it must not be confounded), that branch most practised by the ancients. It consisted in laying threads, or knocking pieces of different metals into another metal.

ENAMEL PAINTING. Painting upon metal previously covered with a glazed ground. This

* The Parthenon with its sculptures constituted an immortal work, never again perhaps to be approached by human thoughts or hands. Though mutilated to a great extent, the fragments of the figures which once adorned the Parthenon, cannot be too often drawn. The superiority of the Elgin Marbles to all others, consists in this, that they represent the human frame draped and undraped, massive, and beyond the natural size, in nearly every attitude, without the artist having in a single instance degenerated into coarseness, mannerism, or been forgetful of absolute truth, from any other figure of a Lamb, which are neither Emblems nor Symbols.

† Besides the pictures of the *Visitation*, we meet with many of the Holy Family by the Italian School, but the most famous of these is that by Raffæle, known as the *Pearl of the Escurial*.

‡ Thus the **SCRIPTURE** is the *Attribute of Royalty*, and the *Emblem or Symbol of Power*. The *Raschid* Lamb of the Jews figures the Lamb without stain, which has expiated the sins of the world; but as Jesus Christ has been depicted under this **EMBLEM** in the New Testament, this **EMBLEM** becomes a **SYMBOL**. And to remove all uncertainty in depicting this Symbol in Christian Art, we give to the Lamb a **NOMOS** upon which is figured a Cross; or the *Cross of the Resurrection*, or simply place a Cross above its head; these are the **ATTRIBUTES** which distinguish it from other figures of a Lamb, which are neither Emblems nor Symbols.

kind of painting can only be done in small pieces and it stands in the same relation to Porcelain-painting as Miniature does to Water-colour-painting. The metals used are gold, silver, and copper; the two latter are usually gilt. For *Bijouterie* an opalised semi-transparent ground is laid on, or a transparent one through which the foil may be seen: for Painting, an opaque white ground, such as we see on the dial-plates of clocks is laid on the metal. The laying-on and burning-in of this ground is called **ENAMELLING**. The grounds are always more fusible than the metal, and they must be less fusible than the colours laid on it. The town of Limoges in the south of France has acquired a great name in the history of the art of Enamelling; it was particularly distinguished in the twelfth century, and its productions were called *Opus de Limogia* and *Labor Limogæ*. Many Reliquaries of that time are still extant, the sides and sloping roofs of which are composed of plates of copper covered with etchings and enamel-paintings.* The most famous artist in Enamelling was Leonard Limousin of Limoges, from whom the French works of Art of that period were called **LIMOUSINS**; other masters in this Art were Pierre Rexnon, Jean Court, called *Vigier*, J. Laudin, P. Nouallier, the master J.P. who is known to us only by his cipher, but whose works are excellent, displaying noble ideas, and the master P.C., who is much praised by DR. WAAGEN in his work on *Art and Artists in England*. As regards the technical part of Painting, the works of these masters rank far below those produced in more recent times; they are rather illuminated line-drawings with a glazed transparency of colour, or monochrome paintings (*en grisaille*), the naked figures being well modelled, and generally of a reddish tint; the ornaments in gold and the glazed lights make the paintings appear rich and brilliant. In the course of the seventeenth century the technical part of the Art of Enamel-painting improved considerably, progressing from **MONOCROME** to that in various colours. Towards the end of the seventeenth and the beginning of the eighteenth centuries, the Art arrived at technical perfection, and real pictures were produced with the softest and most delicate gradations of colour. But the works of this period were of very small dimensions, the paintings being sometimes on silver, but generally upon gold, and principally portrait medallions, for which the Art was now employed. Much that was excellent was produced, but in historical representation the artists followed the degenerate style of the compositions of those days, so that these works, in spite of their technical perfection, must rank below those of the sixteenth century.

ENAMEL-PAINTING ON LAVA. A newly invented style of painting very serviceable for monuments. This invention of enamelling upon stone, discovered in France and well known in Germany, has produced a kind of Painting having all the advantages of colour and treatment, and the great recommendation of being nearly indestructible. The material used was discovered by Count Chabrol de Volvic; it consists of Volvic stone, and Lava from the mountains of Auvergne. The method of Painting is a new kind of Enamelling, and has been used by Abel du Pujol and others in various works of Art; for example, the altar of the church of St. Elizabeth, at Paris; it has recently been used in architecture by Hittorf of Cologne, for the exterior of buildings. In Paris there are several tablets painted with figures in the Arabesque and Pompeian styles which have excited great admiration by the ease and yet preciseness of the treatment, as well as by the firmness of the materials, for a sharp piece of iron might be drawn over them without injuring the painting.†

ENCAIRPA (Gr.) A decorative ornament in

Painting and Sculpture, in the form of a festoon of fruit and flowers.

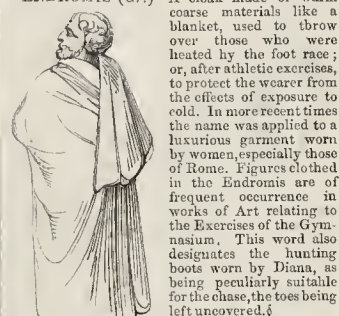

* The time when the Art of Enamelling attained perfection was some centuries later than the above. In the sixteenth century we meet with French Enamel-paintings called *Encaux de Limoges*, from the town where they were produced, and by which name they were afterwards known to all the world. These works, forming a remarkable era in the history of Art, consist of plates and ornamental vessels of various kinds, for the most part made of copper, (latterly, however, of the precious metals) and having various paintings burnt-in. They stand beside the

ENCAUSTIC. Painting with a wax medium, which is impregnated and fixed upon the canvas or panel by the aid of heat, burnt-in (*Incaustum*), practised by the artists of antiquity, who used the style and wax for tablet-pictures and architectural decoration. The invention of Encaustic painting is ascribed to several masters. It was certainly an important branch of ancient Art, but though used upon wood, clay, and marble for decorative purposes, animals and flower-pieces, it was employed but little for gods and heroes; wooden doors, triglyphs, lacunaria, ships and marble architectural ornaments were also painted in Encaustic, sometimes with simple patterns and sometimes with figures. The overlaying of mural paintings with Punic wax to preserve their colours was also called **ENCAUSTIC**, which word seems to have been used in a double sense, viz. for laying on durable pigments, and also for protecting them. There is no antique painting extant which can be called Encaustic; all those supposed to be so, having upon closer examination proved to be in **PRESCO** or in **TEMPERA**. Neither wax nor any other coating has been found in the many paintings, (the Albrandini Marriage, &c.) examined by Sir H. Davy, therefore as our sole knowledge of Encaustic is derived from the writings of ancient authors, which give us no clear account of the art, it would be wiser to leave the subject to the archaeologists. The investigations of connoisseurs and savans also convince us that we have little to regret in the loss of Encaustic painting, since oil is a far better medium than wax.‡

ENCOMBOMA (Gr.) A portion of Greek costume consisting of a kind of apron, fastened loosely round the loins by being gathered into a knot. It was worn chiefly by young maidens; its use appears to have been to keep the Tunic clean. The annexed woodcut represents a young female playing on the double pipes, probably an attendant in the scene of some play.

ENDROMIS (Gr.) A cloak made of warm coarse materials like a blanket, used to throw over those who were heated by the foot race; or, after athletic exercises, to protect the wearer from the effects of exposure to cold. In more recent times the name was applied to a luxurious garment worn by women, especially those of Rome. Figures clothed in the Endromis are of frequent occurrence in works of Art relating to the Exercises of the Gymnasium. This word also designates the hunting boots worn by Diana, as being peculiarly suitable for the chase, the toes being left uncovered.§

ENGRAVING. The art of producing designs by means of incised lines

upon plates of metal, &c., such as copper and steel, which, being filled with ink, yields impressions to paper, upon being submitted to the action of the press. Designs are also engraved upon various articles of ornament (**CHASING**) and upon sepulchral brasses, the details of which do not belong to the plan of this Dictionary, but they may be found in works specially devoted to the subject.¶ Gems and precious stones are also submitted to a process of engraving, either in *Cameo* or *Intaglio*. Engraving on wood is termed **Xylography**.

Italian **MAGOLICA** (vessels made of baked clay with the painting burnt-in), being a branch of Art closely allied to them.

† See Rapport concernant la Peinture en Email sur Lave de Volvic emailée, fait à la Société des Beaux Arts, par M. Mirault.

‡ Those who are curious on the subject of **WAX PAINTING** should consult an excellent pamphlet, entitled *Notice sur la Peinture à la Cire, dite Peinture Encaustique*, par M. A. Durozier. Paris, 1844.

§ See Rich's *Illustrated Companion to the Latin Dictionary and Greek Lexicon*.

¶ See FIELDING, *The Art of Engraving*, 8vo London, 1840.

ENGRAVINGS. Impressions upon paper taken from copper or steel plates; those from wood-blocks are usually termed **WOODCUTS**.

ENKYKLION. A kind of *Himation* used by the Greeks for wrapping round the person; or the half upper Chiton worn by the Greek women. See **CHITON** and **HIMATION**.

ENSIGN. The military standard of the Romans. This originally consisted of a wisp of hay or straw, but was soon succeeded by the representation of various animals, of which the Eagle was the most important (Fig. 1); this was formed of bronze or silver, and affixed to the summit of a pole or ornamented staff, upon which also were attached other emblematic figures (fig. 2, 3), portraits of the Emperors, &c. When Constantine had embraced Christianity, a figure or emblem of Christ, woven in gold upon purple cloth, was substituted for the head of the Emperor (fig. 4). This richly orna-

Fig. 4.

mented standard was called **LABARUM**. Other nations have also their peculiar **ENSIGNS**. See **SERRIN'S Dictionary of Greek and Roman Antiquities**.

EPICHRYSIS. A kind of pitcher or jug, used by the Greeks, with a narrow neck and small lip, from which the wine was poured into the drinking-cup. It was also adopted by the Romans.

EPIC REPRESENTATION. The Epos, or Epic poem, relates a grand event on which important consequences depend. In Plastic Art, Reliefs on Walls, and Friezes, and Eneastic, and Fresco-painting which can be executed on large surfaces as well as Oil-paintings, by which a considerable space on canvas may be filled, are peculiarly adapted for the representation of an Epos, or of a great action. But the artist has not, like the poet, the power of representing in connexion, those consequences of single events, scenes &c., which form the whole. The limits of connexion (with the poet often only single words, clever phrases, or striking transitions) are denied to the artist, and he must therefore limit himself to the means at his command, of showing in the clearest manner possible, the point of the event from which its consequences are developed. The Plastic artist can and may depict the moment of an event or a scene, including several events which he may define or suggest. To choose this moment rightly, to draw strikingly, and to execute intelligibly is the important task, in the performance of which the true master, and Epic Artist are seen. The Epic picture, whether it belong to plastic work or painting, is thus the representation of an important action of human life, of ancient or modern times, of distant or neighbouring nations, of events which have happened or which have been invented. It must in every case be true or probable, i. e., belonging to history and reality, or possible; in other words, the circumstances to be represented must be brought out conformably to Nature and Art, and have nothing contradictory in themselves. The Epic work of Art, is always only a fragment (though an important one), of a classic or romantic, of a more or less historical, or of a pure poetic Epos, often the quintessence of an Epos, but never the Epos itself. The Plastic descriptive work of Art is thus limited to the poetically important event, but is in its limitation the utmost concentration of history, while it brings forward a principal

action, with a short but clear glance of the most important preceding and succeeding circumstances, so that all forms are arranged in action in their due relation to each other, or to the principal point of the Picture. If this be undertaken with genius and happily executed by a masterly hand, the whole will not only attract the eye of the spectator, as a harmonious grouping of different details, rich in references and finding a centre point of union and conclusion, but will rivet his attention.*

EPITAPH. (*EPITAPHIOS, Gr.*) Song of praise, or oration delivered by the Ancients at their funerals; the Moderns understand by this term monuments in churches to the memory of the dead. Epitaphs are thus permanent objects of remembrance, and are either tablets or monuments lying upon the ground, and covering the Grave, such as tombstones and tombs. Epitaphs were general in the middle ages, and many beautiful sculptures now existing of the Roman and Oermanic styles belong to this class of Art. They were generally placed near the grave, and were of various forms, viz., statues, or reliefs in bronze or stone, tablets with carvings and paintings, &c. The weapons, fragments of armour, and drapery, banners and shields placed over or at the grave may be reckoned as Epitaphs. By a further perversion from its original meaning this word is now generally used to designate the *Inscription* commemorative of the actions and virtues (real or imaginary) of the deceased.

EQUESTRIAN STATUE. Statues of men on horseback, usually formed of bronze, but sometimes of lead and stone. London enjoys the singular eminence of possessing the worst equestrian statues to be found in any city of Europe.

ERMINE. The fur of the animal of this name. It is an emblem of purity, and of honour without stain. Robes of royal personages are lined with it to signify the internal purity that should regulate their conduct.

ESCALLOP. An emblem of St. James the Great, which is frequently met with in churches, dedicated to his honour. It is one of the attributes and insignia of pilgrims, adopted by them in their voyages to the sepulchre of this apostle, gathered by them on the sea-shore, and fastened on their hoods or hats as a mark of

the pilgrimage.

ESUTCHEON. The name applied to the shield upon which coat armour is emblazoned. It originally took the simple form of the knight's war-shield, as seen in our first example; but was afterwards varied in a fanciful manner, as exhibited in our specimens, which are selected from various heraldic esutcheons, whose dates range from the time of Edward I. to that of Queen Elizabeth.

ETCHING. That operation by which a slight depression is made at pleasure on the surface of a body by means of a liquid solvent, called Etching-fluid. This is properly a diluted acid, and metals and especially calcareous substances are used for etching upon. For the protection of those parts of the surface which are not to be deepened, and which ought not to be touched by the Etching-fluid, a resisting substance is necessary, which may either be wax, rubbed on the surface when warmed, or a thick varnish, but which generally consists of a preparation of resin; only in a few cases is that plan available which seems at first the simplest, namely, to cover solely those places which are not to be acted upon by the acid; the general method is to cover the whole surface, and then remove the ground in the required parts, as delicacy and clearness can only be acquired in this manner. The scratching away the ground is called **ETCHING**, and is performed with a fine steel needle, or in the broader parts with the pointed blade of a small knife. Etching upon copper is the most common; it is not only executed alone, but is used for the restoration of copper-plates and combined with other kinds of engraving. There are three kinds

* One of the finest examples of the Epic in painting is the *Hunnenschlacht*, 'Battle of the Huns,' by the greatest artist of modern times—**KATZBACH**. It adorns the gallery of M. Baczynski, at Berlin, and is a work of which not only Germany but all Europe may be proud. It is engraved in **RACZYNSKY'S Modern Art in Germany**. The frescoes illustrating the *Nibelungen Lied*, by Cornelius and others, in the palace of the King of Prussia, at Berlin, are fine examples of **EPIC REPRESENTATION**.

of Etching upon copper. **SCRAPING** or *real Etching*; **AQUA FORTIS**; and Etching in *relief* or **ECTYPOGRAPHY**. In the two first methods, the lines of the design are Etched-in; in the third method, the lights are Etched-in, and the lines of the design left standing in relief as are the letters of type-founders. Steel is treated in the same manner as copper. For etching on brass and silver, diluted nitric acid (*aqua-fortis*) is used. Gold is acted upon by nitro-muriatic acid (*Aqua Regia*), this etching is not used for impressions but only for ornaments, or as a preparation for the graver. For Etching on glass, only fluoric acid can be used, which is also employed to etch upon agate, rock-crystal, chalcidony, jasper, and siliceous stones. Calcareous stones, especially that used by lithographers, and also marble are available for etching, for which diluted nitric acid is used.

ETCHING-GROUND. The substance used to protect the surface of the metal, &c., from the action of the acid. It is usually composed of a mixture of wax and resinous substance, differing in composition according to the kind of engraving for which it is used.

ETCHING NEEDLE. The instrument by which the lines of an engraving are cut into the

metal. When used simply as a **BURNIN** to produce the intended effect without the aid of acid, it is then termed a **DRY POINT**.

ETCHINGS. Impressions upon paper of designs etched upon copper, steel, &c., usually limited to works executed with the **Dry-point**.

EVANGELISTS. On the earliest sculptures the **EVANGELISTS** are symbolised by four Serpents, or, with reference to the four Streams of Paradise, by four Rivers flowing down from a hill, on which stands a Cross and the Lamb, the **MONOGRAM** of

Christ. The representation of four Streams flowing from a rock, on which is the lamb, is mentioned in the letters of Paulina of Nota, it refers to the Apocalypse, ch. i. 17, and is also intended as a poetical image of the four Evangelists as the springs of Christianity, ever flowing to all parts of the world. They were afterwards represented as the forms out of Ezekiel, vii. 1-10, viz., a Man, a Lion, a Bull, and an Eagle, which are mentioned as supporting the throne of God (Rev. iv. 6-7). After the fifth century, the Byzantine artists, keeping strictly to biblical terms, represented the Evangelists (at first in mosaic) as miraculous animals, half *men* and half *beasts*; they had wings like the **CHERUBIM**, and were either in the act of writing or had a scroll before them. The human face was given only to Matthew or Mark, of which of these two was doubtful, even to the time of Jerome, with whom originated the present appropriation of the attributes; the other three had the heads of a Lion, an Ox, and an Eagle, with corresponding feet. This representation was customary for some time in the Greek Church. In the latter part of the middle ages the Western Church began to separate the human figure from that of the animal, and to represent the Evangelists only in the former manner, generally as writing, and three of them with the animals by their sides as Attributes. The four animals are often represented with scrolls, anciently inscribed with the initial sentences of each Gospel. In later examples the names of the Evangelists are inscribed on the scrolls, but the commencement of their Gospels is far more appropriate. In sepulchral brasses the Evangelistic symbols are found variously arranged, but they are most frequently placed so as to follow the same order (according to

Mr. Didron, this is the only correct disposition)* According to St. Jerome's arrangement St. Matthew had a Man or Angel by his side, because his Gospel begins with a genealogy showing the human descent of Christ. St. Mark has a Lion, the symbol of the royal dignity of the Saviour, and referring to the desert (Mark i. 13) in which he was with wild beasts. St. Luke has the Ox, the symbol of the high priesthood, because his Gospel begins with the history of Zacharias serving in the temple. St. John has the Eagle, the emblem of the divinity of Christ, and referring to the doctrine of the *Logos*, with which his Gospel commences. Christ was thus symbolised by the Evangelists, as Man, King, High Priest, and God. THE EVANGELISTIC SYMBOLS are found variously employed in Christian edifices and ornaments of every period in the history of Art, and they are introduced in Christian design under a great variety of place and circumstance, e. g. most appropriately on books of the Holy Gospels, enamelled in silver and set on the angles of the covers; on crosses, as being the four great witnesses of the doctrine of the Cross. For the same reason, on the four gables of Cruciform Churches; also in cross frontals for altars; at the four corners of monumental stones and brasses in testimony of the faith of the deceased in the Gospel of Christ; around images of the MAJESTY, the Holy Trinity, Agnus Dei, Crucifixion, Resurrection, whether painted on glass, or ceilings and walls, or embroidered on vestments or altar-cloths, as the Sacred Mysteries represented are described in the Holy Gospels.†

EXECUTION, in Painting is the term given to the peculiar mode of working for effect—the manipulation peculiar to each individual artist; where it predominates over FINISH, or where EXECUTION exhibits a studied eccentricity, it degenerates into MANNERISM, which, when it merely exhibits the manual dexterity of the artist, is usually the exponent of mediocrity: at the same time it must be admitted, that good execution is always aimed at by the true artist.‡

EXOMIS. In Grecian costume a garment worn chiefly by the working classes, with or without sleeves or with only one sleeve for the left arm, leaving the right and part of the breast exposed and free. It varied much in form, sometimes it was a CHITON, at others a PALUDAM, serving the purposes of each. In works of Art it is usually applied to representations of the Amazons, and to Charon, Vulcan, and Dedalus. It was also the dress of old men in the comic plays of Aristophanes and others. Our illustration of this article of dress is given from the statue of a Fisherman, in the Townley Gallery, at the British Museum, and very clearly exhibits the general form it assumed among the poorer classes.

EXPRESSION. That transient change which takes place in the permanent form of a face or figure, while under the influence of various emotions. This permanent form in its normal state may be sufficient to enable us to determine the CHARACTER, and be independent of Beauty, and not even indicative of a capacity for Expression, yet Expression will impart to a face of the most

ordinary character a charm closely allied to Beauty.* The chief feature of Expression is the EYE; it takes a thousand shades from the relations of the surrounding parts; and the EYEBROW, 'that dark arch which surmounts it,' is itself an eloquent index of the mind.† The various Affections impart their own peculiar characteristics upon the human countenance, which must be carefully studied by the artist; 'till he has acquired a poet's eye for nature, and can seize with intuitive quickness the appearances of passion, and all the effects produced upon the body by the operations of the mind, he has not raised himself above the mechanism of his art, nor does he rank with the poet and historian.‡' The disposition of the limbs and body in Expression belongs to GESTURE, much of which appears necessary and common to humanity, but much also belongs to national habits and customs.

EYE. The Eye is the most active feature in the countenance, the first of our organs to awake, and the last to cease motion. It is indicative of the higher and holier emotions, of all those feelings which distinguish man from the brute. In the Eye we look for meaning, sentiment, and reproof; it is the chief feature of Expression. A large Eye is not only consistent with Beauty, but essential to it. Homer describes Juno as 'Ox-eyed.' The Eye of the Gazelle illustrates the Arab's idea of woman's beauty, when he compares the Eye of his beloved to that of this animal. The timidity, gentleness, and innocent fear in the eyes of all the deer tribe, are compared with the modesty of a young girl.§ In a well formed face the Eye ought to be sunk, relatively to the forehead, but not in reference to the face; that would impart a very mean Expression. It is the strong shadow produced by the projecting Eyebrow which gives powerful effect to the Eye in sculpture.¶

EZEKIEL. One of the four principal Prophets. Like them, he bears a book; but his own peculiar attribute is a closed gate with towers, which is either placed in his hand or standing by his side, and which referring to his Vision of the new Temple, is the type of the heavenly Jerusalem, mentioned by St. John in Revelation. It is one of the most noble symbols of Christianity, and also alludes to the mystery of the miraculous Conception; for we find it together with Moses and the burning bush, Aaron's Rod, Gideon's Angel and Fleece, on the volets of a picture of the Virgin by Van Eyck, of which only a copy at Bruges is in existence. The subjects usually chosen by the painter in which Ezekiel appears are—his Vision of the Almighty, and his Vision of the Resurrection of the Dead, and in a group with the three other great Prophets.

ART IN CONTINENTAL STATES.

PARIS.—There has lately been brought to a close in Paris, the publication of a magnificent work, commenced fifteen years ago, and entitled *Trésor de Numismatique et de Glyptique, ou Recueil Général de Médailles, Monumens, Pierres Gravées, Sceaux, Bas-reliefs, Orniemens, &c.*; extending from remembrance to present times, and most curious with reference both to Art and History. Before making our readers acquainted with this important publication, we may mention that the wealthy collection of the British Museum, of the Bank of England, and many of our private collections, have, in a great measure, served to complete this great work; and that Mr. Paul Delaroché, the illustrious painter, whose works are so well appreciated in England, and Mr. Charles Lenormant, Keeper of the Collection of Medals of France, have both directed the vast undertaking.

* It is the opinion of many that there is no inherent Beauty in the normal human face, but that it consists entirely in the capacity of Expression, and the harmony of the features consenting to that Expression. Expression is even of more consequence than shape; it will light up features otherwise heavy; it will make us forget all but the quality of the mind. Vide SIR CHARLES BELL'S *Anatomy of Expression*.

† Besides the Eyes, in the countenance, the Brows, by which requests are granted or refused, appeared to the Ancients especially expressive of earnestness and pride; the Nose, of scorn and ridicule; laying the arm over the head denotes rest, still more completely if both are clasped upon it; the head supported on the hand, earnest reflection; crossing the feet over each other in a standing, or leaning posture appears to denote, in general, rest and firmness.—Vide MULLER'S *Ancient Art and its Remains*.

‡ Anatomy, in its relation to the Arts of Design, is in truth, the grammar of that language in which they address us. The Expression, Attitudes, and Movements of the human figure are the characters of this language, adapted to convey the effect of historical narration, as well as to show the working of human passion, and to give the most striking and lively indication of intellectual power and energy.—SIR CHARLES BELL'S *Anatomy of Expression*.

§ Let her be as the loving hind and pleasant roe." Vide SIR CHARLES BELL'S *Anatomy of Expression*.

of the *Trésor Numismatique et de Glyptique* consists of twenty volumes in folio, and contains upwards of a thousand plates in folio, which reproduce more than fifteen thousand Art-reliefs; it is also divided into three classes: 1st. The antique medals, cameos, &c.; 2dly. The coins of the middle ages, and those appertaining to modern history; 3dly. Those of modern times.

In the 1st class, which consists of four different works: first, the numismatic art of the Greek kings; second, the *Iconographie* of the Roman emperors and their families; third, the new mythological gallery; fourth, the bas-reliefs of the Parthenon and Phigalian marbles; we may confine ourselves, for brevity sake, to mention the works of the Greek and Roman periods. The numismatics of Greek kings, conceived on an entirely new system, differ in many essential respects from the splendid, but costly, "Iconographie Grecque" of Visconti. The work of this illustrious antiquarian, although more comprehensive, as it contains the marbles, bronzes, paintings, engraved gems, and medals, is less complete than the present work, which contains about ten times the amount of matter, whether medals or authentic and celebrated engraved gems. All the cameos, and all stones, whether engraved in relief or intaglio, are given of the exact size of the originals. The portraiture of the Roman emperors and their families, extends to the widest range of Roman numismatics, and also includes the most celebrated antique cameos. This volume also contains ten times the number of medallic specimens to be found in the work of Visconti; there being eighty cameos, and upwards of a hundred intaglio, the size of the originals; whereas, in Visconti, the number of cameos is nineteen, and intaglio seven, and these are either reduced or augmented in size. The finest specimens have been selected from the collections of France, Vienna, Dresden, Munich, Florence, Naples, St. Petersburg, Weimar, &c.

In the 2nd classification, forming ten separate works, in fourteen volumes, on the middle ages and modern history; the medals struck or chiselled in Italy, during the fifteenth and sixteenth centuries, claim especial notice, so various, so fine, so truthful, and so delicately are they worked. Artist and connoisseur will equally relish and study the works of the celebrated Victor Pisano, a Veronese artist, and cotemporary of Masaccio; he executed a great number of admirable medals, and succeeded in founding a colony of illustrious engravers, who afterwards overspread Italy: his chief pupils were M. de' Pasti, his rival; Julio della Torre, Jan. Maria, Pomodoro, Jean Carotto, &c. Secondly, the volumes on the seals of the kings and queens of France, those of England, the great dignitaries of France, &c., at once interesting as art and history. Amongst the seals of the dukes of Burgundy may be noticed for their admirable workmanship those of Charles the Bold, and of Mary of Burgundy, his daughter.

3dly. The selection of the finest French medals from the time of Charles VIII. to 1798, forming three volumes, includes the work of Dupré and Warin, two eminent French engravers, who have engraved the large and magnificent medallions of Henry II. and Catherine di Medici; Charles IX., Henry III., Henry IV., and Mary di Medici, and all the great men of those different reigns. It is especially owing to these two engravers, gifted with such rare and fertile powers, that France ranks so high in this peculiar branch of Art.

4thly. The general collection of bas-reliefs and ornaments, or typographical medley of ivories, weapons, trinkets, and furniture. The artist, the antiquarian, the ornamental carver, and the amateurs of antique productions, will find numberless objects of interest, copied with a fidelity and delicacy incomparable.

The third and last class, which contains the contemporary art of Numismatics, has been condensed into two volumes, in which will be found the medals commemorative of the French Revolution of 1789, and the medals of the "Empire," and the Emperor Napoleon. All the medals of the French Revolution are generally more curious as historical documents than brilliant works of art. The reverse is the case with those of the "Empire," not only are they interesting as examples of the French chisel, they often record facts which have escaped the chronicles of the time. They afford a singularly faithful picture of the political revolution of ideas, and the passage from democratic to monarchical principles, which is as striking as the dissimilarity of the Arts at each epoch.

Whether we glance over the plates of this large work, or the accompanying text, we are bound to acknowledge that the *Trésor de Numismatique et de Glyptique* is the most important work of Scientific Art, which has appeared either in France, or even Europe, for the last fifty years. All our

at the British Museum, and very clearly exhibits the general form it assumed among the poorer classes.

* It is worthy of particular notice, that in the Vision of Ezekiel, each of the four animals had four faces, being those of a man, an lion, an ox, and an eagle; whereas in the Vision of St. John, the four faces are on four distinct beasts. The union of the four evangelistic symbols in one animal is called a TETRASTORON.

† See PUGN'S *Glossary of Ecclesiastical Ornament and Costume*. LORD LINDAV'S *Essays on Christian Art*. DIDRON, *Iconographie Chrétienne—Histoire de Dieu*.

‡ By the term EXECUTION, I understand the right mechanical use of the means of Art to produce a given end. All qualities of Execution, properly so called, are influenced by, and in a great degree dependent on, a far higher power than that of mere Execution—knowledge of truth. For exactly in proportion as an artist is certain of his end, will he be swift and simple in his means; and as he is accurate and deep in his knowledge, will he be refined and precise in his touch.—*Modern Painters*, vol. i.

public libraries may be proud of possessing so rich and splendid a collection.

THE GALLERIES OF VERSAILLES.—Several amateurs of painting, who have recently visited these galleries, have remarked that the large pictures placed in the recently constructed Salles of the Croisades, Constantina, &c., are in such a damaged state that, if immediate steps be not taken, it will be difficult to preserve them from complete destruction.

The late king Louis Philippe having demanded that the Standish and Spanish Galleries in the Museum of the Louvre should be given up to him, the Government, unwilling to assume the responsibility of granting or refusing the request, referred the matter to the Council of State; and it has been by them decided that the two collections shall be restored to the family of the deceased sovereign. The *Athenæum* adds:—"It is now said that the deceased king had been content with the formal admission of his claim,—and that one of the last (and one of the many munificent) acts of his life which France has to set against his errors when she shall have time to be just, was to present these two collections to the nation that drove him out to die in exile.

The Parisians have recently inaugurated a statue of Baron Larrey—Napoleon's famous Chief of the Surgical Staff—in the Court of the Val de Grace. The ceremonial was attended by deputations from all the learned bodies of which the Baron was a member, and one from the old soldiers of the Empire clad in the costume of that time. The statue is the work of M. David; and the bas-reliefs which decorate the sides of the pedestal, represent respectively the Beresina, the Pyramids, Austerlitz, and Somo-Sierra.

BRUSSELS.—The *Brussels Herald* states that the commercial value of the works of art contained in the churches of Antwerp, eleven in number, is, by the late financial report of the province, estimated at 49,763,000*f.*, nearly two millions of English money.

VENICE.—The Emperor of Russia has purchased the celebrated Barbarigo Gallery at Venice. It had been carried to Vienna for the inspection of the Archduke Reginer, on the extinction of the family who had formed it; but after remaining there for some years, the purchase was declined. It contains many *chef-d'œuvres* of the great masters, and as many as seventeen Titians. The Emperor has purchased the whole for 560,000*f.*

CORRESPONDENCE.

SIR,—In the last number of your valuable Journal, your contributor, Mr. Robert Hunt, has fallen into some inadvertencies which I wish to point out.

In an interesting account which he gives of the proceedings of the British Association, at its late meeting in Edinburgh, he makes the following remarks upon my communication to that meeting:—

"As this hypothesis of Mr. D. R. Hay has already been the subject of a communication to the Society of Arts, and having been published by the author, we are not satisfied that it correctly found a place in the proceedings of an association, the object of which is purely the advancement of science by the announcement of new facts or statements of the progress of investigations."

Now the paper I brought before the meeting of the British Association at Edinburgh, was never brought before the Society of Arts; neither has the subject, although now in the press, been published by me. The matter is, no doubt, of a nature quite cognate to papers that I have brought before the Society of Arts, and works that I have already published; but the scope and tendency of the paper in question were exactly what Mr. Hunt truly says are the objects of the Association, for in it *new facts were announced, and statements of the progress of investigations were made.*

Mr. Hunt further observes, that "although disposed to regard the really beautiful as the result of a spiritual power, which will not be controlled by any set formula, or bound within any geometrical lines, it is pleasing to see that the spontaneous emanations of the Greek mind conform to laws—undreamed of by the Greek artists themselves—which are found to prevail through the mechanism of the universe."

Mr. Hunt has written much, and written well, upon the application of Science to Art; and it is, therefore, strange that he should make such remarks as the above. It is a dangerous doctrine, and has hitherto tended to retard the progress of the Fine Arts in this country, to teach that genius is above the observance of any rules. The student in high Art should rather be taught that a know-

ledge of the set formula, by which the human form may be bound within geometrical lines, is of as much importance in assisting the efforts of his genius, as a set formula of grammar and of the mechanism of verse are to the poet. The genius in both cases is, doubtless, a spiritual power; but that power is, in both cases, subject to definite laws, which can be taught and which may be understood by men ungifted with that genius which constitutes the true poet or the true artist. When Mr. Hunt observes, that the great works of Grecian Art were spontaneous emanations of the Greek mind, and that the geometrical laws to which these works are now found to conform, were "undreamed of by the Greek artists;" he apparently forgets that it is recorded in the most authentic histories of ancient Art, that Pamphilus, the master of Apelles, Melanthius, and Pausias, taught a mathematical principle in Art of such importance that his pupils paid a fee of one talent (25*l.* sterling) for which—according to the Abbé Bartholinus—he engaged to "give them, for ten years, lessons founded on an excellent theory;" and that Parrhasius, the rival of Zeuxis, who flourished about the same time, is stated to have accelerated the progress of Art by being in the highest degree acquainted with the science of proportions.

The fact, therefore, appears to be, that the great works of Art handed down to us from the ancient Grecians, at the period of their highest excellence, were as much the result of a thorough education in certain mathematical laws which constituted a science of proportion, as they were the result of spontaneous emanations of mind. A science of proportion and geometrical beauty must sooner or later be the principal branch of education in our schools of Art—else they must remain in their present unsatisfactory condition.

Mr. Hunt denominates my system of geometrical beauty "an hypothesis." This is a misnomer; for nothing remains hypothetical that can be mathematically demonstrated.—I remain, Sir,

Your most obedient servant,

D. R. HAY.

EDINBURGH, Sept. 8th.

PAXTON'S PALACE OF GLASS FOR THE EXHIBITION OF 1851.

This important building having been definitely arranged, the ground enclosed, and Messrs. Fox, Henderson & Co. busily engaged on the materials for its iron frame-work, and Messrs. Chance, of Birmingham, on the glass, it behoves us to give a few notes of its arrangement and size. The main measurements are as follow:—The plan is a parallelogram, 1848 feet long and 408 feet wide, with an addition on the north side, 936 feet long and 48 feet wide. The height is 66 feet. Nearly midway, 900 feet to the centre, on the west side, and 948 feet on the east, a transept is formed, with a semi-circular roof, 108 feet high from the ground, to enclose a group of trees. This further serves to break the long line of the side elevation, and marks out the central entrance. There is another principal entrance at each end. The main parallelogram is formed into 11 divisions longitudinally, alternately 24 feet and 48 feet wide, with the exception of the great central walk, which is 72 feet broad. There are three large refreshment courts. The area on the ground-floor is 752,832 square feet; the area of the galleries included in the contract is 102,528 square feet, making a total of 855,360 feet. Other galleries may be introduced if needed, affording an additional area of 90,432 square feet.

The iron columns are placed 24 feet apart, and are to be of similar form throughout. For convenience of construction the sash bars and each pane of glass are of precisely equal sizes, so that the entire of this immense building may be prepared in such a manner that it will merely want putting together on the ground. The number of columns, varying in length from 14 feet 6 inches to 20 feet, is 3320. There are 2244 cast-iron girders for supporting the galleries and roofs, besides 1128 intermediate bearers or binders, 358 wrought-iron trusses for supporting roof, 34 miles of gutters for carrying water to the columns, which are hollow, and serve as water-pipes, 202 miles of sash-bars, and 90,000 superficial feet of glass. The building will stand on about 18 acres of ground, giving, with the galleries, an exhibiting surface of 21 acres; but provision will be made for a large increase of galleries if necessary. The gallery will be 24 feet wide, and will extend nearly a mile. The length of tables or table space for exhibiting will be about 8 miles. An idea may be formed of the unprecedented quality of materials that will be employed in this edifice, from the fact that the glass alone will weigh upwards of 400 tons. The total cubic contents of the building will be 33,000,000 feet.

The amount of the contract by Messrs. Fox & Henderson for the use and waste of the materials employed in the building, is 73,800*l.*, the whole building to become the property of the contractors, and to be removed by them. If, on the contrary, the building be permanently retained, the cost of it will be 150,000*l.* That it will be permanently retained we feel no doubt; and the way in which it might be made available as a winter-garden, or great covered place for riders and pedestrians in bad weather, has been strongly enforced by many of our contemporaries, in whose opinions as to the advisability of its permanency we entirely concur. It will always be an ornament to the park, and will in many ways be available for public gratification, at the same time that it will be constantly ready for future Exhibitions whenever they occur, and an immense amount of trouble, as well as expense, saved to the country.

The roof of the building, also of glass and iron, consists of a series of ridges and valleys, eight feet span, running transversely, so that there is a valley at the head of each column. Along the sloping sides, without and within, the water is conducted into gutters at the head of each column, whence it escapes through the columns themselves. The provision for ventilation is, according to Mr. Paxton, a very peculiar part of his plan. The whole building, he says, will be fitted with louvre, or louver boards,—so placed as to admit air, but exclude rain. The roof and south side of the building will be covered with canvas,—and in very hot weather it may be watered and the interior kept cool. In the transept alone there will be above 5000 superficial feet of ventilators provided,—and it will be found that, if Mr. Paxton has erred at all in respect of the means of ventilation, there will be too much rather than too little. By covering the south side and roof of the building with canvas, a gentle light will be thrown over the whole of the building,—and the whole of the glass of the northern side of the building will give a direct light to the interior. On each side of the central entrance are the pay-places, rooms for the Royal Commissioners, the committee, clerks, &c. At the east and west entrances are pay-places and clerks' rooms.

As materials for consideration, we may here mention, that the space demanded by the metropolitan districts, up to August 1st, is 27,774 square feet of floor or table, and 24,243 square feet of wall space. For Manchester, it is said 10,000 square feet have been guaranteed. America has accepted 80,000 square feet.

The preliminary proceedings connected with the building, are already being carried on with considerable vigour. Several temporary sheds have been erected within the space enclosed by the hoarding, for stores—including a large one, 200 feet in length, intended to be used as workshops; and another, 60 feet in length, for the use of clerks, draughtsmen, and others connected with the works. This latter shed has a roof constructed upon the same plan as that designed for the building itself, consisting of five series of ridges and valleys filled with glass of the same size as that intended to be used throughout the whole of the beautiful structure. Sheds have also been erected for the gate-keeper and for visitors, and as a pay-office for the men employed in the works. In addition to this, a number of men have been employed in preparing for the construction of the main sewer, which is intended to be connected with one recently formed by Mr. Alger, the builder, between Knightsbridge-barracks and Kensington. A considerable supply of the cast-iron pillars to be used in the structure, have arrived from the foundry, and are deposited on the ground.

There is one important question, regarding the protection from piracy of articles exhibited, which is discussed in the following circular issued to all local committees in connection with the commission, and which, having had several communications on the subject, we think it necessary to insert, as notwithstanding its circulation in the daily papers and through other channels, it appears not to be generally known.

"Office for the Executive Committee,
"1, Old Palace, Westminster, Aug. 26, 1850.

"Sir,—In reference to the eighth decision of Her Majesty's commissioners, which states that 'arrangements will be made for the protection of articles which may be exhibited, from piracy of the design,' I am instructed by the executive committee to request that you will inform your local committee that an act has been passed in the last session of parliament, which enables exhibitors at the Exhibition of 1851, with the view to obtain a protection from piracy for special classes of articles which they may exhibit, to secure a provisional registration of them, which is for a year, or even eighteen months, if so extended by the Board of Trade.

"The nature of the articles and character of the protection afforded, are defined by the two several Designs Acts of 1842 and 1843.

"By the first (5 and 6 Vict. c. 100) a copyright or property is given to the authors or proprietors of original designs for ornamenting any article of manufacture for terms varying from twelve months to three years, on payment of fees varying from 1s. to 3s. And by the second act (6 and 7 Vict. c. 65) a copyright of three years is given to the author or proprietor of any new and original design for the shape or configuration, either of the whole or any part of any article of manufacture having reference to some purpose of utility, on payment of a fee of 10s.

"In both cases the copyrights are conferred and protected from piracy by a penalty of from 5s. to 30s., recoverable either by action in the superior courts or by a summary proceeding before two magistrates.

"During the continuance of the provisional registration the proprietor of the design may exhibit it, and may sell or transfer his right, and at the expiration of the term may register the design in the usual form. It is necessary that intending exhibitors should clearly understand that the provisional registration conferred by the new act, cannot be applied to the articles of new manufacture or invention for which a protection by letters patent is necessary.

"I am further instructed to say that there are reasonable expectations that the Lords' Committee of Privy Council for Trade will be pleased to determine that the rights of provisional registration shall be granted, without payment of any fee whatever, to all persons exhibiting any articles at the Exhibition of 1851, which would be entitled to claim protection under the above mentioned acts, and that the commissioners for the Exhibition of 1851, will be enabled to afford facilities to exhibitors to effect such provisional registration in the building of the exhibition.

"It will be my duty hereafter to transmit for your information, the rules which it may be necessary for exhibitors to follow in availing themselves of this privilege.

"I request you will have the kindness to communicate this letter to the mayor of your town (if any) and the chairman of your local committee, as early as possible.

"I am, Sir, your obedient servant,
(Signed) "M. DIGBY WYATT."

This letter, if we understand it rightly, scarcely settles the question of protection, or at all events certainly does not settle it satisfactorily; for we find in a paragraph towards the end of the circular, that "it is necessary intending exhibitors should clearly understand that the provisional registration conferred by the new act, cannot be applied to the articles of new manufacture or invention for which a protection by letters patent is necessary." So that it would appear, an exhibitor, however ill able he may be to spare the money, must unless the privy council for trade should interfere, of which there seems to be some doubt, though a "reasonable expectation" be at the expense of taking out a patent; unless this "expectation" be grounded on some superior foundation than that which attended the application of Mr. Kerr, of Paisley, for the remission of the duty on the cards used in the manufacture of his shawl, there is little hope of a favourable result.

ART IN THE PROVINCES.

LIVERPOOL.—The Annual Exhibition of the Liverpool Academy opened on Saturday the 14th of September. The private view on the day previous to its opening was numerously attended, and sales to a large amount were effected. On entering the great room we found Ansdell's large picture of 'The Rivals,' 'Baptism in Scotland,' by John Phillips; the two pictures 'Rachel,' and 'Esther's Emotion,' by O'Neill; 'The Halt,' by Ansdell; J. Noel Paton's 'Quarrel of Oberon and Titania,' and his 'Reconciliation of Oberon and Titania,' the property of the Royal Scottish Academy of Painters; 'Please Remember the Grotto' by Webster, R.A.; Turner's picture of 'Van Tromp going about to please his masters, ships a sea, getting a good writing; Egg's 'Peter the Great sees Catherine his future Empress for the first time;' 'A View of the Port of Marseilles,' by E. W. Cooke; Martin's picture of 'The Last Man;' a clever group of flowers by Miss Mutrie; and a picture of great excellence by W. Huggins, called 'A Morning Ride.' Over the fireplace is the large picture of 'Samson Betrayed,' by F. R. Pickersgill, A.R.A., which has obtained the Academy's prize of 50*l.* In proximity to this are small pictures by G. Stanfield, E. A. Goodall, F. H. Henshaw, W.

Oliver, G. Dodson, &c. The next angle of the room contains 'The Kitchen in the Palace of Sir Thomas Mayfield, in Sussex,' by C. Landseer; and the 'Hayfield,' by Alex. Johnson; J. E. Lauder's 'Belarius, Guidarius, and Arviragus, returning from the hunt;' 'A Harvest Field,' by Witherington; W. D. Kennedy's picture of 'Happy Hours—Italy as it was;' Sant's 'Morning;' Hannah's 'Lady Northumberland and Lady Percy dissuading the Earl from joining the wars against Henry IV.'

The next angle, approaching the first entrance, commences with a group 'Cattle,' by T. S. Cooper; Frith's picture of the 'Coming of Age;' a landscape—'Evening,' by Creswick; F. Goodall's picture of 'The Post-Office,' &c. Having gone round the line, it may be necessary to notice that there are clever and interesting subjects in good situations, by E. Duncan, C. Branwhite, C. Bentley, F. H. Henshaw, H. B. Willis, F. F. Minshall, G. A. Williams, W. E. Deighton, H. Jutsum, R. Tongue, H. M. Anthony, J. Linnell, S. R. Percy, J. Stark, B. Callow, E. C. Williams, W. Havell, and others. The portraits are ably sustained by Westcott, J. Robertson, and others.

Entering the second room, we observe, over the door which leads into the third room, the full-length portrait by Illidge of the 'Hon. Sir Edward Cust, K.G.H.,' and on each side portraits of the 'Marchioness of Douro,' and 'Group of Portraits,' by Gambardella. On the line in this room we find a small picture of great merit, by R. Hudson, from 'Comus;' 'Landscape,' by J. W. Oakes; a large circular picture, called 'A Dutch Port—Sunset,' by A. Montague; 'Venice,' by W. Linton; the 'Orphans of the Village,' by F. F. Minshall; 'Landscapes,' by J. C. Bentley and A. Clint; a very cleverly painted subject, by Miss M. Gillies, called 'In the Dominic, speravi,' being a female in the act of kneeling; and some good architectural subjects by W. Oliver. Over the fireplace in this room is Lucy's picture of 'Charles I. parting with his Children;' 'A Winter Scene,' by H. Bright; adjoining is a picture of the 'Water Tower and adjacent scenery at Chester,' by W. G. Herdman, powerfully coloured; as is the next, by W. Havell, the view of 'Rhyddlan Castle—North Wales.' In the centre of the side opposite the entrance is R. S. Lauder's picture of 'Gallioti, the Astrologer, showing Louis XI. the first specimen of Printing;' over this is a large 'Landscape,' by J. W. Allen, 'Cooper's Hill, with Windsor Castle in the Distance,' on the line is 'Kenilworth,' by F. H. Henshaw; 'Fruit,' by G. Lance, and various Landscapes.

The Water-Colour room contains little worthy of notice, it being unusually meagre in this department. On surveying the whole, it will be seen that no new picture of any importance has been produced, and that many of the principal works exhibited in London during the present year have been transferred to Liverpool; yet the Exhibition is well sustained. There are some clever works in the miniature department by J. Pelham. Of the local members of the Academy, some of the names we find altogether absent; the chief exhibitors being J. Robertson, F. Westcott, W. G. Herdman, and W. Huggins, the animals of this last-named artist being very clever. The Sculpture is ably sustained by the Liverpool members—Robertson and M'Bride; the portrait-sculpture of this last gentleman being of the highest order of merit. His 'Bust of John Miller, Esq.,' is a splendid specimen of this branch of art. From the reports we have received, a most prosperous season is anticipated, which we hope to find fully realised.

BIRMINGHAM.—The annual exhibition of the Society of Artists in this town is now open. The five rooms in which the pictures are hung, contain 423 paintings, and four pieces of sculpture; among the latter is a fine colossal marble bust of Mendelssohn, by Hollins, intended to be placed in the Town Hall of Birmingham. In the catalogue of the pictures we recognise many works which have figured on the walls of the metropolitan galleries, such as Roberts's 'Temple of Edfou;' Turner's 'Blue Lights and Rockets;' Etty's 'Three Graces;' E. M. Ward's 'Isaac Walton;' Linnell's 'Eyre on the Deluge;' Stanfield's 'Three Fishermen on the Dogger Bank;' Corbould's 'Elgiva in the hands of the creatures of Odo;' Armitage's 'Aholibah;' R. S. Lauder's 'Quentin Durward;' Zeiter's 'Hungarian Peasants,' &c. &c. Among the names of other contributors we find those of A. Cooper, T. S. Cooper, A. E. Chalton, J. J. Chalton, Egg, Frith, Herbert, Leslie, Pugh, Witherington, J. W. Allen, Anthony, J. C. Bentley, Boddington, Branwhite, D. Cox, Hurlstone, A. Johnston, Le Jeune, Linton, Oliver, Tennant, Vickers, &c. &c.; and among the water-colour artists those of Copley Fielding, Callow, Davidson, J. D. Harding, Mrs. Harrison, Mrs. Margetts, Miss Steers, Penley, &c.

The local artists are ably represented by Harris, Wivell, Underhill (lately of Birmingham), Durt, Coleman, Collis, Henshaw, Lines (Sen. and Jun.), H. H. Lorsty, J. C. Ward, W. Hall, J. E. Walker, &c. Altogether the exhibition is one of a very satisfactory nature.

An exhibition in aid of the fund for the proposed alterations of Queen's College, is also to be carried out in this town. Winterhalter's picture of the Royal Family has been lent by the Queen, and several others have been contributed of a high character, by gentlemen who take an interest in the success of an exhibition which promises to be fully deserving it.

DEVONPORT.—An Exposition of Industrial and Artistic Works was opened at the Mechanics' Institute of this populous town, on the 2nd of September. The inhabitants of the place and its vicinity, interested in the undertaking, had been actively engaged for some time previously, in rendering the exhibition as attractive as possible, the result of which is that they have succeeded in accumulating a vast variety of objects of all kinds, useful and ornamental, ancient and modern, a title of which it would be impossible for us to specify. The opening of the rooms took place in the presence of a large number of visitors of both sexes, including the Mayor of Devonport, many naval and military officers connected with the dockyard and the garrison. Several speeches were made on the occasion, and prizes awarded for mechanical and other scientific inventions and improvements, for models of machinery by adult persons and apprentices respectively, for naval architecture, the Fine Arts, architectural plans, maps, ladies' work, &c. &c. We cannot avoid noticing an excellent feature in this distribution of prizes, namely, that which distinguishes the works of the young from those of mature age, and gives the former an opportunity of gaining a reward without the chance of failure by entering into competition with the man of more enlarged experience. This must operate as a powerful incentive to those who are but novitiates in the mysteries of Art and Science.

EDINBURGH.—ST. MARGARET'S CHAPEL.—This venerable example of ecclesiastical architecture is at present undergoing some alterations with a view to its restoration. Several of the ancient windows of the chapel, which had been built up, are now opened, and filled with stained glass, the work of Messrs. Ballantine and Allan. The stained glass windows are only temporarily fixed, as it is the intention to have a series of figures representing St. Margaret, King Malcolm her husband, and St. David her son. Only one of these figures, that of St. Margaret, at present occupies its position. It is inscribed "S. Margarita, Scotorum Regina. Obiit xvi. Nov. m.c.c.iii."

LANCASTER.—Two rich and elegant stained glass windows have lately been erected in Lancaster Parish Church, at the east end of the north and south aisles. Murillo's celebrated picture of "Las Aguas; or Moses Striking the Rock" (now in the Hospital of La Caridad, at Seville) has furnished the subject for that at the north-east end, and this has been presented by Richard Newsham, Esq., of Preston. That at the south-east extremity is "Christ's Charge to Peter," which has been adapted from Raphael's cartoon, and is the gift of Mrs. Hornby, of Lancaster. The windows have been designed by Mr. Wallis, of Newcastle-on-Tyne, and the execution reflects great credit upon his taste and talents. The large east window, which contains two distinct subjects, "The Crucifixion" and "The Ascension," was executed by the same artist a few years ago, and the entire of the east end of the church, with the elaborately carved wood-work, now presents a very rich appearance.

CHELTEMHAM.—The charming situation of the Old Wells in this favoured city, has been just rendered highly attractive by the erection of a spacious saloon adapted for musical and dramatic entertainments. It is due to the spirited enterprise of Messrs. Rowe and Onley, who celebrated the completion by a concert, in which the abilities of the first London vocalists were displayed. The greatest care has been employed in the internal decoration, to render it worthy of the cultivated society resident in the locality. The proscenium, or stage, is of the most elaborate detail in the Renaissance ornamentation. The drop-scene represents one of the lakes of Upper Italy, seen from the portico of an Italian Palazzo, decorated with statues placed on an eminence with descending terraces, forming a perfect triumph over the difficulties of perspective laws. As may be guessed, it is painted with the vigorous sunny effect of Southern Europe, and reflects the highest praise for design and execution on Mr. Charles Marshall, the talented scenic artist of Her Majesty's Theatre.

ANCIENT BRONZE VASES.

It was correctly observed by Sir Joshua Reynolds that, when the higher branches of Art met with encouragement, those of a less exalted character would most surely flourish; for amongst the number who, roused on by a laudable ambition, seek wealth and reputation in the pursuit of art and science, many will withdraw from the high road to these intellectual attainments, contented with trading successfully in the narrower path. When therefore a period is characterised by the display of unusual taste in an inferior department of art, it may be taken for granted that the higher branches of art were energetically and successfully cultivated. For instance, with respect to the vases herein represented, we feel convinced that, owing to the flowing line and exquisite taste of detail which these exhibit, they are the productions of a period in which the highest aims of art were held in view, and the most important of all artistic studies, that of the *human form* made paramount. In truth, the contemplation of no object save that of the "human form divine," can suggest so graceful and undulating an outline and create the refinement of feeling, which these vases display.

The adaptation of the snake-like form to handles is a thought which we are familiar with. In the specimen before us that thought is happily employed: to combine natural objects with artificial ones is not an easy task; such a combination to be pleasing must have nothing strained in its appearance, but on the contrary should seem readily to suggest itself, as in the present instance.

The vases which these woodcuts represent were discovered at Volterra, a town of ancient Etruria; the forms which they exhibit are captivating. The contemplation of such graceful objects gives rise to important considerations. It may be remarked that with the ancient Greeks the power of designing well was a fruitful source of wealth; it constituted with them an intellectual market to which they drew foreign nations from far and near. It was felt that even to design forms applicable to the more humble accessories of domestic life, such as implements in daily use, details of household furniture, &c., it was necessary to bring to the task a

cultivated mind as well as a skilful hand; hence such apparently trifling details as those under immediate consideration, were not unfrequently, as regards the design, the productions of beings whose natural element was to be found in the loftiest regions of Art; although therefore the great beauty

of such comparatively trivial works enchant us, it need not excite our surprise, since such trifles were for the most part the playful offspring of minds practised in elucidating the noblest themes. Hence these little matters acquired immense value;

value in proportion to that of mind over matter. Beauty of form is to inanimate substance, what virtue is to the human being; both these qualifications give to their respective subjects a sterling worth, an arduous interest; a healthy well-constructed frame is a great desideratum in the human being, but goodness of heart stands first; so careful and substantial construction in dealing with matter

is no doubt a very important aim, but beauty of conception as regards the form which matter is to assume, is paramount; for the contemplation of matter enlivened by the charm of gracefulness, is a source of joy to man whose eye is formed to take delight in beauty. To the highly refined Greeks the contemplation of the Beautiful had become a necessity, hence, with that nation mediocrity in Art

was not admissible; consequently, none but the greatly skilled and highly gifted administered to this their intellectual feast. The cultivation of, and devotion to beauty possessed with the Greeks the universal influence of religion; it was a sentiment that, pervading all ranks and uniting individuals, served as an intellectual bond of union to that nation which—otherwise so divided and so pugnacious—recognised in this universal feeling a common ground upon which it could combine, with the olive branch in hand; for all Greece propitiated Minerva. With us how different a state of things exists! We are generally more regardful of the precise way in which a work is to be executed than of the sentiment which should be conveyed to the mind; frequently intrusting the care of designing the object to the very mechanic

who is to execute the work. To this neglect of the arts of design, and want of appreciation of the very essence and nature of those arts, is to be attributed the fact so happily alluded to by a most intelligent writer of the present day, "that the ladies of England have not, and cannot obtain objects of such pure taste as those commonly possessed by the wives and daughters of the simple peasants of ancient Greece."

A. W. II.

THE VERNON GALLERY.

THE CHURCH OF ST. PAUL, ANTWERP.

D. Roberts, R.A., Painter. E. Challis, Engraver.
Size of the Picture, 4 ft. 8 in. by 3 ft. 7 in.

PRIOR to the suppression of the monastic and ecclesiastical establishments of Belgium, resulting out of the first French Revolution, the Church of St. Paul at Antwerp was known as the Church of the Dominicans, from being attached to a convent of that religious order. It has little in its external appearance to attract notice, but the choir and chancel, which form the subject of the engraving, are very fine; and before the period alluded to, this edifice contained some excellent pictures by Rubens, Van Dyk, the elder Teniers, G. de Crayer, Jansens, Boyermans, and other Flemish painters. A few of these still remain, but the majority were removed by the French when they held possession of the city, and have never been re-instated in their original locality, although they are to be found in other parts of Belgium. The museum of Antwerp possesses several. Those which the church now contains, are four subjects from the life of our Saviour—the "Annunciation," by Van Balen, and the others by Jordans, Mastact, and another painter, whose name is not given; "St. Dominic distributing Rosaries to the People," a copy by Quentemont, after Caravaggio; "The Assembly of the Council," by Rubens; "The Seven Acts of Mercy," ascribed to the elder Teniers; "Christ bearing his Cross," by Van Dyk; "The Adoration of the Shepherds," attributed to Rubens; "The Crucifixion," by Jordans; and an historical subject from the life of St. Norbert, by De Crayer. But by far the finest picture here is Rubens's celebrated "Scourging of Christ;" it is not however shown to visitors, but a good copy, by Van Trendyck, is exhibited in its stead.

Over the high altar, seen in the engraving, where a modern picture of no very high merit—a "Descent from the Cross," by C. Cels—now stands, was originally placed an important painting by Rubens, which represented "Christ with a thunderbolt in his hand," &c. &c.; it is now in the museum of Brussels.

The interior of the "Church of St. Paul" is altogether fine, it is lofty and light in its style of architecture; marble has been principally used in it. The windows of the choir exhibit passages in the life of the saint to whom it is dedicated; they were designed and painted by A. Diepenbeke. A "Confessional" by Verbruggen, in the style of the *Renaissance*, is regarded as the finest piece of sculpture in wood, even in a land so eminently rich in examples of Art of this class as Belgium is.

The view selected by Mr. Roberts for his picture, shows, of course, the most important and picturesque portion of the interior; the choir, with its richly carved stalls, and the high altar of marble with its columns, sculptured by H. Verbruggen, who also executed the fine figure of "St. Paul," which is seen above the altar-piece. These ornamental works were given to the convent by Capello, Archbishop of Antwerp, who, when he had paid the sculptor for his labours, presented him, at the same time, with an elegant silver ewer and dish, in testimony of his great satisfaction.

We consider this picture one of the finest that the artist has painted; it has an air of lightness about it, corresponding with the elegance of the sacred edifice; and this lightness is in no degree impaired by the rich, dark, wood-carvings of the stalls. The manipulation is free and easy, while a nice distinction has been preserved in imitating respectively the wood and the marble; to the latter, on the pavement especially, the most beautiful polish has been given. The church is filling with a number of figures, habited in the costumes of the middle of the seventeenth century, most of them dressed as Spaniards, Antwerp being, at the time when the church was in its highest state of grandeur, much resorted to by the nobles and merchants of Spain.

This picture was exhibited at the Royal Academy in 1849: it was painted expressly for Mr. Vernon.

regards the design, the productions of beings whose natural element was to be found in the loftiest regions of Art; although therefore the great beauty

cutted than of the sentiment which should be conveyed to the mind; frequently intrusting the care of designing the object to the very mechanic

chants of Spain. This picture was exhibited at the Royal Academy in 1849: it was painted expressly for Mr. Vernon.

THE CHURCH OF ST PAUL ANTWERP

FROM A PHOTOGRAPH BY J. VAN DER WEGHE

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY.—We do not recollect any preceding period so many vacancies as there are at present in this Society. First, there is the office of President to be filled up; next, four Academicians are to be elected in the room of Sir Martin A. Shee, Sir William Allan, Etty, and Decring; and, finally, five Associates are to be chosen in the room of those who will receive the higher grade, with the addition of one in the place of W. Westall. All these vacancies have occurred by deaths since November last, the month when elections take place. We have heard many names mentioned as likely to succeed to academical honours, but we refrain from giving publicity to the reports which have reached us, although, with respect to the Presidency there ought not to be any doubt. The office of Keeper is also, we understand, vacant by the resignation of Mr. G. Jones, R.A.

BEST OF MR. VERNON.—This memorial, from a few artists and admirers of Mr. Vernon's princely gift to the country, has just been placed in the entrance-hall of Marlborough House. It is the work of Mr. Behnes, who has produced a most striking and spirited likeness of the deceased gentleman, one that cannot fail to be immediately recognised by all acquainted with his features. Independent of the undoubted resemblance it bears to the original, it is excellent, regarded simply as a work of Art. It stands on a square pedestal of scagliola, whereon are inscribed the names of the contributors and the purpose of their testimonial. The position in which it is placed is admirable as regards light and the colour of the wall at its back, but standing behind Gibson's group of "Hylas and the Nymphs," though at a little distance from this, it may easily escape recognition by visitors who proceed at once to the picture-rooms.

MR. PARK'S STATUE OF WALLACE.—A meeting has been held in Edinburgh to enable Mr. Park to proceed with his colossal statue of the "Deliverer of Scotland." A subscription has been entered into for completing the model, a cast in plaster is then to be made and exhibited, to enable the public to judge as to whether it should be erected in a more perfect form.

MR. CORROUILL has received a commission from Her Majesty to paint a large picture of the coronation scene in the opera of *La Prophète*, as seen upon the stage of the Royal Italian Opera, Covent Garden. The selection by Her Majesty of this gentleman is particularly happy, inasmuch as his peculiar talent will insure great success in a subject so suited to him.

MR. CALDER MARSHALL has finished his statue of Clarendon, for the new Houses of Parliament. It exhibits our great statesman in the striking and noble manner in which he deserves to be contemplated.

LORD WARD'S collection of pictures, about 120 in number, is temporarily placed in the great room at the Egyptian Hall, preparatory to its public exhibition.

MR. EDWARD DAVIS, who has been for some time engaged over a model for the bronze figure of the Duke of Rutland, has just completed his labours; the figure is to be set up in Leicester, and cannot fail to be an object of interest and ornament to that ancient town.

THE NORTH LONDON SCHOOL OF DRAWING AND MODELLING has had a very successful commencement. During the first two months there were more applications for admission than could be complied with, although the room is calculated to accommodate 200 students. During the last month of the term, the members fell off in some degree; but the heat of the summer months always has this effect in similar schools. The second term commenced on Sept. 11th; and if the attendance remains as good as it has hitherto been, there can be no question that the school must exercise a most extensive influence for good, over the workers of relief ornament. The progress of the students has been very satisfactory, and their attention during the hours of study has been most gratifying to witness. It has of course been far beyond the powers of one master, however energetic he may be, to superintend the studies of from 140 to 170 men,

which has been the ordinary nightly attendance out of 200 names on the books; and consequently it has been found necessary to give Mr. Cave Thomas some assistance. Mr. T. Seddon, Jun., who possesses the advantages of being an artist, and who *practically* understands the application of Art to Manufacture, has undertaken the duties of second master, and is about to be officially appointed as such. The committee have been obliged, notwithstanding the strictest economy, to incur heavy expense in fitting up the school, purchasing casts and models, in printing and other matters necessarily incident to the commencement of every undertaking of the kind. And as it will be found impossible to charge the students such fees as will suffice altogether to defray current expenses, together with a proper remuneration for the master's services, the Committee will be to a certain extent dependent on the assistance of all interested in the progress of Art, and the improvement of our working classes, to enable them to carry on the school efficiently: it is sincerely to be hoped that such parties will not be backward in supporting an institution, the object of which is to enable our workmen to enter into fair and honourable, but undoubted, rivalry with foreign workmen. Application has been made to the Board of Trade for a grant of casts and models for the use of the school. It is greatly to be desired, that the prejudices of the authorities at Somerset House (to whom such applications are usually referred,) against the principle adopted by the committee of teaching to draw only from *objects in relief*, will not act to oppose the grant; but that the board, feeling that this is at least a step in the right direction, will assist the committee in the proposed way, even if the grant is only made temporary. An application has been made to the Royal Botanic Society, Regent's Park, for the occasional loan of plants for use in the school; as most desirable objects of study. But a refusal has been given, on the plea of *inconvenience*. A commencement has been made in the formation of a class for females, which it is hoped may lead to very favourable results, in giving to a most numerous class of young women, who at present are above or beneath the usual occupations for females, the means of obtaining an independent income.

BRITISH MUSEUM READING-ROOM.—At the re-opening of the reading room on the 9th of Sept., after the usual close for the first week in that month, a great improvement was visible to its frequenters. A supplemental catalogue of 153 folio volumes has been compiled for the use of the students, and a duplicate copy also provided to facilitate the readers, who will now scarcely ever have to wait while another is using it, as heretofore. All the titles of new books, as well as of others obtained since the old printed catalogue was compiled, are entered, so that they can now be obtained readily. The brass screen-work has been very properly removed from the large collection of books of reference which line the rooms, and extra light admitted from the side windows. The Grenville Library has received due attention, and a catalogue of that also is now accessible.

HIRAM POWERS' STATUE OF MR. CALHOUN.—If the American Sculptor has been unfortunate in having his works consigned to the deep, he is far more fortunate in recovering them. We learn from an American paper that his statue of Mr. Calhoun, which in our last number we stated was wrecked at the entrance to New York, has been found by the United States revenue cutter Morris. The Captain of the vessel is about to return to the spot where it lies, with the necessary apparatus for raising it; he says the statue is in perfect order, and can be got up with little trouble.

REMOVAL OF THE MARBLE ARCH IN FRONT OF BUCKINGHAM PALACE.—For some days men have been engaged in erecting scaffolding round the marble arch in front of Buckingham Palace, for the purpose of its removal. A part of the railing of the Green Park nearly opposite to the northern corner of the Palace, has been taken down, and a short distance on the other side of it, boarding has been erected, for a space of sixty yards long, by thirty wide, within which the

stones of the marble arch are to be deposited, until they are otherwise disposed of. When the arch is removed, the new front of the palace, which has just been completed, will be seen to much greater advantage, and will greatly add to the beauty and imposing appearance of the building. By the way, there is a rumour abroad, which seems warranted by the present appearance of the locality, that it is the intention of the authorities to deprive the public of some portion of the gardens which they have long regarded as their own property; we trust that nothing so likely to engender dissatisfaction and unpopularity will be attempted.

BLACK LEAD.—A discovery of a large mine of this valuable material is said to have been made in New Brunswick, as we learn from the following paragraph extracted from the *St. John's News*:—Within a mile and a half of this city, near the Falls, a discovery, consisting of black lead, was a short time since made, which bids fair to become a great and valuable staple article of export from this province, equal to gold itself. A company, consisting of six spirited gentlemen, was at once organised; they leased the ground from the Government, consisting of a superficies of three miles in extent, and set men to work to dig. A specimen of this lead, got out yesterday, may be seen at our office; it is as pure as if it had been manufactured for use; whereas in England, whence we obtain our black lead, the yield is only 70 per cent. to the miners, the other 30 being of foreign substance. The supply near the Falls is inexhaustible. The surface of the earth for two miles is coated with it, and the deeper it is dug the purer is the quality. Millions of tons of black lead, superior to any in the world, now lie at our feet, for use and exportation; and our readers may have some idea of the value of the article when we inform them that our merchants have been in the habit of importing black lead from England, and paying 38s. per cwt. for it. The article, as it is dug, will command in the English market 20*l.* a ton, and a much higher price in the markets of the United States, where we are informed the duty is but nominal. The St. John's Mining Company—the designation they are known by—have already shipped 44 cwt. of New Brunswick black lead to Liverpool; to New York, 240 cwt.; and as much more to Boston.

IMPROVEMENTS IN PHOTOGRAPHY.—M. Blanquet Everard proposes the following method for preparing photographic paper, to be used *dry*, on the camera, and by which he states as fine an image is procured, and in as short a time, as on the *damp* paper usually employed, where high sensibility is required:—Take curdled milk, and separate the clear portion by filtering. Beat up with about three-fourths of a pint of this serum the white of one egg; this solution is then to be boiled, and again filtered, after which five grains per cent. of iodide of potassium is to be dissolved in it. The paper to be used is to be immersed in this mixture, and suffered to stand in it for two minutes, it is then to be removed, and hung upon a cord by a corner to dry. Thus far the paper can be prepared in ordinary daylight without any particular precaution, and it may be used immediately or kept for six months. The subsequent part of the process is in most respects similar to that previously recommended, the paper being rendered sensitive by a solution made of—

Nitrate of silver	1 part
Crystallised acetic acid	2 parts
Distilled water	10 parts.

M. Everard has also employed albumen alone very successfully, in rendering paper more fitted for receiving the photographic images. In all cases, however, he still adopts the method of developing the picture by gallic acid. We announced in a former number that the fluoride of potassium combined with the iodide had a peculiar accelerating power; that pictures could be taken by means of this salt in a second. M. Nicpoe de Saint Victor now states,—“Of all the accelerating substances with which I am acquainted, I have not found a better than Narbonne honey. It accelerates the process without presenting the inconvenience of such substances as the fluorides.” If this honey is mixed

with the albumen obtained from stale eggs, the greatest degree of acceleration is obtained.

"EXHIBITION VISITORS' ACCOMMODATION IN 1851.—A register is about to be opened at No. 1, Old Palace Yard, Westminster, by the Secretary of the Executive Committee for the Exhibition of 1851, in which will be entered the names and addresses of persons disposed to provide accommodation for artisans from the country whilst visiting the Exhibition next year. It is proposed to furnish copies of this register of lodgings and accommodation to all the local committees. Other arrangements are under consideration for guiding the working classes on their arrival by the trains to the lodgings they may select. The register will contain a column in which the nature and charges for the accommodation each party proposes to afford, will be entered.

THE WILL OF THE LATE SIR ROBERT PEEL, which has been proved at Doctors' Commons. He directs that his pictures at Drayton shall be held by his trustees, in trust for the person who shall, for the time being, be entitled to the possession of the house at Drayton. His books and prints are bequeathed to the present baronet; by a codicil, executed on the 12th of March, last year, which relates solely to his literary possessions, he bequeaths all his manuscripts and correspondence, which he states he presumes to be of great value, as showing the characters of the great men of his age, to Lord Mahou and Mr. Cardwell, with the fullest powers to destroy such as they think fit; and he directs that his correspondence with Her Majesty and her Consort and himself, shall not be published during their lives without their express consent. The trustees are to make arrangements for the safe custody and for the publication of such of his manuscripts as they may think fit, and to give all or any of them to public institutions; and the codicil contains general directions for the custody of such as shall not be disposed of in such manner. By the codicil of March 24th, 1849, all the profits which may arise from the publication of his manuscripts are to be applied for the benefit of literary men or for literary objects.

EXHIBITION OF ANCIENT ART.—The Archaeological Institute announce that, instigated by the success of the Medieval Exhibition at the Society of Arts, they contemplate forming a Central Museum of Ancient Arts and Manufacture, to be held in London simultaneously with the Great Exhibition of 1851. If sufficient space can be found, they suggest that a collection of paintings, illustrative of the early advance of the Art, especially in Great Britain, might be added. We think the idea, if carried out with taste and spirit, could not fail in general interest.

ST. STEPHEN'S, WALLBROOK.—This church is now undergoing a complete repair and restoration. The east window which was bricked up in 1796, is to be reopened, and West's picture is to be placed in the north transept. The organ gallery is to be enriched, and a new cornice to be placed over the altar, which is to be richly decorated with carvings of fruit and flowers. This portion of the ornamental work has been entrusted to Mr. W. G. Rogers, whose peculiar ability for the task needs no encomium from ourselves; and we are glad to find his merits honoured also in the sister island, the Royal Society of Dublin having awarded him their gold medal for the works he recently exhibited in that city.

MONUMENT TO WORDSWORTH.—It is satisfactory to us to be enabled to announce, that upwards of 9000, have already been subscribed towards a befitting monument to this distinguished poet. We are sorry to find, however, that it is not to be erected amid the scenes he immortalised, but in Westminster Abbey, and we cannot look upon this arrangement otherwise than as an act of—

"Giving a sum of more, to that which has too much."

We do sincerely hope that a fine work may be the result of the public desire to commemorate Wordsworth, something which shall not be a mere portrait statue, but a high poetic embodiment; and we hope our sculptors will compete vigorously for the honour.

FOREIGN PENCILS.—An importation having taken place from Hamburgh of a quantity of lead pencils of foreign manufacture, on which

the names of the importers were marked, and therefore detained as being imported contrary to law, the authorities decided that as the names thereon had the appearance of *characters* they could not, therefore, be considered as of British make, and were to be delivered. Is not this carrying out the principles of free trade beyond their ordinary limits?

FREE PUBLIC LIBRARY IN LIVERPOOL.—The town council of Liverpool, by a large majority, have recently determined on the establishment of a free public library; we are always rejoiced to record the foundation of such institutions, which do so much for the well-being of every district. The liberal views of the proposers, it is gratifying to observe, have been met as liberally by the Royal Institution of the same place, who have agreed to hand over to them their library, museum, and gallery of Arts, without any pecuniary consideration whatever. It is to be hoped that the recent government grants for the aid of public libraries and local museums, may be made of much service by similar foundations elsewhere.

M. MINASI.—This veteran artist continues to practise his art with wonderful power, especially when his advanced age is taken into consideration. He has recently completed a pen-and-ink drawing of Caxton's portrait, underneath which is the house of the typographer, and a view of his first printing-press; they are executed with marvellous delicacy and effect, so as scarcely to be distinguished from the finest line-engraving. These drawings of M. Minasi are certainly curiosities of Art, for accuracy and finish; we should be glad to hear he has found a purchaser for them.

EXHIBITION OF BOOKBINDING.—At the close of the month of August, the Bookbinders' Association held their annual exhibition, showing much taste and proficiency in the Art. Their specimens were very varied, and exhibited the styles of many ages and countries most successfully. A table clock-case, richly and tastefully tooled, attracted much notice. The exhibition was altogether highly creditable to the body.

MONUMENTA HISTORICA BRITANNICA.—Under this title a volume has made its appearance, which is a *rare avis* in this country; produced by the government, and at its expense. It is not gratifying after the constant complaints made by all *literateurs* of the want of government patronage or assistance, to see any thing disparaging when a move is made by our rulers in this direction. But, unfortunately, this book has been "jobbed," as all things else seem to be, whenever a chance occurs of "a government contract." It consists of lithographic plates of coins and fac-similes of ancient manuscripts, the coins being executed in a very feeble manner, and descriptive pages of letter-press; the body of the book consisting of chronicles which have, since this book was begun, been reprinted in a cheaper form. To effect this, the enormous sum of 9000*l.* has been spent, over an edition of 700 copies, the volume consisting of 1200 pages; and the charge originally being five guineas. The return for all this is a sale of 46 copies, so that as a matter of business it may be pronounced a decided failure; and no man of business in the book trade will wonder thereat, there being none among them who would think of paying so large a sum for the production of such a work, simply because they could get it done as well for a much smaller one. In order to get rid of the 610 remaining unsold, the price has been reduced to two guineas. Still we predict the work will "lag" in its sale, and we think it would but be just as well as generous, if the government were to present copies to public libraries and literary men, particularly as compulsory claims are made by government on all literary works, for a few privileged libraries, some, like the Bodleian, giving little or nothing to the world of literature in return—unlike the British Museum, being more inclined to close their doors than open them to the student. There are many literary men who have suffered from this forced tax, after producing at their own risk expensive works; many others, like all good scholars not blessed with much money, who cannot afford to purchase such expensive volumes; to all such the volume might be a useful text book, and public money being spent with little hope of a

"trading" return, a graceful step in the right way might enable the government to make some return to many institutions, and men to whom the nation is indebted for much moral good and mental labour.

MR. CURRB'S LOCKS have long been celebrated for their excellence and utility; they are about to be made as remarkable for their external beauty. He is preparing several most highly wrought, after the fashion of Medieval works of the kind, and for exhibition in 1851. A striking and beautiful improvement in the shape of key-handles is also being made by him, introducing ornament of a varied and beautiful kind; when we consider the variety of decoration which may be adopted in this manufacture, we cannot but wonder that it has not been in use before. Our readers may remember that we suggested this peculiar improvement in articles of the kind, in a paper in our Journal for the year. It was this paper, Mr. Chubb states, which suggested to him these improvements.

MODERN VANDALISM.—The beautiful oriel window of John o' Gamut's Palace at Lincoln, so well known to antiquaries, and which excited the attention and admiration of the Archaeological Society in 1848, was advertised for sale a short time since (preparatory, it is supposed, to some alterations), when Earl Brownlow became the purchaser. His lordship has since presented the window to the county magistrates, with a view to its being preserved in the Castle, which will form an appropriate site, it having been one of the official residences of the Prince John. The south wall, which contains this window, is the only portion of the palace that has not fallen a prey to the hand of time, or the taste of a late proprietor. The front next the street, which was tolerably entire when Buck published his view in 1726, with the arms of England and France quarterly on a large shield, has been entirely pulled down and rebuilt, and deprived of its ancient character and ornament, the window, which has survived the chances of 500 years, covered with sculpture, is still in good preservation.

PORTRAITS OF SHAKESPEARE.—Within a recent period a portrait and a plaster cast, purporting to be both representations of the immortal Poet, have come forth, challenging attention. The painting represents the Poet on a bed after death, the cast purports to be moulded from his features. Both came from the Continent, where they are reported to have been carried immediately after the Poet's decease, and kept religiously as heirlooms. It must be borne in mind that there is no name on either, nor any but traditional proof of the name of the person whose features they display. All that connects itself with Shakspeare is so slight, we have so few mementos remaining to us, that it is no wonder if the urgent desire of the world to possess more should occasionally be gratified. Talma, the great French tragedian, was more than charmed with a pretended "genuine" portrait, "discovered" in a country house, painted on a pair of bellows! and in his enthusiasm ornamented his prize with a frame of jewels, and a case of velvet. He was satisfied; so was the party who had duped him. For ourselves, we own to great scepticism on Shakspeare portraits, and believe in none but the Stratford bust, and the first f^oto print, with due allowance for the bad execution of the latter. There is no sound reason for trusting in others.

TORONTO INDUSTRIAL EXHIBITION.—The arts and manufactures of Canada are proposed to be collected and exhibited in Toronto, not only with a view to the reward and display of native talent in its own home, but also with the design of collecting from Upper Canada such articles as it may be desirable to transmit to our Exhibition of 1851. The prize articles will be transmitted, after the close of the present Exhibition, to the provincial fair at Montreal, where they will again compete for provincial prizes, and if successful, be forwarded to England at the public charge, an arrangement which has received the sanction of the House of Assembly. It will thus be seen that in the new world, as well as in the old, the "note of preparation" is sounded, and a vigorous response may be expected, of which we shall hear something on this side of the Atlantic.

REVIEWS.

THE ANTIQUITIES OF RICHBOROUGH, RECUVER, AND LYMNE. By G. ROACH SMITH, F.S.A. J. R. SMITH, Old Compton Street, London.

The wanderer on the Kentish coast, who may have passed heedlessly by the few ruined walls which alone mark the site of the Roman towns, whose remains furnish the subject of the present volume, would scarcely fancy that the antiquary could find interest in them—might only wonder at it—and pass on amazed at such, to him, profitless enthusiasm. That such shapeless masses of ruin, standing so bleak and desolate on the solitary shore, should add their quota to our knowledge of the earliest, the most important, and the darkest period of English history, and resuscitate forgotten ages and their manners, might be doubted; but when proved, would show that the reflections of the judicious antiquary are not to be despised. To him past ages have bequeathed their secrets, and by him must they be revealed to the present. It is not, however, all who call themselves antiquaries to whom so valuable a privilege is accorded; it is not the mere collector of odds and ends because they are old, and the worshipper of grotesque carving because it is quaint and ugly, or the mere measurer of a building, who is the true antiquary; but he who can discover the ore from the dross, and add to our fund of useful knowledge by his researches, and "make the dry bones live." This is the great privilege of the archaeologist; and this the test of the useful student of "lymes old."

Among the many who trundle from the modern watering-place Ramsgate, round Pegwell Bay, to the ruined walls of Richborough, how few could feel or would be inclined to believe, that 170 quarto pages might be profitably occupied, or occupied at all, in detailing its history and its interest! yet the present volume does this, and might have been much enlarged, had not its author been of that rare and conscientious class, who give the largest amount of information in the smallest amount of words. It is not a little curious to note the clearness and accuracy of his deductions, from the smallest scrap of evidence he obtains, whether it be but a simple fragment of inscribed tile, the work of a Roman legionary soldier, or a denarius which may have dropped from the purse of one of "the fair daughters of Italy," when Rome ruled the world and first planted its standard on our own shores. Each fragment of pottery, each fractured urn, tells its tale; the shattered column speaks of the gorgeous temple of which it once formed part; the brief inscription utters the long-past glories of old Rome.

What Wordsworth so beautifully says of the unobservant worldling, or the mere utilitarian—

— "a primrose by a river's brim,
A yellow primrose is to him;
And it is no thing more!"

will equally apply to those who find no "sermons in stones," that compose the walls of an antique edifice; far otherwise is it with the educated eye, that can read the mute but eloquent history they tell, and by its repetition force the attention, and ultimate respect of the most casual observer.

The collections of Mr. Rolfe, of Sandwich, the gathering of many years from the Richborough locale, have greatly contributed to the volume before us; and Mr. Smith, by his judicious comments upon them, adds us very considerably in a knowledge of that darkest portion of history, the habits, manners, and modes of domestic life among the Romans and their immediate followers. The elegant Samian Pottery, with its tasteful ornament and its mythological or other figures, speaks abundantly of the pure and elevated taste of the Romans in domestic life. The rude imitations of the native potter tell a tale of mental inferiority. Mr. Smith says, with much critical acumen, "The philosophic antiquary, who in the meanest work of the hand of man reads, to a certain extent, the mind which guided it, may speculate how far the one may illustrate the other, and, comparing the rude jugs and platters of the middle ages with the Roman *simpulum* and *patena*, sees as great a difference as between the sober history of Tacitus, and the fables of Geoffrey of Monmouth, or between the versification of a poetical monk and the Odes of Horace."

The barbaric magnificence and elaboration of the personal ornaments of the Anglo-Saxons testify to their rude but gorgeous taste, and are quite in accordance with the character of the people; quite as much so as the glass tumbler which holds its pint of liquor, destined to be quaffed ere it can be again set sideways on the table, illustrates and enforces the historic character of these "brewers of strong drink," who exhaled "the six-bottle men" of the last century.

It is this illustration of the more obscure periods of our early history, those periods which occupy but a few pages in our English annals, while the later centuries are spun out *ad nauseam*, that makes the present volume so valuable. Mr. Smith says, that "considerable information has of late years been obtained on the state of Kent during the first ages of its occupation by the Saxons, from discoveries made in the burial-places scattered over the country, and particularly in the eastern districts. They are all Pagan in character; and the objects found in them are not only frequently of Roman origin, but they show in many instances, that Roman habits and customs had been adopted and associated with those of the new inhabitants, to an extent, which must considerably modify our assent to the popular belief that the Saxon invasion either exterminated the Roman monuments, or the influence of Roman civilisation."

Both Richborough and Reculver claim much interest from their early association with the Christian faith. Richborough is traditionally assigned as the place where St. Augustine landed, A.D. 597. Reculver had a church partly constructed from a Roman temple situated in the midst of the Castrum.

The encroachments of the sea on this part of the coast are curiously shown by the map of Reculver in 1855, for the first time engraved in the work before us. About twenty-five rods of land have been gradually washed away since that time; Leland in the reign of Henry VIII., notes it to have been "within a quarter of a mile or little more of the sea." The antiquities found here have been desecrated on by Mr. Smith as ably and probably as before.

Of Lyme, the *Portus Lemnis* of the Romans, one of the greatest keys to Britain, sharing with Rutupia and Dubris commercial importance, as the medium of communication with Gaul, the best account is given in the volume before us. Its lonely situation and fragmentary character had attracted little notice; and it is due to Mr. Smith to record, that it was owing to his persevering zeal that the present extensive excavations were carried out, previous to which it was extremely difficult to form an approximate notion of the original form of this castrum. The irregularities of the ruin is now proved to have been the effect of a hand-slip, and the consequences produced must be quite as curious to the student of nature as to the antiquary.

It will thus be seen that the present volume is not the mere compilation of the closet; but that a considerable amount of active research has been undergone in its production. The entire amphitheatre at Richborough has been exhumed, and the castrum at Lyme trenched entirely round for the first time, its form determined, and the history of its destruction satisfactorily given. A large outlay and much manual labour have been expended on this; but it gives value and originality to Mr. Smith's volume; and exhibits the persevering and untiring industry of his labourer.

The volume has been copiously illustrated by F. W. Fairholt, F.S.A., who has worked in a fellow spirit with the author. Ten plates and more than a hundred woodcuts are given in the work. Their chief merit is their scrupulous exactness; but this appeal to antiquarian requirements will be duly appreciated by all to whom the volume is addressed.

USEFUL HINTS ON VENTILATION, EXPLANATORY OF ITS LEADING PRINCIPLES AND DESIGNED TO FACILITATE THEIR APPLICATION TO ALL KINDS OF BUILDINGS. By W. WALKER, Engineer. Published by J. T. PARKES, Manchester.

Few things are more simple than Ventilation, and there are few about which more nonsense has been written, or for which so large an amount of absurdity has been perpetrated. The principles by which the circulation of air is regulated, are few. Nature has no complicated machinery in her works; and it is fortunate for man that the laws established for the regulation of physical phenomena cannot be disturbed by the meddling of scientific pretenders.

Warm air ascends from its being lighter than the same bulk of cold air, and its place is supplied by air of a lower temperature. By this tendency to an equilibrium, large and small currents are continually being generated, and a more uniform condition of the atmosphere produced, than could by any other means be established.

Air is varied by the exhalations of crowded cities; carbonic acid is formed and sulphuretted hydrogen generated, which would soon destroy animal life but for the beautiful provision of a natural law. Carbonic acid, from its weight, would remain near the ground, and sulphuretted hydrogen would also remain floating in the lower

regions of our atmosphere. The law of diffusion in these and all similar instances exerts its power, the denser body attracts unto itself the lighter one, and a mixture takes place which rapidly leads to a dilution so great that these poisons are rendered innocuous; and it appears probable that even chemical decomposition is effected by the same power.

In the most ill-adjusted building, it is most fortunate nature carries on her own ventilating processes; retarded they may be, they are never stopped; and the best condition of ventilation is such an arrangement as that we find in an Irish cabin, a hole in the highest part of the roof through which the smoke is to escape.

In large buildings, factories, and the like, this arrangement is not always easy, but the attempts to produce the same results by the complicated machinery of furnaces, air-shafts, &c., have never been successful. Open a chancel, through which heated air may obey the law of gravity, and all the other desiderated results will follow.

The book before us would have been a much better book than it is, if the author of it had not a plan of his own to propose. He does this, however, fairly and honestly enough—but being himself a *ventilator*, he joins in the cry against windows and doors, which, to him, appear to be almost a barbarism. Like everyone of the "ventilating doctors," he would have us live like the ferns in Ward's cases, to which the smallest possible amount of air enters by any natural inlet; that which is demanded being duly filtered in by air-ways, and when used, drawn off by shafts. Windows occasion currents of air, and hence they are declared to be bad things, but scientific ventilation has in no instance yet furnished us with a better result. Let us, by being freed from the ever odious window-tax, be enabled to double their number in all our houses,—and thus have a fulness of light and air—let the blessed breezes of heaven blow their healing breaths through our rooms, and we want no "scientific" ventilation. We, for ourselves, have no desire to reduce ourselves to the condition of stove-plants, unable to hear the undiluted air; let us rather imitate the sturdiness of the mountain-fir, and court, rather than avoid, that full fresh current of the atmosphere which bears health and cheerfulness upon its wings.

Those that desire to know what has been done in the way of artificial ventilation, will find this little book useful, and as such we recommend it.

ENGRAVINGS OF SAINT PATRICK'S BELL AND SHRINE. Published by WARD & Co., Edinast; HODGSON, London.

A series of five beautifully executed chromo-lithographic drawings, gives faithful representations of an Irish ecclesiastical bell which is supposed to have belonged to St. Patrick, and the several sides of the jewelled shrine in which it has been preserved for many centuries. A descriptive essay accompanies the plate, in which its history is narrated. The earliest mention of the bell occurs in the annals of Ulster, in the year 552, in which it is noted as one of the relics of St. Patrick, brought by Columbkille to a shrine sixty years after his death; and upon which it was usual to administer oaths, the infringement of which, when taken on this valued relic, as noted by the Four Masters, in an account of the punishment inflicted on the inhabitants of Lower Dundalk in 1044, was generally severe. In process of time it was enshrined in the very costly and elaborate case which is delineated in the present work, and upon which is an inscription denoting the time of its fabrication, in the reign of Donald O'Lochlainn, who came to the throne of Ireland in 1083, and died in 1121. The style of ornament adopted in this shrine, is precisely in character with that found on other monuments of the period; serpents interlaced in the most intricate manner, and enrichments knitted and wreathed in a very elaborate style, interspersed with richly set jewels. As a work of early art we have scarcely ever seen one more worthy the notice of the antiquary; it is as fine an example of Irish art in the twelfth century, as could be offered to the inspection of the curious; and the manner in which the plates are executed, leaves nothing to be wished on the score of beauty or accuracy. It may be safely recommended as a national work, creditably performed, and worthy the best attention of all lovers of ancient Art, of which it is a most remarkable example.

SHAKESPEARE'S SEVEN AGES. Etched by E. GOODALL, from the Designs of D. MACLISE, R.A. Published by the ART-UNION OF LONDON.

When these designs were exhibited at the Royal Academy, in 1848, we expressed a hope that they would be engraved for publication. We know not, nor is it of importance, whether our remark sug-

gested the idea to the Committee of the Art-Union, but they have had them engraved and distributed to their subscribers for the present year; in thus doing they have acted judiciously, and so we have no doubt their subscribers will think with us, for the series forms a beautiful little volume. Mr. Madell's drawings were executed in pencil; the peculiar form he has given them, which, however, in no way detracts from the elegance of composition, arises from their being originally intended to ornament the border and centre of a porcelain plateau. In these subjects, the poet's ideas are poetically rendered, and with a beauty and accuracy of drawing which no artist of the present day can surpass; the subordinate characters introduced into each sketch, are, to our mind, not the least felicitous points of the respective compositions, especially those in the last plate, where the contrast between the youthful figures in the background, and that which portrays "second childishness," is admirably developed. Mr. Goodall has etched the plates in a manner worthy of his high reputation as an engraver.

ILLUSTRATIONS OF THE REMAINS OF ROMAN ART IN CIRENCESTER. Published by G. BELL, London; BAILY & JONES, Cirencester.

The history of early Britain has yet to be written; and its compilation to be made from such books as the present, or such researches as have contributed to the formation of this volume. It is but by slow degrees that we exhume the long-forgotten traces of past ages; here and there the plough turns up a jar of coins, or the uprooting of a tree brings to light a Roman pavement, telling its tale of the art and luxury which these wonderful people introduced into our land. A railway cutting occasionally, as at Ramsgate, finds its way through an unknown cemetery of early Saxons; and many a warrior's grave is laid bare, contributing his weapons to our museums; or a fair lady's "narrow house" is broken in upon, and her valued jewels, prized in life, coveted, and preserved with her in death, are brought forth to show us how far the Arts of luxury had then reached. It is from the careful accumulation of minute facts such as these, and a comparison made between them and the fragments of written history or general literature remaining to us, that that dark period, the early history of Britain, is to be illumined by the scholar and the antiquary. Each old city of our land, each lonely ruin, or early earthwork, tells its tale, and all will aid in the reconstruction of the shattered fragments of a people's history by a people's hand.

Cirencester is remarkable for the noble remains of Roman Art it possesses; we are told "scarcely an excavation takes place within the limits of modern Cirencester, without disinterring some well preserved relic, of interest in itself, and of value in enabling the antiquary to arrive at important conclusions concerning the history of a people whose protracted residence in our island has ever since exerted great influence, even upon the manners and customs of the present inhabitants." Persons scarcely reflect how long a period the Romans occupied Britain; three hundred years they held sway, and during that time they must have done much to naturalise themselves here, and humanise its people.

The range of the Cotswold Hills, forming an important barrier almost in the centre of our island, had been long chosen as a military post; and a range of earthworks extends from "Clifton Downs, near Bristol, across the Valley of the Severn, to the jutting promontories of the Cotswolds, at West-ridge and Stinchcomb Hills, passing on from one prominence to another, along the whole range beyond Clevee Cloud and Nottingham Hills."

Corinium, the modern Cirencester, situated close to this important range of hills, was early colonised by the Romans; and it possessed an amphitheatre whose form is still visible, and numerous buildings of an important kind, as the remains occasionally discovered testify. Fragments of really fine sculpture are still visible in the grounds of Miss Masters; while Earl Bathurst's Park, in the immediate vicinity, exhibits a most beautiful tessellated pavement, representing O'pheus charming the brutes. The pavements, however, discovered in 1849 are very remarkable for their beauty; and these being hitherto unpublished are given in full detail. They are singularly curious and tasteful, and are admirably given in the work before us, so that we seem to be looking at the things themselves, so faithfully are they reproduced. The analysis of the tesserae and of the glass found here is of much interest, and testifies to the care bestowed on the volume in all its details. The notes on early fresco-painting are also good; and the volume altogether reflects great credit on the local press, from which it is issued.

THE ENTRY OF THE SAVIOUR INTO JERUSALEM. Engraved by the Anaglyptograph, from the original Prize Bas-relief, by JOHN HANCOCK. Published by the ART-UNION of London.

The peculiar effect so readily obtained by the process of engraving here adopted in copying Mr. Hancock's work, is excellently adapted to its full development. The surface of the print really appears embossed, while the broad lights and shadows are well rendered. The composition is very simple and good, and the dignified character imparted to the followers of the Saviour, contrasts beautifully with the groups of women and children who joyously welcome him. The subject and its treatment cannot fail to popularise this print.

SKETCHING FROM NATURE. By JOHN WOOD. Published by WHITTAKER & Co., London.

Mr. Wood is well known to many artists and amateurs as the author of an excellent "Manual of Perspective." His aim in the present publication is to place in the hands of the young student, a work which will enable him to apply what he has gained in-doors to the world of nature without. This object he sets forth in a clear and simple manner; but there is nothing in the book which we have not seen once and again in other publications of a similar kind, nor do we think that the examples afforded by the illustrations will do much to enlighten the learner; nevertheless, the treatise may not be without its use, where other instruction is not at hand.

HAGAR AND ISHMAEL. Engraved by PRIDoux & SMITH, from the picture by C. L. EASTLAKE, R.A.

The managing committee of the Art-Union of Glasgow have caused this engraving to be executed for circulation to their subscribers for the year 1850-51; but if the impression we have received be a fair specimen of the engraving, we cannot congratulate the Society on the choice it has made, for we have rarely seen a poorer print. This observation is made with regret, because we are at all times anxious to uphold the interests of these Societies, everywhere; but we cannot withhold our dissatisfaction from such a work as this, which will not, it is greatly to be feared, add much to the exchequer of the Glasgow Art-Union.

THE ILLUSTRATED HAND-BOOK OF NORTH WALES. By J. HICKLIN. Published by WHITTAKER & Co., &c., London; G. PRITCHARD, Chester.

Among the literary fruits which the autumn invariably matures, are the various species of "guides" for travellers, the majority of which are really most excellent topographical works. This, by Mr. Hicklin, is capably set up in all respects. The information, as we know from our own experience of the numerous localities it describes, is both comprehensive and accurate; and abounding as it does with numerous prettily executed woodcuts, it makes, not only a useful travelling companion, but an entertaining one also.

HENRY VII.'S CHAPEL, WESTMINSTER ABBEY. INTERIOR OF THE HOUSE OF LORDS. Drawn and lithographed by E. J. DOLBY. Published by DUFOUR, Westminster.

A pair of very carefully executed and accurate drawings of these two magnificent interiors, showing the respective beauties of each to the greatest advantage. The view of the old building of Henry VII. looks towards the east, and, consequently, includes all that is most attractive; the exquisite workmanship of the ceiling is drawn with the strictest attention to its intricate details, while the carved work of the stalls is as truthfully represented. Both prints are produced by Messrs. Hanhart in colours and as the banners of the knights, which depend from the walls of the chapel, are seen with their various armorial bearings in blue, scarlet, gold, &c., the whole has a very gorgeous effect. Mr. Barry's edifice comes out with equal richness; the view is taken from the end opposite the throne; the combination of colours in the glass windows, the ceiling, the frescoes, and the fittings of all kinds, presents a *coup d'œil* of the most splendid and striking character.

PENNY MAPS. Published by CHAPMAN & HALL, London.

A well-executed map for one penny is certainly something wonderful even in the age of cheap every thing; but we have it here produced in a way that is quite satisfactory; for the series now publishing by Messrs. Chapman & Hall is printed on good paper, in a clear legible type, and of a size to be useful for all ordinary purposes of reference, as well as for those of education.

THE TABERNACLE OF ISRAEL: ITS HOLY FURNITURE AND VESSELS. Published by BAGSTER and Co., London.

The plates which form the principal attraction of this volume, are executed in coloured lithography, with the addition of metallic tints in gold, silver, and brass, to express the metals of the various objects delineated; these are very satisfactorily executed. The letter-press is remarkable for its careful analysis of the sacred text and its meaning, as regards the form and uses of the various articles intended for the religious service of the Tabernacle. It must be borne in mind that the representations of all the religious vessels must be more or less fanciful, depending upon the taste of the artist who endeavours to reconstruct them; for, with the exception of the famous bas-relief of the Arch of Titus at Rome, we have no authentic representation of the sacred Jewish vessels. In the present instance, we can trace many Egyptian authorities used by the artist, as well as the adoption of Etruscan and Roman forms in the vessels. Where nearly every thing must depend upon a realisation from antique analogies, this was the only course; and although we are not fully satisfied that the present work carries out the subject so thoroughly as might be done, it is an immense improvement on the absurdities of Calmet and his pictorial followers, who designed the sacred vessels of the ancient Jewish Tabernacle, in the style of Louis Quatorze. The volume is "got up" in an exceedingly elegant style; and is an excellent example of books of its class.

STAFFA AND IONA. Published by BLACKIE & SON, Glasgow and London.

The islands of Scotland are by no means among the least interesting portions of that country; to some of them Sir W. Scott has given a renown which will be coeval with his writings, and these he has imperishably. The little book published by Messrs. Blackie, will serve as an excellent guide to the places it describes; and inasmuch as steam navigation has opened up a regular and rapid communication with them, we would recommend visitors to the north, who are within a reasonable distance, to put the book in their pockets, and extend their tour to these picturesque and curious localities.

GENERAL VIEW OF THE CITY OF NEW YORK. Published by WILLIAMS & STEVENS, 353, Broadway, New York.

This striking panoramic or 'birds-eye' view of one of the most important American cities, gives an excellent idea of the extent and position of a locality made interesting to the whole world, through the pages of Washington Irving, whose immortal "History" records its early state. The town of Diedrich Knickerbocker was however a very different affair to the present noble city; and the change is not a little instructive to all who study the spread of civilisation. The foreground of the present view is occupied by Union Square with its trees and fountain. Thence the eye is carried up the noble Broadway, with its rows of trees, towards the Battery. The Bowery road is to the left, showing the iron track-way laid down for the speedy conveyance of the enormous double omnibuses, that are constantly plying the three miles of street. In the distance is the old part of the town, beyond is seen Staten Island, and the noble waters surrounding it. The extent and beauty of the city are exceedingly well displayed in this print, which is a careful transcript of nature.

REMARKS ON THE ARCHITECTURE OF LLANDAFF CATHEDRAL; WITH AN ESSAY TOWARDS A HISTORY OF THE FABRIC. By E. A. FREEMAN, M.A. Published by PICKERING, 177, Piccadilly.

The very peculiar and curious cathedral of Llandaff, presenting as it does many differences of construction from such erections in our own land, cannot fail of being interesting to the ecclesiologist. It consists of a long unbroken body, comprising under an uninterrupted roof, nave, choir, and presbytery, with a large Lady Chapel projecting from the east end at a lower elevation; the west end flanked by low towers, and the absence of a central tower and transepts, with the heterogeneous look of the entire structure, cannot fail to strike the most casual eye. But there is much that is both curious and beautiful in the detail of the Norman and early English portion of the building. The history of the changes it has undergone until the bad taste of the last age effectually destroyed it in the process of "beautifying," as it has done to many of our ecclesiastical buildings, is well told. The volume is illustrated by a series of well executed plates and woodcuts.

THE ART-JOURNAL.

LONDON, NOVEMBER 4, 1851.

THE PREPARATIONS IN GERMANY
FOR THE EXHIBITION OF 1851.

WE gave notice to our readers that we had undertaken a Tour to the several leading Cities of the Continent, with a view—first to obtain information concerning their preparations for the Great Exhibition to be held in London in 1851; and next, to arrange with the principal Manufacturers in order to obtain from them drawings of the more important objects they design to contribute, with a view to engrave them in the ART-JOURNAL, in accordance with the plan of which we have submitted an outline to our subscribers.*

This Tour has been made—so far as Germany is concerned. In such cities and towns as we were unable to visit personally, we have established correspondents, and shall, as we receive them, print their reports: a journey to Vienna would have occupied more time than we could devote to it, and we engaged the services of a gentleman at Nuremberg, very competent to the task, whose statements we shall, no doubt, be empowered to publish in our next number. We shall continue the Tour we have thus commenced, by proceeding forthwith to the several cities and towns of Belgium, Holland, and France: and we trust the information we shall thus acquire will be of value, not only as aids to our reports of the Great Exhibition, but as a means of enabling us better to discharge our duties—as conductors of this Journal—to the British manufacturer on the one hand, and the Foreign manufacturer on the other.

In our present article, however, we shall not go at length into details: it will be expedient that we reserve much of them for that report by which, accompanied by illustrations, we hope adequately to represent THE GREAT EXHIBITION; it is an absorbing topic in all parts of the world: there is scarcely an artisan in Europe who does

* It may be well to print here a passage from the Prospectus circulated by us among the Manufacturers:—“The Editor of the *Art-Journal* is actively arranging to Report the Exhibition fully—by describing and illustrating by fine engravings on Wood all the more prominent and meritorious objects contributed by Manufacturers: he will issue Supplementary Parts (or double numbers) of the *Art-Journal*, each Part to consist of at least 52 quarto pages, and containing between 250 and 300 engravings: these engravings will be produced without any cost to the Manufacturer.”

“It will be only necessary that the Manufacturer supplies the Editor with drawings of the principal objects he designs to exhibit, together with such information concerning his establishment as it may benefit him to communicate; but it is essential that these drawings be received at the earliest possible period, in order that they may be in all respects worthily executed and carefully printed.”

“When these Illustrated Reports have been issued with the *Art-Journal*, they will be collected into a Volume, which Volume will contain, probably more than a Thousand Engravings, and become—as a catalogue of its most beautiful and valuable contents—a permanent record of the Exhibition, and a key to the most meritorious Manufacturers of all parts of the world.”

not feel some degree of personal interest in the result; much anxiety concerning it pervades all classes in every country of the globe; and it is certain that manufacturers every where, whether friendly or hostile, confiding or suspicious, are alighting the issue as destined to influence very largely the future commerce of Europe.

The theme is consequently one that must be dealt with in this Journal in a manner, as far as possible, commensurate with its importance; and, at the outset of these remarks, we assure our readers that we shall spare no labour, and grudge no expense, that may enable us worthily to discharge the task we have undertaken—fairly and justly to all competitors.

We have said that our tour had two purposes: First, to procure information concerning the movements and prospects of Industrial Art on the Continent; and 2ndly, to arrange for a supply of drawings of objects contributed to the Exhibition, in order to engrave and describe them in this Journal. We believe we have succeeded thus far, in attaining both purposes; in all the cities we have visited, facilities were readily and liberally obtained for us; our project was considered and encouraged by all the heads and members of Commissions,—in some instances by Ministers of State with whom we had interviews,—and by the manufacturers, without a single exception, to whom our Prospectus was submitted,—by such manufacturers, that is to say, as resolve to contribute to the Exhibition: for the list by no means includes all the meritorious fabricators of Germany; some declining to contribute from suspicion; others from over-occupation, at the present moment; and others from a reluctance to exhibit their designs; and others (these indeed being by far the larger number) withholding their contributions under the belief that as “prices” are not to be fixed to articles, they lose their principal vantage-ground, and consequently the benefit they might derive from the competition.*

* Upon this subject we had some conversation with the Minister of the Interior of Saxony, who honoured us with an invitation to an interview, at Dresden. He is, of course, entirely satisfied as to the good faith of the invitation given by England to the other Nations of the World; but he expressed himself very strongly as to the justice of affixing prices to all articles contributed, assuring us that such is the universal feeling throughout Germany; and that an arrangement to this effect would give general satisfaction, and remove all doubts and prejudices that may exist anywhere.

His opinion is, naturally, based upon the belief that the strength of Germany consists in its power to produce articles cheaper than they can be produced in England. We assured him that English manufacturers generally desired this course as earnestly as it could be desired by German manufacturers, inasmuch as the former entertained the conviction that their capital, machinery, and certain other advantages, gave them the power to produce at a cheaper rate than similar produce could be effected in Germany, notwithstanding its lower rate of manual labour. We presumed to add that, as the result of inquiries, somewhat minute, and a comparison we had felt it our duty to institute in all the places we had visited, we were of opinion, that although articles which depended mainly upon hand-labour (and these chiefly, if not exclusively, unimportant luxuries), might be produced cheaper in Germany than they could be in England (the weekly wages of artisans in Germany being seldom more than 5s. or 6s. a week), all productions by machinery, or such as are essentially aided by machinery, would be produced cheaper by us than they could be by them; and that consequently to affix prices to the articles in the Exhibition of 1851 would, on the whole, be in reality no boon to the Germans.

We had, indeed, to argue this point on many other occasions, and endeavoured to explain the difficulties that lay in the way of affixing prices in all cases, and to the friends to which such a system might lead; but we found the Germans, generally, impressed with a belief that it was impossible for England to manufacture cheaply; a belief that will be very materially changed when they have visited London in May.

We reminded the manufacturers of Germany that it was not the custom to affix prices to articles exposed at the periodical exhibitions of Industrial Art either in Paris, Brussels, or other Continental Cities; and endeavoured to prove to them how much more numerous the evils would be by giving than by withholding prices. We pointed out to them how easy it would be to establish agents in London, where the prices of articles might be

In our number for October, we expressed our regret (then writing from Nuremberg) that the Royal Commission had not consigned to some trusty and experienced person the task of visiting the cities of the Continent, and personally communicating with the heads of the several commissions and the principal manufacturers. That regret was increased as we journeyed northward, and found how comparatively easy it might have been to have removed prejudices and to have established confidence. Many questions were put to us which we were neither able nor willing to answer. Upon those points, however, which implied doubts of the good faith of England in inviting the competition, and as to the ultimate awards of prizes, we considered ourselves free to speak strongly. We ascertained that most erroneous ideas on the subject very generally prevailed; among others, that it was not intended to publish in the catalogue the names of German contributors, nor to admit them to any participation in the prizes to be distributed at the close of the Exposition. It was easy for any Englishman, zealous for the honour of his country, to pledge himself that such notions as these were without the shadow of foundation; but there were other matters upon which no one, without authority, was justified in giving an opinion; and we repeat, much service might have been rendered to the public cause, by the employment of a missionary proceeding direct from the Royal Commission.

If, however, we found on the one hand misconceptions, jealousies, and suspicions, and that they were fostered by several of the leading journals of Germany,* we have, on the other hand, to report that justice was generally done to the grandeur of the scheme and to its large liberality: the project was considered, by all enlightened persons, as in the highest degree creditable to England; as a project which could have emanated only from a country truly great, conscious of its strength and of the power of its resources; and by all the governments of the Continent—with the solitary exception of Hanover—assistance in some form or other has been tendered to manufacturers willing to enter into the competition, not alone as an act of policy; but as an acknowledgment of the generous spirit in which the invitation has been sent forth. It is, however, a mistake to think that this assistance is at all considerable; in most cases, we believe, it amounts to nothing more than free carriage to the boundaries of the kingdom from which the goods are sent; possibly, honorary rewards to those who may contribute to uphold or extend national reputation; and the appointment of Commissions to arrange the modes of transmission, the selection of articles and the nomination of committees to visit London with a view to a public report. In other words, in reality, the German States are doing no more for their manufacturers than the English government are doing for ours. We held, in common with the English public generally, a different opinion, and had largely, but most erroneously, magnified the “government aids” which foreigners were likely to receive. We may observe, by the way, that in numerous instances we found the foreign manufacturer complaining that his government was in reality

made known; and we believe we may say, that, in many cases, we overcame the prejudices which on that ground would have kept away contributors.

* It is scarcely necessary to say that these misconceptions, jealousies, and suspicions are nearly as rife in England as they are in Germany, and that they have been fostered by some of the public journals here as well as there. We extracted a passage from the *Allgemeine Zeitung* so precisely akin to one which we find in *Blackwood's Edinburgh Magazine* for September, that we might almost have considered the one a translation of the other. It is as follows:—

“We do not wonder that our manufacturers have shown themselves averse to come forward on the present occasion; they could not by possibility do anything more suicidal to their real interests. Their obvious duty and policy is to maintain their markets and husband their inventions, not to assist in encouraging and instructing their rivals.”

This is almost to a word the argument with which we were met by all German manufacturers who declined to contribute to the Exposition.

giving him no aid worth having, and using nearly the same expressions which we have been ourselves using for some time past—that in a contest upon which so much is to depend, direct assistance ought to be afforded by the State.

This is not the only wrong impression which our tour has removed from our minds; actual experience, and very careful examination, have much contributed to withdraw from us all apprehension that the contest can be injurious to British interests; there are some manufactures—such as a profuse and most admirable use of zinc—in which we have attempted nothing; there are a few others, such as terra-cotta, cast-iron ornaments, &c., in which we shall be greatly surpassed; but in a large proportion of the articles of manufacture we examined in Germany, we have found deficiencies which the Germans will not find in similar articles manufactured in England; nay, we should not very materially alter this sentence, if we speak (from a partial acquaintance with them) of the manufactures of Belgium and (from more extended knowledge) of the manufactures of France.

The argument to be deduced hence is simply this: that the English manufacturer who from fear of being worsted in the contest, declines to enter into it, is, to say the least, labouring under a delusion.

The Germans have to contend against many difficulties which the English do not find in their way; they enjoy no advantage which may not be enjoyed by us; but we possess advantages which, under existing circumstances, are denied to them. It is more wonderful that they have done so much than that they have done so little, when we consider the state of warfare in which they have been so long engaged—followed by revolutions or domestic broils, that have gone so far to prevent cultivation of the Arts of Peace; and the effects of which still continue to operate most prejudicially against advancement, in all that regards the elegancies and luxuries, and some of the necessities, of life. If labour is cheap, the results of labour must be cheap also; and there will be observed in many articles of taste, a want of finish, resulting from a necessity for smallness of cost, which, so to speak, spoils the hand of the artisan. The artisan, it is known, is compelled in almost all the German states, to expedient several of the best years of his life, in the ranks of the army; much of what he has learned in the workshop he has unlearned in the barrack. An artisan whose ingenuity is great and who may be possessed of ample capital, cannot establish a business for himself; he must wait until a vacancy has been made for him by the death or withdrawal of some predecessor in his trade—the law prohibiting more than a fixed number of persons of any trade from practising such trade; consequently competition is a thing unheard of, and there rarely exists any stimulus to achieve excellence. Many of the more important branches of manufacture are government monopolies, where buyers must take what they can get and not what they deserve. There is a very general opinion that to make things to last would be ruinous to the fabricant, and that to show well for a season is all that ought to be required of the producer.*

We glance at a few of the disadvantages which entailed and embarrass the manufacturers of Germany; happily, they are such as do not touch the manufacturers of England.

It is, therefore, to our minds certain that the great strength of Germany will consist—not as the Germans think in the cheapness of their articles, but in the truth and beauty of their designs; their application of pure Art to ordinary objects; in this respect governments have done justly by the people; their Schools of Design and of Art are for the most part wisely and admirably conducted, and their great artists do not think they condescend when they work for the instruction of the mass.†

* At Nuremberg we had some conversation on this subject with a cutter to whom we exhibited one of the finest Sheffield razors. He said he might perhaps make razors as good; but he would not do so. We asked him why, and he at once replied—if he did, they would last so long that he and his family must starve.

† At Munich we saw a common drinking-cup, on which

The nature of the articles to be contributed to the Exposition will be best shown by the brief sketch of our tour, which accompanies this introduction; we would merely observe here that the sculptors of Germany will be satisfactorily represented; we wish we could say as much of its painters—who might teach very valuable lessons to the artists of England.*

The Professors of Sculpture at Dresden and Berlin, will contribute largely; and some exquisitely beautiful works: they will thus become appreciated in England—where, at present, the honoured names of such men as Ritschel of Dresden, and Rauch, Wichmann, and Kiss, of Berlin, are scarcely known.†

We had made a list of the several queries put to us by manufacturers; some of them are insignificant, and easily answered; others, however, require more consideration, and better information than we were empowered to bear upon them; they had reference chiefly to arrangements at the Custom-house, the employment of agents to receive them, the probabilities of a reduction of duty in cases of sale, whether any commission would be charged on sales, whether articles would be retained in dépôt after the Exhibition, until it was convenient to remove them; other topics, however, and of greater importance, have occurred to contributors; these have especial reference to the security to be afforded to inventions—and as to whether protection would be supplied, by patent, registration, or otherwise, at small expense; it is most essential that information on this point should be circulated soon; but, up to this time

was painted a group, designed expressly for it by Kaulbach, the great artist whom we saw painting the frescoes in the "New Museum" at Berlin—works that will be classed with the mightiest triumphs that genius has ever achieved in any age or country. At Berlin we found several common works in terra-cotta, brackets, flower-pots, &c., designed by leading sculptors and architects.

* We presume to suggest to the Royal Commission that a great boon might be given to the British artists and the British public by collecting in London, during the Great Exhibition, a number of examples of the works of the best foreign painters. This object might be easily attained by the Commission appointing some experienced and trustworthy person to communicate with foreign artists under their sanction—and in a degree upon their responsibility. During our Tour in Germany we had several opportunities of testing the feeling of artists on this point; and we have no doubt whatever of their readiness to contribute. Moreover, we believe that selections might be made from nearly all the Royal and private galleries, and that works from these collections would be willingly lent for the purpose. The attendant expenses would be more than met by charges for admission; a gallery, such as Kalny's, or that at Hyde Park Corner, might be taken; so that although in association with the Great Exhibition, it would not form an actual part of it. A collection of this kind would be interesting not only to the English; the French who visit London would be quite as anxious to see the works of the principal painters of Germany; and the Germans to examine those of Belgium and France. As a mere speculation, the project would answer; indeed, we have no doubt that the plan will be done imperfectly; the leading object will be to make sales; and it is not likely that the best pictures by the best masters will be obtained. If the Royal Commission will delegate the matter to some persons of taste, the result may be to show us the truly great works of Continental painters, to teach our artists through them, and to gratify and instruct hundreds of thousands. We hope the Royal Commission will take this suggestion into their consideration; we could easily prove to them the feasibility of such a plan, and show them how thoroughly it might be brought to bear—provided the invitation to contribute were issued by their sanction and under their responsibility.

† The same may be said in regard to British sculptors in Germany. The German sculptors of course know the immortal Flaxman, and are familiar with the "Eve" of Baily, but their knowledge goes little farther. We were pleased, however, to see in the atelier of Rauch, at Berlin, a cast of the "Sabrina" of Marshall, and to hear the great sculptor's opinion of our English artists, whose works he holds in the highest esteem. He expressed his belief that no sculptors of the modern world had surpassed in natural grace and beauty the sculptured works he had seen a few weeks previously in London; and modestly said that the excellence of those works deterred him from sending to London his own productions in a similar style.

we fear it is impossible to give it—either to Germany or to England.

A question of, perhaps, equal importance regards the time at which articles must be delivered in London; at present the day fixed for the reception of contributions is understood to be the first of March; but as respects Germany such an arrangement would effectually keep back a large proportion of the goods intended to be sent. The navigation of the great circulating rivers will be arrested from December probably to March; and in many cases entire land carriage will be next to impossible. This matter will no doubt receive the consideration of the Commission.*

We have said that, generally, full justice has been done to England—in respect to the grandeur of the scheme of the Great Exhibition, the spirit and energy manifested in carrying it out, and the liberality which dictated an invitation to competitors of all parts of the globe; and we listened with exceeding pleasure to the honour accorded to PRINCE ALBERT, as originating and fostering this plan for bringing into closer relationship, and more positive amity, the several nations of the earth. Nearly all, if not entirely all, the manufacturers who will be contributors, will be also visitors to London in the spring of next year; a large proportion of them have never been in England, and know little or nothing of our manufactures; out of the intercourse thus induced, much good will arise; we shall know more of a great, upright, industrious, and intellectual people, as the Germans are; we shall derive from them valuable lessons in Art, and in all things that have in Art their root, and spring from it. We shall enjoy that friendly intercourse with men, who are made by nature, by study, and by labour to be esteemed and respected; we shall, in short, see and know much of those who will be valued the more, the more they are known. The Germans will return with a clearer comprehension and a better appreciation of England and the English; this, however, is a theme not for a paragraph but for an essay.

We may observe, by the way, that much admiration was generally expressed with regard to the building in which the Exposition is to take place. The originality of the plan startled the Germans; its vast extent astonished them. The drawings they had seen of it conveyed to them notions at once of its grandeur and its fitness; and we often found them loud in praise of the "great architect" who devised so singular, so elegant, and so appropriate a structure. We trust they may never have to know that it was erected only for a season; and that we have been guilty of the folly and extravagance of removing it. When we informed them that at a cost of nearly one hundred thousand pounds it was formed, merely to endure for a season, and then to be sold piecemeal, we found them rather sceptical, or that they considered us insane.

We proceed now with the details of our Tour. Although we visited many places of minor note, it will be seen that our remarks are limited principally to the great cities of Frankfurt; Munich, Dresden, Berlin, and Leipzig. Our route conducted us up the Rhine. Passing Cologne, and its one manufacture by half a hundred "Jean Marie Farinas," we commence our notice with Coblenz.

COBLENZ is not remarkable for any considerable staple manufacture. The most extensive establishment in operation here is one for productions in tin and japan ware, comprehending also the fabric of papier-mâché. The manufactures being strictly of a useful

* We imagine that the Commission will change the period of receiving articles from the 1st March to the 1st April. One month will amply suffice for the arrangement of the Exhibition; for, be it remembered, each contributor will arrange his own stall or compartment. Many manufacturers will be occupied till the latest possible moment in preparing their contributions. The gain of a month will be an immense boon to them; while, to keep their goods half packed and half unpacked, or excluded from light and air in boxes, cannot but do them much injury. During our visit to Sheffield, indeed, we found insuperable objections to sending their finely polished steel to the Exhibition two months before it was to be exposed; and no doubt the objection would hold good in reference to the finer articles of silk.

kind do not much extend to ornamental work. The proprietors state that they supply the English market with papier-mâché tea-trays at a lower price than they can be produced at English manufactories; their ornamentation is simple and elegant in taste, but the articles are much heavier than those of England. To a continental producer of objects of this kind, labour and material are cheaper than with us; hence the cause of the demand for works of a common order; while in tin and hard ware they have not the same advantages. The government iron-works at Stry, under the direction of Herr Bleuel are very extensive; the reputation of these works is considerable, and the design of the smaller ornamental articles is superior to those of the same class with us. There are in Coblenz manufactories of furniture that enjoy considerable reputation; and the works of Markhausen in glass-painting are highly meritorious; but notwithstanding the reputation of the German artists in this department, it must be admitted that the secret was with the old glass painters, and they have kept it well—as witness a comparison in the Cathedral of Cologne between the window by Albert Durer and those presented to the cathedral by the King of Bavaria. The population of Coblenz is about 13,000, and of these, it is said, not less than 2000 are employed in the manufacture of cigars—a branch of industry that has never been prostrated by recent political convulsions.

FRANKFORT.—An establishment formed here for the sale of Bohemian glass, contains some of the best examples of that manufacture. The works which supply the stock are situated at Hayda, and the activity with which they are conducted, here and elsewhere, is necessarily a means of many improvements and novelties. Some of the examples of verre perdue are very beautiful; this is a production in which glass of different colours is joined together. There are also many examples of enamel on colourless glass, presenting forms and designs of much taste; this is one of the *genres* that has been much improved. As examples of rich and beautiful ornamentation, we may instance some of the lustres, which are of ruby glass enriched with gilding; also some of the vases in imitation of alabaster, and those in the Poupardou style. A novelty of much elegance and remarkable among the various stock, was a glass toilet-box, containing a set of scent-bottles; and some of the dessert services, chaste in form and beautifully enamelled on variously coloured glasses, are remarkable works. We find necessarily in a stock so extensive many well-known productions, as jardinières, vases of Moresque and classic decoration, and all the known productions in plain and cut glass; but this establishment contains, with these, the best and most appreciated works. Several of the best will be sent to the Exhibition. The wealthiest and most prosperous manufacturers of Frankfort are those who are occupied in the snuff and tobacco trade, by which large fortunes have been realised here. There is also in this city an establishment for the exclusive sale of the productions of the iron-foundry of Hanau, comprehending a very extensive assortment of objects of utility and ornament,—as candlesticks, branches, paper-weights, vases, tazzas, and every other ornamental object which the French artists and manufacturers produce in bronze. The designs, for the most part, are not original in their manufacture, but very successfully imitative of the most elegant productions of the French, and they are got up in a manner so sharp and spirited in execution as to equal even the nicety of bronze castings and, indeed, with a success in their reproduction, almost rivalling the finer metal, at a price inconceivably low. These productions are of three different degrees of excellence; the commonest, among which are classed articles of household utility, are made of iron, coloured black, and these extend to a large catalogue. The second comprehends all the beautiful and useful articles which are made usually in bronze by French artists, as pendule cases, inkstands, ornamental costumed and historical figures of various sizes, being copies of celebrated public

works in different parts of the Continent; groups of animals designed and executed with singular spirit and success, indeed, all the finest bronze statuettes and assortments, are reproducible at the works of Hanau with a measure of success difficult to conceive the material susceptible of; and in order to render the copy more perfect, the work is faced in a manner closely to resemble bronze in colour. The finest manufacture, that in grey iron, is also brought to a high degree of excellence; this class of productions comprehends every ornamental article in which iron filigree is in anywise available, and so fine is the workmanship in this hair-wire material, that iron, equivalent in value to one pound sterling, may be manufactured into a variety of articles amounting in value to one thousand pounds. These articles are bracelets, chains, purses, brooches, buckles, clasps, &c., all wrought with a finish so extraordinary as to excite astonishment when it is remembered that the material is only iron. We expect many contributions of interest from this establishment to our Exhibition: the manufacturer, however, stated to us that his "orders" were at the present moment so numerous as to prevent his working for England in the way he desired. We visited here the studio of Professor Lamitz, the justly celebrated sculptor, who showed us many works of great interest, especially a galvanoplastic statue intended for the Exhibition. This will be a novelty, for in England we have not yet applied the Art to this purpose.

DARMSTADT, whither we proceeded after quitting Frankfort, is the capital of the Grand Duchy of Hesse Darmstadt, with a population of 22,000 inhabitants, but possessing no mercantile or industrial establishment of consideration. We visited here the studio of Professor Felsing, the eminent engraver, in whose hands we found a picture by Köhler, of the Dusseldorf school. The subject is the "Concealment of Moses by his Mother." The plate is in an advanced state, and promises to be a work of the highest character.

HEIDELBERG is chiefly celebrated for its university; we found here little commercial activity; the demand, however, among the students for pipes is considerable, and these are manufactured to some extent. They are manufactured and painted in enamel (those that are made of porcelain), but their style is generally of a low order.

HEILBRONN, a small town in the kingdom of Wurtemberg, situated on the Neckar; produces wine, paper, and a few other articles of ordinary consumption, but we could not bear of any products of industrial art.

STUTTGART, the capital of Wurtemberg, is a city of great activity and resources; it has the reputation of possessing the best pianoforte and musical instrument manufacturers in Germany. It has forty bookselling establishments, and twenty-six houses in the printing business, besides five letter and three stereotype foundries, together with its trade in wool, cotton, silk, &c. Stuttgart is the residence of the Baron Cotta, and the birthplace of Danneker the sculptor. Under the immediate patronage of the king many public works have been executed by the sculptor Hofer. The contributions from this city will be examples of pianos and other instruments.

ULM, a town of Wurtemberg on the left bank of the Danube, has a trade in linen and floor-cloth; but the most remarkable of its productions are *smalls*, which are used here in great quantities for various markets in Germany and Austria, but especially for that of Vienna, where they are esteemed a great delicacy after having been fed on strawberries.

AUGSBURG has several manufacturing establishments, especially of cotton, also flax factories, weaving and wool-combing establishments, and also colour and paper manufactories. We have by no means found in Bavaria the same anxiety to exhibit, that we met with in Prussia; there is indeed throughout the entire Bavarian territory an inactivity in matters of business which is attributable to political causes. The Industrial and Ornamental Art of Augsburg chiefly consists in the manufacture of silver and gold ornaments. This city is one of the great exchanges of Germany; it has no less than

twenty-two banking-houses. The great establishment of the house of Cotta is here, whence is issued the *Allyeinige Zeitung*. We found ourselves lodged here in the house of the famous merchant Fugger, who advanced money to Charles V.; and upon the occasion of a visit from the Emperor, Fugger was so proud of the honour, that he threw the bond into the stove—the same we believe which still ornaments one of the rooms. The hotel is now called "The Three Moors," and it was in one of the salons of this house that Napoleon assembled the authorities of the city, and very coolly announced to them their annexation to the Bavarian Kingdom.

MUNICH, although a capital and the residence of a court, possesses none of the extensive manufacturing establishments which we find in other cities of Germany. The fame of Munich rests upon its works in Modern Art, and these undoubtedly are of a transcendent order; but it must appear to every reflecting visitor, that with all the wealth in Art possessed by the capital of Bavaria, genius has been here forced even to exhaustion, and, as in all similar cases, an approach to barbarous and meretricious splendour is the result. It is true that the entire effulgence of German Art has been focussed at Munich; but the greatest men are often the most unequal; hence is there much at Munich that is truly sublime, but the whole is not a selection; it is a mingled current in which much is pure and much is of questionable quality. The German school early rejected colour; but they pass at Munich beyond colour to an inglorious excess of gilding, which from all we have seen and learned is, we believe, rather the taste of the King than of the artists. The works in the Basilica, the Allerheiligen and the Ludwig's churches, and in that of the Virgin, in the suburb of Au, require no support from masses of gilding; the works of Cornelius, of Schmor, and of Hess, derive no aid from this kind of enrichment, neither are they to be extinguished by it.

We have not here to deal with the fine Art of Bavaria, but we must observe that the most objectionable part of its accompaniments has exercised a prejudicial influence on the industrial Art; hence we find an excess of gilt ornament on particularly the porcelain productions of Munich; and the fact is the more palpable since the porcelain of Berlin is comparatively sparingly gilded and its style generally in better taste.

The Royal Foundry at Munich has produced greater works than any similar establishment; as the Twelve Statues of the Throne-room, the monument of Maximilian, the statue of Schiller at Stuttgart, that of Goethe at Frankfort, of Mozart at Salzburg, besides a host of others, and finally, the crowning work, the GREAT "BAYARIA,"* but it is probable that a long course of years must elapse before half the number of works may be again cast there. The Royal school of glass-painting is also of recent institution, and here were executed the windows presented by the King to Cologne Cathedral. But this establishment is suffering from the general exhaustion under which others of the Royal establishments are now labouring; hence nothing of the glass-painting of Munich will be contributed to the Exposition; nor much of its famous enamel or porcelain painting, which, under Neureuther, has attained to such perfection; indeed, upon the occasion of our visit to the latter establishment, certain changes were in contemplation which almost threatened its suppression.

At the Government-works in glass painting at Munich there is at present very little in progress; and those productions which are shown to strangers are, although beautiful in execution, extremely insignificant in character. We had an opportunity of examining the manner of this Art, which is carried to a high degree of excellence and minute finish by the nicest stippling. The principal works are a Virgin, after Guido, and a composition after Lucas Van Leyden. Munich enjoys a high reputation for its glass painting; it is therefore to be deplored that its character will not be sustained at the Exhibition of next

* Of this famous statue, the great work of Schwantaler, we have obtained a drawing; and design to engrave it on steel, as one of our series of "statue plates."

year,—because the Government declines granting the means of executing any work sufficiently important to uphold the fame of Munich in this department of Art. For the productions of this establishment designs are made by Kaulbach and others of the first artists of Germany, and hence a great source of their superiority in design. They, like all the originating schools in France, are under the direction of the first artists of the country, whose services are commanded by their respective governments,—a state of things inaccessibly different from that which exists in our own country.

Of the private manufacturing establishments, there are a few which will send to the Exposition works of much beauty. By one establishment for the manufacture of glass, will be contributed an enamelled vase of large size and extraordinary workmanship, of which we purpose giving an engraving in those numbers of the Journal which will be devoted to the Exhibition. The design of the vase is Moresque, and made expressly for this production. As at present intended, it is the only production to be contributed by this establishment, although the manufacture comprehends every novelty and improvement in the art. The drops and lustres in white glass are much inferior to those of English manufacture, but in coloured glass we find the best and newest designs. The enamelled works upon coloured and white glass present the most charming combinations of form with the most gorgeous styles of enrichment.

The articles of furniture manufactured in inland work at Munich are extensively known and appreciated, especially those of an artist who intends contributing to the Exposition an example of his work. He has executed for the Emperor of Russia a pair of saloon doors composed of mixed inlaid work upon rosewood. The design is arabesque, in panel compartments, carried out with variously coloured material, as tortoiseshell, mother of pearl, copper, and gilt metal, and when closed looks like a very highly-finished inlaid work set in a deep frame, ornamented in the like taste. A similar pair of doors has been made for the Duke of Leuchtenberg; also a table of rosewood, almost entirely inlaid with variously coloured metals and mother of pearl. The design of this unique production is florid arabesque.

NÜRNBERG—we were surprised and mortified to find that this ancient city, with its hallowed associations, will contribute but one important example of its Art to the Exhibition; and that is a copy of the celebrated painted glass window in the Church of St. Lawrence, on the right of the choir, a beautiful specimen of the medieval prime of glass painting, but by whom executed is now unknown. The work itself we have not seen, but we have seen the drawing which serves as the immediate model for it; and this, alone, is an enterprise of prodigious labour. From enquiries made of the accomplished artists themselves (a father and two sons, whose works have long been famous throughout Germany), we are enabled to state that the price of works of this class varies from one pound to one pound five per square foot, according to the nature of the subject; this we understand is the price at Nuremberg, the expense and risk of transit to be borne by the purchaser. If we compare this with the prices of such works executed at home, even including every incidental expense, we shall find a considerable advantage in favour of the prices of the Nuremberg artists. We have no doubt the exhibition of this window, and a statement of the prices they require, will obtain for the artists many commissions here. We expected to have been enabled to announce more than one specimen of the Art from Munich, but Nuremberg has no competitor in Bavaria.

The manufacture of papier-mâché is extensively employed in the imitation of metal and plaster casts, but these works are deficient of that sharpness of outline which gives finish and value to the work. None, indeed, of these productions that we have seen here promise any interesting result, except anatomical preparations, which are effected with much success, and the bones of the human frame imitated with the most scrupulous accuracy. The proprietor of these works contemplates, we believe, sending

for exhibition a skeleton in papier-mâché; and this is the sum of the response of Nuremberg to the invitation which it had been thought might have excited in her citizens a spirit of honourable emulation in these Arts in which her name was, centuries ago, pre-eminent beyond those of all others of the world. From some of the neighbouring towns, Bamberg, Furth, Königsberg, and Gratz, we understand contributions may be expected; and we have no doubt that some excellent articles—figures in papier-mâché and toys (for which this district is celebrated)—will be sent to London by the Messrs. Fleichmann of Someberg.

We went to Nuremberg in the hope that the craft of Peter Vischer might in some presentable form survive. The world knows that no part of the starchy mantle of Albert Durer has descended upon mortal man, but not less the apron of the aforesaid Peter has been unworthily borne by successors, and therefore we had hoped to see some works of handicraft that would do honour to the memories of Nuremberg. The population is 50,000, but there exists no staple or considerable manufacture of any kind. Before the discovery of the passage to India by the Cape, Nuremberg received the caravans that conveyed to Europe the wealth of the East. The number of distinguished men that Nuremberg has produced, or at least who have flourished there, is unequalled in the history of any other town of similar size. Besides Durer and Peter Vischer, there were Michael Wohlgemuth, Adam Kraft, and a dozen other known artists whom it were bootless to mention here.

The guilds of Nuremberg at a very early period produced workmen of unparalleled cunning in every branch of mechanism. The art of wire-drawing was invented here, as was also the air-gun. Peter Hehle made here the first watch; and the first observatory was erected here by the astronomer Walthier; and in Nuremberg the inhabitants are surrounded by memorials of all these men, and yet in these essentially utilitarian times have nothing to send to an industrial exhibition. But it is to be presumed that the system of government limitation accounts, in a great measure, for this apathy. Here, as in the other cities of Germany, the number of persons practising each trade is limited, so that, until vacancies occur by death, none can establish themselves in business. By such a law, therefore, an end is at once put to everything like competition and enterprise, and thus everything remains from year to year without any attempt at novelty or advancement. There is enough here which might be available for every department of art and manufacture, but the spirit is wanting; there is no emulation, and the law secures all trades against competition—a law fatal to the general prosperity of all the lower class cities and towns of Germany. There is enough in Nuremberg to found a school of decorative art. It is not necessary to be a genius to render these fine works available, it is only necessary to study them suggestively. The works of Vischer, Kraft, Veit Stoss, Wohlgemuth, Rupprecht, Wurzelbauer, Hans of Ouhmbach after Durer, and others, supply an exhaustless fund of available material which might be so adapted in ornamentation as, although not original, to be at least not too palpably transferred. We see occasionally Peter Vischer cut in wood as the top of a needle-case, or his dog borrowed from the Green Vaults at Dresden, to ornament a paper weight, or the Gausenmächen—the quaint figure with the geese under his arm in the fruit market, assisting in some similar device; but the impulse is lost, and had there been in the days of these works no more effort than there is now, we had never even seen these admirable productions. Are we to believe that our excellent friend, Professor Heidehoff, is the last of the Nuremberg worthies? It is, we believe, he alone who sustains her venerable monuments; and he is, indeed, worthy to rank with those who have gone before him in reflecting honour on their native city, the venerable edifices of which will, we fear, be imperilled when no longer watched by the learned and excellent Heidehoff.*

* We may take occasion to mention here that this accomplished artist and architect—the great authority of

Hor, a small town of Bavaria on the Saxon frontier, has established cotton manufactures of considerable extent, the productions of which supply partially the neighbouring districts, and are, it is said, exported to America. The goods descend in price and quality to the lowest and the cheapest, and when we say that the wages of the workman here are no more than one thaler and a half a week, about four shillings and sixpence, it will serve to show the immense advantage which the Bavarian producer has in this particular over the English manufacturer. One of the factories here employs we understand as many as 1500 persons, who are variously distributed under numerous petty masters, who are responsible for the work and its manner of execution. Gold and silver tissue is wrought here on a cotton base, in designs of much beauty and elegance. This fabric is called *halbside*, and in it are imitated the best silk designs. We visited several of the factories here, especially the smaller ones, among which the great houses distribute their work. The wages of a good workman here is about half-a-crown, or three shillings, English, a week. The retail houses in Munich and other cities in Bavaria are supplied in some measure from the manufactories here.

DRESDEN, the capital of Saxony, has long been celebrated as the chosen residence of men distinguished in letters and arts; yet, beyond contributions of its famous porcelain, little is to be expected from Dresden; although the manufacture is now participated by other cities of Germany, the fame of Dresden will never be extinct, even though it may be now dwindled to a mere *prestige*.

The State porcelain-works are carried on at Meissen, a small town on the Elbe, at the distance of an hour and a half from the city by railway and other conveyance. The whole of the establishment is contained within the old Castle and Cathedral of Meissen, which was the seat of the bishopric of that name. On visiting these works we found them instituted on a scale more limited than might be expected for a Government establishment, although it is sufficiently obvious to the inquiring visitor, that the demand is now in a great measure met by the private and public works of Berlin. The Cathedral and Castle of Meissen are in a ruinous state, and the work rooms, especially those for the various departments of moulding, are distributed throughout the old building, communicating by the long arched galleries and corridors. The dépôt, which was within the same walls, presented nothing remarkable in the way of novelty; the stock consisted principally of table services, interspersed with the ordinary forms in vases and ornamental objects. Indeed, we saw nothing here that could not be equalled in England, even in the best examples, and infinitely surpassed in the more common articles.

This establishment will, probably, exhibit a large vase and pedestal. We saw this work in progress, it was then in the raw clay, having been moulded but not yet fired for the first time; and upon the success of this operation depends the transmission of the vase, for if the slightest accident occur the work will not be exhibited. The works are designed, painted, and perfected within the establishment; and when we consider the wages of workmen and artists here, we marvel the more at the energy and success of similar establishments in England. The salary of a thoroughly educated artist here is about two pounds, or two pounds ten shillings, a month, and the wages of a labourer not more than from three to five shillings per week,—a standard which varies little throughout Germany, excepting in the capitals. This is a fearful odds for English manufacturers to contend, and even to prevail against, in the production of articles which exclude the agency of machinery; but, nevertheless, that success is upon the side of home manufacturers of this class is evident from comparison with the works shown here, notwithstanding that the weekly wages of the

Gothic Art in Germany—is preparing for the *Art-Journal* a series of drawings of early costumes, with their details and accompanying letter-press, which we shall engrave on wood and publish in successive numbers of our Journal.

artisan in England equal those of the artist in Germany.

The history of the Dresden china-manufacture is curious. We read its rise, progress, and decadence in the Porcelain Museum, in the Japanese Palace at Dresden, beginning with the accidental discovery of Böttcher, while prosecuting his experiments in search of the philosopher's stone. The red ware which in 1704 was the result of these researches, is agreeable in colour and elegant in form; the designs are classic, and we saw no instance of their ever having been vitiated. This discovery gave an impulse to futile manufacture; and a few years afterwards, in 1709, it assumed a new character, and gradually rose towards the middle and at the end of the last century, to a degree of excellence which conferred a pre-eminence on Dresden porcelain. The peculiarities of manufacture which distinguished the collection of native works are relieved floral, and bouquet groupments; figures round and relieved; and many varieties of the famous hawthorn pattern: these are distinguishing and never-failing features of the Dresden manufacture. It gave us no little surprise however to find, that with the purest forms and the smallest and most delicate ornamentation at their command in the extensive collection of "Old Dresden," the forms and ornamentation in present use should have so grievously deteriorated. The existing patterns are for the most part excessively bad.

In our interview with the Minister of the Interior, the Baron Von Friessen, (as we have elsewhere intimated,) we were assured of the friendly disposition of the Government towards the Exhibition; the proposition having been immediately met by an order for the execution of the vase which we saw at Meissen. The population of Dresden is 75,000, but, besides its porcelain it possesses no manufacture. Being the seat of the court of Saxony, and a city possessing immense attractions in its palaces and galleries, it has always in addition to its native population a large throng of visitors.*

BERLIN, in arts and manufactures, is undoubtedly the most progressive of the many capitals claimed by the widely diffused populations, derived from the great northern stock, whose language is German. In others of these cities we have found private enterprise languish under the baneful influences of government monopolies, but here individual activity has so far outstripped government agency as to appropriate those branches of industry which belong at all times rather to a people than a government. And the Prussian government wisely resigns into the hands of individuals those industrial Arts which beyond a certain stage cannot flourish under a government. Hence we find that iron manufacture, which has conferred some celebrity on Berlin, now entirely in the hands of private persons. And although in the Government Porcelain Manufactory some of the best designs and enrichments may be exclusively government property, we find in private establishments works equal in excellence to those of the Royal Manufactory. But the political aspect of entire Germany is now exercising upon all private speculation a depressing influence, from which years of peace will be necessary to restore it. On visiting, for example, a porcelain establishment in which six hundred workmen are employed, we found all in full activity, but just recovering by a violent re-action from an entire and lengthened suspension. Having enquired if anything were in progress for the London Exhibition, the reply was, that the establishment was fully busied in completing orders which, having been long suspended, now

came in an embarrassing multiplicity, inasmuch as to exclude the consideration of all else save the merest utilitarian productions. Berlin has a population of 350,000, and its manufactures are in iron, porcelain, crockery and stone-ware, terra-cotta, silk, woollen, linen, and paper, besides large establishments for the manufacture of machinery, examples of which will be exhibited in Loudon next year.

The most famous of the productions of Berlin are its iron-works, and so entirely have the artists of this place adapted this metal to ornamental purposes, that we are surprised to find it wrought into articles produced elsewhere, only in more costly material; and again into others hitherto only estimable when manufactured in the most precious metals. In the iron-foundry under the immediate direction of the Government, we were permitted to view two candelabra or high pedestals, intended for the Exhibition. The design is the same in each; a classically elegant composition by Professor Strack, having as a base a claw tripod with arabesque reliefs, whence rises a shaft which is upwards encircled by a triad of graceful figures, and terminated by a flat top whereon is placed a highly spirited Amazon group, the work of Professor Fischer, also cast in iron. Besides these a copy of the Warwick vase will be contributed, in order to show the extreme delicacy of the casting. The minute productions in iron, for which Berlin is famous, are not produced here, but we observed many busts of extreme softness of surface and minuteness of detail, together with ornamental balustrades, almost worthy of Benvenuto Cellini, in design, and Quintin Matsys in execution. Of the pedestal we shall be enabled to give an engraving in which its florid enrichment will be sufficiently described. The dark tone of the iron is much relieved by an inlaid thread of silver, beautifully wrought into one of the chastest and simplest of the antique configurations. There are also executed numerous zinc mouldings, and enrichments of much excellence of design—but this establishment is now by no means so extensive as formerly, and unlike the porcelain manufactories of other cities it does not condescend to the minor articles of domestic utility. The establishment is of an exclusively Royal character, the busts which are there cast are those of members of the Royal family, and the luxurious ornamental appliances are regal and stately. The effects of popular commotion are irreparable here, for in 1848 the most precious models were broken by the insurgents, amounting in value to 200,000 thalers (30,000*l.*), many of these having been in the possession of the Government two centuries. This department of the Government foundry is of course limited—that in which guns, mortars, howitzers, shot, and shell are cast, being necessarily upon a very extensive scale.

One private establishment employs not less than a thousand men in the production of iron-castings. Its works comprehend numerous articles, useful and ornamental, which are necessarily or speculatively formed of this metal; but this house is so entirely occupied in the execution of its commissions, as to decline competition in ornamentation. This is one of those establishments which directs its energies rather to the necessities than the niceties of life; and it is now labouring under the pressure of business hitherto suspended by the events of political convulsion. Many of the "iron-masters" of various parts of Germany were swept into the raging volcano, and there reduced to their purely sordid elements. Over the heads of others the fiery tempest passed lightly; and some of these were of Berlin, one of whom especially, whose grace saved his wealth, employed his men in ornamenting his garden when his works were at a stand.

Thus the manufacture of those small ornamental iron-works for which Germany is celebrated, is carried on extensively at Berlin, and many contributions in this genre will be sent to London, among which are notable, a cast after a Pilgrim-angel, by Wichmann, a charming figure three feet high; also a figure by Peter Fisher, from the monument in St. Sebald's, at Nuremberg; twelve statues and twelve statuettes, together

with a collection of candelabra, branches, and Berlin bijouterie, sufficiently representing the existing condition of the manufacture. One fact which came to our knowledge in the course of inquiry was, that all the iron employed here is English, a circumstance which points directly to our resources in smelting and purifying; that is to say, that English iron is better suited for casting than any other. Iron properly treated yields a sharper mould than any other metal and for the production of all the little graceful groupments such we see in Berlin and Paris; it is not the *technique* or the material that fails us; it is the essential mould; and there is the ART.

The higher classes of textile fabric, manufactured in Berlin, are extremely substantial in texture and, of course, of a certain degree of excellence in design, but the prices for goods of the same class in England would not, we think, exceed those asked in Berlin. Some of the richest silk damasks had been woven for furniture for certain of the Royal palaces; the design was simple but regal—the black eagle of Prussia upon variously coloured grounds. We had afterwards an opportunity of witnessing the effect of this damask at Bobbersberg, a palace of the Prince of Prussia, near Potsdam. Another kind of furniture showed the design wrought in silk, on a linen base (*hallséide*); the appearance of this material was rich and brilliant, but somewhat coarse. Some of the embroidered silks and satins, which showed the design on both sides, were extremely beautiful productions, we were assured, of the Jacquard loom; and, accompanying these materials, the excellence of which must always sustain them in demand, are numerous presumed new fabrics with ephemeral and fashionable names, which are forgotten in a season or two. The ordinary classes of silks and common goods are inferior to our own and not cheaper.

The wood-carving of Berlin is of a very high order of artistic excellence. Examples of this will be sent to the Exhibition; especially we may note, a large frame for a picture by Raffiello, and intended for the palace of the late king. The principal point in the composition is the figure of the Saviour, which appears at the top, supported and accompanied in other parts by angels, and all the emblems of the Crucifixion. The wood in which this frame is carved is lime, and it is intended to be gilded; it had been in better taste, we humbly submit, to have carved it in a richer toned wood, and have left it unglided. Pear-tree is also employed here in this art; we had an opportunity of seeing other works carved in this wood, after antique designs, and with all the life and spirit of the originals. Carved wood is also employed in conjunction with iron in the manufacture of lustres, candelabra, hanging lamps, and other objects of domestic utility. When joined according to design and convenience, the whole is gilded; the chief merit of this manufacture being its price, which is presumed to be lower than if the article were formed entirely of metal.

The medals executed at Berlin are among the most excellent works of their kind. It is impossible too highly to praise many of those which we have examined. The profiles and groups are sukk with an artistic precision and feeling which cannot be surpassed. Among the silversmiths of Berlin there was but little preparation for the Exhibition; there is, however, a centre piece of beautiful design in progress by one of the court silversmiths; it is of silver enriched with dead gilding.

As in other cities of Germany, so in Berlin, we found many artists busied in the preparation of various works, which they hoped would be accepted by the Commission appointed to receive and report upon the works; but as in all similar cases, many works altogether uninteresting and even unworthy are offered, it may be supposed that not only all such will be rejected, but only those received which will do honour to the arts and manufactures of the country.

Casting in zinc is an art which in Berlin has been brought to an unparalleled degree of excellence. In statues and statuettes, busts, groups of figures and animals, arabesques, candelabra, pedestals, and all the larger castings

* Although somewhat out of place here, we may refer to a visit we paid to the venerable artist Moritz Retzsch. We shall hereafter give a more detailed account of the interesting intercourse we enjoyed with this great man, whose works are perhaps as popular in England as they are in Germany. We may at present mention, however, that we have arranged with Moritz Retzsch for a series of twenty-four drawings, illustrating "Episodes in Life," which he is now preparing expressly for publication in the *Art-Journal*, and of which we shall procure engravings on wood of a large size, and of as great excellence as we can obtain.

usually seen in bronze, zinc is now employed with a success equal to the more valuable material, and at one-sixth of the cost. The hue we must explain does not remain that of the dull zinc, but it undergoes a process of colouring whence it derives a perfectly bronzed appearance, with a smooth and brilliant surface. Among the works which may be announced as about to be exhibited from one house, is a zinc reproduction of the magnificent bronze group which ornaments the entrance to the museum of this city. The subject is a mounted Amazon attacked by a tiger; it is the work of Kiss, a pupil of Rauch, and is of the size of life, and for spirit, truth, and natural action, ranks in the first class of modern productions.* The repetition in zinc, which is about to be sent to London, is of the same size as the original—that is, the size of life—and it will be finished and coloured as a bronze. Other productions in the same material are Baily's "Eve," also of the size of life; a boy and a swan, by Kalide, and a statue of one of the Muses. When we say that these works are finished with all the nicety of perfect modelling, and all the crispness of the finest bronze casts, resembling in short the best works in their best superficial qualification, it is a matter of surprise that this elegant application of a metal so cheap and practicable has not among ourselves met with ready adoption. Since the reign of the dislocated leader Hercules and Apollo that presided in the gardens of many of the wealthy Dutch burghers in the latter part of the sixteenth and during the seventeenth century, nothing has in this way been seriously essayed in anything less costly than bronze, because the art of metal-casting has never been so generally understood as now.

The proprietor of these works says that in a late visit to London he exhibited his designs for the enrichment of architecture, but little or no attention was excited by them—certainly an error of appreciation, when we see the use made of zinc castings in Berlin.

Unlike the Government iron-works, the Royal porcelain-works produce principally articles of domestic utility, and those are in infinitely better taste than those of Dresden. In the ornamentation of the objects of luxury there prevails a chaster style; they depend for effect rather upon elegance of form and harmony of parts than excess of gilding. There is, however, peculiar to Dresden, a class of ornament which has been properly made nowhere else, and which has never been attempted anywhere else with any tolerable degree of success; we mean figures, groups, and flowers, in relief; these are nowhere produced in such variety or with such spirit as at Dresden.

Casting in plaster is among ourselves very little practised with a view to the multiplication of fine compositions; but in Berlin the utmost attention has been given to it, and with results the most satisfactory. The art is very old, but even in Germany it has, until of late, been practised by persons altogether unqualified to reproduce in this material the charming productions accessible to them. It is now, however, customary in Germany, as in France, for all sculptors to have their works re-produced under their own immediate direction, living, of course, legally secured to themselves an interest in their disposal. To this may we attribute the immense improvement which has within a few years been shown in plaster casting. This attention to modern works has necessarily been followed by a like result in respect of all classic relics, which even within two or three years have in the plaster acquired certainly all the valuable and beautiful qualities which may be realised in copies of this kind. It is impossible to speak too highly of the medallion casts which are made at Berlin. The number of these works amounts to nearly seven hundred, and among them is found a portrait of every celebrity of every age, and if we question the authority whence they are supplied, we find each to be an ingenious reproduction from some indisputable source.—the sages or heroes of classic

* The artist has undertaken to furnish us with a drawing of this beautiful work, which we shall engrave on steel, as one of our "statuary plates."

poetry and history given from the priceless gems or Pagan relics which constitute the wealth of national museums; and in the likeness of famous personages of later times we recognise exact reproductions of well known portraits. The best casts also of the works of the most distinguished living artists are also found here; those of the works of Thorvaldsen may be instanced as admirable, including even the famous Alexander frieze, the original of which is in the palace of Christiansberg at Copenhagen.

Terra-cotta has in Berlin been applied to many purposes, as well of elegant ornamentation as simple utility. It has now since its renaissance assumed a various round of applicability unknown to the earlier Italian masters of the art, and with this change, although still literally *terra* and *cotta*, the plastic material is coloured according to taste; this is also the case in our own manufactories, but yet there is a *finesse* here at which we have not arrived. A contribution in this material will be sent to the Exhibition in the form of a large Gothic Vase, after a design by Professor Strack. The general surface of these works is extremely fine, and the detail of the moulding is brought forward with infinite crispness. Many of the Antique, and the Pompeian, Volscian, and Etrurian models are copied in various sizes, and the colour, surface, and ornament, imitated with much truth. The mediæval drinking vessels are extremely curious; the rarest and most famous of these are copied, and the Raffaelesque consoles and small brackets are of the most chaste and elegant designs, as also are those of the hanging lamps, and flower-pots variously coloured; also tazze, and every description of vessel which can derive grace and beauty from ornament. From what we have observed of the various uses of this material, it is certainly susceptible of much more extensive adaptation. There is in the garden of Professor Wichmann, a doorway copied from a mediæval design of which the whole of the arch and side column mouldings are of terra-cotta; it is also used for figure and arabesque bas- and all-relief enrichments of considerable size, and with admirable effect in the front of ordinary dwellings. Within a certain distance from the ground it may be liable to injury; but for florid capitals, mouldings, consoles or bold arabesque, intended to be placed at a certain height from the ground, like for instance, the imperial busts at Hampton Court, nothing could be more suitable; but it will be understood that the recent improvements in the manufacture leave the Hampton Court busts far behind.

The Royal porcelain-works at Berlin afford evidence of a greater advance in good taste than either of the similar establishments at Munich or Dresden. At the former of those places, instead of elegance of form and judicious enrichment, the works receive a surcharge of gold ornament amounting to the rude splendour of the barbaresque in which the chastity of classic taste is overlooked. In the Royal Saxon works this excess of gilding is not usually committed, but the pressure of the times has excluded every consideration, save that of the best means of most readily responding to the call for utilities. The effort at the Berlin porcelain-works seems to be directed to the enhancement of objects of domestic economy. Many of the tea and coffee services here are of considerable merit in design; they are sufficiently enriched, without being surcharged with ornament, and their prices do not necessarily place them in reserve as mere articles of show. Some of those of one colour, as white with a single gold arabesque, or of other colours similarly enriched, are remarkably elegant; and of the more luxurious productions some of the vases ornamented with views of Potsdam are of great beauty. In form there is little here that is new; indeed, no ingenuity can supply us with better forms than the antique, but there is here a superior taste in dealing with these accepted forms. We have hence in the minor details of the works only the same fundamental designs in vases, cups, &c., which are found in Dresden and Munich. There is also in activity in Berlin a porcelain-manufactory, so extensive as to employ six hundred persons; and here not only are produced articles of house-

hold utility, but also works of great beauty and value.

The galvano-plastic works which we saw at Berlin were of a character superior to any that we found elsewhere. In one establishment—the most extensive—the troughs employed are about twelve feet long, and of proportionate breadth, and hence an idea may be formed of the magnitude of the works produced. On the occasion of our visit, the "Christ" of Thorvaldsen, the principal figure in the pediment of the Frauenkirche, at Copenhagen, was in course of execution, and of the size of the original: this work is intended for a church at Potsdam. Among other important works executed by the same means were animals commissioned by the Grand Duke Constantine, Wichmann's "Shield of Achilles," figures by Sturmer, and a set of columnar pedestals executed for the King of Prussia, after designs by Sussmann, which will be sent to the Exhibition, together with a statue of the Elector Frederick of Brandenburg. Among ourselves this Art has been limited to small and comparatively insignificant works, but in Berlin nothing but technical difficulties of execution stands in the way of the productions of large public works. In life-sized figures and heavy groups, the deposition is continued until a general consistency of an inch and a half is attained, and this we are assured has been found sufficiently substantial for any ordinary purpose. The facility with which public monuments, has reliefs, busts, and other works of Art, may be executed by this means, may be readily understood, and at a cost relatively to the character of the work, of one-fourth, one-sixth, or one-eighth of a bronze casting. The Art has also been applied to the production of raised surface compositions for mixing and printing with type. This has been tried among ourselves, but always with indifferent success, when we compare the result with an impression from a wood-cut—and the Germann impressions have the same defects as our own.

We visited no other town or city of Prussia except Berlin; but it is scarcely necessary to say that all the manufactures of the country are to be found in dépot here; and the learned and experienced Doctor who is at the head of the commission, kindly undertook to communicate our project and transmit one of our prospectuses to each of the sub-commissioners—adding his own opinion, that the occasion was one highly favourable to the manufacturers of Germany.

HANOVER, we found a commission had been nominated, but its operations were stultified by a resolution of the Government to contribute in nowise to the transmission of the objects proposed for exhibition in the manner that other governments had done. This determination has arisen we believe with the king, whose views upon this subject are, as upon many others, peculiar to himself. The proposition has been met in Hanover, as in every other place, with the utmost cordiality; and many persons said that, assisted by the Government, they might have contributed to the Exhibition. Although, however, the King of Hanover does not view the Exhibition favourably, his Majesty nevertheless will exhibit twelve statues or statuettes from the government iron-foundry in the Harz. This is all that we have positively heard will come from Hanover. We may except perhaps some interesting objects in gold and silver, especially an elegant tazza; and possibly some minor objects—castings in bronze. There are some wealthy manufacturers here, but as they rise in position they come under the immediate notice of the court in a small state like this, and the feeling of the court they must necessarily consult, or forego its patronage. In the establishments of the principal jewellers, silversmiths, japanners, &c. we saw interesting examples of their productions, but nothing better than we had seen elsewhere. The population of Hanover with its suburbs is 40,000, and it shows more of the life of business than many other German cities. There are cotton and woollen cloth factories, manufactories of machinery, soda, &c., but no extensive establishments for the production of articles of taste.

DUSSELDORF is distinguished as being the seat of an essentially working school of Art, which

has made for itself a solid reputation with a rapidity unequalled in the annals of Painting. The fame of the Pinacothek at Munich is founded on the viclorial wealth which it received from Düsseldorf; and after the removal of the pictures the school which had existed there fell off, until it was reorganised by Cornelius, in 1820, in a manner that attracted many young men of talent, who soon found employment; and among them Stürmer, Silke, Hermann, Güzzenberger, Förster, Rückel, and others, signalled themselves by works at Coblenz, Bonn, Helldorf, and other places; and to these Eberle, and the now famous Kaulbach were soon joined. Cornelius educated his pupils in that severity and purity of style which he so eminently characterises his own works—even his last, those of the cartous for the Campo Santo, which by his special kindness we were permitted to see. The master remains inflexible in his principle of severity, though many of his pupils have yielded to the blandishments of colour and the charm of form. After Cornelius was summoned to Munich, another order of things arose under his successor, the present president, Schadow; and under his direction, the institution, which now receives the name of the Düsseldorf School, continued to rise, until the power and progress of the school took the world of Art by surprise. It is admitted at all hands that the Düsseldorf school, at the period of its utmost lustre, was overrated; but as this is true, it is also true that even in Germany it has since not been justly estimated. The number of students has been, we were informed, upwards of two hundred; it is now, perhaps, about half its former number. In all the works of his pupils we recognise the precept of Schadow. Lossing's "Royal Mourners;" Beudemann's "Hebrew Captives," and "Jeremiah," the "Job," of Hübner; the "Rinaldo and Armida" of Sohn; the "Princes in the Tower," by Hildebrandt; are all subjects conceived in a kindred spirit, and how much soever their monotony may be canvassed by the critical canons of the schools, each has its particular merit. In addition to those already named, Mücke, Köhler, Steinbrück, Rethel, and others, have won merited distinction. But the fame of the Düsseldorf school had concentrated there an assemblage of talent, and the lustre of its rise had been hailed as a *renaissance*, and it was for a time sustained; but the extraordinary effort diminished both the public enthusiasm and the power. Public works were however executed at Aix-la-Chapelle and at Elberfeld, the Castle of Stolzenfels and Apollinarisberg, which, in the highest style of Art, have shown what with opportunity can be effected by well regulated education in Art.

We visited the Academy, and spent some time in the studio of Professor Mücke, the author of the St. Catherine, the property of the Consul Wagnen at Berlin, and so well known through the engraving.* The establishment of a school of Art at Düsseldorf has settled there in a great measure the publication of its works; we find, accordingly, the houses of Buddicus, Schilling, Schulz, and others, continually producing some new work. At Darmstadt, Professor Felsing, the eminent engraver, with much kindness showed us Köhler's picture of the "Concealment of Moses by his mother," from which he is engaged in executing a plate. The fame of Düsseldorf rests only on its school of Art, there are no manufactures that could contribute anything to an industrial exhibition.

The manufacturing town of the district is Elberfeld, distant about twenty miles from Düsseldorf; it is chiefly famous for the manufacture of cloth and ladies' embroidery. Throughout Saxony, however, we found many excellent examples of Art, in ladies' collars, cuffs, veils, &c. They are for the most part beautiful in design and pure in execution, and are principally produced by the peasants among the adjacent mountains—hence the name by which they are known, "mountain lace."

* This distinguished painter has agreed to execute a series of drawings for the *Art-Journal*, which will be brought forward forthwith. They will be drawings on wood, executed by himself, and represent the "Cardinal Virtues."

Our Tour, as far as the manufacturers are concerned, may therefore be said to have terminated with Leipzig. We so managed as to be in that city during "the Fair," long famous all over the world.

The reputation of this city rests upon its book trade—the manufacture is inconsiderable. There is a royal depot of porcelain here, but we saw nothing but what was shown in the depot at Meissen. A general impression exists that the fair of Leipzig is essentially a book fair; this is erroneous, although the bulk of the book trade is transacted at the Spring fair. There are three fairs during the year, one at the new year, a second in the spring, and the third at Michaelmas. Extensive transactions in the book-trade take place on each of these occasions, but the Spring fair is the great book mart. At every fair at Leipzig the influx of strangers into the city is immense, because upon this occasion the exclusive privilege of the city merchants is suspended—the market is open to all vendors—and consequently every available space is filled with merchants and dealers from very remote parts of the world. Not only does every town in Germany send its quota of vendors and buyers, but we see booths, stalls, and merchant shops, from Holland, France, England, many parts of Russia, Poland, Turkey, and Greece; indeed it would seem as if Leipzig at this time were the centre point and resting-place of a thousand caravans of strangers, from every quarter of the globe. The streets are thronged with foreign populations, dealing and bargaining in every dialect, patois, and corruption of German—their booths and stalls fill up the market-places, and the better and wealthier degrees of merchants fill the hotels to the number of hundreds—a literal truth, for if you dine at the Hotel de Pologne, you may count from six to seven hundred guests at table at the same time. Hence Leipzig is essentially a market, and not a manufacturing town; but we had the satisfaction of concluding here an agency for our Journal, with Mr. H. G. Friedlein, in the Rossmarket, who is now our commissioner for the whole of Germany. Every work published or to be issued in Germany must have an agency here, as the only medium of its circulation. Here, although there were no manufactures, we encountered many manufacturers, with whom we held consultations concerning the contributions they designed for England.

We thus conclude the first part of our Tour; in our next we shall, we expect, be in a condition to report our visit to Belgium, and probably to publish our correspondent's report of the state of affairs at Vienna and at Prague.

We repeat that our proposal to publish engravings of the choicest works to be transmitted to England, was everywhere received with cordial approbation; and in no single instance was there the least reluctance to furnish us with the drawings we desired.

We hope it will not be considered presumptuous if we add that the *Art-Journal* was received with marked attention and approval in all quarters—by the very highest personages as well as by the manufacturers; and it was not a little gratifying to us to find among the subscribers, by whom it was regularly, and had been for a long time, received, the names of the King of Prussia, the King of Saxony, the King of Wirtemberg, and the King of Bavaria.

We received the strongest assurances of co-operation: the warmest approval was expressed as regarded the engravings—as examples of British artists with whom the German public might thus become acquainted; and it was repeatedly said that England was the only country of the world in which such a Journal could be produced and receive a support so extensive.

We are grateful for the gracious manner in which, upon all occasions and everywhere, we were met; and if we cannot say all we might desire to say of the progress of the Industrial Arts in Germany (which have, and must for some time have terrible difficulties to contend against), we shall rejoice to render them that justice which they look for at our hands.

OBITUARY.

MR. WILLIAM BARRAUD.

It is with much regret we announce the death of this excellent artist last month, in the fortieth year of his age. The family of Mr. Barraud came over to England from France at the time of the Revolution of the Edict of Nantes; his father held a highly responsible situation in the custom-house, and his grandfather was the well-known chronometer maker of Cornhill. The taste for painting evinced by the subject of the present brief notice, was most probably inherited from his maternal grandfather, an excellent miniature painter; but it was not fostered very early in life, for he was, on quitting school, introduced to a situation in the Customs, where, however, he continued but a short time, and then quitted it to follow the profession most in unison with his talents and feelings, under the guidance of Mr. Abraham Cooper, R.A., with whom he studied a considerable time. His works are too well known, and have been so often favourably noticed by us, that it is quite needless for us to enlarge upon them now. Without attaining to the highest rank in his peculiar department, that of an animal painter, or rather a painter of horses and dogs, for he chiefly confined his practice to these, he was always correct, and even elegant, in his style of work; while the subject pictures which he painted in conjunction with his brother Henry, are far above mediocrity, both in conception and treatment. The two brothers had long been joint-exhibitors at the Royal Academy and the British Institution, and at the time when William was almost suddenly snatched away, they had built and furnished a new study for themselves to labour in, and were about to throw all their energies into some pictures they had together planned to execute; but it was otherwise ordained.

His last illness was short, but his sufferings were intense; these he bore with the patience and resignation of one who ever possessed a well-regulated mind, and had lived a life of consistent charity. His loss will be severely felt by all who had the pleasure of his acquaintance, for he was upright and sincere, and, while unsparingly rigid himself, he was indulgent and considerate towards others.

MR. HENRY ROOM.

The name of this artist must not be passed over in our obituary list of the past month. He was a portrait-painter of some standing, an occasional exhibitor in London, but better known in the neighbourhood of Birmingham, of which place he was, we believe, a native.

Mr. Room came to the metropolis in 1830, where he painted two pictures that obtained some notoriety at the time. "The Interview of Queen Adelaide with the Madagascar Princes at Windsor;" and "The Caffre Chief's Examination before the House of Commons, with Mr. Read and his Son as Interpreters."

MISS BIFFIN.

We copy from the *Liverpool Mercury* the following brief sketch of this extraordinary artist, whose singular talent well merits a passing notice in our columns—

"On Wednesday last, Miss Sarah Biffin, the celebrated miniature painter, who was born without hands or arms, died at her lodgings in Duke-street, Liverpool, at the age of sixty-six. She deceased was born at East Quantoxhead, near Bridgewater, Somerset, in the year 1784. She manifested, in early life, the talent for drawing and painting which she afterwards cultivated to so extraordinary an extent; and she was initiated in the first rudiments of the art by a Mr. Dukes, to whom she bound herself, by a written agreement, to give the whole of her time and exertions, and for that purpose to remain for a term of years in his house. Some time after this engagement had been contracted, the late Earl of Morton became acquainted with, and so much interested in Miss Biffin, that he caused her to be further instructed by Mr. Craig, a gentleman of great eminence in his profession as a miniature painter. Under his skillful tuition, she attained to an almost miraculous degree of perfection; so much so, indeed, that in the year 1821, the 'Society of Arts and Commerce Promoted,' for one of her pictures, presented her with a prize medal, through their president, the late Duke of Sussex. The Earl of Morton also made liberal offers, but unavailingly, to Mr. Dukes, to induce him to relinquish his claims upon Miss Biffin; and although she was assented by professional gentlemen that the agreement was not legally binding, she refused to avail herself of the circumstance, and she remained with Mr. Dukes

for nearly sixteen years. During the whole of this time she resided with Mr. and Mrs. Dukes, as one of their family, and was treated by them with uniform kindness. Miss Biffin, at no time, received from Mr. Dukes, in money, more than five pounds per annum. Miss Biffin was patronised by their late Majesties George III., George IV., and William IV.; by the Queen Dowager, by Her present Majesty, by Prince Albert, and by a host of the nobility, and other distinguished persons. For many years she supported herself by miniature painting; but after the death of the Earl of Morton there was no one, like him, ready to assist her in obtaining orders for pictures, or in disposing of such as she was enabled to complete when not otherwise employed; and as age grew upon her, she became much reduced in circumstances. A few years ago she came to Liverpool, where she made an ineffectual attempt to support herself by her own exertions. Mr. Richard Rathbone took a great interest in her welfare, and it was principally by his exertions that a short time ago a small annuity was purchased for her by subscription."

We further learn that the relatives of the deceased contemplate publishing a sketch of her past history, manuscripts of which have long been prepared by herself; and a life so replete with remarkable incident cannot fail to prove highly interesting.

THE COLLECTION OF THE CONSUL WAGENER AT BERLIN.

The collection of the Consul Wagener is well known to all artists and lovers of Art throughout Germany. He is one of that class of liberal patrons, to whom, not only individuals, but even schools are indebted; for without men of such tastes and feelings, there would be no modern Art. States do not usually form collections of modern Art, and were it not for private collections such as this of which we are about to speak, it would be difficult, under certain circumstances, to see anything of the Art of a country during a limited visit. Experience and observation compel us to draw a wide distinction between collectors of contemporaneous, and collectors of ancient works; the former is always a person of knowledge and taste; the latter is frequently moved only by vanity. We see the great works of the German School at Munich and Berlin, but the visitor wishes also to see some of the minor productions, and collections of these are not always to be met with; it is true the ateliers of the painters are open, but we seldom in them, find more than one or two pictures in progress.

At the period of our visit the collection of the Consul Wagener was divided between two houses in Berlin, as he was at the time removing from one to the other. Like many of the larger houses in Berlin, that of Herr Wagener has a large garden, towards which the house properly fronts. All the rooms are well lighted, but in order that every picture may be seen to advantage, those which occupy the least advantageous places are hung upon a moveable frame work, by means of which, the picture can be brought forward from the wall and placed in any inclination to suit the light. We have never before seen this contrivance, but it is certainly most valuable in private houses, where all the works are good, but where the light cannot be equally distributed.

The number of works contained in this gallery is two hundred and twenty, and the period of the commencement of its formation is the year 1815, since which time it has steadily increased, until the present time, when we believe the commissions for the current year are not yet completed. The proprietor of this collection showed a warm love of Art in very early life, and as soon as his position enabled him to indulge his tastes, he earnestly addressed himself to the acquisition of examples of the styles of the best painters. He had inherited from his father a collection of works nearly all old, and this might in nine cases out of ten have led the possessor to continue collecting similar pictures; but he determined to form this gallery entirely of the works of contemporary artists, and the taste and knowledge he has evinced in their selection, is suffi-

ciently exemplified by the works. The first picture he purchased was a landscape by Schinkel, of the Berlin School, and this commencement was followed from time to time by acquisitions from almost every painter of celebrity of the schools of Germany, and especially of that of Berlin, as from Pistorius, Völker, Wach, Biermann, Gärtner, Krause, Schulz, Schirmer, Bernisch, Beckmann, Meyerheim, Daeger, Henning, Magnus, &c. From the year 1823, to the year 1829, the school of Munich began to attract universal attention, and within that period this collection was enriched by works of Von Heydeck, Rothmann, Ganglo, Peter Hess, Adam, Wagenbauer, and Birkell; and to these were added in 1844 two pictures of Ammiller, and one by Enlhuber. In the year 1828, the Düsseldorf School began to rise under the able direction of Schadow, and Herr Wagener made acquisitions of works of this school of a degree of excellence such as no other collection can boast; inasmuch that of this school the names of some of its members are wanting, save, perhaps, those of Bendemann, and Daeger. There are, accordingly, works of Lessing, Hildebrandt, Preyer, Rethel, Schirmer, Schroeder, Sohn, Jordan, Steinbrück, Mücke, Hübler, Achenbach, and Hasenclever; as also of others who have achieved for themselves an honourable distinction, as Pose, Funk, Heine, Nerenz, Ebers, &c. The first picture of the Düsseldorf school, which was added to the collection, was a romantic landscape by Lessing. The most numerous of these pictures were purchased in the years 1832, 1834, and 1836, the last in 1844. The names, also, of other remote and isolated German artists, as Friedrich and Dahl in Dresden, Catel in Rome, Schultz at Danzig, Klein at Nuremberg, Weller and Biedel in Rome, were added to the catalogue; and also the names of Rebell, Waldmüller, and Rahl, of the school of Vienna. The tastes of the collector are not such as to exclude the productions of distinguished painters of foreign schools. The first work by a foreign artist which was added to the gallery, was a picture by Leopold Robert, and this was succeeded by a work of the Italian architectural painter, Migliara, and subsequently the admirable picture by Horace Vernet—the Slave Market—a sea-piece by Schotel, and an Italian Woman Begging with her Child, by Maes of Ghent. Subsequently to the year 1843, the additions of foreign pictures were more numerous, and from that time until 1849, works of the French artists Gudin and Biard, and of the Dutch painters Koeckock and Van Schendel were added; but of the foreign pictures the greater number have been chosen from among the works of Belgian artists, as of Navez, Bossuet, Loose, Verboeckhoven, Jacobs, Gallat, De Keyser, and De Bieffe.

Thus it has been the object of the consul Wagener to form such a collection of works of Art as should worthily represent the progress and style of the contemporary school. He has wisely confined his commissions to the execution of oil pictures, for fresco is out of place elsewhere than in a palace or a public edifice. Of many artists the works in the collection are among the best they have produced, as those of Mücke, Hildebrandt, Schroeder, Preyer, and others. The "St. Catherine," of Mücke, is well known in this country, by the very popular engraving which has been executed from it. One of the two pictures by Hildebrandt is also known in this country from an engraving which has been made of it; it represents a hard-fearing soldier of the seventeenth century, caressing his child, which he seems just to have removed from his bed. Preyer is a fruit and flower painter; he is little known in this country; five pictures bear his name; they are all fruit and still life compositions, painted with extraordinary truth and feeling. Several of Adolph Schroeder's works we have long known before we had the pleasure of seeing the originals here, as "Tasting Danish Wines;" a company assembled in a cellar, pronouncing with all the gusto of true connoisseurs upon the Johannisberg, Rudesheimer, or Liebfraumlich submitted to them. Another picture, by the same artist, also well known through a spirited engraving, is "Don Quixote," who is represented in his arm-chair

reading *Amadis de Gaul*. This picture is charming in character and colour. A third is the scene between Fluelen and Pistol, in which the former compels the latter to eat the loek; both characters are conceived with a just appreciation of the spirit of the text. Among the other works known to us, is a picture of Verboeckhoven, which, we believe, was exhibited (or a replica of it) two or three years ago in the Royal Academy. The subject is a shepherd followed by his flock, about to seek shelter from a threatening storm; there is a large picture also by this painter, very similar in subject, in the public gallery at Brussels. The picture by Horace Vernet is small and generally low in colour, but with several striking points of effect. The picture by Schadow is a life-sized head, a study from a Roman female model, painted with great natural truth; that by the Baron Wappers shows Peter the Great rescued by his mother from the Strelitz. An admirable picture by Gallat of Brussels is here; the subject is the Count Egmont, with his confessor the Bishop of Ypres, on the morning before his execution at Brussels, in the year 1568; there is a Rembrandtesque character in the work, more successful than anything we have lately seen in deep and striking chiaroscuro. It is in course of engraving, and will be published by Duddens of Dusseldorf.

We have not space to do to the collection of the Consul Wagener, that justice in description which it so fully merits; it is to the pure taste of such patrons, that Art in all countries where it has been fostered, has owed support and development. We have already said that Herr Wagener is still making valuable additions to his collection, which is already one of the best—if not the very best—of the modern collections of Germany.

JENNY LIND.

FROM THE BUST IN MARBLE BY J. DURHAM.

The appearance in England of this highly gifted vocalist and most estimable lady, was the signal for artists of every grade and each peculiar department, to put forth their strength in the production of her likeness, that, at all events, they who were debarred the privilege of hearing her, and the number we believe to be very small comparatively, might at least have some idea of her "form and features." The bust by Mr. Durham, for which Miss Lind sat frequently, has been universally regarded as the most successful portrait brought out, and when it was reproduced in statuary porcelain by Messrs. Copeland, who made of it a beautiful work of art, it attained very great popularity.* We have been induced to have an engraving made from the original work, quite as much from the feeling that we were, in so doing, extending the reputation of a beautiful production of Art, as from the conviction that such a reminiscence of the lady would gratify many thousands who perhaps possess no other memorial of her. Portrait sculpture, especially when it extends so far from the mere bust, has little out of which to form an attractive engraving, but the very elegant treatment by Mr. Durham, of his subject, leaves little or nothing to be desired in advance. The likeness is admirable; there is the beauty of intelligence, amiability, and modest deportment; gifts shining as brightly in the original as that more astonishing one with which nature has endowed her, and which she uses more for the benefit of others than for her own. The sculptor has arranged the drapery of his figure with infinite taste, while the wreath of laurel surrounding the base is a well-timed tribute to her genius.

* While speaking of these exquisite productions from Messrs. Copeland's establishment, we must mention that Marshall's "Dancing Girl Reposing," which we engraved last month, and noticed as having been executed in porcelain, was produced there also; and so was the "Sabrina" of Marshall. These beautiful works have been deservedly popular; we rejoice to know that they have been fully estimated by the public, and that a number of others of equal interest and beauty are preparing to issue from the same admirable establishment. These we shall notice in due course.

The first of these is the question of the right of the artist to be paid for his work. It is a question which has been discussed for many years, and which has not yet been settled. The artist's right to be paid is a question of justice, and it is one which should be settled by the law. The artist is a laborer, and he should be paid for his labor. The law should protect him, and it should not allow him to be exploited by the dealer or the collector.

The second question is the question of the right of the artist to be recognized as the author of his work. This is a question which is also of great importance. The artist should be recognized as the author of his work, and he should be given the same rights as the author of a book. This is a question of justice, and it is one which should be settled by the law. The artist is a laborer, and he should be paid for his labor. The law should protect him, and it should not allow him to be exploited by the dealer or the collector.

The third question is the question of the right of the artist to be given a share in the profits of his work. This is a question which is also of great importance. The artist should be given a share in the profits of his work, and he should be given the same rights as the author of a book. This is a question of justice, and it is one which should be settled by the law. The artist is a laborer, and he should be paid for his labor. The law should protect him, and it should not allow him to be exploited by the dealer or the collector.

The fourth question is the question of the right of the artist to be given a share in the profits of his work. This is a question which is also of great importance. The artist should be given a share in the profits of his work, and he should be given the same rights as the author of a book. This is a question of justice, and it is one which should be settled by the law. The artist is a laborer, and he should be paid for his labor. The law should protect him, and it should not allow him to be exploited by the dealer or the collector.

Jenny Lind

W. Harvey

In our biographical sketch last month, of another Scottish painter, Mr. D. O. Hill, it was remarked that he "has achieved a reputation in Scotland, the most flattering to a native of the soil, inasmuch as it is based upon the delineation of Scottish scenes." This observation applies with equal force to the subject of the present notice, though the two painters are treading different paths in their pursuits, the latter associating himself with the ways and manners of his fellow countrymen, the former with the world of nature as it greets him at every step.

George Harvey was born in February 1806 at St. Ninian's, a small village on the coast of Fifeshire; but in the same year his father removed to Stirling with his family, where the future artist remained till his eighteenth year. We have in him another among the numerous instances to be found of genius struggling successfully against the wishes and opposition of relatives; for notwithstanding he craved, at a very early age, a strong predilection for drawing and painting, his father, perhaps having no taste for the Fine Arts, or considering them at best but a precarious profession, articulated his son to a bookseller, to whom he served a most irksome apprenticeship. In spite of such discouragement young Harvey found time, without neglecting the duties of the business, to indulge his favourite pursuits, by rising early and sitting up late. We have heard him say that at this period of his life, four and five o'clock in the summer would see him in the fields with his sketchbook, and the same hours of the winter months, working with his pencil by the fireside until his daily avocations called him elsewhere. When he had reached his eighteenth year, he was permitted to go to Edinburgh to study in the Trustees' Academy, the Royal Scottish Academy not being then in existence; here he remained two years. At the expiration of this time, that is in 1826, some of the artists of Edinburgh, feeling themselves aggrieved at the treatment to which they had been subjected by the members of the Royal Institution, formed themselves into an association for the purpose of effecting a change in their position. As

Mr. Harvey both then and since has taken a prominent part in all that followed this step—one of vital importance to the Arts in Scotland, a brief outline of its proceedings may not inappropriately be here introduced.

Prior to the year 1826, the Scottish artists were accommodated with apartments in which to exhibit their works, by a committee of members of the Royal Institution; but as a condition of such accommodation, the entire management and emoluments of the exhibition were under the control of the said committee; a state of things which many of the artists justly considered derogatory to their honour as gentlemen, and prejudicial to their interests. A number of them therefore, in the above-named year, resolved to withdraw from the patronage of a body imposing on them regulations which, however well intended, were felt to be both impolitic and unjust, and to establish for themselves an institution by which their own interests might be better forwarded, and the cause of Art more efficiently promoted. Accordingly they constituted themselves the "Scottish Academy of Painting, Sculpture, and Architecture," having for its object the cultivation of Art by the establishment of a School of Design; awarding prizes for merit among the students, and having the power to send abroad such students as should be considered worthy of the distinction; together with a provision for decayed members. This was the foundation of the present Royal Scottish Academy.

Mr. Harvey at the commencement of these proceedings was still a very young man, scarcely twenty years of age; but having already painted one or two pictures which attracted some notice, he was invited to join the confederation that had put itself in hostility to the Royal Institution. This he did without much hesitation, and being ranked as an Associate, took part in all those arrangements which resulted in the establishment of the Academy, and subsequently in the war which has raged for upwards of twenty years, and the dying embers of which still smoulder, between the Royal Institution and the Board of Trustees on the one hand, and

the Academy on the other, never at any time flinching from what he regarded as his duty, supporting every liberal measure, and every thing calculated to promote the honour and well-being of the society to which he belonged through good report and evil report. In April 1829 he was elected full Academician, a title he had earned faithfully and honourably, not only by his talents as a painter, but by his energy and ability in advancing the interests of his brother artists.

A reference to the list of Mr. Harvey's principal pictures, which we subjoin, shows how much the religious history of his country afforded him subject-matter for his art. The persecutions of the Covenanters, that small but noble army of devout enthusiasts, on whom Scott in his "Old Mortality" has thrown such unjust ridicule, have presented to Mr. Harvey's pencil several most eloquent and touching themes. It may easily be imagined how the history of these people, worshipping, according to the dictates of their conscience, not in "temples made with hands," but in caves and glens, and by the hill side, fighting for civil and religious liberty from which bigotry, and intolerance, and practical atheism would have debarred them, must bring out the resources of an intelligent and reflecting mind—of one that had communed with their spirits amid the beautiful scenery where they had prayed, and fought, and died.

The following list includes, we believe, the most important of his works; they are arranged according to the years in which they were exhibited either in London or in Edinburgh:—

- 1826. 'A School.'
- 1827. 'A Small-Debt Court.'
- 1828. 'The Consultation.'
- 1829. 'The Lost Child Restored.'
- 1830. 'Covenanters Preaching.'
- 1831. 'Covenanters' Baptism.'
- 1832. 'Examination of a Village School.'
- 1833. 'Saturday Afternoon.'
- 1834. 'The Collection Platc.'
- 1835. 'Curlers.'
- 1836. 'The Battle of Drumclog.'
- 1837. 'Shakespeare before Sir Thomas Lucy.'
- 1838. 'Bunyan imagining his "Pilgrim's Progress" in Bedford Jail.'
- 1839. 'A Castaway.'
- 1840. 'The Covenanters' Communion.'
- 1841. 'Sabbath Evening.'
- 1842. 'The Duke of Argyle an hour before his Execution.'
- 1843. 'The Minister's Visit.'
- 1844. 'A Highland Funeral.'
- 1845. 'An Incident in the Life of Napoleon.'
- 1846. 'A Schule Skailin.'
- 1847. 'First Reading of the Bible in the Crypt of Old St. Paul's.'
- 1848. 'Quitting the Manse;' 'Past and Present;' 'Children blowing Bubbles in the Old Grey Friars' Churchyard.'
- 1849. 'The Wise and Foolish Builders.'
- 1850. 'Bowlers.'

Besides the above works Mr. Harvey has generally exhibited others annually; some of them have been landscapes only, painted with a true eye for the beautiful in nature.

His historical and *genre* pictures are replete with character of a noble and elevated sentiment; having selected a subject which is worthy of representation—the first duty of an artist—he throws into it all the resources of a well-instructed mind and a well-practised hand. He groups his figures effectively, and spares no labour to make each tell his own tale in the congregated assemblage. His ideal works, such as the "Blowing Bubbles," and others, show a highly poetical imagination, while, in all, his colouring is rich and powerful, and his style of working decidedly bold. There is one point in his personal character which we may mention without flattery, creditable as it is to him; we have heard him say, that "however straitened for time, I never, under any circumstances, touched my paintings on the Sabbath."

Several of the above-mentioned pictures have been engraved, and form most beautiful and popular prints; especially those which refer to the history of the Covenanters, and "The First Reading of the Bible in Old St. Paul's."

THE SWISS HOME.

—“ Turn we to convey
Where rougher climes a nobler race display,
Where the bleak Swiss their stormy mansions tread,
And force a churlish soil for scanty bread.”

GOLDSMITH'S *Traveller*.

W. Müller

The English school of landscape painters rarely sustained a greater loss than that entailed upon it, five years since, by the death of W. J. Müller. At the period of his decease, and during the comparatively short but brilliant career which preceded it, the pages of the *Art-Journal* bore frequent and ample testimony to his genius as an artist, and his exemplary worth as a man. During the present year we have once more held communion with him, through the medium of many of his works, when offered for sale by Messrs. Christie & Manson; which circumstance, coupled with the fact of our having procured a portrait of him, whom we had the privilege of ranking among our most valued friends, has induced us again to bring forward a brief notice of his artistic life, at the risk of repeating what has already been written, though some time since.

The few facts that illustrate his life's history may be briefly told. He was born at Bristol in 1812, and at a very early age gave indication of a strong passion for Art. There are still in existence drawings executed by him at the age of four years. When we first made acquaintance with him, he was about sixteen years old; a fine, intelligent, and most modest youth; it was impossible even then to be an hour in his company without receiving a most favourable impression of his heart and mind; and, from our first interview, we felt towards him that mingling of esteem and regard which augmented as he became a man. We augured his after fame; the tokens he gave of it were not to be mistaken; it was our lot to witness the entire fulfilment of our hope—to find him famous without having lost any portion of that gentle mind and unassuming demeanour which attracted us to him when little more than a boy.

At the time to which we refer, his father, whom we had also the privilege to know, was Curator of the Bristol Museum; he was a native of Germany; his published scientific works prove the enlargement of his mind; and, during his busy and useful life, no inhabitant of the wealthy city in which he was located was more respected and regarded by a large circle of friends. In his excellent school, William Müller was an apt pupil; and acquired that taste for pursuits in science—especially botany and natural

history—which he afterwards travelled so much to work out. A thirst for information, derived from first studies, was with him during his whole career; it was this longing desire for knowledge that enriched his "sketch books" beyond those of any of his contemporaries.

His primary instructions in Art were received from his excellent and accomplished fellow-townsmen, Mr. J. B. Pyne; but he soon quitted a master for that great guide—Nature; and, in the years 1833 and 1834 made the tour of Germany, Switzerland, and Italy—returning to Bristol, and pursuing his profession (but with very partial success) in that city—a city that has produced many great men, but sustained none—a city, indeed, proverbial for neglect of the genius to which it has given birth. In 1838 he encountered a more hazardous journey—visiting Greece, the classic land of the world, where his thoughts had long been. Having enriched his portfolio with a large number of sketches of the most interesting objects to be found where they so abound, he passed into Egypt; gathering treasures as he went, and storing up artistic wealth for the great future—he was, alas! destined never to see. After having ascended the Nile, some distance above the Cataracts, and visited the wonderful Mummy Caves of "Mahabdiés,"—after examining all within a traveller's reach in this vicinity,—he returned to Bristol; but soon found that his resting place could not be there. About the end of the year 1839 he settled in London, at 22, Charlotte Street, Bloomsbury Square. Here he rapidly felt the value of his early labours—that study and travel were profitable as a capital. Surrounded by friends, every one of whom was eminent, or becoming eminent, for intellectual superiority, and honourable as they were accomplished, few men were ever more auspiciously circumstanced; his worth, public as well as private, had been discovered, and wealth was coming with reputation. His pictures were purchased with avidity. His great rapidity of execution enabled him to produce many; and no man's life ever seemed more promising of prosperity. In 1841 he published his noble and beautiful work, "Picturesque Sketches of the Age of Francis I.," which at once

extended his fame beyond his own country, and made it European. His longing for distinction was, however, by no means satisfied; as soon as he heard of the Government expedition to Lycia, he resolved to accompany it; but, in order that his course might be uncontrolled, he resolved to join it at his own expense; and the voyage was made entirely upon his own resources. The money saved out of previous labours was thus greatly expended. The sacrifices he made to accomplish this high purpose were immense; and it is to be feared that the toils he underwent tended to abridge his days. His patience and perseverance were crowned with success; those who have seen his sketches brought thence, have seen wonderful things—things they never can forget. Out of these valuable gatherings he was producing his fine pictures; they have honoured the Royal Academy and the British Institution during several years. But Müller, like many others of high genius and noble heart, was doomed to experience "the worm in the bud" of his hopes and reasonable expectations. He was of course a candidate for admission into the Royal Academy, and was looking forward with hope, not unmingled with apprehension (for he, in common with all other artists, know how little certainty at all times there is for reward to merit within its walls), to the position he was destined to occupy at the exhibition in May 1845, the year of his death. Accident might have led to the injurious hanging of one, or even two,—but, when his friends saw six of his pictures hung either close to the ceiling or along the floor, it was difficult to arrive at any other conclusion than that there was a deliberate design to crush and destroy a man of genius. Deliberate or not this terrible evil resulted, and the very affectation of indifference which he thought it right to assume—except to intimate friends—festered the wound; and though, if physical strength had endured, he would have lived to triumph over this evil, he unquestionably sunk under it. The letters he wrote at this time to some of his friends evidence, amidst his disappointment, his pure and gentle nature, his meek disposition, and forgiven temper, but towards the end of that eventful month of May, feeling that his heart had sunk, and finding labour a total impossibility, he sought his native air, thinking it might revive him, and desiring to spend a few weeks in the quiet home of an affectionate brother. Immediately after his arrival he found medical advice necessary, and consulted one of the first surgeons of the city. It was soon ascertained that his heart was diseased; on the first of July, he had a severe hemorrhage from the nose, which continued at intervals for several days; this reduced him so much that his strength gradually sunk; but, although so weak as to be unable to cross a room without support, his love of his profession was so ardent that he would occasionally paint for three or four hours a day; at other times amusing himself with "pen and ink scraps;" this he continued to do till the 8th of September 1845, when his bodily sufferings, which throughout his illness had been very great, terminated in his death.

It is totally unnecessary, at this date, to expatiate upon Müller's genius as an artist; the high prices which his unfinished pictures and sketches realised at Messrs. Christie & Manson's in July last, testify sufficiently their value. He was a most brilliant colourist, so much so, indeed, as to surpass every painter of his time, except, perhaps Etty; and his method of handling was broad and original. As a man and a valuable member of society we have known few finer characters than his. He was in all respects worthy; in him genius was associated with modesty, independence with courtesy, and generosity with prudence; his highly educated mind and refined sentiments never unfitted him for mingling with the rough and rugged where was to be found the recommendation of talent or character; his naturally sound and upright principles had been strengthened by practised judgment; he was in every way ranking foremost among those whose destiny it is to exhibit the advantage—to the person and to the world—of blending high intellect with moral and social virtues.

VISITS
TO THE MANUFACTURING DISTRICTS.

SHEFFIELD.

In our previous article we noticed at some length that branch of the Manufacturing Arts which gives a peculiar interest to Sheffield—the making of knives, razors, scissors, and such useful articles—a manufacture so extensively known, and so highly appreciated, as to associate the town therewith in the imagination of our Continental neighbours, and also in that of the majority of our fellow-countrymen. The history and peculiarities of that manufacture it then became our province to describe with some amount of detail; it will now be more immediately our object to attend to some novelties and improvements in this branch of the Industrial Arts, as exercised at Sheffield, and to which we shall give precedence on the present occasion as the staple commodity of the locality, in the production of which it has achieved a high position.

Messrs. THOMAS WILKINSON & SON, (17, New Church Street,) are among the most ingenious of the scissor makers of the town, and have adopted many new and useful improvements, as well in the manufacture and form as in the applicability of their various implements. Our cuts will exhibit the taste and elegance of their finer and more delicate work, destined for the use of the fair sex; but an equal amount of ingenuity of a different kind has been exerted upon articles of a coarser kind. The tailors' scissors which they manufacture are remarkable for the peculiar merit of their general

construction, and for the excellent manner in which they are adapted to their necessary uses. The best mode of giving strength and protection to each finger of the hand has been well considered, and the scissor designed so that it may be a most useful auxiliary to the workman, obeying his every want, and befitting his every wish. It is this strict attention to the minutiae of each article among the many manufactured in Sheffield which gives the town its position, and assures the confidence of the world in its varied fabrications in steel; a character which commenced amongst us in the middle ages, and has been triumphantly maintained until the present day.

The patent lever-spring adopted by these makers is a very great improvement to scissors, giving an uniform pressure upon the edges, causing them to work light and even, and it imparts great strength to the cut. By means of the spring any person may cut with the left hand as well as the right. There is very great friction upon scissors without springs, occasioned by their rubbing constantly against each other, which causes them soon to get out of order; the spring obviates this defect, by pressing only where it is actually required.

The scissors we have engraved on the present page are remarkable for the delicacy of their construction and the fancy of their design. The handles are very varied; and when we mention the fact that thousands of scissors are manufactured in Sheffield yearly with no two handles alike, our readers may guess how continually the fancy and taste of the manufacturer are called into action to supply the changes of fashion or taste. There is no establishment which cannot exhibit pattern-hooks containing some two thousand varieties, all known to their workmen by their own peculiar names. Our very limited selection will show how varied are the patterns introduced into this branch of trade, which many might be inclined to think a very circumscribed one. In one instance we leave the real, and enter into the region of the chimerical;

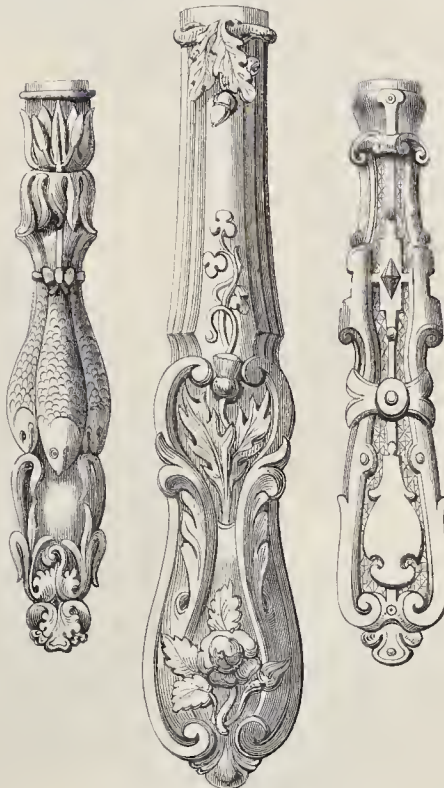

and two dragons unite to form a handle, which may be fearlessly grasped by the most timid hand. From the handles of scissors we may recur to the handles of knives, and exhibit some few from

Rose, Shamrock, and Thistle, is equally good and characteristic. There is more of elaboration in the third design, but that recommends itself to notice by peculiarities and merits of its own.

the manufactory of Mr. HENRY ATEIN, (Howard Street,) which exhibit peculiarities deserving of attention. There is much ingenuity displayed in that of the fish-knife, where those appropriate but generally unmanageable ornamental adjuncts—fish

In looking to articles of this kind the most superficial cannot fail to notice the marked improvement which characterises the various manufactures of the present day, particularly when they are contrasted with the products of a

—are introduced very gracefully, as are also the rushes, which contribute to the peculiar fitness of the design. The centre handle, with its decoration principally composed of the national emblems, the

century ago, when all that was required or expected was mere utility, and ornament might be used appropriately or otherwise without adverse criticism.

The history of all mercantile towns narrates most strongly the fact of their constant improvement in proportion to the liberty enjoyed by their inhabitants. The fetters on industry by absurd regulations, imposed in the old time, being removed, the mind of the workman was enlarged, his energies were much more freely directed, and the result has always added to the wealth of the town as well as to his own.

As an instance of the sort of restraint placed upon the people of Sheffield, and its effects in days happily gone by, we may quote a passage from the history of the town.—

"In the early part of the seventeenth century, Sheffield contained only 2207 inhabitants, most of whom were in abject poverty, and out of 100 'poore artificers,' there was only one who had land enough to keep a cow; so that though there was in 1570 an influx of foreign artisans, the town seems rather to have retrograded than advanced in consequence during the two preceding centuries. But the rules to which the Sheffield manufacturers were in those times subjected, were ill-calculated to foster a spirit of commercial enterprise. The superintendence of the artificers formed a part of the business of the *court-leet* of the manor, in which a *jury of cutlers* was empanelled, to assign marks, enrol indentures of apprenticeship, and to levy fines upon those artisans who had broken any of the regulations agreed upon by the cutlers, and sanctioned by the Lord of the Manor. In the manor court-rolls of 1565 and 1590, these regulations are recited at length, and the following abstract of them will serve to show the state of the town and its manufactures in the reign of Elizabeth. The first article in these 'acts and ordinances, agreed upon by the whole fellowship of cutlers, and by the assente of George, Erie of Shrewsbury,' makes the strange provision that no person engaged in the said manufacture, either as master, servant, or apprentice, shall perform any 'work apperteyninge to the said science or mystere of cutlers' for twenty-eight days after the 8th of August in each year; nor from Christmas to the 23rd of January, but shall apply themselves to other labours, upon 'payne of forfeiture for every offence of the sum of twenty shillings, to the use of the said Earle, his heirs, and assignes, to be levied as other his fines and amercyments within the said Lordshippe have been accustomed.'—2nd, No person to exercise the said trade who had not served an apprenticeship of seven years, or been instructed by his father for that term; penalty 40s.—3rd, No person to have more than one apprentice, nor to engage another until the former be in his last year, nor take any for less than seven years; penalty 40s.—4th, No person occupying any *wheel* for the grinding of knives to allow any work to be done there during the holiday months; penalty as before.—5th, No occupier of a wheel to suffer any person to grind or flaze any knives there who does not reside within the lordship and liberties; on the same penalty.—6th, No person to strike any *mark* upon his wares, but that which is assigned him in the Lord's court; penalty 10s.—7th, No haffer shall haft any knives for any chapman, hardwareman, or dagger-maker, or other person, not dwelling within the liberties; penalty 20s.—8th, Nor shall any knife blades be sold to any person not dwelling in the liberties; penalty 6s. 8d.—9th, No journeyman to be employed under the age of twenty, except such as shall be allowed by the jury, or who have been apprentices or taught by their fathers; penalty 40s.—10th, No person who has not served an apprenticeship, or been instructed by his father, to set up in the trade, except he first pay to the jury of cutlers, 5*l*, the one half for the earl's use, the other for the poor of the said corporation; penalty 40s."

Such was the "good old times" in Sheffield; a great contrast between the reign of Elizabeth and Victoria, and a contrast in spite of all prejudices, which does not tell well for the elder Queen.

Let us return to modern time: The stove manufacture, as we have before observed, is an important one in modern Sheffield: and one of the greatest manufacturers are Messrs. HOOLE and HOBSON, of the Green Lane Works. Our cuts exhibit two specimens from the many they produce. The Stephen's Patent Register Stove is now well known to the public, and is one of the most powerful stoves yet made. It prevents smoke and downward draughts, and possesses very great powers of reflection, radiation, and ventilation; producing also the most agreeable and salubrious warmth: from the simplicity of its construction, it cannot be put out of repair. The varied and tasteful ornament introduced in the two we select will sufficiently tell its own story. They possess much originality and beauty of design; and the ornament is boldly and carefully worked out. The delicate enrichments or the alto-relievos are

equally attended to, and with the most successful results. The variety and ability displayed in the fabrication of similar articles at this factory can only, however, be satisfactorily understood by a personal visit. Many hundreds of similar designs repose in their portfolios, and attest the variety and

fancy exerted on these strictly utilitarian articles, which, in the days of our forefathers, would have been considered strictly as utilities, and, provided they burnt coals well, might have obtruded the

ugliest of forms before the family circle, unheeded, and unrequited. It is, however, now so fully understood that elegance and ugliness are equally cheap, that our taste being better educated, all vote, as a necessary consequence, for the former.

From the manufactory of Messrs. HOWARD & HAWKESWORTH, (Orchard Lane,) we have been supplied with the specimens of plated and silver articles which occupy the present page, and

which exhibit a satisfactory proof of the progress in the art of design now visible in most of our manufactories; the result of the more careful attention to the principles of composition, which now characterises both workmen and masters, and from which we may augur the best results.

The tea-urns engraved in our page are good examples of taste, the lower one in particular, which is of the greatest delicacy of contour, the handles designed with peculiar excellency. When worked out in silver its effect is particularly striking; indeed, we have seldom met with a more elegant addition to the tea-service than the one

here given. It is impossible in our pages to do more than hint, by our cut or our description, at the elegance of these articles; the brilliancy of metal can only exhibit this fully.

The silver cake-basket with its enriched and perforated ornament, has a most delicate and beautiful

effect, and reflects great credit on its fabricants. We have engraved in the centre of our page the principal portions of a new corner or double dish, with a Tudor mounting, and a handle which is designed in a similar taste, but with such variations as give to it a degree of great novelty. At the foot of our

page we have also engraved a soup tureen of considerable simplicity in design, which in its outline is particularly graceful, and reminds us of the designs of this kind which came from the hand of Flaxman in early life. There is frequently great merit, and a large amount of beauty in objects of severe taste,

which do not appear striking upon paper, but which tell with an excellent effect when worked out by a skilful hand. We have often been gratified by such simple articles, which appeal to the educated mind which would turn from mere meretricious designs.

HAWKSWORTH, EYRE, & Co., (68, Nursery Street,) are the makers of the articles which occupy our present page, and are manufacturers who are

fully alive to the necessities of the day, and the demand in the market at the present time not only for a constant succession of novelties, but also for correctness of design, and a proper amalgamation of parts to the general construction; a feeling which

now becomes a matter of serious consideration both on the parts of the manufacturer and the public.

The first of our selected articles from this manufactory exhibits a sugar-basket of open metal-work constructed either in silver or German silver electroplated, with coloured glass lining, which has the

best possible effect, giving a lightness and a brilliancy to the entire article not to be obtained by any other source.

A centre stand for the table follows in our series, and is an agreeable and tasteful design, carrying out fully the floral taste which should reign predominant in all articles destined to this peculiar use. There is much variety and beauty in the leaves and their construction, all of which aid the general effect.

A silver bread-basket, with an enriched border composed of masks and foliage, and with engraved panels of ornament running down the interior, strikes us as possessing considerable merit, the handle carrying out fully the general conception of the whole, which is well disposed in accordance with the peculiarities of this style.

The cruet-frame is of good and useful form, and the flower-vase or stand merits the same eulogium. There is much grace and ability in the construction of the stem of this little vessel; as indeed is there in the general form and treatment of the whole. There is now so general a demand for articles of this kind, and destined to such uses, that we are certain an attention to the production of tasteful and beautiful things of the sort cannot fail to reap its due reward in general appreciation and patronage among the public.

In recurring to the subject of Ornamental Art in general, we are glad to be able to assure ourselves of the satisfactory nature of the progress which we

are constantly seeing in the manufacturing districts of England, and which, directed with the energy which is a general characteristic of English enter-

prise, cannot fail to induce a well-grounded hope that in the forthcoming competition of Industrial Industry, we shall be fully enabled to occupy that

high position which the English manufacturer undoubtedly should retain.

PILGRIMAGES TO ENGLISH SHRINES.

BY MRS. S. C. HALL.

F. W. FAIRBOLT, F.S.A.

THE GRAVE OF EDMUND BURKE.

It has been said that we are inclined to overvalue great men when their graves have been long green, or their monuments grey above them, but we believe it is only then we estimate them as they deserve. Prejudice and falsehood have no enduring vitality, and

posterity is generally anxious to render justice to the mighty dead; we dwell upon their actions,—we quote their sentiments and opinions,—we class them amongst our household gods—and keep their memories green within the sanctuary of our HOMES; we read to our children and friends the written treasures bequeathed to us by the genius and independence of the great statesmen and orators—the men of literature and science—who ‘have been.’ We adorn our minds with the poetry of the past, and value it, as well we may, as far superior to that of the present: we sometimes, by the aid of imagination,—one of the highest of God’s gifts—bring great men before us: we hear the deep-toned voices and see the flashing eyes of some, who it may be, taught kings their duty, or quelled the tumults of a factious people: we listen to the lay of the minstrel, or the orator’s addresses to the assembly, and our pulses throb and our eyes moisten as the eloquence flows—first, as a gentle river, until gaining strength in its progress, it sweeps onwards like a torrent, overcoming all that sought to impede its progress. What a happy power this is!—what a glorious triumph over time!—recalling or creating at will!—peopling our small chamber with the demigods of history; viewing them enshrined in their perfections, unstained by the world; hearing their exalted sentiments; knowing them as we know a noble statue or a beautiful picture, without the taint of age or foiblesness, or the mildew of decay.

If these sweet waking dreams were more frequent, we should be happier; yes, and better than we are; we should be shamed out of much baseness—for nothing so purifies and exalts the soul as the actual or imaginary companionship of the pure and the exalted; no man who purposed to create a noble picture would choose an imperfect model; no one who seeks virtue and cherishes honour and honorable things, will endure the degradation of ignoble persons or ignoble thoughts; no one ever achieved a great purpose who did not plant his standard on high ground.

A little before the commencement of the present century, England was rife in orators, and poets, and men of letters; the times were favourable to such—events called them forth—and there was still a lingering chivalric feeling in our island which the utilitarian principles or tastes of the present period would now treat with neglect, if not contempt.

The progress of the French Revolution agitated Europe; and men wondered if the young Corsican would ever dare to wield the sceptre wrenched from the grasp of a murdered king; people were continually on the watch for fresh events; great stakes were played for all over Europe, and those who desired change were full of hope. It was an age to create great men.

Let us then indulge in visions of those, who, in more recent times than we have yet touched upon,—save in one or two PILGRIMAGES,—illuminated the later days of the last century; and, brightest and purest of the galaxy was the orator, EDMUND BURKE. Ireland, which gave him birth, may well be proud of the high-souled and high-gifted man, who united in himself all the great qualities which command attention in the senate and the world, and all the domestic virtues that sanctify homo; grasping a knowledge of all things, and yet having that sweet sympathy with

the small things of life, which at once bestows and secures happiness, and, in the end, popularity.

EDMUND BURKE was born on Arran Quay, Dublin, January the 1st, 1730; his father was an attorney: the name, we believe, was originally spelt Bourke. The great grandfather of Edmund inherited some property in that county which has produced so many men of talent—the county of Cork; the family resided in the neighbourhood of Castletown Roche, four or five miles from Doneraile, five or six miles from Mallow—now a railroad station—and nearly the same distance from the ruins of Killoolman Castle, whose every mouldering stone is hallowed by the memory of the poet Spenser and his dear friend, “the Shepherd of the Ocean,” Sir Walter Raleigh. There can be little doubt that Edmund—a portion of whose young life was passed in this beautiful locality—imbibed much thought, as well as much poetry, from the sacred memories which here accompanied him during his wanderings.

Nothing so thoroughly awakens the sympathy of the young as the imaginary presence of the good and great amid the scenes where their most glorious works were accomplished; the associations connected with Killoolman are so mingled, that their contemplation produces a variety of emotions—admiration for the poem which was created within its walls—contemplation of the “glorious two” who there spent so much time together in harmony and sweet companionship despite the storms which ravaged the country; then the awful catastrophe, the burning of the castle, and the loss of Spenser’s child in the flames, still talked of in the neighbourhood, were certain to make a deep impression on the imagination of a boy whose delicate health prevented his rushing into the amusements and society of children of his own age. There are plenty of crones in every village, and one at least in every gentleman’s house to watch ‘the master’s children’ and pour legendary lore into their willing ears, accompanied by snatches of song and fairy tale. All these were certain to seize upon such an imagination as that of Burke, and lay the foundation of much of that high-souled mental poetry—one of his great characteristics; indeed, the circumstances of his youth were highly favourable to his peculiar temperament—his delicate constitution rendered him naturally susceptible of the beautiful; and the locality of the Blackwater, and the time-honoured ruins of Killoolman, with its history and traditions, nursed, as they were, by the holy quiet of a country life, had ample time to sink into his soul and germinate the fruitage which, in after years, attained such rich perfection.

An old schoolmaster, of the name of O’Halloran, was his first teacher; he “played at learning” at the school, long since in ruins; and the Dominic used to boast that ‘no matter how great Master Edmund (God bless him) was, HE was the first who ever put a Latin grammar into his hands.’

Edmund was one of a numerous family; his mother, who had been a Miss Nagle, having had fourteen or fifteen children, all of whom died young, except four—one sister, and three brothers; the sister, Mrs. French, was brought up in the faith of her mother, who was a rigid Roman Catholic, while the sons were trained in their father’s belief, this, happily, created no unkindness between them, for not only were they an affectionate and a united family, but perfectly charitable in their opinions, each of the other’s creed. As the future statesman grew older, it was considered wise to remove him to Dublin for better instruction, and he was placed at a school in Smithfield kept by a Mr. James Fitzgerald; but, fortunately for his strength of body and mind, the reputation of an academy in the lovely valley of Ballitore, founded in the midst of a colony of Quakers, by a member of that most benevolent and intelligent society—the well-known Abraham Shackleton—was spreading far and wide; and there the three young Burkes were sent in 1741, Edmund being then twelve year’s old.

He was considered not so much brilliant, as of steady application. Here, too, he was remarkable

* Sylvanus Spenser, the eldest son of the Poet Spenser, married Ellen Nagle, elder daughter of David Nagle, Esq., ancestor of the lady, who was mother to Edmund Burke.

for quick comprehension, and great strength of memory; indications which drew forth at first the commendation, and as his powers unfolded, the warm regard of his master; under whose paternal care, the improvement of his health kept pace with that of his intellect, and the grateful pupil never forgot his obligations: a truly noble mind is prone to exaggerate kindnesses received, and never detracts from their value; it is only the low and the narrow-minded who underrate the benefits they have been blessed with at any period of their lives.

In 1743 he entered Trinity College, Dublin, as a pensioner. He gained fair honours during his residence there, but, like Johnson, Swift, Goldsmith, and other eminent men, he did not distinguish himself so as to lead to any speculation as to his after greatness, although his elders said he was more anxious to acquire knowledge than to display it;—a valuable testimony. His domestic life was so pure, his friendships were so firm, his habits so completely those of a well-bred, well-born IRISH GENTLEMAN—mingling, as only Irish gentlemen can do, the suavity of the French with the dignity of English manners—that there is little to write about, or speculate upon, beyond his public words and deeds.

Like most young men of his time, his first oratory was exercised at a club, and his first efforts as a politician were made in 1749, previous to his quitting the Dublin University, in some letters against Mr. Henry Brooke, the author of ‘Gustavus Vasa.’ His determination was the bar, and his entry at the Middle Temple bears date April 23, 1747. His youthful impressions of England and its capital are recorded in graceful language in his letters to those friends whom he never lost, but by death; one passage is as applicable to the present as to the past. ‘I don’t find that genius, the “rath primrose which forsaken dies,” is patronised by any of the nobility, so that writers of the first talents are left to the capricious patronage of the public.’

It was the taste of his time to desire, if not solicit patronage. In our opinion literature is degraded by patronage, while it is honoured by the friendship of the good and great. Nothing is so loathsome in the history of letters as the debased dedications which men of mind some years ago laid at the feet of the so-styled ‘patron!’ Literature in our days has only to assert its own dignity, to be true and faithful to the right, to avoid ribaldry, and preserve a noble and brave independence; and then its importance to the state, as the minister of good, must be acknowledged. It is only when forgetful of great purpose and great power, that literature is open to be forgotten or sneered at. Still the indifference an Englishman feels towards genius, even while enjoying its fruits, was likely enough to check and chill the enthusiasm of Burke, and drive him to much mystery as to his early literary engagements. One of his observations made during his first visit to Westminster Abbey, while hopes and ambitions quickened his throbbing pulse, and he might have been pardoned for wishing for a resting place in the grand mausoleum of England, is remarkable, as showing how little be changed, and how completely the youth

‘Was father to the man.’

‘Yet after all, do you know that I would rather sleep in the southern corner of a country church-yard than in the tomb of the Capulets. I should like, however, that my dust should mingle with kindred dust; the good old expression, “family burying ground,” has something pleasing in it, at least to me.’

This was his last, as it seems to have been his first desire; and it has found an echo in many a richly dowered heart.

‘Lay me,’ said Allan Cunningham, ‘where the daisies can grow on my grave’; and it is well known that Moore—

‘The poet of all circles,—

and, as a poor Irishman once rendered it—

The darting of his own;’

has frequently expressed a desire to be buried at Sloperston beside his children.

The future orator found the law, as a profession, alien to his habits and feelings, for at the expiration of the usual term he was not even called to the bar. Some say he desired the professorship of logic at the University of Glasgow, and even stood the contest; but this has been disputed, and if he was rejected, it is matter of congratulation, that his talents and time were not confined to so narrow a sphere. At that period his mind was occupied by his theories on the Sublime and Beautiful, which were finally condensed and published in the shape of that essay which roused the world to admiration.

Mr. Prior says, and with every show of reason, 'that Mr. Burke's ambition of being distinguished in literature, seems to have been one of his earliest, as it was one of his latest, passions.' His first avowed work was 'The Vindication of Natural Society,' but he wrote a great deal anonymously; and the essay on 'The Sublime and Beautiful,' triumphant as it was, must have caused him great anxiety; he began it before he was nineteen, and kept it by him for seven years before it was published—a valuable lesson to those who rush into print and mistake the desire for celebrity, for the power which bestows immortality.

The literature which is pursued chiefly in solitude, is always of the best sort: society, which cheers and animates men in most employments, is an impediment to an author if really warmed by true genius, and impelled by a sacred love of truth not to fritter away his thoughts or be tempted to insincerity.

The genius and noble mind of Burke constituted him a high priest of literature; the lighter, and it might be the more pleasurable, enjoyments of existence, could not be tasted without interfering with his pursuits; but he knew his duty to his God, to the world, and to himself, and the responsibility alone was sufficiently weighty to bend a delicate frame, even when there was no necessity for labouring to live—but where an object is to be attained, principles put forth or combated, God or man to be served, the necessity for exertion always exists, and the great soul must go forth on its mission.

That sooner or later this strife, or love, or duty—pursued bravely—must tell upon all who even covet and enjoy their labour, the experience of the past has recorded; and Edmund Burke, even at that early period of life, was ordered to try the effects of a visit to Bath and Bristol, then the principal resort of the invalids of the United Kingdom.

At Bath he exchanged one malady for another, for he became attached to Miss Nugent, the daughter of his physician, and in a very little time formed what, in a worldly point of view, would be considered an imprudent marriage, but which seemed the happiness of his future life; she was a Roman Catholic; but, however unfortunate dissenting creeds are in many instances, in this it never disturbed the harmony of their affection.

She was a woman exactly calculated to create happiness; possessing accomplishments, goodness of heart, sweetness of disposition and manners, veneration for talent, a hopeful spirit to allay her husband's anxieties, wisdom and love to meet his ruffled temper, and tenderness to subdue it—qualities which made him frequently declare 'that every care vanished the moment he sheltered beneath his own roof.'

Edmund Burke became a husband, and also continued a lover—and once presented to his lady-love, on the anniversary of their marriage, his idea of 'a perfect wife.'

* This as a picture is outlined with so delicate a pencil, and coloured with such mingled purity and richness of tone, that we transcribe a few passages, as much in honour of the man who could write, as of the woman who could inspire such praise:—

“The character of —
“She is handsome, but it is beauty not arising from features, from complexion, or from shape. She has all three in a high degree, but it is not by these she touches a heart; it is all that sweetness of temper, benevolence, innocence, and sensibility, which a face can express, that forms her beauty. She has a face that just raises your attention at first sight; it grows on you every moment, and you wonder it did no more than raise your attention at first.

“Her eyes have a mild light, but they awe when she pleases; they command like a good man out of office, not by authority, but by virtue.

For a considerable time after his marriage Burke toiled as a literary man, living at Battersea or in town, now writing, it is believed, jointly with his brother Richard and his cousin William, a work on the 'European Settlements in America,' in two volumes, which, according to tradition, brought him, or them, only fifty pounds! then planning and commencing an abridgment of the 'History of England.'

Struggling, it may be with difficulties brought on by his generous nature, and which his father's allowance of two hundred a year, and his own industry and perseverance could hardly overcome, the birth of a son was an additional stimulant to exertion, and, in conjunction with Dodsley, he established the *Annual Register*. This work he never acknowledged, but his best biographers have no doubt of his having brought forth and nurtured this useful publication. A hundred pounds a volume seems to have been the sum paid for this labour; and Burke's receipts for the money were at one time in the possession of Mr. Upcott.

Long before he obtained a seat in Parliament he won the esteem of Doctor Johnson, who bore noble testimony to his virtue and talent, and what he especially admired, and called, his 'affluence of conversation.'

For a time he went to Ireland as private secretary to Mr. Hamilton, distinguished from all others of his name as 'single speech Hamilton'; but disagreeing with this person, he nobly threw up a pension of three hundred a year, because of the unreasonable and derogatory claims made upon his gratitude by Hamilton, who had procured it for him.

While in Dublin he made acquaintance with the genius of the painter Barry, and though his own means were limited, he persuaded him to come to England, and received him in his house in Queen Anne Street, where he soon procured him employment; he already numbered Mr. afterwards Sir Joshua, Reynolds amongst his friends; and his correspondence with Barry might almost be considered a young painter's

Mr. Burke was then on the threshold of Parliament, Lord Verney arranging for his *début* as member for Wendover, in Buckinghamshire, under the Rockingham Administration; another star was added to the galaxy of that brilliant assembly, and if we had space it could not be devoted to a better purpose than to trace his glorious career in the senate; but that is before all who read the history of the period, and we prefer to follow his footsteps in the under current of private life.

He was too successful to escape the poisoned arrows of envy, or the misrepresentations of the disappointed. Certain persons exclaimed against his want of consistency, and gave as a reason that at one period he commended the spirit of liberty with which the French Revolution commenced, and after a time turned away in horror and disgust from a people who made murder a pastime, and converted Paris into a shambles for human flesh.

But nothing could permanently obscure the fame of the eloquent Irishman, he continued to act with such worthiness, that, despite his schism with Charles James Fox, 'the people' did him the justice to believe, that in his public conduct, he had no one view but the public good.

He outlived calmness, uniting unto genius diligence, and unto diligence patience, and unto patience enthusiasm, and to these, deep-hearted enthusiasm, with a knowledge, not only, it would seem, of all things, but of such ready application, that in illustration or argument his resources were boundless; the wisdom of the Ancients was as familiar to him as the improved state of modern politics, science and laws; the metaphysics and logic of the Schools were to him as household words, and his memory was gemmed with whatever was most valuable in poetry, history, and the arts.

After much toil, and the lapse of some time, he purchased a domain in Buckinghamshire, called 'Gregories'; there, whenever his public duties gave him leisure, he enjoyed the repose so necessary to an overtaxed brain;

GREGORIES.

manner, so full is it of the better parts of taste, wisdom, and knowledge.

“Her stature is not tall, she is not made to be the admiration of everybody, but the happiness of one.

“She has all the firmness that does not exclude delicacy — she has all the softness that does not imply weakness.”

“Her voice is a soft, low music, not formed to rule in public assemblies, but to charm those who can distinguish a company from a crowd; it has this advantage—you must come close to her to hear it.

“To describe her body, describes her mind; one is the transcript of the other; her understanding is not shown in the variety of matters it exerts itself on, but in the goodness of the choice she makes.

“She does not display it so much in saying or doing striking things, as in avoiding such as she ought not to say or do.”

“No person of so few years can know the world better; no person was ever less corrupted by the knowledge.

“Her politeness flows rather from a natural disposition to oblige, than from any rules on that subject, and therefore never fails to strike those who understand good breeding, and those who do not.”

“She has a steady and firm mind, which takes no more from the solidity of the female character, than the solidity of marble does from its polish and lustre. She has such virtues as make us value the truly great of our own sex. She has all the winning graces that make us love even the faults we see in the weak and beautiful in hers.”

and from Gregories some of his most interesting letters are dated.* Those addressed to the painter Barry, whom his liberality sent to and supported in Rome, are, as we have said, replete with art and wisdom; and the delicacy of both him and his excellent brother Richard, while entreating the rough-hewn genius to prosecute his studies and give them pleasure by his improvement, are additional proofs of the beautiful union of the brothers, and of their *oneness* of purpose and determination that Barry should never be cramped by want of means.†

After the purchase of Gregories‡ Mr. Burke

* Our cut exhibits all that now remains of Gregories—a few walls and a portion of the old stables. Mrs. Burke, before her death, sold the mansion to her neighbour, Mr. John Du Pré, of Wilton Park. It was destroyed by fire soon afterwards.

† During Barry's five years' residence abroad he earned nothing for himself, and received no supplies save from Edmund and Richard Burke.

‡ Mr. Prior says in his admirable Life of Burke—“How the money to effect this purchase was procured has given rise to many surmises and reports; a considerable portion was his own, the bequest of his father and elder brother. The Marquis of Rockingham offered the loan of the amount required to complete the purchase; the Marquis was under

had no settled town-house, merely occupying one for the season. In one of his letters to Barry, he tells him to direct to Charles Street, St. James's Square; he writes also from Fludyer Street, Westminster, and from Gerrard Street, Solo; but traces of his 'whereabouts' are next to impossible to find. Barry was not the only artist who profited by Edmund Burke's liberality. Barret the landscape painter had fallen into difficulties, and the fact coming to the orator's ears during his short tenure of power, he bestowed upon him a place in Chelsea Hospital, which he enjoyed during the remainder of his life.

Indeed, this great man's noble love of Art was part and parcel of himself; it was no affectation, and it led to genuine sympathy with, not only the artist's triumphs, but his difficulties. He found time, amid all his occupations, to write letters to the irritable Barry, and if the painter had followed their counsel, he would have secured his peace and prosperity; but it was far otherwise: his conduct, both in Rome and after his return to England, gave his friend just cause of offence; though, like all others who offended the magnanimous Burke, he was soon forgiven.

He never forgot his Irish friends, or the necessities of those who lived on the family estate; the expansive generosity of his nature did not prevent his attending to the minor comforts of his dependants, and his letters 'home' frequently breathe a most loving and careful spirit, that the sorrows of the poor might be ameliorated, and their wants relieved.

We ought to have mentioned before that Mr. and Mrs. Burke's marriage was only blessed by two sons; one died in childhood, the eldest grew up a young man of the warmest affections, and blessed with a considerable share of talent; to his parents he was every thing they could desire; towards his mother he exhibited the tenderness and devotion of a daughter

But, perhaps, a tribute Burke valued more than any, remembering the adage—an adage which, unhappily, especially applies to Ireland, "no man is a prophet in his own country," was, that on a motion of the provost of Trinity College, Dublin, in 1790, the honorary degree of LL.D. was conferred upon him in full convocation, and an address afterwards presented in a gold box, to express the University's sense of his services. When he replied to this distinguished compliment, his town residence was in 'Duko Street, St. James.'

His term of life—over-taxed as it was—might have been extended to a much longer period, but that his deeply affectionate nature, as time passed on, experienced several of those shocks inseparable from even moderate length of days; many of his friends died; among others, his sister and his brother; but still the wife of his bosom and his son were with him—that son whose talents he rated as superior to his own, whom he had consulted for some years on almost every subject, whether of a public or a private nature, that occurred, and very frequently preferred his judgment to his own. This beloved son had attained the age of thirty-four, when he was seized with rapid consumption. When the malady was recognised and acknowledged, his father took him to Brompton, then, as now, considered the best air for those affected with this cruel malady. 'Cromwell House,' chosen as their temporary residence, is standing still, though there is little doubt the rage for extending London through this once sequestered and rural suburb, will soon raze it to the ground, as it has done others of equal interest.

We have always regarded 'Cromwell House,' as it is called, with veneration. In our earliest acquaintance with a neighbourhood, in which we lived so long and still love so well, this giant dwelling, starting with its white walls and halcyoned roof over the tangled gardens which seemed

been to discover the truth, for it destroyed not only our castles in the air, but their inhabitants; we found that Oliver never resided there, but that his son, Richard, had, and was a rate-payer to the parish of Kensington for some time. To this lonely sombre house Mr. and Mrs. Burke and their son removed, in the hope that the soft mild air of this salubrious neighbourhood might restore his falling strength; the consciousness of his being in danger was something too terrible for them to think of. He had just received a new appointment—an appointment suited to his tastes and expectations; he must take possession of it in a little time. He was their child, their friend, their treasure, their all! Surely God would spare him to close their eyes. How could death and he meet together? They entreated him of God, by prayer, and supplication, and tears that flowed until their eyes were dry and their eyelids parched—but all in vain. The man, in his prime of manhood, was stricken down; we transcribe, from an article in the *Quarterly Review*, on 'Fontenelle's Sign of Death,' the brief account of his last moments:—

'Burke's son, upon whom his father has conferred something of his own celebrity, heard his parents sobbing in another room at the prospect of an event they knew to be inevitable. He rose from his bed, joined his illustrious father, and endeavoured to engage him in a cheerful conversation. Burke continued silent, choked with grief. His son again made an effort to console him. "I am under no terror," he said; "I feel myself better and in spirits, and yet my heart flutters, I know not why. Pray, talk to me, sir! talk of religion; talk of morality; talk, if you will, of indifferent subjects." Here a noise attracted his notice, and he exclaimed, "Does it rain?—No; it is the rustling of the wind through the trees." The whistling of the wind and the waving of the trees brought Milton's majestic lines to his mind, and he repeated them with uncommon grace and effect:—

'His praise, ye winds, that from four quarters blow,
Breathe soft or loud; and wave your tops, ye pines,
With every plant, in sign of worship, wave!'

A second time he took up the sublime and melodious strain, and, accompanying the action to the word, waved his own hand in token of worship, and sank into the arms of his father—a corpse. Not a sensation told him that in an instant he would stand in the presence of the Creator to whom his body was bent in homage, and whose praises still resounded from his lips.

The account which all the biographies of Burke give of the effect this bereavement produced upon his parents is most fearful even to read; what must it have been to witness! His mother seems to have regained her self-possession sooner than his father. In one of his letters to the late Baron Smith, he writes—'So heavy a calamity has fallen upon me as to disable me from business, and disqualifies me for repose. The existence I have—I do not know that I can call life. * * Good nights to you—I never have any.' And again—'The life which has been so embittered cannot long endure. The grave will soon close over me, and my dejections.' To Lord Auckland he writes—'For myself, or for my family (alas! I have none), I have nothing to hope or to fear in this world.' And again in another letter—'The storm has gone over me, and I lie like one of those old oaks which the late hurricane has scattered about me. I am stripped of all my honours, I lie prostrate on the earth; I am alone, I have none to meet my enemies in the gate. I greatly deceive myself, if in this hard season of life, I would give a peck of refuse wheat for all that is called fame and honour in the world.

There is something in the 'wail' and character of these laments that recalls the mournful Psalms of David; like the Psalmist he endeavoured to be comforted, but it was by an effort. His political career was shrouded for ever—the *motives* to his great exertions was destroyed—but his mind, wrecked as it had been, could not remain inactive. In 1795 his *private* reply to Mr. Smith's letter, requesting his opinion of the expediency of aid necessary for Catholic Emancipation, got into public circulation; and in that singular

CROMWELL HOUSE.

and his demeanour to his father was that of an obedient son, and most faithful friend; at intervals he enjoyed with them the pleasure they experienced in receiving guests of the highest consideration; amongst them the eccentric Madame de Genlis, who put their politeness to the test by the exercise of her peculiarities, and horrified the meek and amiable Sir Joshua Reynolds by the assumption of talents she did not possess.

The publication of his reflections on the French Revolution, which, perhaps, never would have seen the light but for the rupture with Mr. Sheridan, which caused his opinions to be misunderstood, brought down the applause of Europe on a head then wearying of public life. obligations to him publicly, and privately for some attention paid to the business of his large estates in Ireland. Less disinterested men would have acted the matter otherwise—the one by quartering his friend, the other, by being quartered, on the public purse. To the honour of both a different course was pursued.

to cut it off from all communication with the world, was associated with our 'Hero Worship' of Oliver Cromwell. We were told he had lived there (what neighbourhood has not its 'Cromwell House?')—that the ghastly old place had private staircases and subterranean passages—some underground communication with Kensington—that there were doors in the walls, and out of the walls; and, that if not careful you might be precipitated through trap doors into some unfathomable abyss, and encounter the ghost of old Oliver himself. These tales operated upon our imagination in the usual way; and many and many a moonlight evening, while wandering in those green laes—now obliterated by Onslow and Thurloe Squares—and listening to the nightingales, have we watched the huge shadows cast by that solitary and melancholy-looking house, and, as we have said, associated it with the stern and grand Protector of England. Upon closer investigation, how grieved we have often

document, though he did not enter into the details of the question with as much minuteness as he would previously have done, he pleaded for the removal of the whole of the disabilities of the Roman Catholic body. From time to time he put forth a small work on some popular question. He originated several plans for benefiting the poor in his own neighbourhood. He had a windmill in his park for the purpose of supplying the poor with cheap bread, which bread was served at his own table; and as if clinging to the memory of the youth of his son, he formed a plan for the establishment of an emigrant school at Penn, where the children of those who had perished by the guillotine or the sword amid the French convulsions, could be received, supported, and educated. He made a generous appeal to government for the benefit of these children, which was as generously responded to. The house appropriated to this humane purpose had been inhabited by Burke's old friend, General Haviland; and after his death several emigré French priests sheltered within its walls. Until his last fatal illness Mr. Burke watched over the establishment with the solicitude of a friend and the tenderness of a father. The Lords of the Treasury allowed fifty pounds per month for its sustenance: the Marquis of Buckingham made them a present of a brass cannon and a stand of colours. When the Bonbons were restored in 1814 they relieved the government from this charge, and the institution was dissolved in 1820; in 1822 'Tyler's Green House,' as it was called, was sold in lots, pulled down, and carried away: thus, Burke's own dwelling being destroyed by fire, and this building, sanctified by his sympathy and goodness, razed to the ground, little remains to mark the locality of places where all the distinguished men of the age congregated around 'the Burkes,' and where Edmund, almost to the last, extended hospitalities, coveted and appreciated by all who had any pretensions to be considered as distinguished either by talent or fortune.

It has frequently struck us as strange, the morbid avidity with which the world seizes upon the slightest evidence of abstraction in great men, to declare that their minds are fading, or impoverished: the public gapes for every trifle calculated to prove that the palsied fingers can no longer grasp the intellectual sceptre, and that the well-worn and hard-earned bays are as a crown of thorns to the pulseless brow. It was, in those days whispered in London that the great orator had become imbecile immediately after the publication of his 'Letter to a Noble Lord;' and that he wandered about his park kissing his cows and horses.

A noble friend went immediately to Beaconsfield to ascertain the truth, and was delighted to find Mr. Burke anxious to read him passages from 'A Regicide Peace,' which he was then writing; after a little delicate manoeuvring on his part, to ascertain the truth, Mr. Burke told him a touching incident which proved the origin of this calumny on his intellectual powers.

An old horse, a great favourite of his son's, and his constant companion, when both were full of life and health, had been turned out at the death of his master, to take his run of the park for the remainder of his life, at ease, with strict injunctions to the servants that he should neither be ridden, nor molested by any-one. While musing one day, loitering along, Mr. Burke perceived this worn-out old servant come close up to him, and at length, after some moments spent in viewing his person, followed by seeming recollection and confidence, he deliberately rested his head upon his bosom. The singularity of the action itself, the remembrance of his dead son, its late master, who occupied so much of his thoughts at all times, and the apparent attachment, tenderness and intelligence of the creature towards him—as if it could sympathise with his inward sorrow—rushing at once into his mind, totally overpowered his firmness, and throwing his arms over its neck, he wept long and loudly.

But though his lucid and beautiful mind, however agonised, remained unclouded to the last, and his affections glowed towards his old friends as

warmly as ever, his bodily health was failing fast; one of the last letters he ever dictated was to Mary Leadbeater, the daughter of his old friend and master, Shackleton; this lady was subsequently well known in Ireland as the author of 'Cottage Dialogues.' The first literary attempt, we believe, made towards the improvement of the lower order of Irish, was by her faithful and earnest pen; to this letter, congratulating her on the birth of a son, is a P.S. where the invalid says:—'I have been at Bath these four months to no purpose, and am therefore to be removed to my own house at Beaconsfield tomorrow, to be nearer to a habitation more permanent, humbly and fearfully hoping that my better part may find a better mansion!'

It would seem as if he anticipated the hour of his passing away. He sent sweet messages of loving kindness to all his friends, entreating and exchanging pardons; recapitulated his motives of action on various political emergencies; gave directions as to his funeral, and then listened with attention to some serious papers of Addison on religious subjects and on the immortality of the soul. His attendants after this were in the act of removing him to his bed, when indistinctly invoking a blessing on all around him, he sank down and expired on the 9th of July, 1797, in the sixty-eighth year of his age.

'His end,' said his friend Doctor Lawrence, 'was suited to the simple greatness of mind which he displayed through life; every way unaffected, without levity, without ostentation, full of natural grace and dignity, he appeared neither to wish nor to dread, but patiently and placidly to await the appointed hour of his dissolution.'

It was almost impossible to people, in fancy, the tattered and neglected churchyard of Beaconsfield as it now is—with those who swelled the funeral pomp of the greatest ornament of the British senate; to imagine the tiled pall-bearers, where the swine were tumbling over graves, and rooting at headstones. Seldom, perhaps, never, in England, had we seen a churchyard so little cared for as that, where the tomb of Waller* renders the surrounding disorder 'in a sacred place' more conspicuous by its lofty pretension, and where the church is regarded as the museum of Edmund Burke. Surely the 'decency of churchyards' ought to be enforced, if those to whom they should be sacred trusts, neglect or forget their duty. That the churchyard of Beaconsfield, which has long been considered 'a shrine,' should be suffered to remain in the state in which we saw it, is a disgrace not only to the town, but to England; it was differently cared for during Burke's life-time, and though, like that of the revered Queen Dowager, his Will expressed a disinclination to posthumous honours, and unnecessary expense, never were mourners more sincere—never did there arise to the blue vault of heaven the incense of greater, and more deep-felt sorrow, than from the multitude who assembled in and around the church, while the mortal remains of Edmund Burke, were placed in the same vault with his son and brother.

The tablet to his memory, placed on the wall of the south aisle of the church, records his last resting-place with the relatives just named; as well as the fact of the same grave containing the body of his 'entirely beloved and incomparable wife,' who died in 1812, at the age of 76.

Deeply do we deplore that the dwelling where he enjoyed so much that renders life happy, and suffered what sanctifies and prepares us for a better world, exists no longer; but his name is incorporated with our history, and adds another to the list of the great men who have been called into life and received their first and best impressions in Ireland; and if Ireland had given nothing to her more prosperous sister than the extraordinary men of the past and present century, she merits her gratitude for the gifts which bestow so much honour and glory on the United Kingdoms.

* Waller was a resident in this vicinity, in which his landed property chiefly lay. He lived in the family mansion named Well's Court, a property still in the possession of his descendants. His tomb is a table monument of white marble, upon which rises a pyramid, resting on skulls with bat's wings; it is a peculiar but picturesque addition to the churchyard, and, from its situation close to the walk, attracts much attention.

Mrs. Burke, previous to her death, sold the mansion to her neighbour, Mr. John Du Pré, of

THE TOMB OF EDMUND BURKE.*

Wilton Park. Mrs. Haviland, Mr. Burke's niece, lived with her to the last, though she did not receive the portion of her fortune to which she was considered entitled. Her son, Thomas Haviland Burke, grand-nephew of Edmund, became the lineal representative of the family; but the library and all the tokens of respect and admiration which he received from the good, and from the whole world, went with the property to Mrs. Burke's nephew, Mr. Nugent. Some of the sculpture which ornamented the house now graces the British Museum.

The mansion was burnt on the 23rd of April, 1813. The ground where it stood is unequal; and some of the park wall remains, and fine old trees still flourish, beneath whose shade we picture the meeting between the mourning father and the favourite horse of his lost son.

There is a full-length portrait of Edmund Burke in the Examination Hall of the Dublin University. All such portraits should be copied, and preserved in our own Houses of Parliament, a meet honour to the dead, and a stimulant to the living to 'go and do likewise.' It hardly realises, however, the *ideal* of Burke; perhaps no portrait could. What Miss Edgeworth called the 'ground-plan of the face' is there; but we must imagine the varying expression, the light of the bright quick eyes, the eloquence of the unclosed lips, the storm which could gather thunder-clouds on the well-formed brow; but we have far exceeded our limits without exhausting our subject, and, with Dr. Parr, still would speak of Burke:—

'Of Burke, by whose sweetness Athens herself would have been soothed, with whose amplitude and exuberance she would have been enraptured, and on whose lips that prolific mother of genius and science would have adored, confessed—the Goddess of Persuasion.'

Alas! we have lingered long at his Shrine, and yet our praise is not half spoken!

* Our engraving exhibits his simple tablet, as seen from the central aisle of the church, immediately in front of the pew in which Burke and his family always sat.

† The late Queen Caroline, when Princess of Wales, requested the widow of Edmund Burke to let her have a cast taken from the bust of her husband, and the widow anxious for his honour—as Her Royal Highness said it should be one in a gallery she was about to form of British Worthies—presented the Princess with the original. The collection was never formed; and at the sale of Her Royal Highness's effects at Connaught House, it was discovered amongst the rubbish, and put up for sale. There was a contest for it between Turnerell, the sculptor, and Mrs. Thomas Haviland; the lady bought her uncle's bust, and some time after Mr. Haviland presented it to the British Museum.—Faxon's *Life of Burke*.

A DICTIONARY OF TERMS IN ART.

FAIENCE, FAYENCE, (Fr.) A general term comprising all the various kinds of glazed earthenware and porcelain. The origin of the term is open to dispute; by some it is supposed to be derived from Faenza in Italy, by others, from Fayence in France.*

FAITH, HOPE, AND CHARITY. Three Sisters, of the ages of nine, ten, and twelve, who, according to the old legend, suffered martyrdom by being beheaded, A.D. 120, and were buried by their mother Sophia. The names of these children lead to the supposition that this was a poetical legend, arising probably from some incident at the time of the Christian persecution; for however beautiful it may be to personify 'Faith, Hope, and Love,' yet it is repugnant to our feelings to believe in the martyrdom of the children representing the ideas, which form the basis of our religion, the religion of love. Art has, however, taken the unpoetical view of this story, and the children have been depicted with a sword, the sign of trial. The martyrdom of these daughters of Sophia (or *Divine Wisdom*), is said to have taken place on the 5th, 6th, and 7th of October. Charity or Love, the greatest of the Christian virtues, is often represented as a mother, with Faith and Hope as her children. Such a group is called a Charity, *Caritas* (Italian, *CARITA*).

FAITH (FIDES). In ancient Art is represented as a matron wearing a wreath of olive or laurel leaves, and carrying in her hand ears of corn, or a basket of fruit. In Christian Art, by a female carrying a eup surmounted by a cross, emblematical of the Eucharist, "the Mystery of Faith."

FALCON. The attribute of St. Jerome, and of the holy hermit Otho of Ariano; the former has a hooded falcon on his hand, while the latter has it sitting on his head.

FALDSTOOL, FALDSTOOL, FOLDING-STOOL. A portable folding seat, similar to a Camp-stool, made either of wood or metal, and sometimes

covered with silk or other material. It was used by a bishop when officiating in other than his own Cathedral Church. Faldstools are frequently represented in illuminated manuscripts.†

FAN. In ancient Art, FANS frequently occur, especially on vases, and on mural paintings; they were constructed of various materials and elegant forms, sometimes of peacock's feathers, at others of the wings of a bird fastened together. Our cut represents Cupid fanning his mother Venus, from the antique sculpture published by Maffei.

FASCES. The most ancient insignia to the Roman magistrates, consisting of bundles of elm or birch rods, in the centre of which was an Axe. The custom was borrowed from the Etruscans, and some authors assert that it was known in the time of Romulus, while others maintain that Tarquinius Priscus was the first to adopt it. After the banishment of Tarquinius Superbus, the Fasces were carried before the Consuls by men called *LICTORS*, but this honour was granted to the *Consul Major* only. The Consul and Proconsul had twelve *Lictors*, each of whom carried a Fascis; the Dictator had twenty-four, and when in Rome the Axe was carried before him. The Praetor of the Towns had only two Fasces, those of the provinces and the army had six. The *Duoviri Municipales* and the Roman *Decemviri* had also *Lictors*; no other Magistrates were entitled to this right. When these officers appeared in public, the *Lictors* carried the Fasces upright, but at funerals they were lowered; victorious generals had their Fasces wreathed

* See MARRVATT'S *History of Pottery and Porcelain*. London, 1850.

† Our first example is copied from Cotton, MS. *Tiberius*, a work of the Saxon period. The second shows a similar seat, covered with drapery in the fashion of the most usual, from another MS. of the same period. (Augustus, A. 13.)

with laurel, and carried thus at their triumphs; and this custom, adopted by Caesar, was followed in the time of the Emperors, who gratified their love of splendour by having wreathed or gilded Fasces always carried before them. Under the Empire, the Consuls, who were merely civil magistrates, had twelve Fasces, while the Propraetors and Pro-consuls were allowed six, and this lasted till the fall of Rome.

FASCIA. A Bandage employed in various ways, 1. As a *DIADEM*, worn round the head as an emblem of royalty, the colour being white, that worn by women was purple.* 2. Fastened round the legs, especially of women, from the ankle to the knee, serving the purpose of leggings, as a protection to the legs of the wearer, a practice that was adopted in Europe during the middle ages.

FALAS. A tile or slab of marble cut into an hexagonal shape so as to produce the honeycomb pattern in pavements of the kind called *SECTILIA*.

FEET. In Christian Art, the FEET of Our Lord, also of Angels and of the Apostles, should always be represented naked, without shoes or sandals.

FELICITAS. Fr. The appellation of a Roman goddess; a Christian martyr; and a traditional empress, mentioned in romantic poetry only.

1. *FELICITAS*, a divine being, agreeing with the *Eudemonia (Felicity)* and the *Eutychia (Good Fortune)* of the Greeks, in whom was personified the idea of happiness arising from blissful occurrences. Thus, *Felicitas (Eutychia)* means more than *Fortuna* or *Tyche*, by which was meant chance or luck. The *Felicitas* of the Greeks, *Eutychia*, is represented on many earthen vessels as announcing to the spectator the desired result of the action intended. We also meet with it as illustrative of success in arms, and of happiness in marriage. On Roman coins she is represented with the *MORIBUS* on her head, the staff of *HERMES* in her hand, and resting on a *CORNUCOPIA*, but her attributes differ according to circumstances. 2. St. *Felicitas*, a Christian lady of Rome, who is depicted with a Palm-branch and Cross; she is the patroness of male children. She had seven sons, who with her suffered martyrdom at Rome, A.D. 160. *Felicitas* was thrown into a cauldron of boiling oil, while her sons' heads were cut off and exhibited before her. 3. The Empress *Felicitas*, a principal character in the romance of Count Octavian; her two children, who, with herself, were cast into a forest, were nursed by a lioness.

FEMINALIA. A kind of short Pantaloon or closely-fitting Breeches, reaching a short distance below the knees, worn by the Roman soldiers in their expeditions to cold countries; they are seen depicted on the Column of Trajan,† and on the Arch of Constantine at Rome.

FENGITE. A kind of transparent Alabaster or marble, sometimes used for windows, as in the Church of St. Miniato at Florence.

FERETORY. This term is applied to the Bier or shrine containing the reliques of saints, borne in processions. The type of a *FERETORY* is a coffin,

but the form is usually that of a ridged chest, with a roof-like top, usually ornamented by pierced

* See Cut p. 288. † From which our example is copied.

work, with the sides and top engraved and enamelled, and sometimes with images in high relief. They were made of various metals. 1. Of solid gold and silver adorned with jewels. 2. Of copper, gilt and enamelled. 3. Of wood overlaid with plates of metal, or richly painted and gilt. 4. Of ivory, or of crystal, mounted in metal and gilt. 5. Of wood, covered with precious stuffs and embroidery.*

FESTOON. A carved ornament in wood, stone, &c., usually in the form of a garland or wreath composed of flowers, fruits, leaves, &c., bound together, and suspended by the ends. It was employed by the architects of the middle ages frequently with much success in their friezes of the Composite order. It is usefully and aptly employed in Decoration.†

FIBULA. A Brooch, Buckle, or Clasp, used for fastening together various parts of male and

female attire, as well as for ornament. They were made of ivory, gold, bronze, precious stones set in gold, and sometimes of silver, and of every variety of form, upon which the most elaborate ornament was frequently bestowed. In Ancient Art we see the Fibula employed to pin together the two parts of a Cloak or Scarf, (*Chlamys, Pallium, &c.*), so as to fasten them over the right shoulder. Sometimes, but rarely, we see it on the breast. In female costume it is seen worn on both shoulders, and sometimes on the sleeves, breast, and to fasten the Tunic when tucked up at the knee.‡

FICTILIA, TESTA, (KEREMANIA, Gr.) The term applied to all ancient Pottery, from domestic utensils to architectural ornaments, coarse or fine, burnt, or only hardened by exposure to the air. The most plastic species of clay for the finer kinds of pottery was found in Etruria, and the earthen table vessels of Arretium maintained their superiority even to the time of Pliny.§ Among the Greeks, the pottery of Athens, and of the island of Samos, was the most famed, the finest, and of the most carefully washed earth, it was called *Samian Clay*, and produced the hardest ware.||

FICTOR. A term applied to any artist who works in wax, clay, or other plastic material, as contradistinguished from one who works in bronze, marble, wood, ivory, or other solid substances.

FIGURE. A term in the Arts applied to representations of the human body, and of the human body only. To sketch or paint the figure, a figure in bronze or marble, is always understood to signify a sketch, painting, or statue after the human model. Figure-painting has always been regarded as the highest range of which Art is capable, as it tests the noblest mental faculties of the artist; it is not meant to be understood by this, mere portraiture, but historic or ideal delineation in which the actions and passions of human nature are to be placed before the spectator. For acquiring an anatomical knowledge of the human form, it is customary to draw from the nude, or naked figure; the draperies are frequently arranged by means of what is termed a "lay-figure," which will be treated of in its proper place.

* See *Prigai's Glossary of Ecclesiastical Ornament and Costume*. There is a Feretory in Westminster Abbey. Our cut is copied from a MS., by Matthew Paris, in the Cotton Collection, marked Nero, D. 1.

† See *Encyclopaedia* and its Illustrative Cut, p. 323.

‡ Our Cut exhibits a bow-shaped gold Fibula of the Roman period; and a flat circular enamelled Fibula of the same age. The side view exhibits the pin by which it was fastened.

§ The ornamental stamps used for the pottery were also of baked clay. One containing a pattern for a border is engraved above.

|| The earth used for making Fictilia was usually red, often of the greatest brilliancy when the oxide of iron was present in large quantity; other clays containing a smaller proportion of iron yielded pottery of an ochreous brown colour. Some specimens have been found entirely black, supposed to be due to the mixture of asphaltum with the clay. The clay used for making the modern black tea-pots, &c., owes its colour to the presence of the protoxide of iron and manganese; lastly, the white ware was yielded by pure clay, similar to the Cornish clay used in the manufacture of Porcelain. See ART-JOURNAL, October, 1850.

FIMBRIA, FRINGE.

materials, which were attached to the garments, &c.*

FINIAL. An ornament employed in Gothic architecture, as a termination to pinnacles, pediments, canopies; and therein closely resembles the CROCKET; and sometimes FINIALS are composed of four or more CROCKETS, united together. Church spires, when perfect, are frequently terminated with FINIALS.

FINISH. The last touches applied to a picture or other work of Art. It always constitutes the difference between excellence and mediocrity. Small pictures require the most careful Finish, but in larger works, too much attention to high Finish detracts from a large scale.

FIRE, FLAME. The attribute of St. Florian, the protector against conflagration; of the hermit Anthony, because the tempter appeared to him from the fire; of Bishop Basil, who saved a poor boy, by burning his compact with the devils; of St. Bridget of Scotland, over whose head a flame was seen from childhood; of St. Columba of Cordova, who saved an angel from death by fire; of St. Patrick, before whom fire sprung out of the earth, upon his drawing a Cross upon it with his staff; of the Dominican, Peter Gonzales, called St. Elmo, who, enclosed in a mantle, lay upon burning coals, whence the expression *St. Elmo's fire*; and of many Christian martyrs condemned to die by Fire.

FISH. A Fish has been employed as a symbol of our Lord from the earliest times, (it is found depicted in the tombs of the Roman catacombs,) by whom St. Peter was called a "fisher of men," and the faithful were sometimes represented by Fish, with reference to the waters of baptism in which they were born, and Fish were therefore frequently carved upon the baptismal fonts. Fish are used as emblems of Chastity; it is an attribute of the Apostle Simon. The *Vestica Piscis* is a symbolical figure, consisting of two intersecting segments of circles, employed also as an emblem of the Saviour from the fourth century. The seals of abbeys, colleges, and other religious establishments were all invariably made of this form.†

FITCIL. Among the Brushes used in Painting, some are made of the hair of the sable, a kind of weasel; others of the badger, and of white hog's bristles; but among the best are those of the Fitch or polecat, which are black in colour, elastic and firm, though soft. They are made both flat and round, and are used also for varnishing.

FLAKE WHITE. A white pigment extensively used in oil-painting; like nearly all the other white pigments, it is prepared from the carbonate of the oxide of lead, obtained by exposing sheets of lead to the vapour of acetic and carbonic acids. It derives its name from the form in which it appears in commerce—that of flakes or scales. As a pigment it possesses great body, and enters largely into numerous compound tints.

FLAMBOYANT, FLAME-LIKE. A term applied to those contours of which the inflexions have a resemblance to those of flame; and by antiquaries of France to that style of Architecture which was contemporary in that country with the perpendicular

* Our engraving is copied from WILKINSON'S *Manners and Customs of the Ancient Egyptians*, and exhibits a skirt of that antique period, with a richly fringed border. The ancient Assyrian sculptures exhibit such fringed garments in profusion; and they are frequently mentioned in Holy Writ.

† It takes precisely the form of the Aureole inclosing the figure of the Saviour, p. 110.

in England, from the flame-like wavings of its tracery. It is regarded by some as a vitiated decorated rather than a distinct style; in rich works, the intricacy and redundancy of the ornaments are frequently truly surprising.

FLAMMEUM. The Yellow Veil worn on the wedding-day by Roman brides. It was sufficiently large to cover the wearer from head to foot. It was removed by the husband upon their arrival at their home.*

FLESH, FLESH TINTS (CHAIRS, Fr.) The colours which best represent the human body, sometimes termed the *Carnations*, but employed in a more extended sense than this latter term, which better expresses the more delicate portions of the body, such as the face, bosom, and hands.

FLEUR DE LIS. The royal insignia of France. Its origin is disputed; by some it is supposed to represent a lily, by others, the iron head of some weapon. It is of frequent occurrence in English armory.

FLORENTINE LAKE. A pigment prepared from Cochineal; it is now obsolete; the greater durability in oil-painting of the lakes prepared from Madder having entirely superseded those prepared from Cochineal.

FLORENTINE FRESCO, FRESCO SECCO. A kind of painting first practised at Florence during the flourishing period of Italian Art for decorating walls. Like common Fresco the lime is used wet, but in this case it can be moistened and kept damp and fit for painting on.†

FLORENTINE MOSAIC. The term applied to the art of inlaying tables and other plane surfaces with *pietra dura*, carried on principally at Florence. Very beautiful patterns are thus produced by the combination of precious stones, forming the most difficult branch of mosaic art.‡

FLOWERS. Flowers are employed in Art as Attributes. 1st. Of mythological persons—Aphrodite, the Hours, and Zephyr. 2nd. Among legendary personages—Of St. Dorothea, who is represented with flowers and fruits by her side, or in a basket, also with a branch of roses in her hand, or crowned with those flowers; of St. Sophronia, upon whose corpse birds and flowers are strewn; of St. Rosa de Lima, who was named Rosa on account of her beauty, and has a rose with a broken crown of thorns; of St. Rosa of Viterbo, who holds roses in her hand or in her apron; of St. Elizabeth of Hungary, who has roses in her lap or in a basket; of St. Casilda, who generally wears a wreath of white roses on her head; of the Holy pair Asculus and Victoria, both crowned with roses; of St. Angelus, from whose mouth fall roses and lilies; and of St. Hugo, who holds three flowers in his hand. For the Lily, the attribute of many saints. See LILY. §

* Our cut exhibits its form and mode of wearing as given in a sculpture of a Roman marriage engraved in BARTOLI'S *Admiranda Romanorum Antiqua*.

† This method has been recently employed at Munich by the decorators Stanka, Strauss, Schwaninger, and others. The new inner colonnade of the royal palace is painted in FLORENTINE FRESCO.

‡ The finest specimen of work in *pietra dura* was made for the Grand Duke of Tuscany; it is a table about four feet in diameter, which occupied the labour of four men for three years; upon it is a garland of jasmine and purple grapes, so beautifully shaded that they look like nature. A larger table in Egyptian porphyry, with flowers and antique instruments in mosaic work, cost the Grand Duke, at his own manufactory, 100,000 francs. The gloomy burial Chapel of the Medici in the Lorenzo Church is richly adorned with Florentine mosaic; on the lower part of the marble walls are the arms of all the Tuscan cities, and the costly altar of Lapis Lazuli is splendidly inlaid with yellow chalcidony and other beautiful precious stones, representing Christian symbols, surrounded by the most natural fruit-work.

§ See EMBLEMS OF SAINTS, by which they are distinguished in Works of Art, by the Rev. G. C. Husenbeth, 12mo. 1850.

¶ Flowers have been constantly used in the church as

FONT. The vessel used to contain the consecrated water in Baptism, usually constructed of

stone and lined with lead; and in the earlier ages of the Church were always large enough to allow of the complete immersion of infants. The forms of Fonts have generally varied in different ages, and often exhibit exquisite richness both of design and ornament. Fonts were required to be covered and locked; originally these covers were simply flat moveable lids, but they were subsequently very highly ornamented, assuming the form of spires, and enriched with various decorations in the form of pinnacles, buttresses, &c.*

FOOLS. We frequently meet in ancient churches, especially under the seats of choir-halls, representations of men in grotesque costume, and in various postures, with a fool's cap and bells. These may be emblematical of the Vices, but they also may have been introduced with other significance, the source of which is obscure.†

FORM. The external appearance of objects; the quality that distinguishes one thing from another. Form, in painting, signifies especially the human body. The study of Forms, and the changes they undergo by muscular contractions, require on the part of the artist the utmost attention and assiduity. The conscientious artist ought scrupulously to avoid any tendency to exaggerate the superficial forms of the body; nothing is more simple, more calm; nothing shows a grander breadth of design than the human body; the muscles assist by their reunion in the production of general forms; the special forms are scarcely visible.‡

FORMATIVE ARTS. Those arts which, independently of external wants and aims, yet, on the other hand, bound to the imitation of nature, represent Life by means of the forms naturally connected. §

FORE-SHORTENING. The art of representing objects on a plane surface so they appear to the eye, depending upon a correct knowledge of form, perspective, and chiaroscuro. It is one of the most difficult studies in the art of design, and when executed with skill constitutes the excellence of the Master. Michael Angelo, Rubens, and Correggio, were distinguished among other rare qualities for their skill in Fore-shortening. They practised modelling for assistance in attaining this art.

FRESCO (Ital.) FRESQUE (Fr.) Painting *al fresco* upon fresh or wet ground is executed with emblems of Joy and Festivity; and also as symbols of Love and Devotion towards the saints and martyrs, whose manifold graces and virtues are shadowed in their rich variety of line and colour.¶

* The Font we engrave is from one in Hunstanton Church, Norfolk; of the Norman era.

† The introduction of these and other ludicrous or even indecent images, in the very buildings dedicated to the solemn worship of God, has long been a subject of inquiry among the learned, and of surprise and scandal to the generality of persons. The source of many of these representations may be traced to the Pagan orgies of the Saturnalia and Lupercalia. It is necessary to draw a great distinction between the burlesque figures, and symbolical representations of the Vices and Virtues, which are often introduced under the guise of animals whose nature corresponds to the passion or virtue represented; hence human beings may be depicted with heads of beasts and birds, such as furies, lions, or hawks, to denote cunning, courage, or rapacity. Again, animals are frequently introduced with the same intention, and most admirable moral lessons are imparted under the same types as have been selected by *Æsop* and his imitators.—*FOUN, Glossary of Ecclesiastical Ornament and Customs.*

‡ See *The Anatomy of the External Form of Man, for the Use of Artists, Sculptors, &c.*, by Dr. FAU. Translated by Dr. KNOX, Esq., London, 1849.

§ See MULLER'S *Ancient Art and its Remains.*

¶ The general style of the Formative Arts is the result of a principle of selection which necessarily limits imitation. Such general style exists, therefore, in qualities which distinguish these arts from nature. The specific style of any one of the arts consists in the effective use of those particular means of imitation which distinguish it from the other arts. Style is complete when the spectator is not reminded of any remnant which another art or which nature could supply.—*EASTLARK.*

mineral and earthy pigments upon a freshly laid stucco ground of lime or gypsum. Vegetable pigments cannot be used for fresco-painting even when mixed with mineral pigments, and of the latter, only those are available which resist the chemical action of the lime. Burnt pigments are the best for this style of painting; they are generally ground with clean water, and rendered so thin that they can be worked with the brush; to some are added lime, milk, &c. The pigments unite with the lime or gypsum ground, and are therefore extremely durable; but as this ground after standing a night is unfit for painting on, there must be only a sufficient quantity for one day prepared. Fresco-painting is therefore difficult, as it cannot be retouched. This Art which is employed generally for large pictures on walls and ceilings was understood by the Ancients, but first made of real importance by the Italians in the sixteenth century.

FRËT. An angular interlaced ornament, used

in architecture, as exhibited in our engraving.

Its form varies in heraldry, and is exhibited in our second cut, forming the arms of the Harrington family, whence it is popularly known as the Harrington fret.

FRONTAL. The hangings or ornamental panel in front of an Altar, were of three kinds: 1st, of precious metals, adorned with enamels and jewels; 2nd, of wood, painted, gilt, embossed, and often set with crystals; 3rd, of cloth of gold, velvet, or silk embroidered, and occasionally enriched with pearls.

FRUIT-WORK. This branch of Art attained some excellence in antiquity, although used only for architectural ornaments. Workers in clay and bronze also imitated fruits, and in the time of Marcus Varro, there lived at Rome a clay-modeller who imitated apples and grapes so exactly, that at first sight they were not to be distinguished from nature. Festoons of fruit were also carved in stone for the decoration of temples. The most celebrated specimen in bronze is a colossal pine-apple, formerly on the tomb of the Emperor Hadrian, but now in the great Bramante niche, at the end of the garden of the Belvedere at Rome. We find the capitals and friezes of buildings of the middle ages, carved with grapes, and in the age of the Renaissance we meet with festoons of fruits, which afterwards, in the age of *Lococo*, were employed too frequently in decoration. At Florence, beautiful imitations of richly coloured fruits, such as purple grapes, &c., were made in *Pietra dura*, or FLORENTINE MOSAIC.

FRUIT-PAINTING may be considered to have originated with Zeuxis, who painted a bunch of grapes so naturally that the birds came and pecked at them. Since the introduction in modern times of pictures of *still life*, fruit and flower-painting has become a distinct branch of Art, cultivated principally in the Netherlands.

FUNERAL PALLS. The palls in ancient use, especially at the funerals of persons of distinction, were of the most costly materials and beautifully ornamented, being constructed of velvet or cloth of gold, embroidered with heraldic devices and imagery. The form was usually square, sometimes with lapets, with a cross extending the whole length and width, formed of a different material from the pall itself, and generally enriched with ornaments or appropriate scriptures. The colour of the palls varied at different periods. In the sixteenth century, and perhaps earlier, black was used; they were frequently made of red, purple, green and blue velvet, or of cloth of gold, with reference to the heraldic tinctures that were peculiar to the deceased.

FYLFOT. A cross of peculiar form, frequently introduced in decoration and embroidery during the middle ages. Its construction of some noble edifices. News anterior to the accession of Richard II., being found on the girdle of a priest of the date A.D. 1011. It is considered to have been in use at a very remote period as a mystic symbol amongst religious devotees in India and China, whence it was introduced into Europe about the sixth century.

THE INTERNATIONAL SOCIETY OF ARTISTS.

In whatever way Republican France may have benefited in her social condition by her various political revolutions, it is quite clear that the artists of the country have derived little advantage from the constant shifting of the political scenery, and the change of actors who have successively occupied the stage. All national excitement is inimical to the progress of art of every kind; it is silent when the elements of strife are at work, and droops and dies amid the turmoil of contending factions. It flourishes only when there is peace at home, or when success and conquest abroad leave its followers in quiet possession of the means for carrying on their pursuits; but even in the latter case there must be some powerful hand to assist, and some intelligent head to direct and encourage; one, in short, who is sensible of its advantages, and able to uphold its interests. Thus while the armies of Louis XIV. were overrunning half the continent, Art and literature, under his auspices, were making rapid progress; and Napoleon could find opportunity, while arming his legions for conquest, to call forth the resources of the empire in furtherance of its more intellectual gratification. Under the reign of the recently deceased monarch, Louis Philippe, national and individual employment was given to the great body of French artists and artisans, so that they had little cause to complain of want of encouragement, and the fruits of their labours now testify to their genius and their industry. But the past three or four years tell a widely different tale; the Art-talent of the country is not indeed dead—but it sleeps; there is nothing to rouse it into action, and the majority of those who depend upon it for their daily bread, find their occupation gone without the slightest prospect of its speedy return.

Under these circumstances a body of artists, representing all the various departments to which Art may be, and is, applied, have formed themselves into an association for the purpose, if it can be effected, of giving a new impulse to its practice, and consequently of ameliorating the condition of its professors. But, inasmuch as Art is not exclusive, and the whole civilised world is more or less concerned in its welfare, with that spirit of communism which seems just now to prevail among the nations of Europe, the society invites co-operation and membership from all quarters, and consequently has entitled itself "The International Society of Artists," including architects, painters, engravers, lithographers, literary men, musicians, actors, decorators, *artistes industriels et architectes*. We give the list as it stands in the prospectus of the society, which has been placed in our hands. This prospectus states the reasons which have induced the founders of this society to call it into existence: it sets out with the doctrine that Art is not a social power really organised and established, and which is felt to be absolutely indispensable in modern society; but that, on the contrary, Art and artists, placed beyond the bounds of things positive and essential, are nothing more than superfluities which nations may receive or reject at their pleasure, notwithstanding the powerful influence that history tells us they have in all ages brought to bear on civilisation; and that every social and political movement among nations has been a fruitful theme to Art, and when once accomplished, has been by it reproduced, painted, or sung for the edification of future generations. After referring to its present depressed condition in France, a review is taken of the impetus given to it during the middle ages; how the land was literally covered with the finest monuments of Art, to which provinces and municipalities, the founders of convents and abbeys, nobles and wealthy commoners, devoted their riches; while the respect which in those times was shown to talent of every kind is only equalled by the disdain with which it is treated now. Then deputations waited upon the sons of genius, and by the most liberal offers brought them from one end of Europe to the other; whole populations assisted gratuitously in their labours, entered enthusiastically into their designs; while rich and poor thought it alike a conscientious duty, and a point of honour wherein their own locality was concerned, to yoke themselves to the carts which were used for carrying the necessary materials for the construction of some noble edifice. Now monumental Art is well nigh dead; enthusiasm for great matters is extinct; it is in fact measured by the niggardly standard of individual success, so that each one cares more for himself than for the honour of his profession: in the end, centralisation, in laying the foundation with one hand of national and legal unity, whereas, after all, the political strength of

France is based, has, with the other, severed from the union those places distant from the seat of government which, of old times, possessed no small degree of power. Thus, while a multitude of administrations might have the opportunity of conferring incalculable advantages on the artist,—a single administration, *unique pour la France*, at Paris, is every day becoming more helpless and more restricted in its resources, and finds itself on the eve of saying to the whole artistic community,—"Do as you best can, for one can do nothing for you."

Prompted by the thus precarious state of the Fine Arts, several persons of influence and intelligence, favourable to their interests, have raised a fund for assistance in these evil days.

The International Society of Artists, grateful for the kind aid thus offered, and satisfied that Art cannot possibly be in a lower position than that it now occupies, considers the time has arrived to labour for its ultimate enfranchisement and to endeavour to elevate its professors to the rank in society they are qualified to fill. But this work of regeneration cannot be effected by a single section of Art, nor by the union of all the sections of a single country; to give it power and vitality, the strength and spirit of the artists of the world must be devoted to the object, whereby at length this republic of the Arts and of the Muses may be consummated, concerning which so much has been written for years past, but which none has ever known; yet, by the efforts now made, it may henceforth assume a palpable and visible form to all, under the title that is here chosen for it.

The plan put forth by the Society for accomplishing its purpose is thus announced. Leaving to the prevalent societies connected with Art their own especial field of action, and to local societies the efforts they are continually making to advance their own individual interests, this institution is founded principally for the protection of Art and artists; the latter of whom are too frequently seen struggling through life against insuperable difficulties, and who are sometimes known to sink under the weight of their misfortunes, without having once had an opportunity of fairly exhibiting to the world the fruits of that genius which their Creator has planted in them. An asylum will be founded at Paris for artists of the provinces and for foreigners, as a common centre (*un centre fraternal*) to which all non-residents may apply without hesitation; and it is hoped that the provinces and foreign places will establish similar houses of resort, and thus supersede that isolation to which travelling artists are continually subject—an isolation in every way discouraging in its results. Desirous of affording to young French artists and to strangers the means of communicating with the public, exhibitions will be opened several times during the year, when the Society will especially notice (*elle inaugurerà*) those who seem most worthy of pre-eminence. By timely help and remonstrance, it is hoped that Art, both in France and elsewhere, will obtain such reforms as it demands, and supported by the active measures of this institution, such improvement will be effected that the modern Vandalism which is every day witnessed towards the public monuments, national or otherwise, may be suppressed. Inasmuch as there exist in the minds of many artists ideas which they are unable to carry out for want of assistance, and projects which fail in their accomplishment from the same cause; it is intended to give support to what reason appears to sanction as useful, and to let the author receive the honour which he merits; it is hoped, by these means to render some service to society, by guarding the young and inexperienced, chiefly, from the designs of unprincipled men, who would use their talent solely for their own benefit; while at the same time, genius, too often neglected and unknown, would be duly recognised and encouraged. Resolved to combat the absurd notion that there are already too many artists—convinced, on the contrary, that there are only too many in certain localities, the Society will labour to introduce Art where yet it is comparatively unknown, and to develop it among those who are able to give it greater extension. By means of regular advances or payments, artists will be prevented from inconsiderately sacrificing their future prospects in countries of whose resources and wants they are ignorant. The different central societies, by the exchange of a monthly report, will inform their correspondents, artists industrial and others, of works which have been everywhere successful; they will specify what musical and literary works are most in fashion, and will notify the operatives who may be desirous of placing their talent at the disposal of French or foreign manufacturers.

The society forbids any step towards the solicitation on the part of its members, of govern-

ment employment, for it has no intention of enriching itself either collectively or individually. The annual subscription, payable in advance, is two francs—this is for defraying the expenses of the institution; every branch shall manage its own funds, over which the Parisian committees exercise no control. The means of giving universal circulation which Paris has, enable the central committee of this city to be a ready medium of communication between all places. At stated periods there will be convened at Paris a kind of ARTISTIC CONGRESS, at which all matters connected with the progress and the interests of Art will be freely and amicably discussed.

Such is a brief outline of the objects and the plan of this society, to aid which we have been requested to lend our assistance. We do this readily, inasmuch as though the idea seems vast and surrounded with many difficulties, it is good in the abstract, and doubtless may be accomplished to a very considerable extent. Any project that will unite the artists and *littérati* of Europe in a sort of confederation for the promotion of their interests, which are the interests of the whole civilised world, is commendable, and a "consummation devoutly to be wished." As we are reminded in the fable of the "Old Man, his Sons, and the Bundle of Sticks," each one, singly, may effect little for the regeneration of Art; but united, they have strength; and benefits far more than we can calculate on, may be predicted by such union. It will be the best act that Republican France has yet effected, if she is able to stir up the wiles of those whom she now addresses, to a republic over which the liberal Arts only preside. It is necessary we should add, for the information of those who may feel disposed to hear more on the subject, or to enrol themselves in the society, that M. Paul Justus, Rue de Seine 37, à Paris, will be happy to communicate with them.

THE PATENT LAWS AND DESIGNS' REGISTRATION ACT.

In the September number of the *Art-Journal*, we directed the attention of all interested parties to the act which has recently received the sanction of the legislature for protecting the designer and inventor of articles of utility or ornament; and we showed beyond dispute, how utterly insufficient for the purpose, and how impracticable, were the provisions the act contains.* Were we to print one half the correspondence we have had on the subject from practical men, substantiating our views, we might fill many pages of our publication; it is quite clear that something must be done to meet the difficulty, which on all sides surrounds the matter. If the promoters of the great Exhibition look for support from the British designer and artisan, Mr. Digby Wyatt's letter, published in the *Art-Journal* last month, showed how small was the expectation of any specific and immediate relief with regard to the copyright question, and a correspondence which has since taken place between that gentleman, Lieut. Col. Reid, and Mr. Campbell, the secretary to the "British Inventors' Protecting Company," has nothing in it of a more encouraging nature. This society consists chiefly, we believe, of the working classes, and Mr. Campbell had addressed the executive of the Exhibition, to ascertain what protection was likely to be afforded to "poor British inventors," as well as to obtain the co-operation of the Commissioners for the formation of a working-class committee in London.

Mr. Campbell says, in a letter to Col. Reid:—"There is a class of working men whose genius has been devoted to mechanical inventions, such as the Watts, the Arkwrights, &c., and who, by this exhibition, unless a provision is made for them, will be placed in a most unfavourable position. I know several of such men who have for years devoted their spare time and their means to construct models and machines for various purposes, which would be beneficial to the public. The patent laws of this country require the

* By the way, it amused us greatly to see a few months back the editor of a contemporary publication, devoted to manufacturing interests, assume to the credit of having directed this movement, in some such language as this:—"If our efforts to benefit the producer and manufacturer had resulted in nothing but this (meaning, to bring about the passing of this act), we should have had our reward," &c.; while in the last month's number we find it stated:—"The failure of the recent act to protect inventions exhibited in '51, is beginning to excite public attention throughout the country." The fact is, that any sensible man might have seen at a glance that this act was entirely impotent for any useful purpose; and if the editor of the work in question "brought it about," we wish him joy of the golden opinions he will shortly obtain.

expenditure of so large a sum of money as to put it out of the power of the working man ever to secure a legal right for the protection of his inventions, and many such inventors are now anxious to exhibit their genius by their models or designs, if these could be secured to them against piracy; but as yet no such security has been offered further than for a short period, and, therefore, such poor inventors who are anxious to enter the lists with other nations in the honourable struggle for intellectual prowess, will be compelled to remain passive spectators, or run the risk of losing their property."

We are not aware whether or no the society which speaks thus through its secretary has any particular political bias; possibly it has; for he says—"The working classes feel, therefore, justified in withholding their support to any scheme which refuses them protection at home, and subjects them to unfair competition from abroad." With its political opinions, whatever these may be, we have nothing to do, but the position in which the British operative designer and manufacturer are undoubtedly placed, by the defective state of the laws now in operation, is much to be deplored. And it would further appear by Mr. Wyatt's letter, which concludes the correspondence, that there is no prospect of amelioration, for he says, "It is not in the power of the commissioners to protect unpatented inventions; to do this in an exhibition would require that parliament should first alter the law." What then is to be done under these circumstances? Parliament in all probability, will not meet in time to remedy the evil, if so inclined; meanwhile, whatever operations are in progress by the manufacturer and designer must be suspended, till it may, perhaps, be too late to proceed with them; or they will at once be altogether laid aside. But, surely, the law officers of the crown might frame some enactment to meet the present emergency of the case, which enactment, by an order in council may become law till the assembled parliament shall have given its assent in its regular and constitutional form. If we are right in presuming that this may be done, it is the duty of the manufacturer and others interested, on the one part, to urge it on the executive committee of the Exhibition; and it is still more the duty of the committee to enforce the consideration of it on the government.

THE VERNON GALLERY.

HADRIAN'S VILLA.

R. Wilson, R.A., Painter. J. Carter, Engraver.
Size of the Picture 1 ft. 2 in. by 10 in.

This is one of the numerous pictures of Italian scenery which Wilson, the "father of English landscape-painting," as he is termed, painted during his stay in Italy, or subsequently, from sketches he made while resident there.

Wilson first commenced as a portrait-painter, and visited Italy for the purpose of studying that branch of art; but having made some sketches of the scenery in the environs of Rome, they attracted the notice of Zucherelli and Joseph Vernet, by whose advice he declined his former practice and diligently set to work upon what they recommended him to follow. The sequel shows his advisers were not mistaken in their estimate of Wilson's peculiar talent, for his landscapes are even now held in high esteem. This little picture is a good example of his pencil, rich and transparent in colour, and still fresh in its tone; many of his works have become dark, and have lost their original brilliancy.

Hadrian's Villa is situated at Tivoli, the Tibur of the Romans; it is about sixteen miles from the imperial city, and inasmuch as the surrounding country is very healthy and the scenery of the most romantic character, the ancient Roman nobility, and men of wealth, erected their country residences there. The Emperor Hadrian or Adrian, towards the close of his reign, A.D. 136, constructed near it a magnificent villa, of which extensive remains are still to be seen. The lower part of the building in the picture is presumed to be a portion of the original edifice which, when first erected, contained imitations of the works of art, and of many natural picturesque scenes which he had met with in his travels throughout the empire. Hadrian did not live long to enjoy his princely palace, dying two years after its erection.

Wilson frequently repeated his pictures of the same subject. Among the works of the old masters exhibited during the present year at the British Institution, was a picture, belonging to W. Lambert, Esq., of this scene, with some little variation in the figures and the distance: in colour and effect the two are identically the same.

THE PROPOSED CATALOGUES FOR THE GREAT EXHIBITION.

WITH every desire to do justice to those gentlemen who are labouring diligently to carry out the great scheme of the International Exposition, it is a duty we most unwillingly perform, when we feel called upon to notice the *mistakes* which are unfortunately made by the Executive in various matters to which their attention is necessarily directed. The last great "blunder" appears to be in the matter of the catalogues, for which a specification has been issued to printers for tenders. When we first glanced over this document, our own experience at once showed us the impracticability of the scheme; but, in place of giving our own opinion upon the subject, we prefer quoting a letter that has appeared, evidently from a practical man, in the *Daily News*; and this, notwithstanding we have received several similar communications from correspondents. It is unnecessary that we should print the specification, the general tenor of which will be found in the letter and in the observations that follow:—

TO THE EDITOR OF THE DAILY NEWS.

SIR,—I enclose a copy of the tender for preparing catalogues for the forthcoming Exhibition which has been issued by the executive committee to various printers and publishers. It is a remarkable document. You will observe that it embraces *two distinct forms of catalogue*; but as only *one* comes under the clauses enforcing penalties for non-performance, it is only I wish to call your particular attention.

Two things will immediately strike you, viz., the great want of free action left to the contractor, and the heavy penalties in case of failure. Clauses 7, 9, 13, 14, 15, and 23, all place the contractor more or less at the mercy of the office appointed by the committee. The latter clause, which provides for the delivery of 20,000 copies "within six days of the last portion of MSS. being sanctioned," may become fatal to the contractor, because this would be impossible unless considerable progress had been previously made. And as the contractor is perfectly in the dark as to what would or would not be sanctioned, he cannot take measures for his own security or that of his sureties. Generally speaking, men do not incur penalties of 50*l.* a day for non-fulfilment of contracts unless they have very clear data on which to base their time calculations.

But, perhaps, the advantages are so great as to justify an extraordinary risk. Let us see: In the first place I find on very close and economical calculation that the preliminary cost of making the catalogue; of arranging it for press, so as to fit it to its 320 pages; of setting up the types; of the pay of the salesmen; and all other charges incidental to its publication, will amount very nearly to 1200*l.*

I have then made a calculation of the cost of producing each 1000 copies, which perhaps some of your readers may understand:

	£	s.	d.
Twenty reams of quadruple fcap, at 7½ <i>l.</i> per lb.			
as per sample of 21 lbs. weight	20	5	0
One ream wrapper paper, 0 lb. 13 0			
Machining 20 reams at 6 <i>s.</i> , or double fcap, at 3 <i>s.</i>	6	0	0
Warehouse work, cutting up, &c.	1	0	0
Working wrapper in duplicate	0	5	0
Blinding	5	0	0
	39	5	0

Now the produce of 1000 copies at 1*s.* 6*d.*, of this the commissioners take 8*s.* 6*d.*, the contractor 4*l.* 13*s.* 4*d.*. Take from this the cost as above, and the profit on each 1000 copies is 2*l.* 8*s.* 4*d.*, say 2*l.* 10*s.*. Therefore, before the first cost of 1200*l.* is paid, nearly *half a million* catalogues must be sold, and sold at the Exhibition at full price, without taking into account that a large demand will also arise in the country, in the retail shops in London, and at the railway stations, where the retailer's profit must be allowed, and the price per 1000 reduced from 4*l.* 13*s.* 4*d.* to 2*l.* 6*s.*, or about 10*l.* below cost price.

This, then, is the privilege which the commissioners (who are all this time receiving 8*l.* 6*s.* 8*d.* for every 1000 copies) are willing to sell to the highest bidder, and upon such monstrous conditions. Certainly they have taken care of themselves, but I shall much wonder if any one will enable them to profit by their inanity.

I am, Sir, yours obediently,

A PRINTER.

This letter was made the subject of a leading article in the same newspaper a day or two after it was made public; and from this article we make the following extracts:—"The Executive 'bind down the typographer to a series of conditions which leave him not the slightest scope for the exercise of skill and judgment. Some of these conditions are quite absurd. The figures are to be of one type; the head-lines of another; the remainder, whatever the judgment of the officer appointed by the commission to superintend the printing may dictate. The paper is to be precisely '51 breviers wide, and 68 breviers ems long;' it is to weigh exactly '21 lb. per ream perfect,' and to be of 'colour, quality, and manufacture' with a particular sample. The wrapper is to be of 'coloured paper, 20 lb. per ream perfect;' it is to be printed 'with regulations,' and 'the type to be re-set from time to time, as required by the commissioners.'—Some of the largest firms in London

WADSWORTH'S VILLA

who have gone into calculations concerning this specification, have come to the conclusion that the 'Executive' have put forth an impracticable plan. It has been found by one firm that the paper to answer the remarkable specimen of the Executive cannot be produced by their paper-maker, except at a price which would involve a loss upon the sale. Another large printer, who went into the calculation, assumed a selling price of 1s. for every copy, without any allowance to the trade, but in addition to the royalty deducted 1d. per copy for the cost of the salesmen and other incidental charges. That deduction reduced the produce per 1000 to 374 10s., which is 12 10s. less than the cost at which 1000 copies can be printed! And it is to be observed that this estimated cost of 394 5s. for the printing, leaves out of view all the risk, &c., attending the production. For example, the cost of paper for half a million copies would be at least 13,000l. A firm which enters into a contract of this large amount for a single article required in their trade, not only runs a risk, but has a right to expect a small rate of interest on the money they expend. The calculation we have given takes no account of this, and in other respects is rather below than above what is considered the fair figure."

It would seem to be quite evident from what is here specified, that the Committee were entirely unacquainted with the difficulties of their proposition; in short, they knew not, as they could scarcely be expected to know, the business of a printer. Why then not take the advice of some practical man before issuing their proposals, who would at once have told them what could and what could not have been done? As the matter now stands, it must be gone into afresh, for we doubt whether a single answer will be returned to the Committee; for these are not the days when men choose to labour without profit, or to expend their capital at very considerable risk, even presuming there were no conditions which render the plan altogether impracticable.

The sending forth these applications for tenders seems to us a "shabby" affair; it rather resembles the work of a small shopkeeper than the act of a high and mighty body of noblemen and gentlemen. If there is money to be made by the catalogues—fairly and rightly made, and with due reference to the public benefit—why should it not be made by the Commission: if the catalogue is to be a loss, why should not the loss be borne by the Commission? We reserve our remarks however on this head, until we know whether any contractor can be found to take the charge—with its risks, responsibilities, expenses, and trammels. Unhappy the Commissioners, or rather their advisers, go deeper into the mire every step they take.

ON THE APPLICATIONS OF SCIENCE TO THE FINE AND USEFUL ARTS.

THE GEOMETRICAL PRINCIPLES OF BEAUTY.

WITHOUT hesitation it is admitted, on the showing of Mr. D. R. Hay, that there was a sufficient amount of novelty in the communication made by that gentleman to the British Association at Edinburgh to have removed it beyond those censures which, we believe, were not unjustly cast upon most of the sections of that scientific body for admitting papers which had been previously published. The author of these papers has not however erred singly; the report, as it appears in the *Athenæum*, leading to the inference that, "The science of those proportions by which the human head and countenance are represented in works of ancient Greek Art," had only been condensed and popularised. It appears to have been otherwise—and we trust Mr. D. R. Hay will pardon the mistake; since from the difficulty of so timing your visits, to several sections, meeting at the same hour, as to hear all the papers in which you may be interested—but a portion of this communication, and the discussion which ensued, was heard, and from that portion, we concluded that it was in *essential character* the same as that which had been some time previously delivered at the Society of Arts, the details of which theoretical view appear in a more complete form, in the above work of Mr. Hay's.

Mr. Hay in his communication to you writes: "Mr. Hunt has written much upon the application of Science to Art: and it is therefore strange that he should make such remarks as the above. (See *Art-Journal*, October, p. 326.

September, p. 273). It is a dangerous doctrine, and has hitherto tended to retard the progress of the Fine Arts in this country, to teach that genius is above the observance of any rules. The student in High Art should rather be taught that a knowledge of the set formula, by which the human form may be bound within geometrical lines, is of as much importance in assisting the efforts of his genius, as a set formula of grammar, and of the mechanism of verse are to the poet."

It would have been well had Mr. Hay added: *and no more.* Admitting the value of much that this gentleman has done, and in particular, his efforts to produce chromatic harmony in Decorative Art—it appears, at least from the examination we have been induced to give to the subject, that his "Principles of symmetrical beauty" are urged much too far—that his ellipses and triangles have but an arbitrary value—being constructed to suit the best forms of Art and Manufacture already existing, and it is to be feared, may have a tendency to promote a servile imitation, to the destruction of all original design.

Mr. D. R. Hay states—"The first principles of symmetrical beauty originate in the powers of numbers, and that a means of applying the principle of numbers in the formation of plain figures is afforded by the division of the circumference of the circle into 360 degrees, which degrees are divisible and subdivisible by 60, into minutes, seconds, &c." (*Transactions of the Society of Arts* for 1846-7) and in applying his principles to architecture and to the human form, we have the following positions as laid down in the communication made to the British Association:

"The fundamental principles thus elucidated were as follows:—That the eye is capable of appreciating the exact subdivision of spaces, just as the ear is capable of appreciating the exact subdivisions of intervals of time; so that the division of space into an exact number of equal parts will affect the eye agreeably in the same way that the division of the time of vibration in music, into an exact number of equal parts, agreeably affects the ear. But the question now arises, what spaces does the eye most readily divide? It was stated that the author supposes those spaces to be angles, not lines; believing that the eye is more affected by direction than by distance. The basis of his theory, accordingly, is, that bodies are agreeable to the eye, so far as symmetry is concerned, whenever the principal angles are exact sub-multiples of some common fundamental angle. According to this theory we should expect to find, that spaces, in which the prominent lines are horizontal and vertical lines, will be agreeable to the eye when all the principal parallelograms fulfil the condition that the diagonals make with the side angles, which are exact sub-multiples of one or of a few right angles. The author was stated to proceed to apply his theory to the construction of the human figure, in which we should expect *a priori* to find the most perfect development of symmetric beauty. * * * The line which shall represent the height of the figure being once assumed, every other line is determined by means of angles alone.

"For the female figure, those angles are, one-half, one-third, one-fourth, one-fifth, one-sixth, one-seventh, and one-eighth of a right angle and no others. It must be evident, therefore, that, admitting the supposition that the eye appreciates and approves of the equal divisions of the space about a point, this figure is the most perfect which can be conceived. Every line makes with every other line a good angle. The male figure was stated to be constructed upon the female figure by altering most of the angles in the proportion of nine to eight; the proportion which the ordinary flat seventh bears to the tonic."—*Athenæum*, No. 1190, p. 881.

By these two quotations we believe we have fairly represented the theory of Mr. D. R. Hay, and if he had applied it to *regularity*—even to that combination of regularity which constitutes *symmetry*, there would have been small reason for discussion; but when he advances it in elucidation of *fixed laws* upon which the *Beautiful* is based, we cannot but conceive that he falls in appreciating the "idea of beauty" in that per-

fection in which it appears in all the Protean forms of Nature.

The notion that Beauty is a peculiar quality—the object of a distinct sense—or of powers of perception arising from the combined action of any particular senses, is not tenable. Our appreciation of that, which we call the Beautiful, is due to cultivation, and there are no forms of matter in nature, nor are there any combinations of symmetric lines in Art, which can be fixed on as standards of Beauty.

Again, when we consider the infinite variety of things, all of them equally objects of Beauty, though conformable to no common, or general, system of geometric proportion, it will be evident that the attempt to form a system founded on any mathematical formula must fail. An elegantly formed woman, a lightly bonning stag, a convoluted shell, the tree with pendant branches, or wide spreading-boughs, the wild flowers of the hedge-row, the chalice-like lily of our gardens, or the lovely flower which floats upon the silver-lake, the wild bird on the wing, and a thousand other things wonderful in their organisation, elegant in form, and in their vital perfection fall of Beauty—have nothing in common—they cannot be circumscribed by any system of conic sections. Again, the vase which presents the stern symmetry of the Etruscan forms, or, the light and elaborate proportions of the Florentine—the Corinthian column and the Gothic arch—with the widely different, but still geometric ship, with "all her white wings flying," although susceptible of being resolved into separate mechanical systems, have little in common among themselves, and still less, by which they can be systematically associated with the organisations of nature, yet, each and all, are Beautiful.

It must, however, be remembered that they are not equally so to every mind. The sailor will gaze with rapture on the frigate swimming like a sea-gull upon the ocean, and declare the ship to be most beautiful; but

The primrose on the river's brim,
A yellow primrose is to him.

And it is nothing more. The conchologist will perceive the Beautiful in some painted bivalve of the Indian seas, but he may discover no mark of loveliness in a funeral urn. The botanist will proclaim the deeply-dyed flowers of the distorted cactus, with their capillary pistils, to be above all things beautiful; but he will gaze upon a piece of architecture which shall conform to all the laws of proportion, and present the most elaborate ornamental tracery, only to remark that some flower-like adornment, has a petal too many, or that a leaf has a serrated margin, whereas it should have been *dentated*. The mind "takes colour from that it works in, like the dyer's hand."

These evidences prove that Beauty is entirely dependent on the mind; the perception of the Beautiful is a psychological operation, by which perfections are perceived in an object external to us, approaching to the ideal form which has already existence in the mind. To appreciate the ideal Greek head it is necessary that the eye should have been long accustomed to countenances possessing the regularity and, let us add, the intellectuality which was natural to the chosen examples of the ancient Grecian form. The untutored peasant would prefer some homely face, all "ripe and real," and the beauty of the Grecian face would be, indeed, to him "the nonsense of the bean-ideal."

Mr. Hay expresses some surpris that one who has written on the applications of Science to the Fine Arts, should refuse to admit that the beauty of Grecian Art and Manufacture was the result of the study of geometry. To this remark we will reply by a quotation from the same author, which we regard as truths fatal to his own system, as a system for elevating the character of Art:—

"It cannot be denied that men of great genius in the formative arts are generally possessed of an *instinctive feeling of appreciation for what is beautiful in form*, by means of which they impart to their works the most pleasing proportions independently of any knowledge of the definite laws which govern that species of beauty." "It

is also true that the operations of the conceptive faculty of the mind are uncontrolled by definite laws, and that, therefore, there cannot exist any rules by the inculcation of which an ordinary mind can be imbued with genius sufficient to produce works of high Art."

The laws regulating the mechanical structure of verse and music are advanced in support of the "Science of Proportions" and the "Geometrical Principles of Beauty." It must be submitted that they bear but small resemblance to the theory which is now the subject of our consideration. Few things can have been more varied than the mechanism of poetry. The Hebrew was delighted with antithesis and amplification, copying, as that nation did, the peculiarities of the other Oriental nations. The various forms of Greek verse, as exhibited in the rough music of the Homeric Songs; the terrible majesty of her tragic muse; the sublime severity of the Pindaric Odes; or the playful beauty of the Anacreontic Songs; exhibit no conformity to any defined law. If we take modern poetry as an example, the ballad style of Scott, the exquisitely delicate versification of Shelley, the original rhythm which distinguishes Keats, and the full majesty of the Spenserian stanza as exhibited in the "Childe Harold" of Byron, are not reducible to any uniform law of "fact." It is true we may resolve the poems which have sprung from an individual mind into a system, and clearly deduce the laws which have regulated the structure of the verse; but every piece of poetical composition which, from its originality, has become immortal to men's minds, will require a new law to define it. Since poetry signifies creation, so it will be found that its laws spring from the conditions of the time, and they are vast, variegated, and interwoven with the activities of the human soul, in its most energetic passages. That which applies to poetry is equally applicable to music. The letters of the alphabet enabling us to give form to our ideas, and the musical symbols aiding in communicating to others the modulations of sound which arise, a sort of soul music, in the mind of the composer, may be regarded as of the same nature as straight and curved lines are to the artist. They equally are devices by which the inward conception is rendered an outward reality. It is, therefore, submitted that Mr. Hay's theory has no real support from the fancied analogy between it, and any fixed code of laws regulating poetry or music. It is admitted that according to the character of the wave produced is the resulting sound. The human ear is sensible to a certain number only of these pulsations, and certainly from these "the concord of sweet sounds" must be constructed. In the same manner, when we accumulate together, by the band of genius, a diversity of colours, all arranged in harmony, and thus forming a pleasing whole, we know that the effect is due to delicate combinations of exceedingly simple elements. Red, yellow, and blue, are the only colours employed by nature in painting the flowers of the field, and the artist has none other than these. But like the possible changes upon a set of bells, the skilful manipulator can from these produce an infinite variety of effects.

Again, it is not denied that much assistance is afforded to the artist, how great soever his genius may be, by an education in the mechanical appliances, by which he is enabled with truthfulness to give to a plane surface the resemblance of natural bodies in three proportions. A knowledge of some of the laws of vision, or rather of those of light, is necessary to the realisation of true perspective, without which the artist never achieves more than the ordinary picture of a Chinese tea-board. It is also of the highest advantage to the cultivator of Art to learn those laws of proportion which regulate the construction of the human form, and which determine the symmetry of the works of the architect or the productions of the potter's wheel.

Mr. Hay is obliged to make a division of pleasing objects into the Beautiful and the Picturesque: we must confess to an inability to comprehend the difference—and indeed we see many objections to the use of those terms, as they are severally employed by this author.

We have already given many examples of bodies which would, according to this system, be grouped under the Picturesque, which are essentially Beautiful.

"Truth," says Mr. Hay, "in the sciences has of late been sought, by tracing Nature to her most simple elements and first principles of action and combination. By this means natural philosophy has attained its present advanced state; and by the application of this knowledge, in the useful arts, the happiest results have been produced. But in our search for truth in æsthetic science, a course has been followed not differing widely from that by which the alchemists of the middle ages conducted their investigations; for our ideas of visible beauty are still undefined, and our attempts to produce it in the various branches of Art are left dependent in a great measure upon chance."

We must again suggest that there is no parallelism in the cases selected by Mr. Hay. In inductive science we proceed by the method of analysis, or of synthesis; we either separate a body into its ultimate parts, or of many parts we endeavour to produce a complete whole. It is true that some modern philosophers have contented themselves by giving a name to an effect, and thereby disguised the cause. Of this nature are the terms Catalysis, Epipolism, and the like. But science advances only by the production of the proof in a tangible form, or by results which can be repeated, with care, at will. The alchemists pursued a dream—but the realisation of that dream was to be had tangible gold. Their reasonings were false—the road by which they worked was devious—they were surrounded by errors—but at the end was an object which if obtained could not be mistaken.

Now, in æsthetic science, as defined by this author, we have not to study nature but to aim at the realisation of ideal beauty; by realising which, "the Greeks brought these works to light which are not found in nature." We are to reject all the evidences of sense; we are to throw aside all impulses of the soul, and to aim at a mirage in the far distance—a phantom in cloud-land—which is to be the idol of Art-worship. Then this standard of beauty is to be constructed—not by nature—but by something superior to nature; and all men are to be educated to believe in this goddess of beauty. The modern Aphrodite is not to be constructed upon the model of European womanly beauty; no modern artist is to copy the perfections of our modern maidens, and to bleed them into one divine form. But the harmony of numbers—the division of the circle into 360 parts, is to produce "by the union, in proper proportions, of the contrary principles which they exhibit, the proportional and symmetrical beauty of the human head and countenance."

That Pythagoras, with the subtle powers which belong especially to the gifted, had a dim perception of many of the great truths which have been developed by modern science, all proving the harmonious arrangements of creation, cannot be denied, but Mr. Hay entirely mistakes the tendency of modern science in adopting the following quotation:—

"There is harmony of numbers in all nature: in the force of gravity; in the planetary movements; in the laws of heat, light, electricity, and chemical affinity; in the forms of animals and plants; in the perceptions of the mind. The direction, indeed, of modern, natural, and physical science, is towards a generalisation which shall express the fundamental laws of all, by one simple numerical ratio. We think modern science will show that the mysticism of Pythagoras was mystical only to the unlettered, and that it was a system of philosophy founded on the then existing mathematics; which latter seems to have comprised more of the philosophy of numbers than our present."

In accordance with this same philosophy of harmonious numbers, the ancients determined the existence of four elements: air, fire, earth, and water, of which all things were formed. While by the same philosophy, the alchemists made the elements but three: salt, sulphur, and mercury, and by the mysteries of 3, 7, and 9, every point in natural philosophy was solved. This spirit of mysticism elung even to our great Newton, and

hence his division of the prismatic spectrum into seven distinct rays, whereas the evidence of sense show that some of these rays are but combinations of the others. We are aware that there is a tendency in the present day to resolve all the great powers of nature into unity; and one German philosopher, Oken, has boldly declared that Infinity is the eternal summation of nothing; that nothing, is the ultimate unity from which all things spring. With these examples before us we are sorry to see a repetition of this dangerous element,—numerical harmony,—which can be tortured to prove any possible absurdity, again obtruded upon attention. Sir John Herschel most truly says of the Grecian philosophers, "That restless craving after novelty which distinguished the Greeks in their civil and political relations pursued them into their philosophy. Whatever speculations were only ingenious and new, had irresistible charms, and the teacher who could embody a clever thought in elegant language, or at once save his followers and himself the trouble of thinking or reasoning, by bold assertion, was too often induced to acquire cheaply the reputation of superior knowledge, snatch a few superficial notions from the most ordinary and obvious facts, envelope them in a parade of abstruse words, declare them the primary and ultimate principles of all things, and denounce as absurd and impious all opinions opposed to his own."

It is true Pythagoras stood superior to most of those philosophers who acquired "the art of talking unintelligibly on matters of which we are ignorant," but the whole system of his harmony of numbers was borrowed by him from the Chinese number-philosophy as described in the Book of Unity of Confucius, or from that Indian Pantheism in which "the great first principle has engendered or produced two equations and differences, or primary rules of existence, which have produced four signs or symbols, and these four symbols have produced the eight *Yana* or further combinations." In these we see the origin and danger of adopting in science or any of its applications, the harmony of numbers. It must be distinctly understood that the scales of chemical equivalents founded on the laws of definite combination are quite independent of any of those mystic harmonies to which we now object. All bodies combine according to unvarying laws; there is no chance combination in irregular quantities, but the equivalent value of hydrogen 1—of carbon 6—or of oxygen 8—are mere arbitrary numerals, representing merely the combining proportions or ratios.

The philosophy of the author of the "Science of Proportion" is truly ideal, and in endeavouring to aid in explaining the applications of science to the Fine and Useful Arts, we hope we have only dealt with the real. It is not to be denied that by an arrangement of the square, the equilateral triangle, the pentagon, the circle and the ellipse,—the geometric figures adopted by Mr. Hay "as the elements of Beauty,"—symmetric forms may be produced; or that, if we take any of the fine creations of the Grecian mind, we may resolve them into these geometric elements; and, since these are the fundamental principles of that science which is founded on the external forms of natural bodies, as nature gave them to the geometers of old, it would be somewhat difficult to devise any other figures which should not be derived from these selected.

The study of geometry would be of great service to the artist in enabling him to avoid any deviations from truth; since, in all the forms of nature, the amorphous rock, the regular crystal, the leaf of a tree, or the limb of an animal, we find an obedience to geometric precision; but that the Beautiful is to be created by man by any combinations of squares, triangles, circles, and ellipses, at all superior to that Beauty which has been produced by "The Great Geometer," is a doctrine which may be ingeniously enough put forth by M. Victor Cousin, but its sophism is utterly unworthy of that true science which should direct modern Art.

Because Pappilius taught Apelles drawing, and "would admit no pupil unacquainted with geometry," or that Parrhasius was learned

in the science of proportion, signifies little, and certainly it does not convince us that Mr. Hay's theory is the correct one. We have seen heads, as beautiful as those given by this gentleman as examples of his "Harmony," produced by dividing the face into *squares*, and others equally pleasing by a system of *circles* only. It must, however, be admitted that great advantage would be gained in our Schools of Design if the pupils received instruction in geometry; and in calling attention to this Mr. Hay has done much good service. His theory, however, will not make one artist more or less than there would have been had it never been promulgated.

In conclusion, let it be distinctly understood, that in asserting Mr. Hay's method to be insufficient as a method by which the Beautiful in Art is to be realised, we are led to do so on the same grounds which Plato, the most divine of the Grecian philosophers, adopted, and that too after the construction of his system of Triangles. *It is mind alone that is beautiful, and in perceiving Beauty we only contemplate the shadow of our own affections.*

ROBERT HUNT.

ART IN THE PROVINCES.

WORCESTER.—An exhibition of modern paintings has recently been opened at the rooms of the Athenæum in this city. Among the hundred and seventy-five pictures which hang on the walls, we recognise the titles of several old acquaintances, and the list of exhibitors embraces many well-known names. The principal works are a 'Coast Scene,' C. Stanfield, R.A.; 'Nourmahal, the Light of the Haram,' F. R. Pickersgill, A.R.A.; 'Hunt the Snipper,' F. Goodall; 'A Bacchante,' G. Patten, A.R.A.; 'Philip Baptising the Eunuch,' J. Linnell; 'Burns and Captain Grose,' R. S. Lauder, R.S.A.; 'Robert of Normandy's First Sight of Arletto,' H. Pickersgill; 'The Reaper,' J. Inskipp; 'La Tarantella,' J. Uwins, R.A.; 'Interior of Haddon Hall,' H. M. Anthony; 'Sunday Mornings,' H. J. Bodington; 'Portrait of Sir John S. Pakington, Bart.,' by Sir J. W. Gordon, P.R.S.A.; 'The Farmyard at Milling Time,' H. Jutsum; 'Barges on the Thames—Chiswick,' J. Tennant; 'Water-mill on the Tiber, near Perugia,' W. Oliver; 'The Penance of Jane Shore,' R. S. Lauder; 'The Old Oak Chest,' H. W. Pickersgill, R.A.; 'Going a-Field—Early Morning,' H. B. Willis; 'Landscape with Cows,' F. R. Lee, R.A., and 'T. S. Cooper, A.R.A.; 'Burnham Beeches,' J. Stark; 'Chiusa, near Venice,' W. Linton. Among other contributions of pictures in oil, are Messrs. Desanges, Dearman, H. H. Lines, T. Woodward, Vickers, F. Watts, Hanell, Ince, W. Richardson, Branwhite, Numann, E. Williams, Sen., Kidd, Noble, J. Peel, Shilder, Henshaw, Latilla; and of the articles in water-colours, are, Copley Fielding, Peuley, Scundrett, R. P. Noble, Mrs. Harrison, and Miss M. Harrison, Mrs. Oliver, &c.

GLASGOW.—A movement is in progress for the erection of an Institute of the Fine Arts in Glasgow: where the want of a suitable building for the exhibition of Paintings and Sculpture, and the encouragement of the Fine Arts generally, has long been felt.

Two very clever paintings are now exhibited at the rooms of Mr. Fisher, by a young artist, Mr. F. G. Duval, who is wisely devoting his ability to historic pictures, which have a living interest. One represents John Bunyan in prison: it has been painted some time, and exhibited in many of the chief towns in England and Scotland, and is now in process of engraving; the other picture represents the wife of Bunyan interceding with Chief Justice Hale for the release of her husband from prison. Alone and unfriended, this simple-minded but energetic woman made her way to the court-room of the Justices at the Swan Inn, Bedford, to ask for an intermission of her immortal husband's long imprisonment. The scene is strikingly related by Bunyan's biographers; and Mr. Duval's realisation is worthy of the subject in its truthfulness and simplicity, while its artistic excellence leads us to hope much from this rising painter.

LIVERPOOL.—The following pictures have been sold at the present Exhibition of the Liverpool Academy, up to the middle of the past month:—'Cottage Scene,' T. Westcott; 'The Fall of the Staubach,' H. C. Selous; 'View near Rivington,' R. Tonge; 'The Morning Ride,' W. Huggins; 'Gravel Pits in Burnham Beeches,' H. C. Pidgeon;

'A Breton Family,' E. A. Goddall; 'The Ruins of Blackfriars Priory, Hereford,' W. Callow; 'A Country Lane,' J. C. Bentley; 'The Kitchen in the Palace of Sir Thomas Gresham at Mayfield, Sussex,' G. Landseer, R.A.; 'Glimockie Bridge, on the Esk,' J. Peel; 'Morning,' J. Sant; 'Rivington Pike,' R. Tonge; 'A Group in the Mountains,' T. S. Cooper, A.R.A.; 'Evening,' T. Creswick; A.R.A.; 'Scene on the Avon, near Stratford,' W. E. Dighton; 'Distant View of Dunster Castle, Copley Fielding; 'Queen Elizabeth as the Faerie Queen,' Frank Howard; 'Fish Girl,' W. Davis; 'Kreunach, on the Nahe,' G. Stanfield; 'The Cliffs near Boulogne,' G. Stanfield; 'Edinburgh, from Inchkeith Island,' C. Bentley; 'Fish Girl,' W. Davis; 'Nook in a Farm-yard,' W. Huggins; 'Horses Drinking,' W. Huggins; 'Study from Nature,' T. Westcott; 'Castle of Nassau, from the Village of Schern,' T. M. Richardson; 'The Last Man,' J. Martin; 'Flowers,' Miss Nutric; 'A Fresh Breeze, off the East End of the Isle of Wight,' A. Vickers; 'Landscape with Cattle, near Newport, Isle of Wight,' A. Vickers; 'A Bright Summer's Day,' H. J. Bodington; 'St. Nicholas Church, &c., Liverpool,' J. H. Williams; 'Esther's Emotion,' H. O'Neil; 'Gleaners,' J. A. Puller; 'Sunshine and Shower, in the Vale of the Conway,' C. Barber; 'The Clyde at Bonnington,' J. W. Oakes; 'Eton College,' H. Pilleau; 'Kirkconchon, from the Ramsey Road, Isle of Man,' B. Callow; 'Nottingham, from the Grantham Canal Lock,' H. Dawson; 'The Lesson,' J. A. Puller; 'On the Rhine,' Mary Bright; 'Nell and her Grandfather awaiting the Schoolmaster's Return,' W. Romer; 'Group in marble of Romulus and Remus,' A. Malampré; 'A Sussex Woodland Road,' J. S. Raven; 'The Broken Chord,' W. Fisher. The total amount of sales is upwards of fifteen hundred pounds, and the attendance at the Gallery has been unusually great. We are glad to learn that the drawing of the Art-Union will take place about the 1st of December, so as to allow a longer time for the choice of prizes; it is hoped that the number of subscribers to the Art-Union will far exceed that of last year.

PREPARATIONS

FOR THE EXHIBITION OF 1851.

We find the following in a weekly newspaper, the *Weekly Chronicle*, and presume it may be relied upon as correct:—

"Several meetings of local commissioners, representing various sections of manufactured produce and fine arts, have been held during the week at the new palace, and the reports presented to the Royal Commissioners were considered of a highly satisfactory character.

"The returns received from the various local committees throughout the country, up to the 1st of the present month, have altered to a considerable extent the proportions of some of the main features connected with the Exhibition. A short time since, a careful analysis of the applications for space up to the 1st of September showed that machinery would occupy thirteen times the extent of space in the building occupied by raw materials and the fine arts, and nearly twice as much as manufactures. The exact proportions which these different sections bore to each other, taking fine arts as represented by the unit, was—Fine Arts, 1; Raw materials and produce, 1.02; Manufactures, 6.7; Machinery, 13.2. At the present time however, 'manufactures,' instead of being equal to only one-half of 'machinery,' is equal to it within a very trifling amount. The proportion between raw materials and produce, and the fine arts, remains nearly the same; but machinery instead of being thirteen, is now not more than seven times their extent. As the matter stands at present, supposing the great building to be divided into sixteen equal parts, one portion would be filled with the productions of the fine arts; raw materials and produce would occupy another; and manufactures and machinery each seven parts. Had the Exhibition taken place when the last returns were made up, and the building been divided into twenty-one equal parts, fine arts and raw materials would each have occupied one, manufactures seven, and machinery thirteen parts. The space required for the crude productions of the earth will, according to the latest returns, therefore, be equal to that required for the exhibition of the most finished and elaborate productions of industry; while articles illustrative of the agents which human industry brings to bear upon the raw material, will occupy the same extent as those which will serve to illustrate the results produced by the employment of such agency. Both the

agents and the results obtained will, however, require a space for exhibition seven times greater than that of the products upon which human industry is employed.

"The following is a summary of the returns received from the various metropolitan committees, showing the amount of space required in each of the sections of raw materials, machinery, manufactures, and the fine arts, with the number of exhibitors in each section:—

CORRESPONDENCE.

PROBABLE POSITION OF THE SILVER TRADE AT THE EXHIBITION OF 1851.

[Some questions on this subject having been put to a gentleman very competent to answer them, his views have been transmitted to us for publication. The matter is one which cannot fail to interest many; and the opinions of the writer will have, as they ought to have, weight; we believe, however, he somewhat exaggerates the advantages enjoyed by artisans of the Continent; they have, it is true, famous collections to refer to for instruction, and so have we; among us it has not been the custom to make use of them; but this is an evil that we do not think will continue. We trust also that the Schools of Design will ultimately achieve something in the way of teaching drawing, so that our public Museums, which are by no means deficient of good and safe authorities, may be more beneficial to the student than they have been under existing circumstances. We are of opinion that if all the museums of France were transferred to England, they would be of little practical benefit to our artisans: a time is coming, nevertheless, when we shall make such sources of education as we possess much more available than we have done.]

Sir,—If, in reply to your inquiries regarding the position which, in my humble judgment, the plate-workers of our own country are likely to occupy at the Great Exhibition of 1851, I am induced to express some apprehension; let it be remembered that my fears do not extend to works that have cost thousands of pounds in their execution, but to articles that form the general bulk of the silver trade. The cause I feel to be, not so much the want of artistic skill as the want of artistic artisans and manufacturers, for in France, both have to a great degree been instructed by the government putting before them in an attainable form, copies of the most perfect productions of all ages and nations; thus, instructing not merely the privileged few, but the nation at large; and teaching them on principles which, from their very soundness, have stood the test of ages; thereby enabling them to stand on a level in matters of taste with what any nation can do.

The acknowledgment of right principles thus having gained their sway, you will easily understand how that nature, the origin of all that is beautiful—in its rich and ever varying foliage; in its infinity, and variety of animal creation; and, in its stupendous, and most beautiful product, MAN,—is examined on the Continent with a care, and imitated with an attention, never, or very rarely found, in the English workshops.

It is in vain for artists of talent to spend their time in making designs that workmen are too unskilful to carry out, or manufacturers too prejudiced to old ways to produce. My own experience has led me to express many regrets in regard to bad execution and other uncontrollable circumstances, which have marred the not few works that have been executed from my designs; but this

is to be cured; let the manufacturers be stimulated by prizes for the most beautiful productions; artists will then be employed to superintend the execution of their designs; the workmen thus instructed will, with ease, beat the French, for it takes no more trouble to do anything well than to do it badly; the amount of trouble taken frequently to do a thing badly is incalculable. As things stand at present, the French will beat us in the perception and adoption of the first element of Art—"beauty of form," also in the adaptation to the use and general arrangement of ornament; I do not think in its appropriateness, for I have seen some of their works very indifferent in this respect. In originality of conception, too, the French, I think, will beat us, though I believe the English have, naturally, as much as the French; yet, as things now stand, it is in favour of the latter.

Undoubtedly the most beautiful thing in creation is Man undeformed by sin,—and animals next,—and it is equally certain that the French, as a nation, far surpass the English in the knowledge of their structure, thus enabling them to produce their work with a degree of feeling and precision of finish unknown in the English market.

Another point is, the facility with which a French workman, out of any material, will produce a picturesque effect; French tinsel, is in this respect, preferable to English gold; but, however much at the moment this may please, let the English workman unite the French lightness with his own stability, and it is not difficult to perceive who will triumph.

Very faithfully yours,
X. Y. Z.

THE VERNON GALLERY.

THE PEEP O' DAY BOY'S CABIN.

Sir D. Wilkie, R.A., Painter. C. W. Sharpe, Engraver.
Size of the Picture, 5 ft. 8 in. by 4 ft. 1 in.

We may point to this picture as among the best of those which show the style Wilkie adopted towards the close of his practice: a comparison of this work with that of his "Village Festival," in another room of Marlborough House, exhibits so wide a difference of subject and treatment, that it is scarcely possible to believe them to be the productions of the same mind and hand; for while the latter picture has the delicacy and finish of a Titian, the former is painted with great boldness of handling and unusual breadth of effect. Wilkie went to Ireland in 1835, returning with a portfolio full of valuable sketches, from which, however, he painted but two pictures, this and "The Whiskey Still."

None who have studied the history of that unhappy country for the last twenty or five and twenty years are ignorant of the class who, known by the name of "Peep o' Day Boys," or "Whiteboys," kept certain counties of Ireland in constant fear and excitement by the crimes and outrages committed in the kind of guerilla warfare they carried on. It is no part of our duty to enter into the annals of this period—that dark page in the annals of the country which is not yet completed, and which will never be faithfully chronicled so long as religious feuds and hostile factions prevail. When Wilkie visited Ireland, Whiteboyism existed to a frightful extent, and it may be presumed that it suggested to him the idea of sketching one of the dwellings of these bold partisans; but it is our belief that what he has here given us is rather imaginative than an actual reality, so far, at least, as the "Cabin" appears. This seems to be out of a rock, probably at the foot of a mountain, but our acquaintance with the country informs us that the Irish cabin so constructed is rarely to be met with. Internally, however, it exhibits all the characteristic features of the dangerous employment wherein its inmates are engaged; the "Peep o' Day Boy" has returned home after his night's adventure, for the daylight has broken over the horizon; he has thrown himself on the floor of the cabin, and has fallen asleep, with his fire-arms by his side, to guard against surprise; his wife keeps watch by him, and another female seems to have just entered to give notice of impending danger; everything indicates the fearful position in which his passions or his *amour patrie* have placed him, yet he sleeps soundly with his powerful hand grasping the arm of his naked child. The accessories of the picture are perfectly in keeping with the subject. There are weapons of defence on the walls and in the corners of the hut; a spur lies carelessly on the ground, as if taken off hurriedly after a night's hard riding; the saddle and bridle are suspended on pegs near the door, over which the fowls are still waiting for the "peep o' day."

The composition of the picture is altogether very forcible, it contains many passages of striking and touching interest, but there is a monotony of tone which detracts much from the brilliancy that might have been imparted to such a subject. It has little positive colour in it, and that little is comparatively low, hence the work offers great difficulties to the engraver, so that the plate in less skillful hands than Mr. Sharpe's, would have stood the chance of turning out flat and ineffective. This will be readily understood when we describe the dresses of the two females as painted of a pale red colour, and the dark part of the garment round the loins of the "boy" of a deep blue; this and the fire in the foreground to the right are the only bits of strong colour in the picture; the coat hanging up in the distance is also red toned down. There is a strong prevalence of browns of different shades in the other parts of the work, but the great breadth of light thrown on the group of figures compensates in some measure for the absence of more attractive qualities.

This picture was painted soon after Wilkie's return from Ireland, and was exhibited at the Royal Academy in 1836.

THE UNVEILING OF "THE BAVARIA."

In the course of the artistically glorious reign of the Ex-King Ludwig, of Bavaria, amongst the many comprehensive schemes, accomplished into realities, that have rendered its capital, Munich, what it is, entered the royal idea of erecting on the plain that stretches at an elevation of some thirty or forty feet on the western outskirts of the city, a colossal statue, nationally emblematic, and having for a back-ground the Ruhmeshalle, or Hall of Heroes, a Doric temple of white marble, hereafter to contain the busts of celebrated Bavarians. The king gave the commission of the former to Schwenthaier, the great and now dead sculptor; the latter to Leon Von Klenze, the no less celebrated architect. The first was completed and inaugurated Wednesday the 9th of October, after the lapse and labour of many years; the last will not be finished till several more have joined the past. The immediate result of the sculptural commission of the King was, in 1838, a smaller colossal figure, thirteen feet high; the ultimate, that gigantic bronzen statue, which has just now been revealed to the people, of such vast proportions, that the face is the size of no ordinary figure; the body twelve feet in diameter, the index finger six inches, the arm some five feet; the nail of the great toe can hardly be covered with both hands; the whole height fifty-four feet, further elevated by a granite pedestal of thirty. Yet is this figure most beautiful in symmetry—that of an august and typical virgin, one arm raised, holding the laurel wreath of reward, the other pressing to the mighty breast a sword; the head encircled with oak leaves; heavy masses of wavy hair falling from the broad brow on either side of the low bent, grandly benign, and graciously beautiful countenance: the body clothed in a lion's skin, reaching to the hips, the massive folds of falling drapery passing over the vast and perfect limbs in sublime and simple arrangement to the feet. At the side sits the Lion. Such a work has been achieved through much material difficulty, as well as those attendant upon him who receives such an inspiration. The smaller figure of thirteen feet was modelled in clay to the proposed enormous proportions, on a skeleton prepared by masons, carpenters, and smiths, in the court-yard of the foundry of Stiglmaier. Through the patient devotion of the sculptor, even then weak and suffering under bodily infirmity, it was concluded in two years and submitted to the public. A plaster figure was then obtained, from portions of which moulds were taken of a clay peculiarly prepared, to admit of the reception of the glowing metal, the melting of which in such large quantities was accompanied with much danger, and necessitated such care, as to be watched, on one occasion, by Inspector Müller and his men for some five nights successively, when it required constant stirring to avoid sinking, which would have been certain destruction. Owing to the intensity of the heat from the furnaces the foundry caught fire, but none moved from his post till the metal could be left. To amass the required bronze, Greek divers were employed to obtain the cannon sunk at the battle of Navarino. The whole weight is about 2500 ewt. On the 11th September, 1844, the first portion of the casting was raised from the pit in the presence of King Ludwig; the rest was completed in four other castings; the whole thus consisting of five pieces. The great mass of the body was conveyed to the plain by some sixteen or twenty horses in

the July of 1845; the last portion, the head, on the 7th of August in the same year. On this occasion a procession accompanied the victorious issue of their labours. It was commenced with prayer, and now master and men, in the hour of triumph, bowed themselves in thanksgiving. But in this life there was no joy in the victory to the chief labourers, for the sculptor Schwenthaier, his faithful assistants, Lanzani and Stiglmaier, to whom the first difficulties of the casting were confided, lay at rest in the silence of the grave. On the occasion of its completion, King Ludwig no longer sits upon his throne; yet did every Bavarian desire to do him honour upon the morning of the presentation of this his great gift to the nation; and each trade prepared some achievement, in his own peculiar calling, equally colossal with the "Bavaria," and testifying at once his skill and deep-felt gratitude. At nine o'clock in the morning of the Wednesday, the "Fest Wagens" began to assemble on the Dait Platz; the autumn leaves rustled under the many feet gathering there, and at every window clustered eager faces. The first thing seen travelling through the crowd, far out against the sun-light, was an enormous distaff; it tumbled from the great spinning-wheel upon the waggon, drawn by six horses belonging to the weavers, hutton-makers, tailors, and clothworkers. It was decorated with their tools, and all the different portions of the machinery they employ, with specimens of their work, in bright-coloured cloths, silks, and stuffs; the blue and white ribbons of Bavaria, floating gaily about the whole. Scarcely had the people recovered from this Bohemian reality, than an enormous leather saddle, with bright red lining, appeared in the air surmounting the ear of the shoemakers, saddlers, farriers, tanners, and other analogous trades; to attest the different excellencies of which, were an elegant saddle, a muff—each had a representative;—and this, as well as all the other waggons, was not only full of articles of skillful workmanship, but profusely and all-gracefully decorated with green boughs, fir, vine, ivy, and flowers. Then came nearer, grasped in a haze, gauntletted fist, a colossal sword, too big for the sheath of Goliath,—on each side of this ear were arranged, diverging from one common centre, glittering sabres, daggers, knives, and all articles appertaining to the cutlers. The mimic spire of the Auerkirche now approached, upon the waggon of the people of the Vorstadt-Au, one suburb of Munich, where King Ludwig built the original of this church, and endowed it with its numerous and justly celebrated painted windows. So large was this model, that a child could go in and out of the porch; yet most dextrously, and exactly made. On the body of the stand, white lilies reared their pure emblems, slenderly, on blue lozenge shields; and on either side, among the green, were scroll inscriptions, testifying to the ex-King the still warmly pulsating love, and earnest gratitude of his recent subjects. The deep crimson, falling draperies, of an elegant gold and coloured pavilion, now attracted attention; it belonged to the decorators and gilders. Within the round, Byzantine arches, was the bust of King Ludwig, who had done so much for them,—the taste, variety, and constant employment of ornament, both in fresco and distemper, being one of the characteristics of Munich art and architecture. A golden lion now shone in the sun, and in his mouth glittered a tremendous key, the handle of which, though of such enormous size, was of the most beautiful novelty of form, and most cunning workmanship. This was to give importance to the ear of the locksmiths, and was perhaps one of the quaintest and most effective of the whole. There was a louder laugh among the people now, as the waggon of the hotel-keepers appeared, where nine or ten persons, attended by merry Kalmers and Kalmers, were regaling themselves, in a most rare manner, upon such pies, such substantial comestibles of all sorts, not only at this long table of active consumption, but all round and hanging up, among the greens, rabbits, pheasants, and fat geese;—a jolly ladder—no lack either of inspiring drinks to wash it down with relish and flavour; beer, liqueurs, coffee; baskets of many colours, catching the sunlight, supported in some artful way on the dumb-waiters that were formed at each corner of this Car of Plenty;—not that the bottles and barrels were there only for effect, for the contents were heartily and constantly given away among the crowd. The bakers' and confectioners' cart was now seen, with German trees of coloured bon-bons, and a great birth-day cake for the "Bavaria," the more substantial base of its pyramid composed of Hans-brot, closely laid together, with fir between. This is a sort of brown bread, with caraway seeds, much used for common purposes, and among the lower orders.

THE LIFE OF JAY GORDON

1850

It is very cheap, and made in large bricks. The upper part lighter, with hanging Brezlin, or true lovers' knots of whiter bread; and every form brought in, combining into the most graceful whole. Each trade was idealised upon its memorable day; and truly the whole spirit of Decorative Art was there, giving the symmetry and beauty of form and line to every part,—abundance and richness everywhere, yet neither clumsiness nor confusion. Even the butchers, who had united with their brethren of pork, made their show most beautiful, having, to create their pyramid, hams, the national huge sawleys, and tongues; the upper part festooned by circles of sausages, pale grey and brown, the sombre colours of these solidities answering for depths; while fresh greens, and bright flowers, made brilliant light and colour. At each corner of the cart, among the branches, sat a little, wistful child, holding, by a scarlet cord, two timid lambs of whitest wool; following were butchers three by three, blue aprons fastened sideways, and polished hatchets in their hands. The wagon was drawn by a strong team of oxen, garlanded. The car of the sculptors and artists now arrived upon the Platz. In the centre, under a canopy of trembling foliage, reared lightly from the four corners, was Schwanthaler's colossal statue of King Ludwig, their beloved patron, whose noble thought had vivified all this. On either side a female figure, holding in one case a palette and brushes, her arm supported on a canvas; in the other, bearing in her hands a small model of the "Bavaria," as the chief representative of the sculptors. Among the decorations were smaller figures in bronze and plaster. The intense sunlight cast broad and shifting shadows, that told as blue upon the white figures; the illuminated portions seeming pale yellow in the reflections of the green. The car of porcelain manufactures and potteries now appeared, enriched with many lovely forms. Slender vases of pale brown, brackets and figures in terra-cotta, appeared among the decorations. To gain colour, a child in a scarlet cap and bright dress looked out from the shadow, with a dreamy mystery in his dark eyes. The carpenters and masons had their waggons, with the tools and timbers of their trade; the joiners with the bare roof and roof-tree of their model building; the millers with their full sacks, piled one upon another, afterwards to be given to the poor, and above, waving in the wind, two slender sheaves of wheat, bound together by blue ribbons,—the strong horses with trappings of the same colours. A little removed from the Platz we saw the market gardeners' waggons; vegetables of every kind, cabbages, green and purple white cauliflowers, and scarlet beet-root, pressed together, forming a pyramid of harmonious abundance, accompanied with lovely flowers and trailing plants. Even the wheels were ornamented, till they were stars of varied dahlias; and garlands covered the wood-work and harness of the team. This was followed by young gardeners and pretty boys, in snowy shirts with white sleeves, green braces, shoulder and knee knots, short black breeches, white stockings, high yellow leather shoes, and broad straw hats, with green ribbons; the little girls with white dresses, green bodiced aprons, and straw hats, round which crept the leaves and tendrils of the vine, and falling over the broad brim, sometimes mingled with the glossy smoothness and golden glitter of their long hair. The men bore new rakes in their hands; the children, in wooden and wicker-work baskets, offerings of the finest fruit and flowers. In the centre were two, bearing on their shoulders a great branch, borne in the middle by the weight of a colossal and most beautifully imitated bunch of purple grapes. Nearer the plain we met the brewers' van,—a company of jolly fellows, to keep up the glory of this flourishing calling, in most quaint dresses; one blowing his trumpet as he sat, with herald's distension of cheek, astride a strong horse of the team, all scarlet and silver, and magnificent with many colours; others followed, hearing the different items employed in the production of beer. These I would not venture upon naming; but some looked like enormous bottle brushes, and others great oars. Inside the wagon was a gloriously-designed "bock mug," perhaps some six feet high. "Bock" is a kind of strong punch-like ale, much esteemed, and plentiful at particular seasons, and of a pleasant flavour. The large shape of this was very beautiful,—the heads of beer-barrels jutting out to form the base, and twinings of hop and other decorations enriching it, even to the lid, with which all Germans preserve the freshness of their draught. Arrived upon the plain, it was, though early, one dense mass of people. The bank upon which stands the "Bavaria" had been formed into an amphitheatre of earth terraces, or steps, admitting of broad standing-room for the hundreds gathered there; not only

now for the great event, but for the Volks Fest, which has been going on during the past week. Here might be seen the old Munich costume,—the heavy swinging petticoat bordered with yellow, the blue-cloaked stockings, laced bodices, enormous gaily-coloured sleeves, short waists, and, surmounting all, the strange fur cap, or the handkerchief bound round the head, allowing only a wisp of flying hair to escape from its close confinement; or the citizen-wives and daughters, with the gold and silver swallow-tailed ornament so general in Munich, and long aprons meeting at the back. People were gathering everywhere, especially about the pavilion for King Ludwig, erected opposite the vast grey scaffolding that still concealed the great "Bavaria." A large space before it was reserved for the stopping of the waggons for the King's inspection, and an avenue among the crowd for their passing through. All this murmur and buzz and colour was close around. Behind the grey towers of Munich rose against the sky the Alps, stretched in blue silence, in the far distance; their summits defined by the catching of a rosy light; in the western horizon rested the dark quiet of the pine-forests. Military bands sounded with loud noise, the cannons boomed, the people shouted, carriages rolled through the arena, and the ex-King ascended the steps of his tent. The present King, his son Maximilian, had with the queen left Munich, a day or two before, but Otho, King of Greece, was by his father on this great occasion. The procession with all their huge waggons, in the sunlight, now began to pass before the King and the people, in this order. 1. The music corps on horseback, strangely costumed and caparisoned, with euboean trappings; one wagon, that of the people of Haidkauer, a place some two miles distant from Munich, who desired to manifest their gratitude, no less than the citizens. 2. The wagon of the gardeners and fruiterers. 3. Of millers and corn-merchants. 4. Of bakers and pastry-cooks. 5. Of butchers and pork-butchers. 6. Of brewers and coopers. 7. Of hotel-keepers and publicans; then followed ranks of musicians. 8. The wagon of the weavers, galloon, ribbon, and button-makers, tailors and cloth-workers. 9. Of shoemakers, saddlers, furriers, tanners, comb and brush-makers and hatters. 10. Of the armourers and cutlers. 11. The second wagon of the people of the Haidkauer; 12. Those of the Vorstadt inhabitants; then, with their harmony refreshing the senses, after this carnival of sights, the Munich singing societies; another body of musicians, followed by a procession of builders. 13. Wagon of the masons and joiners. 14. Of the stone-masons. 15. Of the carpenters and coppersmiths. 16. Of the locksmiths. 17. Of the tinner. 18. Of the potteries. 19. Of decorators, paper-hangers, plasterers, gilders, and leakers. 20. Of the cabinet-makers. 21. Of the turners. 22. Of the belt and epaulette makers; then another music choir of the workmen of the bronze foundry; and, lastly, the car of the artists and sculptors. The King, from his animated gestures, appeared much delighted with all he entered the pavilion of the decorators and for each tradesman who from his wagon, went up the steps of the royal tent, to represent his brethren, he had a gracious reception and words of friendship and appreciation. And now, the spirit of fun passed away, the laughter and the wonderment left the faces and hearts of the people before the expectation of the great event of the day; the singers had gone up the high bank, and disappeared behind the wooden work that rose before the "Bavaria;" the children desisted from playing on the ropes that were attached to the screen of timbers above, to the height of seventy feet stretched across the space below—all moved and ranged at a distance—the music ceased to sound; the workmen ascended; there was a hush among the thousands of people; the silence was perfect and intense; yet many there, perhaps, at that moment thought of a stillness more profound, the quiet rest of death, which compassed coldly round the three whose lifework they were soon to look upon; eyes burned with tears, and the thrill of many souls did mute honour to the memory of Schwanthaler, Stiglmayer and Lazarini. The sound of a hammer echoed stroke after stroke; the eager emotion was acute; the time that elapsed, though perhaps not more than a few moments, painfully long; answering voices broke upon the air, again a pause, the ropes loosened, and lowering slowly fell the screen of wood till it grated and crashed upon the bank. The glorious statue stood revealed; silver clouds were moving behind the all-merciful head, low bent in its sweetness towards the earth; and raised above came clearly, against the blue heaven, the uplifted arm and laurel-wreath of Fame; the glorious sunlight fell on the vast breast, and caught and

glittered strangely on the sword-hilt. Nature could not have bestowed a more glorious aid to this divinely grand work; the voices of the singers then standing before the pedestal, rose in solemn hymn. Terchlein, the painter, pronounced an oration in honour of King Ludwig I. of Bavaria; and this, one of the greatest achievements of his reign; and the people broke the awe that had spread over them, and shouted aloud and threw up their hats at the sound of his name. The grandeur of the day was over, each one celebrated it in his own way; many scattered in gay groups, again, to their enjoyments; and the sounds of voices and their merriments gradually stilled and hushed, slowly left the plain.

ART IN CONTINENTAL STATES.

FRANCE.—The *Journal de Lot et Garonne* contains the following paragraph; it must be borne in mind that the *fact* expressed is but founded on the *opinion* of the discoverer:—"Visiting the church of the Mas-d'Agénais, Count Eugène de Lonlay has discovered in the sacristy, concealed beneath dust and spiders' webs, the 'Byzantine Christ,' painted by Rubens in 1631. The head of Christ is remarkable for the large style in which it is painted, for drawing, colour, and vigorous expression."

In the sacristy of the Cathedral of Puy, has been found, beneath a covering of plaster, which has been carefully removed, a magnificent painting of the sixteenth century. The drawing and inscriptions are intact. M. Mérimé, the Inspector-General of Historical Monuments, has pronounced this fresco to be one of the most important existing in France. He believes it is from the hand of a French artist, who had not yet felt the influence of the Italian Renaissance. The figures are correct in drawing and vigorous in colour.

PARIS.—In Paris the Minister of the Interior has ordered a bust of the well-known printer, Firmin Didot, to be placed in the great hall of the *Imprimerie Nationale*.

The annual French Exhibition of the Works of Modern Artists will open at the Palais National on the 15th of December. Paintings, &c., will be received at the palace between the hours of ten and four, from the 1st to the 15th of November, at six o'clock of which latter day the doors will be closed against any further reception.

BERLIN.—The collection of portraits of celebrated contemporary men, formed by the King in his palace, has been transferred to the Marble Palace at Potsdam. This collection, to be increased from time to time, contains the portraits of Humboldt, M. de Schelling, Godfrey Schadow and Rauch, Baron Cornelius, Meyerbeer, Louis Tieck, Ritter the geographer, Leopold de Buch the geologist, and Ideler and Bessel the astronomers.

Oct. 8. There is now great activity in the studios of our most celebrated artists, and at the establishments of our most eminent manufacturers in the completion of the productions proposed to be contributed to the great Exhibition in London. A proposal has been made from several quarters to exhibit here previously to their being sent to London, the various articles intended for exhibition, but the proposition has been negatived by the committee. The exertions put forth by the *Art-Journal*, in order to obtain drawings of the most interesting objects of German Art and industry that are intended for exhibition, with a view to their being engraved in that publication, by the opening of the Exhibition, have been attended by the most satisfactory results. Our most celebrated sculptors, Rauch, Kiss, Wichmann, Drake, Kalide, and also our most eminent manufacturing establishments, royal as well as private, are causing drawings to be prepared for the *Art-Journal*. A very interesting work has been executed in the studio of Professor Köber and the enamel painter, Mertens—it is an enamel painting of six feet broad, and four and a half feet high. It is intended for the castle church at Wittenberg; the subject is Christ on the Cross, and at his feet, on the right, stands Luther holding an open bible and looking up to the Saviour; and, on the left, Melancthon, the faithful co-operator of the great reformer. The tombs of both are in this church, and it is known that to those who, after the capture of the town, desired to destroy these tombs, the Emperor, Charles V., answered, "It was against the living, not against the dead!" It was to the portal of this church that Luther affixed the famous protest against indulgences which occasioned the first movement of the Reformation. The king has caused two doors to be cast in bronze, with this protest inscribed on them, so that it will now be seen there in imperishable characters.

Kaulbach will probably quit us next week, or at least so soon as his second great fresco in the Museum shall be completed, in order to resume for the winter his duties as Director of the Academy of Munich. The sum which he will receive for his six great frescos and the ornamental frieze, will be 80,000 thalers (12,000 sterling) and this is secured to him, as the contract was made before the existence of a constitutional budget. With Cornelius this will not be case, but the Minister of Public Instruction will find some difficulty in meeting the demand of the famous painter, to whom the commission was given by the King, for the ornamentation of the Campo Santo. As the minister thinks the sum proposed by Cornelius too high, being 90,000 thalers (13,500*l.*), the Chamber will, perhaps, hesitate to vote such a sum for this purpose. The colossal equestrian statue of Frederick II, by Rauch, together with the accessory groups, is finished; it cannot however be placed this year, as the granite base is not yet ready. The cost of this work amounts to half a million of thalers (75,000*l.*), which fortunately was provided for before the vote of the Chamber was required.

BRUSSELS.—The *Brussels Herald* announces that M. Charles Van Bevere, the Dutch painter, died recently at the age of forty-one.

SPAIN.—MONUMENT TO COLUMBUS.—A subscription for a suitable monument to the great discoverer of America has been opened in Spain under the immediate auspices of Messrs. Martinez de la Rosa and Salvador Bermudez, both known to the world of letters, aided by many other of the best men of Spain. The designs for the monument are to be the result of a competition of all Europe, and the subscription to be equally open to the world. The estimate for the monument is made at about 20,000*l.* It is proposed to consist of a colossal statue twenty feet in height, surrounded by groups covering forty feet around it, and forming its base. The statues to be of bronze and the pedestal of granite. The situation for the colossal monument has been most appropriately chosen on an elevated spot of *Palos de Marquer*, opposite the convent of St. Ann, whence Columbus started on his first adventurous expedition for the New World.

MADRID.—The *Madrid Gazette* informs us that the frescos of Annibal Caracci, in the church of St. James at Rome, are at length to be removed to Spain. Negotiations for this purpose have been going on for several years, but with little prospect of a successful issue, until the recent political events in Italy, and the armed assistance afforded to the Pope by Queen Isabella, gave the Court of Madrid an influence not to be resisted in the Vatican. The frescos are expected to arrive shortly in the Spanish capital, accompanied by a well-executed cast of the recently discovered figure of the "Gladator."

FINE ARTS AT LISBON. (*From a Correspondent*.)—As you published short notice I send you last year respecting the state of the Fine Arts in Portugal, perhaps you will admit some further account of what is going on in Lisbon. Lately this subject has been taken up by a few persons who are aware of its importance, and of the advancements in the civilisation of a nation which the encouragement of Art promotes. The state of the Royal Academy of Lisbon has been brought before the Cortes, and as that assembly has denounced it as a "disgraceful establishment," it is to be presumed that some reform in its management may speedily be hoped for. From the present state of decorative and all other Art in Lisbon, it is evident that no competent persons for many years have considered or understood the subject, but no time can be more propitious than the present, since the king (himself no mean artist) is well qualified to give the assistance so much needed, of knowledge and good taste. Mr. Corden, an artist sent here from England by Prince Albert to paint the portraits of the king and queen, has, it is said, just finished a satisfactory likeness of the former. The Chevalier L. P. de Menezes, whose works were mentioned in the former paper, has also just finished one of his best works, which he has presented to the queen. Of this artist it may fairly be said that he rejects all academical conventionalisms, and with earnest and patriotic feeling devotes his energies and means to disseminate a taste for the arts amongst his countrymen—an undertaking which it must be admitted is an arduous one, seeing the present total want of interest in all matters connected with the Fine Arts; yet much may be done by the energy of even one man—so let us hope for better times. J. B. K.

TRIXEV.—A very curious discovery has been made in the Mosque of St. Sophia, at Constantinople. In the course of cleansing and repairing the interior, the original decorations in mosaic have been brought to light, including, as it is said,

a portrait of Constantine. Drawings have been made, and are on their way to England. The Sultan, to prevent the necessity of removing them, as the religion of the country would require, has considerably ordered them to be covered up again.—*Builder*.

AMERICA.—It is believed that the present number of persons directly engaged as daguerrotypists in the United States is ten thousand, to which may be added at least five thousand who obtain their living from indirect connexion with the art, by the manufacture of plates, cases, chemicals, and apparatus—or that the aggregate supported in the Union by this means cannot be far short of fifteen thousand persons. According to the *New York Tribune*, Mr. Brady, of that city, is about to establish a new and important improvement—viz., the process of taking pictures on ivory, by the aid of the daguerrotype art.

We have received the report of the proceedings of the Franklin Institute of the State of Pennsylvania, relative to the establishment of a School of Design for Women. The honour of originating the plan is due to Mrs. Peter, of Philadelphia, who has directed much attention to the benevolent end of providing employment for females. In her letter to the committee she says—"For our men, there are now, and there must long continue to exist, so many more direct and more easily to be attained avenues of fortune, that high excellence in the industrial arts of design can rarely be expected from them. Our women, on the contrary, are confined to the narrowest possible range of employment; and owing to the unceasing drain, by emigration to the West and elsewhere, of young and enterprising men, we have a constantly increasing number of young women, who are chiefly or entirely dependent upon their own resources, possessing respectable acquirements, good abilities, sometimes even fine talents, yet who are shut out from every means of exercising them profitably for themselves or others. To such as these the establishment of a School of Design opens at once the prospect of a comfortable livelihood, with the assurance of a useful and not ignoble career." The committee add with much truth that, "The person who points out a new field for the employment of female industry, must be looked upon as a public benefactor; and any mode by which such a field may be rendered accessible to necessitous women, recommends itself strongly to society as a powerful agent in the advancement of our civilisation, and the relief of suffering."

The intentions of the American Art-Union for 1851 we announced in our September number. In addition to the prints to be distributed to the members, the works of Art included in the distribution are much more numerous than in any previous year. They present to the public a list of more than three hundred, several among them being the best productions of their authors. Besides these paintings, there will be included in the distribution a beautiful bas-relief in marble, by Palmer, of "Morning;" a bust in marble by Mosier; twenty copies in bronze of "The Filatrice," a most graceful statuette by Brown; six bronze busts of "Washington," by Kneeland; and several bronze medals of Stuart and Trumbull, a distribution which will be still further extended and increased.

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY will be ere long called upon to elect its President: probably the choice will have been made before our Journal is published, for, we believe, the ordinary law of election does not apply to this vacancy. We earnestly hope the selection will be one that will strengthen and not impair its position: that it will be the result of no "trucking" to rank, on the one hand, and no homage to wealth on the other. There is one member of the academy to whom naturally all eyes will turn—at once an artist, a gentleman, and a scholar; it is rumoured that he objects to take upon himself an office of so much labour and responsibility; if it be so, it will be a matter of deep regret, not only in England, but throughout Europe.

A WINTER EXHIBITION of studies and sketches in oil and water colours is now, we understand, in course of formation under the auspices of some well known amateurs. Among the details of their plan are the following:—No works which are not *bona fide* the property of the artist shall be offered for sale; the artist shall be limited to the exhibition of three such contri-

butions; where contributions are the property of other persons than artists, that fact shall be published, and shall incapacitate them for sale; all sales are to be made for the sole benefit of the artist, without any deductions whatever;—and when the sale of a work has been effected, the artist is to be put in immediate connexion with the purchaser; the expenses of mounting and framing the various works are to be incurred by the association, and repaid out of the receipts proposed to be taken at the doors. It is proposed that this winter exhibition shall be conducted in the rooms of the Water-Colour Exhibition in Pall Mall. The frames are to be of one uniform pattern, to secure symmetry; and no works are to be placed beyond a height which will enable them to be well seen.—Several of our leading artists have already given in their adhesion to this promising scheme.—*Athenaeum*.

STATUES OF SIR R. PEEL.—The statue of the late distinguished Statesman, which was voted by the House of Commons to be erected in Westminster Abbey, has been entrusted to the eminent sculptor Gibson; the Manchester Statue has not yet been assigned to any sculptor, but has been submitted to a limited competition; whilst that for Salford is open to all. Mr. Hollins is reported to have the commissions for Lichfield and Birmingham. Mr. Behnes and Mr. Calder Marshall have executed small models, for the adoption of those places who may obtain them.

RAFAEL'S CARTOONS.—The tapestries executed from Raphael's cartoons, are at present in the Museum at Berlin; they surround the rotunda, which leads to the picture galleries, and are in a state of great purity. The Cartoons themselves are well known at Hampton Court, but the entire series have not been preserved, and they were retouched in the days of William III, in a clumsy manner. There is a fragment of another at Earl Spencer's, which is so good in its execution that it makes the more to be regretted that any wanton damage should have been done to it. The particulars of this damage is thus given in the *Northampton Mercury* of June, 1798, which will be of interest to our readers:—"A remarkable case was tried in the Court of King's Bench, for damaging one of the original cartoons of Raphael d'Urbino, representing Herod's cruelty; the piece damaged was in Westminster Hall, where a great number of linners, virtuous in painting and curious gentlemen, resorted to see it. The action was for 500*l.*, it being valued at near 1500*l.* originally. There are twelve of them painted by that master, eight of which are in England, viz., seven at the palace of Hampton Court, and this now in the possession of one Mr. Mitting; the King of France has one, the King of Sardinia another; and the other two are lost, or it is not known where they are. The jury gave a verdict for the plaintiff of 30*l.* damages and costs of suit."

MR. ALFRED MONTAGUE has resigned his membership of the society of British Artists.

PAXTON'S PALACE OF GLASS.—A large and elaborate lithographic print, by Mr. G. Hawkins, of this vast edifice has recently been put forth by Messrs. Fox, Heuderson, & Co., the contractors. It shows the huge dimensions of the structure to great advantage, and drives its pigmy contemporaries entirely out of the field. While looking over this print, and marvelling at the magnitude of the original, we thought that the latter, when once erected, would never be permitted to be pulled down again; it would be a grievous thing if such were allowed, for it will unquestionably be one of the wonders of the age, though of glass; and will of itself attract a vast crowd of visitors to inspect it, solely. During our recent tour through Germany we heard it spoken of in the highest terms, not only on account of its novelty, but also for the boldness with which it was planned, and the promptitude already exhibited in carrying it forward. It even thus early begins to make a show, while the hammer of the smith, and "the harsh saw of the carpenter" are heard from sunrise to sunset in a hundred different quarters within the enclosure. So much does the forthcoming Exposition excite universal attention that we shall expect every novelty of the

forthcoming season to be christened after its name. The music-publishers have made a beginning, for we saw in a shop window the other day, "The Great Exhibition Polka;" but perhaps the composer has an eye to the period when the results of the world's ingenuity, and taste, and enterprise shall be withdrawn for a time, and the Palace of Glass shall become the resort of the gay and fashionable dancing to the music of bands unmarshalled under the leadership of Colinet, Musard, or Weippert.

HER MAJESTY'S THEATRE has recently undergone considerable alterations, under the superintendence of Mr. John Johnson, the architect, to render it suitable for the grand promenade concerts which are now commenced. All the seats in the pit have been removed, and the partitions of the boxes, with the exception of the grand tier. The promenade remains on the level of the pit floor, and has a flight of steps on each side up to the level of the stage. The orchestra, to hold ninety musicians, is partly on the stage, partly in the promenade. All the machinery, &c., over the stagos has been removed to admit a tent-like covering, to form a grand saloon, which is adorned with statues, &c.

Mrs. PURCELL, her Majesty's needlewoman, is engaged on a work of considerable extent and beauty. She has obtained from M. Gruner a design of great taste and beauty, which measures 30 feet by 20, and upon which she hopes to engage the needles of at least one hundred and fifty of our fair countrywomen, in order that the work may be a remarkable specimen of the ability of English ladies for exhibition to the world at the Great Exhibition of 1851.

BUST OF SIR ROBERT PEEL.—Messrs. Hefley & Co., of Soho Square, have published a small bust, in parian, of Sir Robert Peel, which was modelled by Mr. G. Abbott during the time Sir Robert was sitting as chairman of the Committee of Investigation on the Evesham Election. It is of a convenient size for the mantel-piece, or drawing-room table, and will be an acceptable memento for the admirers of the late statesman. It exhibits him during the "better" part of his life; at that period of his age when a likeness is more desirable to be preserved for posterity.

FIRE-RESISTING GRATES.—We have frequently found occasion to speak favourably of the improvements, which Mr. Pierce of Jernyn Street, has made in the manufacture of stoves and fire-grates. The last novelty of this kind submitted to our notice, is a grate of very simple construction, termed a "Cottage Grate," from its peculiar applicability to houses of a humble character. The sides and back are formed of what is called "fire-clay," which appears as hard as stone; these are made of one piece, and therein are inserted strong iron bars and bottom, with a loose ornamental trivet, removable at pleasure, extending along the whole front, on which two or three small saucers may be placed at the same time. One of its greatest advantages is, that it may be transferred to any room having a fire-place, as it requires no fixing, and it will readily burn anything in the shape of fuel. We would recommend those engaged in building houses where such an article would be required, to inspect this useful invention.

BAILY'S STATUE OF CHIEF JUSTICE TINDAL, is to be immediately erected in his native town of Chelmsford. It is a fine work; and a good sign when country towns esteem and perpetuate their great men thus.

THE CORONATION STONE at Kingston-on-Thames of which we recently gave some notice, has now been placed in its final position, in the centre of the open space opposite the High Street of the town. It is placed on an heptagonal pedestal of granite, which stands on a circular base of the same material. It being uncertain whether two of the kings mentioned by Speed were crowned at Kingston, the corporation have selected the following seven, whose names, with the dates of their respective coronations, are inscribed on the faces of the pedestal, viz.:—Athelstane, A.D. 924; Edward, A.D. 940; Edred, A.D. 946; Edgar, A.D. 959; Edward II., A.D. 975; Ethelred II., A.D. 979; and Edmund II., A.D. 1016. A silver penny of each of these kings is inserted in the stone, and protected by thick glass. The monument is encompassed with

iron railings, having a pillar finished with pinnacles at each of the seven angles, the entire design partaking of the Anglo-Saxon character.

THE BRITISH MUSEUM.—The open space in front of our great national collection, so important for its uses in giving air and due effect to the building—a space which is difficult to obtain in our crowded capital, and which when obtained, should be carefully treasured—is threatened with enclosure: with abnegation in fact, and for the worst of all reasons; not for public convenience, not for the benefit of the building, but simply because the sides of the fore-court contain the houses of the officials connected with the Museum, who desire as great, or greater exclusiveness, than royalty possesses*. A most elegant and useful approach to the grand stair of the Museum might be reserved, and laid out with stannary or fragments of antiquity of a kind that would not injure by exposure and would act as an introduction to the building itself and its contents. The objection to the old Museum was the dismal workhouse-looking wall which enclosed it, and now we have the threat of its re-erection. There is neither necessity, taste, or justice in this intention, and we seriously hope it may be strenuously opposed in the proper, and most influential quarters.

THE NEW HOUSES OF PARLIAMENT.—Within the past month we have taken a turn round and about this pile of building to see what progress has been made of late, and what is yet doing. In the Commons' chamber various alterations are taking place suggested at the trial sittings in the past session. St. Stephen's porch, by which the new House of Commons is entered, is completed; the approach is by two fine flights of steps, the entire breadth of which extends fifty feet into the body of Westminster Hall; the restoration of the ceiling and interior of this latter noble building has been recently commenced. A new entrance from the centre of the hall into the cloisters has also been opened. In the House of Lords, the artists are occupied on the historical pictures yet unfinished. Externally, the statues and ornaments under the gateway of Victoria Tower are completed, and the tower itself is progressing upwards slowly; the Clock Tower, at the east-end, has also been raised several courses of stone-work, which have again been left to settle down before being carried further.

MAGNA CHARTA.—We have recently inspected a copy of this celebrated document, illustrated by an heraldic border, consisting of fifty-seven shields of arms borne by the principal persons connected therewith. It is the work of Mr. Partridge, of Newman Street, an heraldic painter, who has bestowed much time and attention in getting together so large a number of these antique bearings; the effect of the whole is exceedingly striking, and as an historic monument it is of considerable interest. It would be an excellent adjunct to any library, public or private.

NEW RED COLOURING MATTER.—A colouring matter has recently been obtained from the roots of rhubarb, which promises to be of much practical importance, and may even, to a considerable extent, supersede cochineal. One part of the cleaned root is heated, at a gentle heat, with four parts nitric acid. After red fumes have entirely ceased to escape, there remains a mass of yellow or orange colour, which the discoverer, M. Garot, names *erythro*, and which combines with the alkalies, forming crimson and purple compounds. An excess of nitric acid must be carefully avoided, otherwise much oxalic acid will be produced. The ammoniacal compound dissolved in water, or by preference in alcohol, imparts to silk beautiful and permanent colours, resembling those obtained from cochineal, but which it considerably exceeds in tinctorial power. The common garden rhubarb yields 8 to 10 per cent. of *erythro*, and the Asiatic 15 to 20; but as the former imparts the more brilliant red, and can be obtained at a very trifling price, it will deserve the preference.—*Artisan.*

* We understand (and rejoice if it be so) that this project is abandoned.

REVIEWS.

DARSTELLUNGEN AUS DEN EVANGELIEN. VON FRIEDRICH OVERBECK. Published by AUGUSTUS WILLIAM SCHULGEN, Düsseldorf.

Very few of the German painters, who, in their revival of German art, protested against colour, have justified themselves so well as Overbeck. None but men of the very highest powers can afford to dispense with colour. Knauth might well follow in the steps of Cornelius and Overbeck, but he has departed from their early precepts, and now paints his sublime conceptions in the most gloriously brilliant hues. Overbeck's principle is sufficiently clear in his great work in the Städel Institute at Frankfurt, "The Union of Religion and Art." Colour is there employed in a manner extremely subordinate, the great desideratum being severity and impressive narrative, and hence the works of Overbeck do not lose in engraving that which other works must. The series under notice consists of sixteen plates, engraved after drawings in the possession of the Baron von Lotzbeck, by Bartocini, Jos. and Fr. Keller, Ludy, Massau, &c.; the subjects are, according to the title, a selection from the New Testament. The feeling of Overbeck is fully maintained in the compositions; and there are few masses of deep shade, the principal darks being employed only to round the figures. The first subject is entitled "Ecce Homo;" it shows four principal figures, one of them Jesus being led forth to be crucified. "Then came Jesus forth, wearing the crown of thorns and the purple robe; and Pilate saith unto them, Behold the man!" Pilate stands with his back turned to the spectator; he points to the Saviour and addresses "the multitude." The "Healing of the Sick," according to the seventh chapter of St. Luke, and other passages of Scripture, contains many more figures encircling the Saviour, who is in the act of stooping and passing his hand over the eyes of one who kneels before him. There is more shade and middle tone in this than in others of the plates, a qualification which we think gives a greater degree of harmony to the several parts. The "Salutation" presents only four figures, Mary and Elizabeth as principals, and Joseph and Zacharias as secondary. Elizabeth is kneeling on her threshold, and so receives Mary, who has dismounted from the ass, which is held by Joseph. The "Washing of the Saviour's Feet in the House of the Pharisee" is a masterly composition, and admirably fitted for execution either in oil or fresco. The Saviour is seated on a couch, at the foot of which kneels the woman, bending over the feet of Christ, who pronounces the parable of the Two Debtors to the Pharisee who is standing near him; other figures, as guests are seated round the table. Some portions of the costume here approach the modern Oriental dress; but in selecting judiciously from this no artist could be far wrong, because the Arab costume is much the same as existed in the days of Abraham. In the "Marriage at Cana of Galilee" the number of figures introduced is but few, and unlike the usual treatment of the subject, it is rather the miracle than the festival that is described: we find, therefore the Saviour accompanied by few figures. His mother stands by him, and he extends his hand over the wine-jars, which are being filled with water by the attendants. The scene is the court of a rich man's house, and, forming another group, three figures stand at a short distance, speaking of the miracle. "Jesus in the midst of the Doctors in the Temple," is an admirable composition; it would form a magnificent fresco. The child Jesus is seated, and turned towards the doctors, who, to the number of thirteen, are engaged in discussion with him. The variety of the heads and the diversity of their expression are beyond all praise, and the extreme simplicity of the manner of draping the figures is more than usually appreciable here, from the singularly happy arrangements of line prevalent throughout the composition. "And the same day Pilate and Herod were made friends together; for before they were at enmity between themselves;"—such is the subject of another plate, in which we see the reconciliation. Pilate and Herod advance and take each other's hand. We see on the outside of the vestibule, Jesus led away to crucifixion, a spectacle which attracts the attention of a group of women on the side of Herod, and of a knot of soldiers on that of Pilate. The latter is an admirable figure, a presence fit for Caesar, and a head very like him. Pilate was an Idumean, and it would have been better to have kept him so. "At the same time came the disciples unto Jesus, saying, Who is the greatest in the kingdom of heaven?"—this, the 1st verse of the 18th chapter of St. Matthew forms the subject of another plate, in which the Saviour

is seen seated addressing his disciples, who are assembled before him, some kneeling, some sitting, all attentively listening to the divine word. This is followed by the "Call of St. Matthew." Christ is passing with his disciples, and on hearing the command "Follow me," Matthew rises at once and leaves the shed in which he had been receiving custom. "The Annunciation" approaches more closely to the old masters, those upon whom the German school founded their regeneration, than any other of the series; it points directly to the source of inspiration. In the middle of the composition is a *lily*, on one side of which kneels Mary, and on the other the angel Gabriel. The figure of the Virgin is a masterly conception; it is characterised by infinite sweetness; and almost hopeless though it be to introduce any originality into the impersonation, we find, nevertheless, a degree of originality here. These are recent works of Overbeck, many of them are dated 1846, and their fidelity to the early principle is proof of a lasting conviction of its truth in one of the men who have revolutionised the religious art of our time. We have seen nothing in this form that has charmed us more than these engravings; each is worthy to be the subject of a large and important plate.

THE SISTERS AT THE HOLY WELL. Engraved by F. HOLL, from a Drawing by F. W. TOPHAM. Published by LLOYD, BROTHERS.

Irish "holy wells," have afforded subjects for illustration time out of mind, and will do, even when the superstitions which hallow the waters, have either passed away, or given place to others; for, despite our philosophy, there is *that*, in every heart and brain, which clings to the miraculous as well as the supernatural, and will do so to the end of time. We have but to turn to the pages of the lives of some of our greatest men, to note the influence of the mystical; and when we remember this, we can surely regard with sympathy the piety and tenderness which urges the Irish pilgrim to seek health, either for himself or those he loves, from the waters of the "holy," or as he frequently calls it, the "blessed," well. We have seen pictured groups round a "holy well," which, though called "Irish," had no one characteristic of either the people or the country; any one who had been in the country could tell by a thousand indescribable "nothings" that the painter had drawn upon his imagination, but knew nought of the "reality" of the scene he portrayed; every artist is to a certain degree chartered by imagination,—to use some licence,—but not to abandon what he affects to illustrate. There is in this "Irish Holy Well," as much truth as beauty; nothing can surpass the tenderness and sweetness of the two principal female figures; the one kneeling with so much feebleness of attitude, and expression of patience in her sweet face; the other, standing breathing an earnest prayer, while the yet unnumbered rosary hangs from her fingers. The composition of the carved stone, worn out by time, but still retaining the impress of the crucifixion; the female in the background, giving a cup of the "healing waters" to her sick child; the "bocher," who is as much knave as pilgrim; the woman approaching with rapid steps, yet hardly with sufficient rapidity, to save the child she carries at her back; the receding figures, and the distant remains of the mysterious round tower (that long bone of contention, which the Irish antiquaries have picked so here,) are as true as they are harmonious;—there are no false effects, no picturesque "claptraps,"—the very earth and atmosphere are humid. It is faithfully Irish; and the subdued and melancholy character of its beauty but makes it the more true.

A GUIDE TO THE HIGHLANDS AND ISLANDS OF SCOTLAND. By G. H. A. ANDERSON. Published by A. & C. BLACK, of Edinburgh.

This is a third and re-modelled edition, with considerable additions of a very curious and useful kind, of a work which may be already favourably known to most tourists, to whom it cannot fail to be very useful, on account of the clear business-like directions offered to their use, and the curious topographical and historical facts given so abundantly in its course. The chapters devoted to the remote Highland districts are particularly interesting even to those who "stay at home at ease." And the accounts of Zetland and St. Kilda,

"—whose lonely race
Resign the setting sun to Indian seas,"

are extremely curious, presenting as they do so striking a difference to the civilisation of the south. The work is well got up, contains a great amount of information, and some good engravings.

ILLUSTRATED DITTIES OF THE OLDEN TIME.

Published by R. FOLTHORP, Brighton, and D. BOGUE, London.

If the "auld wives" of by-gone days could "revisit the pale glimpses of the moon," and see the honour and respect now paid to the songs where-with they lull'd our forefathers to sleep—the mere jingles, or nonsense verses, which so much delight childhood, but which have "more in them than meets the eye" in some instances; how much would these good old nurses be astonished to see the utmost elaboration of ornament, good inventions by good artists, fine engraving, luxurious paper and print, and showy binding, all combined toward the glorification and preservation of their ditties. There have been several editions of nursery rhymes of late years, illustrated and otherwise. Many have exhibited much artistic excellence; but we really think the general good taste and applicability which characterises this series of designs place the present work, like the baby in the old rhyme—"on the tree top." The engraver has seconded the artist very ably; there is a delicacy and feeling about his work which is very commendable. Among the best of the designs we may note those which illustrate "Pussy in the Well" (which is drawn and engraved in the best possible style); the Queen looking at the Nut-tree, and that which illustrates the lines

"The Hart he loves the high wood,
The Hare she loves the hill;
The Knight he loves his bright sword,
The Ladie loves her will—"

which is worked out in a very striking and original manner, in no degree forced, but with real artistic feeling and truthfulness. Among the side-pieces and those forming a sort of frame-work to the lines, we may particularly mention the man leaving home for duck-shooting—the "Little boy" wading his horn—the maiden presenting her "posies" to the Queen, and the illustration to the "old Lay" of "Goosey Gander" as particularly good. We perceive by the dedication that the work is that of a Lady Amateur who has designed the pictures originally "for the amusement" of her daughter. There is an elegant little poem to a baby at the close of the volume by the author of the dedication.

EDDOLON, OR THE COURSE OF A SOUL; and other Poems. By W. R. CASSELL. Published by W. PICKERING, London.

The purpose of the principal poem in this small volume is to symbolise the course of a poet's mind, wherein thought is immature and in a state of disorder, to that point where it becomes subservient to the true spirit of Poesy. The various transitions and influences by which this change is effected are described in a series of soliloquies spoken by the poet, and in dialogues between him and the spirit. The author's idea of his work is good, and the language he uses chaste and not inelegant; his descriptions of nature are in many parts beautiful, while the lines have a flowing, harmonious measure, the read easily and smoothly. The minor poems show much poetic feeling.

THE ART OF SKETCHING FROM NATURE. By THOMAS ROWBOTHAM, Professor of Drawing to the Royal Naval School. With Illustrations by THOS. L. ROWBOTHAM, JUN. Published by WINSON & NEWTON, London.

This is a small treatise, laying down a clear and brief system of sketching from nature, founded on few principles, but these are incontrovertibly sound—certainly the result of great experience—and assuredly signalling the only royal road to the acquisition of this accomplishment. Certain indispensable premises being disposed of in a few pages, the author addresses the attention of the student at once to the consideration of actual form under such precepts as cannot fail to give him an amount of power, proportionate always to his degree of perseverance, in sketching in outline. This little book is addressed to learners, and we have read it in this spirit. To all beginners the determination of the horizontal line is a source of extreme embarrassment; this is here taught in a few paragraphs accompanied by illustrative diagrams, and in the next two chapters two dispositions are treated of, which have always been stumbling blocks to students, these are, "the uphill view" and "the downhill view;" and nothing can be more perspicuous than the manner in which instructions are conveyed for drawing such views accurately. Succeeding chapters are "On the representation of Horizontal lines, whether parallel, perpendicular, or oblique to the plane of the picture," "Of lines oblique to the picture," "Circular objects," "On the choice of subject," "Composition of lines and forms," and "Light

and Shade." The book contains no useless theories, all is practical; and we have never met with a work wherein the gist of precept is so clearly conveyed as in this. It is abundantly illustrated by woodcuts, which are among the most charming vignettes we have ever seen; and it forms one of a series of little works which open an entirely new vein of instruction to students and amateurs.

KINDERLEHEN IN LIEBERN UND BILDERN, VON WOLFGANG MULLER, UND THEODOR MINNEROP. JOH. HEINR. SCHULZ, Düsseldorf.

Six small allegorical subjects, brought forward as woodcuts, in which the narrative is sustained by children; a kind of composition in which the Germans excel, and which Kaubach in the historical frieze which he purposes painting in the Museum at Berlin, will carry to its *non plus ultra*. The first of these is the "New Year," in which are a youthful party bringing in a long scroll of compliments and good wishes:—

"Wir bringen hier ein einen Fuder
Voll Wünsche, fromm und rein
Die rufen euch Glück und Segen
Zu allen Lebenswegen."

The next plate is "Skating," a party of little figures on the ice, a composition having a character so sculptural that it would form an excellent bas-relief. This is followed by another entitled "Knights;" it has much of the character of the preceding, and represents a couple of Knights, attended by their respective squires, at the moment of their meeting in a joust, the result of which is upon coats, and the animals have taken a part in the encounter by butting with their heads; the spirit and humour of the cut are admirable, the pseudo-heroic vein of the sketch is perfectly sustained. The next is "Shrovetide," kept by a band of happy roysters whose chorus we hear:—

"Lust'ge lust'ge Fastnachtszeit!
Heute jubelt alle Leut'
Heute sind wir alle toll
Alle bunter Scherze voll."

The other subjects are "Playing at Ball," and the "Little Countryman," both in every way equal to the preceding. The style of cutting is after the manner of old engravings, clear and decided, and of the subjects it is enough to say that they are fully worthy of their school.

THE MOUNTAIN SPRING. Engraved by C. W. WASS, from the Picture by P. F. POOLE, A.R.A.

The title of this print scarcely indicates the subject of the work, and yet it is most appropriate. The view shows a tract of country thickly covered with herbage, behind which a volume of clouds is rolling upwards; the "Mountain Spring" falls from a dilapidated wooden spout, a portion of which only is seen in the picture; before this are seen two figures, one a young girl *en dishabille*, arranging her hair, and the other a child, who is playing with the falling waters. The general effect of the scene is very pleasing; it is one of those simple delineations of unsophisticated rustic life that are "ever charming" if not "ever new." It is in such compositions that the English artist shines pre-eminently, and few have done better in this way than Mr. Poole; but a practised eye will here detect some errors, slight indeed in themselves, and in no wise affecting the interest of the work, but which, nevertheless, we should have been glad to see avoided. The right arm of the elder female is awkwardly placed, and her left foot seems preposterously large; the hands of the child are also not well drawn. What a pity it is our artists pay so little regard to these seemingly unimportant matters; for while in true conception and in colouring they are far beyond their Continental contemporaries, in accuracy of drawing they are immeasurably behind them, and the eye is frequently offended by what a little care would have prevented. The engraver has done his work capably, although there are difficulties in the treatment of the subject sufficient to tax his powers to the utmost. Mr. Poole, unlike most other painters, choosing almost invariably to put his figures into shadow; hence when his pictures have to be translated into black and white, the engraver must be troubled to know how to do it the most effectively. This peculiarity of the artist is seen in the child, painted in shadow against a dark sky; colour may easily separate them, but it is not so readily done by tone; the engraver has nevertheless succeeded in making each keep its proper place. This is the largest print we remember from the pencil of this artist; and there is no doubt of its finding favour with the public.

THE ART-JOURNAL.

LONDON, DECEMBER 1, 1850.

At the close of a TWELFTH annual volume of THE ART-JOURNAL, it is necessary, in accordance with old custom, to say a few words to our Subscribers.

We are grateful for the increased support and encouragement which the year 1850 has supplied to us; the circulation of our Journal has approached NINETEEN THOUSAND monthly: and we trust our exertions have been commensurate with the patronage we have received—that public patronage which invariably follows desert, and is rarely experienced where it is not merited. We respectfully affirm that we have omitted nothing we considered might interest, or be useful to our readers, which industry and capital might place at our command; and we regard our prosperity not alone as a reward for our labours, but as a proof that these labours have been satisfactory. We enjoy the consciousness that our efforts have not been in vain: after toiling through many difficulties we have the recompense of knowing that the ART-JOURNAL is respected not only at home but abroad—as the only Journal of Europe that worthily represents the Arts, and ministers to the wants of those by whom the Arts are either professed or cultivated.

We have seen the project we suggested, some years ago, and fostered with anxious care, of an Exhibition of Works of British Industry, progressing under the protection, and personal assistance, of the Prince-Consort; it will be our task, during the coming year, so to report it, as, while producing a worthy and becoming record of the great event, to continue to Manufacturers that serviceable aid and zealous co-operation which they have continually and emphatically acknowledged to have received at our hands.

We refer our readers to the Prospectus of our arrangements for the year 1851; they embrace many improvements, and we shall readily and gladly avail ourselves of any others that may be suggested. Believing that we can in no way so effectually benefit the British artist as by making him more familiar with the painters and sculptors of Germany, we shall consider it our duty to communicate to him, as frequently as possible, the great works of the Continent: some of the engagements we have entered into with this view, we have announced; others will in due course be made public.

We shall endeavour by all available means, thus, and through other sources, to give to our Journal a still higher aim and character than we have yet been able to achieve for it; pausing at no expense, and relaxing in no efforts, that may seem advisable for securing the success, which we cannot contemplate without mingled feelings of pride and gratitude.

MARLBOROUGH CHAMBERS,
49, PAUL MALL,
December 1.

THE PREPARATIONS IN BELGIUM
FOR THE EXHIBITION OF 1851.

FULLY impressed with the paramount importance of the forthcoming Exhibition, regarded in the light of an Industrial Peace Congress of the principal nations of the world, and feeling bound to contribute to the best of our ability to that knowledge of the general movements throughout the old world and the new which we find to be exciting a large amount of attention on all sides, we resume our notice of what foreign competitors are now employed upon, in accordance with the design expressed in our previous numbers, of personally visiting the principal cities of Europe, a design we have already begun to carry out, and are fully prepared to conclude efficiently.

We willingly give precedence to this all-important topic, feeling assured of its deep interest at the present moment; an interest which we have found acknowledged in the highest quarters, with a due regard to the nature and use of our report on what is to be done by continental artisans,—a report which we cannot help feeling will be of much use to the English manufacturer, giving him that knowledge of his competitors' intentions which he cannot obtain elsewhere, and "forewarned, forearmed" he may be the better able to perform his work with due honour to himself and credit to his country.

We must confess that after much experience of the talent which exists in our own country, sometimes perhaps hidden beneath the labour which is necessarily devoted to exigencies alone; but frequently, of late, revealing its power, where and when it was least to be expected—we do not fear the result—

"If England to itself remain but true!"

All personalities should be sunk, all feeling abolished but that which results to the honour of the country. The battle of the soldier has won its laurels for England over and over again, and the national glory has never yet been tarnished; a new battle is now to be fought, one in which we have never yet competed,—a battle of the mind and hand of the artisan, one as honourable and as creditable to the victor as any one yet fought. Like an ancient tourney it is open to all comers; the challenge is to all the world, the challenge has met with an universal response; it will be fought before the eyes of Europe; royalty will look on the field as of old, and a queen (due representative of the Queen of Beauty in the olden time) reward the victor.

We have felt it our duty throughout the progress of this great national event, to take an unbiassed part; not only clearing the onward course of the British artisan, but pointing to errors or dangers that might beset his course towards that "consummation devoutly to be wished"—a due and honourable triumph in a well fought field. We now feel in a position, from the result of our acquaintance with the intentions of our continental competitors to urge them all to be "up and doing." This is or ought to be, no idle time for objection to trifling matters, and indulgence in narrowed views; it is seriously a time to powder well on our position, and to take such wise steps as should preclude the possibility of a defeat in a contest to which we have voluntarily invited the manufacturers of the whole world. There cannot be a doubt that our neighbours will avail themselves fully of the open offer; and it is for us to prepare with energy for the contest. We again repeat that we have no fear for the result, provided that we do not allow our energies to flag, but exert ourselves to be just toward the mechanical and artistic ability we certainly already possess, and which awaited but a chance like this to render itself known to the world.

Our tour in Belgium made within the last few weeks enables us to assure our readers that much may be expected from that country, of an artistic character. Indeed the Belgians seem to be so fully impressed with the importance of this competition, that they are preparing articles of a much more finished and elaborate kind than any they exhibited at their own great Industrial Exhibition in 1847, which we recorded and

illustrated in our pages at that time. So large a number as 685 manufacturers have given in their names to the secretary of the commission for superintending the transmission, &c., of the national manufactures of Belgium; of these 150 are manufacturers in the city of Brussels, and of that number 30 are makers of its far-famed lace.

This we are enabled to state on the highest official authority, as, previous to our departure, the honour of an interview was granted us by his Excellency M. Van de Weyer, the Minister to the Court of England from Belgium, who has done us the honour to observe that our journey would "exceed, without doubt, a favourable influence on the useful arts of Belgium by the extra-publicity given them in our work," adding that from an acquaintance of many years with our labours "he fully appreciated the utility of our enterprise." M. de Broeckere, Burgomaster of Brussels, who was also acquainted with our labours in the due illustration of the Belgian Exhibition in 1847, received us most cordially; we having the honour of a letter of introduction from M. Van de Weyer, and he in the most liberal manner offered us all facilities in his power; indeed we were received everywhere with an *accueil cordiale* of the most gratifying kind.

We have found everywhere the same amount of surprise and admiration expressed in Belgium that we found in Germany, with regard to the nature of the building about to be erected. The same appreciation of its magnitude, and the rapidity with which it is to be called into being; the same acknowledgment of the generosity and grandeur of the entire scheme of the Exhibition, which we found it our duty to record in our last number, as the experience of an extensive and varied Tour in Germany, &c. This generous tone is due to the mischievous nature of the challenge; and we cannot but strongly feel the value in a moral point of view which must result from a personal connection between ourselves and our foreign brethren; the necessary result of the visits which are so universally promised.

Indeed, we have scarcely met with a manufacturer who has not expressed a determination to visit London during the Great Exhibition; and we cannot too strongly express our conviction that such a visit cannot fail to dispel national prejudices far more than any other means, and largely aid in bringing about that period, so ardently hoped for by the Poet,—

"When man to man, the world o'er,
Shall brothers be."

The folly of national prejudice, so frequently the result of ignorance, or fostered by ignorant politicians for temporary or evil purposes, will be fully displayed in all its absurdity; and we hope and believe that the wholesome consequence will be a large abstraction from its intensity.

With these preliminary observations we may proceed with our report of what is at present finished, or, in the ateliers of Belgium, preparing for next year's competition; and we commence with the capital, and its various artisans who are now vigorously bestirring themselves.

BRUSSELS.—From the capital of Belgium may be expected all that variety and quantity of ornamental and useful articles which are to be seen in so large and important a city, and which are called forth by the necessities or the luxury of its inhabitants. manifold and various are all the works which will be contributed by its many artists and manufacturers. Its sculptors will exhibit some of their best productions, several expressly designed for the next year's Great Exhibition, and some very poetical. A large window, in stained glass, valued at 6000 francs, will be contributed. Some very beautiful earthenware and glass will also be sent, but we were amused on going over one of the principal factories in the former trade to see a large quantity of the famous "willow pattern" plates and services, as well as many other old favourites, not so remarkable for their beauty as for their popularity. The greatest variety in glass may be expected, rivaling in beauty the ancient Venetian "verres filigranés;" some excellent built-furniture we inspected also, and we heard of a great competition in carriage-building, with an intention of rivaling the far-famed coach-makers of England.

The lace-manufacture has for a long period been most successfully carried on in Brussels, and some extraordinary works of this kind will be contributed, though we were told that the demand for the extremely fine, elaborate, and expensive lace is diminishing, as well as the power of fabricating it; inasmuch as the old hands who had the ability for this peculiar and pains-taking labour have not been succeeded by others as patient or as clever: neither is there now a sufficient demand for such extremely delicate work, the same patterns in a coarser material contenting the lace wearers; although, when we use the word *coarser*, it must be borne in mind that we use it only comparatively; the lace is still most exquisitely delicate, but the extreme of that quality only is found when threads are used which cannot be worked when the wind is in the north, or the slightest breath of air moves—from their extraordinary tenacity. A notion of its extreme delicacy may be formed from the fact that a pound of such thread sometimes costs 5500 francs, and that with all the extra care bestowed upon it, it is even then not sufficiently refined for entire use, but that nearly one-half of the costly article is wasted; it takes sometimes three weeks to make a Flemish ell of Malines lace, and 400 bobbins are used for a lace three inches wide; for the Valenciennes lace 250 bobbins are used in making an inch-wide lace, and it takes six weeks to make an ell; the wages of the most skilful vary from three to five francs daily, and one large manufacturer employs 1200 persons in this branch of the industrial arts. To see the lace-maker at work is a really remarkable sight to a stranger; the minuteness of the labour, the extraordinary tenacity of the thread, the great number of bobbins, and multitude of pins, confusing the eye not a little; while the intensity of attention and slowness of labour would seem to wear out any amount of patience. The value of these fine works may be estimated from the fact that a scarf was ordered by the late queen which was to occupy some years of labour, at a cost of 2000 francs, and that lace of three inches wide will cost 240 francs the Flemish ell. The *fond*, or ground, is of bobbin-make, when most valuable, six of the finest threads may be used together for it, and even when thus conjoined it has the appearance of fine gossamer, but it is, notwithstanding, very strong.

Having spoken of the decorative or ornamental works which will be sent from Brussels, and of those but briefly, and by no means detailing a title of what will certainly appear, we may add that in the useful as well as the ornamental arts, some large contributions will be sent. It was remarked to us by an extensive manufacturer in this city that "Belgium was not large enough" for his exertions, a feeling which speaks volumes, which exhibits an amount of perseverance and speculation on their parts, which must be met on that of our manufacturers by increased exertion in products of good quality and good taste.

Ghent.—This ancient and important manufacturing town, in which cotton is so extensively fabricated, that it may be considered as the Manchester of Belgium, will not make much show at our Universal Congress of Industry. It is the intention of some few *fabricants* to send some specimens of their cotton goods, and the whole process of making cotton, but nothing artistic will appear among their works.

Bruges.—This noble old town, venerable for its historic associations, and possessing some of the earliest and finest works of Flemish Art, has, in the progress of years, "fallen from its high estate" as a manufacturing city, and it is now but a shadow of what it formerly was; its magnificent Hotel de Ville, and public buildings toll but of its past splendour. It has now no manufacturing of an important kind, but is supplied from other towns. There are, however, many ingenious *fabricants* within its walls, but we could hear only of one, M. De Hondt, a goldsmith and medallist, who intended to exhibit his work in the latter art. He is favourably known to his fellow-townsmen as "*un vrai artiste*," and has executed the medals given to Provincial Expositions of Belgium, as honorary rewards. We also saw in the hands of its proprietor, in this city, a

very admirable work of Art, intended for exhibition in London, but not in Hyde Park; it is a copy of the famous Chasse of St. Ursula; a shrine of goldsmith's work, ornamented with the finest paintings by Memling, the earliest of the Flemish painters in oil. This wonderful work of early art is now in the Hospital of St. John, and is justly considered as one of the finest labours of the fifteenth century; the colouring and finish of the painting is most extraordinary, the ornamental canopies and Gothic tracery is equal in beauty. It has been copied so exactly in form and style, and its matchless painting so carefully reproduced by modern Art, that we are sure it will excite much attention upon its appearance amongst us. The Chasse itself is reproduced by an ingenious worker in bronze of this town; the paintings are the work of a Provincial artist, M. Vanden Broecke, who has been highly successful in his task.*

Courtray.—This town, the centre of the famous flax-manufacturers of Flanders, is at present principally employed in the fabrication of linen-cloths of a plain kind, such as are used for ordinary purposes, and varying from the coarsest sail-cloths to the finer fabrics resembling cambric; the latter are now manufactured in a very limited degree, as the use of cotton has greatly superseded it. There is, however, here, a very extensive manufactory of woollen cloths for trousers, &c., which is of remarkably good fabric, and a great variety of patterns, in as varied qualities, are to be sent to our Exhibition; indeed as many as a hundred varieties are spoken of as likely to appear. At the village of Roulers, near Courtray, a large manufacturer of damask linens of most elaborate design, intends sending also a great number of his finest productions.

Ypres.—This ancient town, celebrated in the history of manufacturing Art, as the place where diapers were first fabricated, and from whence they obtained the name (*d'ypres*), will send some samples of the ability of its lace-makers, as will also Alost and Crammont.

Tournay.—Here is established the Royal Manufactory of Carpets, and from whence we shall have some good examples of pure taste and skill. We believe that our own manufacturers may profit from the artistic ability displayed in these articles by our Continental neighbours. Indeed, we are fully convinced that each nation may, and will, benefit by the Exhibition of 1851; and that the peculiar excellencies of every branch of manufacture may be tested by this peaceful rivalry; we ourselves occasionally teaching our neighbours, and in return receiving from them useful lessons.

Mons.—In this town, by far the most important manufacturers are *Bochs fèvres*, whose establishment is for the making of pottery, an establishment which disseminates through Belgium some of the most artistic and beautiful works in that class we have seen. Indeed, we cannot but regret that this important manufacturer does not exhibit in London. His plea is an overwhelming amount of business; and this we can readily understand from the quantity of works we see at all the principal towns of Belgium, and from their universal acceptance by the public. They are in themselves so artistically beautiful that we do not wonder at this, although in their tone there is a sombre effect; brown grounds relieved by light flowers being the prevailing colours. These ornaments are very spiritedly modelled and laid upon the surface; and the works altogether exhibit much good taste, and infinitely more vigour than is usually seen in works of the class. We saw a beer-jug, covered with hops, entwined about it in the richest and most beautiful style; and we must confess we felt sorry that this and many other works from the same manufactory would not be exhibited.

There are other important manufacturers in the town who will exhibit, and from them we may expect excellent works in their kind; and particularly in fictile Art. The porcelain ex-

* A very full description of this Chasse (with lithographs of the size of the original pictures) has been written by M. Octave Delepierre, the present Belgian Consul in London. This learned gentleman is also the author of the "Lives of the Painters of Bruges," in which are notices of many excellent painters unknown in England, but whose fine pictures still decorate the churches and public buildings of Bruges.

hibits much that is good; and many of the difficulties which present themselves in this branch of the Arts have been overcome very admirably. We were particularly pleased with a life-sized bust of King Leopold, which was very excellently and truthfully rendered in biscuit-porcelain; an undertaking of no ordinary difficulties, when the shrinking and distortion which sometimes occurs in the baking of the clay is borne in mind, and which always has the effect of rendering the ultimate character of the finest works a matter of some uncertainty and anxious solicitude. We found the clays here very carefully chosen, and in some instances brought from France and from England, according to the nature and quality of the work for which they were wanted.

We are, however, exceedingly well satisfied with our own works in porcelain, and with the great improvement manifested in that branch of our commercial industry within the last few years. We have seen, in the course of our Tour, many beautiful and many peculiar works in this class, but nothing to cause any fear for our national honour.

Namur, the Sheffield of Belgium, will, of course, exhibit cutlery: knowing, as we do, from our recent tour to the "world's factory" in our own country, the great improvements and artistic excellence which will be displayed by them in 1851, in the works at present preparing, we feel no fears of a dangerous rivalry. From the Glass Manufactory here, however, we shall see some works worthy of ancient Venice, and in the style which made that city so famous in by-gone days; exhibiting those delicate inter-laced threads of coloured glass introduced in the stems of drinking-glasses, or over the surface of glass cups and plates, which give so much beauty to this peculiar fabric.

Liege.—This ancient city, once the residence of a potentate of the Church, whose palace is still an object of curiosity to visitors, and whose various public buildings and works rendered it an object of interest in the Middle Ages—an interest which its numerous manufactories have continued to the present day; and whose artisans are honourably determined to uphold still—of which we shall have abundant proof in the forthcoming year—is conveniently and beautifully situated in the valley of the Meuse, its houses and factories skirting its margin, and the picturesque hills rising around it on all sides. Large forests are close to its walls; iron is abundant in the immediate vicinity; and coals are at once to be obtained beneath the surface.* All these advantages have been seized with avidity by its inhabitants, and Liège, consequently, to Belgium, what Birmingham is to our country. It possesses, like all great towns, many and varied manufactures, but the principal is that of iron and steel, and, in some particular branches of the art, it is certainly unrivalled. This is particularly the case with the manufacture of fire-arms of all kinds, from the largest cannon to the smallest pistol; in the one instance surprising us by

* We could not help being much struck with the great economy of fuel in Liège, an economy the result of useful thought, not the consequence of want (for there is abundance of coal to be had at the rate of forty shillings a cart-load), but of proper frugality. The small coal is not wasted here, but is mixed with clay in small quantities—merely enough to make the mass adhere. This is done by tramping it with the feet; and women and men who deal in it may be seen mixing it in this way with their large and heavy wooden shoes at the doors of the consumers daily. When properly mixed it is kneaded into balls, in size and form similar to the *pistoles* or small loaves of bread used at the breakfast table (something like a double cone); these are ranged in front of the fire, and the rough coal thrown in behind. A mixture of wetted small coals is then laid over all, which hardens into a cake, and covers the fire in, preventing a large exhalation of smoke and a rapid and unnecessary consumption of fuel. The fire burns on well and steady for half a day without rapidly, and throwing out a constant equal heat, the poker being seldom or never used throughout the day; and that great waste of heat up the chimney, which is constant in England, completely prevented; there being far less perceptible heat on placing the hand above the fire than in placing it in front of it. When we consider how rapidly we burn coals away in our fire-places, and that generally two-thirds of the heat goes up the chimney uselessly, and that we have literally mountains of good coal-dust at Sunderland and elsewhere never used, and becoming a positive obstruction and nuisance like the waste slate of a Welsh mine, surely a useful lesson may be gained from our Belgian neighbours how to turn all this to advantage.

size,* in the other by the beauty of decoration. For a long time Versailles disputed with Liège the palm of superiority in the manufacture of ornamental fire-arms; but that portion of its labours being abolished, Liège now reigns supreme. Certainly we have never seen decoration carried further than in a gun which we inspected in the hands of the maker, and which is destined for the Industrial Congress in Hyde Park. The utmost elaboration and the greatest taste is visible in its ornamentation; and the precious metals are introduced to relieve the gun-metal with the happiest effect. Indeed, we have never inspected *armes de luxe* at all comparable to those made at Liège. Spain and the East are the principal markets for these elaborate and expensive arms; they have all the gorgeousness of Eastern taste, with the refinements of European knowledge. The wealthy of the East consider their arms and their horses as their chief treasures; the East can supply the one from its own resources, and the ateliers of Liège constantly contribute the other.

Those well-known "*Société de la Vieille Montagne*," and the factory at Seraing, are both in the vicinity of Liège, and many are the works produced by the town. The *Portes-Cochères* which meet the eye in every street, with their beautiful open panels, filled with iron-work of the richest design, attest the ability and artistic excellence of the "workers in iron" who inhabit the ancient City. But it is not only to massive work that these artisans restrict themselves; they are prepared to produce and exhibit the most *recherché* elegancies for the drawing-room. In tenacity of fabric they do not rival the iron-workers of Berlin, but in carefulness of workmanship and artistic feeling they will certainly stand any test. We have seen such articles as shirt-pins, the substance of which is in iron, but inlaid with the most beautiful ornament in silver and gold, which attest the highest excellence. We have inspected some tazzas, worthy in their gracefulness to be placed with the best works of the Middle Ages, in which the richness of the design can only be equalled by the excellence of execution perceptible in all its parts, producing a *tout ensemble* of singular beauty; the brilliancy of the decoration telling with admirable effect on the dark brown tint of the iron—all ornament being of the most delicate and subdued style of enrichment.

In one instance we inspected a cameo of much excellence, with a group of at least a dozen figures; the same artist intending to exhibit a cup ornamented with similar works. But the truest notion of the large and general nature of the contributions to be expected from some of the principal Belgian towns, may be obtained from a list of what is to come from Liège, and which will consist of zinc in divers forms; lead; cards for cotton and woollen spinning; minerals in their native and finished state; nails, pewter works, pottery, statues in plaster, cloth, scythes, files, tanned and dressed calveskins, brushes of all kinds, starch, a safety-lamp for colliers, all kinds of basket-work, paper, glue, galvanised iron, and iron wire. While from the famous establishment at Seraing, conducted by Messrs. Cockerell, will be sent many works in iron, particularly steam-engines.

Of the various and large manufacturers of arms, seventeen have promised to contribute, and have placed their intention on record. They are expected to exhibit at least six hundred highly wrought fowling-pieces, and six hundred pairs of pistols of the same class. The Royal Cannon Foundry will exhibit several specimens of cannon and cannon-balls. Liège will thus altogether exhibit a large variety of implements of war. The Arms sent from Liège will be formed into an ornamental group, with the cannon and balls from the Royal Foundry in the centre, the ornamental guns, pistols, &c., radiating around them.

This *résumé* of the intentions of the manufacturers of Liège will give a fair idea of the nature

* The *monstre mortier*, which was used at the siege of Antwerp, is now raising as a curiosity in the court of the Royal Arsenal at Liège; a government foundation, under the superintendence of Colonel Frederix, who assured us that 800 cannon were cast and finished in this establishment yearly.

and variety of the contributions to be expected from the large Belgian towns, ranging, as it does, through the Useful and Ornamental Arts, and including military implements of the most ordinary as well as the most sumptuous kind. It shows that the motto exhibited in the arcade of the town, amid the shops of its various *fabricants*, is not mere empty words:—" *Activité, Ordre, Économie*"—and that, acting up to their belief in the power of these three words, they pin their faith to another sentence inscribed on the same walls:—" *La centralization du Commerce contribue à sa Prospérité.*"

VERVIERS.—From this town, on the frontiers of Prussia, we have not heard of much to be contributed. The lace-making trade in the old time was of so much celebrity, and gave such character to Brussels and other cities, that many more anxiously desired similar fame, and it was extensively made elsewhere; each town became, in this manner, celebrated for its own particular style of lace-manufacture. Now, the peculiarity of one town is transferred to another, and we were told that Malines lace was made best at Antwerp; while the lace of Valenciennes was constructed at Brussels. Verviers is to exhibit some of the oldest style—*guipure* lace—so called from the flowers and other ornaments which compose the pattern, being held to each other by long threads. It is that kind of lace most commonly seen in our curiosity shops, and which upon the stage is considered as the peculiar property of grand-mamas, or ladies of two centuries ago, who wear it for their aprons. The town is also celebrated for its fine woollen manufacture, and specimens of the best sort are to be sent to London in 1851.

SPA.—The principal *fabricants* at Spa are those so constantly engaged on Ornamental Articles, for which there is a continued demand by visitors *en passant*. They consist of works of an ornamental character in wood, such as baskets, chimney ornaments, &c., which are decorated with paintings of fruit, flowers, &c. The wood is a white wood, beautifully stained, of a warm grey colour; the veins imbibing less of the colouring matter applied to the surface, and giving it much of the effect of marble. There are many hundreds of persons employed in this branch of ornamental industry; and among them a very large number who paint the designs on each article. It is the intention of the manufacturers here to exhibit some of their best works in this class, which are to be executed by their cleverest workmen, and with a duo amount of artistic skill in the paintings.

LOUVAIN.—This ancient city possesses one of the finest gems of ancient structural Art, in its matchless *Hôtel de Ville*, a building incrustated with carved work of the most elaborate order over its entire surface, consisting of groups of admirably arranged figures, designed to illustrate the histories in the Old and New Testament; floriated ornaments; enriched cornels; and tabernacle-work of the most gorgeous kind. The chief manufacture now carried on in the town is beer.

There is a very large paper-maker in this town, whose manufactory for producing ornamental papering for rooms occupies 120 men in constant employ; he is himself an artist, and designs the principal patterns which are produced here, and he is about to send to London, we believe for the first time, specimens of his ability in this branch of Art, which he has expressly designed and carried out for the Great Exhibition next year. His designs are remarkable for the taste and harmony of their colours, and we were particularly struck with the rich and beautiful effects produced by the adoption of various gradations of the same tint in one design, each gradation varying in intensity, and giving singular harmony and richness to the *ensemble*.

Besides this manufacturer, the principal exhibitors will be those who devote themselves to the fabrication of sacerdotal vestments, several of which are being prepared of that sumptuous kind which so particularly distinguish the clergy of the Romish faith. Lace for the army-clothier is also made to some considerable extent in this town, and it is the intention of the lace-makers here to send specimens of their taste and ability in the manufacture of epaulettes, &c.

While in this town we paid a visit to the

atelier of M. Geerts, one of the famous sculptors of Belgium, who has so successfully adopted the feeling of the Middle Ages without its barbarism; refused by M. Ceerts' good taste, this class of design reappears with great beauty, and we were especially pleased with the groups he had in hand for the decoration of the stalls in the Cathedral at Antwerp. There is a flight into Egypt in one compartment, which for grace and beauty we have never seen surpassed. M. Geerts executes his designs in stone as well as wood, and his ateliers are full of busy occupants all labouring with mallet and chisel. He intends sending to London two statues in wood in the taste of the fifteenth century, elaborately coloured and gilt, and a group from the Martyrdom of the Innocents, of much originality of conception. This artist has been exclusively employed in works of the kind, and has done all the figures in wood which decorate the stalls of Antwerp Cathedral. He is also engaged to execute in stone 260 statues to place in the niches of the *Hôtel de Ville*, at Louvain, which will thus become one of the most sumptuously decorated buildings in existence. He is also engaged in designing twenty-six panels, with stories from Scripture, for the Church of St. Joseph, recently erected in Brussels; these are in the style of Lorenzo Ghiberti, at the Baptistery, Florence. In these M. Geerts has shown the finest taste in design and execution; they partake of all the delicacy and beauty of the famed Italian artist; they are also to be cast in bronze, and cannot fail to do honour to modern Art in Belgium. M. Geerts has produced a number of statues, chiefly of a devotional kind, many of which are very beautiful, and he has also some graceful figures of nymphs, &c., which we hope, at some future period, to introduce to our readers.

MALINES is chiefly remarkable as the grand central station for all the Belgian railways, an arrangement wisely intended to save the capital (within half an hour's ride) the bustle and inconvenience of an enormous railway traffic. Malines will contribute specimens of furniture, cloths, &c.; but the greatest display will be made by M. Hanig, who is so well known throughout Europe for the taste he displays in Catholic devotional works, as well as for the sumptuous character of their style. It is his intention to exhibit many of the best he has executed; those *livres de luxe* which have made him celebrated; and they will be arranged in a novel manner, and one which will contribute not a little to the general effect of the compartment he will occupy in the World's Exhibition, and of which he was kind enough to exhibit to us his plan.

ANTWERP.—The city of Rubens is not without its able modern professors of Art; while its school of drawing, under the superintendence of Barou Wappers, is second to none in size and utility. One of its statuary will contribute to our Exhibition; and an artist whose works in wood are matchless in their class, will contribute a chimney-piece, eighteen feet in height, ordered of him by Lord Robert Grosvenor. It is to this artist that Antwerp is indebted for the carved Gothic screen and stalls which adorn its cathedral and enshrine the groups of wooden figures by M. Geerts of Louvain, which we have already described. These stalls are justly esteemed among the finest modern architectural wood carving in existence.

In furniture, another inhabitant of the ancient City will exhibit some specimens, certainly equal to anything which has fallen under our notice. We were particularly pleased with a Gothic hook-case and *écritoire*, with most elaborate tracery, pinnacles, and statuettes in ebony, of chaste design and execution; and a bedstead in the style of Francis I., with large figures and ornaments, singularly bold in character.

A piano is also to come from Antwerp to London, on the exterior of which the maker intends to bestow much taste and costly ornament. Furniture, pottery, and glass, are the principal *artistique* manufactures which will reach us, but the number of manufacturers who have been placed on record as claiming a position in Mr. Paxton's glass palace, is about thirty; and the articles they intend to exhibit are as varied as those we have enumerated as coming

from Liège. Among the number, some pipes of a novel and beautiful character may be expected, which are spoken of as articles combining great taste with much splendour, and which, of course, are very costly in construction. In a country of smokers it will be expected that the pipe should come in for a due share of that thought which is so constantly directed toward all articles susceptible of ornament, and that the artistic development of ideas which more or less impregnates the work of the continental artisan, and which it is the care of the government to foster in its Schools of Design, which are spread throughout Belgium, will show its fruit in all quarters. In Antwerp in particular, no school whatever is without its drawing-masters; even that for the poorest classes.

Three years ago we stated in the pages of our Journal that the Baron Wappers, Director of the Academy, had solicited the aid of the Belgian government to extend the elementary instruction in Drawing to every public educational institution. His request was acceded to by the vote of a sum of money, and at the present moment drawing forms a part of the tuition given in all these humble schools, which with us are significantly called "Ragged Schools."

The present "*École Royale des Beaux Arts*" in Antwerp is of very early origin, having existed before the use of oil medium established the glory of the Flemish school. A document lately discovered among the archives of the academy, and called the "*Liggere*," (an untranslatable word), records the names of the professors and pupils from the year 1445 to 1615. The subsequent importance conferred on the academy by the advent of Rubens and his illustrious contemporaries, has not diminished at the present day—the academy now numbering between thirteen and fourteen hundred pupils. The edifice where this aggregation of students in every department of the fine arts, from simple elements to the highest theories, is located, is an ancient conventual erection. For this purpose its numerous halls, corridors, and cloisters are admirably adapted; and our visit during the hours of evening instruction was both delightful and astounding. We passed through school after school, embracing a perfect classification of separate studies, each superintended by an accomplished professor of the separate branches. In the highest class of drawing from the life, many young men were assiduously modelling the subject with clay in alto-relievo very successfully. The drawing-school from casts was attended by a still greater number of students modelling the figure, independently of those who were making chalk drawings. The most perfect silence existed during the time; the students were mostly young men; and the Baron Wappers informed us that many of them were already excellent painters. The lower school was, as may be expected, the most numerous, as many of the students devote their evenings to study for their own improvement, as manufacturing workmen, without any desire to pursue an artistic career.

The academy may be said to be composed of two great divisions. The first relating to instruction in the arts of painting and sculpture, and the other, architecture, and with it all the industrial applications of ornament and design, such combining, as it were, under one direction, such studies as are presented by our Royal Academy and our Government School of Design, but on a vastly extended scale.

The professor of architecture gives to the most clever pupils a rough block on paper, consisting of a few lines only, marking the general map of the proposed building, and requires them to carry out the details according to the order, or styles. Many of these drawings were very elaborately executed, and reflect great honour on the instructors. In the other class of this section of the academy our admiration was truly excited. Young men and youths, masons, bricklayers, and plasterers, in their working habiliments, were with surprising cleverness modelling in clay all kinds of ornamental patterns, mouldings and friezes from flat drawings; the beauty and relief of which were absolutely astonishing. Carpenters were drawing diagrams of staircases, and all the different

combinations of joinery. Other workmen were sedulously studying the geometrical lines for vaultings, arches, buttresses, and the several components of buildings; after which they construct models from their drawings on the true principles of stereotomy, many of which we saw completed, displaying a vast deal of clever combination and knowledge of construction. The last school we visited was a vast apartment more than 150 feet long, and of proportionate width, completely crowded with young men and youths, some not more than twelve years of age, all engaged in drawing scrolls and ornaments of every description. This apartment must have contained at least 300 persons, all apparently of the working classes, habited in their ordinary blouses and caps.

The schools for teaching drawing, applicable to the works of industry in the academy of Antwerp, have been entirely organised by the Baron Wappers since he became appointed the director. M. François Durlot is the master to whom this important department is confided; this gentleman's talent is well known by the magnificent stalls he has erected in the cathedral, and by the just praise given him by Mr. Pugin in his recent work on floriated ornament. With such highly gifted and practical instructors, there is not much to be wondered at, that the workmen abroad should surpass Englishmen in all that relates to design. At Liège, the professor at the academy is also himself a caster in iron, producing works unapproachable for elegance and perfection of moulding. The contrast must be admitted to be humiliating to us as Englishmen, when we reflect on the disorganisation and want of system in our academies and schools of design. The approaching competition, will, perhaps, make us largely acquainted with our deficiencies; and it will be no discredit to profit by our neighbours' longer experience and superior tact. The school of Antwerp is worthy of our intense consideration for the admirable arrangement, vast extent of accommodation, and abundance of models and studies. It is besides presided over by the Baron Wappers, an artist of the highest eminence, and an enthusiast for everything that can contribute to the progress of his art and the artistic glory of the Belgian kingdom.

There is one great advantage gained in this country through the ease with which artistic information and assistance may be obtained, not only by the Belgian manufacturers and capitalists, but by the most ordinary workmen, which our own countrymen do not possess. We have shown how the humblest class of hand-labourer may be perfected in his own branch of the Industrial Arts, how the meanest school has its professor of drawing; but the highest ability is at the command of the manufacturer who may demand its exertion, and the most accomplished artist may be applied to with success for designs by any manufacturer who may desire them; there is no foolish or mistaken pride on this point; no artist imagines that he descends from his pedestal in visiting the workshop. The assistance of the best sculptor may be asked and obtained by the maker of a chimney-piece, who may desire that his console heads or side figures should be artistically excellent, and as good as he knows he is able to make his ornamental accessories. By such means excellent works are performed, works which ask for such combinations. The artist who could design cannot always execute; the sculptor who could produce admirable figures would fail in ornamental scrolls or other enrichments, which, however, can be obtained from other hands, while architectural portions may be executed by those most competent to that branch of Art, and foliage or flowers by others who have studied them best, and can execute them with the most accurate and artistic feeling. It is constantly the case that an article of furniture is thus made by a dozen different hands, and put together by the original designer; the consequence being a perfection in all its parts not obtainable by other means.

We have certainly seen much of a beautiful and artistic kind in Belgium, which we shall find a difficulty in rivalling here; but these are all *objets de luxe*, and we feel sure would be pro-

duced by ourselves, had we the same combination of artist and artisan which gives our neighbours the advantage. In the utilities of life we are certainly safer, and we found that "the good, solid, substantial, honest English article," to use the words of Lord Brougham, met with its due amount of appreciation everywhere; nay, that the Belgian was often willing to pay the larger sum for the English manufacture than was asked for the native one, because he was fully assured it would last longer and be cheaper in the end. This feeling, by a natural consequence, must ultimately be shared by the foreign manufacturer, who will learn from ourselves the importance and value of solid, wearable, or well finished goods; our own manufacturers will also be taught the advantage and power to be obtained from true artistic knowledge, rising from first principles, through all the gradations of manipulative Art to the biggest combinations. It is less usual to see upon the Continent that absurd mixture of styles, or that false combination of parts in an article of furniture or ornament, which we occasionally see among ourselves. We are, however, fully aware that such mistakes are to be found on the Continent as well as at home; indeed, we have seen instances of bad taste just as painful abroad, but they meet the eye less frequently, and are forgotten amid so much that is really excellent, and which evinces a large spread of true artistic power.

It must be borne in mind that all these good works are not cheap—not cheaper than they would be among ourselves; we still believe that "the good and cheap" are principally obtainable in England, or from English manufacturers; artistic articles or works of care and time must necessarily be what is called "dear"—but are not really so, when the large amount of experience, thought and ability, which combine in their fabrication is considered. When continental articles are cheaper than our own, they are generally worse; this is particularly the case in all wearing apparel. The greater amount of time employed by continental artisans in their work over that of our steadily and continuously-working handicraftsmen, brings the expense of most good articles to an equality between the countries, for though time and hand labour be cheaper abroad, there is so much more consumed and paid for by the manufacturer there, that it gives him little advantage in price over ourselves.

Altogether in Belgium we found a strong disposition among artists and manufacturers to excel—a disposition wisely fostered by king and government. Every manufacturer will have the advantage of his articles being shipped to England at government expense. All feel the importance of duly upholding national credit by what they may exhibit, and all wish to do their best, and show well among the nations. It will be for our own manufacturers to work in the same spirit, to come forward vigorously and manfully; to think well before they act, to perform well after they have thought well, and to feel that the honour of the country is in their own hands.

THE PREPARATIONS IN AUSTRIA, &c. FOR THE EXHIBITION OF 1851.

NURNBERG, November 1, 1850.

SIR,—Having returned from the journey which, at your request, I undertook in order to collect information respecting the preparations for the Great Industrial Exhibition of 1851, and particularly as regards the contributions which may be expected from some of the chief towns in Austria, I proceed to give you an account of those I met with, more immediately interesting for the objects of the Art-Journal, together with such observations as occurred to me from the information I received during my progress. My first stay *en route* from this place was at

RATISBON.—From this town, though not much renowned for its industry, there will be some objects received of a kind that will grace the Exhibition, and do itself honour. First among these are the works of an artist-sculptor and modeller, who, following the example of many of his renowned countrymen of old, though he

can carve a Venus, does not hesitate to devote his study and skill to the embellishment of objects in everyday use, and therefore refuses not to stoop from his exclusive attitude to improve a flower-vase or to model a drinking-cup. His tasteful models of all kinds are in high request, and his occupation constant; and my only fear is, that his hands are so full he will scarcely be able to transmit more than one or two objects direct from himself. He has, however, designed and modelled, in a very superior kind of red clay, a curious and most interesting set of chess-figures, each exhibiting a distinct mediæval character and costume. There is the bishop of the olden time in his rich vestments and quaint tonsure, with mitre and crozier; the knight is indicated by the highly caparisoned war-horse; the castle, by the antique German gateway-tower. Each pawn represents an individual character or personage of the time, amongst whom may be observed the motley fool, the "dainty courtier," the drunken beggar, and the roystering soldier. The king and queen are of dimensions larger than the rest of the figures, clad in their pictorial robes, and bear the insignia of their rank and power. The subjects of the various designs are all taken from the period of the middle ages; the style is bold, the expression strikingly true, and the peculiar features of individual character admirably given. Indeed I do not remember ever having seen figures thus modelled, except, perhaps, some by Roubilliac, more perfect in outline, and combining so much force with so much freedom. The clay of which they are formed is found in the neighbourhood, but not in large quantities; it is of a peculiar nature, expensive, and difficult to work; but when at length properly tempered and well burnt, it is almost as hard as metal, and susceptible of a very fine polish. A set of these figures, which are perfectly unique of their kind, and executed with true artistic feeling, ought to grace the saloon of every chess-club in Europe. The pawns are about fifteen inches high, and the figures cost, one with the other, about a guinea a piece. The artist has unfortunately had an accident with some of them, on which account several have to be re-modelled; but he hopes to be able to transmit a set, complete, to the Exposition.

The next contribution will be by a carver and cabinet-maker. He was a pupil of Schwabler's. Besides examples of beautifully carved shrine-work, he will send a table of oak, exquisitely inlaid, and of most elaborate finish, enriched with foliage and figures of men and animals, after an antique specimen of the thirteenth century, belonging to M. Koeb of this city.

A silver-worker, who has frequently, as I am informed, been employed by Prince Taxil, will also submit something; probably a vase. I am in daily expectation of receiving the drawings from these parties. The porcelain manufactory will not contribute anything; but if I may judge from some specimens I saw in the town, this decision will not greatly affect the interests of the Exhibition.

From the manufactory of Messrs. Rehbach will be forwarded some excellent lead pencils. The quality of these is very superior. They stand only second in estimation to those of Messrs. Faber, of Stein, whose productions are mentioned hereafter. The first-class pencils made by these two manufacturers are the finest this country can produce, and at prices considerably below those of the English makers. This is to architects no slight boon.

I had interviews with other parties, from whom something might fairly have been expected; but, owing to the indifferent feeling, and languid efforts, of those who have the conduct of affairs in this town, nothing more of any consequence, or of an interesting kind, is likely to find its way to Hyde Park; nor, but for the visit you suggested, do I believe that either of the above-named artists would have decided to place themselves upon the list of contributors to the Exhibition. But more of this presently.

LINZ.—But few objects will come from hence. There will probably be a few wood-carvings of

no great merit; and some well-wrought model head-dresses of gold thread and gauze, as worn by the better class of peasants, were also shown to me as likely to be transmitted. It is said that the Government carpet-manufactory will likewise forward specimens. It may here be remarked, that great improvement is observable in the design, colour, and texture of their productions within the last three years. No drawings, however, were to be obtained; but this is the less to be regretted, as there will be finer specimens in this branch of industry from other parts of the country.

VIENNA.—It is impossible to go through the manufacturing districts of Austria without feeling that, if all things be taken into consideration, Austria possesses the most generally important and extensive, if not the most flourishing industry of any country in Germany. Towards the promotion and increase of this many circumstances most fortunately conspire: First, it has, for the most part, beautiful, easily worked, and very productive soil—provisions are therefore cheap. Its labourers and artisans are in that condition which renders their wants but few, and, as such, easily supplied. These facts regulate in a considerable degree the rate of wages, which are extremely low; * and the government, anxiously alive to the importance of everything affecting the great question of industrial produce, do all that in them lies to assist the efforts of an able and enlightened Board of Trade, in removing every obstruction to its full development. Other kingdoms and provinces of Germany are wont to laugh at the Austrian, and will tell you, "He is behind the world;" but it is not improbable that in the great Exhibition of next year the Austrian will find occasion to point triumphantly to some branches of his own manufacture, and then, in his turn, to laugh at them. Let any one who is interested in the improvement of these objects go through the various localities of Austrian industry, and observe, for himself, the rapid advances the Industrial Arts have made within the last four years, and he will be surprised and gratified to discover that, although they can only date an existence of about thirty years, their progress has been sure, strongly marked, and successful; establishing moreover the fact, that Austria, in the grand competition of next year, will form a very important European section, and exhibit herself, if not in many things amongst the first, certainly in none among the last of the German producers.

There will be upwards of a thousand contributors, whose productions will be of such a nature as to afford the best evidence of what the industry of that country can and will become, when such efforts can be made amidst, and indeed in spite of, all its revolutionary storms and disturbances, and with its greatest resources at present undeveloped.

Since Austria produces almost everything that is necessary to supply the natural and even artificial wants of mankind—its luxuries as well as comforts—the objects which will be sent to London are numerous and of varied character. They will comprise machinery, mechanical and artistic works in silver and gold, in ivory, wood, tortoiseshell, meerschaum, stone, and bronze. In iron, steel, brass, zinc (which latter they have an excellent mode of preparing, both as to colour and pliability), and other metals. Mathematical, astronomical, optical, and other scientific instruments; works and models in glass, porcelain, clay, wood, ivory, and papier-mâché. This last struck me as being a good deal heavier than the English. Musical instruments, particularly pianofortes, of which specimens have been announced from upwards of eighty makers.

Amongst the more prominent manufactures are those in woollen-cloths, and those also of a mixed quality, both spun and woven; also in shawls (some of Vienna manufacture of exquisite texture), silks, linens, cottons, and calicoes, as well printed as plain. Likewise chemical pre-

* Just now wages are somewhat higher, owing to the want of hands. Hundreds of artisans have been obliged to absent themselves for political reasons; and thousands more are torn away by conscription. Orders of an extensive and important kind must remain for many months unexecuted; and this state of things has not been without its effect upon the contributions to London.

parations, having reference to dyes and manufactures, of which several are of a very interesting nature.

Besides the above, there will be some magnificent examples of shrine-work, wood carving, and furniture from Vienna; together with paper-hangings and carpets, admirable alike both in design and manufacture.

For the reasons referred to in the memoranda accompanying this, I am not yet at liberty to give a more precise description, but must defer both this and the transmission of the drawings to a subsequent opportunity.

For the present, in so far satisfactory, state of things here, in reference to the London Exposition, Austria is mainly indebted to the energetic, incessant, and untiring exertions made by the Commission to enlighten the minds and encourage the efforts of the producers. At the head of this stands his Excellency the Minister of Commerce, ably supported by Baumgartner (Sections - Chef), Dr. Hock, and Dr. Schwarz.* In the hands of such men, possessing the clearest perception of the several advantages likely to accrue to the world by such an Exhibition—men of refined taste, and sound practical views—it was to be expected that their efforts would be liberally met, and a desire awakened worthily to represent Austrian industry; and their success, if not so complete as they or we could wish, has, at all events, been strikingly great. For though there existed at first much misrepresentation and jealousy, much darkness and mistrust—the clouds of which have unfortunately, even now, not entirely cleared away—still much, very much, has been effected by means of this enlightened and excellently organised Commission, towards establishing a better understanding of the nature, objects, and probable results of the great Industrial display.

With all this, however, it cannot be denied that a great number of producers of articles, both of taste and industry, whose works it would be highly desirable to see exhibited, are holding back solely under feelings of prejudice, doubt, or misapprehension. The more I reflect upon this subject, the more convinced I am that, while there was yet time, something should have been done, to remove wrong impressions, and to induce and confirm right ones, amongst the producers themselves. I am aware that the Art-Journal has already offered this suggestion, and that it was not thought necessary to respond thereto. Had it been otherwise, however; had different views been entertained of its expediency; had two or three persons, properly appointed, been sent amongst the producers of all classes in the principal German towns, I am firmly persuaded, that a clearer perception, a better feeling, and a greater degree of practical interest, would have been awakened; and what I consider no slight matter, their confidence would have been secured. In order to show that the opinion thus offered is not merely speculative, I may perhaps be forgiven for stating that, amidst few opportunities, with limited influence, and no authority, I have in my own individual capacity, within the last three or four months, been enabled to remove certain of these prejudices, to correct some misapprehension, and thereby to add nearly twenty persons to the various lists of those announced as contributors. My only inducement to this, was the natural anxiety that every Englishman must, or ought to, feel, for the complete success of this grand and important undertaking. It may be that there are already as many contributors as can be accommodated—Be it so—it neither alters the facts referred to nor the necessity resulting therefrom. To have proffered every possible explanation; to have at least endeavoured to remove prejudice, and to clear away doubt, was due to the high position and objects of England: it was due to those who have been invited to become contributors; and due to the character and welfare of the Exhibition itself. I have moreover reason to know, and say this advisedly; and after communication with some of the chief members of

* I had the honour of interviews with these gentlemen, and am not only indebted to them for a very kind reception, but also for much valuable information and assistance.

more than one or two of the principal committees in this and in other towns; that they would only have been too grateful for any such efforts to co-operate with and to confirm their own.

Let us now turn to the acts of the Austrian Government and we shall find them such as could not fail to exercise a widely extended and powerful influence upon the amount of the contributions from that country. While some governments have made no efforts at all; others only languid and half-sincere ones; and others held out hopes of assistance which have not been realised; the Imperial Government stretches forth its hand most liberally to all who are desirous of submitting the produce of their skill. These have only to deliver to the Commission their productions and they will be sent to England, and returned again to them, if not sold, *Free of Expense*. This was, at all events, a guarantee of a nature which could not fail to inspire a certain degree of public confidence. It challenged the exertion of the manufacturers; it encouraged the efforts of the artisan; and sustained and strengthened the influence of those to whose hands was principally entrusted the executive department. Of these gentlemen it must be said, they were amongst the first in Germany to promulgate the true opinion, that Mechanism, Invention, Science, and Art, are indigenous to no clime or country, and can bear no monopoly, but, like the air we breathe, are common to all; and that the world at large is interested in their advance and improvement. "What," said one of them to me, "is the grand object of this, by many, so misconceived and dreaded Exhibition? That object belongs exclusively, neither to England, France, nor Germany. It is a *Welt ausstellung*—and I cannot but regard it as an Exhibition to show to the world the point at which its industry has now arrived. I hope soon to see such another; and, after five or six years, to regard with increased pleasure the efforts of my countrymen, and say, 'There we were,' and now, 'Here we are.'" It is true. It must be so regarded; apart from all narrow, selfish principles of exclusive personal benefit. It is a step in the right direction of the world's future history—it is a step towards that free and kindly interchange among the nations, which forms the common bond of brotherhood to all—it is a step towards the realisation of the objects of the Peace Congress, proclaiming universal good-will and fellowship amongst mankind—it is a step towards the accomplishment of that time, when nations shall not lift up the sword against nation, neither shall they learn war any more.

BRUNN.—This is an active flourishing town of about 45,000 people, possessing the first manufacture of cloths and woollen stuffs in the Imperial Dominions. It has lately become celebrated also for the lighter kinds of ladies' cloths, and its trade in this branch has greatly increased within the last two years. Some specimens which I saw, may safely challenge comparison with those of any other country. This little town, which is called the Austrian Leeds, will also send various examples of its produce to the great Competition of 1851.

REICHENBERG.—This town is situated on the Neisse, capital of a territory of that name, in the district Bauzlan, in Bohemia. It contains about 10,000 inhabitants. It possesses an important cloth manufactory carried on by about 900 different firms, and a flourishing stocking trade amongst about 300 knitters. It turns out annually about 50,000 pieces of cloth. It is called the *Austrian Manchester*, and enjoys a considerable foreign trade. Some very important contributions may be expected from hence.

PRAGUE.—The principal articles to be expected from this section of the empire consist of porcelain and glass. Amongst the specimens of the former which were shown to me I was glad to observe the absence of that excessive style of gilding formerly so much indulged in. There is also perceptible a marked improvement both in outline and general design—and no labour or expense are spared by the enterprising and skilful proprietors, to extend this as far as possible to objects formed of either material.

I am informed there are in Bohemia about ninety glass-houses, or manufactories; thirty to forty mills for grinding and polishing; and that in these works upwards of 4000 families find their entire occupation and means of subsistence. Several cotton factories have for some time past been established here, and likewise works for calico-printing. These are on the left bank of the Moldau, and the locality in which they are situated is designated "Little Manchester!" Some highly creditable samples in these particular branches of produce will be submitted at the forthcoming Exposition.

Beyond these, and a few pipe-heads, some plastic figures, and similar objects of comparatively minor importance, I could hear of nothing likely to be contributed from this part of the country.

On my way back to Nuremberg I stayed a few hours in

BAMBERG.—Amongst the objects to be transmitted from hence, is a fine alabaster model of the cathedral in this town. It is the work of a poor bookbinder, who, *con amore*, has laboured at it, overtime, for the last six and a half years, and succeeded in finishing an architectural model of the most interesting kind. It is scrupulously correct, not only in every detail, but in every stone, fitting, and ornament, inside and out, from the elaborately wrought pinnacles to the mosaic pavement; a complete and perfect transcript of the beautiful original. In all probability another model, in bronze, and by a different artist, of Cologne Cathedral, will accompany the former. As far as I could learn, some snuff-boxes of bark, preparations of fine ultramarine, and a superior and very cheap kind of gauze-wire for blinds &c., complete the list of contributions from this place.

FURTH.—This is a busy little town of about 16,000 inhabitants, amongst whom are many wealthy and enterprising Jews. Its industry has risen rapidly during the last five years, and it is already a formidable rival to Nuremberg, whose absurd and unchristian edicts in regard to the Israelites established them here to its own prejudice.* Until within the last few months, a Jew could not even sleep in Nuremberg!

A clever cabinet-maker and skilful wood-carver is completing some well designed and gracefully executed carvings, consisting of private altars, shrines, furniture, &c., for the Exhibition. Likewise a pair of enriched church doors, which he is ready to execute to any design. His prices are so low compared with those of England, that architects would find it greatly to their advantage to try a contract with him; and it will give me much pleasure to afford any further information or assistance that may be desired on this subject.

A turner and ivory chaser will submit specimens of his craft. The principal of these will be a drinking cup (*spokale*), representing in relief subjects from the *Nibelungen Lied*. The form, as will be seen by the drawings, might perhaps have been more gracefully proportioned, but the illustrative carvings are treated with a high degree of artistic feeling, and in every respect carefully finished.

An engraver and worker in gold, silver, and bronze will send a goblet of the last named material, embellished with sporting subjects, well and effectively executed.

There will be other interesting objects from hence if they can be received, but several producers who announced themselves in August, have been told they were "*too late!*" The effect of this has been to deter others from thinking any more about the Exhibition.

NUREMBERG.—Of the glass paintings coming from Messrs. Kellner you have already had notice. Mr. Held is occupied in finishing off some meerschaum pipe bowls, of which the too hastily prepared drawings herewith transmitted convey but a very imperfect idea. Some interesting figures, &c., in bread, from a *Brod-künstler* will also be sent, and no doubt attract a considerable degree of interest. I will shortly

* Its manufactures are pipes, toys, gold-leaf, bronze, looking-glasses, mathematical instruments, brass, tin, zinc, and other metal wares—buttons, wire, medals, &c.; it is called the Bavarian Birmingham.

send you a more precise account of this curious and delicately adapted plastic material.

Some splendid specimens of prepared ultramarine will appear from the manufactory of M. Zellner; and likewise several small cases of the celebrated pencils made by Messrs. Faber of Stein, near this town. If my opinion (as an architect) may be allowed any weight, I can only say, I never used finer or more agreeably working pencils in my life than these. The lead even of the hard engineering kinds, yields easily to the India rubber, and leaves no indent upon your paper. The prices of his finest class pencils are ridiculously low, and they do but require to be more fully known to become still more extensively used in England.

Mr. Weher, a sculptor, will contribute some figures; and Mr. Schmiedner, some excellently finished specimens of gold and silver wire, for which his manufactory is much celebrated.

The foregoing, together with the anatomical figures in paper-mâché, by Fleischnan, already noticed in your November number, a few magnetic tin toys, and such like trifles, make up the sum total of contributions from this, the principal manufacturing and commercial town in Bavaria!

One naturally inquires "How this comes to pass?" Nuremberg could have supplied many interesting and tasteful objects to the Exhibition, objects moreover in which no competition is to be feared. The producers of these, moreover, could thereby have placed themselves in direct connexion with the English market, and thus have increased considerably their profits: whence then comes this singular defalcation? A combination of causes have tended to produce it, and some of these it may not be altogether uninteresting or unprofitable to endeavour to trace.

Among the great class of German producers it unfortunately happens that but few of themselves look to any thing beyond a prospect of their own immediate personal interest or convenience. Any idea of doing aught for the credit of their country's skill, or to honour the industry of their own native towns, does not seem to have occurred; and to awaken better and higher feelings, Bavaria, in common with some other countries, has done little or nothing. The government appears to have set a very lukewarm, and, indeed, as people complain, even a discouraging example; while several of the German newspapers and periodicals have discouraged the producers still more by disseminating false views, and calling forth the most unbecoming suspicions as to the nature, management, and ultimate objects of the Exhibition. It is strange, and at the same time painful, that even amidst the better and more educated classes of Germany, so many persons are found, who, let England do whatever she may, refuse to give her credit for aught towards the improvement of mankind. Limited operations and limited experience beget limited views; thus they put all down to the score of a selfish policy, and, in this case, to a desire, under pretence of doing good, to "cheat the rest of the world out of their inventions and industry." Against such miserable and unworthy opinions no argument is necessary, and I only allude to them here, because their promulgation has been a great and serious hindrance to complete success in respect of the contributions.

Another co-operating cause may be looked for in the peculiar commercial position of this country. It must never be forgotten that most of the German producers are without any great extent either of capital or enterprise. Such, therefore, are mostly indebted for the sale of their goods to commission houses; and these commission houses are, from the nature of their profits, deeply interested in preventing the direct communication of the producer and consumer. I could give many remarkable instances of this; it is, however, sufficient for my purpose to say, that cases have come to my knowledge in several important German towns, wherein the system of prevention has gone so far, that threats have been held out to the effect, that "if anything be sent to the English Industrial Exposition, no future orders need be expected."

It sometimes happens that the heads of such commission houses are on the local committees.

Their influence then is direct and powerful; and I must say, that, wherever I have found a committee so constituted, there has always been the greatest difficulty in bringing the producers to a right understanding of the nature, objects, and probable results of the Exhibition.

With regard more particularly, however, to Nuremberg, there is yet another circumstance which has operated still more prejudicially; this is, the delay of the necessary intimation as to the period in which contributors were to announce themselves. It is not my province to offer any opinion as to where the blame lay, but the fact should be made public, that although the central committee in Munich decided that all persons intending to contribute must announce themselves on or before the 1st of August, the Nuremberg Committee were not made aware of this decision till on or about the 15th of July; so that the issue of the proclamation from the meeting-room of the committee could not take place till the 16th; and thus there was only the space of about fourteen days for the distribution of the order, and for the decision of the producers, as to the precise character and extent of their contributions.

Add to the before-mentioned causes the fear entertained by many of the necessary costs of transmission, in a country where government does nothing to encourage or assist the producers, amongst whom, as I have said, capital is not particularly abundant, and who are therefore compelled to calculate with the greatest care every expense in the transaction of their daily business; and you have before you the whole secret of German shortcomings as regards the Exposition. Do not let it be supposed that political feeling has anything to do with it among the people themselves. An appeal has been made to their sense of political interest, through that most susceptible of all organs—the pocket. They have responded thereto, and the result is, that many of them withhold their contributions, not considering how great a wrong they do to a truly noble and generous design, nor how much the display of such selfish impulses tends to check the growth of their own industrial prosperity.

At Nuremberg my duties closed, and I do not know that I can at present add anything else of interest to this report. I will not fail, however, to forward from time to time such further information as may appear likely to be of service; and besides the drawings sent herewith, you may expect many others very shortly.

HENRY J. WHITING.

ON THE APPLICATIONS OF SCIENCE TO THE FINE AND USEFUL ARTS.

CHEMISTRY OF POTTERY.—PORCELAIN.

THE composition of natural clay has already engaged our attention; and the principal chemical characters of earthenware have formed the subject of a former paper; proceeding, therefore, in the line which appears the natural one, we have now to consider the peculiarities of composition and of physical character, which distinguish the varieties of porcelain, or, as it is often called, *Chinaware*.

In the progress of the potter's art in our own country, we have repeated examples of the influence of one individual, by whose energy the manufacture has reached a certain point of excellence, from which it has gradually fallen back when that directing mind ceased to exercise its control. In the examples of the Derby, Worcester, Chelsea, Bow, Nantgarow, and Staffordshire China, this may be distinctly traced. The principal cause of this has arisen from the very uncertain manner in which the mixtures have been measured, and the want of a systematic mode of manipulating. We have given, in the last article on this subject, a quotation from Shaw, in which he speaks of mixing by harrowfuls, and using "slip," in the utmost state of uncertainty as to the quantity of solid matter it contained. The remark of Vauquelin is peculiarly applicable:—"Good pottery differs from inferior, much less in the number of its components, than in being

combined in proper proportions." The potters of the present time are not so open to this censure as they were twenty years since; and hence the constantly improving character of the porcelain now produced in the potteries of Staffordshire.

Some account of the manufacture of Oriental China will not be without interest. The China of Japan is considered superior to all others. It is remarkable for the closeness of its texture, which is granular, but exceedingly compact. Owing to this it is highly sonorous, and rings like a bell when struck with a hard body; and it is so hard that it strikes off particles of steel, like a flint, in a state of incandescence. It is exceedingly infusible, and is capable of standing a very high degree of heat, and may be employed for boiling liquids, or subjected to a still higher temperature without injury.

It is stated on good authority, that the Japan China is composed of equal proportions of Kaolin and Pe-tunt-se and an aluminous earth. Kaolin is of the same general character as the Cornish, Devonshire, and other China clays already described; although, in all probability, that which is native to the Japan Islands is, in some respects, superior to our own; possibly, from the entire absence of micaceous particles. It is found in beds among the primary rock formations, and is felspar in a state of disintegration. The Japanese mix this clay with water, and then heat it into foam, after which it is allowed to settle—is dried and cut into squares for use.

The *Pe-tunt-se* has its name from being an impalpable powder formed into square cakes. It is a rocky mineral of the felspathic character, having a green colour. The process to which it is subjected, appears to be an exceedingly tedious one. Fragments of this felspathic porphyry are put into water, and forcibly agitated by rubbing against each other; fine particles are abraded, which, being light, form a foam upon the surface of the water; this foam is regularly removed to another vessel, in which these skimmings are allowed to subside slowly; and when the water is quite clear, it is carefully drawn off, leaving the precipitated powder, in an almost impalpable condition, at the bottom of the vessel.

Reaumur informs us that *Pe-tunt-se* is fusible at a moderate heat, and that Kaolin was not fusible at any heat he could employ. The use of the aluminous earth is necessary to render those two materials plastic, so that the potter is enabled to mould them, and also to give a firmer body to the ware.

The porcelain of the Chinese is nearly equal to that of Japan; and, probably the superior examples of their art, which are not allowed to leave the country, are quite as good as any of those fine specimens of Japan porcelain which the Dutch merchants have from time to time brought to Europe.

With the Chinese potters the preparation of the clay is always in a state of progress. The *pe-tunt-se* and the Kaolin are accurately mixed by being kneaded together, and then they are added to the aluminous earth, and sometimes to a powdered stearite, a magnesian limestone, known among us as the soap-rock.

This mixture is well trodden in tanks, and allowed to remain in them for a very long period,—the value of the clay being supposed to increase with its age. Ten and twenty years often elapse between the period of filling a pit and employing the clay, and not unfrequently a Chinese potter uses the clay which was prepared by his grandfather.

A peculiar kind of Chinese porcelain, the *hoaché* China, contains an excess of the stearite; it is of exceedingly fine grain; but is brittle, exceedingly light, and is only burnt by employing much care and giving constant attention to the process of firing. The Persian china of Shiraz is frequently imported into Europe as the Chinese, which, indeed, it very much resembles in its general character.

Many centuries before the birth of Christ the name of *Porcelain* was common among the Chinese; hence, the statement that it was derived from the Portuguese term *porcellana* as applied to the porcelain shell, can scarcely be considered as correct. The earliest European imitation of Oriental pottery appears to have

been in 1695, in France, when the *tender porcelain*, or the ironstone china was introduced. The composition of this tender porcelain as made at Sèvres, was saltpetre, sea-salt, burnt alum, soda, gypsum, and sand. No clay entered into the composition; and it can be regarded as little other than a glass, since, if sufficiently fired, complete vitrification would ensue. From the difficulty of working a mass of this composition, mixtures of soap and glue, and of gum tragacanth, were employed to give the required amount of plasticity to it. From the tendency of the mass to vitrify, and its liability to bend, or melt down, the process of burning was an exceedingly tedious one, and the article had to be supported in every possible way. After the first firing, which was very cautiously applied, and which lasted from seventy to a hundred hours, the glaze, consisting of sand, quartz, litharge, soda, and potash, was applied. This glaze was indeed a crystal glass, and hence it gave to a very imperfect body a high degree of transparency. The process was a costly one, and has, since the introduction of Botticher's process of manufacturing true porcelain, been entirely abandoned on the Continent. In England however, a *tender porcelain* is still manufactured, owing to the difficulty of procuring a material which shall answer the purpose of making durable *Seggars*, or clay cases in which the porcelain is baked. From the importance of the seggar to the porcelain manufacturer, it deserves a brief description in this place. They are cases or boxes made of plastic clay, crushed quartz-sand, and the ground fragments of destroyed seggars, which are generally in the shape of shallow cylinders; various modifications have been from time to time introduced by the manufacturer, the objects being economy of space, firmness of support, and the regular distribution of heat to the enclosed pieces of porcelain. Owing to the different qualities of clay, as found in separate localities, the duration of the seggar varies within very wide limits. At Sèvres, the seggar will stand fifteen or twenty firings, while at Berlin they seldom endure more than two or three, and often are destroyed in the first firing. At Meissen more than twenty per cent. of the seggars are lost in the first fire.

The tender porcelain of England is however, of a very different character from the Continental variety just described. It is in fact a clay ware, being composed of plastic clay, Cornish china clay, and decomposed granite; to which is added burnt bones, flints, and stearite, which contains:—

Magnesia	44 grains.
Silica	44 "
Alumina	2 "
Iron	7 "
Manganese	1 "
Chromium	1 "

and also some lime and alkalis, with traces of chlorine.

This body is glazed with a mixture of decomposed granite, chalk, ground flint, and borax. From some analyses of English soft china, made by Mr. Cowper, its composition is proved to be as follows:—

Silica	39.68
Alumina	21.48
Lime	10.06
Phosphate of Lime	26.44
Alkaline Matter	2.14

Bones are imported largely from America in addition to the supply derived from our own cattle. They are first boiled to extract all the gelatinous matter they contain, and then heated to redness so as to destroy all organic compounds, so that the resulting bone-ash is a pure white substance, composed of phosphate of lime, carbonate of lime, and some magnesia.

True porcelain is composed of an infusible china clay and a fusible flux. The body formed by the Kaolin, or china clay, alone, would be found to be an exceedingly porous one; but the flux, which is composed of felspar, quartz, and gypsum, is melted in the heat of the porcelain furnace, and completely filling all the pores of the clay, binds the whole into a firm mass. Microscopic examination shows that porcelain consists—regarding its physical characteristics

only—of small opaque particles, arranging themselves in linear directions, while the transparent flux has interfused itself through the whole mass. The following are the proportions in which some of the true porcelains are made:—

SEVRES.	
Kaolin (china clay)	48 parts.
Sand separated in the process of washing the clay	48 "
Chalk	4 "

BERLIN.	
Kaolin	76 parts.
Felspar	24 "

VIENNA.	
Kaolin	72 "
Felspar	12 "
Quartz	12 "
Gypsum	4 "

Having already described the natural mode of occurrence of the clay, we need not again return to the subject.

The pottery thus made is glazed with the decomposed china stone, or pure felspar mixed with a little gypsum.

All the materials employed in the manufacture of porcelain must be reduced to a state of very fine powder; and it is, indeed, essential that the finely comminuted particles should be as nearly as possible of the same size. As the china clay is already prepared at the works by washing, nature having effected the required decomposition and disintegration, this material does not usually require much additional attention from the potter. It is found, however, that the fine particles of mica which are mixed with the clay in the clay-pits, and which are removed but with great difficulty, are a source of much inconvenience in many specimens of china clay. By mixing the clay with water, and passing the mixture through sieves, much of the mica may be separated, but still a considerable portion passes through with the pure Kaolin. From experiments which we have tried, we are disposed to suggest a close imitation of a natural operation, by which substances, differing but very slightly from each other in specific gravity, are separated and deposited in different beds. When substances of nearly the same density are deposited in *still water*, they fall together, owing to the operation of the attraction of cohesion, or that peculiar attractive force which resides on the surfaces of all bodies, a modified form, without doubt, of gravitation, to which the name of *epiploic force* has been applied. If, however, the water in which these matters are suspended moves slowly down an inclined plane, the force of gravitation becomes more powerful than the mere surface force, and a new arrangement of the parts results. If a mixture of several fine powders, which are not soluble in water, is made, and the whole suspended in water; if this water is allowed to flow in a thin sheet down an incline of but three or four degrees, it will be found that the various matters will be uniformly separated out according to their specific gravities, and deposited at the sides of the inclined plane; arranging themselves in curve lines of considerable regularity, and with a wave-like surface, while the lightest material is carried away with the stream. A method approaching to this is adopted by many of the proprietors of clay-works, but it is seldom effected with that precision and care which is necessary to insure the complete separation of the micaceous particles.

Mills are employed to grind down the felspar, chalk, gypsum, and also the broken porcelain which some potters introduce into their ware. These are formed of two millstones fixed in a wooden box, the lower one being immovable, while the upper one has a rotatory motion. The substances to be reduced to powder are inserted between these stones, and by their attrition they are brought to the required condition. Previously, however, to the introduction of the materials to the mill, by the action of crushing or stamping machinery, these substances are reduced to a uniform size.

When all the materials are of the required degree of fineness, they have to be mixed together. Could they be united in weighed quantities in a dry state, the utmost degree of

accuracy could be obtained. In practice, however, this is not found to be an easy matter, and, consequently, the ingredients are united, suspended in water, or in the state of "slip" as it is technically called.

Having made the required "slip," the mode adopted to insure as close an approach to correctness as possible, is to take a measured quantity of the liquid mass, and by evaporating to dryness, ascertain the quantity of solid matter each gallon of it contains. This does not, however, insure the manufacturer the production of the exact mixture he requires, owing to several circumstances which operate to prevent the uniformity of these liquid mixtures.

It is the practice in all the principal manufactories to deduce the best mass from the analysis of porcelain of known good quality. Upon this point, however, in many minds much misconception prevails even in the present day, when chemical science is so widely cultivated. We have heard it declared that it would be impossible to tell the ingredients employed or the proportions in which they were mixed before firing, after they had been submitted to that final operation. This is a mistake; all the ingredients employed by the potter are of the most permanent kind, and the only substance which is dissipated during the process is water. Therefore by a careful analysis it is easy to determine with great exactness the materials which have been employed, and proportions in which they have been used. The standard analysis at Sevres is:—

Silica	58 grains.
Alumina	35 "
Lime	5 "
Potash	2 "
	100 "

To maintain this standard, constant analyses are required of the different substances employed, and in the Continental establishments such analyses are very regularly made. In our potteries this is not generally the case; and hence the inferiority of our superior porcelain to that of Sevres, Dresden, or Meissen and Vienna. Such attention is not required for the production of the ordinary ware, but it is absolutely necessary if we would insure the uniform production of a higher class manufacture. We have seen some specimens of true porcelain, recently produced in Staffordshire, which approaches very nearly to the perfection of the Berlin China. In appearance nothing can be finer; but we are informed that it does not stand extreme changes of temperature, in the manner which renders the Berlin China vessels so valuable to the analytical chemist. A little attention will, however, we have no doubt, lead to its improvement; and we hope, among other things, that the Industrial Exhibition of 1851, will contain specimens of our own manufacture, which may, in every respect, compete with the productions of our Continental brethren.

In the article on earthenware, the process of reducing the "slip" to that consistence which is necessary for moulding has been described. The same method has been adopted for porcelain. Some, however, employ the process of absorption by pouring the slip upon plates of gypsum—others use presses—the thick mixture being placed in horse-hair bags; and, in a few manufactories, filtration aided by atmospheric pressure has been adopted. The manipulatory details which connect themselves with the formation of the article from the plastic mass, do not enter into the design of these articles. The glaze for porcelain is composed of Cornish China stone, to which is often added some plaster of Paris and broken porcelain. The mean composition of the best glaze, given by analysis, being:—

Silica	73 grains
Alumina	18 "
Potash	9 "

This forms in fact a true glass which flows into all the pores of the body.

Much depends upon the fusibility of the glaze; if too difficult of fusion, it flows unequally and an uneven surface is the result; if too easy of fusion, it is absorbed by the paste before this is sufficiently burnt, and the resulting surface is rough.

The clay body is once burnt, in which state it is termed *biscuit*. It is now porous and absorbent. The liquid glaze being prepared, the articles in the state of *biscuit* are dipped into it, and the water being absorbed by the body, the solid materials remain on the surface. Many niceties of manipulation are demanded in the process of dipping the biscuit ware, the object being to insure uniformity and purity of colour. The glaze being dry the vessels are submitted to the intense heat of the second firing in the glazing-kiln, from which it should come forth of a milk white, the glaze and mass intimately combined, and hence an entire absence of porosity; and it should be sufficiently hard to resist the knife, and it should endure very sudden changes of temperature without cracking.

ROBERT HUNT.

THE VERNON GALLERY.

THE ENTHUSIAST.

T. Lane, Painter. H. Beckwith, Engraver.
Size of the Picture, 1 ft. 10½ in. by 1 ft. 4½ in.

THERE is little to record concerning the painter of this humorous picture, except the melancholy circumstance of his death. He was killed, about twenty years ago, by accidentally falling through the skylight of a large Repository in Gray's Inn Road, for the sale of horses and carriages, whither he had gone, it is believed, for the purpose of making some sketches.

Lane was a young man when thus suddenly deprived of life; but he had already painted some pictures, similar in character to "The Enthusiast," which gained for him considerable popularity; and had his career been prolonged, there is no doubt he would have attained great eminence in his peculiar style. He exhibited at the Royal Academy, in 1827, "The Christmas Present, or Disappointment;" and, in 1828, "Disturbed by the Night-Mare;" both of them works most humorously conceived, yet without vulgarity, and excellently painted.

His picture of "The Enthusiast" was engraved some years back, we believe before it came into Mr. Vernon's possession; it consequently has become well-known, particularly among the followers of the "gentle craft," as showing "to what complexion *they may come at last*." What a capital satire is it upon some veteran brother of the angle, whom age, and its frequent attendant, the gout, have forbidden to wander by sedgy streams and willow banks! And yet how enthusiastically he pursues his pastime—how anxiously he is watching for "a bite"—how he has gathered around him all the means and appliances for alluring his prey; the boxes of worms and gentles, the enticing balls of savoury meats, and every thing else which an experienced angler knows to be essential to success! And all these are placed side by side with the draughts, and the pill-box, and the cup of grog, which his own ailments require, as if the enjoyments of health and the miseries of sickness could be united in the same chamber. Nevertheless we doubt not that "The Enthusiast" is very happy in being able, even in this mimic fashion, to recall to recollection the pleasures of days gone by.

This picture is painted with a finish and delicacy almost equal to the Dutch school.

PICTURE SALES OF THE MONTH.

It is rarely our duty to record a sale of pictures at this time of the year; but the disposal of some eighty, by Messrs. Foster & Son, at 9, Great Stanhope Street, claims a short notice, inasmuch as among the number, to most of which great names were appended, there were a few good specimens that sold at good prices. 'An Italian Lake Scene,' by R. Wilson, was bought for 68 gs.; a fine 'Landscape,' by Both, about four feet by three, was bought by Mr. Capron for 235 gs.; 'A View of Koenigsstein, on the Elbe, by the younger Canaletti, 95 gs.; a small Ruysdael, 'Landscape and Buildings,' of excellent quality, 265 gs.; 'A Barge lying at Anchor under an old Roman Bridge,' Berghem, 95 gs., sold to Mr. Norton; 'A Landscape,' by Cuyt, to Mr. Russell for 105 gs.; 'The Dutch Fleet, in a light breeze, off the Texel,' a small picture by W. Vanderweide, a rare specimen of the master, was sold to Mr. Alderson for 510 gs.; and an upright 'Landscape,' about three feet by five feet nine inches, by Berghem, one of his most brilliant pictures, was sold to Mr. Bousfield for 700 gs.

John Watson Gordon

SIR JOHN WATSON GORDON is descended from the Watsons of Overmans, in Berwickshire, a respectable family in that county, at one time in possession of extensive property; and it is from the same family that the late George Watson Taylor, Esq., had his origin. He was born at Edinburgh, and received his education in that city and neighbourhood. His father was an officer in the Navy, and died a Post-Captain. In his early years he served as midshipman under Admiral Digby, and was in Keppel's action; he was also under the same commander at the relief of Gibraltar.

Mr. Watson, in the year 1797, held the rank of lieutenant, and when the great mutiny broke out at the *Nere*, he was involved in its consequences. In the year 1800 he commanded and suffered shipwreck on board the *Staffin*, gun vessel off Yarmouth, when, during the night, several of the crew perished from cold, and it was with the greatest difficulty that any of the survivors were saved.

Through his father's family, Sir John was related to Sir Walter Scott, his grandmother being cousin-german to Sir Walter's mother. By his own mother, he numbers among his ancestors the names of Principal Robertson, the historian; Falconer, the unfortunate author of the "Shipwreck;" and Alexander Henderson, one of the Scottish Reformers.

It does not appear that Sir John Watson Gordon showed any predilection whatever for the study of the learned languages during the usual attendance at school; but this was not in those days considered a matter of great importance, as he was intended for the army. The study of geography and mathematics in all its branches suited much better his turn of mind, and in those branches of education he proceeded with particular pleasure.

During the early part of his career, nothing appears to have occurred worthy of any particular notice, unless it is the circumstance of his having acquired the power of writing without

any instruction, except what he was able to pick up by his own observation; and it may not be out of place here to describe the process by which this was achieved. While a mere child, and scarcely able to read, he happened to be walking with his younger brother and sister in company with the servant; he noticed a word written with white chalk on a deer, which the servant informed him was his own name; the fancy immediately occurred that it would be quite possible for him to imitate the same. Accordingly, on returning home, he immediately furnished himself with a piece of chalk, and commenced operations; and the object was seen attained, but not, before every door and passage in the house bore marks of the first lesson of his new undertaking. This step having been obtained, his surname was the next object which occupied his attention, and this was got over by somebody having written the name for him; as soon as this was accomplished, there came the place of residence; sentences followed, and when the period arrived for sending boys of his age to the writing-master, it was found quite unnecessary, as he then wrote a very fair hand.

After having got over the usual branches of education, it was intended by his friends to make application for a cadetship in the Military Academy at Woolwich; but as he was too young by several months, it was decided that application should be made for admission to the Trustees Academy, which was obtained and most gladly accepted. The Academy belonging to the Board of Trustees for the Encouragement of Manufacture at this time was under the able direction of the late Mr. John Graham; amongst the most distinguished of whose pupils on his commencement of the duties of that office was the late Sir William Allan, to whom succeeded Sir David Wilkie, whose talents and determined application rendered him a particular favourite with his master, and who bestowed on him the greatest attention. Mr. John Burnet, the celebrated engraver, was also a pupil at the same time,

and several others. It was about this period, when Sir David had finished his studies, and before he commenced his "Village Peleicians," that our youth found himself unexpectedly in a situation most congenial with every feeling of his nature; and is it to be wondered at that he very soon made up his mind to devote himself to that profession which has been his delight?

During four years he continued his studies under Mr. Graham, and has good reason to remember with gratitude the kindness and attention of his master, who never failed to impart with consideration and liberality, that instruction in the Art which he was so well qualified to inculcate. Being of rather an enthusiastic turn of mind, after leaving the academy, he had certain ideas of his own, and nothing would suit his ambitious reveries but historical and fancy painting; under this impression he laboured hard for a considerable time, but found it necessary at length to turn his attention to portrait painting. The time, however, spent in the prosecution of such studies contributed in a very great degree in leading the way to that professional distinction he has now reached through a long course of attention and study; for it is quite certain, that whatever talents he might have originally possessed, he owes more to an indomitable perseverance and determination of character, which seems inherent in his nature, than to any other qualification whatever; at the same time it is not unworthy of notice that the history of all his acquisitions partakes very much of the feeling that enabled him to acquire the art of writing.

Although he has long since bid adieu to compositions of a poetical or fancy character, yet the visions of the past still haunt his imagination; and it seldom happens that he is entirely without a subject of this description occupying his fancy, but from want of leisure it never appears on canvas.

During the whole progress of the Academy, from the first effort toward its formation in 1808, when several of the profession joined and made the experiment, which met with a very satisfactory reception on all sides, John Watson Gordon has been intimately connected with his brethren in their exertions to forward the grand object of their ambition, and has, as far as lay in his power, contributed to every Exhibition that has been got up during that period; and on the decease of their late lamented President, Sir William Allan, he was unanimously elected to succeed him in the chair of the Academy, and, in consequence, has since received the honour of Limner to the Queen for Scotland, an ancient office in the gift of the monarchs.

To give any description of the portraits he has painted since his commencement does not appear necessary. It will be sufficient to notice some of the most noted, being principally of a public nature. In the Archers' Hall at Edinburgh there are two full-length portraits—one of "The late General the Right Hon. John, Earl of Hopetoun, their Captain-General on King George IVth's Visit to Scotland;" and another of "The late Earl of Dalhousie as Captain-General, on receiving their Standards, presented by His Majesty King William, as body-guard in Scotland to the Sovereign." Of this royal company he has long had the honour of being a member. There is a full-length portrait of "The Right Hon. Charles Hepe, the late Lord Justice General," painted for the Faculty of Writers to the Signet, and is now placed in their chambers. He has also painted two distinct portraits of the present "Lord Justice General the Right Hon. David Boyle," one for the Faculty of Advocates, and the other for the Writers to the Signet. He has also executed a great many others; but it appears quite unnecessary to go over a mere list of names; and in concluding this part of the narration, it is sufficient to allude to the circumstance of his having contributed a number of his works to the Annual Exhibitions of the Royal Academy of London, of which he has long had the honour of being an Associate. And as allusion has been made to his works of a poetical nature, we may add that very few have been produced of late years, and those few almost entirely confined to the gambols and frolics of children.

PASSAGES FROM THE POETS.

Drawn by W. Harey.

Engraved by G. Dalziel.

IL PENSEROSO.

"Hence! vain deluding Joys,
The brood of folly without father bred;
How little you bested
Or fill the fixed mind with all your toys!

But hail! thou Goddess, sage and holy,
Hail! Divinest Melancholy!"

THE CASTLE GARDEN.

"Towers and battlements he sees
Boson'd high in tufted trees,
Where, perhaps, some beauty lies,
The cynosure of neighb'ring eyes."

MILTON.

John Hogan

In the *Dublin University Magazine* for January of the present year, appears an interesting biography of this accomplished Irish sculptor, from which we gather the following facts relative to his personal and professional history.

John Hogan was born at Tallow, in the county of Waterford, in the month of October, 1800; his father was a builder, and there is a nice little bit of romance connected with his marriage with the mother of John, which our limits will not permit us to transcribe. The family, soon after the birth of the third child and eldest son, the subject of this notice, removed to Cork; but the boy, at a proper age, was sent back to school at Tallow, where he remained till he was fourteen. He was then placed in the office of a solicitor of large practice, in Cork; but "every moment that could be stolen from the day's dull work was occupied in sketching, chiefly architectural fancies," and whatever else came within his reach. The thralldom of the writing desk was, at the termination of two years, superseded by more congenial employment; Mr. (now Sir Thomas) Deane, the eminent architect and contractor, having had an opportunity of testing the talents of young Hogan, received him into his office, with the purpose of educating him for the profession of an architect. "Once enlisted, his industry was indefatigable; there was nothing too laborious or too delicate from which he restrained his hands. Into the mystery of every detail of the craft he penetrated with enthusiasm. He sketched, modelled in clay, and, in short, was ever ready and ever eager to be usefully employed. After some months' duration, Mr. Deane, who was perfectly capable of appreciating his unwearied strivings after self-improvement, and whose liberal nature loved to encourage modest deserving, supplied him with his first set of chisels, and at last, in his nineteenth year, Hogan was wedded to the vocation of his destiny, and became—a Sculptor."

Until about the year 1822, Hogan remained with Sir Thomas Deane, for whom he executed numerous carvings; attending diligently during this period the rooms of the Cork Society of Arts, for the purpose of studying the fine collection of casts from the antique, presented by the then pope of Rome to the Prince Regent, at the close of the war, and which had been transferred to the above society. In the year just referred to he executed on his own account about forty figures of saints, in wood, for Dr. Murphy, Roman

Catholic Bishop of Cork; each of these figures stands about three feet and a half in height, and form the principal ornaments of the north chapel. In 1823, through the liberality of the late Lord de Tabley, the Royal Irish Institution, and the Dublin Society, he was enabled to visit Rome, where, after the lapse of a year, passed in studying the great works in the Imperial City, he produced his first sculpture in marble,—*The Shepherd Boy*," originally intended as a present to Sir Thomas Deane, but circumstances compelled him to part with it to the late Lord Powerscourt, who estimated it so highly as to give it a place in his gallery, by the side of a "Cupid," by Thorwaldsen. His next work was an "Eve," after her expulsion from Paradise, encountering a dead dove; a beautiful and expressive production, executed for Lord De Tabley, and now in the family mansion in Cheshire. "The Drunken Faun" followed.

Hogan's first visit to his native land, and the earliest exhibition of any of his works there, was in 1829, when his *'Dead Christ'*, a life-size figure in relief, was exhibited in College Street. It is under the high altar of the Roman Catholic Chapel, in Clarendon Street, Dublin. Subsequently followed his *'Monument to Dr. Doyle'*; the statues of *'T. Drummond'*, *'Bishop Brinkley'*, *'Hibernia'*, *'W. Crawford'*, *'Daniel O'Connell'*; a beautiful monument to a daughter of Curran, in the Church of St. Isidore, at Rome; an altar-relievo of the *'Deposition from the Cross'*, in the Convent of Rathfarnham; and that of the *'Nativity'*, in Dalkey; a *'Monument to the memory of Dr. Collins, Catholic Bishop of Cloyne'*, at Skibbereen; one to that of *'Bishop Brinkley'*, at Cloyne; and another to *'W. Beamish'*, of Beaumont, in Blackrock Church, near Cork."

Our space precludes us from entering upon a detailed criticism of the respective works of this artist; it is sufficient to state that they vindicate the genius we claim for our united country. In the case of Hogan it is both original and powerful; less delicate in its perceptions, perhaps, than in some of his cotemporaries, but not a whit behind the best in its intellectual vigour and depth of thought.

Although at present residing, with his family, in Ireland, he still retains his studio at Rome. He is at present engaged on a large altar-relievo to the memory of the late Peter Purcell; and has also commenced a statue of the late Dr. Macnamara, elected Titular Bishop of Cloyne.

THE NATIONAL GALLERY.

The Select Committee appointed to consider the present accommodation afforded by the National Gallery, and the best mode of preserving and exhibiting to the public the works of Art given to the nation, or purchased by Parliamentary grants, have reported as follows:—

It appears to us that the building itself contains no element of danger to the pictures; the walls seem to be perfectly dry, and the boarding upon them is well calculated to prevent any transmission of damp to the pictures. Without pronouncing an opinion as to whether the system of warming is perfect and complete, we do not think there is any such imperfection in the mode of regulating the temperature of the rooms as to endanger the pictures.

"In considering the position of the National Gallery, our attention was drawn to the vicinity of several large chimneys, particularly that of the baths and washhouses, and that connected with the steam-engine by which the fountains in Trafalgar-square are worked, from which great volumes of smoke are emitted. In the neighbourhood, also, the numerous chimneys of the various club-houses are constantly throwing out a greater body of smoke than those of ordinary private residences; the proximity, likewise, of Hungerford-stairs, and of that part of the Thames to which there is a constant resort of steam-boats, may tend to aggravate this evil; but, on the other hand, it is to be observed that the very large open space in front and at the back of the building must be likely to establish a greater purity of atmosphere than is often attainable in the centre of crowded cities; the gravelly nature of the soil, also, on which the building is placed is a further circumstance in favour of the locality."

The commissioners then proceed to notice that which constitutes, in their opinion, the chief source of danger to the pictures, namely, the injury arising from the dust and impure atmosphere to which they are continually exposed.

Upon this subject they observe, that the central position of the Gallery is attended with some disadvantages unnoticed in all former inquiries. "It appears," they state, "that the Gallery is frequently crowded by large masses of people, consisting not merely of those who come for the purpose of seeing the pictures, but also of persons having obviously for their object the use of the rooms for wholly different purposes; either for shelter in case of bad weather, or as a place in which children of all ages may recreate and play, and not infrequently as one where food and refreshments may conveniently be taken. The evils consequent on these circumstances can be moderated by the care of those who have charge of the Gallery in cases only of extreme abuse. On the days on which the guard, after being changed, returns to St. George's barracks, the numerous crowd of persons, without apparent calling or occupation, who on such occasions follow the military band, are stated to come in large bodies immediately after it has ceased playing, and fill the rooms of the National Gallery."

The average of daily visitors is said to exceed 2000. The dust and impure vapours occasioned by this number of persons, tend not only to cover the pictures with a film of dirt, but to produce, according to the opinion of Mr. Faraday, further injury to the colour of the paintings, which will permanently diminish their value.

With a view to the preservation of the pictures, the commissioners suggest that the pictures of moderate size might be covered with glass, and that means should be taken to preserve the backs of the pictures from the dust and impurities continually deposited upon them.

The committee, having carefully considered the report of the commission, together with the further evidence here collected, feel it to be their duty to offer the following observations to the House:—

"The present National Gallery does not afford space for the accommodation and due exhibition of the pictures belonging to the nation; a considerable addition of space might, however, be obtained by the removal of the Royal Academy from their portion of the building."

The committee do not recommend that any expenditure should be at present incurred for the purpose of increasing the accommodation of a National Gallery upon the existing site; and they cannot positively recommend its removal elsewhere. The document concludes with a belief that a building might be constructed capable of future extension and so well adapted for the safety of the pictures, as to "induce in patriotic and generous men a well founded confidence that pictures presented or bequeathed to the nation will be preserved with every possible care."

ARABS FIGHTING SPAIN.

FROM THE LIBRARY OF THE BERNARDINI FOUNDATION

OBITUARY.

SIR WILLIAM PILKINGTON, BART.

THE name of this worthy Baronet, an amateur painter of more than ordinary ability, and an enthusiastic lover of the Fine Arts, is entitled to a place in our Obituary list. He died on the 30th of September, at his seat, Chevot Hall, near Wakefield, Yorkshire, at the advanced age of seventy-five.

The name of Pilkington is well-known among those who have studied the biographies of artists; but the subject of the present notice, we believe, claimed no relationship with the author of the "Dictionary of Painters." Sir William was one of the most accomplished and persevering amateurs of our day; and, until his last illness, he devoted a certain portion of his time to his favourite pursuit. He chiefly excelled in landscapes, forming his style in a great measure upon that of Richard Wilson. His pictures exhibit breadth and truthfulness of effect, combined with depth and transparency of colouring. One of his latest works was a large view of the Chapel on the bridge at Wakefield, erected by Edward IV., in commemoration of the engagement fought between the rival houses of York and Lancaster in 1460. This exquisite specimen of the architecture of that period was ruthlessly swept away, on the plea of restoration, from its original site; but was subsequently rescued from destruction by the interference and liberality of the Hon. C. Norton, who has re-erected the same, with great judgment, on the bosom of a lake in the grounds of his seat at Kettlethorpe, Yorkshire.

Architecture, as well as painting, engaged much of the late Baronet's attention. The design of Butterton Hall, Staffordshire, will remain an enduring monument of the elegance of his taste and the soundness of his judgment. As a scholar, he was "a ripe and good one;" he studied the Scriptures in their vernacular tongue, and also published a translation of Schiller's "Marie Stuart." Sir William had travelled much, with an observant eye and with most persevering research into all matters connected with the arts he loved. Those who were intimately acquainted with him will never forget his varied information, his intimate knowledge of the progress of Art during the last half century, and his happy elucidation of it by references to his own original sketches and his illustrated library of rare productions. He possessed a few valuable pictures by the old masters, and some by R. Wilson, Morland, and Thompson; but he disclaimed altogether the idea of being considered a collector. Of Turner's drawings, however, he had a portfolio of unusual excellence, of the best period of this great artist. The series embraces views in Italy, Switzerland, and Great Britain.

Sir William rather avoided the great world, as it is termed; in fact, the daily and affectionate intercourse he held with his large family, together with the occupation of much of his time as a practical agriculturist, and a laborious amateur, left him but little opportunity, even had he been so inclined, for participating in the pursuits of fashion. His character was that of a polished, unobtrusive gentleman—one of the old school—whose heart was in its right place, and who worthily responded to all claims upon his relative and social position.

CHARLES SCHORN.

The *Augsburgh Gazette* announces the death of this distinguished painter of the German School, on the 7th of October, at the age of forty-seven years.

Schorn was born at Disseldorf, in 1803; he studied first under Cornelius at Munich, and subsequently under Gros and Ingres, at Paris. Returning again to Munich, he once more entered the studio of Cornelius to assist in the execution of some of the great works upon which the latter was then engaged. At an early period Schorn was occupied in the atelier of Wach, in the same city. Yet through these various examples before him, he must ever be regarded as an independent artist, one who entirely followed no master, and belonged to no particular school; his imagination was discursive, and his talent for invention ready and fertile. His works generally are not what may be strictly termed historical, they belong rather to the genre kind; as, for instance, "Monks and Soldiers carousing at a Tavern," "A Group of Partisans," exhibiting a Roundhead minister and a party of Cromwell's soldiers discussing religious matters in an open wood. Raczynski, in his *L'Art Moderne en Allemagne* has given two engravings of Schorn's works, perhaps the best he had executed up to the period of the publication of those volumes, 1841,—these are a large picture of "Paul III., contemplating the Portrait of Luther," painted

for the Consul Wagueur, at Berlin, whose collection we noticed last month; a fine composition, full of dignified character. The other, "Salvator Rosa among the Brigands," a wood-scene, with the figures grouped in the most picturesque and abandon manner, the great Italian painter himself in the midst of them sketching the leader, who sits upon the boll of a huge tree with his arm thrown over the shoulders of the queen of the outlaws.

From the Royal Glass and Porcelain Manufactory at Munich issued between the years 1828 and 1832, several splendid painted windows for the cathedral at Ratisbon; Schorn furnished cartoons for one of them, "The Conversion of Slaves by St. Beno."

Professor Schorn was employed by the King of Bavaria in the formation of the Munich Gallery, perhaps the most famous, considering its size, in Europe. In order to collect pictures to be placed therein, he visited almost of the Continental cities, and also our own country, where he purchased Wilkie's "Reading the Will," for the royal gallery.

ART IN THE PROVINCES.

NOTTINGHAM.—Mr. Hammersley, lately head master of the School of Design in this town, but now filling the same post at Manchester, recently delivered an address to a numerous auditory here, on the results of a short continental trip he had made, for the purpose of ascertaining what was doing, in the places visited, for the forthcoming great Exhibition. As the ground travelled over by this gentleman is the same as that over which we have already gone, or purpose to go, we shall abstain from following him on his journey to the manufacturers, and from noting what he saw of their preparations—at Ostend, Brussels, and Lyons: in all which places both masters and men are heartily and energetically working together. Mr. Hammersley's knowledge and experience sufficiently qualify him to conduct such an inquiry, and there is no doubt the facts he laid before his hearers will prove of material advantage to them.

GLASGOW.—The annual exhibition of the "West of Scotland Academy;" was opened late in October, with a display of more uniform excellence in the contributions than preceding years had seen. There may formerly have been individual pictures of higher merit and of more general interest; but, as a whole, the exhibition is of a better order than usual; and decided improvement is manifested in the works of the younger contributors. We have not as yet learned the name of the successful competitor for the 50*l.* prize offered by the committee of the Art-Union of Glasgow. The leading pictures in the rooms are two of Raeburn's characteristic portraits; a "Landscape," by Turner, R.A.; a "Scene in Venice," by the late W. Müller; E. M. Ward's, A.R.A.; James receiving the News of the Landing of the Prince of Orange; T. J. Barker's "Edinburgh—News of Battle after Plaiding;" Jones and the Disciples at Emmaus, by R. S. Lauder, R.S.A.; two "Views in the Highlands," by H. McCulloch, R.S.A.; four "Forest Studies," by Henshaw; two pictures by Boddington, in his well-known pleasant style; two figure subjects by T. Clater; four by C. Lucey; and one by M. Innes. The local artists are represented chiefly, by J. G. Gilbert, who has sent two small works, rich in colour; by Macnee and C. Randolph, in portraits; by J. M. Donald, who contributes "Fingling Glen Campsie," and by A. D. Robertson's "Balhousie Dell, near Perth;" T. Knott exhibits several portraits, and a scene from "Indian Life in the Wilderness," and D. Munroe, "The Week's Wage," and "The Wife's Appeal," two subjects from Lowland Scottish life.

In the water-colour department appear the names of Copley Fielding, Richardson, A. Penley, S. Bough, and others. In sculpture, are P. Farley's "Bust of the late Lord Jeffrey," a head of "Cupid," and "Early Sorrow," by McDowell; a bas-relief, "The Finding of Moses," by J. Mossman, of Glasgow; and a group from Motherwell's "Jeanie Morrison," by G. Mossman. Here, as in most other places, there are loud complaints against the "Hanging Committee," and one angry contributor, finding his picture occupied a position he deemed unworthy of it, wreaked his revenge upon the committee, and on *hansell*, by actually "daubing it over with untempered mortar," or some other matter, so as to render it invisible.

BOLTON.—The Local Committee of the Bolton Operative Fund, with reference to the Exposition of 1851, anxious to encourage and develop the talents of designers for the figured textile fabrics

* We understand his address is about to be published as a pamphlet, and may have occasion to refer to it at greater length.

manufactured in this town and neighbourhood, have resolved to offer money prizes for the best designs in several branches of manufacture.

The same Committee, with the laudable view of showing to their workmen how and by what means a visit may be paid to the metropolis during the exhibition, have caused a number of circulars to be printed and distributed among them, in which are stated the probable expenses incurred by such a journey, numerous advantages which the trip may afford, and how each man by saving a certain sum weekly may accomplish the purpose. The plan is so good that we print it for the benefit of other large manufacturing places to whom it may serve as a model. It is presumed that the visit would be paid in the autumn, about the month of August or September.

"The expense of the journey would probably be:—

	£	s.	d.
For railway fare to London and back	1	0	0
Eight breakfasts, at 9 <i>d.</i> ; eight dinners, at 1 <i>s.</i> ; eight suppers, at 9 <i>d.</i>		1	0
Six beds, at 1 <i>s.</i> 2 <i>d.</i> ; malt liquor or tea, 1 <i>s.</i> per day, 8 <i>s.</i>		0	16
Fees of admission to various exhibitions, with the expense of a trip by steamer up and down the Thames	1	0	0
Extra	0	4	0
	4	0	0

"For these exhibitions and excursions it is calculated that forty-five hours will be required, which leaves about thirty hours out of six working days to see free exhibitions, public buildings, streets, parks, churches, &c. Thus it appears that for a working man's visit to London, eight days time and four pounds in money are required. No doubt the visit may be made for less money and in less time, but not with such a share of comfort, and with such opportunity to examine the objects of curiosity with attention as is here suggested. No extra expense for clothing is recommended. At this Exhibition a cleanly, decent working-man will be most respected in his own character.

"To save 4*l.* from the wages of a year 1*s.* 6*d.* must be set aside for fifty-two weeks, but to allow for accident or illness, it is recommended that 1*s.* 9*d.* per week be the sum saved, commencing on the first Saturday in September. If not commenced until January 4th, the contribution for nine months must be 2*s.* 7*d.*; if delayed for six months, 3*s.* 6*d.* per week; which is more than can be afforded generally by a working-man without injury to himself and family. No time, therefore, should now be lost."

For much of these arrangements the public is indebted to Mr. Gilbert French, of Bolton, the eminent manufacturer of fabrics for churches, who has done so much to combine purity of taste and accuracy of character with excellence of material and workmanship.

THE VERNON GALLERY.

ARABS DIVIDING SPOIL.

Sir W. Allan, R.A., Painter. J. T. Smyth, Engraver. Size of the Picture, 2 ft. 6*½* in. by 1 ft. 8*½* in.

THE late President of the Royal Scottish Academy, the painter of this picture, was a great traveller; sometimes in pursuit of health, but more frequently in search of subjects for his art. Italy, France, Spain, Russia, Belgium, Asia Minor, and the Coast of Barbary, are countries some of which he visited on more than one occasion; his journeys into the East, especially, were productive of some of his best pictures; that here engraved, though small, is not among the least excellent of them.

There is so much that is attractive and picturesque in the garb and habits of these wild sons of Ismael—the robbers of the desert—whose "hand is against every man and every man's hand against them," that they cannot fail to excite the attention of any artist or lover of artistic nature, who possesses sufficient courage to wander across their tracks, or venture into their haunts of desolation.

The nationality of these Arabs has been well preserved in the composition of this work, and the subject is altogether most effectively supported.

We are somewhat at a loss to know whence the light comes which is thrown on the figures whose shadows appear on the rock, for the time is evening, and the last rays of the sunset are seen through the trees in the distance, and are slightly reflected in the brook which flows at the entrance of the cave; the light therefore is at the back of the picture; nevertheless the work is highly luminous and richly coloured. The dark-blue cap and scarlet coat of the nearer figure come out in strong relief against the warm subdued tones of the rock. The other figure is habited in a light green jacket, which, with the white turban, seems to keep its wearer in his proper position between the two other principal objects; almost any other treatment of this figure would have brought it too forward. The draperies and other objects on the ground also show much powerful colouring.

THE CARRIAGE MANUFACTORY
OF MESSRS. HOLMES, OF DERBY.

EVER since Mr. Stephenson's first locomotive engine was tried, on a short colliery railway, near Newcastle, in July, 1814, the minds of all classes of the community have been busily contemplating the good which has resulted, and which may result, from the substitution of mechanical for animal power in our internal communication; and, as the comfortable and independent travelling chariot and cozy stage coach gave way to their more capacious and expeditious rivals on the rails, the interest previously attached to road carriages gradually subsided. In our opinion, however, there is much that is artistic and ingenious in the graceful outline, the elegant interior, and the highly mechanical construction of many of the vehicles still drawn by horses, and it has long been our wish to investigate the various processes by which they are manufactured, and the progress made therein up to the present time, and to put our readers in possession of such information as we might find worthy of their notice. A most favourable opportunity of gratifying this desire was afforded us, a few weeks since, at Derby, where a gentleman volunteered to introduce us to the Messrs. Holmes, proprietors of, perhaps, the most extensive and complete private carriage-manufactory in the kingdom. Of their premises, machinery, various classes of artisans, materials and productions, it is now our intention to give such a description as our limited space will permit. The entrance-yard, which is about 300 feet long, rises gradually from the street, and is neatly paved; the show-rooms and workshops, two stories high, are built round it; the windows are large and numerous, and the walls are painted white, to reflect the light; at the top is a large clock, which can be seen from every workshop, and through the walls in several places project the screwed ends of high-pressure water-pipes, to which may be attached either large hose in case of fire, or small flexible tubes for washing the dirt from carriages without injury to the paint. On each side of the yard is an inclined plane of wood, up which carriages are raised to the higher story of the workshops or show-rooms, by means of cleverly constructed pulleys. After inspecting two or three curious old vehicles, and some large piles of dried timber of various kinds, in one of the lower buildings, we ascended, by a staircase which formed the centre of an incline, to the room above. In it forty or fifty second-hand carriages are arranged for sale; the wall, at one end, is occupied by rolls of floor-cloth, kept to shrink before use; and at the other end, wide folding-doors open into the seasoned timber-store, an extensive, well-ventilated place (aired, in winter, by steam pipes) containing large quantities of heavy planking, and wood artificially bent, over which, in the roof of the building, are broad racks, reaching one hundred and fifty feet in one direction, and fifty or sixty feet in another, full of dry boards. The timber used in carriage building is mahogany, cedar, pine, teak, hickory, lancewood, American birch, ash, and elm, English oak, ash, elm, sycamore, and poplar; and all these in their full growth, cut to various thicknesses according to their uses, weathered in the air, and dried in open sheds, had eventually been deposited here ready for the workmen's use, with what appeared to us, almost unnecessary care. This store is separated from the body-makers' shop by a small room, in which an experienced person is stationed, whose duty it is to select and mark out suitable wood for each piece of work, cut it up with the machine-saws, and deliver it to the respective workmen. Before proceeding further, it is well to observe that, in coach-making, a greater number of different trades, or rather crafts, are combined, than in almost any other business; coach body-makers, carriage-makers,

wheelwrights, wood-turners, joiners, sawyers, smiths, axle-makers, spring-makers, trimmers, brace and harness-makers, panel-painters, carriage-painters, heraldry and ornamental painters, lamp-makers, as well as designers and draughtsmen, in all sixteen classes of artisans, jointly numbering about one hundred and fifty, employed on the premises we are describing: these classes are again subdivided; for instance, the smiths have fitters and hammermen, the carriage-makers, framers and carvers, &c., so that there is an extensive division of labour. We believe, however, that very few coachmakers carry on as many branches of their trade as we have here enumerated; yet the Messrs. Holmes assert (and we think with truth, from the firmly-framed and beautifully-proportioned work we saw in progress) that they possess immense advantages over those ostensible coachmakers who employ piece-masters to build or complete various parts of their carriages; piece-masters being small tradesmen, who carry on one branch of the business only, and have, in many instances, a very limited stock of materials to work upon.

But, to continue our description. The body-makers' shop is a well-lighted room, one hundred and thirty feet long, having substantial workbenches arranged down one side, and numerous large, black drawing-boards, about twelve feet long and nine feet high, down the other; on these boards the full-sized design of a carriage is first drawn in chalk, according to the requirements of the person ordering it; wood patterns are then fitted to the curved lines, and by these patterns much of the carriage is built, the drawing being guide to each artisan throughout. The frame-work of carriage-bodies is always constructed of English ash, of a light nature, put together in a skeleton form; the panels, of Honduras mahogany, are fitted into grooves made in the framing, the floors and footboards of pine and elm are screwed into rabbets, and the roof, if the carriage be close, is covered with light pine boards; a large wet hide of undyed leather, called russet leather, is then placed upon the roof, and down the sides and back of the body as low as the centre; this is moulded, by pressure, exactly to the form of the roof and panels intended to be covered, and when dry is painted and japanned.

About fifteen, or twenty bodies, of various forms, were being built in this room, and the framing of each exhibited much ingenuity and mechanical skill; we were especially pleased with a mode adopted here of securing the edge-plates of iron which strengthen the doorways and sides of bodies, whereby a plate, one-eighth of an inch thick, is rendered as efficient as a plate three-eighths of an

inch thick fixed in the ordinary way; lightness is very much studied, and, each piece of framing, whilst it forms or continues some elegantly curved line, is mechanically combined with the other framing, in such a manner, as to take part of the strain and add to the general strength, without increasing the weight; amongst many very light carriages, we saw a private omnibus, constructed to carry fourteen persons, and which, when quite complete, weighed only ten and a half hundred-weight. Several arrangements in the bodies here building were entirely new to us; a Clarence had the windows balanced by weights, so that they moved with the slightest touch, rested where placed, and required no pulls or holders; a Brougham had part of the roof constructed to open, that persons riding in it might stand up, if so inclined; a Park Phaeton, (See our last cut page 381) had a very cleverly contrived knee-boot, invented by Anthony Strutt, Esq., of Milford, consisting of two light flat frames, paneled on the top and hinged together, to which leather sides were attached; it was self-folding, allowed abundance of room for the knees, was waterproof, and could be closed or opened instantly. A kind of inside car suggested some years since by Robert Arkwright, Esq., of Sutton, (See the second cut page 384) appeared to us to be a very light and comfortable vehicle for country use; it can be built to carry two, four, or six persons, besides the driver. Indeed, each piece of work displayed some points of excellence, either in the construction or appendages, but our space will not permit us to describe more of them. The roof of this building was filled, from end to end, with dry boards; the floors, walls, and windows were remarkably clean, and near the door was a hollow plate, heated by waste steam, in which were several bright copper kettles for making glue, paste, and anti-attribution; attached to this were valves, for turning the waste steam, when required, through pipes, which warm a large portion of the manufactory. We now descended to the carriage-makers' shop, a room very like the one just described, but situated on the ground-floor. The frame-work of a carriage (which coachmakers understand to mean all that framing below the body designed to connect the springs, axles, body, pole or shafts, according to the construction of the vehicle,) is of stout-natured ash, firmly framed together, gracefully swept, and, when duly plated with iron, is always neatly, and sometimes elaborately carved: the "lock" (that part of a carriage which regulates its facility of turning) requires to be very judiciously arranged, and, since low vehicles have become fashionable,

much attention has been paid to it, with the view of making short carriages, having bodies near the ground and high front wheels, turn well, in narrow streets. Several plans for attaining this desirable result were shown to us; one, invented by Messrs. Holmes, was particularly simple and effective; and another, first introduced by them into England, and patented by Mr. Buchanan, of Glasgow, was very ingenious. It has two bolts, or pivots, which slide in grooves in the lower forecarriage, causing the wheels to turn well under the front seat, without approaching much nearer the body; the outline on next page will convey an idea of it. Nearly seven years since the proprietors of this establishment determined to erect a steam-engine, feeling satisfied that the labours of the skilled artisans they employ might be materially lightened, and their work, in many instances, finished with greater accuracy and expedition by the assistance of machinery; fashion, however, so frequently changes the outline of carriages, that their first object was to decide upon which parts it could be most advantageously employed, and their next, to contrive suitable machines;—the success which has attended their various projects will appear as we proceed. The steam-engine, a very compact, high-pressure one, of fifteen horse power, is in excellent order, and the room it stands in particularly clean; attached to it is a powerful pump, which supplies the whole premises with water, and is capable of raising 300 gallons per minute. The boiler-house is below, and adjoining it are the coal-cells, also a depository for the bark of trees, refuse pieces of wood, shavings and sawdust, which serve, in some degree, to economise the fuel required by the boiler-fire.—The joiners' shop is light and well arranged, and their work is much facilitated by circular saws. The wheelwrights' shop is capacious, and contains eight work-benches, with a corresponding number of pits, or excavations in the floor, wherein wheels revolve as they are framed. A carriage-wheel ought to be fitted together with great truth; it should be firm and solid in its joints, though slightly elastic from its conical form, and strong from the combination of its parts, though light in weight and appearance; the nave, or centre, should be of elm, the spokes, or radiating bars, of cleft oak-sapling; the felloes, or segments forming the rim, of tough ash, and the hoop, or tyre, of iron. Passing on to the machine-shop, our attention was first directed to a circular saw-table, having two apparatuses, one for cutting tenons, and the other for squaring the ends of felloes, and regulating their length according to the circumference of the wheels for which they are intended—the gauges of both are very nicely contrived. A large circular saw-table, used for general purposes, has also a sliding gauge, with spindle attached to it, on which naves, and other round pieces of wood, can be prepared for the lathe, in a true and an expeditious manner. A narrow upright saw, for cutting curved timber, works very smoothly, and has a clever simple guide to it, also a blast-pipe for freeing the chalk, or pencil line, from sawdust, as the timber is pressed forward. The felloe-machine is very ingeniously arranged; two rough pieces of wood are placed in it; the indices are set to similar or differing sizes, as the workman may desire, and two felloes, perfectly true and beautifully curved, are produced in a few minutes. A boring-machine has disk-plates attached to it for dividing felloes for the dowels and spokes, and naves for the spokes, according to the number to be inserted in them. A long powerful lathe has all necessary appurtenances for turning both in wood and iron. The hoisting-engine is so adjusted that it would be difficult to let an axle-hox into a nave otherwise than true with the face of the wheel, and exactly in its centre; this

engine must be a most valuable auxiliary to a coach-maker who desires to make his carriages run lightly and quietly. The heavy shears will sever a bar of iron, two inches square, and they are placed near to a bending machine, which may be gauged to bend any thickness of tire-iron to any diameter of wheel, with great precision; and, what is more essential in securing a

has a water tue-iron, a blast-pipe, a pair of hellsows, a slake-trough, a pair of large vices, and gas-light, and it will hold a day's supply of coke; the tools belonging to each are kept in excellent order, and arranged, with much neatness, in long racks on the walls; the front of the shop is occupied by fitters' benches, which have every necessary appendage, and are well lighted by large glazed windows. No

sound tyre, it compresses the inner surface of the iron and extends the outer one equally throughout. But, perhaps, the most scientific piece of mechanism is the spoke-machine, which will produce from 300 to 500 perfect spokes per day; the arrangements for graduating their sizes are extremely simple, and the spindles by which they are formed revolve at the extraordinary speed of 5000 revolu-

tion per minute! ironwork requires to be so skilfully manufactured as that which appertains to a carriage; it must be light, on account of the power which propels it; strong, to resist the unequal strain it has to bear; soundly wrought, precisely fitted, and gracefully swept.—Spring-making is a nice art, such skill as experience alone can give being requisite to fit and temper spring-plates properly. The second

tions per minute! Grind-stones turning, at various speeds, some for grinding tools, and others for grinding steel and iron-work, a drill, a punching-machine, a tapping and screwing engine, and a large fan for blowing the smiths' fires, are adjuncts to the steam machinery in this shop, and are arranged in the usual way. On entering the first smiths' shop, which is nearly one-hundred-and-forty feet long,

smiths' shop contains two large forges, an oven for heating tires, and a concave cast-iron fitting-plate six feet in diameter, for truing them upon: when a tire is welded up to a proper size, which is something less in its inside measure than the entire circumference of the wood-work of the wheel, it is set true, and put in the oven; the wood-wheel is then screwed down to the fitting-plate before

we were much struck with its light and cheerful appearance; the forges, eight in number, are built along the back; at the side of each is a flagged level, eleven feet square, which is a great assistance to the workman in setting true the axles and tortuous stays of carriages; it also affords him the advantage of having the frames of bodies and carriages near his anvil whilst he plates them. Every hearth

mentioned, the heated tire placed round it, and the plate, wheel, and tire descend into water; when the wheel is released it is found to be tightly bound together; by these means tiring is done with great truth and celerity. After walking through the large and well filled timber-yards and sheds, and the iron and steel stores, we ascended to the harness-makers' lof, where a number of men

were at work, whose operations it is unnecessary to describe. Passing on to the trimmers' lof, we were pleased with the taste displayed by these carriage upholsters, and with the excellent materials they were using; attached to this branch of the business is a power-carding machine, employed for opening the curled-hair stuffing of carriage linings, when under repair, and cleaning it effectually from the moth and dust. The three painting lofts are spacious, and scrupulously clean, and, though the temperature is necessarily high, the atmosphere is rendered peculiarly fresh and wholesome by a fan, which withdraws the impure air, and any particles of dust that may arise, and discharges them above the roof. The revolving trestles, on which bodies are placed to be painted, and the other utensils required in these shops, are appropriate and convenient. Carriage-painting is a tedious and an expensive process. When a carriage-body is finished by the maker, it receives three coats of lead-coloured paint, and five or six coats of filling-up stuff; the panels and mouldings are then rubbed down with pumice-stone and water, until a face is obtained almost as level as polished marble; four coats of oil-colour follow; between the last two all slight indents not previously filled up are stopped with a kind of hard putty, and the surface is again rubbed smooth with pumice-stone; four coats of the finishing colour are then laid on and five coats of copal varnish, (between each of which the body is flatted down with fine pumice dust, flannel and water) complete the operation. The wheels and underworks do not receive so many coats of paint and varnish as the bodies, yet the numerous relief lines now fashionable, require that a great amount of skill and labour should be expended upon them. The heraldry we saw was very beautifully executed, and gave us a high opinion of the ability of the artists employed here. The painters' store room, situated in the centre of the lofts, is under the care of a person whose knowledge of chemistry enables him to judge of the quality of colours, and to mix them in such proportions and combinations as are most likely to prove permanent; his room is thoroughly ventilated by the fan before alluded to, and his labours are considerably lessened by two grinding-mills, driven by steam power. We had almost forgotten that there is, amongst the machines, a small lathe, arranged for making a kind of frost-chisel and stud, which may be screwed into the winter shoes of horses, and changed, (the studs for the chisels, when the roads are icy, and vice versa when they become otherwise) without removing the shoes; the increased safety and comfort afforded to horses by these chisels, if really well made and fitted, will be apparent to every one.

This large manufactory, which occupies nearly two acres of ground, is, of course, supported by a very wide-spread connection; we saw carriages and cases of saddlery, packing for Malta, India, and Australia, whilst others were making for parties here, whose names give weight to works of taste and ingenuity. The Messrs. Holmes have been honoured, too, with warrants appointing them coach-makers in ordinary to Her Majesty the Queen (for whose use at Osborne they are at present building a handsome light Clarence), to His Royal Highness Prince Albert, and to the late lamented Queen Dowager, and we were informed that they had the gratification of building the first travelling carriage for the establishment of His Royal Highness the Prince of Wales. That the Messrs. Holmes are practical coach-makers, thoroughly conversant with every process of carriage construction, is sufficiently shown by the number of branches they carry on, as well as by the extensive patronage they receive; and, that they have considerable mechanical knowledge, is apparent from their varied and clever machinery; but what chiefly interests us, and is decidedly essential to their prosperity, is, their possessing a great amount of taste, they employ it very judiciously in the adornments of their most graceful productions. We obtained permission to copy a state coach designed and drawn by Mr. Arthur Holmes, which we think exhibits a great degree of artistic talent.

During our numerous wanderings in the cause of British Industrial Art we do not recollect having ever enjoyed among us expected, that there was afforded us on the day we inspected these premises, and we cannot refrain from remarking that the highly respectable bearing of the artisans (many of whom had held their situations from thirty to forty years,) the regard which they evinced for their employers, and the pride with which they showed their productions, added many charms to the pleasant hours we spent here, and spoke volumes in praise of the work which should emanate from such willing hands, ably directed, and impelled by but one desire—the attainment of professional eminence. It is always peculiarly gratifying to note such facts as these.

THE WINTER EXHIBITION
OF PICTURES.

On the 18th of last month an exhibition of drawings and sketches was opened in the room of the Society of Painters in Water-Colours, in Pall Mall East, with a view to the establishment of a permanent Winter Exhibition. We have many exhibitions of Art, it is true, but so long as there may be room for anything like *private* speculation in the shape of *public* exhibitions, we have not yet enough; we advert to this institution with infinite satisfaction and in the hope that we may in future hear no more of trading ventures of this kind. Nothing can be more liberal than the terms on which the promoters of the Winter Exhibition meet the profession; their disinterested purpose merits support. The direct object of the Institution is to bring the artist and the patron more immediately together. Rising members of the profession are frequently in a great degree in the hands of speculators, and it is with a view of aid in rescuing them from such a ruinous position that the Institution has been promoted. Many of the works have been sent only for exhibition by their authors,—many are contributed from private collections, one or two from that of Her Majesty,—and others are exhibited for sale. Works are disposed of, not through the medium of the authorities of the gallery, but the purchaser is referred at once to the artist, who receives the value of his picture without any deduction whatever on the part of the Institution. The prices of the works for sale, are, we believe, known at the gallery, but this may have been necessary for the sake of insurance, or it may have been deemed advisable for the purpose of saving the artists unnecessary trouble.

The works exhibited are three hundred and twenty-six in number, and consist of water-colour and oil sketches, all framed and mounted alike; that is, the oil-sketches are partially covered with white pasteboard, giving them the appearance of being mounted in the manner of water-colour works. The frames are all uniform; the pattern being simply a thin border with a small corner ornament. These are supplied by the Institution, and, we believe, the mounts likewise, with a view, it would appear, to the preservation of uniformity. A white mount for a low-toned oil-sketch is a great trial, but there are many oil compositions that seem to have been touched for the nonce, and those pre-eminently light, instantly *souvent aux yeux* of the spectator, while from others the white extracts the colour and reduces their mellow harmonies to flat and faded hues. This will be at once felt by the authors of some of these works; and if such be the determinate form of exhibition, it will be necessary to work with a view to such an ordeal. This observation escapes us, because we see that so much has not been done for this exhibition as its proposition merits; but we trust that next year its value will be fully felt. The contributors are numerous and distinguished, but every work merits an individual notice, but we have space for the titles of a portion only. The idea of a Winter Exhibition is well worthy of support; and the founders of the Institution have displayed spirit and energy, and we trust they will be met by the profession with all the confidence due to their liberality.

J. M. W. TURNER, R.A. 'Junction of the Tees and the Greta,' and two views entitled 'Vesuvius.' These are water-colour drawings, which remind us of the palmy time of the artist. Like all his drawings they are brilliant and elaborately wrought into that atmospheric softness which no other hand can imitate.

DAVID ROBERTS, R.A. 'Study made on the spot of the entrance to the Crypt, Roslin Castle.' From this drawing an oil picture was executed and exhibited a year or two ago. There were two figures in the picture, and the lights were much more forced than the two are here.

THOMAS DWINS, R.A. 'Sketch of a Picture of the Neapolitan Saint Manufactory.' This subject has been recently exhibited as an oil picture; it is very full of highly-finished material.

G. CATTELMOLE. 'The Intercepted Letter.' A composition of numerous figures habited in the costume of the seventeenth century. It has all the usual spirit and originality of the artist's works.

CHARLES LANDSEER, R.A. 'Studies of Old Furniture in the Brown Gallery, Knole.' The objects are principally two arm chairs; the little picture is charming in colour, and remarkable for its harmonious repose. Other subjects by the same artist, are 'Joeline Joliffe whispering his communication to Phoebe Mayflower,' and 'Wildrake's Attack upon Cromwell.'

COPLEY FIELDING. 'View of Den Slarive and Loch Etive, Argyleshire,'—and other sketches of

Scottish scenery, all highly characteristic of the localities.

S. A. HART, R.A. 'The Court-yard of the Bargello, at Florence;' 'Interior—the Church of St. Francesco, at Assisi,' &c. The former of these two drawings is made out with such fidelity that the place is at once recognisable.

T. WENSTER, R.A. 'The First Day of Oysters.' This and 'The Lobber' are both exquisite sketches which were made for the pictures. When we remember the latter, it is interesting to see how far they may have been changed from the original idea.

T. CRESWICK, A.R.A. 'At Tarbert,' and 'At Dalnally,' are two sketches full of the qualities which distinguish the works of the artist.

JOHN JAMES CHALON, R.A. 'At Nortbend, Hampstead,' painted on the spot. An extremely simple subject, but distinguished by the aspect and spirit of nature.

G. LANCE. 'Fruit.' An agroupment of peaches, grapes, &c., less gorgeous in composition than usual, but not less fresh and luxurious.

E. M. WARD, A.R.A. 'Sketch for the Picture of Dr. Johnson perusing the Manuscript of the "Vicar of Wakefield," as the last resource for rescuing Goldsmith from the hands of the Bailiffs.' A highly interesting memorandum (for we presume it has been touched from the picture), of a work which celebrates an affecting incident in the life of one of the most single-hearted of our writers.

J. D. HARDING. 'Villeneuve—Avignon,' 'A Slady Grove.' Both are charming sketches, but the latter, a close sylvan scene, shows especially the masterly feeling which the artist throws into his tree compositions. It has the appearance of having been painted on the spot.

JOHN MARTIN, R.A. 'View in Richmond Park, near Ham Gate.' There is much natural truth in the detail of this sketch, but this might have been preserved with yet more freedom of manner.

A. ELMORE, A.R.A. 'Beatrice' and 'Reflection.' Two small figures, the faces of which are finished with a nicety and brilliancy equal to fine miniatures, and without loss of breadth.

W. P. FRITH, A.R.A. Sketches for the Pictures of an 'Old English Merry-making,' and 'Coming of Age,' &c. In the latter many changes have been worked out in the large picture.

RICHARD REDGRAVE, A.R.A. 'Ophelia.' This is a study of Ophelia in her madness. The head and features are painted in shade and reflected light, and with an expression extremely successful.

J. B. PYNE. 'Teatro Malibran—Venice,' 'The Fortress of Ehrenbreitstein,' and 'the Moselle.' These sketches are distinguished by masterly qualities, which nothing but incessant out door practice can give.

JOHN TENNIEL. 'Alexander's Feast,'—a sketch for a fresco. This composition is full of powerfully dramatic character. The impersonations are classic and poetic, and the drawing throughout is of an accurate and careful character that we rarely see in sketches.

J. C. HOOK, A.R.A. First sketch of a picture of 'Francesco Novello and his Wife taking Refuge in a Thicket from the Emigrants of G-razzo Visconti.' The picture was exhibited, we think, last season; it differs considerably from the sketch, but the latter is full of fine feeling.

W. E. FROST, A.R.A. 'The Daughters of Hesperus,' 'Persens and Andromeda,' &c. These sketches exhibit the predilection of the artist for the figure; the subjects are not new, but they are beautifully dealt with.

F. R. PICKERSGILL, A.R.A. 'The Sirens' and 'Marivel discovered wounded on the Sea-shore.' These are very sparkling compositions, and tell extremely well in the manner of their execution.

There are yet numerous other compositions fully equal in their respective departments with those already instanced, but we have space only for the titles of a few of them.—'A Breton Interior,' E. A. GOODALL; 'Selling Timber,' J. STARK; 'On the Scarborough Coast,' A. PENLEY; 'The Close of Day,' J. J. JENNINGS; 'The Admiration,' W. HUNT; 'At Pyrford—Surrey,' F. W. HULME; 'The Hayfield,' a finished sketch, A. JOHNSON; 'Lassie Knitting,' F. W. TOPHAM; 'Ballad Singers at a Cottage Door,' G. DODGSON; 'At Clovelly—North Devon,' H. JUTSUM; 'Studies from Nature,' G. E. HERING; 'The Old Bridge—Warwick,' 'The Guerrilla Watch,' H. M. ANTHONY; 'The Palace Gardens,' J. D. WINGFIELD; 'Pilot Boat going Out,' E. DENSMAN; 'The Ejected Family,' E. GOODALL; 'View near the Canal, Venice,' JAMES HOLLAND; 'The Leper,' F. STONE; 'Evening,' W. F. WETHERINGTON, R.A., &c., &c.

Thus, it will be seen, this Institution opens its doors for the first time, indorsed by a galaxy of talent who, if they break not their pledged troth, will render this by no means the least attractive exhibition of the year.

GOVERNMENT SCHOOLS OF DESIGN.

In pursuance of a motion made by Mr. Milner Gibson in the House of Commons, on the 6th of August last, for "Reports and documents exhibiting the state and progress of the head and branch Schools of Design during the last twelve months,"—the requisite papers have been prepared and recently published. The information they afford is most circumstantial, and we wish we could add, most satisfactory; but a careful and attentive perusal of these printed documents, with the most earnest wish to put the best and most hopeful construction upon their contents, forbids our doing so. We will analyse them a little, beginning with the question of finances, as being of primary importance; after which we will proceed to that of facts: both, we think, will bear out our opinion.

The total receipts for the year terminating on the 31st of March, 1850, as furnished by Mr. Deverell, the Secretary at the Head School, Somerset House, were 12,517. 3s. 4d., of which the parliamentary grants amounted to 11,373l. 11s., and the amount of fees received from the pupils, male and female, in that establishment, was 441l. 14s. The disbursements, up to the same period, were 12,621l. 5s. 6d., including, in round numbers, about 6530l. appropriated to branch and provincial schools; 300l. for Mr. Gruner's drawing-book; and nearly 800l. for lectures, travelling expenses of provincial inspectors, and other items under this head. The financial accounts of the branch schools in Spitalfields, and the country are anything but encouraging; there are sixteen in all, at which the entire sums received for the year 1849, are 2982l. 11s. 6d., by subscriptions and donations, and 1555l. 14s. 5d. by fees of pupils. But the most melancholy part of the matter is that, with the exception of Coventry, Paisley, and Cork, not one of these sixteen schools is out of debt; Manchester, Birmingham, Glasgow, Sheffield, Newcastle-upon-Tyne, each, except the last, perhaps, with its hundreds of wealthy manufacturers, permitting its school of design to be in arrears for paltry sums of 300l. or 400l. Glasgow owes 4200l., chiefly for building. Do these facts show even the smallest degree of hearty interest and goodwill on the part of the manufacturers?

It appears that the average number of students on the books in the head school during the period referred to, that is, eleven months, was 441; and in the whole of the branch schools, 2540. From the former, seven female pupils and fourteen male pupils have had their designs purchased by manufacturers, and four male pupils have been permanently engaged by manufacturers. How is it to be explained that, out of many hundreds of designs—very many of them exceedingly beautiful—which we saw exhibited by the pupils at the commencement of the present year, only some thirty have been purchased, and not the whole of these by manufacturers? and that only four from among 441 pupils, have been able to procure permanent employment? We shall probably find a solution to these queries when we come to examine the several "Reports" concerning the provincial schools; and particularly the evidence of Mr. Poynter, their inspector, who says:—

"With respect to the established designers and draughtsmen, whatever influence they may possess with the manufacturers, and it is necessarily considerable, is exercised to a great extent to the disadvantage of the schools. They naturally look upon them as nurseries for rivals who are to eject them from their position.

"To this feeling on the part of the draughtsmen and designers there have been many honourable exceptions; and it is scarcely necessary to add, that the better feeling has always been on the part of those whose superior talents and knowledge have taught them the value of the schools in supplying the deficiencies in their education which had been previously irremediable. Coming into the schools with a certain amount of artistic skill and a thorough knowledge of the conditions upon which Art is to be applied to manufacture, students of this grade have been found a valuable acquisition to the schools, and have been the means of more speedily introducing a better style of Art into the manufactories where they are engaged. As men of mature age and fixed habits cannot always be

expected to take their places among the elementary pupils, the advantage of the old designers and draughtsmen has been consulted by opening to them the libraries of the schools; but they are slow to avail themselves of this privilege, although it gives them an opportunity of using many valuable works on Art to which they have no other means of access."

"In concluding these observations on the provincial schools in general, it must be repeated, that whatever impediments may retard their development, they are operating successfully in their true intention of educating designers and draughtsmen, and operative workmen capable of executing designs artistically. Whatever may be the apathy, real or affected, of those by whom the schools ought to be the most encouraged, there has been of late years an undeniable improvement in the drawing and execution of ornament in all branches of manufacture, and a general public interest in industrial art, which have certainly resulted from the schools; but their progress must be slow. It involves no less than a national progression in art, and until time has elapsed for a new generation of artists and designers, adding experience to knowledge, to be met by a new generation of manufacturers possessing a due appreciation of art; until artistic knowledge and skill are thrown into the market in an abundance which will force them into the channels of industrial art, and of a quality to dissipate the notion that the meanest portrait-painter is better than any designer for manufacture, the schools cannot produce their ultimate results; and an unreasonable and unreasoning expectation of what they are to perform in the mean time is the greatest danger they have to encounter. If any misapprehension arises on this point from a reference to the French schools, it should be borne in mind that in their professed system of instruction our schools differ in nothing from the French, and that the high development and extensive influence through which the French schools have produced such eminent practical results are due to the operation of time, and to that appreciation of their importance which spares no expense to maintain and promote them. It would be curious to observe, if it were possible to ascertain, what the French schools had effected at that period of their existence to which the English have now attained."

Mr. Poynter's Report is, of course, based on what he saw, and the information he received, during his tour of inspection. We can only say we lament his experience, and hope he may not renew it.

When we consider what more Mr. Poynter says on the subject, there seems less prospect of a hopeful or a satisfactory issue. Thus with respect to Birmingham, it is remarked that, "The question of money stands in the way of every proposition for increasing the efficiency of the school," and the difficulty of maintaining even the present subscriptions is commented upon. Of Leeds, we find it said, "with respect to the prospects of the school, and its future influence as a school of design, it must be remembered, that although Leeds is the centre, it is not the seat, of the fancy woollen manufactures, and that the actual manufacturing localities lie at so great a distance, and are so widely spread, as to render it difficult for the Leeds school to be of much direct benefit to the designers and artisans of the district." On the other hand,—"Manchester is undoubtedly gaining in the estimation of the manufacturers. In fact the practical effects of the school upon the manufactures of the loom, are making themselves manifest in a way which may waken the interest of the most indifferent, by showing that good Art possesses a money value." Of Norwich we learn that "the manufacturers are still expressing their disappointment that the school cannot furnish them with designs better, and cheaper, than they can obtain from experienced designers;" which designers, it seems, look upon the school with dislike, and prefer, if requiring an apprentice, a boy with some knowledge of pattern-drawing, to any one from the school. Of Spitalfields it is observed,—"It is unknown that any of the pupils who have distinguished themselves, have ever been able to secure employment as designers in the manufactories there, although the talents and acquirements of several have obtained for them good positions elsewhere."

Now, in opposition to this feeling at home, let us hear what Mr. Hammersley, the headmaster of the Nottingham school, who has recently re-

turned from Lyons, says he found in that city. "In Lyons an immense square, resembling Somerset House in London, both in size and shape, was provided for the purpose of the school, and contained an ample museum for the use of the students as well as other conveniences. The sum allowed by Government was about 5000. That by the English Government to the Nottingham school was, he believed, about 4000; but to the former a further sum of 20000. was allotted by the municipality of Lyons."

The sum of 20000. annually voted by the corporation of Lyons to support its school of design in a building as large as Somerset House, while Manchester contributes 7130. for a similar purpose! Is it marvellous, therefore, the silks of France drive ours out of the market? But we must leave the subject, and our readers to draw their own inferences from what has been stated. To the document, however, we shall probably recur.

THE BUILDING

FOR THE EXHIBITION OF 1851.

THIS gigantic structure is proceeding with a rapidity which testifies strongly to the energies of the contractors, Messrs. Fox & Henderson, who appear to evince a determination to perfect their contract well and satisfactorily in every respect. Already the effect both of exterior and interior may be fully appreciated, inasmuch as the lower gallery on that side of the building near the Kensington Road is floored and roofed, the sides boarded in, and the tops glazed. Indeed, we scarcely expected to see so much effected in so short a time. The exterior of the building is striking from its size, but by no means so much so as the interior, which for immensity and extent is really most astonishing. The long vistas which meet the eye are gigantic and grand, and the building, when finished and roofed in, would be "sight" enough to any curious visitor if its walls were totally unfurnished with the millions of articles they are destined to contain.

In the course of last month Mr. Paxton delivered a paper on the origin and details of construction of this building, before the Society of Arts, on their first meeting for the season. He traced the idea back for a long series of years, during which he had strenuously endeavoured to effect those improvements in the structure of greenhouses, which ultimately led to the erection of the celebrated one at Chatsworth, and the adoption of a similar construction for the Exhibition of 1851. The present building is therefore no sudden thought, but the result of many years experience, and hence the certainty with which it is put together, and the rapidity and success which attend it. "One great feature," observes Mr. Paxton, "in the present building is, that not a vestige of either stone, brick, or mortar is necessary to be used, but the whole is composed of dry material, ready at once for the introduction of articles for the exhibition. By no other combination of materials but iron, and wood, and glass, could this important point be effected; and when we consider the limited period allowed for the erection of so stupendous a structure, the attainment of this all-important point has secured what may almost be deemed the most important consideration. The absence of mortar, plaster, or any moist material in the construction, together with the provision made for the vapours which will necessarily arise, and are condensed against the glass, enables the exhibitor at once to place his manufactures in their respective situations without the probability of articles, even of polished ware, being tarnished by their exposure."

The iron pillars and girders have of course to be painted; but instead of an uniform plain tint, it has been proposed to decorate them with "prismatic colours of blue, red, and green." One portion of the building has been thus coloured as a specimen, and it is well that it has been done, because, after seeing it, we urgently hope that the project may be abandoned. To cover the slender pillars with alternate stripes of vivid colour, cannot do otherwise than produce a mass of confusion to the eye, and totally destroy that harmony and simplicity which will give grandeur to the interior. Small strips of colour in violent contrast in all directions will be both painful and unsightly; and we know nothing but a barber's pole worthy of a comparison with it. We must protest, in the strongest terms, against the commonplace vulgarity of the conception; added to its other evils will be the injury it will do to the colours of a majority of the goods exhibited.

THOUGHTS AND SUGGESTIONS ON THE EXPOSITION OF 1851.

THE TIME FOR RECEIVING CONTRIBUTIONS.

IN resuming our review of this engrossing topic we proceed to the consideration of a most important "decision" of the Royal Commissioners, and one, which if adhered to, will be in a great degree prohibitory as regards many works of the highest class of Art-manufacture, including those of which the execution demands a large expenditure of time and means—and will in its general influence, also, be fraught with much present annoyance and subsequent disappointment. We allude to the third of the "general conditions," which runs as follows—

"The Commissioners will be prepared to receive all articles which may be sent to them, and delivered at a place to be named by the Commissioners in London, on or before the 1st of January, 1851, and will continue so to receive goods until the 1st of March inclusive, after which day no further goods will be received."

Now we submit that this decision is as wholly unnecessary as it will be injurious if persisted in. This stipulation was made at a time when there were diversities of opinion upon the general bearing of the scheme itself, consequent in some degree upon misunderstanding of its object, and doubt and suspicion of its judicious direction. So much indeed had various causes tended to estrange the feelings of British manufacturers from its adoption, that it was found necessary to enlarge the date for the reception of claims for space originally required to be sent in by the 1st of May—until the 31st of November; thus fully acknowledging that the matter remained in abeyance, and that the necessary steps for efficient representation had not even been commenced.

There was prudential scepticism, as well as prejudiced opposition, to be met and overcome before the work could be taken up boldly and earnestly. The conviction upon which alone the required effort could be firmly based, had to be demonstrated, viz. that the *Exposition would take place at all*. This was rendered doubtful by the frequent changes in the preliminary movements; the repeated modifications of the primary arrangements; the impracticable nature of the building itself, as originally decided on; and the subsequent determined and powerful opposition (principally on this ground) to the site selected for the purpose. The result was indecision and delay, alike fatal to the spirit of action and progress. Another prominent hindrance was found in the present unsatisfactory state of the Patent Laws. The vast expense at which their protection must be realised, and the insufficiency of its security when obtained, threatened in a very serious degree to prejudice the higher range of intellectual and scientific labour.

From the first, the *Art-Journal* has endeavoured, vividly and earnestly to force on the consideration of the British manufacturer, the absolute and inevitable importance of his joining issue in the cause and making it his own; while differing occasionally upon points in its direction, which prevented our giving an undivided and entire adhesion to the whole scheme—still, in all our strivings, we have been influenced only by a cognisance of the opposition and mistrust, which many of its bearings would certainly arouse. Confidence in the good faith and policy of the plan, as well as in its practical direction, were necessary to its general adoption; this, by mistaken and questionable courses, to a great extent, was negated: suspicion, misunderstanding, and dislike ensued; and we felt bound to become the medium of communicating, and commenting on, this feeling; which, unless removed, must, as far as England is concerned, have crushed the hopes of its advocates.

To enforce on the British manufacturer the duty of preparing for the issue of a challenge so boldly sounded to all corners we laboured ardently, truthfully, and trust we may add, successfully.

The *Art-Journal* has been a prominent means of inducing this result. Free and unfettered in position and relation, it can and will review impartially the progress of the movement, and cordially lend its aid to further and promote its successful consummation. So lenient as to its details, it will watch with anxious solicitude, the gradual development of a scheme which, in many of its essentials, it may claim to have originated, and, consonant with this feeling, it now advocates, and on behalf of British manufacturers solicits, an extension of time for the reception of exhibitiv works—as a concession which their peculiar and critical position imperatively demands.

By slow degrees, the doubts and objections which

voiled the dawn of the project have, by judicious modifications, been dispelled, and the Exhibition of 1851 now stands revealed as "a great fact." We learn from a report of the executive committee, that the returns of claims for space at length far exceed the possibility of a full provision; and we rejoice that such is the case, because we are thus supplied with conclusive evidence, that our manufacturers are alive to the duties which their position and interests involve; at the same time that it enforces the exercise of much solicitude and care, to guard them against the disadvantages which procrastination, thus induced, must necessarily expose them to.

The improved state of trade in many of the manufacturing districts coming, as it has, after a long season of considerable depression, has absorbed the productive energies of those localities and left but little inclination to devote time and means, to works of merely prospective benefit, which could be expended upon those of immediate and profitable return. Much as those thus situated, might wish to avail themselves of the promised aid of 1851, still 1849 has more pressing and urgent calls. The "decision" not to receive articles after the 1st of March is now generally felt a most unnecessary and mischievous exaction; the Exhibition is not to open till the 1st of May, even if this date, as originally announced, be adhered to,—and what benefit, we would ask, can result from a costly and hazardous stock (as in many instances even the contributions of an individual exhibitor will be) lying for two months certainly unproductive, and probably liable to injury and deterioration. We feel convinced that this "decision" must be rescinded. In many branches of manufacture, setting aside the consideration of the loss sustained by unproductive capital, as in works of gold, silver, and the higher class of Art-decoration, it must be evident that the stock would sustain serious and irremediable injury from such a course. For the orderly arrangement of the vast and miscellaneous collection of articles which the Exhibition will draw together, it is evident that due time should, and must, be allowed; but still we contend that the time now allotted (*two months*) is sadly over-estimated, and that many intending exhibitors of the more valuable and fragile articles, will, even if otherwise prepared by the advanced state of their productions, hesitate to submit to such a requirement. As the exhibitors after their relative amount of space has been decided on, will be permitted, or expected, to arrange their respective productions, (probably under some general restrictions,) and as this arrangement may be carried on simultaneously, and generally upon some pre-conceived system, the task would not be one of very protracted or onerous performance. But the chief objection is the consequent curtailment of time, already far too limited, for the adequate completion of such works as may reasonably warrant to their producer honourable mention. We have spoken to, and corresponded with many manufacturers on the subject, and the outcry for *time* is universal. *Time* is now the principal requirement; the desire to enter the lists is at last sufficiently general, and fitting preparation only is needed, which *time* alone can furnish. We urge that every possible consideration should be given to British manufacturers, in preparing for a contest, so novel and difficult to them; they have entered on a new and untried course with much, very much, to learn, and all to do; and the result will, to a considerable extent, affect for good or evil their future commercial interests. From personal knowledge of the works now in progress at some of the principal manufacturing districts, our own conviction is, that England will, in the aggregate of her productions, take and maintain a much higher position in the industrial struggle, than would be generally, at the present moment, conceded. The stimulus given by the hope of a *competent and powerful Tribunal, attending and regarding superiority and excellence*, and the zest of honourable rivalry, to secure the consequent advantages which such an award will bring, have done their natural and invigorating work, the results of which will be proudly evidenced in the forthcoming products of many of our chief manufacturers. On their behalf and in their names we reiterate our plea for an *extended time* for the reception of the exhibitive articles, all but for a month. Surely this "decision," one which presses so unduly, and we contend unnecessarily hard, on a numerous class of exhibitors, will not be the *only* one that is to be *fixed and unalterable*; let this not be the exception to the general rule of change, which, consequent upon the maturing of so vast a scheme, has hitherto been found advisable. In this instance the Commission will act well and wisely, finding the "decision" adverse to the general wish and interest, to amend its tenor, and thus deserve and

receive the thanks of the community at large. At any rate, a latitude as to time might surely be allowed in the section of the Fine Arts and ornamental productions generally, including works in the precious metals, &c. &c.; indeed, the latter class will be most seriously affected by the present regulation, if enforced as it now stands. It is a fallacy to suppose that goldsmiths and silversmiths for instance will deposit a large and costly stock (and it is rumoured that one eminent house will send articles of the value of *one hundred thousand pounds*), to remain for two months totally unproductive, and, further, liable to deterioration and damage; other manufacturers also, such as those in polished steel for grates, mathematical and surgical instruments, gilt and decorated porcelain, &c. &c., would during this time receive, in all cases temporary, and in some permanent, injury.

The requirement for *extension of time* is not peculiar or confined to this or that district; it extends throughout the length and breadth of the land; direct and personal communications with the manufacturing interests not only attest this fact, but also confirm its absolute and imperious necessity. We trust that we may in our next have the satisfaction to record that this concession to the requirements and anxieties of our manufacturers has been admitted.

B.

CORRESPONDENCE.

SIR,—In an article "On the Applications of Science to the Fine and Useful Arts," contributed by Mr. Robert Hunt, to your Journal for last month, that gentleman, after having acknowledged and satisfactorily accounted for the mistakes committed in his report of the communication I had the honour to make to the British Association during its last meeting in Edinburgh, gives a series of observations upon my "First principles of Symmetrical Beauty," in which it appears to me that he has completely misunderstood the nature and tendency of that work. Therefore as it is a matter of no small importance to the arts of design, that any attempt to develop and systematise these principles should be fairly placed before the readers of the *Art-Journal*, I trust you will again oblige me by giving this communication a place in your columns.

The first opinion Mr. Hunt advances, is to the following effect—"It appears, at least from the examination we have been induced to give to the subject, that Mr. Hay's Principles of Symmetrical Beauty are urged too far; that his ellipses and triangles have but an arbitrary value, being constructed to suit the best forms of Art and Manufactures already existing, and it is to be feared may have a tendency to promote a servile imitation to the destruction of all original design."

It is scarcely possible for any statement to be made more calculated to mislead your readers as to the nature, object, and tendency of the work in question than the above. Not that I for one instant would infer that this generally valuable contributor to your Journal would wilfully misrepresent the nature and tendency of any of my works. I attribute the errors he has committed to haste and inadvertency alone. Now, the nature of the work to which he refers is simply an attempt to develop the principles of symmetrical beauty in a popular manner, and to point out modes of applying them in such of the useful arts as may be thereby improved; and also to enable those unconnected with such arts, more readily to perceive and appreciate this species of beauty when exhibited in the works of the artist.

In the introduction to this subject, I have stated plainly that I did not pretend to give rules for that kind of beauty which we all know can only be produced by genius, and which thus constitutes high Art, but confined myself to such elementary principles of Art, as resemble the elementary principles of language, to be found in the most simple treatises on grammar, and such as are calculated to convey as much instruction in the arts of design, as such treatises impart in the science of literature. This, surely, was not urging the matter too far.

Now, as to the manner in which I have evolved these principles and explained the mode of their application, so far from adopting triangles and ellipses that "had but an arbitrary value," my leading triangles are the primary elements of the Platonic bodies, as Mr. Hunt in another part of his essay acknowledges, and the others are evolved by an harmonious process fully explained, while the curvilinear figures are such as belong exclusively to these; and so far from being "constructed to suit forms of Art and Manufacture already existing," they are constructed and systematised so as to afford the artist the power of producing an

inexhaustible variety of new designs, and thereby to supersede entirely the necessity of servile imitation. Its tendency must therefore be of an entirely opposite character to that which Mr. Hunt fears it may have.

Mr. Hunt goes on to observe, "If Mr. Hay had applied it to regularly, even to that combination of regularity which constitutes symmetry, there would have been small reason for discussion; but when he advances it in elucidation of fixed laws, upon which the beautiful is based, we cannot but conceive that he falls in appreciating the 'idea of beauty' in that perfection in which it appears in the protean forms of nature." I am quite unconscious of ever having attempted to apply my system of proportion in any other way than to exemplify the beauty of regularity and symmetry, simply and as combined with variety. I have also been most careful in explaining in what respects designs framed agreeably to the laws of symmetrical beauty, differ from those that owe their excellence exclusively to an imitation of the forms of nature. And I think I have satisfactorily proved, that when the laws of this species of beauty are obeyed in the production of any work, however humble it may be, there can be nothing to offend the eye of taste; while, it is universally felt, that imperfect imitations of natural objects are always offensive.

But if in doing this I have failed "in appreciating the 'idea of beauty' in that perfection in which it appears in all the protean forms of nature," it is more to my own loss than to that of my readers; for the attempts to explain this idea of beauty, made by various writers, who think they do appreciate it, are anything but clear; and, so far as I am able to judge, can have no beneficial tendency on the practice of the Arts of Design.

In thus systematising the most elementary principles of visible beauty, and showing how they may be applied in all the formative Arts, I am well aware that I do not add to mankind one genius more "than there would have been, had my system never been promulgated." But I am at the same time aware, that those first principles of symmetry and proportion, the general diffusion of which would enable the mechanic in his humble workshop to impart beauty to the result of his labour, are identical with those by which the artist of genius in his studio, might be assisted in the embodiment of his grandest ideas; just as those first principles of literature, which enable the mechanic to correspond in writing with his employer, are identical with those by which the poet is assisted in delighting mankind with the emanations of his genius. But the division of the front of a plain street house, the formation of a soup-tureen, or a tea-pot, the diaper pattern which enriches a window-curtain, a carpet, or the walls of a room, although subject to the first principles of high Art, are no more necessarily productions of artistic genius than the letter of the mechanic is a work of literary genius, from being dependent upon the first principles of written language.

Mr. Hunt observes that I am "obliged to make a division of pleasing objects into the beautiful and the picturesque," and confesses his inability to comprehend the difference. Were I to make such division, it would imply that I do not consider the picturesque to belong to the beautiful. But the division I make, in the work to which Mr. Hunt alludes, is into the symmetrically beautiful, and picturesquely beautiful; and, in order that he, and such of your readers as are similarly situated, may be enabled to comprehend this division, I shall attempt to explain it.

The contrary principles of uniformity and variety give rise to these two kinds of beauty, according to the predominance of the one or the other principle in the form of the object. The first predominates in symmetrical beauty, and the second in picturesque beauty. Natural objects have, in general, a preponderance of picturesque beauty, but the highest degree of perfection is the result of an equal balance of both kinds. Of this the human figure is an example; because, when it is of those proportions generally reckoned the most perfect, its symmetrical beauty and its picturesque beauty are equally balanced. For instance, its lateral halves are perfectly uniform to the eye, and its principal divisions relate to each other most symmetrically, agreeably to a law lately developed and easily defined. In this consists the symmetrical beauty of the human figure; but its picturesque beauty is of a very different character; it consists in the undulations of the forms of the external muscles, occasioned by the innumerable positions and motions of the parts to which the muscles belong, and in the expression of the countenance, depending upon the operations of the mind, as well as in the correspondence between this expression and that of the attitude or motion of the whole figure. This latter species of beauty is that with which genius only can deal,

for it is subject to no rules that can yet be defined, and belongs exclusively to high Art.

There are objects in nature, however, which have no symmetrical beauty, but are nevertheless beautiful. An ancient oak, for example, is one of the most picturesquely beautiful objects in nature, and its peculiar species of beauty is even enhanced by want of apparent symmetry. Thus, the more fantastically crooked its branches, and the greater the dissimilarity and variety it exhibits in its masses of foliage, the more beautiful it appears to the artist and the amateur. And, as in the human figure, any attempt to produce variety in the proportions of its lateral halves would deteriorate its symmetrical beauty, so in the oak tree, any attempt to produce palpable similarity between its opposite sides would equally deteriorate its picturesque beauty. As in nature there are objects which are beautiful without apparent symmetry, so in Art there are others which are beautiful without that degree of variety which produces the picturesque. Such are the beautiful architectural structures, vases, and many of the ornamental works of the ancient Greeks. This is what I conceive to be the difference between symmetrical beauty and picturesque beauty.

Because the theory of harmonic numbers, upon which my science of proportion is based, agrees with that of the ancient Grecian philosophers, Mr. Hunt, with a view to prove its worthlessness, observes that, "St. John Herschel most truly says of the Grecian philosophers, 'That restless craving after novelty which distinguished the Greeks in their civil and political relations, pursued them into their philosophy. Whatever speculations were only ingenious and new, had irresistible charms, and the teacher who could embody a clever thought in elegant language, or at once save his followers himself the trouble of thinking or reasoning, by bold assertion, was too often induced to acquire cheaply the reputation of superior knowledge.'"

After making this quotation, it is extraordinary to find Mr. Hunt concluding his comments upon my science of proportion in the following words:—"Let it be distinctly understood, that in asserting Mr. Hay's method to be insufficient as a method by which the Beautiful in Art is to be realised, we are led to do so on the same grounds which Plato, the most divine of Grecian philosophers, adopted, and that, too, after the construction of his system of triangles. It is *MIND* alone that is beautiful, and in perceiving beauty we only contemplate the shadow of our own affections."

Now what do these words of Plato's, upon which Mr. Hunt grounds his opinion of my method, literally mean? If "*MIND* alone be beautiful" then visible beauty can have no existence, because the mind is not a visible object. And if "*in perceiving beauty we only contemplate the shadow of our affections*," then beauty would appear to be determined by the feelings alone, and not by the understanding, in which case every individual would have a right to set up his own standard, and the man, (for such men there are,) who can see no standard of beauty in the forms of the finest specimens of Grecian sculpture, might insist that his wife and family were the only perfectly beautiful specimens of the human form, because he contemplated in them the shadows of his own affections.

This sentence of Plato's, whether originally obscure, or rendered so by the translators, could not have been intended to support such a doctrine. Probably it was meant to convey an idea of the following fact, (stated at page 5 of my work on Symmetrical Beauty,) viz., "Absolute beauty is relative only to the human mind by which it is perceived, and in which there seems implanted a faculty that reciprocates, in some degree or other, to certain visible modes of combination in the elements of creation."

The chief point of difference between the views I have taken of the subject, in my various works, and those by which Mr. Hunt opposes them in the *Art-Journal*, is simply, that I assert my belief in the appreciation of absolute or geometric beauty being as much an inherent faculty of the human mind as the appreciation of truth, and that its nature is of a definite character; while, on the other hand, Mr. Hunt asserts his belief to be, that "the mind takes colour from that it works in, like the dyer's hand;" therefore the "untutored peasant would prefer some homely face all 'ripe and real' and the beauty of the Grecian face would be, indeed, to him, the nonsense of the *beau idéal*;" and, consequently, that the mind only appreciates beauty by being trained to it.

Which of these two theories is the correct one, I must leave to your readers to determine.

I am, Sir,

Your most obedient servant,

EDINBURGH, Nov. 12.

D. R. HAY.

ART IN CONTINENTAL STATES.

MUNICH.—On the 15th of October the "Siegesthor" (Arch of Triumph) was inaugurated, in presence of King Maximilian, who, at the head of the troops, surrendered it, by order of his royal father, to the magistrate of the capital. The "Siegesthor," standing at the end of the large Ludwigsstrasse, is an imitation of the triumphant Arch of Constantine in Rome, and is of the same form, order, and distribution; but the effect is totally different, and I am convinced you will find it more beautiful than the Roman monument. The principal difference consists in the proportion of the height to the breadth, and in the mode of decoration. Our monument seems to be higher than it is broad, because the pedestals of the columns, the walls of the three gates, and the arches are very much elevated; and the basso-relievos show the fourth part of the height. There are basso-relievos only over the lateral gates and on the small sides of the building; likewise medallions on the attica, so that the architectural masses, not interrupted by a quantity of decorations, produce their full effect. Over the columns up the jutting cornices stand Victories with crowns in their hands. The figures in the medallions represent the provinces of the kingdom, and the basso-relievos show combats between infantry and infantry, infantry and cavalry, and cavalry and cavalry, troops passing through a river, storming a bulwark, and blockading a fortress. Though the building is a monument of the valour of the Bavarian army, the military actions represented are not taken from history, but are general and without any sign of a particular nation. The costume of the warriors is ancient Roman, as well as the style of the sculpture, and the architecture of the whole building. There is an inscription on the outside of the attica, over the middle arch—"Dem bayrischen Heere" (To the Bavarian army); and on the inside—"Eriehet Von Ludwig I. König Von Bayern, 1850" (Erected by Louis I. King of Bavaria, 1850.)

On the plate is a pedestal, on which a colossal group of lions will be placed, Bavaria on a car, drawn by four lions, saluting the returning victorious army. The whole building is of yellowish limestone; the architect was F. von Gartner, and after his death, Ed. Metzger. The sculptures invented by Mart. Wagner in Rome, executed by different artists in Munich, are of white marble, with the exception of the bronze group of Bavaria. There is a very fine photograph of the "Siegesthor," taken by Böcherer.

The two first frescoes on the outside of the new Pinacotheca are finished. The subject of the whole series is the history of the modern Fine Arts in Germany. The origin of the restoration of them is not at home, but in Rome, where our artists go as to the University of Art. Therefore you see in the two first frescoes the German artists in Rome. For the first you see the depictees of nature or genre-painters, and different groups of Roman people dancing, girls and men, a fine beggar-woman with her child, an old capuchin, three boys bearing a large bunch of grapes, and then a number of painters copying the most agreeable views, whilst one of them, an enthusiast or religiousist, is kneeling before the crucifix in the hand of the capuchin. The second fresco shows the artists of a higher degree and direction, before the works of Raphael and Michael Angelo, of the antique sculptures and architectural monuments. There is Cornelius, Schnorr, Hess, Klenze, Gärtner, Schwantaler, etc., and on the left is entering to them a messenger of King Louis of Bavaria, with a long list of artistic undertakings, which is read by the artists with the greatest delight and astonishment. On the right you see a very melancholy figure, totally sunk in thought and despair, an example of artists, who, instead of studying and doing something, prefer the contemplation of their misery. Next to it stands a pair of pifferari from the Campagna, poor fellows, without fortune and glory, but content in the possession of their bagpipe as the fund of daily food and pleasure. The compositions are by Kaubach, the frescoes by Nilson.

By order of King Maximilian the pictures in the "Saalbau" (of the new palace) are being continued. There the *Odyssey* is represented in six saloons, four of which are finished. The painter is Hillensperger, but the compositions are the work of the late Schwantaler. The whole undertaking appears an experiment on the union of the imagination of an ingenious sculptor, with the execution of a talented painter. But the works of the Fine Arts do not suffer engrainment like fruit-trees, but ever grow from the root.

A second picture, being executed by order of

King Maximilian, is the "Nibelungenlied" (Song of the Nibelungs) in the new Königsbau. Jul. Schnorr, the painter of this work, is unluckily hindered by a disease of the eyes from finishing it himself, and has engaged for it Director Gustav Jäger of Leipzig. The painting commenced this year represents the death of Kriemhild. This unfortunate queen, after having had her brother King Gunther and her cousin Zagen killed as the murderer of her first consort Siegfried, is killed by the old Knight Hildebrandt, who, though a vassal of hers, cannot suffer the death of a hero by the hand of a woman. The scene is in a large hall of the palace of King Ezel, the expiring queen is sunk in his arms; before her lies her slaughtered enemy Hagen, and in the background you see a group of servants, with the greatest excitement King Gunther; Hildebrandt in the sheath, and on the opposite side his companion Dietrich is turning from the terrible scene of calamity. The effect of this painting is very tragic, but without a disheartening effect. No horror is to be seen, and the death is represented as the reconciling end of immortal vengeance. Noble and true in expression, simple in arrangement, energetic in design, this picture without doubt is the most excellent of the works of Julius Schnorr.

King Maximilian proposes to found an institute for the instruction and education of talented young men, for which the architects of Europe are to be invited to send in their plans for an adequate building. The Royal Academy is engaged to publish the programme of it. In this building a large hall is projected, destined for a gallery of paintings from universal history. Different masters are already engaged to execute some paintings; Overbeck, "The Creation of the Man;" Kaubach, "The Emperor Ludwig the Bavarian with the Electors in Rhense;" Dietz, "Max Emanuel before Belgrade;" Piloty, "Maximilian the Elector as the head of the League;" Peter Hess, "The Battle of Leipzig, 1813."

MUNICH.

E. F.

THE BIRTH OF THE ROSE.

FROM THE SCULPTURE BY B. JENNINGS.

The original of this small figure was exhibited at the Royal Academy in the present year; it is the work of a young sculptor who has been studying for some time past in Rome; and to whom the conception and execution of the statue does high honour. It may be accepted as the promise of future fame. The following lines suggested the idea:—

"Se dar volesse una regina al fiori
O Giove, in trono al Pella domando
Sa rosa regina de' tuoi primi amoro
Ti raccomandò."
Da un Ode di Saffo.

Which will bear some such literal translation as this:—"O Jupiter, if thou desirest to give a queen to the flowers, a throne to beauty, I recommend thee the rose, daughter of thy first love."

The above extract is from the lyric poem, by Sappho, entitled "The Rose," one among the few which have been handed down to us; in it Cupid asserts the right of the rose to be made the Queen of flowers. This is the point aimed at by the sculptor. Cupid is supposed to be standing in the presence of the celestial deities exhibiting to them the rose which he has just culled from the Cyprian flowers, and is claiming their admiration of it. The attitude of the figure has been well and appropriately studied; the limbs are finely set and proportioned; while there is an air of youthfulness and gaiety quite in keeping with the subject. Round the trunk of the tree which support the figures, are wreaths of lilies, emblematical of their rejection in favour of the new favourite that has risen up to occupy its place in celestial regard.*

* Elsewhere we have made note of the arrangements into which we have entered for the publication of engravings of works in sculpture during the coming year. Many of them we shall derive from the sculptors of Germany; but we believe we shall be soon in a position to announce a consecutive series, comprising a gallery of the choicest sculptures of Modern Art.

THE BIRTH OF THE ROSE

ENGRAVED BY T. W. KNIGHT FROM THE STAT. BY F. S. COLEMAN

VISITS TO THE MANUFACTURING DISTRICTS.

ROTHERHAM AND SHEFFIELD.

IN our opening article on the manufactures of that important mart—Sheffield, whose cutlery and other works render its name and productions celebrated in all parts of the civilised world, we alluded to the very early date at which it had achieved fame for the cutlery it sent forth. We at the same time alluded to the fact, that in the old time its neighbour Rotherham was the most important town of the two, an importance which has now been very greatly superseded by Sheffield. Rotherham remains what it was, and is still a large place of manufactures; but Sheffield has increased so enormously within the last century that comparison ceases between the two. The ancient history of Rotherham, as far as relates to its manufactures, may be thus briefly told:

Rotherham, as early as the twelfth century, was famed for its mines of ironstone and coal, its smelting furnaces and forges; as well as its manufacture of edge tools, the natural consequence of its favourable locality, and which was also enjoyed by Sheffield, but not to so great an extent. Rotherham increased in wealth and importance, until the year 1482, when Thomas Scott, Archbishop of York, usually called Thomas of Rotherham, who was then Bishop of Lincoln, founded its College, and Rotherham became a seat of learning and ecclesiastical importance; and its manufacturers of edge tools gradually found their way to Sheffield, then a small village, possessing a limited number of persons, and a rivalry in trade and importance was established between the two; the very superior advantages which accrued, from various circumstances, to Sheffield, gave great importance to that town, and which in our previous paper we have descanted on more fully, and to which we must refer.

In the year 1746, Messrs. WALKERS commenced an iron-foundry, and by their skill, industry, and perseverance succeeded in so remarkable a manner, that their works became the largest iron-works in the kingdom, embracing working mines of ironstone and coal, smelting furnaces, forges and rolling-mills, at which they manufactured iron of very

ties; but the largest and most important branch of their business was their extensive iron-foundries, in which they manufactured during the wars large quantities of cannon, and every description of castings for home consumption and for exportation. Here the first iron bridges that were ever constructed were manufactured; the earliest of much magnitude was the one crossing the River Wear at Sunderland, called the Sunderland Bridge; their successful career being terminated by the manufacture of the noble iron bridge called the Southwark Bridge, with its three magnificent arches, the centre one of 240 feet, and the two side arches of 210 feet each—exclusive of the piers—spanning the

at Rotherham; some branches of which were allowed to dissolve away; other branches were taken by different individuals and companies, and it is gratifying to find that these various branches have not only been carried on, but by the indefatigable industry and enterprising spirit of the various proprietors have been greatly enlarged; and the trade now carried on at Rotherham in all these several branches far exceeds that of any former period.

The ironstone and coal-mines fell into the hands of the late Mr. Samuel Clark, and are now carried on by Messrs. Beale & Co.

The forge was taken by Messrs. Knowles & Brown.

The rolling-mills for sheet-iron and tinned plates were taken by Messrs. Habershon.

The steel business was taken by the late Mr. William Osley, of the Park Gate Steel Works, and by Messrs. Grant & Solby, of Masbro.

The manufactory of wrought-iron articles by Messrs. Bardeken & Fairbairn.

The foundry business was offered to Mr. James Yates, who was joined by Mr. C. R. Sandford.

In addition to the above, Rotherham has now the extensive iron-works of Messrs. Beale & Co., Park Gate.

The Midland Iron-works, Masbro; Messrs. Sandford & Boston.

The Steel-Works of Messrs. Peter Stubbs & Co.; besides other smaller establishments.

Our specimens of the productions now executed at Rotherham are selected from the "Edingham Works," the proprietors of which are Messrs. YATES, HAYWOOD, & Co. It is one of the largest which the town presents, and the articles there fabricated are remarkable for the variety and ability they display.

The senior partner in these works, Mr. James Yates, of Carr House, was brought up in the iron-works of the Messrs. Walkers, already alluded to, he was more particularly in connection with their extensive iron-foundries, at the Holmes, near Rotherham. He was actively engaged for several years in his youth in the manufacture of the stupendous iron bridge at Southwark, to the construction of which we have already alluded. This bridge was the last great work done at the Holmes, and after it was completed, the Walkers allowed their business at Rotherham to dwindle away. Most of the various branches, however, were soon taken by different individuals and companies, as above detailed.

The foundry business, reduced to a very small

River Thames from Queen Street, Cheapside, to the Borough. This stupendous structure of iron was during its progress visited by very many thousands of individuals from all parts of the country; and when completed, in 1819 or 1820, was looked upon as one of the great wonders of the world. At this period iron-works were springing up in Staffordshire and Wales in profusion, and competition became very strong, so much so that the Walkers, who, for three quarters of a century, had had immense demand for their goods at most lucrative prices, began to feel the effect of competition, and the consequent reduction in charges, and

works of the Messrs. Walkers, already alluded to, he was more particularly in connection with their extensive iron-foundries, at the Holmes, near Rotherham. He was actively engaged for several years in his youth in the manufacture of the stupendous iron bridge at Southwark, to the construction of which we have already alluded. This bridge was the last great work done at the Holmes, and after it was completed, the Walkers allowed their business at Rotherham to dwindle away. Most of the various branches, however, were soon taken by different individuals and companies, as above detailed.

The foundry business, reduced to a very small

first-rate quality into bars, rods, and hoops, of every size; also of sheet-iron and tinned plates of every size. They had an extensive manufactory of wrought-iron articles in great variety. They had also extensive steel-works, at which they manufactured all kinds of steel of the best quali-

ties; but the largest and most important branch of their business was their extensive iron-foundries, in which they manufactured during the wars large quantities of cannon, and every description of castings for home consumption and for exportation. Here the first iron bridges that were ever constructed were manufactured; the earliest of much magnitude was the one crossing the River Wear at Sunderland, called the Sunderland Bridge; their successful career being terminated by the manufacture of the noble iron bridge called the Southwark Bridge, with its three magnificent arches, the centre one of 240 feet, and the two side arches of 210 feet each—exclusive of the piers—spanning the

at Rotherham; some branches of which were allowed to dissolve away; other branches were taken by different individuals and companies, and it is gratifying to find that these various branches have not only been carried on, but by the indefatigable industry and enterprising spirit of the various proprietors have been greatly enlarged; and the trade now carried on at Rotherham in all these several branches far exceeds that of any former period.

general iron-founders, stove-grate and range manufacturers. Soon after this they purchased the business of Messrs. Bardeken & Fairbairn, successors to the Walkers in the manufacture of wrought-iron articles, and added this to the Phoenix Works. After a few years they commenced their forge for the manufacture of heavy wrought-iron work; and also purchased the business carried on at the Rotherham Foundry by Messrs. Kirk, Kidgel, & Co. These all went on gradually increasing until June, 1838, when the partnership closed by efflux of time, and the two partners decided to make a division of the business, Mr. Sandford taking to those branches in the heavy line carried on at the Phoenix Works, while Mr. Yates took to the manufacture of stoves, stove-grates, fenders, and ornamental castings; and immediately commenced the Effingham Works in conjunction with the Rotherham Foundry; in June, 1846, Mr. George Haywood and Mr. John Drabble became his partners, and the business has since been carried on under the firm of Yates, Haywood, & Co., and has now become the most extensive in the kingdom, for the manufacture of grates and fenders.

A remarkable feature in the manufactory is the wide range which is taken in the classifications and qualities of the articles manufactured. Thus, in stove-grates, they have five hundred distinct patterns in all the various useful sizes and qualities, from the cottage grate at 2s. 6d. each to the splendid drawing-room grate at 400 guineas each.

In fenders they make all qualities in wrought-iron, cast-iron, cast ormolu, and steel.

In warm-air stoves they have great variety, running through every grade, from the small shop stove at 7s. each, to the superb polished hall stove, cabin stove, and stove for large public rooms, with one, two, or four sides, up to 100 guineas each.

In kitchen and cottage ranges they have a small variety.

In ornamental castings they have some beautiful patterns of hall and drawing-room tables, table ornaments, flower-pot stands, hat stands, umbrella stands, &c. During our inspection of this establishment we were particularly pleased with some ornamental tables in the richest style of the French and Italian taste, with festoons of flowers and scroll-work, executed in iron, with the apparent lightness of wood-carving. We were also much gratified with some garden sofas and tables, constructed to represent rustic-work, and treated in a very natural and characteristic manner, the rough stems of the trees apparently tied together by cords, and the whole painted very naturally exhibiting the apparent slenderness of wood with the enduring strength of metal.

We engrave on our previous page two specimens of the manufacture of this firm; both of which exhibit novelty and good taste. The form of the grate front—a horse-shoe curve—ensures great elegance of outline to the opening of the fire-place, and does away with the ugly squareness which too often characterises our English grates. The grate itself is also rendered elegant and less stiff than usual in its contour by the addition of ornamental lines of foliage placed at its sides. The wreath of open worked scrolls and floriated ornaments which bend over the front of the grate is a very elegant design, and of great value for the richness which it gives to the entire composition.

The fender is more florid in its style, and properly so. The lines formed by the entire outline are all good. The angular forms taken by the scrolls in front, are relieved and made accordant to the other portions of the design by the introduction of foliage and flowers. The way in which each end of the fender curls upward into an enriched and beautiful group of vegetative ornament is also very successful, and shows good taste. Altogether we consider this a very successful design.

In our northern climate, with all its tendency

to damp and changes of temperature, a fire-place becomes not a luxury only but a strict matter of necessity. Our first conquerors, the Ancient Romans, knew this well, and the foundations of their numerous villas scattered over our country, occasionally exhumed, attest the fact of their constant precaution against its evil influences. Their houses are never discovered without exhuming the hypocausts by means of which they were properly warmed; these consisted of fire-places beneath the floor, which threw a heat completely under it, spreading itself abroad between the brick pillars which supported it, and thence ascending square flues in the sides of the rooms above, disseminated warmth throughout the whole building.

But the comparative degree of perfection to which the Romans had attained in all the arts of life was doomed to be speedily forgotten after the fall of their empire; and we find in the middle ages a great want not only of the elegancies, but of the comforts of life, enjoyed by the earlier denizens of our land. Fire-places and chimneys were comparatively rare, and the hall of the baron could frequently boast of no other warmth than that of a fire of logs in a hearth in its centre, the smoke

rays, thus preventing the possibility of that scorching and warping of furniture which have been found to arise from the concentration of rays in the old inefficient attempts at reflecting stoves. For a square room, or for a long room with the fire-place at the side, the Conical Reflector is preferable, as it insures a more extended diffusion of the light and heat. In both cases the reflection takes place from a comparatively cold surface, and therefore the air is not deprived of its moisture, but however hot the room may be required to be, there can be no oppression, but always an elastic and congenial atmosphere. There is also ample provision for the regulation of the temperature.

We have tested this stove by trying the effect of the fire without the aid of the reflector, when seated at some distance from it, and which of course was very little, no more than could be expected from an ordinary fire when seated at the opposite end of a room. But by the addition of the reflector, a powerful warmth was felt by the same fire and at the same distance, which we scarcely prepared to expect, and which was most satisfactory.

Our engraving exhibits an ornamental stove of this class. The circular front is a very elegant novelty. From this the reflector recedes inwardly to the fire-place in the centre, and gives that great power to the rays from thence which aids the proper diffusion of heat. It effects a considerable saving of fuel, and all the heat and light are so completely thrown into the room as to afford a degree of cheerfulness and warmth which twice the amount of fuel would fail to produce in any ordinary fireplace. The full heat is diffused equally into every corner, and the floor is thus warmed without any draught across the feet. The recessed reflector is a novelty and even an ornament to a room. The circular form is also agreeable, and the style of decoration generally adopted by the makers evince much good taste.

We have very frequently had occasion to notice the great improvement made in stoves, not only in the saving of fuel, the proper generation, and dissemination of heat, but also in the superior taste and beauty of design which characterises their general appearance, and which now makes a stove a really elegant piece of drawing-room furniture; according in its style of ornament with any kind of decoration which may be adopted as the preponderating style of the room or its furniture. It is this general fitness of design which gives

from which found its way out only through an opening in the roof above. Indeed, the use of the stove-grate may be dated at a comparatively modern period, and attention was bestowed to its improvement not till toward the end of the last century; then philosophers first cared to cast a thought toward the economy of heat, and stove-makers turned their ideas toward the construction of elegant designs.

We return to Sheffield for one of the remarkable novelties of the kind (engraved above), and at the manufactory of Messrs. Jonsen & Co., inspect their patent light and heat reflecting stoves. The peculiar features of this invention are, that the reflector entirely surrounds the fire; that it can be removed at pleasure, with the greatest ease; and that the ash-pan, being placed out of sight, does not require to be taken out and emptied more than three times a week. A far greater amount of warmth is obtained from even a much less quantity of fuel than is used in the common fire-place, and its very moderate price brings it within the reach of all classes.

When the heat is required to extend to a considerable distance from the fire, as in a long room with the fire-place at the end, the Parabolic Reflector is the best adapted for use, because the light and heat are projected from it in parallel

so great a degree of elegance, and such a charming *tout ensemble* to the drawing-rooms, or indeed, to the rooms in general, in which our continental neighbours dwell. The reason why their rooms possess so beautiful and chaste a character is beginning to be better understood by ourselves, and it is now very possible to furnish our own homes in a style which will not admit of so much contradiction as we have hitherto erred in adopting; and consequently tables, chairs, paper-hangings, &c., may be made accordant, and even the stove and fender exhibit the same ruling character of design.

It cannot, we presume, be doubted or denied that the great attention our manufacturers have bestowed on the excellence and durability of their wares, will, when combined with a due amount of artistic knowledge, and the true fundamental principles of design, give to them and to their works that respect and that success in a mercantile point of view which they may desire, and which they fully deserve. None can rejoice more entirely than ourselves at seeing these steps so constantly made in the right direction. We are glad to see that artistic aid of a high kind is at their command, and that they are anxious to obtain it, and avail themselves to the utmost of its aid. It has been our duty to urge this upon artist and manufacturer repeatedly, and we rejoice when they adopt it.

The plate in our present page is from the manufactory of Messrs. BROADHEAD & ATKIN, (Britannia Works), all the articles being in the material termed by them "Anglo-Argentine," a white metal electro-silver-plated; a class of manufacture which has given much celebrity to Sheffield, and which the manufacturers of that town have greatly improved during recent years by the adoption of a purer metal for their basis, and by calling in the aid of modern improvements in science, as in the present instance.

The first of our engravings is a very elegant and enriched design for a salt-cellar. The light scroll work which covers its surface springs from the tails of the dolphins, whose heads form the foot. The ornament is richly interlaced and is in the taste of the Italian school. The receptacle for the salt is of coloured glass, and the rich tint which it presents to the eye affords an excellent relief to the perforated ornament of the metal with which it is enclosed.

The sugar basket to which we would next direct

attention is covered with tracery and scrolls which recall the style of the *renaissance* to our memory. This open work gives a character of much lightness to the whole, relieved as it is by the glass lining, acting as a foil to the silvered surface of the perforated ornament. The handle is designed in keeping with the whole, and is very light and original in its composition.

The chamber-candlestick presents much simple

elegance of design. The plate is composed of the Lotus leaf, so arranged as to afford by the agreeable flow of the lines a series of beautiful curves. The stalks of the plant form the handle, and are intertwined with tendrils; a smaller leaf projecting from the upper part to form the rest for the thumb. A

flower acts as the extinguisher; the stalk being twined round its base and forming the means by which it is affixed to the candlestick.

A similar adoption of leaves appears in the cake basket at the top of our page, and which, we think,

one of the most successful of the designs we submit to our readers. The body of this very elegant basket is another arrangement of the Lotus leaf, the side handles being formed of the stalk, intertwined with leaves and tendrils. The foot of the basket

is constructed of ornament consisting of perforated leaf and scroll work. To relieve the plainness of the interior surface, a wreath of leaves and berries is engraved round the bottom of the basket, forming a sort of central *corona* of flowers.

The oval double dish, or corner dish, has its ornament composed of scrolls and leaves of water plants, the general shape of dish and cover being a plain undulating pattern, in which all objectionable angles are omitted; this is desirable both for utility

and appearance, both deserving of due attention.

The six-cup egg frame which concludes our series of specimens from this manufactory, possesses one novelty, the bottom on which the cups rest being

of perforated scroll work, which gives the article a very light appearance. The ornamental border round the bottom is composed of narcissus and blue bells, held together by intertwining grasses.

The bodies of the egg-cups are perforated in a similar manner to the stand; and the design altogether possesses much richness of detail.

It will be seen that the study of natural forms and their applicability to ornamental art in general,

as well as the adoption of various styles to the wants of the day, are now carefully thought upon by our manufacturers, and it is a course of study which cannot fail to bring forward the best results, considered in a mercantile or artistic view.

In our present page we give some examples of novelties in fenders from the extensive factory of Messrs. ROBERTSON, CARR, & STEELE, (Chantrey Works,) and which are specimens of the taste and progress in design now evinced by our manufac-

can be no excuse for those who endure ugliness in this particular branch of our furnishing ironmongers' trade. We have occasionally seen very beautiful designs as cheap as any of the old abortions, and we feel quite sure that the day is rapidly

of next year will of course be the fit and proper place for the due display of their novelties; and to that point, doubtless, will the best energies of the best men be enthusiastically directed. We can only say that our own will be directed in the

turers, and which we have so frequently had the satisfaction of seeing and applauding. It is almost within memory when any other pattern for a fender than a straight bend of fine wire-work, supported by a band of bright brass, was all that was con-

approaching when ill-constructed and disagreeable designs will not be tolerable at any price.

We must here for the present bring our notice of Sheffield to a close. The end of the year and our volume calls for this. We hope that we have been

same channel, and that it will be our pride and pleasure to see there next year, such a display of the industry, the ability, and the taste of our manufacturers, as may carry them triumphantly through the contest—a contest most important to

sidered necessary, and the beautiful grace of line which might be adopted for its curves, and the abundance of ornament of which it is capable, was quite unneeded.

That this is not the case now, the present page,

enabled in our series of papers to do its various manufacturers what justice we could, and to exhibit to the world the progress in the arts of life made by them. We are conscious that with all we have done, there is much still behind in this

the honour of all who struggle in it—one which will redound lasting honour to the victor; one in which we trust and hope to see the manufacturers of England in no degree fail.

We are prepared to the best of our ability to

or indeed any ironmonger's shop can witness. There is, perhaps, no article of constant manufacture and of constant necessity, of which so many and such beautiful varieties are now attainable. The fancy of the designer has been brought to bear on them with the happiest effect, and there

large and important town to which we could not even allude; and some manufacturers whose works have not fallen under our notice at all. We shall however take a future opportunity to notice their novelties and improvements in a manner commensurate with their demands. The great Exhibition

describe and illustrate fully the progress of the Manufacturing Arts of our countrymen; we hope thus to do justice to our artisans of all grades, as well as to their continental fellow-workers, and give that permanent record to their works we shall feel due to the ability displayed in them.

PATENT LAWS.

EXHIBITION OF 1851.

It can be no matter of surprise to those who are acquainted with the Patent Laws of this country, that numerous ingenious persons should be deterred from exhibiting their inventions, by the expense and the imperfect security of such laws. The difficulty, especially as it may affect the Exhibition of next year, was felt by the legislature during the past session. A short bill was brought in late in the session, and after much mutilation became one of the statutes of the realm. We have adverted to its glaring defects in a former number;* at the very last stage, the word "Patent," in connection with designs and manufactures, was erased from every part of the bill, which thereby lost nearly all its efficacy. We have received numerous enquiries as to the security now existing, by law, against piracy, and as to the expense of obtaining patents. The only answer we have been able to give is, that, unfortunately, the whole subject is surrounded at present by difficulty and expense. We may say in 1851 as was stated in 1829, by a witness, in giving evidence before the Commons' Committee on Patents:—"The subject is so pregnant with difficulties, that you are choosing among difficulties." A recent order has been issued by the Attorney-General (Sir John Romilly), which has for its object a more detailed and accurate description by drawing or outline specification of the proposed improvement for which a patent is demanded. This may be a very prudent guarantee for the identity of a patent, and so far may be used as a useful check against the fraud or mistakes of rival claimants. It adds, however, another item of trouble, and a small additional expense in the way of a class to whom these are important. An accurate specification or verbal statement of the principle or mode of application, accompanied as it frequently is by diagrams, was always considered, generally speaking, as sufficient. What is required by inventors at this time, is perfect security or protection against piracy and litigation. We agree with the answer of an intelligent witness (Mr. Spence), to a question proposed to him in the Committee on Signet and Privy Seal Offices in 1848—"For the patentee the two great points are security of property, and (so far as is consistent with public justice), freedom from competition during the terms of the monopoly. And for the public, I think that the important point is the real improvement of manufactures." The whole subject of the Patent Laws ought, at an early period, to occupy the attention of Government, and, we believe, will do so.

It would be unreasonable to imagine that patents can be obtained gratuitously; but when we find it stated, upon respectable authority, that the expense of an unopposed English patent is 100*l.*, and that if it is to be extended to Ireland and Scotland about 200*l.* more has to be paid, it must be admitted that this is not merely unjust, but what, sooner or later, all injustice is found to be—unjust policy. We are unwilling to believe that there is any intention to perpetrate injustice towards a class, requiring rather consideration and encouragement. There are probably vested interests, which are difficult to be compensated, and there may be a want of leisure, if not of willingness, to look difficulties in the face. In the meantime, the very moderate charge for which patents may be obtained abroad, must operate adversely to the interests of British manufactures and British commerce.

We trust that some patriotic members of the legislature will, early in the next session, have the subject again investigated, and will bring a bill founded upon the evidence taken in 1829, and before the Committee on the Signet and Privy Seal Offices in 1849. We fear that it is almost too late to expect any reform in this department, in sufficient time to benefit the Exhibitors of 1851. A short Act, however, might be passed on the assembling of Parliament, to enable her Majesty in Council, or the Board of Trade, to grant patents, for a limited period, at a merely nominal sum. A grant might be made by Parliament to supply the deficiency of fee and stamps, which would be more than compensated by the stimulus given to inventors, and the encouragement to persons desirous of sending articles of manufacture to Hyde Park. It seems to have been forgotten that the committee of 1829 left their task unfinished. They examined several witnesses, but they had no more than ten or eleven sittings; they merely reported the shorthand writer's notes of the evidence, and concluded, what is called, their report, consisting of but one paragraph, by "earnest recommendation to the House that the inquiry

may be resumed early in the next session." Since that time the subject has been allowed to remain the topic of complaint, and we fear we must add, the cause of ruin and disappointment to hundreds of our fellow-countrymen. The productive energies of the country have been fettered instead of being allowed to expand freely. Although we have expressed ourselves partly in despondency, and partly with indignation, we yet have hopes that the name of Romilly, associated as it is, and has long been, with so much that is connected with humanity and civilisation, will ere long find its claim to be remembered as instrumental in the progress of British science, by placing on a just and solid basis the Laws of Patent Inventions.

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY.—Charles Lock Eastlake, Esq., has been elected President of the Royal Academy, in the room of Sir Martin Archer Shee, deceased. This election will give exceeding satisfaction to the public as well as to the profession. There was some apprehension that it might not have taken place, in consequence, it is said, of Mr. Eastlake's difficulty of resigning his appointment as secretary to the Commission of Fine Art: that appointment, it is understood, he will retain: we trust it is so; it would be the extreme of weakness to consider it *infra dig.* to continue in the discharge of so important a trust, although his position may be in one sense more elevated. As secretary of the Commission, Mr. Eastlake has conferred incalculable benefit upon the Arts and his country; his withdrawal would be an evil of magnitude; the office is but temporary, and no doubt he conceives himself honourably bound to carry to a close the proceedings he commenced, and not to deprive the Commission of advice and assistance which the Commissioners, we know, look upon as of vital consequence to the issue of the Commission. As a scholar, a gentleman, and an artist, Mr. Eastlake enjoys universal respect; the Royal Academy will be raised in public esteem by this election; no man of the age is better fitted to sustain its dignity and augment its usefulness. He enters on his duties, however, when they are likely to become more serious and responsible than they have been. The Academy, as a body, is the most unpopular ever existed in this country; neither public approval, public encouragement, nor public sympathy is with it; reforms, which its members pertinaciously refuse to listen to, have become necessary, arising out of the many changes which time has wrought in the profession and in society within these eighty-four years past, since the Academy was established; and it is impossible but that some changes must take place—changes which are of deep import to the institution, and of vast consequence to the British public. We trust Mr. Eastlake will be of the present more than of the past; and that he will forestall those alterations in the constitution of the Academy which may be disastrous if forced upon it.

THE NEW PRESIDENT OF THE ROYAL ACADEMY.—We are gratified in being able to announce that Her Majesty has conferred the honour of knighthood upon Mr. C. L. Eastlake; this graceful act is fully due to the high and honourable position which that gentleman has so worthily held in Art, and in literature, as well as to the position he now holds as head of our Academy.

THE NATIONAL MONUMENT TO SIR ROBERT PEEL, for which the sum of 5000*l.*, if we remember rightly, was voted during the late session of parliament, has, it is understood, been assigned for execution to Mr. Gibson—confessedly the most eminent living sculptor of Europe. The position has been, almost universally, accorded to him; but it is not on this account that the first Lord of the Treasury should have singled him out from all others for the task. Mr. Gibson will, no doubt, produce a work worthy of his own high fame and of the distinguished statesman whose memory is to be thus honoured; yet where national money is voted for a national purpose, it is not the prime minister who should solely have the disposition of the funds; there are others—the public—claiming a right to its

disposal; and other sculptors anxious to try, at least, if they cannot produce something that will entitle them to a large sum of public money. In short, the design for the monument ought to have been submitted to open competition. But then again comes "the rub;" competition, in works of art especially, has become so much a byword among artists of any repute, that few will be found willing to enter the arena; and so much undue influence and favouritism are mixed up with all such proceedings, that in five cases out of six, if a certain artist sends designs for a particular work, it is tolerably well known it will be entrusted to him; not, it may be, because his designs are the best, but because he has most friends to back him. These things are notorious. Let us not be misunderstood as bringing such a charge against Mr. Gibson; for we will venture to affirm that, if the work had been competed for, he would never have appeared in the lists; having it offered him, however, he naturally accepts it, and is not to be censured for so doing. We will give Lord John Russell, too, the credit of having to some extent acted openly in the business; he certainly has not invited our sculptors to spend weeks and months in preparing drawings and models, while he at the same time held the determination of giving the commission to one particular individual. This would indeed have been a greater wrong to the profession than that he has now done it, by indirectly saying, "you are insufficient for the work." But why did not his lordship tell what he purposed to do, when the vote was taken! Much hopeful anticipation would not then have been indulged, and much loss of time would have been spared to many, who, we know, have been working in the expectation of a call to compete. Were his lordship an artist he would understand the sickening and baneful influence of such proceedings on the hearts of "sons of genius." National grants in England for public works of Art are neither so numerous nor so frequent as to be unearned for by those who hope to derive from them fame or emolument, if not both, and who have an unquestionable right to be placed in a position to strive for these advantages.

MR. JONES, R.A., has resigned the Keepership of the Royal Academy; his successor, we believe, has not yet been named. Mr. Jones gave universal satisfaction to the students by his gracious and amiable manners, and by his continual desire to promote their wishes and interests in all ways permitted by the rules and regulations of the Academy.

MR. JAMES CLARK HOOK has been elected an Associate of the Royal Academy, in the room of Mr. Westall, deceased. Mr. Hook obtained the gold medal, and was "the travelling student" of the Academy, and his works at the several exhibitions since his return from Italy have contributed to uphold his fame. He has long been regarded as one of the "rising artists" of the country, and the honour conferred upon him has been amply merited. Mr. Hook is a grandson of the late learned Dr. Adam Clark; and son of the late Colonial Secretary at Sierra Leone. Although we rejoice at the appointment, as honourably earned and worthily bestowed, we cannot close our eyes to the fact that this promotion of a young man is at the expense of many artists who were famous in Art before Mr. Hook ever used a pencil, and who have been year after year, for many years, "solleing;" the distinction now conferred upon one so much their junior. This evil can be remedied only by augmenting the number of members of the Royal Academy; they are "forty" in 1850, they were "forty" in 1770; yet of artists there are now, perhaps, fifty to one, comparing the middle of the present with the end of the past century. Such a state of things is as much opposed to common prudence as it is to common sense; while such men as Lancelotti, Harding, Linnell, Stone, and, at the least, a score of others, are "rejected candidates," again and again, there must be in the body a disease that ought to be eradicated.

THE BRITISH INSTITUTION.—On the 20th of last month, the gallery was opened for the exhibition of the studies made from the pictures which had been left for copying. The selection

* Vide the Art-Journal for August.

contained, we think, the best works that could have been chosen for the purpose. Among them were of course Rembrandt's "Duchess of Lorraine;" also a "Spanish Peasant Girl," by Velasquez; "St. John in the Wilderness," Guercino; a "Holy Family," Schidone; a "River View," Vanderwerf; "The Saviour driving the Money Changers from the Temple," Paul Veronese; "Landscape with Waterfall," Both; the ship "Sovereign Royal," &c., Old Vandevelde, &c. &c. Several of the copies by ladies appear this year to be of a superior order; we may instance that of the Schidone, by Miss Guthrie, the St. John in water colour by Miss Greener; the Rembrandt has been copied with much success by Mr. Baines, and also by Miss Lane; the Paul Veronese by Miss Gould; the Both by Mr. Pearson, and the Vandevelde by Mr. Mornewick. Some of the pictures are extremely difficult of imitation, but the manner in which the best of the copies have been executed, is superior to that of antecedent years.

MR. MACREADY.—With the close of the present year, this accomplished gentleman and long popular actor bids farewell to the stage. He quits it before his reputation is even on the wane; while he is yet in the vigour of manhood; and when his intellectual and physical strength are in sufficient force to promise a much more extended career of success. He has his own reasons for this somewhat premature departure; and no doubt they are good ones. Fortunate and happy in all the home relations of life, we presume he considers that his children demand his duties even more than the public; and, it is understood, that in order to superintend their education and form their minds, he has retired to some distance from London, in the immediate vicinity of a public school. We cannot, however, take our leave of him without a passing word or two. As an actor he has had no competitor—at least in the remembrance of the more youthful generation of our age; and, if not, in the estimation of those who are half a century old, "the noblest Roman of them all," he, at all events, leaves no successor upon whom his mantle may descend. The glories of the tragic drama expire with him; and we may only hope that time will produce some one worthy to take the place he leaves vacant. But there are other and higher considerations associated with Mr. Macready's connection with the stage; his character, for upwards of thirty years of public life, has been, so to speak, "without spot or blemish;" he has been one of the proofs,—too few indeed—that the highest and most delicate uprightiness may co-exist with temptations to thoughtlessness or recklessness which are sometimes deemed excusable in actors; as a gentleman and a scholar, as a man of stern integrity, pursuing a path of invariable rectitude, from the commencement to the close of his public life; seeking, and finding, friends only among those who are renowned for learning or eminent for virtue; as an example to his profession—his career is invaluable as a contribution to dramatic history. His management of "Covent Garden" will be long remembered, and the reforms he introduced into the theatre,—in its moral influence as well as in its artistic character—have received the testimony of the good and the refined of the country. Who will have forgotten the delicacy of taste, the accuracy of costume, the scenic beauties, the study of truth in everything, and all the graces of Art, which he brought to bear on the acted drama, rendering the theatre that which is its natural property—a great school for teaching what is excellent and what is true. No doubt every public journal will give expression to that mingled feeling of gratification and regret which announces his retirement into private life; wishing him many years of enjoyment in the tranquillity of a happy home and the society of a family in which he is fervently beloved; and, perhaps, when so many, certainly not more worthy, are receiving "testimonials" in acknowledgment of services rendered and of pleasures continually bestowed, some one will consider that a testimonial to this gentleman, on his withdrawal from the stage, will be a duty to which thousands will gladly contribute.

THE LORD MAYOR'S SHOW.—This time-worn, if

not time-honoured annual, has put forth extra claims to public attention this year, by discarding the "men in armour," and resorting to allegorical representations. Now the latter are never particularly clear; and on the present occasion were not a little contradictory. "Peace," who headed the novelties (b) looked excessively as if she had had, of late, a hard struggle amid conflicting revolutions, and was "the worse for wear." The rest of Mr. Batty's horse-riders, although painted and decorated as the four quarters of the globe, and "other branches of learning," cut as sorry a figure as Vauxhall by daylight. Stage-finery asks necessarily for the light of gas; it is not pleasant to note

— "the pale faces
And late hour traces
That mark the *tournees* of the evening graces."

All things should have their places, and the men-in-armour certainly looked better than these, inasmuch as there was a reality about them; and their suits were frequently of a valuable kind from our national collection at the Tower. The living beasts, camel or elephant, were certainly truthful enough; but why nullify this by making them carry a few stuffed monkeys and parrots, on dead branches of trees, to indicate their native forests. A bunch of straw and a bee-hive is a poor emblem of "Industry;" and the "Fine Arts" represented by a plaster cast or two; and a picture in a gilt frame that would be dear at half-a-crown, does not shadow forth much of the arts of a nation to command respect. A car containing "Happiness" seated on a globe, with "Britannia" at the base, was the best portion of the show, and really well done; but here the danger of allegory was displayed in the comment of a by-stander, who remarked that "Britannia" was far below 'Happiness.'" The genius of a Rubens could only make these things tolerable in a past age, when the taste for them was more universal, and among people who liked "this kind of thing." In the streets of London in 1851 they become simply ridiculous. Who are the lookers on, and what good end can it answer? The day has gone by for all this.

THE NELSON COLUMN.—Another bas-relief has been placed in the base of this column, leaving only one compartment now unfilled. It is by Mr. Termouth, and represents Nelson in the centre of a group of officers and sailors, sealing the letter to the authorities of Copenhagen, containing his definitive arrangements, upon the mouth of a ship's gun. The story is well set forth; and the group by which he is surrounded, excellently designed. There is one great merit in this series of bas-reliefs, which is, that though they are from different artists, they all possess that uniformity of character which should be seen in the series.

THE GOETHE INTERFERENCE.—We learn from a German correspondent that, in accordance with the last will of the great poet, the collections famous in Germany as the *Goethe Inheritance*, are to be sold immediately for the benefit of his heirs. The sale has hitherto been delayed by several causes, some of a public and some of a private nature. An offer was made in the first instance by the *Bundestag* to purchase the house at Weimar, with the collections as they stood, and convert the whole into a sort of museum. The heirs, however,—his two grandsons,—were unwilling to convert the rooms in which their grandfather had lived for forty years, in which they had grown up from infancy at his feet, in which he had breathed his last breath,—into a common show, at least while they lived and had the hope and intention of inhabiting the family mansion. They refused, therefore, on any terms, to part with the house, though willing, in accordance with their grandfather's testamentary arrangements to part with the collections, which they offered to their native city, Weimar, at a price even beneath the money value. The offer was declined, apparently with the idea of forcing them to sell the house. Their refusal not to do this has exposed them to a great deal of misconstruction and abuse, as if proceeding from a want of public spirit, but many will sympathise with the private and domestic feelings and filial piety of these young men, to whom the great

Goethe was the loving and honoured parent, while, to the world at large, he is merely the writer and the poet. The collections now to be sold consist, in the first place, of a series of about 5000 medals and coins, of especial value and importance, some of great rarity, almost unique. Secondly, of Majolica, of the best style and period, upwards of a hundred specimens. Thirdly, of bronzes, terra-cottas, and carvings in wood and ivory, antique and of the best Italian and German work. Fourthly, a collection of antique gems, purchased by Goethe himself in Italy. Fifthly, upwards of 2000 prints and engravings, for the most part rare and fine impressions; and more than 500 original drawings, among them an album of portraits from life, of distinguished men, princes, poets, and artists, who formed the circle of Goethe's friends. Lastly, a collection of minerals, fossils, and objects of natural history, formed by Goethe himself to assist him in his studies, and consisting of more than 6000 specimens. A very good *catalogue raisonné* of the whole of these collections has been published by Fromman, the well-known bookseller, at Jena, and is in itself so interesting and so characteristic of the poet, that it ought to form a part of the series of his works. In the present unsettled state of affairs in Germany, the heirs have decided on selling the whole property at once and in one lot for a moderate sum, and those who wish to treat for the purchase are desired to address themselves by letter to the Baron Walther von Goethe at Vienna. If the different objects were disposed of in separate lots in America, or England, or Germany, they would probably realise three or four times as much as would now be accepted for the whole; or the whole would form the nucleus of a local or national museum of especial interest, for there is scarce an object of beauty or value contained in it, which is not alluded to in some part of Goethe's writings, as familiarly associated with his daily life, his compositions, and his studies; at all events we think we do good service to the cause of art and literature in making the circumstances generally known.

MANUFACTURERS AND DEALERS.—The difficulties which we foresaw and commented upon some months ago, are now beginning to be felt; they must be grappled with. The *Times* in an able and sensible article has taken the matter up; its recommendation being that the manufacturer shall be at liberty to give or withhold his name, as he pleases; to "covet honour" and obtain it, or to rest content with the pecuniary advantage he derives from transferring his fame to the dealer to whom he sells his goods. This plan will give rise to much evil—much injustice; but it is not easy to devise a better. It will, however, we presume be absolutely necessary for the manufacturer to sanction the exhibition of his productions by only one of his customers; or we shall see some favourite lamp, or jug, or silk, repeated upon half a hundred counters. It will thus be comparatively easy to ascertain who is really the manufacturer in cases where it ought to be known; and where the manufacturer, as frequently, only shares the merit of the design with the dealer; it is perhaps but fair that the latter should have the lion's part of the glory. It is very encouraging to see the *Times* dealing with the subject of Art-manufacture, throwing its weight into the scale, and teaching the lesson we have been striving to inculcate for the last seven years,—that "good taste need not cost more than bad taste;" or, in the words we have so frequently used, that "beauty may be as cheap as deformity."

THE PRIZE OF ONE HUNDRED GUINEAS.—The Earl Fitzwilliam, at the York Banquet, expressed his regret that the Royal Commission had not offered a prize for an essay in reference to the Great Exhibition of 1851. His lordship was not then aware that the proprietors of the *Art-Journal* had done so several months previously. The adjudicators have since been appointed; they are:—G. R. Porter, Esq., Secretary of the Board of Trade; Apsley Pellat, Esq., Manufacturer; Thomas Wright, Esq., M.A., F.S.A. The essay will be published in the *Art-Journal*, probably in the number for July next.

THE SPACE applied for the Great Exhibition is understood to be about double that which can

be allotted, and a difficult task, consequently, devolves upon those to whom the delicate duty may be entrusted. We have heard of applications excessively absurd; applicants seem to have acted on the assumption (and have not concealed the fact that it is so) that the more they asked for the more they would get; inasmuch as they were not likely to be judged by parties acquainted with their actual requirements and the nature of their proper wants. We earnestly hope that strict justice and impartiality will be exercised in this matter; we may expect nine out of ten persons to be disappointed—but that will be of little consequence if the public are satisfied that integrity has been the basis of the awards. The objects designed to be contributed will also have to be somewhat scrupulously considered; we have heard of an application for space to contribute Banbury cakes; yet this seems quite as reasonable a request as that which refers to Neufchâtel cheeses—to which it appears the commission have assented.

THE FUNDS contributed throughout Great Britain, in aid of the Great Exhibition, amount, it appears, to 75,000*l.*, of which London contributes a little more than one-third; but it will be remembered, that this one-third includes the sums of hundreds and five hundreds given by rich merchants and bankers. The amount is precisely that which we expected it to be—but it is said not to be "near enough"—that a much larger amount will be required, exclusive of the sums for admission, now the only source of revenue to be calculated upon hereafter—for the catalogues will yield little, we believe, indeed, nothing—inasmuch as we feel assured the twopenny royalty will have to be abandoned. One thing is clear, a larger sum than one shilling for admission *must not be demanded*; even then, the tax will be a heavy one upon those who are most required to profit by the Exhibition, and to whom one or two visits will do but small service. Foreigners especially, who are used—and rightly used—to free admissions to all such national expositions, will think a shilling payment a large one. We repeat what we said some months ago—Parliament must be eventually called upon to pay for the Exhibition.

THE SPECTATOR, acting on the information we supplied, relative to the demand of the manufacturers of Germany, that prices shall be affixed to the articles they contribute to the Exhibition, advises that the principle he conceded in the case of foreigners. We presume to say, that the good to be obtained by such concession would be far over-balanced by the evil. Surely British manufacturers would justly complain; but one thing is certain, and, to our minds, conclusive on the subject—in none of the great periodical expositions of the Continent are prices ever affixed to the articles exposed.

PRESENT TO THE QUEEN.—Among other contributions to the Exhibition of 1851 will be two huge sofas and four chairs, of marble, carved in single pieces, sent by an Indian Rajah, with directions that when they leave Hyde Park they shall be forwarded as gifts to the Queen, in order to be placed at convenient intervals in the walks surrounding Windsor Castle.

THE EXHIBITION CATALOGUES.—The privilege to print exclusively the catalogues of the Exhibition of 1851, has been bought by Messrs. Spicer and Clowes, the former the extensive paper maker, the latter the eminent printer. The price at which they have purchased it is not at present known; nor has it been ascertained to what extent the Commission has modified the absurd arrangements which clogged the proposals of "the Executive" for tenders. Long before the time for receiving these tenders had expired, it was known that Messrs. Spicer and Clowes (who are printers to the Commission) would be the parties to purchase the right; they can probably see what other experienced men could not see—the way to do the work properly, and yet to make money by it. We hope they may make it answer; but it will only be by some concessions—probably by the Commission yielding up to the contractors the twopenny royalty. We have no doubt that when their plans are carried out, and the catalogues are completed, both the contractors

and the Commission will see the absolute necessity of some such step; and the public, from a sense of justice, will readily assent to it. We believe Messrs. Clowes have planned two catalogues—one to sell for one shilling, and one to sell for ten shillings. Meanwhile, all sorts of catalogues are announced from private parties; there will be scores of all sorts and sizes; but the great advantage to be enjoyed by Messrs. Spicer and Clowes, will be the right to sell within the building.

FRAUDS IN REFERENCE TO THE GREAT EXHIBITION.—Manufacturers and the public should be warned against fraudulent attempts to obtain drawings, information, and advertisements, under the pretence that they are required for catalogues of the Exhibition. One advertisement we have seen, informs contributors that they ought to send drawings to a certain wood-engraver; another applies for advertisements, with the fees paid in advance; other snarcs of the kind have been laid, in some instances skilfully. We understand the police are already "on the scent," and that prosecution will follow detection.

A SOCIETY AT VIENNA, for the encouragement of Art and manufacture, has subscribed to send one hundred artisans free of expense to London, in May, to remain there a fortnight, studying the collection of manufactured works at the Great Exhibition. A correspondent, to whom we are indebted for this information, adds "a great impression has been made at Vienna by Prince Albert's speech at York; and on the whole, the importance and popularity of the Exhibition is decidedly on the increase."

THE GOLDSMITHS' COMPANY have, with that liberality for which they have been long famous, offered prizes amounting to 1000*l.* for the best examples of design and workmanship in gold and silver, being the productions of British artists. The particulars may be ascertained by reference to the Company.

REVIEWS.

ANCIENT ART AND ITS REMAINS, OR, A MANUAL OF THE ARCHEOLOGY OF ART. By C. O. MULLER. Translated by JOHN LEITCH. Published by FULLARTON & Co., London and Edinburgh.

We take up this new edition of "Ancient Art and its Remains" with an increased respect for the patient industry of its author. It is extremely difficult to believe that a man whose research has possessed him of every description of, and allusion to, every production of antique Art, could faithfully adhere to his prescribed manual form *ad ope manu ad manum*, that is, from the dawn to the twilight and obscurity of ancient Art, without being tempted into compendious history. His diligence has proved his love of Art, and with this love his abstinence is an exaltation far beyond the vulgar virtues of every-day life. The book is kept as purely artistic as possible, that is, referring more especially to the sculptured and other less perishable remains of ancient Art which remain as monuments of the social, religious, and political life among nations, of some of which, all that survives consists of these same monuments. The author, it seems, entertains peculiar views of the designs, and doubts, it would appear, the orthodoxy of the sacred theology, of the Greek sculptors; but, in order to adhere strictly to the form which he has adopted, he has refrained from expressing in any wise his views on the subject. This work has been known for some years to artists and archaeologists, and the form in which it is now presented to the public is that of a second edition, in which the most recent additions to our knowledge of ancient Art are noticed. And in addition to the purposes of the work as a book of reference, it was intended as a basis for a course of one hundred lectures and also as a handbook for the student. As a book of reference perhaps a chronological arrangement might be dispensed with; but as pointing to the materials for a long course of lectures, which necessarily must be put into chronological arrangement, we presume to think that such form had been advantageous. It is undoubtedly true that of all ancient Art the Greek is paramount; but its excellence was the result of progress, and inasmuch as later schools founded their principles on those of the Greeks, the later had been preceded by others who practised primitive Art. The divisions of the matter are the first period of Greek sculpture,

terminating with the 50th Olympiad; the second period, from the 50th to the 80th Olympiad; the third period, from the 80th to the 111th Olympiad; the fourth period, from the 111th to the third year of the 158th Olympiad; and the fifth period, from the year of the city to the middle ages. Then follow the Egyptians, the Babylonians, the nations of Arian race, the Syrian races, and the Indians. Another great division is devoted to the systematic treatment of Art, comprehending Tectonics and Formative Art, each of which subdivisions is again classified into other subordinate sections. We cannot believe that the work had been less original in a chronological arrangement, while we are persuaded that it would have smoothed the path of the student. The monuments of Egypt, India, and Assyria contribute nothing to practical art education; but if they are classified, they had better have been in their places. To a reader and a student the system had been more available commencing with a consideration of Pelagian monuments, and then of Indian, Egyptian, then of Western Asia, then Greek and Roman. The works of the early Greek schools were not less barbarous than the productions of those nations that aspired at little beyond the manufacture of hideous idols. When the wood-carvers ventured to make entire images, the eyes were represented only by a streak, and the feet were placed close together, and the hands hung close to the body; and in this form they were polished, painted, and decorated for worship with crowns, diadems, necklaces, ear-pendants, &c.; and this manner of dressing their idols was borrowed from the Babylonians; hence a relation which is important enough in the history of art to give a definite place to the Syrian idols. However, under any arrangement, the materials brought forward, with the numberless authorities, must be invaluable to every writer and lecturer upon Art. The translator has had a task of great difficulty; he has allowed himself as few licences as possible. In translating from the German there is greater danger of obscurity than in rendering any other European language.

SIR ROGER DE COVERLEY. By THE SPECTATOR. Published by LONGMANS & Co., London.

It sometimes happens that a single character in a book will insure its popularity; such an one often becomes immortal; we will not go so far as to say that the Coverley papers are the most attractive in the *Spectator*, but we do affirm they are sufficient of themselves to secure their own renown by being published as an independent volume. Sir Roger, in any garb, is a most welcome visitor, but coming, as he does here, in the very dress which it is presumed he wore on his first public appearance, we greet him once more right heartily. We made his acquaintance very early in our youth, for we have a distinct recollection of frequently taking down the volume containing his history from the shelves of the school-library, and sitting with it in the old hall of the baronial mansion where our school-days were passed, while we pleased ourselves with the fancy that Sir Roger himself must have occupied some such similar residence, and feasted—but not intemperately—the squires of his day. The character of the honest, hearty, gallant, but somewhat sensitive, old English gentleman has been too often commented upon to render criticism necessary now; and his humorous and pardonable extravagancies have excited a smile, and will continue so to do while our language lasts, in tens of thousands of readers. This edition of the Coverley papers is elegantly got up; it is printed in type similar to that in use when Addison wrote, and is embellished with a number of exquisitely engraved wood-cuts by Thompson, from designs by F. Taylor, making altogether a desirable volume for the drawing-room table or the library. Parts of Mr. Taylor's drawings are excellent; but he has not, we think, pictured the good old Sir Roger, so as to meet our fancy of the man. He was far more of a gentleman than the artist has described him to be. The volume contains various interesting and useful notes by Mr. Wills, which add considerably to its value, and go far to justify the publication of the papers as an illustrated and somewhat costly book.

SIX COMPOSITIONS FROM THE LIFE OF CHRIST. Drawn by F. R. PICKERSGILL, A.R.A. Engraved by DALZIEL. Published by CHAPMAN & HALL, London.

Various have been the attempts of late years to bring within the scope of popular Art such offerings to the heart and the eye, as may, at one and the same time, prove advantageous to both. Few, however, of the publications which have hitherto been put forward with this object have answered the purpose intended; in some cases good Art has not been cheap Art; in others, what professes to be

good has not in reality been so, and has accordingly been unwelcomed. We have seen numerous foreign introductions, excellent of their kind, and issued at a tolerably moderate charge, but that charge has not been sufficiently low to bring them within the range of the classes whose means should more especially have been consulted—the intelligent working-classes and those who belong to them. Now, Mr. F. R. Pickersgill's series is just the publication to meet their requirements; it comes within the reach of their pockets, while it is no less adapted for their mental instruction and to elevate the conception to the beauty and sublimity of true Art. We should, however, be doing scanty justice to these really fine compositions if we limited their usefulness only to the classes just spoken of, for they may be profitably studied by those well initiated in all the excellences of Art; it is not too much to affirm that nothing so truly valuable, in a similar form, has heretofore been published in this country. The six subjects are—"The Wise Men's Offering," "Christ blessing Little Children," "The Woman taken in Adultery," "Mary anointing the Feet of our Saviour," "Christ's Entry into Jerusalem," and "The Atonement." If our space permitted us to enlarge upon these illustrations respectively, we could find much to say about each, so highly do we estimate the sublimity of their conception and their vigorous and accurate drawing. The mind has been at work here with no ordinary result; and we shall be much mistaken if these subjects, slight as they are as engravings, do not add greatly to the artist's already well-earned reputation. The engraver has executed his share of the work with a vast deal of spirit. To the clergy for their schools; and, indeed, to all engaged in the education of the young, these six large-sized prints, published at a shilling, must prove invaluable. We shall think it augurs well for the improved taste of the people to know that they have found a place in every decent and well-ordered abode.

A CYCLOPEDIA OF USEFUL ARTS.—PART I. Edited by C. TOMLINSON. Published by G. VIRTUE, London and New York.

Every year of our present existence seems to require some new work which treats of scientific and mechanical subjects, or some enlarged addition to previously published books. The improvements brought forward, almost each successive month, on matters connected with the useful and manufacturing arts, tend to make that state and unprofitable which was of great worth but a short time since; so that the records of preceding attainments in science become almost as useless as old almanacs. The great lights of a quarter of a century back would be astonished at what those who came after them have accomplished in obedience to the demands of the present state of society, which is ever moving onwards with a rapidity that almost defies calculation, and which, in many of its movements, would lead the reflective mind to doubt whether the progress is as safe as it is most certainly swift. It is not, however, our province to dilate now upon the good or evil wherewith the advanced state of knowledge may ultimately lead, but rather to direct attention to a serial publication whose object is to assist the acquirement of that knowledge. Notwithstanding the multitudinous works constantly issuing from the press that relate to such matters, one that may come within the reach of the pockets of the operative, and that is made comparatively intelligent to his understanding, is still wanting, and such, we think, Mr. Tomlinson's Cyclopaedia gives good promise of effecting. The first number of a book published in parts is scarcely sufficient for the expression of a decided opinion, but if the work is carried through as commenced, and of this there can be no doubt from what we know of the editor's fitness for the task he has undertaken, it will be a valuable addition to our scientific literature. The subjects already treated of appear to be written with extreme care and simplicity, yet with abundant amplitude; for instance, the word "Acrostation" occupies more than nine pages of closely-printed, yet legible type; "Acetic Acid" about five pages; and other words of greater or less importance in similar proportions, while a large number of well-executed engravings are introduced to illustrate the subjects, which it is intended shall include everything connected with mechanics, chemistry, manufactures, mining, engineering, &c., &c.

ILLUSTRATIONS OF BRITISH BIRDS AND THEIR EGGS. By H. L. MEYER. Published by the Author, Chertsey; and sold by SIMPKIN, MARSHALL, & Co., London. Ornithology, next to botany, is the most instructive

study in natural history which can engage the mind; there is so much to be learned from the habits and modes of living of the winged tribes of the air,—so much positive good to be derived from the knowledge thus acquired,—so much that is curious in their organisation and wonderful in their actions, that it is impossible to contemplate them without a feeling of astonishment and admiration. Birds and flowers are typical of all that is lovely in nature, but the flowers seem to lose half their beauty if the birds are not present to welcome them, and the forests have a lonely and desolate grandeur when the music of their feathered inhabitants is silent. We are accustomed to regard our native birds as far inferior to those of foreign countries in brilliancy of plumage and variety of colour, but Mr. Meyer's illustrations show that we have amidst us many that may vie in beauty with the most exquisite in creation; some of these, too, are among the common tribes which engage little general observation. There is no work on British ornithology, of which we have any recollection, so complete and so well got up as this; it contains upwards of four hundred plates coloured with the greatest care and finish, and presenting specimens not only of all our native birds, but also of those migratory visitors who find their way hither from across the waters, and become lodgers, if not permanent tenants, in our fields and wood. The text accompanying these plates gives just so much information concerning their uses and necessary to know, either for reference or scientific purposes; taken altogether the publication is one evincing much labour and diligent study; no library can be considered perfect without it.

"HORACE."—ODES, EPODES, AND CARMEN SECVLARE. Translated into English Verse by CAPT. WHYTE MELVILLE, Late Coldstream Guards. Published by SIMPKIN, MARSHALL, & Co., London.

Without going quite into the extremes of those enthusiasts who trace all of "the beautiful" in the human form, who refer all of "the graceful" in modern language, back to the shapely proportions of the Greek model, and to the severe rules of Latin composition—without holding such bigoted faith in antiquity as these, we are yet glad to see in the present day a strong tendency to revert for instruction and amusement to those standard classical works long the delight of the scholar, which the education and refinement now spreading so generally amongst all classes of society are fast enabling "the million" to enjoy.

If Art in the olden time could boast of a deeper devotion in votaries, dating the creation of their master-pieces from the Olympic games of glorious Greece, she can now, in the nineteenth century, at least count a far greater number of worshippers thronging to her shrine. Like the fabled Mercury whose inanimate representation has been deemed one of her greatest triumphs, she is gradually and surely maturing the intellect and moulding the character of the Anglo-Saxon race,—the mightiest and the most numerous upon the face of the earth. It is too much to expect that the generality of mankind should have time or inclination to wade through the drudgery indispensable for a perusal of the best Latin or Greek poets, in the original; but surely our own beautiful language has richness and versatility to render, as our countrymen have taste and feeling to appreciate, those deeper beauties of thought and imagery, that poetry of the mind, without which elegance of diction and harmony of rhythm are indeed but empty sounds.

The translation now before us appears to have been written with the view of opening to the unlearned the beauties of Rome's favourite bard, and of producing on the English mind the same effect that we can conceive his much-applauded odes to have had on an audience polished by the taste and cultivation of the Augustan age. In this Captain Melville has been most successful, and his adaptation to the Latin lines of metres, which, without losing their English character, and consequent harmony to an English ear, are still as far as possible assimilated to the original; conveys, most happily, the spirit and intention of the poet he has undertaken to translate. In looking over the work, we do certainly, here and there, light upon faults both of omission and commission, inaccuracies of spelling and rhyme, which at once betray the carelessness and inexperience of a young author, but we must confess on the other hand, that several passages abound with a freshness and vigour, unfortunately not always accompanying the more elaborate performances of a maturer author, and it is but justice to say, that the beauties far out-number the errors. Captain Melville seems to have thrown his whole mind and feelings into the task. He is evidently

an enthusiast in his admiration for his author, whose manifold charms he seems thoroughly to appreciate; and the consequence is that his translation, while abounding in beautiful language and harmonious lines, is thoroughly imbued with the Horatian spirit,—scarcely departing from the actual expression, never from the meaning of the original. We can confidently recommend this work as well to those whom ignorance of Latin has hitherto prevented from becoming acquainted with the Epicurean bard, as to the scholar, who will not be sorry to recognise his old favourite Horace clothed in a garb, which, the more he studies, the more he will be led to confess is a costume at once graceful and becoming, and who will appreciate the difficulties of rendering the terse and pointed expressions, so peculiar to the Latin idiom, into a language like our own.

EMBLEMS OF SAINTS. By the Rev. F. C. HUSENBETH. Published by BURNS & LAMBERT, London.

There seems to us to have been a vast deal of profitless labour bestowed on the compilation of this small volume, as its professed utility will be appreciated by only the very few engaged in the pursuits of Archaeology and Ecclesiology. The object of the book is chiefly to show how the Saints are distinguished in works of Art; but the far greater majority of those who admire painted windows and sculptured figures, and even the buyers of ancient pictures, care little who among the thousand and one holy men and women that make up the saintly roll are represented, provided the painting or the sculpture is good as a work of Art,—whether it be "St. Alexis having dirty water thrown upon him," or "St. Pantoleon pushed off a rock with a pitchfork." The time is long since gone by when such subjects are felt as matters of interest independent of their artistic excellence.

A SYNOPSIS OF THE CONIFEROUS PLANTS GROWN IN GREAT BRITAIN, and sold by KNIGHT & PERRY, at the Exotic Nursery, King's Road, Chelsea, Svo. London, LONGMANS & Co.

The appearance of this book furnishes a suitable opportunity of drawing the attention of architects and landscape gardeners to some points closely connected with their pursuits. Horace has pointed out the ill-effects of incongruity in a variety of cases, and it is as displeasing when manifested in laying out the pleasure-grounds of a mansion, as in a poem or a play. In the beautiful, but rare volume, entitled, "The Country House," edited by Lady Mary Fox, are many valuable suggestions for the construction of such a residence, augmented by an exposition of the principles which should regulate the internal decorations, from the pen of Sir C. L. Eastlake, now fully elevated to the highest rank in the Royal Academy; but the landscape decorations are not treated of, save by a reference to the work of Prince Puckler Muskau. We would have those who erect a house, the style of which is the Italian or revived Grecian, take care that the trees nearest to the mansion should be in keeping with it, and for this purpose the stone pine (*Pinus pinea*), and at a greater distance, where circumstances permit, the Lombardy poplar, should abound. These would lend to one harmonious whole, pleasing both to the eye and mind. So again, when the Gothic style is adopted, the Norway spruce (*Abies excelsa*), and the Scotch fir, should occupy the chief elevated spots near the house, as they would give the aspect of a Scandinavian scene, naturally associated with a Gothic mansion. The Swiss villa would be best accompanied by the Silver fir (*Picea pectinata*), intermingled with the Siberian pine (*Pinus Cembra*), the spruce, and Scotch fir, with here and there a clump of larches. A parsonage will be most suitably surrounded by the cedars of Lebanon (*Cedrus Libani*), and its lofty congener, the Deodar (*Cedrus Deodara*), with some Scotch fir, deciduous cypress (*Taxodium distichum*), and arbor vitae (*Biota orientalis*, *B. pendula* and still better the new *Libo-cedrus tetragona*, Endlicher.) With these should be freely intermixed trees of a lighter aspect, such as the flowering ash, and others, for we would not have our parsonages and their grounds entirely to resemble "church-yards and charnel-houses." These views must be modified according to circumstances, for the landscape-gardener must "consult the genius of the place in all." Particularly must he be influenced by the soil with which he has to deal. On this head he will find succinct directions in the manual, the title of which is given above, and to which we refer all who mean really to enjoy a country life in houses of their own erection and decoration.
